And, the only action the federal government compels state action on is the sharing of fingerprints but that is not what their internal link to the police advantage is about --- it assume other, more overt forms of local and state police cooperation.

Federal government doesn’t mandate state and local law enforcement cooperation

Linthicum & Romney, 7/19/15 (Kate Linthicum and Lee Romney, “L.A. County considers new immigration program for jails in light of S.F. slaying,”

<http://www.latimes.com/local/california/la-me-immigration-jails-20150720-story.html#page=1>,

JMP) *** Note --- **Jeh Johnson is the Homeland Security Secretary**

At the hearing, Johnson faced heavy criticism from Republicans, who asked why ICE hasn't required local agencies to comply with all aspects of the new program.

"I do not believe that we should mandate the cooperation of state and local law enforcement officials," Johnson said. "I believe that the most effective way to work with jurisdictions, particularly the larger ones, is through a cooperative effort with a program that removes the legal and political controversy."

Rep. Zoe Lofgren (D-San Jose) welcomed Johnson's approach, which she called more "respectful to local communities" than previous ICE jails programs. While Secure Communities was at times presented as a mandatory program that local officials had to comply with, **the new program acknowledges that local jurisdictions may craft their own policies about what types of criminal convictions would warrant notification,** she said.

"Somebody sitting in Washington doesn't know the details of how to do policing in San Jose or San Francisco or Chicago," she said.

For some local officials, giving ICE agents so much as a heads up on release — even for those previously convicted of violent felonies and facing new charges of violence — is unacceptable without a warrant.

"The idea of notifying undermines the interest of limiting compliance with ICE," said San Francisco Supervisor John Avalos.

10th amendment also prevents federal mandates

Asian Law Caucus, 15 (4/13/2015, ICE Out of California Implementation Act: Building Upon the California Trust Act, <http://www.slideshare.net/JenniferRojas10/ice-out-of-california-implementation-guide>, JMP)

Just like ICE holds, notification to ICE of an individual's release date is completely voluntary. **Under the Tenth Amendment, ICE is prohibited from imposing any mandatory duties on local law enforcement agencies to engage in civil immigration enforcement.** Because notification runs contrary to the purpose of the TRUST Act and creates distrust within immigrant communities, advocates should ask local law enforcement to opt out of PEP-Comm by adopting policies that refuse notification to ICE.

The Priority Enforcement Program replaced the Secure Communities program their evidence is discussing --- it is VOLUNTARY program

Ocampo, 7/20/15 --- Associate Director of Immigration at the Center for American Progress (Lizet, "Federal-Local Coordination on Immigration Enforcement: Prioritizing Public Safety," <https://www.americanprogress.org/issues/immigration/news/2015/07/20/117772/federal-local-coordination-on-immigration-enforcement-prioritizing-public-safety/>, JMP)

The recent shooting death of Kathryn Steinle in San Francisco is a tragedy. The United States must do everything in its power to avoid tragedies like this in the future. Given that the suspect was undocumented, some public figures have used this instance to ignite a debate about the U.S. immigration system. Policymakers should look at what more can be done to ensure better communication between federal and local authorities. But the furor surrounding this controversy has been sorely lacking in actual facts regarding both local cooperation with federal immigration enforcement and the role of trust in effective local law enforcement.

With the U.S. undocumented population totaling an estimated 11 million people, the U.S. Department of Homeland Security, or DHS, and U.S. Immigration and Customs Enforcement, or ICE, must determine how to prioritize their resources in order to enforce immigration law. Given that most immigrants have deep community ties—having lived in the country for more than 10 years and having made substantial contributions to both U.S. society and the economy—the Obama administration has focused on specific enforcement priorities, which include national security threats and convicted violent criminals.

As the federal government has tailored its enforcement priorities, states and localities also have a strong need to prioritize resources for the benefit of public safety. In response, **they have worked to create community trust policies:** individualized polices that determine what is best for local law enforcement agencies and the communities they serve.

The evolution of federal-local collaboration

The practice of engaging local police in federal immigration enforcement has dramatically increased in recent years. While some forms of collaboration with local law enforcement has existed for decades, the federal government has only just recently asked local police to act as enforcers of federal immigration policies. In 1996, the Illegal Immigration Reform and Immigrant Responsibility Act added Section 287(g) to the Immigration and Nationality Act, which authorized ICE to enter into agreements with state and local law enforcement in order to enforce immigration law. However, it was not until 9/11 and the ensuing heightened focus on national security that 287(g) agreements were implemented: The number of jurisdictions participating in the program jumped from eight in 2006 to 69 in 2010. This new relationship, combined with a lack of adequate training for all parties involved, began to increase concerns about racial profiling in some jurisdictions, drastically damaging trust with police.

In 2008, the George W. Bush administration began piloting the Secure Communities program, which expanded nationwide under the Obama administration. Under Secure Communities, when anyone was booked into police custody, local law enforcement were required to send fingerprints to the Federal Bureau of Investigation, or FBI, and the DHS. For those the DHS wanted removed from the country, a detainer was issued—a request that the state or local jail hold the individual for 48 hours, allowing ICE to remove them from the United States. Many of the same concerns that arose from 287(g) resurfaced with the implementation of Secure Communities, including continued concerns regarding racial profiling; undocumented individuals with minor offenses, such as traffic violations, being targeted for arrest by local police, leading to deportation; and a continued undermining of trust in police.

Entanglement can harm public safety, encourage racial profiling, and violate the Constitution

As the practice of engaging police in immigration enforcement has become more widespread, so has concern with the system itself. As law enforcement leaders have stated, requiring state and local law enforcement agencies to enforce federal immigration laws leads to communities fearing the police, undermines community trust, and leads to a decline in reported crimes, as well as the level of cooperation with law enforcement officials. For example, a 2013 study found evidence of fear and lack of trust in major cities across the country: 70 percent of undocumented individuals reported that they are less likely to contact police if they are the victim of a crime due to local police entanglement with federal immigration enforcement. And the trust concerns go beyond the undocumented population as it affects those with citizenship and the community at large. In the same study, nearly half of all Latinos said they are less likely to contact the police because they fear that officers will take the opportunity to inquire into either their immigration status or the status of people they know.

These fears are not unfounded. Past iterations of the program—namely 287(g) and Secure Communities—led to numerous deportations of individuals with deep community ties and no criminal history, as well as extensively documented racial profiling. That is why hundreds of local sheriffs and law enforcement officials support policies that limit federal-local entanglement on immigration. These community trust policies would allow police departments to work more

effectively with their communities to both solve and prevent crimes. In addition, a number of federal courts have ruled that holding someone beyond the time permitted under state law without a judicial finding of probable cause is an unconstitutional deprivation of an individual's liberty. In other words, the DHS detainer policies violate the Constitution's Fourth Amendment.

Due to the community-related and legal concerns, President Obama announced in November 2014 that Secure Communities would be **replaced with a new voluntary program** called the Priority Enforcement Program, or PEP. The Obama administration has recently begun to roll out the program.

There are several key differences between PEP and Secure Communities. In addition to sending fingerprints to the FBI and the DHS at booking, the DHS now determines if an undocumented individual is a priority for removal under **more specific and narrower enforcement priorities**. **Given the constitutional concerns, the new PEP program moves away from detainers and toward notifications**—defined as requests for local police to notify ICE 48 hours before an individual is released. Local jurisdictions can then fulfill the requests based on their local enforcement policies and priorities. If necessary, ICE has the legal avenue to ask local jurisdictions to detain individuals through a warrant, and the agency maintains the authority to detain individuals it deems a priority at any time. Additionally, in March, ICE announced new, enhanced oversight and release procedures focused on individuals that pose a public safety or national security threat.

AT: Can't Solve --- Federal Rollback

***note when prepping file --- a version of this ev is in the AT: USFG Forces Cooperation Block

Secretary of Homeland Security empirically resists GOP criticism to force more state and local cooperation. Even the impetus for rollback proves we have a strong politics link too.

AT: Can't Solve --- Not Resolve Trust

CP solves --- it draws a clear distinction between federal and state and local efforts --- that is the key variable in rebuilding with local communities. That's Lansdowne.

Their ev ssumes SQ piecemeal efforts by states and localities --- the counterplan has EVERY STATE simultaneously refuse cooperation with ICE. This is clear national action that would send an unmistakable signal.

States are perceived as agents of the U.S. as a whole and the collective nature of the counterplan ensures a deeper and more sustainable relationship

Blase, Phd-Government-UT Austin 2k3 pg online @ <http://www.lib.utexas.edu/etd/d/2003/blasejm039/blasejm039.pdf>

Although what the states and cities are doing may not rise to the level of federal law, many of these policy initiatives are in harmony with domestic policy goals. Collectively, it can be argued, they serve to shape the foreign relations of the nation as a whole. Ivo Duchacek sees no difference in relations conducted by federal actors and by subnational actors. "If by diplomatic negotiation we mean processes by which governments relate their conflicting interest to the common ones, there is, conceptually, no real difference between the goals of paradiplomacy and traditional diplomacy: the aim is to negotiate and implement an agreement based on conditional mutuality."⁴⁵ Brian Hocking objects to treating the foreign relations of subnational governments as if they were something distinct from the federal level. Hocking studies what happens in federal systems when foreign policy issues become local concerns. He sets his approach apart from the complex interdependence crowd, such as Duchacek, saying that ideas such as "paradiplomacy" places subnational activities outside of traditional diplomatic patterns.

Hocking sees non-central governments as integrated into a dense web of diplomatic interactions, in which they serve more as "allies and agents" in pursuit of national objectives rather than as flies in the ointment. "The nature of contemporary public policy with its dual domestic- international features, creates a mutual dependency between the levels of government and an interest in devising cooperative mechanisms and strategies to promote the interests of each level."⁴⁶ Rather than separating the activities of non-central governments from those of central governments, Hocking's goal is to "locate" subnational governments in the traditional diplomatic and foreign policy processes initiated and carried through by the federal government.

Politics

Agency Links

Executive Action links to politics and gets rolled back

Weaver 13 (Kent, Professor at Georgetown University and a Senior Fellow in Governance Studies at the Brookings Institution, "Policy Leadership and the Blame Trap: Seven Strategies for Avoiding Policy Stalemate", March 2013

[http://www.brookings.edu/~media/research/files/papers/2013/3/29%20policy%20leadership%20blame%20weaver/weaverpolicy%20leadership%20and%20the%20blame%20trapv5032813.pdf\\CLans\)](http://www.brookings.edu/~media/research/files/papers/2013/3/29%20policy%20leadership%20blame%20weaver/weaverpolicy%20leadership%20and%20the%20blame%20trapv5032813.pdf\\CLans)

EXECUTIVE ACTION: If a hyper-partisan and divided Congress is unable to break policy stalemates, what about executive action as an alternative? There certainly are some opportunities for breaking stalemate through executive action, as President Obama showed in June 2012 when he suspended deportation of young illegal immigrants who had entered the country illegally. Additional executive action by the Obama administration has been promoted by liberal advocates of action in policy areas such as climate change, gun control home mortgage refinancing, and gay and lesbian rights. But it clearly has limitations as well: most changes taken through executive action are reversible, relatively modest, and risk being portrayed in Republican blame-generating narratives as the actions of an arrogant president who skirts the law.

Presidents are tied to agency action --- Obama will get embroiled

Wallison, 3 --- resident fellow at AEI (1/1/2003, "A Power Shift No One Noticed," <http://www.aei.org/issue/15652>)

Control over independent regulatory agencies has traditionally resided with Congress, which created all of them. The recent controversy over the Securities and Exchange Commission suggests, however, that now Congress, the White House, and the public all take for granted that the independent agencies are the president's responsibility. The political frenzy surrounding Enron's collapse and other corporate scandals may have produced--or at least exposed--a significant shift in the relationship between Congress and the White House. The efforts of congressional Democrats to pin some of the blame for the scandals on the president and the head of the Securities and Exchange Commission--and President Bush's willingness to act as though the SEC is his responsibility--may signal the end of more than a century of experimentation with independent regulatory agencies as a so-called "fourth branch" of government. History of Independent Agencies Independent agencies such as the SEC have always been regarded as "arms of Congress," outside the control of the executive branch. The president appointed the members and the chairman, but the terms for these officials overlapped presidential administrations, allowing--and encouraging--them to act without policy direction from the White House. The political fallout from the recent scandals has turned all this on its head. These independent agencies are creatures of Congress, not the Constitution. The first, the Interstate Commerce Commission (ICC), was established in 1887 to control the powerful railroad industry. Later, especially during the Progressive and New Deal eras, a number of other agencies were created, several of which still exist--including the SEC, the Federal Trade Commission, and the Federal Communications Commission. Several others, such as the Federal Power Commission and the Civil Aeronautics Board, went out of business a quarter-century ago. The ICC closed its doors in 1995. There was no clear reason, or constitutional rationale, why the duties of these bodies could not have been performed by regular executive branch departments. Presidents have expressed their unhappiness with this diminution of their authority, and some have tried to influence agency policies through the appointments process, but they have not confronted Congress on the issue. And Congress--always jealous of its prerogatives in the face of the executive branch's growing power--has never conceded that the independent regulatory agencies could take policy direction from the president. Then, in 1971, the status quo was called into question. The President's Advisory Council on Executive Organization--known as the Ash Council after its chairman, Roy L. Ash of Litton Industries--recommended that almost all of the functions of these bodies be transferred to single administrators, appointed by the president and accountable to him. The Ash Council's rationale for this reform was simple: If the president's policy control did not extend to these independent agencies, then his responsibility for them could not be clearly fixed and voters could not hold him accountable. Moreover, the president's policies, even if adopted by Congress, could be frustrated through contrary actions by the independent agencies. The Ash Council's proposal, like many reform ideas, went nowhere. There was no support in Congress for enhancing the president's power, and the Nixon administration--beset first by economic problems and then by the Watergate scandal--had no stomach for challenging Congress. (The Ash Council's report did lead, however, to the creation of the Environmental Protection Agency, headed by an administrator who answers to the president.) During the Reagan administration, however, the executive branch became more assertive. The Justice Department took the Constitution's separation of powers seriously, which by implication challenged the very legitimacy of the independent regulatory agencies. Nevertheless, because of congressional sensitivities and the continuing sense that

these bodies were quasi-judicial in nature, White House officials were warned that all contacts with the independent regulatory agencies had to be approved in advance--or actually carried out--by the White House counsel's office. The Reagan administration never seriously considered taking on Congress through a legislative proposal that would bring these independent agencies within the constitutionally established structure. The Presidential Role All this history appears to have been forgotten in the politics of 2002. The Democrats, hoping to make an election issue out of the SEC's "failure" to stop "corporate corruption," proceeded to blame a Republican president for events that were solely within the authority of the SEC. There was no indication that departments or agencies unquestionably controlled by the president had any role for policing either the securities industry or the companies under scrutiny. So if President Bush was somehow responsible for what happened at Enron, WorldCom, Tyco, and the rest, it had to be as a consequence of some presidential authority over the SEC. To be sure, the president had appointed the chairman and the other members of the SEC, but that in itself would not make him blameworthy unless one assumed that he was also directly responsible for how the SEC acted before, and after, the scandals erupted. That is the nub of the important but largely unnoticed change that has occurred: the unchallenged assumption on the part of all parties--in Congress, in the media, among the public, and even in the White House itself--that the president was fully accountable for an agency that has always been viewed as independent. The significance of this change in the grand government scheme of things can hardly be overstated. Without legislation or judicial decision, **the president has suddenly become electorally responsible for the decisions of bodies that were considered to be within the special purview of Congress, susceptible only to congressional policy direction.** Of course, this functional revolution did not give the president any new powers with respect to the independent regulatory agencies. But **the die is now cast. The way the American people look at the president's responsibilities apparently is changing, and that will affect the attitude of Congress.** If the American people believe that the president should be responsible for the actions of the SEC, it will be difficult to convince them otherwise. Significantly, since Harvey Pitt's resignation as SEC chairman in November, the media have routinely referred to the president's choice to head the SEC, investment banker William H. Donaldson, as a member of the Bush "economic team."

Independent agency action can spur a congressional backlash --- especially when it goes counter to its interests

Datla and Revesz 12 (Kirti and Richard, NEW YORK UNIVERSITY SCHOOL OF LAW PUBLIC LAW & LEGAL THEORY RESEARCH PAPER SERIES WORKING PAPER NO. 12-44 LAW & ECONOMICS RESEARCH PAPER SERIES WORKING PAPER NO. 12-23t, "Deconstructing Independent Agencies (and Executive Agencies)", August 2012 \\CLans)

The ability of agency heads to adopt policies somewhat independently of presidential monitoring and control matters only if agency heads will diverge from the President's preferences in the absence of direct presidential control. One might ask why the preferences of an agency head would ever diverge from those of the President who appointed him, given that the President presumably appoints agency heads who share his policy preferences. But the President is not the only "principal" of an agency head. Congress, political parties, regulated interest groups, and the agency staff exert influence on the agency head.²⁵⁷ Congress primarily exerts influence over agency heads (and presumably also conveys the preferences of the political parties) through the power of the purse. Thus "[an] agency has an incentive to shade its policy choice toward the legislature's ideal point to take advantage of that inducement."²⁵⁸ The preferences of members who serve on the agency's appropriations committee will presumably carry more weight than those of Congress generally. Congress also can influence agencies through hearings and legislative proposals. Political parties also influence agency heads and can cause an agency head to diverge from the President's preferences. Because agency heads tend not to retire from public life after their tenure, they therefore consider the impacts of their decisions on future career prospects.²⁵⁹ Agency heads will consider the preferences of their political party, which controls (or at least influences) their potential for advancement. Decisions that will "optimize the agency head's future stream of income and reputational benefits will not necessarily be compatible with the [P]resident's agenda at all times."²⁶⁰ Interest groups also exert influence over agency heads. The phenomenon of interest group influence is commonly referred to as agency capture. The capture thesis recognizes that because interest groups representing regulated entities tend to be overrepresented in the agency decision-making process compared to interest groups representing public interests, the outputs of agencies will tend to be biased in favor of those

interests.²⁶¹ Interest groups are overrepresented in agency decision making because they are well organized, well funded, possess an information advantage over the agency, and can offer perks such as future employment.²⁶² Finally, agency staff members are able to influence agency heads as a result of several factors. First, “government administrators will seek employment at an agency because of an ideological identification with that agency’s mission.”²⁶³ Then, as agency heads serve in their positions, they gain expertise and “adopt the preferences and perspectives of agency careerists on policy issues”—called “going native.”²⁶⁴ Finally, the agency staff simply spends more time with the agency head than the President or his advisors can.

Circumvention

Circumvention --- Agency Reconfiguration

Plan gets circumvented – rename agency and redistribute roles – how ICE was formed

US Legal, 7 (US Legal Law Digest, “United States U.S. Immigration and Naturalization”, June 3 2007, <http://lawdigest.uslegal.com/immigration/u.s.-immigration-and-naturalization/7262/#ReorganizationAfterSeptember112001>) KW

Over the years, INS was repeatedly criticized for its seemingly unmanageable bureaucracy. Border Patrol agents and INS investigators developed reputations of being undertrained and overworked. People applying for immigration benefits often encountered backlogs that stretched for years. Many suggestions were made for reorganization, but the terrorist attacks of 2001 finally precipitated major change. In the wake of September 11, INS was criticized for its failure to prevent the terrorists from entering the country. Calls for change became more strident after the revelation that several of the hijackers had received visas to come to the U.S. to attend flight-training schools.

On November 19, 2002, President George W. Bush signed legislation that established the Department of Homeland Security, a cabinet-level department. DHS encompassed 22 agencies and 190,000 employees. Along with INS, the Coast Guard and the Customs Service came under DHS jurisdiction on March 1, 2003.

Under the auspices of DHS, the U.S. Citizenship and Immigration Services (USCIS) has assumed the responsibility for administering benefits, including oversight over:

Immigrant and nonimmigrant admission to the country

Work authorization and other permits

Naturalization of qualified applicants for U.S. citizenship

Asylum and refugee processing

Immigration enforcement now comes within the purview of the Directorate of Border and Transportation Security. Duties are further divided between the Bureau of Immigration and Customs Enforcement (ICE), and the Bureau of Customs and Border Protection (CBP). ICE is responsible for the enforcement of immigration laws within the U.S. CBP is responsible for inspections of people coming to the country, and for patrolling the border. Enforcement responsibilities for ICE and CBP include:

Preventing aliens from entering the country unlawfully

Detection and removal of aliens who are living in the U.S. unlawfully

Preventing terrorists and other criminal aliens from entering or residing in the U.S.

ICE formed when another agency was dismantled – same thing could happen to ICE

Hollingsworth, 14 (Gabrielle, LegalMatch Legal Writer and Attorney at Law, “INS Reorganization”, 4/16/14, <http://www.legalmatch.com/law-library/article/ins-reorganization.html>)
KW

What Was the INS?

“INS” is an acronym for the Immigration and Naturalization Service, a U.S. agency that was dismantled in 2003. The law that formed the INS was the Immigration and Naturalization Act (INA). As a response to the 9/11 attacks on the World Trade Center, the Patriot Act made major changes to the INA in 2001. The feeling existed that the INS no longer met the needs of a society under threat of terrorism.

What Replaced the INS?

Among the changes included creating the Student and Exchange Visitor Information System (SEVIS), a computerized system to keep track of foreign students living in the US. Other changes included the 2002 Homeland Security Act and the 2002 Enhanced Border Security and Visa Entry Reform Act. These amendments mandated, for reasons of national security, that a number of federal agencies be **created, renamed, and reorganized.**

On March 1, 2003, the Immigration and Naturalization Service (INS) was dismantled and reorganized into the Department of Homeland Security (DHS). Within the DHS there are three new agencies: the U.S. Citizenship and Immigration Services (USCIS), the U.S. Immigration and Customs Enforcement (ICE), and the U.S. Customs and Border Protection (CBP).

The USCIS absorbed the former INS office administration and immigration services. ICE, the main enforcement arm of the DHS, absorbed the former U.S. Customs investigators, the Federal Protective Service, and the Federal Air Marshal Service. And CBP absorbed the former INS and Customs Inspectors, the Department of Agriculture, and the Border Patrol.

As a result of these changes, the U.S. immigration agencies are now more “enforcement-oriented,” meaning that they aim to help increase the security of the U.S., while protecting U.S. citizens from terrorism within their borders.

Even small changes to names causes them to be considered new agencies

MCALEENAN and RAGSDALE 14 (KEVIN K. MCALEENAN Acting Deputy Commissioner U.S. Customs and Border Protection Department of Homeland Security and DANIEL H. RAGSDALE Deputy Director U.S. Immigration and Customs Enforcement Department of Homeland Security. “Authorizing Customs and Border Protection and Immigration and Customs Enforcement.” April 8, 2014
<http://www.ice.gov/doclib/news/library/speeches/140408ragdale.pdf>) KW

With the creation of DHS, the enforcement and service functions of INS and the U.S. Customs Service were absorbed into the Directorate of Border and Transportation Security, including U.S. Customs, Bureau of Border Security, and Bureau of Citizenship and Immigration Services. In 2003, President George W. Bush submitted a reorganization plan for DHS, renaming the Bureau of Border Security the Bureau of Immigration and Customs Enforcement and the Customs Service the Bureau of Customs and Border Protection. In 2007, DHS changed the name of the

Bureau of Customs and Border Protection to U.S. Customs and Border Protection and the Bureau of Immigration and Customs Enforcement to U.S. Immigration and Customs Enforcement.

History proves the agencies always change but immigration control only gets stronger

Allgov ND— (provides up-to-date news about more than 340 departments and agencies of the U.S. government, <http://www.allgov.com/departments/department-of-homeland-security/us-immigration-and-customs-enforcement-ice?agencyid=7352>). WM

Immigration first became a political issue in the late 19th Century as waves of European and Asian immigrants flooded into the US. After the Civil War, some states started to pass their own immigration laws, which prompted the Supreme Court to rule in 1875 that immigration was the responsibility of the federal government, not the states. To solidify this duty, US officials created the Office of the Superintendent of Immigration within the Treasury Department in 1891. This office was responsible for admitting, rejecting and processing all immigrants seeking admission to the United States and for implementing national immigration policy. Legislation in March 1895 upgraded the Office of Immigration to the Bureau of Immigration and changed the agency head's title from Superintendent to Commissioner-General of Immigration. Also during the 1890s, the legendary immigration station at Ellis Island in New York opened and became the nation's largest and busiest immigrant-processing center well into the 20th Century.

In 1906, Congress passed the Basic Naturalization Act which established naturalization procedures that have endured until today. The act encouraged state and local courts to relinquish their jurisdiction over immigrants to federal courts, and it expanded the Bureau of Immigration into the Bureau of Immigration and Naturalization.

Seven years later, in 1913, the Department of Commerce and Labor reorganized into today's separate cabinet departments, and for a time, the Bureau of Immigration and Naturalization followed suit, each becoming a separate bureau, one for immigration, one for naturalization.

After World War I, immigration into the US again rose, prompting Congress to act once more by instituting the national-origins quota system. Laws passed in 1921 and 1924 limited the numbers of newcomers by assigning a quota to each nationality based upon its representation in previous US census figures. Each year, the State Department issued a limited number of visas; only those immigrants who had obtained them and could present valid visas were permitted entry. Because of the limitations that the quota system imposed on immigration, illegal attempts to enter the US first began to occur. Illegal entries and alien smuggling occurred along land borders, so Congress created the Border Patrol in 1924 within the Immigration Service. Stricter immigration policies coupled with Border Patrol apprehensions resulted in the bureau getting involved in deportations.

In 1933, Congress decided to remarry immigration and naturalization into one agency, creating the Immigration and Naturalization Service (INS). With war brewing in Europe in the 1930s, immigration took on greater importance, especially with fears of fascist spies entering the country. President Franklin D. Roosevelt moved the INS from the Department of Labor to the Department of Justice in 1940. The task of securing American borders against enemy aliens became a key duty of the INS during WWII, causing it to double in size, from approximately 4,000 to 8,000 employees.

Following the attack on Pearl Harbor by Japan in December 1941, national fears about foreign-born citizens and residents erupted. In response, President Roosevelt signed an executive order

that forced thousands of Japanese-Americans living on the West Coast to live in internment camps. The INS played a role in this forced relocation, setting up internment camps and detention facilities

In the post-war era, immigration concerns shifted from those of European descent to those entering the US from Latin America and Asia. In 1965, Congress amended federal immigration law by replacing the national-origins system with a preference system designed to reunite immigrant families and attract skilled workers. Although the number of immigration visas available each year was still limited, Congress continued to pass special legislation, as it did for Indochinese refugees in the post-Vietnam era of the 1970s.

The Immigration Reform and Control Act of 1986 expanded the INS's responsibilities, making it more of a modern-day law-enforcement agency. The act charged INS with enforcing sanctions against American employers who hired undocumented aliens. This meant the INS was now investigating, prosecuting and levying fines against corporate and individual employers and deporting aliens found to be working illegally in the US. Also during the 1980s, anti-immigrant movements began to rise, focusing mostly on Hispanic immigration in the American Southwest. This backlash continued into the 1990s with the passage of initiatives in California that sought to ban social services to illegal immigrants and eliminate bilingual education in public schools.

The terrorist attacks of Sept. 11, 2001, shifted the immigration debate in a different direction. Upon learning the hijackers of commercial airliners that crashed into the World Trade Center and the Pentagon were non-US citizens who had slipped into the country despite some of them already being on terrorist “watch lists,” federal officials decided to make dramatic changes in government operations overseeing domestic security and immigration. As part of the formation of the Department of Homeland Security in 2003, the INS was changed into the US Citizenship and Immigration Services, while the US Customs Service became the US Customs and Border Protection agency. Furthermore, the law enforcement arms of the former INS and Customs Service were folded into the newly created Immigration and Customs Enforcement (ICE) in order to “more effectively enforce our immigration and customs laws and to protect the United States against terrorist attacks,” according to ICE. Almost overnight, ICE became the second largest law enforcement agency in the country, next to the FBI.

Immigration Northwestern

Topicality

States

Immigration is handled at local and state level not entirely by the federal government

Harvard Law Review 2015, “Policing Immigrant Communities,” Harvard Law Review, 4/10/ 15, 128 Harv. L. Rev. 1771

Enforcement by Federal Delegation. — Immigration enforcement is the prerogative of the federal government, but Congress has defined circumstances under which the federal government may delegate immigration-enforcement authority to state and local police. The biggest federal delegation program, the 287(g) program, allows the Attorney General to grant immigration enforcement authority to state and local police departments that sign Memoranda of Understanding (MOU) with Immigration and Customs Enforcement (ICE). These MOUs allow state and local police to enforce civil immigration laws so long as they participate in ICE training, agree to ICE supervision, and abide by certain ICE rules.

States have their own laws for immigration independent of the federal government.

Harvard Law Review 2015, “Policing Immigrant Communities,” Harvard Law Review, 4/10/ 15, 128 Harv. L. Rev. 1771

(b) Enforcement by State Authority. — States and cities often enforce federal immigration laws — and their own immigration policies — without federal authority. States, at times joined by the federal government, claim an “inherent authority” to enforce federal criminal laws. The purported authority stems from the Tenth Amendment: one sovereign has the authority to assist another sovereign in arrests and, since states retain their sovereignty under the Constitution, they have the power to arrest for violations of federal criminal law. Additionally, states often enact laws that target immigrants and allow officers to regulate immigration. For instance, many states have “human smuggling” laws that prohibit transporting consenting unauthorized immigrants into the state. Others restrict undocumented-immigrant employment. Arizona, for instance, amended its identity theft laws to criminalize the use of false information to get a job, whether the identity belonged to a “real or fictitious person.” And some states and cities target the jobs that immigrants can get. Together, inherent arrest authority and independent state laws mean police target and detain suspected immigrants and their communities without the authorization or oversight of the federal government.

Federalism Answers

Immigration Federalism Bad

Curtailing the States power to make immigration laws good

Stella Burch **Elias 2013**, Associate Professor of law, University of Iowa, “The New Immigration Federalism,” Ohio State Law Journal, 12/06/2013, <http://moritzlaw.osu.edu/students/groups/oslj/files/2013/12/6-Elias.pdf>

The Supreme Court’s recent immigration preemption doctrine effectively precludes states passing their own anti-unauthorized-immigrant “immigration” laws. Although some state legislators may fear that this curtailment of their lawmaking powers will herald a permissive era of amnesty and laissez-faire acceptance of undocumented immigrants, all available evidence suggests that the opposite is true. Under the Obama Administration, federal immigration authorities have carried out record numbers of deportations, with over 400,000 immigrants removed from the United States in 2009 and 2010, and with the Department of Homeland Security set to deport two million immigrants by 2014—approximately the same number of immigrants who were deported in the 105 years from 1892 to 1997.¹⁰⁹ Despite this extraordinary record of immigration enforcement activity, since President Obama took office, according to the National Conference of State Legislatures, a record number of immigration-related laws were passed by state governments, including thirty-seven pertaining to state participation in immigration enforcement.¹¹⁰ State engagement with the enforcement of federal immigration laws excluding individuals from entry to the United States is not a new phenomenon,¹¹¹ but state involvement grew exponentially in the early years of the twenty-first century.¹¹² This growth involved a plethora of state laws authorizing direct enforcement of federal “immigration laws,” whether under so-called 287(g) agreements with ICE delegating authority to do so,¹¹³ or under independent state initiatives such as Arizona’s S.B. 1070.¹¹⁴ At the same time a wide range of exclusionary “alienage” laws pertaining to the treatment of immigrants were introduced, limiting immigrants’ access to housing, employment, or language, and effectively serving an indirect enforcement function.¹¹⁵

Solvency deficit--- States strongly support anti-immigrant laws

Raquel **Aldana 08**, Willam S. Boyd School of Law and University of Nevada, Las Vegas, February 2008, Vol 41, No. 3, http://lawreview.law.ucdavis.edu/issues/41/3/rights-remedies/41-3_Aldana.pdf

Since the events of 9/11, anti-immigrant groups like the Federation of American Immigration Reform (FAIR) and the U.S. English-Only, Inc. have been supporting or promoting local efforts to pass anti-immigrant ordinances or include them as propositions in key local elections.²⁵⁶ In 2006 alone, at least seventy-eight state immigration related bills were approved in thirty-three states.²⁵⁷ These ordinances range from denying the undocumented basic worker protections to restricting their access to higher education and other state benefits, such as denying them driver’s licenses, barring them from congregating as day laborers, and prohibiting them from speaking Spanish.²⁵⁸ The ordinances also include housing and employer restrictions, such as the 2006 Hazleton, Pennsylvania anti-immigrant ordinances that sought to bar the undocumented from taking jobs, renting apartments, or engaging in other commercial transactions. These housing and employer ordinances would have required employers, landlords, and businesses to monitor the immigration status of workers and tenants. They also sought to impose both civil and criminal penalties on employers, landlords, or businesses that violated the restrictions.

Local communities plan to add more officers in immigration raids

Raquel **Aldana 08**, Willam S. Boyd School of Law and University of Nevada, Las Vegas, February 2008, Vol 41, No. 3, http://lawreview.law.ucdavis.edu/issues/41/3/rights-remedies/41-3_Aldana.pdf

One thing is certain: like federal enforcement, local immigration enforcement will be characterized as regulatory in nature, particularly when the consequences continue to be nonpenal. In Hazleton, undocumented tenants and workers will be forced out of workplaces and homes, and possibly reported to immigration agencies, but not prosecuted per se. Nevertheless, these consequences are all extremely harsh, and criminal prosecution, as in the federal immigration enforcement context for such crimes as identity theft and fraud, remains a strong possibility.

An interesting parallel exists between these new anti-immigrant ordinances and attempts by local police to regulate disorder among the homeless and poor. For many generations, local police enforced laws criminalizing public order offenses, such as vagrancy, loitering, and public drunkenness, until the courts stepped in to declare them unconstitutional under doctrines such as the prohibition against status crimes.³⁰⁰ These legal challenges, however, encouraged the proliferation of order-maintenance policies that replaced criminal with administrative enforcement, namely through property regulation tools like zoning laws.³⁰¹ Here again, the relaxed criminal safeguards in the context of administrative law enforcement has made it possible for these measures to survive judicial scrutiny at a significant “cost of rights.”³⁰² Local anti-immigrant ordinances, such as those in Hazleton, if successful, have the potential to exponentially multiply the number of law enforcement officers involved in immigration raids, and are likely to suffer from similar “costs of rights,” including to the Fourth Amendment.

Despite public backlash states strongly support restrictive immigration laws

Shannon K. **O’Neil 13**, Nelson and David Rockefeller Senior Fellow for Latin America Studies and Director of the Civil Society, Markets, and Democracy Program, 2013, " TWO NATIONS INDIVISIBLE MEXICO, THE UNITED STATES, AND THE ROAD AHEAD,"

States took up the call—most vocally in Arizona. Facing a tough reelection fight in 2010, Governor Jan Brewer did not hesitate as she signed the Support Our Law Enforcement and Safe Neighborhoods Act, or Arizona SB 1070. The law required police officers to check people’s immigration status if there was a “reasonable suspicion” that they might be here illegally, and made it a crime not to have official identification on hand. In defending the bill, Brewer assured constituents that it would protect U.S. citizens “against a relentless and daily barrage of narco-terrorist drug and human smugglers.”¹⁶

Public outrage immediately spilled forth. Rallies around the country denounced the bill, with protesters carrying signs saying “Stop the hate” and “What does illegal look like?” Opponents warned that now WWH—“walking while Hispanic”—would be a crime. **Yet counter rallies also occurred, with placards declaring “Arizona got it right” and “Adiós illegals.”** Opinion polls revealed strong backing for the law, and similar initiatives began to work their way through other state legislatures across the country, passing in Georgia, Alabama, Indiana, and South Carolina.¹⁷

State Flexibility Now

Immigration federalism curtails the states' ability to make immigration laws

Stella Burch **Elias 2013**, Associate Professor of law, University of Iowa, "The New Immigration Federalism," Ohio State Law Journal, 12/06/2013, <http://moritzlaw.osu.edu/students/groups/oslj/files/2013/12/6-Elias.pdf>

State and local "alienage" laws designed to welcome, integrate, and include immigrants play an increasingly important, but hitherto underexplored role in U.S. immigration law and policy. While some states have developed exclusionary statutes and regulations pertaining to immigrants, especially undocumented immigrants, other states and localities—including individual localities within immigrant-exclusionary states—have promulgated laws designed to foster the inclusion and integration of all immigrants into their local communities.¹⁹⁴ It is not possible to discuss in this Article all of the myriad inclusionary measures adopted in different locales throughout the United States. This Part therefore focuses on two examples of local and state immigrant-inclusionary provisions that have proliferated since the mid-1990s: (1) so-called sanctuary laws, designating areas (usually cities) as "sanctuaries" from immigration enforcement and providing all residents, regardless of immigration status, with equal access to local governmental services; and (2) in-state tuition initiatives and other measures designed to provide immigrant youth with equal access to higher education. This Part argues that while the new immigration federalism curtails states' and localities' ability to engage in immigrant-exclusionary lawmaking, it simultaneously creates opportunities for states and localities to promulgate laws designed to foster immigrant inclusion.

Econ Answers

Immigration Bad for Mexican Econ

Immigration steals innovation and economic benefits from Mexico

Shannon K. **O’Neil 13**, Nelson and David Rockefeller Senior Fellow for Latin America Studies and Director of the Civil Society, Markets, and Democracy Program, 2013, " TWO NATIONS INDIVISIBLE MEXICO, THE UNITED STATES, AND THE ROAD AHEAD,"

Mexican immigrants’ time in the United States has helped to debunk the facile stereotypes of the PRI days, including views of Mexico’s northern neighbor. Nearly six in ten Mexicans see life as better in the United States; for those with friends and relatives up north the number is even higher. Today over half of Mexicans have a favorable opinion of the United States, near Spain and Britain.⁸³

Yet Mexico’s widespread and long-standing migration to the United States has had its drawbacks as well. Over six hundred thousand (or about a sixth) of all Mexican college degree recipients and roughly half of all PhD holders reside in the United States.⁸⁴ Here, U.S. gains are Mexico’s losses, as these professionals make their careers, start their businesses, and contribute to communities far away from their native land. Economists call this phenomenon “**brain drain**”—an exodus of talent from the very countries that need it most.

Remittances too are not an unqualified benefit. The money sent back to families divides small towns between the haves and the have-nots. The influx of dollars to migrants’ hometowns can drive up local prices, making it harder for those that remain to make ends meet. This pushes even more to migrate, perpetuating a cycle that ensures survival, but not development.

Open borders hurts Mexican Economy

Nonie **Darwish 2013**, “IS ILLEGAL IMMIGRATION GOOD FOR MEXICO?,” Frontpage Magazine, 6/18/2013, <http://www.frontpagemag.com/fpm/193700/illegal-immigration-good-mexico-nonie-darwish>

If the huge number of illegal immigrants from Mexico was good for Mexico as a nation, then how come its economic, political and security conditions have not improved over the years, but instead have steadily deteriorated? The steady absorption of the bottom of Mexican society by the US has deprived Mexico of its motivation to improve its economy and to become a government that serves the welfare and living conditions of its poor and unemployed. Why should Mexico work hard on improving conditions for the poor and unemployed if America is doing the job for them?^a It is not easy for any nation to be located on the border with a giant economic super power like the United States. This situation tempts smaller nations to exist like small fish living off the crumbs and leftovers of a giant whale.^a The situation in both Mexico and the US is unnatural and self-defeating, leaving Mexico stagnant and unmotivated to improve and meet the needs of its citizens. Groups in America who claim moral superiority for being on the side of open borders and absorbing all illegal aliens because they have big hearts are in fact absolving the Mexican government of its duty toward its citizens and economy and are contributing to the internal problems of Mexico and the United States. In the long run, we are not doing Mexico a favor with our open borders, but we are crippling them and robbing them of the healthy functioning of their nation.^a The US should immediately end the politicization of the immigration issue not only for the sake of America, but also for the sake of Mexico. We need a sane immigration policy that respects US sovereignty and that helps Mexico become more responsible as an independent nation to end its sluggish economy and political corruption.^a The sovereignty of both the US and Mexico has been compromised under the status quo, which is unsustainable. Either we control the US border or say goodbye to both US and Mexican sovereignty as two separate nations.

Immigration prevents Mexico from improving its economy

Bill Ong **Hing 2011**, Professor of Law at the University of San Francisco, "Mexico's Economy Is the Problem That Anti-Immigrant Laws Won't Solve," Huffington Post Politics, 05/ 25/ 2011, http://www.huffingtonpost.com/bill-ong-hing/mexicos-economy-is-the-pr_b_829377.html

Everyone agrees that we need immigration reform. For years, Congress has attempted to strike a principled balance between greater enforcement and a fair way to adjust the status for the 10 to 12 million undocumented immigrants in the country. However, even immigrant rights advocates must acknowledge that legalization will not solve undocumented migration permanently. An expansion of visas will certainly help, but if the package does not include at least the first steps toward helping Mexico improve its economy and infrastructure, undocumented Mexican migration will continue, and the tension over undocumented migration will resurface down the road. To truly understand undocumented migration, we have to do what Americans have thus far been unwilling to do: Look beyond the simple explanation that migrants cross the border in search of work. We have to ask why they cannot find what they want in Mexico. In 1994, we were told that NAFTA would solve the undocumented problem because new jobs would be created in Mexico. But NAFTA ultimately contributed to huge job losses in Mexico. Mexican corn farmers could not compete with heavily-subsidized U.S. corn farmers, and now Mexico imports most of its corn from the U.S. Because of globalization, 100,000 jobs in Mexico's domestic manufacturing sector were lost from 1993 to 2003. Where do those unemployed workers look for work? El Norte.^e An economic turnaround in Mexico is central to solving the undocumented migration challenge in the United States. Conservatives should understand that. And liberals should recognize that reducing undocumented migration is in Mexico's interest as well; the persistent loss of able-bodied workers needed to build its infrastructure and economy only hurts Mexico. All of us understand that economic investment in Mexico will not and, probably, should not be done without close monitoring.

Relations Answers

Relations High

US/ Mexico relations high now --- NAFTA proves

Enrique Peña Nieto **2015**, President of Mexico, “Why the U.S.-Mexico Relationship Matters,” Politico, 1/ 06/ 2015, <http://www.politico.com/magazine/story/2015/01/us-mexico-relationship-enrique-pea-nieto-113980.html#.VaqtpCpViko>

Our countries have an intense economic relationship that is spread over a myriad of areas. Since the beginning of my administration, I have worked with President Barack Obama to create bilateral mechanisms that harness the full potential of our relationship. We are already seeing concrete results from the High Level Economic Dialogue (HLED), the Mexico-U.S. Bilateral Forum on Higher Education, Innovation and Research (FOBESII), the Mexico-U.S. Entrepreneurship and Innovation Council (MUSEIC) and the 21st Century Border Action Plan of 2014. We are steadfast in our belief that the continuous promotion of bilateral trade is a win-win situation for both our countries. Mexico is the third largest trading partner of the U.S., just behind China and Canada. Total bilateral trade between us amounted to more than \$500 billion during 2013. Our exports to the U.S. have increased significantly since NAFTA entered into force, with roughly 80 percent of them coming to this country. Meanwhile, U.S. exports to Mexico in 2013 were \$226 billion, up 443 percent since 1993. In fact, Mexico buys more U.S. goods than all of the BRICS combined—and nearly as much as the entire European Union. Moreover, 5.9 million U.S. jobs depend on trade with Mexico. Even Mexican exports benefit the American economy: 40 percent of the value of Mexican exports to the U.S. contains American inputs. By 2020, Mexico will have the capacity to build one in every four vehicles in North America, up from one in six in 2012. Additionally, Mexico has begun to invest in high technology exports; we have become the leading exporter of flat screen televisions in the world, the fourth largest computer exporter and a growing pioneer in the aerospace industry. We are interlinked.

The Mexican population's approval rate of the US is at its highest since '09

Juliana Menasce **Horowitz 13**, Senior Researcher at Pew Global Attitudes Project, 5/1/2013, "How Mexicans See America," <http://www.pewglobal.org/2013/05/01/how-mexicans-see-america/>

When U.S. President Barack Obama travels to Mexico this week, he will encounter a Mexican public that has far more positive attitudes about the United States than at any time in the last several years.

America’s image south of the border fell sharply in 2010, when Arizona passed a “show me your papers” law aimed at identifying, prosecuting and deporting immigrants who are in the U.S. illegally. But Mexican views have rebounded since then, and U.S. favorability ratings are now at their highest point since 2009. The prospects for U.S. immigration reform may be, at least in part, the source of renewed Mexican approval of their neighbor to the north.

A new Pew Research Center poll found that 66 percent of Mexicans have a favorable opinion of the U.S., up 10 percentage points from a year ago and up 22 points from May 2010, immediately following the enactment of Arizona’s immigration law. The last time America’s image was as strong among Mexicans was in 2009, when 69 percent said they had a favorable opinion.

Drug War Alt Cause

Alt cause drug wars--- plan can't solve--- fuels bad relations and misunderstandings between the two governments

David **Shirk 13**, Associate Professor at University of San Diego and Director of the Justice in Mexico Project, 5-4-13, "U.S.-Mexico Relations Complicated, Conditioned By Drug War," <http://www.npr.org/2013/05/04/181053775/u-s-mexico-relations-complicated-conditioned-by-drug-war>

SCOTT SIMON, HOST:

In many ways, the relationship between the U.S. and Mexico is complicated and conditioned by the long and the bloody war on drugs. It's difficult to say exactly how many people have been killed in that war, but Mexican media have estimated that around 70,000 people have died since 2006; many thousands more have been disappeared. The United States has been closely involved, providing money, technology and intelligence to the Mexican government.

But Mexican President Enrique Pena Nieto has begun to back away from the U.S. And this week, his administration said they would limit its contacts with American agencies. David Shirk is an associate professor at the University of San Diego. He studies the U.S.-Mexico relationship, and joins us in our studios. Thanks so much for being with us.

DAVID SHIRK: Thank you for having me.

SIMON: How closely has the United States been involved?

SHIRK: In the last 12 years, and especially the last six years, have really been a high-water mark in U.S.-Mexico collaboration, particularly on security issues. Levels of trust are so high that we have had the opportunity to fly drones in Mexico, we have agents operating in direct collaboration with their Mexican counterparts, we've seen record levels of extradition. So, the collaboration is at a much higher level of intensity than we've ever seen before - or has been, at least over the last six years or so.

SIMON: And has U.S. involvement been helpful?

SHIRK: That's a great question. I think it has been, depending on what you consider to be success. We have not seen violence go down. We have not necessarily seen the flow of drugs diminish. We have not seen necessarily an overall reduction in corruption in Mexico. But you can look at tactical successes. The dismantling of major organized crime groups, the target of specific organized crime figures has been accomplished over the last several years, thanks to this very high level of collaboration.

SIMON: So, why would President Enrique Pena Nieto be eager to reduce that cooperation?

SHIRK: Well, I'm not sure that the idea is necessarily to reduce collaboration so much as to reshape the dynamics of collaboration. I think that's probably how the Pena Nieto administration would portray this. For one thing, the Pena Nieto administration is trying to move away from the security policies that were employed by the Calderon administration. So, these efforts to go after high-level targets and to dismantle drug-trafficking organizations is diminishing as a priority of the Mexican government. And what they have emphasized instead is promoting citizen security.

I think that the Pena Nieto administration thinks that you had a real problem with the lack of coordination under the Calderon administration. And their idea, in the Pena Nieto government, is to try to tighten up and centralized the mechanisms of coordination and cooperation with the United States. And I think that's a deliberate attempt to vet and control whatever types of cooperation we're going to see between the U.S. and Mexican government.

SIMON: Well, that raises an issue that I think you've even touched on in some of your writings. Has this been, in many ways, a drug war that's been an American war conducted over the border?

SHIRK: I think that there are a lot of people who would agree with that idea. And in some ways, you can see that the drug war, as it's played out over the last 34 years, in particular as a U.S. proxy war. That said, over the last six years, working with Mexico, U.S. officials have consistently tried to let Mexico set the agenda. U.S. officials that I spoke to, repeatedly - and Mexican officials - repeatedly expressed the understanding that Mexico and the United States were working together because they had a shared responsibility to deal with the problem of drug trafficking and organized crime. But I think U.S. officials are really waiting to see whether they will be able to cooperate with the Pena Nieto administration and in what areas. Because there is some sense that the trust and collaboration that was built up over the last six years is at least on hold, if not in recession.

SIMON: It seems to me - I've spoken with Mexicans, who, to deal in shorthand, are sick of the drug wars and sick of the cartels and blame them for thousands of deaths, and yet at the same time, in some ways, they blame Americans for being the market for those drugs.

SHIRK: Yeah, I think that's true. I mean, first of all, I think many Mexicans are tired of having their country portrayed as a lawless, violent and corrupt place. That said, I also think that, for many Mexicans, this incredible fight that they've made over the last six years to try to take on organized crime has not yielded major gains in stopping the flow of drugs in even necessarily breaking down some of the major cartels that operate in Mexico. So, there is a sense that they've made all of this effort and it's primarily to prevent U.S. drug consumers in engaging in an illicit market activity. I think some Mexicans may simply say this is not worth the effort. This is not our fight. Let's let the drug traffickers get back to business as usual and we can get on with our lives.

Other/Random

AT: Cartels Impact

Mexico is resilient--- drug cartels can't make a failed state

Pamela K. **Starr 09**, director of the U.S.-Mexico Network and Associate Professor of International Relations at USC April 2009, "Mexico and the United States: A Window of Opportunity?," <http://www.pacificcouncil.org/document.doc?id=35>

This suggests that violence and insecurity on the Mexican side of the U.S. southern border will persist in the years ahead and occasionally spill over into American territory. That does not mean, however, that Mexico is likely to become a “failed state” as many have recently argued. The Mexican state is relatively strong, albeit with important pockets of profound institutional weakness. The reach of the federal government—from tax collection to poverty programs—is felt throughout the country. Unlike the Taliban, the Mexican cartels have no interest in overthrowing the Mexican state but instead, like any businessmen, simply want to reduce state intervention in their economic enterprise. And unlike Pakistan, Mexico lacks the sharp regional, ethnic, and religious divides that feed the formation of anti-state political actors. This balance of power obviously has not prevented the crime syndicates from controlling a large number of municipalities; corrupting politicians and law enforcement officials; killing policemen, state prosecutors, and federal police officials; and sowing fear and insecurity in several key border towns. Nor does it preclude the possibility of occasional unpleasant surprises, like the assassination of high ranking government officials. But **it limits the likely reach of their influence and thereby suggests that while the violence will persist in the years ahead, the cartels are not well positioned to threaten the stability and survival of the Mexican state.**

Offcase

DA Link---Surveillance K2 Border Control

Surveillance and interoperable databases are key to extensive border control

Anil **Kalhan 14**, Associate Professor of Law at Drexler University and chair of the New York City Bar Association's International Human Rights Committee, "Immigration Surveillance," 74 Md. L. Rev. 1,
<http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr>

Far from being a clear, fixed line that is coextensive with the territorial border, the picture of the migration border that emerges is a worldwide, pointillist archipelago of layered boundary points, both fixed and mobile. New immigration surveillance technologies are what make this reconfiguration of the migration border possible. To police this deterritorialized boundary, federal immigration authorities cooperate and coordinate with an enormous number of public and private actors—both within and outside the United States—to collect, analyze, store, and share biometrics and other personal information, to identify individuals, to monitor and control mobility, and in some instances to detain individuals or otherwise restrain their liberty. Interoperable database systems help to create and make possible these broader assemblages, which “integrate and coordinate otherwise discrete surveillance regimes” in both “temporary configurations [and] in more stable structures”—thereby **connecting and integrating** the vast array of actors and institutions involved in immigration governance.²⁴⁸

Disease DA

Immigration control conducts medical examinations for immigrants and prevents the introduction of diseases into the U.S.

Anil **Kalhan 14**, Associate Professor of Law at Drexler University and chair of the New York City Bar Association's International Human Rights Committee, "Immigration Surveillance," 74 Md. L. Rev. 1,
<http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr>

Public Health Surveillance. Public health officials have also implemented systems to conduct **disease surveillance on noncitizens** who have entered the United States. Individuals long have been inadmissible on certain public health-related grounds, and Congress has required individuals seeking admission to undergo medical examinations in their countries of origin before being issued immigrant visas or being admitted as refugees. **Individuals seeking to enter as nonimmigrants can be required to undergo medical examinations upon arrival at ports of entry.**²¹¹ To implement these inadmissibility provisions and the statutory obligation to **prevent communicable diseases** from being introduced and transmitted within the United States, the Centers for Disease Control and Prevention has established the Electronic Disease Notification system, which collects and stores health information on these individuals and transmits that health information to state and local public health authorities and refugee resettlement authorities when noncitizens with certain specified health conditions enter their jurisdictions.²¹²

The US-Mexico border is a gateway for contagious diseases--- curtailing surveillance sends Michelle **Weinberg 03**, Division of Global Migration and Quarantine, January 2003, "The U.S.-Mexico Border Infectious Disease Surveillance Project: Establishing Binational Border Surveillance," http://wwwnc.cdc.gov/eid/article/9/1/02-0047_article#comment

The 2,000-mile U.S.-Mexico border is one of the world's busiest international boundaries. An estimated 320 million people cross the northbound border legally every year (1). The U.S.-Mexico border is a unique region where the geopolitical boundary does not inhibit social and economic interactions nor the transmission of infectious diseases among residents on each side of the border. Some border cities (such as El Paso and Ciudad Juarez) are separated by a short distance and serve as one large metropolitan area for the local community (Figure 1). From an epidemiologic perspective, the border population must be considered as one, rather than different populations on two sides of a border; pathogens do not recognize the geopolitical boundaries established by human beings. The border region has a population of approximately 11 million people (2), many of whom cross the border daily to work, shop, attend school, seek medical care, or visit family and friends (3,4). The border population also includes persons who pass transiently through the region and others who come the area to work in maquilas, the border factories. The region has experienced tremendous population growth. During 1993–1997, the U.S. border population grew by 1.8% annually, more than double the national U.S. average of 0.8%, while the Mexican border population has grown by 4.3% per year, almost three times the national Mexican annual growth rate of 1.6% (2,5). Population growth has been spurred by increased economic opportunities after the North American Free Trade Agreement was implemented in 1994. Currently, an estimated 3,300 maquilas, employing >1 million workers, are located along the border (6,7). The proliferation of border factories has generated a wave of internal migration of persons from other regions of Mexico and Central America toward the border (8).

From Mexico's perspective, the border encompasses some of the country's most economically prosperous states. In contrast, the U.S. border region is among the poorest areas in the United States, with >30% of families living at or below the poverty level (8). Along the Texas border, an estimated 350,000 or more people live in 1,450 unincorporated areas known as colonias, which lack adequate sanitation infrastructure (8).

The large population movement, limited public health infrastructure, and poor environmental conditions contribute to increased incidence of certain infectious diseases (8–11) Analysis of data from the U.S. National Notifiable Diseases Surveillance System for 1990 through 1998 showed increased risks for certain foodborne, waterborne, and vaccine-preventable diseases in U.S. counties within 100 kilometers of the border, compared with nonborder states. These data show a two- to fourfold greater incidence of hepatitis A, measles, rubella, shigellosis, and rabies and an eightfold greater incidence of brucellosis in border counties than in nonborder states (11). Studies have identified the importance of cross-border movement in the transmission of various diseases, including hepatitis A (12,13), tuberculosis (14–18), shigellosis (19), syphilis (20), Mycobacterium bovis infection (21), and brucellosis (22,23).

Despite the high prevalence of infectious diseases and increasing movement of people across the borders, no surveillance system had been established to assess the border population as a geographic unit. Gaining an accurate picture of public health needs was limited by the following factors. First, the surveillance case definitions used for public health reporting in Mexico and the United States are different. Also, laboratory confirmation is often unavailable in the Mexican border states, and therefore reported cases of infectious diseases are defined primarily by clinical findings. In contrast, for the many notifiable diseases in the United States, laboratory confirmation is required, and U.S. surveillance is heavily based on laboratory reporting. This system likely underestimates the true incidence rates. In the past, the two countries have exchanged limited border surveillance data. However, these differences diminish the usefulness of national surveillance data for developing a comprehensive, regional understanding of infectious disease epidemiology in the border areas. A consistent binational perspective is essential to effectively control and prevent the transmission of infectious diseases that move easily through the geopolitical boundary.

The Border Infectious Disease Surveillance (BIDS) project was designed to bridge this surveillance gap by forming partnerships among institutions in both countries serving the region and bringing together each country's complementary experiences in syndromic and laboratory-based surveillance. This report describes the establishment of a binational surveillance system for hepatitis and febrile exanthems along the U.S.-Mexico border.

Illegal Immigration DA

Border Security Reduces illegal immigration

Manuela **Angelucci 11**, Ph. D development economist, 7/29/11, "U.S. Border Enforcement and the Net Flow of Mexican Illegal Migration" <http://www-personal.umich.edu/~mangeluc/EDCC-enforcement.pdf>

This paper contributes to the existing literature on Mexican illegal migration to the United States and its border enforcement by estimating the effect of enforcement on the net flow of undocumented migrants. Border enforcement increases migration costs, reducing the inflow of illegal migrants and increasing their human capital. The marginal effect of enforcement is a positive function of enforcement for the inflow but a constant or decreasing one for the outflow. Thus, as enforcement increases in the time period considered, it becomes more effective at reducing the net flow of illegal migrants. This evidence of high and rising migration costs that select a better pool of illegal migrants provides a rationale for Chiquiar and Hanson's findings that Mexican migrants who live in the United States in the 1990's and 2000's are not negatively self-selected: as the costs get higher, low human capital individuals are prevented from migrating.

Visas CP

Visa programs like the CP solve and provide remittances

Melissa **MacNeil 8**, Discussion of the Validity of a Guest Worker Program in the United States, "Discussion of the Validity of a Guest Worker Program in the United States", http://digital.library.unt.edu/ark:/67531/metadc86950/m2/1/high_res_d/macneil-melissa.pdf

Migration flows follow certain patterns, and governments develop policy responses based on the type and duration of migratory flows. The aim of most new immigration policy implemented in Western countries is to curb illegal migration. Several authors have outlined plans that would curb illegal migration and are pertinent to the discussion of a guest worker program because most involve provisions that could be remedied by such a program. Martin and Straubhaar argue that to slow migration, governments on both sides of the issue must maximize the migration experience by ensuring payoffs with the "three R's," which are recruitment of workers, remittances to family members in emigration areas, and a return to the country of origin when the migrant has earned his targeted amount (Martin & Straubhaar, 2002). These three factors ensure that the migrant maximizes savings potential, and rather than settle in the immigration area they return to their country of origin with more social capital and thus power within the community. As remittances are an important component of ensuring that the rotation model of migration functions effectively, the benefits of remittances must be maximized. Currently, emigrant communities are not benefiting up to their potential from the remittances sent by migrant workers because there is not enough competition from money transfer agencies, which keeps the costs of transfer low. Countries with high rates of emigration have not effectively implemented programs to encourage small investments of remittance money, and the governments themselves do not effectively appropriate remittance revenue into long-term investments (Martin & Straubhaar, 2002).

Trade CP---1NC

The United States federal government should decrease restrictions on trade between the United States and Mexico

Releasing protectionist policies boosts the Mexican economy--- motivates Mexicans to stay

Pamela K. **Starr 09**, director of the U.S.-Mexico Network and Associate Professor of International Relations at USC April 2009, "Mexico and the United States: A Window of Opportunity?," <http://www.pacificcouncil.org/document.doc?id=35>

Evidence of dysfunction in the U.S. immigration system is so bountiful and varied that policymakers and advocates from all points of view agree that the **current system is broken**. An effective, multifaceted reform of immigration law is obviously the ideal longterm response despite the disagreements over detailed provisions and sequencing that produced a stalemate in 2007. Despite President Obama's promise to take up the issue before the end of 2009, however, it remains unclear that a broad legislative effort on immigration will rise to the top of Washington's agenda in 2009 or even 2010, given competing priorities in domestic policy, such as health care, and the need to address the economic crisis. **But that does not mean nothing can be done**.

If the United States is serious about reducing migration from Mexico, it should help Mexico create the **500,000 new jobs needed each year** to employ new entrants into the Mexican job market. This effort should target the above mentioned **aid programs** to the regions in Mexico that have only recently begun to send migrants to the United States. Since the culture of migration is apt to be less well-developed in these new sending regions, **job creation can be a more powerful motivation to stay home than in regions where migration has already become a way of life**. This effort could also include expanded loan guarantees provided by the Overseas Private Investment Corporation. The most important U.S. policy tool for helping to create jobs in the Mexican economy, however, is not aid but **fairer trade**. Although reducing existing protection in the midst of an economic crisis is evidently not feasible, **new protectionist impulses must be averted**. Keeping the U.S. economy open to competitive Mexican exports and reducing subsidies on U.S. exports to Mexico, meanwhile, are essential medium-term policy reforms. And while trade alone is not a development or an anti-poverty program, it is hard to imagine how a country such as Mexico, where trade accounts for 30 percent of national production, can prosper in an increasingly protectionist environment. The United States must internalize the reality that if Mexico cannot export its goods to its main trading partner, it is destined to **continue exporting labor instead**.

Trade CP---Solves Immigration

Trade and economic relations stop negative immigration and foster effective ties between the US and Mexico

Oscar **Montealegre 13**, M.A. in International Relations at University of Westminster and contributing writer at Diplomatic Courier, 1/25/13, " U.S.-Mexico Relations: Love Thy Neighbor," <http://www.diplomaticcourier.com/u-s-mexico-relations-love-thy-neighbor/>

It is not common knowledge that Mexico is the United States' **third largest trading partner**, behind Canada and China. Every day, at least a **billion dollars of goods flows across the border**. Yet, Mexico is frequently negatively caricaturized, primarily with images of migrants illegally crossing the border into the U.S. and stealing U.S. jobs. Instead of viewing Mexico as a valuable partner that can benefit the U.S. in many facets, it is perceived as a liability, a region that cultivates corruption and violence and is the root of the current U.S. immigration 'problem' that has spurred controversial rogue measures like Arizona's SB 1070.

In matters of foreign policy, Mexico is an afterthought—our attention and resources are diverted to the Middle East or to grand strategies based on 'pivoting' our geopolitical and economical capacity towards Asia. With the U.S. economy performing at a snail-like pace, an emphasis on exports has re-emerged, but the bulk of the exporting narrative revolves around Asia. This is unfortunate, because our neighbor to the south has quietly positioned itself to be the **next jewel in the emerging markets portfolio**.

For example, Market Watch (a Wall Street Journal subsidiary) recently published a bullish article on Mexico with the following headline: "Mexico: Investor's New China". The Economist published an opinion piece titled "The Global Mexican: Mexico is open

for business”, highlighting Mexican companies that are investing locally and in the U.S. and arguing that Mexico is fertile ground for more investment, especially in the manufacturing sector. And according to The Financial Times, BRIC countries (Brazil, Russia, India, and China) are no longer the flavor of the month; Mexico is now taking over that distinction.

In essence, immigration and the drug trade will no longer anchor the relationship between the U.S. and Mexico; instead, economics, finance, trade, and commerce will dictate the terms between the neighboring countries.

However, in order to move forward, undoubtedly the elephant in the room must be addressed promptly. Immigration—although the topic is polarizing, it is imperative that President Obama tackles this issue steadfastly and in the most bi-partisan manner possible. It can be seen as one-sided that the onus is on the U.S., while Mexico gets carte blanche in its contradictory policy with their border patrol methods towards Central American migrants entering through Guatemala. True, but when you are world’s super power, not all is fair in love and war.

Fortifying borders, beefing up security, creating walls that divide the two countries that mimic uncomfortable parallels between Israel and Palestine should not be the main focus. With the world becoming more flat, the emphasis in tackling the immigration quagmire should be trade and commerce. Engagement, interaction, and the exchange of ideas should be the picture we want to paint. We should not foster the argument that an open border policy and a global business paradigm will compromise American jobs and bite into our distinctive American competitiveness.

The reason Mexicans cross the border illegally into the U.S. is because of one desire: opportunity. If Mexico develops a lasting robust economy, Mexicans will no longer desire to come to the U.S. in such droves. According to Nelson Balido, President of the Border Trade Alliance, this already occurring: “Mexico’s economy has, for the most part, weathered the worst of the economic downturn, meaning that more young Mexicans can reasonably seek and find work in their patria rather than heading north.”

A strong American economy is extremely favorable for Mexico. Turn the tables a bit, and ponder what it means for the U.S. when a Mexican economy is robust and stable—more export possibilities for the U.S.; more investment from the U.S. to Mexico, and vice versa, creating a win-win situation. Less need for Mexicans to leave their homeland and look for jobs in the U.S.

Sounds familiar? The characteristics of many vibrant emerging markets such as China, Indonesia, Brazil, and India, are occurring right next door. Why go East when we can venture South? Or perhaps, approach both simultaneously. According to a Nomura Equity Research report, Mexico in the next decade will surpass Brazil in being Latin America’s largest economy. When comparing Mexico on a GDP per capita basis, Mexico happens to be less developed than Argentina, Chile, and Brazil. This might sound negative, but in actuality it should be music to investors’ ears: more catching up for Mexico, meaning more investment and business activity.

Moreover, Mexico’s economy is highly interconnected with the U.S. economy. Currently, Mexico sends almost 80 percent of its exports to the U.S., and roughly 50 percent of its imports are from the U.S. Manufacturing costs in Mexico are once again competitive compared to China. Ten years ago, China’s labor costs were four times cheaper than Mexico, but with labor wages in China inflating, Mexico now has a comparative advantage because its proximity to the U.S. Shipping cargo across the Pacific can be more expensive and arduous, versus trucking cargo from northern Mexico and delivering to Wisconsin in a matter of days.

However if the U.S. administration continues to close the borders, the exchange of commerce between Mexico and the U.S. will suffer due to setbacks of just getting goods to cross the border. Luckily, NAFTA is already in place, but both parties (and Canada) can do more to cut red tape and streamline the movement of trade and commerce.

States CP

Banning state immigration laws relieves the economy

Shannon K. **O’Neil 13**, Nelson and David Rockefeller Senior Fellow for Latin America Studies and Director of the Civil Society, Markets, and Democracy Program, 2013, " TWO NATIONS INDIVISIBLE MEXICO, THE UNITED STATES, AND THE ROAD AHEAD,"

Local laws too have had deleterious effects. Early in 2011, Georgia passed a strict new immigration law to “relieve” it of the burdens of illegal aliens. As the start date approached, immigrant farm workers fled Georgia’s famous peach orchards and Vidalia onion fields. Searching for a solution, the governor asked farm owners to hire parolees. 34 The experiment ended almost as soon as it started, as nearly all quit within the first day, claiming the work was too hard. One participant observed, “Those guys out here weren’t out there thirty minutes and they got the bucket and just threw them in the air . . . They just left, took off across the field walking.” By mid-June, Georgia farmers were desperate for help; there were eleven thousand vacant field-hand positions, and the economy had already lost hundreds of millions of dollars. 35

More comprehensive studies reaffirm this anecdotal evidence. A study by University of Alabama researcher Samuel Addy estimates the combined effects of lost sales and income taxes (somewhere between US\$80 million and US\$350 million) and the fall in aggregate demand from lost consumers (eighty-five thousand unauthorized immigrants, roughly 5 percent of the state’s workforce) from Alabama’s restrictive immigration laws could shrink the state’s annual GDP by up to US\$11 billion (6 percent). 36 Studies by the Center for American Progress and the University of Arizona have found that deporting unauthorized immigrant workers would have a similar effect in California and Arizona respectively. 37 A different study by the Americas Society / Council of the Americas suggests that restrictive laws hurt rather than help local employment in the long run. 38

Privacy K Links

The problems of immigration surveillance revolve around the right of privacy and individual interests

Anil **Kalhan 14**, Associate Professor of Law at Drexler University and chair of the New York City Bar Association's International Human Rights Committee, “Immigration Surveillance,” 74 Md. L. Rev. 1,

<http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr>

Immigration surveillance demands reassessment of the interests at stake when personal information and travel history are collected, maintained, analyzed, and disseminated for purposes related to immigration control and the mechanisms to protect those interests. 304 The proliferation of zones where immigration control activities take place—and where detailed information on individuals and their migration and mobility histories is collected and subsequently aggregated, stored, and disseminated—carries a range of social costs. 305 While it is entirely appropriate to collect, maintain, and disseminate personal information for immigration control purposes in some contexts and subject to certain constraints, both individuals and society as a whole have legitimate interests in preserving zones in which these immigration surveillance activities do not take place and in making sure that when they do take place those activities are appropriately limited and constrained.

To some extent, those interests are individual interests, stemming from the value of preserving individual anonymity or quasi-anonymity more generally and the individual harms that can result when individuals’ migration and mobility are routinely tracked and detailed information is

maintained.³⁰⁶ But they also arise from a broader set of social concerns that surveillance and information privacy scholars have increasingly recognized as important. These social interests—for example, preventing coercive or excessive aggregations of unrestrained government power—often have less to do with the particular information being collected in any given instance than with the harms that can arise from the means of surveillance and information management.³⁰⁷ In recent decisions, the Supreme Court has signaled a willingness to give greater weight to these kinds of interests than they have traditionally received.³⁰⁸

Their Aldana evidence recut says privacy rights for immigrants should be recognized

Raquel **Aldana 08**, Willam S. Boyd School of Law and University of Nevada, Las Vegas, February 2008, Vol 41, No. 3, http://lawreview.law.ucdavis.edu/issues/41/3/rights-remedies/41-3_Aldana.pdf

Finally, privacy rights for immigrants should be recognized, despite their constructed illegality, because there are compelling policy reasons for protecting privacy in certain spaces.³³¹ In the workplace, for example, immigration raids have devastated employers, the wellbeing of small towns, and the economic well-being of the entire nation.³³² The reality is that immigrant workers dominate certain industries, including agriculture and meatpacking plants like that of Swift & Co. “Ridding” the country of twelve million undocumented workers through raids is not only unrealistic but incredibly disruptive.

Border DA

1NC Shell

Border Patrol is effective in keeping illegal immigrants out

Lynnette **Curtis 10**, 9-5-10, "Border Patrol finds success in curbing illegal immigration, targets Las Vegas," <http://www.reviewjournal.com/news/border-patrol-finds-success-curbing-illegal-immigration-targets-las-vegas>

For some Border Patrol agents, boredom has replaced illegal immigration as Public Enemy No. 1. That is a good thing, said Chris Van Wagenen, a supervisory agent, as he steered his SUV past cotton fields near the Colorado River in late August.

"It's been a very hard battle to get where we are," he said. "We've gone from getting killed to having things handled."

In the last several years, the Yuma sector's border with Mexico has transformed from one of the busiest, most dangerous hot spots for illegal crossings to practically sleepy.

The U.S. Border Patrol now considers the sector, which includes 126 miles of U.S.-Mexico border, to be under "operational control," and it is a model for other sectors that line the border.

This unprecedented level of control has allowed Yuma to branch out and focus more of its efforts on areas within its sector but farther from the border, including a city 300 miles away that officials say has become a hub for human and drug smuggling from Mexico.

U.S. Border Patrol agents recently descended upon that city -- Las Vegas -- where they raided several bus stations, arrested 31 suspected illegal immigrants and angered some in the Hispanic community.

Curtailing border control allows criminals to enter the U.S.

Albaro **Tutasig 14**, Worker's Institute Research Fellow at Cornell University, 9-8-2014, "IMMIGRATION: A NATIONAL SECURITY THREAT?," <http://cuslar.org/2014/09/08/immigration-a-national-security-threat/>

The argument that undocumented immigration is a threat to the security of the United States is also supported by the criminal activities that accompany the increasing number of people immigrating to the United States—in particular the rising numbers of individuals crossing the U.S.-Mexican border. According to a Congressional Research Service report released in August 2012, revealed that over a 33-month period, about 159,000 undocumented immigrants were arrested by local authorities, but released shortly after. The report also showed that nearly one-sixth of previous detainees were arrested for crimes, mostly drunk-driving offenses, drug-crimes and felonies. In 2012, Republican Rep. Lamar Smith of Texas, then chairman of the House judiciary committee, criticized of what detractors have called a "catch and release" immigration policy: "Rather than protect the American people he was elected to serve, President Obama has imposed a policy that allows thousands of illegal immigrants to be released into our communities." ICE claimed the policy was aimed at focusing limited resources on apprehending dangerous criminals.

ISIS terrorists reside in Ciudad Juarez

Lauren **Carroll 14**, PolitiFact staff writer and major in Political Science from Duke University, 9-17-2014, "Is ISIS in Mexico and planning to cross the border?," <http://www.politifact.com/truth-o-meter/statements/2014/sep/17/trent-franks/isis-mexico-and-planning-cross-border/>

With the Islamic State of Iraq and Syria growing in the Middle East, nearly half of Americans think the country is less safe than it was before Sept. 11, 2001, according to a recent poll.

Some Republicans have expressed concern that the southern border is so porous, members of the extremist group could slip into the United States from Mexico. And a few have said such a plot is already in the works -- but federal agencies don't agree.

Rep. Trent Franks, a Republican from Arizona, said his state faces an imminent threat in a recent phone conference with conservative nonprofit Staying True to America's National Destiny. BuzzFeed picked up Franks' comment, and it made its way around the Internet.

"It is true, that we know that ISIS is present in Ciudad Juarez or they were within the last few weeks," Franks said. "So there's no question that they have designs on trying to come into Arizona. The comment that I've made is that if unaccompanied minors can cross the border then certainly trained terrorists probably can, too. It is something that is real."

Several other politicians have made similar claims, including Texas Gov. Rick Perry, Rep. Lou Barletta, R-Pa., and Sen. Marco Rubio, R-Fla. And the claims are spreading around conservative online media, like the Daily Caller, Breitbart News and pundit Sean Hannity at Fox News.

Drug cartels export terrorists across the border

Judicial Watch 2015, non-partisan educational foundation promoting transparency, accountability and integrity in government, politics and the law, 4-14-2015, "ISIS Camp a Few Miles from Texas, Mexican Authorities Confirm,"

<http://www.judicialwatch.org/blog/2015/04/isis-camp-a-few-miles-from-texas-mexican-authorities-confirm/>

ISIS is operating a camp just a few miles from El Paso, Texas, according to Judicial Watch sources that include a Mexican Army field grade officer and a Mexican Federal Police Inspector.

The exact location where the terrorist group has established its base is around eight miles from the U.S. border in an area known as "Anapra" situated just west of Ciudad Juárez in the Mexican state of Chihuahua. Another ISIS cell to the west of Ciudad Juárez, in Puerto Palomas, targets the New Mexico towns of Columbus and Deming for easy access to the United States, the same knowledgeable sources confirm.

During the course of a joint operation last week, Mexican Army and federal law enforcement officials discovered documents in Arabic and Urdu, as well as "plans" of Fort Bliss – the sprawling military installation that houses the US Army's 1st Armored Division. Muslim prayer rugs were recovered with the documents during the operation.

Law enforcement and intelligence sources report the area around Anapra is dominated by the Vicente Carrillo Fuentes Cartel ("Juárez Cartel"), La Línea (the enforcement arm of the cartel) and the Barrio Azteca (a gang originally formed in the jails of El Paso). Cartel control of the Anapra area make it an extremely dangerous and hostile operating environment for Mexican Army and Federal Police operations.

According to these same sources, "coyotes" engaged in human smuggling – and working for Juárez Cartel – help move ISIS terrorists through the desert and across the border between Santa Teresa and Sunland Park, New Mexico. To the east of El Paso and Ciudad Juárez, cartel-backed "coyotes" are also smuggling ISIS terrorists through the porous border between Acala and Fort Hancock, Texas. These specific areas were targeted for exploitation by ISIS because of their understaffed municipal and county police forces, and the relative safe-havens the areas provide for the unchecked large-scale drug smuggling that was already ongoing.

Mexican intelligence sources report that ISIS intends to exploit the railways and airport facilities in the vicinity of Santa Teresa, NM (a US port-of-entry). The sources also say that ISIS has “spotters” located in the East Potrillo Mountains of New Mexico (largely managed by the Bureau of Land Management) to assist with terrorist border crossing operations. ISIS is conducting reconnaissance of regional universities; the White Sands Missile Range; government facilities in Alamogordo, NM; Ft. Bliss; and the electrical power facilities near Anapra and Chaparral, NM.

Nuclear terror is feasible and likely – high motivation

Matthew **Bunn '15**, Professor of Practice at Harvard University's John F. Kennedy School of Government, Nickolas Roth, Research Associate at the Project on Managing the Atom in the Belfer Center for Science and International Affairs at Harvard Kennedy School, “Reducing the risks of nuclear theft and terrorism,” from Routledge Handbook of Nuclear Proliferation and Policy ed. Joseph F. Pilat and Nathan E. Busch, 5/15/15, pp. 419-420

But we now live in an age that includes a few groups intent on inflicting large-scale destruction to achieve more global objectives. In the 1990s, the Japanese terror cult Anni Shinrikyo first sought to buy nuclear weapons in Russia, then to make them themselves, before turning to biological weapons and the nerve gas they ultimately used in the Tokyo subways. ¶ Starting also in the 1990s, al Qaeda repeatedly sought nuclear materials and the expertise needed to make them into a nuclear bomb. Ultimately, al Qaeda put together a focused program reporting directly to Ayman al-Zawahiri (now head of the group), which progressed as far as carrying out crude but sensible conventional explosive tests for the nuclear program in the desert of Afghanistan. ¶ The killing of Osama bin Laden and the many other blows against al Qaeda have surely reduced the risk that al Qaeda could put together and carry through a nuclear bomb project. But by how much? The core organization of al Qaeda has proved resilient in the past. There is every reason to believe Al-Zawahiri remains eager to inflict destruction on a nuclear scale. Indeed, despite the large number of al Qaeda leaders who have been killed or captured, nearly all of the key players in al Qaeda's nuclear program remain alive and at large - including Abdel Aziz al-Masri, an Egyptian explosives expert who was al Qaeda's “nuclear CEO.” No one knows what capabilities a secret cell of al Qaeda may have managed to retain or build. And regional affiliates and other groups in the broader violent Islamic extremist movement — particularly some of the deadly Pakistani terrorist groups — may someday develop the capability and intent to follow a similar path. ¶ North Caucasus terrorist groups sought radiological weapons and threatened to sabotage nuclear reactors. There is significant, though less conclusive, evidence that they sought nuclear weapons as well — particularly confirmation from senior Russian officials that two teams were caught carrying out reconnaissance at Russian nuclear weapon storage sites, whose very locations are a state secret. ¶ More fundamentally, with at least two, and probably three, groups having gone down this path in the past twenty-five years, there is no reason to expect they will be the last. The danger of nuclear terrorism will remain as long as nuclear weapons, the materials needed to make them, and terrorist groups bent on large-scale destruction co-exist.

Terrorism causes extinction---hard-line responses are key

Nathan **Myhrvold '13**, Phd in theoretical and mathematical physics from Princeton, and founded Intellectual Ventures after retiring as chief strategist and chief technology officer of Microsoft Corporation, July 2013, "Strategic Terrorism: A Call to Action," The Lawfare Research Paper Series No.2, <http://www.lawfareblog.com/wp-content/uploads/2013/07/Strategic-Terrorism-Myhrvold-7-3-2013.pdf>

Several powerful trends have aligned to profoundly change the way that the world works. Technology ¶ now allows stateless groups to organize, recruit, and fund ¶ themselves in an unprecedented

fashion. That, coupled with the extreme difficulty of finding and punishing a stateless group, means that stateless groups are positioned to be lead players on the world stage. They may act on their own, or they may act as proxies for nation-states that wish to duck responsibility. Either way, stateless groups are forces to be reckoned with. At the same time, a different set of technology trends means that small numbers of people can obtain incredibly lethal power. Now, for the first time in human history, a small group can be as lethal as the largest superpower. Such a group could execute an attack that could kill millions of people. It is technically feasible for such a group to kill billions of people, to end modern civilization—perhaps even to drive the human race to extinction. Our defense establishment was shaped over decades to address what was, for a long time, the only strategic threat our nation faced: Soviet or Chinese missiles. More recently, it has started retooling to address tactical terror attacks like those launched on the morning of 9/11, but the reform process is incomplete and inconsistent. A real defense will require rebuilding our military and intelligence capabilities from the ground up. Yet, so far, strategic terrorism has received relatively little attention in defense agencies, and the efforts that have been launched to combat this existential threat seem fragmented. History suggests what will happen. The only thing that shakes America out of complacency is a direct threat from a determined adversary that confronts us with our shortcomings by repeatedly attacking us or hectoring us for decades.

Add-Ons

The US-Mexico border is a gateway for contagious diseases--- curtailing surveillance allows for disease breakout in the U.S.

Michelle **Weinberg 03**, Division of Global Migration and Quarantine, January 2003, "The U.S.-Mexico Border Infectious Disease Surveillance Project: Establishing Binational Border Surveillance," http://wwwnc.cdc.gov/eid/article/9/1/02-0047_article#comment

The 2,000-mile U.S.-Mexico border is one of the world's busiest international boundaries. An estimated 320 million people cross the northbound border legally every year (1). The U.S.-Mexico border is a unique region where the geopolitical boundary does not inhibit social and economic interactions nor the transmission of infectious diseases among residents on each side of the border. Some border cities (such as El Paso and Ciudad Juarez) are separated by a short distance and serve as one large metropolitan area for the local community (Figure 1). From an epidemiologic perspective, the border population must be considered as one, rather than different populations on two sides of a border; pathogens do not recognize the geopolitical boundaries established by human beings. The border region has a population of approximately 11 million people (2), many of whom cross the border daily to work, shop, attend school, seek medical care, or visit family and friends (3,4). The border population also includes persons who pass transiently through the region and others who come the area to work in maquilas, the border factories. The region has experienced tremendous population growth. During 1993–1997, the U.S. border population grew by 1.8% annually, more than double the national U.S. average of 0.8%, while the Mexican border population has grown by 4.3% per year, almost three times the national Mexican annual growth rate of 1.6% (2,5). Population growth has been spurred by increased economic opportunities after the North American Free Trade Agreement was implemented in 1994. Currently, an estimated 3,300 maquilas, employing >1 million workers, are located along the border (6,7). The proliferation of border factories has generated a wave of internal migration of persons from other regions of Mexico and Central America toward the border (8).

From Mexico's perspective, the border encompasses some of the country's most economically prosperous states. In contrast, the U.S. border region is among the poorest areas in the United States, with >30% of families living at or below the poverty level (8). Along the Texas border, an estimated 350,000 or more people live in 1,450 unincorporated areas known as colonias, which lack adequate sanitation infrastructure (8).

The large population movement, limited public health infrastructure, and poor environmental conditions contribute to increased incidence of certain infectious diseases (8–11) Analysis of data from the U.S. National Notifiable Diseases Surveillance System for 1990 through 1998 showed increased risks for certain foodborne, waterborne, and vaccine-preventable diseases in U.S. counties within 100 kilometers

of the border, compared with nonborder states. These data show a two- to fourfold greater incidence of hepatitis A, measles, rubella, shigellosis, and rabies and an eightfold greater incidence of brucellosis in border counties than in nonborder states (11). Studies have identified the importance of cross-border movement in the transmission of various diseases, including hepatitis A (12,13), tuberculosis (14–18), shigellosis (19), syphilis (20), Mycobacterium bovis infection (21), and brucellosis (22,23).

Despite the high prevalence of infectious diseases and increasing movement of people across the borders, no surveillance system had been established to assess the border population as a geographic unit. Gaining an accurate picture of public health needs was limited by the following factors. First, the surveillance case definitions used for public health reporting in Mexico and the United States are different. Also, laboratory confirmation is often unavailable in the Mexican border states, and therefore reported cases of infectious diseases are defined primarily by clinical findings. In contrast, for the many notifiable diseases in the United States, laboratory confirmation is required, and U.S. surveillance is heavily based on laboratory reporting. This system likely underestimates the true incidence rates. In the past, the two countries have exchanged limited border surveillance data. However, these differences diminish the usefulness of national surveillance data for developing a comprehensive, regional understanding of infectious disease epidemiology in the border areas. A consistent binational perspective is essential to effectively control and prevent the transmission of infectious diseases that move easily through the geopolitical boundary.

The Border Infectious Disease Surveillance (BIDS) project was designed to bridge this surveillance gap by forming partnerships among institutions in both countries serving the region and bringing together each country's complementary experiences in syndromic and laboratory-based surveillance. This report describes the establishment of a binational surveillance system for hepatitis and febrile exanthems along the U.S.-Mexico border.

Tuberculosis can breakout between the borders and develop resistant forms

Betsy **McKay 13**, Atlanta Bureau Chief for The Wall Street Journal, 3-8-2013, "Risk of Deadly TB Exposure Grows Along U.S.-Mexico Border,"

<http://www.wsj.com/articles/SB10001424127887323293704578336283658347240>

To be sure, the actual number of cases in the U.S. and Mexico is still small and the rates of multidrug-resistant TB—or MDR—are nowhere near as severe as India, China, or Eastern Europe, where drug-resistant TB is at epidemic proportions. In 2011, the most recent year available, Mexico had 467 MDR-TB cases, the World Health Organization estimates, while the U.S. had 124, according to the Centers for Disease Control and Prevention. Almost half of the U.S. cases came from California and Texas. Health officials say it is crucial to jump on prevention now, because the disease is transmitted airborne and can spread quickly.

"We're all connected by the air we breathe," said Thomas Frieden, director of the CDC, and a TB expert who successfully battled a major outbreak of multidrug-resistant TB in New York City in the 1990s, then spearheaded India's TB-fighting program for the World Health Organization.

Gonzalo Garcia has struggled with drug-resistant tuberculosis while living in Tijuana. He doesn't know when he contracted the disease.

In its drug-resistant forms, TB can still be fatal, and the treatment may be painful, requiring up to two years or more of medication and potentially months of isolation. Costs are steep too; according to a recent CDC study, treatment on average in the U.S. was about \$140,000 and ran as high as \$700,000.

For health officials, the challenge of trying to control an airborne disease along an area as large as the U.S.-Mexico border is enormous. More than 150 million people cross the border each year. Many, like Mr. Garcia, go back and forth to work, or to play, with visas that allow short trips in the border region. Two CDC quarantine

stations sit along the border to deal with health concerns. "TB is the most common disease we get called about," said Steve Waterman, chief of the CDC's U. S.-Mexico unit in the agency's Division of Global Migration and Quarantine.

The U.S.-Mexico border is "not like the Berlin Wall," said David Shirk, director of the Trans-Border Institute at the University of San Diego. "It's one region." That means people live on one side of the border and run a business on the other, and shoppers from both countries frequent the same malls, he said.

In the Mexican state of Baja California, officials are treating three cases of XDR-TB, a rare but severe form of the disease in which a patient's TB is resistant both to the two most potent drugs for treatment as well as some drugs used to treat drug-resistant TB, said Dr. Laniado-Laborin. Six new cases of this type were reported in the entire U.S. in 2011.

North of the border, in San Diego, the overall TB rate is around twice the U.S. national average. Los Angeles is grappling with its worst TB outbreak in a decade, and police have been reminded to use face masks when encountering those who are sick. "You can learn from San Diego how things could play out in the heartland of America," says Richard Kiy, chief executive of International Community Foundation, a public foundation that supports treatment of drug-resistant TB patients at Dr. Laniado-Laborin's clinic and elsewhere in Baja California.

Officials say that when drug-resistant cases show up in the U.S., there is often a Mexico connection. Of San Diego's 14 multidrug-resistant TB cases between 2007 and 2011, half were either from Mexico or had a Mexico link based on the particular strain of the disease, said Kathleen Moser of the county's Health & Human Services Agency, which sees many patients who live and work on both sides of the border.

Part of the problem, of course, is that Mexico's rate of TB infection is much higher—in some cases 10 times higher. The resistant strains begin to breed, experts say, when doctors there give patients similar drug regimens over and over. Other times, patients who aren't supervised closely abandon treatment before they are cured.

UQ

Border security is effective--- 84% of illegal crossings are prevented

Brad **Plumer 13**, Senior Editor at Vox and former reporter for the Washington Post, 6-21-2013, "Border security is the key to immigration reform. So how do we measure it?,"

<http://www.washingtonpost.com/news/wonkblog/wp/2013/06/21/border-security-is-the-key-to-immigration-reform-so-how-do-we-define-it/>

1) At the moment, the U.S. government considers border security in the Southwest about **84 percent "effective."**

It was only last year that the nine Border Patrol sectors along the Southwest border finally standardized their metrics for how effectively they were securing the border. The results are laid out in a 2012 report from the Government Accountability Office:

Each sector measures three things: "Apprehensions" are the portion of border-crossers who are caught and detained. "Turn backs" are people who had either climbed a fence or crossed the border but were sent back to Mexico. "Got aways" are, well, border-crossers who made it through without getting caught.

These numbers are thought to be reasonably accurate, says Rebecca Tallent, the director of immigration policy for the Bipartisan Policy Center. The Border Patrol will use cameras and other evidence to get a rough count for "turn backs" and "got aways." Workers at the Yuma sector, for instance, will comb the desert every morning and count footprints in the sand to see who slipped through in the night. That said, they're still rough estimates. It's very possible that other border-crossers are slipping by undetected.

In 2011, the GAO reports, border security along the Southwest was thought to be about 84 percent effective. That is, 16 percent of attempts to cross the border were successful — which amounted to about 85,000 people getting through. Another 61.3 percent resulted in apprehensions. And 22.7 percent of attempts were turned back.

Now, effectiveness varied by sector — the Yuma sector, which is very well-staffed, had an effectiveness rate of 93.7 percent. By contrast, border security in the Rio Grande Valley sector was just 70.8 percent effective. Here's a map of the sectors, via the BPC's Matt Graham:

Link

Terrorists will exploit open entrances in the border.

Todd **Steinmetz 11**, Homeland Security Analyst at EWA/IIT, Fall 2011, “Mitigating the Exploitation of U.S. Borders by Jihadists and Criminal Organizations,” <http://scholarcommons.usf.edu/cgi/viewcontent.cgi?article=1124&context=jss>

History demonstrates that terrorists search for security gaps and invent creative ways to exploit them. In fact, terrorists rely on security weaknesses to operate effectively. International terrorist groups know that criminal organizations in Central and South America maintain well-established networks that enable them to smuggle large quantities of narcotics and people across America's southern border. Terrorists could use these illicit criminal networks to smuggle weapons, chemicals, biological contaminants, and/or explosives into the United States. As Zapata County, Texas Sheriff Sigifredo Gonzalez observed:

"If smugglers can bring in tons of marijuana and cocaine at one time and can smuggle twenty–thirty persons at one time, one can just imagine how easy it would be to bring in two to three terrorists or their weapons of mass destruction... chances of apprehension are very slim."³¹

Terrorists also know that large segments of both the northern and southern border remain relatively unsecured. It is a known fact that several radical international Islamic groups maintain significant operations in Central and South America and engage in money laundering, drug trafficking, arms dealing, and other legitimate and illegitimate means to funnel millions of dollars every year into the hands of transnational terrorists.³²

Drug cartels in the border practice terrorist tactics--- decapitations and skinning

Carrie F. **Cordero 13**, Director of National Security Studies in the Georgetown University Law Center, “Breaking the Mexican Cartels: A Key Homeland Security Challenge for the Next Four Years,” <http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2211&context=facpub>

The homeland security community has been forced to steadily increase its engagement on the issue of how the U.S. legal and policy framework should address the Mexico Situation. The traditional view has been to treat the Mexican drug cartels⁴ like criminal organizations—that is, primarily as a law enforcement issue. But, in recent years, the drug cartels have stretched beyond the Italian mafia model; their activities increasingly are more similar to those of international terrorist organizations and insurgencies as defined by the laws of war. According to Steven C. McCraw, Director of the Texas Department of Public Safety and a former FBI Agent, the Mexican Situation is both a public safety and national security issue.⁵

[The cartels] use military and terrorist tactics and weaponry ... They employ horrific tactics to intimidate their adversaries and the public such as decapitations, acid baths, skinning people alive, torture and Improvised Explosive Devices and they have expanded their criminal operations to profit from kidnappings, robberies, human trafficking, extortions, and theft We continu[e] [to] see multi-ton drug loads seized throughout Texas.⁶

In line with McCraw's description, events of recent years have made clear that the citizens of Mexico live in terror. Murder, torture, kidnappings, and extortion are the daily goings-on in Mexico at the direction of the cartels.⁷ The average Mexican citizen, law enforcement official, or local public official, may no longer have a

choice whether or not to cooperate with the cartels. When the choice is to cooperate, or face death of oneself or one's family, there really is no choice.⁸

The frightening security situation is not limited to the Mexican side of the border. Americans are at risk, too. Sigifredo Gonzalez, the Zapata County, Texas Sheriff, described in May 2011 how families on the United States side of the border have bullet holes in their homes and periodically need to hide or evacuate to avoid cross-border gunfire.⁹ U.S. citizens have been killed, including some on official duty (e.g., the February 2011 killing of U.S. Immigration and Customs Enforcement ("ICE") Agent Jaime Zapata by Los Zetas), and others innocently visiting Mexico (e.g., Agustin Roberto "Bobby" Salcedo).¹⁰

Once terrorist groups obtain nuclear weapons from Pakistan, bombs can be sent to the US through smuggling tunnels

Eben **Blake 15**, intern covering general affairs at IBTimes in New York City and currently pursuing a degree in English and History at Brown University, 6-3-2015, "Islamic State Nuclear Weapons: ISIS Claims It Can Smuggle Devices Through Nigeria, Mexico To The United States," <http://www.ibtimes.com/islamic-state-nuclear-weapons-isis-claims-it-can-smuggle-devices-through-nigeria-1950280>

The Islamic State group claims it could purchase a nuclear device from Pakistan and transport it to the United States through drug-smuggling channels. The group, also known as ISIS and ISIL, would transfer the nuclear weapon from Pakistan to Nigeria or Mexico, where it could be brought to South America and then up to the U.S., according to an op-ed allegedly written by kidnapped British photojournalist John Cantlie and published in Dabiq, the group's propaganda magazine.

The op-ed said that Boko Haram, the Nigerian jihadist group that announced its formal allegiance to ISIS in March, would make their efforts to transport a weapon to the U.S. much easier, reported Nigerian newspaper Premium Times. ISIS claims the Nigerian army is in a "virtual state of collapse" because of its war against Boko Haram.

While U.S. officials have dismissed the ability of the group to acquire or transport a nuclear weapon, Indian Minister of State Defense Rao Inderjit Singh said at the Shangri-La regional security conference in Singapore last weekend that "[w]ith the rise of ISIL in West Asia, one is afraid to an extent that perhaps they might get access to a nuclear arsenal from states like Pakistan." Bloomberg reported.

Cantlie describes how ISIL would hypothetically call on supporters in Pakistan to "purchase a nuclear device through weapons dealers with links to corrupt officials in the region," after which it would be "transported overland until it makes it to Libya" when "the mujahedeen move it south to Nigeria." It would then be moved to South America in the same method that "drug shipments bound for Europe pass through West Africa," according to Premium Times. After transporting the device through the "porous borders of South America" to Mexico, it would be "just a quick hop through a smuggling tunnel" to bring the nuclear bomb into America.

Since his abduction in 2012, Cantlie has appeared in multiple ISIS propaganda videos, including the series "Lend Me Your Ears."

Visas CP

INC

CP Text: The USFG should create a program, reminiscent of the Bracero Program, giving immigrants temporary visas to come work in the US as agricultural laborers with “visa portability”. Monetary sanctions will be utilized to assure cooperation.

That solves the cse

Alex **Nowrasteh 13**, Immigration policy analyst at the Cato Institute’s Center for Global Liberty and Prosperity, 3-5-2013, “Guest Workers Key to Reform,” <http://www.cato.org/publications/commentary/guest-workers-key-reform>

The U.S. Chamber of Commerce and AFL-CIO reached a tentative agreement to support increasing lawful migration through a guest-worker program for lower-skilled migrants. The details are obscure, but this agreement is an essential first step for successful immigration reform — a step so far ignored by the Obama administration.

Without a guest-worker program, quite simply, **immigration reform will fail.**

Overwhelmingly, immigrants come to the United States because they want jobs, and American businesses have jobs to give. Legalizing the unauthorized migrants already here is a sound policy, but without a legal channel for workers to come, others will continue to enter the country illegally.

Policymakers seem to forget that there is recent evidence to this effect. Ronald Reagan instituted an amnesty in 1986, but unauthorized immigration continued unabated. Increased border and immigration enforcement — and it did increase — couldn’t stem the tide.

It is foolish to expect legalization and enforcement alone to stop unauthorized immigration.

The demand is too strong on both sides of the labor equation. We need reforms that adapt to that reality.

Why is President Obama ignoring a guest-worker visa program? Because unions — one of the president’s most valued constituencies — have historically opposed guest workers.

A 2007 immigration reform effort largely failed because of union efforts to kill it. Late in the game, Senate Democrats amended the bill to end its guest-worker program after five years. The amendment passed 49-48 — with then-Sen. Obama, ominously, voting in favor. As a result, Republicans and business interests that supported increased lawful immigration withdrew their support, and the reform effort collapsed.

At the time, the leaders of the AFL-CIO, the Teamsters, and other **unions** all wrote letters opposing the guest-worker program. James P. Hoffa of the Teamsters opposed a guest-worker program because it would “[force] workers to toil in a truly temporary status with a high risk of exploitation and abuse by those seeking cheap labor.”

But the employer abuse issue is a straw man. There is a rather simple remedy: visa portability, which would allow guest workers to easily switch jobs. The ability to quit a job without the legal risk of deportation would give guest workers the ability to effectively enforce their own labor standards: They could depart an abusive employer without fear of deportation.

Instead of more migrant freedom, labor leaders are supporting more regulations for guest-worker visas. The Obama-endorsed blueprint wants reform to “protect workers by ensuring labor protections.” But those so-called protections have already made current lower-skilled guest-worker visas too costly for American employers — a by-product unions favor.

To their credit, unions support legalization of current unauthorized immigrants and family reunification. But from the Chinese Exclusion Act in 1882 through the race-based quotas of the 1920s to today, unions have supported every migrant-worker restriction.

César Chávez's United Farm Workers (UFW) lobbied hard to end the Bracero Program, a 1940s guest-worker program created to address an agricultural labor shortage created by World War II. UFW members beat up unauthorized migrants, formed a "wet line" (their words) on the border to stop migrants, and reported unauthorized immigrants to the Immigration and Naturalization Service.

If there is a model for a successful guest-worker program, however, **the Bracero Program is it.** Under Bracero, immigrants could work temporarily, but they had to leave the United States every season. **American farms got the labor they demanded, immigrant workers made money, and agricultural production increased.**

The program was so successful that it was extended until 1964. It combined enforcement that funneled migrants into a legal system with an unlimited temporary migration system. Often, Border Patrol agents enrolled unauthorized immigrants they arrested in the Bracero Program and let them return to work — this time lawfully.

Mexican workers thinking of entering the United States illegally overwhelmingly chose the legal Bracero option instead. Throughout the 1950s, unauthorized immigration declined by 95 percent. If a Bracero-type guest-worker visa existed today, one that allowed migrants to switch jobs and work in nonagricultural areas, **unauthorized immigration would dramatically decrease.**

Internal NB: Mexican Economy

The past Bracero program alleviated the Mexican economy

Maria Elena **Bickerton 01**, founding member of Bradshaw & Bickerton PLLC, 2001 "An Agricultural Law Research Article: Prospects for a Bilateral Immigration Agreement with Mexico: Lessons from the Bracero Program," http://nationalaglawcenter.org/publication/note-prospects-for-a-bilateral-immigration-agreement-with-mexico-lessons-from-the-bracero-program-79-texas-l-rev-895-919-2001/wppa_open/

Despite these concerns, the Mexican government recognized the advantages of the program. ⁷⁶ They had been assured that it would be a government-to-government program in which Mexico would have a strong voice. ⁷⁷ By working on American farms, the braceros would acquire technical skills that could benefit Mexican agriculture. ⁷⁸ The braceros would also have the opportunity to earn substantial money for themselves, their families, and their country, thus alleviating rural poverty and providing a safety valve to deal with a politically explosive underemployed population. ⁷⁹ Finally, it was a chance for Mexico to contribute significantly to the war effort, and refusing the American request risked "antagoniz[ing] the consumer of a potentially large amount of Mexican raw materials during the war." ⁸⁰ Mexico decided that overall the positive effects of the program outweighed the negative. ⁸¹

More Solvency Mechanisms

The guest-worker program establishes a bilateral relationship that improves the US' overall relations with Mexico

Maria Elena **Bickerton 01**, founding member of Bradshaw & Bickerton PLLC, 2001 "An Agricultural Law Research Article: Prospects for a Bilateral Immigration Agreement with Mexico: Lessons from the Bracero Program," http://nationalaglawcenter.org/publication/note-prospects-for-a-bilateral-immigration-agreement-with-mexico-lessons-from-the-bracero-program-79-texas-l-rev-895-919-2001/wppa_open/

Last year Mexican Labor Minister Jose Antonio Gonzalez Fernandez expressed his government's intention to ask the United States to join Mexico in examining the **possibility of a worker exchange**

program when the NAFTA labor side-agreement comes up for review in the future. 4 Such a bilateral effort, the Bracero Program was executed in the 1940s and 1950s.⁵ Under this program Mexican agricultural workers were legally permitted to temporarily enter the United States to work. The Bracero Program remains the only example of a bilateral immigration program between the United States and Mexico. 6 Since then, the U.S. government has made little effort even to discuss a new bilateral program for Mexican immigration to the United States. 7

This Note will examine the bilateral nature of the Bracero Program, and the various factors that made the program possible from 1942 until 1964. That is, what brought about the air of cooperation, what drove it away, and what was accomplished in the interim. Ultimately, this examination will demonstrate that the economic and political conditions that exist today are similar to those that existed when the Bracero Program was established, providing hope that a new bilateral labor agreement between Mexico and the United States may be forthcoming.

A bilateral immigration program could provide significant advantages over unilateral immigration policy. First, the two countries could more effectively achieve their migration goals through a cooperative effort since the policies of either nation can influence migration patterns. 8 Additionally, cooperation and compromise in the area of immigration can improve overall relations between Mexico and the United States so that cooperation will continue in other fields, such as trade. 9 However, differences in the sociopolitical atmosphere of the two countries and weaknesses in the Bracero Program itself indicate that a new agreement would not and should not follow the Bracero model. Nonetheless, the failures in cooperation and the weaknesses of the earlier program can provide some of the best insight on how any future bilateral immigration program should be structured.

Different card: Current immigration enforcement fails

Maria Elena **Bickerton 01**, founding member of Bradshaw & Bickerton PLLC, 2001 “An Agricultural Law Research Article: Prospects for a Bilateral Immigration Agreement with Mexico: Lessons from the Bracero Program,” http://nationalaglawcenter.org/publication/note-prospects-for-a-bilateral-immigration-agreement-with-mexico-lessons-from-the-bracero-program-79-texas-1-rev-895-919-2001/wppa_open/

Finally, the perception that Mexican labor migration to the United States was not amenable to control through unilateral efforts by either government, the perception that led to the creation of the Bracero Program, has been reaffirmed since the termination of the program. 183 Unilateral steps taken by the United States, for example, to stem the tide of illegal immigration have proven ineffective. 184 In fact, the United States experienced a significant increase in the pace of Mexican immigration in the 1970s and 1980s.¹⁸⁵ In the 1990s, approximately 200,000 Mexican immigrants (legal and illegal) came to the United States each year, 186 and one to two million additional Mexicans (legal and illegal) worked at least seasonally in the United States each year. 187

The U.S. response to the massive flow of unauthorized migration has focused on apprehending those attempting illegal entry. 188 Yet, instead of deterring attempted illegal entries, the U.S. strategy has only caused migrants to pay professional smugglers higher fees and to attempt crossing the border several times before successfully entering. 189 There has, in turn, been a significant increase in the number of migrants who have died while attempting to gain unauthorized entry.¹⁹⁰ The U.S. strategy has also created an unintended incentive for unauthorized migrants to remain in the United States once they have entered since re-entry is ever more difficult. 191

Cooperation with Mexico has advantages that improve the chances of having greater success in achieving the migration goals of both countries. 192 Although in the long run, both governments expect NAFTA to create jobs in Mexico for people who might otherwise immigrate to the United States,¹⁹³ reduced migration is an unrealistic expectation in the near- to medium-term future. 194 Conditions in both countries will continue to influence immigration decisions. 195 Conditions pulling Mexicans to the United States include the demand for immigrant labor by U.S. employers, opportunities and higher wages, and family connections in this country. 196 Conditions pushing Mexicans to leave Mexico include demographic population growth, urban and rural insecurity, economic restructuring disruptions, and severe degradation of the environment in Mexico. 197

A2: Solvency Deficits

Migration goals between both governments mean that the program will pass

Maria Elena **Bickerton 01**, founding member of Bradshaw & Bickerton PLLC, 2001 "An Agricultural Law Research Article: Prospects for a Bilateral Immigration Agreement with Mexico: Lessons from the Bracero Program," http://nationalaglawcenter.org/publication/note-prospects-for-a-bilateral-immigration-agreement-with-mexico-lessons-from-the-bracero-program-79-texas-l-rev-895-919-2001/wppa_open/

Any plan for a bilateral legalized worker program would have to address the human rights and illegal and permanent immigration problems of the Bracero Program. It would also have to overcome the fears of domestic labor and persuade American workers that such a program would not adversely affect the domestic job market. Additionally, it would have to overcome the extreme anti-immigrant attitude that has dominated U.S. public opinion in recent years. Nonetheless, it appears that conditions are quite favorable for a new immigration agreement with Mexico in light of the atmosphere of cooperation that exists, the confidence that the United States is enjoying with a booming economy, and the existence of common migration goals between the two countries.

Monetary sanctions and legalization protects the laborers and the bilateral agreement

Maria Elena **Bickerton 01**, founding member of Bradshaw & Bickerton PLLC, 2001 "An Agricultural Law Research Article: Prospects for a Bilateral Immigration Agreement with Mexico: Lessons from the Bracero Program," http://nationalaglawcenter.org/publication/note-prospects-for-a-bilateral-immigration-agreement-with-mexico-lessons-from-the-bracero-program-79-texas-l-rev-895-919-2001/wppa_open/

Many in Mexico have suggested that a new bilateral guest worker program, "operat[ing] within currently existing migratory labor markets," could satisfy the migration goals of both Mexico and the United States by replacing "highly exploited undocumented migrants" with regulated guest workers. ²²⁶ Legalizing migrant laborers on a bilateral basis allows both governments to ensure adequate safeguards for labor. With such protections, Mexican workers would have an incentive to remain within the program, the Mexican government would have assurances that their citizens' human rights would not be violated, and U.S. labor would be more likely to support the use of foreign labor. ²²⁷ U.S. growers should support the program, even with safeguards for the laborers, because it would help satisfy their need for a "just-in-time labor force."²²⁸ For both countries, such a program would also promote the return of Mexican immigrants to Mexico, minimizing "brain drain"²²⁹ so that Mexico can benefit from the migrants' new skills and conform to the seasonal fluctuations of the U. S. growers' demand for labor. ²³⁰

Of course, both countries must insist that enforcement of the safeguards be taken seriously to avoid a repetition of the worst aspects of the Bracero Program. Any bilateral migration agreement should contain mechanisms that provide serious incentives for enforcement of workers' rights under the agreement. ²³¹ For example, commentators have argued that automatic monetary sanctions for breaches of rules in international agreements can significantly strengthen the rights and obligations created by the agreement. ²³² Including this type of sanctions provision in any new bilateral migration program would penalize the United States if it were to ignore its obligations under the agreement as it did under the Bracero Program. Thus, the experience with the Bracero Program, while teaching us what mistakes to avoid, demonstrates that there are good prospects for a new bilateral program today.

CP Shields Link to Politics

Republicans pushing for guest worker programs

Yaël **Ossowski 15**, national investigative reporter for Watchdog, April 2, 2015, “Conservatives push guest worker program to halt illegal immigration,” <http://watchdog.org/209762/guest-worker-program/>

An easy way to fix the convoluted immigration system in the United States entails making it easier for foreigners to be hired, without a lot of red tape in their way.

Even the 8.1 million illegal immigrants now in the workforce.

That, at least, was the consensus of the five witnesses convened to present at the Senate Committee on Homeland Security and Government Affairs last week.

“I worry about a government that would criminalize the rational activity of someone selling their labor to improve their condition, and another who buys labor in order to make a profit — which is what our current immigration law does,” said Daniel Garza, executive director of the LIBRE Initiative, a free market organization representing Latinos. “I fear a growing government that hinders economic growth, that restricts opportunities.”

He was joined by experts from Pew Research Center, the U.S. Chamber of Commerce, the American Enterprise Institute and the Migration Policy Institute, who were all united behind the idea of expanding the existing guest worker program as a means to trigger economic growth and fix the nation’s immigration problems.

The committee hearing chaired by Sen. Ron Johnson, a Republican from Wisconsin, was called “Securing the Border: Defining the Current Population Living in the Shadows and Addressing Future Flows.” It focused more on reforming the visa programs than border controls, demonstrating a shift in the conservative examination of immigration.

The meeting was marked by a united front by the conservative-leaning panel of witnesses, coming from industry, academia and activism.

Asked what was needed for Congress to solve the illegal immigration crisis, Randel Johnson, a vice president of the U.S. Chamber of Commerce, pulled no punches. “It’s a combination of an expanded temporary worker programs and a sensible pathway to legalization,” he testified.

He emphasized that it must be easier for companies to hire immigrants to provide for the best educated and skilled employees to compete in the global marketplace.

The U.S. has the largest guest worker program in the world, made up of the H-2A and H-2B visas, which allow employers to temporarily hire foreign workers.

But even with the largest guest worker program in the world, the U.S. also has the distinction of having the largest illegal immigrant population in the world, according to the Migration Policy Institute, which makes for an interesting paradox.

That’s made worse by the fact there has been no significant immigration reform since at least 1996, when stricter policies were enacted and helped bulk up immigration enforcement instead of solving the problem of the growing population of undocumented immigrants.

“Immigration enforcement has cost the U.S. government over \$208 billion since 2001,” Marc Rosenblum, deputy director of the Migration Policy Institute, said at the committee hearing. “It spends more on immigration enforcement than any other federal criminal law enforcement activities combined.”

Senator Johnson, the committee chairman, generally agreed with the witnesses, but he remained skeptical about whether accepting larger numbers of immigrants and legalizing those already in the country would hurt the native workforce.

“There is a dispute as to whether undocumented workers have or haven’t depressed wages,” said Johnson, citing a case from a California energy company looking to hire technicians from outside the United States.

His question was immediately addressed and downplayed.

“The bulk of studies unquestionably find that there is almost no effect,” said Madeline Zavodny, economics professor at Agnes Scott College and an adjunct scholar at the conservative American Enterprise Institute. “There is no zero-sum number of jobs. When immigrants come, jobs also get created.”

She was unequivocal in her support for expanding a guest worker program to help not just immigrants but also native workers themselves.

“To protect native workers from unfair competition, we need to allow guest workers to move to employers who want to hire them and want to offer higher wages to have them,” said Madeline Zavodny, economics professor at Agnes Scott College and an adjunct scholar at the conservative American Enterprise Institute.

This positive take on immigration reform is rising not just among conservative economists and activists but also among the potential top GOP candidates for president, including **Sen. Rand Paul of Kentucky, Sen. Marco Rubio of Florida and Gov. Scott Walker of Wisconsin.**

Republicans pushing for non-border immigration reform

Paul **Dupont 15**, reporter for American Principles Project, 1-2-2015, “Republican-Led Immigration Proposals Taking Shape For New Year,”

<https://americanprinciplesproject.org/blog/republican-led-immigration-proposals-taking-shape-for-new-year/>

However, as I have argued in the past, bolstering border security and enforcement in other areas will not fix America’s immigration system on its own. There is also a need to improve U.S. guest worker programs in order to address the increasing demand for foreign workers to fill high- and low-skill positions for which American workers cannot be found. Fortunately, some in Congress also seem keen to tackle this issue:

Other Republicans are preparing legislation to address additional aspects of the immigration system. Rep. Raúl Labrador (R., Idaho), a onetime immigration attorney, plans two bills, an aide said.

One would create a temporary worker program that would allow as many as 350,000 foreigners to enter the country each year for construction, restaurant and other low-skilled jobs. These workers would have most of the labor rights afforded in a broad immigration bill that passed the Senate last year, such as the right to change jobs.

Meanwhile, Sen. Orrin Hatch (R., Utah) plans to introduce legislation making more visas available for high-tech workers, a spokesman said.

Sen. Dianne Feinstein (D., Calif.) is working on a bill revamping the agricultural visa program, based on provisions in last year’s Senate bill. Her staff is in talks on the measure with Republicans including Sen. Marco Rubio of Florida, who helped work out a compromise on this issue in 2013.

Of course, many details remain to be settled before any of these proposals can be fully evaluated. However, given the need for major reforms in these areas, news of such developments may give proponents of a truly conservative immigration policy reason to feel cautiously optimistic.

CP Shields Link to Border DA

Legalization of workers reveals terrorists from the migrating population

Daniel **Griswold 04**, director of the Cato Institute's Center for Trade Policy Studies, 4-1-2004, “Securing Our Borders Under a Temporary Guest Worker Program,”

<http://www.cato.org/publications/congressional-testimony/securing-our-borders-under-temporary-guest-worker-program-0>

Indeed, legalizing and regularizing the movement of workers across the U.S.-Mexican border could enhance our national security by bringing much of the underground labor market into the open, encouraging newly documented workers to cooperate fully with law enforcement officials, and freeing resources for border security and the war on terrorism.

Real immigration reform would drain a large part of the underground swamp that facilitates illegal immigration. It would reduce the demand for fraudulent documents, which in turn would reduce the supply available for terrorists trying to operate surreptitiously inside the United States. It would eliminate most of the human smuggling operations overnight. The vast majority of Mexican workers who enter the United States have no criminal record or intentions. They would obviously prefer to enter the country in a safe, orderly, legal process through an official port of entry, rather than put their lives in the hands of unscrupulous smugglers. By entering legally through a temporary worker program, they could travel freely across the border for multiple visits home rather than incurring the risk and expense of re-crossing the border illegally. As a consequence, legalization would drain the underground channels through which terrorists might try to enter the country.

Just as importantly, legalization would encourage millions of currently undocumented workers to make themselves known to authorities by registering with the government, reducing cover for terrorists who manage to enter the country and overstay their visas. Workers with legal documents would be more inclined to cooperate with law enforcement and provide evidence if they do not fear deportation. Furthermore, we would free up enforcement and border-control resources to focus on protecting the American homeland from terrorist attack. Our Department of Homeland Security should concentrate its limited resources and personnel on tracking and hunting down terrorists instead of raiding chicken processing plants and busting janitors at discount stores.

India CMS Georgia

India CMS Adv Answers

No Modeling

No modeling – India follows Britain not the US

Mate 10 (Manoj, J.D. Harvard Law School, “The Origins of Due Process in India: The Role of Borrowing in Personal Liberty and Preventive Detention Cases”, Berkeley Journal of International Law, 2010, 28 Berkeley J. Int'l L. 216, lexis)

It is important to note here that the particular structure of Article 19 reflected the framers desire for a constitution modeled on the Irish, **not the U.S. Constitution**.ⁿ¹³ Unlike the American system, which was predicated on horizontal separation of powers with separate coordinate legislative, executive and judicial branches, **India's constitutional system was rooted in the traditions of British parliamentary sovereignty and legal positivism. Thus, the emergence of a strong Supreme Court challenging parliamentary legislation via substantive due process was unlikely given this**

traditional historical context. But aside from the historical legacy of British rule and legal positivism, two specific historical factors directly influenced the Constituent Assembly to explicitly omit a due process clause in the section on Fundamental Rights. The first was the influence of United States Supreme Court Justice Felix Frankfurter on Constitutional Adviser B.N. Rau, who traveled to Britain, Ireland, the United States and Canada in 1947 to meet with jurists regarding the drafting and framing of the Indian Constitution.ⁿ¹⁴ The second factor was the tumultuous and chaotic period of communal violence that gripped Northern India as a result of the partition of Muslim Pakistan from Hindu India, which led the framers of the Indian Constitution to remove the due process clause from their draft constitution for the protection of individual liberty.

Countries don't emulate U.S. policies – past policies have undercut our model

Moravcsik 5 (Andrew, Professor of Government and Director of the European Union Program at Harvard University, January 31, 2005, Newsweek, “Dream On, America,” lexis)

Not long ago, the American dream was a global fantasy. Not only Americans saw themselves as a beacon unto nations. So did much of the rest of the world. East Europeans tuned into Radio Free Europe. Chinese students erected a replica of the Statue of Liberty in Tiananmen Square. You had only to listen to George W. Bush's Inaugural Address last week (invoking "freedom" and "liberty" 49 times) to appreciate just how deeply Americans still believe in this founding myth. For many in the world, the president's rhetoric confirmed their worst fears of an imperial America relentlessly pursuing its narrow national interests. But the greater danger may be a delusional America--one that believes, despite all evidence to the contrary, that the American Dream lives on, that America remains a model for the world, one whose mission is to spread the word. The gulf between how Americans view themselves and how the world views them was summed up in a poll last week by the BBC. Fully 71 percent of Americans see the United States as a source of good in the world. More than half view Bush's election as positive for global security. Other studies report that 70 percent have faith in their domestic institutions and nearly 80 percent believe "American ideas and customs" should spread globally. Foreigners take an entirely different view: 58 percent in the BBC poll see Bush's re-election as a threat to world peace. Among America's traditional allies, the figure is strikingly higher: 77 percent in Germany, 64 percent in Britain and 82 percent in Turkey. Among the 1.3 billion members of the Islamic world, public support for the United States is measured in single digits. Only Poland, the Philippines and India viewed Bush's second Inaugural positively. Tellingly, the anti-Bushism of the president's first term is giving way to a more general anti-Americanism. A plurality of voters (the average is 70 percent) in each of the 21 countries surveyed by the BBC oppose sending any troops to Iraq, including those in most of the countries that have done so. Only one third, disproportionately in the poorest and most dictatorial countries, would like to see American values spread in their country. Says Doug Miller of GlobeScan, which conducted the BBC report: "President Bush has further isolated America from the world. Unless the administration changes its approach, it will continue to erode America's good name, and hence its ability to effectively influence world affairs." Former Brazilian president Jose Sarney expressed the sentiments of the 78 percent of his countrymen who see America as a threat: "Now that Bush has been re-elected, all I can say is, God bless the rest of the world." The truth is that Americans are living in a dream world. Not only do others not share America's self-regard, they no longer aspire to emulate the country's social and economic achievements. The loss of faith in the American Dream goes beyond this swaggering administration and its war in Iraq. A President Kerry would have had to confront a similar disaffection, for it grows from the success of something America holds dear: the spread of democracy, free markets and international institutions--globalization, in a word. Countries today have dozens of political, economic and social models to choose from. Anti-Americanism is especially virulent in Europe and Latin America, where countries have established their own distinctive ways--none made in America. Futurologist Jeremy Rifkin, in his recent book "The European Dream," hails an emerging European Union based on generous social welfare, cultural diversity and respect for international law--a

model that's caught on quickly across the former nations of Eastern Europe and the Baltics. In Asia, the rise of autocratic capitalism in China or Singapore is as much a "model" for development as America's scandal-ridden corporate culture. "First we emulate," one Chinese businessman recently told the board of one U.S. multinational, "then we overtake."

No Indo-Pak War

No India-Pakistan war – nuclear deterrence checks

Khan 12 (Ikram Ullah, analyst for the South Asian Strategic Stability Institute, "Nuclear Pakistan: Defence Vs Energy Development," 7/26, <http://www.eurasiareview.com/26072012-nuclear-pakistan-defence-vs-energy-development-oped/>)

We must be clear that nuclear weapons are here to maintain peace and stability between Pakistan and India. Pakistan was forced to run its nuclear weapon program due to India's nuclear weapon program and its hegemonic ambition. Pakistan has long said that its nuclear weapon program is security driven. While on other hand Indian nuclear weapon program is not security driven, rather it is based on its regional and global aspirations.¶ The security threats still exist for Pakistan, but due to its credible nuclear deterrence Pakistan is capable of crushing such threats or plans. In the recent past, the tragedy, which many historians remember as the "Fall of Dhaka", carries some lessons for us to be learnt. If India could intervene at that time, then it is quite possible it could intervene in Balochistan. Now the nuclear capability of Pakistan deters India from perusing any kind of intervention because of the fear of perceived consequences.¶ It is Pakistan's credible nuclear deterrence capability that effectively neutralizes any ill intent of its opponent against its integrity and sovereignty. It is evident that after the December 13, 2001 terrorists attack on Indian Parliament, India mobilized its armed forces to attack on Pakistan, but refrained from doing so as it realized that any such irrational action would lead to a nuclear war. The same was the case after Mumbai attacks on November 26, 2008 – the nuclear deterrence prevailed and it prevented the likelihood of an all out nuclear war in South Asia.

A2 CMS = Honeytrap for Cyberattacks

CMS surveillance is not a honeytrap of privacy – aff claims are exaggerated

Xynou 13 (Maria, Policy Associate on the Privacy Project at the Centre for Internet & Society. She has previously interned with Privacy International and with the Parliament of Greece. Maria holds a Master of Science in Security Studies from the University College London. "India's 'Big Brother': The Central Monitoring System (CMS)" – April 8th - <http://cis-india.org/internet-governance/blog/indias-big-brother-the-central-monitoring-system>)

Another cyber security expert argued that the idea that the privacy of our messages and online activity would be intercepted is a misconception. The expert stated that: 'The police are actually looking out for open source intelligence for which information in public domain on these sites is enough. Through the lab, police can access what is in the open source and not the message you are sending to your friend.' Cyber security experts also argued that the purpose of the creation of the Mumbai social media lab and the CMS in general is to ensure that Indian law enforcement agencies are better informed about current public opinion and trends among the youth, which would enable them to take better decisions on a policy level. It was also argued that, apparently, there is no harm in the creation of such monitoring centres, especially since other countries, such as the U.S., are conducting the same type of surveillance, while have enacted stringent privacy regulations. In other words, the monitoring of our communications appears to be justified, as long as it is in the name of security.

Hack won't work – India's cyber-defenses are strong and improving.

Times of India 10 (Internally citing senior military officials - "Cyber war: Indian Army gearing up" - Times of India - July 19, 2010 – <http://timesofindia.indiatimes.com/tech/tech-news/Cyber-war-Indian-Army-gearing-up/articleshow/6187297.cms>)

The Indian Army is fighting attacks in the cyber world with electronic warfare capability of the "highest standard", say officials pointing out that virtual strikes have shot up from hostile quarters in both sophistication and frequency. "The army is cognisant of the threat to its cyber space from various state and non-state actors. But our network is well secured in compliance with the highest standards of cyber security," a senior official in the military headquarters told IANS on condition of anonymity. The official said the army has established an "impenetrable and secure wide area network exclusively for its functioning". Officials in the 1.3 million force privately admit they are facing "next generation threats" and are rather worried over the complex world of cyber warfare amid reports of Chinese and Pakistani spies targeting the Indian military establishment via the internet. Though attacks from hackers - professional or amateur - can come from anywhere in the world, cyber onslaughts have been more frequent from China and Pakistan, which have reportedly been peeking into India's sensitive business, diplomatic and strategic records. As per reports from the cyber industry, China and Pakistan hackers steal nearly six million files worldwide every day. A report in the US-based Defence Systems magazine found that there were 25 million new strains of malware created in 2009. That equals a new strain of malware every 0.79 seconds. The report underlines how the current cyber threat environment is dramatically changing and becoming more challenging as the clock ticks. However, the Indian army is confident. Revealing that secret information had been secured with unhackable electronic passwords, the official said various "cryptographic controls" have been incorporated in the wake of a significant number of viruses, worms and other forms of malware. To address cyber defence, which is also under threat from terrorist outfits that have their own trained recruits, officials said the army frequently upgrades its comprehensive cyber security policy to pro-actively deal with and anticipate these threats. The force has established the Computer Emergency Response Team (CERT) to respond to attacks targeting the army's critical systems and infrastructure. Another official said the army has its own cyber audit process conducted by cyber security personnel. "The audit is conducted in accordance with established security standards such as ISO 27001. Audit of the network is a continuous and active process which helps identification and mitigation of vulnerabilities in a network to counter latest threats as also check the network for cyber security policy compliance," he said. However, the official admitted there was no room for complacency in times of rapid technological change. "In the area of cyber space, the battle between hackers and defenders is an ongoing process, influenced by latest technological developments. Due to the dynamic nature of threats, the army is constantly upgrading its network," he said.

Successful hack couldn't create havoc – too much of India's critical infrastructure is not yet online. Dedicated networks also check risk of an attack.

Shukla 13 (Ajai. Indian journalist and retired Colonel of Indian Army. He currently works as Consulting Editor with Business Standard writing articles on strategic affairs, defence and diplomacy. He earlier worked with DD News and NDTV – "India's digital battleground" - Business Standard - June 21, 2013 - http://www.business-standard.com/article/current-affairs/india-s-digital-battleground-113062101013_1.html)

India has been slow in fixing its attention on cyber security. This may partly be because much of the country's critical infrastructure - power grids, public transportation, nuclear power plants, defence systems - is controlled by manual systems, or by standalone computer systems that are not linked over the internet. In that respect, India's infrastructural backwardness has proved useful against cyber-attacks. "It is not unusual to find central ministry officials in New Delhi using unsecured email systems, sometimes even commercial email accounts on public servers. But India's sensitive networks tend to be isolated, with no point of contact with the Internet that would render them vulnerable to online hacking. Several agencies have their own dedicated, secure fibre-optic networks, notably the military, Defence R&D Organisation (DRDO), and police's Crime and Criminal Tracking Network System," says Praveen Swami, strategic affairs editor of Network18.

Yes Modeling Links

India Models U.S. Surveillance structures

Chaulia 9 Sreeram Chaulia is associate professor of world politics at the OP Jindal Global University in Sonapat, India India caught in a terror tangle
http://www.atimes.com/atimes/South_Asia/KL11Df05.html

The ills in India's intelligence apparatus were highlighted recently when India's Home Minister P Chidambaram announced a new chief for the proposed National Intelligence Grid (NATGRID) project for counter-terrorism. This is an ambitious venture to pool all data and information relating to a person - ranging from bank accounts, rail and air travel to income tax, telephone and Internet usage. Without being obtrusive, NATGRID is mandated to link 21 different databases for the access of 10 security agencies. While it sounds like an innovate idea that could enable the speedy detection and interception of security threats, NATGRID is symptomatic of the troubles plaguing India's divided state. It is the brainchild of the Home Ministry, which sees itself as a veteran in competition with the office of the National Security Advisor (NSA) for the prized position as the lead governmental node handling strategic issues. The NSA, which falls under the all-powerful Prime Minister's Office, already has under its aegis, since 2004, the National Technical Research Organization (NTRO) - a highly specialized technical intelligence-gathering "super-feeder agency" - to act as a clearing house for all other members of the security establishment. Modeled after the US National Security Agency, NTRO had until recently been dubbed "India's newest secret agency". Now, the Home Ministry's NATGRID, or one or other of the ever-mushrooming pet creations of the vast Indian bureaucracy, might vie for this honor as they build their own personnel, budgets and images. The Home Ministry has also just floated the idea of forming a National Counter-Terrorism Center (NCTC), again borrowing a leaf from the American book, although this new body would have major overlaps in terms of technology and processes with the pre-existing NTRO. In May, just after the ruling Congress-led coalition retained power in general elections, the politically heavyweight Home Ministry began advocating a new Centralized Lawful Interception and Monitoring System that would "monitor all communication traffic to tighten the country's security and surveillance set-up" and catch early warning signals of impending terrorist attacks. These tasks, again, were hitherto being managed by a full-fledged department of the NTRO. There have been 20 major terrorist strikes in India since 2001, including attacks by militants in Jammu and Kashmir and on parliament in New Delhi, as well as bombings throughout the country. Prior to last year's attack in Mumbai, the deadliest strikes was the bombing of several railway stations and trains in the city in July 2006, with some 180 people killed. In May 2008, bombs exploded in crowded markets outside Hindu temples in the popular tourist destination of Jaipur, killing at least 60. In August 2008, National Security Advisor M K Narayanan said that as many as 800 terrorist cells operated in the country. The domestic Intelligence Bureau (IB), which comes under the purview of the Home Ministry, has also been active in the area of Internet telephony and interception of potential terrorist conversations, adding to the plethora of trespassing mechanisms over and above the heads of existing entities. The IB is now readying for the establishment of a new counter-intelligence center under its supervision. NTRO has struggled in other intramural battles with its notionally allied organization in the labyrinthine state security apparatus, the Research and Analysis Wing (RAW), India's external intelligence organization. The latter's failures in detecting Pakistani intrusions prior to the brief 1999 Kargil war had elicited criticism of its monopoly over foreign intelligence-gathering and culminated in calls to detach RAW's Aviation Research Center (ARC) and merge it with NTRO as a single super agency for technical intelligence. This handover has not been fully accomplished to date and continues to keep the scorebook of bureaucratic wrangling open with highly wasteful expenditure and possible national security costs. Often mocked as a "soft state" that has failed to rectify dysfunctional behavior, India can be better understood as a flabby state with far too many agencies, which work at cross-purposes and keep the structure unprepared and uncoordinated for the next potentially devastating blow of anti-national actors. The gaps and loopholes in the state's counter-terrorist response system have ironically grown with the proliferation of more and more agencies and projects. So bureaucratically dense has the web of competing interests and responsibilities within the Indian state become since the Mumbai attacks that the larger purpose of doing social good by advancing protection of citizens has been subsumed by a "me too" attitude in which everyone and anyone who has some clout within government will press a finger into the pie. In this game of bureaucratic politics, who gets which piece of the cake in terms of influence and counterbalancing "pull" (a uniquely Indian term referring to leveraging power) has overshadowed the core mission of finessing state responses to multifarious threats. Indian's melee of multiplying committees, bodies and agencies scarcely boosts the average citizen's confidence that he or she can be safer after all the revamps and "shakeups". A state is not a monolith but a vast constellation of loosely allied institutions, organizations and centers of power. Visualized from the summit or the apex, the state reproduces itself like hydra into smaller ramifications that carry the seal of sovereignty into the spaces that are inhabited by citizens. The give-and-take between these state agencies and the public is theoretically based on mutual trust and need. Unfortunately, the one-upmanship games bedeviling the Indian security structure have not done justice to this quid pro quo, which lies at the heart of contemporary political life. One pattern emerging from the mess of the flabby Indian state is the attempt of its top echelons to emulate the United States in terms of

merging, refurbishing or creating anew specialized agencies to tackle emerging security risks. What Indian policymakers may have missed in the process of learning lessons from the US is that the latter has been historically bogged down with the same severe symptoms of bureaucratic politicking.

India policy leaders emulate U.S. counterterrorism strategies

Rizvi 8 Dr Hasan-Askari Rizvi is a political and defence analyst, analysis: Imperatives of counter-terrorism —Dr Hasan-Askari Rizvi, <http://archives.dailytimes.com.pk/editorial/14-Dec-2008/analysis-imperatives-of-counter-terrorism-dr-hasan-askari-rizvi>

The post-Mumbai strategies of India and Pakistan reflect their immediate political concerns rather than long-term, coherent and shared perspectives on counter-terrorism. India is trying to extract maximum diplomatic dividend against Pakistan by activating multilateral channels and applying direct pressure. Pakistan is engaged in damage control in an extremely difficult diplomatic situation created by the Mumbai attacks. Pakistan has banned the Jama'at-ud Dawa, sealed its offices and arrested several of its leaders and activists. One wonders why the government had to wait for a UN Security Council resolution and prodding by the United States to act. Pakistan's intelligence agencies must have enough information on the activities of hard-line and militant groups, as well as on their linkages with the Taliban. It is also well known that a good number of non-Pakhtun Pakistanis are involved in the Pakistani Taliban movement. Similarly, Pakistani agencies would know if JuD was a front for banned terrorist group Lashkar-e Tayba. The present Pakistani government and military top brass view the Pakistani Taliban and other militant groups as a major threat to Pakistan's internal political and societal stability. This is a shift from the past when General Pervez Musharraf's regime pursued a dual policy of taking some action against these groups but leaving them enough space to continue with their activities in a low-key manner. The present government asked the military to launch the ongoing operations against the Taliban and Al Qaeda in some tribal agencies, and the operations have made significant gains in Bajaur and Khyber. Militants were also pushed back in Swat, though they are far from being fully contained. Given that the security forces had their hands full in the tribal areas, the government did not want to open a new front against militants in mainland Pakistan. However, consensus at the international level on the involvement of a Pakistan-based group in the Mumbai attacks left Pakistan with no credible option but to take immediate action against militant groups in the mainland. These groups are transnational and use all possible means, including violence, to pursue their agenda with total disregard to the imperatives of Pakistan as a nation-state in the comity of nations. They want Pakistan to be subservient to their agenda, and do not respect Pakistan's sovereign status and territorial boundaries. Should these movements be allowed to impose precarious foreign policy situations on Pakistan? If Pakistan is to function as a coherent and effective state, it cannot allow non-state actors to engage in violent and disruptive activities inside or outside its boundaries. Pakistan's policymakers need to do some hard and realistic thinking on the current situation and terrorism-related issues. Indian policymakers need to do the same. They need not descend into traditional India-Pakistan polemics to deflect criticism of internal security lapses and the probability of terrorism having domestic roots. The Indian government has not blamed the Pakistani government of direct involvement in the Mumbai attacks, but maintains that a Pakistan-based group planned and executed them. This places indirect responsibility on the Pakistani government, given that it is seen to have allowed such a group to use Pakistani territory for a terrorist attack abroad. However, semi- and non-official Indian circles rarely maintain this distinction and project Pakistan as an irresponsible terrorist state. They find encouragement to adopt this position in India's official effort to extract the highest possible diplomatic dividends against Pakistan at the international level. As citizens of a number of states were killed in the attacks, India has found it easy to mobilise support. It is interesting to note that Indian expats in the US are fully involved in the campaign to get Pakistan designated as a terrorist state and to get UN approval for Indian airstrikes in Pakistan. A review of this ongoing Indian diplomatic campaign gives a strong impression that India is more interested in undermining and isolating Pakistan at the international level to further India's wider regional agenda rather than evolving a shared regional counter-terrorism strategy. The present strategy may meet India's immediate domestic needs, but it does not serve the long-term need of countering terrorism holistically and effectively. This long-term objective cannot be achieved without working with Pakistan. A large number of people in India's official and non-official circles want to emulate the United States: the argument is that if the US can launch airstrikes in Afghanistan and invade Iraq in response to attacks on its soil, India can do the same to counter terrorism originating in Pakistan.

India and the U.S. dialogue on counter-terrorism strategies and India seeks to learn best practices from the U.S.

Kumar 15 Manan Kumar reporter for DNA India India prepares for bigger counter-terrorism collaboration with US Thursday, 15 January 2015 - 6:45am IST | Place: New Delhi | Agency: dna,<http://www.dnaindia.com/india/report-india-prepares-for-bigger-counter-terrorism-collaboration-with-us-2052633>

As India prepares to roll out red carpet to president Barack Obama as the chief guest during the Republic Day parade, Prime Minister's Office and union home ministry are finalising an elaborate agenda to address Indian concerns in the homeland security dialogue with their US counterparts. Poised to share wider range of concerns amidst increasing bonhomie, the two countries are looking forward to hold in-depth exchange of views on common areas of interest and collaboration to further mutual counterterrorism goals that includes checking the spread of Islamic State of Iraq and Syria (ISIS) and al Qaeda which recently announced its new wing, al Qaeda in Indian Subcontinent (AQIS). Though still better off than western countries in terms of youth traction towards ISIS, the twin threats are steadily creeping into India and the two countries are eager to learn from each other and develop joint strategies to check their spread, government sources said. The union home ministry is keen to learn from their US counterparts to check proliferation of Jehadi forums in cyberspace that is gaining ground among Urban Indian youth. Recent studies done by IB revealed thousands of Indian youth hooked to such forum thus giving rise to the fear of self indoctrination as Jihadis and possibility of lone wolf attacks. US expertise in checking such proliferation and ways to pinpoint the source of such forums and blocking them can help us tackle this threat in a major way, said sources adding that the talks are at an advanced stage to get the knowhow to get quicker access to block dangerous uploads on social media sites and import of better cyber forensic techniques to crackdown on virtual Jihadis. India is also banking on US for building capacity in cybersecurity and critical infrastructure protection to counter threats and keep terrorist at bay. The two countries will also hold advanced talk on law enforcement engagement proposals include sharing lessons learned and best practices in SWAT team training and responding to mass casualty exercises, improving both nations' capabilities to respond to terrorist incidents and natural disasters.

India has modeled its counterterrorism model after the U.S.

Raman 12 Bahukutumbi Raman is the additional secretary (retired), cabinet secretariat, Government of India, New Delhi, and, presently, director, Institute For Topical Studies, Chennai, and Associate of the Chennai Centre For China Studies), How PC tried to emulate US counter-terrorism centre and failed, <http://www.rediff.com/news/slide-show/slide-show-1-how-pc-tried-to-emulate-us-counter-terrorism-centre-and-failed/20120116.htm>

The 26/11 terrorist strikes in Mumbai revealed more or less the same deficiencies in our counter-terrorism architecture as the deficiencies in the counter-terrorism architecture of the US revealed by the 9/11 terrorist strikes. Namely, inadequate intelligence and lack of co-ordinated follow-up action even on the intelligence that was available. In his first statement to the Lok Sabha on the 26/11 terrorist strikes after taking over as the Home Minister P Chidambaram said that the responsibility for follow-up action on available intelligence was found to be diffused. Shortly thereafter, he had visited the US to study the working of the Department of Homeland Security and the NCTC, both of which came into being after 9/11. He came back a strong votary of two ideas: For the creation of a separate Ministry of Internal Security patterned after the Department of Homeland Security of the US and for the creation of an NCTC patterned after its US counterpart.

India modeled their high tech surveillance after U.S. – It was created after the Indian Home Minister visited the NSA

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

In the spring of 2009, even as municipal crews in Mumbai were still sifting through the debris of 26/11, India's newly-appointed home minister, P Chidambaram, was ushered into the digital heart of the United States' war against terrorism, its super-secret National Counter-Terrorism Centre. He gazed intently, an aide recalls, at its giant video-walls, where information from across the world displayed in real time, and asked searching questions about the dozens of classified databases that feed them. Later that year, Chidambaram promised a made-in-India NCTC would be up and running "by the end of 2010"- a third of the time it had taken the United States. "India cannot afford to wait 36 months", he declaimed. -

Or Nah Modeling

Their modeling evidence goes the wrong direction—Even if India used the U.S. as a model for strengthening its counterterrorism strategy they will not reverse model reductions – India perceives itself as facing very different threats and domestic politics would block any roll back in surveillance

Kumar 12 Vikas Kumar is Assistant Professor of Economics at Azim Premji University, Bangalore, East Asia Forum, Why the India–US counter-terrorism partnership is largely symbolic 11 October 2012, <http://www.eastasiaforum.org/2012/10/11/why-the-india-us-counter-terrorism-partnership-is-largely-symbolic/> Zabiuddin Ansari, wanted among other things for the 2008 Mumbai terrorist attack, was recently deported from Saudi Arabia to India. This has been hailed as a sign of growing convergence among India, the US and Saudi Arabia on terrorism and Iran. But B. Raman, former head of the counter-terrorism division of India's external intelligence agency, has convincingly argued that the India–Saudi Arabia link of the triad will remain weak. And there are several reasons why even India–US counter-terrorism cooperation will also continue to be largely symbolic and sporadic for the foreseeable future. Let us begin with demography. Muslims, mostly immigrants, account for just 0.6 per cent of the US population, whereas Muslims account for more than an eighth of India's population and are among the country's founding fathers and leading public and cultural figures. India is geographically close to the nerve centres of Islamic terrorism in South and West Asia. This proximity is a disadvantage as Pakistan-based transnational terrorists can easily penetrate India's porous land and maritime borders. Moreover, India, unlike the US, has only a limited overseas capacity to counter terrorism at its source. But even if it had such a capacity, it would be largely ineffective against nuclear Pakistan. And irrespective of the incentives India may offer Pakistan's megalomaniac and paranoid military-intelligence establishment, the latter will not deliver results because any letting down of the hate campaign against India would conflict with its raison d'être. In contrast, the US, which is geographically isolated and has a better counter-terrorism capacity, is able to fight terrorism far away from its territory. India and the US also differ in their ability to influence Islamic countries. India is hugely dependent on Middle Eastern oil and many of its workers are employed in this region. This reduces India's bargaining power vis-à-vis the Middle East, which is a major source of financial and ideological support for Islamic terrorist organisations in South Asia. In contrast, given its influence over international institutions and the global financial system, the US is relatively better placed to favourably influence the policies of Islamic countries. Last but not the least, since the early 19th century Indian Muslims have been influenced by developments in West Asia, and since the early 20th century they have been in conflict with the majority Hindus. The Muslim–Hindu conflict resulted in the bloody partition of India that has left behind unresolved territorial issues, and the West Asian influence has radicalised some sectors of the Muslim community in India. As a result, the Indian policymaker and common man alike believe that terrorism is to some extent linked to the Kashmir question and to Indian youth affected by Muslim–Hindu riots, both of which are problems internal to India. These factors contribute to a number of differences between the counter-terrorism strategies of India and the US. US policy makers regard terrorism as a foreign and national defence problem. There is no influential domestic lobby that radically differs from the establishment's views in this regard. The domestic debate in the US is largely about the

logistics of fighting terrorism and the identification of suitable international partners. Changes in counter-terrorism strategy will not have a dramatic effect on US domestic politics. So, policymakers have sufficient freedom to rework strategy in response to changing threat patterns. In contrast, minor changes in strategy can disproportionately affect domestic politics in India: a strong-arm strategy will radicalise the Muslim masses, whereas a softer strategy will validate the Hindu right's claim that Muslims are appeased in the name of secularism. So, unlike the drone-borne counter-terrorism efforts of the US, India's fight against terrorism is almost entirely police-driven and backed by potential soft cultural options. India is similarly constrained on the foreign policy front. There are three reasons for this. First, Indian policy makers and the public view international counter-terror operations as undesirable insofar as they contribute to internationalising the Kashmir issue and attracting international jihadi attention to India. Second, India is a net oil importer; Muslims have a much stronger political presence in India; and mainstream political parties view the Palestine problem through the prism of decolonisation. So, on the one hand, the Indian government cannot, for example, support Israel on the Palestine issue and benefit from US–Israel counter-terrorism expertise. On the other hand, India cannot afford to go all out against Saudi Arabia and Iran because of the deep attachment felt by many Sunni and Shia Muslims to holy places in these countries and because of India's dependence on oil imports. Third, the US can bargain with countries like Pakistan over, say, rendering terrorists like David Coleman Headley to third countries and demanding, in exchange, cooperation to detect threats against its homeland. But India does not have access to such tradable assets. To conclude, India and the US view Islam differently and they face very different geo-political and domestic constraints. This in turn implies a divergence rather than convergence of counter-terrorism strategies. Moreover, belated revision of the US's Kashmir policy and procrastination in banning terror groups focused on India ensure that the Indian public and policymakers continue to distrust the intentions of the US — and a reciprocal feeling exists in this latter country. The two sides, therefore, need to overcome historical distrust of each other. In the meantime, it is unfair to treat counter-terrorism cooperation as the bellwether of their relationship. In fact, it would help if existing counter-terror cooperation were downplayed to knock the wind out of jihadi propaganda against the phantom Judaeo–Christian–Hindu alliance. The India–US relationship should instead build upon common interests like the promotion of maritime security, free trade, energy security, clean technologies, anti-proliferation regimes, human rights and democracy.

They have no reverse modeling evidence—India has explicitly rejected U.S. privacy restrictions on surveillance

Bhatia 15 Gautam Bhatia is Advocate, Delhi High Court, STATE SURVEILLANCE AND THE RIGHT TO PRIVACY IN INDIA: A CONSTITUTIONAL BIOGRAPHY, stsfor.org/content/changing-face-privacy-india-analysis

Ever since the explosive Snowden disclosures in May 2013, State surveillance and citizens' right to privacy have been at the forefront of international debate. Even as the Snowden documents were revealing, detail by detail, the American and British intelligence agencies' extensive surveillance systems (PRISM and TEMPORA, among others) used to spy both on their own citizens, and upon communications elsewhere, reports about Indian bulk surveillance began to trickle in. It is now known that there are at least two surveillance regimes in India, in uncertain stages of preparation: the Central Monitoring System (CMS), which provides for the collection of telephony metadata by tapping into the telecommunications' companies records²; and Netra, a dragnet surveillance system that detects and sweeps up electronic communication that uses certain keywords such as “attack”, “bomb”, “blast” or “kill”. These programs, wide in their reach and scope, have dubious statutory backing. They also, very clearly, impinge upon basic fundamental rights. A discussion of the legal and constitutional implications, therefore, is long overdue. This essay presents an analytical and chronological history of the Indian Supreme Court's engagement with the right to privacy. While discussions for a privacy statute have stagnated and are presently in limbo³, the Court has been active for nigh on fifty years. This essay aims to achieve a comprehensive, doctrinal understanding of the constitutional right to privacy, as evolved, understood and implemented by the judiciary. Such an understanding, indeed, is an essential prerequisite to embarking upon a legal and constitutional critique of mass State surveillance in India. II. FOUNDATIONS Privacy is not mentioned in the Constitution. It plays no part in the Constituent Assembly Debates. Indeed, a proposal to include a provision akin to the American Fourth Amendment (and the root of American privacy law), prohibiting ‘unreasonable searches and seizures’, was expressly rejected by the Assembly. The place of the right – if it exists – must therefore be located within the structure of the Constitution, as fleshed out by judicial decisions.

The India system has not modeled existing U.S. restrictions on metadata

Lowenthal 14 Mark M. Lowenthal is the senior specialist in U.S. foreign policy at the Congressional Research Service Intelligence: From Secrets to Policy

India has a growing cyberspace capability, which, like that of many other nations, appears to have been used against potential foes, such as China and Pakistan, and more friendly states, like the United States. India is in the midst of deploying a Centralised (or Central) Monitoring System (CMS) that is designed to track all communications within India—telephone, computer, landline, mobile, and so on. Unlike the NSA program, CMS will not have to ask providers' permission for access but will have that built into the technology of the telecom and data service providers. (IMS will provide intelligence to foreign and domestic agencies, the police, and tax collectors—a list that some believe is too broad. Like the NSA program, CMS appears to focus on metadata. CMS is being developed and will be run by a government technology development center that is not part of the intelligent complex. The Ministry for Home Affairs will have the power to determine who is monitored.

India has not modeled restrictions—They have far more surveillance authority than the U.S.

Mirani 13 Leo Mirani is a reporter for Quartz, Think US snooping is bad? Try Italy, India or...Canada, <http://qz.com/92648/think-us-snooping-is-bad-try-italy-india-or-canada/>

Just because something is legal doesn't necessarily make it a good thing. So far, legality is the main rationale US officials have used to defend the government's PRISM spying program. It's all perfectly legal, approved by Congress and the courts. But a more potent argument might be to compare PRISM with the spying programs of other countries. Compared to the data-mining that goes on elsewhere, US intelligence agencies may be relatively constrained. Start with Canada, which many consider to be a cuddlier, saner version of the US. The Globe and Mail reports today that the Canadian defense minister approved a plan similar to PRISM back in 2005, and renewed it in 2011. Run by the Communications Security Establishment Canada (CSEC), a signals intelligence agency similar to the US's NSA or Britain's Government Communication Headquarters (GCHQ), the program collects metadata from phone and internet communication. Like PRISM, CSEC's primary targets are said to be foreigners. But what makes the Canadian effort somewhat more sinister is that it was instituted through the executive branch of government without legislative approval. According to the Globe and Mail, "a regime of ministerial directives—decrees not scrutinized by Parliament—have authorized the broad surveillance programs." At least PRISM won the approval of Congress, however clueless the legislature may be about the details. Then there is Italy. According to Italian lawyer Fulvio Sazrana (link in Italian), a law passed earlier this year by the outgoing Mario Monti government also skipped over court orders and other legal approvals. Instead, Monti issued a directive laying down guidelines for the protection of cybernetics and national cyber security. In so many words, the directive gives government agencies what the French call "carte blanche" to raid private data banks in the name of "internet security." There will be no Italian equivalent of Twitter, which does not participate in PRISM. In India, internet service providers are "insisting upon Indian users' privacy to be protected from any such misadventure of any intelligence departments." Meanwhile, India's government is setting up a vast surveillance system with the express purpose of spying on its citizens, something the NSA has been at pains to say it does not do. For instance, the government's Central Monitoring System gives it access to all telecom traffic, including calls, text messages and mobile internet. According to the Hindu newspaper, another proposed "national cyber coordination cell" plans to: Collect, integrate and scan [internet] traffic data from different gateway routers of major ISPs at a centralised location for analysis, international gateway traffic and domestic traffic will be aggregated separately ... The NCCC will facilitate real-time assessment of cyber security threats in the country and generate actionable reports/alerts for proactive actions by the concerned agencies. India's external intelligence agency, the armed forces, and even the local defense research establishment, among others, will have access. It is debatable whether India, Canada or Italy's data-acquisition and data-mining technology are as powerful as that of the NSA. But when they are, these countries will already have laws and systems in place to abuse them.

The U.S. meta data program had legal privacy protections built in even before the Freedom Act
Perez 13

Evan Perez reporter for Wall Street Journal, Phones Leave a Telltale Trail, Updated June 15, 2013, <http://www.wsj.com/articles/SB10001424127887324049504578545352803220058>

Under the NSA phone program, the government collects domestic phone metadata without a specific investigative lead. Trained analysts only search the database in conjunction with a terrorism investigation, authorities say. Intelligence

agencies "basically reimpose at the level of analysis the standards you might ideally have for collection," said Timothy Edgar, a former top national-security privacy lawyer in the Bush and Obama administrations. Mr. Edgar said the increasingly specific location data raises concerns about potential violations of Fourth Amendment protections against unreasonable searches and seizures. Once a person can be located within a building, the monitoring more closely resembles a search that would traditionally require a warrant.

The NSA program is accompanied by privacy restrictions, Obama administration officials say. To search the database, the government must have "reasonable suspicion" that the basis for the query is "associated with a foreign terrorist organization," they say. Search warrants approved by the secret Foreign Intelligence Surveillance Court are required before the contents of the calls may be monitored.

No reverse modeling – No restrictions on surveillance that exist in the U.S. have ever been modeled in India—India has far more access to data than the U.S. does now—The CMS collects and listens to all calls directly—it is not limited to metadata and they have not modeled any privacy protections

Prakash 13 Pranesh Prakash is Policy Director, The Centre for Internet and Society, Bangalore, How Surveillance Works in India July 10, 2013, http://india.blogs.nytimes.com/2013/07/10/how-surveillance-works-in-india/?_r=0

When the Indian government announced it would start a Centralized Monitoring System in 2009 to monitor telecommunications in the country, the public seemed unconcerned. When the government announced that the system, also known as C.M.S., commenced in April, the news didn't receive much attention. After a colleague at the Centre for Internet and Society wrote about the program and it was lambasted by Human Rights Watch, more reporters started covering it as a privacy issue. But it was ultimately the revelations by Edward J. Snowden about American surveillance that prompted Indians to ask questions about its own government's surveillance programs. In India, we have a strange mix of great amounts of transparency and very little accountability when it comes to surveillance and intelligence agencies. Many senior officials are happy to anonymously brief reporters about the state of surveillance, but there is very little that is officially made public, and still less is debated in the national press and in Parliament. This lack of accountability is seen both in the way the Big-Brother acronyms (C.M.S., Natgrid, T.C.I.S., C.C.T.N.S., etc.) have been rolled out, as well as the murky status of the intelligence agencies. No intelligence agency in India has been created under an act of Parliament with clearly established roles and limitations on powers, and hence there is no public accountability whatsoever. The absence of accountability has meant that the government has since 2006 been working on the C.M.S., which will integrate with the Telephone Call Interception System that is also being rolled out. The cost: around 8 billion rupees (\$132 million) — more than four times the initial estimate of 1.7 billion — and even more important, our privacy and personal liberty. Under their licensing terms, all Internet service providers and telecom providers are required to provide the government direct access to all communications passing through them. However, this currently happens in a decentralized fashion, and the government in most cases has to ask the telecoms for metadata, like call detail records, visited Web sites, IP address assignments, or to carry out the interception and provide the recordings to the government. Apart from this, the government uses equipment to gain access to vast quantities of raw data traversing the Internet across multiple cities, including the data going through the undersea cables that land in Mumbai. With the C.M.S., the government will get centralized access to all communications metadata and content traversing through all telecom networks in India. This means that the government can listen to all your calls, track a mobile phone and its user's location, read all your text messages, personal e-mails and chat conversations. It can also see all your Google searches, Web site visits, usernames and passwords if your communications aren't encrypted. You might ask: Why is this a problem when the government already had the same access, albeit in a decentralized fashion? To answer that question, one has to first examine the law. There are no laws that allow for mass surveillance in India. The two laws covering interception are the Indian Telegraph Act of 1885 and the Information Technology Act of 2000, as amended in 2008, and they restrict lawful interception to time-limited and targeted interception. The targeted interception both these laws allow ordinarily requires case-by-case authorization by either the home secretary or the secretary of the department of information technology. Interestingly, the colonial government framed better privacy safeguards into communications interception than did the post-independence democratic Indian state. The Telegraph Act mandates that interception of communications can only be done on account of a public emergency or for public safety. If either of those two preconditions is satisfied, then the government may cite any of the following five reasons: "the sovereignty and integrity of India, the security of the state, friendly relations with foreign states, or public order, or for preventing incitement to the commission of an offense." In 2008, the Information Technology Act copied much of the interception provision of the Telegraph Act but removed the preconditions of public emergency or public safety, and expands the power of the government to order interception for "investigation of any offense." The IT Act thus very substantially lowers the bar for

wiretapping. Apart from these two provisions, which apply to interception, there are many laws that cover recorded metadata, all of which have far lower standards. Under the Code of Criminal Procedure, no court order is required unless the entity is seen to be a “postal or telegraph authority” — and generally e-mail providers and social networking sites are not seen as such. Unauthorized access to communications data is not punishable per se, which is why a private detective who gained access to the cellphone records of Arun Jaitley, a Bharatiya Janata Party leader, has been charged under the weak provision on fraud, rather than invasion of privacy. While there is a provision in the Telegraph Act to punish unlawful interception, it carries a far lesser penalty (up to three years of imprisonment) than for a citizen’s failure to assist an agency that wishes to intercept or monitor or decrypt (up to seven years of imprisonment). To put the ridiculousness of the penalty in Sections 69 and 69B of the IT Act provision in perspective, an Intelligence Bureau officer who spills national secrets may be imprisoned up to three years. And under the Indian Penal Code, failing to provide a document one is legally bound to provide to a public servant, the punishment can be up to one month’s imprisonment. Further, a citizen who refuses to assist an authority in decryption, as one is required to under Section 69, may simply be exercising her constitutional right against self-incrimination. For these reasons and more, these provisions of the IT Act are arguably unconstitutional. As bad as the IT Act is, legally the government has done far worse. In the licenses that the Department of Telecommunications grants Internet service providers, cellular providers and telecoms, there are provisions that require them to provide direct access to all communications data and content even without a warrant, which is not permitted by the existing laws on interception. The licenses also force cellular providers to have ‘bulk encryption’ of less than 40 bits. (Since G.S.M. network encryption systems like A5/1, A5/2, and A5/3 have a fixed encryption bit length of 64 bits, providers in India have been known use A5/0, that is, no encryption, thus meaning any person — not just the government — can use off-the-air interception techniques to listen to your calls.) Cybercafes (but not public phone operators) are required to maintain detailed records of clients’ identity proofs, photographs and the Web sites they have visited, for a minimum period of one year. Under the rules designed as India’s data protection law (oh, the irony!), sensitive personal data has to be shared with government agencies, if required for “purpose of verification of identity, or for prevention, detection, investigation including cyber incidents, prosecution, and punishment of offenses.”

India has not modeled any of the privacy protections that exist in the U.S. – They have no legislation protecting privacy

Xynou 13 Maria Xynou Maria is a Policy Associate on the Privacy Project at the CIS, FinFisher in India and the Myth of Harmless Metadata, <http://cis-india.org/internet-governance/blog/fin-fisher-in-india-and-myth-of-harmless-metadata>

Furthermore, India lacks privacy legislation which could safeguard individuals from potential abuse, while sections 66A and 69 of the Information Technology (Amendment) Act, 2008, empower Indian authorities with extensive surveillance capabilities.^[28] While it remains unclear if Indian law enforcement agencies are using FinFisher spy products to unlawfully target individuals, it is a fact that FinFisher control and command servers have been found in India and that, if used, they could potentially have severe consequences on individuals’ right to privacy and other human rights.[]

AT: CMS Economy “honey pot” scenario

Their scenario makes no sense - CMS is a data base for communication records and telephone data—It does not connect to the banks or financial markets—Hacking the CMS does not equal attacks on financial institutions

Cyber attacks can't crush the economy because India's economic infrastructure is compartmentalized and the national data base is protected

Shukla 13 Ajai Shukla reporter for Business Standard, Cyberspace: India's digital battleground, 22nd Jun 13 <http://ajaiashukla.blogspot.com/2013/06/cyberspace-indias-digital-battleground.html>

India, however, has been slow in fixing its attention on cyber security. This may partly be because much of the country's critical infrastructure --- power grids, public transportation, nuclear power plants, defence systems --- is controlled by manual systems, or by stand-alone computer systems that are not linked over the internet. In that respect, India's infrastructural backwardness has proved a useful safeguard against cyber attack. "It is not unusual to find New Delhi's central ministry officials using unsecured email systems, sometimes even commercial email accounts on public servers. But India's sensitive networks tend to be isolated, with no point of contact with the internet that would render them vulnerable to on-line hacking. Several agencies have their own, dedicated, secure optic fibre networks, notably the military; the Defence R&D Organisation (DRDO); and the police's Crime and Criminal Tracking Network System (CCTNS), the national database that is being gradually rolled out." says Praveen Swami, the Strategic Affairs Editor of Network 18.

Not Unique—Cyber attacks on India's financial infrastructure are exploding now before CMS has been completed

Athavale 14 Dileep Athavale, reporter for the Times of India. Cyberattacks on the rise in India , TNN | Mar 10, 2014, <http://timesofindia.indiatimes.com/tech/it-services/Cyberattacks-on-the-rise-in-India/articleshow/31757791.cms>

The ease of online banking and transactions has brought with it a significant rise in malicious attacks on digital devices and software systems. Most of these attacks, as recent instances of online thefts have demonstrated, have been in the banking and financial services domain. According to reports by research agencies, the problem has become more complex with the proliferation of mobile devices and the users' preference towards transactions on the go. In addition, there is also laxity on the part of the users when it comes to following safe practices during such transactions, coupled with a significant lack of manpower with skills to handle the rising number of such attacks, the agencies' reports state. Arbor Networks' research report states that 2013 witnessed a huge rise in attacks against the banking and financial services sector. Government establishments also faced such attacks. The firm said there was a 136% increase in cyberthreats and attacks against government organizations and 126% against financial services organizations in India. India has seen significant increase in attacks against financials and government, with 34% and 43% of them reporting cyberthreats and attacks respectively, up from last year's 15% and 19%, the report revealed. "From the ISP to the enterprise, IT and security teams are facing a dynamic threat landscape and very skilled and patient adversaries," Matthew Moynahan, president of Arbor Networks, said. "Multi-layered defenses are clearly needed, but so is a commitment to best practices for people and process," he added. Another report, from EC-Council Foundation pointed at a major gap in information security threat handling capabilities in India, thanks mainly to the talent crisis in the country. The report shows talent levels in nine crucial segments of information security, the implications of which could impact handling of cyberthreats in industries such as banking and economy, defence, healthcare, information and energy among others. Close to an alarming 75% participants displayed low levels or a lack of skill in error handling, while 73% participants were not adequately equipped with skills in file handling, the report revealed. Experts have recognized that malicious file inclusions, malware distribution and distributed denial of service (DDOS) attacks are known threats that can arise out of improper file handling and such threats are often used to synchronize attacks

on websites or large networks, the report stated. Anshul Abhang, managing director and chief executive of enterprise security solutions firm Deltaproactive, told ToI that a malicious attacker now looks for high-value targets that can benefit him financially. "Hacking is no more a satisfaction game but has become serious business. The attackers also look for indirect financial benefits by targeting particular organizations' services and taking it down eventually. Such service outages result in financial loss as well as goodwill and image loss in the market."

India's banking sector is vulnerable to cyber attacks now

Kaushik 14 Ram. K. Kaushik is a blogger for Cyber Security in India, <http://cybersecurityforindia.blogspot.com/>

However, cyber security in India is in a poor condition. Cyber security of banks in India is also required to be strengthened. The banks operating in India are not at all serious about maintaining cyber security of banking related transactions and this is resulting in many cyber and financial crimes in India. In the absence of appropriate skills development and modernisation of law enforcement agencies of India, police force are finding it really difficult to solve technology related crimes. Further, cyber security of sensitive databases like National Identity Cards would also require strong privacy protection and cyber security compliances.

Turn, Only completing the CMS can allow the surveillance necessary to stop cyber attacks on the financial system

GKT 15 General Knowledge Today: India's Daily E Magazine, Feb 2015
<http://www.gktoday.in/blog/developing-the-cyber-security-architecture/>

Cyber warfare is the internet based conflict which arises when the information system of the strategic departments of the country are attacked in order to get the classified information. In the modern world of digitization such politically motivated snooping is done to interrupt the strategic affairs of the nation. Sometimes it is aimed at attacking the major infrastructures of the nation. With the shrinking world, the internet connectivity and heavy dependence of the government functioning on internet, it is imperative to have a cyber securing framework. In the world of digitization critical infrastructure like banking system, financial market, power infrastructure, and hydroelectric projects are prone to such attack. The grid failure like instances can be its consequences. Hydroelectric projects prone to disaster, may be attacked and create disasters. 'Stuxnet' like malwares which were introduced in the centrifuge of Iran was one such incidence. NSA's PRISM snooping incidence, Dropmier, Tempora are such other global surveillance programmes which were operationalised to mine the data strategic to India. Hackers from different countries like Pakistan and china try to deface the Indian website are the potential attackers. Hence it is imperative to have in the modern times a properly tucked national security and monitoring system to have a digital surveillance in the country protecting it from cyber warfare and cyber espionage. India's efforts to minimize the cyber threat With the rise of India in last some decades as a global power and emerging economy it attracted global attention and remains vulnerable with regard to information protection. India's cyber security architecture as of now do not provide any mass surveillance mechanism with only few distinguished agencies like RAW, IB get access to such monitoring after the approval. India's effort include CERT-In (Computer Emergency Response Team- India) which was formed in 2002-03 to create awareness on cyber threat, understand vulnerabilities and devise ways to mitigate them. National Technical Response Organization (NTR0) was given responsibility of protecting the critical infrastructure institution and developing offensive capabilities. Amendments to the IT act 2008, raised the level of awareness about the cyber crimes. It recognizes various ways of cyber attacks and also provides help to prosecute the cyber criminals. National cyber security policy 2013 was framed to build a secure and resilient cyber space for government, citizen and business to protect the classified information critical to India's security. Its features include range of provisions including 24X7 mechanisms to deal with cyber threats. India is following the path of developing intense surveillance system which not only monitor the cyber threat to the national security but also seems to compromise the privacy of its citizen in some cases. The Central Monitoring System (CMS) is an ambitious project that is required to keep the national security and monitoring under surveillance. It would be a centralized mechanism where the telecommunication and internet connections can be analyzed by Indian government and its agencies. Central and regional database would help law enforcement agencies to monitor and intercept. Call data recordings and data mining to identify call details of the targeted numbers. Another such Efforts is NeTRA (Network Traffic Analysis System) will intercept

and examine communication over the internet for keywords like 'attack', 'blast', 'kill'. It appears to be Indian government first attempt of mass surveillance rather than individual targets. It will scan the activities over the social networking websites like twitter and would scan the mails and chat transcript and even the voices in the internet traffic. India's cyber security has not only to be effectively implemented but also to be redrawn in line with growing cyber crimes.

Turn, metadata is key to DETER cyber attacks

Michaels 13 Jim Michaels, is a military writer for USA TODAY and has covered wars around the world. He is a former Marine infantry officer USA TODAY June 6, 2013, NSA [data mining can help stop cybercrime](#), analysts say [The huge volume of telephone records](#) turned over to the U.S. government [could help investigators identify and deter](#) a range of terrorist acts, including [cyberattacks](#), analysts say. "Once you have this big chunk of data and you have it forever... you can do all sorts of analytics with it using other data sources," said Joseph DeMarco, former head of the cybercrime unit in the U.S. attorney's office in New York City. "A data set like this is the gift that keeps on giving," said DeMarco, a partner at the law firm DeVore & DeMarco.

Turn- NCCC Metadata program for preventing cyber terror attacks is modeled after U.S. data collection and will prevent cyber attacks

Keck 13 Zachary Keck is assistant editor of The Diplomat, India Sets Up Domestic PRISM-Like Cyber Surveillance?, <http://strategicstudyindia.blogspot.com/2013/06/afghan-lessons-for-arming-syrian-rebels.html>

Even as [the United States' PRISM cyber-snooping program](#) is raising alarm across the world, [India is in the midst of setting up a similar program](#) designed to collect intelligence via the internet domestically. The Hindu reports that the India government is creating a centralized mechanism to coordinate and analyze information gathered from internet accounts throughout the country. [The mechanism will be called the National Cyber Coordination Centre](#) [NCCC]. "The federal Internet scanning agency [will give law enforcement agencies direct access to all Internet accounts](#), be it your e-mails, blogs or social networking data," the Hindu reported, referring to the NCCC. A classified government "note" that The Hindu obtained explains the NCCC in this way: "The NCCC will collect, integrate and scan [Internet] traffic data from different gateway routers of major ISPs at a centralised location for analysis, international gateway traffic and domestic traffic will be aggregated separately ... [The NCCC will facilitate real-time assessment of cyber security threats in the country and generate actionable reports/alerts for proactive actions](#) by the concerned agencies" NDTV, however, reports that the NCCC will not target individuals but rather will seek to access threats to India's cyber infrastructure as a whole. "The new system will look for unusual data flow to identify and access cyber threats and not individual data," NDTV reported, citing unnamed government officials. But the Hindustan Times reports that [Indian authorities have long used meta-data to track potential cyber threats](#) inside the country. According to that paper, the program does not allow Indian authorities to access actual content, but rather look for "patterns in the manner emails, phone calls and SMSes are sent and delivered." It's unclear how much the NCCC would expand this authority and in which ways, if at all. One purpose of the NCCC seems to be simply trying to coordinate the different activities of government agencies tasked with elements of cybersecurity. During a speech last month, Prime Minister Singh briefly alluded to the then-forthcoming NCCC, "We are implementing a national architecture for cyber security and have taken steps to create an office of a national cyber security coordinator."

Turn, India's metadata surveillance program will prevent cyber attacks

Jhala 14 Krishna Jhala is an associate attorney at Priti Suri & Associates, India gets ready to set up cyber snooping agency March 2014, http://www.psalegal.com/FLASH_POPUP.php?flashID=144

[India will soon be setting up a federal internet scanning agency called NCCC to spy all internet accounts and online data](#). NCCC is [to monitor cyber security threats and inform concerned law enforcement agencies for proactive action to prevent crime](#). NCCC will collect and integrate internet traffic data from different gateway routers of major ISPs at a centralized location for analysis. NCCC would be set up at a cost of INR 10 billion and all top government spy and technical agencies including Department of Telecommunication, Intelligence Bureau, Research and Analysis Wing, Indian Computer Emergency Response Team, Army, Navy, Air force, National Security Council Secretariat,

Defence Research and Development Organization will play an active role in the functioning of NCCC. PSA view - In the present internet era, cyber attacks are on an increase and pose as a huge threat to the safety and security of the nation. Recently, Central Bureau of Investigation's website had been defaced by hackers and in another case attempts were made to break into Indian Railway Website. Therefore, NCCC is need of the hour and a step in the right direction to address the shortcoming in the cyber security. 100% FDI allowed in telecom sector In a meeting of the Department of Policy and Promotion chaired by Prime Minister on July 16, 2013, it was announced that FDI limit in the telecom sector has been increased to 100%. The earlier limit was 74%. As per latest announcements, investment up to 49% is allowed to come in through the automatic route and investment above 49% is required to be brought in through the government route i.e. approval of the Foreign Investment Promotion Board. PSA view - The announcement is seen as a welcome change. However, the policy and implementation of these announcement is what is most awaited. The increased limits are set to bring in billions of investments in this sector. Fresh foreign investments would help catalyze growth and the process of proliferation in the telecom sector across the country. India set to frame new testing norms for telecom equipment The Department of Telecommunications with the Department of Electronics & IT and National Technical Research Organization are all set to frame new testing standards for telecom gear to shield networks from potential cyber attacks. The Common Criteria Recognition Arrangement ("CCRA") clearance will no longer be enough to certify global telecom gear used in India, announced the National Security Council Secretariat, the apex agency looking into India's political, economic and energy and strategic security concerns. PSA view - CCRA was created ten years back by UK, US, Canada, France, Germany and the Netherlands, Australia and New Zealand, to define a common process to evaluate security-sensitive IT & telecom products and an objective to motivate global telecom vendors to find common processes to reduce equipment certification costs worldwide. But now India has started creating country-specific telecom gear testing standards and adopting several measures: (i) mobile phone companies have been mandated to use equipment deemed "safe" by an authorized testing lab in India from November 1, 2013; (ii) India is preparing a cyber security framework and a cyber security policy; (iii) India is setting up a National Cyber Coordination Centre to monitor metadata on cyber traffic flows; (iv) Establish a pilot lab and a full-fledged certification center and development system; and (v) To adopt global approaches to its procurement policies, India is reviewing its Preferential Market Access policy designed to compel foreign companies to manufacture electronic products in India if they want to sell in India.

LeT Disad

LeT stands for Lashkar e Taiba (sometimes called

Let - Internal Links

VOIP Links

LeT can avoid detection because it relies on VOIP communication that can't be tracked

Sharwood 12 Simon Sharwood is a reporter for the Register Terrorists 'build secure VoIP over GPRS network' Secret comms channel eludes Indian spooks, http://www.theregister.co.uk/2012/05/01/terror_group_voip/

Terror group Lashkar-e-Taiba has developed its own VoIP network that connects its members over GPRS networks, according to the Times of India. UK and US authorities have both declared Lashkar-e-Taiba a proscribed terror organisation. The group's aims include India ceding sovereignty over Kashmir. Members of the organisation participated in the 2008 attacks on Mumbai. The VoIP network is frustrating India's intelligence community, the report says, because it means they can no longer trace the group's members as it is far harder to spy on than email or commercial VoIP services. "Earlier, we could intercept conversations on phone or locate Lashkar cadres based on their IP addresses through their emails," an intelligence source told the Times. "But now we're finding it tough to gather intelligence because Lashkar men hold audio or video conferences using private VoIP." The network even has a name: Ibotel. The report says Lashkar-e-Taiba recruited "technicians, engineers and information technology executives ... intensify its operations across India." Some of those recruits, the report suggests, developed Ibotel as the group sought more secure methods of communication.

LeT use of VOIP is making them impossible to track down with conventional intelligence methods

Singh 12 Aarti Tikoo Singh reporter for Times of India, Lashkar's own Skype frazzles Indian intelligence, TNN | Apr 30, 2012, <http://timesofindia.indiatimes.com/india/Lashkars-own-Skype-frazzles-Indian-intelligence/articleshow/12934037.cms>

The increasing use by terror group Lashkar-e-Taiba [LeT] of Voice over Internet Protocol (VoIP) for communication, and its impenetrability, is proving frustrating for Indian intelligence. In fact, Lashkar supreme commander of operations, Zaki-ur Rehman Lakhvi, who is in a Rawalpindi jail, has been networking using a private VoIP on his smart phone with Lashkar cadres. "Lakhvi's compound serves as Lashkar's alternative headquarters," a top intelligence source told TOI. It was his imprisonment, sources said, that stopped Lashkar cadres from using emails and phones and restrict communication to VoIP. VoIP is a technology that delivers audio and video messages over the internet. It's distinct from phone as it converts audio signals into binary data. VoIP also allows encryption of data, which makes it difficult to decode messages. Senior intelligence sources in Kashmir told TOI that Muridke (Lahore) based Lashkar known for using technology more than any other terror group in Kashmir, has its own private VoIP, Ibotel, to communicate with its cadres in Pakistan and Kashmir. Ibotel, Lashkar's exclusive VoIP that runs on GPRS (mobile data service on 2G or 3G cellular communication system), was created by Lashkar's own tech team. The group began recruiting technicians, engineers and information technology executives almost a decade ago to intensify its operations across India. Lashkar, which is headed by Hafiz Saeed against whom the US recently announced a \$10 million bounty for his alleged role in the November 2008 Mumbai attacks, started using VoIP as soon as the technology became common in early 2000s. Lashkar's handlers used VoIP during the Mumbai attacks, intelligence sources said. "Earlier, we could intercept conversations on phone or locate Lashkar cadres based on their IP addresses through their emails. But now we're finding it tough to gather intelligence because Lashkar men hold audio or video conferences using private VoIP," said intelligence sources. "It's difficult to track their locations." And even if we know their IP addresses and the time and date of their audio or video calls, we remain technologically handicapped because we can't intercept what transpired between them," said a senior government official. "There may not be more than 50-odd Lashkar men. Yet, they are a threat because they have the ability to strike in the Valley or other parts of the country. We need to catch up with the technology to hunt them down," said a senior J&K police officer.

CMS is key to tracking VOIP communications

Parbat 13

Kalyan Parbat, ET Bureau Dec 30, 2013, Home Ministry pushes for IB right to screen VoIP services offered by Skype, Yahoo, GTalk, RediffBol c Dec 30, 2013, http://articles.economictimes.indiatimes.com/2013-12-30/news/45711413_1_interception-solution-voip-indian-telegraph-act

Learning from the interception pilot will be used by the government to fine tune the Centralised Monitoring System (CMS), the much-awaited national surveillance system that will be equipped to track all forms of communications, including wireless, landline, satellite, internet and VoIP calls from next year.

A comprehensive study demonstrated that disrupting LeT is key to stopping its attacks

Dilegge 12

¶ Dave Dilegge is Editor-in-Chief of Small Wars Journal and serves as a Director at Small Wars Foundation. ¶ University of Maryland Scientists Develop New Methods to Combat Pakistani Terrorist Group Lashkar-e-Taiba, <http://smallwarsjournal.com/blog/university-of-maryland-scientists-develop-new-methods-to-combat-pakistani-terrorist-group-lashk>

¶ Effectively reducing the likelihood and intensity of attacks by the Pakistani terrorist group Lashkar-e-Taiba (LeT), the perpetrators of the November 2008 assault on Mumbai, India, requires a cocktail of actions including fostering dissent within LeT, hampering the organization's ability to conduct communication campaigns or provide social services, and disrupting the links between LeT and other Islamist terror groups, says a new study completed by an interdisciplinary research team at the University of Maryland's Lab for Computational Cultural Dynamics.¶¶ Presented at an international symposium on Lashkar-e-Taiba held in Washington on Sep 10, 2012, the study also confirms traditional wisdom that pressuring Pakistan to rein in its terrorist proxies and disrupt LeT terrorist training camps is also necessary to reduce the scope of LeT attacks. The UMD research further showed that traditional counter-terror and law-enforcement tools such as arrests, raids, and targeting the group's field commanders have only had a limited impact in reducing the likelihood of Lashkar-e-Taiba attacks. The study also is being published as a book: "Computational Analysis of Terrorist Groups: Lashkar-e-Taiba" (Springer, released Sep. 10, 2012).¶¶ Besides killing hundreds of civilians, LeT threatens the stability of South Asia because its attacks heighten tensions between nuclear-armed rivals India and Pakistan. Further, since the assault on Mumbai, information on Lashkar-e-Taiba suggests that it has increasingly turned its attention towards attacking the West not only in Afghanistan but also in Europe and Australia.¶¶ "Our study of LeT is different," explains V.S. Subrahmanian, lead author of the study, and director of the University of Maryland's Laboratory for Computational Cultural Dynamics, "It is the first in-depth analysis of a terror group that uses sophisticated data mining algorithms to learn temporal probabilistic rules as well as new algorithms to automatically suggest set policies which are sets of actions that should and should not be taken in order to elicit a desired behavior. Companies like Google and Amazon use these kinds of analytic methodologies to model the behaviors of customers every day. Decision-makers dealing with deadly threats to national security should have the same kinds of tools available."¶¶ The findings

on how best to deal with LeT are based on systematically gathered monthly data on 770 variables over a period of over 20 years. The UMD researchers mined this data for temporal probabilistic rules that not only identify conditions under which different types of terror strikes are carried out by LeT or its affiliates, but also the time delay with which these actions occur. Given these rules about the likelihood of LeT actions, a new Policy Computation Algorithm identifies sets of actions that reduce the likelihood of LeT attacks.¶¶ A typical rule states that two months after 5-24 Lashkar-e-Taiba operatives were arrested and Lashkar-e-Taiba operatives were on trial in either India or Pakistan, there was an 88 percent probability of Lashkar-e-Taiba engaging in clashes with local security forces in which Lashkar-e-Taiba operatives are killed. The software generated hundreds of such rules about a vast range of Lashkar-e-Taiba attacks including their targeting of civilians, professional security forces, transportation centers, security installations, and symbolic/tourist locations.¶¶ Overall the rules showed that support from Pakistan's government for LeT (which over the years has included financial, military, as well as operational support) is strongly correlated with almost every type of Lashkar-e-Taiba violence, while when Lashkar-e-Taiba is suffering from internal dissension they are less likely to carry out every type of attack.

Meta data links

India access to Meta data is key to prevent attacks orchestrated through VOIP and to prevent terrorist attacks in India

Sharma 14

Laveesh Sharma, Graduate Student at Jindal School of International Affairs, Haryana, Changing Face of Privacy in India: An Analysis, <http://stsfor.org/content/changing-face-privacy-india-analysis>

In the year of 2012, the National Security Council of India, which was headed by the former Prime Minister Manmohan Singh, planned the establishment of the National Critical Information Infrastructure Protection Centre (NCIPC) that was to be created by the National Technical Research Organization (NTRO) (Joseph, 2012). The Standing Committee on Information Technology has recommended the following apart from the setting up of the NCIPC (Legislative, 2014): * Establishment of a protection centre; * Creation of a single centralised body dealing with cyber-crimes; * Employment of skilled IT professionals to overcome shortage of manpower and; * Funding as well as conducting extensive research and development. In the hindsight, the right to privacy has not been granted under the Constitution of India, although the courts encompass it within the 'freedom of speech and expression' under Article 19(1) (a) and 'right to life and personal liberty' under Article 21. Currently there is no dedicated legislation in place aimed at data protection or privacy. The data protection laws are a set of privacy laws and procedures meant for minimizing intrusion of privacy, owing to surveillance and data collection. Nevertheless the Centre for Internet & Society, an NGO based in New Delhi has researched extensively and drafted a version of the Privacy Protection Bill, 2013 (Acharya, 2013). Some characteristics of the bill include: * It seeks to heavily penalize organisations or institutions obtaining personal data under false pretext; * It authorizes suspension of telecom service provider's license if it violates conditions of confidentiality mentioned in the bill; * It states that recommendations shall be made by committee comprising the Cabinet Secretary, Secretaries of Departments of Personnel and Electronics and IT, as well as two experts of data protection, law and finance to be nominated by the Central government. However, the National Security Advisor (NSA) seeks to weaken the bill by reducing its scope and introducing provisions that would protect the intelligence agencies. The current IT Act applies only on entities and persons located in India and not foreign corporations or people located abroad (Kosturi Ghosh, 2014). It is designed to be incursive. For instance under Section 43A, the IT Act legalizes handling of sensitive personal data, and under Section 69, the Government of India can "intercept, monitor or decrypt" any information transmitted or generated from any computer resource in the interest of the sovereignty and integrity, defence, public order, preventing incitement and for the security of the State (Dalmia, 2011). The impact on privacy will be

hard hitting when the Central Monitoring System (CMS) comes into action. It was fast tracked post 26/11 Mumbai attacks in which the perpetrators used voice over internet protocol (VoIP). This system would allow the Government to access every digital communication and telecommunication in the country. The CMS will be capable of covering text messages, online activities, phone calls, online searches and even social media conversations! (Nandakumar, 2013). According to investigations, about 160 million users are already under the scrutiny of wide-ranging surveillance. They have further revealed that a “Lawful Intercept and Monitoring Systems” is in place, which has been arranged by the Centre for Development of Telematics for the purpose of monitoring Skype, emails, web-browsing and of course Internet traffic (Singh, 2013). The surveillance agency in Australia, Defence Signals Directorate (DSD) shared metadata of its citizens with intelligence allies overseas. Prime Minister Tony Abbott defined meta-data as “essentially the billing data which is different from the actual content of calls.” A metadata can paint a “visual rendering” of one’s digital and physical existence (Laughland, 2013). Owing to the trails of pieces, internet activities of an individual can be linked and traced back. The NSA’s meta-data surveillance programme compiles the data giving a detailed picture of lives of individuals; these can provide information about people’s political or religious affiliations and even their relationships. One of the other important phenomena has been the rise in the number of smart phones in India. The industry has been very successful and has seen spike in the number of smart phone users, with the market leader Android reportedly holding 62% of the market share according to a 2012 survey (Brindaalakshmi, 2013), followed by Windows Mobile, RIM, IOS and so on. A rising consumer base for these companies is a cause of concern, as in the past these very firms had provided direct access to the NSA. The NSA allegedly had access to over 180 million records from Yahoo, Google and Facebook. In 2013, the percentage of obtained information from Skype rose to 248%, for Facebook, 131% and 63% for Google with DropBox being designed as a PRISM provider (Glenn Greenwald, 2013). The recent upgrades in the Android software (Kit-Kat) make it the best spying phone that could capture highly personal data of movements, activities, interests, internet searches and geo-locations. These smart phones use cutting-edge technology, making them a potential spying weapon (Liss, 2014). The fact remains that such an incident can happen without anyone’s knowledge just like the NSA snoop-gate, and governments would not even come to know unless there is another Snowden out there. The mechanisms and artillery adopted in the IT sector by the Indian Government may all seem too invasive of one’s own privacy but all of these are absolute a necessity for the fight against cyber terrorism. mass-surveillance, cyber espionage and to prevent another snoop-gate by a foreign country. The past incidents have shown how powerful and exploitative these instruments are as they hamper freedom of speech and expression and lead to wrongful arrests for even ‘liking’ a post on Facebook or tweeting. Legal frameworks to tackle these issues are extremely essential; at the same time amends have to be made in the IT Act.

Sophisticated social network tools can turn metadata into effective intelligence information

Wheaton & Richey 14 Kristan J. Wheaton is an Associate Professor at Mercyhurst University and Melonie K. Richey is a graduate student at Mercyhurst University who is currently participating in IARPA’s Sirius Project. Metadata Analysis as an Intelligence Tool, e-International Relations January 9, 2014 , <http://strategicstudyindia.blogspot.com/2014/06/metadata-analysis-as-intelligence-tool.html>

The legality of the National Security Agency’s (NSA’s) use of US citizens’ metadata to identify and track foreign intelligence organizations and their operatives is currently a subject of much debate. Less well understood (and consequently routinely misreported) are the capabilities and limitations of social network analysis, the methodology often used to evaluate this metadata. One of the first causes of confusion is definitional. Social network analysis is often linked to an inappropriate degree with social media. True, social media such as Facebook and Twitter are frequently used as rich data sources for social network analysis, but understanding the importance of networks in the affairs of states has been around at least since Machiavelli.[1] In addition, the first modern version of what would come to be called social network analysis was developed not by an intelligence agency or computer scientist but by Columbia professor and psychosociologist, Jacob Moreno, in 1934. These “sociograms,” as Moreno called them were used to graph individual preferences or relations within a small group. Little did Moreno suspect that his method for understanding the relationships between people, when combined with graph theory and the processing power of computers, would allow for the detailed analysis of thousands of people or organizations with hundreds of thousands of connections between them (See Fig. 2). [2] Figure 2 – Modern social network analysis uses powerful computers and graph theory to map out the relationships between thousands of nodes and hundreds of thousands of links. Shown here is the network of the over 6000 Twitter users who follow the Twitter handle of the American Nuclear Society along with their over 200,000 connections. (Image Source: Melonie Richey) Along with the undeniable power of this type of analysis comes the inevitable (and justified) concerns for privacy and constitutionality. But just how powerful is social network analysis? What can intelligence agencies actually glean from the exabytes of data they are purportedly collecting? Social Network Analysis, as an analytic method, has inarguable applicability to the field of intelligence and is

progressively reshaping the analytic landscape in terms of how analysts understand networks. For example, analysts currently use SNA to identify key people in an organization or social network, develop a strategic agent network, identify new agents and simulate information flows through a network. Beyond this, SNA can be easily combined with other analytic practices such as Geographic Information Systems (GIS), gravity model analysis or Intelligence Preparation of the Battlefield (IPB) to create robust, predictive analyses. Identifying Key People/Organizations in a Network The most obvious use of SNA is its ability to identify key actors and entities within a network. Centrality measures within a network are means for measuring a node's relative importance within the network. [3] It is well-accepted that "the ability to measure centrality in social networks has been a particularly useful development in social network analysis." What is more interesting, however, is the number of centrality measures that social network analysts use to reveal different things about how key actors interact within a network. [4] For example, a node with a high degree centrality is connected to many other nodes. In Figure 3 below, it is unsurprising that the American Nuclear Society (ANS) has the highest degree centrality in its own Twitter network. However, a node with a high betweenness centrality is one that connects the cliques in the network. Figure 4 shows the same ANS network, reconfigured and revisualized with an emphasis on betweenness, with a new node, Nuclear.com, emerging as the most important. For example, by analyzing the network in accordance with different centrality measures and establishing filtering criteria (and using Carnegie Mellon's ORA software), [5] we were able to reduce a network representing the entire nuclear energy and non-proliferation communities on Twitter (6000+ nodes and 200,000+ links) to the 19 most influential individuals within that network (See Figure 5). These individuals are the nodes that would be able to disseminate information to the majority of the network within a matter of hours. Identifying New Agents Another traditional intelligence activity that could benefit from SNA is identifying potential new "agents" – people or organizations who might be willing or able to provide information to an intelligence agency. For example, by using Twitter's list feature, which allows users to establish lists of people to follow for particular purposes, and some simple cross-referencing techniques, we were able to identify 50 new, highly reputable individuals and organizations talking about strategic mining and minerals on Twitter. [6] While such a use by intelligence agencies may seem Orwellian, it is similar to techniques currently used in business to identify potential customers. Likewise, a similar algorithm likely supports various friend/colleague recommendation engines such as LinkedIn's "People You May Know" feature. Simulating Information Flows Of all the capabilities of SNA, simulations are likely one of the most useful. Carnegie Mellon's ORA, for example, provides four main kinds of simulations in order to demonstrate how money, information, disease or technology would move through a network. Pathway simulations locate the most direct or indirect routes from one node to another. Still other simulations also indicate how a network would react to the removal of any particular node or set of nodes (for example, how a decentralized terrorist network such as the Taliban would function if the leaders from two key cells were killed). As an example of this feature, Figure 7, shows the effect of providing a highly relevant piece of information to the 19 individuals identified in the Twitter network of nuclear specialists discussed above. The dots, representing individuals and organizations on Twitter, get larger and change color as the information flows throughout the system. Variables within the simulation allow researchers to alter the level of interest the network likely has to a particular piece of information (the information's "virality"). Combining SNA with Other Methods These simulations and other features of SNA provide idealized analyses that can then be combined with other techniques, such as GIS. Networks within ORA and many other SNA tools can be visualized geospatially if coordinates are provided for each node. Running simulations through these networks can then be represented on a map much like the simulation of Syrian refugee population movement throughout Turkey shown in Figure 8. This, in turn, allows for powerful predictive analytics. Figure 9 reflects the outcome of the simulation in Figure 8; not only does the image represent reality (the known locations of Syrian refugees according to the UN), [7] it also predicts where refugees are likely to move within the next 12 to 24 months. This analysis employed SNA as the cornerstone analytic technique in conjunction with GIS and even includes ideas from the more traditional intelligence methodology of Intelligence Preparation of the Battlefield.

India has modeled metadata collection—India depends on metadata

Xynou 13 Maria Xynou Maria is a Policy Associate on the Privacy Project at the CIS, FinFisher in India and the Myth of Harmless Metadata, <http://cis-india.org/internet-governance/blog/fin-fisher-in-india-and-myth-of-harmless-metadata>

Over the last months, it has been reported that the Central Monitoring System (CMS) is being implemented in India, through which all telecommunications and Internet communications in the country are being centrally intercepted by Indian authorities. This mass surveillance of communications in India is enabled by the omission of privacy legislation and Indian authorities are currently capturing the metadata of communications.[30] Last month, Edward Snowden leaked confidential U.S documents

on PRISM, the top-secret National Security Agency (NSA) surveillance programme that collects metadata through telecommunications and Internet communications. It has been reported that through PRISM, the NSA has tapped into the servers of nine leading Internet companies: Microsoft, Google, Yahoo, Skype, Facebook, YouTube, PalTalk, AOL and Apple.[31] While the extent to which the NSA is actually tapping into these servers remains unclear, it is certain that the NSA has collected metadata on a global level.[32] Yet, the question of whether the collection of metadata is “harmful” remains ambiguous. According to the National Information Standards Organization (NISO), the term “metadata” is defined as “structured information that describes, explains, locates or otherwise makes it easier to retrieve, use or manage an information resource”. NISO claims that metadata is “data about data” or “information about information”.[33] Furthermore, metadata is considered valuable due to its following functions: •Resource discovery •Organizing electronic resources •Interoperability •Digital Identification •Archiving and preservation Metadata can be used to find resources by relevant criteria, to identify resources, to bring similar resources together, to distinguish dissimilar resources and to give location information. Electronic resources can be organized through the use of various software tools which can automatically extract and reformat information for Web applications. **Interoperability is promoted through metadata, as describing a resource with metadata allows it to be understood by both humans and machines, which means that data can automatically be processed more effectively. Digital identification is enabled through metadata**, as most metadata schemes include standard numbers for unique identification. Moreover, metadata enables the archival and preservation of large volumes of digital data.[34] **Surveillance projects, such as PRISM and India's CMS, collect large volumes of metadata**, which include the numbers of both parties on a call, location data, call duration, unique identifiers, the International Mobile Subscriber Identity (IMSI) number, email addresses, IP addresses and browsed webpages.[35] However, the fact that such surveillance projects may not have access to content data might potentially create a false sense of security.[36] When Microsoft released its report on data requests by law enforcement agencies around the world in March 2013, it revealed that most of the disclosed data was metadata, while relatively very little content data was allegedly disclosed

India depends on metadata for intelligence

Lowenthal 14 Mark M. Lowenthal is the senior specialist in U.S. foreign policy at the Congressional Research Service Intelligence: From Secrets to Policy

India has a growing cyberspace capability, which, like that of many other nations, appears to have been used against potential foes, such as China and Pakistan, and more friendly states, like the United States. India is in the midst of deploying a Centralised (or Central) Monitoring System (CMS) that **is designed to track all communications within India**-telephone, computer, landline, mobile, and so on. Unlike the NSA program, CMS will not have to ask providers' permission for access but will have that built into the technology of the telecom and data service providers. (IMS will provide intelligence to foreign and domestic agencies, the police, and tax collectors-a list that some believe is too broad. **Like the NSA program, CMS appears to focus on metadata**. CMS is being developed and will be run by a government technology development center that is not part of the intelligent complex. The Ministry for Home Affairs will have the power to determine who is monitored.

Sleeper Cell Link

Domestic Surveillance in India is key—connections with internal groups in India is key to its ability to attack

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Lashkar-e-Tayyiba has always required some level of support from local Indian citizens to facilitate its operations in Kashmir and India. According to the Indian government, several Indians aided the 2008 Mumbai attacks including Arshad Ansari, Sabahuddin Ahmad, and Syed Zabiuddin Syed Zakiuddin Ansari. **LeT has also connected with local militant movements in India to extend its operational capabilities and expand its recruiting network**. One of these groups includes the Students Islamic Movement of India (SIMI). While SIMI was formed in 1977, at some point in the late 1990s a militant movement emerged out of the group. Some commentators suspect that SIMI has acted

as a major conduit for LeT activities. Another movement also associated with LeT known as the Indian Mujahideen (IM) either emerged out of SIMI or taken over its militant elements in 2007. Many analysts consider the two groups as synonymous.¹⁸⁴ Ideologically, IM and SIMI reject Hinduism, secularism, democracy, and nationalism.¹⁸⁵ The 2002 Gujarat riots likely has fueled an expansion of LeT's network into India. LeT has actively exploited the riots to expand its network in India. Shortly following the riots, Hafiz Saeed called for the Muslims of India to rise up stating that "the riots have proved that the Hindus are fully armed but the Muslims are badly ill-equipped to cope with such a situation." Indeed, even some women may have joined LeT as a result of the riots.¹⁸⁶ Indian investigators believe that a Mumbai-based SIMI operative Rahil Sheikh was tasked with aiding the transit of SIMI volunteers through the Iran-Pakistan border to train at LeT camps following the communal pogrom in Gujarat. Among the volunteers included Zakiuddin Ansari, the Indian believed to have been in the control room during the 2008 Mumbai attack.¹⁸⁷ This example may be indicative of how LeT has utilized its existing networks with a local Indian militant group to capitalize on Muslim anger at the communal violence.

Domestic surveillance in India is key to breaking LeT connections to domestic groups in India and cutting off funding

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Proactive steps should be taken to break Lashkar's alliance with homegrown jihadi outfits like Indian Mujahidin (IM) and the Student Islamic Movement of India (SIMI) who are known to provide logistical as well as surveillance services to Lashkar. Not just domestic jihadi organizations but also their links to organized crime and mafia leaders who provide a safe channel for money laundering should be cracked down upon. One of the most effective ways to disrupt Lashkar's operations is to disrupt their money flow. Further even though India has joined the Financial Action Task Force in 2009 and has with the help of the United States declared Dawood Ibrahim an international terrorist, but because Lashkar has such an extensive global network for fund raising as well as money laundering, it is difficult for authorities to move through slow diplomatic channels to fully implement and stop the money flow, especially with regard to Pakistan who seems to be extra cautious and slow while providing any kind of cooperation against Lashkar.

Indian domestic surveillance is key to prevent attacks--The LeT is a massive threat to India through sleeper cells in India activated through internet communications

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Lashkar- e- Taiba which translates into the 'Army of the Pure' is the most robust and powerful terrorist group operating out of Pakistan and a prominent threat to India. Lashkar has proved its capability for planning and executing highly sophisticated attacks like the one in Mumbai in 2008 where the operatives used maritime insertion, GPS navigation and satellite phones for real time monitoring and as well as for communication with their leaders in Pakistan. Lashkar-e-Taiba has also been the pioneer for introducing Fedayeen attacks in India, their first recorded attack was in Kashmir in 1993. LeT has infiltrated and built an extensive network of sleeper cells and associations with other jihadi groups in the sub-continent, which if not dealt with can and most probably will result in more Mumbai-style attacks. If we look at Lashkar's expenditure for the Mumbai attacks, the biggest operation Lashkar has planned and successfully executed, they spent around \$200,000 which when compared with LeT's overall annual budget (probably in the \$50 million or more range), it is evident that terrorism remains a low-cost endeavor.^[i] The group also has a robust above ground infrastructure that may be used as a first point of contact for would be jihadists.^[ii] It has a

sophisticated website named after its social wing- Jamaat-ud-Dawa and has an active presence on social media like Facebook and Twitter. Despite Lashkar being connected to various other attacks in Mumbai before November 26, 2008 as well as in other incidents across India which also involved a large number of casualties, the Mumbai attacks in 2008, which claimed 164 lives and injured 308, brought to attention Lashkar's global jihad ideology. For the first time after 9/11 foreign tourists, the Jewish community and luxury hotels were specifically targeted in Mumbai and the event forced national security authorities all across the world to rethink their preparedness as well as the possibility of another 'Mumbai style attack'. Also, since its formation Lashkar has shared very special relationship with Al-Qaida. It is widely believed that Osama Bin Laden was the one to provide seed funding for the establishment of Lashkar's headquarters in Muridke, Pakistan. The affiliation grew stronger with time especially after 9/11 when it became impossible for Lashkar to ignore global jihad. Dr. Bruce Hoffman, as RAND Director of the Washington office, said in an interview, "LeT is increasingly transforming itself from a localized group to one that is not only an al-Qaida surrogate but a global jihadist group. This is part of al-Qaida's strength: exploiting a group and getting them to buy into the global jihadist imperative." [iii] Al-Qaeda's core strategy aims at distracting and exhausting adversaries, creating divisions between counter-terrorism allies, forging close ties and assisting local affiliates, planning major international or global attacks and monitoring western security and defense systems. [iv] The only difference in Lashkar's core strategy is that the jihad they wage is directed towards India. Furthermore, not only they share a strong alliance but also similarities can be seen in their tactics and modus operandi. Many experts believe that the Mumbai attacks showed an uncanny resemblance to attacks carried out by Al- Qaida. The Mumbai gunmen were well-prepared and trained. The terrorists had done their reconnaissance and planning, which would have taken months to coordinate. They knew the terrain and locations. They had worked out the internal infrastructure and layout of the buildings and moved with stealth, combing their way through 10 locations and creating devastation along the way; [v] much like how Al-Qaida likes to conduct their operations.

LeT is growing a network of cells inside India

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Furthermore, the involvement of local Indians in both the attack planning as well as the operation itself suggest that LeT may have an expanding network of support cells in India. Indian authorities charged two detained Indian nationals—Fahim Arshad Ansari and Sabahuddin Ahmad— with preparing the maps and videotapes that aided the Lashkar militants to their targets during the Mumbai attack in February 2009. This marked the first official acknowledgement by the Indian government that Indians had participated in the attacks. [16] Furthermore, the intercepted communications between the Mumbai attackers and their controllers in Pakistan revealed that one of the controllers spoke Hindi. The Hindi-speaking Lashkar control was later identified by Indian intelligence agencies as Syed Zabiuddin Syed Zakiuddin Ansari from Maharashtra state in India. [17] His role in the control room during the attack raises the question of whether LeT has begun to concede to greater Indian involvement in its operations. The remainder of this paper will seek to resolve some of the issues raised by Mumbai attack and discern the factors that have fueled LeT's evolution leading into the attack.

Uniqueness

India is solving LeT terror threats now

IE 5/13 — Indian Express, 2015. (“Government successful in dealing with terror threats: Kiren Rijiju”, May 5th, 2015, Available Online at: <http://indianexpress.com/article/india/india-others/government-successful-in-dealing-with-terror-threats-kiren-rijiju/>)

Government on Wednesday said it has been successful in dealing with threats to coastal security in the recent past, but did not disclose details on security grounds. Replying to a question on terrorists sneaking through the sea route, Minister of State for Home Kiren Rijiju said “I can tell this august House that in the last 11 months, we have been successful in dealing with all the threats we have. “I don’t want to claim credit for that. It is the duty of the government to secure the country and we are committed to that.” He refused to divulge details on grounds of security. To a specific question regarding Mumbai, Rijiju said besides Lashkar-e-Taiba (LeT), “there are many other terrorist groups which are working on destroying the peace and tranquility of this country. They are a threat to our national security. “They have Indian affiliates also, which are banned under the relevant laws. All the steps are being taken and I am very confident that it is paying dividend also. There is no need to really worry and say that we are not taking enough steps to secure Mumbai.” He also listed out the steps to beef up security in the coastal areas of the country and added that whole security system has been “synergised”. To another question, Rijiju’s ministerial colleague Haribhai Parathibhai Chaudhary said the government receives intelligence inputs relating to attack plans by LeT on targets in the coastal areas from time to time and shares it with respective state governments. “However, further details in this matter cannot be disclosed in the interest of national security.” he said in a written reply. He was asked whether it is a fact that according to an intelligence report, Pakistan-based LeT terrorists might sneak into Mumbai via the sea route to carry out terror attacks.

We control uniqueness, India is preventing LeT attacks now but continued vigilance is essential

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India’s National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarjournal.com/printpdf

The most successful of all countermeasures though has been the arrest of key Lashkar-e-Taiba operatives. In 2013, Indian security officials arrested Abdul Karim Tunda- an expert bomb maker for the terrorist outfit. In 2012 approximately 61 operatives were killed in encounters with Indian security forces including Lashkar Division and District Commanders. Around 48 were arrested and 8 sleeper cells were neutralized. [xxiv] The arrests included key recruiter for Lashkar from India and Nepal Mohammad Omar Madni and Chief Coordinator for Jammu and Kashmir Manzoor. Looking at the numbers, it certainly seems like the intelligence community is successful in gathering critical information as well as preventing further attacks but in my opinion they still have a long way to go. In 2013 itself, there has been a record of 254 infiltration bids made by terrorists along the India- Pakistan border. In 133 cases, the terrorists were made to ‘return’ to Pakistan territory, while they successfully crossed over in 84 cases.[xxv] The operatives that crossed over in these 84 cases could well be planning another Mumbai.

India has prevented LeT attacks designed to crush the economy

Press Trust of India 12

Fake currency pushed at behest of Pak intel agencies, Lashkar-e-Taiba: Cops Delhi | Press Trust of India | Updated: April 15, 2012, <http://www.ndtv.com/delhi-news/fake-currency-pushed-at-behest-of-pak-intel-agencies-lashkar-e-taiba-cops-476737>

The Delhi police has told a court here that a consignment of over Rs. 1.18 crore fake currency notes, seized by it in January, had been sent from Pakistan at the behest of its intelligence agency and banned terror outfit Lashkar-e-Taiba (LeT) to destabilise the Indian economy. The police made this claim in its charge sheet, filed in the court of Chief Metropolitan Magistrate Vinod Yadav and indicting five Indians, arrested along with the fake currency note consignment on January 12. The seizure of the counterfeit notes with a face value of over Rs. 1.18 crore, concealed in 33 cloth bundles and loaded in two tempos, was made from near a godown at Dabri in West Delhi. The police has named Zeeshan Khan, a resident of Dabri, Ash Mohammad of Uttar Pradesh, Ghulam Ahmed, Yakoob Ali and Mohd Rafiq from Jammu and Kashmir as accused. All of them are presently in judicial custody.

Impacts

India/Pakistan War

Future LeT attacks are the most likely trigger for a nuclear war between India and Pakistan

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

A better understanding of LeT's evolution carries major implications for U.S. policy since the group poses major challenges to U.S. security interests. First and foremost, stability in South Asia is a key U.S. security interest and will continue to remain so as long as it remains entrenched in Afghanistan. LeT attacks have, on occasion, brought India and Pakistan to the brink of war and the group remains one of the most likely catalysts to war between the two nuclear-armed countries. At the very least, LeT acts as a major source of contention between the two countries and keeps Pakistan's national security establishment focused on India. This, in turn, distracts Pakistan from stabilizing its tribal regions on its border with Afghanistan complicating U.S. and NATO operations in that country. At worst, a future LeT attack could precipitate in a major war between the two countries that would carry the frightening risk of becoming the world's first nuclear war. Second, LeT has targeted U.S. forces in both Iraq and Afghanistan. While its foray into Iraq was relatively short-lived, since at least 2006, it has begun to actively support and participate in the insurgency in 2 Afghanistan. The group has been implicated in several attacks against U.S. forces in Afghanistan and coalition forces consider Lashkar militants among the most effective fighters in the region.¹ Though the group has had little impact on the insurgency thus far, its presence in Afghanistan will likely continue to expand.

Future LeT attack triggers nuclear war

Zarete 11 Juan Zarete, senior adviser at the Center for Strategic and International Studies, An alarming South Asia powder keg Sunday, February 20, 2011, <http://www.washingtonpost.com/wp-dyn/content/article/2011/02/18/AR2011021807465.html>

In 1914, a terrorist assassinated Archduke Franz Ferdinand in Sarajevo - unleashing geopolitical forces and World War I. Today, while the United States rightly worries about al-Qaeda targeting the homeland, the most dangerous threat may be another terrorist flash point on the horizon. Lashkar-i-Taiba holds the match that could spark a conflagration between nuclear-armed historic rivals India and Pakistan. Lashkar-i-Taiba is a Frankenstein's monster of the Pakistani government's creation 20 years ago. It has diverse financial networks and well-trained and well-armed cadres that have struck Indian targets from Mumbai to Kabul. It collaborates with the witches' brew of terrorist groups in Pakistan, including al-Qaeda, and has demonstrated global jihadist ambitions. It is merely a matter of time before Lashkar-i-Taiba attacks again. Significant terrorist attacks in India, against Parliament in 2001 and in Mumbai in 2008, brought India and Pakistan to the brink of war. The countries remain deeply distrustful of each other. Another major strike against Indian targets in today's tinderbox environment could lead to a broader, more devastating conflict. The United States should be directing political and diplomatic capital to prevent such a conflagration. The meeting between Indian and Pakistani officials in Bhutan this month - their first high-level sit-down since last summer - set the stage for restarting serious talks on the thorny issue of Kashmir. Washington has only so much time. Indian officials are increasingly dissatisfied with Pakistan's attempts to constrain Lashkar-i-Taiba and remain convinced that Pakistani intelligence supports the group. An Indian intelligence report concluded last year that Pakistan's Inter-Services Intelligence Directorate was involved in the 2008 Mumbai attacks, and late last year the Indian government raised security levels in anticipation of strikes. India is unlikely to show restraint in the event of another attack. Lashkar-i-Taiba may also feel emboldened since the assassination in early January of a moderate Punjabi governor muted Pakistani moderates and underscored the weakness of the government in Islamabad. The group does not want peace talks to resume, so it might act to derail progress. Elements of the group may see conflict with India as in their interest, especially after months of unrest in Kashmir. And the Pakistani government may not be able to control the monster it created. A war in South Asia would be disastrous not just for the United States. In addition to the human devastation, it would destroy efforts to bring stability to the region and to disrupt terrorist havens in western Pakistan. Many of the 140,000 Pakistani troops fighting militants in the west would be redeployed east to battle Indian ground forces. This would effectively convert tribal areas bordering Afghanistan into a playing field for militants. Worse, the Pakistani government might be induced to make common cause with Lashkar-i-Taiba, launching a proxy fight against

India. Such a war would also fuel even more destructive violent extremism within Pakistan. In the worst-case scenario, an attack could lead to a nuclear war between India and Pakistan. India's superior conventional forces threaten Pakistan, and Islamabad could resort to nuclear weapons were a serious conflict to erupt. Indeed, The Post reported that Pakistan's nuclear weapons and capabilities are set to surpass those of India.

A future LeT attack will force India to attack Pakistan destabilizing all of Southeast Asia

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Second, India will need to vastly improve its anti-terrorism measures as indicated by the effectiveness of the 2008 Mumbai attacks in which its security forces were clearly ill-prepared. India will need to invest heavily in its internal security including training, human capital, and equipment. Since stability in South Asia is a key U.S. priority, the U.S. might also assist India in these efforts through the provision of funds and anti-terrorism equipment and training. Domestic opinion in India may force India to respond much more harshly against Pakistan should a future devastating terrorist attack occur potentially destabilizing the whole of South Asia. Thus, it would be beneficial to both U.S. and Indian interest to limit the impact from a future mass casualty terrorist attack.

LeT terrorism is the unique threat of India Pakistan war risking a nuclear conflict

Blank 13 Jonah Blank1 The RAND Corporation Lashkar-e Taiba and the Threat to the United States of a Mumbai-Style Attack* Before the Committee on Homeland Security Subcommittee on Counterterrorism and Intelligence House of Representatives June 12, 2013 http://www.rand.org/content/dam/rand/pubs/testimonies/CT300/CT390/RAND_CT390.pdf

Fourth, LeT has a unique potential to precipitate a major war between India and Pakistan. Due to its traditional sponsorship by Pakistan's military, an attack by LeT is regarded by India as nearly synonymous with an attack by the state of Pakistan. At least twice in the recent past- after the 2008 Mumbai attack, and after the 2001 attack on India's Parliament- New Delhi came very close to launching a military strike across the border in response to an attack attributed to LeT. As the 1999 Indo-Pakistani combat at Kargil demonstrated, any serious military engagement between these two rivals runs the risk of nuclear escalation: During the Kargil episode, the Pakistani military began mobilizing the nation's nuclear assets without the knowledge of the civilian prime minister.¹⁰ Apart from the risk to tens of thousands of American citizens in India and Pakistan, the threat of a nuclear exchange anywhere in the world would obviously have a monumental impact on US strategic and economic interests.

Future terror attacks on India risk Indo Pak nuclear war

Markey 10 Daniel Markey is adjunct senior fellow for India, Pakistan, and South Asia at the Council on Foreign Relations, Terrorism and Indo-Pakistani Escalation, www.cfr.org/.../CPA_contingencymemo_6

India faces the real prospect of another major terrorist attack by Pakistan-based terrorist organizations in the near future. Unlike the aftermath of the November 2008 attack on Mumbai, in which 166 people died, Indian military restraint cannot be taken for granted if terrorists strike again. An Indian retaliatory strike against terrorist targets on Pakistani soil would raise Indo-Pakistani tensions and could even set off a spiral of violent escalation between the nuclear-armed rivals. Given Washington's effort to intensify pressure on al-Qaeda, the Taliban, and associated militants operating from Pakistani territory, increased tensions between India and Pakistan would harm U.S. interests even if New Delhi and Islamabad stop well short of the nuclear threshold because it would distract Pakistan from counterterrorism and counterinsurgency operations, jeopardize the U.S. mission in Afghanistan, and place new, extreme stresses on Islamabad.

Future LeT attack will lead to Indo-Pak war

Indian Express 15 3/6/15 Talking terms India and Pakistan have broken their silence. But it will require focused effort to break the impasse

<http://indianexpress.com/article/opinion/columns/talking-terms/>

The short-term purpose of these talks, it doesn't take much to see, isn't to solve intractable problems. Instead, the fact of diplomatic engagement adds a crisis-management cushion to the arsenals of both governments. For months now, Pakistan has feared that a terrorist attack against India could lead Prime Minister Narendra Modi to order military counter-strikes — catching it at a moment of special vulnerability, when a large part of its armed forces are tied down fighting terrorists in its northwest. Now, it hopes, Delhi will first address its problems through diplomatic channels, making rapid escalation of conflict less likely. For both countries, this is a pragmatic step. In the throes of severe economic challenges, India can ill afford a conflict, and near-bankrupt Pakistan can do so even less. But it would be dangerous to mistake this diplomatic breathing space for bedtime. Islamabad has scaled back jihadist operations in Kashmir, and placed restraints on organisations targeting India. It hasn't, however, dismantled the infrastructure of groups like the Lashkar-e-Toiba — leaving open the prospect of a future attack sparking off a crisis. The last two years have, notably, seen the first uptick of violence in Kashmir in over a decade. Delhi, for its part, has not unveiled just what it is willing to bring to the diplomatic table. The engagement of Kashmiri secessionists in dialogue, the demilitarisation of Siachen, and the settlement of the Sir Creek issue — the government's position on all these remains unclear. Barring focused effort, this latest engagement could also end in that depressing place both know so well — impasse.

Collapse Indian Economy

LeT attacks would target IT sector and crush India's economy

Saxena 5 Sudhir Saxena Institute for Defense Studies and Analysis, The rise of fiscal terror
March 25, 2005

http://www.idsa.in/idsastrategiccomments/Theriseoffiscalterror_SSaxena_250305.html

By targetting the IT industry, terrorists are revealing that the Indian economy may increasingly be their target. The elimination of the Delhi based Lashkar-e-Tayyiba (LeT) cell on 6 March 2005, could possibly indicate a new trend in Pakistan-based terror operations in India. Preliminary reports indicate that these terrorists were intending to strike against the Indian Military Academy (IMA) and the IT infrastructure especially in Bangalore using the network of the banned Students Islamic Movement of India (SIMI). A couple of issues emerge from the episode. First, is this an indication of widening of the area of operations by the LeT and similar groups away from Jammu and Kashmir and North India to relatively un-touched peninsular India? Secondly, do the plans of the captured terrorist suggest a change in the nature of targets from tactical to strategic, indicating increasing complexity of conceptual planning and hence institutional involvement? Jammu and Kashmir is undergoing a rather harsh and prolonged winter snow fall season. Like the tsunami,

unpredictable mother nature seems to have purged any possibility of an escalation of terrorist activity. Further, the Indo-Pak Composite Dialogue Process (CDP) process (agreed to in January 2004) has shrunk the political space for high-intensity, high-frequency terror operations. It is quite possible that the political and geo-climactic factors may have forced the terrorists to shift areas of operation southwards and if possible perform a repeat of the 12/13 attack on the Parliament. Though, there have been sporadic incidents involving J&K terrorist (like LeT) operating in areas like Hyderabad, the phenomenon could not be termed as wide spread, possibly due to logistical reasons. The planned future intentions of the LeT cell captured in Delhi may indicate just such a spread. The choice of targets certainly raises a new warning. It is known that the IT industry has been one of the success stories contributing to the growing vitality of the Indian economy. The amount of RDX captured (10.5 kgs along with detonators) provides clues to the nature and explosive power of the planned operation. However, a pertinent question needs to be answered - was blowing up few buildings of the Polaris company the only aim of the now failed operation, or was there a larger objective? A strike against a leading IT company and its aftermath would have no doubt lead to many tactical counter-operational and intelligence measures. But it would have also left a certain wariness in the investor market, particularly in the FDI sector, which is very sensitive about security of its assets give the experience in Iraq, Afghanistan and certain African locations. A planned strike at IMA, Dehradun is indicative of similar operations by the Zarqawi group in Iraq.

LeT attacks can collapse Indian democracy

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, **THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI**, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Since 2002, LeT has also begun to shift its focus increasingly into the Indian hinterland. Several factors may account for this. To begin with, the Indian government completed a 700- kilometer border fence along the Jammu and Kashmir border in 2004 making infiltration increasingly difficult. The Indian army claimed the fence reduced infiltration of militants by 80%.¹²³ In addition, militants stopped receiving cover fire and infiltration support from the Pakistani army following the ceasefire between the two countries in 2003. These factors have made it much more difficult to infiltrate into Kashmir and has made infiltration through transit by third countries more attractive which also increases access to the other parts of India. In addition, the predominantly Punjabi militants of LeT could likely blend in much easier in the larger and more cosmopolitan cities of the hinterland where they would not stand out among the more diverse population of these areas. Furthermore, the effectiveness of Fidayeen attacks in Kashmir may have also had diminishing returns as the Jammu and Kashmir Police developed more effective tactics to counter them. According to the Indian journalist Praveen Swami who has followed LeT closely for years, between 1999 and 2002, the worst years of LeT fidayeen attacks, less than 200 people died in them.¹²⁴ Finally, Kashmiris may simply have becoming increasingly exhausted from the militancy and bloodshed in the region and may have become harder to recruit for support. The 2002 Gujarat riots—in which Muslims bore the greater brunt of the bloodshed— generated willing volunteers for LeT and provided new opportunities to expand its network into India. During the riots, LeT put images of the riot victims on its website and called for jihad to avenge the bloodshed. Recruiting Muslims from outside Pakistan and Kashmir could also persuade Kashmir residents that they have no future in India.¹²⁵ By stoking the flames of Hindu-Muslim violence, LeT could discredit India as a democracy and reinforce its belief that Hindus cannot justly govern Muslims. Indeed, Hindu-Muslim violence tears at the very fabric of Indian society and has the potential to destabilize large swathes of India. In September of 2002, only a few months after the Gujarat riots ravaged the province, two heavily armed fighters carried out a fidayeen attack on the Akshardham temple in Gandhinagar, Gujarat. The attack turned into a nearly 14 hour hostage siege and the resulted in 33 dead including a commando and a state police officer along with 70 others wounded. Given the sophisticated nature of the attack and the heavy firepower the attackers carried, the attack contained the hallmarks of a typical LeT attack and made it unlikely the attack resulted as retaliation by local Muslims for the earlier communal violence—at least without external support.¹²⁶ Indeed, shortly following the Gujarat riots, Indian intelligence officials had estimated at least as many as 40 local Gujarati Muslims may have travelled to train in Lashkar camps as a result of the communal violence and LeT may have viewed an attack on the Akshardham temple attack as an opportunity to provoke further communal violence if they indeed did carry out the attack.¹²⁷ Given the timing and target of the attack, the objective was clearly to provoke Hindu-Muslim violence.

LeT seeks collapse of India

Karim 12 Maj Gen Afsir Karim War against Lashkar-e-Taiba

<http://www.indiandefencereview.com/news/war-against-lashkar-e-taiba/>

The LeT follows the radical Wahhabi ideology, which advocates global jihad against all infidels and moderate Muslims. Although the primary area of operations of the LeT in India is Kashmir, its main aim is the destabilisation of India and it has not confined its disruptive activities only to Jammu and Kashmir. The LeT has repeatedly claimed through its journals and websites that its main aim is to destroy the Indian republic and to annihilate Hinduism and Judaism.

Bioweapons

LeT has ability and will use bioweapons

Nanjappa 13

Vicky Nanjappa reporter for Rediff India Abroad, India faces real threat of biological warfare

January 01, 2013 <http://www.rediff.com/news/report/india-faces-real-threat-of-biological-warfare/20130101.htm>

As far as India is concerned, a possible bioterrorism tactic would appeal to Pakistan based Lashkar-e-Tayiba and other Kashmir centric groups. LeT is aware about the potential utility of bio weapon pathogen as it had observed the large-scale disruptions during the US anthrax letter cases. Also, it does not have to recruit or employ microbiologists or life scientists to carry out bioterrorist attacks. ¶As a matter of fact it has the most robust medical and path lab network in Pakistan and many of its activists are trained medical professionals. (eg Ad Dawa medical missions, Taiba Hospitals and Path Labs in Lahore, Karachi and number of mobile dispensaries). ¶Potentially the infrastructures and the manpower at the disposal of LeT/ Jamaat ud Dawa (JuD) can be modified to develop bio weapon pathogens without any large investments or at least spreading bioscare if the leadership wish to resort to the tactic.

LeT has ability and motive to use bioweapons

Nanjappa 9 Vicky Nanjappa reporter for Rediff India Abroad Bio weapons could be the next big terror threat: IB | March 27, 2009, <http://www.rediff.com/news/2009/mar/27bio-weapons-could-be-the-next-big-terror-threat-ib.htm>

Rogue outfits such as the Lashkar-e-Tayiba [Images] and the Al Qaeda are constantly planning various ways to attack India. While there were intelligence intercepts following the Mumbai [Images] attack that the next attack could be from the sea, reports now point to the fact that the next on the agenda of terror outfits would be biological warfare.¶ Intelligence Bureau officials say that the Inter-Services Intelligence has helped these terror outfits set up bases in Afghanistan way back in the late 1990s to build laboratories to manufacture biological weapons. ¶The first of such labs was established in 1998 in Kandahar where chemical and radiological weapons were being manufactured. ¶There is also a laboratory set up to manufacture biological weapons in Muzafarabad in Pakistan Occupied Kashmir. This lab which belongs to the Lashkar-e-Tayiba

is known as the electronics laboratory. Apart from manufacturing detonators for bombs and weapons, this laboratory has also a full fledged unit to manufacture biological weapons.¶ Several scientists were recruited exclusively for this purpose and have been working on the manufacture of these weapons since the past ten years. Intelligence Bureau sources they expect that terror groups would try and use biological warfare when all other means are exhausted.

LeT will use bioweapons

Chandran 05 D Suba Chandran Assistant Director, Institute of Peace and Conflict Studies, Looking Beyond Bio-Weapons and Bio-Terrorism in South Asia
<http://www.ipcs.org/article/terrorism/looking-beyond-bio-weapons-and-bio-terrorism-in-south-asia-1750.html>

Militant groups fighting for non-political purposes are more likely to use biological weapons in South Asia, especially the Lashkar-e-Toiba and the Jaish-e-Mohammad. Both these organizations are fighting for a religious cause and are not bothered about popular support in India. The radical right wing groups are more likely to use such weapons. The fact that the Aum Shinrikyo, a religious cult group, used biological weapons in the past need to be reckoned with. Al Qaeda search for chemical and biological weapons also need to be taken into account from this perspective.

Nuclear weapons

A close study of LeT reveals it has the ability and will to use nuclear weapons and will use any means to annihilate India

Sharma 12 Surinder Kumar Sharma consultant for Institute for Defense Studies and Analyses
LeT: Terror incorporated The Caliphate's Soldiers: The Lashkar-e-Tayyeba's Long War by Wilson John http://www.atimes.com/atimes/South_Asia/NB04Df04.html

LeT is likely the world's most powerful and resourceful multinational terror consultancy firm, keeping a rolodex of multinational terrorists, trainers and a massive support network. ¶ The author documents LeT's expansion extensively in the book. David Headley, a Pakistani-American who pleaded guilty in the US for his role in the Mumbai attacks, was working closely with the LeT commanders and facilitators in India, Pakistan, Bangladesh, Saudi Arabia, US and Muscat. Then, attacks were being planned on three different countries simultaneously - India, Bangladesh and Denmark - in a clear indication of the LeT's growing capability to organize transnational attacks independent of al-Qaeda networks. ¶ This book also details how the LeT has become a hub for training terrorists in using the latest weapons, explosives and communications devices. The emergence of the Salafi group in the Maldives has considerably helped the LeT expand its recruitment drive in the country. The author warns that what makes the LeT's growing influence on the Maldives more worrisome is the possibility that the group will use the island nation for

attacks against India, or block strategic sea communication lines in the Indian Ocean. ¶ The LeT has also been using Nepal as a transit point for terrorists travelling to and from Bangladesh and Pakistan while routing money and weapons for attacks in India. Instead of operating its own units in Nepal, as has done in the past, the ISI has been keen on establishing networks with Maoist and Muslim organizations for anti-India operations. ¶ A closer study of Hafiz Saeed's speeches and writings and other published works compiled by the author lay out a roadmap of global jihad with surprising clarity: once Kashmir is liberated, the group plans to work towards disintegrating India in whatever manner possible. ¶ Interestingly, the book also reveals that the LeT is not averse to using nuclear weapons to achieve its goals. LeT has not only trained cadres in chemical and radiological weapons (dirty bombs), it also has links with nuclear scientist Dr Abdul Qadeer Khan, who is a frequent visitor to the LeT's annual congregation in Muridke. ¶

LeT with nuclear weapons could not be deterred

Yingling 11 PAUL L. YINGLING: An Absence of Strategic Thinking – On the Multitude of Lessons Not Learned in Afghanistan, <http://cpost.uchicago.edu/blog/>

The future of Pakistan is more difficult to predict. It could limp along as a failing state, or suddenly fail with little warning. The West knows so little about the internal dynamics of the country that virtually any significant change will come as a surprise. Although the exact timing and extent of state failure in Pakistan is difficult to predict, the consequences of such failure are not. Partial or total state failure of a nuclear Pakistan would pose a grave threat to the United States. In such a scenario, the White House would not know who controlled Pakistan's nuclear arsenal. A nuclear-armed al Qaeda, Lashkar-e-Taiba, or other extremist group would be difficult if not impossible to deter.

AT: No ability for high tech weapons

LeT has ability to access science and technology and pull off complex attacks

Tellis 12

Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace, <http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

Seventh, LeT is an effective terrorist group that is adept at exploiting science and technology, extra-national social links, and state vulnerabilities in order to advance its political aims. The attacks in Mumbai unambiguously demonstrated LeT's sophistication in a way that few previous attacks had done. The meticulous planning, the enormous resources committed to a complex mission across great distances and long periods of time, and the burdens of a difficult sea-land operation all confirmed LeT's capacity to execute increasingly difficult terrorist attacks. This mission involved months of training in Pakistan and extensive reconnaissance of targets in Mumbai; after these tasks were complete, the terrorists left Karachi on local craft, hijacked a fishing trawler on the high seas, and, upon reaching India's territorial waters, transferred to inflatable

General threat evidence

LeT is a global threat that risks terror attacks on India and the United States

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,
<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

It is clear that after al-Qaeda, LeT is the most dangerous terrorist group operating in South Asia because of its: ¶ 1. Global vision and international ambitions ¶ 2. Distinct ideology that underwrites Islamic revanchism, justifying collaboration with other terrorist groups ¶ 3. Loyalty to Pakistan and willingness to protect its patron state against domestic opponents ¶ 4. Diversified network for mobilizing resources, promoting its international presence, and recruiting members, which minimizes its dependence on the state ¶ 5. Involvement in terrorism and social development concurrently, which limits Pakistan's ability to target the group even if it were so inclined ¶ 6. Cohesive and hierarchic organizational structure that is effective at both the conduct of violence and the delivery of social programs ¶ 7. Proficiency at exploiting science and technology, extra-national social links, and state vulnerabilities in order to advance its political aims ¶ LeT is a formidable and highly adaptable adversary with a genuinely global reach and the ability to grow roots and sustain operations in countries far removed from its primary theater of activity in South Asia. Though India's proximity to Pakistan has resulted in New Delhi absorbing most of the blows unleashed by LeT, the carnage in Mumbai demonstrates that the terrorism facing India is not simply a problem for New Delhi alone. An attack could even reach U.S. soil. ¶ The only reasonable objective for the United States is the permanent evisceration of LeT and other vicious South Asian terrorist groups—with Pakistani cooperation if possible, but without it if necessary.

The LeT is a massive global threat to India and the U.S.

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,
<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

¶ Given the interaction of LeT's ideology and its sources of Pakistani state support, it is not surprising that Hafiz Mohammed Saeed, LeT's emir, wholeheartedly endorsed the objective of destroying India writ large. Asserting in a 1999 interview that "jihad is not about Kashmir only," he went on to declare that "about fifteen years ago, people might have found it ridiculous if someone told them about the disintegration of the USSR. Today, I announce the break-up of India, Insha-Allah. We will not rest until the whole [of] India is dissolved into Pakistan." In a later 2001 statement he reaffirmed the proposition that "our struggle will continue even if Kashmir is liberated. We still have to take revenge for East Pakistan." In accordance with his declaration that Kashmir was merely a "gateway to capture India," Saeed then directed his LeT cadres to focus their attention on capturing the Muslim-dominated areas outside of Jammu and

Kashmir, such as Hyderabad, Junagadh, Munabao, and West Bengal, which he argued were forcibly occupied by India in 1947. ¶ **Judging from LeT's operational record, Saeed has been as good as his word.** The earliest LeT presence in India was detected in 1993, when a cohort of the group's Punjabi cadres crossed the Line of Control that separates the Pakistan-controlled from the Indian-controlled portions of Jammu and Kashmir. The organization's presence, however, was not publicly recognized until early 1996 when a group of LeT terrorists massacred sixteen Hindus in Barshalla in Kashmir's Doda District. Since then, hundreds of terrorist attacks involving LeT militants have occurred throughout India. LeT was implicated in plots like the terrorist attacks in New Delhi in October 2005; in Bangalore in December 2005; in Varanasi in March 2006; in Nagpur in June 2006; and in the July 2007 train bombings in Mumbai. ¶ ¶ Through these myriad efforts, **LeT has attempted**—consistent with both its own ideology and the interests of its state supporters—**to cripple India's economic growth, destroy national confidence in its political system, attack its open society, and provoke destabilizing communal rivalries.** All the while, the group has tried to send a message that India will remain an adversary because its successes make it a hindrance to LeT's larger cause. ¶ ¶ It took, however, the devastating November 2008 Mumbai attacks—a bloodbath that claimed the lives of over 150 people, including 26 foreigners of fifteen nationalities—for the international community to recognize that **LeT's ambitions, transcending India, were actually part of a larger war with the West and with liberal democracies more generally.** The barbarity in Mumbai thus represents the ugly face of **a brand of Islamist terrorism that threatens India, the United States and its allies, the larger international system, and, though often missed, Pakistan as well.** ¶ ¶ LeT's universal ambitions simply do not permit the group to confine itself only to South Asia. As Saeed has unequivocally declared, **LeT intends to “plant the flag of Islam in Washington, Tel Aviv and New Delhi.”** Such statements are not simply grandiose. That LeT has by no means restricted itself to keeping only India in its sights, even if it has focused on the latter disproportionately thus far—thanks to ISI objectives and support—is now acknowledged even by those who were initially skeptical of the group's larger ambitions. ¶ ¶ Like many other radical Islamist groups, **the LeT leadership has on numerous occasions singled out the Jewish community and the United States as being among the natural enemies of Islam.** Saeed warned, for example, that although his outfit may be presently consumed by the conflict with India, “Our struggle with the Jews is always there.” This enmity with the Jewish people is supposedly eternal and ordained by God himself. When Saeed was asked in the aftermath of the tragic 2005 earthquake in Pakistan whether then-president Pervez Musharraf's solicitation of aid from Israel was appropriate, he had no hesitation in declaring forthrightly that Pakistan “should not solicit help from Israel. It is the question of Muslim honor and self-respect. The Jews can never be our friends. This is stated by Allah.” ¶ ¶ This twisted worldview found grotesque expression during the November 2008 atrocities when **the group deliberately targeted the Jewish Chabad center** at Nariman House in Mumbai. Justifying this attack as reprisal for Israeli security cooperation with India, **LeT did not simply murder the Jewish hostages at Nariman House but humiliated and brutally tortured them before finally killing them** during the three-day siege. ¶ ¶ **Outside of al-Qaeda, LeT today therefore represents the most important South Asian terrorist group of “global reach.”** Indian intelligence currently estimates that LeT maintains some kind of terrorist presence in 21 countries worldwide with the intention of either supporting or participating in what Saeed has called the perpetual “jihad against the infidels.” LeT has declared that it would provide free training to any Muslim desirous of joining the global jihad, and the group has since delivered on that promise, as now corroborated by the testimony in the cases involving the “Virginia paintball jihad network.” In that instance, a group of ¶ extremists played paintball in anticipation of the launch of a global jihad against the West. After offering support to

LeT, several members of the group attended an LeT camp and received combat training to prepare for war against American soldiers in Afghanistan. Rather than being an isolated incident, the Virginia paintball jihad network is emblematic of LeT's larger ambitions. LeT's operatives have now been identified as engaging in:

- liaison and networking with numerous terrorist groups abroad, particularly in Central and Southeast Asia and the Middle East;
- the facilitation of terrorist acts, including in, but not restricted to, Chechnya and Iraq;
- fundraising in the Middle East, Europe, Australia, and the United States;
- the procurement of weapons, explosives, and communications equipment for terrorist operations from both the international arms markets and Pakistani state organizations such as the ISI;
- the recruitment of volunteers for suicidal missions in South Asia as well as the Middle East;
- the creation of sleeper cells for executing or supporting future terrorist acts in Europe, Australia, and likely the United States; and
- actual armed combat in at least India, Afghanistan, Pakistan, and Iraq.

Al Qaida Impact

India breaking the LeT is key to breaking Al Qaeda as well

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

India also proactively needs to end the cycle of radicalization and recruitment of youth by building strong confidence building programs and programs which counter jihadi propaganda. Further, India also needs to invest in technology which helps the security agencies combat terrorism and secure porous borders. Moreover, Lashkar has always shared a very special relationship with Al-Qaida and destroying Lashkar's strength is not only an important step for India's national security but also a step towards limiting Al-Qaida's brand name and the global jihad phenomenon. Hence, how the Indian authorities respond to Lashkar plays a very critical role.

AT: Empirically denied-Mubai

In a future attack India will be forced to retaliate—The restraint shown after Mubai won't happen again

Yusef 14 Moeed W. Yusuf is director of South Asia programs at the U.S. Institute of Peace. , Pakistan's Counterterrorism Challenge p, 16-7

Compounding these internal dynamics, Pakistan's delicate and dysfunctional relationship with its traditional rival, India, allows militant groups to register a significant threat to Pakistan's regional security. As was the case in the December 2001 attack on the Indian parliament by the Pakistan-based militant outfit Jaish-E-Mohammed (JeM), and again in the November 2008 Mumbai carnage orchestrated by Lashkar-e-Taiba (LeT), such episodes cause Pakistan to be the object of tremendous international condemnation.' They also risk escalating India-Pakistan tensions. Should a similar, future attack in India occur, some Indian strategists argue that the government in New Delhi will face too much public pressure to be able to exercise the restraint it showed following the 2008 Mumbai attacks.' Indeed, armed nonstate organizations based in Pakistan are in the unusual, and perilous, position of being able to undermine peace between two nuclear armed neighbors.

Future attacks will trigger war – Past restraint won't be repeated

Jan 11 Reza Jan was an Analyst and the Pakistan Team Lead for the Critical Threats Project at the American Enterprise Institute, Indo-Pak Talks Survive Mumbai Attack July 28, 2011, <http://www.criticalthreats.org/pakistan/jan-india-pakistan-talks-survive-mumbai-attack-july-28-2011>

Yesterday, the foreign ministers of Pakistan and India met as part of a series of talks between the two nuclear-armed neighbors five months after they officially resumed bilateral dialogue. Relations between the two countries appear to be well on the mend following the devastating 2008 Mumbai attacks in which 166 people were killed by the Pakistan-based terrorist organization, Lashkar-e-Taiba (LeT). The two sides discussed "confidence-building measures, including cross-border trade and visa protocols." Yet the talks could just as easily have been scuppered before they began by the recent terrorist attack in Mumbai. On July 13, a series of deadly bomb blasts ripped through India's financial capital, killing 23 people and wounding over 130. Unlike in the case of many previous attacks, however, there were no verbal barbs hurled across the border, no wild speculation from official sources regarding Pakistani involvement and no cancellation or delay of talks. Given the history of Indian reactions to terrorist attacks on its soil, this "non-reaction" is, by itself, noteworthy. Indian authorities and official functionaries have exhibited uncharacteristic restraint so far in declaring who they believe to have been behind the recent bomb attacks in Mumbai. Whereas in the past, authorities have been quick to point the finger at groups based in Pakistan, such as LeT, or Indian organizations with links to Pakistani terror groups, such as the Indian Mujahideen (IM), top officials in India have stated that they do not want to speculate on who might be responsible until investigations of the attacks are complete and more is known. Part of this hesitancy may be due to the fact that they are simply unsure of who is responsible. Monsoon rains on the night of the attack have complicated efforts to gather forensic evidence at the bomb sites. Then again, even though the pattern of the attack closely resembles that of previous attacks by IM, speculation to the fact remains muted. This is likely for two reasons. First, in the aftermath of the 2008 Mumbai attacks, any indicators that Pakistan or groups inside Pakistan had some role to play in a future attack would put tremendous pressure on the Indian government to take some sort of action. Indian Prime Minister Manmohan Singh and India's ruling Congress party were able to stave off such pressure in 2008 by a hair's breadth. They are highly unlikely to be able to do so a second time, especially if they are seen to be soft on a threat to which they themselves draw attention. Avoiding the pressure to take risky or uncomfortable action will only benefit the government.

U.S. Attack scenario

The LeT will use sleeper cells to attack the U.S.

<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

¶ Given the interaction of LeT's ideology and its sources of Pakistani state support, it is not surprising that Hafiz Mohammed Saeed, LeT's emir, wholeheartedly endorsed the objective of destroying India writ large. Asserting in a 1999 interview that "jihad is not about Kashmir only," he went on to declare that "about fifteen years ago, people might have found it ridiculous if someone told them about the disintegration of the USSR. Today, I announce the break-up of India, Insha-Allah. We will not rest until the whole [of] India is dissolved into Pakistan." In a later 2001 statement he reaffirmed the proposition that "our struggle will continue even if Kashmir is liberated. We still have to take revenge for East Pakistan." In accordance with his declaration that Kashmir was merely a "gateway to capture India," Saeed then directed his LeT cadres to focus their attention on capturing the Muslim-dominated areas outside of Jammu and Kashmir, such as Hyderabad, Junagadh, Munabao, and West Bengal, which he argued were forcibly occupied by India in 1947.¶ ¶ Judging from LeT's operational record, Saeed has been as good as his word. The earliest LeT presence in India was detected in 1993, when a cohort of the group's Punjabi cadres crossed the Line of Control that separates the Pakistan-controlled from the Indian-controlled portions of Jammu and Kashmir. The organization's presence, however, was not publicly recognized until early 1996 when a group of LeT terrorists massacred sixteen Hindus in Barshalla in Kashmir's Doda District. Since then, hundreds of terrorist attacks involving LeT militants have occurred throughout India. LeT was implicated in plots like the terrorist attacks in New Delhi in October 2005; in Bangalore in December 2005; in Varanasi in March 2006; in Nagpur in June 2006; and in the July 2007 train bombings in Mumbai.¶ ¶ Through these myriad efforts, LeT has attempted—consistent with both its own ideology and the interests of its state supporters—to cripple India's economic growth, destroy national confidence in its political system, attack its open society, and provoke destabilizing communal rivalries. All the while, the group has tried to send a message that India will remain an adversary because its successes make it a hindrance to LeT's larger cause.¶ ¶ It took, however, the devastating November 2008 Mumbai attacks—a bloodbath that claimed the lives of over 150 people, including 26 foreigners of fifteen nationalities—for the international community to recognize that **LeT's ambitions, transcending India, were actually part of a larger war with the West and with liberal democracies more generally.** The barbarity in Mumbai thus represents the ugly face of **a brand of Islamist terrorism that threatens India, the United States and its allies, the larger international system, and, though often missed, Pakistan as well.**¶¶¶ LeT's universal ambitions simply do not permit the group to confine itself only to South Asia. As Saeed has unequivocally declared, **LeT intends to "plant the flag of Islam in Washington, Tel Aviv and New Delhi."** Such statements are not simply grandiose. That LeT has by no means restricted itself to keeping only India in its sights, even if it has focused on the latter disproportionately thus far—thanks to ISI objectives and support—is now acknowledged even by those who were initially skeptical of the group's larger ambitions.¶¶¶ Like many other radical Islamist groups, **the LeT leadership has on numerous occasions singled out the Jewish community and the United States as being among the natural enemies of Islam.** Saeed warned, for example, that although his outfit may be presently consumed by the conflict with India, "Our struggle with the Jews is always there." This enmity with the Jewish people is supposedly eternal and ordained by God himself. When Saeed was asked in the aftermath of the tragic 2005 earthquake in Pakistan whether then-president Pervez Musharraf's solicitation of aid

from Israel was appropriate, he had no hesitation in declaring forthrightly that Pakistan “should not solicit help from Israel. It is the question of Muslim honor and self-respect. The Jews can never be our friends. This is stated by Allah.”¶¶ This twisted worldview found grotesque expression during the November 2008 atrocities when the group deliberately targeted the Jewish Chabad center at Nariman House in Mumbai. Justifying this attack as reprisal for Israeli security cooperation with India, LeT did not simply murder the Jewish hostages at Nariman House but humiliated and brutally tortured them before finally killing them during the three-day siege.¶ ¶ Outside of al-Qaeda, LeT today therefore represents the most important South Asian terrorist group of “global reach.” Indian intelligence currently estimates that LeT maintains some kind of terrorist presence in 21 countries worldwide with the intention of either supporting or participating in what Saeed has called the perpetual “jihad against the infidels.” LeT has declared that it would provide free training to any Muslim desirous of joining the global jihad, and the group has since delivered on that promise, as now corroborated by the testimony in the cases involving the “Virginia paintball jihad network.” In that instance, a group of ¶ extremists played paintball in anticipation of the launch of a global jihad against the West. After offering support to LeT, several members of the group attended an LeT camp and received combat training to prepare for war against American soldiers in Afghanistan. Rather than being an isolated incident, the Virginia paintball jihad network is emblematic of LeT’s larger ambitions. LeT’s operatives have now been identified as engaging in: •liaison and networking with numerous terrorist groups abroad, particularly in Central and Southeast Asia and the Middle East; ¶ ¶ •the facilitation of terrorist acts, including in, but not restricted to, Chechnya and Iraq; ¶ ¶ •fundraising in the Middle East, Europe, Australia, and the United States; ¶ •the procurement of weapons, explosives, and communications equipment for terrorist operations from both the international arms markets and Pakistani state organizations such as the ISI; ¶ ¶ •the recruitment of volunteers for suicidal missions in South Asia as well as the Middle East; ¶ ¶ •the creation of sleeper cells for executing or supporting future terrorist acts in Europe, Australia, and likely the United States; and ¶ ¶ actual armed combat in at least India, Afghanistan, Pakistan, and Iraq.

Broad surveillance under patriot has been key to stopping LeT attacks on the U.S.

Jessica Zuckerman is a Research Associate in the Allison Center for Foreign Policy Studies at The Heritage Foundation. Fifty Terror Plots Foiled Since 9/11: The Homegrown Threat and the Long War on Terrorism. Fifty Terror Plots Foiled Since 9/11: The Homegrown Threat and the Long War on Terrorism, <http://www.heritage.org/research/reports/2012/04/fifty-terror-plots-foiled-since-9-11-the-homegrown-threat-and-the-long-war-on-terrorism?lfa=Protect-America%2CProtect-America%2CProtect-America%2CProtect-America> In 2007, The Heritage Foundation became the first and only organization to track thwarted terrorist attacks against the United States. That year, Heritage reported that at least 19 publicly known terrorist attacks against the United States had been foiled since 9/11. Today, that number stands at 50. The fact that the United States has not suffered a large-scale attack since 9/11 speaks to the country’s counterterrorism successes. But, one year after the death of Osama bin Laden, the long war on terrorism is far from over. Reviewing the terrorist plots that have been foiled since 9/11 can provide valuable information for understanding the nature of the threat, as well as best practices for preventing the next attack. The U.S. must also be ready to adapt its security strategies—such as to counter terror attacks by an increasing number of homegrown terrorists. After the death of Osama bin Laden on May 2, 2011, many worried that al-Qaeda would try to carry out another large-scale attack against the United States as an act of revenge. Indeed since bin Laden’s death, at least nine publicly known Islamist-inspired terror plots against the United States have been foiled, bringing the total number of foiled plots since 9/11 to at least 50. Ultimately, none of the plots foiled since bin Laden’s death proved to be of the scale that many feared, with the vast majority of the plots lacking major international connections. Instead, many of these plots could be categorized as homegrown terror plots—planned by American citizens, legal permanent residents, or visitors radicalized predominately in the United States.[1] Combating this continued threat of homegrown terrorism requires not only continued reliance on existing counterterrorism and intelligence tools, such as the PATRIOT Act, but also enhancing cooperation among federal, state, and local authorities as well as

mutual trust and partnerships with Muslim communities throughout the United States. Likewise, the Department of Homeland Security (DHS) and Congress must continue to plug gaps to halt terrorist travel, and create a lawful detainment framework for the incapacitation and interrogation of suspected terrorists. Continued Threat of Homegrown Terrorism Since 9/11, terrorist networks have been dismantled, training camps have been dispersed, and the terrorist leadership largely decimated. Internationally, al-Qaeda has become more decentralized, leading to a greater dependence on its affiliates and allies. At the same time, since increased domestic security has made it harder for terrorists to plan and carry out attacks, terrorists must increase their baseline skills and capabilities needed for a successful attack in the United States.[2] With the global operating environment for terrorist networks having become increasingly hostile, homegrown terrorism has become more appealing to al-Qaeda and other terrorist networks. Homegrown terrorist actors can often bridge the divide between the United States and the other regions of the world in which terrorist networks operate, frequently possessing the cultural and linguistic skills to easily move between the two. It is this "duality" for instance, that served Najibullah Zazi in his attempt to bomb the New York City subway system, with Zazi "being able to operate with facility in environments as starkly different as New York and Peshawar." [3] The value for terrorist networks also often lies in the ability of homegrown terrorists to more easily travel back and forth and work within the United States without raising suspicion. Of course, it is also these same abilities that can make it more challenging for U.S. intelligence and law enforcement to detect homegrown terrorist plots. Similarly, difficulties in detecting attempted homegrown attacks are also present in the fact that homegrown terror plots tend to involve significantly fewer actors and connections to terrorist networks at home and abroad. The frequency of lone wolf actors, radicalized independent of direct connections to terrorist networks either through the Internet or social circles, can further elevate these challenges. Yet, lacking the support of broader terrorist networks, violent extremists may lack a profound understanding of such specialized skills as bomb making, as well as financing, support networks, and training, causing them to be reluctant or even unable to carry out a large-scale, highly destructive attack independently.[4] This same lack of training and resources may also open up homegrown terror plots for detection by U.S. intelligence and law enforcement by affording more room for error on the part of the terrorist. Ultimately, while some signals of homegrown terror plots have gone unnoticed—most notably in the cases of Major Nidal Hasan's 2009 deadly attack on Fort Hood, the near-successful attempts in 2009 of Christmas Day bomber Umar Farouk Abdulmutallab, and in 2010 of Times Square bomber Faisal Shahzad—the vast majority of attempted attacks against the United States have been thwarted in their early stages through the concerted efforts of U.S. law enforcement and intelligence. For the individual homegrown terrorist, personal motives may vary greatly. It could be a desire for collective revenge against the U.S. for the purported "war on Islam," poverty or social alienation, or brainwashing. There is no one path to radicalization. As DHS's Office of Intelligence and Analysis has indicated, motives and paths to radicalization can vary significantly depending on one's ideology and religious beliefs, geographic location, or socioeconomic condition.[5] Nevertheless, trends do seem to exist among those attempted homegrown terror plots thwarted since 9/11, most significantly a seeming aversion to suicide or martyrdom.[6] 50 Plots Foiled Since 9/11 Compiled by The Heritage Foundation since 2007, the following list outlines those publicly known terrorist plots against the U.S. that have been foiled since 9/11.[7] Based on Heritage's research, at least 50 publicly known Islamist-inspired terror plots targeting the United States have been foiled since 9/11. Of these, at least 42 could be considered homegrown terror plots. While three of the 50 known plots were foiled by luck or the quick action of the American public, the remaining 47 were thwarted due to the concerted efforts of intelligence and law enforcement. 1. Richard Reid—December 2001. A British citizen and self-professed follower of Osama bin Laden who trained in Afghanistan, Richard Reid hid explosives inside his shoes before boarding a flight from Paris to Miami on which he attempted to light the fuse with a match. Reid was caught in the act and apprehended aboard the plane by passengers and flight attendants. FBI officials took Reid into custody after the plane made an emergency landing at Boston's Logan International Airport.[8] In 2003, Reid was found guilty on charges of terrorism, and a U.S. federal court sentenced him to life in prison.[9] He is currently incarcerated at a federal maximum-security prison in Colorado. Saajid Badat, a supporter to Reid, has been sentenced to 13 years in jail for planning to blow up a passenger plane. The 26-year-old, a religious teacher from Gloucester, England, was sentenced after he admitted conspiring with fellow Briton Reid. Badat pled guilty in February 2005 to the plot to blow up the transatlantic flight on its way to the U.S. in 2001.[10] 2. Jose Padilla—May 2002. U.S. officials arrested Jose Padilla in May 2002 at Chicago's O'Hare airport as he returned to the United States from Pakistan, where he met with 9/11 mastermind Khalid Sheikh Mohammed and received al-Qaeda training and instructions.[11] Upon his arrest, he was initially charged as an enemy combatant, and for planning to use a dirty bomb (an explosive laced with radioactive material) in an attack in the U.S.[12] Along with Padilla, Adham Amin Hassoun and Kifah Wael Jayyousi were convicted in August 2007 of terrorism conspiracy and material support. It was found that the men supported cells that sent recruits, money, and supplies to Islamic extremists worldwide, including al-Qaeda members. Hassoun was the recruiter and Jayyousi served as a financier and propagandist in the cell. Before his conviction, Padilla had brought a case against the federal government claiming that he had been denied the right of habeas corpus (the right of an individual to petition his unlawful imprisonment). In a five-to-four decision, the U.S. Supreme Court found that the case against him had been filed improperly.[13] In 2005, the government indicted Padilla for conspiring against the U.S. with Islamic terrorist groups. In August 2007, Padilla was found guilty by a civilian jury after a three-month trial. He was later sentenced by the U.S. District Court for the Southern District of Florida to 17 years and four months in prison.[14] In September 2011, an appellate court ruling deemed Padilla's original sentence to be too lenient.[15] Padilla is being held at the same penitentiary as Richard Reid and is awaiting resentencing. 3. Lackawanna Six—September 2002. When the FBI arrested Sahim Alwan, Yahya Goba, Yasein Taher, Faysal Galab, Shafal Mosed, and Mukhtar al-Bakri in Upstate New York, the press dubbed them the "Lackawanna Six," the "Buffalo Six," and the "Buffalo Cell." Five of the six had been born and raised in Lackawanna, New York.[16] All six are American citizens of Yemeni descent, and stated that they were going to Pakistan to attend a religious camp, but attended an al-Qaeda training camp in Afghanistan instead. The six men pled guilty in 2003 to providing support to al-Qaeda. Goba and al-Bakri were sentenced to 10 years in prison, Taher and Mosed to eight years, Alwan to nine and a half years, and Galab to seven years.[17] Goba's sentence was later reduced to nine years after he, Alwan, and Taher testified at a Guantanamo Bay military tribunal in the case against Osama bin Laden's chief propagandist, Ali Hamza al-Bahlul.[18] Recent reports indicate that Jaber Elbaneh, one of the FBI's most wanted and often considered to be a seventh member of the Lackawanna cell, has been captured in Yemen. It remains to be seen whether he will be tried in the U.S., since the U.S. does not have an extradition treaty with Yemen.[19] 4. Uzair and Saifullah Paracha—March 2003. Uzair Paracha, a Pakistani citizen with permanent residency status in the U.S., was arrested in March 2003 and charged with five counts of providing material and financial support to al-Qaeda. Uzair attempted to help another Pakistani, Majid Khan, an al-Qaeda operative, gain access to the United States via immigration fraud. Khan is said to have been in contact with 9/11 mastermind Khalid Sheikh Mohammed and planned to bomb underground storage tanks at Maryland gas stations.[20] Uzair was convicted and sentenced to 30 years in prison. Saifullah Paracha, Uzair's father, a 64-year-old citizen of Pakistan and resident alien of the U.S., is currently being held at Guantanamo Bay awaiting trial. Paracha was arrested in Bangkok, Thailand, in July 8, 2003, through the efforts of the FBI and information provided by his son. He is believed to have had close ties to Khalid Sheikh Mohammed, and Mohammed's nephew Ammar al-Baluchi. Saifullah is said to have used his international business connections to help al-Qaeda procure chemical and biological explosives and assist in their shipment to the U.S., along with the shipment of ready-made explosives.[21] 5. Iyman Faris—May 2003. Iyman Faris is a naturalized U.S. citizen, originally from Kashmir, who was living in Columbus, Ohio. He was arrested for conspiring to use blowtorches to collapse the Brooklyn Bridge, a plot devised after meetings with al-Qaeda leadership, including Khalid Sheikh Mohammed.[22] The New York City Police Department learned of the plot and increased police surveillance around the bridge. Faced with the additional security, Faris and his superiors called off the attack.[23] Faris pled guilty to conspiracy and providing material support to al-Qaeda and was later sentenced in federal district court to 20 years in prison, the maximum allowed under his plea agreement.[24] 6. Ahmed Omar Abu Ali—June 2003. Ahmed Omar Abu Ali is an American citizen of Jordanian descent who was arrested in Saudi Arabia on charges that he conspired to kill President George W. Bush, hijack airplanes, and provide support to al-Qaeda. He was arrested while attending Medina University, where he had joined an al-Qaeda cell. His plans, according to authorities, were to kill President Bush and then establish an al-Qaeda cell in the United States, with himself as the head.[25] He was convicted by an American court on November 22, 2005, and sentenced to life in prison on July 27, 2009, overturning a 2006 sentence of 30 years that was ruled to be too lenient.[26] 7. Virginia Jihad Network—June 2003. Eleven men were arrested in Alexandria, Virginia, for weapons counts and for violating the Neutrality Acts, which prohibit U.S. citizens and residents from attacking countries with which the United States is at peace. Four of the 11 men pled guilty. Upon further investigation, the remaining seven were indicted on additional charges of conspiring to support terrorist organizations. They were found to have connections with al-Qaeda, the Taliban, and Lashkar-e-Tayyiba, a terrorist organization that targets the Indian government. The authorities stated that the Virginia men had used paintball games to train and prepare for battle. The group had also acquired surveillance and night vision equipment and wireless video cameras.[27] Two more men were later indicted in the plot: Ali al-Timimi, the group's spiritual leader, and Ali Asad Chandia. Ali al-Timimi was found guilty of soliciting individuals to assault the United States and was sentenced to life in prison. Ali Asad Chandia received 15 years for supporting Lashkar-e-Tayyiba.[28] Randall Todd Royer, Ibrahim al-Hamdi, Yong Ki Kwon, Khwaja Mahmood Hasan, Muhammad Aatique, and Donald T. Surratt pled guilty and were sentenced to prison terms ranging from three years and 10 months to 20 years. Masoud Khan, Seifullah Chapman, and Hammad Abdur-Raheem were found guilty and later sentenced to prison terms ranging from 52 months to life.[29] Both Caliph Basha Ibn Abdur-Raheem and Sabri Benkhala were acquitted at trial.[30] 8. Nuradin M. Abdi—November 2003. Nuradin M. Abdi, a Somali citizen living in Columbus, Ohio, was arrested and charged in a plot to bomb a local shopping mall. Abdi was an associate of convicted terrorists Christopher Paul and Iyman Faris and admitted to conspiring with the two to provide material support to terrorists. Following his arrest, Abdi admitted to traveling overseas to seek admittance to terrorist training camps, as well as meeting with a Somali warlord associated with Islamists. Abdi has since pled guilty to conspiracy to provide material support to terrorists, one of the four counts for which he was indicted. He was subsequently sentenced to 10 years in jail per the terms of a plea agreement.[31] 9. Dhiren Barot—August 2004. Seven members of a terrorist cell led by Dhiren Barot were arrested for plotting to attack the New York Stock Exchange and other financial institutions in New York, Washington, D.C., and Newark, New Jersey. They were later accused of planning attacks in England. The plots included a "memorable black day of terror" that would have included detonating a dirty bomb. A July 2004 police raid on Barot's house in Pakistan yielded a number of incriminating files on a laptop computer, including instructions for building car bombs.[32] Barot pled guilty and was convicted in the United Kingdom for conspiracy to commit mass murder and sentenced to 40 years.[33] However, in May 2007, his sentence was reduced to 30 years.[34] His seven co-conspirators were sentenced to terms ranging from 15 to 26 years on related charges of conspiracy to commit murder and conspiracy to cause explosion.[35] 10. James Elshafay and Shahwar Matin Siraj—August 2004. James Elshafay and Shahwar Matin Siraj, both reportedly self-radicalized, were arrested for plotting to bomb a subway station near Madison Square Garden in New York City before the Republican National Convention.[36] An undercover detective from the New York City Police Department's Intelligence Division infiltrated the group, providing information to authorities, and later testified against Elshafay and Siraj.[37] Siraj was convicted and sentenced to 30 years in prison. Elshafay, a U.S. citizen, pled guilty and received a lighter, five-year sentence for testifying against his co-conspirator.[38] 11. Yassin Aref and Mohammad Hossain—August 2004. Two leaders of a mosque in Albany, New York, were charged with plotting to purchase a shoulder-fired grenade launcher to assassinate a Pakistani diplomat.[39] An investigation by the FBI, the Bureau of Alcohol, Tobacco, Firearms and Explosives, and local police contributed to the arrest. With the help of an informant, the FBI set up a sting that lured Mohammad Hossain into a fake terrorist conspiracy. Hossain brought Yassin Aref, a Kurdish refugee, as a witness. The informant offered details of a fake terrorist plot, claiming that he needed the missiles to murder a Pakistani diplomat in New York City. Both Aref and Hossain agreed to help.[40] Aref and Hossain were found guilty of money laundering and conspiracy to conceal material support for terrorism and were sentenced to 15 years in prison.[41] 12. Hamid Hayat—June 2005. Hamid Hayat, a Pakistani immigrant, was arrested in Lodi, California, after allegedly lying to the FBI about his attendance at an Islamic terrorist training camp in Pakistan. Hamid was found guilty of providing himself as "material support" to terrorists and three counts of providing false statements to the FBI.[42] In interviews with the FBI, he stated (correctly) that he specifically requested to come to the United States after receiving training in order to carry out jihad.[43] He was sentenced to 24 years in prison.[44] 13. Levar Haley Washington, Gregory Vernon Patterson, Hammad Riaz Samana, and Kevin James—August 2005. The members of the group were arrested in Los Angeles and charged with conspiring to attack National Guard facilities, synagogues, and other targets in the Los Angeles area. Kevin James allegedly founded Jamiyyat ul-Islam Is-Saheeh (JIS), a radical Islamic prison group, and converted Levar Washington and others to the group's mission. The JIS allegedly planned to finance its operations by robbing gas stations. After Washington and Patterson were arrested for robbery, police and federal agents began a terrorist investigation, and a search of Washington's apartment revealed a target list.[45] James and Washington pled guilty in December 2007. James was sentenced to 16 years in prison and Washington to 22 years. Patterson received 151 months, while Samana was found unfit to stand trial and was initially detained in a federal prison mental facility. He was later sentenced to 70 months in jail.[46] 14. Michael C. Reynolds—December 2005. Michael C. Reynolds was arrested by the FBI and charged with involvement in a plot to blow up a Wyoming natural gas refinery; the Transcontinental Pipeline, a natural-gas pipeline from the Gulf Coast to New York and New Jersey; and a Standard Oil refinery in New Jersey.[47] He was arrested while trying to pick up a \$40,000 payment for

planning the attack.[48] Shannen Rossmiller, his purported contact, was a Montana judge and private citizen working with the FBI. Rossmiller posed as a jihadist, tricking Reynolds into revealing his plan. The FBI later found explosives in a storage locker in Reynolds's hometown of Wilkes-Barre, Pennsylvania.[49] Reynolds claimed that he was doing much the same as Rossmiller, and was working as a private citizen to find terrorists.[50] Reynolds was convicted of providing material support to terrorists, soliciting a crime of violence, unlawful distribution of explosives, and unlawful possession of a hand grenade. He was sentenced to 30 years in prison.[51] 15. Mohammad Zaki Amawi, Marwan Othman El-Hindi, and Zand Wassim Mazloum—February 2006. Amawi, El-Hindi, and Mazloum were arrested in Toledo, Ohio, for conspiring to kill people outside the United States, including U.S. Armed Forces personnel serving in Iraq.[52] The men also conspired to train and arm for a violent jihad against the United States, both domestically and abroad.[53] Training involved use of materials including those found on secure and exclusive jihadist websites, downloaded and copied training videos, and materials for jihad training sessions. The men also were found to have provided material support to terrorist organizations and to have verbally threatened attacks on President George W. Bush.[54] The investigation was begun with the help of an informant who was approached to help train the group.[55] In June 2008, the three men were convicted of conspiring to commit acts of terrorism against Americans overseas, including U.S. military personnel in Iraq, and other terrorism-related violations. Amawi was sentenced to 20 years, El-Hindi to 13 years, and Mazloum to approximately eight years.[56] 16. Syed Haris Ahmed and Ehsanul Islam Sadeque—April 2006. Ahmed and Sadeque, from Atlanta, Georgia, were accused of conspiracy, having discussed terrorist targets with alleged terrorist organizations. They allegedly met with Islamic extremists in the U.S. and gathered video surveillance of potential targets in the Washington, D.C., area, including the U.S. Capitol and the World Bank headquarters, and sent the videos to a London Islamist group. Ahmed is said also to have traveled to Pakistan with the goal of joining Lashkar-e-Tayyiba.[57] Both men were indicted for providing material support to terrorist organizations and pled not guilty.[58] In June 2009, a federal district judge found Ahmed "guilty of conspiring to provide material support to terrorists here and overseas." [59] Ahmed was subsequently sentenced to 13 years in jail. Sadeque was also found guilty and sentenced to 17 years.[60] 17. Narseal Batiste, Patrick Abraham, Stanley Grant Phanor, Naudimar Herrera, Burson Augustin, Lyglenson Lemorin, and Rotschild Augustine—June 2006. Seven men were arrested in Miami and Atlanta for plotting to blow up the Sears Tower in Chicago, FBI offices, and other government buildings around the country. The arrests resulted from an investigation involving an FBI informant. Allegedly, Batiste was the leader of the group and first suggested attacking the Sears Tower in December 2005.[61] All of the suspects pled not guilty. On December 13, 2007, Lemorin was acquitted of all charges, but the jury failed to reach a verdict on the other six.[62] The second trial ended in a mistrial in April 2008.[63] In the third trial, the jury convicted five of the men on multiple conspiracy charges and acquitted Herrera on all counts. On November 20, 2009, the five were sentenced to prison terms ranging from six to 13.5 years, with Batiste receiving the longest sentence.[64] 18. Assem Hammoud—July 2006. Conducting online surveillance of chat rooms, the FBI discovered a plot to attack underground transit links between New York City and New Jersey. Eight suspects, including Assem Hammoud, and al-Qaeda loyalist living in Lebanon, were arrested for plotting to bomb New York City train tunnels. Hammoud, a self-proclaimed operative for al-Qaeda, admitted to the plot.[65] He was held by Lebanese authorities but was not extradited because the U.S. does not have an extradition treaty with Lebanon. In June 2008, Lebanese authorities released him on bail.[66] In February 2012, Hammoud was convicted in a Lebanese court. He was sentenced to two years in prison, which he had already served.[67] 19. Liquid Explosives Plot—August 2006. British law enforcement stopped a terrorist plot to blow up 10 U.S.-bound commercial airliners with liquid explosives.[68] Twenty-four suspects were arrested in the London area. The style of the plot raised speculation that al-Qaeda was behind it, but no concrete evidence has established a link. The United Kingdom initially indicted 15 of the 24 arrested individuals on charges ranging from conspiring to commit murder to planning to commit terrorist acts.[69] Eventually, in April 2008, only eight men were brought to trial. In September, the jury found none of the defendants guilty of conspiring to target aircraft, but three guilty of conspiracy to commit murder.[70] The jury was unable to reach verdicts on four of the men. One man was found not guilty on all counts.[71] 20. Derrick Shareef—December 2006. Derrick Shareef was arrested on charges of planning to set off hand grenades in a shopping mall outside Chicago. Shareef reportedly acted alone and was arrested after meeting with an undercover Joint Terrorism Task Force agent. FBI reports indicated that the mall was one of several potential targets, including courthouses, city halls, and government facilities. Shareef, however, settled on attacking a mall in the days immediately preceding Christmas because he believed it would cause the greatest amount of chaos and damage.[72] Shareef was also found to have connections to convicted terrorist Hassan Agujahad, who was charged with attempted use of a weapon of mass destruction and later sentenced to 35 years in prison.[73] 21. Khalid Sheikh Mohammed—March 2007. Khalid Sheikh Mohammed, captured in Pakistan in 2003, was involved in a number of terrorist plots and is one of the most senior bin Laden operatives ever captured.[74] He is being held at the U.S. military detention facility in Guantanamo Bay. In March 2007, Mohammed admitted to helping plan, organize, and run the 9/11 attacks. He also claimed responsibility for planning the 1993 bombing of the World Trade Center and the 2002 bombings of nightclubs in Bali and a Kenyan hotel. He has stated that he was involved in the decapitation of Wall Street Journal reporter Daniel Pearl and took responsibility for helping to plan the failed shoe-bomb attack by Richard Reid, along with plots to attack Heathrow Airport, Canary Wharf, Big Ben, various targets in Israel, the Panama Canal, Los Angeles, Chicago, the Empire State building, and U.S. nuclear power stations. He had also plotted to assassinate Pope John Paul II and former President Bill Clinton. In December 2008, Mohammed and his four co-defendants (Ramzi Binalshibh, Mustafa Ahmad al-Hawsawi, Ali Abd al-Aziz Ali, and Walid Bin Attash) told the military tribunal judge that they wanted to confess and pleaded guilty to all charges.[75] The judge has approved the guilty plea of Mohammed and two co-defendants but has required mental competency hearings before allowing the other two conspirators to plead guilty. In November 2009, U.S. Attorney General Eric Holder announced that Mohammed would be relocated to the United States to face a civilian trial in the U.S. District Court for the Southern District of New York.[76] That decision has now been reversed and the Administration announced that Khalid Sheikh Mohammed and the other Guantanamo Bay detainees would be prosecuted in military tribunals at Guantanamo.[77] The date for the arraignment of Khalid Sheikh Mohammed and his co-defendants has been set for May 5, 2012, beginning the long-awaited legal proceedings for the five men.[78] 22. Fort Dix Plot—May 2007. Six men were arrested in a plot to attack Fort Dix, a U.S. Army post in New Jersey. The plan involved using assault rifles and grenades to attack and kill U.S. soldiers. Five of the alleged conspirators had conducted training missions in the nearby Pocono Mountains. The sixth helped to obtain weapons. The arrests were made after a 16-month FBI operation that included infiltrating the group. The investigation began after a store clerk alerted authorities after discovering a video file of the group firing weapons and calling for jihad. The group has no known direct connections to any international terrorist organization.[79] In December 2008, five of the men were found guilty on conspiracy charges but were acquitted of charges of attempted murder.[80] Four were also convicted on weapons charges. The five men received sentences ranging from 33 years to life plus 30 years. The sixth co-defendant pled guilty to aiding and abetting the others in illegal possession of weapons and was sentenced to 20 months in jail.[81] 23. JFK Airport Plot—June 2007. Four men plotted to blow up "aviation fuel tanks and pipelines at the John F. Kennedy International Airport" in New York City. They believed that such an attack would cause "greater destruction than in the Sept. 11 attacks." Authorities stated that the attack "could have caused significant financial and psychological damage, but not major loss of life." [82] Russell Defreitas, the leader of the group, was arrested in Brooklyn. The other three members of the group—Abdul Kadir, Kareem Ibrahim, and Abdul Nur—were detained in Trinidad and extradited in June 2008. Kadir and Nur have links to Islamic extremists in South America and the Caribbean. Kadir was an imam in Guyana, a former member of the Guyanese Parliament, and mayor of Linden, Guyana. Ibrahim is a Trinidadian citizen and Nur is a Guyanese citizen.[83] In 2010, Kadir was found guilty on five counts and sentenced to life in prison. In February, both Defreitas and Nur were also found guilty. Defreitas was sentenced to life in prison, while Nur was sentenced to 15 years.[84] The final conspirator, Kareem Ibrahim, was convicted in May 2011 and has been sentenced to life in prison.[85] 24. Hassan Abujihaad—March 2008. Hassan Abujihaad, a former U.S. Navy sailor from Phoenix, Arizona, was convicted of supporting terrorism and disclosing classified information, including the location of Navy ships and their vulnerabilities, to Babar Ahmad and Syed Talha Ahsan, the alleged administrators of Azzam Publication websites (the London organization that provided material support and resources to terrorists). Abujihaad was arrested in March 2007 and pled not guilty to charges of supporting terrorism in April 2007. In May 2008, he was convicted by a jury and sentenced to 10 years in prison.[86] In 2010, his conviction was upheld in a federal court of appeals.[87] Both Babar Ahmad and Syed Talha Ahsan are being held in Britain on anti-terrorism charges and are fighting extradition to the U.S.[88] 25. Christopher Paul—June 2008. Christopher Paul is a U.S. citizen from Columbus, Ohio. He joined al-Qaeda in the 1990s and was involved in conspiracies to target Americans in the United States and overseas. In 1999, he became connected to an Islamic terrorist cell in Germany, where he was involved in a plot to target Americans at foreign vacation resorts. He later returned to Ohio and was subsequently arrested for conspiracy to use a weapon of mass destruction—specifically, explosive devices—"against targets in Europe and the United States." Paul pled guilty to the charges and was sentenced to 20 years in prison.[89] 26. Bryant Neal Vinas—November 2008. Bryant Neal Vinas is an American citizen of Hispanic descent who converted to Islam in 2004.[90] In 2007, Vinas left home telling his parents he wanted to study Islam and Arabic. He then traveled to Pakistan where he was trained by and joined the Taliban. During his time in Pakistan, Vinas assisted with unsuccessful attacks on American forces and provided al-Qaeda with extensive information regarding the Long Island Rail Road for a potential attack.[91] He was arrested by Pakistani forces and sent back to the United States, where he pleaded guilty and began cooperating with authorities. He is currently in the custody of the U.S. Marshals and is awaiting sentencing.[92] 27. Synagogue Terrorist Plot—May 2009. On May 20, 2009, the New York Police Department announced the arrest of James Cromitie, David Williams, Onta Williams, and Laguerre Payen for plotting to blow up New York-area Jewish centers and shoot down planes at a nearby Air National Guard Base.[93] The four had attempted to gain access to Stinger missiles and were caught in the act of placing bombs in the buildings and in a car. (The bombs were duds, because undercover agents stole the four defendants fake explosives as part of an ongoing sting operation). All four men were found guilty. In June 2011, James Cromitie, David Williams, and Onta Williams were sentenced to 25 years in prison.[94] In September 2011, Laguerre Payen received the same sentence.[95] 28. Raleigh Jihad Group—July 2009. A group of seven men in North Carolina were arrested on charges of conspiring to support terrorist groups abroad, engage in terror attacks abroad and plotting an attack on the U.S. Marine base at Quantico, Virginia.[96] Their ringleader, Daniel Patrick Boyd, is believed to have a long association with radical groups, dating from his time living in Pakistan. In Pakistan, he is believed to have been an active member of Hezb-e-Islami (Party of Islam). The Raleigh group also raised funds and trained extensively in preparation to wage attacks both at home and abroad. [97] The men were denied bail and are awaiting trial.[98] 29. Najibullah Zazi—September 2009. Najibullah Zazi, a 24-year-old Afghan, was arrested after purchasing large quantities of chemicals used to make a TATP bomb, the same type of weapon used in the 2005 bombing of the London Underground and the 2001 shoe-bomb plot. Zazi had traveled to Pakistan, where he received instruction in bomb making and attended an al-Qaeda training camp. Zazi allegedly planned to detonate TATP bombs on the New York City subway.[99] It has since been found that the plot was directed by senior al-Qaeda leadership in Pakistan.[100] Najibullah Zazi's father, Mohammed Wali Zazi, was also indicted for obstructing justice, witness tampering, and lying to the FBI in attempts to help his son cover up plans for his attack.[101] A cousin of Zazi, Amanullah Zazi, also publicly admitted that he played a role in Zazi's 2009 plot. Amanullah pled guilty in secret and agreed to become a government witness in federal court in Brooklyn against Najibullah's father.[102] The father has since been found guilty and sentenced to four and a half years in prison.[103] Najibullah Zazi pled guilty, as the result of a plea bargain, and remains in jail. He is currently awaiting sentencing.[104] At least three other individuals have since been arrested on allegations of conspiring to carry out the attack with Zazi. One of them, New York religious leader Ahmad Afzali, has pled guilty to charges of lying to federal agents about informing Zazi that he was being investigated by authorities. [105] As part of a plea deal, Afzali was sentenced to time served and ordered to leave the country within 90 days.[106] A second man, Zarein Ahmedzay has also pled guilty to conspiring to use weapons of mass destruction in the foiled plot and lying to investigators. Adis Medunjanin has pled not guilty to conspiracy to commit murder in a foreign country and to receiving terrorist training.[107] Ahmedzay and Medunjanin are thought to have traveled to Pakistan with Zazi, and to have met with wanted al-Qaeda operative Adnan El Shukrijumah, who has also been charged in the plot.[108] A fourth individual, Abid Nasser, has also been implicated in the plot led by Zazi, as well as other plots in England and Norway. He is currently in the United Kingdom facing extradition to the United States.[109] Also charged in the plot are, Tariq Ur Rehman, and a fifth defendant known as "Ahmad," "Sohab," or "Zahid." Both El Shukrijumah and Rehman are not in custody.[110] 30. Hosam Maher Hussein Smadi—September 2009. Smadi, a 19-year-old Jordanian, was apprehended in an attempt to plant a bomb in a Dallas skyscraper. Originally identified through FBI monitoring of extremist chat rooms, Smadi was arrested and charged after agents posing as terrorist cell members gave Smadi a fake bomb, which he later attempted to detonate.[111] Smadi was found guilty and sentenced to 24 years in prison.[112] 31. Michael Finton—September 2009. Michael Finton, an American citizen, was arrested on September 23, 2009, by undercover FBI agents after attempting to detonate a car bomb filled with what he believed to be close to one ton of explosives outside the Paul Findley Federal Building and Courthouse in downtown Springfield, Illinois. The blast was also intended to destroy the nearby office of Representative Aaron Schock (R-IL).[113] Evidence presented against Finton has shown that he expressed a desire to become a jihadist fighter and was aware that his planned attack would cause civilian injuries. He has been arrested on charges of attempted murder of federal employees and attempted use of a weapon of mass destruction. Finton pled guilty and was sentenced to 28 years in prison.[114] 32. Tarek Mehanna and Ahmad Abousamra—October 2009. Tarek Mehanna, previously indicted for lying to the FBI about the location of terrorist suspect Daniel Maldonado, was arrested on October 21, 2009, on allegations of conspiracy to kill two U.S. politicians, American troops in Iraq, and civilians in local shopping malls, as well as conspiracy to provide material support to a terrorist organization.[115] Mehanna and Ahmad Abousamra, his co-conspirator, were indicted on charges of providing and conspiring to provide material support to terrorists, conspiracy to kill Americans in a foreign country, and conspiracy to provide false information to law enforcement.[116] The two men are not believed to be associated with any known terrorist organization.[117] Mehanna has pled not guilty to charges held against him and has since been convicted, while Abousamra remains at large in Syria.[118] 33. The Christmas Day Bomber—2009. Umar Farouk Abdulmutallab, a 23-year-old Nigerian engineering student living in London, boarded a plane from Nigeria to Amsterdam and then flew from Amsterdam to the U.S. It was on this second flight when he attempted to detonate a bomb hidden in his underwear as the plane began to land. The device ignited but did not detonate, and passengers quickly stopped Abdulmutallab from trying again, leading to his arrest by U.S. authorities upon landing in Detroit. The bomb, containing the explosives PETN and TATP, was similar to the failed device used by Richard Reid in his shoe in 2001. Media accounts following the plot indicate that Abdulmutallab admits involvement with al-Qaeda in Yemen and has pleaded not guilty to charges including conspiracy to commit an act of terrorism and attempting to use a weapon of mass destruction.[119] In February 2012, Abdulmutallab was sentenced to life in prison following his conviction.[120] 34. Raja Lahrasib Khan—March 2010. Chicago taxi driver Raja Lahrasib Khan, a naturalized U.S. citizen from Pakistan, was arrested by the Chicago FBI's Joint Terrorism Task Force on two counts of providing material support to a foreign terrorist organization. According to the charges, Khan was affiliated with Ilyas Kashmiri, leader of the al-Qaeda-linked extremist group Harakat ul-Jihad-I-Islami in Kashmir, and has previously been indicted in the U.S. on terrorism charges.[121] Khan originally transferred \$950 to Pakistan, to be delivered to Kashmiri, and later attempted to send around \$1,000 provided to him by an undercover agent to Kashmiri by having his son carry the money to England, where Khan then planned to rendezvous with him and carry the money the rest of the way to Pakistan. His son was stopped by government agents at Chicago's O'Hare airport before leaving the country. The criminal complaint filed against Khan also alleges that he had discussed plans to bomb an unnamed sports stadium in the United States. Khan has since pleaded guilty as part of a plea deal recommending a sentence of five to eight years. His sentencing has been scheduled for May 30, 2012.[122] 35. Faisal Shahzad—May 2010. Faisal Shahzad, a naturalized citizen from Pakistan, attempted to detonate explosives in an SUV parked in Times Square. After explosives training in Pakistan, he is said to have received \$12,000 from entities affiliated with the terrorist organization Tehrik-e-Taliban to fund the attack. Following the failed bombing attempt, Shahzad attempted to flee the country to Dubai, but was arrested before the flight was able to leave New York's JFK airport.[123] Shahzad pled guilty to 10 counts, including conspiracy to commit an act of terrorism and to use a weapon of mass destruction.[124] He was sentenced to life in prison and is being held at the same Colorado maximum-security prison as Richard Reid and Jose Padilla.[125] 36. Paul G. Rockwood, Jr., and Nadia Pirokska Maria Rockwood—July 2010. Paul G. Rockwood, Jr., an American citizen, became an adherent to Anwar al-Awlaki's ideology of violent jihad after converting to Islam. In studying al-Awlaki's teachings, Rockwood came to believe it was his religious responsibility to seek revenge against anyone who defiled Islam. He created a list of 15 individuals to be targeted for assassination, including several members of the U.S. military. Rockwood is said to have researched explosive techniques and discussed the

possibility of killing his targets with a gunshot to the head or through mail bombs. Nadia Piroška Maria Rockwood, Paul's wife, knowingly transported the list to Anchorage, Alaska, to share with an unnamed individual who apparently shared Rockwood's ideology. The list then made it into the hands of the FBI's Joint Terrorism Task Force in Anchorage. Paul was charged with making false statements to the FBI in a domestic terrorism charge, while Nadia was charged with making false statements to the FBI in connection to the case against her husband. Paul was sentenced to eight years in prison, while his wife was sentenced to five years probation.[126] 37. Ferooq Ahmed—October 2010. Pakistani-American Ferooq Ahmed was arrested following an FBI investigation into plots to attack the Washington, D.C., subway. Ahmed is said to have conducted surveillance on the D.C. Metrorail system on multiple occasions, and was in contact with undercover FBI agents whom he believed to be individuals affiliated with al-Qaeda.[127] According to an unsealed affidavit, Ahmed wanted to receive terrorist training overseas and become a martyr. The affidavit also indicates that he sought to specifically target military personnel in his bombing attempt.[128] Ahmed pled guilty to charges of material support and collecting information for a terrorist attack on a transit facility. He was then immediately sentenced to 23 years in prison.[129] 38. Air Cargo Bomb Plot—October 2010. Two packages shipped from Yemen to Chicago-area synagogues were discovered to contain explosive materials of the same type used by Richard Reid and Umar Farouk Abdulmutallab in previously thwarted bombing attempts.[130] The packages contained printer cartridges filled with the explosive material and were identified with the help of intelligence tips from Saudi Arabian authorities while in transit on cargo planes in the United Kingdom and Dubai.[131] While no arrests have been made, the Yemen-based Al-Qaeda in the Arabian Peninsula (AQAP) has claimed responsibility for the failed attack. 39. Mohamed Osman Mohamud—November 2010. Mohamed Osman Mohamud, a 19-year-old Somali-American, was arrested after attempting to detonate a car bomb at a Christmas tree lighting ceremony in Portland, Oregon. The bomb was composed of inert explosives given to him by undercover FBI agents. Mohamud had previously sought to travel overseas to obtain training in violent jihad. Having failed in that attempt, he wanted to commit an attack that would cause mass casualties to individuals and their families.[132] Mohamud has pled not guilty to the charges.[133] 40. Antonio Martinez—December 2010. Antonio Martinez, a 21-year-old American citizen also known as Muhammad Hussain, planned to bomb a military recruiting center in Maryland. The FBI learned of the plot from an unnamed informant. Martinez was arrested after attempting to detonate a fake explosive device supplied by FBI agents. He has been charged with attempted murder of federal officers and employees, as well as attempted use of a weapon of mass destruction.[134] He has pled not guilty and awaits further trial.[135] 41. Khalid Ali-M Aldawsari—February 2011. Khalid Ali-M Aldawsari, a Saudi citizen studying in Lubbock, Texas, was arrested by the FBI after placing an order for the toxic chemical phenol. Both the chemical supplier and the freight shipping company became suspicious of the order, which could be used to make an improvised explosive device (IED), and alerted the FBI and local police. Surveillance of Aldawsari's e-mail turned up a list of potential "nice targets" including dams, nuclear power plants, military targets, a nightclub, and the Dallas residence of former President George W. Bush. The search also recovered plans to acquire a forged U.S. birth certificate and multiple driver's licenses. Aldawsari seems to have considered using these documents to obtain rental cars for use in vehicle bombings. He has pled not guilty to charges of attempted use of a weapon of mass destruction and faces up to life in prison.[136] 42. Ahmed Ferhani and Mohamed Mamdouh—May 2011. Ahmed Ferhani of Algeria, and Moroccan-born Mohamed Mamdouh, a U.S. citizen, were arrested by the New York Police Department after attempting to purchase a hand grenade, guns, and ammunition to attack an undetermined Manhattan synagogue. The men planned on disguising themselves as Orthodox Jews in order to sneak into the synagogue.[137] Reports have also cited the Empire State Building as a possible second target.[138] Both men face charges of conspiracy to commit a crime of terrorism and conspiracy to commit a hate crime, as well as criminal possession of a weapon.[139] 43. Yonathan Melaku—June 2011. On June 17, 2011, Yonathan Melaku, an Ethiopian and a naturalized U.S. citizen and former Marine Corp reservist, was arrested at Fort Myer near Arlington National Cemetery, where he was found with a backpack filled with ammonium nitrate, spray paint, and spent ammunition rounds. The discovery led authorities to unravel a series of mysterious events from the fall of 2010, when shots had been fired at night from the street at various military buildings, including the Pentagon, causing over \$100,000 in damages. After searching his bag and house, authorities found video of Melaku shooting at the buildings and providing commentary, a series of notebooks written in Arabic with references to terrorism, and a list of equipment needed to make a timed explosive device. He has since pleaded guilty and was sentenced to 25 years in prison.[140] 44. Abu Khalid Abdul-Latif and Wali Mujahidh—June 2011. In a raid on a warehouse in Seattle, the FBI arrested Abu Khalid Abdul-Latif and Wali Mujahidh. The two suspects had arranged to purchase weapons from an anonymous informant in contact with the Seattle Police Department. They were seeking to purchase automatic machine guns and grenades in preparation for an attack on a military recruiting station in Seattle. Since the arrests have been made, authorities have learned that Abdul-Latif, a felon and Muslim convert, had initially planned to attack the Joint Base Lewis-McChord with his friend, Los Angeles resident Mujahidh. The target was later changed to the Seattle Military Entrance Processing Station for undisclosed reasons.[141] The men have been charged with conspiracy to murder officers and employees of the United States government, conspiracy to use a weapon of mass destruction, and possession of firearms in furtherance of crimes of violence. Abdul-Latif has also been charged with two counts of illegal possession of firearms and is awaiting further trial.[142] Mujahidh has pled guilty and faces up to 32 years in prison.[143] 45. Emerson Winfield Begolly—August 2011. Begolly, a moderator and supporter for the internationally known Islamic extremist Web forum Ansar al-Mujahideen English Forum (AMEF), was arrested on charges of terrorist actions involving solicitation to commit a crime of violence and distribution of information in relation to explosives, destructive devices, and weapons of mass destruction. Through his profile on AMEF, the Pennsylvania-born man solicited others to engage in violent acts of terrorism against post offices, water plants, military facilities, bridges, train lines, and Jewish schools. Begolly also used the website to post a downloadable 101-page document that contains information on how to create, conduct, and manufacture chemical explosives. The instructional document is loosely linked to al-Qaeda's former top chemical and biological weapons expert Abu Khabbab al Misi. Begolly pled guilty to counts of soliciting others to engage in acts of terrorism within the U.S., and attempting to use a 9-mm semi-automatic handgun during an assault upon inquiring FBI agents. He is currently awaiting further trial.[144] 46. Rezwan Ferdous—September 2011. Ferdous, a self-radicalized 26-year-old U.S. citizen, was arrested for trying to provide material support to terrorist organizations when he gave a modified cell phone to someone he believed to be an al-Qaeda operative.[145] He did so believing the man would use the cell phone to detonate improvised explosive devices against American soldiers. The alleged al-Qaeda operative was an undercover FBI agent. Ferdous also sought to use small drone aircraft laden with explosives to attack the Pentagon and U.S. Capitol, followed by a ground attack carried out by armed men with automatic rifles. He had already purchased some items, including C4 and AK-47s, toward this goal from an undercover agent.[146] He is being held awaiting trial.[147] 47. Iranian Terror Plot—October 2011. On October 11, 2011, Mansoor Arbabsiar, an Iranian-born U.S. citizen, was arrested for plotting to assassinate the Saudi Arabian ambassador to the U.S., as well as bomb the Saudi and Israeli embassies in Washington, D.C. He claims he was working for the Iranian Quds Forces, a special unit of the Iranian Revolutionary Guard. On behalf of the Quds Forces, Arbabsiar is said to have contacted members of a Mexican drug cartel with the goal of hiring them to assassinate the Saudi ambassador. The two parties allegedly agreed on a payment of \$1.5 million, with a down payment of \$100,000 that Arbabsiar wired to members of the cartel, supposedly from the Iranian government. The plot was uncovered because the supposed members of the cartel he approached were informants for the Drug Enforcement Agency.[148] He was arrested at JFK airport in New York, has pleaded not guilty, and is currently awaiting trial.[149] Another man, Gholam Shakuri, is an Iranian citizen who is wanted in connection with the plot; he is believed to be in Iran.[150] This is the first publicly known post-9/11 Islamist-inspired terror plot aimed at the United States specifically linked to state-sponsored terrorism. 48. Jose Pimentel -November 2011. On November 20, 2011, Jose Pimentel, a naturalized U.S. citizen from the Dominican Republic, was arrested on charges of planning to use pipe bombs to attack targets throughout New York City. His proposed targets included police stations, post offices, and U.S. soldiers. He was a homegrown radical inspired by Anwar al-Awlaki. Pimentel also managed his own radical website espousing his beliefs in violent jihad.[151] The plot was uncovered by an informant and Pimentel was arrested by the NYPD. He has pleaded not guilty and awaits trial.[152] 49. Sami Osmakac—January 2012. On January 7, 2012, Sami Osmakac, a naturalized U.S. citizen from the Kosovo region of the former Republic of Yugoslavia, was arrested on charges of planning attacks against night clubs, businesses, and a sheriff's office [153] He came to the attention of the authorities when a source alerted them that Osmakac had asked how to locate an al-Qaeda flag. He planned to conduct a multi-pronged attack against his proposed targets with vehicle-borne explosives. He also wished to take hostages. He was introduced to an undercover FBI agent who he believed was an arms dealer and procured disabled AK-47s and explosives from him.[154] He was arrested by the FBI's Tampa office and has since pleaded not guilty.[155] 50. Amine El Khalifi—February 2012. Amine El Khalifi, a Moroccan citizen illegally in the United States, was arrested on charges of plotting to attack the U.S. Capitol. He was arrested as he left his parked car with guns and a bomb. He did not know that the weapons had already been rendered inoperable, as they had been provided to him by FBI agents he believed to be al-Qaeda operatives. Before choosing the Capitol building as a target, El Khalifi had proposed targets including D.C. office buildings, restaurants, and synagogues.[156] He is currently being held in federal custody in Alexandria, Virginia, awaiting trial. 50 Terrorist Plots Foiled Since 9/11 Preventing the Next Terrorist Attack The death of Osama bin Laden marked an important victory in the long war on terrorism. The war, however, is not won. Terrorists, including those radicalized in the United States, continue to seek to harm the U.S. and its people.

As the first anniversary of the death of bin Laden approaches, Congress and the Administration should be mindful of what is needed to continue to combat the threat of terrorism at home and abroad. In order to prevent the next terrorist attack, lawmakers should: · Preserve existing counterterrorism and intelligence tools, such as the PATRIOT Act. Support for important investigative tools, such as the PATRIOT Act, is essential to maintaining the security of the United States and combating terrorist threats. Key provisions in the act, such as the roving surveillance authority and business records provisions, have proven essential in thwarting numerous terror plots. For instance, the PATRIOT Act's information-sharing provisions were essential for investigating and prosecuting homegrown terrorists, such as the Lackawanna Six. This case, along with others, demonstrates that national security investigators continue to require the authorities provided by the PATRIOT Act to track leads and dismantle plots before the public is put in danger. Bearing this fact in mind, Congress should not let key provisions of the PATRIOT Act expire, and instead, should make them permanent.

LeT attack on the U.S. would trigger U.S. war with Pakistan

Tellis 12

Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace, <http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

This is because the most vicious entities now engaged in attacks on India, like LeT, have objectives that go way beyond Kashmir itself. They seek to destroy what is perhaps the most successful example of a thriving democracy in the non-Western world, one that has prospered despite the presence of crushing poverty, incredible diversity, and a relatively short history of self-rule. India's existence as a secular and liberal-democratic state that protects political rights and personal freedoms—despite all its failures and imperfections—thus remains a threat to groups such as LeT, with their narrow, blighted, and destructive worldviews. It is also a threat to other praetorian and antidemocratic institutions such as the Pakistan Army and the ISI. India, accordingly, becomes an attractive target, while its mistakes, inadequacies, and missteps only exacerbate the opportunities for violence directed at its citizenry.

It would be a gross error, however, to treat the terrorism facing India as simply a problem for New Delhi alone. When viewed from the perspective of the United States, it is safe to say that LeT has long undermined U.S. interests in the global war on terror. It threatens U.S. soldiers and civilians in Afghanistan and has now killed U.S. citizens in Mumbai. Thus far it has not mounted any direct attacks on the American homeland, but that is not for want of motivation. Given the juicier and far more vulnerable U.S. targets in South Asia, LeT has simply found it more convenient to attack these (and U.S. allies) in situ rather than overextend itself in reaching out to the continental United States, especially when al-Qaeda still remains focused on that task. An LeT attack on the U.S. homeland would also lead Washington to target the ISI and the Pakistani state directly, problems that the Pakistani military can do without at a time when groups like LeT and its regional partners are more than amply successful in advancing the Pakistan Army's aims by undermining larger U.S. and coalition investments in Afghanistan.

LeT operatives have been stopped in the U.S.

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Several LeT operatives have also been arrested in the United States. These include a network of jihadists in northern Virginia known as the Virginia Jihad Network. Ali al-Timimi, an American born Islamic scholar popular among a group of young Muslim men in Virginia, was convicted of advocating war against the U.S. He exhorted his followers to join the Taliban following the U.S. invasion of Afghanistan. While none of them ever did join the Taliban, four of them ended up receiving training from LeT.¹⁹⁵ Ali Asad Chandia, a resident of College Park, Maryland and third grade teacher, was convicted of aiding a British member of LeT, Mohammed Ajmal Khan, with acquiring military equipment for LeT.¹⁹⁶ Nine other members of the network were convicted in 2003 and 2004 variously for providing material support to LeT, assisting others in gaining entry into LeT training camps, and for obtaining training to wage war against the United States.¹⁹⁷ The most notable American operative of LeT is David Headley. As previously noted, the American-born Headley had legally changed his name from Daoud Gilani to make travel easier and moved effortlessly between the U.S., Pakistan, and India for nearly seven years.¹⁹⁸ According to Headley's plea agreement, he made at least five trips to Mumbai between 2006 and 2008 to scout locations for attacks and scouted targets in Pune and Goa in India. While in Mumbai, he made videos of the targets, collected coordinates with a GPS device, and scouted the landing site for the attackers. Between 2002 and 2005, Headley had trained at Lashkar camps on at least five occasions. During this training he learned the use of explosives, small arms and countersurveillance techniques.¹⁹⁹

U.S. has been preventing domestic LeT attacks on U.S. homeland

Jones 11 Seth G. Jones is director of the International Security and Defense Policy Center at the RAND Corporation, The Future of Al Qaeda CT-362 May 2011,

http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=12&ved=0CCUQFjABOApqFQoTCKrvpZ-H-MYCFcc4iAod7-8KHw&url=http%3A%2F%2Farchives.republicans.foreignaffairs.house.gov%2F112%2Fjon052411.pdf&ei=E2-0VeqZN8fxoATv36v4AQ&usg=AFQjCNH28hzNYeUrTDQ2grEJvGW46_6aRQ&sig2=OwaEnNRKOptgEs7KiwQs3Q

In September 2009, for example, Najibullah Zazi was arrested for planning attacks on the New York City subway. Zazi pleaded guilty in U.S. District Court to “conspiracy to use weapons of mass destruction” and “providing material support for a foreign terrorist organization” based in Pakistan.¹¹ Several al Qaeda operatives, including Saleh al-Somali and Adnan el Shukrijumah, were involved in the plot. According to U.S. government documents, Zazi’s travels to Pakistan and his contacts with individuals there were pivotal in helping him build an improvised explosive device using triacetone triperoxide (TATP), the same explosive used effectively in the 2005 London subway bombings. In October 2009, Chicago-based David Coleman Headley (aka Daoud Sayed Gilani) was arrested for involvement in terrorist activity. He is a Pakistani-American who had cooperated with Lashkar-e Tayyiba and senior al Qaeda leaders to conduct a series of attacks, including the November 2008 Mumbai attack and a plot to attack a newspaper in Copenhagen that had published a cartoon of the Prophet Muhammad. His base in Chicago made him ideally suited for a future attack in the U.S. homeland.

LeT is a global threat that risks terror attacks on India and the United States

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,

<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

It is clear that after al-Qaeda, LeT is the most dangerous terrorist group operating in South Asia because of its: ¶ 1. Global vision and international ambitions ¶ 2. Distinct ideology that underwrites Islamic revanchism, justifying collaboration with other terrorist groups ¶ 3. Loyalty to Pakistan and willingness to protect its patron state against domestic opponents ¶ 4. Diversified network for mobilizing resources, promoting its international presence, and recruiting members, which minimizes its dependence on the state ¶ 5. Involvement in terrorism and social development concurrently, which limits Pakistan’s ability to target the group even if it were so inclined ¶ 6. Cohesive and hierarchic organizational structure that is effective at both the conduct of violence and the delivery of social programs ¶ 7. Proficiency at exploiting science and technology, extra-national social links, and state vulnerabilities in order to advance its political aims ¶ LeT is a formidable and highly adaptable adversary with a genuinely global reach and the ability to grow roots and sustain operations in countries far removed from its primary theater of activity in South Asia. Though India’s proximity to Pakistan has resulted in New Delhi absorbing most of the blows unleashed by LeT, the carnage in Mumbai demonstrates that the terrorism facing India is not simply a problem for New Delhi alone. An attack could even reach U.S. soil. ¶ The only reasonable objective for the United States is the permanent evisceration of LeT and other vicious South Asian terrorist groups—with Pakistani cooperation if possible, but without it if necessary.

AT: HUMINT Turn

Human intel can't work for India—They have massive shortages of human spy personnel and don't have the ability to train enough human spys

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

Indians waited that, and longer-and while they did, the foundations on which India's intelligence services have been rotting. The Intelligence Bureau, highly-placed government sources said, is over 30% short of staff-particularly critical mid-level executive positions. For its part, the Research and Analysis Wing (R&AW), tasked with securing Indian interests across the world, has desperate shortages of specialists in languages and the sciences-deficits that are running as high as 40% in critical departments. Later this year, Prime Minister Narendra Modi is expected to make his first appointment to lead the Intelligence Bureau. He is expected to choose from among Ashok Prasad, who helped build the organisation's counter-terrorism data-hub, the Multi-Agency Centre, D P Sinha, a veteran of anti-terror operations, and Dineshwar Sharma, a quiet but highly respected analyst, who won his spurs when he volunteered to serve in Jammu and Kashmir in the early 1990s. The Prime Minister will also have to find a leader to rebuild R&AW-devastated by internal feuds, staff shortages and technology deficits. He is expected to choose between Rajinder Khanna, the leader of R&AW's counter-terrorism efforts in recent years, and Arvind Saxena, a veteran with long experience of Pakistan, the United States and organisational management. Too few spies Figures released to Parliament by the United Progressive Alliance government show that even as Chidambaram's efforts to create new institutions became the focus of official efforts, staffing deficits became endemic across the intelligence services. In March 2013, then Minister of State for Home R P N Singh told Parliament that the IB had 18,795 personnel on its rolls, against a sanctioned strength of 26,867 – in other words, a shortfall of over 30 per cent, and that based on manpower requirements drawn up in the 1970s. The effects are evident across the states: dedicated counter-terrorism groups set up by National Security Advisor Ajit Doval, while he was Intelligence Bureau chief, have been sucked into routine duties. The Intelligence Bureau's operations hub in New Delhi has just 30-odd executive staff. Intelligence Bureau chief Asif Ibrahim has cut the shortfall to some 7,000 people-taking in as many as the service's overstretched training facility can handle. It's proved just too little though and not because of lack of trying. In 2009, Chidambaram authorised the hiring of 6,000 personnel. However, the IB's existing training facilities can process just 600 to 700 staff in a year, which barely -covers attrition from retirements and resignations. "There's another problem, too", notes a senior Intelligence Bureau officer. "Let's say we, by some miracle, find the 6,000-odd people we need in one go. They'll need to be promoted from time to time-and there just won't be positions for them. The government needs to do a thoroughgoing review of staffing, and the last one just wasn't interested". R&AW, estimated to have some 5,000 personnel, faces a similar shortage. The organisation is short of some 130 management-level staff, the sources said, particularly cutting-edge under-secretaries and deputy secretaries. R&AW is also short of personnel with specialist language and area knowledge, particularly Arabic, Chinese and minor Pakistani languages. –

They no longer have a pool to recruit sufficient human intelligence—Indian states won't let their best police get recruited intelligence

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

Long years of neglect, intelligence officials said, had contributed to the staffing crisis at the R&AW and the IB. "The intelligence services," a senior officer said, "had always relied on young Indian Police Service officers, recruited early in their careers, to serve in middle and senior-management roles. The overall shortfall in the IPS's strength, though, has meant states are loath to allow their best officers to serve in - New Delhi on deputation." The R&AW's internal cadre, the Research and Analysis Service, for its part, froze recruitment

from the 2004-2005 batch to the 2009-2010 batch, and in other years, cut hiring to a trickle. Last year, bulk recruitment to fill the deficits was agreed on, but a debate about whether needs would be best met through Union Public Service Commission-run examinations or campus recruitment rages on. –

Answers to LeT

Even if India gets intelligence data it won't be effectively used to stop terrorism because of inaction and corruption

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Actionable intelligence is the first thing that comes to mind when one thinks about disrupting a terrorist plot. Although its primary function is strategic intelligence, the Indian Intelligence Bureau has an excellent record in providing tactical support to state police forces- within reasonable limits. Between 1998 and 2003, it reportedly neutralized 250 ISI- backed jihadist cells across India, excluding Jammu and Kashmir and the North Eastern states. This neutralization rate of approximately one terrorist cell per week has been maintained even after the current spate of jihadist violence erupted in 2005. Where problems have arisen is not so much in the IB's response to pan-Islamist terrorism, but in that of the political leadership. Put simply, there has been no policy response to ample warnings from the intelligence community since 2002 that Pakistan planned to target the Indian heartland.[xxxvi] Before the Mumbai attacks there were reports of at least 20 intelligence reports provided to the Mumbai Police Department specially warning them about Fedayeen attacks or sea borne infiltrations. The Intelligence Bureau of India had also received two specific warnings about the Taj hotel. One concerned a possible attack on 24 May and the other on 11 August, both prompted by tip offs from a source in Pakistan said to be inside Lashkar. [xxxvii] The hotel was made aware of the tip offs but nothing was really done to beef up security or improve the current measures in place, like CCTV cameras and security guards on the front gate. Prem Mahadevan writes in his book 'The Politics of Counterterrorism in India', "Such inaction (failure to act on intelligence) stems from four factors, two of which are political and two operational. The factors are: a lack of political consistency and consensus, and a lack of operational capacity and coordination. Between them, these constraints ensure that decision- makers in the Indian political and security establishments fail to act on initial warnings provided by intelligence agencies."[xxxviii] Additionally, the security agencies as well as the people in the position of responsibility have an attitude problem. Till the time everything is right and nothing goes wrong the attitude is simply 'Chalta hai' – Everything works. Any amount of intelligence is of no use till the time it is taken seriously and acted upon. Despite such specific intelligence inputs, as mentioned before, Mumbai's Joint Police Commissioner Rakesh Maria said in an interview that it was a 'failure of imagination' on the part of the police department. This clearly shows the lack of seriousness attributed to the importance of intelligence in counterterrorism. To overcome this, personnel in state police departments need to go through rigorous training for intelligence gathering as well as to deal with the gathered intelligence inputs. A committee set up to find the loopholes in the response to the Mumbai attacks, The Pradhan Committee, found out that "well set out procedures for handling intelligence and 'crisis management' were overlooked and the Commissioner of Police Mumbai Hasan Gafoor did not exhibit adequate initiative in handling the multi-pronged attack and remained at one spot near Trident Hotel throughout the operations.[xxxix] There is an urgent need for proper Standard Operating Procedures in place and not just on paper but for them to be enforced through drills and simulation games. There is also a need for a centralized command and control, so that in an event of an attack, forces on the ground know who they are taking orders from and remain coordinated in their efforts. Most importantly, it is necessary to be practical about countermeasures being put in place, most of the steps taken by Indian authorities remain non-operational and useless. In the end everything boils down to resource allocation and in India where every official must have his 'cut' at every step of the process, it becomes increasingly difficult to implement any policies. It is imperative that a strong anti-corruption system comes in place, especially where authorities are working for national or state security for a speedy and proper implementation of counter terrorism policies.

Analysis tools for meta data empirically fail

Wheaton & Richey 14 Kristan J. Wheaton is an Associate Professor at Mercyhurst University and Melonie K. Richey is a graduate student at Mercyhurst University who is currently participating in IARPA's Sirius Project. Metadata Analysis as an Intelligence Tool, e-

International Relations January 9, 2014 ,

<http://strategicstudyindia.blogspot.com/2014/06/metadata-analysis-as-intelligence-tool.html>

Caveat Emptor Like all analytic techniques, SNA is imperfect and comes with a number of caveats for researchers new to the method. SNA, while widely applicable, is by no means universally applicable. For example, in early 2013, one of the authors sought to use SNA to locate terrorists using social media. SNA and social media seemed like a good place to start, even though it seemed unlikely that many such individuals would self identify as a “radical extremist” or “Al-Qaeda affiliate.” Ultimately though, the effort failed because there was just too much of what social network analysts like to call “white noise,” or extraneous information picked up through a comprehensive scraping of the Internet. Our search for radical extremists returned journalists, university students of international relations and politics, and a slew of ordinary people just keeping up with current events and Tweeting about it. Another issue with SNA has to do with the nature of relationships. In the real world, they are often messy and convoluted. Just because two people work together and do so often, does not necessarily mean that they like each other. Similarly, the best way to describe the relationship between two businesses might not be the number of contracts the two have signed together. SNA works best, however, with clearly definable relationships and where one factor in the relationship correlates well with other factors important in a relationship. Modern intelligence problems, which often contain, political, economic, military, tribal, geographic, personal, and historical relationship data require the application of advanced SNA techniques and, even then, may yield little of real use to decisionmakers. Finally, SNA is fundamentally a mathematical tool but is most useful in the decisionmaking process when the networks are visualized. It is, without doubt, the visualization of these networks that tends to capture the most attention from the policymakers that intelligence units typically support. This is both a blessing and a curse. While it is easy to capture attention, explaining why the charts and graphs look the way they do is an art. All too often, the initial excited reaction to these diagrams turns to boredom and confusion as analysts bog the decisionmakers down with the arcana of SNA. In addition, creating these complex visualizations often stresses even the most powerful personal computers (the images of the simulation in Figure 8 above took approximately 2 hours to produce using a powerful desktop PC with two high end graphics cards). Like every analytic technique, SNA has great utility for the right question. Within its limits, SNA is unmatched and can be usefully applied to identify key individuals or organizations within a network, generate new leads and simulate the flows of information or money throughout a network. SNA, however, remains just a answer, not the answer. Used inappropriately or without a full understanding of the limits of the method and analysts will only be finding new and more technically sophisticated ways to fail. That, then, is the primary job of the modern day analyst: making the judgment call of which techniques to use and when. Equally as important as knowing when to use SNA is knowing when not to use it.

Surveillance fails — even if countries have the data, it doesn't translate into preemptive politics

NYT 14 — New York Times, 2014. (“In 2008 Mumbai Attacks, Piles of Spy Data, but an Uncompleted Puzzle”, James Glanz, December 21st, 2014, Available Online at:

<http://www.nytimes.com/2014/12/22/world/asia/in-2008-mumbai-attacks-piles-of-spy-data-but-an-uncompleted-puzzle.html> Accessed 7-22-15)

In the fall of 2008, a 30-year-old computer expert named Zarrar Shah roamed from outposts in the northern mountains of Pakistan to safe houses near the Arabian Sea, plotting mayhem in Mumbai, India's commercial gem. Mr. Shah, the technology chief of Lashkar-e-Taiba, the Pakistani terror group, and fellow conspirators used Google Earth to show militants the routes to their targets in the city. He set up an Internet phone system to disguise his location by routing his calls through New Jersey. Shortly before an assault that would kill 166 people, including six Americans, Mr. Shah searched online for a Jewish hostel and two luxury hotels, all sites of the eventual carnage. But he did not know that by September, the British were spying on many of his online activities, tracking his Internet searches and messages, according to former American and Indian officials and classified documents disclosed by Edward J. Snowden, the former National Security Agency contractor. They were not the only spies watching. Mr. Shah drew similar scrutiny from an Indian intelligence agency, according to a former official briefed on the operation. The United States was unaware of the two agencies' efforts, American officials say, but had picked up signs of a plot through other electronic and human sources, and warned Indian security officials several times in the months before the attack.

Indian domestic surveillance not key — US international solves

ET 14 — The Economic Times, 2014. (“US alerts India of possible terror attack by Lashkar-e-Taiba, capital on high-alert”, Aman Sharma, Decemeber 12th, 2014, Available Online at: http://articles.economictimes.indiatimes.com/2014-12-12/news/56990498_1_delhi-police-terror-strike-republic-day-function)

It was the United States which alerted India of an impending major terror strike in Delhi by Pakistan-based Lashkar-e-Taiba, triggering a comprehensive security review of the national capital by the Delhi Police and Intelligence Bureau. "The alert came directly from US intelligence agencies...it was not a pin-pointed information and did not specify any place or time of attack but the input said there was clear intelligence with the US of a big terror strike somewhere in Delhi by LeT," a senior Home Ministry official told ET. The government has decided to take no chances as the said tip-off from the US came shortly after the visit of US President Barack Obama to India was confirmed for being the chief guest at the Republic Day. Sources in the home ministry said that besides taking extra steps to secure Delhi, IB has also begun a "coordination exercise" with neighbouring states like UP and Rajasthan, sensitising them of the terror threat and asking them to be on alert for any terror module in their jurisdictions which may target Delhi. "Many meetings have been held between state authorities and IB since. Delhi Police Commissioner BS Bassi has also met National Security Advisor Ajit Doval to brief him of the security measures taken for Delhi.

Chaulia 9 Sreeram Chaulia is associate professor of world politics at the OP Jindal Global University in Sonapat, India India caught in a terror tangle
http://www.atimes.com/atimes/South_Asia/KL11Df05.html

The ills in India's intelligence apparatus were highlighted recently when India's Home Minister P Chidambaram announced a new chief for the proposed National Intelligence Grid (NATGRID) project for counter-terrorism. This is an ambitious venture to pool all data and information relating to a person - ranging from bank accounts, rail and air travel to income tax, telephone and Internet usage. Without being obtrusive, NATGRID is mandated to link 21 different databases for the access of 10 security agencies. While it sounds like an innovate idea that could enable the speedy detection and interception of security threats, NATGRID is symptomatic of the troubles plaguing India's divided state. It is the brainchild of the Home Ministry, which sees itself as a veteran in competition with the office of the National Security Advisor (NSA) for the prized position as the lead governmental node handling strategic issues. The NSA, which falls under the all-powerful Prime Minister's Office, already has under its aegis, since 2004, the National Technical Research Organization (NTRO) - a highly specialized technical intelligence-gathering "super-feeder agency" - to act as a clearing house for all other members of the security establishment. Modeled after the US National Security Agency, NTRO had until recently been dubbed "India's newest secret agency". Now, the Home Ministry's NATGRID, or one or other of the ever-mushrooming pet creations of the vast Indian bureaucracy, might vie for this honor as they build their own personnel, budgets and images. The Home Ministry has also just floated the idea of forming a National Counter-Terrorism Center (NCTC), again borrowing a leaf from the American book, although this new body would have major overlaps in terms of technology and processes with the pre-existing NTRO. In May, just after the ruling Congress-led coalition retained power in general elections, the politically heavyweight Home Ministry began advocating a new Centralized Lawful Interception and Monitoring System that would "monitor all communication traffic to tighten the country's security and surveillance set-up" and catch early warning signals of impending terrorist attacks. These tasks, again, were hitherto being managed by a full-fledged department of the NTRO. There have been 20 major terrorist strikes in India since 2001, including attacks by militants in Jammu and Kashmir and on parliament in New Delhi, as well as bombings throughout the country. Prior to last year's attack in Mumbai, the deadliest strikes was the bombing of several railway stations and trains in the city in July 2006, with some 180 people killed. In May 2008, bombs exploded in crowded markets outside Hindu temples in the popular tourist destination of Jaipur, killing at least 60. In August 2008, National Security Advisor M K Narayanan said that as many as 800 terrorist cells operated in the country. The domestic Intelligence Bureau (IB), which comes under the purview of the Home Ministry, has also been active in the area of Internet telephony and interception of potential terrorist conversations, adding to the plethora of trespassing mechanisms over and above the heads of existing entities. The IB is now readying for the establishment of a new counter-intelligence center under its supervision. NTRO has struggled in other intramural battles with its notionally allied organization in the labyrinthine state security apparatus, the Research and Analysis Wing (RAW), India's external intelligence organization. The latter's failures in detecting Pakistani intrusions prior to the brief 1999 Kargil war had elicited criticism of its monopoly over foreign intelligence-gathering and culminated in calls to detach RAW's Aviation Research Center (ARC) and merge it with NTRO as a single super agency for technical intelligence. This handover has not been fully accomplished to date and continues to keep the scorebook of bureaucratic wrangling open with highly wasteful expenditure and possible national security costs. Often mocked as a "soft state" that has failed to rectify dysfunctional behavior, India can be better understood as a flabby state with far too many agencies, which work at cross-purposes and keep the structure unprepared and uncoordinated for the next potentially devastating blow of anti-national actors. The gaps and loopholes in the state's counter-terrorist response system have ironically grown with the proliferation of more and more agencies and projects. So bureaucratically dense has the web of competing interests and responsibilities within the Indian state become since the Mumbai attacks that the larger purpose of doing social good by advancing protection of citizens has been subsumed by a "me too" attitude in which everyone and anyone who has some clout within government will press a finger into the pie. In this game of bureaucratic politics, who gets which piece of the cake in terms of influence and counterbalancing "pull" (a uniquely Indian term referring to leveraging power) has overshadowed the core mission of finessing state responses to multifarious threats. Indian's melee of multiplying committees, bodies and agencies scarcely boosts the average citizen's confidence that he or she can be safer after all the revamps and "shakeups". A state is not a monolith but a vast constellation of loosely allied institutions, organizations and centers of power. Visualized from the summit or the apex, the state reproduces itself like hydra into smaller ramifications that carry the seal of sovereignty into the spaces that are inhabited by citizens. The give-and-take between these state agencies and the public is theoretically based on mutual trust and need. Unfortunately, the one-upmanship games bedeviling the Indian security structure have not done justice to this quid pro quo, which lies at the heart of contemporary political life. One pattern emerging from the mess of the flabby Indian state is the attempt of its top echelons to emulate the United States in terms of

merging, refurbishing or creating anew specialized agencies to tackle emerging security risks. What Indian policymakers may have missed in the process of learning lessons from the US is that the latter has been historically bogged down with the same severe symptoms of bureaucratic politicking.

India policy leaders emulate U.S. counterterrorism strategies

Rizvi 8 Dr Hasan-Askari Rizvi is a political and defence analyst, analysis: Imperatives of counter-terrorism —Dr Hasan-Askari Rizvi, <http://archives.dailytimes.com.pk/editorial/14-Dec-2008/analysis-imperatives-of-counter-terrorism-dr-hasan-askari-rizvi>

The post-Mumbai strategies of India and Pakistan reflect their immediate political concerns rather than long-term, coherent and shared perspectives on counter-terrorism. India is trying to extract maximum diplomatic dividend against Pakistan by activating multilateral channels and applying direct pressure. Pakistan is engaged in damage control in an extremely difficult diplomatic situation created by the Mumbai attacks. Pakistan has banned the Jama'at-ud Dawa, sealed its offices and arrested several of its leaders and activists. One wonders why the government had to wait for a UN Security Council resolution and prodding by the United States to act. Pakistan's intelligence agencies must have enough information on the activities of hard-line and militant groups, as well as on their linkages with the Taliban. It is also well known that a good number of non-Pakhtun Pakistanis are involved in the Pakistani Taliban movement. Similarly, Pakistani agencies would know if JuD was a front for banned terrorist group Lashkar-e Tayba. The present Pakistani government and military top brass view the Pakistani Taliban and other militant groups as a major threat to Pakistan's internal political and societal stability. This is a shift from the past when General Pervez Musharraf's regime pursued a dual policy of taking some action against these groups but leaving them enough space to continue with their activities in a low-key manner. The present government asked the military to launch the ongoing operations against the Taliban and Al Qaeda in some tribal agencies, and the operations have made significant gains in Bajaur and Khyber. Militants were also pushed back in Swat, though they are far from being fully contained. Given that the security forces had their hands full in the tribal areas, the government did not want to open a new front against militants in mainland Pakistan. However, consensus at the international level on the involvement of a Pakistan-based group in the Mumbai attacks left Pakistan with no credible option but to take immediate action against militant groups in the mainland. These groups are transnational and use all possible means, including violence, to pursue their agenda with total disregard to the imperatives of Pakistan as a nation-state in the comity of nations. They want Pakistan to be subservient to their agenda, and do not respect Pakistan's sovereign status and territorial boundaries. Should these movements be allowed to impose precarious foreign policy situations on Pakistan? If Pakistan is to function as a coherent and effective state, it cannot allow non-state actors to engage in violent and disruptive activities inside or outside its boundaries. Pakistan's policymakers need to do some hard and realistic thinking on the current situation and terrorism-related issues. Indian policymakers need to do the same. They need not descend into traditional India-Pakistan polemics to deflect criticism of internal security lapses and the probability of terrorism having domestic roots. The Indian government has not blamed the Pakistani government of direct involvement in the Mumbai attacks, but maintains that a Pakistan-based group planned and executed them. This places indirect responsibility on the Pakistani government, given that it is seen to have allowed such a group to use Pakistani territory for a terrorist attack abroad. However, semi- and non-official Indian circles rarely maintain this distinction and project Pakistan as an irresponsible terrorist state. They find encouragement to adopt this position in India's official effort to extract the highest possible diplomatic dividends against Pakistan at the international level. As citizens of a number of states were killed in the attacks, India has found it easy to mobilise support. It is interesting to note that Indian expats in the US are fully involved in the campaign to get Pakistan designated as a terrorist state and to get UN approval for Indian airstrikes in Pakistan. A review of this ongoing Indian diplomatic campaign gives a strong impression that India is more interested in undermining and isolating Pakistan at the international level to further India's wider regional agenda rather than evolving a shared regional counter-terrorism strategy. The present strategy may meet India's immediate domestic needs, but it does not serve the long-term need of countering terrorism holistically and effectively. This long-term objective cannot be achieved without working with Pakistan. A large number of people in India's official and non-official circles want to emulate the United States: the argument is that if the US can launch airstrikes in Afghanistan and invade Iraq in response to attacks on its soil, India can do the same to counter terrorism originating in Pakistan.

India and the U.S. dialogue on counter-terrorism strategies and India seeks to learn best practices from the U.S.

Kumar 15 Manan Kumar reporter for DNA India India prepares for bigger counter-terrorism collaboration with US Thursday, 15 January 2015 - 6:45am IST | Place: New Delhi | Agency: dna,<http://www.dnaindia.com/india/report-india-prepares-for-bigger-counter-terrorism-collaboration-with-us-2052633>

As India prepares to roll out red carpet to president Barack Obama as the chief guest during the Republic Day parade, Prime Minister's Office and union home ministry are finalising an elaborate agenda to address Indian concerns in the homeland security dialogue with their US counterparts. Poised to share wider range of concerns amidst increasing bonhomie, the two countries are looking forward to hold in-depth exchange of views on common areas of interest and collaboration to further mutual counterterrorism goals that includes checking the spread of Islamic State of Iraq and Syria (ISIS) and al Qaeda which recently announced its new wing, al Qaeda in Indian Subcontinent (AQIS). Though still better off than western countries in terms of youth traction towards ISIS, the twin threats are steadily creeping into India and the two countries are eager to learn from each other and develop joint strategies to check their spread, government sources said. The union home ministry is keen to learn from their US counterparts to check proliferation of Jehadi forums in cyberspace that is gaining ground among Urban Indian youth. Recent studies done by IB revealed thousands of Indian youth hooked to such forum thus giving rise to the fear of self indoctrination as Jihadis and possibility of lone wolf attacks. US expertise in checking such proliferation and ways to pinpoint the source of such forums and blocking them can help us tackle this threat in a major way, said sources adding that the talks are at an advanced stage to get the knowhow to get quicker access to block dangerous uploads on social media sites and import of better cyber forensic techniques to crackdown on virtual Jihadis. India is also banking on US for building capacity in cybersecurity and critical infrastructure protection to counter threats and keep terrorist at bay. The two countries will also hold advanced talk on law enforcement engagement proposals include sharing lessons learned and best practices in SWAT team training and responding to mass casualty exercises, improving both nations' capabilities to respond to terrorist incidents and natural disasters.

India has modeled its counterterrorism model after the U.S.

Raman 12 Bahukutumbi Raman is the additional secretary (retired), cabinet secretariat, Government of India, New Delhi, and, presently, director, Institute For Topical Studies, Chennai, and Associate of the Chennai Centre For China Studies), How PC tried to emulate US counter-terrorism centre and failed, <http://www.rediff.com/news/slide-show/slide-show-1-how-pc-tried-to-emulate-us-counter-terrorism-centre-and-failed/20120116.htm>

The 26/11 terrorist strikes in Mumbai revealed more or less the same deficiencies in our counter-terrorism architecture as the deficiencies in the counter-terrorism architecture of the US revealed by the 9/11 terrorist strikes. Namely, inadequate intelligence and lack of co-ordinated follow-up action even on the intelligence that was available. In his first statement to the Lok Sabha on the 26/11 terrorist strikes after taking over as the Home Minister P Chidambaram said that the responsibility for follow-up action on available intelligence was found to be diffused. Shortly thereafter, he had visited the US to study the working of the Department of Homeland Security and the NCTC, both of which came into being after 9/11. He came back a strong votary of two ideas: For the creation of a separate Ministry of Internal Security patterned after the Department of Homeland Security of the US and for the creation of an NCTC patterned after its US counterpart.

India modeled their high tech surveillance after U.S. – It was created after the Indian Home Minister visited the NSA

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

In the spring of 2009, even as municipal crews in Mumbai were still sifting through the debris of 26/11, India's newly-appointed home minister, P Chidambaram, was ushered into the digital heart of the United States' war against terrorism, its super-secret National Counter-Terrorism Centre. He gazed intently, an aide recalls, at its giant video-walls, where information from across the world displayed in real time, and asked searching questions about the dozens of classified databases that feed them. Later that year, Chidambaram promised a made-in-India NCTC would be up and running "by the end of 2010"- a third of the time it had taken the United States. "India cannot afford to wait 36 months", he declaimed. -

Or Nah Modeling

Their modeling evidence goes the wrong direction—Even if India used the U.S. as a model for strengthening its counterterrorism strategy they will not reverse model reductions – India perceives itself as facing very different threats and domestic politics would block any roll back in surveillance

Kumar 12 Vikas Kumar is Assistant Professor of Economics at Azim Premji University, Bangalore, East Asia Forum, Why the India–US counter-terrorism partnership is largely symbolic 11 October 2012, <http://www.eastasiaforum.org/2012/10/11/why-the-india-us-counter-terrorism-partnership-is-largely-symbolic/> Zabiuddin Ansari, wanted among other things for the 2008 Mumbai terrorist attack, was recently deported from Saudi Arabia to India. This has been hailed as a sign of growing convergence among India, the US and Saudi Arabia on terrorism and Iran. But B. Raman, former head of the counter-terrorism division of India's external intelligence agency, has convincingly argued that the India–Saudi Arabia link of the triad will remain weak. And there are several reasons why even India–US counter-terrorism cooperation will also continue to be largely symbolic and sporadic for the foreseeable future. Let us begin with demography. Muslims, mostly immigrants, account for just 0.6 per cent of the US population, whereas Muslims account for more than an eighth of India's population and are among the country's founding fathers and leading public and cultural figures. India is geographically close to the nerve centres of Islamic terrorism in South and West Asia. This proximity is a disadvantage as Pakistan-based transnational terrorists can easily penetrate India's porous land and maritime borders. Moreover, India, unlike the US, has only a limited overseas capacity to counter terrorism at its source. But even if it had such a capacity, it would be largely ineffective against nuclear Pakistan. And irrespective of the incentives India may offer Pakistan's megalomaniac and paranoid military-intelligence establishment, the latter will not deliver results because any letting down of the hate campaign against India would conflict with its raison d'être. In contrast, the US, which is geographically isolated and has a better counter-terrorism capacity, is able to fight terrorism far away from its territory. India and the US also differ in their ability to influence Islamic countries. India is hugely dependent on Middle Eastern oil and many of its workers are employed in this region. This reduces India's bargaining power vis-à-vis the Middle East, which is a major source of financial and ideological support for Islamic terrorist organisations in South Asia. In contrast, given its influence over international institutions and the global financial system, the US is relatively better placed to favourably influence the policies of Islamic countries. Last but not the least, since the early 19th century Indian Muslims have been influenced by developments in West Asia, and since the early 20th century they have been in conflict with the majority Hindus. The Muslim–Hindu conflict resulted in the bloody partition of India that has left behind unresolved territorial issues, and the West Asian influence has radicalised some sectors of the Muslim community in India. As a result, the Indian policymaker and common man alike believe that terrorism is to some extent linked to the Kashmir question and to Indian youth affected by Muslim–Hindu riots, both of which are problems internal to India. These factors contribute to a number of differences between the counter-terrorism strategies of India and the US. US policy makers regard terrorism as a foreign and national defence problem. There is no influential domestic lobby that radically differs from the establishment's views in this regard. The domestic debate in the US is largely about the

logistics of fighting terrorism and the identification of suitable international partners. Changes in counter-terrorism strategy will not have a dramatic effect on US domestic politics. So, policymakers have sufficient freedom to rework strategy in response to changing threat patterns. In contrast, minor changes in strategy can disproportionately affect domestic politics in India: a strong-arm strategy will radicalise the Muslim masses, whereas a softer strategy will validate the Hindu right's claim that Muslims are appeased in the name of secularism. So, unlike the drone-borne counter-terrorism efforts of the US, India's fight against terrorism is almost entirely police-driven and backed by potential soft cultural options. India is similarly constrained on the foreign policy front. There are three reasons for this. First, Indian policy makers and the public view international counter-terror operations as undesirable insofar as they contribute to internationalising the Kashmir issue and attracting international jihadi attention to India. Second, India is a net oil importer; Muslims have a much stronger political presence in India; and mainstream political parties view the Palestine problem through the prism of decolonisation. So, on the one hand, the Indian government cannot, for example, support Israel on the Palestine issue and benefit from US–Israel counter-terrorism expertise. On the other hand, India cannot afford to go all out against Saudi Arabia and Iran because of the deep attachment felt by many Sunni and Shia Muslims to holy places in these countries and because of India's dependence on oil imports. Third, the US can bargain with countries like Pakistan over, say, rendering terrorists like David Coleman Headley to third countries and demanding, in exchange, cooperation to detect threats against its homeland. But India does not have access to such tradable assets. To conclude, India and the US view Islam differently and they face very different geo-political and domestic constraints. This in turn implies a divergence rather than convergence of counter-terrorism strategies. Moreover, belated revision of the US's Kashmir policy and procrastination in banning terror groups focused on India ensure that the Indian public and policymakers continue to distrust the intentions of the US — and a reciprocal feeling exists in this latter country. The two sides, therefore, need to overcome historical distrust of each other. In the meantime, it is unfair to treat counter-terrorism cooperation as the bellwether of their relationship. In fact, it would help if existing counter-terror cooperation were downplayed to knock the wind out of jihadi propaganda against the phantom Judaeo–Christian–Hindu alliance. The India–US relationship should instead build upon common interests like the promotion of maritime security, free trade, energy security, clean technologies, anti-proliferation regimes, human rights and democracy.

They have no reverse modeling evidence—India has explicitly rejected U.S. privacy restrictions on surveillance

Bhatia 15 Gautam Bhatia is Advocate, Delhi High Court, STATE SURVEILLANCE AND THE RIGHT TO PRIVACY IN INDIA: A CONSTITUTIONAL BIOGRAPHY, stsfor.org/content/changing-face-privacy-india-analysis

Ever since the explosive Snowden disclosures in May 2013, State surveillance and citizens' right to privacy have been at the forefront of international debate. Even as the Snowden documents were revealing, detail by detail, the American and British intelligence agencies' extensive surveillance systems (PRISM and TEMPORA, among others) used to spy both on their own citizens, and upon communications elsewhere, reports about Indian bulk surveillance began to trickle in. It is now known that there are at least two surveillance regimes in India, in uncertain stages of preparation: the Central Monitoring System (CMS), which provides for the collection of telephony metadata by tapping into the telecommunications' companies records²; and Netra, a dragnet surveillance system that detects and sweeps up electronic communication that uses certain keywords such as “attack”, “bomb”, “blast” or “kill”. These programs, wide in their reach and scope, have dubious statutory backing. They also, very clearly, impinge upon basic fundamental rights. A discussion of the legal and constitutional implications, therefore, is long overdue. This essay presents an analytical and chronological history of the Indian Supreme Court's engagement with the right to privacy. While discussions for a privacy statute have stagnated and are presently in limbo³, the Court has been active for nigh on fifty years. This essay aims to achieve a comprehensive, doctrinal understanding of the constitutional right to privacy, as evolved, understood and implemented by the judiciary. Such an understanding, indeed, is an essential prerequisite to embarking upon a legal and constitutional critique of mass State surveillance in India. II. FOUNDATIONS Privacy is not mentioned in the Constitution. It plays no part in the Constituent Assembly Debates. Indeed, a proposal to include a provision akin to the American Fourth Amendment (and the root of American privacy law), prohibiting ‘unreasonable searches and seizures’, was expressly rejected by the Assembly. The place of the right – if it exists – must therefore be located within the structure of the Constitution, as fleshed out by judicial decisions.

The India system has not modeled existing U.S. restrictions on metadata

Lowenthal 14 Mark M. Lowenthal is the senior specialist in U.S. foreign policy at the Congressional Research Service Intelligence: From Secrets to Policy

India has a growing cyberspace capability, which, like that of many other nations, appears to have been used against potential foes, such as China and Pakistan, and more friendly states, like the United States. India is in the midst of deploying a Centralised (or Central) Monitoring System (CMS) that is designed to track all communications within India—telephone, computer, landline, mobile, and so on. Unlike the NSA program, CMS will not have to ask providers' permission for access but will have that built into the technology of the telecom and data service providers. (IMS will provide intelligence to foreign and domestic agencies, the police, and tax collectors—a list that some believe is too broad. Like the NSA program, CMS appears to focus on metadata. CMS is being developed and will be run by a government technology development center that is not part of the intelligent complex. The Ministry for Home Affairs will have the power to determine who is monitored.

India has not modeled restrictions—They have far more surveillance authority than the U.S.

Mirani 13 Leo Mirani is a reporter for Quartz, Think US snooping is bad? Try Italy, India or...Canada, <http://qz.com/92648/think-us-snooping-is-bad-try-italy-india-or-canada/>

Just because something is legal doesn't necessarily make it a good thing. So far, legality is the main rationale US officials have used to defend the government's PRISM spying program. It's all perfectly legal, approved by Congress and the courts. But a more potent argument might be to compare PRISM with the spying programs of other countries. Compared to the data-mining that goes on elsewhere, US intelligence agencies may be relatively constrained. Start with Canada, which many consider to be a cuddlier, saner version of the US. The Globe and Mail reports today that the Canadian defense minister approved a plan similar to PRISM back in 2005, and renewed it in 2011. Run by the Communications Security Establishment Canada (CSEC), a signals intelligence agency similar to the US's NSA or Britain's Government Communication Headquarters (GCHQ), the program collects metadata from phone and internet communication. Like PRISM, CSEC's primary targets are said to be foreigners. But what makes the Canadian effort somewhat more sinister is that it was instituted through the executive branch of government without legislative approval. According to the Globe and Mail, "a regime of ministerial directives—decrees not scrutinized by Parliament—have authorized the broad surveillance programs." At least PRISM won the approval of Congress, however clueless the legislature may be about the details. Then there is Italy. According to Italian lawyer Fulvio Sazrana (link in Italian), a law passed earlier this year by the outgoing Mario Monti government also skipped over court orders and other legal approvals. Instead, Monti issued a directive laying down guidelines for the protection of cybernetics and national cyber security. In so many words, the directive gives government agencies what the French call "carte blanche" to raid private data banks in the name of "internet security." There will be no Italian equivalent of Twitter, which does not participate in PRISM. In India, internet service providers are "insisting upon Indian users' privacy to be protected from any such misadventure of any intelligence departments." Meanwhile, India's government is setting up a vast surveillance system with the express purpose of spying on its citizens, something the NSA has been at pains to say it does not do. For instance, the government's Central Monitoring System gives it access to all telecom traffic, including calls, text messages and mobile internet. According to the Hindu newspaper, another proposed "national cyber coordination cell" plans to: Collect, integrate and scan [internet] traffic data from different gateway routers of major ISPs at a centralised location for analysis, international gateway traffic and domestic traffic will be aggregated separately ... The NCCC will facilitate real-time assessment of cyber security threats in the country and generate actionable reports/alerts for proactive actions by the concerned agencies. India's external intelligence agency, the armed forces, and even the local defense research establishment, among others, will have access. It is debatable whether India, Canada or Italy's data-acquisition and data-mining technology are as powerful as that of the NSA. But when they are, these countries will already have laws and systems in place to abuse them.

The U.S. meta data program had legal privacy protections built in even before the Freedom Act
Perez 13

Evan Perez reporter for Wall Street Journal, Phones Leave a Telltale Trail, Updated June 15, 2013, <http://www.wsj.com/articles/SB10001424127887324049504578545352803220058>

Under the NSA phone program, the government collects domestic phone metadata without a specific investigative lead. Trained analysts only search the database in conjunction with a terrorism investigation, authorities say. Intelligence

agencies "basically reimpose at the level of analysis the standards you might ideally have for collection," said Timothy Edgar, a former top national-security privacy lawyer in the Bush and Obama administrations. Mr. Edgar said the increasingly specific location data raises concerns about potential violations of Fourth Amendment protections against unreasonable searches and seizures. Once a person can be located within a building, the monitoring more closely resembles a search that would traditionally require a warrant.

The NSA program is accompanied by privacy restrictions, Obama administration officials say. To search the database, the government must have "reasonable suspicion" that the basis for the query is "associated with a foreign terrorist organization," they say. Search warrants approved by the secret Foreign Intelligence Surveillance Court are required before the contents of the calls may be monitored.

No reverse modeling – No restrictions on surveillance that exist in the U.S. have ever been modeled in India—India has far more access to data than the U.S. does now—The CMS collects and listens to all calls directly—it is not limited to metadata and they have not modeled any privacy protections

Prakash 13 Pranesh Prakash is Policy Director, The Centre for Internet and Society, Bangalore, How Surveillance Works in India July 10, 2013, http://india.blogs.nytimes.com/2013/07/10/how-surveillance-works-in-india/?_r=0

When the Indian government announced it would start a Centralized Monitoring System in 2009 to monitor telecommunications in the country, the public seemed unconcerned. When the government announced that the system, also known as C.M.S., commenced in April, the news didn't receive much attention. After a colleague at the Centre for Internet and Society wrote about the program and it was lambasted by Human Rights Watch, more reporters started covering it as a privacy issue. But it was ultimately the revelations by Edward J. Snowden about American surveillance that prompted Indians to ask questions about its own government's surveillance programs. In India, we have a strange mix of great amounts of transparency and very little accountability when it comes to surveillance and intelligence agencies. Many senior officials are happy to anonymously brief reporters about the state of surveillance, but there is very little that is officially made public, and still less is debated in the national press and in Parliament. This lack of accountability is seen both in the way the Big-Brother acronyms (C.M.S., Natgrid, T.C.I.S., C.C.T.N.S., etc.) have been rolled out, as well as the murky status of the intelligence agencies. No intelligence agency in India has been created under an act of Parliament with clearly established roles and limitations on powers, and hence there is no public accountability whatsoever. The absence of accountability has meant that the government has since 2006 been working on the C.M.S., which will integrate with the Telephone Call Interception System that is also being rolled out. The cost: around 8 billion rupees (\$132 million) — more than four times the initial estimate of 1.7 billion — and even more important, our privacy and personal liberty. Under their licensing terms, all Internet service providers and telecom providers are required to provide the government direct access to all communications passing through them. However, this currently happens in a decentralized fashion, and the government in most cases has to ask the telecoms for metadata, like call detail records, visited Web sites, IP address assignments, or to carry out the interception and provide the recordings to the government. Apart from this, the government uses equipment to gain access to vast quantities of raw data traversing the Internet across multiple cities, including the data going through the undersea cables that land in Mumbai. With the C.M.S., the government will get centralized access to all communications metadata and content traversing through all telecom networks in India. This means that the government can listen to all your calls, track a mobile phone and its user's location, read all your text messages, personal e-mails and chat conversations. It can also see all your Google searches, Web site visits, usernames and passwords if your communications aren't encrypted. You might ask: Why is this a problem when the government already had the same access, albeit in a decentralized fashion? To answer that question, one has to first examine the law. There are no laws that allow for mass surveillance in India. The two laws covering interception are the Indian Telegraph Act of 1885 and the Information Technology Act of 2000, as amended in 2008, and they restrict lawful interception to time-limited and targeted interception. The targeted interception both these laws allow ordinarily requires case-by-case authorization by either the home secretary or the secretary of the department of information technology. Interestingly, the colonial government framed better privacy safeguards into communications interception than did the post-independence democratic Indian state. The Telegraph Act mandates that interception of communications can only be done on account of a public emergency or for public safety. If either of those two preconditions is satisfied, then the government may cite any of the following five reasons: "the sovereignty and integrity of India, the security of the state, friendly relations with foreign states, or public order, or for preventing incitement to the commission of an offense." In 2008, the Information Technology Act copied much of the interception provision of the Telegraph Act but removed the preconditions of public emergency or public safety, and expands the power of the government to order interception for "investigation of any offense." The IT Act thus very substantially lowers the bar for

wiretapping. Apart from these two provisions, which apply to interception, there are many laws that cover recorded metadata, all of which have far lower standards. Under the Code of Criminal Procedure, no court order is required unless the entity is seen to be a “postal or telegraph authority” — and generally e-mail providers and social networking sites are not seen as such. Unauthorized access to communications data is not punishable per se, which is why a private detective who gained access to the cellphone records of Arun Jaitley, a Bharatiya Janata Party leader, has been charged under the weak provision on fraud, rather than invasion of privacy. While there is a provision in the Telegraph Act to punish unlawful interception, it carries a far lesser penalty (up to three years of imprisonment) than for a citizen’s failure to assist an agency that wishes to intercept or monitor or decrypt (up to seven years of imprisonment). To put the ridiculousness of the penalty in Sections 69 and 69B of the IT Act provision in perspective, an Intelligence Bureau officer who spills national secrets may be imprisoned up to three years. And under the Indian Penal Code, failing to provide a document one is legally bound to provide to a public servant, the punishment can be up to one month’s imprisonment. Further, a citizen who refuses to assist an authority in decryption, as one is required to under Section 69, may simply be exercising her constitutional right against self-incrimination. For these reasons and more, these provisions of the IT Act are arguably unconstitutional. As bad as the IT Act is, legally the government has done far worse. In the licenses that the Department of Telecommunications grants Internet service providers, cellular providers and telecoms, there are provisions that require them to provide direct access to all communications data and content even without a warrant, which is not permitted by the existing laws on interception. The licenses also force cellular providers to have ‘bulk encryption’ of less than 40 bits. (Since G.S.M. network encryption systems like A5/1, A5/2, and A5/3 have a fixed encryption bit length of 64 bits, providers in India have been known use A5/0, that is, no encryption, thus meaning any person — not just the government — can use off-the-air interception techniques to listen to your calls.) Cybercafes (but not public phone operators) are required to maintain detailed records of clients’ identity proofs, photographs and the Web sites they have visited, for a minimum period of one year. Under the rules designed as India’s data protection law (oh, the irony!), sensitive personal data has to be shared with government agencies, if required for “purpose of verification of identity, or for prevention, detection, investigation including cyber incidents, prosecution, and punishment of offenses.”

India has not modeled any of the privacy protections that exist in the U.S. – They have no legislation protecting privacy

Xynou 13 Maria Xynou Maria is a Policy Associate on the Privacy Project at the CIS, FinFisher in India and the Myth of Harmless Metadata, <http://cis-india.org/internet-governance/blog/fin-fisher-in-india-and-myth-of-harmless-metadata>

Furthermore, India lacks privacy legislation which could safeguard individuals from potential abuse, while sections 66A and 69 of the Information Technology (Amendment) Act, 2008, empower Indian authorities with extensive surveillance capabilities.^[28] While it remains unclear if Indian law enforcement agencies are using FinFisher spy products to unlawfully target individuals, it is a fact that FinFisher control and command servers have been found in India and that, if used, they could potentially have severe consequences on individuals’ right to privacy and other human rights.[]

AT: CMS Economy “honey pot” scenario

Their scenario makes no sense - CMS is a data base for communication records and telephone data—It does not connect to the banks or financial markets—Hacking the CMS does not equal attacks on financial institutions

Cyber attacks can't crush the economy because India's economic infrastructure is compartmentalized and the national data base is protected

Shukla 13 Ajai Shukla reporter for Business Standard, Cyberspace: India's digital battleground, 22nd Jun 13 <http://ajaiashukla.blogspot.com/2013/06/cyberspace-indias-digital-battleground.html>

India, however, has been slow in fixing its attention on cyber security. This may partly be because much of the country's critical infrastructure --- power grids, public transportation, nuclear power plants, defence systems --- is controlled by manual systems, or by stand-alone computer systems that are not linked over the internet. In that respect, India's infrastructural backwardness has proved a useful safeguard against cyber attack. "It is not unusual to find New Delhi's central ministry officials using unsecured email systems, sometimes even commercial email accounts on public servers. But India's sensitive networks tend to be isolated, with no point of contact with the internet that would render them vulnerable to on-line hacking. Several agencies have their own, dedicated, secure optic fibre networks, notably the military; the Defence R&D Organisation (DRDO); and the police's Crime and Criminal Tracking Network System (CCTNS), the national database that is being gradually rolled out." says Praveen Swami, the Strategic Affairs Editor of Network 18.

Not Unique—Cyber attacks on India's financial infrastructure are exploding now before CMS has been completed

Athavale 14 Dileep Athavale, reporter for the Times of India. Cyberattacks on the rise in India , TNN | Mar 10, 2014, <http://timesofindia.indiatimes.com/tech/it-services/Cyberattacks-on-the-rise-in-India/articleshow/31757791.cms>

The ease of online banking and transactions has brought with it a significant rise in malicious attacks on digital devices and software systems. Most of these attacks, as recent instances of online thefts have demonstrated, have been in the banking and financial services domain. According to reports by research agencies, the problem has become more complex with the proliferation of mobile devices and the users' preference towards transactions on the go. In addition, there is also laxity on the part of the users when it comes to following safe practices during such transactions, coupled with a significant lack of manpower with skills to handle the rising number of such attacks, the agencies' reports state. Arbor Networks' research report states that 2013 witnessed a huge rise in attacks against the banking and financial services sector. Government establishments also faced such attacks. The firm said there was a 136% increase in cyberthreats and attacks against government organizations and 126% against financial services organizations in India. India has seen significant increase in attacks against financials and government, with 34% and 43% of them reporting cyberthreats and attacks respectively, up from last year's 15% and 19%, the report revealed. "From the ISP to the enterprise, IT and security teams are facing a dynamic threat landscape and very skilled and patient adversaries," Matthew Moynahan, president of Arbor Networks, said. "Multi-layered defenses are clearly needed, but so is a commitment to best practices for people and process," he added. Another report, from EC-Council Foundation pointed at a major gap in information security threat handling capabilities in India, thanks mainly to the talent crisis in the country. The report shows talent levels in nine crucial segments of information security, the implications of which could impact handling of cyberthreats in industries such as banking and economy, defence, healthcare, information and energy among others. Close to an alarming 75% participants displayed low levels or a lack of skill in error handling, while 73% participants were not adequately equipped with skills in file handling, the report revealed. Experts have recognized that malicious file inclusions, malware distribution and distributed denial of service (DDOS) attacks are known threats that can arise out of improper file handling and such threats are often used to synchronize attacks

on websites or large networks, the report stated. Anshul Abhang, managing director and chief executive of enterprise security solutions firm Deltaproactive, told ToI that a malicious attacker now looks for high-value targets that can benefit him financially. "Hacking is no more a satisfaction game but has become serious business. The attackers also look for indirect financial benefits by targeting particular organizations' services and taking it down eventually. Such service outages result in financial loss as well as goodwill and image loss in the market."

India's banking sector is vulnerable to cyber attacks now

Kaushik 14 Ram. K. Kaushik is a blogger for Cyber Security in India, <http://cybersecurityforindia.blogspot.com/>

However, cyber security in India is in a poor condition. Cyber security of banks in India is also required to be strengthened. The banks operating in India are not at all serious about maintaining cyber security of banking related transactions and this is resulting in many cyber and financial crimes in India. In the absence of appropriate skills development and modernisation of law enforcement agencies of India, police force are finding it really difficult to solve technology related crimes. Further, cyber security of sensitive databases like National Identity Cards would also require strong privacy protection and cyber security compliances.

Turn, Only completing the CMS can allow the surveillance necessary to stop cyber attacks on the financial system

GKT 15 General Knowledge Today: India's Daily E Magazine, Feb 2015
<http://www.gktoday.in/blog/developing-the-cyber-security-architecture/>

Cyber warfare is the internet based conflict which arises when the information system of the strategic departments of the country are attacked in order to get the classified information. In the modern world of digitization such politically motivated snooping is done to interrupt the strategic affairs of the nation. Sometimes it is aimed at attacking the major infrastructures of the nation. With the shrinking world, the internet connectivity and heavy dependence of the government functioning on internet, it is imperative to have a cyber securing framework. In the world of digitization critical infrastructure like banking system, financial market, power infrastructure, and hydroelectric projects are prone to such attack. The grid failure like instances can be its consequences. Hydroelectric projects prone to disaster, may be attacked and create disasters. 'Stuxnet' like malwares which were introduced in the centrifuge of Iran was one such incidence. NSA's PRISM snooping incidence, Dropmier, Tempora are such other global surveillance programmes which were operationalised to mine the data strategic to India. Hackers from different countries like Pakistan and china try to deface the Indian website are the potential attackers. Hence it is imperative to have in the modern times a properly tucked national security and monitoring system to have a digital surveillance in the country protecting it from cyber warfare and cyber espionage. India's efforts to minimize the cyber threat With the rise of India in last some decades as a global power and emerging economy it attracted global attention and remains vulnerable with regard to information protection. India's cyber security architecture as of now do not provide any mass surveillance mechanism with only few distinguished agencies like RAW, IB get access to such monitoring after the approval. India's effort include CERT-In (Computer Emergency Response Team- India) which was formed in 2002-03 to create awareness on cyber threat, understand vulnerabilities and devise ways to mitigate them. National Technical Response Organization (NTR0) was given responsibility of protecting the critical infrastructure institution and developing offensive capabilities. Amendments to the IT act 2008, raised the level of awareness about the cyber crimes. It recognizes various ways of cyber attacks and also provides help to prosecute the cyber criminals. National cyber security policy 2013 was framed to build a secure and resilient cyber space for government, citizen and business to protect the classified information critical to India's security. Its features include range of provisions including 24X7 mechanisms to deal with cyber threats. India is following the path of developing intense surveillance system which not only monitor the cyber threat to the national security but also seems to compromise the privacy of its citizen in some cases. The Central Monitoring System (CMS) is an ambitious project that is required to keep the national security and monitoring under surveillance. It would be a centralized mechanism where the telecommunication and internet connections can be analyzed by Indian government and its agencies. Central and regional database would help law enforcement agencies to monitor and intercept. Call data recordings and data mining to identify call details of the targeted numbers. Another such Efforts is NeTRA (Network Traffic Analysis System) will intercept

and examine communication over the internet for keywords like 'attack', 'blast', 'kill'. It appears to be Indian government first attempt of mass surveillance rather than individual targets. It will scan the activities over the social networking websites like twitter and would scan the mails and chat transcript and even the voices in the internet traffic. India's cyber security has not only to be effectively implemented but also to be redrawn in line with growing cyber crimes.

Turn, metadata is key to DETER cyber attacks

Michaels 13 Jim Michaels, is a military writer for USA TODAY and has covered wars around the world. He is a former Marine infantry officer USA TODAY June 6, 2013, NSA [data mining can help stop cybercrime](#), analysts say [The huge volume of telephone records](#) turned over to the U.S. government [could help investigators identify and deter](#) a range of terrorist acts, including [cyberattacks](#), analysts say. "Once you have this big chunk of data and you have it forever... you can do all sorts of analytics with it using other data sources," said Joseph DeMarco, former head of the cybercrime unit in the U.S. attorney's office in New York City. "A data set like this is the gift that keeps on giving," said DeMarco, a partner at the law firm DeVore & DeMarco.

Turn- NCCC Metadata program for preventing cyber terror attacks is modeled after U.S. data collection and will prevent cyber attacks

Keck 13 Zachary Keck is assistant editor of The Diplomat, India Sets Up Domestic PRISM-Like Cyber Surveillance?, <http://strategicstudyindia.blogspot.com/2013/06/afghan-lessons-for-arming-syrian-rebels.html>

Even as [the United States' PRISM cyber-snooping program](#) is raising alarm across the world, [India is in the midst of setting up a similar program](#) designed to collect intelligence via the internet domestically. The Hindu reports that the India government is creating a centralized mechanism to coordinate and analyze information gathered from internet accounts throughout the country. [The mechanism will be called the National Cyber Coordination Centre](#) [NCCC]. "The federal Internet scanning agency [will give law enforcement agencies direct access to all Internet accounts](#), be it your e-mails, blogs or social networking data," the Hindu reported, referring to the NCCC. A classified government "note" that The Hindu obtained explains the NCCC in this way: "The NCCC will collect, integrate and scan [Internet] traffic data from different gateway routers of major ISPs at a centralised location for analysis, international gateway traffic and domestic traffic will be aggregated separately ... [The NCCC will facilitate real-time assessment of cyber security threats in the country and generate actionable reports/alerts for proactive actions](#) by the concerned agencies" NDTV, however, reports that the NCCC will not target individuals but rather will seek to access threats to India's cyber infrastructure as a whole. "The new system will look for unusual data flow to identify and access cyber threats and not individual data," NDTV reported, citing unnamed government officials. But the Hindustan Times reports that [Indian authorities have long used meta-data to track potential cyber threats](#) inside the country. According to that paper, the program does not allow Indian authorities to access actual content, but rather look for "patterns in the manner emails, phone calls and SMSes are sent and delivered." It's unclear how much the NCCC would expand this authority and in which ways, if at all. One purpose of the NCCC seems to be simply trying to coordinate the different activities of government agencies tasked with elements of cybersecurity. During a speech last month, Prime Minister Singh briefly alluded to the then-forthcoming NCCC, "We are implementing a national architecture for cyber security and have taken steps to create an office of a national cyber security coordinator."

Turn, India's metadata surveillance program will prevent cyber attacks

Jhala 14 Krishna Jhala is an associate attorney at Priti Suri & Associates, India gets ready to set up cyber snooping agency March 2014, http://www.psalegal.com/FLASH_POPUP.php?flashID=144

[India will soon be setting up a federal internet scanning agency called NCCC to spy all internet accounts and online data](#). NCCC is [to monitor cyber security threats and inform concerned law enforcement agencies for proactive action to prevent crime](#). NCCC will collect and integrate internet traffic data from different gateway routers of major ISPs at a centralized location for analysis. NCCC would be set up at a cost of INR 10 billion and all top government spy and technical agencies including Department of Telecommunication, Intelligence Bureau, Research and Analysis Wing, Indian Computer Emergency Response Team, Army, Navy, Air force, National Security Council Secretariat,

Defence Research and Development Organization will play an active role in the functioning of NCCC. PSA view - In the present internet era, cyber attacks are on an increase and pose as a huge threat to the safety and security of the nation. Recently, Central Bureau of Investigation's website had been defaced by hackers and in another case attempts were made to break into Indian Railway Website. Therefore, NCCC is need of the hour and a step in the right direction to address the shortcoming in the cyber security. 100% FDI allowed in telecom sector In a meeting of the Department of Policy and Promotion chaired by Prime Minister on July 16, 2013, it was announced that FDI limit in the telecom sector has been increased to 100%. The earlier limit was 74%. As per latest announcements, investment up to 49% is allowed to come in through the automatic route and investment above 49% is required to be brought in through the government route i.e. approval of the Foreign Investment Promotion Board. PSA view - The announcement is seen as a welcome change. However, the policy and implementation of these announcement is what is most awaited. The increased limits are set to bring in billions of investments in this sector. Fresh foreign investments would help catalyze growth and the process of proliferation in the telecom sector across the country. India set to frame new testing norms for telecom equipment The Department of Telecommunications with the Department of Electronics & IT and National Technical Research Organization are all set to frame new testing standards for telecom gear to shield networks from potential cyber attacks. The Common Criteria Recognition Arrangement ("CCRA") clearance will no longer be enough to certify global telecom gear used in India, announced the National Security Council Secretariat, the apex agency looking into India's political, economic and energy and strategic security concerns. PSA view - CCRA was created ten years back by UK, US, Canada, France, Germany and the Netherlands, Australia and New Zealand, to define a common process to evaluate security-sensitive IT & telecom products and an objective to motivate global telecom vendors to find common processes to reduce equipment certification costs worldwide. But now India has started creating country-specific telecom gear testing standards and adopting several measures: (i) mobile phone companies have been mandated to use equipment deemed "safe" by an authorized testing lab in India from November 1, 2013; (ii) India is preparing a cyber security framework and a cyber security policy; (iii) India is setting up a National Cyber Coordination Centre to monitor metadata on cyber traffic flows; (iv) Establish a pilot lab and a full-fledged certification center and development system; and (v) To adopt global approaches to its procurement policies, India is reviewing its Preferential Market Access policy designed to compel foreign companies to manufacture electronic products in India if they want to sell in India.

LeT Disad

LeT stands for Lashkar e Taiba (sometimes called

Let - Internal Links

VOIP Links

LeT can avoid detection because it relies on VOIP communication that can't be tracked

Sharwood 12 Simon Sharwood is a reporter for the Register Terrorists 'build secure VoIP over GPRS network' Secret comms channel eludes Indian spooks, http://www.theregister.co.uk/2012/05/01/terror_group_voip/

Terror group Lashkar-e-Taiba has developed its own VoIP network that connects its members over GPRS networks, according to the Times of India. UK and US authorities have both declared Lashkar-e-Taiba a proscribed terror organisation. The group's aims include India ceding sovereignty over Kashmir. Members of the organisation participated in the 2008 attacks on Mumbai. The VoIP network is frustrating India's intelligence community, the report says, because it means they can no longer trace the group's members as it is far harder to spy on than email or commercial VoIP services. "Earlier, we could intercept conversations on phone or locate Lashkar cadres based on their IP addresses through their emails," an intelligence source told the Times. "But now we're finding it tough to gather intelligence because Lashkar men hold audio or video conferences using private VoIP." The network even has a name: Ibotel. The report says Lashkar-e-Taiba recruited "technicians, engineers and information technology executives ... intensify its operations across India." Some of those recruits, the report suggests, developed Ibotel as the group sought more secure methods of communication.

LeT use of VOIP is making them impossible to track down with conventional intelligence methods

Singh 12 Aarti Tikoo Singh reporter for Times of India, Lashkar's own Skype frazzles Indian intelligence , TNN | Apr 30, 2012, <http://timesofindia.indiatimes.com/india/Lashkars-own-Skype-frazzles-Indian-intelligence/articleshow/12934037.cms>

The increasing use by terror group Lashkar-e-Taiba [LeT] of Voice over Internet Protocol (VoIP) for communication, and its impenetrability, is proving frustrating for Indian intelligence. In fact, Lashkar supreme commander of operations, Zaki-ur Rehman Lakhvi, who is in a Rawalpindi jail, has been networking using a private VoIP on his smart phone with Lashkar cadres. "Lakhvi's compound serves as Lashkar's alternative headquarters," a top intelligence source told TOI. It was his imprisonment, sources said, that stopped Lashkar cadres from using emails and phones and restrict communication to VoIP. VoIP is a technology that delivers audio and video messages over the internet. It's distinct from phone as it converts audio signals into binary data. VoIP also allows encryption of data, which makes it difficult to decode messages. Senior intelligence sources in Kashmir told TOI that Muridke (Lahore) based Lashkar known for using technology more than any other terror group in Kashmir, has its own private VoIP, Ibotel, to communicate with its cadres in Pakistan and Kashmir. Ibotel, Lashkar's exclusive VoIP that runs on GPRS (mobile data service on 2G or 3G cellular communication system), was created by Lashkar's own tech team. The group began recruiting technicians, engineers and information technology executives almost a decade ago to intensify its operations across India. Lashkar, which is headed by Hafiz Saeed against whom the US recently announced a \$10 million bounty for his alleged role in the November 2008 Mumbai attacks, started using VoIP as soon as the technology became common in early 2000s. Lashkar's handlers used VoIP during the Mumbai attacks, intelligence sources said. "Earlier, we could intercept conversations on phone or locate Lashkar cadres based on their IP addresses through their emails. But now we're finding it tough to gather intelligence because Lashkar men hold audio or video conferences using private VoIP," said intelligence sources. "It's difficult to track their locations. And even if we know their IP addresses and the time and date of their audio or video calls, we remain technologically handicapped because we can't intercept what transpired between them," said a senior government official. "There may not be more than 50-odd Lashkar men. Yet, they are a threat because they have the ability to strike in the Valley or other parts of the country. We need to catch up with the technology to hunt them down," said a senior J&K police officer.

CMS is key to tracking VOIP communications

Parbat 13

Kalyan Parbat, ET Bureau Dec 30, 2013, Home Ministry pushes for IB right to screen VoIP services offered by Skype, Yahoo, GTalk, RediffBol c Dec 30, 2013, http://articles.economictimes.indiatimes.com/2013-12-30/news/45711413_1_interception-solution-voip-indian-telegraph-act

Learning from the interception pilot will be used by the government to fine tune the Centralised Monitoring System (CMS), the much-awaited national surveillance system that will be equipped to track all forms of communications, including wireless, landline, satellite, internet and VoIP calls from next year.

A comprehensive study demonstrated that disrupting LeT is key to stopping its attacks

Dilegge 12

¶ Dave Dilegge is Editor-in-Chief of Small Wars Journal and serves as a Director at Small Wars Foundation. ¶ University of Maryland Scientists Develop New Methods to Combat Pakistani Terrorist Group Lashkar-e-Taiba, <http://smallwarsjournal.com/blog/university-of-maryland-scientists-develop-new-methods-to-combat-pakistani-terrorist-group-lashk>

¶ Effectively reducing the likelihood and intensity of attacks by the Pakistani terrorist group Lashkar-e-Taiba (LeT), the perpetrators of the November 2008 assault on Mumbai, India, requires a cocktail of actions including fostering dissent within LeT, hampering the organization's ability to conduct communication campaigns or provide social services, and disrupting the links between LeT and other Islamist terror groups, says a new study completed by an interdisciplinary research team at the University of Maryland's Lab for Computational Cultural Dynamics.¶ Presented at an international symposium on Lashkar-e-Taiba held in Washington on Sep 10, 2012, the study also confirms traditional wisdom that pressuring Pakistan to rein in its terrorist proxies and disrupt LeT terrorist training camps is also necessary to reduce the scope of LeT attacks. The UMD research further showed that traditional counter-terror and law-enforcement tools such as arrests, raids, and targeting the group's field commanders have only had a limited impact in reducing the likelihood of Lashkar-e-Taiba attacks. The study also is being published as a book: "Computational Analysis of Terrorist Groups: Lashkar-e-Taiba" (Springer, released Sep. 10, 2012).¶ Besides killing hundreds of civilians, LeT threatens the stability of South Asia because its attacks heighten tensions between nuclear-armed rivals India and Pakistan. Further, since the assault on Mumbai, information on Lashkar-e-Taiba suggests that it has increasingly turned its attention towards attacking the West not only in Afghanistan but also in Europe and Australia.¶ "Our study of LeT is different," explains V.S. Subrahmanian, lead author of the study, and director of the University of Maryland's Laboratory for Computational Cultural Dynamics, "It is the first in-depth analysis of a terror group that uses sophisticated data mining algorithms to learn temporal probabilistic rules as well as new algorithms to automatically suggest set policies which are sets of actions that should and should not be taken in order to elicit a desired behavior. Companies like Google and Amazon use these kinds of analytic methodologies to model the behaviors of customers every day. Decision-makers dealing with deadly threats to national security should have the same kinds of tools available."¶ The findings

on how best to deal with LeT are based on systematically gathered monthly data on 770 variables over a period of over 20 years. The UMD researchers mined this data for temporal probabilistic rules that not only identify conditions under which different types of terror strikes are carried out by LeT or its affiliates, but also the time delay with which these actions occur. Given these rules about the likelihood of LeT actions, a new Policy Computation Algorithm identifies sets of actions that reduce the likelihood of LeT attacks.¶¶ A typical rule states that two months after 5-24 Lashkar-e-Taiba operatives were arrested and Lashkar-e-Taiba operatives were on trial in either India or Pakistan, there was an 88 percent probability of Lashkar-e-Taiba engaging in clashes with local security forces in which Lashkar-e-Taiba operatives are killed. The software generated hundreds of such rules about a vast range of Lashkar-e-Taiba attacks including their targeting of civilians, professional security forces, transportation centers, security installations, and symbolic/tourist locations.¶¶ Overall the rules showed that support from Pakistan's government for LeT (which over the years has included financial, military, as well as operational support) is strongly correlated with almost every type of Lashkar-e-Taiba violence, while when Lashkar-e-Taiba is suffering from internal dissension they are less likely to carry out every type of attack.

Meta data links

India access to Meta data is key to prevent attacks orchestrated through VOIP and to prevent terrorist attacks in India

Sharma 14

Laveesh Sharma, Graduate Student at Jindal School of International Affairs, Haryana, Changing Face of Privacy in India: An Analysis, <http://stsfor.org/content/changing-face-privacy-india-analysis>

In the year of 2012, the National Security Council of India, which was headed by the former Prime Minister Manmohan Singh, planned the establishment of the National Critical Information Infrastructure Protection Centre (NCIPC) that was to be created by the National Technical Research Organization (NTRO) (Joseph, 2012). The Standing Committee on Information Technology has recommended the following apart from the setting up of the NCIPC (Legislative, 2014): * Establishment of a protection centre; * Creation of a single centralised body dealing with cyber-crimes; * Employment of skilled IT professionals to overcome shortage of manpower and; * Funding as well as conducting extensive research and development. In the hindsight, the right to privacy has not been granted under the Constitution of India, although the courts encompass it within the 'freedom of speech and expression' under Article 19(1) (a) and 'right to life and personal liberty' under Article 21. Currently there is no dedicated legislation in place aimed at data protection or privacy. The data protection laws are a set of privacy laws and procedures meant for minimizing intrusion of privacy, owing to surveillance and data collection. Nevertheless the Centre for Internet & Society, an NGO based in New Delhi has researched extensively and drafted a version of the Privacy Protection Bill, 2013 (Acharya, 2013). Some characteristics of the bill include: * It seeks to heavily penalize organisations or institutions obtaining personal data under false pretext; * It authorizes suspension of telecom service provider's license if it violates conditions of confidentiality mentioned in the bill; * It states that recommendations shall be made by committee comprising the Cabinet Secretary, Secretaries of Departments of Personnel and Electronics and IT, as well as two experts of data protection, law and finance to be nominated by the Central government. However, the National Security Advisor (NSA) seeks to weaken the bill by reducing its scope and introducing provisions that would protect the intelligence agencies. The current IT Act applies only on entities and persons located in India and not foreign corporations or people located abroad (Kosturi Ghosh, 2014). It is designed to be incursive. For instance under Section 43A, the IT Act legalizes handling of sensitive personal data, and under Section 69, the Government of India can "intercept, monitor or decrypt" any information transmitted or generated from any computer resource in the interest of the sovereignty and integrity, defence, public order, preventing incitement and for the security of the State (Dalmia, 2011). The impact on privacy will be

hard hitting when the Central Monitoring System (CMS) comes into action. It was fast tracked post 26/11 Mumbai attacks in which the perpetrators used voice over internet protocol (VoIP). This system would allow the Government to access every digital communication and telecommunication in the country. The CMS will be capable of covering text messages, online activities, phone calls, online searches and even social media conversations! (Nandakumar, 2013). According to investigations, about 160 million users are already under the scrutiny of wide-ranging surveillance. They have further revealed that a “Lawful Intercept and Monitoring Systems” is in place, which has been arranged by the Centre for Development of Telematics for the purpose of monitoring Skype, emails, web-browsing and of course Internet traffic (Singh, 2013). The surveillance agency in Australia, Defence Signals Directorate (DSD) shared metadata of its citizens with intelligence allies overseas. Prime Minister Tony Abbott defined meta-data as “essentially the billing data which is different from the actual content of calls.” A metadata can paint a “visual rendering” of one’s digital and physical existence (Laughland, 2013). Owing to the trails of pieces, internet activities of an individual can be linked and traced back. The NSA’s meta-data surveillance programme compiles the data giving a detailed picture of lives of individuals; these can provide information about people’s political or religious affiliations and even their relationships. One of the other important phenomena has been the rise in the number of smart phones in India. The industry has been very successful and has seen spike in the number of smart phone users, with the market leader Android reportedly holding 62% of the market share according to a 2012 survey (Brindaalakshmi, 2013), followed by Windows Mobile, RIM, IOS and so on. A rising consumer base for these companies is a cause of concern, as in the past these very firms had provided direct access to the NSA. The NSA allegedly had access to over 180 million records from Yahoo, Google and Facebook. In 2013, the percentage of obtained information from Skype rose to 248%, for Facebook, 131% and 63% for Google with DropBox being designed as a PRISM provider (Glenn Greenwald, 2013). The recent upgrades in the Android software (Kit-Kat) make it the best spying phone that could capture highly personal data of movements, activities, interests, internet searches and geo-locations. These smart phones use cutting-edge technology, making them a potential spying weapon (Liss, 2014). The fact remains that such an incident can happen without anyone’s knowledge just like the NSA snoop-gate, and governments would not even come to know unless there is another Snowden out there. The mechanisms and artillery adopted in the IT sector by the Indian Government may all seem too invasive of one’s own privacy but all of these are absolute a necessity for the fight against cyber terrorism. mass-surveillance, cyber espionage and to prevent another snoop-gate by a foreign country. The past incidents have shown how powerful and exploitative these instruments are as they hamper freedom of speech and expression and lead to wrongful arrests for even ‘liking’ a post on Facebook or tweeting. Legal frameworks to tackle these issues are extremely essential; at the same time amends have to be made in the IT Act.

Sophisticated social network tools can turn metadata into effective intelligence information

Wheaton & Richey 14 Kristan J. Wheaton is an Associate Professor at Mercyhurst University and Melonie K. Richey is a graduate student at Mercyhurst University who is currently participating in IARPA’s Sirius Project. Metadata Analysis as an Intelligence Tool, e-International Relations January 9, 2014 , <http://strategicstudyindia.blogspot.com/2014/06/metadata-analysis-as-intelligence-tool.html>

The legality of the National Security Agency’s (NSA’s) use of US citizens’ metadata to identify and track foreign intelligence organizations and their operatives is currently a subject of much debate. Less well understood (and consequently routinely misreported) are the capabilities and limitations of social network analysis, the methodology often used to evaluate this metadata. One of the first causes of confusion is definitional. Social network analysis is often linked to an inappropriate degree with social media. True, social media such as Facebook and Twitter are frequently used as rich data sources for social network analysis, but understanding the importance of networks in the affairs of states has been around at least since Machiavelli.[1] In addition, the first modern version of what would come to be called social network analysis was developed not by an intelligence agency or computer scientist but by Columbia professor and psychosociologist, Jacob Moreno, in 1934. These “sociograms,” as Moreno called them were used to graph individual preferences or relations within a small group. Little did Moreno suspect that his method for understanding the relationships between people, when combined with graph theory and the processing power of computers, would allow for the detailed analysis of thousands of people or organizations with hundreds of thousands of connections between them (See Fig. 2). [2] Figure 2 – Modern social network analysis uses powerful computers and graph theory to map out the relationships between thousands of nodes and hundreds of thousands of links. Shown here is the network of the over 6000 Twitter users who follow the Twitter handle of the American Nuclear Society along with their over 200,000 connections. (Image Source: Melonie Richey) Along with the undeniable power of this type of analysis comes the inevitable (and justified) concerns for privacy and constitutionality. But just how powerful is social network analysis? What can intelligence agencies actually glean from the exabytes of data they are purportedly collecting? Social Network Analysis, as an analytic method, has inarguable applicability to the field of intelligence and is

progressively reshaping the analytic landscape in terms of how analysts understand networks. For example, analysts currently use SNA to identify key people in an organization or social network, develop a strategic agent network, identify new agents and simulate information flows through a network. Beyond this, SNA can be easily combined with other analytic practices such as Geographic Information Systems (GIS), gravity model analysis or Intelligence Preparation of the Battlefield (IPB) to create robust, predictive analyses. Identifying Key People/Organizations in a Network The most obvious use of SNA is its ability to identify key actors and entities within a network. Centrality measures within a network are means for measuring a node's relative importance within the network. [3] It is well-accepted that "the ability to measure centrality in social networks has been a particularly useful development in social network analysis." What is more interesting, however, is the number of centrality measures that social network analysts use to reveal different things about how key actors interact within a network. [4] For example, a node with a high degree centrality is connected to many other nodes. In Figure 3 below, it is unsurprising that the American Nuclear Society (ANS) has the highest degree centrality in its own Twitter network. However, a node with a high betweenness centrality is one that connects the cliques in the network. Figure 4 shows the same ANS network, reconfigured and revisualized with an emphasis on betweenness, with a new node, Nuclear.com, emerging as the most important. For example, by analyzing the network in accordance with different centrality measures and establishing filtering criteria (and using Carnegie Mellon's ORA software), [5] we were able to reduce a network representing the entire nuclear energy and non-proliferation communities on Twitter (6000+ nodes and 200,000+ links) to the 19 most influential individuals within that network (See Figure 5). These individuals are the nodes that would be able to disseminate information to the majority of the network within a matter of hours. Identifying New Agents Another traditional intelligence activity that could benefit from SNA is identifying potential new "agents" – people or organizations who might be willing or able to provide information to an intelligence agency. For example, by using Twitter's list feature, which allows users to establish lists of people to follow for particular purposes, and some simple cross-referencing techniques, we were able to identify 50 new, highly reputable individuals and organizations talking about strategic mining and minerals on Twitter. [6] While such a use by intelligence agencies may seem Orwellian, it is similar to techniques currently used in business to identify potential customers. Likewise, a similar algorithm likely supports various friend/colleague recommendation engines such as LinkedIn's "People You May Know" feature. Simulating Information Flows Of all the capabilities of SNA, simulations are likely one of the most useful. Carnegie Mellon's ORA, for example, provides four main kinds of simulations in order to demonstrate how money, information, disease or technology would move through a network. Pathway simulations locate the most direct or indirect routes from one node to another. Still other simulations also indicate how a network would react to the removal of any particular node or set of nodes (for example, how a decentralized terrorist network such as the Taliban would function if the leaders from two key cells were killed). As an example of this feature, Figure 7, shows the effect of providing a highly relevant piece of information to the 19 individuals identified in the Twitter network of nuclear specialists discussed above. The dots, representing individuals and organizations on Twitter, get larger and change color as the information flows throughout the system. Variables within the simulation allow researchers to alter the level of interest the network likely has to a particular piece of information (the information's "virality"). Combining SNA with Other Methods These simulations and other features of SNA provide idealized analyses that can then be combined with other techniques, such as GIS. Networks within ORA and many other SNA tools can be visualized geospatially if coordinates are provided for each node. Running simulations through these networks can then be represented on a map much like the simulation of Syrian refugee population movement throughout Turkey shown in Figure 8. This, in turn, allows for powerful predictive analytics. Figure 9 reflects the outcome of the simulation in Figure 8; not only does the image represent reality (the known locations of Syrian refugees according to the UN), [7] it also predicts where refugees are likely to move within the next 12 to 24 months. This analysis employed SNA as the cornerstone analytic technique in conjunction with GIS and even includes ideas from the more traditional intelligence methodology of Intelligence Preparation of the Battlefield.

India has modeled metadata collection—India depends on metadata

Xynou 13 Maria Xynou Maria is a Policy Associate on the Privacy Project at the CIS, FinFisher in India and the Myth of Harmless Metadata, <http://cis-india.org/internet-governance/blog/fin-fisher-in-india-and-myth-of-harmless-metadata>

Over the last months, it has been reported that the Central Monitoring System (CMS) is being implemented in India, through which all telecommunications and Internet communications in the country are being centrally intercepted by Indian authorities. This mass surveillance of communications in India is enabled by the omission of privacy legislation and Indian authorities are currently capturing the metadata of communications.[30] Last month, Edward Snowden leaked confidential U.S documents

on PRISM, the top-secret National Security Agency (NSA) surveillance programme that collects metadata through telecommunications and Internet communications. It has been reported that through PRISM, the NSA has tapped into the servers of nine leading Internet companies: Microsoft, Google, Yahoo, Skype, Facebook, YouTube, PalTalk, AOL and Apple.[31] While the extent to which the NSA is actually tapping into these servers remains unclear, it is certain that the NSA has collected metadata on a global level.[32] Yet, the question of whether the collection of metadata is “harmful” remains ambiguous. According to the National Information Standards Organization (NISO), the term “metadata” is defined as “structured information that describes, explains, locates or otherwise makes it easier to retrieve, use or manage an information resource”. NISO claims that metadata is “data about data” or “information about information”.[33] Furthermore, metadata is considered valuable due to its following functions: •Resource discovery •Organizing electronic resources •Interoperability •Digital Identification •Archiving and preservation Metadata can be used to find resources by relevant criteria, to identify resources, to bring similar resources together, to distinguish dissimilar resources and to give location information. Electronic resources can be organized through the use of various software tools which can automatically extract and reformat information for Web applications. **Interoperability is promoted through metadata, as describing a resource with metadata allows it to be understood by both humans and machines, which means that data can automatically be processed more effectively. Digital identification is enabled through metadata**, as most metadata schemes include standard numbers for unique identification. Moreover, metadata enables the archival and preservation of large volumes of digital data.[34] **Surveillance projects, such as PRISM and India's CMS, collect large volumes of metadata**, which include the numbers of both parties on a call, location data, call duration, unique identifiers, the International Mobile Subscriber Identity (IMSI) number, email addresses, IP addresses and browsed webpages.[35] However, the fact that such surveillance projects may not have access to content data might potentially create a false sense of security.[36] When Microsoft released its report on data requests by law enforcement agencies around the world in March 2013, it revealed that most of the disclosed data was metadata, while relatively very little content data was allegedly disclosed

India depends on metadata for intelligence

Lowenthal 14 Mark M. Lowenthal is the senior specialist in U.S. foreign policy at the Congressional Research Service Intelligence: From Secrets to Policy

India has a growing cyberspace capability, which, like that of many other nations, appears to have been used against potential foes, such as China and Pakistan, and more friendly states, like the United States. India is in the midst of deploying a Centralised (or Central) Monitoring System (CMS) that **is designed to track all communications within India**-telephone, computer, landline, mobile, and so on. Unlike the NSA program, CMS will not have to ask providers' permission for access but will have that built into the technology of the telecom and data service providers. (IMS will provide intelligence to foreign and domestic agencies, the police, and tax collectors-a list that some believe is too broad. **Like the NSA program, CMS appears to focus on metadata**. CMS is being developed and will be run by a government technology development center that is not part of the intelligent complex. The Ministry for Home Affairs will have the power to determine who is monitored.

Sleeper Cell Link

Domestic Surveillance in India is key—connections with internal groups in India is key to its ability to attack

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Lashkar-e-Tayyiba has always required some level of support from local Indian citizens to facilitate its operations in Kashmir and India. According to the Indian government, several Indians aided the 2008 Mumbai attacks including Arshad Ansari, Sabahuddin Ahmad, and Syed Zabiuddin Syed Zakiuddin Ansari. **LeT has also connected with local militant movements in India to extend its operational capabilities and expand its recruiting network**. One of these groups includes the Students Islamic Movement of India (SIMI). While SIMI was formed in 1977, at some point in the late 1990s a militant movement emerged out of the group. Some commentators suspect that SIMI has acted

as a major conduit for LeT activities. Another movement also associated with LeT known as the Indian Mujahideen (IM) either emerged out of SIMI or taken over its militant elements in 2007. Many analysts consider the two groups as synonymous.¹⁸⁴ Ideologically, IM and SIMI reject Hinduism, secularism, democracy, and nationalism.¹⁸⁵ The 2002 Gujarat riots likely has fueled an expansion of LeT's network into India. LeT has actively exploited the riots to expand its network in India. Shortly following the riots, Hafiz Saeed called for the Muslims of India to rise up stating that "the riots have proved that the Hindus are fully armed but the Muslims are badly ill-equipped to cope with such a situation." Indeed, even some women may have joined LeT as a result of the riots.¹⁸⁶ Indian investigators believe that a Mumbai-based SIMI operative Rahil Sheikh was tasked with aiding the transit of SIMI volunteers through the Iran-Pakistan border to train at LeT camps following the communal pogrom in Gujarat. Among the volunteers included Zakiuddin Ansari, the Indian believed to have been in the control room during the 2008 Mumbai attack.¹⁸⁷ This example may be indicative of how LeT has utilized its existing networks with a local Indian militant group to capitalize on Muslim anger at the communal violence.

Domestic surveillance in India is key to breaking LeT connections to domestic groups in India and cutting off funding

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Proactive steps should be taken to break Lashkar's alliance with homegrown jihadi outfits like Indian Mujahidin (IM) and the Student Islamic Movement of India (SIMI) who are known to provide logistical as well as surveillance services to Lashkar. Not just domestic jihadi organizations but also their links to organized crime and mafia leaders who provide a safe channel for money laundering should be cracked down upon. One of the most effective ways to disrupt Lashkar's operations is to disrupt their money flow. Further even though India has joined the Financial Action Task Force in 2009 and has with the help of the United States declared Dawood Ibrahim an international terrorist, but because Lashkar has such an extensive global network for fund raising as well as money laundering, it is difficult for authorities to move through slow diplomatic channels to fully implement and stop the money flow, especially with regard to Pakistan who seems to be extra cautious and slow while providing any kind of cooperation against Lashkar.

Indian domestic surveillance is key to prevent attacks--The LeT is a massive threat to India through sleeper cells in India activated through internet communications

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Lashkar-e-Taiba which translates into the 'Army of the Pure' is the most robust and powerful terrorist group operating out of Pakistan and a prominent threat to India. Lashkar has proved its capability for planning and executing highly sophisticated attacks like the one in Mumbai in 2008 where the operatives used maritime insertion, GPS navigation and satellite phones for real time monitoring and as well as for communication with their leaders in Pakistan. Lashkar-e-Taiba has also been the pioneer for introducing Fedayeen attacks in India, their first recorded attack was in Kashmir in 1993. LeT has infiltrated and built an extensive network of sleeper cells and associations with other jihadi groups in the sub-continent, which if not dealt with can and most probably will result in more Mumbai-style attacks. If we look at Lashkar's expenditure for the Mumbai attacks, the biggest operation Lashkar has planned and successfully executed, they spent around \$200,000 which when compared with LeT's overall annual budget (probably in the \$50 million or more range), it is evident that terrorism remains a low-cost endeavor.^[i] The group also has a robust above ground infrastructure that may be used as a first point of contact for would be jihadists.^[ii] It has a

sophisticated website named after its social wing- Jamaat-ud-Dawa and has an active presence on social media like Facebook and Twitter. Despite Lashkar being connected to various other attacks in Mumbai before November 26, 2008 as well as in other incidents across India which also involved a large number of casualties, the Mumbai attacks in 2008, which claimed 164 lives and injured 308, brought to attention Lashkar's global jihad ideology. For the first time after 9/11 foreign tourists, the Jewish community and luxury hotels were specifically targeted in Mumbai and the event forced national security authorities all across the world to rethink their preparedness as well as the possibility of another 'Mumbai style attack'. Also, since its formation Lashkar has shared very special relationship with Al-Qaida. It is widely believed that Osama Bin Laden was the one to provide seed funding for the establishment of Lashkar's headquarters in Muridke, Pakistan. The affiliation grew stronger with time especially after 9/11 when it became impossible for Lashkar to ignore global jihad. Dr. Bruce Hoffman, as RAND Director of the Washington office, said in an interview, "LeT is increasingly transforming itself from a localized group to one that is not only an al-Qaida surrogate but a global jihadist group. This is part of al-Qaida's strength: exploiting a group and getting them to buy into the global jihadist imperative." [iii] Al-Qaeda's core strategy aims at distracting and exhausting adversaries, creating divisions between counter-terrorism allies, forging close ties and assisting local affiliates, planning major international or global attacks and monitoring western security and defense systems. [iv] The only difference in Lashkar's core strategy is that the jihad they wage is directed towards India. Furthermore, not only they share a strong alliance but also similarities can be seen in their tactics and modus operandi. Many experts believe that the Mumbai attacks showed an uncanny resemblance to attacks carried out by Al- Qaida. The Mumbai gunmen were well-prepared and trained. The terrorists had done their reconnaissance and planning, which would have taken months to coordinate. They knew the terrain and locations. They had worked out the internal infrastructure and layout of the buildings and moved with stealth, combing their way through 10 locations and creating devastation along the way; [v] much like how Al-Qaida likes to conduct their operations.

LeT is growing a network of cells inside India

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Furthermore, the involvement of local Indians in both the attack planning as well as the operation itself suggest that LeT may have an expanding network of support cells in India. Indian authorities charged two detained Indian nationals—Fahim Arshad Ansari and Sabahuddin Ahmad— with preparing the maps and videotapes that aided the Lashkar militants to their targets during the Mumbai attack in February 2009. This marked the first official acknowledgement by the Indian government that Indians had participated in the attacks. [16] Furthermore, the intercepted communications between the Mumbai attackers and their controllers in Pakistan revealed that one of the controllers spoke Hindi. The Hindi-speaking Lashkar control was later identified by Indian intelligence agencies as Syed Zabiuddin Syed Zakiuddin Ansari from Maharashtra state in India. [17] His role in the control room during the attack raises the question of whether LeT has begun to concede to greater Indian involvement in its operations. The remainder of this paper will seek to resolve some of the issues raised by Mumbai attack and discern the factors that have fueled LeT's evolution leading into the attack.

Uniqueness

India is solving LeT terror threats now

IE 5/13 — Indian Express, 2015. (“Government successful in dealing with terror threats: Kiren Rijiju”, May 5th, 2015, Available Online at: <http://indianexpress.com/article/india/india-others/government-successful-in-dealing-with-terror-threats-kiren-rijiju/>)

Government on Wednesday said it has been successful in dealing with threats to coastal security in the recent past, but did not disclose details on security grounds. Replying to a question on terrorists sneaking through the sea route, Minister of State for Home Kiren Rijiju said “I can tell this august House that in the last 11 months, we have been successful in dealing with all the threats we have. “I don’t want to claim credit for that. It is the duty of the government to secure the country and we are committed to that.” He refused to divulge details on grounds of security. To a specific question regarding Mumbai, Rijiju said besides Lashkar-e-Taiba (LeT), “there are many other terrorist groups which are working on destroying the peace and tranquility of this country. They are a threat to our national security. “They have Indian affiliates also, which are banned under the relevant laws. All the steps are being taken and I am very confident that it is paying dividend also. There is no need to really worry and say that we are not taking enough steps to secure Mumbai.” He also listed out the steps to beef up security in the coastal areas of the country and added that whole security system has been “synergised”. To another question, Rijiju’s ministerial colleague Haribhai Parathibhai Chaudhary said the government receives intelligence inputs relating to attack plans by LeT on targets in the coastal areas from time to time and shares it with respective state governments. “However, further details in this matter cannot be disclosed in the interest of national security.” he said in a written reply. He was asked whether it is a fact that according to an intelligence report, Pakistan-based LeT terrorists might sneak into Mumbai via the sea route to carry out terror attacks.

We control uniqueness, India is preventing LeT attacks now but continued vigilance is essential

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India’s National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarjournal.com/printpdf

The most successful of all countermeasures though has been the arrest of key Lashkar-e-Taiba operatives. In 2013, Indian security officials arrested Abdul Karim Tunda- an expert bomb maker for the terrorist outfit. In 2012 approximately 61 operatives were killed in encounters with Indian security forces including Lashkar Division and District Commanders. Around 48 were arrested and 8 sleeper cells were neutralized. [xxiv] The arrests included key recruiter for Lashkar from India and Nepal Mohammad Omar Madni and Chief Coordinator for Jammu and Kashmir Manzoor. Looking at the numbers, it certainly seems like the intelligence community is successful in gathering critical information as well as preventing further attacks but in my opinion they still have a long way to go. In 2013 itself, there has been a record of 254 infiltration bids made by terrorists along the India- Pakistan border. In 133 cases, the terrorists were made to ‘return’ to Pakistan territory, while they successfully crossed over in 84 cases.[xxv] The operatives that crossed over in these 84 cases could well be planning another Mumbai.

India has prevented LeT attacks designed to crush the economy

Press Trust of India 12

Fake currency pushed at behest of Pak intel agencies, Lashkar-e-Taiba: Cops Delhi | Press Trust of India | Updated: April 15, 2012, <http://www.ndtv.com/delhi-news/fake-currency-pushed-at-behest-of-pak-intel-agencies-lashkar-e-taiba-cops-476737>

The Delhi police has told a court here that a consignment of over Rs. 1.18 crore fake currency notes, seized by it in January, had been sent from Pakistan at the behest of its intelligence agency and banned terror outfit Lashkar-e-Taiba (LeT) to destabilise the Indian economy. The police made this claim in its charge sheet, filed in the court of Chief Metropolitan Magistrate Vinod Yadav and indicting five Indians, arrested along with the fake currency note consignment on January 12. The seizure of the counterfeit notes with a face value of over Rs. 1.18 crore, concealed in 33 cloth bundles and loaded in two tempos, was made from near a godown at Dabri in West Delhi. The police has named Zeeshan Khan, a resident of Dabri, Ash Mohammad of Uttar Pradesh, Ghulam Ahmed, Yakoob Ali and Mohd Rafiq from Jammu and Kashmir as accused. All of them are presently in judicial custody.

Impacts

India/Pakistan War

Future LeT attacks are the most likely trigger for a nuclear war between India and Pakistan

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

A better understanding of LeT's evolution carries major implications for U.S. policy since the group poses major challenges to U.S. security interests. First and foremost, stability in South Asia is a key U.S. security interest and will continue to remain so as long as it remains entrenched in Afghanistan. LeT attacks have, on occasion, brought India and Pakistan to the brink of war and the group remains one of the most likely catalysts to war between the two nuclear-armed countries. At the very least, LeT acts as a major source of contention between the two countries and keeps Pakistan's national security establishment focused on India. This, in turn, distracts Pakistan from stabilizing its tribal regions on its border with Afghanistan complicating U.S. and NATO operations in that country. At worst, a future LeT attack could precipitate in a major war between the two countries that would carry the frightening risk of becoming the world's first nuclear war. Second, LeT has targeted U.S. forces in both Iraq and Afghanistan. While its foray into Iraq was relatively short-lived, since at least 2006, it has begun to actively support and participate in the insurgency in 2 Afghanistan. The group has been implicated in several attacks against U.S. forces in Afghanistan and coalition forces consider Lashkar militants among the most effective fighters in the region.¹ Though the group has had little impact on the insurgency thus far, its presence in Afghanistan will likely continue to expand.

Future LeT attack triggers nuclear war

Zarete 11 Juan Zarete, senior adviser at the Center for Strategic and International Studies, An alarming South Asia powder keg Sunday, February 20, 2011, <http://www.washingtonpost.com/wp-dyn/content/article/2011/02/18/AR2011021807465.html>

In 1914, a terrorist assassinated Archduke Franz Ferdinand in Sarajevo - unleashing geopolitical forces and World War I. Today, while the United States rightly worries about al-Qaeda targeting the homeland, the most dangerous threat may be another terrorist flash point on the horizon. Lashkar-i-Taiba holds the match that could spark a conflagration between nuclear-armed historic rivals India and Pakistan. Lashkar-i-Taiba is a Frankenstein's monster of the Pakistani government's creation 20 years ago. It has diverse financial networks and well-trained and well-armed cadres that have struck Indian targets from Mumbai to Kabul. It collaborates with the witches' brew of terrorist groups in Pakistan, including al-Qaeda, and has demonstrated global jihadist ambitions. It is merely a matter of time before Lashkar-i-Taiba attacks again. Significant terrorist attacks in India, against Parliament in 2001 and in Mumbai in 2008, brought India and Pakistan to the brink of war. The countries remain deeply distrustful of each other. Another major strike against Indian targets in today's tinderbox environment could lead to a broader, more devastating conflict. The United States should be directing political and diplomatic capital to prevent such a conflagration. The meeting between Indian and Pakistani officials in Bhutan this month - their first high-level sit-down since last summer - set the stage for restarting serious talks on the thorny issue of Kashmir. Washington has only so much time. Indian officials are increasingly dissatisfied with Pakistan's attempts to constrain Lashkar-i-Taiba and remain convinced that Pakistani intelligence supports the group. An Indian intelligence report concluded last year that Pakistan's Inter-Services Intelligence Directorate was involved in the 2008 Mumbai attacks, and late last year the Indian government raised security levels in anticipation of strikes. India is unlikely to show restraint in the event of another attack. Lashkar-i-Taiba may also feel emboldened since the assassination in early January of a moderate Punjabi governor muted Pakistani moderates and underscored the weakness of the government in Islamabad. The group does not want peace talks to resume, so it might act to derail progress. Elements of the group may see conflict with India as in their interest, especially after months of unrest in Kashmir. And the Pakistani government may not be able to control the monster it created. A war in South Asia would be disastrous not just for the United States. In addition to the human devastation, it would destroy efforts to bring stability to the region and to disrupt terrorist havens in western Pakistan. Many of the 140,000 Pakistani troops fighting militants in the west would be redeployed east to battle Indian ground forces. This would effectively convert tribal areas bordering Afghanistan into a playing field for militants. Worse, the Pakistani government might be induced to make common cause with Lashkar-i-Taiba, launching a proxy fight against

India. Such a war would also fuel even more destructive violent extremism within Pakistan. In the worst-case scenario, an attack could lead to a nuclear war between India and Pakistan. India's superior conventional forces threaten Pakistan, and Islamabad could resort to nuclear weapons were a serious conflict to erupt. Indeed, The Post reported that Pakistan's nuclear weapons and capabilities are set to surpass those of India.

A future LeT attack will force India to attack Pakistan destabilizing all of Southeast Asia

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Second, India will need to vastly improve its anti-terrorism measures as indicated by the effectiveness of the 2008 Mumbai attacks in which its security forces were clearly ill-prepared. India will need to invest heavily in its internal security including training, human capital, and equipment. Since stability in South Asia is a key U.S. priority, the U.S. might also assist India in these efforts through the provision of funds and anti-terrorism equipment and training. Domestic opinion in India may force India to respond much more harshly against Pakistan should a future devastating terrorist attack occur potentially destabilizing the whole of South Asia. Thus, it would be beneficial to both U.S. and Indian interest to limit the impact from a future mass casualty terrorist attack.

LeT terrorism is the unique threat of India Pakistan war risking a nuclear conflict

Blank 13 Jonah Blank1 The RAND Corporation Lashkar-e Taiba and the Threat to the United States of a Mumbai-Style Attack* Before the Committee on Homeland Security Subcommittee on Counterterrorism and Intelligence House of Representatives June 12, 2013 http://www.rand.org/content/dam/rand/pubs/testimonies/CT300/CT390/RAND_CT390.pdf

Fourth, LeT has a unique potential to precipitate a major war between India and Pakistan. Due to its traditional sponsorship by Pakistan's military, an attack by LeT is regarded by India as nearly synonymous with an attack by the state of Pakistan. At least twice in the recent past- after the 2008 Mumbai attack, and after the 2001 attack on India's Parliament- New Delhi came very close to launching a military strike across the border in response to an attack attributed to LeT. As the 1999 Indo-Pakistani combat at Kargil demonstrated, any serious military engagement between these two rivals runs the risk of nuclear escalation: During the Kargil episode, the Pakistani military began mobilizing the nation's nuclear assets without the knowledge of the civilian prime minister.¹⁰ Apart from the risk to tens of thousands of American citizens in India and Pakistan, the threat of a nuclear exchange anywhere in the world would obviously have a monumental impact on US strategic and economic interests.

Future terror attacks on India risk Indo Pak nuclear war

Markey 10 Daniel Markey is adjunct senior fellow for India, Pakistan, and South Asia at the Council on Foreign Relations, Terrorism and Indo-Pakistani Escalation, www.cfr.org/.../CPA_contingencymemo_6

India faces the real prospect of another major terrorist attack by Pakistan-based terrorist organizations in the near future. Unlike the aftermath of the November 2008 attack on Mumbai, in which 166 people died, Indian military restraint cannot be taken for granted if terrorists strike again. An Indian retaliatory strike against terrorist targets on Pakistani soil would raise Indo-Pakistani tensions and could even set off a spiral of violent escalation between the nuclear-armed rivals. Given Washington's effort to intensify pressure on al-Qaeda, the Taliban, and associated militants operating from Pakistani territory, increased tensions between India and Pakistan would harm U.S. interests even if New Delhi and Islamabad stop well short of the nuclear threshold because it would distract Pakistan from counterterrorism and counterinsurgency operations, jeopardize the U.S. mission in Afghanistan, and place new, extreme stresses on Islamabad.

Future LeT attack will lead to Indo-Pak war

Indian Express 15 3/6/15 Talking terms India and Pakistan have broken their silence. But it will require focused effort to break the impasse

<http://indianexpress.com/article/opinion/columns/talking-terms/>

The short-term purpose of these talks, it doesn't take much to see, isn't to solve intractable problems. Instead, the fact of diplomatic engagement adds a crisis-management cushion to the arsenals of both governments. For months now, Pakistan has feared that a terrorist attack against India could lead Prime Minister Narendra Modi to order military counter-strikes — catching it at a moment of special vulnerability, when a large part of its armed forces are tied down fighting terrorists in its northwest. Now, it hopes, Delhi will first address its problems through diplomatic channels, making rapid escalation of conflict less likely. For both countries, this is a pragmatic step. In the throes of severe economic challenges, India can ill afford a conflict, and near-bankrupt Pakistan can do so even less. But it would be dangerous to mistake this diplomatic breathing space for bedtime. Islamabad has scaled back jihadist operations in Kashmir, and placed restraints on organisations targeting India. It hasn't, however, dismantled the infrastructure of groups like the Lashkar-e-Toiba — leaving open the prospect of a future attack sparking off a crisis. The last two years have, notably, seen the first uptick of violence in Kashmir in over a decade. Delhi, for its part, has not unveiled just what it is willing to bring to the diplomatic table. The engagement of Kashmiri secessionists in dialogue, the demilitarisation of Siachen, and the settlement of the Sir Creek issue — the government's position on all these remains unclear. Barring focused effort, this latest engagement could also end in that depressing place both know so well — impasse.

Collapse Indian Economy

LeT attacks would target IT sector and crush India's economy

Saxena 5 Sudhir Saxena Institute for Defense Studies and Analysis, The rise of fiscal terror
March 25, 2005

http://www.idsa.in/idsastrategiccomments/Theriseoffiscalterror_SSaxena_250305.html

By targetting the IT industry, terrorists are revealing that the Indian economy may increasingly be their target. The elimination of the Delhi based Lashkar-e-Tayyiba (LeT) cell on 6 March 2005, could possibly indicate a new trend in Pakistan-based terror operations in India. Preliminary reports indicate that these terrorists were intending to strike against the Indian Military Academy (IMA) and the IT infrastructure especially in Bangalore using the network of the banned Students Islamic Movement of India (SIMI). A couple of issues emerge from the episode. First, is this an indication of widening of the area of operations by the LeT and similar groups away from Jammu and Kashmir and North India to relatively un-touched peninsular India? Secondly, do the plans of the captured terrorist suggest a change in the nature of targets from tactical to strategic, indicating increasing complexity of conceptual planning and hence institutional involvement? Jammu and Kashmir is undergoing a rather harsh and prolonged winter snow fall season. Like the tsunami,

unpredictable mother nature seems to have purged any possibility of an escalation of terrorist activity. Further, the Indo-Pak Composite Dialogue Process (CDP) process (agreed to in January 2004) has shrunk the political space for high-intensity, high-frequency terror operations. It is quite possible that the political and geo-climactic factors may have forced the terrorists to shift areas of operation southwards and if possible perform a repeat of the 12/13 attack on the Parliament. Though, there have been sporadic incidents involving J&K terrorist (like LeT) operating in areas like Hyderabad, the phenomenon could not be termed as wide spread, possibly due to logistical reasons. The planned future intentions of the LeT cell captured in Delhi may indicate just such a spread. The choice of targets certainly raises a new warning. It is known that the IT industry has been one of the success stories contributing to the growing vitality of the Indian economy. The amount of RDX captured (10.5 kgs along with detonators) provides clues to the nature and explosive power of the planned operation. However, a pertinent question needs to be answered - was blowing up few buildings of the Polaris company the only aim of the now failed operation, or was there a larger objective? A strike against a leading IT company and its aftermath would have no doubt lead to many tactical counter-operational and intelligence measures. But it would have also left a certain wariness in the investor market, particularly in the FDI sector, which is very sensitive about security of its assets give the experience in Iraq, Afghanistan and certain African locations. A planned strike at IMA, Dehradun is indicative of similar operations by the Zarqawi group in Iraq.

LeT attacks can collapse Indian democracy

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Since 2002, LeT has also begun to shift its focus increasingly into the Indian hinterland. Several factors may account for this. To begin with, the Indian government completed a 700- kilometer border fence along the Jammu and Kashmir border in 2004 making infiltration increasingly difficult. The Indian army claimed the fence reduced infiltration of militants by 80%.¹²³ In addition, militants stopped receiving cover fire and infiltration support from the Pakistani army following the ceasefire between the two countries in 2003. These factors have made it much more difficult to infiltrate into Kashmir and has made infiltration through transit by third countries more attractive which also increases access to the other parts of India. In addition, the predominantly Punjabi militants of LeT could likely blend in much easier in the larger and more cosmopolitan cities of the hinterland where they would not stand out among the more diverse population of these areas. Furthermore, the effectiveness of Fidayeen attacks in Kashmir may have also had diminishing returns as the Jammu and Kashmir Police developed more effective tactics to counter them. According to the Indian journalist Praveen Swami who has followed LeT closely for years, between 1999 and 2002, the worst years of LeT fidayeen attacks, less than 200 people died in them.¹²⁴ Finally, Kashmiris may simply have becoming increasingly exhausted from the militancy and bloodshed in the region and may have become harder to recruit for support. The 2002 Gujarat riots—in which Muslims bore the greater brunt of the bloodshed— generated willing volunteers for LeT and provided new opportunities to expand its network into India. During the riots, LeT put images of the riot victims on its website and called for jihad to avenge the bloodshed. Recruiting Muslims from outside Pakistan and Kashmir could also persuade Kashmir residents that they have no future in India.¹²⁵ By stoking the flames of Hindu-Muslim violence, LeT could discredit India as a democracy and reinforce its belief that Hindus cannot justly govern Muslims. Indeed, Hindu-Muslim violence tears at the very fabric of Indian society and has the potential to destabilize large swathes of India. In September of 2002, only a few months after the Gujarat riots ravaged the province, two heavily armed fighters carried out a fidayeen attack on the Akshardham temple in Gandhinagar, Gujarat. The attack turned into a nearly 14 hour hostage siege and the resulted in 33 dead including a commando and a state police officer along with 70 others wounded. Given the sophisticated nature of the attack and the heavy firepower the attackers carried, the attack contained the hallmarks of a typical LeT attack and made it unlikely the attack resulted as retaliation by local Muslims for the earlier communal violence—at least without external support.¹²⁶ Indeed, shortly following the Gujarat riots, Indian intelligence officials had estimated at least as many as 40 local Gujarati Muslims may have travelled to train in Lashkar camps as a result of the communal violence and LeT may have viewed an attack on the Akshardham temple attack as an opportunity to provoke further communal violence if they indeed did carry out the attack.¹²⁷ Given the timing and target of the attack, the objective was clearly to provoke Hindu-Muslim violence.

LeT seeks collapse of India

Karim 12 Maj Gen Afsir Karim War against Lashkar-e-Taiba

<http://www.indiandefencereview.com/news/war-against-lashkar-e-taiba/>

The LeT follows the radical Wahhabi ideology, which advocates global jihad against all infidels and moderate Muslims. Although the primary area of operations of the LeT in India is Kashmir, its main aim is the destabilisation of India and it has not confined its disruptive activities only to Jammu and Kashmir. The LeT has repeatedly claimed through its journals and websites that its main aim is to destroy the Indian republic and to annihilate Hinduism and Judaism.

Bioweapons

LeT has ability and will use bioweapons

Nanjappa 13

Vicky Nanjappa reporter for Rediff India Abroad, India faces real threat of biological warfare

January 01, 2013 <http://www.rediff.com/news/report/india-faces-real-threat-of-biological-warfare/20130101.htm>

As far as India is concerned, a possible bioterrorism tactic would appeal to Pakistan based Lashkar-e-Tayiba and other Kashmir centric groups. LeT is aware about the potential utility of bio weapon pathogen as it had observed the large-scale disruptions during the US anthrax letter cases. Also, it does not have to recruit or employ microbiologists or life scientists to carry out bioterrorist attacks. ¶As a matter of fact it has the most robust medical and path lab network in Pakistan and many of its activists are trained medical professionals. (eg Ad Dawa medical missions, Taiba Hospitals and Path Labs in Lahore, Karachi and number of mobile dispensaries). ¶Potentially the infrastructures and the manpower at the disposal of LeT/ Jamaat ud Dawa (JuD) can be modified to develop bio weapon pathogens without any large investments or at least spreading bioscare if the leadership wish to resort to the tactic.

LeT has ability and motive to use bioweapons

Nanjappa 9 Vicky Nanjappa reporter for Rediff India Abroad Bio weapons could be the next big terror threat: IB | March 27, 2009, <http://www.rediff.com/news/2009/mar/27bio-weapons-could-be-the-next-big-terror-threat-ib.htm>

Rogue outfits such as the Lashkar-e-Tayiba [Images] and the Al Qaeda are constantly planning various ways to attack India. While there were intelligence intercepts following the Mumbai [Images] attack that the next attack could be from the sea, reports now point to the fact that the next on the agenda of terror outfits would be biological warfare.¶ Intelligence Bureau officials say that the Inter-Services Intelligence has helped these terror outfits set up bases in Afghanistan way back in the late 1990s to build laboratories to manufacture biological weapons. ¶The first of such labs was established in 1998 in Kandahar where chemical and radiological weapons were being manufactured. ¶There is also a laboratory set up to manufacture biological weapons in Muzafarabad in Pakistan Occupied Kashmir. This lab which belongs to the Lashkar-e-Tayiba

is known as the electronics laboratory. Apart from manufacturing detonators for bombs and weapons, this laboratory has also a full fledged unit to manufacture biological weapons.¶ Several scientists were recruited exclusively for this purpose and have been working on the manufacture of these weapons since the past ten years. Intelligence Bureau sources they expect that terror groups would try and use biological warfare when all other means are exhausted.

LeT will use bioweapons

Chandran 05 D Suba Chandran Assistant Director, Institute of Peace and Conflict Studies, Looking Beyond Bio-Weapons and Bio-Terrorism in South Asia
<http://www.ipcs.org/article/terrorism/looking-beyond-bio-weapons-and-bio-terrorism-in-south-asia-1750.html>

Militant groups fighting for non-political purposes are more likely to use biological weapons in South Asia, especially the Lashkar-e-Toiba and the Jaish-e-Mohammad. Both these organizations are fighting for a religious cause and are not bothered about popular support in India. The radical right wing groups are more likely to use such weapons. The fact that the Aum Shinrikyo, a religious cult group, used biological weapons in the past need to be reckoned with. Al Qaeda search for chemical and biological weapons also need to be taken into account from this perspective.

Nuclear weapons

A close study of LeT reveals it has the ability and will to use nuclear weapons and will use any means to annihilate India

Sharma 12 Surinder Kumar Sharma consultant for Institute for Defense Studies and Analyses
LeT: Terror incorporated The Caliphate's Soldiers: The Lashkar-e-Tayyeba's Long War by Wilson John http://www.atimes.com/atimes/South_Asia/NB04Df04.html

LeT is likely the world's most powerful and resourceful multinational terror consultancy firm, keeping a rolodex of multinational terrorists, trainers and a massive support network. ¶ The author documents LeT's expansion extensively in the book. David Headley, a Pakistani-American who pleaded guilty in the US for his role in the Mumbai attacks, was working closely with the LeT commanders and facilitators in India, Pakistan, Bangladesh, Saudi Arabia, US and Muscat. Then, attacks were being planned on three different countries simultaneously - India, Bangladesh and Denmark - in a clear indication of the LeT's growing capability to organize transnational attacks independent of al-Qaeda networks. ¶ This book also details how the LeT has become a hub for training terrorists in using the latest weapons, explosives and communications devices. The emergence of the Salafi group in the Maldives has considerably helped the LeT expand its recruitment drive in the country. The author warns that what makes the LeT's growing influence on the Maldives more worrisome is the possibility that the group will use the island nation for

attacks against India, or block strategic sea communication lines in the Indian Ocean. ¶ The LeT has also been using Nepal as a transit point for terrorists travelling to and from Bangladesh and Pakistan while routing money and weapons for attacks in India. Instead of operating its own units in Nepal, as has done in the past, the ISI has been keen on establishing networks with Maoist and Muslim organizations for anti-India operations. ¶ A closer study of Hafiz Saeed's speeches and writings and other published works compiled by the author lay out a roadmap of global jihad with surprising clarity: once Kashmir is liberated, the group plans to work towards disintegrating India in whatever manner possible. ¶ Interestingly, the book also reveals that the LeT is not averse to using nuclear weapons to achieve its goals. LeT has not only trained cadres in chemical and radiological weapons (dirty bombs), it also has links with nuclear scientist Dr Abdul Qadeer Khan, who is a frequent visitor to the LeT's annual congregation in Muridke. ¶

LeT with nuclear weapons could not be deterred

Yingling 11 PAUL L. YINGLING: An Absence of Strategic Thinking – On the Multitude of Lessons Not Learned in Afghanistan, <http://cpost.uchicago.edu/blog/>

The future of Pakistan is more difficult to predict. It could limp along as a failing state, or suddenly fail with little warning. The West knows so little about the internal dynamics of the country that virtually any significant change will come as a surprise. Although the exact timing and extent of state failure in Pakistan is difficult to predict, the consequences of such failure are not. Partial or total state failure of a nuclear Pakistan would pose a grave threat to the United States. In such a scenario, the White House would not know who controlled Pakistan's nuclear arsenal. A nuclear-armed al Qaeda, Lashkar-e-Taiba, or other extremist group would be difficult if not impossible to deter.

AT: No ability for high tech weapons

LeT has ability to access science and technology and pull off complex attacks

Tellis 12

Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace, <http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

Seventh, LeT is an effective terrorist group that is adept at exploiting science and technology, extra-national social links, and state vulnerabilities in order to advance its political aims. The attacks in Mumbai unambiguously demonstrated LeT's sophistication in a way that few previous attacks had done. The meticulous planning, the enormous resources committed to a complex mission across great distances and long periods of time, and the burdens of a difficult sea-land operation all confirmed LeT's capacity to execute increasingly difficult terrorist attacks. This mission involved months of training in Pakistan and extensive reconnaissance of targets in Mumbai; after these tasks were complete, the terrorists left Karachi on local craft, hijacked a fishing trawler on the high seas, and, upon reaching India's territorial waters, transferred to inflatable

General threat evidence

LeT is a global threat that risks terror attacks on India and the United States

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,

<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

It is clear that after al-Qaeda, **LeT is the most dangerous terrorist group operating in South Asia because of its:** ¶ 1. **Global vision and international ambitions** ¶ 2. **Distinct ideology** that underwrites Islamic revanchism, justifying collaboration with other terrorist groups ¶ 3. **Loyalty to Pakistan** and willingness to protect its patron state against domestic opponents ¶ 4. **Diversified network for mobilizing resources**, promoting its international presence, and recruiting members, which minimizes its dependence on the state ¶ 5. **Involvement in terrorism** and social development concurrently, which limits Pakistan's ability to target the group even if it were so inclined ¶ 6. **Cohesive and hierarchic organizational structure** that is effective at both the conduct of violence and the delivery of social programs ¶ 7. **Proficiency at exploiting science and technology**, extra-national social links, and state vulnerabilities in order to advance its political aims ¶ **LeT is a formidable and highly adaptable adversary with a genuinely global reach and the ability to grow roots and sustain operations in countries far removed from its primary theater of activity in South Asia.** Though India's proximity to Pakistan has resulted in New Delhi absorbing most of the blows unleashed by LeT, the carnage in Mumbai demonstrates that the terrorism facing India is not simply a problem for New Delhi alone. **An attack could even reach U.S. soil.** ¶ **The only reasonable objective for the United States is the permanent evisceration of LeT** and other vicious South Asian terrorist groups—with Pakistani cooperation if possible, but without it if necessary.

The LeT is a massive global threat to India and the U.S.

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,

¶ Given the interaction of **LeT's ideology and its** sources of Pakistani state support, it is not surprising that Hafiz Mohammed Saeed, **LeT's emir**, **wholeheartedly endorsed the objective of destroying India** writ large. Asserting in a 1999 interview that "jihad is not about Kashmir only," he went on to declare that "about fifteen years ago, people might have found it ridiculous if someone told them about the disintegration of the USSR. Today, I announce the break-up of India, Insha-Allah. **We will not rest until the whole [of] India is dissolved into Pakistan.**" In a later 2001 statement he reaffirmed the proposition that "our struggle will continue even if Kashmir is liberated. We still have to take revenge for East Pakistan." In accordance with his declaration that Kashmir was merely a "gateway to capture India," Saeed then directed his LeT cadres to focus their attention on capturing the Muslim-dominated areas outside of Jammu and

Kashmir, such as Hyderabad, Junagadh, Munabao, and West Bengal, which he argued were forcibly occupied by India in 1947. ¶ **Judging from LeT's operational record, Saeed has been as good as his word.** The earliest LeT presence in India was detected in 1993, when a cohort of the group's Punjabi cadres crossed the Line of Control that separates the Pakistan-controlled from the Indian-controlled portions of Jammu and Kashmir. The organization's presence, however, was not publicly recognized until early 1996 when a group of LeT terrorists massacred sixteen Hindus in Barshalla in Kashmir's Doda District. Since then, hundreds of terrorist attacks involving LeT militants have occurred throughout India. LeT was implicated in plots like the terrorist attacks in New Delhi in October 2005; in Bangalore in December 2005; in Varanasi in March 2006; in Nagpur in June 2006; and in the July 2007 train bombings in Mumbai. ¶ ¶ Through these myriad efforts, **LeT has attempted**—consistent with both its own ideology and the interests of its state supporters—**to cripple India's economic growth, destroy national confidence in its political system, attack its open society, and provoke destabilizing communal rivalries.** All the while, the group has tried to send a message that India will remain an adversary because its successes make it a hindrance to LeT's larger cause. ¶ ¶ It took, however, the devastating November 2008 Mumbai attacks—a bloodbath that claimed the lives of over 150 people, including 26 foreigners of fifteen nationalities—for the international community to recognize that **LeT's ambitions, transcending India, were actually part of a larger war with the West and with liberal democracies more generally.** The barbarity in Mumbai thus represents the ugly face of **a brand of Islamist terrorism that threatens India, the United States and its allies, the larger international system, and, though often missed, Pakistan as well.** ¶ ¶ LeT's universal ambitions simply do not permit the group to confine itself only to South Asia. As Saeed has unequivocally declared, **LeT intends to “plant the flag of Islam in Washington, Tel Aviv and New Delhi.”** Such statements are not simply grandiose. That LeT has by no means restricted itself to keeping only India in its sights, even if it has focused on the latter disproportionately thus far—thanks to ISI objectives and support—is now acknowledged even by those who were initially skeptical of the group's larger ambitions. ¶ ¶ Like many other radical Islamist groups, **the LeT leadership has on numerous occasions singled out the Jewish community and the United States as being among the natural enemies of Islam.** Saeed warned, for example, that although his outfit may be presently consumed by the conflict with India, “Our struggle with the Jews is always there.” This enmity with the Jewish people is supposedly eternal and ordained by God himself. When Saeed was asked in the aftermath of the tragic 2005 earthquake in Pakistan whether then-president Pervez Musharraf's solicitation of aid from Israel was appropriate, he had no hesitation in declaring forthrightly that Pakistan “should not solicit help from Israel. It is the question of Muslim honor and self-respect. The Jews can never be our friends. This is stated by Allah.” ¶ ¶ This twisted worldview found grotesque expression during the November 2008 atrocities when **the group deliberately targeted the Jewish Chabad center** at Nariman House in Mumbai. Justifying this attack as reprisal for Israeli security cooperation with India, **LeT did not simply murder the Jewish hostages at Nariman House but humiliated and brutally tortured them before finally killing them** during the three-day siege. ¶ ¶ **Outside of al-Qaeda, LeT today therefore represents the most important South Asian terrorist group of “global reach.”** Indian intelligence currently estimates that LeT maintains some kind of terrorist presence in 21 countries worldwide with the intention of either supporting or participating in what Saeed has called the perpetual “jihad against the infidels.” LeT has declared that it would provide free training to any Muslim desirous of joining the global jihad, and the group has since delivered on that promise, as now corroborated by the testimony in the cases involving the “Virginia paintball jihad network.” In that instance, a group of ¶ extremists played paintball in anticipation of the launch of a global jihad against the West. After offering support to

LeT, several members of the group attended an LeT camp and received combat training to prepare for war against American soldiers in Afghanistan. Rather than being an isolated incident, the Virginia paintball jihad network is emblematic of LeT's larger ambitions. LeT's operatives have now been identified as engaging in:

- liaison and networking with numerous terrorist groups abroad, particularly in Central and Southeast Asia and the Middle East;
- the facilitation of terrorist acts, including in, but not restricted to, Chechnya and Iraq;
- fundraising in the Middle East, Europe, Australia, and the United States;
- the procurement of weapons, explosives, and communications equipment for terrorist operations from both the international arms markets and Pakistani state organizations such as the ISI;
- the recruitment of volunteers for suicidal missions in South Asia as well as the Middle East;
- the creation of sleeper cells for executing or supporting future terrorist acts in Europe, Australia, and likely the United States; and
- actual armed combat in at least India, Afghanistan, Pakistan, and Iraq.

Al Qaida Impact

India breaking the LeT is key to breaking Al Qaeda as well

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

India also proactively needs to end the cycle of radicalization and recruitment of youth by building strong confidence building programs and programs which counter jihadi propaganda. Further, India also needs to invest in technology which helps the security agencies combat terrorism and secure porous borders. Moreover, Lashkar has always shared a very special relationship with Al-Qaida and destroying Lashkar's strength is not only an important step for India's national security but also a step towards limiting Al-Qaida's brand name and the global jihad phenomenon. Hence, how the Indian authorities respond to Lashkar plays a very critical role.

AT: Empirically denied-Mubai

In a future attack India will be forced to retaliate—The restraint shown after Mubai won't happen again

Yusef 14 Moeed W. Yusuf is director of South Asia programs at the U.S. Institute of Peace. , Pakistan's Counterterrorism Challenge p, 16-7

Compounding these internal dynamics, Pakistan's delicate and dysfunctional relationship with its traditional rival, India, allows militant groups to register a significant threat to Pakistan's regional security. As was the case in the December 2001 attack on the Indian parliament by the Pakistan-based militant outfit Jaish-E-Mohammed (JeM), and again in the November 2008 Mumbai carnage orchestrated by Lashkar-e-Taiba (LeT), such episodes cause Pakistan to be the object of tremendous international condemnation.' They also risk escalating India-Pakistan tensions. Should a similar, future attack in India occur, some Indian strategists argue that the government in New Delhi will face too much public pressure to be able to exercise the restraint it showed following the 2008 Mumbai attacks.' Indeed, armed nonstate organizations based in Pakistan are in the unusual, and perilous, position of being able to undermine peace between two nuclear armed neighbors.

Future attacks will trigger war – Past restraint won't be repeated

Jan 11 Reza Jan was an Analyst and the Pakistan Team Lead for the Critical Threats Project at the American Enterprise Institute, Indo-Pak Talks Survive Mumbai Attack July 28, 2011, <http://www.criticalthreats.org/pakistan/jan-india-pakistan-talks-survive-mumbai-attack-july-28-2011>

Yesterday, the foreign ministers of Pakistan and India met as part of a series of talks between the two nuclear-armed neighbors five months after they officially resumed bilateral dialogue. Relations between the two countries appear to be well on the mend following the devastating 2008 Mumbai attacks in which 166 people were killed by the Pakistan-based terrorist organization, Lashkar-e-Taiba (LeT). The two sides discussed "confidence-building measures, including cross-border trade and visa protocols." Yet the talks could just as easily have been scuppered before they began by the recent terrorist attack in Mumbai. On July 13, a series of deadly bomb blasts ripped through India's financial capital, killing 23 people and wounding over 130. Unlike in the case of many previous attacks, however, there were no verbal barbs hurled across the border, no wild speculation from official sources regarding Pakistani involvement and no cancellation or delay of talks. Given the history of Indian reactions to terrorist attacks on its soil, this "non-reaction" is, by itself, noteworthy. Indian authorities and official functionaries have exhibited uncharacteristic restraint so far in declaring who they believe to have been behind the recent bomb attacks in Mumbai. Whereas in the past, authorities have been quick to point the finger at groups based in Pakistan, such as LeT, or Indian organizations with links to Pakistani terror groups, such as the Indian Mujahideen (IM), top officials in India have stated that they do not want to speculate on who might be responsible until investigations of the attacks are complete and more is known. Part of this hesitancy may be due to the fact that they are simply unsure of who is responsible. Monsoon rains on the night of the attack have complicated efforts to gather forensic evidence at the bomb sites. Then again, even though the pattern of the attack closely resembles that of previous attacks by IM, speculation to the fact remains muted. This is likely for two reasons. First, in the aftermath of the 2008 Mumbai attacks, any indicators that Pakistan or groups inside Pakistan had some role to play in a future attack would put tremendous pressure on the Indian government to take some sort of action. Indian Prime Minister Manmohan Singh and India's ruling Congress party were able to stave off such pressure in 2008 by a hair's breadth. They are highly unlikely to be able to do so a second time, especially if they are seen to be soft on a threat to which they themselves draw attention. Avoiding the pressure to take risky or uncomfortable action will only benefit the government.

U.S. Attack scenario

The LeT will use sleeper cells to attack the U.S.

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,

Steve Bucci, PhD, is a Senior Research Fellow for Defense and Homeland Security in the Allison Center for Foreign Policy at the Heritage Foundation. Jessica Zuckerman is a Research Associate in the Allison Center for Foreign Policy Studies at The Heritage Foundation. Fifty Terror Plots Foiled Since 9/11: The Homegrown Threat and the Long War on Terrorism Fifty Terror Plots Foiled Since 9/11: The Homegrown Threat and the Long War on Terrorism, <http://www.heritage.org/research/reports/2012/04/fifty-terror-plots-foiled-since-9-11-the-homegrown-threat-and-the-long-war-on-terrorism?lfa=Protect-America%2CProtect-America%2CProtect-America%2CProtect-America> In 2007, The Heritage Foundation became the first and only organization to track thwarted terrorist attacks against the United States. That year, Heritage reported that at least 19 publicly known terrorist attacks against the United States had been foiled since 9/11. Today, that number stands at 50. The fact that the United States has not suffered a large-scale attack since 9/11 speaks to the country’s counterterrorism successes. But, one year after the death of Osama bin Laden, the long war on terrorism is far from over. Reviewing the terrorist plots that have been foiled since 9/11 can provide valuable information for understanding the nature of the threat, as well as best practices for preventing the next attack. The U.S. must also be ready to adapt its security strategies—such as to counter terror attacks by an increasing number of homegrown terrorists. After the death of Osama bin Laden on May 2, 2011, many worried that al-Qaeda would try to carry out another large-scale attack against the United States as an act of revenge. Indeed since bin Laden’s death, at least nine publicly known Islamist-inspired terror plots against the United States have been foiled, bringing the total number of foiled plots since 9/11 to at least 50. Ultimately, none of the plots foiled since bin Laden’s death proved to be of the scale that many feared, with the vast majority of the plots lacking major international connections. Instead, many of these plots could be categorized as homegrown terror plots—planned by American citizens, legal permanent residents, or visitors radicalized predominately in the United States.[1] Combating this continued threat of homegrown terrorism requires not only continued reliance on existing counterterrorism and intelligence tools, such as the PATRIOT Act, but also enhancing cooperation among federal, state, and local authorities as well as

mutual trust and partnerships with Muslim communities throughout the United States. Likewise, the Department of Homeland Security (DHS) and Congress must continue to plug gaps to halt terrorist travel, and create a lawful detainment framework for the incapacitation and interrogation of suspected terrorists. Continued Threat of Homegrown Terrorism Since 9/11, terrorist networks have been dismantled, training camps have been dispersed, and the terrorist leadership largely decimated. Internationally, al-Qaeda has become more decentralized, leading to a greater dependence on its affiliates and allies. At the same time, since increased domestic security has made it harder for terrorists to plan and carry out attacks, terrorists must increase their baseline skills and capabilities needed for a successful attack in the United States.[2] With the global operating environment for terrorist networks having become increasingly hostile, homegrown terrorism has become more appealing to al-Qaeda and other terrorist networks. Homegrown terrorist actors can often bridge the divide between the United States and the other regions of the world in which terrorist networks operate, frequently possessing the cultural and linguistic skills to easily move between the two. It is this "duality" for instance, that served Najibullah Zazi in his attempt to bomb the New York City subway system, with Zazi "being able to operate with facility in environments as starkly different as New York and Peshawar." [3] The value for terrorist networks also often lies in the ability of homegrown terrorists to more easily travel back and forth and work within the United States without raising suspicion. Of course, it is also these same abilities that can make it more challenging for U.S. intelligence and law enforcement to detect homegrown terrorist plots. Similarly, difficulties in detecting attempted homegrown attacks are also present in the fact that homegrown terror plots tend to involve significantly fewer actors and connections to terrorist networks at home and abroad. The frequency of lone wolf actors, radicalized independent of direct connections to terrorist networks either through the Internet or social circles, can further elevate these challenges. Yet, lacking the support of broader terrorist networks, violent extremists may lack a profound understanding of such specialized skills as bomb making, as well as financing, support networks, and training, causing them to be reluctant or even unable to carry out a large-scale, highly destructive attack independently.[4] This same lack of training and resources may also open up homegrown terror plots for detection by U.S. intelligence and law enforcement by affording more room for error on the part of the terrorist. Ultimately, while some signals of homegrown terror plots have gone unnoticed—most notably in the cases of Major Nidal Hasan's 2009 deadly attack on Fort Hood, the near-successful attempts in 2009 of Christmas Day bomber Umar Farouk Abdulmutallab, and in 2010 of Times Square bomber Faisal Shahzad—the vast majority of attempted attacks against the United States have been thwarted in their early stages through the concerted efforts of U.S. law enforcement and intelligence. For the individual homegrown terrorist, personal motives may vary greatly. It could be a desire for collective revenge against the U.S. for the purported "war on Islam," poverty or social alienation, or brainwashing. There is no one path to radicalization. As DHS's Office of Intelligence and Analysis has indicated, motives and paths to radicalization can vary significantly depending on one's ideology and religious beliefs, geographic location, or socioeconomic condition.[5] Nevertheless, trends do seem to exist among those attempted homegrown terror plots thwarted since 9/11, most significantly a seeming aversion to suicide or martyrdom.[6] 50 Plots Foiled Since 9/11 Compiled by The Heritage Foundation since 2007, the following list outlines those publicly known terrorist plots against the U.S. that have been foiled since 9/11.[7] Based on Heritage's research, at least 50 publicly known Islamist-inspired terror plots targeting the United States have been foiled since 9/11. Of these, at least 42 could be considered homegrown terror plots. While three of the 50 known plots were foiled by luck or the quick action of the American public, the remaining 47 were thwarted due to the concerted efforts of intelligence and law enforcement. 1. Richard Reid—December 2001. A British citizen and self-professed follower of Osama bin Laden who trained in Afghanistan, Richard Reid hid explosives inside his shoes before boarding a flight from Paris to Miami on which he attempted to light the fuse with a match. Reid was caught in the act and apprehended aboard the plane by passengers and flight attendants. FBI officials took Reid into custody after the plane made an emergency landing at Boston's Logan International Airport.[8] In 2003, Reid was found guilty on charges of terrorism, and a U.S. federal court sentenced him to life in prison.[9] He is currently incarcerated at a federal maximum-security prison in Colorado. Saajid Badat, a supporter to Reid, has been sentenced to 13 years in jail for planning to blow up a passenger plane. The 26-year-old, a religious teacher from Gloucester, England, was sentenced after he admitted conspiring with fellow Briton Reid. Badat pled guilty in February 2005 to the plot to blow up the transatlantic flight on its way to the U.S. in 2001.[10] 2. Jose Padilla—May 2002. U.S. officials arrested Jose Padilla in May 2002 at Chicago's O'Hare airport as he returned to the United States from Pakistan, where he met with 9/11 mastermind Khalid Sheikh Mohammed and received al-Qaeda training and instructions.[11] Upon his arrest, he was initially charged as an enemy combatant, and for planning to use a dirty bomb (an explosive laced with radioactive material) in an attack in the U.S.[12] Along with Padilla, Adham Amin Hassoun and Kifah Wael Jayyousi were convicted in August 2007 of terrorism conspiracy and material support. It was found that the men supported cells that sent recruits, money, and supplies to Islamic extremists worldwide, including al-Qaeda members. Hassoun was the recruiter and Jayyousi served as a financier and propagandist in the cell. Before his conviction, Padilla had brought a case against the federal government claiming that he had been denied the right of habeas corpus (the right of an individual to petition his unlawful imprisonment). In a five-to-four decision, the U.S. Supreme Court found that the case against him had been filed improperly.[13] In 2005, the government indicted Padilla for conspiring against the U.S. with Islamic terrorist groups. In August 2007, Padilla was found guilty by a civilian jury after a three-month trial. He was later sentenced by the U.S. District Court for the Southern District of Florida to 17 years and four months in prison.[14] In September 2011, an appellate court ruling deemed Padilla's original sentence to be too lenient.[15] Padilla is being held at the same penitentiary as Richard Reid and is awaiting resentencing. 3. Lackawanna Six—September 2002. When the FBI arrested Sahim Alwan, Yahya Goba, Yasein Taher, Faysal Galab, Shafal Mosed, and Mukhtar al-Bakri in Upstate New York, the press dubbed them the "Lackawanna Six," the "Buffalo Six," and the "Buffalo Cell." Five of the six had been born and raised in Lackawanna, New York.[16] All six are American citizens of Yemeni descent, and stated that they were going to Pakistan to attend a religious camp, but attended an al-Qaeda training camp in Afghanistan instead. The six men pled guilty in 2003 to providing support to al-Qaeda. Goba and al-Bakri were sentenced to 10 years in prison, Taher and Mosed to eight years, Alwan to nine and a half years, and Galab to seven years.[17] Goba's sentence was later reduced to nine years after he, Alwan, and Taher testified at a Guantanamo Bay military tribunal in the case against Osama bin Laden's chief propagandist, Ali Hamza al-Bahlul.[18] Recent reports indicate that Jaber Elbaneh, one of the FBI's most wanted and often considered to be a seventh member of the Lackawanna cell, has been captured in Yemen. It remains to be seen whether he will be tried in the U.S., since the U.S. does not have an extradition treaty with Yemen.[19] 4. Uzair and Saifullah Paracha—March 2003. Uzair Paracha, a Pakistani citizen with permanent residency status in the U.S., was arrested in March 2003 and charged with five counts of providing material and financial support to al-Qaeda. Uzair attempted to help another Pakistani, Majid Khan, an al-Qaeda operative, gain access to the United States via immigration fraud. Khan is said to have been in contact with 9/11 mastermind Khalid Sheikh Mohammed and planned to bomb underground storage tanks at Maryland gas stations.[20] Uzair was convicted and sentenced to 30 years in prison. Saifullah Paracha, Uzair's father, a 64-year-old citizen of Pakistan and resident alien of the U.S., is currently being held at Guantanamo Bay awaiting trial. Paracha was arrested in Bangkok, Thailand, in July 8, 2003, through the efforts of the FBI and information provided by his son. He is believed to have had close ties to Khalid Sheikh Mohammed, and Mohammed's nephew Ammar al-Baluchi. Saifullah is said to have used his international business connections to help al-Qaeda procure chemical and biological explosives and assist in their shipment to the U.S., along with the shipment of ready-made explosives.[21] 5. Iyman Faris—May 2003. Iyman Faris is a naturalized U.S. citizen, originally from Kashmir, who was living in Columbus, Ohio. He was arrested for conspiring to use blowtorches to collapse the Brooklyn Bridge, a plot devised after meetings with al-Qaeda leadership, including Khalid Sheikh Mohammed.[22] The New York City Police Department learned of the plot and increased police surveillance around the bridge. Faced with the additional security, Faris and his superiors called off the attack.[23] Faris pled guilty to conspiracy and providing material support to al-Qaeda and was later sentenced in federal district court to 20 years in prison, the maximum allowed under his plea agreement.[24] 6. Ahmed Omar Abu Ali—June 2003. Ahmed Omar Abu Ali is an American citizen of Jordanian descent who was arrested in Saudi Arabia on charges that he conspired to kill President George W. Bush, hijack airplanes, and provide support to al-Qaeda. He was arrested while attending Medina University, where he had joined an al-Qaeda cell. His plans, according to authorities, were to kill President Bush and then establish an al-Qaeda cell in the United States, with himself as the head.[25] He was convicted by an American court on November 22, 2005, and sentenced to life in prison on July 27, 2009, overturning a 2006 sentence of 30 years that was ruled to be too lenient.[26] 7. Virginia Jihad Network—June 2003. Eleven men were arrested in Alexandria, Virginia, for weapons counts and for violating the Neutrality Acts, which prohibit U.S. citizens and residents from attacking countries with which the United States is at peace. Four of the 11 men pled guilty. Upon further investigation, the remaining seven were indicted on additional charges of conspiring to support terrorist organizations. They were found to have connections with al-Qaeda, the Taliban, and Lashkar-e-Tayyiba, a terrorist organization that targets the Indian government. The authorities stated that the Virginia men had used paintball games to train and prepare for battle. The group had also acquired surveillance and night vision equipment and wireless video cameras.[27] Two more men were later indicted in the plot: Ali al-Timimi, the group's spiritual leader, and Ali Asad Chandia. Ali al-Timimi was found guilty of soliciting individuals to assault the United States and was sentenced to life in prison. Ali Asad Chandia received 15 years for supporting Lashkar-e-Tayyiba.[28] Randall Todd Royer, Ibrahim al-Hamdi, Yong Ki Kwon, Khwaja Mahmood Hasan, Muhammad Aatique, and Donald T. Surratt pled guilty and were sentenced to prison terms ranging from three years and 10 months to 20 years. Masoud Khan, Seifullah Chapman, and Hammad Abdur-Raheem were found guilty and later sentenced to prison terms ranging from 52 months to life.[29] Both Caliph Basha Ibn Abdur-Raheem and Sabri Benkhala were acquitted at trial.[30] 8. Nuradin M. Abdi—November 2003. Nuradin M. Abdi, a Somali citizen living in Columbus, Ohio, was arrested and charged in a plot to bomb a local shopping mall. Abdi was an associate of convicted terrorists Christopher Paul and Iyman Faris and admitted to conspiring with the two to provide material support to terrorists. Following his arrest, Abdi admitted to traveling overseas to seek admittance to terrorist training camps, as well as meeting with a Somali warlord associated with Islamists. Abdi has since pled guilty to conspiracy to provide material support to terrorists, one of the four counts for which he was indicted. He was subsequently sentenced to 10 years in jail per the terms of a plea agreement.[31] 9. Dhiren Barot—August 2004. Seven members of a terrorist cell led by Dhiren Barot were arrested for plotting to attack the New York Stock Exchange and other financial institutions in New York, Washington, D.C., and Newark, New Jersey. They were later accused of planning attacks in England. The plots included a "memorable black day of terror" that would have included detonating a dirty bomb. A July 2004 police raid on Barot's house in Pakistan yielded a number of incriminating files on a laptop computer, including instructions for building car bombs.[32] Barot pled guilty and was convicted in the United Kingdom for conspiracy to commit mass murder and sentenced to 40 years.[33] However, in May 2007, his sentence was reduced to 30 years.[34] His seven co-conspirators were sentenced to terms ranging from 15 to 26 years on related charges of conspiracy to commit murder and conspiracy to cause explosion.[35] 10. James Elshafay and Shahwar Matin Siraj—August 2004. James Elshafay and Shahwar Matin Siraj, both reportedly self-radicalized, were arrested for plotting to bomb a subway station near Madison Square Garden in New York City before the Republican National Convention.[36] An undercover detective from the New York City Police Department's Intelligence Division infiltrated the group, providing information to authorities, and later testified against Elshafay and Siraj.[37] Siraj was convicted and sentenced to 30 years in prison. Elshafay, a U.S. citizen, pled guilty and received a lighter, five-year sentence for testifying against his co-conspirator.[38] 11. Yassin Aref and Mohammad Hossain—August 2004. Two leaders of a mosque in Albany, New York, were charged with plotting to purchase a shoulder-fired grenade launcher to assassinate a Pakistani diplomat.[39] An investigation by the FBI, the Bureau of Alcohol, Tobacco, Firearms and Explosives, and local police contributed to the arrest. With the help of an informant, the FBI set up a sting that lured Mohammad Hossain into a fake terrorist conspiracy. Hossain brought Yassin Aref, a Kurdish refugee, as a witness. The informant offered details of a fake terrorist plot, claiming that he needed the missiles to murder a Pakistani diplomat in New York City. Both Aref and Hossain agreed to help.[40] Aref and Hossain were found guilty of money laundering and conspiracy to conceal material support for terrorism and were sentenced to 15 years in prison.[41] 12. Hamid Hayat—June 2005. Hamid Hayat, a Pakistani immigrant, was arrested in Lodi, California, after allegedly lying to the FBI about his attendance at an Islamic terrorist training camp in Pakistan. Hamid was found guilty of providing himself as "material support" to terrorists and three counts of providing false statements to the FBI.[42] In interviews with the FBI, he stated (correctly) that he specifically requested to come to the United States after receiving training in order to carry out jihad.[43] He was sentenced to 24 years in prison.[44] 13. Levar Haley Washington, Gregory Vernon Patterson, Hammad Riaz Samana, and Kevin James—August 2005. The members of the group were arrested in Los Angeles and charged with conspiring to attack National Guard facilities, synagogues, and other targets in the Los Angeles area. Kevin James allegedly founded Jamiyyat ul-Islam Is-Saheeh (JIS), a radical Islamic prison group, and converted Levar Washington and others to the group's mission. The JIS allegedly planned to finance its operations by robbing gas stations. After Washington and Patterson were arrested for robbery, police and federal agents began a terrorist investigation, and a search of Washington's apartment revealed a target list.[45] James and Washington pled guilty in December 2007. James was sentenced to 16 years in prison and Washington to 22 years. Patterson received 151 months, while Samana was found unfit to stand trial and was initially detained in a federal prison mental facility. He was later sentenced to 70 months in jail.[46] 14. Michael C. Reynolds—December 2005. Michael C. Reynolds was arrested by the FBI and charged with involvement in a plot to blow up a Wyoming natural gas refinery; the Transcontinental Pipeline, a natural-gas pipeline from the Gulf Coast to New York and New Jersey; and a Standard Oil refinery in New Jersey.[47] He was arrested while trying to pick up a \$40,000 payment for

planning the attack.[48] Shannen Rossmiller, his purported contact, was a Montana judge and private citizen working with the FBI. Rossmiller posed as a jihadist, tricking Reynolds into revealing his plan. The FBI later found explosives in a storage locker in Reynolds's hometown of Wilkes-Barre, Pennsylvania.[49] Reynolds claimed that he was doing much the same as Rossmiller, and was working as a private citizen to find terrorists.[50] Reynolds was convicted of providing material support to terrorists, soliciting a crime of violence, unlawful distribution of explosives, and unlawful possession of a hand grenade. He was sentenced to 30 years in prison.[51] 15. Mohammad Zaki Amawi, Marwan Othman El-Hindi, and Zand Wassim Mazloum—February 2006. Amawi, El-Hindi, and Mazloum were arrested in Toledo, Ohio, for conspiring to kill people outside the United States, including U.S. Armed Forces personnel serving in Iraq.[52] The men also conspired to train and arm for a violent jihad against the United States, both domestically and abroad.[53] Training involved use of materials including those found on secure and exclusive jihadist websites, downloaded and copied training videos, and materials for jihad training sessions. The men also were found to have provided material support to terrorist organizations and to have verbally threatened attacks on President George W. Bush.[54] The investigation was begun with the help of an informant who was approached to help train the group.[55] In June 2008, the three men were convicted of conspiring to commit acts of terrorism against Americans overseas, including U.S. military personnel in Iraq, and other terrorism-related violations. Amawi was sentenced to 20 years, El-Hindi to 13 years, and Mazloum to approximately eight years.[56] 16. Syed Haris Ahmed and Ehsanul Islam Sadeque—April 2006. Ahmed and Sadeque, from Atlanta, Georgia, were accused of conspiracy, having discussed terrorist targets with alleged terrorist organizations. They allegedly met with Islamic extremists in the U.S. and gathered video surveillance of potential targets in the Washington, D.C., area, including the U.S. Capitol and the World Bank headquarters, and sent the videos to a London Islamist group. Ahmed is said also to have traveled to Pakistan with the goal of joining Lashkar-e-Tayyiba.[57] Both men were indicted for providing material support to terrorist organizations and pled not guilty.[58] In June 2009, a federal district judge found Ahmed "guilty of conspiring to provide material support to terrorists here and overseas." [59] Ahmed was subsequently sentenced to 13 years in jail. Sadeque was also found guilty and sentenced to 17 years.[60] 17. Narseal Batiste, Patrick Abraham, Stanley Grant Phanor, Nadimar Herrera, Burson Augustin, Lyglenson Lemorin, and Rotschild Augustine—June 2006. Seven men were arrested in Miami and Atlanta for plotting to blow up the Sears Tower in Chicago, FBI offices, and other government buildings around the country. The arrests resulted from an investigation involving an FBI informant. Allegedly, Batiste was the leader of the group and first suggested attacking the Sears Tower in December 2005.[61] All of the suspects pled not guilty. On December 13, 2007, Lemorin was acquitted of all charges, but the jury failed to reach a verdict on the other six.[62] The second trial ended in a mistrial in April 2008.[63] In the third trial, the jury convicted five of the men on multiple conspiracy charges and acquitted Herrera on all counts. On November 20, 2009, the five were sentenced to prison terms ranging from six to 13.5 years, with Batiste receiving the longest sentence.[64] 18. Assem Hammoud—July 2006. Conducting online surveillance of chat rooms, the FBI discovered a plot to attack underground transit links between New York City and New Jersey. Eight suspects, including Assem Hammoud, and al-Qaeda loyalist living in Lebanon, were arrested for plotting to bomb New York City train tunnels. Hammoud, a self-proclaimed operative for al-Qaeda, admitted to the plot.[65] He was held by Lebanese authorities but was not extradited because the U.S. does not have an extradition treaty with Lebanon. In June 2008, Lebanese authorities released him on bail.[66] In February 2012, Hammoud was convicted in a Lebanese court. He was sentenced to two years in prison, which he had already served.[67] 19. Liquid Explosives Plot—August 2006. British law enforcement stopped a terrorist plot to blow up 10 U.S.-bound commercial airliners with liquid explosives.[68] Twenty-four suspects were arrested in the London area. The style of the plot raised speculation that al-Qaeda was behind it, but no concrete evidence has established a link. The United Kingdom initially indicted 15 of the 24 arrested individuals on charges ranging from conspiring to commit murder to planning to commit terrorist acts.[69] Eventually, in April 2008, only eight men were brought to trial. In September, the jury found none of the defendants guilty of conspiring to target aircraft, but three guilty of conspiracy to commit murder.[70] The jury was unable to reach verdicts on four of the men. One man was found not guilty on all counts.[71] 20. Derrick Shareef—December 2006. Derrick Shareef was arrested on charges of planning to set off hand grenades in a shopping mall outside Chicago. Shareef reportedly acted alone and was arrested after meeting with an undercover Joint Terrorism Task Force agent. FBI reports indicated that the mall was one of several potential targets, including courthouses, city halls, and government facilities. Shareef, however, settled on attacking a mall in the days immediately preceding Christmas because he believed it would cause the greatest amount of chaos and damage.[72] Shareef was also found to have connections to convicted terrorist Hassan Agujiahaad, who was charged with attempted use of a weapon of mass destruction and later sentenced to 35 years in prison.[73] 21. Khalid Sheikh Mohammed—March 2007. Khalid Sheikh Mohammed, captured in Pakistan in 2003, was involved in a number of terrorist plots and is one of the most senior bin Laden operatives ever captured.[74] He is being held at the U.S. military detention facility in Guantanamo Bay. In March 2007, Mohammed admitted to helping plan, organize, and run the 9/11 attacks. He also claimed responsibility for planning the 1993 bombing of the World Trade Center and the 2002 bombings of nightclubs in Bali and a Kenyan hotel. He has stated that he was involved in the decapitation of Wall Street Journal reporter Daniel Pearl and took responsibility for helping to plan the failed shoe-bomb attack by Richard Reid, along with plots to attack Heathrow Airport, Canary Wharf, Big Ben, various targets in Israel, the Panama Canal, Los Angeles, Chicago, the Empire State building, and U.S. nuclear power stations. He had also plotted to assassinate Pope John Paul II and former President Bill Clinton. In December 2008, Mohammed and his four co-defendants (Ramzi Binalshibh, Mustafa Ahmad al-Hawsawi, Ali Abd al-Aziz Ali, and Walid Bin Attash) told the military tribunal judge that they wanted to confess and pleaded guilty to all charges.[75] The judge has approved the guilty plea of Mohammed and two co-defendants but has required mental competency hearings before allowing the other two conspirators to plead guilty. In November 2009, U.S. Attorney General Eric Holder announced that Mohammed would be relocated to the United States to face a civilian trial in the U.S. District Court for the Southern District of New York.[76] That decision has now been reversed and the Administration announced that Khalid Sheikh Mohammed and the other Guantanamo Bay detainees would be prosecuted in military tribunals at Guantanamo.[77] The date for the arraignment of Khalid Sheikh Mohammed and his co-defendants has been set for May 5, 2012, beginning the long-awaited legal proceedings for the five men.[78] 22. Fort Dix Plot—May 2007. Six men were arrested in a plot to attack Fort Dix, a U.S. Army post in New Jersey. The plan involved using assault rifles and grenades to attack and kill U.S. soldiers. Five of the alleged conspirators had conducted training missions in the nearby Pocono Mountains. The sixth helped to obtain weapons. The arrests were made after a 16-month FBI operation that included infiltrating the group. The investigation began after a store clerk alerted authorities after discovering a video file of the group firing weapons and calling for jihad. The group has no known direct connections to any international terrorist organization.[79] In December 2008, five of the men were found guilty on conspiracy charges but were acquitted of charges of attempted murder.[80] Four were also convicted on weapons charges. The five men received sentences ranging from 33 years to life plus 30 years. The sixth co-defendant pled guilty to aiding and abetting the others in illegal possession of weapons and was sentenced to 20 months in jail.[81] 23. JFK Airport Plot—June 2007. Four men plotted to blow up "aviation fuel tanks and pipelines at the John F. Kennedy International Airport" in New York City. They believed that such an attack would cause "greater destruction than in the Sept. 11 attacks." Authorities stated that the attack "could have caused significant financial and psychological damage, but not major loss of life." [82] Russell Defreitas, the leader of the group, was arrested in Brooklyn. The other three members of the group—Abdul Kadir, Kareem Ibrahim, and Abdul Nur—were detained in Trinidad and extradited in June 2008. Kadir and Nur have links to Islamic extremists in South America and the Caribbean. Kadir was an imam in Guyana, a former member of the Guyanese Parliament, and mayor of Linden, Guyana. Ibrahim is a Trinidadian citizen and Nur is a Guyanese citizen.[83] In 2010, Kadir was found guilty on five counts and sentenced to life in prison. In February, both Defreitas and Nur were also found guilty. Defreitas was sentenced to life in prison, while Nur was sentenced to 15 years.[84] The final conspirator, Kareem Ibrahim, was convicted in May 2011 and has been sentenced to life in prison.[85] 24. Hassan Abujihad—March 2008. Hassan Abujihad, a former U.S. Navy sailor from Phoenix, Arizona, was convicted of supporting terrorism and disclosing classified information, including the location of Navy ships and their vulnerabilities, to Babar Ahmad and Syed Talha Ahsan, the alleged administrators of Azzam Publication websites (the London organization that provided material support and resources to terrorists). Abujihad was arrested in March 2007 and pled not guilty to charges of supporting terrorism in April 2007. In May 2008, he was convicted by a jury and sentenced to 10 years in prison.[86] In 2010, his conviction was upheld in a federal court of appeals.[87] Both Babar Ahmad and Syed Talha Ahsan are being held in Britain on anti-terrorism charges and are fighting extradition to the U.S.[88] 25. Christopher Paul—June 2008. Christopher Paul is a U.S. citizen from Columbus, Ohio. He joined al-Qaeda in the 1990s and was involved in conspiracies to target Americans in the United States and overseas. In 1999, he became connected to an Islamic terrorist cell in Germany, where he was involved in a plot to target Americans at foreign vacation resorts. He later returned to Ohio and was subsequently arrested for conspiracy to use a weapon of mass destruction—specifically, explosive devices—"against targets in Europe and the United States." Paul pled guilty to the charges and was sentenced to 20 years in prison.[89] 26. Bryant Neal Vinas—November 2008. Bryant Neal Vinas is an American citizen of Hispanic descent who converted to Islam in 2004.[90] In 2007, Vinas left home telling his parents he wanted to study Islam and Arabic. He then traveled to Pakistan where he was trained by and joined the Taliban. During his time in Pakistan, Vinas assisted with unsuccessful attacks on American forces and provided al-Qaeda with extensive information regarding the Long Island Rail Road for a potential attack.[91] He was arrested by Pakistani forces and sent back to the United States, where he pleaded guilty and began cooperating with authorities. He is currently in the custody of the U.S. Marshals and is awaiting sentencing.[92] 27. Synagogue Terrorist Plot—May 2009. On May 20, 2009, the New York Police Department announced the arrest of James Cromitie, David Williams, Onta Williams, and Laguerre Payen for plotting to blow up New York-area Jewish centers and shoot down planes at a nearby Air National Guard Base.[93] The four had attempted to gain access to Stinger missiles and were caught in the act of placing bombs in the buildings and in a car. (The bombs were duds, because undercover agents stole the four defendants fake explosives as part of an ongoing sting operation). All four men were found guilty. In June 2011, James Cromitie, David Williams, and Onta Williams were sentenced to 25 years in prison.[94] In September 2011, Laguerre Payen received the same sentence.[95] 28. Raleigh Jihad Group—July 2009. A group of seven men in North Carolina were arrested on charges of conspiring to support terrorist groups abroad, engage in terror attacks abroad and plotting an attack on the U.S. Marine base at Quantico, Virginia.[96] Their ringleader, Daniel Patrick Boyd, is believed to have a long association with radical groups, dating from his time living in Pakistan. In Pakistan, he is believed to have been an active member of Hezb-e-Islami (Party of Islam). The Raleigh group also raised funds and trained extensively in preparation to wage attacks both at home and abroad. [97] The men were denied bail and are awaiting trial.[98] 29. Najibullah Zazi—September 2009. Najibullah Zazi, a 24-year-old Afghan, was arrested after purchasing large quantities of chemicals used to make a TATP bomb, the same type of weapon used in the 2005 bombing of the London Underground and the 2001 shoe-bomb plot. Zazi had traveled to Pakistan, where he received instruction in bomb making and attended an al-Qaeda training camp. Zazi allegedly planned to detonate TATP bombs on the New York City subway.[99] It has since been found that the plot was directed by senior al-Qaeda leadership in Pakistan.[100] Najibullah Zazi's father, Mohammed Wali Zazi, was also indicted for obstructing justice, witness tampering, and lying to the FBI in attempts to help his son cover up plans for his attack.[101] A cousin of Zazi, Amanullah Zazi, also publicly admitted that he played a role in Zazi's 2009 plot. Amanullah pled guilty in secret and agreed to become a government witness in federal court in Brooklyn against Najibullah's father.[102] The father has since been found guilty and sentenced to four and a half years in prison.[103] Najibullah Zazi pled guilty, as the result of a plea bargain, and remains in jail. He is currently awaiting sentencing.[104] At least three other individuals have since been arrested on allegations of conspiring to carry out the attack with Zazi. One of them, New York religious leader Ahmad Afzali, has pled guilty to charges of lying to federal agents about informing Zazi that he was being investigated by authorities. [105] As part of a plea deal, Afzali was sentenced to time served and ordered to leave the country within 90 days.[106] A second man, Zarein Ahmedzay, has also pled guilty to conspiring to use weapons of mass destruction in the foiled plot and lying to investigators. Adis Medunjanin has pled not guilty to conspiracy to commit murder in a foreign country and to receiving terrorist training.[107] Ahmedzay and Medunjanin are thought to have traveled to Pakistan with Zazi, and to have met with wanted al-Qaeda operative Adnan El Shukrijumah, who has also been charged in the plot.[108] A fourth individual, Abid Nasser, has also been implicated in the plot led by Zazi, as well as other plots in England and Norway. He is currently in the United Kingdom facing extradition to the United States.[109] Also charged in the plot are, Tariq Ur Rehman, and a fifth defendant known as "Ahmad," "Sohab," or "Zahid." Both El Shukrijumah and Rehman are not in custody.[110] 30. Hosam Maher Hussein Smadi—September 2009. Smadi, a 19-year-old Jordanian, was apprehended in an attempt to plant a bomb in a Dallas skyscraper. Originally identified through FBI monitoring of extremist chat rooms, Smadi was arrested and charged after agents posing as terrorist cell members gave Smadi a fake bomb, which he later attempted to detonate.[111] Smadi was found guilty and sentenced to 24 years in prison.[112] 31. Michael Finton—September 2009. Michael Finton, an American citizen, was arrested on September 23, 2009, by undercover FBI agents after attempting to detonate a car bomb filled with what he believed to be close to one ton of explosives outside the Paul Findley Federal Building and Courthouse in downtown Springfield, Illinois. The blast was also intended to destroy the nearby office of Representative Aaron Schock (R-IL).[113] Evidence presented against Finton has shown that he expressed a desire to become a jihadist fighter and was aware that his planned attack would cause civilian injuries. He has been arrested on charges of attempted murder of federal employees and attempted use of a weapon of mass destruction. Finton pled guilty and was sentenced to 28 years in prison.[114] 32. Tarek Mehanna and Ahmad Abousamra—October 2009. Tarek Mehanna, previously indicted for lying to the FBI about the location of terrorist suspect Daniel Maldonado, was arrested on October 21, 2009, on allegations of conspiracy to kill two U.S. politicians, American troops in Iraq, and civilians in local shopping malls, as well as conspiracy to provide material support to a terrorist organization.[115] Mehanna and Ahmad Abousamra, his co-conspirator, were indicted on charges of providing and conspiring to provide material support to terrorists, conspiracy to kill Americans in a foreign country, and conspiracy to provide false information to law enforcement.[116] The two men are not believed to be associated with any known terrorist organization.[117] Mehanna has pled not guilty to charges held against him and has since been convicted, while Abousamra remains at large in Syria.[118] 33. The Christmas Day Bomber—2009. Umar Farouk Abdulmutallab, a 23-year-old Nigerian engineering student living in London, boarded a plane from Nigeria to Amsterdam and then flew from Amsterdam to the U.S. It was on this second flight when he attempted to detonate a bomb hidden in his underwear as the plane began to land. The device ignited but did not detonate, and passengers quickly stopped Abdulmutallab from trying again, leading to his arrest by U.S. authorities upon landing in Detroit. The bomb, containing the explosives PETN and TATP, was similar to the failed device used by Richard Reid in his shoe in 2001. Media accounts following the plot indicate that Abdulmutallab admits involvement with al-Qaeda in Yemen and has pleaded not guilty to charges including conspiracy to commit an act of terrorism and attempting to use a weapon of mass destruction.[119] In February 2012, Abdulmutallab was sentenced to life in prison following his conviction.[120] 34. Raja Lahrasib Khan—March 2010. Chicago taxi driver Raja Lahrasib Khan, a naturalized U.S. citizen from Pakistan, was arrested by the Chicago FBI's Joint Terrorism Task Force on two counts of providing material support to a foreign terrorist organization. According to the charges, Khan was affiliated with Ilyas Kashmiri, leader of the al-Qaeda-linked extremist group Harakat ul-Jihad-I-Islami in Kashmir, and has previously been indicted in the U.S. on terrorism charges.[121] Khan originally transferred \$950 to Pakistan, to be delivered to Kashmiri, and later attempted to send around \$1,000 provided to him by an undercover agent to Kashmiri by having his son carry the money to England, where Khan then planned to rendezvous with him and carry the money the rest of the way to Pakistan. His son was stopped by government agents at Chicago's O'Hare airport before leaving the country. The criminal complaint filed against Khan also alleges that he had discussed plans to bomb an unnamed sports stadium in the United States. Khan has since pleaded guilty as part of a plea deal recommending a sentence of five to eight years. His sentencing has been scheduled for May 30, 2012.[122] 35. Faisal Shahzad—May 2010. Faisal Shahzad, a naturalized citizen from Pakistan, attempted to detonate explosives in an SUV parked in Times Square. After explosives training in Pakistan, he is said to have received \$12,000 from entities affiliated with the terrorist organization Tehrik-e-Taliban to fund the attack. Following the failed bombing attempt, Shahzad attempted to flee the country to Dubai, but was arrested before the flight was able to leave New York's JFK airport.[123] Shahzad pled guilty to 10 counts, including conspiracy to commit an act of terrorism and to use a weapon of mass destruction.[124] He was sentenced to life in prison and is being held at the same Colorado maximum-security prison as Richard Reid and Jose Padilla.[125] 36. Paul G. Rockwood, Jr., and Nadia Pirokska Maria Rockwood—July 2010. Paul G. Rockwood, Jr., an American citizen, became an adherent to Anwar al-Awlaki's ideology of violent jihad after converting to Islam. In studying al-Awlaki's teachings, Rockwood came to believe it was his religious responsibility to seek revenge against anyone who defiled Islam. He created a list of 15 individuals to be targeted for assassination, including several members of the U.S. military. Rockwood is said to have researched explosive techniques and discussed the

possibility of killing his targets with a gunshot to the head or through mail bombs. Nadia Piroška Maria Rockwood, Paul's wife, knowingly transported the list to Anchorage, Alaska, to share with an unnamed individual who apparently shared Rockwood's ideology. The list then made it into the hands of the FBI's Joint Terrorism Task Force in Anchorage. Paul was charged with making false statements to the FBI in a domestic terrorism charge, while Nadia was charged with making false statements to the FBI in connection to the case against her husband. Paul was sentenced to eight years in prison, while his wife was sentenced to five years probation.[126] 37. Ferooq Ahmed—October 2010. Pakistani-American Ferooq Ahmed was arrested following an FBI investigation into plots to attack the Washington, D.C., subway. Ahmed is said to have conducted surveillance on the D.C. Metrorail system on multiple occasions, and was in contact with undercover FBI agents whom he believed to be individuals affiliated with al-Qaeda.[127] According to an unsealed affidavit, Ahmed wanted to receive terrorist training overseas and become a martyr. The affidavit also indicates that he sought to specifically target military personnel in his bombing attempt.[128] Ahmed pled guilty to charges of material support and collecting information for a terrorist attack on a transit facility. He was then immediately sentenced to 23 years in prison.[129] 38. Air Cargo Bomb Plot—October 2010. Two packages shipped from Yemen to Chicago-area synagogues were discovered to contain explosive materials of the same type used by Richard Reid and Umar Farouk Abdulmutallab in previously thwarted bombing attempts.[130] The packages contained printer cartridges filled with the explosive material and were identified with the help of intelligence tips from Saudi Arabian authorities while in transit on cargo planes in the United Kingdom and Dubai.[131] While no arrests have been made, the Yemen-based Al-Qaeda in the Arabian Peninsula (AQAP) has claimed responsibility for the failed attack. 39. Mohamed Osman Mohamud—November 2010. Mohamed Osman Mohamud, a 19-year-old Somali-American, was arrested after attempting to detonate a car bomb at a Christmas tree lighting ceremony in Portland, Oregon. The bomb was composed of inert explosives given to him by undercover FBI agents. Mohamud had previously sought to travel overseas to obtain training in violent jihad. Having failed in that attempt, he wanted to commit an attack that would cause mass casualties to individuals and their families.[132] Mohamud has pled not guilty to the charges.[133] 40. Antonio Martinez—December 2010. Antonio Martinez, a 21-year-old American citizen also known as Muhammad Hussain, planned to bomb a military recruiting center in Maryland. The FBI learned of the plot from an unnamed informant. Martinez was arrested after attempting to detonate a fake explosive device supplied by FBI agents. He has been charged with attempted murder of federal officers and employees, as well as attempted use of a weapon of mass destruction.[134] He has pled not guilty and awaits further trial.[135] 41. Khalid Ali-M Aldawsari—February 2011. Khalid Ali-M Aldawsari, a Saudi citizen studying in Lubbock, Texas, was arrested by the FBI after placing an order for the toxic chemical phenol. Both the chemical supplier and the freight shipping company became suspicious of the order, which could be used to make an improvised explosive device (IED), and alerted the FBI and local police. Surveillance of Aldawsari's e-mail turned up a list of potential "nice targets" including dams, nuclear power plants, military targets, a nightclub, and the Dallas residence of former President George W. Bush. The search also recovered plans to acquire a forged U.S. birth certificate and multiple driver's licenses. Aldawsari seems to have considered using these documents to obtain rental cars for use in vehicle bombings. He has pled not guilty to charges of attempted use of a weapon of mass destruction and faces up to life in prison.[136] 42. Ahmed Ferhani and Mohamed Mamdouh—May 2011. Ahmed Ferhani of Algeria, and Moroccan-born Mohamed Mamdouh, a U.S. citizen, were arrested by the New York Police Department after attempting to purchase a hand grenade, guns, and ammunition to attack an undetermined Manhattan synagogue. The men planned on disguising themselves as Orthodox Jews in order to sneak into the synagogue.[137] Reports have also cited the Empire State Building as a possible second target.[138] Both men face charges of conspiracy to commit a crime of terrorism and conspiracy to commit a hate crime, as well as criminal possession of a weapon.[139] 43. Yonathan Melaku—June 2011. On June 17, 2011, Yonathan Melaku, an Ethiopian and a naturalized U.S. citizen and former Marine Corp reservist, was arrested at Fort Myer near Arlington National Cemetery, where he was found with a backpack filled with ammonium nitrate, spray paint, and spent ammunition rounds. The discovery led authorities to unravel a series of mysterious events from the fall of 2010, when shots had been fired at night from the street at various military buildings, including the Pentagon, causing over \$100,000 in damages. After searching his bag and house, authorities found video of Melaku shooting at the buildings and providing commentary, a series of notebooks written in Arabic with references to terrorism, and a list of equipment needed to make a timed explosive device. He has since pleaded guilty and was sentenced to 25 years in prison.[140] 44. Abu Khalid Abdul-Latif and Wali Mujahidh—June 2011. In a raid on a warehouse in Seattle, the FBI arrested Abu Khalid Abdul-Latif and Wali Mujahidh. The two suspects had arranged to purchase weapons from an anonymous informant in contact with the Seattle Police Department. They were seeking to purchase automatic machine guns and grenades in preparation for an attack on a military recruiting station in Seattle. Since the arrests have been made, authorities have learned that Abdul-Latif, a felon and Muslim convert, had initially planned to attack the Joint Base Lewis-McChord with his friend, Los Angeles resident Mujahidh. The target was later changed to the Seattle Military Entrance Processing Station for undisclosed reasons.[141] The men have been charged with conspiracy to murder officers and employees of the United States government, conspiracy to use a weapon of mass destruction, and possession of firearms in furtherance of crimes of violence. Abdul-Latif has also been charged with two counts of illegal possession of firearms and is awaiting further trial.[142] Mujahidh has pled guilty and faces up to 32 years in prison.[143] 45. Emerson Winfield Begolly—August 2011. Begolly, a moderator and supporter for the internationally known Islamic extremist Web forum Ansar al-Mujahideen English Forum (AMEF), was arrested on charges of terrorist actions involving solicitation to commit a crime of violence and distribution of information in relation to explosives, destructive devices, and weapons of mass destruction. Through his profile on AMEF, the Pennsylvania-born man solicited others to engage in violent acts of terrorism against post offices, water plants, military facilities, bridges, train lines, and Jewish schools. Begolly also used the website to post a downloadable 101-page document that contains information on how to create, conduct, and manufacture chemical explosives. The instructional document is loosely linked to al-Qaeda's former top chemical and biological weapons expert Abu Khabbab al Misi. Begolly pled guilty to counts of soliciting others to engage in acts of terrorism within the U.S., and attempting to use a 9-mm semi-automatic handgun during an assault upon inquiring FBI agents. He is currently awaiting further trial.[144] 46. Rezwan Ferdous—September 2011. Ferdous, a self-radicalized 26-year-old U.S. citizen, was arrested for trying to provide material support to terrorist organizations when he gave a modified cell phone to someone he believed to be an al-Qaeda operative.[145] He did so believing the man would use the cell phone to detonate improvised explosive devices against American soldiers. The alleged al-Qaeda operative was an undercover FBI agent. Ferdous also sought to use small drone aircraft laden with explosives to attack the Pentagon and U.S. Capitol, followed by a ground attack carried out by armed men with automatic rifles. He had already purchased some items, including C4 and AK-47s, toward this goal from an undercover agent.[146] He is being held awaiting trial.[147] 47. Iranian Terror Plot—October 2011. On October 11, 2011, Mansoor Arbabsiar, an Iranian-born U.S. citizen, was arrested for plotting to assassinate the Saudi Arabian ambassador to the U.S., as well as bomb the Saudi and Israeli embassies in Washington, D.C. He claims he was working for the Iranian Quds Forces, a special unit of the Iranian Revolutionary Guard. On behalf of the Quds Forces, Arbabsiar is said to have contacted members of a Mexican drug cartel with the goal of hiring them to assassinate the Saudi ambassador. The two parties allegedly agreed on a payment of \$1.5 million, with a down payment of \$100,000 that Arbabsiar wired to members of the cartel, supposedly from the Iranian government. The plot was uncovered because the supposed members of the cartel he approached were informants for the Drug Enforcement Agency.[148] He was arrested at JFK airport in New York, has pleaded not guilty, and is currently awaiting trial.[149] Another man, Gholam Shakuri, is an Iranian citizen who is wanted in connection with the plot; he is believed to be in Iran.[150] This is the first publicly known post-9/11 Islamist-inspired terror plot aimed at the United States specifically linked to state-sponsored terrorism. 48. Jose Pimentel -November 2011. On November 20, 2011, Jose Pimentel, a naturalized U.S. citizen from the Dominican Republic, was arrested on charges of planning to use pipe bombs to attack targets throughout New York City. His proposed targets included police stations, post offices, and U.S. soldiers. He was a homegrown radical inspired by Anwar al-Awlaki. Pimentel also managed his own radical website espousing his beliefs in violent jihad.[151] The plot was uncovered by an informant and Pimentel was arrested by the NYPD. He has pleaded not guilty and awaits trial.[152] 49. Sami Osmakac—January 2012. On January 7, 2012, Sami Osmakac, a naturalized U.S. citizen from the Kosovo region of the former Republic of Yugoslavia, was arrested on charges of planning attacks against night clubs, businesses, and a sheriff's office [153] He came to the attention of the authorities when a source alerted them that Osmakac had asked how to locate an al-Qaeda flag. He planned to conduct a multi-pronged attack against his proposed targets with vehicle-borne explosives. He also wished to take hostages. He was introduced to an undercover FBI agent who he believed was an arms dealer and procured disabled AK-47s and explosives from him.[154] He was arrested by the FBI's Tampa office and has since pleaded not guilty.[155] 50. Amine El Khalifi—February 2012. Amine El Khalifi, a Moroccan citizen illegally in the United States, was arrested on charges of plotting to attack the U.S. Capitol. He was arrested as he left his parked car with guns and a bomb. He did not know that the weapons had already been rendered inoperable, as they had been provided to him by FBI agents he believed to be al-Qaeda operatives. Before choosing the Capitol building as a target, El Khalifi had proposed targets including D.C. office buildings, restaurants, and synagogues.[156] He is currently being held in federal custody in Alexandria, Virginia, awaiting trial. 50 Terrorist Plots Foiled Since 9/11 Preventing the Next Terrorist Attack The death of Osama bin Laden marked an important victory in the long war on terrorism. The war, however, is not won. Terrorists, including those radicalized in the United States, continue to seek to harm the U.S. and its people.

As the first anniversary of the death of bin Laden approaches, Congress and the Administration should be mindful of what is needed to continue to combat the threat of terrorism at home and abroad. In order to prevent the next terrorist attack, lawmakers should: · Preserve existing counterterrorism and intelligence tools, such as the PATRIOT Act. Support for important investigative tools, such as the PATRIOT Act, is essential to maintaining the security of the United States and combating terrorist threats. Key provisions in the act, such as the roving surveillance authority and business records provisions, have proven essential in thwarting numerous terror plots. For instance, the PATRIOT Act's information-sharing provisions were essential for investigating and prosecuting homegrown terrorists, such as the Lackawanna Six. This case, along with others, demonstrates that national security investigators continue to require the authorities provided by the PATRIOT Act to track leads and dismantle plots before the public is put in danger. Bearing this fact in mind, Congress should not let key provisions of the PATRIOT Act expire, and instead, should make them permanent.

LeT attack on the U.S. would trigger U.S. war with Pakistan

Tellis 12

Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace, <http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

This is because the most vicious entities now engaged in attacks on India, like LeT, have objectives that go way beyond Kashmir itself. They seek to destroy what is perhaps the most successful example of a thriving democracy in the non-Western world, one that has prospered despite the presence of crushing poverty, incredible diversity, and a relatively short history of self-rule. India's existence as a secular and liberal-democratic state that protects political rights and personal freedoms—despite all its failures and imperfections—thus remains a threat to groups such as LeT, with their narrow, blighted, and destructive worldviews. It is also a threat to other praetorian and antidemocratic institutions such as the Pakistan Army and the ISI. India, accordingly, becomes an attractive target, while its mistakes, inadequacies, and missteps only exacerbate the opportunities for violence directed at its citizenry.

It would be a gross error, however, to treat the terrorism facing India as simply a problem for New Delhi alone. When viewed from the perspective of the United States, it is safe to say that LeT has long undermined U.S. interests in the global war on terror. It threatens U.S. soldiers and civilians in Afghanistan and has now killed U.S. citizens in Mumbai. Thus far it has not mounted any direct attacks on the American homeland, but that is not for want of motivation. Given the juicier and far more vulnerable U.S. targets in South Asia, LeT has simply found it more convenient to attack these (and U.S. allies) in situ rather than overextend itself in reaching out to the continental United States, especially when al-Qaeda still remains focused on that task. An LeT attack on the U.S. homeland would also lead Washington to target the ISI and the Pakistani state directly, problems that the Pakistani military can do without at a time when groups like LeT and its regional partners are more than amply successful in advancing the Pakistan Army's aims by undermining larger U.S. and coalition investments in Afghanistan.

LeT operatives have been stopped in the U.S.

Adlakha 10 Joshua Adlakha, Graduate Student in Security Studies at Georgetown University, THE EVOLUTION OF LASHKAR-E-TAYYIBA AND THE ROAD TO MUMBAI, <https://repository.library.georgetown.edu/bitstream/.../adlakhajoshua.pdf>.

Several LeT operatives have also been arrested in the United States. These include a network of jihadists in northern Virginia known as the Virginia Jihad Network. Ali al-Timimi, an American born Islamic scholar popular among a group of young Muslim men in Virginia, was convicted of advocating war against the U.S. He exhorted his followers to join the Taliban following the U.S. invasion of Afghanistan. While none of them ever did join the Taliban, four of them ended up receiving training from LeT.¹⁹⁵ Ali Asad Chandia, a resident of College Park, Maryland and third grade teacher, was convicted of aiding a British member of LeT, Mohammed Ajmal Khan, with acquiring military equipment for LeT.¹⁹⁶ Nine other members of the network were convicted in 2003 and 2004 variously for providing material support to LeT, assisting others in gaining entry into LeT training camps, and for obtaining training to wage war against the United States.¹⁹⁷ The most notable American operative of LeT is David Headley. As previously noted, the American-born Headley had legally changed his name from Daoud Gilani to make travel easier and moved effortlessly between the U.S., Pakistan, and India for nearly seven years.¹⁹⁸ According to Headley's plea agreement, he made at least five trips to Mumbai between 2006 and 2008 to scout locations for attacks and scouted targets in Pune and Goa in India. While in Mumbai, he made videos of the targets, collected coordinates with a GPS device, and scouted the landing site for the attackers. Between 2002 and 2005, Headley had trained at Lashkar camps on at least five occasions. During this training he learned the use of explosives, small arms and countersurveillance techniques.¹⁹⁹

U.S. has been preventing domestic LeT attacks on U.S. homeland

Jones 11 Seth G. Jones is director of the International Security and Defense Policy Center at the RAND Corporation, The Future of Al Qaeda CT-362 May 2011,

http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=12&ved=0CCUQFjABOApqFQoTCKrvpZ-H-MYCFcc4iAod7-8KHw&url=http%3A%2F%2Farchives.republicans.foreignaffairs.house.gov%2F112%2Fjon052411.pdf&ei=E2-0VeqZN8fxoATv36v4AQ&usg=AFQjCNH28hzNYeUrTDQ2grEJvGW46_6aRQ&sig2=OwaEnNRKOptgEs7KiwQs3Q

In September 2009, for example, Najibullah Zazi was arrested for planning attacks on the New York City subway. Zazi pleaded guilty in U.S. District Court to “conspiracy to use weapons of mass destruction” and “providing material support for a foreign terrorist organization” based in Pakistan.¹¹ Several al Qaeda operatives, including Saleh al-Somali and Adnan el Shukrijumah, were involved in the plot. According to U.S. government documents, Zazi’s travels to Pakistan and his contacts with individuals there were pivotal in helping him build an improvised explosive device using triacetone triperoxide (TATP), the same explosive used effectively in the 2005 London subway bombings. In October 2009, Chicago-based David Coleman Headley (aka Daoud Sayed Gilani) was arrested for involvement in terrorist activity. He is a Pakistani-American who had cooperated with Lashkar-e Tayyiba and senior al Qaeda leaders to conduct a series of attacks, including the November 2008 Mumbai attack and a plot to attack a newspaper in Copenhagen that had published a cartoon of the Prophet Muhammad. His base in Chicago made him ideally suited for a future attack in the U.S. homeland.

LeT is a global threat that risks terror attacks on India and the United States

Tellis 12 Ashley J. Tellis, Senior Associate, South Asia Program, Tellis is a senior associate at the Carnegie Endowment for International Peace,

<http://carnegieendowment.org/2012/03/13/menace-that-is-lashkar-e-taiba/a2hn>

It is clear that after al-Qaeda, LeT is the most dangerous terrorist group operating in South Asia because of its: ¶ 1. Global vision and international ambitions ¶ 2. Distinct ideology that underwrites Islamic revanchism, justifying collaboration with other terrorist groups ¶ 3. Loyalty to Pakistan and willingness to protect its patron state against domestic opponents ¶ 4. Diversified network for mobilizing resources, promoting its international presence, and recruiting members, which minimizes its dependence on the state ¶ 5. Involvement in terrorism and social development concurrently, which limits Pakistan’s ability to target the group even if it were so inclined ¶ 6. Cohesive and hierarchic organizational structure that is effective at both the conduct of violence and the delivery of social programs ¶ 7. Proficiency at exploiting science and technology, extra-national social links, and state vulnerabilities in order to advance its political aims ¶ LeT is a formidable and highly adaptable adversary with a genuinely global reach and the ability to grow roots and sustain operations in countries far removed from its primary theater of activity in South Asia. Though India’s proximity to Pakistan has resulted in New Delhi absorbing most of the blows unleashed by LeT, the carnage in Mumbai demonstrates that the terrorism facing India is not simply a problem for New Delhi alone. An attack could even reach U.S. soil. ¶ The only reasonable objective for the United States is the permanent evisceration of LeT and other vicious South Asian terrorist groups—with Pakistani cooperation if possible, but without it if necessary.

AT: HUMINT Turn

Human intel can't work for India—They have massive shortages of human spy personnel and don't have the ability to train enough human spys

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

Indians waited that, and longer-and while they did, the foundations on which India's intelligence services have been rotting. The Intelligence Bureau, highly-placed government sources said, is over 30% short of staff-particularly critical mid-level executive positions. For its part, the Research and Analysis Wing (R&AW), tasked with securing Indian interests across the world, has desperate shortages of specialists in languages and the sciences-deficits that are running as high as 40% in critical departments. Later this year, Prime Minister Narendra Modi is expected to make his first appointment to lead the Intelligence Bureau. He is expected to choose from among Ashok Prasad, who helped build the organisation's counter-terrorism data-hub, the Multi-Agency Centre, D P Sinha, a veteran of anti-terror operations, and Dineshwar Sharma, a quiet but highly respected analyst, who won his spurs when he volunteered to serve in Jammu and Kashmir in the early 1990s. The Prime Minister will also have to find a leader to rebuild R&AW-devastated by internal feuds, staff shortages and technology deficits. He is expected to choose between Rajinder Khanna, the leader of R&AW's counter-terrorism efforts in recent years, and Arvind Saxena, a veteran with long experience of Pakistan, the United States and organisational management. Too few spies Figures released to Parliament by the United Progressive Alliance government show that even as Chidambaram's efforts to create new institutions became the focus of official efforts, staffing deficits became endemic across the intelligence services. In March 2013, then Minister of State for Home R P N Singh told Parliament that the IB had 18,795 personnel on its rolls, against a sanctioned strength of 26,867 – in other words, a shortfall of over 30 per cent, and that based on manpower requirements drawn up in the 1970s. The effects are evident across the states: dedicated counter-terrorism groups set up by National Security Advisor Ajit Doval, while he was Intelligence Bureau chief, have been sucked into routine duties. The Intelligence Bureau's operations hub in New Delhi has just 30-odd executive staff. Intelligence Bureau chief Asif Ibrahim has cut the shortfall to some 7,000 people-taking in as many as the service's overstretched training facility can handle. It's proved just too little though and not because of lack of trying. In 2009, Chidambaram authorised the hiring of 6,000 personnel. However, the IB's existing training facilities can process just 600 to 700 staff in a year, which barely -covers attrition from retirements and resignations. "There's another problem, too", notes a senior Intelligence Bureau officer. "Let's say we, by some miracle, find the 6,000-odd people we need in one go. They'll need to be promoted from time to time-and there just won't be positions for them. The government needs to do a thoroughgoing review of staffing, and the last one just wasn't interested". R&AW, estimated to have some 5,000 personnel, faces a similar shortage. The organisation is short of some 130 management-level staff, the sources said, particularly cutting-edge under-secretaries and deputy secretaries. R&AW is also short of personnel with specialist language and area knowledge, particularly Arabic, Chinese and minor Pakistani languages. –

They no longer have a pool to recruit sufficient human intelligence—Indian states won't let their best police get recruited intelligence

Indian Express 14

India's spy agencies more toothless than ever, <http://indianexpress.com/article/india/india-others/indias-spy-agencies-more-toothless-than-ever/>

Long years of neglect, intelligence officials said, had contributed to the staffing crisis at the R&AW and the IB. "The intelligence services," a senior officer said, "had always relied on young Indian Police Service officers, recruited early in their careers, to serve in middle and senior-management roles. The overall shortfall in the IPS's strength, though, has meant states are loath to allow their best officers to serve in - New Delhi on deputation." The R&AW's internal cadre, the Research and Analysis Service, for its part, froze recruitment

from the 2004-2005 batch to the 2009-2010 batch, and in other years, cut hiring to a trickle. Last year, bulk recruitment to fill the deficits was agreed on, but a debate about whether needs would be best met through Union Public Service Commission-run examinations or campus recruitment rages on. –

Answers to LeT

Even if India gets intelligence data it won't be effectively used to stop terrorism because of inaction and corruption

Bhatia 14 Raashi Bhatia is the Co-Founder of a non-profit organization Business Alternatives for Peace, Action and Reconstruction (BAPAR) based in New Delhi and a Graduate Student in Security Studies with the Center of Security Studies, Georgetown University, India's National Security Policies and the Threat of Lashkar-e-Taiba: A Forgotten Concern Small Arms Journal Journal Article | Apr 15 2014, smallwarsjournal.com/printpdf

Actionable intelligence is the first thing that comes to mind when one thinks about disrupting a terrorist plot. Although its primary function is strategic intelligence, the Indian Intelligence Bureau has an excellent record in providing tactical support to state police forces- within reasonable limits. Between 1998 and 2003, it reportedly neutralized 250 ISI- backed jihadist cells across India, excluding Jammu and Kashmir and the North Eastern states. This neutralization rate of approximately one terrorist cell per week has been maintained even after the current spate of jihadist violence erupted in 2005. Where problems have arisen is not so much in the IB's response to pan-Islamist terrorism, but in that of the political leadership. Put simply, there has been no policy response to ample warnings from the intelligence community since 2002 that Pakistan planned to target the Indian heartland.[xxxvi] Before the Mumbai attacks there were reports of at least 20 intelligence reports provided to the Mumbai Police Department specially warning them about Fedayeen attacks or sea borne infiltrations. The Intelligence Bureau of India had also received two specific warnings about the Taj hotel. One concerned a possible attack on 24 May and the other on 11 August, both prompted by tip offs from a source in Pakistan said to be inside Lashkar. [xxxvii] The hotel was made aware of the tip offs but nothing was really done to beef up security or improve the current measures in place, like CCTV cameras and security guards on the front gate. Prem Mahadevan writes in his book 'The Politics of Counterterrorism in India', "Such inaction (failure to act on intelligence) stems from four factors, two of which are political and two operational. The factors are: a lack of political consistency and consensus, and a lack of operational capacity and coordination. Between them, these constraints ensure that decision- makers in the Indian political and security establishments fail to act on initial warnings provided by intelligence agencies."[xxxviii] Additionally, the security agencies as well as the people in the position of responsibility have an attitude problem. Till the time everything is right and nothing goes wrong the attitude is simply 'Chalta hai' – Everything works. Any amount of intelligence is of no use till the time it is taken seriously and acted upon. Despite such specific intelligence inputs, as mentioned before, Mumbai's Joint Police Commissioner Rakesh Maria said in an interview that it was a 'failure of imagination' on the part of the police department. This clearly shows the lack of seriousness attributed to the importance of intelligence in counterterrorism. To overcome this, personnel in state police departments need to go through rigorous training for intelligence gathering as well as to deal with the gathered intelligence inputs. A committee set up to find the loopholes in the response to the Mumbai attacks, The Pradhan Committee, found out that "well set out procedures for handling intelligence and 'crisis management' were overlooked and the Commissioner of Police Mumbai Hasan Gafoor did not exhibit adequate initiative in handling the multi-pronged attack and remained at one spot near Trident Hotel throughout the operations.[xxxix] There is an urgent need for proper Standard Operating Procedures in place and not just on paper but for them to be enforced through drills and simulation games. There is also a need for a centralized command and control, so that in an event of an attack, forces on the ground know who they are taking orders from and remain coordinated in their efforts. Most importantly, it is necessary to be practical about countermeasures being put in place, most of the steps taken by Indian authorities remain non-operational and useless. In the end everything boils down to resource allocation and in India where every official must have his 'cut' at every step of the process, it becomes increasingly difficult to implement any policies. It is imperative that a strong anti-corruption system comes in place, especially where authorities are working for national or state security for a speedy and proper implementation of counter terrorism policies.

Analysis tools for meta data empirically fail

Wheaton & Richey 14 Kristan J. Wheaton is an Associate Professor at Mercyhurst University and Melonie K. Richey is a graduate student at Mercyhurst University who is currently participating in IARPA's Sirius Project. Metadata Analysis as an Intelligence Tool, e-

International Relations January 9, 2014 ,

<http://strategicstudyindia.blogspot.com/2014/06/metadata-analysis-as-intelligence-tool.html>

Caveat Emptor Like all analytic techniques, SNA is imperfect and comes with a number of caveats for researchers new to the method. SNA, while widely applicable, is by no means universally applicable. For example, in early 2013, one of the authors sought to use SNA to locate terrorists using social media. SNA and social media seemed like a good place to start, even though it seemed unlikely that many such individuals would self identify as a “radical extremist” or “Al-Qaeda affiliate.” Ultimately though, the effort failed because there was just too much of what social network analysts like to call “white noise,” or extraneous information picked up through a comprehensive scraping of the Internet. Our search for radical extremists returned journalists, university students of international relations and politics, and a slew of ordinary people just keeping up with current events and Tweeting about it. Another issue with SNA has to do with the nature of relationships. In the real world, they are often messy and convoluted. Just because two people work together and do so often, does not necessarily mean that they like each other. Similarly, the best way to describe the relationship between two businesses might not be the number of contracts the two have signed together. SNA works best, however, with clearly definable relationships and where one factor in the relationship correlates well with other factors important in a relationship. Modern intelligence problems, which often contain, political, economic, military, tribal, geographic, personal, and historical relationship data require the application of advanced SNA techniques and, even then, may yield little of real use to decisionmakers. Finally, SNA is fundamentally a mathematical tool but is most useful in the decisionmaking process when the networks are visualized. It is, without doubt, the visualization of these networks that tends to capture the most attention from the policymakers that intelligence units typically support. This is both a blessing and a curse. While it is easy to capture attention, explaining why the charts and graphs look the way they do is an art. All too often, the initial excited reaction to these diagrams turns to boredom and confusion as analysts bog the decisionmakers down with the arcana of SNA. In addition, creating these complex visualizations often stresses even the most powerful personal computers (the images of the simulation in Figure 8 above took approximately 2 hours to produce using a powerful desktop PC with two high end graphics cards). Like every analytic technique, SNA has great utility for the right question. Within its limits, SNA is unmatched and can be usefully applied to identify key individuals or organizations within a network, generate new leads and simulate the flows of information or money throughout a network. SNA, however, remains just a answer, not the answer. Used inappropriately or without a full understanding of the limits of the method and analysts will only be finding new and more technically sophisticated ways to fail. That, then, is the primary job of the modern day analyst: making the judgment call of which techniques to use and when. Equally as important as knowing when to use SNA is knowing when not to use it.

Surveillance fails — even if countries have the data, it doesn't translate into preemptive politics

NYT 14 — New York Times, 2014. (“In 2008 Mumbai Attacks, Piles of Spy Data, but an Uncompleted Puzzle”, James Glanz, December 21st, 2014, Available Online at:

<http://www.nytimes.com/2014/12/22/world/asia/in-2008-mumbai-attacks-piles-of-spy-data-but-an-uncompleted-puzzle.html> Accessed 7-22-15)

In the fall of 2008, a 30-year-old computer expert named Zarrar Shah roamed from outposts in the northern mountains of Pakistan to safe houses near the Arabian Sea, plotting mayhem in Mumbai, India's commercial gem. Mr. Shah, the technology chief of Lashkar-e-Taiba, the Pakistani terror group, and fellow conspirators used Google Earth to show militants the routes to their targets in the city. He set up an Internet phone system to disguise his location by routing his calls through New Jersey. Shortly before an assault that would kill 166 people, including six Americans, Mr. Shah searched online for a Jewish hostel and two luxury hotels, all sites of the eventual carnage. But he did not know that by September, the British were spying on many of his online activities, tracking his Internet searches and messages, according to former American and Indian officials and classified documents disclosed by Edward J. Snowden, the former National Security Agency contractor. They were not the only spies watching. Mr. Shah drew similar scrutiny from an Indian intelligence agency, according to a former official briefed on the operation. The United States was unaware of the two agencies' efforts, American officials say, but had picked up signs of a plot through other electronic and human sources, and warned Indian security officials several times in the months before the attack.

Indian domestic surveillance not key — US international solves

ET 14 — The Economic Times, 2014. (“US alerts India of possible terror attack by Lashkar-e-Taiba, capital on high-alert”, Aman Sharma, Decemeber 12th, 2014, Available Online at: http://articles.economictimes.indiatimes.com/2014-12-12/news/56990498_1_delhi-police-terror-strike-republic-day-function)

It was the United States which alerted India of an impending major terror strike in Delhi by Pakistan-based Lashkar-e-Taiba, triggering a comprehensive security review of the national capital by the Delhi Police and Intelligence Bureau. "The alert came directly from US intelligence agencies...it was not a pin-pointed information and did not specify any place or time of attack but the input said there was clear intelligence with the US of a big terror strike somewhere in Delhi by LeT," a senior Home Ministry official told ET. The government has decided to take no chances as the said tip-off from the US came shortly after the visit of US President Barack Obama to India was confirmed for being the chief guest at the Republic Day. Sources in the home ministry said that besides taking extra steps to secure Delhi, IB has also begun a "coordination exercise" with neighbouring states like UP and Rajasthan, sensitising them of the terror threat and asking them to be on alert for any terror module in their jurisdictions which may target Delhi. "Many meetings have been held between state authorities and IB since. Delhi Police Commissioner BS Bassi has also met National Security Advisor Ajit Doval to brief him of the security measures taken for Delhi.

Case

Intelligence Advantage

1NC — Intelligence Advantage

They can't solve for spy aircrafts and battlefield sensors

Irwin 12 [Sandra Irwin, "Too Much Information, Not Enough Intelligence," *National Defense*, May 2012, pg. <http://tinyurl.com/7ty8gl8>

The Defense Department over the last decade has built up an inventory of billions of dollars worth of **spy aircraft and battlefield sensors**. Those systems create avalanches of data that clog military information networks and overwhelm analysts.

Intelligence experts say the military is drowning in data but not able to convert that information into intelligible reports that break it down and analyze it.

"The challenge for users of intelligence is that all the different types of information come in a stove-piped manner," says Michael W. Isherwood, a defense analyst and former Air Force fighter pilot.

Intelligence feeds include electronic signals, satellite imagery, moving-target data and full-motion video. "How do you integrate this into a clear picture?" Isherwood asks. "That is one of the enduring challenges in the ISR [intelligence, surveillance and reconnaissance] arena for all the services."

The returnee threat is low

Zammit 15 – Researcher @ Monash University's Global Terrorism Research Centre [Andrew Zammit (PhD candidate @ University of Melbourne) "Australian foreign fighters: Risks and responses," *Lowy Institute for International Policy*, April 2015

Despite the seriousness of the threat, it does not follow that most foreign fighters attempt attacks on return. In fact, **very few do**. In his study of foreign fighters, Hegghammer found that only up to **one in nine** jihadist foreign fighters from Western countries later became involved in terror plots within the West, and that even this was likely to be an **overestimate**.¹⁸ Similarly, a study by Jeanine de Roy van Zuijdewijn found that only a very small portion of Western jihadist fighters returned to carry out attacks.¹⁹ This leaves governments with a seemingly paradoxical problem: **most foreign fighters do not prove a threat on return**, but those who do are highly dangerous and have been involved in a substantial proportion of the domestic jihadist plots in the West, including the most serious attacks such as the 2005 London bombings. This raises the question of what distinguishes the many returned foreign fighters who do not pose a domestic threat from the few who do. Pg. 4-5

No Saudi-Iran war

Khashoggi 15 - US-educated Saudi journalist, columnist, author and the general manager and editor-in-chief of Al Arab News Channel [Jamal Khashoggi, "Saudi Arabia and Iran heading to war?," *Al Arabiya News*, Monday, 8 June 2015, pg. <http://tinyurl.com/pkajljf>

Saudi Arabia does **not want an open confrontation** with Iran, realizing the high cost of such a war. The same goes for Iran, which knows that the military budget, especially for the air force, is not in its favor. Moreover, Riyadh has alliances with a number of Arab and Islamic countries willing to defend the Land of the Two Holy Mosques. Both countries have enough arms to destroy each others' capacities. It is a binary threat and an important **deterrence**.

Iran is a model of internal stability

Saremi 15 - Strategic analyst w/ a PhD in International Relations [Dr. Fariborz Saremi, "Is Iran the Most Stable Country in Region?," *Counter Punch*, January 30, 2015, pg. <http://tinyurl.com/pp6pywf>

In the turbulent 35 years since the Islamic Republic of Iran emerged overnight following revolution in that country, the balance of power in Middle East has shifted. For much of that time Iran has been hampered by **internal power struggles**, the imposition of sanctions, and from ostracization due to its links with terrorism. Today, however, Iran is emerging as a **model of stability** given that several of its neighbors have fallen into utter turmoil. Some of them are still suffering the back-swell from the Arab Spring, while others are under severe threat from violent extremists such as ISIS. Finally, observers see a distinct possibility that Iran may move towards meaningful rapprochement with its former enemies in the west.

TURN: ISIS threat will reset US-Iran relations

Mohseni 14 – Director of the Iran Project @ Harvard Kennedy School's Belfer Center for Science and International Affairs and a Fellow for Iran Studies at the Kennedy School. [Payam Mohseni, "Bad Move, ISIS: Why America and Iran Should Work Together," *The National Interest*, October 6, 2014, pg. <http://tinyurl.com/ph83pjx>

While a threat to U.S. interests, the Islamic State of Iraq and al-Sham (ISIS) presents us with a **unique opportunity** to "reset" the Middle East equation—to actively transform regional relations, to abate the cold war between Iran and Saudi Arabia and to forge a new working relationship with Iran. As the United States moves to escalate its war against ISIS and forge a coalition against the terrorist group, it is important that Iran be included in the process. After all, U.S. and Iranian interests have increasingly converged in the Middle East with the emergence of a common enemy, and no power in the region is better suited to taking on ISIS than Iran and its affiliated Shi'a militias in Iraq.

Just as importantly, Iran will have to be a key part of any meaningful solution to regional instability and any effort to help sustain a new unity government in Iraq. By formally acknowledging the role it can play in the conflict, Iran can be guided into becoming a **constructive stakeholder** in a more inclusive Middle East order—a goal that has become increasingly salient as the possible success of the Iranian nuclear negotiations forebodes a transformation of the Middle East status quo and Iran's role in the region.

Despite its public statements, **Iran has already signaled its willingness to cooperate on ISIS.** Iran's decision to remove its support from former Iraqi prime minister Nouri al-Maliki was not primarily driven by fear or simply a response to the grave threat posed by ISIS—as commonly perceived in the West—but rather a demonstration of its own flexibility and accommodation with

regional powers. Based on my conversations with the conservative elite in Tehran during the summer, the Iranian leadership does not view ISIS as a serious threat to the country, but rather an opportunity for further empowerment—not just for Iran, but for the larger Shi'a community and the “popular militias” in Iraq as they become entrenched as a consequence of the conflict. Iran's influence and leverage in Iraq has certainly expanded with the ISIS offensive. By rapidly moving to support the Shi'a militias at the very beginning of the conflict, Iran has effectively gained the support of the Iraqi Shi'a as they have been pushed toward Iran as a source of protection. Iranian influence has also increased over the Sunni Kurds as it has helped them establish a buffer zone on its Western frontier.

Iran's decision to facilitate Maliki's removal signals the leadership's intent and willingness to cooperate with regional countries and the United States in search of a political solution instead. This intent is most clearly demonstrated by the prominent role played by Rear Admiral Ali Shamkhani, the chairman of Iran's Supreme National Security Council, when he traveled to Iraq to broker an agreement on a new unity government. Shamkhani's role is important for two reasons. First, not only is he a moderate in the Iranian political spectrum—appointed last year by President Rouhani—but he is also an Iranian of Arab origin who is believed to be held in high esteem by the Saudi King. Both his appointment and his recent visit to Iraq signal Iran's desire to pursue rapprochement with the Saudis and abate sectarianism.

Second, Shamkhani's role demonstrates that the Iranian Revolutionary Guards work within the constitutional boundaries of the state—operating within, rather than outside, the Supreme National Security Council to discuss and negotiate Iran's role in Iraq. This development was particularly striking, since the security files of Iraq and Syria belong to the Revolutionary Guards and the position of the Guards has only strengthened with the escalation of the ISIS conflict. By working within the Council, the Guards opened the space and possibility for greater foreign cooperation, allowing the Iranian government to influence and coordinate with the Guards based on government discussions with the Iraqis and external powers.

These positive signals, however, seem to contravene Iran's growing declarations that it will not engage U.S. efforts against ISIS. It also begs the question of why Iran would cooperate with the United States or an Arab coalition if it perceives itself to be strengthened by the conflict and if it considers ISIS to be a foreign conspiracy. Of course, it is not likely that Iran will work with the United States openly, due to the historical relations between the two countries, but it may do so within a regional framework that formalizes Iran's role and protects its interests in the Middle East. In other words, Iran is looking at the larger picture and vision it has for the future Middle East beyond ISIS and will base its foreign policies on two driving considerations: Iran's role in the security architecture of the region, including in Syria, and the increasing sectarian nature of conflicts and politics in the Middle East. If cooperation preserves Iran's role in the region and diminishes sectarian strife, Iran will cooperate. For Iran to do so explicitly and publicly will depend on how it sees itself to be accepted and incorporated as part of this process—one from which it sees itself largely excluded thus far.

By viewing ISIS as an opportunity to “reset” its working relation with Iran in the region, the United States can help Iran become a constructive player in the conflict and **weaken the potential for it to act as a spoiler or destabilizing force.** Moreover, it will allow the United States to make effective use of Iranian power and the Shi'a militias in opposing ISIS, by far the best regional means of military boots on the ground. To do so, the United States must not only clarify its own vision for the Middle East, but also, just as importantly, persuade Saudi Arabia to

cooperate and work with the Iranians. Yes, engaging Iran and incorporating it as part of the Middle East order will be a daunting task fraught with its own risks, particularly at a time when the nuclear negotiations are taking place. But not doing so will only further exacerbate the ongoing conflict in a direction that will be worse not only for the entire Middle East, but for U.S. interests as well.

Common ground prevents war

Duggan 15 – Professor of history @ Georgetown University, [Dr. Michael F. Duggan, “The Persian Elephant in the Room: Revitalizing U.S.-Iran Relations After the Iran Nuclear Deal,” Georgetown Journal of International Affairs, April 9, 2015, pg. <http://tinyurl.com/ofngsf8>

Deep down every specialist of the Middle East with a grounding in history knows that in dealing with Iran there are only a handful of options, and that all but one or two of them are likely to produce constructive results. The others are likely to produce little more than continued **violence and instability** in an already troubled region, and will do nothing to prevent Iran from achieving its nuclear goals. It is therefore mystifying as to why the United States and Israel have used rhetoric that will be impossible to back up without catastrophic consequences, and which will inflame an already difficult situation. In terms of the United States’s general treatment of Iran, it would seem that the options are fourfold. First, the United States could keep up its economic sanctions in an attempt to generate Iranian compliance under threat of further destabilizing the nation’s economy. The problem with this sort of approach—beyond the very real violence it does to civilians—is that it will do nothing to derail Iran’s nuclear program, and in fact signals the exact sort of hostility that continues to justify the desire for and pursuit of such weapons in Iranian eyes. Some Americans think that because sanctions worked in Libya (over a period of more than two decades and before a NATO air campaign), they will also work in Iran. But Gaddafi’s Libya and present-day Iran are two fundamentally different cases. Whereas Libya is a flat analog to Afghanistan, consisting of a number of mostly disunified tribes with a territorial boundary drawn around them, Iran—historical Persia—is a proud civilization with antecedents that date back to before the time of the Ancient Greeks and Israelites. Iran is more like pre-WWII Japan in the sense that its people are unlikely to knuckle under to the pressure of external sanctions and embargoes. Rather, it is quite possible that they will unify, radicalize, and eventually fight. At the very least, continued U.S. sanctions will push Iran closer to Russia. Iran’s relative social stability, its considerable natural resources, and its potential for strengthened economic ties with Russia and China will allow it to safely endure any sanctions imposed by the West.

A second option for the United States is to attack Iran outright. Over the past half-decade, some American and Israeli leaders have talked openly about pursuing this course of action. Doing so, however, would embroil the United States in a war with a nation with more than twice the population of Iraq, almost four times its land area, a far more varied and difficult terrain, and a much more capable military. Considering how its military adventures in Iraq and Afghanistan have gone to date, U.S. leadership should probably err on the side of nonmilitary options vis-à-vis Iran first. Attacking Iran directly would only destabilize the wider region in a way that could potentially spell the eventual end of Israel—and bankrupt the United States in the process.

The third option is for the United States to contrive some way to divide and/or isolate Iran, the world’s dominant Shiite Muslim nation, from the rest of the (mostly Sunni) Islamic world.

However, such a divide and conquer component to a grand strategy primarily focused on economic sanctions would be completely obvious to the great majority of the world's Muslims. Moreover, the very real and menacing conflict between Sunni and Shia in the greater Muslim world that threatens to escalate into a regional conflagration constitutes a further elephant in the room of U.S. strategic planning. Such a strategy would also run afoul of the inconvenient truth that Iranian-backed forces are currently shouldering a large portion of the ground war against ISIS in Western Iraq, and are proving to be valuable assets there. Divide and conquer strategies—using mutual hatreds to play enemies off each other—is a dirty and tricky game that can easily blow up in the faces of those who initiate them (see the civil war in Ukraine).

This leaves only the fourth and most realistically promising approach to the situation: the United States could try to find **common ground with Iran** and bury the hatchet. After all, it is in the national interest of the United States to be on good terms with regional powers and soon-to-be nuclear states, and there is a slight chance that positive relations may actually preclude the latter. Without overstating things, Iran is now the dominant regional power of Southwest Asia—and it was the United States' removal of Iraq as a secular counterbalance that elevated Iran to this status, or at least helped cement its claim. Moreover, the nuclear genie was let out of the bottle when India, Israel, and Pakistan developed bombs of their own, and there is nothing the United States can do to reverse the process. Finally, in 2001, Iran allowed the United States passage through Iranian air space in order to launch the latter's invasion of Afghanistan, and it is time we acknowledged this good faith accommodation with renewed talks about the general security of the region.

Ext Zammit 15 – No Returnee threat

They will go quiet upon return

Zammit 15 – Researcher @ Monash University's Global Terrorism Research Centre [Andrew Zammit (PhD candidate @ University of Melbourne)“Australian foreign fighters: Risks and responses,” *Lowy Institute for International Policy*, April 2015

Some research indicates that those who train with jihadist groups are more likely to pose a terrorist threat on return than those who actually fight on the frontlines. Van Zijdewijn's study of Western jihadist foreign fighters involved in European terror plots found that two-thirds had trained, while only one-third had actually engaged in combat. 32 A study by Jonathan Githens-Mazer on UK foreign fighters supports this. His research found that many jihadist combat veterans often **went quiet on return or actively discouraged others** from becoming involved, while some particularly dangerous returnees had not made it to the frontlines.33 There are parallels with the involvement of former US military personnel in far-right extremist groups. Research has found that they tended to have had short-lived and unsuccessful military careers, suggesting that those most likely to turn to violent extremism once back home may be those who feel they have more to prove. 34 By contrast, exposure to combat increases the likelihood of a foreign fighter becoming **disillusioned or indeed being injured or killed.** Pg. 6

Ext Serami 15 – Iran stable

It has a thriving economy. No internal backlash

Nair 15 – Founder and CEO of the Global Institute For Tomorrow (GIFT) [Chandran Nair, “The Futility and Immorality of Iran Sanctions,” *Huffington Post*, Posted: 07/09/2015 12:06 pm EDT, pg. <http://tinyurl.com/nwyfrdz>

Contrary to what many have come to believe, U.S. sanctions on Iran are not as crippling as they are made out to be. Unlike many of its neighbors who are almost entirely dependent on oil, Iran is a diversified economy with a functioning manufacturing, agricultural and service sector, albeit inefficient due to sanctions and inadequate investments. The World Bank classifies it as an "upper middle income" country and despite sanctions Iran, with a GDP of \$415.3 billion, is still the second largest economy in the Middle East and North Africa region. Average life expectancy (74 years) is almost as good as any in the developed world, and when it comes to primary school enrollment, Iran is leagues ahead of its neighbors.

But, if anything, the Iranian people are resourceful and creative. They get around the problem through ingenuity and enterprise. A thriving currency market in the bazaars of Isfahan allowed me to exchange as much cash as I wanted for my travel and shopping, and sellers were happy to accept the Hong Kong dollar, renminbi and the yen. Carpet merchants, hoteliers and even taxi drivers are ever ready to swap foreign currencies for the riyal. Bank Melli Iran even issues pre-paid "cash cards" that allow tourists to swipe transactions just as they would in Hong Kong or Singapore.

Ext Mohseni 15 – Turn: US-Iran Relations

ISIS threat will force US-Iran to work together

Mekhennet 14 [Souad Mekhennet, “ISIS is the best thing to happen to Iran-U.S. relations in years,” *The Washington Post*, June 19, 2014, pg. <http://tinyurl.com/q3suo99>

TEHRAN—Even here, nobody is happy about Iraq’s implosion. But Iranian officials are preparing to make the best of it. In a raft of interviews this week with government officials, a consensus has emerged: Iraq is a chance to make amends with the United States. It may even be the beginning of a beautiful friendship.

Already, the question both here and in Washington is not “if” Tehran and Washington should work together to combat the advance of the Islamist insurgency ISIS, but “how.” “We are open to any constructive process here that could minimize the violence, hold Iraq together — the integrity of the country — and eliminate the presence of outside terrorist forces that are ripping it apart.” Secretary of State John Kerry said in Washington Monday. President Obama added today that “Iran can play a constructive role.”

Iran is moving to cast itself as a U.S. ally in the fight against terrorism (despite its official sponsorship of Hezbollah). In meetings here over the last week, part of the Bergedorf Round Table — the session was called “Stability in the Middle East: Prospects for Cooperation between Iran and the West” — Iranian officials repeatedly said things like this: “Like the U.S. and Europe, we are fighting terrorism.” They also stressed common interests with the West. (My trip, like the

conference, was sponsored by the Körber Foundation, a nonpartisan group devoted to social development.)

ISIS threat fuels US-Iran cooperation

Milani 14 – Professor of Politics and the Executive Director of the Center for Strategic and Diplomatic Studies @ University of South Florida [Mohsen Milani, “This is What Détente Looks Like,” *Foreign Affairs*, August 27, 2014, pg. <http://tinyurl.com/os9I9t9>

Tehran and Washington find themselves on the same side in the fight against the Islamic State of Iraq and al-Sham (ISIS), also called the Islamic State (IS), and there are already signs that they have been cooperating against the extremist group’s advance through Iraq. Although there is no guarantee that this will last for the duration of the war, such cooperation is clearly a positive step.

The United States and Iran both view ISIS as a significant threat to their own interests. An ISIS stronghold near the Iranian border would be a profound and immediate security threat to Tehran. For one, the Sunni jihadists of ISIS are openly disdainful of the Shia faith, the sect of Islam that the overwhelming majority of Iranians and the majority of Iraqis adhere to. The group is already in a sectarian war in Syria and Iraq, and Tehran must assume that it eventually plans on turning its attention to Iran.

Washington, for its part, has also concluded that ISIS poses a significant threat. If ISIS manages to create a safe haven in Iraq, it could use the territory to plan operations against the West, undermine Western allies in the region, and endanger oil shipments in the Persian Gulf. In the meantime, the group’s war against the Iraqi state also poses a danger to U.S. interests. Over the past decade, Washington has paid a high price in blood and treasure to create a stable and relatively friendly Iraq. The collapse of that state would be a humiliating defeat.

Although the United States and Iran have different visions for the future of Iraq, they share three major strategic goals there: protecting Iraq’s territorial integrity; preventing a sectarian civil war that could easily metastasize into the entire region; and defeating ISIS. There is also a precedent of tactical cooperation in Iraq between Tehran and Washington: In 2001, the two cooperated to dislodge the Taliban from Afghanistan.

ISIS threat is large enough to solidify cooperation with US and solves their Iran-Saudi war impact

Milani 14 – Professor of Politics and the Executive Director of the Center for Strategic and Diplomatic Studies @ University of South Florida [Mohsen Milani, “This is What Détente Looks Like,” *Foreign Affairs*, August 27, 2014, pg. <http://tinyurl.com/os9I9t9>

Despite these difficulties, cooperation between Washington and Tehran is likely to deepen, rather than ebb, in the weeks ahead. ISIS is a clear transnational threat that demands a transnational solution. Iran has considerable experience fighting against ISIS in Syria and Lebanon and can offer much assistance to those who seek to eradicate the threat posed by the militant group. Indeed, the fight against ISIS may even produce the previously unthinkable: cooperation between Iran and Saudi Arabia, two countries that have more or less fought an open proxy war for the past several years in Iraq, Lebanon, and Syria. Now, both countries are threatened by ISIS, which explains why Saudi Arabia openly welcomed Abadi’s nomination to become prime minister.

Two weeks ago, Alaeddin Boroujerdi, chairman of the Iranian parliament's Foreign Policy and National Security Committee, correctly stated that Iran, Saudi Arabia, and the United States are the key players in Iraq. If Washington and Tehran manage to cooperate to stabilize in Iraq, it would not only be good news for the Iraqis -- it could also pave the way for a final agreement in the ongoing nuclear negotiations. In that sense, the two countries would have truly achieved significant rapprochement, if not in the way that many observers originally anticipated.

Ext Duggan 15 – Iran War Impact

Goes nuclear

Avery, 13 --- Associate Professor, University of Copenhagen (11/6/2013, John Scales Avery, "An Attack On Iran Could Escalate Into Global Nuclear War," <http://www.countercurrents.org/avery061113.htm>)

Despite the willingness of Iran's new President, Hassan Rouhani to make all reasonable concessions to US demands, Israeli pressure groups in Washington continue to demand an attack on Iran. But such an attack might escalate into a global nuclear war, with catastrophic consequences. As we approach the 100th anniversary World War I, we should remember that this colossal disaster escalated uncontrollably from what was intended to be a minor conflict. There is a danger that an attack on Iran would escalate into a large-scale war in the Middle East, entirely destabilizing a region that is already deep in problems. The unstable government of Pakistan might be overthrown, and the revolutionary Pakistani government might enter the war on the side of Iran, thus introducing nuclear weapons into the conflict. Russia and China, firm allies of Iran, might also be drawn into a general war in the Middle East. Since much of the world's oil comes from the region, such a war would certainly cause the price of oil to reach unheard-of heights, with catastrophic effects on the global economy. In the dangerous situation that could potentially result from an attack on Iran, there is a risk that nuclear weapons would be used, either intentionally, or by accident or miscalculation. Recent research has shown that besides making large areas of the world uninhabitable through long-lasting radioactive contamination, a nuclear war would damage global agriculture to such a extent that a global famine of previously unknown proportions would result. Thus, nuclear war is the ultimate ecological catastrophe. It could destroy human civilization and much of the biosphere. To risk such a war would be an unforgivable offense against the lives and future of all the peoples of the world, US citizens included.

Iran war escalates

White 11, July/August 2011 (Jeffrey—defense fellow at the Washington Institute for Near East Policy, What Would War With Iran Look Like, National Interest, p. <http://www.the-american-interest.com/article-bd.cfm?piece=982>)

A U.S.-Iranian war would probably not be fought by the United States and Iran alone. Each would have partners or allies, both willing and not-so-willing. Pre-conflict commitments, longstanding relationships, the course of operations and other factors would place the United States and Iran at the center of more or less structured coalitions of the marginally willing. A Western coalition could consist of the United States and most of its traditional allies (but very likely not Turkey, based on the evolution of Turkish politics) in addition to some Persian Gulf states, Jordan and perhaps Egypt, depending on where its revolution takes it. Much would depend

on whether U.S. leaders could persuade others to go along, which would mean convincing them that U.S. forces could shield them from Iranian and Iranian-proxy retaliation, or at least substantially weaken its effects. Coalition warfare would present a number of challenges to the U.S. government. Overall, it would lend legitimacy to the action, but it would also constrict U.S. freedom of action, perhaps by limiting the scope and intensity of military operations. There would thus be tension between the desire for a small coalition of the capable for operational and security purposes and a broader coalition that would include marginally useful allies to maximize legitimacy. The U.S. administration would probably not welcome Israeli participation. But if Israel were directly attacked by Iran or its allies, Washington would find it difficult to keep Israel out—as it did during the 1991 Gulf War. That would complicate the U.S. ability to manage its coalition, although it would not necessarily break it apart. Iranian diplomacy and information operations would seek to exploit Israeli participation to the fullest. Iran would have its own coalition. Hizballah in particular could act at Iran's behest both by attacking Israel directly and by using its asymmetric and irregular warfare capabilities to expand the conflict and complicate the maintenance of the U.S. coalition. The escalation of the Hizballah-Israel conflict could draw in Syria and Hamas; Hamas in particular could feel compelled to respond to an Iranian request for assistance. Some or all of these satellite actors might choose to leave Iran to its fate, especially if initial U.S. strikes seemed devastating to the point of decisive. But their involvement would spread the conflict to the entire eastern Mediterranean and perhaps beyond, complicating both U.S. military operations and coalition diplomacy.

Extinction

Giribets 12 [Miguel Giribets, "If US Attacks Iran, Human Survival May Be at Risk (Part III)," Argen Press, 10 January 2012, pg. <http://watchingamerica.com/News/141596/if-us-attacks-iran-human-survival-may-be-at-risk-part-iii/>]

The dangers of global war are clear. On one side, hundreds of Russian technicians would die working on Iranian nuclear facilities, to which Russia could not stand idly by. According to Chossudovsky: "Were Iran to be the object of a "pre-emptive" aerial attack by allied forces, the entire region, from the Eastern Mediterranean to China's Western frontier with Afghanistan and Pakistan, would flare up, leading us potentially into a World War III scenario. The war would also extend into Lebanon and Syria." It is highly unlikely that the bombings, if they were to be implemented, would be circumscribed to Iran's nuclear facilities as claimed by US-NATO official statements. What is more probable is an all out air attack on both military and civilian infrastructure, transport systems, factories, public buildings.

"The issue of radioactive fallout and contamination, while casually dismissed by US-NATO military analysts, would be devastating, potentially affecting a large area of the broader Middle East (including Israel) and Central Asian region." As an example, a few years ago Burma moved its capital Rangoon to Pyinmana, because it believed that the effects of nuclear radiation caused by an attack on Iran would be less there. Radiation and nuclear winter could have uncontrollable consequences for humans. Put plainly, the survival of the human race would be put at stake if the U.S. attacks Iran.

Iran proliferates – global proliferate – nuclear wars everywhere

Edelman, 11 — Distinguished Fellow at the Center for Strategic and Budgetary Assessments, former U.S. Undersecretary of Defense for Policy (Eric, “The Dangers of a Nuclear Iran: The Limits of Containment”, Foreign Affairs, 2011, proquest)

FROM ISLAMABAD TO RIYADH The reports of the Congressional Commission on the Strategic Posture of the United States and the Commission on the Prevention of Weapons of Mass Destruction Proliferation and Terrorism, as well as other analyses, have highlighted the risk that a nuclear-armed Iran could trigger additional nuclear proliferation in the Middle East, even if Israel does not declare its own nuclear arsenal. Notably, Algeria, Bahrain, Egypt, Jordan, Saudi Arabia, Turkey, and the United Arab Emirates- all signatories to the Nuclear Nonproliferation Treaty (npt)-have recently announced or initiated nuclear energy programs. Although some of these states have legitimate economic rationales for pursuing nuclear power and although the low-enriched fuel used for power reactors cannot be used in nuclear weapons, these moves have been widely interpreted as hedges against a nuclear-armed Iran. The npt does not bar states from developing the sensitive technology required to produce nuclear fuel on their own, that is, the capability to enrich natural uranium and separate plutonium from spent nuclear fuel. Yet enrichment and reprocessing can also be used to accumulate weapons-grade enriched uranium and plutonium—the very loophole that Iran has apparently exploited in pursuing a nuclear weapons capability. Developing nuclear weapons remains a slow, expensive, and difficult process, even for states with considerable economic resources, and especially if other nations try to constrain aspiring nuclear states' access to critical materials and technology. Without external support, it is unlikely that any of these aspirants could develop a nuclear weapons capability within a decade. There is, however, at least one state that could receive significant outside support: Saudi Arabia. And if it did, proliferation could accelerate throughout the region. Iran and Saudi Arabia have long been geopolitical and ideological rivals. Riyadh would face tremendous pressure to respond in some form to a nuclear-armed Iran, not only to deter Iranian coercion and subversion but also to preserve its sense that Saudi Arabia is the leading nation in the Muslim world. The Saudi government is already pursuing a nuclear power capability, which could be the first step along a slow road to nuclear weapons development. And concerns persist that it might be able to accelerate its progress by exploiting its close ties to Pakistan. During the 1980s, in response to the use of missiles during the Iran-Iraq War and their growing proliferation throughout the region, Saudi Arabia acquired several dozen css-2 intermediate-range ballistic missiles from China. The Pakistani government reportedly brokered the deal, and it may have also offered to sell Saudi Arabia nuclear warheads for the css-2s, which are not accurate enough to deliver conventional warheads effectively. There are still rumors that Riyadh and Islamabad have had discussions involving nuclear weapons, nuclear technology, or security guarantees. This "Islamabad option" could develop in one of several different ways. Pakistan could sell operational nuclear weapons and delivery systems to Saudi Arabia, or it could provide the Saudis with the infrastructure, material, and technical support they need to produce nuclear weapons themselves within a matter of years, as opposed to a decade or longer. Not only has Pakistan provided such support in the past, but it is currently building two more heavy-water reactors for plutonium production and a second chemical reprocessing facility to extract plutonium from spent nuclear fuel. In other words, it might accumulate more fissile material than it needs to maintain even a substantially expanded arsenal of its own. Alternatively, Pakistan might offer an extended deterrent guarantee to Saudi Arabia and deploy nuclear weapons, delivery systems, and troops on Saudi territory, a practice that the United States has employed for decades with its allies. This arrangement could

be particularly appealing to both Saudi Arabia and Pakistan. It would allow the Saudis to argue that they are not violating the npt since they would not be acquiring their own nuclear weapons. And an extended deterrent from Pakistan might be preferable to one from the United States because stationing foreign Muslim forces on Saudi territory would not trigger the kind of popular opposition that would accompany the deployment of U.S. troops. Pakistan, for its part, would gain financial benefits and international clout by deploying nuclear weapons in Saudi Arabia, as well as strategic depth against its chief rival, India. The Islamabad option raises a host of difficult issues, perhaps the most worrisome being how India would respond. Would it target Pakistan's weapons in Saudi Arabia with its own conventional or nuclear weapons? How would this expanded nuclear competition influence stability during a crisis in either the Middle East or South Asia? Regardless of India's reaction, any decision by the Saudi government to seek out nuclear weapons, by whatever means, would be highly destabilizing. It would increase the incentives of other nations in the Middle East to pursue nuclear weapons of their own. And it could increase their ability to do so by eroding the remaining barriers to nuclear proliferation: each additional state that acquires nuclear weapons weakens the nonproliferation regime, even if its particular method of acquisition only circumvents, rather than violates, the npt. N-PLAYER

COMPETITION Were Saudi Arabia to acquire nuclear weapons, the Middle East would count three nuclear-armed states, and perhaps more before long. It is unclear how such an n-player competition would unfold because most analyses of nuclear deterrence are based on the U.S.-Soviet rivalry during the Cold War. It seems likely, however, that the interaction among three or more nuclear-armed powers would be more prone to **miscalculation and escalation** than a bipolar competition. During the Cold War, the United States and the Soviet Union only needed to concern themselves with an attack from the other. Multipolar systems are generally considered to be less stable than bipolar systems because coalitions can shift quickly, upsetting the balance of power and creating incentives for an attack. More important, emerging nuclear powers in the Middle East might not take the costly steps necessary to **preserve regional stability and avoid a nuclear exchange**. For nuclear-armed states, the bedrock of deterrence is the knowledge that each side has a secure second-strike capability, so that no state can launch an attack with the expectation that it can wipe out its opponents' forces and avoid a devastating retaliation. However, emerging nuclear powers might not invest in expensive but survivable capabilities such as hardened missile silos or submarine-based nuclear forces. Given this likely vulnerability, the close proximity of states in the Middle East, and the very short flight times of ballistic missiles in the region, any new nuclear powers might be compelled to **"launch on warning"** of an attack or even, during a crisis, to use their nuclear forces preemptively. Their governments might also **delegate launch authority** to lower-level commanders, heightening the possibility of **miscalculation** and escalation. Moreover, if early warning systems were not integrated into robust command-and-control systems, the risk of an unauthorized or accidental launch would increase further still. And without sophisticated early warning systems, a nuclear attack might be unattributable or attributed incorrectly. That is, assuming that the leadership of a targeted state survived a first strike, it might not be able to accurately determine which nation was responsible. And this uncertainty, when combined with the pressure to respond quickly, would create a **significant risk** that it would retaliate against the wrong party, potentially triggering a regional **nuclear war**. Most existing nuclear powers have taken steps to protect their nuclear weapons from unauthorized use: from closely screening key personnel to developing technical safety measures, such as permissive action links, which require special codes before the weapons can be armed. Yet there is no guarantee that emerging nuclear powers would be willing or able to implement these measures, creating a significant risk that their governments might lose control

over the weapons or nuclear material and that nonstate actors could gain access to these items. Some states might seek to mitigate threats to their nuclear arsenals; for instance, they might hide their weapons. In that case, however, a single intelligence compromise could leave their weapons vulnerable to attack or theft.

Ext Duggan 15 – Iran Solves the Case

Only US-Iran cooperation can resolve the ISIS threat

Milani 15 – Professor of Politics and the Executive Director of the Center for Strategic and Diplomatic Studies @ University of South Florida [Mohsen Milani, “What are the Prospects for US-Iran Cooperation Against ISIS?,” *Iran Matters*, May 20, 2015, pg. <http://tinyurl.com/q3jo3ac>

As the situation stands now, the United States is faced with a dilemma: “If we don’t put boots on the ground to fight ISIS, who will?” It is unlikely that Arab states like Saudi Arabia, other GCC countries, Egypt, and Jordan will have the desire to muster an army to fight a force that is primarily Sunni. The Iraqi Security Forces, despite U.S. training, have proved incapable of single handedly defeating the jihadist threat. The Turkish military has the strength, but the government is determined to overthrow the Assad regime and therefore is unlikely to engage in any military operations against ISIS at this time. Nor does the Shi’a dominated government in Iraq have any interest to invite Sunni armies to interfere in Iraq’s internal affairs. The Kurdish Peshmerga have the desire, willingness and the manpower to fight ISIS, but they cannot single handedly defeat ISIS or expel them from Iraq.

Iran has the willingness and the determination to fight against ISIS by helping the Iraqi government. Moreover, Iranian trained Iraqi militias have had a good record of fighting against ISIS. Should there be a nuclear agreement between six global powers and Iran, there is a reasonable possibility that the hostile relations between Iran and the U.S. can change and the two countries can join together to undermine ISIS and address other areas of common interest.

Turn – Leaks Decrease Coop

Turn: Leaks undermine intel cooperation

Walsh 15 - Professor of political science @ University of North Carolina - Charlotte. [James Igoe Walsh, “How the latest leak hurts intelligence cooperation,” *The Washington Post*, February 25, 2015, pg. <http://tinyurl.com/pleau7m>

The leak is likely to have important implications for the willingness of intelligence agencies to share information in the future. At its heart, intelligence sharing involves the exchange of not simply information, but information that must be kept secret from others. States that share secrets worry that their partners will divulge them, deliberately or inadvertently. The current leak is the latest case, after Wikileaks and the Edward Snowden revelations, where an intelligence “insider” has broken this promise of secrecy.

States’ reaction to this leak will have important consequences for their own security. Greater limits on intelligence sharing might restrict states’ ability to counter transnational terrorist groups and other threats to peace and stability. Leaks by insiders have fast become the biggest challenge

to the current intelligence sharing regime. To some extent, these leaks are a public good. They have provided a lot of information about intrusions on civil liberties and human rights by intelligence agencies around the world.

Intelligence agencies are likely to want to share less after this document leak. It makes sense to share only with those whom you trust to keep information secret. Insider leaks may lead states to update their assessments of the trustworthiness of their partners. But limiting sharing to only the most trustworthy states imposes quite serious costs. Only a handful of countries have foreign intelligence services of any size, and none comes close to matching the United States. For smaller countries, this means there are relatively few partners who can provide intelligence on a wide range of issues. After the Wikileaks and Snowden revelations, many commentators suggested that foreign intelligence services would limit sharing with the United States, but it is not clear that this has actually happened.

But cooperating with only the most trustworthy states is not the only way to share intelligence. As I discuss in my book, “International Politics of Intelligence Sharing,” cooperating states can construct institutions and practices that limit their vulnerability to exploitation by their partners. The United States, for example, provides funding and technical support to the intelligence agencies of a number of smaller states. This not only builds partner states’ capacity to develop mutually useful intelligence, but also provides the United States with leverage it can use to punish partners who violate sharing agreements.

This and earlier insider threats suggest it is becoming increasingly difficult for intelligence services to keep their secrets secret. Although we do not yet know the motives of the leaker or leakers in the South African case, many of the previous leakers were unhappy about their governments’ willingness to aggressively exploit their growing capacity to monitor communications, even when doing so threatens civil liberties.

Status quo solves US-Saudi intelligence sharing

Hosenball et al. 4/10 (MARK HOSENBALL, PHIL STEWART AND WARREN STROBEL, 2015, Reuters, “Exclusive: U.S. expands intelligence sharing with Saudis in Yemen operation,” <http://www.reuters.com/article/2015/04/11/us-usa-saudi-yemen-exclusive-idUSKBN0N129W20150411>)/RTF

The United States is expanding its intelligence-sharing with Saudi Arabia to provide more information about potential targets in the kingdom's air campaign against Houthi militias in Yemen. U.S. officials told Reuters. The stepped-up assistance comes as two weeks of relentless air strikes by the Saudis and other Gulf Arab allies have largely failed to halt advances by the Iran-linked Houthi forces. The U.S. officials said the expanded assistance includes sensitive intelligence data that will allow the Saudis to better review the kingdom's targets in fighting that has killed hundreds and displaced tens of thousands since March. "We have opened up the aperture a bit wider with what we are sharing with our Saudi partners," said one U.S. official. "We are helping them get a better sense of the battlefield and the state of play with the Houthi forces. We are also helping identify 'no strike' areas they should avoid" to minimize any civilian casualties, the official said. U.S. ally Saudi Arabia is concerned that the violence could spill over the border it shares with Yemen, and is also worried about the influence of Shi'ite Iran, which has denied Saudi allegations it has provided direct military support to the Houthis. The United States, whose fight against al Qaeda militants in Yemen has been dealt a heavy setback by the Houthi takeover of the capital Sanaa and ousting of the previous government, has avoided a direct role in the worsening conflict. It will still stop short of picking targets for the Saudis, said the four

U.S. officials, who spoke on condition of anonymity. But Washington has come under pressure to do more to assist the alliance led by Saudi Arabia, which fears the Houthi advance is expanding the influence of arch foe Iran to its border. Saudi concerns of growing Iranian influence have also been heightened by nuclear talks between Tehran and world powers that could result in a deal by June 30 removing punishing sanctions on the country. A senior U.S. diplomat said earlier this week that Washington was speeding up arms supplies and bolstering intelligence sharing with the Saudi-led alliance. The Pentagon has said it is beginning aerial refueling of Arab coalition jets – although outside Yemeni airspace. Until recent days, U.S. intelligence support was limited to examining Saudi targeting information to try to affirm its accuracy, U.S. and Saudi officials said. The U.S. role has now expanded in size and scope, involving more detailed “vetting” of targeting information prepared by the Saudis, with a particular interest in helping the Saudis to avoid civilian casualties, according to the U.S. officials. The White House and Pentagon would not comment specifically when asked about expanded intelligence-sharing. "The United States is providing our partners with necessary and timely intelligence to defend Saudi Arabia and respond to other efforts to support the legitimate government of Yemen," said Alistair Baskey, a White House spokesman. LEGAL BARRIERS Aid groups have said the Saudi strikes, which began March 25, have caused many civilian deaths, including a March 30 attack on a Houthi-controlled refugee camp in northern Yemen that the International Organization for Migration said killed 40 people. Senior Saudi officials have blamed such incidents on the Houthis themselves. The Saudi-led air campaign is aimed at rolling back territorial gains by the Houthis and reinstalling Yemeni President Abd-Rabbu Mansour Hadi, who has fled the country. While the White House announced U.S. intelligence support soon after the operation began, American officials said that data sharing had been extremely minimal in the campaign's early days. That is partly due to legal barriers, the officials said. While the United States has used lethal force against an al Qaeda offshoot in Yemen, it does not consider itself at war with the Houthis. Some officials said the U.S. administration's analysis is that it lacks the ability under international and U.S. law to collaborate with the Saudis in an offensive against the Houthis. Baskey said that U.S. actions were "fully consistent with applicable domestic and international legal requirements." Deputy Secretary of State Antony Blinken spoke in general terms about the expanded cooperation during a Monday visit to Riyadh, without disclosing specifics. "Saudi Arabia is sending a strong message to the Houthis and their allies that they cannot overrun Yemen by force," Blinken said. "As part of that effort, we have expedited weapons deliveries, we have increased our intelligence sharing, and we have established a joint coordination planning cell in the Saudi operation center," he added. The United States has sent a 20-member military coordination team to interact with the Gulf allies, led by Marine Major General Carl Mundy. Assigning a two-star general will facilitate interactions with other high-ranking officials from other nations, U.S. officials said. The United States this week started daily air-to-air refueling flights of fighter jets from Saudi Arabia and the United Arab Emirates. But even with its refueling flights, the United States is exhibiting caution -- carrying out the flights outside Yemeni airspace and requesting financial reimbursement from allies. It is still unclear how the United States plans to accelerate the delivery of bombs and guidance kits to its allies. One person familiar with the matter, speaking on condition of anonymity, said the United States might accelerate shipments to the United Arab Emirates, which could then also help resupply Saudi Arabia.

Squo solves- countries are already taking measures to mitigate the threat and intel sharing is taking place

Zelin and Prohov 14 (Aaron and Jonathan, May 18th, Aaron Y. Zelin is the Richard Borow Fellow at The Washington Institute and the Rena and Sami David Fellow at the International Centre for the Study of Radicalisation. He also runs the website Jihadology.net. Jonathan Prohov is a research assistant at the Institute, "Proactive Measures: Countering the Returnee," <http://www.washingtoninstitute.org/policy-analysis/view/proactive-measures-countering-the-returnee-threat//RTF>

Fears that foreign fighters traveling to Syria might return home once the conflict is over and engage in terrorism have prompted an unprecedented level of proactive measures by countries around the world. In the past, many countries only changed their laws after an attack occurred, but this time around many states are trying to get ahead of the issue. Compared to the number of foreigners who fought against the United States in Iraq or the Soviets in Afghanistan, the number of foreigners fighting in Syria has exceeded both of those cases -- and in less than half the time. Around 9,000 individuals from more than 80 countries have joined the fight against the Assad regime, with the majority coming from the Arab world and Western Europe. U.S. intelligence officials told the Los Angeles Times in February that at least 50 Americans had joined the fight in Syria, and FBI director James Comey recently stated that the number of Americans who had either traveled to Syria or tried to do so had grown by a few dozen since the beginning of 2014. The United States was one of the first to designate Jabhat al-Nusra, Al Qaeda's branch in Syria, as a terrorist organization. Some European Union (EU) countries, as well as Canada, Australia, and Britain, have followed suit. The United States has also used sting operations to stop individuals from joining the fight. Australia has used laws already on the books that allow it to revoke individuals' passports to prevent its citizens from going to fight in Syria in the first place and to prevent those who have already gone from getting back into the country. In the EU, the Netherlands has banned certain individuals from returning home, used ankle bracelets to track those who have returned from Syria, and ruled that preparing to travel to Syria to participate in jihad is a crime. In Germany, three different Salafist organizations have been banned for providing recruitment networks for groups fighting in Syria, and one German official has proposed setting up a network

of telephone hotlines and counseling centers to enable friends and relatives to report radicalized young men as a sort of early warning system. Some EU countries have also discussed cutting off individuals' access to government benefits such as healthcare and other social services if they've participated in the jihad in Syria. One way Britain has tried to combat the recruitment of its citizens is by removing recruitment material from the Internet. Between January and March 2014, Britain had 8,000 "takedowns" of online content -- a sudden and dramatic increase, considering there were only 21,000 takedowns conducted over the previous four years combined. The Foreign and Commonwealth Office has also been putting money into a social media program aimed at deterring British citizens from traveling to Syria to fight. In addition, the British police recently announced that they will be partnering with charitable organizations in a campaign to prevent young people from going to Syria. As reported by the New York Times, "Officers plan to hand out leaflets at British ports warning of the risks of traveling to Syria, and officers plan to advise people who want to support humanitarian efforts in Syria to avoid traveling there and to donate to nonprofit organizations instead." Just last week, the House of Commons Home Affairs Committee issued a detailed report recommending a number of new policy initiatives aimed at dealing with the returnee threat; these included revoking the passports of British citizens fighting in Syria, sending "spotters" to countries that border Syria to identify British citizens at risk of crossing the border to fight (a program currently used to track soccer hooligans in foreign countries), and coordinating with mental health practitioners to help returning fighters cope with the violence they've experienced. And according to the New York Times, the House of Lords on Monday "passed legislation that allows the government to strip terrorism suspects of their citizenship even if it renders them stateless." Britain's counterparts in France launched a new counter-radicalization program in October 2013, and they recently announced an expansion of the program with 20 additional measures, including a plan to stop minors from leaving France without parental consent; increased surveillance of Islamist websites that recruit fighters; and, similar to the program proposed in Germany, a system to encourage parents to identify and report suspicious behavior in their children. Smaller countries like Bosnia, Finland, and Azerbaijan are also considering strengthening their anti-terrorism laws. Bosnia recently passed a law that imposes a sentence of up to ten years for any citizen who fights or recruits others to fight in a conflict abroad. Finland's parliament has begun to debate strengthening their terrorism laws to include making it a criminal offense to receive training to commit acts of terror. In Azerbaijan, an amendment has been introduced to increase penalties for involvement in international terrorism, financing of terrorism, and using any form of media for extremist purposes. Most countries in the Arab world are also concerned and are taking steps in anticipation of potential problems. Saudi Arabia has done this before, opening a rehabilitation center in Riyadh in 2007 for all Al Qaeda members serving prison sentences. Beyond opening additional rehabilitation centers to serve those who fight in Syria, the Saudis have increased preventive measures in several other ways: in early February 2014, the government issued a royal order declaring that any citizen who fights in conflicts abroad will face between three and twenty years in jail. A month later, the Saudis released a royal decree designating Jabhat al-Nusra and Al Qaeda in Iraq (better known these days as the Islamic State of Iraq and Syria, or ISIS) as terrorist organizations. To help deter further recruitment of Saudi citizens by groups in Syria, the Saudis also promoted a disillusioned returned Saudi fighter, Sulayman Sa'ud Subai'i, on the television program Humumana ("Our Concerns"). In the show, Subai'i explained that the Syrian jihad is not as glamorous as it is portrayed in the media and online and decried a number of offensive practices he saw various rebel groups in Syria engaged in, including what he referred to as "the weaponization of takfir" among the different rebel groups. (Takfir is an Islamic term that refers to the act of labelling another Muslim as a non-Muslim, which in this context then implies that one can now kill that person.) In Kuwait, where much of the financing for extremists in Syria has originated or been routed through, members of parliament passed a bill in early April 2014 to combat money laundering and funding of terror groups that carries a potential sentence of up to 20 years in prison. Similarly, Turkey passed an anti-terrorism finance law in February 2013 in order to maintain compliance as a member of the Financial Action Task Force, a money-laundering watchdog organization comprised of 36 members. The new law allows the state to freeze the financial assets of terrorists without a court order; however, Turkey's enforcement of these laws remains very poor. More recently -- and perhaps more effectively -- Turkey also changed its policy related to issuing tourist visas. Starting in mid-April 2014, tourists wanting to travel to Turkey must obtain a visa ahead of time and cannot simply get one at the airport once they arrive in Turkey. Turkey has also administratively authorized a no-entry list for over 3000 individuals based on information received from Interpol, other countries, and individuals' families. In addition, the country has started building a fence along parts of its border with Syria. Major fighting along Jordan's borders since the conflict in Syria began combined with the fact that a number of Jordanians have gone to fight in Syria prompted Jordan to update its 2006 Anti-Terrorism Law: amendments include a clause

that criminalizes the act of joining or attempting to join jihadi groups abroad and recruiting or attempting to recruit for these groups. The law also explicitly criminalizes using "information technology, the Internet or any means of publication or media, or the creation of a website, to facilitate terrorist acts or back groups that promote, support or fund terrorism." In Lebanon, where violence has spiked tremendously due to the spillover effects of the Syrian conflict raging next door (including several bombing incidents carried out by Al Qaeda-affiliated groups), laws have remained unchanged thanks to a 10-month period of political deadlock that has prevented the formation of a government. Instead, law enforcement personnel have beefed up their domestic enforcement efforts, including dramatically increasing the number of arrests and preemptively detonating cars they suspect of being rigged with explosives. Taking a less bellicose approach, the Tunisian government has established a mechanism for individuals who have gone to Syria but have not killed anyone to be integrated back into society through an amnesty program. Ridha Sfar, a deputy minister in Tunisia's interior ministry, described it as "a forgiveness and repentance law which was previously enacted in countries like Algeria and Italy," and said that the policy applied to "[a]ny Tunisian who does not have blood on his hands." Morocco is also looking into a reintegration process for those who do not pose a security risk. Currently, the Moroccan government is using administrative powers to delay the issuance of passports to those it suspects intend to travel to Syria to fight; however, this measure is unlikely to be successful since of the Moroccans that have traveled to Syria, 81% were previously unknown to Moroccan security forces. Broader multilateral approaches are also being taken to mitigate this issue. In February 2014, the Global Counterterrorism Forum (GCTF) -- an international organization created by the United States and Turkey in 2011 with 30 member countries and partnerships with several other international organizations -- launched the "Foreign Terrorist Fighters" Initiative. Led by the Netherlands and Morocco, the Initiative "will include two expert meetings and the development of good practices that could be adopted by the GCTF at the ministerial level." At the opening meeting, participants discussed the challenges posed by foreign fighters and the ways different countries and organizations are already dealing with the issue. For instance, some states have begun utilizing Interpol yellow notices -- designed to locate missing persons -- to disseminate information about suspected foreign fighters. Only time will tell how effective all of these policies will prove to be at mitigating the threat of foreign fighters returning home from Syria. The fact that countries across the region and far beyond are already making such changes indicates the seriousness of the threat posed by the proliferation of violence well beyond Syria's borders. Foreign fighters present such a complex problem that prospects for failure are likely. Multilateral counterterrorism mechanisms instituted after 9/11 mean that the United States and the international community do not have to build capabilities and relationships from scratch. Yet even as additional programs and policies are implemented and strengthened, the fact remains that it only takes one successful attack for these policies to be deemed insufficient. Attacks have already occurred in the Middle East, where security is precarious due to domestic instability, and attacks have quietly been thwarted in western countries as well. The United States must remain vigilant at home and continue to take a leadership role abroad, encouraging best practices and helping foreign governments craft policies to address the threat. In particular, the United States needs to apply further pressure on certain key countries, such as Turkey, which is the main point of entry into Syria for foreign fighters and whose borders are still notoriously easy for fighters to cross, and Kuwait, which remains the "epicenter of fundraising for terrorist groups in Syria." Meanwhile, the source of the problem -- the Syrian conflict itself -- has become what the Economist describes as a "bloody stalemate" with no end in sight.

Status quo intel sharing solves

Nielsen 1/19 (Nikolaj, 2015, Danish-American journalist working for EUobserver in Brussels. He won a King Baudouin Foundation grant for investigative journalism in 2010, "EU to increase intelligence sharing with Arab states," <https://euobserver.com/foreign/127283>)/RTF

The EU wants to step up security and intelligence co-operation with neighbouring countries to counter terrorist threats. The plan is part of a broader effort discussed on Monday (19 January) by EU

foreign ministers to reduce the risk of militant attacks by getting national intelligence and law enforcement agencies to share data and to communicate better with each other and their counterparts in Turkey, north Africa, and Asia. An EU source said it could involve a future proposal by the EU's counter-terrorism chief Gilles de Kerchove to rebuild dismantled intelligence agencies in post-Arab spring countries, such as Tunisia. Federica Mogherini, the EU's foreign policy chief, told reporters in Brussels she wants "security attaches" posted in EU delegations to help liaise with the host country's authorities. She also wants to reach out to Arab-speaking populations by "improving our capacity to speak Arabic, read Arabic" and "listen to the messages coming from the Arab world". Mogherini, in a separate meeting with Arab League secretary general Nabil El Arabi, agreed to work closer together on counter-terrorism threat and announced that projects would be launched in the coming weeks with Algeria, Egypt, Turkey, Yemen, the Gulf countries and some African nations. "We know very well that the first victims of terrorists and terrorist attacks are Muslims and Arab countries," she said. Monday's meeting, marked by a sense of urgency, outlined plans with formal decisions set to be taken on 12 February. A meeting in Brussels is also planned in the next few days with experts from the EU, US, Australia, Canada, Iceland, Japan, Norway, Switzerland, and UN agencies to figure out how to cut the funding schemes that bankroll militant groups in Iraq and Syria. The aftermath of the Charlie Hebdo murders, which left 17 dead, has seen national governments trying to fast track security measures provisionally announced last October. These includes, among others, stepping up external border checks and blocking, with the help of Facebook, Google, Twitter, and Microsoft, online content that glorifies the violence perpetrated by Islamic militants. But concerns are mounting that additional security calls made by national governments, such as confiscating passports, pose a threat to civil liberties and may result in unanticipated adverse affects.

Squo solves intel coop

Born 07 (Hans, October 6th, Senior Fellow, DCAF, Geneva, "International Intelligence Cooperation: The Need for Networking accountability," <http://www.dcaf.ch/content/download/37081/529379/version/1/file/born-international-intelligence-cooperation-networking-accountability-071006.pdf>)/RTF

International intelligence cooperation takes many forms, from ad hoc information sharing to the institutionalized exchange of intelligence between states. Cooperation may occur: Bilaterally; • Multilaterally within specific arrangements for intelligence sharing such as the Club of Bern, UKUSA and the Alliance Base Counterterrorist Intelligence Center near Paris;3 • Intelligence cooperation (or the lack thereof) takes place within the context of international organizations such as NATO and the EU. There can be little doubt that states have for long shared intelligence. However, the events of 11 September 2001 and subsequent terrorist attacks in Bali, Beslan, London and Madrid have driven states to cooperate more intensively and on a broader range of issues than ever before. This increased cooperation has not only developed between traditional international partners in the West, but has also extended to a range of states that were not previously considered to be traditional allies in security matters – principally in the Middle East, Central Asia and Southeast Asia. Cooperation with these non-traditional partners has generated significant problems, largely because the collection and use of intelligence may not be subject to the same human rights safeguards as applied in NATO member states. As many of you may be aware, international intelligence cooperation as part of the so-called 'war on terror' has generated a series of high profile controversies – to name just two examples – the alleged CIA secret detention centres in Europe and the case of Maher Arar in Canada. These practices have been exposed through inquiries, however, the fact these events took place is in part the result of a lack of accountability of intelligence cooperation, I will now discuss this 'accountability gap' more fully.

Alt Causes

Alt Causes to Intel Sharing:

Personal data

McGill and Gray 12 (Anna-Katherine Staser and David H, Summer, School of Graduate and Continuing Studies in Diplomacy and Campbell University, "Challenges to International Counterterrorism Intelligence Sharing," <http://globalsecuritystudies.com/McGill%20Intel%20Share.pdf>)/RTF

Personal data is critical to counterterrorism efforts because it “often provide[s] the only evidence of connections between members of terrorist groups and the types of activities that they are conducting” (Bensehal 48). However, Europe has shown resistance to freely sharing this type of information with its American counterparts since many of the US’s European allies have much more stringent views on the protection of personal data. In the EU, there are safeguards at the national and regional level that regulate the storage and sharing of personal data information. These laws are a product of Europe’s historical experience with fascism and thus its sensitivity to the abuse of such information as travel records or communications (Bensehal, 48). In “The Counterterror Coalitions: Europe, NATO, and the European Union” Nora Bensehal explains “by contrast, the United States protects personal information through legal precedents and procedures rather than [unified] legislation” which the Europeans find insufficient (48). The EU’s concerns over the US’s protection of personal data caused them to withhold information from the US and created a substantial challenge to their combined counterterrorism efforts. Following 9/11 the heightened political will to overcome such issues enabled the US and the EU to compromise on this issue but there are lingering limits to EU willingness to share personal data with the US. In the wake of the attacks, the US and Europol signed an agreement to permit the sharing of personal data. Although it increased operational effectiveness and intelligence sharing this agreement is limited to law enforcement operations which excludes personal data found in commercial activities. Furthermore, provisions in the agreement state that “personal information can be used only for the specific investigation for which it was requested” (Bensehal, 48). If the suspect is being investigated for murder and is discovered to have ties to a smuggling ring the US must submit a separate request to use the murder information in the case regarding the smuggling activities.

Extraordinary Rendition

McGill and Gray 12 (Anna-Katherine Staser and David H. Summer, School of Graduate and Continuing Studies in Diplomacy and Campbell University, “Challenges to International Counterterrorism Intelligence Sharing,” <http://globalsecuritystudies.com/McGill%20Intel%20Share.pdf>//RTF

The US and the EU have also had substantial disagreements on the treatment and punishment of accused terrorists. This tension hinges on such issues as the use of the death penalty and “extraordinary rendition”. Fortunately, the death penalty issue was resolved with the passage of a multilateral treaty on extradition however the US has not fully recovered from the backlash of criticism and mistrust from its practice of “extraordinary rendition”. Prior to a May 2002 summit, the US and EU were at a disagreement over the death penalty. The EU’s aversion to capital punishment led it to not only hesitate from sharing information but deny requests for extradition unless the US would guarantee that the individual in question would not face the death penalty. The 2002 summit did however bring both the US and EU to at least agree in principle to a treaty on extradition and Mutual Legal Assistance Treaty (MLAT) and both parties ratified the treaties in 2003. The extradition treaty allowed for a blanket policy for European nations to “grant extradition on the condition that the death penalty will not be imposed” and the MLAT provided enhanced capability to gather and exchange information (Bensehal 49). The CIA’s use of “extraordinary rendition”, the practice of transporting a suspect to a third country for interrogation, has also stoked the ire of many traditional allies. Critics charge that this tactic quite simply allows the CIA to sidestep international laws and obligations by conducting interrogations in nations with poor human-rights records. In 2003, an Italian magistrate formally indicted 13 CIA agents for allegedly kidnapping an Italian resident and transporting him to a third country for interrogation. Ultimately 22 CIA agents and one US military officer were convicted in absentia of crimes connected to the abduction (Stewart, 1). The case not only heightened criticism of the US in Italy but challenged U.S. strategic communications aimed at reducing anti-Americanism worldwide (Reveron 462). According to Julianne Smith, director of the Europe program at the Center for Strategic and International Studies (CSIS), “[extraordinary rendition] makes it extremely difficult [for European governments] to stand shoulder-to-shoulder with the U.S.” (Heller 1). In 2002 Deputy Secretary of State Richard Armitage testified that increased counterterrorism collection and sharing “results not just from collective revulsion at the nature of the attacks, but also the common recognition that such groups present a risk to any nation with an investment in the rule of law” (qtd in Reveron, 455). Indeed, increased political will on both ends has greatly improved intelligence sharing between the US and its allies. Yet, as demonstrated in the previous section, bonding over the catastrophic events of 9/11 cannot settle all disputes even with the closest of friends. It is even more difficult as commonalities and shared interests are limited at best, as is the case with many of the US’s new allies. As will be discussed in the following section, extraordinary rendition is just one of the ways the US is currently challenged by its relationships with new allies.

Anti-Americanism

McGill and Gray 12 (Anna-Katherine Staser and David H, Summer, School of Graduate and Continuing Studies in Diplomacy and Campbell University, "Challenges to International Counterterrorism Intelligence Sharing," <http://globalsecuritystudies.com/McGill%20Intel%20Share.pdf>)//RTF

Non-traditional relationships with Muslim nations like Saudi Arabia and Pakistan have been critical to the crackdown on terrorism financing and the ongoing operations against terrorists and insurgents in both Afghanistan and Pakistan's Federally Administered Tribal Areas. Yet the domestic populations of these nations put strains on cooperation with the US. In Saudi Arabia, the ultra conservative Wahhabi culture prevented the Saudi royal family from taking decisive action against terrorism facilitation within its boundaries years after it openly agreed to multilateral anti-terrorism treaties. Though it would stand to reason that the Saudi royals had a vested interest in undermining groups like al Qaeda who considered Saudi Arabia to be an apostate regime and therefore a target, it could not risk inciting public outrage by cracking down on donations to these groups. The intermingling of naïve benevolence toward seemingly legitimate charities, those hiding behind the veil of religious duty, and sympathy for al Qaeda's cause against the West made enforcement of counterterrorism measures in Saudi Arabia highly unlikely. It wasn't until the 2003-2004 Riyadh terrorist attacks did the Saudis jump into action. Since then they have been an extremely helpful ally for the US and yet domestic support for Islamic extremists remain and will continue to cause strains for US-Saudi CT cooperation in the future. The US-Saudi relationship was able to weather the storm of domestic anti-Americanism in large part to the long history of their alliance. Though traditional by no means this arrangement hinged on the trade of oil for security and the US dependence on Saudi oil prevented it from abandoning its relationship despite the feet dragging on CT issues. Had the Saudis not made an about face following the Riyadh attacks, it is questionable if this relationship would have survived. The US's relationship with Pakistan, however, does not enjoy the same benefits of a long-nurtured and ingrained alliance. Over the past half-century the relationship has been marked with highs and lows and though the US is heavily reliant on Pakistan for CT operations in Central Asia now, recent developments threaten to dismantle their alliance. Pakistan is home to many Islamic radicals and militants including Tehrik-i-Taliban Pakistan, responsible for the attempted Time Square bombing, and Lashkar-e Toiba, responsible for the 2008 Mumbai attacks. These extremist groups, Lashkar-e Toiba in particular, enjoy a considerable amount of influence amongst the populace and antiAmericanism is a cornerstone of the message it wishes to impart on the Pakistani people. The recent crisis over the arrest Raymond Davis, a CIA contractor accused of killing two Pakistani men in Lahore, highlights this tension and threatens Pakistani support of the war on terrorism as well as its own domestic stability. Upon the arrest of Davis, the US demanded his release on the grounds of diplomatic immunity. The location of the shooting, the city of Lahore in the Punjab region of Pakistan happens to be a hotbed of anti-American sentiment and a stronghold of many Pakistan based militant groups. Despite American pressure, and possibly pressure from the government of Pakistan, the Lahore courts have denied Davis's diplomatic immunity. For the past month multiple demonstrations organized by extremists groups like Lashkar-e Toiba and Jammāt-i-Islami have called for the execution of Davis and accused the Pakistani government of being "Washington's agents" (Hindustan Times). Demonstrators were also seen carrying signs with messages like "Friends of America are traitors" (Arnoldy 1). As a result of the public outcry against US demands for Davis's release the Government of Pakistan has officially stated that it will not make a determination on Davis's diplomatic immunity until March 14th. The US, in response, cancelled Secretary of State Hillary Clinton's meeting with Pakistan's Foreign Minister and a trilateral meeting with Afghanistan and Pakistan officials in Washington (Crilly 1; Arnoldy 1). Adding to the political pressure against the Government of Pakistan, President Obama himself spoke out on the matter shortly after the crisis began to urge the Pakistanis to release Davis on the conditions of diplomatic immunity and to emphasize that the case was a priority for the US government (Tapper & Farren 1). He further emphasized the importance of this matter by stating that the arrest and detention of foreign diplomats is a violation of the Vienna Convention and sets a dangerous precedent. If the Pakistanis chose to detain Davis they risk losing US aid and if Pakistan's anti-American sentiments are further incited, and possibly exploited by Pakistani extremist groups, the US may lose a key ally in its CT and counterinsurgency operations in Afghanistan and the FATA.

1NC Turns Iran-Saudi

ISIS conflict key to Iran-Saudi bilateral relations—preserves broader stability in Mideast—specifically resolves proxy wars. Even if that fails, ISIS doesn't collapse Iran.

Daily Star 14 Lebanese paper of record, 2014-09-06, "ISIS Brings Saudi Arabia and Iran Closer," <http://www.aina.org/news/20140905213005.htm>

Beirut -- The ISIS threat has brought Saudi Arabia and Iran closer together, and convinced the two rivals of the need to cooperate in order to face an "existential and strategic" menace to their countries,

analysts and experts said. They also emphasized that Saudi-Iranian cooperation is crucial to confront the mounting threat posed by ISIS. The jihadist group has sent shockwaves across the entire world over the past few months following its significant military advances in Iraq and Syria, coupled with its brutal practices, namely the execution of its prisoners and the beheading of two American journalists. **A long-awaited rapprochement between Riyadh and Tehran is a key tool to defuse sectarian tensions and long-simmering conflicts in the region,** particularly in Syria and Iraq, analysts said.

"The **ISIS** threat **has** brought Iran and Saudi Arabia closer together and **convinced them to engage in diplomacy in order to resolve lingering issues.**" Hilal Khashan, a professor of political science at the American University of Beirut, told The Daily Star. "I think **Saudi-Iranian cooperation is very important** in the battle to defeat ISIS. In order for them to successfully eliminate the ISIS threat, **they need to agree on lingering regional issues, such as the situation in Yemen, Iraq and Syria.**" he said. "For Saudi Arabia, ISIS poses an existential threat, while ISIS poses a strategic threat for Iran in the region," Khashan added. "**ISIS can have an appeal to** a segment of the **Saudi** population, **but** it does **not** have such an appeal **within the Iranian population.**" Sami Nader, a professor of economics and international relations at the Universite St. Joseph, echoed a similar view. "A Saudi-Iranian rapprochement is fundamental to confront the Daesh threat in the region," Nader told The Daily Star, using the Arabic acronym for ISIS. "For Saudi Arabia, ISIS poses an existential threat, while the militant group poses a strategic threat for Iran." "**Both countries have shown a great deal of pragmatism** in the attempt to cooperate to face the Daesh threat," said Nader, also the director of the Levant Institute for Strategic Affairs (LISA), a Beirut-based think-tank. "**A Saudi-Iranian rapprochement is a master key to defuse conflicts in the region,** namely in Iraq, Syria, Yemen, Lebanon and Bahrain." Nader said that strained Saudi-Iranian ties were going through "detente" that could lead to the beginning of a rapprochement. "For now, [the] dÃ©tente is based on a single subject, which is a common threat posed by ISIS. **Both countries are facing the Daesh threat.** This is why the **confrontation by their proxies in the region has calmed down.**" he said. **Signs of a thaw in strained Saudi-Iranian relations emerged last month** when **Iran's Deputy Foreign Minister** Hossein Amir Abdollahian **held an ice-breaking meeting with Saudi Foreign Minister** Prince Saud al-Faisal in the Saudi city Jeddah. Abdollahian described the **talks**, which also **covered** the **ISIS** threat, as "positive and constructive." "**Both sides emphasized the need to open a new page of political relations** between the two countries," he said after meeting Prince Saud. Abdollahian is expected to visit Beirut next week as part of a tour that will also take him to Syria to brief officials in both countries on the new climate of understanding between Saudi Arabia and Iran, a political source told The Daily Star. Prince Saud has said he had invited his Iranian counterpart Mohammad Javad Zarif to visit Saudi Arabia and was awaiting a reply. He said Iran is a neighboring country which can contribute to stability in the region. Zarif said he was ready to visit Saudi Arabia and welcome Prince Saud in Tehran. Speaking at a news conference in Tehran Aug. 31, Zarif, commenting on Abdollahian's talks in Jeddah, said: "Iran is always eager to establish good relations with neighboring states and Saudi Arabia is the most important of these states. It is an important country at the Islamic world level and enjoys a wide role and influence." He said Iran and Saudi Arabia have "common interests and are facing common threats. "Extremism, violence and terrorism are the most important dangers facing the Islamic world," he added. Since he was elected as Iran's president last year, Hassan **Rouhani has said he would make it a top priority to mend frayed relations** with Saudi Arabia. The imminent dÃ©tente between Riyadh and Tehran comes as U.S. President Barack Obama, with his NATO allies, is struggling to establish an international coalition to confront the ISIS threat. The United States said Friday that it was forming a "core coalition" to battle ISIS militants in Iraq. Obama sought to use a NATO summit in Wales to enlist allied support in fighting the Islamist militants, but it is unclear how many nations might join the United States in the battle. **A Saudi-Iranian rapprochement would have ramifications across the Middle East, potentially cooling political and military struggles in Syria, Iraq, Lebanon, Bahrain and Yemen.** Saudi Arabia has long been suspicious of Iran's influence in the region. Riyadh and other Gulf states have also been apprehensive of Tehran's nuclear ambitions. Saudi-Iranian relations have been further strained by policy differences, particularly over the war in Syria, where the two countries support opposing sides. Saudi Arabia and its Gulf neighbors back rebels fighting to topple President Bashar Assad's government, which is supported by Tehran. In Lebanon, Saudi Arabia and Iran also support opposing sides. While Saudi Arabia backs the Future Movement-led March 14 coalition, Iran supports the Hezbollah-led March 8 alliance. Speaker Nabih Berri and rival Lebanese politicians have said that improved Iranian-Saudi relations would result in breakthroughs in Lebanon and the conflicts in Syria and Iraq. Berri expressed hope that **renewal of talks between Saudi Arabia and Iran would ward off terrorism threats facing the region.** "I am counting on the Saudi-Iranian meeting to fight off the danger facing the region," Berri was quoted as saying by lawmakers last week. Shafik Masri, a professor of international law at the Lebanese University and the American University of Beirut, agreed that a Saudi-Iranian dÃ©tente is pivotal to confronting the ISIS threat. "A Saudi-Iranian **rapprochement has not materialized yet. But there are intentions driven by an understanding** between Saudi Arabia and Iran," Masri told The Daily Star. "**The Saudi-Iranian understanding is seeking to address** the region's problems, beginning with the **ISIS** threat."

1NC Russia Relations

ISIS threat isn't existential—but protracted fight rebuilds US-Russia relations—overwhelms Ukraine

Naumkin and Kramer 14 Mark Kramer, Professor, Director of the Cold War Studies Program at Harvard's Davis Center for Russian and Eurasian Studies, Vitaly Naumkin, director of the Institute of Oriental Studies at the Russian Academy of Sciences (RAS), editor-in-chief of Vostok (ORIENS) journal, member of the Science Council at the Russian Foreign Ministry and the Russian Security Council, "Will the ISIS threat help to reset US-Russia anti-terrorism cooperation?" Aug 19, 2014, <http://www.russia-direct.org/debates/will-isis-threat-help-reset-us-russia-anti-terrorism-cooperation>

The new round of limited airstrikes carried out by the U.S. against the Islamic State of Iraq and Greater Syria (ISIS) indicates that U.S. President Barack Obama is very concerned about the increasingly unstable situation in northern Iraq. Likewise, UK Prime Minister David Cameron makes no bones about his readiness and resolve to provide diplomatic and military aid to help prevent ISIS – which he called a "monstrous organization" - from expanding further. Even though both Obama and Cameron are hesitant about putting boots on the ground and sending their troops, they may use "all the assets we have – our diplomacy, our political relationships, our aid, the military prowess and expertise we have to help others," as Cameron told BBC1's Breakfast program on Monday. Likewise, Russia is still trying to figure out what to do about the potential threat that ISIS and religious radicalism pose for the region. On July 22, Russia's Foreign Ministry expressed concerns about ISIS persecuting and oppressing representatives of religious minorities, including Christians, forcing them to flee the country. It regarded "such aggressive and systematic actions" as "absolutely unacceptable and criminal." ISIS has become a sort of bogeyman for a reason. Its religious fanaticism, severe discipline and brutality can overshadow even Al-Qaeda's. Its military advance and expanding turf in Iraq is become more obvious, even though its ambitions to establish a caliphate throughout the Middle East and Europe looks like an exaggeration and a surreal fantasy. In July, Russia's Foreign Ministry called all the world's stakeholders to do "their utmost" to prevent the ethnic and religious hatred that may have very grave implications for the world. Yet this call seems to be futile. On one hand, there is the increasing confrontation between Russia and the West over Ukraine and lingering distrust toward the Kremlin, and on the other hand, skepticism about the true scale of the ISIS threat. Indeed, naysayers would posit that the ISIS threat is highly exaggerated. Does ISIS really pose a threat to Russia and the U.S.? Can this Islamic organization really succeed in expanding its influence globally? Should the world really take seriously the declarations from ISIS about their geopolitical ambitions and a global caliphate? "ISIS is surely a major problem for Iraq, and its tactics and strategy are abhorrent, such as its use of crucifixions and its genocidal attacks on the small Yazidi minority," reads CNN's website. "But that doesn't mean it is a serious threat to the American homeland." Yet some experts admit that despite the looming threat from ISIS, so far it is not included in Russia's international agenda. Jack Goldstone, political expert and professor at George Mason University, argues that Russia might not be interested in dealing with ISIS as much as NATO and the Persian Gulf countries are. "While ISIS is both a threat to Russian interests and to Russian clients (Bashar Assad in Syria), Ukraine is far more important to Russia," he said. "So I do not expect Russia to change its behavior. It will focus on Ukraine first, and the Middle East second." Most importantly, the sanctions war between Russia and the West triggered by the Ukrainian crisis might put at stake Russian-American counter-terrorism cooperation. "Putting Russian security chiefs on the EU sanctions list formalizes the end of anti-terrorist cooperation between Russia and the West," wrote Carnegie Moscow Center's Dmitri Trenin in his Facebook post on July 22. Nevertheless, the looming threat of ISIS and international terrorism for Russia, the U.S., and Europe seems like it has the potential to bring them closer together and forget about (or at least ignore) their differences over Ukraine. Although such a scenario is unlikely (at least while ISIS doesn't pose a more serious existential threat for all stakeholders), the question of how to minimize Russia-West confrontation over Ukraine to deal with ISIS together remains open. Russia Direct interviewed experts to find out if ISIS poses a real threat for Washington and Moscow and if they can overcome their differences over Ukraine and find ways to collaborate despite the beginnings of a new Cold War? Mark Kramer, Professor, Director of the Cold War Studies Program at Harvard's Davis Center for Russian and Eurasian Studies Despite severe tensions over Ukraine, the United States and Russia still have important common interests, which they can pursue cooperatively. In particular, the two countries have a lot to gain by working together on some counter-terrorism issues, including efforts to neutralize the Islamic State (formerly known as ISIS). Because of glaring blunders committed by the Obama administration in its dealings with Iraq, the brutal terrorists in the Islamic State were able to gain a foothold and spread their influence. Obama's weak and indecisive response to the disaster in Syria has further strengthened the

Islamic State and other radical Islamist terrorists who are using Syria as a training ground. Russia has not made as many foolish blunders, but it has not done enough to try to combat the Islamic State. U.S.-Russian cooperation against the Islamic State might inspire other countries to do more, including counter-terrorism offensives that would take the fight to ISIS, seeking to destroy it. U.S.-Russian cooperation [in the region] might prove difficult in some respects – the Russian authorities will want to solidify Bashar al-Assad's regime, whereas the United States has sought to replace Assad – but these problems are not so severe that they will stymie cooperation altogether. Cooperation against the Islamic State might have the further important benefit of getting U.S. and Russian officials to begin to ease the confrontational stance they have taken against each other. Tensions will persist for a long while to come, but the shrill rhetoric of recent months has been needlessly antagonistic. **Cooperation against radical Islamic terrorists might help to turn things around** at least a bit. Vitaly Naumkin, director of the Institute of Oriental Studies at the Russian Academy of Sciences (RAS), editor-in-chief of Vostok (ORIENS) journal, member of the Science Council at the Russian Foreign Ministry and the Russian Security Council No doubt, putting Russian security chiefs on the EU sanctions list further complicates Russia – West counter-terrorist **cooperation, but cannot completely destroy it given the size of the threat emanating from terrorism and religious extremism for both sides.** One example: According to Guido Steinberg from Stiftung Wissenschaft und Politik, Chechen jihadist fighters in Syria “represent a domestic security problem for Europe and Turkey” because many of them come from the diaspora – Georgia, Turkey, and “dozens from Austria and France and rather fewer from Belgium, Scandinavia and Germany.” What will be their agenda when they come back home and who are they going to fight against? Without meaningful cooperation, we’ll be not able to deter this threat. Another example: ISIS leaders declare that they will be killing Americans everywhere in the world. Doesn’t the U.S. need cooperation with all partners including Russia to obstruct terrorists from inflicting damage to U.S. citizens inside and outside the U.S.? Russia, in turn, also needs international support in its struggle against terrorism and extremism. I do believe that we can overcome our disagreements over the Ukrainian crisis however serious they are and at least preserve what is left from the cooperation between Russia and the West **in the field of security, which is becoming more and more indispensable** for them in this era of hyper-globalization.

Relations prevent nuclear war—93% of the world’s arsenals

Shukla 5/21/15 Vikas is a reporter and value investor. He has an MBA in finance and a deep interest in tech, science and politics. **“How Russia And The US Can Avert A Nuclear War,”** <http://www.valuwalk.com/2015/04/russia-us-can-avert-a-nuclear-war/>

While Russia and the U.S. agreed in 2010 to reduce their nuclear arsenal to about 1,500 warheads each, the two countries are aggressively upgrading their nuclear weapons. **The U.S. and Russia together have 93% of the world's nuclear stockpile.** Ukraine crisis has brought down the relations between Moscow and Washington to historic lows. Russia US Russia and the U.S. still practice Cold War-era nuclear doctrine In a column published in The The New York Times Company (NYSE:NYT), the former US Marine Corps General James E. Cartwright and former Russian Major General Vladimir Dvorkin said that a nuclear war was a serious and real threat. They believe that rising tensions between the two countries, modern technologies, and Cold War-era nuclear doctrines all point to the possibility of a nuclear war. Last month, reports surfaced that Russian President Vladimir Putin had put nuclear warheads on alert during the Crimea crisis last year. Cartwright and Dvorkin say that the Cold War-era nuclear doctrine is still practiced by the U.S. and Russia. It dictates three strategic options: first strike, post-attack retaliation and **launch on warning**. Of them, launch on warning is the riskiest scenario. Under this strategy, a country fires its nuclear missiles upon detecting the launch of enemy rockets. It relies on ground radar and early-warning satellites for information about the launch of enemy missiles. Russia and U.S. should eliminate launch on warning from their strategies Strategic missiles have a flight time of about 15-30 minutes, so the target country has only a few minutes to decide whether to launch after detection of an apparent attack. Due to the emergence of cyber-warfare, there is a significantly high potential for false alerts from early warning systems. So, there is a likelihood of error and the opportunities for ill-considered decisions are quite real. Cartwright and Dvorkin said that the presidents of Russia and the United States should discuss and eliminate the launch on warning option from their nuclear strategies. The two countries should restart military-to-military talks, which were suspended due to the Ukraine crisis, "to pursue this stand-down as an urgent priority." A joint decision on this will not affect either country's nuclear deterrence, they said. **Once the Russia-U.S. relations are restored, they can explore detailed verification measures.**

1NC Assad Tradeoff

Eliminating ISIS causes Assad fill-in—reestablishes his power

CNN 9/24/14 “Obama's Syria dilemma: Does hurting ISIS help al-Assad?”

<http://edition.cnn.com/2014/09/24/world/meast/syria-isis-airstrikes-assad/index.html>

The United States has inflicted damage on one enemy in Syria with the airstrikes it launched against ISIS. But it may also be helping another foe: the regime of President Bashar al-Assad. Rewind a year, and it was al-Assad's forces, not Islamic militants, against which President Barack Obama was weighing military action. Those strikes never happened, due in large part to a timely diplomatic intervention from Russia. Now, warplanes from the U.S. and Arab nations are pummeling the stronghold of ISIS, a group that has gained global notoriety for its brutal tactics and ruthless treatment of people who don't follow its extremist version of Islam. But ISIS, which controls broad areas of northern Syria and Iraq, has also been racking up military victories against al-Assad's troops. The Syrian regime may end up as "the real winner" from the expanded campaign against ISIS, said CNN Political Commentator Peter Beinart. First tweet of the Syrian airstrikes First tweet of the Syrian airstrikes 01:08 PLAY VIDEO Who is Khorasan? Who is Khorasan? 03:02 PLAY VIDEO Iraqi PM: Happy Arab nations joined U.S. Iraqi PM: Happy Arab nations joined U.S. 01:09 PLAY VIDEO The potential benefits to al-Assad from the airstrikes "may be the most dangerous and morally troubling consequence of President Obama's decision to cross the Syrian border to fight the Islamic State," The New York Times warned in an editorial Tuesday. To try to prevent that, the Obama administration has to delicately navigate this minefield. Here are the challenges it faces: 1. Distance itself from al-Assad The White House has been at pains to stress that the airstrikes took place without any cooperation with al-Assad's government, which has been fighting against rebel groups for more than three years in a vicious conflict that has killed around 200,000 people. "I want to be very clear ... that we did not coordinate with them, we did not provide them advance notice of the timing or of targets that the U.S. was going to strike. In fact, we warned them to not pose a threat to our aircraft," Ben Rhodes, Obama's deputy national security adviser for strategic communications said Tuesday. The only contact, he said, was U.S. Ambassador to the United Nations Samantha Power telling her Syrian counterpart that direct action was to be taken. U.S. officials are also playing down the advantages of the airstrikes to the Syrian regime, although not very convincingly. Map: Airstrikes in Syria EXPAND IMAGE "I wouldn't characterize the effects we had last night as benefiting Assad," said Lt. Gen. William Mayville, director of operations for the Joint Chiefs of Staff. 2. Quickly bolster moderate rebels The big question is that if the airstrikes weaken ISIS' grip on northern Syria, who will step in and take that territory. In his address Tuesday, Obama emphasized intensified U.S. efforts to train and equip more moderate Syrian rebels as "the best counterweight" to both ISIS and al-Assad. But many analysts are skeptical that the rebels will be in a position to make major inroads anytime soon. Congress only approved Obama's request to arm and train "appropriately vetted" rebel groups last week. U.S., Arab nations attack ISIS in Syria 13 photos 01 isis airstrikes 092502 isis airstrikes 092505 isis airstrikes 03 isis airstrikes 092507 Syria attack obama 092302 syria attack 092303 syria attack 092305 syria attack 092304 syria attack 092301 syria attack 092306 syria attack 10 syria attack 092311 syria attack 0914 EXPAND GALLERY What life is like inside ISIS stronghold What life is like inside ISIS stronghold 02:40 PLAY VIDEO What weapons are U.S. using? What weapons are U.S. using? 01:23 PLAY VIDEO Pentagon: ISIS fight will take years Pentagon: ISIS fight will take years 04:23 PLAY VIDEO Turning those groups into a force that can take on ISIS' feared fighters and al-Assad's military will take time. But the strikes against ISIS are happening now. 3. Manage a fragmented opposition Experts say that the rebels fighting for the Western-backed Free Syrian Army (FSA) lack a unified leadership. "Syria is a fragmented country, and most of these militias have a very town-centric quality. They're based on clan structures and regional structures," Joshua Landis, director of the Center for Middle East Studies at the University of Oklahoma, said in an interview with WBEZ earlier this month. "None of them have really developed a national scope, except for the Islamist ones, like al Qaeda and ISIS," he said. The sheer number of different militias across Syria -- estimated in the hundreds -- runs the risk of turning Syria into a patchwork of warlord fiefdoms. "If you just give them money without unifying them, you're going to get Somalia," said Landis. 4. Juggle unaligned objectives Keeping the rebels on board with American military objectives is also fraught with difficulty. The initial reaction from Syrian activists to the airstrikes Tuesday was a sense of relief that the U.S. had taken action against ISIS, CNN's Arwa Damon reported. But that was before it emerged that the strikes had also hit members of the al-Nusra Front, a terrorist organization that was nonetheless among the rebel groups resisting ISIS. That news, along with reports of civilian casualties, soured the mood among the activists, Damon reported, with apprehension growing on the ground about what intentions of the U.S. and its allies have for Syria. The focus on defeating ISIS may also be hard to stomach for many rebels. "We have to remember, the FSA wants to destroy Assad, not ISIS," Landis said. "They will destroy ISIS if America makes it contingent -- they don't like ISIS. But their goal, from the beginning, has been to fulfill this revolution. If their only object is to kill ISIS, many of them feel the revolution will be dead."

Fall of Assad is coming in the squo—that destroys Hezbollah power projection and influence

Yacoubian 11 “Hezbollah After Assad,” Aug 20, 2014, Mona Yacoubian serves as Deputy Assistant Administrator for the Middle East Bureau

<https://www.foreignaffairs.com/articles/middle-east/2011-12-01/hezbollah-after-assad>

Hezbollah faces a moment of reckoning. The increasingly likely demise of Bashar al-Assad’s regime in Damascus would deprive the militant Lebanese Shia organization of one of its main patrons and could constrain its ability to play an active role in regional politics. Moreover, by offering up unbridled support for Syria, Hezbollah has placed itself at odds with the popular revolts that are unseating autocratic rulers across the Arab world, undermining the narratives of resistance and justice for the oppressed that it has long espoused. Facing the loss of a key ally and with its credibility compromised, an off-balance Hezbollah could turn inward, deepening its involvement in Lebanese politics in order to consolidate its power. Together with Iran, Hezbollah stands to lose the most from the fall of the Syrian regime. Over the years, the organization and the Assad regime have nurtured strong ties due to their often overlapping interests in Lebanon, a proxy arena for Western confrontation with Iran and Syria. The relationship deepened following Syria’s 2005 withdrawal from Lebanon, which forced Damascus to rely more heavily on Hezbollah to extend its influence in the country. Assad has reportedly supplied Hezbollah with training and access to sophisticated weapons systems, including long-range Scud missiles, on Syrian soil. Beyond its bilateral ties to Hezbollah, Damascus has also served as an important conduit for Iranian arms and played a bridging role between the Persian power and its Lebanese acolytes. Bound together by their shared hostility toward Israel, these three allies, together with Hamas, have formed a so-called axis of resistance to serve as a counterweight to more moderate forces in the region. Although Hezbollah’s relationship with Iran would endure without Assad, the alliance would lose an important center of gravity. Moreover, the instability in Syria has deepened sectarian divisions in Lebanon, which could further challenge Hezbollah. Lebanon’s Sunnis overwhelmingly support the Syrian opposition and have publicly demonstrated their outrage at Damascus’ repression; the ruling March 8 bloc, comprising Hezbollah, the Shia party Amal, and their Christian allies, has sided with Assad. Rival pro- and anti-Syrian rallies regularly occur in Beirut and in the northern city of Tripoli, where Sunni-Alawi clashes in June left several dead and required the Lebanese army to quell the violence. Although Hezbollah’s military predominance in Lebanon minimizes the prospects for renewed civil war, a surge in sectarian violence would significantly undermine its position. Hezbollah’s steadfast support for Assad has already dealt its credibility a severe blow, in Lebanon and across the region. Its pro-regime declarations stand in marked contrast to the group’s boisterous encouragement of every other popular uprising during the Arab Spring. Hassan Nasrallah, Hezbollah’s charismatic leader, was once a hero across the Arab world but now appears increasingly tone deaf as he struggles to defend Damascus against a growing chorus of Arab and Muslim condemnation. Established media outlets, such as al Jazeera, as well as Arab youth using social media sites, charge Nasrallah with hypocrisy and double standards. The revolt against Assad has put Iran and Hezbollah on the wrong side of Arab history, and has compromised their mantle as champions of the oppressed. No matter what happens in Syria, Hezbollah will retain its preeminent military and political role in Lebanon. But the likely end of the Assad regime poses an existential dilemma for the organization, accentuating the divide between its regional objectives of resisting the West and Israel and its local role in Lebanon as the representative of a once marginalized Shia community. The organization may need to recalibrate its priorities, choosing either to double down on its military objectives or evolve into a wholly political force and further develop as a grassroots movement with a vast political and social network. If Hezbollah goes with the first option, it would likely move quickly to consolidate its control over Lebanon, possibly using military force. Such a move might be precipitated by emboldened Sunni aggression toward Hezbollah or by other circumstances that threaten the organization and its weapons. But Hezbollah’s probable triumph in an armed struggle would be a pyrrhic victory, dramatically undermining its popular credibility in Lebanon and leaving the country highly unstable. Hezbollah might also choose to direct its militancy toward Israel. This could come as part of a broader struggle between Israel and Iran or as a result of escalating tensions between Israel and Hezbollah. Hezbollah is not likely to intentionally provoke another war with Israel; both sides have acknowledged that a third Israel-Lebanon war would be far more brutal, and encompass far more territory, than the one in 2006. But if either Israel or Hezbollah miscalculated and provoked a conflict, Hezbollah would be at a strategic disadvantage without a Syrian supply line and safe haven. War with Israel could rejuvenate Hezbollah’s resistance narrative, particularly if Israel used excessive force that produced massive civilian casualties. But Hezbollah would pay a significant price internally, particularly with its war-weary Shia constituency.

AT Hurts Privacy

The program itself is incredibly reasonable and has built in safeguards to prevent widespread paranoia and civil liberties violations

USDA, 2014, (“USDA Insider Threat Program,” Office of Homeland Security and Emergency Coordination (OHSEC), U.S. DEPARTMENT OF AGRICULTURE, June 30, 2014, [//erg](http://www.ocio.usda.gov/sites/default/files/docs/2012/DR%204600-003%20Insider%20Threat.htm)

The purpose of this directive is to set forth the U.S. Department of Agriculture’s (USDA) roles and responsibilities for an Insider Threat Program, as directed by Executive Order (EO) 13587 dated October 7, 2011, titled, Structural Reforms to Improve the Security of Classified Networks and Responsible Sharing and Safeguarding of Classified Information and the National Insider Threat Policy and the Minimum Standards issued in November 2012. 2.

BACKGROUND The Secretary of Agriculture, under EO 13587, is mandated to develop and implement an Insider Threat Program with the primary mission to prevent, deter and detect compromises of classified information by malicious insiders. Although **EO 13587 applies only to the safeguarding and sharing of classified national security information**, the National Insider Threat Task Force (NITTF) recognizes that an agency may possess information that it considers sensitive but that is not classified. As stated in the NITTF’s Guide to Accompany the National Insider Threat Policy and Minimum Standards, issued in November 2013, the policies and standards under EO 13587 can be applied generally to protect the sensitive but unclassified environment. The National Insider Threat Policy and Minimum Standards require that the USDA addresses key components to be implemented: a. Establish a program for deterring, detecting, and mitigating insider threat; security, information assurance, and other relevant functions and resources to identify and counter the insider threat; b. Establish an integrated capability to monitor and audit information for insider threat detection and mitigation.

Critical program requirements include but are not limited to: (1) monitoring user activity on classified computer networks controlled by the Federal Government; (2) evaluation of personnel security information; (3) employee awareness training of the insider threat and employees' reporting responsibilities; and (4) gathering information for a centralized analysis, reporting, and response capability. c. Develop and implement sharing policies and procedures whereby the organization's insider threat program accesses, shares, and integrates information and data derived from offices across the organization, including security, information assurance, and human resources offices. d. Designate a senior official(s) with authority to provide management, accountability, and oversight of the organization's insider threat program and make resource recommendations to the appropriate agency official. e. **Consult with records management, legal counsel, and civil liberties** and privacy **officials to ensure any legal, privacy, civil rights**, or civil liberties issues (including use of personally identifiable information) are appropriately addressed. f. Promulgate additional department and agency guidance, if needed, to reflect unique mission requirements, but not inhibit meeting the minimum standards issued by the NITTF pursuant to this policy. g. Perform self-assessments of compliance with insider threat policies and standards; the results of which shall be reported to the Senior Information Sharing and Safeguarding Steering Committee (hereinafter Steering Committee). h. Enable independent assessments, in accordance with Section 2.1 (d) of Executive Order 13587, of compliance with established insider threat policy and standards by providing information and access to personnel of the NITTF.

They exaggerate—the program itself protects liberties

FAS No Date, (“National Insider Threat Policy,” [//erg](http://www.fas.org/sgp/obama/insider.pdf)

Executive Order 13587 directs United States Government executive branch departments and agencies (departments and agencies) to establish, implement, monitor, and report on the effectiveness of insider threat programs to protect classified national security information (as defined

in Executive Order 13526; hereinafter classified information), and requires the development of an executive branch program for the deterrence, detection, and mitigation of insider threats, including the safeguarding of classified information from exploitation, compromise, or other unauthorized disclosure. Executive Order 12968 promulgates classified information access eligibility policy and establishes a uniform Federal personnel security program for employees considered for initial or continued access to classified information. Consistent with Executive Orders 13587 and 12968, this policy is applicable to all executive branch departments and agencies with access to classified information, or that operate or access classified computer networks; **all employees with access to classified information, including classified computer networks** (and including contractors and others who access classified information, or operate or access classified computer networks controlled by the federal government); and all classified information on those networks. **This policy leverages existing federal laws, statutes, authorities, policies, programs, systems, architectures and resources in order to counter the threat of those insiders who may use their authorized access to compromise classified information.** Insider threat programs shall employ **risk management principles, tailored to meet the distinct needs, mission, and systems of individual agencies, and shall include appropriate protections for privacy, civil rights, and civil liberties.**

The Insider Threat Program has checks built into it to balance b/w preserving civil liberties and national security—protects whistleblowers, privacy and rights

NCSC, '14, ("National Insider Threat Task Force Mission Fact Sheet," NCSC, Aug 15, 2014, http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf)/erg

Is this insider threat emphasis going to infringe on anyone's civil rights? **Insider threat programs are developed and operated in coordination with** an agency's records management office, legal counsel, and **civil liberties and privacy officials to build in protections against infringing upon employees' civil liberties/civil rights, privacy or whistleblower protections.** Departments and agencies are **required to provide training in these areas to program personnel, as well as the general workforce.** Department and agency heads also have a responsibility to ensure these protections are maintained through oversight of their insider threat programs. **Insider threat programs target anomalous activities, not individuals.** Additionally, government employees who handle classified information understand that, **to hold a security clearance, they accept additional oversight of their workplace activities.** **Employees sign authorizations for the conduct of investigations** to obtain and retain security clearances and there are warning banners on computers and **in certain areas of facilities that alert people that they have less expectation of privacy.** What harm can someone do to our government based on the unauthorized release of classified information? When classified information is divulged in an unauthorized manner outside the confines of the U.S. Government (USG) national security structure, **that information can create situations that are harmful to U.S. interests and, in some cases, could be life-threatening.** Classified information in the wrong hands **can provide a unique and potentially dangerous advantage to those states and non-state actors whose interests are opposed to those of the United States.** For example, the unauthorized release of classified information **could: provide details about weapons systems we rely on to defend our country; expose our overseas intelligence operations and personnel; and identify critical vulnerabilities in the U.S. national infrastructure which, if exploited, could damage internal U.S. defense, transportation, health, financial, and/or communications capabilities.**

The Insider Threat programs protects employees' best interests

NCSC, '14, ("National Insider Threat Task Force Mission Fact Sheet," NCSC, Aug 15, 2014, http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf)/erg

Do all insider threats involve malicious individuals? It is critically important to recognize that an individual may have no malicious intent, but is in need of help. We have invested a tremendous amount in our national security workforce and it is in everyone's best interests to help someone who may wrongly feel he or she has no other option than to commit an egregious act – such as espionage, unauthorized disclosure, suicide, workplace violence, or sabotage. Intervention prior to the act can save an employee's career, save lives and protect national security information. There are also unwitting insiders who can be exploited by others. Our adversaries have become increasingly sophisticated in targeting U.S. interests, and an individual may be deceived into advancing our adversaries' objectives without knowingly doing so. Is every agency required to implement the new minimum standards? Yes, taken together, the E.O. and the national policy mandate that every executive branch agency with access to classified information establish an insider threat program in line with standards and guidance from the NITTF. However, there is a recognition of differing levels of risk—and, therefore, differing levels of protection required—based on such things as size of cleared population, extent of access to classified computer systems, and amount of classified information maintained by the D/A. The national insider threat policy directs heads of D/As to develop their programs using risk management principles. The NITTF is working with D/As, as well as the Classified Information Sharing and Safeguarding Office in the office of the Program Manager--Information Sharing Executive, to assess the extent of applicability of the minimum standards to each of the 70+ executive branch D/As with access to classified information based on associated risk.

Observation and behavioral analysis don't produce modern day Salem

Winkler and Manke, '14, (Ira, Irari Report, Secure Mentem, Internet Security Advisors Group and Samantha, Executive Vice President of Secure Mentem, "How to create awareness of the insider threat," CSO, Apr 15, 2014, <http://www.csoonline.com/article/2142603/security-leadership/how-to-create-awareness-of-the-insider-threat.html>)//erg

You must however avoid manifesting a modern day Salem. The focus of your guidance should be telling employees to look for behaviors that are clear violations of policies and procedures. Examples include observing people looking through other people's desks, asking for passwords, being in areas that they do not belong, and attempting to access other people's computer accounts. There are also financial and other wrongdoings related to job roles and industry sector. A more delicate, but just as important, aspect of awareness is for people to be comfortable reporting uncomfortable feelings. This is admittedly vague, but uncomfortable feelings have resulted in catching malicious insiders in a variety of incidents. In one case we are personally familiar with, an employee felt uncomfortable that one of her coworkers was speaking Chinese a lot on the telephone at work, and they did not work with any Chinese people. The woman reported the incident and an FBI investigation uncovered that the employee in question was funneling information to Chinese intelligence operatives. Everyone violates policies and procedures at some point in time, without malicious intent. However, people need to know that some of the most harmful incidents were stopped because of observant employees. Again though, the focus is on reporting of incidents, and not of the individuals committing the violations. This is important for a wide variety of reasons. The action that employees need to take is to simply report the questionable incidents to Human Resources, their management or the security team. However, you need to remember to allow for anonymous reporting and have strong measures in place to protect the identity of the employee reporting the incident. Reporting another employee can clearly result in negative consequences for all involved. The anonymity is critical even if it potentially means that it is impossible to gather criminal evidence. The goal is to detect incidents and stop the loss. Most organizations should already have an established incident reporting structure. Those that do not should consult with the legal and human resources departments to create one. Clearly, when trying to motivate employees to inform the organization about the violations of other employees, you should get the Human Resources and Legal departments involved in at least approving the awareness materials that are distributed. They very likely will be able to provide guidance on how to best implement other aspects of the program as well. [Insider threats and how they can be mitigated] Snowden's activities triggered an interest in organizations to examine what technological controls that they can put in place to stop their own Snowden. Yet much like NSA realized that Snowden's coworkers should have detected his crimes, all organizations must proactively strengthen their non-technical security measures, including especially awareness. Snowden's coworkers

should have been able to more effectively detect his actions than any technical countermeasure could have. Therefore, **companies that are truly interested in preventing the insider threat should focus on making their employees the primary detectors of insider abuse.** The insider threat is too important a subject to shy away from, no matter how sensitive the implications may be. Unfortunately, **history has shown us that the risk is too great.**

Agencies are focusing on collecting electronic data—no “workplace” impact/overwhelmed filers

Davenport, ’14, (Christian, has served as an editor on the Metro desk and as a reporter covering military affairs, Post author, “Federal agencies embrace new technology and strategies to find the enemy within,” Washington Post, March 7, 2014,

http://www.washingtonpost.com/business/economy/federal-agencies-embrace-new-technology-and-strategies-to-find-the-enemy-within/2014/03/07/22ce335e-9d87-11e3-9ba6-800d1192d08b_story.html)//erg

After years of focusing on outside threats, **the federal government and its contractors are turning inward, aiming a range of new technologies and counterintelligence strategies at their own employees to root out spies, terrorists or leakers. Agencies are now monitoring their computer networks with unprecedented scrutiny,** in some cases down to the keystroke, and **tracking employee behavior for signs of deviation from routine.** At the Pentagon, new rules are being written requiring contractors to institute programs against “insider threats,” a remarkable cultural change in which even workers with the highest security clearances face increased surveillance. The “if you see something, say something” mind-set of the post-9/11 world has fully arrived in the workplace, with new urgency following high-profile leaks such as the revelations of former National Security Agency contractor Edward Snowden. “People’s sensitivity to this has changed substantially,” said Lynn Dugle, president of a Raytheon business unit that markets an insider threat detection system called SureView. “I can tell you five years ago, when we were talking to agencies or companies about insider threat, we would normally be talking to (chief information officers) who were under budget stress. . . . And that was a very tough sell. Now we see boards of directors and CEOs really understanding what the threat can mean to them, and the risk it poses to them.” **In response to the breach by former Army intelligence analyst Pfc. Bradley Manning, President Obama in 2011 issued an executive order that established a National Insider Threat Task Force** and required all federal agencies that handle classified material to institute programs designed to seek out saboteurs and spies. While corporate security has long been part of Beltway culture, the heightened focus and the emergence of new monitoring technology touched off a burgeoning industry. In addition to Raytheon, Lockheed Martin has developed an insider-threat detection service, as have several start-ups in the Washington area. Even Booz Allen Hamilton, which faced national embarrassment when Snowden, one of its employees, walked off with some of the country’s most guarded secrets, counsels its clients on how to detect rogue employees. A recent job posting said the company was looking for an “insider threat analyst,” which required a security clearance and more than five years of experience in counterintelligence. The posting spread on the Web and sparked ridicule over the notion that the company that employed Snowden was now looking to help turn the historic breach into a profitable lesson learned. Raytheon’s SureView program allows agencies to create all sorts of internal alerts indicating when something may be amiss. A company could, for example, program the software to detect whenever a file containing the words “top secret” or “proprietary” is downloaded, e-mailed or moved from one location on the system to another. **Once that wire is tripped, an alert almost immediately pops up on a security analyst’s monitor, along with a digital recording of the employee’s screen.** All the employee’s actions — the cursor scrolling over to open the secure file, the file being copied and renamed — can be watched and replayed, even in slow motion. It’s the cyber equivalent of the security camera that records robbers sticking up a convenience store. Lockheed Martin provides a service called Wisdom, which acts as “your eyes and ears on the Web,” according to a company official. At its broadest use, **the service can monitor mountains of data on the Web** — Facebook, Twitter, news sites or blogs — **to help predict everything** from a foreign coup or riot to political elections. But **it can also be turned inward, at employees’ online habits, to predict who within the organization might go rogue.** Counterintelligence officials **use Wisdom to “evaluate employee behavior patterns, flagging individuals who exhibit high risk characteristics.”** the company says in a brochure. **“I like to think of it as a digital intuition that is being developed.”** said Jason O’Connor, Lockheed’s vice president for analysis and mission solutions. A trade-off for companies The market is much broader than the defense and intelligence industries. It extends to hospitals, which need to protect patients’ information; retailers, which hold customers’ credit card numbers; and financial institutions. Some worry that the programs are an overreaction to a relatively rare threat that will do more to hinder the free flow of information than to deter crime, while creating repressive working environments. Despite the soon-to-come federal mandate, many defense contractors have “already

implemented fairly imposing controls to minimize the unauthorized use of data,” said Loren Thompson, a defense industry consultant who has worked with Lockheed Martin and other contractors. But he warned that this “clearly is a trade-off in which values like efficiency and collaboration will be sacrificed in order to reduce the likelihood of internal wrongdoers from succeeding.” After Sept. 11, many agencies were criticized for not sharing sensitive information that could have prevented the attacks, so steps were taken to consolidate data within the government. Thompson fears the current climate of worry about Snowden-like leaks could lead to a return to the old habits, with key information once again compartmentalized. “Insider threats are a real problem, but mandating a particular standard for all contractors will cost huge amounts of money and quite possibly result in the wrong steps being taken,” he said. In addition to the cases that have made headlines worldwide, there are an untold number of incidents in the broader corporate world where insiders wreak havoc — from the systems administrator at what was then UBS Paine Webber who planted a “logic bomb” on the company’s network, to the Chinese national who was convicted of stealing trade secrets from Ford Motor Co.

Tech systems protect against privacy violations while monitoring sensitive databases

Davenport, '14, (Christian, has served as an editor on the Metro desk and as a reporter covering military affairs, Post author, “Federal agencies embrace new technology and strategies to find the enemy within,” Washington Post, March 7, 2014, http://www.washingtonpost.com/business/economy/federal-agencies-embrace-new-technology-and-strategies-to-find-the-enemy-within/2014/03/07/22ce335e-9d87-11e3-9ba6-800d1192d08b_story.html)//erg

‘Looking at the patterns’ Chris Kauffman, the founder and chief executive of Personam, a McLean company that focuses entirely on insider threats, said programs can “assess insider threatening behaviors without breaching the employee’s privacy.” “There’s always the concern of the Orwellian overseers watching everything we’re doing. But we’re very sensitive to that.” he said. “We evaluate the activities and the transactions over the networks. Which Web sites they go to, which file servers they go to. But what we don’t do is absorb the content of that data. We don’t read e-mails or chats or texts. Or even the content of the Web sites they go to. We’re looking at the patterns they use.” MITRE, a not-for-profit research and development company, did a study in 2009 where it asked some of its own employees to try to access sensitive information on its own network. In addition to assessing the network’s strength, the company wanted to “study evasiveness,” said Deanna Caputo, MITRE’s principal behavioral psychologist. “We wanted to see what good guys gone bad would look like.” Working under a grant from the Defense Advanced Research Projects Agency, the Pentagon’s research arm, Georgia Tech computer scientists have worked to develop software that can detect a rogue employee even before he or she has broken bad. “When a soldier in good mental health becomes homicidal or a government employee abuses access privileges to share classified information, we often wonder why no one saw it coming,” said a Georgia Tech news release. All this corporate scrutiny doesn’t necessarily bother groups that advocate for privacy protections. When it comes to using a government or corporate network, employees often do not have expectations of privacy, especially if they are dealing with classified information, said Ginger McCall, an associate director at the Electronic Privacy Information Center. “I think there is an important distinction between monitoring a person’s personal e-mails and monitoring access to sensitive databases,” she said. And since so much information about ordinary Americans is contained on government and corporate databases, there are benefits to making sure they are protected and under constant surveillance. “We would want to know if someone at the FBI is accessing a database on a person when they shouldn’t be,” she said. Michael Crouse, Raytheon’s director of insider threat strategies, said such programs help agencies “trust but verify.” “We trust our privileged users,” he said. “But what we’re seeing is that you can verify that they are doing the work that is assigned to their role.” It’s sort of like a big factory, he said, “where the foreman is looking down on the factory floor making sure everyone is doing their job.”

Groupthink Advantage

1NC — Groupthink Advantage

No nuclear war

Shukla 15 - Vikas is a reporter and value investor. He has an MBA in finance and a deep interest in tech, science and politics (Vikas, “Russia-US Tension Over Ukraine Won’t Lead To Nuclear War”, [valuewalk.com](http://www.valuewalk.com), May 15, 2015, <http://www.valuewalk.com/2015/05/russia-us-tension-nuclear-war/>) JC

In February, Russia was rated among the most unfavorable countries by Americans in a Gallup poll. Tensions between the U.S. and Russia have escalated over the Ukraine crisis. The United States has accused Russia of backing separatists in eastern Ukraine. But there is **no threat of a nuclear war** between Moscow and Washington, says a senior U.S. State Department official.

In an interview with Russia’s Kommersant newspaper, Rose Gottemoeller, the Under Secretary of State for Arms Control and International Security for the US State Department, said that the White House did not believe the Ukrainian conflict would trigger a nuclear crisis. Though the two countries have different opinions regarding the Ukraine crisis, **neither Russia nor the U.S. desire to use nuclear weapons** to back up their arguments.

Gottemoeller told the Russian newspaper that the two countries have a "**stable relationship**" on nuclear issues. The State Department official added that the two countries have taken a series of steps over the past few decades to reduce their nuclear arsenal. Gottemoeller's statement comes as many other security experts have proclaimed that Russia and the U.S. are heading towards a nuclear war.

Obama resists groupthink

Hughes 14 [Brian Hughes, “Obama warns against 'groupthink' in government,” Washington Examiner, 9/24/14 6:26 PM, pg. <http://tinyurl.com/oq3q6mm>

President Obama at a government transparency meeting at the United Nations General Assembly Wednesday advised fellow world leaders to heed the criticisms of their citizens to **avoid “groupthink”** in government.

“All governments think they’re doing what’s right and don’t like criticism,” Obama said at the Open Government Partnership Event in New York City. “It’s shocking to say that all not criticism from civil society is always fair. **But, as leaders, making our governments more open does mean that as a consequence of that criticism, there’s self-reflection.** It means that questions were asked that might not have otherwise been answered, and that groupthink doesn’t develop inside a government.”

Turn: Political resolve key to deterring Russia

Stephens 14 - Columnist on politics, global affairs and economics @ Financial Times [Philip Stephens, "Europe needs a cold war lesson in deterrence," *Financial Times*, July 24, 2014 5:51 pm, pg. <http://tinyurl.com/nr69amw>

There is nothing to be gained from another cold war, even if it is evident that Vladimir Putin wants to tear up the post-communist settlement in Europe. There are, however, lessons to be rescued from the decades-long confrontation with the Soviet Union. One of them is about **deterrence**. Politicians sedated by hopes of a world organised around international collaboration will have to wake up again to the dynamics of great power rivalry.

Francis Fukuyama was half right in declaring the end of history. Capitalism reigns supreme, but rising states such as China and declining ones such as Russia have found a new political model. Authoritarian capitalism, as the Harvard scholar Michael Ignatieff called it in this summer's Ditchley Foundation annual lecture, presents them with an alternative to liberal democracy. As for a rules-based global system, these states prefer to dine à la carte. They take what they like and reject what is inconvenient.

Europeans have been slow to recognise the world as it is rather than as they imagined. The reaction to Russia's march into Ukraine has made this painfully obvious. The reflex has been to seek to defuse the crisis. On one level this is admirable – war did not solve much in Iraq and Afghanistan. The snag is that **ceding ground** to Mr Putin does not amount to de-escalation. To the contrary, **weakness stokes the Russian president's expansionism.**

The west's priority – and the downing by Russian-backed insurgents of Malaysia Airlines flight MH17 provides an opportunity – should be to recover the concept of **deterrence**. Not the nuclear deterrence of mutually assured destruction but the traditional **understanding that political resolve and a readiness** to deploy force can apply a brake. The mistake many Europeans have made – and, to a lesser degree, Barack Obama's White House has done the same – is to confuse **deterrence with escalation.** I cannot count the times I have heard politicians and policy makers say they must tread carefully for fear of provoking Mr Putin.

Some of these protestations are self-serving – what these people really mean is that they do not want to jeopardise economic relationships. But **there seems** also **to be a genuine misunderstanding about the purpose of deterrence.** Imposing sanctions on Moscow will not of itself persuade Mr Putin to pull out of Ukraine. It might persuade him to think twice before marching his army into other Russian-speaking territories.

To be effective, deterrence has above all to be credible. The potential adversary has to believe that aggression will provoke proportionate retaliation, whether economic or, as a last resort, military. The sanctions imposed on Moscow by the EU have been anything but credible. Washington has gone further, but not far enough to signal serious intent. What Mr Putin has seen of a divided west tells him it is bluffing. He will take sanctions seriously when he sees that those threatening them are ready to bear the costs.

Turn: Perceived decline in our readiness to fight encourages Russian aggression and escalation

Olson 14 – Reporter for Stars and Stripes [Wyatt Olson, “Military’s reduced readiness seen as emboldening China, Russia,” *Stars and Stripes*, Published: May 20, 2014, pg.

<http://tinyurl.com/n6vq7zr>

“The U.S. certainly retains an ability to project an awful lot of air and sea power for more limited contingencies — and do so very quickly,” said Anthony Cordesman, a defense expert at the bipartisan Center for Strategic and International Studies in Washington, D.C.

And even if U.S. forces did become embroiled in Pacific confrontations such as those unfolding in Vietnam and the Philippines, they aren’t the kind of interventions that demand huge follow-up forces, he said.

Cordesman cautioned against equating these kinds of skirmishes with a potential outbreak of hostilities on the Korean peninsula because the U.S. is prepared and willing to match escalation there, he said.

“You’re not going to go to general war over an [exclusive economic zone] or a reef somewhere in the Pacific,” he said.

Still, Cordesman admitted, irrational behavior and miscalculations by adversaries can quickly lead to escalation and “the need for putting many more follow-on forces in the field over time.”

Some experts say that flagging readiness — real or perceived — actually invites escalation by weakening America’s “deterrent effect” as China and Russia continue beefing up their Pacific forces.

In congressional testimony, top-ranking military chiefs have already warned that readiness is deteriorating, partly because of cuts from last year’s sequester at a time the military is struggling to refit and retrain after a decade of wars in Iraq and Afghanistan.

Gen. Curtis Scaparrotti, commander of U.S. forces in South Korea, testified before a Senate subcommittee in March that he was concerned about the readiness of “follow-on forces” that would be required should the peninsula enter crisis.

Marine Corps Commandant Gen. John Amos told the same committee last fall that budget cuts leave “fewer forces, arriving less-trained, arriving later in the fight.”

Reduced readiness cuts two ways, said Todd Harrison, a defense expert with the nonpartisan Center for Strategic and Budgetary Assessments in Washington, D.C.

“I think this reduction in readiness that we’re looking at will reduce our confidence in the ability of our military to intervene successfully if called upon,” he said. “That may weaken the deterrent effect on potential adversaries, but it could also create a situation where we self-deter.”

Dakota Wood, a defense expert at the conservative Heritage Foundation in Washington, D.C., said that America’s current budget and readiness woes do not go unnoticed by China and Russia.

“There’s this deterrent value in being strongly forward, being strongly postured and having the perception that not only are your forces ready for action, but that the government in the U.S. is willing to press that case if it comes to it.”

“When it comes to China, we are seeing increasing aggressiveness in trying to push forward their territorial claims in the **East and South China Seas**.

“China is likely viewing this as a window of opportunity to aggressively press its claims in these waters, and the U.S. is not well postured to come to the assistance of friends and allies in the region.”

Wood described this “pattern of conduct” as “**taking small bites of an apple**,” which over time will consume it.

“So each one of these little actions is below the threshold that would invite a large-scale conventional military response,” he said. “But they’re willing and able to take these small bites because they know the U.S., by this series of incidents, is unwilling to press the case.”

Terrence K. Kelly director of the Strategy and Resources Program at the RAND Corporation, said that individual skirmishes such as these might seem insignificant. But over time countries such as **China and Russia** can achieve their goals by “**nibbling away**” with “subresponse-level” aggression, Kelly said.

“It’s probably calculated to slowly over time achieve an effect that won’t elicit a military response from the U.S. or its allies,” he said.

Cordesman said, however, that even a modest U.S. intervention could lead to **unintended escalation**.

“The problem is that the United States responding — even if it solves one small, short-term problem — may lead to the other side responding in ways that again produce a **steady pattern of escalation**,” Cordesman said.

Ext Shukla – No US Russia war

No war over Ukraine – expert consensus proves

Koplowitz 15 - graduated from the SUNY-Albany, where he received a bachelor's degree in political science and minored in journalism. And he reports on crime and breaking news events for International Business Times (Howard, “US And Russia Going To War? Ukraine Crisis May Lead To Military Conflict, Mikhail Gorbachev Warns, Others Not So Sure”, [ibtimes.com](http://www.ibtimes.com/us-russia-going-war-ukraine-crisis-may-lead-military-conflict-mikhail-gorbachev-warns-1798992), January 29, 2015, <http://www.ibtimes.com/us-russia-going-war-ukraine-crisis-may-lead-military-conflict-mikhail-gorbachev-warns-1798992>) JC

While Gorbachev, the Soviet Union's head of state from 1988 until its dissolution in 1991, warned of war, most academics surveyed in a snap poll released Sunday don’t envision the U.S. and Russia going to war in the next decade. On a scale of zero to 10, with zero meaning no likelihood of going to war and 10 meaning high likelihood, a plurality of scholars -- 23 percent -- rated the chance at 2. Nearly 20 percent rated the chances as a 3, another 20 percent as a 1 and about 12 percent said there was zero chance, according to the poll conducted by the Teaching, Research and International Policy Project at the Institute for the Theory and Practice of

International Relations at the College of William & Mary in Virginia. Only .14 percent of scholars rated the chances of war at a 10.

A plurality of scholars also disagreed that the U.S. and Russia were heading back toward a new cold war. More than 48 percent, or 273 scholars, said that was the case, while 38 percent said the two countries are heading back toward a cold war and about 13 percent weren't sure.

The U.S won't go to war over Ukraine – multiple warrants prove

Peck 14 - contributing editor for Foreign Policy Magazine, a writer for the War is Boring defense blog and of course a contributor at Forbes (Michael, “7 Reasons Why America Will Never Go To War Over Ukraine”, forbes.com, March 5, 2014, <http://www.forbes.com/sites/michaelpeck/2014/03/05/7-reasons-why-america-will-never-go-to-war-over-ukraine/>) JC

America is the mightiest military power in the world. And that fact means absolutely nothing for the Ukraine crisis. Regardless of whether Russia continues to occupy the Crimea region of Ukraine, or decides to occupy all of Ukraine, the U.S. is not going to get into a shooting war with Russia.

This has nothing to do with whether Obama is strong or weak. Jimmy Carter or Ronald Reagan would face the same constraints. The U.S. may threaten to impose economic sanctions, but here is why America will never smack Russia with a big stick:

Russia is a nuclear superpower. Russia has an estimated 4,500 active nuclear warheads, according to the Federation of American Scientists. Unlike North Korea or perhaps Iran, whose nuclear arsenals couldn't inflict substantial damage, Russia could totally devastate the U.S. as well as the rest of the planet. U.S. missile defenses, assuming they even work, are not designed to stop a massive Russian strike.

For the 46 years of the Cold War, America and Russia were deadly rivals. But they never fought. Their proxies fought: Koreans, Vietnamese, Central Americans, Israelis and Arabs. The one time that U.S. and Soviet forces almost went to war was during the Cuban Missile Crisis. Neither Obama nor Putin is crazy enough to want to repeat that.

Russia has a powerful army. While the Russian military is a shadow of its Soviet glory days, it is still a formidable force. The Russian army has about 300,000 men and 2,500 tanks (with another 18,000 tanks in storage), according to the “Military Balance 2014” from the International Institute for Strategic Studies. Its air force has almost 1,400 aircraft, and its navy 171 ships, including 25 in the Black Sea Fleet off Ukraine's coast.

U.S. forces are more capable than Russian forces, which did not perform impressively during the 2008 Russo-Georgia War. American troops would enjoy better training, communications, drones, sensors and possibly better weapons (though the latest Russian fighter jets, such as the T-50, could be trouble for U.S. pilots). However, better is not good enough. The Russian military is not composed of lightly armed insurgents like the Taliban, or a hapless army like the Iraqis in 2003. With advanced weapons like T-80 tanks, supersonic AT-15 Springer anti-tank missiles, BM-30 Smerch multiple rocket launchers and S-400 Growler anti-aircraft missiles, Russian forces pack enough firepower to inflict significant American losses.

Ukraine is closer to Russia. The distance between Kiev and Moscow is 500 miles. The distance between Kiev and New York is 5,000 miles. It's much easier for Russia to send troops and supplies by land than for the U.S. to send them by sea or air.

The U.S. military is tired. After nearly 13 years of war, America's armed forces need a breather. Equipment is worn out from long service in Iraq and Afghanistan, personnel are worn out from repeated deployments overseas, and there are still about 40,000 troops still fighting in Afghanistan.

The U.S. doesn't have many troops to send. The U.S. could easily dispatch air power to Ukraine if its NATO allies allow use of their airbases, and the aircraft carrier George H. W. Bush and its hundred aircraft are patrolling the Mediterranean. But for a ground war to liberate Crimea or defend Ukraine, there is just the 173rd Airborne Brigade in Italy, the 22nd Marine Expeditionary Unit sailing off Spain, the 2nd Stryker Cavalry Regiment in Germany and the 82nd Airborne Division at Fort Bragg, North Carolina.

While the paratroopers could drop into the combat zone, the Marines would have sail past Russian defenses in the Black Sea, and the Stryker brigade would probably have to travel overland through Poland into Ukraine. Otherwise, bringing in mechanized combat brigades from the U.S. would be logistically difficult, and more important, could take months to organize.

The American people are tired. Pity the poor politician who tries to sell the American public on yet another war, especially some complex conflict in a distant Eastern Europe nation. Neville Chamberlain's words during the 1938 Czechoslovakia crisis come to mind: "How horrible, fantastic, incredible it is that we should be digging trenches and trying on gas-masks here because of a quarrel in a far away country between people of whom we know nothing."

America's allies are tired. NATO sent troops to support the American campaign in Afghanistan, and has little to show for it. Britain sent troops to Iraq and Afghanistan, and has little to show for it. It is almost inconceivable to imagine the Western European public marching in the streets to demand the liberation of Crimea, especially considering the region's sputtering economy, which might be snuffed out should Russia stop exporting natural gas. As for military capabilities, the Europeans couldn't evict Libyan dictator Muammar Gaddafi without American help. And Germans fighting Russians again? Let's not even go there.

Ext Hughes 14 – No Obama groupthink

Their internal link is theoretically flawed

Badie 10 — Dina Badie, Assistant Professor of Politics and International Studies at Centre College KY and Ph.D. at the University of Connecticut, expert in international relations and security and American foreign policy in the Middle East and Asia, 2010 ("Groupthink, Iraq, and the War on Terror: Explaining US Policy Shift toward Iraq," Foreign Policy Analysis Journal p.277-296, 2010, Available online at <http://onlinelibrary.wiley.com/doi/10.1111/j.1743-8594.2010.00113.x/pdf> , accessed 7/7/15, J.L.)

Janis's work on groupthink incited much interest and criticism. The original formulation failed to position groupthink within the socio-psychological literature, resulting in an incomplete

explanation of its emergence and its mechanism. Longley and G Pruitt (1980) recognized this lack of determinacy. They argue that some of Janis's "symptoms" were in fact antecedents and that a causal link could not be established between groupthink and its preconditions. Longley and Pruitt recognized that groups eventually bring an end to the deliberative process in order to make a decision; a lack of deliberation does not in itself indicate the presence of groupthink. They instead argue that the timing of the end to deliberation depends on the nature of the decision, whether a major foreign policy or a routine task. Other critics of groupthink sought to offer alternative explanations to small group dynamics that extended "beyond groupthink." Hoyt and Garrison (1997) recognize that within the context of small groups, individuals can "manipulate" the decision-making process on several levels. Manipulation can take place in the traditional sense whereby individuals can alter procedural norms, but can also take the form of structural manipulation through deliberate inclusion and exclusion of individuals (1997:252). Additionally, individuals can manipulate the deliberative process through direct influence; the success of individual manipulation is determined by the individual's likeability, acceptance of his/her authority, perception of expertise, or recognition of the efficacy of the strategy (1997:258). As Hoyt and Garrison propose, the effects of manipulation may, in some cases, offer an alternative to groupthink.

Group think theory is flawed — lack of studies

Griffin 91 — Em Griffin, professor in the Communication department at Wheaton College, author of "A First Look," 1991 ("CRITIQUE: AVOIDING UNCRITICAL ACCEPTANCE OF GROUPTHINK," A First Look at Communication Theory First Edition, McGraw-Hill, 1991, available online at <http://higher.ed.mheducation.com/sites/dl/free/0073010189/228359/groupthink2.html> , accessed 7/10/15) JL

Janis calls for greater critical assessment of proposals lest they be adopted for reasons other than merit. Since his description of groupthink has received great popular approval—perhaps because we're fascinated with colossal failure, it seems only fair to note that efforts to validate the theory have been sparse and not particularly successful.

Most students of groupthink pick a high-profile case of decision making where things went terribly wrong and then use Janis's model as a cookie cutter to analyze the disaster—much as I've done with the Challenger and New Era. They seem to take the existence of groupthink for granted and employ the theory to warn against future folly or suggest ways to avoid it. This kind of retrospective analysis is great for theory construction, but provides no comparative basis for accepting or rejecting the theory. For example, is the lack of evidence that NASA managers formed a cohesive in-group when they approved the Challenger launch a good reason to drop or revise the theory? Or does my report of extensive "due diligence" of New Era invalidate the claim that groupthink was a reason so many people fell for the fraud?

Janis thought it made sense to test the groupthink hypothesis in the laboratory prior to trying to prove it in the field.¹⁹ His suggestion is curious, however, because a minimal test of his theory that controls for the antecedent conditions shown on the left side of Figure 18.2 would require over 7000 willing participants.²⁰ As it is, the few reported groupthink experiments have tended to focus on cohesiveness—a quality that's hard to create in the laboratory. The results are mixed at best. Janis's quantitative study of nineteen international crises is problematic as well. When he

and two co-authors linked positive outcomes with high-quality decision-making procedures during international crises, they never assessed the cohesiveness of the groups in charge.²¹

Ext Olson 14 – Readiness prevents war

US readiness is key to halt Russian attacks on Ukraine. The entire architecture of European security is at risk

Stephens 14 – Associate editor of the Financial Times [Philip Stephens (Fulbright Fellow and winner of the 2002 David Watt Prize for outstanding political journalism), “Europe needs a cold war lesson in deterrence,” *Financial Times*, July 24, 2014 5:51 pm, pg. <http://tinyurl.com/prfj6kq>

Europeans have been slow to recognise the world as it is rather than as they imagined. The reaction to Russia’s march into Ukraine has made this painfully obvious. The reflex has been to seek to defuse the crisis. On one level this is admirable – war did not solve much in Iraq and Afghanistan. The snag is that ceding ground to Mr Putin does not amount to de-escalation. To the contrary, weakness stokes the Russian president’s expansionism.

The west’s priority – and the downing by Russian-backed insurgents of Malaysia Airlines flight MH17 provides an opportunity – should be to recover the concept of deterrence. Not the nuclear deterrence of mutually assured destruction but the traditional understanding that political resolve and a **readiness to deploy force can apply a brake.** The mistake many Europeans have made – and, to a lesser degree, Barack Obama’s White House has done the same – is to confuse deterrence with escalation. I cannot count the times I have heard politicians and policy makers say they must tread carefully for fear of provoking Mr Putin.

Some of these protestations are self-serving – what these people really mean is that they do not want to jeopardise economic relationships. But there seems also to be a genuine misunderstanding about the purpose of deterrence. Imposing sanctions on Moscow will not of itself persuade Mr Putin to pull out of Ukraine. It might persuade him to think twice before marching his army into other Russian-speaking territories.

To be effective, deterrence has above all to be credible. The potential adversary has to believe that aggression will provoke proportionate retaliation, whether economic or, as a last resort, military. The sanctions imposed on Moscow by the EU have been anything but credible. Washington has gone further, but not far enough to signal serious intent. What Mr Putin has seen of a divided west tells him it is bluffing. He will take sanctions seriously when he sees that those threatening them are ready to bear the costs.

European hesitation has ceded to the Kremlin control of the public debate. The annexation of Crimea overturned the cardinal pillar of European security since 1945: states cannot extend their territory by force of arms. As such, Russia’s action represents a profound threat to the security of the continent. Yet to listen to the discussion in some European capitals is to wonder if Mr Putin is not among the victims.

Nato has a chance to remedy this when its leaders hold a summit in Newport, Wales, in September. The gathering had been intended as a stocktaking exercise after the alliance’s planned withdrawal from Afghanistan. The imperative now is to restore NATO as a solid guardian of the post-1945 security order.

Many of the things the alliance needs to do are practical. They are set out persuasively in a report published this week by the think-tank Chatham House. Nato needs to find ways of working in groupings smaller than the full membership of 28. The alliance should extend the interoperability of forces and improve planning and burden-sharing. Governments badly need to re-explain to their electorates why Nato is vital for their security. Jihadis are not the only threat.

The big danger, though, lies in the credibility deficit. Seen from Moscow, Nato looks like two-tier alliance. No one doubts its resolve to defend, say, Germany, but does the Article 5 guarantee of collective security apply equally to the states that joined after the collapse of communism? Would the US – or Britain, France, or Italy – really resist if Mr Putin turned his attention to “protecting” the Russian-speaking people of the Baltics? If the answer is no, the alliance is worthless.

The best way to make sure the commitment is never tested is to make it credible. That can be done by stationing sufficient “tripwire” forces in the east to persuade Mr Putin that a robust response to aggression would be unavoidable.

The heavy lifting, as ever, will have to be done by the US. Europe has depended since 1945 on Washington’s security guarantee and events in Ukraine suggest that is not about to change. But Europeans cannot forever be reluctant partners in their own defence. **The way to avoid war is to deter aggressors.**

No Groupthink

Organization electronic detection protocols check and prevent groupthink

Lewellen et al ’13, (Todd Lewellen, George J. Silowash, Daniel Costa, “Insider Threat Control: Using Plagiarism Detection Algorithms to Prevent Data Exfiltration in Near Real Time,” Software Engineering Institute, October 2013, [//erg">http://resources.sei.cmu.edu/asset_files/TechnicalNote/2013_004_001_64688.pdf//erg](http://resources.sei.cmu.edu/asset_files/TechnicalNote/2013_004_001_64688.pdf)

We define a malicious insider as a current or former employee, contractor, or business partner with all three of the following attributes: • has or had authorized access to an organization’s network, system, or data • intentionally exceeded or misused that access • negatively affected the confidentiality, integrity, or availability of the organization’s information or information systems Malicious insiders are able to act within an organization by taking advantage of weaknesses they find in systems. Organizations must be aware of such weaknesses and how an insider may exploit them. Organizations must also be aware of the many ways in which weaknesses are introduced. For example, an organization may have relaxed or nonexistent acceptable-use policies for internet access. In other cases, a lack of situational awareness introduces weaknesses that malicious insiders can exploit. Additionally, an organization that allows its employees to use web-based services, such as email, increases the potential for data leakage. Establishing proper auditing policies and technical controls, as discussed in this technical note, mitigates some of these risks. Our research has revealed that most malicious insider crimes fit into one of three categories: information technology sabotage, theft of intellectual property (IP), and fraud. This technical note focuses on the theft of information using web-based services, in particular, email accessed through a web browser using the HTTP protocol and encrypted with SSL. The tools and techniques presented in this technical note represent only a subset of practices an organization could implement to mitigate insider threats. For example, organizations may wish to deploy commercially available software to prevent data loss. These tools and methods can be used by organizations of any size. We intentionally selected open source and public-domain tools since they are freely available to the public. 2.1 TheMan-in-The-

Middle(MiTM)Proxy This report builds on the previously published technical note, Detecting and Preventing Data Exfiltration Through Encrypted Web Sessions via Traffic Inspection [Silowash 2012]. Those wishing to implement the capabilities discussed in this report will need to be familiar with the prior technical note and will need to have configured their environment accordingly. This technical note will leverage the existing work by implementing an additional ICAP server to perform additional content scanning of attachments and text entered into web pages to determine if IP is being exfiltrated. 2.2

TheInspectionProcess In the prior technical note, Detecting and Preventing Data Exfiltration Through Encrypted Web Sessions via Traffic Inspection, a Squid proxy server, C-ICAP, and ClamAV are used to inspect CMU/SEI-2013-TN-008 | 2 both clear text and encrypted web sessions for the presence of documents that may contain keywords or are tagged with hidden metadata [Silowash 2012]. Expanding on this, the CERT@ Insider Threat Center developed an additional tool for inspecting documents. This tool leverages the GreasySpoon ICAP server1 and Apache Lucene2. According to the Apache Software Foundation, “Apache Lucene™ is a high-performance, full-featured text search engine library written entirely in Java. It is a technology suitable for nearly any application that requires full-text search, especially cross-platform” [Apache 2012]. The CERT Insider Threat Center developed an agent that resides on the GreasySpoon ICAP server. This agent is written in Java and monitors a given directory of IP. When a new file is created, updated, or deleted, the agent reads the file and updates Lucene’s index. When a user uploads a document to a web-based service such as Gmail, Yahoo Mail, or Facebook, or pastes text into an online form, the document or text is compared to the indexed library of IP. If the document or text matches any of the IP above an organizationally defined threshold, the connection is blocked. Because Squid allows for the simultaneous use of multiple ICAP servers, this approach can be used with the document tagging and keyword detection capabilities discussed in the prior technical note.

AT Russia Scenario

The US is gearing up to fight Russia now – the aff cant resolve this

Bandow 6/24 (Doug, Senior Fellow at the Cato Institute and a former Special Assistant to President Ronald Reagan, “Washington Confronts Russia over Ukraine: Yet Europeans Won’t Protect Themselves from Vladimir Putin,” <http://www.cato.org/publications/commentary/washington-confronts-russia-over-ukraine-yet-europeans-wont-protect//RTF>

Europe is at risk, we are told. Russia’s assault on Ukraine threatens the post-Cold War order. Moscow may follow up with similar attacks on Moldova and even such NATO members as Estonia, Latvia, and Lithuania. But no one in Europe seems to care. Even the countries supposedly in Vladimir Putin’s gun sites aren’t much concerned. No one is bolstering their military. And the European people oppose taking any military risks to help their neighbors. Unfortunately, the Ukraine crisis is likely to continue for some time. The allies hope sanctions will bring Moscow to heel, but the Pew Research Center found that 88 percent of Russians backed Vladimir Putin’s foreign policy, the highest number since Pew started polling in 2003. At least Putin, though no friend of the West, is no fool. He recently opined: “only an insane person and only in a dream can imagine that Russia would suddenly attack NATO.” But if Putin changes his mind, the Europeans don’t plan on defending themselves. Instead, virtually everyone expects America to save them, if necessary. Washington is being played for a sucker as usual. Defense Secretary Ashton Carter is visiting Europe this week. On Monday while observing exercises by NATO’s new rapid response force he announced that the U.S. will contribute aircraft, weapons, and personnel to the “Very High Readiness Joint Task Force.” Americans will provide intelligence, logistics, reconnaissance, and surveillance support. That’s not all. Separately, the Obama administration plans to pre-position tanks and other equipment for a combat brigade in seven nations in Eastern Europe. James Stavdis, a former NATO commander, now dean of the Fletcher School at Tufts, said this “provides a reasonable level of reassurance to jittery allies.” Carter explained that Washington was acting “because the United States is deeply committed to the defense of Europe, as we have for decades.” America is more committed to Europe than are Europeans. “We are moving forward together, with new capabilities,” he said. What does he mean by “we”? Washington again will do the heavy lifting. “You can nearly hear the sigh of relief in Europe,” said Heather Conley of the Center for Strategic and International Studies, in learning that the U.S. again would bail out its allies. The Europeans scrimp on the military while funding their generous welfare state. They promise Washington whatever it desires—to increase outlays, hit the two percent of GDP level, improve international coordination, and more. Then they will go back to doing what they do best, depend on America. “Washington is being played for a sucker as usual.” NATO always stood for North America and the Others. During the Cold War the allied states shamelessly took a very cheap ride on the U.S. That made sense in the immediate aftermath of World War II, but by the 1960s Europe had recovered and should have spent amounts commensurate with the Soviet threat. However, Europeans correctly gauged that Washington wouldn’t leave, despite periodically upbraiding them for their

meager efforts. Cato Institute forum on future of NATO The problem has gotten worse in recent years. The U.S. accounts for three-quarters of NATO outlays even though Europe has a larger GDP than America. Because of European cutbacks, overall outlays are down 1.5 percent this year. Of 28 members only the U.S., Britain, and Greece—mostly because of its confrontation with fellow alliance member Turkey—typically broke the officially recommended level of two percent of GDP. Estonia has become a member of that exclusive club, but not Latvia and Lithuania, despite being on the front line. After frenetically demanding that the U.S. do more, Poland only hit that mark this year. But several members have been cutting outlays, despite the continent's embarrassing showing against Libya (running out of missiles, for instance) and limited capacity to aid the Baltics (little more than nil) let alone defend a nation like Ukraine. Of the five largest European defense budgets, only France's will increase. Those of Canada, Germany, Great Britain, and Italy will continue to decline. None of these countries will hit the recommended two percent of GDP level in 2015. Only Britain and France exceed 1.5 percent. Canada barely makes one percent. (At the G-7 Summit President Barack Obama essentially begged the British to spend more; London has responded by considering whether reclassifying intelligence and foreign aid outlays as "military" would allow Britain to technically meet the standard.) Those NATO members spending more this year—Estonia, Latvia, Lithuania, Poland, Netherlands, Norway, and Romania—collectively have outlays only half that of Britain. Cooperation is poor even among those most at risk. Add Poland to the three Baltic and five Nordic states and the group enjoys a GDP about a third larger than that of Russia. However, their military outlays are only about 40 percent of Moscow's. Moreover, complains Edward Lucas of the Center for European Policy Analysis, they "are divided" and suffer from "strategic incoherence." Never mind the events of the last year. Ukraine has not served as Thomas Jefferson's famed "fire bell in the night," despite the supposedly terrible threat posed to the peace and stability of Europe. "It is much more business as usual," said British defense analyst Ian Kearns. As of 2013 the Europeans devoted just 3.6 percent of their governments' budgets to the military, compared to a fifth of U.S. government spending. America's per capita military outlays are five times that of the alliance's Cold War members and eight times that of those states which joined later. "Total military spending by NATO's European members was less in real terms in 2014 than in 1997—and there are 12 more member states in NATO today," observed my Cato Institute colleague Chris Preble. The issue is more than just money. From the onset of the crisis with Russia a number of American analysts have proposed deploying U.S. forces to Ukraine, treating the latter as if it was a NATO ally. No Europeans have volunteered to follow. The U.S. House has approved legislation to arm Kiev's forces, and a similar measure is being pushed by ever warlike Senate Armed Services Committee Chairman John McCain. Most European governments have resisted the idea. "Make no mistake: we will defend our allies," declared Carter. But will the Europeans defend anyone, even themselves? A new poll suggests not. The Pew Foundation recently surveyed eight leading NATO countries: If Russia got into a conflict with another member of NATO, should your country use military force in the victim's defense? A majority of French, Germans, and Italians said no. (The Germans were particularly emphatic, with 58 percent rejecting war. German support for NATO has dropped by 18 percent in just six years.) Only pluralities said yes in Poland, Spain, and the United Kingdom. (Yet Poland is insisting that everyone else defend it!) The highest European support level was in Britain, at 49 percent. Only in America, naturally, and Canada did a majority say yes (56 and 53 percent, respectively). Ivo Daalder, a former U.S. ambassador to NATO, said "it will take a serious effort by the alliance to convince its public of the need to prepare for, deter and, if necessary, respond to a Russian attack." Yet why should they take action as long as they believe they can count on Washington to save them? According to Pew, two-thirds of Europeans were convinced the Americans would come rushing over to do what they would not do for themselves. It's time to change that. Judy Dempsey of Carnegie Europe asked why Washington allowed itself to be used in this way: "Europe is prosperous. It should be confident enough both to take care of its own security and to contribute to a greater role in burden sharing." It will not do so as long as U.S. policymakers insist that Americans do the job instead. The Cold War is over. Moscow is an unpleasant regional actor, not a global threat. Europe has a much larger GDP and population than Russia and even with its current anemic level of military outlays devotes more to defense. The U.S. government is essentially bankrupt, with far greater unfunded liabilities than the Europeans, despite Greece's travails. Instead of pouring more resources into NATO, Washington should be disengaging militarily, turning leadership of the alliance and responsibility for defending the continent over to Europe. Americans shouldn't be expected to protect their rich cousins even if the latter were devoted to protecting each other. That the Europeans expect the U.S. to do their job is yet another reason for Americans to say no more.

The impact's inevitable- congress already wants to arm Ukraine

Wong 15 (Kristina, 2/5/15, The Hill, "Lawmakers to Obama: Arm Ukraine now," <http://thehill.com/policy/defense/231874-senators-to-obama-arm-ukraine-now>)/RTF

The White House came under bipartisan pressure from both sides of the Capitol to provide weapons to Ukraine Thursday. Republicans and Democrats on the Senate Armed Services Committee made a big push on the issue, while a bipartisan group of House members called for the same course of action in a letter. "The United States must act with urgency to provide defensive lethal assistance to Ukraine," said Sen. John McCain (R-Ariz.), the chairman of the Armed Services Committee. "Russia's invasion of sovereign territory of Ukraine, which has continued unabated in the face of political and economic sanctions, is the gravest threat to European security in decades," he

said. In an unusual display of bipartisan agreement, McCain was joined at the press conference by the committee's ranking member, Sen. Jack Reed (D-R.I.), and Sens. James Inhofe (R-Okla.), Bill Nelson (D-Fla.), Lindsey Graham (R-S.C.), Richard Blumenthal (D-Conn.), Kelly Ayotte (R-N.H.), Joe Donnelly (D-Ind.), Joni Ernst (R-Iowa), Mike Rounds (R-S.D.), Tom Cotton (R-Ark.) and Dan Sullivan (R-Alaska). Meanwhile, the group of House lawmakers said that the administration needed to provide weapons to Ukraine to deter further Russian aggression. "We are calling on the Administration to increase its support for Ukraine. Tighter sanctions and greater humanitarian assistance should be part of that support, but now, more than ever, the U.S. must supply Ukraine with the means to defend itself," they said in their letter. Rep. Adam Schiff (D-Calif.), ranking member on the House Intelligence committee, was the lead signatory on the letter. He was joined by more than 30 Republicans and Democrats. The U.S. and Western allies slapped economic sanctions on Moscow after it invaded Ukraine and annexed its peninsula of Crimea last March, but the country has continued to arm and train pro-Russian rebels in Eastern Ukraine. Secretary of State John Kerry said while visiting Ukraine on Thursday that President Obama is "reviewing all his options." "Among those options obviously is the possibility of providing defensive systems to Ukraine," he said, according to the Associated Press. However, he added, "We are not interested in a proxy war. Our objective is to change Russia's behavior." The White House has so far turned down Ukraine's requests for weapons out of fear it would further provoke Russia, but has provided nearly \$122 million in non-lethal military equipment to Ukrainian forces, such as blankets, body armor and meal packets. The senators said the time has come to provide weapons as well, given gains by rebels in recent weeks and Russian President Vladimir Putin's violation of a ceasefire agreement. "Blankets don't do very well against tanks," said McCain. Providing arms "will raise the risk and costs Russia must incur to continue its offensive," he said. McCain said that since April, Russian-backed separatists in Ukraine have killed 5,358 Ukrainian forces, wounded 12,235 others and killed 224 civilians. Reed said Ukrainian forces have fought courageously. "We must help Ukraine to defend itself against Russian aggression," he said. "We cannot let Vladimir Putin get away with invading another sovereign country. ... This is what we should do, lethal assistance," Nelson added. "We should always be on the side of struggling democracies," Graham said. "Helping a friend somewhere makes friends of America everywhere feel better." Blumenthal called Putin "a thug." "He has not responded to sanctions. Sanctions are not working," he said. "He is the schoolyard bully," added Ayotte. "I am so glad we've come together on a bipartisan basis to do this." Donnelly called Ukraine a "friend" of the United States and said providing arms "is the least that we can do." Meanwhile, the letter from the House members urged the administration to provide "a substantial amount of military assistance as soon as possible in 2015," and in the following years. That assistance should include non-lethal aid such as counterbattery radars, drones, electronic counter-measures against Russian drones, secure communications capabilities, armored Humvees and medical equipment, they said. Lethal aid should include light anti-armor missiles, "given the large numbers of armored vehicles that the Russians have deployed in Donetsk and Luhansk and the abysmal condition of the Ukrainian military's light anti-armor weapons," the letter said. The letter was also signed by Reps. Steny Hoyer (D-Md), Michael Burgess (R-Texas), Gerry Connolly (D-Va), Steve Chabot (R-Ohio), Rosa DeLauro (D-Conn.), Eliot Engel (D-N.Y.), Michael Fitzpatrick (R-Penn.), Alcee Hastings (D-Fla.), Steve Israel (D-N.Y.), David Jolly (R-Fla.), Marcy Kaptur (D-Ohio), Mike Kelly (R-Penn.), John Larson (D-Conn.), Sander Levin (D-Mich.), Daniel Lipinsky (D-Ill.), Thomas Marino (R-Penn.), Michael McCaul (R-Texas), Tom McClintock (R-Calif.), Tim Murphy (R-Penn.), Mike Quigley (D-Ill.), Bill Pascrell (D-N.J.), Robert Pittenger (R-N.C.), Ted Poe (R-Texas), Reid Ribble (R-Wisc.), Thomas Rooney (R-Fla.), Peter Roskam (R-Ill.), David Schweikert (R-Ariz.), John Shimkus (R-Ill.), Adam Smith (D-Wash.), Steve Stivers (R-Ohio), and Michael Turner (R-Ohio). The non-voting member from Guam, Del. Madeleine Bordallo (D), also signed. "We know that a resolution to the Ukrainian crisis will ultimately require a diplomatic, not military, solution," the letter said. "But Russia is feeling emboldened, and Ukraine is economically stretched to its breaking point. It is time to provide the Ukrainian government with the tools to keep the separatists at bay and to make the conflict too costly for their Russian patrons to continue." Separately, Senate Foreign Relations Committee Chairman Bob Corker (R-Tenn.) urged President Obama in a letter Thursday to fully implement a law passed last year, which requires him to report to Congress by Feb. 15 on plans to provide weapons to Ukraine. "We hope the administration will submit a report to the Senate Foreign Relations Committee later this month that clearly states your readiness to supply appropriate lethal assistance to the Ukrainian government and provides details of the specific weapons to be delivered," said Corker, a co-author of the bill.

Republican Congress makes the impact inevitable

Jensen 14 (Donald, November 18th, resident fellow at the Center for Transatlantic Relations in the Nitze School of International Studies at Johns Hopkins University, "Republican Congress to Push Harder Russia Line," <http://imrussia.org/en/analysis/world/2085-republican-congress-to-push-harder-russia-line>)/RTF

The United States' recent midterm elections tipped the balance of power away from president Barack Obama and will greatly complicate his remaining two years in office, not just in terms of domestic policy, but foreign policy as well. Riding a wave of popular discontent, the Republican Party gained eight seats (which could increase by one after Louisiana holds a runoff in December). The GOP also increased its majority in the House of Representatives and performed well in state races. The Republican capture of the Senate will force Obama to scale back his legislative agenda and limit his ambitions to either executive actions that do not require legislative approval, or issues that have bipartisan support. But the Republicans, hoping to win the White House in 2016, will also be under pressure to show the electorate that they are capable of governing after drawing scorn for shutting down the government last year and allegedly demonizing the president. The president's supporters and the national media, in turn, are also guilty of exaggeration: they are fond of caricaturing the GOP as being held hostage to an "extremist" Tea Party base. Many of these critics expect (and hope) that Republican unity will be difficult to achieve. The day after the midterm elections, President Obama promised to work with Republicans, but warned that he was also prepared to make more use of his executive powers. Foreign policy is rarely a primary concern of U.S. voters. Indeed, surveys suggest that those who went to the polls this November were primarily concerned with the state of the economy, partisan gridlock in Washington, and Obama's leadership. In September, according to a Pew Research Center poll, 64 percent of respondents said foreign policy would be an important factor in their midterm election vote. In an October poll, by a margin of 43 to 37 percent, voters believed Republicans would do a better job of handling foreign affairs than Democrats. It appears such sentiments have much to do with the public's view that Obama has demonstrated poor leadership on international issues. "Setting aside individual debates about individual policy choices," David Rothkopf recently wrote for Foreign Policy, "the public wants America and its leaders to appear strong." In recent weeks, the opinions of the Washington elite on how to deal with Russia, like public sentiment more generally, have been marked by an uneasy balance. Earlier this year, views were divided. One point of view maintained that Russia's meddling in Ukraine was mostly a defensive action against the threat of NATO enlargement and Ukraine's disintegration; the other accused Russian president Vladimir Putin of directly challenging Europe's political and security structures and Western values, and argued that he needed to be countered. The shoot-down of Malaysian Flight MH17 in July and subsequent abundant evidence of Russia's extensive military involvement in the incident yielded a consensus behind the latter view. Yet there remained disagreements over how far Putin would go and how the U.S. should push back. The Obama Administration expressed warm words of support for Ukraine, but was strongly against arming Kiev. It argued that doing so would provoke Russia into greater intervention; that Ukraine's armed forces could not "absorb" high-tech equipment; that there exists no military solution to the crisis; and that Ukraine would be better able to withstand Russian aggression if it focused on political and economic reform. In Congress, however, where sympathy for Ukraine was strong (and bipartisan), there was firm support for providing arms. This debate took place, as Standard Bank analyst Tim Ash wrote in October, amid widespread uncertainty about what Putin would do next and general agreement that Western sanctions on Russia are working. Although they may have done little to directly discourage Russian military activity, sanctions have extracted a heavy price from Russia and the elites around Putin. Two bills that would provide Ukraine with defensive but lethal weapons are likely to be taken up by the new Republican Senate majority, despite the president's wishes. With a GOP majority in both houses of Congress—including in the crucial Senate Armed Services and Foreign Affairs Committees—Republican leaders are now likely to step up the pressure on the weakened president, already a lame duck, to be tougher on Russia and provide weapons to Ukraine. Senator John McCain, the incoming chairman of the Senate Armed Service Committee, said in an interview on November 5 that he has already discussed a new national security agenda with fellow Republicans Bob Corker and Richard Burr, who are likely to be chairmen of the Senate Foreign Relations Committee and Senate Select Committee on Intelligence, respectively. McCain promised to raise the issue of military assistance. Two bills that would provide Ukraine with defensive but lethal weapons are likely to be taken up by the new Republican Senate majority, despite the president's wishes. The first of these bills, the Ukraine Security Assistance Act of 2014, would help Ukraine "neutralize the military-support advantage that separatist rebels are using to target civilian and military aircraft in eastern Ukraine" and would authorize President Obama to "provide adequate and necessary assistance to protect Ukrainian democracy and sovereignty." The second, the Ukraine Freedom Support Act of 2014, calls for military and security assistance to Ukraine, designates it as a "major non-NATO ally" (MNNA), and imposes further sanctions on the Russian Federation. MNNA is a designation given by the United States government to close allies (including Australia, Egypt, Israel, Japan, and South Korea) who have strategic working relationships with U.S. armed forces but are not members of NATO. While the MNNA status does not automatically establish a mutual defense pact with the United States, it does confer a variety of military and financial advantages that otherwise are not obtainable by non-NATO countries. Moreover, codifying U.S. sanctions against Russia into legislation would make it far more difficult to end them than is currently the case, thereby immunizing the sanctions against actions by the White House. It is unclear whether Obama will veto either bill should they pass. The White House's rationale that arming Kiev would provoke Moscow grows ever weaker, as Russia has stepped up its military support of the eastern breakaway republics in recent days. An Obama veto would also put him at odds with powerful congressional leaders in both parties, now emboldened by the elections to take a tougher line on an issue that appears

secondary to the rest of the president's agenda. In the past, Obama has stood his ground in the face of congressional opposition when he believed he was right, but according to sources in Congress, he has not yet indicated what he would do if a Ukraine bill were to reach his desk. Putin's intentions, as ever, remain uncertain. On the one hand, the Kremlin has little incentive to escalate its military presence in Ukraine, regardless of any military assistance the U.S. might provide Ukraine (though such aid would certainly give Putin pause). Russian public opinion does not support an invasion: Kremlin authorities made great efforts during the fighting of August and September to restrict media coverage of Russian military casualties. The economic costs of rebuilding the Ukrainian east or funding additional sustained major military operations are likely prohibitive, given the downturn in the Russian economy. On the other hand, Putin's current stepped-up support for separatist forces, in violation of the Minsk agreement and despite Western threats, suggests that he could go further no matter the economic cost or Western reaction. For example, he could carry out a quick strike to establish a land bridge to Crimea. The Obama Administration also continues to seek Russian cooperation on Iran and the Middle East, showing Putin there are limits to Washington's willingness to push back over Ukraine. In the end, therefore, the dispute in Washington over military assistance to Ukraine may have more to do with the power struggle between Congress and the administration than the realities of the military situation on the ground.

Republicans are pushing for it

Coca 6/24 (Onan, 2015, writing for Eagles Rising, "John McCain says It's "Shameful" Not to Send Arms to Ukraine!," <http://eaglerising.com/2010/john-mccain-says-its-shameful-not-to-send-arms-to-ukraine/#TKxhbSzXdKLiQ4d.99>)//RTF

GOP Sen. John McCain spoke at a Saturday press conference during his trip to Ukraine and lambasted the U.S. for refusing to provide weapons to Ukrainian forces. According to McCain, Ukraine has shown repeatedly that it's willing to fight for freedom, making it shameful to deny the country much-needed military assistance against well-armed separatists in the eastern region. The Associated Press reports. For McCain, the 300 paratroopers sent as advisers in April aren't sufficient. A lack of weapons only cedes more ground to Russian President Vladimir Putin's designs to pull Ukraine away from NATO and other western countries, he says. Observers allege that the reason separatists in Luhansk and Donetsk are able to keep fighting is because Russian support lurks behind the scenes. Putin steadfastly denies any and all such accusations. "This is shameful that we will not provide [the Ukrainians] with weapons to defend themselves. They are fighting with 20th-century weapons against Russia's 21st-century weapons. That's not a fair fight," McCain said, after meeting with Ukrainian President Petro Poroshenko and other officials. Since Russia annexed Crimea last year, McCain has been one of the most vocal proponents of shipping military gear to Ukraine. "We need to give long-term military assistance... because God knows what Vladimir Putin will do next," McCain said in March 2014. Accompanying McCain was Republican Sen. Tom Cotton, who argued that sending weapons is a necessity, as Putin has repeatedly refused de-escalation attempts. The National Defense Authorization Act includes \$300 million for military assistance to Ukraine, but the defense budget bill still needs to make it through Congress and the White House first. Recent back-and-forth disputes between the Republican-dominated legislature and the Obama administration threaten the bill's passage. Russia meanwhile opposes any attempt from the U.S. to send military assistance, saying that any military aid will only increase instability. Putin has also warned Israel in April not to sell weapons. Shortly after the press conference, Lithuania's ambassador to Ukraine, Marius Yanukonis, said that Lithuania is preparing to ship arms to Ukrainian forces, in an effort to persuade other NATO member countries to follow suit.

A bill providing military support's already passed the senate

AP 6/20 (Associated Press, 2015, "US Senator McCain slams European stance on Ukraine," <http://news.yahoo.com/us-senator-mccain-slams-european-stance-ukraine-172844262.html>)//RTF

KIEV, Ukraine (AP) — U.S. Sen. John McCain has said during a visit to Ukraine that it is shameful that Washington's European allies have not done more to assist Ukrainian forces in their quest to defeat Russian-backed separatists in the east. McCain was part of a delegation of U.S. senators that met Saturday with senior Ukrainian officials, including President Petro Poroshenko, after visiting troops and volunteers working on the front line. The U.S. Senate this week approved a bill that includes provisions to supply Ukraine with \$300 million worth of defensive military equipment. Approval

from Congress and the White House is still pending. European countries have favored a diplomatic settlement as a way out of the conflict. Russia condemns U.S. military aid to Ukraine and says it will foment instability.

Noncompliance

The Navy needs their ITP program – they wont stop

Lombardo 13

(Tony -Staff writer, SECNAV launches plan to battle 'insider threats', Sep. 7, 2013, <http://archive.navytimes.com/article/20130907/NEWS/309070005/SECNAV-launches-plan-battle-insider-threats->, JZG)

The Navy has a new plan to confront “insider threats” in the Navy and Marine Corps, and it will involve more scrutiny, better training and a team of top leaders to oversee its implementation.

Navy Secretary Ray Mabus issued an instruction in August that creates the Department of the Navy Insider Threat Program. The goal is to prevent cases like the data leaks by Army Pfc. Bradley Manning and former National Security Agency contractor Edward Snowden, and violence like Army Maj. Nidal Hasan’s shooting rampage at Fort Hood, Texas. “With this instruction, Secretary Mabus has given the Department of the Navy its marching orders.” said Vice Adm. Michael Rogers, head of Fleet Cyber Command. “We need to do all we can to be aware of the threat, and take those actions necessary to reduce that threat.” As head of the Navy’s cybersecurity arm, Rogers’ team of cyber warriors plays a critical role in fighting insider threats. But Rogers insists the threat is an “all hands” issue. “All who serve within the Navy — active, reserve, officer, enlisted, civilian employees and contract support personnel — are put at risk by this threat, and all can help diminish that threat,” said Rogers, who responded to Navy Times’ questions via email.

Reform ITP CP

1NC

CP Text: The United States federal government should update the ITP program to include a common definition of what an insider threat is and realign insider threat training to focus toward preventing threats.

Common definitions solves cohesion

Porter 14 -Master in Security Studies

(Michael Lawrence, COMBATING INSIDER THREATS: AN ANALYSIS OF CURRENT UNITED STATES INSIDER THREAT POLICIES AND NECESSARY IMPROVEMENTS, May 2014, <http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y>, JZG)

The first improvement that is needed is the establishment of a common definition of an insider threat. Currently, there are over 15 different definitions as outlined in the NCIX's Official Terms & Definitions of Interest List¹²². Such a broad list of definitions leaves many questions in the minds of the different IC agencies as to what an insider threat is, and who has jurisdiction regarding collection, analysis, and apprehension. Most importantly, the definition in the 2012 National Policy lacks any sort of tie to a foreign nexus¹²³. This vague language creates confusion as to who has jurisdiction over potential insiders. According to the policy definition, CI would have been responsible for identifying and handling any threat, to include domestic law enforcement cases. The problem is that if these threats are American citizens, not working for extremist organizations or foreign nations, then CI does not have jurisdiction as assigned in EO 12333. This current lack of specificity can cause confusion when it comes to handling insider threats, because over utilization of CI and LE on areas outside of their jurisdiction leaves them both over-exerted and stretched thin¹²⁵. Furthermore, establishing a definition will be difficult with as many different and divergent definitions as we already have throughout the government. As was mentioned, consensus is important and right now there is none. Changing this will require the NITTF to build common ground and push past the differences. The important thing to remember is that words have meanings and, as the 2009 NIS states, insider threats are the priority for CII²⁶. An open-ended definition will tax a stressed organization. Specificity allows work to be spread across the spectrum of CI and Law Enforcement cases and thus increase the amount of success. Chapter 1 of this paper outlined the author's definition of an insider threat as "an individual with placement and access to critical infrastructures, military units, and the government and their supporting agencies who have allegedly turned against and targeted their parent organization, thus aiding a foreign power or international terrorist organization." This definition is based on a conglomeration of multiple different definitions used across the IC. It encompasses all of the critical elements of the threat and leaves no question in the minds of the different agencies as to who has jurisdiction. Simply adopting a new definition does not mean that "jurisdiction battles" will be solved. Inherent to any definition is the constant need for cooperation amongst the different organizations of CI and in the case of uncertainty, to allow for joint investigations and the sharing of potentially valuable information between the different disciplines¹²⁷ Evaluation will be more than just the success or failure of a standard definition. The definition itself will be tied to a broader evaluation of the National Threat Policy. Accordingly, the ITAG and the JITTF would be primarily responsible for the evaluation of current policies. In order to do this, an evaluation of classified and unclassified reporting and investigations, at the national level, will identify increases in reporting, opening of investigations, opening of joint investigations, prosecutions, and operations conducted. An increase in these numbers would be a strong indication that programs are working, at least in the short-term. This data would be compiled and presented by the NCIX to the DNI and policy makers as an indicator of the change that is occurring with new policies. Granted this information would not be shown to all policy makers, but there are representatives in Congress and the White House that would be privy to this information, and that serve as representatives for the broader policy community¹²⁸.

Adding threat prevention training solves

Porter 14 -Master in Security Studies

(Michael Lawrence, COMBATING INSIDER THREATS: AN ANALYSIS OF CURRENT UNITED STATES INSIDER THREAT POLICIES AND NECESSARY IMPROVEMENTS, May 2014, <http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y>, JZG)

The second improvement needed is that the CI Community should realign insider threat training to focus toward preventing threats, not simply identifying them. The National Insider Threat Policy includes a set of “Minimum Standards for Executive Branch Insider Threat Programs.” These minimum standards are the current guidelines promulgated by the executive branch, the NCIX, and the JITTF regarding Insider Threat Programs¹²⁹. The programs’ standards have addressed many of the issues relating to insider threats except one key issue: prevention. The minimum standards read more like a list of training for identification of a current threat, and less like a set of preventative measures. Identifying threats is useful, but the problem with insider threats is that they are often unidentifiable; more is needed in the form of prevention. The major problem with passing changes such as these is, once again, the problem of time. As previously stated, policy makers like to see fast results. Preventative measures will not get nearly the same results as fast as identification. Focusing training on identification can give quantifiable numbers to policy makers about how successful a program has been by catching bad guys. One can hope that politics is not all that is at play when it comes to determining how these programs are organized, but these changes will need to be made quickly because the longer they wait the longer the system goes without preventative measures. Not much needs to be added to current CI training, but an understanding of the basic threat psychology, as addressed in Chapter 2, should be a part of the Minimum Standards. A key element of this “preventative measure” is the provision of information regarding where developing threats can seek assistance, how coworkers can report suspected problems for assistance, and how supervisors can refer to assistance. These insights would be crucial both for impacting the potential downward spiral and the apprehension of an individual. The one major outlet that exists is in Employee Assistance Programs (EAPs). As stated in EO 12968, all individuals working for agencies with access to classified information are eligible to use EAPs for “assistance concerning issues that may affect their eligibility for access to classified information, such as financial matters, mental health, or substance abuse.” Essentially EAPs are counseling services for those in the IC who need an extra support structure to get personal help¹³⁰. The problem is that often there is a stigma placed on anyone for using these services. The proper use of these programs is crucial for serving this preventative measure and should be included in training as a healthy outlet free of judgment or damage to one’s career. One thing that the Spy cycle and the Radicalization cycle both underscored was that in the earliest stages of the development of an insider threat, there was a need for help. The spy found that help in the solace of a foreign intelligence service, while the future violent extremist found it in the support network of an international terrorist organization. By focusing training on identification at the later stages of development, we are skipping an important step in the progression of an insider threat. Ignoring the early stages does nothing to prevent those potential future threats sitting on the edge of right and wrong from making bad choices. By adding to the current training a focus of earlier detection then the potential to remove the future insiders from their support structure and offer them a healthy outlet is possible. Additionally, teaching this training to everyone will turn personnel into sensors for future threats, not just current ones¹³¹

2NC

Reform to the ITP is necessary

Porter 14 -Master in Security Studies

(Michael Lawrence, COMBATING INSIDER THREATS: AN ANALYSIS OF CURRENT UNITED STATES INSIDER THREAT POLICIES AND NECESSARY IMPROVEMENTS, May 2014, <http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y>, JZG)

Chapter 4: The Reform Process Given the many insider threat-related challenges the CI Community faces, the United States has done a great deal to confront this dangerous enemy. Nonetheless, the CI Community must make additional changes due to weaknesses in the current legislative processes, organizational interactions, and other issues involved in this effort⁹⁹. As addressed in Chapter 3, the structure of the CI Community has adapted over the years, but the sad reality is that these changes happened largely as a result of failures in the system and kneejerk reactions designed to address specific instances of failure¹⁰⁰. Even then, the changes that do occur often do not come easily and are the result of extensive reform processes throughout the IC. The ever-present threat posed by insiders means that the US CI Community must routinely evaluate the process it operates under and look to better itself. Our CI specialists must address a range of persistent vulnerabilities to help strengthen the American security apparatus. The problem is that substantive reform is often very difficult to accomplish in the IC, and subsequently the CI Community, for two reasons. First, intelligence reform is usually more politically motivated than it is focused on, and motivated by, the need for substantive change¹⁰¹. Second, since the IC is a tool of the policy makers, who ultimately oversee these organizations, this often means that the people making decisions for the IC have little to no real understanding of the Intelligence process¹⁰². As Chapter 3 demonstrated, there were multiple reforms over the past 20 years that have helped mold the CI Community into an organization that could fight the insider threat. These changes however, were not the result of planned reform, they were reactionary movements to larger community failures that allowed insiders like Ames, Hanssen, and Hassan to exist. Politicians do not like huge failures for political reasons, so large high-profile events act as "motivation" for change, and to show their constituents that they are making things better¹⁰³.

DOD CP

1NC

CP Text: The Department of Defense should enact new efficiency standards and guidelines for their insider threat program.

Reform through the GAO standards solves efficiency and insider threats

Pomerleau 15

(Mark, DOD coming up short on insider threat safeguards, GAO says, Jun 04, 2015, <http://defensesystems.com/Articles/2015/06/04/DOD-insider-threat-gaps-GAO.aspx?Page=1>, JZG)

While certain components of DOD's insider-threat implementation program have been incorporated, other major standards have been neglected, according to a Government Accountability Office report. Specifically, the department has not analyzed gaps or incorporated risk assessments into the program. Going back to 2000, DOD issued an integrated process team report to guard against insider threats to information systems. This issue came to a head in 2010 following massive disclosures of classified information by then-Army soldier Bradley (now Chelsea) Manning. (The report refers to leaks by Manning and Edward Snowden, though not by name.) Congress in 2011 called for DOD to establish an insider threat program while the White House issued an executive order establishing an interagency task force, known as the National Insider Threat Task Force. A 2012 presidential memorandum directed agencies to create insider threat programs by May 2013 and identified six minimum standards for the programs: (1) designation of senior official(s); (2) information integration, analysis, and response; (3) insider-threat program personnel; (4) access to information; (5) monitoring user activity on networks; and (6) employee training and awareness. GAO stated that DOD and the six selected DOD components it reviewed have begun incorporating the minimum standards, they have not done so consistently. GAO's report, which was originally issued in a classified setting in April, notes that around that same time, DOD made a particular point to highlight the need to mitigate insider threats in its newly updated Cyber Strategy, which said DOD was pursuing security against insider threats "through continuous network monitoring, improved cybersecurity training for the workforce, and improved methods for identifying, reporting, and tracking suspicious behavior." The report continued: "Mitigating the insider threat requires good leadership and accountability throughout the workforce. Beyond implementing policies and protocols, leaders will strive to create a culture of awareness to anticipate, detect, and respond to insider threats before they have an impact." Although DOD is required to complete a continuing analysis of gaps in security measures,

DOD officials reported in 2014 that this survey had been suspended due to financial and personnel limitations. “This survey would have allowed DOD to define existing insider-threat program capabilities; identify gaps in security measures; and advocate for the technology, policies, and processes necessary to increase capabilities in the future,” GAO wrote. Without that information, “the department will not know whether their capabilities for insider-threat detection and analysis are adequate and fully address the statutory requirements.” GAO starkly pointed out that it found DOD had not incorporated risk assessments into insider threat programs. Risk assessments, GAO pointed out, “provide a basis for establishing appropriate policies and selecting cost-effective techniques to implement these policies. Risk assessments generally include the tasks of identifying threats and vulnerabilities, and determining consequences.” Despite the fact that some DOD officials said insider threats are included in other risk assessments, these assessments are “technical in nature and focus on the vulnerabilities of individual systems” and “do not provide insider-threat program officials with complete information to make informed risk and resource decisions about how to align cybersecurity protections.” Further compounding this issue, GAO continued, is that officials in the Office of the Undersecretary of Defense for Intelligence do not view the results of the National Security Agency assessments or Command Cyber Readiness Inspection reports, meaning a “senior-level official does not know which specific types of risk the department is incurring.” Aside from the two major flaws mentioned at the outset, GAO also picked up on a lack of guidance from the top level of DOD. “DOD officials stated that they would need supplemental planning guidance that helps them identify actions, such as the key elements, beyond the minimum standards that they should take to enhance their insider-threat programs,” according to the report. “The current DOD directive does not contain additional guidance for implementing key elements of an insider-threat program beyond the minimum standards.” A draft implementation plan provides guidance on minimum standards but not recommended elements. DOD was expected to release a supplemental guidance in January 2015.

The insider threat program has a ton of data now – new guidelines and effectiveness measures are critical to success

Tucker 7-19

(Patrick -Patrick Tucker is technology editor for Defense One. He’s also the author of *The Naked Future: What Happens in a World That Anticipates Your Every Move?* (Current, 2014). Previously, Tucker was deputy editor for *The Futurist* for nine years. Tucker has written about emerging technology in *Slate*, *The Sun*, *MIT Technology Review*, *Wilson Quarterly*, *The American Legion Magazine*, *BBC News Magazine*, *Utne Reader*, and elsewhere, “To Prevent Insider Threats, DOD Must First Define ‘Normal’”, JULY 19, 2015, <http://www.defenseone.com/threats/2015/07/insider-threat-prevention-complicated-automated/118099/>, JZG)

Imagine your job is to anticipate when that sort of thing might occur by using digital data produced by and about soldiers like Hasan. The task before you is enormous. There were around 65,000 people personnel stationed at Fort Hood at the time of Hasan’s rampage. If you were to scan every piece of electronic communication between those soldiers, and their contacts, for hints of future violence, your graph would include 14,950,000 different nodes—people, devices, and other communication points—and up to 4,680,000,000 messages, according to a paper published after the incident by the Defense Advanced Research Projects Agency, or DARPA. Nevertheless, predicting such insider attacks on the basis of digital clues is something the Defense Department is committed to doing. Following the 2011 leak of classified documents by Army Pvt. First Class Bradley (now Chelsea) Manning, President Obama signed Executive Order 13587, establishing the National Insider Threat Task Force. The Defense Department and the Task Force have since taken various steps to predict and prevent insider attacks. But the ultimate goal — a continuous and automated understanding of every potential threat posed by everyone with any connection to the defense establishment — remains elusive. DOD is working to meet one of the Task Force’s key recommendations: establish a center to coordinate its insider

threat efforts, codify best practices, and monitor the most important cases. This Defense Insider Threat Management and Analysis Center, or DITMAC, slated to reach initial capability this fall, is meant to be able to analyze and fuse insider threat data that it gets from different components. Full operational capability will come in 2018 or 2019. Insider threat detection, as specified by DOD requirements, will also become standard for any defense contractor with top-secret clearance, according to forthcoming changes in the National Industrial Security Program Operational Manual. Key to DoD's these efforts is what's called continuous evaluation, a method to continuously monitor personnel with important clearances or access for changes that Department believes could make them insider threats, like credit problems, family issues, arrests, etc. But DoD would like to be able to subject all personnel to that sort of examination. A recent quarterly report of the Insider Threat program suggested that 225,000 personnel would be subject to continuous evaluation by one of the CE pilot programs by the end of 2015, and 1 million by 2017. But, as recent GAO reports make clear, progress has been uneven. The DoD CE program will automatically and continuously check records using data from the government, commercial sources to insure to look for warning signs. "As it matures, the CE capability will continuously ingest and filter data as it becomes available and provide ... relevant information to appropriate security entities for action." Mark Nehmer, who is leading that effort as the DITMAC team's deputy chief for implementation, told Defense One in an email. That means developing software to detect threat signals, bad credit, unusual travel, arms purchases, etc. the second that that information becomes available. The usefulness of continuous evaluation will depend on DOD's ability to tell normal behavior from abnormal on a department-wide scale and do so automatically. A few years ago, DARPA funded a program called Anomaly Detection at Multiple Scales, or ADAMS. The goal was to "create, adapt and apply technology to the problem of anomaly characterization and detection in massive data sets... The focus is on malevolent insiders that started out as 'good guys.' The specific goal of ADAMS is to detect anomalous behaviors before or shortly after they turn." That set the stage for many current research efforts. "We're working through a number of different efforts right now, behavioral analytics, to actually try and figure out [for] all of these different known insider threats that we've seen, what the characteristics have been of those individuals, what are the behaviors that they've exhibited," said Nehmer. "Where were they in their work life? Where were they in their social life? We're doing as deep a dive as we can get on individuals that have actually exhibited insider threat behavior," Nehmer said at a recent Defense One event. That seems straightforward enough — but it presents a technical challenge as big as big data. Consider Hasan, on whom the Army had an abundance of data. They knew that he had become withdrawn after receiving abuse from other soldiers and that he wanted out of the military. In the summer of 2009, they knew that Hasan had begun to buy non-issue guns. The military looks for those behaviors among many others, as indicators of potential insider attacks. This 2011 guide to characterizing so-called "indicators of potential insider attackers lists a few of them. "Socially withdraws on some occasions," "strange habits," and "lacks positive identity with unit or country" are Category I indicators that could apply to every American teenager. The Category III indicators include "takes unusual travel," "Exhibits sudden interest in partner nation headquarters or individual living quarters," and "Stores or collects ammunition or other items that could be used to injure or kill multiple personnel." But these clues can present themselves too late. The thing about "normal behavior" is that its definition depends entirely on context. Normal for one person in one job is abnormal for another. "There is no normal across a department," says Nehmer, "There is no normal across a command ... We've been doing some machine learning in the department and they've been looking at what normal behavior looks like by a single position. You go to a particular component, you go to a sub unit in that component, and then you look at a position. We know what that should look like. That's where we've done the homework." "For instance, say you have someone who is an administrative assistant. And this assistant is spending a lot of time looking at foreign military websites. And they're downloading things off the Internet and sending emails to a foreign email address. So someone looks into that and finds that the person is actually putting together travel for one of the flags [flag officers], in that particular country." Nehmer says that that sort of behavior should be automatically flagged by a user activity monitoring, or UAM, system, prompting a closer inspection by a human analyst within the insider's component. It shouldn't necessarily trigger high institutional concern. Developing software to automatically flag and possibly mitigate concerns as they come up will involve training programs on massive amounts of anonymized data related to emails, texts, and messages. As continuous evaluation rolls out, a higher level of surveillance is going to become the norm across the Defense Department. Patricia Larsen, co-director of the National Insider Threat Task Force, said that while continuous evaluation might feel intrusive for DOD employees, it doesn't actually represent a fundamental change from types of screening and vetting procedures that the Department undertakes now. Analysts looking for insider threats today can use a tool called the Automated Continuous Evaluation System, or ACES, to run queries about an individual across different databases. It's Google for instant background checks, not truly automatic. "ACES has been running for 20 years," Larsen said. "So we have been looking at you as a person. But it's been a slow, methodical and sometimes painstaking way of doing it. What we're saying is that there's a lot of information about you that's already out there. We want to put it together in one place so we can short-circuit the information gathering point and get to the analysis of you faster and be able to look at you more proactively." Carrie Wibben, director security policy and oversight division for

the Office of the Under Secretary of Defense (Intelligence) likened the new level of scrutiny to a routine lie-detector test. “I don’t like that,” she said, “but I feel better knowing that everyone alongside me had to go through the same polygraphic examinations that I had.” Of course, continuous evaluation will be a great deal more intrusive than a one-time polygraph session. It will, among other things, collect every DOD worker’s public posts on social media along with all other communication that the Department can legally collect. Such data could be used, as far as possible, to monitor not just credit and life changes but each individual’s current emotional state. “A machine could monitor that and get a contextual feel for a person’s mood. I think that’s in the future. But we have to sift through the volumes that we’re talking about and you have to get a baseline for people,” said Nehmer. Deriving a sense of mood or sentiment from textual clues, perhaps in real time, is a fast-growing area of machine learning research. Consider this paper by Chris Poulin in which he and his fellow researchers tried to use subtle language clues harvested from social media to predict which veterans might attempt suicide. They found indicators that allowed them to predict with better than 65% accuracy. Then there’s another worry: the data that’s left off the table. Asked how her office was looking into deep web or dark web content for insider threat indicators, Wibben answered, “We’re not looking to that at all. We have to stay within the bounds of the [Standard Form 86] consent form, so things that individuals put out there publicly, that’s what we’re looking at right now. If you protect it behind a password, we’re not looking at it... at least not on the background investigation, continuous evaluation side.” All the data that DOD can obtain, legally but at no small inconvenience to those who soldiers who create it, may still not be enough to prevent future insider attacks from taking place.

All Agencies are in ITP

The DOD is part of XO 13587

NCSC.gov No Date

(NATIONAL INSIDER THREAT TASK FORCE MISSION FACT SHEET,
http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf, JZG)

Who runs the task force, and which agencies are involved? Under Executive Order (E.O.) 13587, the National Insider Threat Task Force (NITTF) is co-chaired by the U.S. Attorney General and the Director of National Intelligence (DNI). They, in turn, designated the Federal Bureau of Investigation (FBI) and the National Counterintelligence Executive (NCIX) to co-direct the daily activities of the NITTF. The NITTF comprises employees and contractors from a variety of federal departments and agencies (D/A), and its work impacts more than 70 federal D/As that handle classified material. Currently, the following departments and agencies have representatives on the NITTF: FBI, Office of the National Counterintelligence Executive (ONCIX), Defense Intelligence Agency (DIA), Veterans Administration (VA), and Department of Justice (DOJ). The NITTF responds directly to the Senior Information Sharing and Safeguarding Steering Committee, which was also established under E.O. 13587. The Steering Committee comprises representatives from largely Intelligence Community agencies with extensive access to classified networks and materials, including the Departments of State, Energy, Justice, Defense, and Homeland Security, CIA, FBI, ODNI, ONCIX, NSA, DIA, the Program Manager--Information Sharing Environment, Office of Management and Budget, the National Security Council Staff, and the Information Security Oversight Office.

All agencies are included

NCSC.gov No Date

(NATIONAL INSIDER THREAT TASK FORCE MISSION FACT SHEET,
http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf, JZG)

Is every agency required to implement the new minimum standards? Yes, taken together, the E.O. and the national policy mandate that every executive branch agency with access to classified information establish an insider threat program in line with standards and guidance from the NITTF. However, there is a recognition of differing levels of risk—and, therefore, differing levels of protection required—based on such things as size of cleared population, extent of access to classified computer systems, and amount of classified information maintained by the D/A. The national insider threat policy directs heads of D/As to develop their programs using risk management principles. The NITTF is working with D/As, as well as the Classified Information Sharing and Safeguarding Office in the office of the Program Manager--Information Sharing Executive, to assess the extent of applicability of the minimum standards to each of the 70+ executive branch D/As with access to classified information based on associated risk.

Coast Guard CP

CP Text: The Coast Guard should implement reforms to its insider threat program.

Coast Guard insider threat prevention needs to be reformed to solve

McDermott 15

(Ryan -Editor in the Government Publishing Group at FierceMarkets, G: Coast Guard taking steps to reduce insider threats, but more needs to be done, April 9, 2015, <http://www.fiercehomelandsecurity.com/story/ig-coast-guard-taking-steps-reduce-insider-threats-more-needs-be-done/2015-04-09>, JZG)

Although the Coast Guard has taken steps to reduce insider threats, there's still more to do, including training Coast Guard employees about insider threat awareness, says a March 27 Homeland Security Department inspector general report. The IG reviewed the efforts of the Coast Guard's progress toward protecting its information technology assets from threats posed by its employees, especially those with trusted or elevated access to sensitive but unclassified information systems or data. Coast Guard has generally been doing a good job, the report (pdf) says. The service established an Insider Threat Working Group designed to implement a program focused on the insider risk and has established the Cyber Security Operations Center to monitor and respond to potential insider threat risks. They also implemented a process to verify that system administrators have the appropriate level of access to information technology systems and networks to perform their assigned duties. But Coast Guard still needs to implement software to protect against the unauthorized removal of sensitive information through the use of removable media devices, such as flash drives, and email accounts. Coast Guard also should implement stronger physical security controls to protect Coast Guard's information technology assets from possible loss, theft, destruction or malicious actions, the IG says. Employees at the Coast Guard all need better threat security awareness training, says the report. Coast Guard agreed with all of the IG's recommendations.

2NC

Coast guard reform is needed – prevents terrorism and allows for an effective coast guard

Kimery 15

(Anthony, Insider Threats Continue To Pose Risks To USCG, IG Audit Found 04/07/2015, <http://www.hstoday.us/briefings/daily-news-analysis/single-article/insider-threats-continue-to-pose-risks-to-uscg-ig-audit-found/b03b06fe2027f79bc68b50d296f5864e.html>, JZG)

The Department of Homeland Security (DHS) Inspector General (IG) concluded in a 29-page audit report that while the US Coast Guard (USCG) has taken steps to address the risk of insider threats to its information systems and data, is still needs to take additional steps to further address the risks posed by so-called "trusted insiders" inside the Coast Guard. "An internal breach by a trusted employee could impact [the Coast Guard's] ability to protect the nation's maritime interests and environment," the IG disclosed. Specifically, the IG said the Coast Guard needs to implement software to protect against the unauthorized removal of sensitive information through the use of removable media devices and email accounts; implementing stronger physical security controls to protect USCG's information technology assets from possible loss, theft, destruction or malicious actions; and providing insider

threat security awareness training for all Coast Guard employees. According to the IG's audit report, the Coast Guard "has taken some steps to address the risk of insider threats to its information systems and data, such as establishing an Insider Threat Working Group that's designed to implement a holistic program focused on the insider risk." "In addition," the IG stated, "USCG implemented a process to verify that system administrators have the appropriate level of access to information technology systems and networks to perform their assigned duties. Further, USCG established the Cyber Security Operations Center to monitor and respond to potential insider threat risks or incidents against USCG information systems and networks." The Coast Guard concurred with all three of the IG's recommendations, which, "if implemented, should strengthen USCG's management of the threat posed by trusted insiders," the IG stated. In its audit of Coast Guard efforts to address the risk posed by trusted insiders, the IG determined the USCG "has taken some steps to address the risk of insider threats," but that it also discovered "additional steps [that] are needed to further reduce the risk of insider threats to information technology assets." The IG said it's testing "revealed potential vulnerabilities in technical and physical security controls that could allow for: The unauthorized data removal from USCG information systems; and The loss, theft or destruction of information technology assets. "In addition," the IG stated, "insider threat security awareness training is needed for USCG employees. The IG's audit report stated, "Trusted insiders could be given elevated access to mission-critical assets, including personnel, facilities, information, equipment, networks or systems. Potential threats can include damage to the United States through espionage, terrorism and unauthorized disclosure of national security information." Continuing, the IG said, "Trusted insiders may also be aware of weaknesses in organizational policies and procedures, as well as physical and technical vulnerabilities in computer networks and information systems." And "this institutional knowledge poses a continual risk to the organization," the IG's audit said, emphasizing that, "In the wrong hands, insiders use this knowledge to facilitate malicious attacks on their own or collude with external attackers to carry out such attacks." According to Coast Guard officials interviewed at length by the IG, "a malicious insider could do the most harm to the USCG mission by: Compromising sensitive and classified information; Damaging operational infrastructure and resources; and Causing loss of life through workplace violence.

ADAMS CP

1NC - Solvency

The Defense Advanced Research Projects Agency should substantially increase its funding for the Anomaly Detection at Multiple Scales program.

ADAMS is still in its infancy—but success makes the ITP more effective—destroys false positives

Keating 13 Joshua E. Keating is an associate editor at Foreign Policy. JUNE 13, 2013, "Type 'S' for Suspicious," <http://foreignpolicy.com/2013/06/13/type-s-for-suspicious/>

Government-funded trolls. Decoy documents. Software that identifies you by how you type. Those are just a few of the methods the Pentagon has pursued in order to find the next Edward Snowden before he leaks. The small problem, military-backed researchers tell Foreign Policy, is that every spot-the-leaker solution creates almost as many headaches as it's supposed to resolve. With more than 1.4 million Americans holding top-secret clearance throughout a complex network of military, government, and private agencies, rooting out the next Snowden or Bradley Manning is a daunting task. But even before last week's National Security Agency (NSA) revelations, the government was funding research to see whether there are telltale signs in the mountains of data that can help detect internal threats in advance. In the months following the WikiLeaks revelations, the Defense Advanced Research Projects Agency (DARPA) — the U.S. military's far-out tech arm — put out a number of requests for research on methods to detect suspicious behavior in large datasets as a way to root out rogue actors like Manning (or in more extreme cases, ones like Fort Hood shooter Nidal Malik Hasan.) The most ambitious of these is known as Anomaly Detection at Multiple Scales (ADAMS), a program that as an October 2010 research request put it, is meant "to create, adapt and apply technology to the problem of anomaly characterization and detection in massive data sets." The hope is that ADAMS would develop computers that could analyze a large set of user-generated data — the emails and data requests passing through an NSA office in Honolulu for instance — and learn to detect abnormal behavior in the system. The tricky part of this kind of analysis is not so much training a computer to detect aberrant behavior — there's plenty of that going around on any large network — it's training a computer what to ignore. "I like to

use the example of learning to recognize the difference between reindeer and elk," wrote Oregon State University computer scientist Tom Dieterich, who worked on developing anomaly detection methods for ADAMS, in an email to Foreign Policy. "If all I need to do is tell these species apart, I can focus on the size [of] their antlers and whether the antlers have velvety fur, and I don't need to consider color. But if I only focus on these features, I won't notice that Rudolph the Red-Nosed Reindeer is anomalous, because I'm ignoring color (and noses, for that matter). So in an anomaly detection system, it is important to consider any attribute (or behavior) that might possibly be relevant rather than trying to focus on a very few specific characteristics." Over the past three years, DARPA has shelled out millions of dollars on efforts to learn how to root out Rudolfs from the rest of the reindeer and find out exactly what these red noses look like. This includes a \$9 million award to Georgia Tech to coordinate research on developing anomaly detection algorithms. You can peruse much of the research funded through ADAMS online. For instance, a proposal by the New York-based firm Allure Security Technology, founded by a Columbia University computer science professor, calls for seeding government systems with "honeypot servers" and decoy documents meant to entice potential leakers to subversives. The files would alert administrators when accessed and allow the system to develop models for suspicious behavior. The company cheekily refers to this technique as "fog computing." Another ADAMS-funded paper by Carnegie Mellon University computer scientist Kevin Killourhy looks at systems to "distinguish people based on their typing." For instance, Killourhy explains, when three typists are asked to type the password ".tie5Roanl," the three users can be easily identified by how long they hold down the "t" key. The paper suggests such technologies "could revolutionize insider-threat detection," though unfortunately even the best systems can have an error rate of up to 63 percent, and detection can apparently be thrown off if the person just isn't a very good typist. (Note to prospective whistle-blowers: Try two-finger typing.) Under the fairly obtuse title "Non-Negative Residual Matrix Factorization with Application to Graph Anomaly Detection," two DARPA-supported IBM researchers attempted to identify the kind of behaviors that might indicate suspicious behavior in a large network. These included "a connection between two nodes which belong to two remotely connected communities," such as an author publishing a paper on a topic not normally associated with his or her research; "port-scanning like behavior," which is when a particular IP address is receiving information from an unusually high number of other addresses; and "collusion," such as a "group of users who always give good ratings to another group of users in order to artificially boost the reputation of the target group." The thinking has gone somewhat beyond the theoretical level. At a conference in May, researchers from defense firm SAIC presented results from the PRODIGAL (Proactive Discovery of Insider Threats Using Graph Analysis and Learning) research team — part of the overall ADAMS initiative — which tested a series of anomaly detection methods on an organization of approximately 5,500 users over the course of two months. "Red teams" were inserted into the data simulating characters such as a "saboteur," an intellectual property thief, and a "rager" — someone prone to "strong, vociferous, abusive, and threatening language in email/Webmail/instant messages." The detection methods varied widely in effectiveness. Such systems are clearly not yet up to the task of identifying a leaker before he or she strikes, and Dieterich, the Oregon State computer scientist, was cautious when asked whether they ever would be. "Anything I would say here would just be speculation, and artificial intelligence researchers have learned the painful lesson that we are very bad at predicting when, if, or how the methods we develop will be useful," he stated. ADAMS may still be in the trial stage, but "insider threat" detection was clearly a major priority for the U.S. government even before last week. In October 2011, for instance, President Barack Obama signed an executive order calling for the creation of an interagency Insider Threat Task Force charged with the "safeguarding of classified information from exploitation, compromise, or other unauthorized disclosure."

1NC – PTX Net Benefit

Black budget means no link to politics

Wired 12 02.15.12, "SEE FOR YOURSELF: THE PENTAGON'S \$51 BILLION 'BLACK' BUDGET" <http://www.wired.com/2012/02/pentagons-black-budget/>

Because it's not easy saying we have the complete number. The Pentagon likes to play a little hide and seek with its black budget. Projects with code names like the Navy's "RETRACT JUNIPER" and "LINK PLUMERIA" are simple enough to find in the research development, testing and evaluation budget (.pdf). As are many of the Army's "TRACTOR" projects: "TRACTOR NAIL," "TRACTOR CAGE," and so on. But then comes along a project like "TRACTOR DESK" hiding in one of the Army's eight research budget documents, while others find their way to the operations and maintenance and procurement budgets. These projects are also where to go when searching for what's getting cut. Something called the "Classified Program USD(P)," formerly valued around a respectable \$100 million, had its budget reduced to zero. "TRACTOR JUTE" is on life support and "COBRA JUDY" had the sting taken out of it. Most other projects saw lesser cuts, however, and others like "RETRACT MAPLE" even saw minor gains. This is also while the researcher at Darpa only received a slight trim. The Pentagon budget also sheds light on the shadowy world of special operations forces and their "new normal" requirements in Afghanistan "and other locations" like the Horn of Africa. According to SOCOM's operation and maintenance budget, an estimated 11,500 special forces personnel are expected to be in Afghanistan next year, a drop from the 12,321 (or so) commandos financed for this year. SOCOM is also getting a \$796 million shave, but some budget wizardry should make up the difference. According to the budget, \$889 million was shuffled from SOCOM's overseas spending to "baseline" budgets with titles like "contract services" and "contractor logistics support." Yet, "The overall amount of troops and missions within [Afghanistan] are projected to increase," it says. This means the special forces will

“require additional resources to reposition personnel and equipment as well as increase the number of missions executed,” says the report (.pdf). Though to put it in perspective, the Pentagon is still spending more on classified projects than most nations spend on their entire military forces in year. And that’s just the beginning. The budget for the Military Intelligence Program was released this week, adding another \$19.2 billion — down from a record \$27 billion in 2010. That also doesn’t include the budget for the National Intelligence Program, which oversees spy agencies like the CIA. Their budget hasn’t been released yet but prior budgets have shown it to hover in the \$50 billion range. So we could be talking about \$120 billion or more in black accounts. There’s also a slight problem. The Pentagon has another “classified” budget line with the money to show for it, but the dollar-amounts don’t match the individual projects. In other words, the exact amount the Pentagon spends on its black projects may, in fact, be a mystery even to itself.

2NC - Solvency

ADAMS key to effective data analysis

Hemsoth 12 Nicole Hemsoth, Co-Editor at The Platform, August 15, 2012, “How DARPA Does Big Data,” http://www.datanami.com/2012/08/15/how_darpa_does_big_data/

DARPA, like other government agencies worldwide, is struggling to keep up with its lava flow of hot military intelligence data. Research and public sector organizations have become experts at finding new ways to create data, so the challenge has been keeping up with it—effectively running fast enough to stay just ahead of the heat with the hopes of being able to understand its source before the stream hardens and becomes static, useless. As many are already aware, these challenges were at the heart of the U.S. government’s recent big data drive, where funding was doled out to address barriers to making use of the flood of intelligence, research and military data. This week we wanted to take a step back and look at how a defense-oriented intelligence and research organization is trying to capture, handle and make the best use of its data flows by highlighting select projects. Without further delay, let’s begin with the first big intel data project—NEXT — Who Needs Precogs When You Have ADAMS? >> Who Needs Precogs When You Have ADAMS? It’s a sad but relatively commonplace surprise when a soldier or government agent whom others might have thought to be in good mental health suddenly begins making bad decisions—either to the detriment of national security or those around him. When this happens, the first reaction is often one of awe, “how could something like this happen—how couldn’t someone know that there was a problem before it got to such a point?” In other words, in the case of a government that has some of the most sophisticated intelligence-gathering and analysis capabilities, how could anything slip through the cracks? DARPA is seeking to snag this problem by understanding operative and soldier patterns via network activity and large volumes of data with a \$35 million project that has been underway since late 2010. According to DARPA, the Anomaly Detection at Multiple Scales (ADAMS) program has been designed to “create, adapt and apply technology to anomaly characterization and detection in massive data sets.” The agency says that triggers in the large data would tip them off to possible “insider threats” in which “malevolent (or possibly inadvertent) actions by a trusted individual are detected against a background of everyday network activity.” DARPA says that the importance of anomaly detection is cemented in the “fact that anomalies in data translate to significant, and often critical actionable information.” They claim that operators in the counter-intelligence community are the target end users for ADAMS insider threat detection technology. While there are not many details about the actual algorithms or systems used to handle this information, when the project was first announced the agency was seeking an “automated and integrated modeling, correlation, exploitation, prediction, and resource management” system to handle the needs. Researchers from Georgia Tech are among those who are helping DARPA with its insider threat detection project. Under the leadership of computer scientist Dr. David Bader, the team has been in the midst of a \$9 million, 2-year project to create a suite of algorithms that can scan for such anomalies across a diverse pool of data, including email, text messages, file transfers and other forms of data. To develop new approaches for identifying “insider threats” before an incident occurs, Georgia Tech researchers will have access to massive data sets collected from operational environments where individuals have explicitly agreed to be monitored. The information will include electronically recorded activities, such as computer logins, emails, instant messages and file transfers. The ADAMS system will be capable of pulling these terabytes of data together and using novel algorithms to quickly analyze the information to discover anomalies. “We need to bring together high-performance computing, algorithms and systems on an unprecedented scale because we’re collecting a massive amount of information in real time for a long period of time,” explained Bader. “We are further challenged because we are capturing the information at different rates — keystroke information is collected at very rapid rates and other information, such as file transfers, is collected at slower rates.”

2NC – S False Positives

CP solves false positives—that's the internal link to Intel—perception solves groupthink

Defense Systems 11 Henry Kenyon, contributing writer for Defense Systems, Nov 17, 2011, "DARPA program seeks early detection of insider threats,"

<http://defensesystems.com/articles/2011/11/17/darpa-anomaly-detection-at-multiple-scales.aspx>

Usually the pattern of events that leads to a person becoming an insider threat is only discovered after the fact. Now a team of researchers funded by the Defense Advanced Research Projects Agency (DARPA) and the Army Research Office is developing a set of algorithms to detect anomalous activity before the damage is done. DARPA's Anomaly Detection at Multiple Scales (ADAMS) program seeks to create a software-based approach to track a person's online work activity — everything from e-mail messages to instant messages, file access, and Web traffic — to detect anomalous behavior, explained David Bader, the project's co-principal investigator and a professor at the Georgia Tech School of Computational Science and Engineering and the Georgia Tech Research Institute. The project is led by Science Applications International Corporation (SAIC) and includes researchers from Oregon State University, the University of Massachusetts, and Carnegie Mellon University. The project also seeks to determine how trusted insiders become radicalized; but doing so requires sifting through terabytes of data. This is a big challenge, one that requires powerful algorithms running on high performance computers, Bader said. One of the ADAMS program's predictive aspects will be to find and flag suspicious behavior before a security breach occurs. "Our system tries to find these individuals who have gone down that slippery slope, but before they've done any crime or anything illegal," he said. ADAMS will collect data and put the pieces together for analysts by highlighting potential threats. Researchers want the system to boil down the number of anomalies to a short list for an analyst to investigate. "Today an analyst is overwhelmed with thousands of anomalies per day," said Bader. The team is taking a different approach from traditional methods that use pattern matching and profiling by working on algorithms to identify suspicious user activities through change detection. Because an anomaly is an unexplained event in the context of a person's work routine, the algorithms being developed for ADAMS will allow analysts to understand a user's behavior. "Unlike pattern matching, which has many false positives, we're using a different approach to understand humans within an organization," he said.

DARPA is getting a lot more money—it can shift it to ADAMS

UPI 14 "Proposed 2015 budget means more funding for DARPA," March 6, 2014,

http://www.upi.com/Business_News/Security-Industry/2014/03/06/Proposed-2015-budget-means-more-funding-for-DARPA/36881394141291/

WASHINGTON, March 6 (UPI) -- The U.S. Defense Advanced Research Projects Agency says the Defense Department's proposed 2015 budget will restore more of its financial resources. Those resources, it said, will allow promising "investments in new technology-driven ideas for the United States." "We (the United States) are faced with huge uncertainties and shifting threats, but we also have unparalleled opportunities to advance technologies in a way that can provide the nation with dramatic new capabilities," said DARPA Director Arati Prabhakar. The proposed Defense Department budget is part of President Barack Obama's budget request to Congress. DARPA will receive \$2.915 billion in funding for 2015 if the current budget request is passed. The fiscal year 2014 appropriation was \$2.779 billion, which restored \$199 million in previously cut funding. DARPA said it lost 20 percent in real terms between fiscal 2009-2013. The new amount would "enable DARPA to invest more in vital areas that will improve U.S. national security by rethinking complex military systems, capitalizing on information at scale, and advancing biology as technology." Prabhakar said in a release. It also would allow DARPA to restore funding for its basic research portfolio so that we can continue to create new technologies in support of future capabilities."

Disadvantages

Terrorism

1NC — Terrorism

Leaks risk terrorism

Clapper 15 - Director of National Intelligence [James R. Clapper, *Worldwide Threat Assessment of the US Intelligence Community*, Senate Armed Services Committee, February 26, 2015

COUNTERINTELLIGENCE

We assess that the leading state intelligence threats to US interests in 2015 will continue to be **Russia and China**, based on their capabilities, intent, and broad operational scopes. Other states in South Asia, the Near East, and East Asia will pose increasingly sophisticated local and regional intelligence threats to US interests. For example, Iran's intelligence and security services continue to view the United States as a primary threat and have stated publicly that they monitor and counter US activities in the region.

Penetrating the US national decisionmaking apparatus and Intelligence Community will remain primary objectives for foreign intelligence entities. Additionally, the targeting of national security information and proprietary information from US companies and research institutions dealing with defense, energy, finance, dual-use technology, and other areas will be a **persistent threat** to US interests.

Non-state entities, including transnational **organized criminals and terrorists**, will continue to employ human, technical, and cyber intelligence capabilities that present a significant counterintelligence challenge. Like state intelligence services, these non-state entities **recruit sources** and perform physical and technical surveillance to facilitate their illegal activities and avoid detection and capture.

The internationalization of critical US supply chains and service infrastructure, including for the ICT, civil infrastructure, and national security sectors, increases the potential for subversion. This threat includes individuals, small groups of "hacktivists," commercial firms, and state intelligence services.

Trusted insiders who **disclose sensitive** US Government information without authorization will remain a significant threat in 2015. The technical sophistication and availability of information technology that can be used for nefarious purposes exacerbates this threat. Pg. 2

Politics

1NC — Politics Link

Massive congressional opposition to eliminating the Insider Threat Program. National Defense Authorization Act proves

Aftergood 14 - Directs the FAS Project on Government Secrecy. [Steven Aftergood, "Congress Tells DoD to Report on Leaks, Insider Threats," *Federation of American Scientist*, Posted on Dec.08, 2014, pg. <http://tinyurl.com/o4tq4y9>

For the next two years, Congress wants to receive quarterly reports from the Department of Defense on how the Pentagon is responding to leaks of classified information. The reporting requirement was included in the pending National Defense Authorization Act for FY 2015 (Sec. 1052).

"Compromises of classified information cause indiscriminate and long-lasting damage to United States national security and often have a direct impact on the safety of warfighters," the Act states.

"In 2010, hundreds of thousands of classified documents were illegally copied and disclosed across the Internet," it says, presumably referring to the WikiLeaks disclosures of that year.

"In 2013, nearly 1,700,000 files were downloaded from United States Government information systems, threatening the national security of the United States and placing the lives of United States personnel at extreme risk," the Act states, in a presumed reference to the Snowden disclosures. "The majority of the information compromised relates to the capabilities, operations, tactics, techniques, and procedures of the Armed Forces of the United States, and is the single greatest quantitative compromise in the history of the United States."

The Secretary of Defense will be required to report on changes in policy and resource allocations that are adopted in response to significant compromises of classified information.

The defense authorization act does not address irregularities in the classification system, such as overclassification or failure to timely declassify information.

It does call for additional reporting on the Department of Defense "insider threat" program (Sec. 1628), and on "the adoption of an interim capability to continuously evaluate the security status of the employees and contractors of the Department who have been determined eligible for and granted access to classified information."

By definition, this continuous evaluation approach does not focus on suspicious individuals or activities, but rather is designed to monitor all security-cleared personnel.

2NC/1NR — Politics Links

Bipartisan support for the insider threat program

Sasso 13

(Brendan, Senators back NSA bill, target 'insider threats', 11/06/13,
<http://thehill.com/policy/technology/189416-senate-panel-advances-surveillance-funding>, JZG)

The Senate Intelligence Committee has advanced legislation to reauthorize funding for the National Security Agency and surveillance programs. The bill includes new funding for technology to combat "insider threats" and leaks of classified information. The committee approved the legislation in a 13-2 vote late Tuesday. The approval of the annual funding measure comes after leaks by former NSA contractor Edward Snowden earlier this year revealed controversial details about the scope of the government's secret surveillance programs. The bill would empower the director of national intelligence to make improvements to the government's process for investigating people with security clearances, such as Snowden. Intelligence officials say the Snowden leaks have damaged the ability of the U.S. to spy on terrorists and thwart attacks. The bill would create new protections for "legitimate" whistle-blowers to bring their concerns to Congress or agency leaders, the committee said. The measure would also make the NSA director and inspector general subject to Senate confirmation. "We recognize that budget reductions and sequestration are impacting our intelligence agencies, and Congress has a responsibility to ensure the [director of national intelligence] and other intelligence leaders have the resources and flexibility they need to protect the nation," committee Chairwoman Dianne Feinstein (D-Calif.) said in a statement. The exact level of funding for the surveillance programs is classified. According to documents leaked by Snowden to The Washington Post, the "black budget" for intelligence operations in 2013 was \$52.6 billion, including \$10.8 billion for the NSA alone. The funding reauthorization bill now heads to the Senate floor. The House Intelligence Committee has yet to move companion legislation.

Both houses support the ITP

Abbott 13

(Maxwell, PR Watch, Bills in Congress Crack Down on Whistleblowers, 21 December 2013,
<http://www.truth-out.org/opinion/item/20777-bills-in-congress-crackdown-on-whistleblowers#>, JZG)

President Obama was elected on a platform that included promises for increased transparency and openness in government. Despite this rhetoric, Obama has prosecuted more whistleblowers than any administration in history and overseen the massive growth of the NSA's surveillance apparatus. In November, the Senate (S. 1681) and House (H.R. 3381) Intelligence Committees each released their own version of the "Intelligence Authorization Act for Fiscal Year 2014." This was an opportunity for Congressional leadership to address one of the defining issues of our time and either take a stand for increased transparency or continue down an Orwellian path of pervasive secrecy. A review of each chamber's proposed legislation demonstrates that "1984" is the future. Stopping "Insider Threats" The bills contain provisions which will intensify efforts to stop whistleblowers or "insider threats," no doubt inspired by Edward Snowden and his release of sensitive NSA documents. The House version of the funding bill provides \$75 million of increased funding specifically for classified information protection. According to Tom Devine, Legal Director of the Government Accountability Project, "the 'insider threat' program is a cover for a witch hunt of whistleblowers."

The media and both parties support being tough on whistleblowers

Hanrahan 15 —John Hanrahan is a former executive director of The Fund for Investigative Journalism and reporter for The Washington Post, The Washington Star, UPI and other news organizations. He also has extensive experience as a legal investigator. Hanrahan is the author of Government by Contract and co-author of Lost Frontier: The Marketing of Alaska. 6-25-2015 ("War on Whistleblowers, After Obama," consortium news, 6-25-2015, Available Online at <https://consortiumnews.com/2015/06/25/war-on-whistleblowers-after-obama/>, Accessed 7-14-2015)

And here's another thing: With leaders of both political parties having either kept silent or cheered on the Obama administration's unprecedented crackdown on whistleblowers, who in high

position in Congress would have one shred of moral authority or credibility to challenge a future president's excesses under the Espionage Act? On the question of keeping American citizens in the dark and of punishing whistleblowers who dare to enlighten them, we truly have bipartisan authoritarianism.

NSA whistleblower Edward Snowden speaking in Moscow on Oct. 9, 2013. (From a video posted by WikiLeaks)

NSA whistleblower Edward Snowden speaking in Moscow on Oct. 9, 2013. (From a video posted by WikiLeaks)

And then a third thing: Don't count much on major U.S. news media for any meaningful oversight of, and opposition to, the treatment of whistleblowers under future presidents. The mainstream press and big-name journalists — with some intermittent, notable exceptions such as these two New York Times editorials and this Newark Star-Ledger editorial — have largely ignored the jail-the-whistleblowers policies of the Obama administration.

Or, worse, as we've reported before, some of the most prominent names in the media joined elected and appointed government officials in calling for harsh penalties for Edward Snowden, Chelsea Manning, Julian Assange and Wikileaks, and others whom they claim (without proof) to have endangered U.S. national security by providing classified information to the news media.

With his Justice Department having produced three times as many Espionage Act indictments for classified document disclosure as all other administrations combined since the passage of that legislation back in 1917, Obama has opened the door for his successors to continue — and even expand — the assault on national security state whistleblowers who act in the public interest.

Would any of the announced presidential candidates close that door after Obama leaves office in January 2017? Again, as with leading journalists and members of Congress, don't count on it.

It's an open question as to whether any future president could be more aggressive than Obama in going after whistleblowers. But based on the vengeful views of many of the large crop of Republican candidates and on Democratic front-runner Hillary Clinton's tough statements on Edward Snowden's NSA spying disclosures, prospects are not good for a sharp departure from the whistleblower crackdown of the last six years. Clinton and leading Republican candidates take the hard line that Snowden committed a serious crime and must be punished for it, with no chance of leniency.

Obama is all in on the war on whistleblowers [then some flip flop link in the other ptx file]

Chapman 15 —Chapman is president and founder of the American Small Business League, 4-30-2015 ("Congress should investigate the war on government whistleblowers," 4-30-2015, Available Online at <http://thehill.com/blogs/congress-blog/the-administration/240592-congress-should-investigate-the-war-on-government>, Accessed 7-14-2015)

I searched the phrase "Obama's war on whistleblowers" the other day and was stunned at the number of stories that popped up on the Internet. The Obama administration's unprecedented war on whistleblowers and the administration's historic lack of transparency has been reported all around the world.

Academy award winning director Robert Greenwald's documentary, *The War on Whistleblowers*, chronicles the nightmare four individuals endured to expose unsafe weapons systems at the Pentagon and illegal activities by federal agencies.

Congress should hold hearings on why federal employees and private citizens that have exposed blatant wrong doing by federal contractors and illegal behavior by federal agencies continue to be harassed and persecuted.

Individuals that report fraud and illegal activities by federal agencies are still having their careers ruined and in some cases facing federal prosecution and even harassment by the IRS.

If you uncover a government contractor that has cheated the federal government you can receive millions in rewards under the False Claims Act. I think the same principal should apply for uncovering fraud within the federal government. If a federal employee or private citizen exposes fraud within the federal government they should be assisted and protected not persecuted and prosecuted.

have won dozens of legal battles with the federal government under the Freedom of Information Act. My research prompted the first GAO investigation into fraud in federal small business contracting programs. Now the House Small Business Committee has unanimously adopted an amendment to request yet another GAO investigation into fraud in federal small business contracting programs based on my research. Rep. Janice Hahn (D-Calif.) drafted the amendment to uncover why Fortune 500 firms continue to land billions in federal small business contracts year after year. The federal government should support and protect private citizens like myself that expose fraud and abuse within the government, but unfortunately that has not been my experience.

I recently won a major Freedom of Information Act case against the Pentagon. Federal District Court Judge William Alsup described me as being in a "David and Goliath" battle with "big government." In talking about the Pentagon's efforts to withhold information Judge Alsup stated, "and here is the United States covering it up." In a subsequent hearing he accused the Pentagon of "trying to suppress the evidence." Is the United States Department of Justice helping me to uncover abuse and mismanagement at the Pentagon? No, the Department of Justice is representing the Pentagon and essentially helping them withhold evidence of possible fraud and abuse in the Pentagon's Comprehensive Subcontracting Plan Test Program (CSPTP).

It seems like I'm doing the job the Justice Department and the SBA Office of Inspector General should be doing. Shouldn't they be doing all the work I have done to expose fraud and abuse in federal small business contracting and subcontracting programs?

Looking at the way whistleblowers have been treated recently I'm concerned that I'm more likely to get a retaliatory IRS audit and/or prosecution by the Department of Justice than any kind of protection or assistance from the federal government.

Flip flopping when it comes to Executive Orders drains Political Capital — immigration proves
Brown 14 —Carrie Budoff Brown is the editor of POLITICO Europe. , 7-25-2014 ("Obama's immigration flip flop," POLITICO, 7-25-2014, Available Online at

<http://www.politico.com/story/2014/07/barack-obama-immigration-rhetoric-then-vs-now-109352.html>, Accessed 7-14-2015)

Obama's pledge to use his executive powers by the end of the summer marked both a dramatic reversal in rhetoric and a major strategic shift on immigration. The president is no longer emphasizing his own powerlessness but rather his determination "to fix as much of our immigration system as I can on my own, without Congress."

The administration is examining how far it can go, legally and politically, to protect millions of undocumented immigrants from deportation. Despite the flow of young Central American children across the southwestern border, Obama remains committed to taking significant action, according to senior advisers and advocates who have attended recent meetings with White House officials.

In other words, Obama has signaled that he intends to do exactly what he's long said he's unable to do.

"I take executive action only when we have a serious problem, a serious issue, and Congress chooses to do nothing," Obama said last month in his Rose Garden announcement. "And in this situation, the failure of House Republicans to pass a darn bill is bad for our security, it's bad for our economy, and it's bad for our future."

Even immigrant rights advocates, who were on the receiving end of the White House denials for years, were surprised by his abrupt and enthusiastic move toward executive action in June after House Speaker John Boehner (R-Ohio) ruled out a legislative overhaul of immigration this year. Activists had gotten so fed up in recent months that some tagged the president as the "deporter-in-chief" and demanded that he shift immediately from a legislative strategy to an administrative one.

"The way they talked about it was, 'There's nothing we can do, only Congress can solve it, we don't have the authority,'" said Lorella Praeli, director of advocacy and policy for United We Dream. "That is very different from what they are saying today. It is completely different."

The shift could be used by critics as an example of Obama saying one thing and doing something else, another "evolution," in White House parlance, on a hot-button social issue. Some Republicans see it as fertile ground for advancing their midterm election strategy, which focuses on raising questions about the president's credibility and competence.

"It brings into question, when he commits to other things, whether he will keep that commitment," said Sen. John McCain (R-Ariz.), who worked closely with Obama on passing a Senate immigration overhaul bill last year. "Things in this town, to a large degree, are done on people's commitments."

Executive Orders divide Democrats and unite the GOP against Obama.

Kraushaar 14 —Josh Kraushaar is the political editor for National Journal, and pens the weekly "Against the Grain" column. Kraushaar has been managing editor for politics at National Journal, and as executive editor and editor-in-chief of The Hotline. In addition to his management of The Hotline, Kraushaar plays a critical role in shaping National Journal's overall political coverage. He was a political correspondent for Politico. Kraushaar has also served as the editor of

House Race Hotline. Kraushaar has appeared as a political analyst on television and radio, including FOX News, MSNBC, CNN, National Public Radio and C-SPAN., 11-18-2014 ("Obama's Agenda Threatens to Divide the Democratic Party," nationaljournal, 11-18-2014, Available Online at <http://www.nationaljournal.com/against-the-grain/obama-s-agenda-threatens-to-divide-the-democratic-party-20141118>, Accessed 7-14-2015)

President Obama's biggest problem over the next two years may not be coming from recalcitrant Republicans, but from members of his own party blanching at his activist agenda over the final two years of his presidency. While the midterm election results suggested widespread dissatisfaction with the president's policies, Obama nonetheless is planning to press forward on several polarizing decisions in his final two years. It could help advance his legacy, but come at the expense of the Democratic Party's long-term health.

Three of the administration's biggest agenda items—threatening a veto of bipartisan legislation authorizing construction of the Keystone XL pipeline, reaching a nuclear deal with Iran, and issuing an executive order legalizing millions of illegal immigrants—divide Democrats, and unite Republicans. If the president moves forward with all of them, it would aggravate fissures in an increasingly-divided Democratic Party. And it would put Hillary Clinton, his party's expected 2016 standard-bearer, in an uncomfortable position even before she announces her candidacy. She's already avoided taking stances, if not outright rejecting the direction Obama is heading during his final two years in office.

The dirty secret in Washington is that while Obama (rightly) blamed Republicans for holding positions to the right of the American electorate, the president is pursuing policies that are equally as far to the left.

Approving construction of the long-delayed Keystone XL pipeline may not be the most consequential legislation, but it is symbolic of the lengths the administration has gone to avoid a postelection bipartisan accomplishment. Embattled Sen. Mary Landrieu, on the ballot next month in a Louisiana Senate runoff, has been furiously lobbying colleagues to approve the pipeline, and won support from 14 Democrats in an unsuccessful vote Tuesday. A new USA Today poll of adults, conducted last week, found strong support for it—60 percent backing construction of the Keystone pipeline, with only 25 percent opposed. This month, the Pew Research Center found even 44 percent of Democrats supporting it, with 46 percent opposed. When Republicans take control of the Senate in January, it's expected to pass with at least 63 votes.

A president looking to change the tone in Washington would be well-served to find common ground on an issue that members of both parties agree on. But instead, he dismissed its job-creating benefits and left his spokesman, Josh Earnest, to hint at a veto last week. The project has now been delayed for six years. Given that energy issues played a consequential role in Senate contests from Colorado to Kentucky—and are dooming the prospects of an otherwise-reliable ally in Landrieu—the administration's stubbornness on the issue is baffling. If it's only a symbolic issue, why not use it to build some confidence-building capital with Republicans on other more significant goals?

Blame environmental activists, who make up a small slice of the Democratic electorate but an outsize share of influence, for the gridlock. The president is either being held hostage by his base, or is in sync ideologically with their interests. Either way, it's remarkably similar to the problems Republican congressional leaders faced with their rank-and-file—a conflict that led to the deeply unpopular government shutdown. (And as I wrote in last week's column, there are clear signs that

the incoming Republican-controlled House and Senate are more pragmatic than their predecessors, making the president's leftward lurch before the next Congress is even sworn in a case of awful timing.)

Public opinion is more closely divided on immigration reform. Majorities sympathize with the ends but not the means of the administration's intent to issue an executive order legalizing millions of undocumented immigrants. There's a reason that the president avoided intervening in the middle of the midterm campaign, a telltale acknowledgement that a unilateral decision was a major political loser. The latest round of polling backs that up. Among all adults surveyed in a new USA Today poll, a 46 percent plurality want the president to wait for the GOP Congress to act on immigration, while 42 percent support the president's desire to act now. If the sample was of registered voters, the margin would be even greater.

Within the White House, the prevailing political support for the sweeping executive action is twofold: Win back enthusiasm from Hispanic voters, and bait Republicans into opposing the move in the most self-defeating way possible. It's a risky political decision, one that downplays the fact that the White House is running against public opinion on the issue and spending the little political capital Obama has left in doing so. There's hardly a guarantee that Hispanics would respond to the executive order by turning out for Hillary Clinton, and it could spark a backlash from blue-collar voters migrating away from the party. Over one-quarter of Democrats oppose unilateral action on immigration, a significant enough minority to cause the party future problems. In the meantime, it risks foreclosing other opportunities for working with the GOP Congress on trade, tax reform, or even a scaled-back version of immigration reform in the future. Again, Obama is playing to the base over reaching out to the middle.

Unknown cost of Executive Orders cause fights and drain PC

Gregory Korte, 15 —Gregory Korte is a White House reporter for USA TODAY, focusing on executive power and the presidency, 3-21-2015 ("How much do executive orders cost? No one knows," USA TODAY, 3-21-2015, Available Online at <http://www.usatoday.com/story/news/politics/2015/03/21/cost-of-obama-executive-orders/25024489/>, Accessed 7-14-2015)

Public opinion is more closely divided on immigration reform. Majorities sympathize with the ends **but not the means** of the administration's intent to issue an executive order legalizing millions of undocumented immigrants. There's a reason that the president avoided intervening in the middle of the midterm campaign, a telltale acknowledgement that a unilateral decision was a major political loser. The latest round of polling backs that up. Among all adults surveyed in a new USA Today poll, a 46 percent plurality want the president to wait for the GOP Congress to act on immigration, while 42 percent support the president's desire to act now. If the sample was of registered voters, the margin would be even greater.

Within the White House, the prevailing political support for the sweeping executive action is twofold: Win back enthusiasm from Hispanic voters, and bait Republicans into opposing the move in the most self-defeating way possible. It's a risky political decision, one that downplays the fact that the White House is running against public opinion on the issue and spending the little political capital Obama has left in doing so. There's hardly a guarantee that Hispanics would respond to the executive order by turning out for Hillary Clinton, and it could spark a backlash

from blue-collar voters migrating away from the party. Over one-quarter of Democrats oppose unilateral action on immigration, a significant enough minority to cause the party future problems. In the meantime, it risks foreclosing other opportunities for working with the GOP Congress on trade, tax reform, or even a scaled-back version of immigration reform in the future. Again, Obama is playing to the base over reaching out to the middle.

When President Obama issued an executive order granting civilian federal employees a 1% pay raise last December, the White House did not tell Congress how much those raises would cost.

Instead, White House Office of Management and Budget Director Shaun Donovan said in a report that the order "is not anticipated to increase discretionary obligations and outlays overall."

To Rep. Ander Crenshaw, R-Fla., that statement is "ludicrous."

As Congress and the White House battle over whether Obama has the executive authority to halt deportation, delay implementation of the Affordable Care Act or negotiate a nuclear deal with Iran, another skirmish has opened up over the question of how much Obama's executive orders cost.

The answer: No one knows.

Crenshaw, the chairman of a House appropriations subcommittee that controls the White House budget, is trying to fix that. He inserted a provision into the spending bill passed by Congress last year, requiring OMB to issue a statement on the budgetary impact of each executive order.

But 10 executive orders later, Congress has no more insight into their cost. OMB has declared six to have a "de minimus," or trivial, effect on costs or revenues, and four are expected to increase spending by an unknown amount.

For example, an executive order signed Thursday, requiring agencies to cut their greenhouse gas emissions by 40%, contains the same boilerplate language as the pay raise. "This executive order is not anticipated to increase discretionary obligations and outlays overall." But it also suggests long-term cost savings through decreased energy and water use.

Congress continues to support Insider Threat

Aftergood 14 — Steven Aftergood directs the FAS Project on Government Secrecy. ("Congress Tells DoD to Report on Leaks, Insider Threats," Federation Of American Scientists, 12-8-2014, Available Online at <https://fas.org/blogs/secrecy/2014/12/dod-leaks-report/>, Accessed 7-16-2015)

For the next two years, Congress wants to receive quarterly reports from the Department of Defense on how the Pentagon is responding to leaks of classified information. The reporting requirement was included in the pending National Defense Authorization Act for FY 2015 (Sec. 1052).

"Compromises of classified information cause indiscriminate and long-lasting damage to United States national security and often have a direct impact on the safety of warfighters," the Act states.

“In 2010, hundreds of thousands of classified documents were illegally copied and disclosed across the Internet,” it says, presumably referring to the WikiLeaks disclosures of that year.

“In 2013, nearly 1,700,000 files were downloaded from United States Government information systems, threatening the national security of the United States and placing the lives of United States personnel at extreme risk,” the Act states, in a presumed reference to the Snowden disclosures. “The majority of the information compromised relates to the capabilities, operations, tactics, techniques, and procedures of the Armed Forces of the United States, and is the single greatest quantitative compromise in the history of the United States.”

The Secretary of Defense will be required to report on changes in policy and resource allocations that are adopted in response to significant compromises of classified information.

The defense authorization act does not address irregularities in the classification system, such as overclassification or failure to timely declassify information.

It does call for additional reporting on the Department of Defense “insider threat” program (Sec. 1628), and on “the adoption of an interim capability to continuously evaluate the security status of the employees and contractors of the Department who have been determined eligible for and granted access to classified information.”

Insider Threat DA

The NITTF is vital for national security but still preserves an environment of productivity and trust
NCSC, '14, (“National Insider Threat Task Force Mission Fact Sheet,” NCSC, Aug 15, 2014, http://www.ncsc.gov/nitff/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf)//erg

Why was the NITTF established? The National Insider Threat Task Force was established after the WikiLeaks release of thousands of classified documents through the global media and internet. Its mission is to deter, detect and mitigate actions by employees who may represent a threat to national security by developing a national insider threat program with supporting policy, standards, guidance and training. Who runs the task force, and which agencies are involved? Under Executive Order (E.O.) 13587, the National Insider Threat Task Force (NITTF) is co-chaired by the U.S. Attorney General and the Director of National Intelligence (DNI). They, in turn, designated the Federal Bureau of Investigation (FBI) and the National Counterintelligence Executive (NCIX) to co-direct the daily activities of the NITTF. The NITTF comprises employees and contractors from a variety of federal departments and agencies (D/A), and its work impacts more than 70 federal D/As that handle classified material. Currently, the following departments and agencies have representatives on the NITTF: FBI, Office of the National Counterintelligence Executive (ONCIX), Defense Intelligence Agency (DIA), Veterans Administration (VA), and Department of Justice (DOJ). The NITTF responds directly to the Senior Information Sharing and Safeguarding Steering Committee, which was also established under E.O. 13587. The Steering Committee comprises representatives from largely Intelligence Community agencies with extensive access to classified networks and materials, including the Departments of State, Energy, Justice, Defense, and Homeland Security, CIA, FBI, ODNI, ONCIX, NSA, DIA, the Program Manager--Information Sharing Environment, Office of Management and Budget, the National Security Council Staff, and the Information Security Oversight Office. What is an insider threat? It is a threat posed to U.S. national security by someone who misuses or betrays, wittingly or unwittingly, his or her authorized access to any U.S. Government resource. This threat can include damage through espionage, terrorism, sabotage, unauthorized disclosure of national security information, or through the loss or degradation of departmental resources or

capabilities. ⁽⁶⁶⁾ How does the task force operate? The NITTF has drawn together expertise from across the government in the areas of security, counterintelligence, and information assurance to develop the policies and standards necessary for individual D/As to implement insider threat programs. Part of the NITTF **effort involves** hosting training and providing D/As with **assistance to better educate their workforce to recognize potential insider threat activity, without creating an atmosphere of distrust.** The NITTF conducts assessments of the adequacy of insider threat programs within individual D/As. Through its interface with individual D/As, the NITTF identifies and circulates best practices for detecting, deterring and mitigating emerging threats, and continues to assist D/As in troubleshooting issues. How do you detect an insider threat? Detection of potentially malicious behavior involves authorized insider threat personnel gathering information from many sources and analyzing that information for clues or behavior of concern. A single indicator may say little; however, if taken together with other indicators, a pattern of concerning behavior may arise that can add up to someone who could pose a threat. It is important to consider relevant information from multiple sources to determine if an employee's behavior deserves closer scrutiny, or whether a matter should be formally brought to the attention of an investigative or administrative entity, such as the FBI or an agency's Inspector General. It is also possible that the individual has no malicious intent, but is in need of help. In either case, the individual may pose a threat to national security, and the situation requires further inquiry.

DOD insider threat prevention is getting better now- new tech and behavioral analysis solve threats

Pomerleau 15

(Mark, Jul 16, 2015, DOD trying behavioral analytics as a way to thwart insider threats, <http://defensesystems.com/Articles/2015/07/16/DOD-IC-behavioral-analytics-insider-threats.aspx?Page=3>, JZG)

The thought of a data breach such as the one that hit the Office of Personnel Management is truly frightening to government officials and the public at large. The sensitive personal data of tens of millions of federal employees that has been lifted recently not only puts individuals at risk, but compromises certain operational practices of the U.S. military/intelligence complex. But while these incidents are disturbing, they are also to be expected. "To grab the equivalent in the Chinese system, I would not have thought twice," former CIA and NSA chief Gen. Michael Hayden (ret.) said recently about the OPM hacks thought to be perpetrated by China. "I would not have asked permission...This is not 'shame on China.' This is 'shame on us' for not protecting that kind of information." And while the U.S. works to exploit intelligence gaps and deficiencies of adversaries and protect its own data from similar attacks, one other trend that has blindsided the defense and intelligence communities can't be overlooked—leaks from the inside. The insider threat has posed significant challenges, from the trove of millions of documents unearthed by former contractor Edward Snowden to the documents released by former Army Pvt. Chelsea Manning. "The insider threat is not new. But what is changing is that threat landscape," Patricia Larsen, co-director of the National Insider Threat Task Force of the Office of the Director of National Intelligence, said this week during a panel discussion in Arlington, Va., hosted by Defense One. Larsen noted that in the not-so-distant past, these types of breaches were much harder to pull off. One had to stand at a copier, copy several pages, and meet someone somewhere. "Now, somebody sitting at the comfort of their desk can go to a website...and find their secure drop page and upload a classified document or something sensitive, still be anonymous and have that published in tomorrow's Washington Post...That is a whole different paradigm," she warned. For Larsen, however, the part of the solution for mitigating potential threats also poses a risk if one is capable of getting into the system. "In the past, it was very hard to get a lot of information about you as a person in one place," she said. "Now, it is so much easier to pull the entire 360 of an individual using technology and using all the data we've collected on you. That is a great, great asset for any insider threat program. It's also a liability because that same individual can access a ton of information sitting from the comfort of their own workstation as well." The Defense Department is trying a few different technological approaches to mitigating the insider threat, through various

beta programs and behavioral analytics. One such effort is the creation of the DOD Insider Threat Management and Analysis Center, or DITMAC, which would “enable information sharing collaboration analysis and risk management across the Department of Defense components to address current and emerging threats to DOD personnel and missions,” said Mark Nehmer, deputy chief of implementation for DITMAC. In 2013, then-Secretary of Defense Chuck Hagel outlined the establishment of DITMAC as one of four key recommendations following the Navy Yard shooting. Over the past year, DITMAC has worked “to really gather and fuse relative information from different data sources within the department,” said Carrie Wibben, director of Security Policy Operations Directorate at the Office of the Undersecretary of Defense. Information Management Enterprise System Application, or IMESA, is another approach being used to vet individuals with regard to workplace violence, Wibben said. IMESA is also useful for evaluating the identity of individuals by comparing Common Access Cards with information in internal and external databases to ensure that individuals are who they say they are. DOD also is working with behavioral analytics, Nehmer said, to compile the indicators, characteristics and behaviors associated with insider threats, including “how they’ve written, where were they in social media, where were they in their work life, where were they in their personal life that we know of that we can find – as deep a dive as we can get on the individuals that we know have actually committed insider threat behaviors.” But despite the push of what Nehmer called this “human science,” he said he’s not sure when DOD will be able to establish verifiable metrics for identifying insider threats. The other component to the behavioral issue is tying it to authorizing users within the network. “Authentication goes back to identity. It says you’re credentialed to get in. But what if you steal the credentials? Well now you’re authorized, you have the authority to be there but you still shouldn’t,” Christine Heckart, CMO of Brocade, a data storage and networking solutions firm, said in an interview in June. “So, we’ve got to look beyond identity, beyond the normal sources of authentication to behavior. The network can understand and take a benchmark on all kinds of behavioral based analytics. What is the norm? And the minute you start deviating from that norm, you can say ‘alright, there might be a problem.’” Heckart explained that in real time, the network can respond by either stopping traffic and calling for more analytics or shutting down operations until a human authorizes the activity. “Once we add behavioral-based analytics and tools to the identity and credentialed based system, you’ve got additional layers,” of security protection, she said. Expanded use of multi-factor authentication is something that many security experts and Federal CIO Tony Scott have called for, especially after recent high-profile security breaches. Going forward, one challenge regarding analyzing online behavior, however, is context. Computers and humans have not figured out a way to determine context of social media postings to determine the tone, be it serious or sarcastic, though, this is only one component of a multi-pronged risk assessment.

Litany of reasons the program is good

Amjad and Gelles, ’15, (Adnan, partner, Cyber Risk Services, Deloitte & Touche LLP and Michael, director, Deloitte Consulting LLP, “9 Building Blocks of Insider Threat Mitigation Programs,” CIO Journal, March 23, 2015, <http://deloitte.wsj.com/cio/2015/03/23/9-building-blocks-of-insider-threat-mitigation-programs/>)/erg

A definition of insider threats. Few organizations have a specific internal working definition of insider threats because they’ve traditionally paid more attention to preventing external attacks. Yet defining what constitutes an insider threat is an essential first step in formulating a mitigation program; it helps to inform the program’s size, structure, scope, and alignment with business risk priorities. Broadly speaking, an insider threat can be defined as an employee, contractor, or vendor that either maliciously or due to complacency or ignorance uses privileged access in a way that results in malfeasance, whether fraud, espionage, sabotage, data theft, or workplace violence. A risk assessment. It’s important to prioritize the critical assets requiring extra protection—for example, facilities, source code, and customer information—and determine the organization’s tolerance for loss of or damage to those assets. Identify the top threats that could affect your business and consider vulnerabilities from a technology and process perspective: What weaknesses or loopholes could an insider abuse? How could an employee exploit or damage a facility, product, process, or fellow employees without ever using a computer system? Tailor the development of the insider threat mitigation program to address those specific needs and threats, and take into account the organization’s culture—in other words, the specific measures it may or may not be willing to take (such as monitoring employees, blocking Web mail, or restricting the use of USB drives) to protect critical assets while sustaining the way it has traditionally operated and done business. Broad-based support. An insider threat mitigation program should have one owner but comprise a broad set of invested stakeholders. It should also have top leadership support. Consider establishing a cross-disciplinary insider threat working group with stakeholders from a variety of functions that may include HR, risk, legal, finance, IT, and research and development (R&D). These stakeholders can serve as change agents and cement buy-in from their respective functions. The working group should assist in addressing common concerns, such as privacy and legal issues, and support

the development of messaging tailored to executives, managers, and the broader employee population. Technology. Identity and access management systems, compliant provision systems, data loss prevention systems, digital rights management systems, and encryption are just a few of the technologies companies can implement to help monitor and prevent unauthorized access and restrict employees' ability to download, print, or transmit certain data assets. People-centric policies and training. While technology is an essential component of detecting and preventing insider threats, insider threats are fundamentally a people issue that involves a peoplecentric solution. Consequently, an insider threat mitigation program should define the behavioral expectations of the workforce through clear and consistently enforced policies that also articulate the consequences for violating them. Policy areas might include segregation of duties, social media, processes for reporting incidents, and bring your own device. The program should also include customized security training based on employees' physical and network access levels, privilege rights, and job responsibilities. Audits and verification. Establishing routine and random reviews of privileged and critical functions such as IT, finance, and R&D can also help identify potential insider threats. Continually monitor systems that employees in those functions access and the data they download. Organizations should trust their workforce, but balance that trust with verification to avoid unfettered access and single points of failure. Behavioral analysis. Case studies analyzed by the CERT Division of the Software Engineering Institute at Carnegie Mellon University³ have shown that insider threats are seldom impulsive acts. Instead, the analyses indicate that insiders move on a continuum from idea to action. Along the way, they often display observable behaviors that can serve as risk indicators or otherwise signal malicious intent: They may begin coming in late to work, staying at the office after hours, violating policies, or trying to access systems or facilities they don't typically use. Therefore, effective detection of insider threats should include behavioral-based techniques that consider how people operate in the office and on the network, and build baselines of normal behavior to help identify anomalies. Analytics. Correlating precursors or potential risk indicators can give organizations insights into micro and macro trends regarding the high-risk behaviors exhibited across the organization. An advanced analytics platform that correlates data from a variety of tools can help organizations identify potential insider threats to investigate. Analytics can also shed light on processes and policies that the organization should either strengthen or implement; these processes can often enhance efficiency and productivity.

Status quo solves—the program is becoming more targeted and effective—it's necessary for security

Dillard, '14, (John, President of Big Sky, application of evidence-based management science to security and insider threats, “Changes To National Insider Threat Policy: Is Your Agency Prepared?” Big Sky, 2014, [//erg](http://www.bigskyassociates.com/blog/bid/370857/Changes-To-National-Insider-Threat-Policy-Is-Your-Agency-Prepared)

Until recently, national insider threat policy wasn't measuring if your agency's insider threat detection program actually identified insider threats. The only measure was that you had a program that met certain standards. However, all of that is changing fast, especially for agencies under the Department of Defense. (Other agencies likely need to follow suit, more below.) Because of major insider threat incidents like THE WASHINGTON NAVY YARD SHOOTING and Edward Snowden's information leaks, federal law now mandates that your agency not only have an insider threat detection program, but that your internal organizational security meet specific functioning standards. In order to understand what action steps your agency needs to take today, we need to take a step back to review the evolving story of national insider threat policy. Memorandum For National Insider Threat Policy In November 2012, President Obama issued a MEMORANDUM FOR ALL AGENCIES UNDER HIS JURISDICTION entitled, “The National Insider Threat Policy and Minimum Standards for Executive Branch Insider Threat Programs.” The policy requires all executive departments and agencies that access classified information to establish insider threat detection programs. The required programs must adhere to minimum standards for personnel security, threat and risk

analysis, law enforcement, information sharing, network monitoring and training and awareness.

Each agency and department must conduct quarterly self-assessments on insider threat compliance and report the results to the National Insider Threat Task Force, which oversees the policy implementation. Memorandum Failure Points As with most far-reaching national policies, many of the memorandum's requirements aren't specific in expressing what insider threat compliance involves. Usually, it is up to the agencies themselves to determine compliance. For example, the mandatory self-assessments use metrics known as Key Information Sharing and Safeguarding Indicators (KISSI). These are essentially "yes or no" questions that assess whether an agency has an insider threat detection program. There are about fifty of these questions in the assessment, including: Do we have an implemented insider threat program? Do we have an insider threat policy? Do we monitor user activities for insider threat indicators? Do we conduct briefings for travel to countries with high-risk security threats and vulnerabilities? KISSI assessments are useful for a high-level view of an agency's insider threat compliance, but they don't measure the effectiveness of the program. Instead, metrics should CALCULATE THE VALUE OF DIFFERENT EFFORTS IN PREVENTING INSIDER THREATS and should require nuanced discussion in their answers. For example, after noting that your agency employs network monitoring tools, you should also ask: What kinds of network monitoring tools are employed? How much do they cost? What aspects of user behavior do they monitor? How effectively do they detect anomalous or suspicious behavior? With the Snowden affair and Navy Yard shooting occurring after the November 2012 memorandum was issued, the failure points of the policy became clearer. As a result, federal policy focused more intently on the effectiveness of insider threat detection programs. A Shift Toward Effectiveness: The 2014 NDA Act The best example this shift toward insider threat detection effectiveness is the 2014 National Defense Authorization (NDA) Act. This law mandates the Secretary of Defense, Director of National Intelligence and the Director of the Office of Management and Budget develop a strategy to modernize personnel security for the Department of Defense and reduce insider threats and espionage. The President and Congress also demanded that these updated processes be evaluated with specific metrics. By assessing the effectiveness of the Defense Department's insider threat detection program, the new law could be much more applicable in deterring and detecting potential threats. Implications For Other Federal Agencies While the NDA Act focuses primarily on Defense Department personnel, the law also emphasizes the importance of sharing information between different agencies – including those not under the Department of Defense. Specifically, it calls for the electronic integration of information systems between every agency deemed necessary for complete insider threat assessment and deterrence. If your agency is included in that information sharing or system integration, then you need to prepare your agency for full compliance with the NDA Act and its insider threat detection implications. The NDA Act shows that Congress and the President aren't satisfied with agency self-built and self-assessed insider threat programs – instead, they're raising the bar. While that might initially only include the Department of Defense and a handful of connected groups, every agency should plan for the NDA's jurisdiction to widen if its initial requirements are successful. Even if your agency doesn't fall under the initial jurisdiction of the new law, start preparing today for more accountable insider threat detection metrics. And since NDA requirements don't come with an explicit budget increase, plan to COMPLETE YOUR UPGRADES WITH LITTLE OR NO BUDGET BOOST.

Insider threat program secures DoD programs that combat terrorism and crime

Work, '14, (Robert O., Deputy Secretary of Defense, "The DoD Insider Threat Program,"

NUMBER 5205.16, September 30, 2014,

<http://www.dtic.mil/whs/directives/corres/pdf/520516p.pdf>//erg

1. PURPOSE. In accordance with sections 113 and 131 through 137 of Title 10, United States Code (U.S.C.) (Reference (a)); Presidential Memorandum (Reference (b)); Executive Orders (E.O.s) 12333, 13526, and 13587 (References (c), (d), and (e)); section 922 of Public Law 112- 81 (Reference (f)); National Security Directive 42 (Reference (g)), and Committee on National Security Systems Directive 504 (Reference (h)), this directive: a. Establishes policy and assigns responsibilities within DoD to develop and maintain an insider threat program to comply with the requirements and minimum standards to prevent, deter, detect, and mitigate actions by malicious insiders who represent a threat to national security or DoD personnel, facilities, operations, and resources. b. Identifies appropriate training, education, and awareness initiatives that may be made available to DoD personnel and contractors in accordance with Reference (b). c. Ensures appropriate DoD policies, including but not limited to counterintelligence (CI), cybersecurity, security, civilian and military

personnel management, workplace violence, emergency management, law enforcement (LE), and antiterrorism (AT) risk management, are evaluated and modified to effectively address insider threats to DoD. d. Cancels Secretary of Defense Memorandum (Reference (i)). e. Incorporates and cancels Deputy Secretary of Defense Memorandum (Reference (j)). 2. APPLICABILITY. This directive: a. Applies to: (1) OSD, the Military Departments, the Office of the Chairman of the Joint Chiefs of Staff and the Joint Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other ~~(OOO)~~ organizational entities within DoD (referred to collectively in this directive as the “DoD Components”). (2) Contractors and other non-DoD entities that have authorized access to DoD resources as required by their contract or agreement. (3) Individuals who volunteer and donate their services to the DoD Components, including non-appropriated fund instrumentalities, pursuant to DoD Instruction (DoDI) 1100.21 (Reference (k)). b. Will not alter or supersede: (1) The existing authorities and policies of the Director of National Intelligence regarding the protection of sensitive compartmented information and special access programs for intelligence as directed by Reference (c) and other laws and regulations. (2) Existing statutes, E.O.s, and DoD policy issuances governing access to or dissemination of LE, LE sensitive, or classified LE information. (3) Existing suspicious activity reporting and dissemination requirements as outlined in DoDI 2000.26 (Reference (l)). 3. POLICY. It is DoD policy that: a. DoD will implement the National Insider Threat Policy and Minimum Standards for Executive Branch Insider Threat Programs in accordance with References (b), (e), (f), and (h). b. The threat that an insider will use their authorized access to do harm to the security of the United States requires the integration and synchronization of programs across the Department. **This threat can include damage to the United States through espionage, terrorism, unauthorized disclosure of national security information, or through the loss or degradation of resources or capabilities.**

Insider Threat Program allows for reasonable monitoring in vital national security departments
Work, '14, (Robert O., Deputy Secretary of Defense, “The DoD Insider Threat Program,”
NUMBER 5205.16, September 30, 2014,
[//erg](http://www.dtic.mil/whs/directives/corres/pdf/520516p.pdf)

Through an integrated capability to monitor and audit information for insider threat detection and mitigation, the DoD Insider Threat Program will gather, integrate, review, assess, and respond to information derived from CI, security, cybersecurity, civilian and military personnel management, workplace violence, AT risk management, LE, the monitoring of user activity on DoD information networks, and other sources as necessary and appropriate to identify, mitigate, and counter insider threats. d. Appropriate training, education, and awareness of the insider threat will be provided to DoD military and civilian personnel, DoD contractors, and volunteers who have access to DoD resources. DoDD 5205.16, September 30, 2014 ~~(OOO)~~ e. The collection, use, maintenance, and dissemination of information critical to the success of **DoD efforts to counter insider threats must comply with all applicable laws and DoD policy issuances, including those regarding whistleblower, civil liberties, and privacy protections.** (1) Personally identifiable information (PII) for U.S. persons must be handled in accordance with section 552a of Title 5, U.S.C. (also known as “The Privacy Act of 1974” (Reference (m))), DoD Directive (DoDD) 5400.11 (Reference (n)), and DoD 5400.11-R (Reference (o)). (2) Defense Intelligence Components will handle U.S. persons’ PII in accordance with DoD 5240.1-R (Reference (p)). (3) Activities related to the insider threat program, including information sharing and collection, will comply with DoDI 1000.29 (Reference (q)). (4) **Information on individuals and organizations not affiliated with the DoD will not be collected** unless allowed pursuant to DoDD 5200.27 (Reference (r)). (5) **Personally identifiable health information must be handled in accordance with Public Law 104-191** (Reference (s)), parts 160, 162, and 164 of Title 45, Code of Federal Regulations (Reference (t)), DoDI 6490.04 (Reference (u)), DoDI 6490.08 (Reference (v)), DoD 6025.18-R (Reference (w)), and DoD 8580.02-R (Reference (x)). 4. RESPONSIBILITIES. See Enclosure 2. 5. INFORMATION COLLECTIONS REQUIREMENTS. The DoD Insider Threat Program annual progress report and quarterly Key Information Sharing and Safeguarding Indicators questionnaire self-assessment compliance reports, referred to in paragraphs 1e, 5d, 5e, 6e, 6f, 8g, 11f and 11h of Enclosure 2 of this directive, have been assigned report control symbol DD- CIO(A,Q)2561 in accordance with the procedures in Volume 1 of DoD Manual 8910.01 (Reference (y)).

Shift to more effective board/oversight is key—avoids paranoia and bad work environment

Bunn, '13, (Chris, Manager of IS Decisions, “Insider Threat Program. From Paranoia to Protection,” IS Decisions, 2013, <http://www.isdecisions.com/blog/it-security/insider-threat-program-from-paranoia-to-protetion//erg>)

The Unreported Insider Threat Insider cases are numerous and spin all industries. It's said that 3 out of 4 cases are unreported! As you can see reputation is perhaps the biggest risk of all. Organizations don't want to tell or don't even know. This shouldn't however be about the business of fear. It calls for a Risk Management approach. Understand the risk and balance it. This however, requires top level strategic oversight for any enterprise. Risk Management is and must be, a problem for the board. Are the board always considered when an organization attempts to manage these risks? From our own research involving 500 IT decision makers, the insider threat is not a top security priority, even for IT professionals. This however could be changing. The belief is that the Target Breach could well be a turning point. The breach resulted in the first CEO to lose their job because of an insider security breach and possibly five other directors to follow. This is significant. Every board should now be thinking this is not going to happen to me. we need to address this problem. The latest news however suggests that the retailer's chief executive and board may not get a complete picture on the company's security, if the CISO does not report directly to them. Proactive Steps to Mitigate the Risk Today's reality is there are proactive steps to mitigate the risk. But organizations and individuals are guilty of not having the time, so end up creating bigger gaps. One typical example is when employees who have left the organization still have access to the network. The thinking suggests if your organization is not doing the basics – forget about any more complex behavior analysis to alert high risks or any big data tools. Building an Insider Threat Program Building an Insider Threat Program moves an organization from paranoia to protection. Not only is this a sensible thing to do but a US Mandate means organizations must develop an Insider Threat Program if dealing with a federal government. It also applies to worldwide companies that are dealing with the US government. To help the CERT Insider Threat Centre has been serving as a trusted broker to assist the community in the short term and through ongoing research since 2001. The foundation of their work is a database of more than 1000 insider threat cases, government records and information from criminals themselves, which helps characterize the nature of the insider threat problem and offers dynamic indicators of insider threat risk. They also identify and experiment with administrative and technical controls for insider threat mitigation. The CERT Insider Threat Program helps organizations consider or start making themselves more secure and more immune to reputation and financial damage. In the UK, The CPNI (Centre for the Protection of National Infrastructure) and PA Consulting published new guidance (HoMER) to help organizations reduce employee risk. HoMER (Holistic Management of Employee Risk) offers a range of practical measures to help organizations reduce the risk from their employees. The risk ranges from oversight such as sharing passwords to opportunistic behavior including theft and fraud. Moving from paranoia to protection Moving from paranoia to protection means involving a sophisticated tool set, staff and manager's awareness and an efficient process. At IS Decisions, our solution UserLock is a unique and proven technology tool that helps organizations mitigate the risk of insider threat by securing users access to the shared Windows network. Whether we're dealing with careless or malicious activity both involve authenticated users who have access and rights. Organizations are recognizing the need to better manage and secure network access for authenticated users to reduce the risk of security breaches. FileAudit helps organizations proactively track, alert and report on all access (and access attempts) to files and folders. It helps protect an organizations most sensitive information stored on Windows Servers.

Team methods and co-worker cooperation can detect threats and eliminate dark corners that make attacks possible

Catrantzios, '10, (Nick, Adjunct Professor, Homeland Security & Author of Managing the Insider Threat: No Dark Corners, “Tackling the Insider Threat,” CRISP REPORT, ASIS Foundation, 2010, <http://www.popcenter.org/library/crisp/insider-threat.pdf//erg>)

All a hostile insider needs to carry out an attack are access to a worthy target, an open door, and a dark corner from which to study and strike. Insider threat studies abound, and the malicious insider phenomenon remains statistically rare yet potentially devastating to any institution with critical assets to defend. Accepted wisdom offers conventional

security advice: preemployment background investigations, random audits, tighter access controls, more invasive monitoring through procedural or technological innovations. This report combines a review of the insider threat literature with the findings of a Delphi study to arrive at a new approach to defeating the kind of trust betrayer intent on carrying out an attack that is fatal to the organization. While the Delphi research itself began with substantially the same views and counsel as prevailing wisdom represented in the literature, it ended altogether somewhere else. Certain pivot points in the research revealed that a reasonably prepared infiltrator poses a greater threat than a disgruntled career employee—at least if the focus is on adversaries bent on bringing an institution to its knees, rather than on exacting revenge against bosses or carrying out nuisance-level attacks against the employer. Research findings also highlighted flaws in traditional defenses, including background investigations that identify neither the prepared infiltrator nor the future disgruntled careerist. Findings even suggested random audits are seldom truly random and pose only a surmountable hurdle to a worthy adversary. Moreover, ineffective exercise of employer prerogatives like probationary periods appears underexploited as an insider threat defense. Into this context, **a new approach emerged. This approach is about engaging co-workers on the team level to take a hand in their own protection.** It calls into protective service the vast majority of employees consigned to the sidelines and sometimes referred to as the weakest link in insider defense. Instead, with a shift in emphasis toward more productive countermeasures, the proposed alternative brings these people off the sidelines and onto the front lines, making them the first line of defense. **No Dark Corners** extends to private spaces and institutions the seminal theories of proprietary interest and ownership that “Defensible Space” and “Fixing Broken Windows” demonstrated for public housing and community environments. In defending against insider threats, this approach proposes less emphasis on the laser of specialized monitoring by corporate sentinels. Instead, it promotes using the flashlight of open team engagement as a method of implementing layered defenses, particularly on the front lines of detection and intervention, where critical operations take place.

Snowden could have been detected with the program—insiders are dangerous but detectable

McNamara, '13, (Paul, “Snowden used sys admin role to collect passwords: Reuters,” Network World, Nov 8, 2013, <http://www.networkworld.com/article/2225752/security/snowden-used-sys-admin-role-to-collect-passwords--reuters.html>)//erg

Reuters is reporting this morning that former NSA contractor Edward Snowden "persuaded" some two dozen colleagues at a Hawaii government facility to give him their login credentials by claiming it was necessary for him to do his job as systems administrator. From that Reuters report: A handful of agency employees who gave their login details to Snowden were identified, questioned and removed from their assignments, said a source close to several U.S. government investigations into the damage caused by the leaks. Snowden may have persuaded between 20 and 25 fellow workers at the NSA regional operations center in Hawaii to give him their logins and passwords by telling them they were needed for him to do his job as a computer systems administrator, a second source said. The revelation is the latest to indicate that inadequate security measures at the NSA played a significant role in the worst breach of classified data in the super-secret eavesdropping agency's 61-year history. It's not clear whether "removed from their assignments" means fired or not, but, if true, his damaging the careers of coworkers will add another dimension to the debate about whether Snowden is a whistleblower or a traitor. What is clear has long been understood, though: There is no greater security threat than a "trusted" insider with access.

Behavioral analysis within the program stops attacks

Winkler and Manke, '14, (Ira, Irari Report, Secure Mentem, Internet Security Advisors Group and Samantha, Executive Vice President of Secure Mentem,” How to create awareness of the insider threat,” CSO, Apr 15, 2014, <http://www.csoonline.com/article/2142603/security-leadership/how-to-create-awareness-of-the-insider-threat.html>)//erg

One of the results of Edward Snowden's data leak is that companies are now concerned about the insider threat more than they ever were before. He demonstrates that a single person inside an organization can devastate the organization.

While technology should have caught Snowden, there is also the realization that his coworkers and managers should have noticed indications of unusual activities. The question then becomes how do you train employees to tactfully recognize the signs of a malicious insider, without creating widespread distrust within an organization. Back when I worked at NSA, one of my coworkers pointed out two documents that both describe a fellow employee who was 1) always interested in what their coworkers are doing, 2) volunteers for extra assignments, 3) always works late, and 4) never takes a vacation. One of the documents was from human resources on how to get promoted. The other was from the security department describing how to tell if your coworker is a spy. MORE ON CSO: 10 ways to prep for – and ace – a security job interview Clearly NSA employees failed to determine which side of the spectrum Snowden fell on, while employees at his past employer, the CIA, accurately determined his predisposition to expose classified information. Snowden demonstrates that even within organizations that should know better, detecting a malicious insider is hit or miss. How then is an organization outside of the Intelligence Community supposed to make their employees aware of the concern, especially without inspiring a witchhunt? The problem is real. Malicious insiders have wreaked havoc in organizations of all types. While the IT world focuses on stories of rogue administrators, insiders in all roles carry out thefts and other malicious actions. While some wrongdoers are very clever and are able to cover their actions very well, the reality is that just about all malicious insiders show indications of their intent. This is relevant to awareness programs as their coworkers are in the best position to see those indications. Balancing concerns of tact and awareness is delicate, but it must be done to maintain order. Generally, there are three requirements for awareness to be effective: 1) Understanding of the problem, 2) Knowledge of what actions to take, and 3) Motivation to take the appropriate actions. Generally understanding the problem should create motivation, but an effective awareness program must specifically ensure that it addresses both concerns. You can be aware an issue exists, while not being motivated to do anything about it. The easy part of addressing the insider threat is that there are now many examples to help get the message across. People like Snowden and Chelsea Manning are clear examples that it only takes one person to cause a lot of damage. While these individuals have become household names, it is better to use examples from your own company or industry. While some companies understandably do not like to highlight their own incidents, they can anonymize the cases. The message is actually simple, insiders are a big threat and do not ignore signs of questionable behaviors. The message tagline could be the organizational equivalent of, "If you see something, say something." The message should highlight to be on the lookout for violations of policies and procedures. It is also critical to remind employees that it is people, just like themselves, who have stopped major insider crimes. [Why companies need to check their handling of internal threats]

Insider Threat program utilizes patterns and best data studies

Moore, '14, (Andrew P, CERT Insider Threat Team Research Leader, "Designing Insider Threat Programs," SEI, September 29, 2014, <http://blog.sei.cmu.edu/post.cfm/designing-insider-threat-programs-272//erg>)

Insider threat is the threat to organization's critical assets posed by trusted individuals - including employees, contractors, and business partners - authorized to use the organization's information technology systems. Insider threat programs within an organization help to manage the risks due to these threats through specific prevention, detection, and response practices and technologies. The National Industrial Security Program Operating Manual (NISPOM), which provides baseline standards for the protection of classified information, is considering proposed changes that would require contractors that engage with federal agencies, which process or access classified information, to establish insider threat programs. The proposed changes to the NISPOM were preceded by Executive Order 13587, Structural Reforms to Improve the Security of Classified Networks and the Responsible Sharing and Safeguarding of Classified Information. Signed by President Obama in September 2011, Executive Order 13587 requires federal agencies that operate or access classified computer networks to implement insider threat detection and prevention programs. Since the passage of Executive Order 13587, the following key resources have been developed: The National Insider Threat Task Force developed minimum standards for implementing insider threat programs. These standards include a set of questions to help organizations conduct insider threat self-assessments. The Intelligence and National Security Alliance conducted research to determine the capabilities of existing insider threat programs The Intelligence Community Analyst-Private Sector Partnership Program developed a roadmap for insider threat programs. CERT's insider threat program training and certificate programs are based on the above resources as well as CERT's own Insider Threat Workshop.

common sense guidelines for mitigating insider threats, and in-depth experience and insights from helping organizations establish computer security incident response teams. As described in this blog post, researchers from the Insider Threat Center at the Carnegie Mellon University Software Engineering Institute are also developing an approach based on organizational patterns to help agencies and contractors systematically improve the capability of insider threat programs to protect against and mitigate attacks. A Pattern-based Approach to Insider Threat This post is the latest installment in an ongoing series describing our research to create and validate an insider threat mitigation pattern language to help organizations prevent, detect, and respond to insider threats. As described in a previous post, our research is based upon our database of more than 700 insider threat cases and interviews with the United States Secret Service, victims' organizations, and convicted felons. From that database, we identified 26 patterns that capture reusable solutions to recurring problems associated with insider threat. Insider threat mitigation patterns are organizational patterns that involve the full scope of enterprise architecture concerns, including people, processes, technology, and facilities. This broad scope is necessary because insiders often have authorized access—both online and physical—to organizational systems. Our approach acknowledges inter-relationships between organizational structures, such as policy, training, and employee and policy agreements, and draws upon those inter-relationships to describe the patterns themselves. The following is a high-level outline of a pattern for disabling access after an insider leaves an organization for other employment, an older version of which was published at the 2013 PLOP Workshop: Title: Eliminate Methods of Access after Departure Intent: To avoid insider theft of information or sabotage of information technology after departure Context: An insider is departing an organization for employment elsewhere and you have a comprehensive record of access paths the insider has for accessing the organization's systems Problem: Insiders who depart an organization under problematic circumstances may become angry to the point of wanting to steal information from the organization or compromise the integrity of the organization's information or information systems. Active access paths into the organization's systems after departure provide the opportunity to do that. Solution: Disable accounts that you know about upon departure, and prepare to monitor suspicious remote access after departure for signs of unauthorized access attempts Related Patterns: Monitor Activity after Departure For organizations and agencies establishing insider threat programs, our approach specifies what processes are important and stresses the need for consistent enforcement what policies are important how those processes and policies are implemented both by humans and technology what technology is needed to support all of that There will undoubtedly be great variation in insider threat programs, depending on the risks faced by individual organizations. We therefore use capability development scenarios to designate paths through the mitigation pattern language with the goal of mitigating a specific insider threat behavior. The mitigation pattern outlined above will be used in a capability development scenario described below. Such capability development scenarios serve to guide insider threat program designers as they try to ensure their programs are resilient against insider threats to their critical assets. An Example Capability Development Scenario In a forthcoming report on this topic, we will outline several capability development scenarios (CDSs). One scenario involves mitigating theft of intellectual property when an employee resigns or is fired from the organization: Through our analysis of our insider threat database, we observed that 70 percent of insiders who stole intellectual property from an employer did so within 60 days of their termination from an organization. This CDS urges that both parties must agree at employee hiring regarding the ownership of intellectual property as well as the consequences if the agreement is breached. Upon termination, whether voluntary or forced, the organization should disable insider's accesses. During the exit interview, the organization must review existing agreements regarding IP. The CDS advocates that an employer monitor insider actions 60 days prior to termination and for 60 days after termination. Suspicious behaviors including uncharacteristically large downloads of intellectual property should be handled either by the human resources or legal departments or a combination of both. As specified by the associated path through the mitigation pattern language, this CDS advocates that organizations Screen Employees Agree on IP Ownership Periodically Raise Security Awareness Log Employee Actions Increase Monitoring Due to an Employee's Pending Departure Reconfirm Employee Agreements on Departure Eliminate Methods of Access after Departure Monitor Activity after Departure In summary, mitigating theft of IP at departure involves ensuring that the organization increases their monitoring of any insider with access to critical assets for specific suspicious behaviors when the insider resigns or is terminated. In addition, the insider must agree to and be reminded that they can't take organization-owned IP with them. Future Work in Insider Threat Continuing our efforts to help federal agencies and contractors develop insider threat programs, per executive order 13587, we are now seeking active government partners to apply and refine our approach. We also are continuing our research into fundamental patterns of insider threat mitigation to make sure that they remain well grounded and validated scientifically. Looking ahead, we plan next to investigate insider social networks and the role they play in contributing to insider threat. In particular, we plan to examine how those social networks change over time to determine whether we can distinguish the social networks of malicious and non-malicious insiders. As part of this research, we are collaborating with Dr. Kathleen Carley, a professor at Carnegie Mellon University's Institute for Software Research in the School of Computer Science.

The insider threat program sets extensive threat mitigation standards—employees could unintentionally aid an external organization—detection and monitoring are key

Amjad and Gelles, '15, (Adnan, partner, Cyber Risk Services, Deloitte & Touche LLP and Michael, director, Deloitte Consulting LLP, “9 Building Blocks of Insider Threat Mitigation

Programs,” CIO Journal, March 23, 2015, <http://deloitte.wsj.com/cio/2015/03/23/9-building-blocks-of-insider-threat-mitigation-programs//erg>

You can't blame organizations that focus their cyber risk mitigation programs primarily, if not exclusively, on external threats. After all, external actors, including hostile nation-states and criminal organizations, are alleged to have been behind some of the most damaging and high-profile cyber attacks of the past two years. But, often enough, those external actors are assisted by an employee or third party associated with the targeted organization. An employee or contractor, either ignorant of or flippant toward company policies or specific security threats, may unwittingly download malware onto a corporate network, giving attackers access to intellectual property (IP), employee social security numbers, patients' protected health information, or customer credit card data. On other occasions, employees and contractors aren't innocent. When they leave a company, some may feel entitled to walk off with IP they helped to develop, even though the IP legally belongs to the organization. And even if they're not stealing sensitive information for personal or financial gain, plenty get a voyeuristic thrill from accessing data and records that literally aren't their business. According to a survey conducted on behalf of Raytheon, 65 percent of respondents indicated curiosity, not job necessity, compels users with privileged access to peek (or worse) at sensitive or confidential data.¹ Given the many ways insiders may threaten their organizations' security, it's no wonder nearly nine out of 10 IT professionals polled on behalf of data security provider Vormetric believe their organizations are vulnerable to insider threats.² And almost as many IT professionals surveyed appear to have trouble addressing the risks insiders can pose. According to the Raytheon survey, 88 percent of respondents are concerned about insider threats but have difficulty identifying specific threatening actions, and 69 percent said their security tools don't provide enough context to determine insiders' intent. A well-designed and executed insider threat mitigation program that considers how individuals conduct themselves in both virtual and physical environments and that includes policies, training, technology, behavioral analysis, and a broad set of stakeholders can help organizations detect, prevent, and respond to insider threats. Here are nine crucial components to consider when implementing a systematic insider threat mitigation program.

They are wrong—they get rid of key detection procedures. Behavioral analysis and awareness is key to catch threats

Garlipp, '14, (Matthew, Associate at Grant Thornton LLP, “HOW CAN YOU COMBAT INSIDER THREATS?” Gov Loop, December 3, 2014, <https://www.govloop.com/can-combat-insider-threats//erg>)

Insider threats can have severe consequences, with victim organizations facing significant costs and damages. According to the FBI, the average cost per incident is \$412,000, with victims losing an average of \$15 million a year. Although most agencies primarily focus on external cyber threats, it is crucial to also prepare and combat insider threats. The U.S. Computer Emergency Response Team (CERT) defines an insider threat as: A current or former employee, contractor, or other business partner who has or had authorized access to an organization's network, system, or data and intentionally exceeded or misused that access in a manner that negatively affected the confidentiality, integrity, or availability of the organization's information or information systems. Insider threats are not necessarily hackers and they often don't start with malicious intent. Usually a trigger event — such as a denied vacation or being bypassed for a raise or promotion — initiates the threat. What's more striking, the CERT Division of the Software Engineering Institute (SEI) at Carnegie Mellon University found that 90 percent of IT saboteurs were system administrators. Despite this, most security tools are designed with hackers in mind, but they're not always the real threat. For a more overarching, office-wide approach, Patrick Reidy, former chief information security officer at the FBI, offers three pieces of advice regarding insider threats: A good insider threat program should focus on deterrence, not detection. An employee's work environment, regardless of job function, should discourage insiders by crowdsourcing security and deploying data-centric, not system-centric, security. By creating a data-centric approach, organizations can monitor how data moves across an agency and block certain actions from occurring. This gives a more holistic view of data, rather than just simply monitoring a workstation or specific network systems. This helps create an environment where it is difficult to become an “insider.” Avoid the data

overload problem. In security efforts, do not get overwhelmed with data. Reidy proposes that only two sources of data are needed: HR data to better understand employees and workplace or personnel issues and system logs to track what is being printed or downloaded via USB, CD or DVD. **Detection of insider threats must use behavior-based techniques**. Detecting insider threats is very hard, like looking for “a needle in a stack of needles,” Reidy said. By using behavioral analytics, **agencies can build a baseline of behavior and look for red flags** — anomalies that differentiate potential insiders from innocuous employees. The CERT Division of SEI also provides 10 best practices to prevent and combat insider threats: **Institute periodic enterprise-wide risk assessments and security awareness training for all employees**. Implement strict password and account management policies and practices. Log, monitor and audit employee online actions, especially unusually large queries, downloads, print jobs or e-mails, or other suspicious behavior. Use extra caution with system administrators and privileged users. Collect and save data for use in investigations. Implement secure backup and recovery processes. Clearly document insider threat controls. Provide an Employee Assistance Program or other recourse for employees experiencing personal problems. Deactivate computer access and change passwords for all accounts upon termination, including external accounts. Train management on the patterns of behavior that could indicate an IT sabotage attack. **Insider threats present potentially catastrophic risks for all organizations**, no matter what sector. **But preparation, awareness, training, periodic assessments and the implementation of security measures and strategies can decrease an organization’s vulnerability**.

The program provides key oversight that gets rid of dark corners—prevents cascading failure of critical infrastructure—peer vigilance key

Catrantzos, ’10, (Nick, Adjunct Professor, Homeland Security & Author of Managing the Insider Threat: No Dark Corners, “Tackling the Insider Threat,” CRISP REPORT, ASIS Foundation, 2010, <http://www.popcenter.org/library/crisp/insider-threat.pdf//erg>)

All a hostile insider needs to carry out an attack are access to a worthy target, an open door, and a dark corner from which to plot and maneuver. Any adversary seeking to strike a devastating blow against any institution need look no further. Public and private sector institutions and critical infrastructures number among the many worthy targets, as would any organization with critical assets to be defended. The potential for loss does not always stop at the door of one target, however. **Not only are some targets like infrastructure irreplaceable, their damage or destruction may lead to cascading failures of other, interdependent components, from banking and finance to emergency responders, from transportation and logistics to food and agriculture.** All depend on electricity or water or communications—the double-edged sword of living in an interconnected world. **The open door comes from a traditional culture of openness and few restrictions to movement or assets in the average workplace.** This openness flourishes because local government agencies and investor-owned organizations alike must answer to demanding stockholders, ratepayers, and various regulatory agencies. Even when these organizations have critical assets to protect, when it comes to their public customers, they cannot be perceived as having something to hide. In this environment, **defenses against infiltrators or any type of insider threat require a cultural shift.** The challenge is to close the door to infiltrators while leaving it open to legitimate workers and business. Even if an infiltrator sets sights on a worthy target and exploits weak defenses, **he or she still needs a dark corner free of oversight in order to gather pre-strike intelligence and then initiate an attack without risk of timely intervention and defeat. The best way to defeat such an attack is to remove the dark corners.** Our society’s reliance on technology and specialists to solve problems can marginalize the average employee, excluding him or her from playing a useful and necessary role in insider defense. Employees should be recognized as the first line of defense, bringing them onto the front lines with a No Dark Corners approach. Consequently, **in addressing the insider threat, we must reconsider our usual efforts to penetrate with the intensity and focus of a laser what we should instead be illuminating with a flashlight.** No matter how deep the laser drills, it points to only a fragment of the entire picture. Caught in the laser’s beam, a clever insider can mask or explain away hostile activities with relative ease. **The same malicious insider, however, cannot deceive alert peers whose combined, wider gaze acts as a flashlight making enemy action visible before it is too late to intervene.** The new approach offers open team and employee engagement as a method of implementing layered defenses, particularly on the

front lines of detection and intervention, where critical operations take place. The insider threat remains as alive as it is statistically rare, despite generations of study. Infiltrators continue to pose a risk to critical infrastructure and other institutions. There are no easy answers. No Dark Corners shows promise, however, as an approach to overcome gaps in traditional defenses. By going beyond corporate sentinels to engage stakeholders in their own protection, this approach offers the victory of ownership over surprise.

Counter measures against insider threats are critical for preventing crime and terrorist attacks

Catrantzos, '10, (Nick, Adjunct Professor, Homeland Security & Author of Managing the Insider Threat: No Dark Corners, "Tackling the Insider Threat," CRISP REPORT, ASIS Foundation, 2010, <http://www.popcenter.org/library/crisp/insider-threat.pdf>)//erg

The insider threat is an Achilles heel for critical infrastructure protection and the protection of any enterprise or institution targeted for destruction by adversaries. While risk and vulnerability assessments skyrocketed in the aftermath of 9/11, as reflected in the federal subsidies promoting them, the security focus centered largely on the vulnerability of large populations to attack (Masse, O'Neil, & Rollins, 2007, pp. 5–7). In this context, adversaries were characterized as traditional attackers working as outsiders who generally approach their targets head on with brute force—precisely in the manner of the 9/11 hijackers. The insider threat, in this context, has been generally relegated to secondary status. One possible reason is that there is a dearth of statistically significant data on hostile insiders. As a review of the current literature indicates, trust betrayal—whether in espionage or other fields—remains statistically rare (Shaw & Fischer, 2005, p. 34; Parker & Wiskoff, 1991, p. 4).¹ When analyzed further, the insider threat has been subordinated to cyber security studies centering on hackers and disgruntled employees, ex-employees, or consultants (Brackney & Anderson, 2004; Cappelli, Moore, Trzeciak, & Shimeall, 2009; Leach, 2009). While such studies have supplied value and drawn attention to the problem, they 1 Shaw and Fischer, looking at espionage as a subset of trust betrayal, argued that such trust betrayal appeared relatively rare, while betrayals by cyber insiders might be poised to be more frequent, hence more amenable to profiling and categorizing by subtype. have offered few solutions other than to advise continuing scrutiny. Data compiled to date suggest that the vast majority of insider cyber attacks have been either fraud-driven or moderate in scope and impact. In other words, such attacks remain less than devastating to the targeted employer—the modern, electronic equivalent of embezzlement or vandalism (Kowalski, Cappelli, & Moore, 2008, pp. 24–26). Similarly, such studies preserve their narrow focus by excluding cases of espionage, while at the same time avowing that the threat remains real and advising ordinary, more-of-the-same solutions like layered defense (Cappelli, Moore, Trzeciak, & Shimeall, pp. 6–8). Consequently, it is difficult for security practitioners to derive new insights from cyber-centric insider threat investigations. The net result is that today's insider threat remains substantially as it did yesterday: often studied retroactively, yet seldom yielding practical tools, tactics, or recommendations that would serve a defender in countering the threat. The overall aim of this study is to identify countermeasures that defenders can use to prevent terrorist attacks via trust betrayers and thereby reduce the vulnerability of critical infrastructure and institutions. The journey to this destination involves applying lessons of experts from other, more mature arenas of defense from insider threats, such as workplace violence, line management, corporate security, and counter-espionage. In the course of following this path, the study also explores one answer to the question, "If current indicators and countermeasures fall short, what should we do differently?"

Insider threats are real—staff awareness is key to detection

Greitzer, et al '08, (Frank L., a chief scientist at the Pacific Northwest National Laboratory, Andrew P. Moore is a senior member of the technical staff of CERT at the Software Engineering Institute at Carnegie Mellon University, Dawn M. Cappelli is senior member of the technical staff, Dee H. Andrews, Lynn A. Carroll, Thomas D. Hull is a graduate fellow with the

Oak Ridge Institute for Science and Education, "Combating the insider Cyber threat," 2008, <http://www.dtic.mil/dtic/tr/fulltext/u2/a498605.pdf>//erg

(Summary.pdf), reveal that current or former employees and contractors are the second greatest cybersecurity threat, exceeded only by hackers, and that the number of security incidents has increased geometrically in recent years. The insider threat is manifested when human behavior departs from compliance with established policies, regardless of whether it results from malice or a disregard for security policies. **The types of crimes and abuse associated with insider threats are significant**; the most serious include espionage, sabotage, terrorism, embezzlement, extortion, bribery, and corruption. **Malicious activities include an even broader range of exploits, such as copyright violations, negligent use of classified data, fraud, unauthorized access to sensitive information, and illicit communications with unauthorized recipients. The "insider" is an individual currently or at one time authorized to access an organization's information system, data, or network; such authorization implies a degree of trust in the individual.** The insider threat refers to harmful acts that trusted insiders might carry out; for example, something that causes harm to the organization, or an unauthorized act that benefits the individual. A 1997 US Department of Defense (DoD) Inspector General report¹ found that 87 percent of identified intruders into DoD information systems were either employees or others internal to the organization. More generally, recent studies of cybercrime (such as the 2004 through 2006 E-Crime Watch Surveys; www.cert.org/archive/) in both government and commercial sectors reveal that although the proportion of insider events is declining (31 percent in 2004 and 27 percent in 2006), the financial impact and operating losses due to insider intrusions are increasing. Of those companies experiencing security events, the majority (55 percent) report at least one insider event (up from 39 percent in 2005). In this article, we'll focus on the need for effective training to raise staff awareness about insider threats and the need for organizations to adopt a more effective approach to identifying potential risks and then taking proactive steps to mitigate them.

Insider threats are real and dangerous—full vigilance is key

Spitzner, '03, (Lance, internationally recognized leader in the field of cyber threat research and security training and awareness, "Honey pots: Catching the Insider Threat," Honey pot Technologies Inc, 2003, <http://craigchamberlain.com/library/insider/Honey pots%20-%20Catching%20the%20Insider%20Threat.pdf>//erg

Before we can discuss how honeypots, specifically Honeynets and honeytokens, can catch the insider threat, we need to first define what our goal is, and the threat we face. **Our goal is to detect, identify, and confirm insider threats. This means leveraging honeypots to not only indicate that we have an insider, but also confirm their actions, and potentially learn their motives and resources. What makes our goal difficult is the threat we face, the sophisticated insider.** What we mean by this is someone who is technically skilled, highly motivated, and has access to extensive resources. For example, this threat may be an employee working for a large corporation, but in reality they are employed by a competitor to engage in corporate espionage. A second example is highly skilled, disgruntled employee motivated to cause a great deal of damage before they are fired. A third example could be a spy working for a foreign country. Regardless of who the insider is, we are dealing with a highly dangerous threat, one that is extremely difficult to detect. They have access to critical information; they know the structure of the organization. They are most likely after information, not systems. As a result, there may be few attacks and their access to information may even be authorized. It is what they do with that information that comprises the threat. It is our goal to detect and capture the activity of this threat. For the purposes of this paper, we will take the lessons learned from the ARDA Cyber Indications and Warning workshop. In this workshop, we focused on past spies in the Intelligence community. Examples of such spies include Aldrich Ames, Robert Hansen, and Anna Montes. These individuals were all highly trusted individuals with extensive and critical knowledge to their respective organizations. However, as insiders they were able to cause extreme harm to their organizations, and over long periods of time without being detected.

Internal Link Turns Groupthink

Combatting the insider threat avoids groupthink

Catrantzos, '10, (Nick, Adjunct Professor, Homeland Security & Author of *Managing the Insider Threat: No Dark Corners*, “Tackling the Insider Threat,” CRISP REPORT, ASIS Foundation, 2010, <http://www.popcenter.org/library/crisp/insider-threat.pdf//erg>)

The Delphi process is iterative yet anonymous, and required a significant commitment on the part of respondents, including responses that took the form of explanatory narratives. In order to obtain meaningful insights rather than just confirming the author's opinions, this study sought out practitioners who each have over 20 years of experience in responsible charge in their respective fields and were willing to voluntarily participate in what would otherwise constitute billable hours. This undertaking required the fullest stretch of the author's network and availing of professional courtesy. Despite 31 years of industry experience and an address book with some 2,024 entries, the author rated himself fortunate to be able to assemble a dozen professionals who contributed their career thoughts throughout the Delphi process. Note that the Delphi method isolates respondents from each other, rather than gathering them together in a focus group. This technique defends against groupthink and offers equal deference to the introverted whose voices might otherwise go unheard in the presence of more vocal and extroverted participants gathered together in the same room. In order to increase respondent numbers, the research would have risked a corresponding lowering of the bar in experience and insight of experts. Neophytes are in greater supply, as are graduate students who would be more receptive to providing iterative responses. However, such a response pool would necessarily rob the process of the kind of wisdom and “deep smarts” that come only through broad, practical experience over time (Leonard & Swap, 2004). In Delphi research, the smallest number of respondents should not fall under 10, hence this study settled on 12—in case of any losses from one round of questions to the next. In practice, informed analysts have gone on record to state that “the sample size varies... from 4 to 171 ‘experts.’ One quickly concludes that there is no ‘typical’ Delphi; rather that the method is modified to suit the circumstances and research question (Skulmoski, G. J., Harman, F. T., & Krahn, J., 2007, p. 5).” Other analysts, applying the Delphi method to policy issues, found useful sample sizes varying from 10 to 50 experts (Linstone, H., & Turoff, M., 2002, p. 82). The Delphi research effort itself extended from January through April 2009 and consisted of three iterative rounds of questions and feedback. Recruitment of experts and gathering of their signed, informed consent forms, in satisfaction of the requirements of the Institutional Review Board of the Naval Postgraduate School, took place between the months of November 2008 to January 2009.

Russia Containment DA

1NC

Deterring Russia in Europe is k2 curb Russian expansionism

O'Hanlon 7/12 (Michael, 2015, senior fellow at The Brookings Institution, “We Need to Get Serious About Russia, Now,” [//RTF">http://www.politico.com/magazine/story/2015/07/we-need-to-get-tough-with-russia-now-120002.html#ixzz3gOxGu49h">//RTF](http://www.politico.com/magazine/story/2015/07/we-need-to-get-tough-with-russia-now-120002.html#ixzz3gOxGu49h))

We are at a crucial juncture in the conflict over Ukraine and the West's relationship with Russia. Obama's restraint has been wise at one level, but Washington's tendency has been to move this issue to the back burner and hope it stays there. Yet there is little reason to think that it will—and also little reason to believe that a new U.S. president in 18 months, who will probably be harder-line in dealing with Vladimir Putin than Barack Obama has been, will be able to fix the situation either. As Gen. Joseph Dunford, the incoming Joint Chiefs chairman, told the Senate Armed Services Committee at his confirmation hearing last week: “If you want to talk about a nation that could pose an existential threat to the United States, I would have to point to Russia. ... If you look at their behavior, it's nothing short of alarming.” Meanwhile the current crisis over Greece and the Eurozone—which is not likely to end soon, if ever—is only likely to further undermine Europe's resolve and induce it to turn inward, allowing Putin to breathe easier. Or at least, the Russian president might get that impression. So the United States and its NATO allies need to get serious about the

situation now, and complement their existing policy approach with new ideas—some of them to show resolve and firmness towards Putin and Russia, others to offer him a way out of this crisis should he wish to take such a path. But this is not a time for drift; the longer the Kremlin senses irresolution in the West, the more it is likely to assume that its new “order” in the east is a fait accompli. There is also a risk it could become yet more aggressive, even towards the NATO-member Baltic states, in some

way. The context of the situation was well summarized in a recent poll, released June 10, that the Pew Research Center conducted over the previous several months. It underscored that the West has a number of strengths in dealing with Putin—but also a number of serious vulnerabilities that will not get better just by ignoring them. The survey, led by Bruce Stokes and Katie Simmons, found that majorities of citizens in a number of key NATO states would not favor the use of force to protect another alliance member in the event of Russian aggression against them. That would seem, on its face, to ignore Article V of the NATO alliance’s founding charter, the Washington Treaty of 1949, which states that an attack on one is an attack on all, and should be treated accordingly. This may appear to some as tantamount to an invitation to renewed Russian aggression. It seems to raise the scenario of Vladimir Putin again employing his patriotic cyber attackers and “little green men,” not just in Crimea but perhaps in Latvia or Estonia—former republics in the Soviet Union turned independent nations and, since 2004, members of NATO. Each also has significant populations of Russian speakers that Putin can claim want to be reunited with the motherland; each is too far east for NATO easily to mount a military defense in any case. Are such parts of the Western alliance, and perhaps other countries like Poland, now vulnerable to Russian aggression? In fact, it would be a mistake to reach this conclusion based on the Pew survey or any other recent polling. While

there are indeed some troubling findings in the Pew results, on balance what emerges is the picture of an alliance that still provides the West with considerable cohesion, and considerable leverage, in addressing the problem of Putin. Before trying to make sense of the poll results, it is important to summarize not just the headline-dominating findings noted above, but several other key results from Pew: The NATO publics have negative views of Russia and Putin. They seem to have little doubt of who is primarily responsible for the crisis in relations of the last two years, dating to the immediate aftermath of the Sochi Olympics when protests in Ukraine forced out the country’s previous leader, President Yanukovich. Five of eight NATO countries surveyed (the UK, France, Spain, Italy and Germany) oppose sending weapons to Ukraine to defend itself in the current crisis. NATO countries remain more than willing to employ sanctions against Russia over its behavior. This was true in every alliance member-state that was polled, including Germany, the most pro-Russia NATO state that was included in the polling. Indeed, although just 38 percent of Germans favored a military response in the event of a hypothetical Russian attack against another NATO member, they remained in favor of sanctions against Russia. Only 29 percent favored a loosening of the current sanctions, unless Russia’s behavior were to change. This helps explain why the EU just reauthorized sanctions against Russia, with even Greece in support. Putin remains extremely popular in Russia, with favorability ratings approaching 90 percent; Russians currently blame the West, and falling oil prices, for their current economic woes, and not their own government or its policies.

Forebodingly, most Russians believe that eastern Ukraine, where the current fighting rages, should not remain part of Ukraine but should either become independent or join their country. Two more key points are crucial to remember. First, the type of hypothetical Russian attack against a NATO country that formed the premise for the Pew question about Article V was not clearly specified. Perhaps respondents were in some sense wondering if a takedown of several Latvian or Estonian computer networks really needed to be met with NATO tanks? For most western publics, the advisability of a major military response might well, understandably enough, depend in detail on the nature of the perceived Russian attack as well as the other options available to the alliance. Second, and relatedly, it is important to remember that Article V does NOT demand an automatic, unconditional military response by each alliance member. It says, rather, that an attack on one should lead to a response by all—involving whatever means the individual states determine. This ambiguity may risk complicating deterrence, to be sure—but it worked during the Cold War and, if NATO leaders are sufficiently clear in their dealings with Putin, it can and should work now.

These results collectively suggest the following path ahead: The United States and other NATO member states should adopt the Pentagon’s recent proposal to station modest amounts of equipment in the easternmost NATO countries—a proposal that is harder to oppose at this juncture given Putin’s continued stirring up of the conflict. Ideally, equipment from NOT ONLY America BUT also other NATO countries would be part of the initiative. The sanctions tool remains powerful and should still be employed. As they pursue Russian compliance with the so-called Minsk accords, which Moscow agreed to this past winter, and which would allow autonomy for Ukraine’s eastern provinces in return for verifiable Russian withdrawal from those same regions and an end to hostility by separatists, western policymakers can and should keep up the economic pressure. A grand solution should also be proposed to Moscow. As a complement to the Minsk concept and the continuation of economic sanctions, the West should offer a proposal for a new Central European security architecture for non-NATO states that Russia would be asked and expected to co-guarantee, if it wishes that countries like Ukraine permanently forgo pursuit of NATO membership. This should not weaken Ukraine’s formal sovereignty; no long-term “Hong Kong handover” solution is needed. But all would understand that Ukraine would not formally join the West in geostrategic terms, though it certainly could accept western help out of its current economic malaise once the right policy foundation was established. So far Putin has managed to convince Russians that their economic predicament is not his fault, but over time, he may not be able to maintain the charade. The Pew poll suggests that Western publics are firmly united behind this sanctions-based approach—and that modern democracies, while wary about the use of force, are a far cry from the paper tigers their critics sometimes purport them to be. But our policies are far from adequate to the task at hand and need to be improved now—before the situation escalates further and reduces our room for maneuver, and before the 2016 U.S. presidential race reduces Washington’s room for maneuver as well.

Expansion risks war and nuclear use

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible,"
[//RTF](http://www.vox.com/2015/6/29/8845913/russia-war)

II. The gamble: Putin's plan to make Russia great again Should the warnings prove right, and a major war break out in Europe between Russia and the West, then the story of that war, if anyone is still around to tell it, will begin with Russian President Vladimir Putin trying to solve a problem. That problem is this: Putin's Russia is weak. It can no longer stand toe to toe with the US. It no longer has Europe divided in a stalemate; rather, it sees the continent as dominated by an ever-encroaching anti-Russian alliance. In the Russian view, the country's weakness leaves it at imminent risk, vulnerable to a hostile West bent on subjugating or outright destroying Russia as it did to Iraq and Libya. This is made more urgent for Putin by his political problems at home. In 2012, during his reelection, popular protests and accusations of fraud weakened his sense of political legitimacy. The problem worsened with Russia's 2014 economic collapse; Putin's implicit bargain with the Russian people had been that he would deliver economic growth and they would let him erode basic rights. Without the economy, what did he have to offer them? Putin's answer has been to assert Russian power beyond its actual strength — and, in the process, to recast himself as a national hero guarding against foreign enemies. Without a world-power-class military or economy at his disposal, he is instead wielding confusion and uncertainty — which Soviet leaders rightly avoided as existential dangers — as weapons against the West. Unable to overtly control Eastern Europe, he has fomented risks and crises in there, sponsoring separatists in Ukraine and conducting dangerous military activity along NATO airspace and coastal borders, giving Russia more leverage there. Reasserting a Russian sphere of influence over Eastern Europe, he apparently believes, will finally give Russia security from the hostile West — and make Russia a great power once more. Knowing his military is outmatched against the Americans, he is blurring the distinction between war and peace, deploying tactics that exist in, and thus widen, the gray between: militia violence, propaganda, cyberattacks, under a new rubric the Russian military sometimes calls "hybrid war." "This was the theory of the Kaiser before World War I: The more threatening you are, the more people will submit to your will. Putin's going to threaten and threaten and hope that NATO bends. But the long run of international relations suggests that it goes the other way." Unable to cross America's red lines, Putin is doing his best to muddy them — and, to deter the Americans, muddying his own. Turning otherwise routine diplomatic and military incidents into games of high-stakes chicken favors Russia, he believes, as the West will ultimately yield to his superior will. To solve the problem of Russia's conventional military weakness, he has dramatically lowered the threshold for when he would use nuclear weapons, hoping to terrify the West such that it will bend to avoid conflict. In public speeches, over and over, he references those weapons and his willingness to use them. He has enshrined, in Russia's official nuclear doctrine, a dangerous idea no Soviet leader ever adopted: that a nuclear war could be winnable. Putin, having recast himself at home as a national hero standing up to foreign enemies, is more popular than ever. Russia has once more become a shadow hanging over Eastern Europe, feared and only rarely bowed to, but always taken seriously. Many Western Europeans, asked in a poll whether they would defend their own Eastern European allies from a Russian invasion, said no. Russia's aggression, born of both a desire to reengineer a European order that it views as hostile and a sense of existential weakness that justifies drastic measures, makes it far more willing to accept the dangers of war. As RAND's F. Stephen Larrabee wrote in one of the increasingly urgent warnings that some analysts are issuing, "The Russia that the United States faces today is more assertive and more unpredictable — and thus, in many ways, more dangerous — than the Russia that the United States confronted during the latter part of the Cold War." Joseph Nye, the dean of Harvard University's school of government and one of America's most respected international relations scholars, pointed out that Russia's weakness-masking aggression was yet another disturbing parallel to the buildup to World War I. "Russia seems doomed to continue its decline — an outcome that should be no cause for celebration in the West," Nye wrote in a recent column. "States in decline — think of the Austro-Hungarian Empire in 1914 — tend to become less risk-averse and thus much more dangerous."

Nuclear war in Europe with Russia is possible and on the brink

Fisher 6/29 (Max, 2015, writing for Vox, “How World War III became possible,”
<http://www.vox.com/2015/6/29/8845913/russia-war//RTF>)

It was in August 2014 that the real danger began, and that we heard the first warnings of war. That month, unmarked Russian troops covertly invaded eastern Ukraine, where the separatist conflict had grown out of its control. The Russian air force began harassing the neighboring Baltic states of Estonia, Latvia, and Lithuania, which are members of NATO. The US pledged that it would uphold its commitment to defend those countries as if they were American soil, and later staged military exercises a few hundred yards from Russia's border. Both sides came to believe that the other had more drastic intentions. Moscow is convinced the West is bent on isolating, subjugating, or outright destroying Russia. One in three Russians now believe the US may invade. Western nations worry, with reason, that Russia could use the threat of war, or provoke an actual conflict, to fracture NATO and its commitment to defend Eastern Europe. This would break the status quo order that has peacefully unified Europe under Western leadership, and kept out Russian influence, for 25 years. Fearing the worst of one another, the US and Russia have pledged to go to war, if necessary, to defend their interests in the Eastern European borderlands. They have positioned military forces and conducted chest-thumping exercises, hoping to scare one another down. Putin, warning repeatedly that he would use nuclear weapons in a conflict, began forward-deploying nuclear-capable missiles and bombers. Europe today looks disturbingly similar to the Europe of just over 100 years ago, on the eve of World War I. It is a tangle of military commitments and defense pledges, some of them unclear and thus easier to trigger. Its leaders have given vague signals for what would and would not lead to war. Its political tensions have become military buildups. Its nations are teetering on an unstable balance of power, barely held together by a Cold War–era alliance that no longer quite applies. If you take a walk around Washington or a Western European capital today, there is no feeling of looming catastrophe. The threats are too complex, with many moving pieces and overlapping layers of risk adding up to a larger danger that is less obvious. People can be forgiven for not seeing the cloud hanging over them, for feeling that all is well — even as in Eastern Europe they are digging in for war. But this complacency is itself part of the problem, making the threat more difficult to foresee, to manage, or, potentially, to avert. There is a growing chorus of political analysts, arms control experts, and government officials who are sounding the alarm, trying to call the world's attention to its drift toward disaster. The prospect of a major war, even a nuclear war, in Europe has become thinkable, they warn, even plausible. What they describe is a threat that combines many of the hair-trigger dangers and world-ending stakes of the Cold War with the volatility and false calm that preceded World War I — a comparison I heard with disturbing frequency. They described a number of ways that an unwanted but nonetheless major war, like that of 1914, could break out in the Eastern European borderlands. The stakes, they say, could not be higher: the post–World War II peace in Europe, the lives of thousands or millions of Eastern Europeans, or even, in a worst-case scenario that is remote but real, the nuclear devastation of the planet.

2NC – Containment Key

Hardline responses to Russia deter expansion

Aleksashenko 5/28 (Sergei, 2015, nonresident senior fellow in Global Economy and Development @ Brookings, Former deputy chairman of the Central Bank of Russia and former chairman of Merrill Lynch Russia, “Stop calling Russia weak,”
<http://www.brookings.edu/blogs/order-from-chaos/posts/2015/05/29-russia-not-weak-aleksashenko//RTF>)

Twelve weeks have passed since the second Minsk agreement was signed, and the military situation in Eastern Ukraine has quieted. While this is a positive development, we cannot declare the crisis over. Unfortunately, it seems most likely that another territory with non-specified status will emerge in Europe, opening the door for yet another frozen conflict in the region. In the short run, the current situation in Ukraine is in some sense understood on all sides: Ukraine is able to concentrate on its reform agenda efforts; Russia can keep Donbass hostage and maintain its ability to destabilize Ukraine at any moment; Europe can relax a bit as the threat

of military spillover subsides; and the United States hopes to just forget about the whole headache. But that approach would be a major strategic mistake for the U.S. and Europe. In the wake of the 2008 Georgian war, the West made the grave error of letting down its guard. Going this direction again means undermining European and American principles. At the same time, it undermines our very global security system, which rejects the use of force as an instrument of conflict resolution and forcible changes of the state borders via military intervention. By accepting the status quo in Ukraine, the West suggests to the world that it will not prevent Putin from imposing his narrative across Russian borders. More broadly, it risks demonstrating that it is the rule of force—not of law—that reigns in the world today. Tacitly supporting a return to business as usual in Ukraine makes life easier for the U.S. and Europe. But the West's reliance on traditional methods of diplomacy is a mistake in dealing with Putin, who has clearly decided to employ nontraditional forms of international relations. The West needs a nontraditional response to Russia's nontraditional foreign policy. If leaders in Europe and the U.S. believe Putin is weak—as Valeriano and Maness propose—they should demonstrate that fact to the world and to the Russian president himself. We have yet to see that kind of clear demonstration.

2NC – Expansionism Bad

Russian expansion into the Baltic states causes war

Fisher 6/29 (Max, 2015, writing for Vox, “How World War III became possible,” <http://www.vox.com/2015/6/29/8845913/russia-war//RTF>)

IV. How it would happen: The Baltics scenario In September of last year, President Obama traveled to Estonia, a nation of 1.3 million people that most Americans have never heard of, and pledged that the United States would if necessary go to war with Russia to defend it. Estonia, along with Latvia and Lithuania — together known as the Baltic states — are at the far edge of Eastern Europe, along Russia's border. They were formerly part of the Soviet Union. And they are where many Western analysts fear World War III is likeliest to start. These small countries are "the most likely front line of any future crisis," according to Stephen Saideman, an international relations professor at Carleton University. Allison and Simes, in their essay warning of war, called the Baltics "the Achilles' heel of the NATO alliance." A full quarter of Estonia's population is ethnically Russian. Clustered on the border with Russia, this minority is served by the same Russian state media that helped stir up separatist violence among Russian speakers in eastern Ukraine. But unlike Ukraine, the Baltic states are all members of NATO, whose charter states that an attack on one member is an attack on them all. Whereas a Russian invasion of Ukraine prompted Western sanctions, a Russian invasion of Estonia would legally obligate the US and most of Europe to declare war on Moscow. “We'll be here for Estonia. We will be here for Latvia. We will be here for Lithuania. You lost your independence once before. With NATO, you will never lose it again,” Obama pledged in his September speech in Estonia. Less than 48 hours after Obama's address, Russian agents blanketed an Estonia-Russia border crossing with tear gas, stormed across, and kidnapped an Estonian state security officer, Eston Kohver, who specialized in counterintelligence. Kohver has been held illegally in a Russian prison for nine months now. It was something like an act of geopolitical trolling: aggressive enough to assert Russian dominion over Estonia, but not so aggressive as to be considered a formal act of war that would trigger a Western counterattack. And it was one of several signs that Putin's Russia is asserting a right to meddle in these former Soviet territories. The Russian military has already begun pressing the Baltic states. Russian warships were spotted in Latvian waters 40 times in 2014. Russian military flights over the Baltics are now routine, often with the planes switching off their transponders, which makes them harder to spot and increases the chances of an accident. Military activity in the region had reached Cold War levels. NATO, fearing the worst, is increasing military exercises in the Baltics. The US is installing heavy equipment. And in February, the US military paraded through the Russian-majority Estonian city of Narva, a few hundred yards from Russia's borders. It's a textbook example of what political scientists call the security dilemma: Each side sees its actions as defensive and the other side's as offensive. Each responds to the other's perceived provocations by escalating further, a self-reinforcing cycle that can all too easily lead to war. It is considered, for example, a major contributor to the outbreak of World War I. That it is entirely foreseeable does little to reduce the risk. Even if Russia in fact has no designs on the Baltics, its bluffing and posturing has already created the conditions for an unwanted war. In early April, for example, a Russian fighter jet crossed into the Baltic Sea and “buzzed” a US military plane, missing it by only 20 feet. It was one of several recent near-misses that, according to a think tank called

the European Leadership Institute, have had a "high probability of causing casualties or a direct military confrontation between Russia and Western states." Meanwhile, Russia has been flying its nuclear-capable strategic bombers along NATO airspace, often with the planes' transponders switched off, making an accident or misperception more likely. As if that weren't dangerous enough, the bombers — hulking, decades-old Tupolev Tu-95 models — have become prone to accidents such as engine fires. What if a Tu-95 went down unexpectedly, say, off the coast of Norway? What if it was carrying nuclear warheads, or it went down during a moment of high tension? Such incidents can lead to misunderstandings, and such misunderstandings can lead to war. By late April, when NATO officials gathered at the security conference in Estonia's capital of Tallinn, the severity of the danger had become unmistakable. As Ahmed Rashid wrote from the conference: Baltic presidents and NATO officials were unusually blunt in describing the extent to which the security architecture in Eastern Europe has collapsed, how Russia poses the gravest threat to peace since World War II, and how the conflict in Ukraine and the loss of the Crimea has left the Baltic states on the front line of an increasingly hostile standoff. Amid these tensions, the thought of a plane crash leading to war seems scarily plausible. It is not just Western officials who fear such an incident could spark war. Fyodor Lukyanov, the prominent Russian analyst who is considered close to the government, worried that the NATO military exercises in the Baltics meant to deter Russia were also contributing to the problem. "Russia reacts to that because Russia perceives it as a hostile approach to the Russian border," he explained. "And it's a vicious circle." It is easy to imagine, Lukyanov said, any number of ways that the powder keg could explode. "Without any intention to create the big conflict, it might happen," he said. "One step, another step, and reciprocity can become very dangerous. Say a Russian aircraft comes very close to an area that NATO believes is prohibited while Russia believes it's not prohibited, and then British aircraft respond. It might be manageable, and in most cases of course it will be, but who knows."

2NC – NATO Scenario

If NATO doesn't intervene, it'll be destroyed

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible," <http://www.vox.com/2015/6/29/8845913/russia-war//RTF>)

V. How it would happen: A plot to break NATO It was Andrei Piontkovsky, a Russian political analyst and frequent Kremlin critic, who first suggested the theory, last August, that Putin's plan for the Baltics was more sophisticated, and more calculated, than anybody realized. Piontkovsky was trying to answer a question that Western analysts and policymakers had been puzzling over since Russian provocations began in the Baltics last fall: What does Putin want? Unlike in Ukraine, with which Russia has a long shared history, there is little demand among the Russian public for intervention in the Baltic states. They are of modest strategic value. And the risks of Russia's aggression there are potentially catastrophic. Why bother? His is a theory that is now taken much more seriously by Western policymakers — and appears more plausible all the time. Putin hopes to spark a conflict in the Baltics, Piontkovsky wrote, so as to force Western European leaders into an impossible choice: Fulfill their NATO obligation to defend the Baltics and counterattack, even if it means fighting World War III over a tiny post-Soviet republic most Europeans couldn't care less about — or do nothing. The implications of doing nothing, Piontkovsky pointed out, would extend far beyond the Baltics. It would lay bare NATO's mutual defense provision as a lie, effectively dissolving the military alliance, ending a quarter-century of Europe's security unification under Western leadership, and leaving Eastern Europe once more vulnerable to Russian domination. In this way, Putin could do what Soviet leaders never came close to: defeat NATO. "This is his most cherished objective," Piontkovsky told me when we talked in his kitchen, in a leafy Moscow neighborhood across the river from Gorky Park. "It's an enormous temptation. He may retreat at any stage, but the temptation is enormous, to destroy NATO. ... The risk is big, yes? But the prize is enormous." "To destroy NATO, to demonstrate that Article V does not work, the Baltic republics of Estonia and Latvia are the best place for this," he said. "It's happening now, every day. Intrusions into the airspace, psychological pressure, the propaganda on TV." He suggested that Putin, rather than rolling Russian tanks across the border, would perhaps seed unmarked Russian special forces into, say, the Russian-majority city of Narva in Estonia, where they would organize localized violence or a phony independence referendum. A handful of such unacknowledged forces, whom Putin referred to as "little green men" after they appeared in Crimea, would perhaps be dressed as local volunteers or a far-right gang; they might be joined by vigilantes, as they were in eastern Ukraine.

They would almost certainly be aided by a wave of Russian propaganda, making it harder for outsiders to differentiate unmarked Russian troops from civilian volunteers, to determine who was fighting where and had started what. Such an intervention would force NATO into an impossible choice: Are you really going to open fire on some hoodlums stirring up trouble in Estonia, knowing they might actually be unmarked Russian troops? Would you risk the first major European war since 1945, all to eject some unmarked Russian troops from the Estonian town of Narva? Putin, Piontkovsky believes, is gambling that the answer is no. That NATO would not intervene, thus effectively abandoning its commitment to defend its Eastern European member states. Piontkovsky's scenario, once considered extreme, is now widely seen by Western security experts and policymakers as plausible. At the end of 2014, the military intelligence service of Denmark, a member of NATO, issued a formal paper warning of precisely that: Russia may attempt to test NATO's cohesion by engaging in military intimidation of the Baltic countries, for instance with a threatening military build-up close to the borders of these countries and simultaneous attempts of political pressure, destabilization and possibly infiltration. Russia could launch such an intimidation campaign in connection with a serious crisis in the post-Soviet space or another international crisis in which Russia confronts the United States and NATO. "The concern is that what Putin wants to do is break NATO, and the best way to do that would be to poach on the Baltics," Saideman, the political scientist, told me on a call from a European security conference where he said the scenario was being taken very seriously. "And if Germany doesn't respond to incursions in the Baltics, if France doesn't respond and it's just an American operation, then it will lead to the breaking of NATO, is the theory," he said. "That's the biggest concern." Saideman described a variation on this scenario that I heard from others as well: that Putin might attempt to seize some small sliver of the Baltics quickly and bloodlessly. This would make it politically easier for Western European leaders to do nothing — how to rally your nation to war if hardly anyone has even been killed? — and harder to counterattack, knowing it would require a full-scale invasion. "I think they're very serious about this," Saideman said. "There's a real concern."

Either Russian expansion causes war or it fractures NATO

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible," <http://www.vox.com/2015/6/29/8845913/russia-war//RTF>)

VI. How it would happen: The fog of hybrid war In early 2015, Pew pollsters asked citizens of several NATO states the exact question that analysts and policymakers from Washington to Moscow are gaming out: "If Russia got into a serious military conflict with one of its neighboring countries that is our NATO ally, do you think our country should or should not use military force to defend that country?" The numbers from Western Europe were alarming: Among Germans, only 38 percent said yes; 58 percent said no. If it were up to German voters — and to at least some extent, it is — NATO would effectively surrender the Baltics to Russia in a conflict. This poll is even worse than it looks.

It assumes that Russia would launch an overt military invasion of the Baltics. What would actually happen is something far murkier, and far more likely to leverage European hesitation: the playbook from Ukraine, where Russia deployed its newly developed concepts of postmodern "hybrid war," designed to blur the distinction between war and not-war, to make it as difficult as possible to differentiate grassroots unrest or vigilante cyberattacks from Russian military aggression. Putin may already be laying the groundwork. In March of 2014, shortly after Russia had annexed Crimea, Putin gave a speech there pledging to protect Russians even outside of Russia, which many took as a gesture to the substantial Russian minorities in the Baltics. "That kind of misperception situation is definitely possible, and that's how wars start" Then, in October, Putin warned that "open manifestations of neo-Nazism" had "become commonplace in Latvia and other Baltic states" — repeating the language that he and Russian state media had earlier used to frighten Russian speakers in Ukraine into taking up arms. This April, several Russian outlets issued spurious reports that Latvia was planning to forcibly relocate ethnic Russians into Nazi-style ghettos — an echo of similar scaremongering Russian propaganda broadcast in the runup in Ukraine. Martin Hurt, a former senior official of the country's defense ministry, warned that his country's ethnic Russian minority could be "receptive to Kremlin disinformation." Moscow, he said, could generate unrest "as a

pretext to use military force against the Baltic states." In early 2007, Estonia's parliament voted to relocate a Soviet-era military statue, the Bronze Soldier, that had become a cultural symbol and annual rallying point for the country's ethnic Russians. In response, Russian politicians and state media accused the Estonian government of fascism and Nazi-style discrimination against ethnic Russians; they issued false reports claiming ethnic Russians were being tortured and murdered. Protests broke out and escalated into riots and mass looting. One person was killed in the violence, and the next day hackers took many of the country's major institutions offline. Russia could do it again, only this time gradually escalating further toward a Ukraine-style conflict. NATO is just not built to deal with such a crisis. Its mutual defense pledge, after all, rests on the assumption that war is a black-and-white concept, that a country is either at war or not at war. Its charter is from a time when war was very different than it is today, with its many shades of gray. Russia can exploit this flaw by introducing low-level violence that more hawkish NATO members would consider grounds for war but that war-averse Western European states might not see that way. Disagreement among NATO's member states would be guaranteed as they hesitated over where to declare a moment when Russia had crossed the line into war. Meanwhile, Russian state media, which has shown real influence in Western Europe, would unleash a flurry of propaganda to confuse the issue, make it harder to pin blame on Moscow for the violence, and gin up skepticism of any American calls for war. Germany, which is widely considered the deciding vote on whether Europe would go to war, would be particularly resistant to going to war. The legacy of World War II and the ideology of pacifism and compromise make even the idea of declaring war on Russia unthinkable. German leaders would come under intense political pressure to, if not reject the call to arms, then at least delay and negotiate — a de facto rejection of NATO's collective self-defense. In such a scenario, it is disturbingly easy to imagine how NATO's European member states could split over whether Russia had even crossed their red line for war, much less whether to respond. Under a fog of confusion and doubt, Russia could gradually escalate until a Ukraine-style conflict in the Baltics was foregone, until it had marched far across NATO's red line, exposing that red line as meaningless. But the greatest danger of all is if Putin's plan were to stumble: By overreaching, by underestimating Western resolve to defend the Baltics, or by starting something that escalates beyond his control, it could all too easily lead to full-blown war. "That kind of misperception situation is definitely possible, and that's how wars start." Saideman said, going on to compare Europe today with 1914, just before World War I. "The thing that makes war most thinkable is when other people don't think it's thinkable." In 1963, a few months after the Cuban missile crisis had almost brought the US and Soviet Union to blows, President John F. Kennedy gave a speech drawing on the lessons of the world's brush with nuclear war: "Above all, while defending our vital interests, nuclear powers must avert those confrontations which bring an adversary to a choice of either a humiliating retreat or a nuclear war." That is the choice that Putin may well force upon NATO.

Russian Expansion fractures NATO

Johnston 6/3 (Ian, 2015, The Guardian, "Nato and EU face collapse if they fail to stop Russian aggression, warn experts," <http://www.independent.co.uk/news/world/politics/nato-and-eu-face-collapse-if-they-fail-to-stop-russian-aggression-experts-warn-10295927.html>)/RTF

Nato and the European Union "could collapse" in the face of increasing aggression from Russia, which has been emboldened by the EU's apparent unwillingness to "defend its principles", an influential think-tank has warned. A major study by Chatham House found the conflict in Ukraine – where Moscow is backing separatist rebels – represented a "defining" moment for the future of Europe. It called for the West to increase the strength of its conventional military forces. It also warned that Russia was prepared to use tactical nuclear weapons in certain circumstances and Nato should make clear that a so-called "limited war" was "impossible". "The conflict in Ukraine is a defining factor for the future of European security," the report said. "Ukraine's failure would deepen instability in Eastern Europe, increase the risk of further Kremlin adventures and diminish the prospects for eventual beneficial change in Russia. Russia may have the greater interest in

Ukraine. But the West has an even bigger interest in preserving the post-Cold War environment. “If that is dismantled, it is conceivable that Nato and the EU could collapse too.” The report, whose authors include two former ambassadors to Moscow, Sir Roderic Lyne and Sir Andrew Wood, said Russian President Vladimir Putin had been encouraged by the “weak and unconvincing responses” from the West to events such as Russia’s seizure of South Ossetia and Abkhazia from Georgia in 2008. “The Kremlin perceives that Europe lacks the will to pay the necessary price to defend its principles,” it said. “Russian ambitions and intentions had been telegraphed for well over a decade, but the West found it easier at the time to disregard them and indulge in the fantasy that Russia was progressing towards a liberal-democratic model with which the West felt comfortable. “The war in Ukraine is, in part, the result of the West’s laissez-faire approach to Russia.” And it warned that if there was a wider conflict in Europe, Russia would be prepared to use tactical nuclear weapons. “Nato must retain its credibility as a deterrent to Russian aggression. In particular, it needs to demonstrate that limited war is impossible and that the response to ‘ambiguous’ or ‘hybrid’ war will be robust.” Hybrid tactics is a term that describes the deployment of unbadged Russian troops and the use of local pro-Moscow forces in eastern Ukraine. The growing threat from Moscow means that “conventional deterrent capability must be restored as a matter of urgency and convincingly conveyed, to avoid presenting Russia with inviting targets”, the think-tank warned. The Treasury has reportedly asked the Ministry of Defence to make spending cuts of £1bn this year. David Lidington, the Europe minister, said: “The UK is working closely with EU and G7 partners in response to Russian actions in Ukraine. “The UK is also playing a leading role in Nato exercises in Eastern Europe and with Baltic partners as part of the assurance measures and collective defence in the region.”

Collapse of NATO causes multiple escalatory nuclear wars

John **Duffield** 1994, Assistant Professor of Government and Foreign Affairs at the University of Virginia,

[Political Science Quarterly 109:5, p. 766-7]

Initial analyses of NATO’s future prospects overlooked at least three **important factors** that have helped to **ensure the alliance’s enduring relevance**. First, they underestimated the extent to which **external threats sufficient to** help **justify the preservation of the alliance** would **continue** to exist. In fact, NATO still serves to secure its members against a number of actual or potential dangers emanating from outside their territory. **These include not only** the residual threat posed by **Russian military power, but** also the relatively new concerns raised by **conflicts in neighboring regions**. Second, the **pessimists failed to consider NATO’s capacity for institutional adaptation**. Since the end of the cold war, the alliance has begun to develop two important new functions. **NATO is increasingly** seen as having a significant role to play in **containing and controlling militarized conflicts in Central and Eastern Europe**. And, at a deeper level, **it works to prevent such conflicts from arising** at all **by** actively **promoting stability** within the former Soviet bloc. Above all, NATO pessimists overlooked the valuable intra-alliance functions that the alliance has always performed and that remain relevant after the cold war. Most importantly, NATO has helped stabilize Western Europe, whose states had often been bitter rivals in the past. By damping the security dilemma and providing an institutional mechanism for the development of common security policies, **NATO has contributed to making the use of force in relations among the countries of the region virtually inconceivable**. In all these ways, NATO clearly serves the interests of its European members. But even the United States has a significant stake in preserving a peaceful and prosperous Europe. In addition to strong transatlantic historical and cultural ties, American economic interests in Europe— as a leading market for U.S. products, as a source of valuable imports, and as the host for considerable direct foreign investment by American companies — remain substantial. If history is any guide, moreover, **the United States could easily be drawn into a future major war in Europe, the consequences of which would likely be even more devastating than those of the past, given the existence of nuclear weapons**.¹¹

2NC – War Goes Nuclear

Russian nuclear doctrine means war in Ukraine escalates

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible,"

<http://www.vox.com/2015/6/29/8845913/russia-war//RTF>

III. The drift: How the unthinkable became possible The Cold War was a dangerous game, but it was a game in which everyone knew and agreed upon the stakes and the rules. That is not the case today. The Western side believes it is playing a game where the rules are clear enough, the stakes relatively modest, and the competition easily winnable. The Russian side, however, sees a game where the rules can be rewritten on the fly, even the definition of war itself altered. For Russia, fearing a threat from the West it sees as imminent and existential, the stakes are unimaginably high, justifying virtually any action or gamble if it could deter defeat and, perhaps, lead to victory. Separately, the ever-paranoid Kremlin believes that the West is playing the same game in Ukraine. Western support for Ukraine's government and efforts to broker a ceasefire to the war there, Moscow believes, are really a plot to encircle Russia with hostile puppet states and to rob Russia of its rightful sphere of influence. Repeated Russian warnings that it would go to war to defend its perceived interests in Ukraine, potentially even nuclear war, are dismissed in most Western capitals as bluffing, mere rhetoric. Western leaders view these threats through Western eyes, in which impoverished Ukraine would never be worth risking a major war. In Russian eyes, Ukraine looks much more important: an extension of Russian heritage that is sacrosanct and, as the final remaining component of the empire, a strategic loss that would unacceptably weaken Russian strength and thus Russian security. Both side are gambling and guessing in the absence of a clear understanding of what the other side truly intends, how it will act, what will and will not trigger the invisible triplines that would send us careening into war. Today's tensions bear far more similarity to the period before World War I. During the Cold War, the comparably matched Western and Soviet blocs prepared for war but also made sure that war never came. They locked Europe in a tense but stable balance of power; that balance is gone. They set clear red lines and vowed to defend them at all costs. Today, those red lines are murky and ill-defined. Neither side is sure where they lie or what really happens if they are crossed. No one can say for sure what would trigger war. That is why, analysts will tell you, today's tensions bear far more similarity to the period before World War I: an unstable power balance, belligerence over peripheral conflicts, entangling military commitments, disputes over the future of the European order, and dangerous uncertainty about what actions will and will not force the other party into conflict. Today's Russia, once more the strongest nation in Europe and yet weaker than its collective enemies, calls to mind the turn-of-the-century German Empire, which Henry Kissinger described as "too big for Europe, but too small for the world." Now, as then, a rising power, propelled by nationalism, is seeking to revise the European order. Now, as then, it believes that through superior cunning, and perhaps even by proving its might, it can force a larger role for itself. Now, as then, the drift toward war is gradual and easy to miss — which is exactly what makes it so dangerous. But there is one way in which today's dangers are less like those before World War I, and more similar to those of the Cold War: the apocalyptic logic of nuclear weapons. Mutual suspicion, fear of an existential threat, armies parked across borders from one another, and hair-trigger nuclear weapons all make any small skirmish a potential armageddon. In some ways, that logic has grown even more dangerous. Russia, hoping to compensate for its conventional military forces' relative weakness, has dramatically relaxed its rules for using nuclear weapons. Whereas Soviet leaders saw their nuclear weapons as pure deterrents, something that existed precisely so they would never be used, Putin's view appears to be radically different. Russia's official nuclear doctrine calls on the country to launch a battlefield nuclear strike in case of a conventional war that could pose an existential threat. These are more than just words: Moscow has repeatedly signaled its willingness and preparations to use nuclear weapons even in a more limited war. This is a terrifyingly low bar for nuclear weapons use, particularly given that any war would likely occur along Russia's borders and thus not far from Moscow. And it suggests Putin has adopted an idea that Cold War leaders considered unthinkable: that a "limited" nuclear war, of small warheads dropped on the battlefield, could be not only survivable but winnable. "It's not just a difference in rhetoric. It's a whole different world," Bruce G. Blair, a nuclear weapons scholar at Princeton, told the Wall Street Journal. He called Putin's decisions more dangerous than those of any Soviet leader since 1962. "There's a low nuclear threshold now that didn't exist during the Cold War." Nuclear theory is complex and disputable; maybe Putin is right. But many theorists would say he is wrong, that the logic of nuclear warfare means a "limited" nuclear strike is in fact likely to trigger a larger nuclear war — a doomsday scenario in which major American, Russian, and European cities would be targets for attacks many times more powerful than the bombs that leveled Hiroshima and Nagasaki. Even if a nuclear war did somehow remain limited and contained, recent studies suggest that

environmental and atmospheric damage would cause a "decade of winter" and mass crop die-outs that could kill up to 1 billion people in a global famine.

Russian nuclear doctrine means even conventional wars escalate

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible," <http://www.vox.com/2015/6/29/8845913/russia-war//RTF>)

VIII. The nuclear dangers: The red line is closer than you think This August, as the Russian military launched its undeclared and unofficial invasion of eastern Ukraine to defend separatist rebels there against defeat, Putin attended an annual youth conference at Lake Seliger, just north of Moscow. During a Q&A session, a teaching student asked an odd question about the "cyclical" nature of history and concerns that Russia could be "drawn into a new, open global conflict." Putin, in his answer, did something that the leaders of major nuclear powers generally avoid doing — he rattled the nuclear saber a bit: Let me remind you that Russia is one of the world's biggest nuclear powers. These are not just words — this is the reality. What's more, we are strengthening our nuclear deterrent capability and developing our armed forces. They have become more compact and effective and are becoming more modern in terms of the weapons at their disposal. There is a certain fear in Russia, never far from the surface, that the only thing preventing the West from realizing its dream of destroying or subjugating Russia is its nuclear arsenal. (Three months later, Putin warned that the West wanted to tame the Russian bear so as to "tear out his fangs and his claws," which he explained meant its nuclear weapons.) "There is a widespread belief that the only guarantee for Russian security, if not sovereignty and existence, is the nuclear deterrent," Lukyanov, the Russian foreign policy expert, explained. "After the Yugoslavia wars, Iraq War, Libyan intervention, it's not an argument anymore, it's conventional wisdom: 'If Russia were not a nuclear superpower, the regime change of an Iraqi or Libyan style would be inevitable here. The Americans are so unhappy with the Russian regime, they would do it. Praise God, we have a nuclear arsenal, and that makes us untouchable.'" But Russia faced a problem: Its conventional military forces are now so much weaker than NATO's, and its capital city so close to NATO's forces in the Baltics, that it feared NATO tank divisions could push all the way to Moscow and quickly win a war without ever using a nuclear weapon. Both the US and Russia had pledged to use nuclear weapons only to deter one another from nuclear attacks. This kept the Cold War cold. But because the US would not need its ICBMs to win a war, that deterrence is no longer enough to keep Russia safe. In response, Russia has been gradually lowering its bar for when it would use nuclear weapons, and in the process upending the decades-old logic of mutually assured destruction, adding tremendous nuclear danger to any conflict in Europe. The possibility that a limited or unintended skirmish could spiral into nuclear war is higher than ever. Russia's nuclear doctrine, a formal document the Kremlin publishes every few years outlining when it will and will not use nuclear weapons, declares that the Russian military can launch nuclear weapons not just in the case of a nuclear attack, but in case of a conventional military attack that poses an existential threat. In other words, if Russia believes that American tanks could be bound for the Kremlin, it has declared it may respond by dropping nuclear bombs. The danger that this adds to any possible confrontation, particularly along the Baltic states, is difficult to overstate. If an accident or miscalculation were to lead to a border skirmish, all it would take is for the Kremlin to misperceive the fighting as the beginning of an assault toward Moscow and its own doctrine would call for using nuclear weapons. Indeed, it would be the only way to avoid total defeat. There is another layer of danger and uncertainty to this; It is not clear what Russia would consider a conventional threat worthy of a nuclear response. A few months after he'd annexed Crimea, Putin revealed that during Russia's undeclared invasion of the territory he had considered putting his country's nuclear forces on alert; his government has signaled it would consider using nuclear force to defend Crimea from an attack, something Russian analysts told me was not just bluster. The United States, of course, has no intention of militarily retaking Crimea, despite surprisingly common fears to the contrary in Russia. But Russian paranoia about such a threat, and a possible willingness to use nuclear weapons to avert it, adds more danger to the already dangerous war in eastern Ukraine and the fears that greater Russian or Western involvement there could spark a broader conflict. And the Crimea revelation raises a disconcerting question: Where exactly does Moscow place the line for a threat severe enough to

use nuclear weapons? Its doctrine says they should be used only against an existential threat, but an attack on Crimea would be far from existentially dangerous. We can only guess where the real red line lays, and hope not to cross it by mistake.

Any war escalates- Russian actions put us on the brink

Fisher 6/29 (Max, 2015, writing for Vox, "How World War III became possible," [//RTF](http://www.vox.com/2015/6/29/8845913/russia-war))

IX. The nuclear dangers: How Putin is pushing us back to the brink There is a specific moment that arms control experts often cite to highlight the dangers of nuclear weapons, how they kept the world poised, for years at a time, mere minutes away from nuclear devastation. That moment was September 26, 1983. That evening, a Russian lieutenant colonel named Stanislav Petrov settled in for his shift overseeing the Soviet Union's missile attack early warning system. Petrov had a top-secret network of satellites, all pointed squarely at the United States and its arsenal of nuclear-armed intercontinental ballistic missiles, which pointed back at him. The US and Soviet Union were ramping up development of ICBMs, which could circle the globe in 30 minutes and reduce an enemy city to ash. Both sides were driven by fear that the other could one day gain the ability to launch a preemptive nuclear strike so devastating and so fast that it would start and win the war within hours. Each sought to develop ever more sensitive warning systems, and ever more rapid mechanisms for retaliation, to deter the threat. Petrov ran one such warning system. If he caught an American attack as soon as it crossed his sensors, it would give the Soviet leadership about 20 minutes of warning time. That was their window to determine how to respond. The space for mistakes was effectively zero. Five hours into Petrov's shift that night, something he had never encountered in his 11-year career happened: The system went into full alarm. The word "LAUNCH" displayed in large red letters. The screen announced a "high reliability" of an American ICBM barreling toward the Soviet Union. Petrov had to make a decision: Would he report an incoming American strike? If he did, Soviet nuclear doctrine called for a full nuclear retaliation; there would be no time to double-check the warning system, much less seek negotiations with the US. If he didn't, and he was wrong, he would have left his country defenseless, an act tantamount to treason. His gut instinct told him the warning was in error, but when he flipped through the incoming imagery and data and he could reach no hard conclusion from it. After a few moments, he called his superiors and stated categorically that it was a false alarm. There was, he insisted, no attack. Petrov waited in agony for 23 minutes — the missile's estimated time to target — before he knew for sure that he'd been right. Only a few people were aware of it at the time, but thanks to Petrov, the world had only barely avoided World War III and, potentially, total nuclear annihilation. The US and Soviet Union, shaken by this and other near-misses, spent the next few years stepping back from the brink. They decommissioned a large number of nuclear warheads and signed treaties to limit their deployment. One of their most important measures was a 1987 agreement called the Intermediate-Range Nuclear Forces (INF) Treaty, which saw both sides conclude that the medium-range, land-based nuclear missiles they'd stuffed across Europe were simply too dangerous and destabilizing to be allowed. Because the missiles could reach Moscow or Berlin or London at lightening speeds, they shortened the "response time" to any crisis — the window in which a Soviet or Western leader would have to decide whether the country was under attack before such an attack would hit — to just a few minutes. They made the danger of an unintended escalation, or of an error like the that one Petrov only barely prevented, far greater. The risk they posed was deemed, in the 1987 INF Treaty, unacceptable to the world. And the weapons were removed. Putin has taken several steps to push Europe back toward the nuclear brink, to the logic of nuclear escalation and hair-trigger weapons that made the early 1980s, by many accounts, the most dangerous time in human history. Perhaps most drastically, he appears to have undone the 1987 INF Treaty, reintroducing the long-banned nuclear weapons. In March, Russia announced it would place nuclear-capable bombers and medium-range, nuclear-capable Iskander missiles in the Russian enclave of Kaliningrad — only an hour, by commercial airliner, from Berlin. Meanwhile, it has been testing medium-range, land-based missiles. The missiles, to the alarm of the United States, appear to violate the INF Treaty. This is far from Putin's only nuclear escalation. He is developing more nuclear weapons, and calling frequent attention to them, as apparent cover for his aggression and adventurism in Europe. There are suspicions, for example, that Russia may have deployed nuclear-armed submarines off of the US Eastern Seaboard. What makes this so dangerous is that Putin appears to believe, as the scholar Edward Lucas outlined in a recent report for the Center for European Policy Analysis, that he has a greater willingness than NATO to use nuclear weapons, and thus that his superior will allows him to bully the otherwise stronger Western powers with games of nuclear chicken. This is a substantial, and indeed terrifying, break from Cold War-era nuclear thinking, in which both sides rightly feared nuclear brinkmanship as too dangerous to contemplate and used their weapons primarily to deter one another. "Russia's nuclear saber-rattling is unjustified, destabilizing and dangerous," NATO

Secretary-General Jens Stoltenberg said in a May speech in Washington. Putin is acting out of an apparent belief that increasing the nuclear threat to Europe, and as a result to his own country, is ultimately good for Russia and worth the risks. It is a gamble with the lives of hundreds of millions of Europeans, and perhaps many beyond, at stake.

Insider Threats Michigan 7

!!!Counterplans!!!

Reform the FDA CP's

Funding and FDA Reform CP

Text: The United States federal government should double the budget for the United States Food and Drug Administration for 2015 and provide that funding level as a budget floor in fiscal years 2016-2020.

The counterplan restores FDA credibility by creating budget independence for the FDA – it doubles funding and eliminates the need for business and political influences on future budget levels.

Dr. Feder '9

(The FDA's Deadly Gamble with the Safety of Medical Devices,” pg online @ <http://www.pogo.org/our-work/reports/2009/ph-fda-20090218.html#Recommendations> //um-ef)

1. Budget and independence of the FDA. The FDA, more than most government agencies, needs markedly increased support by the administration and Congress. **This includes increasing the FDA budget considerably and shielding it from excessive political and business influence.** At least a doubling of the budget by 2012, as recommended by the authors of the FDA Science and Mission at Risk report, is needed. Strong leadership at the top is also essential. Until these reforms are implemented, correcting the worsening problems at the FDA will be very difficult.

2NC Solvency

Counterplan solves – lack of funding is the reason for the lack of Agency credibility

Modern Healthcare 13

("FDA credibility hurting due to budget issues, commissioner says," pg online @

<http://www.modernhealthcare.com/article/20131105/NEWS/311059963/fda-credibility-hurting-due-to-budget-issues-commissioner-says> //um-ef)

Federal budget cuts and budget uncertainty are hurting the credibility of the Food and Drug Administration, agency Commissioner Dr. Margaret Hamburg said Tuesday. At a conference hosted by Bloomberg Government, Hamburg said the stakeholders regulated by the FDA expect predictability and transparency in how the agency conducts its oversight. And that's been hard to deliver given the continuing federal budget wars. One problem has been the freeze on user fees paid by manufacturers who want their products approved for safety and efficacy. Because of the budget sequestration cuts, the FDA is set to lose \$85 million in user fees in fiscal 2013, even though that money comes from regulated businesses, not from taxpayers. "You can't run agency as important as the FDA if you don't have predictability, if you don't know what budget you'll be given during the year, or if you don't know whether you can draw from certain resources or not," she said. Increased responsibilities, such as regulating medical mobile apps, also have made the agency's work more challenging. She said the FDA has been "stretched thin for decades."

User Fees CP

User fees make FDA accountable to Big Pharma rather than the public.

HOUSE SUBCOMMITTEE 07 (US Senator Chuck Grassley, R- Iowa- Chairman of the Senate Judiciary Committee; (TUESDAY, FEBRUARY 13, 2007; House Of Representatives, Subcommittee On Oversight And Investigations, Committee On Energy And Commerce; Washington, D.C., The Adequacy Of Fda To Assure The Safety Of The Nation's Drug Supply; <http://www.gpo.gov/fdsys/pkg/CHRG-110hhrg35502/pdf/CHRG-110hhrg35502.pdf>; 07/10/15) JG

Mr. STUPAK. Last month the FDA proposed an increase in annual user fees paid to the agency by pharmaceutical companies to improve drug safety oversight, the post-marketing surveillance we speak of, to speed approval time for the new drugs and monitor direct to consumer advertising. Do you think user fees give companies too much influence over the FDA? Senator GRASSLEY. Well, from that standpoint, it is kind of, since money is fungible, I suppose it shouldn't, but when you have got an agency getting their money directly from the industry that they are regulating, it is hard for the public and maybe for us, and it causes us to be a little more suspicious here in the Congress, but for the public that is unsophisticated about how Government works, it is sure going to appear to them of undue influence. But more importantly than just the user fees, I can make reference to a lot of e-mails that we have had access to from within the FDA that would say things along this line, and I don't have a specific reference. I could have my staff get you a specific reference, but things that said well, if there is any question about this or that, some specific drug they would mention, talk to us first or let us have an opportunity to explain, et cetera. It is almost like the pharmaceutical companies feel like they have a seat at the table and maybe this fee business makes them feel that way. I don't know for sure. But the point is, there should only be one person across the table from the FDA and that is John Q. Public, not members of the pharmaceutical industry. Mr. STUPAK. Senator, you went all the way to the Department of Health and Human Services to talk to an agent regarding Ketek. Has HHS finally given you access to that agent? Senator GRASSLEY. Absolutely not and there is not reason to, but their excuse is that there is a criminal investigation or there is an investigation generally, see, an investigation generally. And I will tell you how absurd this gets. Now, they referred to the fact that the Department of Justice is advising them accordingly, see? So I am sitting in Judiciary

Committee in the United States Senate on an entirely different issue and Senator Kennedy, with more seniority, goes ahead of me and he says something to somebody from the Department of Justice, I want to ask these line agents some questions. Well, you can have access to these line agents. Well, a light bulb goes off that Chuck Grassley can't have access to a line agent because somebody in the Justice Department told HHS that I couldn't talk to Agent West. So I talked to the Justice Department about the situation right after Senator Kennedy gets done and they said I could have access the same way Kennedy had access, to other agents in some other department. I still don't have access to Agent West. So if the Justice Department is advising VerDate 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00024 Fmt 6633 Sfmt 6633 Q:\DOCS\110-5 SCOM1 PsN: SCOM1 21 HHS that you can't have access to Agent West but the Justice Department, in a similar case of a line agent says Senator Kennedy has, well, what is the policy of this administration on having access to line agents? Is it one policy for Kennedy, a Democrat, and another policy for Grassley, a Republican?

Ptix Net Benefit

And, politics is a net benefit – the cp is bipartisan and wont be controversial

AP 9

**(“Is the FDA a broken agency?,” pg online @
<http://www.today.com/id/29495269/43136851%20In%20the%20five%20years%20since%20the%20AP%20article%20was%20published,%20more%20diastasters%20%20have%20occurred.#.VaiIwflVgSV> //um-ef)**

Congress has been pumping more money into the FDA the last couple of years. And the Obama administration seems willing to consider big changes, especially on food safety. The two leading candidates for FDA commissioner are physicians from outside the agency. One is Baltimore health commissioner Joshua Sharfstein, a pediatrician who has taken on the FDA over risks in children's cough and cold drugs. The other is Margaret Hamburg, a bioterrorism expert who served in the Clinton administration and as New York's health commissioner. “One area where we could see bipartisan cooperation might be the strengthening of the FDA.” said Dr. Paul Stolley, a former department head at the University of Maryland medical center who had a stint as a visiting scientist at the FDA. “I don't think ideological differences should interfere.”

Other Reform CPs

Alt causes to FDA failure- CP solves better

HOUSE SUBCOMMITTEE 07 (US Senator Chuck Grassley, R- Iowa- Chairman of the Senate Judiciary Committee; (TUESDAY, FEBRUARY 13, 2007; HOUSE OF REPRESENTATIVES,

SUBCOMMITTEE ON OVERSIGHT AND INVESTIGATIONS, COMMITTEE ON ENERGY AND COMMERCE; Washington, D.C., THE ADEQUACY OF FDA TO ASSURE THE

SAFETY OF THE NATION'S DRUG SUPPLY; <http://www.gpo.gov/fdsys/pkg/CHRG-110hhr35502/pdf/CHRG-110hhr35502.pdf>; 07/10/15) JG

Even so, what I have learned about what happened with Ketek troubles me. I have learned that FDA gave its advisory committee questionable data on Ketek and did not tell them about problems with that data. I sent a letter to the FDA in December regarding my findings on this matter and I am still awaiting a response. The FDA approved Ketek without much safety data from the U.S. The agency relied almost exclusively on foreign post-marketing safety data. And lastly, Ketek's sponsor, in all likelihood, was aware of the fact that it submitted some questionable data to the FDA regarding its large safety study. The sponsor was informed of the problem on 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00020 Fmt 6633 Sfmt 6633 Q:\DOCS\110-5 SCOM1 PsN: SCOM1 171 lems with one of the study sites prior to the date of submission to the FDA. However, according to the FDA reviewers, the sponsor never raised these problems with the FDA. FDA learned about them after his own investigators inspected the site. During the last 3 years, I have also tried to work in a productive way with the Commissioners and Acting Commissioners of the FDA. It will take bold leadership to get on top of the FDA's problems and to turn the agency around. So far, lip service has been fine; the reality has been a lot less. Last month, Senator Chris Dodd and I introduced two reform bills that we proposed in 2005 to get the safety, to fix the safety shortcomings at FDA. Our first bill would elevate and empower the office with the FDA that is responsible for monitoring FDA-approved drugs after they are on the market. It would make the postmarket safety function within the FDA independent, but within the FDA, instead of under the thumb of the office and the center that puts the drugs on the market in the first place and that is the way it is today. I want to point your attention to the Wall Street Journal in regard to Chairman Dingell. It is reported that he is intrigued by the idea of drug safety center within the FDA. I appreciate that view. It doesn't make any sense that the FDA officials who are supposed to monitor the safety of a drug on the market serve only as consultants to the FDA officials who approve the drug in the first place. The officials who approve the drug would obviously be conflicted in making a judgment that approval is no longer appropriate or was a mistake in the first place. Kind of like having egg on your face. A separate center for drug safety within the FDA is a vital lynchpin when it comes to meaningful reform and improvement of the agency's post-marketing surveillance. The second bill that Senator Dodd and I have introduced would expand an existing public data base by mandating the registry of all clinical trials and the results of those trials. This reform is key to establishing greater transparency regarding clinical trials, the good ones and the bad ones, and to hold drug makers and drug regulators accountable and to give doctors all the information they can to their patients. Both of these legislative initiatives would make drug information used by doctors and patients more complete and more accessible. American consumers should not have to second guess the safety of pills in their cabinet.

Only CP can solve FDA circumvention- plan doesn't go far enough

HOUSE SUBCOMMITTEE 07 (US Senator Chuck Grassley, R- Iowa- Chairman of the Senate Judiciary Committee; (TUESDAY, FEBRUARY 13, 2007; HOUSE OF REPRESENTATIVES,

SUBCOMMITTEE ON OVERSIGHT AND INVESTIGATIONS, COMMITTEE ON ENERGY AND COMMERCE; Washington, D.C., THE ADEQUACY OF FDA TO ASSURE THE SAFETY OF THE NATION'S DRUG SUPPLY; <http://www.gpo.gov/fdsys/pkg/CHRG-110hhr35502/pdf/CHRG-110hhr35502.pdf>; 07/10/15) JG

Mr. STUPAK. I understand. I want to respect your time. I am done with my 10 minutes. Any comments, Mr. Green? Ms. DeGette? Thank you. Thank you. Mr. Whitfield, please, for 10 minutes. Mr. WHITFIELD. Thank you, Mr. Stupak, and I have one question and then we will let the other Members on our side expend the 10 minutes. Senator, we appreciate you being here. In your testimony, you brought attention to one of the basic tenets of our Government and that is the responsibility of oversight by the legislative branch and I would just ask you a question because I think you have touched on a significant issue, just the difficulty that you had in obtaining information from a branch of the Government on the executive side. Did you consider using a subpoena at any time to, not only a subpoena, but holding them in contempt? Senator

GRASSLEY. In the Senate, you get to this place. We considered that, yes. But you have to have a majority vote of the committee. You have to have a majority vote of the Senate for that to happen and so we did not decide to go that route because we thought there were other routes we could go. Obviously, the other routes have not been successful, either. Mr. WHITFIELD. Well, we appreciate very much your bringing attention to this issue and we look forward to working with you as we try to address it and— Senator GRASSLEY. Well, let me suggest to you, Chairman, or Ranking Member Whitfield, that you can be very helpful. This double standard in this administration, that a Democratic Senator, supposedly not as friendly with the administration as I am, maybe they don't consider me friendly anymore, but the point is if Senator Kennedy can get access to line agents why can't Senator Grassley get access to a line agent, when I have already had access to line agents over the years? So some sort of new policy? Mr. WHITFIELD. Yes, I understand. I get frustrated. I find the appropriators sometimes have access to things I don't have access to and it is very frustrating. Since I guess I am controlling the time on our side, at this time I recognize Mr. Ferguson, Mr. Burgess and then Mr. Walden. Mr. FERGUSON. Thank you, Mr. Whitfield. Senator, thank you very much for being here today. I can fully identify with your frustration in not always getting information that you are looking for. I know you were commenting before on whether the administration considers you a friend or not, we all certainly here consider you a friend and we very much appreciate your being here. Senator GRASSLEY. Well, sometimes I wonder why I spent 2 days in the car with President Bush riding around the cold of Iowa to help him get nominated in the year 2000, as an example. Mr. FERGUSON. I wish I could shed more light on that for you but maybe I ought to stick to my topic. Senator, you mentioned before the Mosholder investigation on SSRI's with children. That was a VerDate 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00025 Fmt 6633 Sfmt 6633 Q:\DOCS\110-5 SCOM1 PsN: SCOM1 22 very, very important topic for this subcommittee, something that I was very involved with personally and really highlights the importance of this topic, this issue of post-market analysis and I know, in your bill, your approach in the bill that you have introduced would move this issue of post-market review out of CDER, out of the Center for Drug Education or Evaluation and Research. Would you just comment on the differences between your approach and the approach that was suggested by the recommendations of the Institute of Medicine? I don't want to bring up Senator Kennedy's name, because that seems to raise your ire, but I know in the bill that Senator Kennedy has introduced, his approach seems to be, anyway, more consistent with the recommendation that the Institute of Medicine had suggested. Would you just comment on those differences, please? Senator GRASSLEY. In a very general way, I think that the main difference is that I want, within FDA—because some people think we are setting up something outside FDA, so I want to emphasize, we are doing it within FDA—report directly to the Director so that there is no doubt that even though, on a chart of organization, the Office of New Drugs is separate from the post-marketing, the Office of Drug Safety, but as I indicated, it is not really so. So I want to get this box over here, wherever this box is located, I want it not to be under the thumb of this agency, even though the chart doesn't show it that way, reporting directly to it. And I think that Senator Kennedy's approach, and it is probably a bipartisan bill, so it is not a political, partisan issue, is that we are going to still have a cloudy relationship, not the black and white separation that I call for under the bill that came out of committee last year. Now, I don't know whether Senator Kennedy, in his new bill, is going the same direction this year or not, but last year, that is the way it was and we just want guaranteed independence in reporting directly so that we don't have these people in the Office of New Drugs that says this drug is safe, trying to quash out here when somebody says it isn't safe. And I don't want what happened to some of your witnesses who are patriotic Americans, wanted to make sure the scientific process works, being blackballed and ruined professionally because of that. It doesn't need to be. It compromises too much and there is too much found out in post-marketing surveillance that needs to have an independent judgment of it. And I don't think that in the bill that Senator Kennedy has that it goes far enough. Mr. WHITFIELD. We have less than 4 minutes left. Dr. Burgess, did you have a question? Mr. BURGESS. Yes, Mr. Whitfield. Senator, thank you for being here. On perhaps just a side note. Yesterday in the Wall Street Journal there was an op-ed article about clinical trials and patients who have reached the end of their therapeutic ropes, if you will, who are denied access to drugs that are in phase 2 trials. It raises a separate issue with the FDA, but physicians and clinical staffs who apply for exceptions to get their patients into these clinical trials find the statistical issues raised by the FDA staff aimed at the applying physician can sometimes rival receipt from the IRS. Clearly, that is an interference in getting new cutting edge medications to patients, again, who have exhausted all therapeutic activity, so I hope, Mr. Chairman, we can perhaps spend some time looking at that, as well. I guess I am most interested, Senator, and I do agree with you, the proper respect for the scientific process needs to be paramount in our minds. Line Agent West, whom you referenced, were you ever able to establish contact with this individual and if not, Mr. Chairman, are we planning on asking for similar access to Line Agent West? Senator? Senator GRASSLEY. Well, I have not personally had access to him in the way that makes any difference. I think maybe I better not speak beyond that because I don't want to get anybody in trouble, but we have some information, but we need to get the information in an open, transparent way. And I don't want to imply we got information, that we just want to be more transparent. We don't have all the information we can get if we can talk to him. Mr. BURGESS. But I judged from your tone and demeanor you felt that this individual had some pretty important information? Senator GRASSLEY. Oh, absolutely. Without a doubt. Mr. BURGESS. Thank you, Mr. Chairman. I will yield. Mr. WHITFIELD. Mr. Walden. Senator GRASSLEY. Can I? On the first thing you brought up, I don't think you meant to imply this, but just in case; I don't want any misunderstanding. I hope, in all of my testimony, that I don't want to interfere with the things that you were bringing up that were in the Wall Street Journal in the sense of special opportunities for people who are willing to be guinea pigs because it is the end of the life, it might save their life, it might not save their life. Where an

individual is totally aware of every gamble he is taking and he is educated in that and he is will to take it and everything is transparent, I don't want to stand in the way of that. Mr. WHITFIELD. Mr. Walden. Mr. WALDEN. Thank you. Thank you, Mr. Chairman. Senator, welcome. We appreciate your work on this issue. I want to touch on one topic and that is that Memorandum of Understanding that I understand exists between the IG's office and HHS and the FDA. Senator GRASSLEY. Yes. Mr. WALDEN. To allow the FDA to investigate itself, basically, on employee misconduct issues. And I am just curious. I know that is an issue you have been concerned about, Senator, and I wondered if you or your staff has learned anything new regarding the status of that MOA? Senator GRASSLEY. Well, I think I better look at my staff, but I don't think we have anything more than we are just recommending that it should be reviewed and rewritten. I don't know that we're in the process of thinking it is being reviewed and rewritten. Yes. We have asked the IG to examine it. He has come up with some recommendations. But your question to me is, is it being rewritten and the answer is no. OK? Mr. WALDEN. All right. It is just a concern I think we share. Senator GRASSLEY. Well, yes, and it would be nice if—this is an extremely powerful committee you have here and the extent to which you can push that, it would be much appreciated by me, but more importantly, the people's safety is at stake here and independence from industry being regulated would be enhanced by it, as well, I think. VerDate 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00027 Fmt 6633 Sfmt 6633 Q:\DOCS\110-5 SCOM1 PsN: SCOM1 24 Mr. WALDEN. I think we concur with that. Senator GRASSLEY. And maybe less pressure brought against whistleblowers, too. Mr. STUPAK. Well, Senator, there is concern on that memorandum that the FDA is using it under a criminal pretext to suppress scientific opinion on drugs that are being approved. It appears, from the SSRI, Vioxx and others, when a scientist within the FDA or a whistleblower is going to speak out, they suddenly find themselves under some kind of criminal investigation from the FDA underneath this Memorandum of Understanding. It seems like it is a form of retaliation and harassment on scientists willing to speak up and speak out. Senator GRASSLEY. Yes. And let me tell you, you have stated it better than I could and as a matter of emphasis, and more importantly, because you are chairman of this subcommittee, I hope people listen, from that point of view, and you pursue that because you are absolutely right. Mr. STUPAK. Thank you. Mr. Dingell, anything for Senator Grassley? The CHAIRMAN. Mr. Chairman, only this. I want to thank our old friend for coming over here. Thank you, Senator, very much for being here. I would ask that perhaps if I send you a little letter requesting some information on your statement today and your comments on some questions before us related to this matter. Perhaps maybe you would respond and I would ask unanimous consent that that response be put in the record. Senator GRASSLEY. Yes, we will do that, Chairman Dingell, and thank you for your leadership and I look forward to a return to the days of your aggressive oversight work where almost every agency knew that you were going to get to the bottom of things and that they ought to cooperate. The CHAIRMAN. Thank you. Well, you have set a good example and I will certainly try to follow it, but we have an outstanding chairman in this subcommittee, Senator, in the person of Mr. Stupak and he will do a superb job of helping folks understand that we all work for the taxpayers and the people, as do you, sir. Thank you very much for being here. Senator GRASSLEY. That last statement he made, if I could comment on it. We all work for the taxpayers and we have got institutions, not just FDA. Maybe the example I always use is the FBI more than the FDA in this manner, but we have got too many agencies around here that talk about it as our agency or our institution. In the case of the FBI, it was our institution. I got tired of the director saying that all the time at a meeting we were in, our institution, and I said that is what is wrong with the FBI and maybe that is what is wrong with the FDA, although I haven't heard that from them, but the point is that I said we all work for the American people. It is not your agency, it is not my agency, it is the people's agency and we are all working for the American people and the sooner we understand we are working for the American people and not for our institution, the better we are going to do our job. VerDate 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00028 Fmt 6633 Sfmt 6633 Q:\DOCS\110-5 SCOM1 PsN: SCOM1 25 Mr. STUPAK. Well said. Any other comments? Senator, thank you once again. Thank you for your time and thank you for your work and we look forward to working with you. Senator GRASSLEY. Thank you. Mr. STUPAK. We will call our second panel up to testify. Mr. BURGESS. Mr. Chairman, while the second panel is seating, can I ask for a unanimous consent request? I ask unanimous consent that yesterday's op-ed from the Wall Street Journal be submitted as part of the record? Mr. STUPAK. Hearing no objection, it will be made part of the record. Mr. STUPAK. The second panel will consist of Dr. David Ross, National Clinical Health Programs, U.S. Department of Veterans Affairs; Ann Marie Cisneros, Independent Clinical Research Associate; and Dr. John Powers, Scientific Applications International Corporation. If they would come forward, please. It is the policy of this subcommittee to take all testimony under oath. Please be advised that witnesses have the right, under the rules of the House, to be advised by counsel during testimony. Do any of the witnesses before us, this panel, have counsel at this time? Do you want to introduce your counsel, Dr. Ross? Dr. ROSS. My counsel is Mr. Mark Cohen of the Government Accountability Project. Mr. STUPAK. OK. Ms. Cisneros? Ms. CISNEROS. My counsel is the same. Mr. STUPAK. Same. Dr. Powers? Dr. POWERS. Same. Mr. STUPAK. OK. Please rise and raise your right hand to take the oath. [Witnesses sworn.] Mr. STUPAK. OK, record shall reflect the witnesses have been sworn and Dr. Ross, we will begin with your opening statement, please.

Insider Threats CP

1NC Reform CP

Text: The United States federal government should create a common definition of an “insider threat.” The United States federal government should amend the Insider Threat Policy to include insider threat training that focuses on threat psychology and proper use of Employee Assistance Programs.

The Counterplan competes – it doesn’t increase congressional oversight

And, it solves – it creates a training program to help employees better understand and interact with the program and it prevents insider threats – avoids the threats disad and the collapse of the Intelligence Program caused by the Aff’s substantial overhaul of the system

Porter 14

(Michael Lawrence, Master in Security Studies, “Combating Insider Threats: An Analysis Of Current United States

Insider Threat Policies And Necessary Improvements,” pg online @ [//ghs-ef\)](http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y)

Given the many insider threat-related challenges the CI Community faces, the United States has done a great deal to confront this dangerous enemy. Nonetheless, the CI Community must make additional changes due to weaknesses in the current legislative processes.

organizational interactions, and other issues involved in this effort

99. As addressed in Chapter 3, the structure of the CI Community has adapted over the years, but the sad reality is that these changes happened largely as a result of failures in the system and kneejerk reactions designed to address specific instances of failure¹⁰⁰. Even

then, the changes that do occur often do not come easily and are the result of extensive reform processes throughout the IC. The ever-present threat posed by insiders means that the US CI Community must routinely evaluate the process it operates under and look to better

itself.

Our CI specialists must address a range of persistent vulnerabilities to help strengthen the American security apparatus. The problem is that substantive reform is often very difficult to accomplish in the IC, and subsequently the CI Community, for two reasons. First, intelligence reform is usually more politically motivated than it is focused on, and motivated by, the need for substantive change¹⁰¹. Second, since the IC is a tool of the policy makers, who ultimately oversee these organizations, this often means that the people making decisions for the IC have little to no real understanding of the Intelligence process¹⁰². As Chapter 3 demonstrated, there were multiple reforms over the past 20 years that have helped mold the CI Community into an organization that could fight the insider threat. These changes however, were not the result of planned reform, they were reactionary movements to larger community failures that allowed insiders like Ames, Hanssen, and Hassan to exist. Politicians do not like huge failures for political reasons, so large high-profile events act as “motivation” for change, and to show their constituents that they are making things better¹⁰³. Policymakers drive the intelligence cycle. As the driving force, they should continually evaluate the systems in place, judging their effectiveness and adapting them as need be¹⁰⁴. Unfortunately, this is often not the priority of those in the policy community¹⁰⁵. The absolute certainty of the need for reforms in the CI Community begs the question, why have major substantive reforms not happened yet¹⁰⁶? The answer to this question relates to the challenges that intelligence reform faces: time, concession of power, and consensus. Time is a valuable commodity and one that has a dramatic impact on the actions of people everywhere. Whether it is rushing to meet a deadline or hanging on for the long run, time seems to dictate our lives, and this idea could not be truer for both the IC and the policy community. The reason that time is such a significant challenge to reform has to do with the nature of the IC and CI communities, the policy community, and the dramatically different understandings they have of time. First, in the IC there has traditionally been less sense of time-urgency, because before 9/11 intelligence was seen mostly as a long-run game, an endurance race. The challenges posed by agile extremist organizations have forced the IC to face a new paradigm in this arena. However, when it comes to collecting, analyzing, and exploiting so much information from the enemy, whether that is an insider threat, a nation-state he spies for, or an ITO supporting him, the operations tend to last for years. As intelligence professionals see it, steady analysis not rushed by political pressure is the key to success. Conversely, in Congress and the White House, politicians are rushed to make their mark by showing their constituents what they have accomplished. In this sense, they often view intelligence as a tool to gain large results in a short period of time. With the two operating under a different time frame there are bound to be confrontations¹⁰⁷. The second and most important way that time holds back reform is in the reform process itself. Given that reform will be drafted and incorporated by the policy community, the US Congress cannot simply “change.” Rather, there have to be bills written, voted on, debated, passed, and signed into law. This all takes time—a very long time. To make matters worse, it is the legislature’s right to conduct an investigation into failures, or reasons for reform¹⁰⁸. As Berkowitz states, “Commissions take months to convene, staff, and complete their work. Experience shows that commissions require, on average, a year to two to report their results—and even more time to declassify their reports so they can be released for public discussion. During this time, any passion officials might have had for fixing intelligence ebbs and the public’s attention wanders out other matters.” Just one example of this is the September 11th Commission, which was formed a year after the attacks, releasing results two years later, and passing changes through Congress 10 months later¹⁰⁹. The problem here is that the IC has its most fervent reform supporters immediately after the failure, as was the case with Ames, Hanssen, and Manning, yet as time drags on, the supporters of reform begin to become busy with other things, and the intended reforms do not come to fruition¹¹⁰. The next major barrier to reform is cession of power, because giving up power is not what any agency, or leader, wants to do¹¹¹. This desire to maintain power often results in nothing more than long debates and very weak results, if any at all. An example of this is clear within the IC. In 2002, with the creation of the position of the NCIX, the Counterintelligence Enhancement Act of 2002 tasked the NCIX with developing the annual National CI Strategy. Developing this strategy would be based on the NTPA as stated in Chapter 3. The problem is that the NTPA and the CI Strategy are not based on the Director of National Intelligence’s National Intelligence Strategy (NIS), nor does the NIS say anything about CI¹¹². This is because with the creation of the NCIX in 2002, it was given the power of drafting the CI Strategy, while the DNI, created in 2004, does not have the power to “develop” any part of the CI Strategy. This is one area where a small cession of power and cooperation between organizations could go a long way to unifying the role that the DNI has within the IC¹¹³. This tight hold on the CI Community has had drastic consequences for the office of the DNI, which was originally designed to provide leadership and guidance for all of the IC, but left weak and limited. Like time, consensus is a chief barrier to reform for the IC and policy community because of how the intelligence cycle works. However, consensus is probably the most important barrier because of the ways in which it can affect other barriers to reform. One of the key ways in which consensus is a challenge to reform has to do with the fact that consensus implies that both sides come to an agreement. As Berkowitz discusses, political compromise allows opponents to sabotage the creation of any new agency from the start by simply not agreeing to certain aspects of potential future laws¹¹⁴. This truly is a hurdle for reform because while politicians, and heads of agencies, can come with hands outstretched under the banner of reform, a “nay” vote or even language inserted into a bill that passes through the legislature can destroy consensus and weaken any real reforms. Another major barrier to consensus is the secret nature of the IC. The reality is that the majority of the work that the IC does is classified, which can be a problem for the policy community. The reason this level of secrecy is such a major issue is that members of the policy community do not normally have the clearance to see all the information necessary to make proper decisions about CI or any other reforms. This lack of information basically leaves the IC asking Congress to go along with their plans with a minimum amount of information and understanding of what the plans actually are¹¹⁵. In this way a call to reform without all the necessary components is not asking for consensus, but rather asking for acceptance by the few who have access to the intelligence, which in the case of the Senate is a Select Committee of 15 individuals and in the House, 21 individuals. Finally, for the proper cession of power there must be consensus on the level of gains or losses, which can end up being a problem, especially for agencies or individuals not wishing to lose power. For example, when the office of the Director of National Intelligence was created, the policy makers and the Department of Defense never could gain consensus as to the level of power the DNI would have, and the result of this was a DNI with very little power¹¹⁶. Ultimately, time, power struggles, and consensus will remain barriers to reform and until those barriers are overcome, the IC, the CI Community, and the policy community will continue to experience problems like those already seen. This continuing failure will waste time and effort—time that is already in short supply and could be used to stop insiders instead of allowing them to continue damaging the United States. In light of these challenges and the problems that still exist, we must evaluate the kinds

of changes required for the continued fight against insider threats. As has been previously mentioned, this work focuses on reform efforts at the strategic level

for three reasons. First, top-down reform is critical when it comes to addressing an enemy like the insider threat

where a unified approach is needed. Second, reform suggestions for individual agencies look too deeply

at specific tactics. Addressing weaknesses would have very real security implications due to the nature of the sensitivity of the mission. Finally, the sheer number of

differences between the different operational agencies and their different mission sets would

inundate researchers and not allow adequate analysis of weaknesses at any other level.

In order properly to look at each problem, this work will first define the problem within the CI Community that interested parties must address. Next, it will outline steps for proper implementation of the reforms. Inherent to this is how implementation will address the aforementioned barriers to reform. Lastly, for each reform effort this work will offer some evaluation criteria, which may be used to identify strengths/successes or weaknesses of the reform efforts. Before presenting recommendations, understanding what type of reform is best for the IC is

essential to ensuring the best changes. **Sweeping reform efforts generally do not work. Often, in the effort to “fix problems” policy makers will make massive and revolutionary changes**¹¹⁷. **These risk throwing out the good organizational structures, procedures, and systems in place along with the bad ones. The changes proposed in this work are intended to limit the “pendulum swings”** that Richard Betts refers to, **and to offer minor corrections that will benefit CI in its continued missions to stamp out insider threats**¹¹⁸.

Lastly, one important issue to highlight for evaluation is that intelligence reform evaluations are difficult to assess due to the nature of intelligence. By definition, intelligence helps to inform. Good intelligence may help to inform leaders of decisions needed to prevent negative outcomes. In this case, decisions made will yield little to no “visible” result. However, when intelligence does not inform, and disaster occurs, policy makers will tend to say there was a failure in intelligence¹¹⁹. Failures are always visible, and the IC is almost always held accountable. The root of this problem rests in the fact that the only true success is 100-percent success¹²⁰. The next time a spy is caught or a violent extremist blows himself and American citizens up, policy makers will begin looking at the system as a failure. The reason this is seen as a failure is because of the misunderstanding of what intelligence is and what it does. Intelligence is not predictive and it cannot catch 100 percent of the problems, especially when it comes to insider threats. As with all things in this world, everyone and everything has a say, to include our enemies, for every action that we take our enemies can be expected to take two. Knowing this, policy makers must understand that there will always be uncertainty in intelligence and that “failure” is not necessarily failure there is always more that is accomplished that is never seen¹²¹. **The first improvement that is needed is the establishment of a common definition of an insider threat. Currently, there are over 15 different definitions** as outlined in the NCIX’s Official Terms & Definitions of Interest List¹²². **Such a broad list of definitions leaves many questions in the minds of the different IC agencies as to what an insider threat is, and who has jurisdiction regarding collection, analysis, and apprehension**. Most importantly, the definition in the 2012 National Policy lacks any sort of tie to a foreign nexus¹²³. **This vague language creates confusion as to who has jurisdiction over potential insiders**. According to the policy definition, CI would have been responsible for identifying and handling any threat, to include domestic law enforcement cases. The problem is that if these threats are American citizens, not working for extremist organizations or foreign nations, then CI does not have jurisdiction as assigned in EO 12333124. **This current lack of specificity can cause confusion when it comes to handling insider threats, because over utilization of CI and LE on areas outside of their jurisdiction leaves them both over-exerted and stretched thin**¹²⁵. Furthermore, establishing a definition will be difficult with as many different and divergent definitions as we already have throughout the government. As was mentioned, consensus is important and right now there is none. Changing this will require the NITTF to build common ground and push past the differences. The important thing to remember is that words have meanings and, as the 2009 NIS states, insider threats are the priority for CI¹²⁶. An open-ended definition will tax a stressed organization. Specificity allows work to be spread across the spectrum of CI and Law Enforcement cases and thus increase the amount of success. Chapter 1 of this paper outlined the author’s definition of an insider threat as “an individual with placement and access to critical infrastructures, military units, and the government and their supporting agencies who have allegedly turned against and targeted their parent organization, thus aiding a foreign power or international terrorist organization.” This definition is based on a conglomeration of multiple different definitions used across the IC. It encompasses all of the critical elements of the threat and leaves no question in the minds of the different agencies as to who has jurisdiction. Simply adopting a new definition does not mean that “jurisdiction battles” will be solved. Inherent to any definition is the constant need for cooperation amongst the different organizations of CI and in the case of uncertainty, to allow for joint investigations and the sharing of potentially valuable information between the different disciplines¹²⁷. Evaluation will be more than just the success or failure of a standard definition. The definition itself will be tied to a broader evaluation of the National Threat Policy. Accordingly, the ITAG and the JITTF would be primarily responsible for the evaluation of current policies. In order to do this, an evaluation of classified and unclassified reporting and investigations, at the national level, will identify increases in reporting, opening of investigations, opening of joint investigations, prosecutions, and operations conducted. An increase in these numbers would be a strong indication that programs are working, at least in the short-term. This data would be compiled and presented by the NCIX to the DNI and policy makers as an indicator of the change that is occurring with new policies. Granted this information would not be shown to all policy makers, but there are representatives in Congress and the White House that would be privy to this information, and that serve as representatives for the broader policy community¹²⁸. **The second improvement needed is that the CI Community should realign insider threat training to focus toward preventing threats, not simply identifying them. The National Insider Threat Policy** includes a set of “Minimum Standards for Executive Branch Insider Threat Programs.” These minimum standards are the current guidelines promulgated by the executive branch, the NCIX, and the JITTF regarding Insider Threat Programs¹²⁹. **The programs’ standards have addressed many of the issues relating to insider threats except one key issue: prevention.** The minimum standards read more like a list of training for identification of a current threat, and less like a set of preventative measures. **Identifying threats is useful, but the problem with insider threats is that they are often unidentifiable. more is needed in the form of prevention.** The major problem with passing changes such as these is, once again, the problem of time. As previously stated, policy makers like to see fast results. Preventative measures will not get nearly the same results as fast as identification. Focusing training on identification can give quantifiable numbers to policy makers about how successful a program has been by catching bad guys.¹³⁰ One can hope that politics is not all that is at play when it comes to determining how these programs are organized, but these changes will need to be made quickly because the longer they wait the longer the system goes without preventative measures. **Not much needs to be added to current CI training, but an understanding of the basic threat psychology**, as addressed in Chapter 2, should be a part of the Minimum Standards. **A key element of this “preventative measure” is the provision of information regarding where developing threats can seek assistance, how coworkers can report suspected problems for assistance, and how supervisors can refer to assistance. These insights would be crucial both for impacting the potential downward spiral and the apprehension of an individual**. The one major outlet that exists is in Employee Assistance Programs (EAPs). As stated in EO 12968, **all individuals working for agencies with access to classified information are eligible to use EAPs for “assistance concerning issues that may affect their eligibility for access to classified information**, such as financial matters, mental health, or substance abuse.” Essentially **EAPs are counseling services for those in the IC who need an extra support structure to get personal help**¹³⁰. **The problem is that often there is a stigma placed on anyone for using these services. The proper use of these programs is crucial for serving this preventative measure and should be included in training as a healthy outlet free of judgment or damage to one’s career.** One thing that the Spy cycle and the Radicalization cycle both underscored was that **in the earliest stages of the development of an insider threat, there was a need for help**. The spy found that help in the solace of a foreign intelligence service, while the future violent extremist found it in the support network of an international terrorist organization. **By focusing training on identification at the later stages of development, we are skipping an important step in the progression of an insider threat. Ignoring the early stages does nothing to prevent those potential future threats sitting on the edge of right and wrong from making bad choices. By adding to the**

current training a focus of earlier detection then the potential to remove the future insiders from their support structure and offer them a healthy outlet is possible. Additionally, teaching this training to everyone will turn personnel into sensors for future threats, not just current ones!31.

2NC Solvency

Reform key – overhaul collapses the prevention of insider threats

Porter 14

(Michael Lawrence, Master in Security Studies, “Combating Insider Threats: An Analysis Of Current United States

Insider Threat Policies And Necessary Improvements,” pg online @ <http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y> //um-ef)

These four changes, while not dramatic, offer insights into a few things that the IC can do to fix the “fractured” systems in the CI Community. They maintain that there are valuable systems in the IC and that the “changes” should not be so dramatic as to throw out potentially good processes. The insider threat is too important to be tossed aside because of political inconveniences, only to be looked at when there have been failures. **The increase in insider activity in the past few years is an indication that policy makers and the IC should place serious consideration on what needs to happen to the insider threat framework.** It is sad that it must come down to the loss of some of the nation’s most important secrets for this to happen, so we must continue to work toward meaningful reform.

WB CP

1NC Incentives CP

Text: The United States federal government should consolidate environmental whistleblower programs under the Environmental Protection Agency and establish a program that provides financial incentives for successful whistleblowers based on government recovery benefits in the Securities Exchange Commission (SEC) whistleblower program.

That solves and avoids politics – it incentivizes whistleblowers to come forward despite the potential risks

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

c. Models to Follow: The Dodd-Frank Whistleblower Programs **The alignment of government and whistleblower interests can provide significant advantages for the enforcement of environmental statutes**, but it must be achieved through an effective mechanism. n255 In light of the adoption of the SEC and Commodity Futures Trading Commission (CFTC) whistleblower programs under the Dodd-Frank Act (the "Act"), it appears Congress has recognized and embraced the agency-wide program model to monitor financial malfeasance. n256 [*223] Agency programs, such as those implemented by the Act, **serve as an effective and useful alternative to successful litigation-based whistleblower statutes**, such as the False Claims Act (FCA). n257 Most environmental crimes, like most financial crimes, generally do not involve claims submitted to the government for payment, which precludes them from falling under the qui tam provisions of the FCA. n258 Nevertheless, **the government can, and has, pursued other avenues to provide the incentives needed for whistleblowers to spearhead enforcement actions, through agency-mandated programs**. n259 In all likelihood, **the government's willingness to create more whistleblower incentive programs has largely been spurred by the successful outcomes produced by the FCA qui tam provisions**. n260 Before the Act's programs, the prototype of the agency enforcement model was the Internal Revenue Service (IRS) whistleblower program. n261 The program was the first federal agency effort to incentivize whistleblowers to come forward, and it incentivized such action with a set financial award for any financial recovery. n262 As a result, both the government and the whistleblower had some incentive to pursue high quality claims and recover illegally held funds. n263 **The value of this information can be seen in Congress' choice to strengthen the program so that the agency awards are now mandatory, not discretionary**. n264 Although the IRS program has been the archetype for agency whistleblower enforcement, it lacks some key features that make other whistleblower programs successful. n265 Most notably, it fails to adequately protect [*224] whistleblower confidentiality and it does not have an expressly authorized whistleblower protection program. n266 The Dodd-Frank programs however, **improved upon the IRS whistleblower program**. n267 As an initial matter, the programs emulated the IRS program by providing the set, mandatory financial awards that whistleblowers can expect for providing specific, previously unknown information that leads to a successful case. n268 The programs then went further by strengthening whistleblower protections by ensuring confidentiality and creating the possibility for greater financial awards in successful retaliation claims. n269 **Congress included whistleblower programs in the Act because it recognized the massive threat posed by financial crimes, and the valuable part that insiders could play in curbing it**. n270 The programs seek to address the problem, using a combination of financial incentives and well-structured protection and confidentiality programs. n271 **A similar approach in the environmental realm could be just as, if not more valuable to the public and the common good**. n272 For that reason, **Congress should adopt an agency-wide whistleblower program under the EPA, similar to those adopted under the SEC** and the CFTC in the Act. n273 Set financial awards can bring those with direct knowledge of environmental violations to the forefront. n274 **Making such awards mandatory would [*225] incentivize these parties to come forward and encourage competent legal representation to engage these claimants**. n275 Furthermore, whistleblower protection under the umbrella of the EPA would ensure prospective whistleblowers know there is a single source for their protection that can instill uniform guidelines. n276 An EPA program could also help ensure anonymity for whistleblowers and ensure greater financial rewards against retaliators than those provided by OSHA. n277

2NC Solvency (Short)

Counterplan solves

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

Over the past several years, several substantial government settlements in whistleblower cases have led to whistleblower suits becoming increasingly mainstream and lucrative for whistleblowers and their attorneys. n7 Both positive and negative effects for the whistleblowers themselves have accompanied the growth of this area of the law. n8 Although there are major success stories, such as that of a former UBS AG executive recovering over \$ 100 million for reporting a tax evasion scheme, there are also chilling reports that highlight the risks of coming forward, such as financial ruin, loss of work, industry resentment and protracted litigation with varying degrees of success. n9 To ensure that whistleblowers [*197] continue to be willing to come forward, the government must ensure that they receive adequate financial incentives and protection against retaliation. n10 At present, the state of environmental whistleblower law is fractured between various statutes that have differing levels of financial incentive and protection. n11 Recent legislative measures undertaken by Congress in other areas, however, may present the opportunity for wider reform to increase whistleblower engagement in the environmental law arena. n12 In 2010, Congress adopted agency-wide whistleblower programs for the Securities Exchange Commission (SEC) and Commodity Futures Trading Commission (CFTC) to deal with the fallout from the 2008 financial crisis and to prevent financial fraud in the future. n13 The programs combine economic incentives for whistleblowers with measures to protect against retaliation, in an effort to compel whistleblowers with knowledge of financial fraud to come forward. n14 The purpose of the programs being to enlist private interests into the fight against serious threats to the U.S. economy. n15 Using this model, the Environmental Protection Agency (EPA) should consider a similar program to incentivize whistleblowers to take actions to protect the environment, thereby confronting a problem that not only threatens the U.S. economy, but every aspect of daily life. n16

2NC Solvency

The counterplan solves the whistleblowers advantage – it provides financial incentives for environmental whistleblowers to come forward and consolidates environmental whistleblowing in a central program – whistleblowing is chilled in the status quo because whistleblowers are hunted by the government and the risk is much higher than the reward for potential discoveries and public disclosure – the counterplan makes it worthwhile for whistleblowers to come forward and disclose criminal acts within the federal government – that's enough incentive

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

Advantages of Whistleblower Programs Whistleblower programs provide assistance to the U.S. government and regulatory agencies by aligning public and private interests. n224 When private instruments of justice are undertaken in the interest of the common good, they can produce beneficial tools, such as legal talent, investigative resources, and inside information. n225 Wrongdoing can often be difficult to detect, and therefore, an insider with intimate knowledge of a company or a potentially liable party's actions, can be invaluable in prosecuting enforcement actions without expending prohibitively large amounts of resources. n226 1. Aligning Public-Private Interests Through Monetary Awards The fact that citizen suits and other enforcement mechanisms limit the alignment of interests between private parties and the government deters those private parties from coming forward to further litigation that could be beneficial to the public. n227 Although these suits may account for attorneys' fees, costs, and potentially punitive damages, their application may be limited to specific instances and their rewards too minimal to attract significant attention from the most sophisticated and knowledgeable legal organizations. n228 Furthermore, **they provide little incentive for insiders to come forward with knowledge of violations, in light of the risks posed in doing so.** n229 By comparison, incentivizing potential whistleblowers through programs that allow them to share in government recoveries, such as qui tam actions and the Securities Exchange Commission (SEC) program, have proven extremely [*220] **successful.** n230 These types of suits attract skilled legal talent--driven by the incentive of large fees--to represent the whistleblower's interests and to assist the government prosecution. n231 These large fees are the result of certain statutes that provide for potentially significant damages and penalties. n232 Legal talent--whatever its motivation--can provide expert analysis and careful research in assessing highly complex claims, which in turn, have the potential to be lucrative. n233 These whistleblower attorneys can also help analyze the merits of the claims and determine whether there are viable legal remedies and regulatory mechanisms in place. n234 Whistleblowers also provide the government with a tremendous service throughout prosecutions because they often know important inside information. n235 Such information is extremely valuable because it is often intimate knowledge of complex and highly technical matters. n236 Insiders can also point to violations of the law that the gov-ernment would have no other way of ascertaining, such as illegal dumping at sea. n237 Whistleblower programs recognize this inside information as a valuable asset. n238 Whistleblower programs can also be of substantial value to the government by generating publicity for private enforcement programs. n239 Multiple news outlets have covered stories about the large payouts available to whistleblowers, which alerts people with knowledge of potential misconduct that they too can be rewarded if they come forward and expose crime. n240 Given the substantial [*221] risks facing whistleblowers, knowledge that there are also financial incentives and programs that provide protection can be invaluable to bringing those with potential claims forward. n241 While there is a significant public benefit that comes with environmental whistleblowing, whistleblowers put themselves at potentially serious risk. n242 **Thus, the law should adequately reflect the cost-benefit analysis that each whistleblower must do by offsetting the risk with adequate awards.** n243 Although there are currently whistleblower awards under select environmental statutes, they are wholly inadequate in light of the possible risks. n244 Some statutes, such as the Clean Air Act (CAA) provide only nominal awards when compared to the risks that whistleblowers would be taking, and others, such as the Clean Water Act (CWA) provide no financial incentive whatsoever. n245 **Without significant changes to these statutory schemes--such as the proposed whistleblower programs--those with inside information about environmental crimes will be unlikely to come forward when facing the risks involved with doing so.** n246 2. Streamlining Whistleblower Protection Although many environmental statutes provide whistleblowers with protection against retribution, there is room for improvement. n247 Currently, whistleblower protection in environmental statutes is only available to whistleblowers who file complaints with the Occupational Safety and Health Administration (OSHA). n248 While OSHA protects employee-whistleblowers against retaliation, it is required to conduct an investigation to satisfy a common law [*222] framework before doing so. n249 Furthermore, individual statutes have varying procedural hurdles that must be met for a successful claim. n250 **A whistleblower program that is consolidated under the EPA could avoid the pitfalls of the current scheme by strengthening the language of a whistleblower provision, providing uniformity in enforcement, and extending to potential whistleblowers that are not employees.** n251 All claims could be submitted under one organization, which would then handle enforcement of the alleged violation and protect the whistleblower against any potential retaliation. n252 Furthermore, **a consolidated environmental whistleblower program could gain publicity through the payment of big**

awards, which in turn could make whistleblowers more aware that such incentives and protections are available n253 Implementing a new statutory provision could also allow for the construction of more meaningful whistleblower awards when retaliatory measures can be shown. n254

General Incentives Solvency

And, comprehensive studies prove – incentives mean whistleblowers are more likely to come forward

Employment Law Daily 13

(Wolters Kluwer Employment Law Daily, “Whistleblower reward laws play critical role in fraud detection, study finds,” pg online @ <http://www.employmentlawdaily.com/index.php/news/whistleblower-reward-laws-play-critical-role-in-fraud-detection-study-finds/#sthash.XTBp6CUG.dpuf> //um-ef)

Whistleblower reward or qui tam laws “work remarkably well and should be exploited in order to protect individuals and businesses that play by the rules and do not cheat in order to gain a competitive advantage.” according to a recent report analyzing the impact of such legislation on the willingness of employees to report fraud or misconduct—both internally and externally. The report, released on Friday, December 6, by the National Whistleblowers Center, was based on a review of statistical studies on employee-reporting behaviors. **Its authors urged Congress not only to reject watering down any current whistleblower laws but to expand the scope of their coverage.** The authors note that their findings echo prior independent studies that have reached the same conclusion as to the importance of legislation that provides financial incentives for whistleblowers. For example, the Senate Judiciary Committee in 2009 reviewed the 25-year history of the False Claims Act, the oldest modern qui tam law, and reached the unanimous (bipartisan) conclusion that a considerable amount of fraud would go undetected absent the willingness of qui tam relators to come forward. “The existence of qui tam or whistleblower rewards programs are an absolutely essential component for a successful fraud detection program.” the report notes. “Without strong incentives the vast majority of fraud will neither be detected nor reported to the appropriate authorities.” Currently, a plurality of employees fail to disclose misconduct to anyone, and less than 2 percent of employees are willing to disclose misconduct, fraud or violations of law to a government agency. Despite this “real crisis in employee-reporting behaviors,” however, employees remain the key source of fraud detection. And whistleblower reward laws are a key factor in their willingness to report allegations of misconduct, both internally to corporate compliance programs and externally to law enforcement. **Among the report’s recommendations: Congress should enact a general False Claims Act to provide for whistleblower rewards in areas that are not covered under current law.** Such rewards should be based on a percentage of monies actually recovered by the United States based on the documented contribution of the whistleblower. Moreover, the authors urged the Department of Justice to undertake efforts to stimulate the filing of more FCA cases, “as the current number of cases filed each year is dramatically low.”

AT: Disads to the CP (short)

And, the counterplan can overcome their disads – just minor blips that are fixed with the construction of the program

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

D. Perceived Challenges That Must Be Overcome

As with any major system overhaul, there are challenges that must be overcome in order to implement an EPA whistleblower program of this sort. n278 There will be fears and concerns about an overload of low-quality or vindictive whistleblower complaints, an inability to adequately provide financial incentives or overcome agency capture, and of giving monies paid by violators to private parties, rather than using the funds to help the public. n279 **Nevertheless, most of these issues will not realistically materialize, and those that do can be overcome.** n280

AT: Lawsuit overload

No risk of overload or overstretch – program will build in protections to prevent it

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

For example, although there may be an influx of whistleblower claims to begin with, the EPA and other enforcing agencies should be able to readily distinguish between those that are viable and those that are frivolous. n281 Further, competent lawyers will likely only be willing to work with claimants they deem credible, which will serve as a signal to the agencies who will work [*226] closely with these lawyers. n282 Although there may be a risk that extra staff will have to be devoted to investigating these claims, those resources would still be expended in furtherance of alerting the EPA of potential risks that threaten the environment and further, may uncover truly dire situations. n283

AT: No Funds

SEC program provides a model that solves funding issues

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

Given the fact that many current environmental statutes provide such low rewards, or no rewards at all to whistleblowers, there may be a concern about the ability of the EPA to allocate funds to pay significant awards for successful claims. n284 This can be rectified by paying into a fund--similar to those employed by the SEC and the CFTC--that can ensure successful payments to worthy whistleblowers. n285 These funds can be bolstered by any recoveries from convicted environmental violators. n286 Furthermore, many statutes that do not have whistleblower awards, such as the CWA, actually have extremely significant monetary sanctions that can amount to millions of dollars over the course of only a few days. n287 For statutes such as these, a set percentage of the recovery would provide the funds needed to adequately reward whistleblowers. n288

AT: Agency Capture

Dodd-Frank proves it wont happen

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

Some may also argue that these statutes will be ineffective at overcoming the problem of agency capture because there is no private recourse for citizens beyond the administrative apparatus. n289 Although these concerns are legitimate, there are reasons to believe that agency capture will not become a systemic issue. n290 Even though whistleblowers may not have private judicial recourse, they can pressure and embarrass agencies through the media. n291 Further, **competent legal counsel will also likely advise their clients on how to press their cases with the agency.** n292 Giving whistleblowers access to the enforcement [*227] apparatus is still better than the other option, which is to have the agencies act with nearly complete autonomy. n293 The same concern is applicable to the Dodd-Frank whistleblower programs, but the programs have still had success and been met with optimism. n294

AT: Money for Env't Key

Need for whistleblower incentives outweighs

Warren 15

(Christopher K. Warren, Senior Note Editor, Boston College Environmental Affairs Law Review, 2014-2015, Boston College Environmental Affairs Law Review, 40 B.C. Env'tl. Aff. L. Rev. 195, "Blowing The Whistle On Environmental Law: How Congress Can Help The Epa Enlist Private Resources In The Fight To Save The Planet," pg lexis//um-ef)

Lastly, there will be some who argue that any recovery received from environmental polluters should be reserved strictly for government cleanup efforts and preventative activities. n295 The government, however, may never obtain these recoveries in the first place if not for the prospective whistleblowers. n296 Therefore, despite merit of any concerns about giving private parties a portion of the recovery, the fact remains that **it is more important to get the recovery in the first place, and thus rewarding whistleblowers with a portion of recoveries is warranted and encourages future whistleblowers to come forward,** which must ultimately be the primary goal. n297

Alternate WB Counterplan

Human Rights Watch, June 18, 2013

(Human Rights Watch, nonprofit, nongovernmental human rights organization made up of roughly 400 staff members around the globe. Its staff consists of human rights professionals including country experts, lawyers, journalists, and academics of diverse backgrounds and nationalities. Established in 1978, Human Rights Watch is known for its accurate fact-finding, impartial reporting, effective use of media, and targeted advocacy, often in partnership with local human rights groups. Each year, Human Rights Watch publishes more than 100 reports and briefings on human rights conditions in some 90 countries, generating extensive coverage in local and international media. With the leverage this brings, Human Rights Watch meets with governments, the United Nations, regional groups like the African Union and the European Union, financial institutions, and corporations to press for changes in policy and practice that promote human rights and justice around the world, June 18, 2013, "US: Statement on Protection of Whistleblowers in Security Sector," <https://www.hrw.org/news/2013/06/18/us-statement-protection-whistleblowers-security-sector>, Accessed: July 7, 2015, YDEL)

Moving Forward to Protect Whistleblowers and Democratic Accountability. In light of these specific facts, Human Rights Watch urges the Obama administration not to prosecute Edward Snowden or other national security whistleblowers until it is prepared to explain to the public, in as much detail as possible, what the concrete and specific harms to national security his disclosures have caused, and why they outweigh the public's right to know. If the administration truly welcomes a debate on issues of privacy, rights, and security, as President Obama has said it does, then prosecuting the man who sparked the debate is not the way to show it. In addition, the government should cease using the Espionage Act to charge those who disclose classified information to the public that shows wrongdoing or unethical government programs or policies. In this regard, we note that the penalties for disclosures under the Espionage Act, whose charges carry 10-year prison terms, are significantly heavier than what many other democracies impose

on government agents who expose secrets, and that the European Court of Human Rights has ruled in favor of protecting security sector whistleblowers when the public interest in their disclosures outweighs other important state interests.[22]¶ **Congress should provide effective protections for confidential disclosures and legal rights that security sector whistleblowers can invoke in case of retaliation.** Congress has authority to demand greater transparency from the executive branch, and to inform citizens of the scope of secret surveillance programs. It should set firm limits on not only what sort of data may be collected for what purpose, but also how long the NSA and other agencies may retain data not directly connected to an ongoing investigation. All branches of government have a responsibility to minimize the amount of information that is withheld from the public, so that the functioning of government does not have to rely on leaks to be visible to the governed. ¶

Congress has the power to provide oversight for whistleblowers

Human Rights Watch, June 18, 2013

(Human Rights Watch, nonprofit, nongovernmental human rights organization made up of roughly 400 staff members around the globe. Its staff consists of human rights professionals including country experts, lawyers, journalists, and academics of diverse backgrounds and nationalities. Established in 1978, Human Rights Watch is known for its accurate fact-finding, impartial reporting, effective use of media, and targeted advocacy, often in partnership with local human rights groups. Each year, Human Rights Watch publishes more than 100 reports and briefings on human rights conditions in some 90 countries, generating extensive coverage in local and international media. With the leverage this brings, Human Rights Watch meets with governments, the United Nations, regional groups like the African Union and the European Union, financial institutions, and corporations to press for changes in policy and practice that promote human rights and justice around the world, June 18, 2013, "US: Statement on Protection of Whistleblowers in Security Sector," <https://www.hrw.org/news/2013/06/18/us-statement-protection-whistleblowers-security-sector>, Accessed: July 7, 2015, YDEL)

We believe US authorities should exercise discretion when considering prosecuting such leaks under US laws governing classified information. They should not bring charges against whistleblowers who expose government wrongdoing unless they can make a compelling case that the harm to national security caused by the disclosure is so significant that it overrides the public's right to know and are prepared to make that case publicly, providing as much detail as possible on the actual harm.¶ Any law that respects rights should place the burden of this argument on the government, not the whistleblower, and the simple fact that information is classified should never be sufficient on its own to defeat protection for disclosures that are in the public interest. In particular, the Espionage Act, which was framed to punish the passing of sensitive information to a foreign enemy, should never be distorted beyond its intended purpose and used to punish whistleblowers.¶ **Congress should live up to its responsibility to provide effective protection and meaningful recourse to whistleblowers.** To start, it should enact meaningful laws on which they can rely, both to challenge official retaliation and to defend themselves from criminal and civil liability. It should insist on greater disclosure from security agencies and share information concerning the dimensions and modalities of security surveillance with the public. And it should work with the administration to cut back on the overwhelming growth of classified information and protect the public's right to know.¶ **Both Congress and the Obama administration should rethink surveillance programs and reform them to ensure that they intrude no more than necessary on the private communications of all people, not just US**

citizens. The United States has been a strong proponent of Internet freedom, but it risks its reputation when it fails to respect the rights of Internet and phone users.

DOD PIC

1NC CP Shell

Sternstein 15

(Aliya Sternstein. Nextgov.com, Jun 4, 2015, "Watchdog Says Pentagon Needs to Crank Up 'Insider Threat' Monitoring," pg Proquest //um-ef)

Work to rein in some post-Sept. 11 domestic surveillance practices ended with passage of a bill that limits the National Security Agency's collection of U.S. call records. But regular Joes inside the Pentagon -- or at least those with access to sensitive or classified information -- should expect even greater scrutiny on their workplace digital activities. Just before the Senate cleared the USA Freedom Act, the Government Accountability Office released a report recommending the Defense Department take new steps to set up so-called "insider threat" programs, which aim to stop information leaks by disgruntled employees. The unclassified version of the report found only half of military components GAO reviewed have logged system and user behaviors to develop "a baseline of normal activity patterns." The purpose of tracing the activities of Pentagon personnel is to zero in on network "anomalies," computer usage that might be indicative of a leaker, the watchdogs said. NSA is part of the Defense Department. The employee insider threat program was borne out of various laws and White House policies issued since 2010 that require all departments to do a better job of fortressing classified information. That year, former soldier Chelsea Manning shared top secret files with the WikiLeaks website. The ability of ex-NSA contractor Edward Snowden to reveal classified intelligence in 2013 suggests anti-leak programs need more muscle. Patricia Larsen, co-director of the governmentwide National Insider Threat Task Force, said last December. This week, GAO agreed. A key element of the Pentagon's program has not consistently been incorporated Defensewide, the auditors said, noting "three of the six components [evaluated] have developed a baseline of normal activity" on Defense networks. They did not identify the organizations by name. "Anomalous activities are network activities that are inconsistent with the expected norms, the watchdogs added. "These activities, such as network activity outside of normal work hours or changes in typical data download patterns, could indicate the exploitation of cyber vulnerabilities, among other things." To detect anomalies, three of the components GAO examined plan to buy or upgrade analytic tools that allow them to monitor user behavior suggesting insider-threat activities. One entity that already has such technology said the enhanced model it expects to obtain will be able to watch a user's behavior across unclassified, secret and top-secret networks. A handful of policies published between 2000 and 2012 call for establishing a normal activity baseline. Auditors also pointed to a post-Snowden, nonpublic February 2014 directive on protecting national security systems from insider threats. The U.S. military's 2000 Final Report of the Insider Threat Integrated Process Team instructs organizations to come up with a specific list of employee behaviors that should be tracked online, because otherwise managers will suffer information overload. It will be impossible to baseline normal activity patterns "with the sheer volume of user characteristics data" unless supervisors establish an "inventory of behavior attributes and patterns grounded in counterintelligence experience and stored to allow for rapid automatic analysis and monitoring," the authors of that Defense report wrote. Once a Pentagon organization has selected which employee and system activities to keep tabs on, those attributes should be studied for more than a couple of days. A December 2012 Carnegie Mellon Software Engineering Institute manual, Common Sense Guide to Mitigating Insider Threats, states "the longer the organization monitors the chosen data points, the more reliable the baseline will be." Recommended data points to observe include: Communications between devices: the devices a workstation communicates with and the devices a server communicates with; Bandwidth consumed, especially noting the differences between bandwidth use during and after business hours;. Virtual private network users; times of access, bandwidth consumed, geolocation information; Ports and protocols; Normal firewall and IDS alerts--Normal alerts may occur when business processes change (e.g., there is increased website traffic). The Carnegie Mellon researchers note, "Organizations may find it challenging to maintain employee privacy while collecting data to establish a baseline."

Counterintelligence efforts in federal agencies prevents insider leaks now—Insider Threats program protects vital security information

Washington Post 14

("Federal agencies embrace new technology and strategies to find the enemy within," Washington Post, 3/7, pg lexis//um-ef)

After a string of high-profile incidents from the Ft. Hood shooter to Wikileaks and NSA contractor Edward Snowden, government agencies and contractors have started monitoring their own employees and networks with unprecedented scrutiny. After years of focusing on outside threats, the federal government and its contractors are turning inward, aiming a range of new technologies and counterintelligence strategies at their own employees to root out spies, terrorists or leakers. Agencies are now monitoring their computer networks with unprecedented scrutiny, in some cases down to the keystroke, and tracking employee behavior for signs of deviation from routine. At the Pentagon, new rules are being written requiring contractors to institute programs against "insider threats," a remarkable cultural change in which even workers with the highest security clearances face increased surveillance. The "if you see something, say something" mind-set of the post-9/11 world has fully arrived in the workplace, with new urgency following high-profile leaks such as the revelations of former National Security Agency contractor Edward Snowden. "People's sensitivity to this has changed substantially," said Lynn Dugle, president of a Raytheon business unit that markets an insider threat detection system called SureView. "I can tell you five years ago, when we were talking to agencies or companies about insider threat, we would normally be talking to (chief information officers) who were under budget stress. . . . And that was a very tough sell. Now we see boards of directors and CEOs really understanding what the threat can mean to them, and the risk it poses to them." In response to the breach by former Army intelligence analyst Pfc. Bradley Manning, President Obama in 2011 issued an executive order that established a National Insider Threat Task Force and required all federal agencies that handle classified material to institute programs designed to seek out saboteurs and spies. While corporate security has long been part of Beltway culture, the heightened focus and the emergence of new monitoring technology touched off a burgeoning industry. In addition to Raytheon, Lockheed Martin has developed an insider-threat detection service, as have several start-ups in the Washington area. Even Booz Allen Hamilton, which faced national embarrassment when Snowden, one of its employees, walked off with some of the country's most guarded secrets, counsels its clients on how to detect rogue employees. A recent job posting said the company was looking for an "insider threat analyst," which required a security clearance and more than five years of experience in counterintelligence. The posting spread on the Web and sparked ridicule over the notion that the company that employed Snowden was now looking to help turn the historic breach into a profitable lesson learned. Raytheon's SureView program allows agencies to create all sorts of internal alerts indicating when something may be amiss. A company could, for example, program the software to detect whenever a file containing the words "top secret" or "proprietary" is downloaded, e-mailed or moved from one location on the system to another. Once that wire is tripped, an alert almost immediately pops up on a security analyst's monitor, along with a digital recording of the employee's screen. All the employee's actions — the cursor scrolling over to open the secure file, the file being copied and renamed — can be watched and replayed, even in slow motion. It's the cyber equivalent of the security camera that records robbers sticking up a convenience store. Lockheed Martin provides a service called Wisdom, which acts as "your eyes and ears on the Web," according to a company official. At its broadest use, the service can monitor mountains of data on the Web — Facebook, Twitter, news sites or blogs — to help predict everything from a foreign coup or riot to political elections. But it can also be turned inward, at employees' online habits, to predict who within the organization might go rogue. Counterintelligence officials use Wisdom to "evaluate employee behavior patterns, flagging individuals who exhibit high risk characteristics," the company says in a

brochure. “I like to think of it as a **digital intuition** that is being developed” said Jason O’Connor, Lockheed’s vice president for analysis and mission solutions.

Insider threat ensures a cyber attack on the nation’s grid

Angerholzer et al 2014 [MA international affairs, CEO and president of Center for the Study of the Presidency and Congress]

(Maxmillian, Securing the US electrical Grid: Understanding the Threats to the Most Critical of Critical Infrastructure, While Securing a Changing Grid”<https://www.thepresidency.org/sites/default/files/Grid%20Report%20July%202015%20First%20Edition.pdf>)

Major problems can occur when an employee—purposefully or inadvertently—gains access to an infected USB or is able to plant a virus that destroys a system. The threat of this issue is **heightened in the case of** many decentralized, **local power grids accompanied with minimal physical security and detection systems. An insider may be able to gain access to the physical components of a power station, thus having the ability to cause serious physical damage. Actors posing threats may be disgruntled employees following termination or employees experiencing financial pressures** and stress.¹⁰³ Job-related stress and unfortunate events can cause employees to extract revenge or open up insider secrets to third party inquirers.¹⁰⁴ Many of these events are on a situational basis and apply differently to each company; however, **it should be made more of a priority that businesses and utilities increase security and employee screening. Individual attacks can have major effects on communities due to dependencies on the power grid.** An individual was arrested in Arkansas for a series of attacks on power lines stationed in Arkansas. He acted alone, and did not seem to be involved in a larger terrorist organization. On August 21, 2013, a shackle that secured a 500,000-volt electricity line was cut, and over 100 bolts of the support tower were removed.¹⁰⁵ The tower collapsed, causing power lines to be severed by a passing train and leaving the town of Cabot, Arkansas, without power. On September 29, 2013, the Entergy electricity station in Scott, Arkansas, was set on fire, causing over \$2 million in damages.¹⁰⁶ The third and final attack occurred in Jacksonville, Arkansas. Two power poles were cut, one of which was then pulled down by a tractor. This attack caused a 115,000-volt transmission line to fall, causing an outage for 9,000 people.¹⁰⁷

¹⁰³ Byron Acohido, “Disgruntled employees, insiders pose big hacking risk,” USA Today, March 15, 2013, <http://www.usatoday.com/story/tech/2013/03/15/insider-threat-matthew-keys-anonymous/1991265/> ¹⁰⁴ Ibid ¹⁰⁵ “Arrest made over Arkansas power grid attacks,” CBS News, October 14, 2013, <http://www.cbsnews.com/news/arrest-made-over-arkansas-power-grid-attacks/> ¹⁰⁶ Ibid. ¹⁰⁷ Ibid. July 2014 – First Edition ⁴⁹ Insider threats oftentimes pose a greater risk than outsider attacks. In an FBI and Computer Security Institute joint Computer Crime and Security Survey, **80 percent of enterprises** that responded to the survey **cited disgruntled or dishonest employees as most likely to attack.**¹⁰⁸ Additionally, 55 percent of enterprises that responded reported unauthorized access by insiders. While security measures have increased over time, insider threat incidents continue to occur. In 2012, Homeland Security’s Industrial Control Systems Cyber Emergency Response Team (ICS-CERT) was called to a power generation system that had been targeted by an insider threat. An employee was discovered with an infected USB device after he took the device to the IT department. The infected USB left several machines at the power plant subject to the virus. Fortunately, the ICS-CERT and the anti-virus software already existing in the system were able to eliminate the virus.¹⁰⁹ Sometimes, an attacker will recruit an insider to assist in launching an attack.

In 2011, the Department of Homeland Security issued a report titled “Insider Threat to Utilities.” In this report, they stated that “violent extremists have, in fact, obtained insider positions,” and that “outsiders have attempted to solicit utility-sector employees” for damaging physical and cyber-attacks.¹¹⁰ In 2010 an alleged American recruit to al Qaeda was arrested in Yemen. Sharif Mobley, of New Jersey, had been employed at five different U.S. nuclear power plants in Pennsylvania after successfully passing federal background checks. Fortunately, insider threats to the power grid have been fairly contained—still, internal security must remain a priority. There should be periodic risk assessment throughout an enterprise, as well as increased security awareness training for employees. Companies can issue strict passwords for employees, monitor online actions, and note suspicious behavior. The company should separate duties and limit access amongst different employees to ensure that one person does not have the ability to cause major damage. Following termination or transfer, any previous computer access must be deactivated. Additionally, up-to-date anti-virus software and backup and recovery processes should be implemented for all online systems.¹¹¹

Extinction

Habiger, 2/1/2010

(Eugue – Retired Air Force General, Cyberwarfare and Cyberterrorism, The Cyber Security Institute, p. 11-19)

A modestly advanced enemy could use a cyberattack to shut down (if not physically damage) one or more regional power grids. An entire region could be cast into total darkness, power-dependent systems could be shutdown. **An attack on one** or more regional power grids **could** also **cause cascading effects that could jeopardize our entire national grid.** **When word leaks that the blackout was caused by a cyberattack, the specter of a foreign enemy**

capable of sending the entire nation into darkness **would only increase the fear, turmoil and unrest.** While the finance and energy sectors are considered prime targets for a cyberattack, an attack on any of the 17 delineated critical infrastructure sectors could have a major impact on the United States. For example, our healthcare system is already technologically driven and the Obama Administration's e-health efforts will only increase that dependency. A cyberattack on the U.S. e-health infrastructure could send our healthcare system into chaos and put countless of lives at risk. Imagine if emergency room physicians and surgeons were suddenly no longer able to access vital patient information. A cyberattack on our nation's water systems could likewise cause widespread disruption. An attack on the control systems for one or more dams could put entire communities at risk of being inundated, and could create ripple effects across the water, agriculture, and energy sectors. Similar water control system attacks could be used to at least temporarily deny water to otherwise arid regions, impacting everything from the quality of life in these areas to agriculture. In 2007, the U.S. Cyber Consequences Unit determined that the destruction from a single wave of cyberattacks on critical infrastructures could exceed \$700 billion, which would be the rough equivalent of 50 Katrina-esque hurricanes hitting the United States all at the same time.²⁹ Similarly, one IT security source has estimated that the impact of a single day cyberwar attack that focused on and disrupted U.S. credit and debit card transactions would be approximately \$35 billion.³⁰ Another way to gauge the potential for harm is in comparison to other similar noncyberattack infrastructure failures. For example, the August 2003 regional power grid blackout is estimated to have cost the U.S. economy up to \$10 billion, or roughly .1 percent of the nation's GDP. ³¹ That said, a cyberattack of the exact same magnitude would most certainly have a much larger impact. The origin of the 2003 blackout was almost immediately disclosed as an atypical system failure having nothing to do with terrorism. This made the event both less threatening and likely a single time occurrence. Had it been disclosed that the event was the result of an attack that could readily be repeated the impacts would likely have grown substantially, if not exponentially. Additionally, a cyberattack could also be used to disrupt our nation's defenses or distract our national leaders in advance of a more traditional conventional or strategic attack. **Many military leaders actually believe that such a disruptive cyber**

pre-offensive is the most effective use of offensive cyber capabilities. This is, in fact, the way Russia utilized cyberattackers—whether government assets, governmentdirected/ coordinated assets, or allied cyber irregulars—in advance of the invasion of Georgia. Widespread distributed denial of service (DDOS) attacks were launched on the Georgian governments IT systems. Roughly a day later Russian armor rolled into Georgian territory. The cyberattacks were used to prepare the battlefield; they denied the Georgian government a critical communications tool isolating it from its citizens and degrading its command and control capabilities precisely at the time of attack. In this way, these attacks were the functional equivalent of conventional air and/or missile strikes on a nation's communications infrastructure.³² One interesting element of the Georgian cyberattacks has been generally overlooked: On July 20th, weeks before the August cyberattack, the website of Georgian President Mikheil Saakashvili was overwhelmed by a more narrowly focused, but technologically similar DDOS attack.³³ This should be particularly chilling to American national security experts as our systems undergo the same sorts of focused, probing attacks on a constant basis. The ability of an enemy to use a cyberattack to counter our offensive capabilities or soften our defenses for a wider offensive against the United States is much more than mere speculation. In fact, in Iraq it is already happening. Iraq insurgents are now using off-the-shelf software (costing just \$26) to hack U.S. drones (costing \$4.5 million each), allowing them to intercept the video feed from these drones.³⁴ By hacking these drones the insurgents have succeeded in greatly reducing one of our most valuable sources of real-time intelligence and situational awareness. If our enemies in Iraq are capable of such an effective cyberattack against one of our more sophisticated systems, consider what a more technologically advanced enemy could do. At the strategic level, in 2008, as the United States Central Command was leading wars in both Iraq and Afghanistan, a cyber intruder compromised the security of the Command and sat within its IT systems, monitoring everything the Command was doing. ³⁵ This time the attacker simply gathered vast amounts of intelligence. However, it is clear that the attacker could have used this access to wage cyberwar—altering information, disrupting the flow of information, destroying information, taking down systems—against the United States forces already at war. Similarly, during 2003 as the United States prepared for and began the War in Iraq, the IT networks of the Department of Defense were hacked 294 times.³⁶ By August of 2004, with America at war, these ongoing attacks compelled then-Deputy Secretary of Defense Paul Wolfowitz to write in a memo that, "Recent exploits have reduced operational capabilities on our networks."³⁷ This wasn't the first time that our national security IT infrastructure was penetrated immediately in advance of a U.S. military option.³⁸ In February of 1998 the Solar Sunrise attacks systematically compromised a series of Department of Defense networks. What is often overlooked is that these attacks occurred during the ramp up period ahead of potential military action against Iraq. The attackers were able to obtain vast amounts of sensitive information—information that would have certainly been of value to an enemy's military leaders. There is no way to prove that these actions were purposefully launched with the specific intent to distract American military assets or degrade our capabilities. However, such ambiguities—the inability to specifically attribute actions and motives to actors—are the very nature of cyberspace. Perhaps, these repeated patterns of behavior were mere coincidence, or perhaps they weren't. The potential that an enemy might use a cyberattack to soften physical defenses, increase the gravity of harms from kinetic attacks, or both, significantly increases the potential harms from a cyberattack. Consider the gravity of the threat and risk if an enemy, rightly or wrongly, believed that it could use a cyberattack to degrade our strategic weapons capabilities. Such an enemy might be convinced that it could win a war—conventional or even nuclear—against the United States. **The effect of this would be to undermine our deterrence**-based defenses, **making**

us significantly more at risk of a major war.

Uniqueness

Uniq: Insider Threats High

U.S. internal threats are the most dangerous – unpredictable, irreparable

Hall, 2014, [Strategic Intelligence Graduate]

(Caitlin Squire, March 20, “The Trusted Shadow and Trojan Horse of the United States Government” <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>)

An insider threat is irrefutably one of the greatest threats to United States national security. Greg Chung, Chi Mak, Robert Philip Hanssen, and Edward Snowden are a few of the dozens of personalities who have leaked or passed secrets to foreign governments over the past thirty years. Rita M. Barrios elaborates on the significance of the insider threat stating, “The theft and exposure of the critical data components that resides in a relational database by the authorized insider is on the rise” (Barrios 2013, 54). In comparison to threats such as weapons of mass destruction, cyber, and nuclear, the insider threat can often be overlooked; however, the threat of the insider is not the method of attack, rather the threat is the individual (Blades 2010, 32). The insider threat is comparable to a Trojan horse and is identifiable as a trusted shadow of the government who, despite the extensive background checks, obtains a security clearance providing access to classified information. Furthermore, the United States can strategically mission plan for all divisions of the military, yet it takes one individual to take those plans and pass that information to the enemy, or make it public knowledge. One individual can obtain classified information on the location of United States submarines, specs on the B-2 stealth bomber, or tactics, techniques, and procedures of the United States military and pass that intelligence to a news agency or foreign government easily. With the ever growing world of electronics and advancements in technology, a young adult could walk in and out of the work place with dozens of classified documents saved on a CD. In addition, with websites like Wikileaks, secrets can be published anonymously adding to the elusive nature of an insider threat. These factors make all government employees with a security clearance dangerous as there is no patch to an insider threat, only prevention and minimization. But is that what makes an insider threat so challenging to acknowledge and track? Or is it the fact that these individuals are a trusted shadow whose motivation is prompted by unknown factors? Ellen Messmer highlights this noting, “While the U.S. military is building up defenses to fend off network-based attacks from enemy states and terrorists, some say the more-insidious security problem is the threat is an insider bent on sabotage or stealing data” (Messmer 2003, 12). Messmer, in a sense, simply acknowledges that the motivation of an individual can be as minuet as ‘I felt like it.’ That being said, is it only the fault of the insider for a leak or do co-workers impact the process of detection as well? This realm of threat to a government entity is challenging due to the fact that, for any organization, they are dealing with the unknown.

Uniq: Insider Threat High

insider threats real – even subtle threats escalate

Deputy chief of naval operations, 2014

("what is 'insider threat'" January-March, CHIPS: The Department of the Navy's Information Technology Magazine, www.doncio.navy.mil/CHIPS/ArticleDetails.aspx?id=4890)

****we don't endorse ableist language**

According to a 2011 Presidential Executive Order, an Insider Threat is "a person with authorized access who uses that access to harm national security interests or national security through unauthorized disclosure, data modification, espionage, terrorism, or kinetic actions resulting in loss or degradation of resources or capabilities." Put simply, Insider Threat means the unauthorized disclosure of classified information that damages national security, or violence that results in injury/loss of life and damage to operational resources. Although the

Navy has experienced a number of destructive and debilitating insider incidents over the years (the Walker-Whitworth espionage case of the 1980s, for example), the recent spate of information disclosures and workplace violence has compelled a more focused institutional examination of the threat. The tragic events at the Washington Navy Yard in September, the shooting at Fort Hood in 2009, the damage to USS Miami (SSN-755) in 2012, during a shipyard availability, and massive classified information disclosures by a National Security Agency contractor in 2013 and Army Pfc.

Bradley Manning in 2010, all clearly fall within the definition. In each case, the actions of these perpetrators could likely have been prevented had their colleagues been alert and attentive to their behaviors and reported it. Why is This Such a Big Threat? With the most powerful military and the largest economy in the world, the United States is an attractive target not only to our adversaries, but to insiders who seek to harm us. Insiders are particularly pernicious because they have managed to gain our confidence and, with that trust, obtained access to systems, capabilities or people they would otherwise not be authorized to access. To cause damage, insider threats to cyber security may target specific sensitive information on programs or operations and reveal what they perceive to be an unjust policy or disclose intelligence. And, as the recent high profile cases have demonstrated, systems administrators with privileged user accounts, the ubiquity of our information systems, our workforce's broad access to these systems, and the comparative ease with which data can be transferred all greatly compound this problem. What Motivates Someone to Consider Acting in This Way? A feeling of injustice, a loss of something valuable, the need to feel important, or an antithetical moral obsession could transform

an otherwise trustworthy service member or employee into a disgruntled insider or potential target for an adversary to exploit. Equally threatening are those who may be stressed by circumstances beyond their control, and who may choose violence in retaliation for some perceived wrongdoing. Criminal behaviors that may manifest as a consequence of these motivations include espionage, unauthorized disclosure of sensitive information, sabotage against the United States, and workplace. The Navy Insider Threat Program To combat the Insider Threat, Secretary of the Navy Ray Mabus recently signed

SECNAV Instruction 5510.37, implementing the Department of the Navy (DON) Insider Threat Program (InTP). According to the instruction, the DON shall: Ensure existing and emerging insider threat training and awareness programs are developed, updated and implemented. Enhance technical capabilities to monitor user activity on all systems in support of a continuous evaluation program. Leverage Antiterrorism/Force Protection (AT/FP), Counterintelligence (CI), Human Resources (HR), Information Assurance (IA), Law Enforcement (LE), Security and other authorities to improve existing insider threat detection and mitigation efforts. Detect, mitigate, and respond to insider threats through standardized processes and procedures. Ensure legal, civil and privacy rights are safeguarded. Promote awareness and use of employee assistance programs to enhance interventions for employees in need. This link provides additional information, resources and guidance available through the Navy Insider Threat Program: <http://www.militaryonesource.mil>. In support of SECNAV's policy and to elevate attention Navywide on this issue, the Chief of Naval Operations has organized a team to address the Insider Threat. CNO's InTP team will focus on measures aimed at preventing future workplace violence as well as the intentional disclosure of classified information. In close coordination with stakeholders from across the Navy, this team will issue directives and recommend policy changes that reinforce the safety and security of both our people and our information. A core member of the team, OPNAV N2/N6 will focus on the cyber security aspects of Insider Threat. Under this initiative, OPNAV N2/N6 recently established an Insider Threat to Cyber Security (ITCS) Office to lead the focus on the intelligence, counterintelligence, information assurance, anomaly detection, and continuous evaluation elements of Navy Insider Threat. The ITCS Office is charged with overseeing Insider Threat activities within these specific areas, and coordinating with related efforts across the antiterrorism/force protection, human resources, law enforcement, security and other mission areas within the operational Navy. The ITCS Office is also charged with improving information sharing on insider threat deterrence, detection and mitigation efforts. Major elements of ITCS Mission To deter, detect, assess, exploit and deny the activities of insider threats operating against DON programs, information, and operations, while fostering a workforce environment in which employee issues are identified and addressed prior to the advent of inappropriate behavior. Vision To implement and execute the full scope of ITCS, consisting of policies and procedures; a governance structure, employee assistance activities, enhanced continuous evaluation, centralized user activity monitoring, and an analytic and response capability that provides a timely response to potential threat information derived from AT/FP, CI, IA, HR, LE, security, and other sources, as necessary. Guiding Principles We will effectively and efficiently develop and execute U.S. Navy ITCS. We will also align it with national, Department of Defense, SECNAV, and the larger U.S. Intelligence Community Insider Threat activities, while partnering to increase effectiveness and efficiencies. The Effort <="" p=""> Deterrence and sustained vigilance. Taking immediate actions to enhance safeguards and decrease the likelihood of insider activity, focusing on the compromise or loss of sensitive or classified information. These actions include: Enhanced continuous evaluation of those in trusted positions; Security review and update; Network upgrades and network hardening efforts; Deploying Two-Person Integrity in case of sensitive networks and critical infrastructure; Expanded random polygraphs for privileged users and system administrators; Revalidating the need for privileged user accounts; Training the workforce; and Creating an environment of trust. Compliance: An All Hands issue. Sailors, civilians and contractors have been entrusted with unique access to information and information systems, most of which are directly or indirectly related to our national security. As a consequence they must adhere to appropriate security policies and procedures designed to safeguard personnel, facilities, information and the systems. Compliance with governing law, policies and procedures is a command responsibility and commanders will be held accountable for ensuring security policies, processes and procedures are followed. Insider Threats Are Real The highly publicized Insider Threat incidents discussed earlier represent extreme cases where lives were lost and classified information was leaked on an unprecedented scale. A successful Insider Threat incident, however, doesn't have to be as dramatic or explosive as these to cause serious or grave damage to the national security. The threat can be much more subtle, and still have crippling consequences.

But no matter how subtle it may be, it is still real and we must be both cognizant of the motivations and vigilant of

behaviors that could lead a sailor or employee to become Insider Threats. This is particularly the case in times of fiscal uncertainty and declining budgets when the impacts of sequestration and work furloughs may stress otherwise stable and highly dependable people. The fact that SECNAV has instituted an Insider Threat program for the department reinforces the concern.

insider threats are the greatest - must understand psychological motives

Messmer, 2003, [senior editor, network world]

(Ellen, "Security experts: Insider threat looms largest," NetworkWorld
www.networkworld.com/article/2329002/lan-wan/security-experts--insider-threat-looks-largest.html)

WASHINGTON, D.C. - While the U.S. military is building up defenses to fend off network-based attacks from enemy states and terrorists, some say the more-insidious security problem is the threat of an insider bent on sabotage or stealing data. Winn Schwartau explains. At last week's Forum on Information Warfare, researchers from the FBI and George Washington University emphasized the insider threat during presentations that drew military personnel and academics from around the world. In particular, IT systems administrators increasingly are seen as the most potentially dangerous insider threat - and military concern - because of their power over networks. In his keynote speech, Lt. Gen. Kenneth Minihan, former head of the National Security Agency (NSA), compared today's systems administrators to the encryption-code clerks of past wars who broke enemy secrets. He said **systems administrators deserve greater attention from the military and should be better paid.** Some researchers say they have seen the systems administrator go bad and see it as the Achilles' heel of national defense. FBI and George Washington researchers have studied the case histories of criminal computers use, including interviews with prisoners. "The systems administrator responsible for designing computer systems has the extraordinary ability to do damage," said Jerrold Post, professor of psychiatry, political psychology and international affairs at George Washington. He cited cases that occurred at Fort Bragg in North Carolina, and in banking and other industries, to underscore the danger posed by IT insiders who exploit power over networks. Post noted that computer-based crimes, such as fraud, extortion, sabotage and espionage, have a variety of motivations, including revenge and financial gain. He said it is critical to understand the psychology of IT administrators in general to recognize possible danger signs. IT specialists are "overwhelmingly represented by introverts" who "internalize stress and express themselves only online," he said. A study of IT specialists caught for computer-based crimes reveals them typically to share some character traits. Post said close analysis of work histories of IT administrators who sabotaged their employers' networks or did other damage reveals that they often first commit less-serious infractions, such as refusing to train their backup. Intervention by management early on could help prevent problems from escalating, because introverted people usually don't seek help. The FBI has started its own study of those who commit computer crimes - not necessarily focusing on IT administrators - by interviewing those now in jail, said John Jarvis, an FBI behavioral research scientist. "Cybercrime is primarily an insider phenomenon," Jarvis said. **Only a quarter can be classified as "outsider,"** he said.

insider threat reform key - more serious than outsider threats

Achido, 2013, [USA TODAY tech reporter who specializes in Internet security and privacy.
Achido won the Pulitzer Prize]

(Byron, March 15, "Disgruntled employees, insiders pose big hacking risk" www.usatoday.com/story/tech/2013/03/15/insider-threat-matthew-keys-anonymous/1991265/)

SEATTLE -- In today's networked world, a disgruntled employee can pose a greater corporate risk than an outside hacker. That's one big lesson drawn from the indictment of Matthew Keys, the Reuters web editor who in late 2010 allegedly conspired with members of the hacktivist collective Anonymous to deface the website of his former employer. A survey last year by network security firm AlgoSec found that security managers consider threats from low-level insiders more worrisome than the threat of a sophisticated hack by well-funded, external criminal organization. Some 29% of the survey takers said they were most concerned about the lack of visibility into applications and networks, while 28% said their top concern was insider threats. Both of those concerns relate to how a disgruntled employee, or an insider aligned with criminals, could disrupt a company's network, or steal valuable intellectual property. By contrast, just 14% said financially-motivated hackers worried them most, while 6% cited political hacktivists. "As serious as external threats are, only one out of five respondents saw external threats as their top risk," says Sam Erdheim, AlgoSec senior security strategist. Poor internal processes, such as failing to revoke network access to a fired employee, or making firewall changes that don't apply system wide, can translate into opportunities for current or ex-employees with malicious intent. "Organizations need to have effective policies in place, and the real key is to enforce them," says Erdheim. "This doesn't completely solve the problem, of course, but it certainly takes away low hanging fruit." Protecting websites and restricting access to sensitive data have become much trickier in today's increasingly networked and cloud-based business environment, observes Pravin Kothari, CEO of encryption firm CipherCloud. "With information moving and residing across a combination of on-premise and off-site servers, often in various geographies, access points have multiplied -- leaving more gaps for both insider and external threats," Kothari says. Keys, 26, of Secaucus, N.J., has been charged with one count each of transmitting information to damage a protected computer, attempted transmission and conspiracy. He was let go from Sacramento television station KTXL Fox40 in October 2010. A few weeks later, he is alleged to have provided members of the hacker group Anonymous with log-in credentials to a computer server at the station's parent company. The hackers then defaced at least one of the station's news stories posted on a website. Stricter data loss disclosure regulations are being discussed in the U.S., Europe and Australia. At the same time, more organizations are turning to data storage and computing power supplied by a third party over the Internet cloud. That adds up to a bigger burden of responsibility on network managers to protect company systems and data -- from insiders and outsiders alike. Advises Kothari: "Use military grade encryption to protect information before it is sent to the cloud. That way, even when they breach the solution, unauthorized viewers see only gibberish and cannot make use of the data. For tighter control, give enterprises the encryption keys for deciphering the information instead of leaving the keys with the cloud provider."

terrorism by an insider is the most probable scenario – easy access

Ross et al 2011 [ABC chief investigative correspondent]

(Brian, "New Terror Report Warns of Insider Threat to Utilities" abcnews.go.com/Blotter/terror-alert-warns-insider-threat-infrastructure/story?id=14118119)

Sabotage by an insider at a major utility facility, including a chemical or oil refinery, could provide al Qaeda with its best opportunity for the kind of massive Sept. 11 anniversary attack Osama bin Laden was planning, according to U.S. officials. A new intelligence report from the Department of Homeland Security issued Tuesday, titled Insider Threat to Utilities, warns "violent extremists have, in fact, obtained insider positions," and that "outsiders have attempted to solicit utility-sector employees" for damaging physical and cyber attacks. "Based on the reliable reporting of previous incidents, we have high confidence in our judgment that insiders and their actions pose a significant threat to the infrastructure and information systems of U.S. facilities," the bulletin reads in part. "Past events and reporting also provide high confidence in our judgment that insider information on sites, infrastructure, networks, and personnel is valuable to our adversaries and may increase the impact of any attack on the utilities infrastructure." Watch the full report tonight on ABC News "World News With Diane Sawyer". In the materials recovered after the Navy SEAL operation that killed Osama bin Laden in May, officials found evidence bin Laden sought to repeat the carnage of the Sept. 11, 2001, terror attacks on or around its ten year anniversary. "The only way you can actually kill the large scale number of Americans that [bin Laden] literally was calculating was through the use of this critical infrastructure," Chad Sweet, former DHS chief of staff and co-founder of the Chertoff Group, told ABC News. After gaining access to such sites, causing mayhem could be relatively easy, according to former White House counter-terrorism advisor and ABC News consultant Richard Clarke. "There are a lot of very sensitive facilities where someone can get a job on the inside, get access to a control room, flip a switch, which causes an electric power grid to short circuit, causes a pipeline to explode," Clarke said.

insider threat program key – understanding psychology will prevent attacks

McCalley, 2014, [producer at federal news radio]

(Sean, April 28, "Understanding psychology of insider threats could stop the next one" federalnewsradio.com/federal-drive/2014/04/understanding-psychology-of-insider-threats-could-stop-the-next-one/)

When an Energy Department contractor found himself swimming in debt, he hatched a plan to make a secondary income and pay his bills: Try to sell uranium equipment used to build atomic weapons. The sensitivity of his position allowed access to the materials, which he stole and marketed to foreign government agents for \$200,000. Through interviews and record analysis, the FBI and DoE set up a sting operation to catch the contractor at the point of sale. Roy Oakley made off with a six-year prison sentence and the notorious honor as a DoE "Spy of the Month." Oakley's attempt was foiled, but others still manage to get away. From a number of recent shootings at military bases to the infamous leaks by

former contractor Edward Snowden, the federal government struggles to mitigate insider threats. “In many instances, whether its violence or the exploitation of some type of information, an individual has access, has a particular crisis and has a disposition to [attack].” said Dr. Michael Gelles, former chief psychologist for the Naval Criminal Investigative Service, on the Federal Drive with Tom Temin and Emily Kopp. Gelles co-authored “Mitigating the Insider Threat”, a report released by Deloitte in 2012. In the report, he said understanding the psychology behind seemingly disgruntled or disloyal colleagues should be part of every agency’s insider threat prevention plan. The report preaches employee engagement with their colleagues to take notice to strange behavior or events that could warn of a future attack. “If we can understand and begin to pay attention to those behaviors, and looking at them as data elements, we can begin to identify these behaviors and look at how they’re different from baseline behavior of an employee, and interrupt forward motion.” Gelles said. The report identifies some key personality traits of an “at risk” employee: Not impulsive Has a history of managing crises inefficiently Displays a pattern of frustration, disappointment and inadequacy Constantly seeks validation Has an exaggerated view of own abilities and achievements A strong sense of entitlement Views self above the rules Needs immediate gratification, validation and satisfaction For example, if an employee with access to sensitive data starts complaining about salary and lower-than-expected bonuses, that’s a red flag. If the employee has a pattern of working on holidays but complains about it anyway, that’s another flag. If the employee has access to an agency from a personal computer, three red flags. Add to those a criminal background including burglary, assaults or drug charges, Deloitte says the agency needs to raise shields and move to full red alert. Risk-Prone Generation of Federal Employees The standard psychology behind new and younger federal employees could foretell an increase of insider attacks, according to Deloitte. As of 2009, more than 40 percent of the federal workforce was older than 50. As they’re replaced by a younger generation with stronger backgrounds in computers and social media, the overall value placed on classified data might shift. “It used to be that we’d do business in the world of bricks and mortar,” Gelles said. “Now that we’re in an environment where most business is done virtually, we’re seeing that there’s an increase in the way people are sharing and moving information.” Gelles said new federal employees might be at particular risk of complacency. Similar to how many people immediately click “Accept” when confronted by the terms and conditions of a software update, they might not follow the necessary security measures to keep data from falling into the wrong hands. “If there aren’t hard set policies, rules and the appropriate training, people aren’t going to do things they don’t feel are important,” Gelles said. “Or they’re going to do things because they’re ignorant.” Deloitte said members of Generation Y and younger naturally view information as “readily available and accessible, and shared across a larger community.” Combined with personal connections to social media outlets and a less “passive” attitude about information sharing, the incoming federal workforce is already creating its own set of risk factors based on how they typically (and sometimes constantly) use the Internet. Creating Prediction Models for Insider Threats In its report, Deloitte offered agencies a model to try and predict which employee is most likely to become an insider threat. It calculates risk based on four different criteria: Internal Data: Employee interviews Interviews with coworkers Computer log-in histories Expense reports External Data: Posts on social media accounts Public filings (court cases, permits, etc.) Behavior Patterns: Noticeable mood changes Increasing negativity Attempts to undermine coworkers External Precursors: Not getting a bonus or promotion Workplace dispute Personal issue outside of work Natural disaster affecting employee or family Combining those elements with the length of an employee’s career, the employee’s amount of access to classified data and a background check, Deloitte argues that agencies should have a fair idea of which employees are most likely to commit an insider attack. But that doesn’t mean federal employees should fear a “guilty before proven innocent” policy or that good-intentioned whistleblowers should stop pursuing a call to action: “What we’re not doing here is looking to profile anyone.” Gelles said. “What we’re not doing here is pointing the finger at anyone. What we’re trying to do is look for anomalous behavior. Those are behaviors that begin to look very different than what a person has been normally doing. By being able to identify that, [it then] leads to having a conversation with that person [and to] interrupt forward motion.”

current policies fail – need to account for the complexity behind motivation

Hall, 2014, [Strategic Intelligence Graduate]

(Caitlin Squire, March 20, “The Trusted Shadow and Trojan Horse of the United States Government” <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>)

What then are these motivations provoking an individual to commit such an act of betrayal to the United States and what makes detection difficult? The Office of the Director of National Intelligence acknowledged in the 2012 Report on Security Clearance Determinations that as of October 1, 2012, there were 4,917,751 individuals who held and were approved for a secret or top secret security clearance. There is no way, technologically, to combat against 4,917,751 individuals; therefore, awareness in the work place is crucial for detection. There are personal, organizational, and behavioral factors and indicators that motivate an individual to become an insider. The FBI identifies an insider "may steal solely for personal gain, or that insider may be a 'spy'—someone who is stealing company information or products in order to benefit another organization or country" (2013). As a result, President Barack Obama implemented the Insider Threat Program which exhorts not only the insider, but co-workers and managers who fail to report suspicious activity. This encourages profiling in the work environment, which as a country, we have been trying to prevent for decades. The underlying complexities making an insider threat dangerous is not just at the hands of the insider now; rather, in the hands of co-workers as well. Despite the fact that the insider threat has been an issue since the Revolutionary War and the present day technological advancements open the doors to espionage, there are also economic, personal, and organizational motives that must be taken into consideration. These motives provoke consideration of government employees with a security clearance to take part in the act of espionage. Recognizing these motives and taking into account the state of the economy at any given time is crucial when assessing the potential for a co-worker to be involved in espionage. Having a comprehensive understanding of the big picture must first be identified in order to not only successfully analyze the complexities that make an insider threat dangerous, but to conduct predictive analysis on the impact over the next decade based on the current economy. There are major limitations preventing the ability to detect and avert an insider threat from becoming a reality at all government installations. As aforementioned, the threat of an insider is not the method of attack, rather the individual therefore it is difficult to develop a profile. Whereas the nuclear and weapons of mass destruction threat has strategic indications and warnings via various forms of intelligence, such is not the case for the insider threat. There is no movement of foreign naval vessels or forward deployment of aircraft that can be observed or tracked provoking the United States to increase the heightened alert level. Additionally, there is no perimeter defense that has to be bypassed seeing as the insider is a decentralized threat, a Trojan horse. That is the limitation in obtaining information on the insider threat as the insider could be anyone with a security clearance; therefore, behavior, both psychological and sociological, must be assessed. In order to overcome these limitations, qualitative and quantitative data must be analyzed in order to draw commonalities, make assessments and determine what the specific underlying complexities are motivating someone to become an insider threat. The most prevalent types of qualitative data include analyzing case studies, and assessments made by subject matter experts. Case studies allow for the ability to draw conclusions and make assessments based on what is known as a result of past insider threat successes. Case studies acknowledge the underlying complexities that not only make an insider threat dangerous but highlight motives, psychological and behavioral factors, as well as identify level of involvement in espionage and explain how an insider ultimately became an insider. Additionally, quantitative data is important as it allows for ability to fully obtain an accurate perception of the insider threat. Quantitative data adds to the value of the qualitative data provided by identifying the length in time an individual has been committing espionage and the amount of damage done as a result. Furthermore, quantitative data identifies how big a threat the insider is by highlighting the number of individuals in the United States that have a security clearance and provides probabilities that aid in grasping the big picture. After taking all of this information into account, assessments and predictive analysis can be conducted so that complexities can be identified.

insider threat program has been a success but further enforcement is key

Porter, 2014 [MA security studies]

(Michael Lawrence, May, thesis "Combating Insider Threats: An Analysis of Current United States Insider Threat Policies and Necessary Improvements")

As this paper has shown, in the years since the end of the Cold War, the United States has spent nearly 13 years fighting international terrorism. The efforts spent overseas were a part of a larger mission to protect the American people and ensure global peace stability. The problem is that while the United States was fixated on the fight against al-Qaeda, foreign governments and international terrorist organizations were reorganizing, targeting the weaknesses that remained on the US homeland. Many governments took this as an opportunity to **exploit weak intelligence security**, through the use of spies. Additionally, terrorists, who had been stopped overseas, set their sights on America and began working with US citizens to conduct their attacks. These two threats, the American terrorist and the American spy, comprise what is known collectively as insider threats. This is not a new threat, it is one that is as old as nation-states, but it is one that is once again becoming a chief concern for policy makers as America's wars come to an end and a renewed focus is placed on internal security. This paper has sought to answer one main question: How successful has the United States Intelligence Community (IC) been in responding to the increase of insider threats? As the last four chapters have shown, given the nature of Intelligence work, a clear evaluation is not possible for operational successes and failures. As was previously stated, the purpose of intelligence is to inform leaders of current situations and to provide them with the best understanding of policy actions. When intelligence does not fully inform, and bad policies are made, the results are often dramatic and result in policy makers blaming intelligence for these failures. Additionally, any correct decisions made will yield little to no "visible" results of success. What is apparent is that the United States has made many strategic reforms needed to better posture the IC to defeat the Insider Threat. These reforms 65 have been strategic successes by altering IC structures and organizations. These reforms are addressing insider threats from the top down for the first time in history and have been very beneficial to the strategic makeup of the CI Community. What effect these changes will have on the operational level is yet to be seen, and will in fact not be realized for several years. Despite these successful changes there are still reforms that are needed to bolster previous actions. This assessment is based on the answers to the 5 sub-questions that each chapter looked at in detail. Chapter 1 provided a more in-depth description of an insider threat. It did so in an effort to identify the best definition and to demonstrate that there is a certain amount of disparity in the IC about the definition of an insider threat. In this discussion, greater detail and understanding of the different types of insider threats revealed just how similar the threats really are. This Chapter was essential to provide the reader a complete understanding of what the threat is and why the threat exists. Building on this definitional effort, Chapter 2 looked at the theoretical process by which people become insider threats. This chapter sought to answer where insider threats come from and highlighted the many studies that have been conducted recently focusing on insider threat psychology. Identifying the answer to this question relied heavily on the psychological aspects of insider threats and explaining why some people decide to betray their country. While the goals of the two types of threats may be different, the "radicalization"/"spy lifecycle" processes are very similar. Additionally, this chapter is significant because it reveals various key considerations that must be understood when determining how to deal with insider threats. Chief among these considerations is understanding how insider threats develop. Understanding an insider threat's origins offers 66

insights into possible preventative measures that the CI Community can use to develop proactive policies.

And, co-workers are the best chance to catch insider-threats

Porter 14

(Michael Lawrence, Master in Security Studies, “Combating Insider Threats: An Analysis Of Current United States

**Insider Threat Policies And Necessary Improvements,” pg online @
[//ghs-ef\)](http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y)**

Finally, at the tactical level, individual agents for the different organizations are on the streets daily, confronting the threat, and catching the “bad guys.” This final level, however, is not just agents. It also includes the general public. **Due to the threat posed by insiders, the person best suited to catch insider threats before or during their acts is the person sitting to their right or left, their friends, coworkers, or neighbors**. Because an insider by definition is no different in appearance than any other person, a knowledge and understanding of the threats, by the general population, is very important. Countering this threat is not one where the agents can do all of the work. Every person must do his or her part to help.

Links: Adaptation

must continue to adapt policy to emerging threats – the plan reverses years of progress

Porter, 2014 [MA security studies]

(Michael Lawrence, May, thesis "Combating Insider Threats: An Analysis of Current United States Insider Threat Policies and Necessary Improvements")

The last and largest NITTF benefit to the IC is a new collection of country threat briefings and threat analyses they produce. These briefings will be created by the NITTF and used as apart of regular threat briefings to IC personnel traveling outside the United States. The analysis will be conducted by IC analysts and given from the NITTF to IC agencies regularly to ensure that there is a clear, coherent, and current threat analysis for every country in the world. These provide government agencies a general CI threat picture. This information is important because it gives leaders in the Army, Navy, Air Force, or one of the 17 intelligence agencies information on threats that will be seen by all organizations. **This is a good starting point for deeper analysis by the CI Community on their mission-specific threats.** By forcing the CI Community to operate together and create unified policies, 97 In the past year, the Air Force, Navy, and DIA have all drafted new Insider Threat programs, which conform to the new standards of the NITTF. The Army devised their training in 2011. 98 Department of the Army, Army Regulation 381-12, Threat Awareness and Reporting Program, 1993. 45 different perspectives of CI will drive future changes. **Continual adaptation means increased awareness of and sensitivity to emerging threats, which in turn**

equates to greater success. The Counterintelligence Community has come a long way from its beginnings. It has changed and adapted over the years to meet the challenges it has faced. The NITTF and the ITAG are very useful additions to the CI Community, but will they accomplish their goals? The unified policy now in its second year is already making strides to fix problems, but there are still changes to be made. These will not be easy, as is the case with most reform, whether it is with the Intelligence Community as a whole or just the CI Community.

strong insider threat programs prevent huge leaks – Hoffman proves

AdvantageSci 2014 [professional security and counterintelligence firm]

(Volume 2, Issue 5, Spring, "Stopping a Dangerous Insider Threat" advantagesci.com/wp-content/uploads/2014/03/Spring-CI-Newsletter.pdf)

On February 10, 2014, Robert Patrick Hoffman, II, 40, of Virginia Beach, Virginia, was sentenced to 30 years in prison for attempting to commit espionage on behalf of the Russian Federation. Hoffman served for 20 years in the U.S. Navy as a Cryptologic Technician-Technical. In that capacity, he worked aboard or in conjunction with U.S. submarines for much of his naval career. While deployed, Hoffman operated electronic sensors and systems designed to collect data and information about potential adversaries, scanned the operating environment for threats to the submarine, and provided technical and tactical guidance to submarine commanders. As a sailor with a top secret clearance, a sensitive job on a submarine, and 20 years of service in the Navy, Robert Hoffman possessed a tremendous amount of knowledge about the U.S. nuclear fleet and its operations—knowledge he was willing to sell to the Russians. “It’s almost impossible to say why someone would become a spy,” said Special Agent James Dougherty, who investigated the case from our Norfolk Division, but Hoffman represents a classic example of the insider threat. “When a U.S. citizen with classified information threatens to betray his country,” Dougherty explained, “the resulting damage to national security and loss of American lives can be catastrophic.” Investigators speculate that Hoffman may have blamed his divorce on the Navy, along with his failure to gain promotion. The FBI and the Naval Criminal Investigative Service (NCIS) became concerned in 2011 when, nearing retirement, Hoffman told friends he was going on a “man-cation” to Belarus to see Russian women he had previously met when he was stationed in Bahrain—even though he knew the women would not be there. “He had some sort of motivation to travel to Belarus that didn’t seem logical,” said Dougherty. In addition, Hoffman ignored the requirement to alert military security officers that he would be traveling out of the country, and he failed to adhere to other security rules of reporting any suspicious incidents while overseas. However, Hoffman did post items on social media channels saying he met the president of Belarus. “All of that added to our suspicion,” Dougherty noted. Using court-authorized surveillance, wiretaps, and other investigative tools, FBI and NCIS investigators began monitoring Hoffman’s movements at his home in Virginia Beach following his retirement from the Navy in late 2011. Soon after, our undercover operatives made contact with him to assess his intentions. Then, in September 2012, a female FBI undercover agent posing as a Russian operative knocked on Hoffman’s door and delivered a message ostensibly from Russian intelligence officials. “He received instructions from the woman, who asked him to respond by e-mail within one week,” Dougherty said. “We didn’t want to pressure him. We wanted him to make a conscious decision, knowing he would be dealing with the Russian intelligence service.” Hoffman didn’t wait a week—he responded within hours. He agreed to answer a series of questions on an encrypted thumb drive that was to be left in a hollow tree in a park—a hiding place known in the spy world as a dead drop. On the third such drop, Hoffman divulged top secret national defense information. “American lives could have been lost based on the information he was willing to give up,” Dougherty said. “He had access to things that were highly, highly sensitive.” In August 2013, a jury in Norfolk found Hoffman guilty of attempted espionage; in February, the 40-year-old was sentenced to 30 years in prison. “The insider threat is very real,” said Dougherty, explaining that in these types of cases, there are often people who are suspicious of a friend or colleague’s statements or behavior but who don’t act on those suspicions. “One of the things we teach in insider threat training,” Dougherty said, “is that if you see something, say something. Often, people don’t want to rock the boat,” he added, “but if you see something that doesn’t seem right, it’s your legal obligation to report it. Let the FBI sort it out. That’s what we get paid for.”

Links: Monitoring

specifically, colleague monitoring is the most effective

AdvantageSci 2014 [professional security and counterintelligence firm]

(Volume 2, Issue 5, Spring, "Stopping a Dangerous Insider Threat" advantagesci.com/wp-content/uploads/2014/03/Spring-CI-Newsletter.pdf)

The message is actually simple, insiders are a big threat. Do not ignore signs of questionable behaviors. The message tagline could be the organizational equivalent of "If you see something, say something." The message should highlight to be on the lookout for violations of policies and procedures. It is also critical to remind employees that it is people, just like themselves, who have stopped major insider crimes. You must however avoid manifesting a modern day Salem. The focus of your guidance should be telling employees to look for behaviors that are clear violations of policies and procedures. Examples include observing people looking through other people's desks, asking for passwords, being in areas that they do not belong, and attempting to access other people's computer accounts. There are also financial and other wrongdoings related to job roles and industry sector. A more delicate, but just as important, aspect of awareness is for people to be comfortable reporting uncomfortable feelings. This is admittedly vague, but uncomfortable feelings have resulted in catching malicious insiders in a variety of incidents. In one case we are personally familiar with, an employee felt uncomfortable that one of her coworkers was speaking Chinese a lot on the telephone at work, and they did not work with any Chinese people. The woman reported the incident and an FBI investigation uncovered that the employee in question was funneling information to Chinese intelligence operatives. Everyone violates policies and procedures at some point in time, without malicious intent. However, people need to know that some of the most harmful incidents were stopped because of observant employees. Again though, the focus is on reporting of incidents, and not of the individuals committing the violations. This is important for a wide variety of reasons. The action that employees need to take is to simply report the questionable incidents to Human Resources, their management or the security team. A However, you need to remember to allow for anonymous reporting and have strong measures in place to protect the identity of the employee reporting the incident. Reporting another employee can clearly result in negative consequences for all involved. The anonymity is critical even if it potentially means that it is impossible to gather criminal evidence. The goal is to detect incidents and stop the loss. Most organizations should already have an established incident reporting structure. Those that do not should consult with the legal and human resources departments to create one. Clearly, when trying to motivate employees to inform the organization about the violations of other employees, you should get the Human Resources and Legal departments involved in at least approving the awareness materials that are distributed. They very likely will be able to provide guidance on how to best implement other aspects of the program as well. The Snowden crimes triggered an interest in organizations to examine what technological controls that they can put in place to stop their own Snowden. Yet much like NSA realized that Snowden's coworkers should have detected his crimes, all organizations must proactively strengthen their non-technical security measures, including especially awareness. Snowden's coworkers should have been able to more effectively detect his actions than any technical countermeasure could have. Therefore, companies that are truly interested in preventing the insider threat should focus on making their employees the primary detectors of insider abuse. The insider threat is too important a subject to shy away from, no matter how sensitive the implications may be. Unfortunately, history has shown us that the risk is too great.

NSA leaders confirm – insider threat programs top of their agenda

Kopan, 14 [reporter for Pro Cybersecurity.]

(Insider threats top to-do lists - New Snowden docs link NSA surveillance, cyber mission - Today: CJS debate should finally begin"www.politico.com/morningcybersecurity/0614/morningcybersecurity14345.html]

Stopping the next Edward Snowden requires deploying technology and human resources intelligence at machine speed, said top defense intelligence officials at a panel discussion yesterday. “Unfortunately, perhaps we all haven’t put as much attention into the insider threat — as the NSA or I can raise my hand and say we were burned by that as much as anyone in recent memory,” said Philip Quade, chief operating officer of the information assurance directorate of the National Security Agency, acknowledging the former intelligence contractor by name at yesterday’s MeriTalk Cybersecurity Brainstorm. “There’s no badguy.com and there’s no stupidguy.com, where there’s this one corner of your network [you can] say, ‘This is where I’m going to optimize my hunting for the insider or remote threat. . . . The good news, is that’s where computing can come in, where analysis and big data analysis and behavior-based analysis can really, really directly address this problem.’” he said. More from Quade and officials at the Defense Intelligence Agency and Defense Security Service, from your host:

Internals: Chinese Threat Real

Chinese insider threat real

Wortzel, 2013 [seven-term Commissioner of the U.S.-China Economic and Security Review Commission of the United States Congress]

(Larry M., May 16, "Espionage Threats at Federal Laboratories: Balancing Scientific Cooperation while Protecting Critical Information" Testimony before the House of Representatives, Committee on Science, Space and Technology Subcommittee on Investigations and oversight,origin.www.uscc.gov/sites/default/files/Wortzel_Espionage%20Threat%20at%20Federal%20Laboratories05.16.13.pdf)

Science and technology cooperation programs are vital to China’s own long-term goals, but they also help foster bilateral cooperation between China and the United States. However, there also is a substantial espionage threat posed by the large number of Chinese nationals working at U.S. laboratories and academic institutions. The counterintelligence education web site maintained by the Federal Bureau of Investigation highlights the “insider threats” posed by foreign intelligence collection to research, technologies, and intellectual property ostensibly protected by export

controls.⁴ Indeed, of the ten incidents of “insider threat” espionage cited by the FBI, six cases are related to China. Three former U.S. officials, Mike McConnell, former Director of National Intelligence; Michael Chertoff, former Secretary of Homeland Security; and William Lynn, former Deputy Secretary of Defense, said in a January 27, 2012 Wall Street Journal opinion piece that: “The Chinese government has a national policy of espionage in cyberspace, pointing out that “it is more efficient for the Chinese to steal innovations and intellectual property than to incur the cost and time of creating their own.” This cyber espionage takes place alongside or in conjunction with other forms of espionage. ³ The U.S.-China Economic and Security Review Commission’s annual report of 2007 reviews how China acquires foreign equipment and technology to support its defense industrial base and documents six espionage prosecutions related to China.⁵ That annual report recommended that Congress provide additional funding and emphasis on export control enforcement and counterintelligence efforts to detect and prevent espionage. In 2009, the Commission’s annual report to Congress addressed espionage conducted by Chinese statecontrolled research institutes and commercial entities.⁶ In 2012, the Commission recommended that Congress ask the National Academy of Sciences for an assessment of Chinese strategies to acquire technology and to identify the extent to which industrial espionage has been used as a tool to advance China’s interests. According to the National Counterintelligence Executive, “of the seven cases that were adjudicated under the Economic Espionage Act (18 USC 1831 and 1832) in Fiscal Year 2010, six involved China.” An article in a March 2012 manufacturing newsletter notes that “there have been at least 58 defendants charged in federal court related to Chinese espionage since 2008.”⁷ China’s targets have included are stealth technology, naval propulsion systems, electronic warfare systems for our ships and aircraft, and nuclear weapons. There is a certain natural tension between the goal of preventing espionage by China (or any other country) and maintaining scientific openness. National Security Decision Directive 189 (NSDD 189), of September 21, 1985, makes it clear that U.S. national policy is that “to the maximum extent possible, the products of fundamental research remain unrestricted;” when restrictions are needed, the answer is that the products be classified as national security information according to U.S. statute.⁸ The directive went on to define “fundamental research” as “basic and applied research, the results of which ordinarily are published and shared broadly ⁴ within the scientific community, as distinguished from proprietary research from industrial design, production, and product utilization, the results of which are restricted for proprietary or national security reasons.” In a 2010 memorandum to defense agency heads and military department secretaries, then Under Secretary of Defense for Acquisition, Technology and Logistics Ashton B. Carter restated Department of Defense policy on fundamental research to ensure that it followed NSDD 189. He also instructed the Department of Defense that where controls are needed, classification of the product is the “only appropriate mechanism.”⁹

only strict gov action prevents Chinese infiltration

Wortzel, 2013 [seven-term Commissioner of the U.S.-China Economic and Security Review Commission of the United States Congress]

(Larry M., May 16, "Espionage Threats at Federal Laboratories: Balancing Scientific Cooperation while Protecting Critical Information" Testimony before the House of Representatives, Committee on Science, Space and Technology Subcommittee on Investigations and

oversight,origin.www.uscc.gov/sites/default/files/Wortzel_Espionage%20Threat%20at%20Federal%20Laboratories05.16.13.pdf)

When you look at China, you must consider the political environment in the home country of a particular researcher. You are dealing with a citizen of an authoritarian state that is ruled by a single political party. The Chinese Communist Party runs the country, the police, intelligence agencies, the university heads, as well as members of the judiciary, who are all members of the Communist Party. All residents are potential hostages to party dictates in a nation that has no rule of law. People in China applying for passports and permission to study or conduct research overseas may be interviewed by the security services. The future employment of these individuals, their place or residence, and the residences and employment of their family or loved ones is subject to Party dictates. A foreign national from China, or a state like China, is vulnerable to coercion and to having his or her loved ones held hostage. And there is no right of refusal for citizens of these states when the government asks them to gather information. No policy on fundamental research will resolve this problem, however. It is up to American government security services and the FBI to appropriately administer programs that involve classified or export controlled information. And it is up to the government to ensure that foreign nationals do not get access to information that should not be disclosed to them.

Impacts

2NC Impacts: Cyber War

Cyber war causes nuclear lashout

Fritz '9

(Jason - former Captain of the U.S. Army, July, Hacking Nuclear Command and Control)

The US uses the two-man rule to achieve a higher level of security in nuclear affairs. Under this rule two authorized personnel must be present and in agreement during critical stages of nuclear command and control. The President must jointly issue a launch order with the Secretary of Defense; Minuteman missile operators must agree that the launch order is valid; and on a submarine, both the commanding officer and executive officer must agree that the order to launch is valid. In the US, in order to execute a nuclear launch, an Emergency Action Message (EAM) is needed. This is a preformatted message that directs nuclear forces to execute a specific attack. The contents of an EAM change daily and consist of a complex code read by a human voice. Regular monitoring by shortwave listeners and videos posted to YouTube provide insight into how these work. These are issued from the NMCC, or in the event of destruction, from the designated hierarchy of command and control centres. Once a command centre has confirmed the EAM, using the two-man rule, the Permissive Action Link (PAL) codes are entered to arm the weapons and the message is sent out. These messages are sent in digital format via the secure Automatic Digital Network and then relayed to aircraft via single-sideband radio transmitters of the High Frequency Global Communications System, and, at least in the past, sent to nuclear capable submarines via Very Low Frequency (Greenemeier 2008, Hardisty 1985). The technical details of VLF submarine communication methods can be found online, including

PC-based VLF reception. Some reports have noted a Pentagon review, which showed **a potential "electronic back door into the US Navy's system for broadcasting nuclear launch orders to Trident submarines"** (Peterson 2004). The investigation **showed that cyber terrorists could potentially infiltrate this network and insert false orders for launch.**

The investigation led to "elaborate new instructions for validating launch orders" (Blair 2003). Adding further to the concern of cyber terrorists seizing control over submarine launched nuclear missiles; The Royal Navy announced in 2008 that it would be installing a Microsoft Windows operating system on its nuclear submarines (Page 2008). The choice of operating system, apparently based on Windows XP, is not as alarming as the advertising of such a system is. **This may attract hackers and narrow the necessary reconnaissance to learning its details and potential exploits.** It is

unlikely that the operating system would play a direct role in the signal to launch, although this is far from certain. **Knowledge of the operating system may lead to the insertion of malicious code, which could be used to gain accelerating**

privileges, tracking, valuable information, and deception that could subsequently be used to initiate a launch Remember from Chapter 2 that the UK's nuclear submarines have the authority to launch if they believe the central command has been destroyed.

Attempts by cyber terrorists to create the illusion of a decapitating strike could also be used to engage fail-deadly systems.

Open source knowledge is scarce as to whether Russia continues to operate such a system. However evidence suggests that they have in the past. Perimetr, also known as Dead Hand, was an automated system set to launch a mass scale nuclear attack in the event of a decapitation strike against Soviet leadership and military. In a crisis, military officials would send a coded message to the bunkers, switching on the dead hand. If nearby ground-level sensors detected a nuclear attack on Moscow, and if a break was detected in communications links with top military commanders, the system would send low-frequency signals over underground antennas to special rockets. Flying high over missile fields and other military sites, these rockets in turn would broadcast attack orders to missiles, bombers and, via radio relays, submarines at sea. Contrary to some Western beliefs, Dr. Blair says, many of Russia's nuclear-armed missiles in underground silos and on mobile launchers can be fired automatically. (Broad 1993) Assuming such a system is still active, cyber terrorists would need to create a crisis situation in order to activate Perimetr, and then fool it into believing a decapitating strike had taken place. While this is not an easy task, the information age makes it easier. Cyber reconnaissance could help locate the machine and learn its inner workings. This could be done by targeting the computers high of level official's—anyone who has reportedly worked on such a project, or individuals involved in military operations at underground facilities, such as those reported to be located at Yamantau and Kosvinsky mountains in the central southern Urals (Rosenbaum 2007, Blair 2008) Indirect Control of Launch

Cyber terrorists could cause incorrect information to be transmitted received, or displayed at nuclear command and control centres, or shut down these centres' computer networks completely. In 1995, a Norwegian scientific sounding rocket was mistaken by Russian early warning systems as a nuclear missile launched from a US submarine. A radar operator used Krokus to notify a general on duty who decided to alert the highest levels. Kavkaz was implemented, all three chegets activated, and the countdown for a nuclear decision began. It took eight minutes before the missile was

properly identified—a considerable amount of time considering the speed with which a nuclear response must be decided upon (Aftergood 2000). **Creating a false signal** in these early warning systems **would be relatively easy using** computer network operations. The real difficulty would be gaining access to

these systems as they are most likely on a closed network. However, **if they are transmitting wirelessly, that may provide an entry point** and information gained through **the internet may reveal** the details, such as **passwords and software, for gaining entrance to the closed network**. If access was obtained, **a false alarm could be followed by** something like

a DDoS attack, so the operators believe an attack may be imminent, yet they can no longer verify it. **This could add pressure to the decision making process** and if coordinated precisely, could appear as a first round EMP burst. Terrorist **groups could** also **attempt to launch a non-nuclear missile**, such as the one used by Norway, **in an attempt to fool the system**.

The number of states who possess such technology is far greater than the number of states who possess nuclear weapons. Obtaining them would be considerably easier, especially when enhancing operations through computer network operations. Combining traditional terrorist methods with cyber techniques opens opportunities neither could accomplish on their own. For example, **radar stations might be more vulnerable to a computer attack**, while satellites are more vulnerable to jamming from a laser beam, thus together they deny dual phenomenology. Mapping communications networks through cyber reconnaissance may expose weaknesses, and automated scanning devices created by more experienced hackers can be readily found on the internet. Intercepting or spoofing communications is a highly

complex science. These systems are designed to protect against the world's most powerful and well funded militaries. Yet, there are recurring gaffes, and **the very nature of asymmetric warfare is to bypass complexities by finding simple loopholes**. For example, **commercially available software for voice-morphing could be used to capture voice commands within the command and control structure, cut these sound bytes into phonemes, and splice it back together in order to issue false voice commands** (Andersen 2001, Chapter 16). **Spoofing could also be used to escalate a volatile situation in the hopes of starting a nuclear war.**

“In June 1998, a group of international hackers calling themselves Milw0rm hacked the web site of India's Bhabha Atomic Research Center (BARC) and put up a spoofed web page showing a mushroom cloud and the text “If a nuclear war does start, you will be the first to scream” (Denning 1999). Hacker web-page defacements like these are often derided by critics of cyber terrorism as simply being a nuisance which causes no significant harm. However, web-page defacements are becoming more common, and they point towards alarming possibilities in subversion. During the 2007 cyber attacks against Estonia, a counterfeit letter of apology from Prime Minister Andrus Ansip was planted on his political party website (Grant 2007). This took place amid the confusion of mass DDoS attacks, real world protests, and accusations between governments.

Escalates to global war

Lawson ‘9 (Sean, Assistant professor in the Department of Communication at the University of Utah, Cross-Domain Response to Cyber Attacks and the Threat of Conflict, p. <http://www.seanlawson.net/?p=477>, June 13, 2009)

At a time when it seems impossible to avoid the seemingly growing hysteria over the threat of cyber war,[1] network security expert Marcus Ranum delivered a refreshing talk recently, “The Problem with Cyber War,” that took a critical look at a number of the assumptions underlying contemporary cybersecurity discourse in the United States. He addressed one issue in particular that I would like to riff on here, the issue of conflict escalation—i.e. the possibility that offensive use of **cyber attacks could escalate to the use of physical force**. As I will show, his concerns are entirely legitimate as current U.S. military cyber doctrine assumes the possibility of what I call “cross-domain responses” to cyberattacks. Backing Your Adversary (Mentally) into a Corner Based on the premise that completely blinding a potential adversary is a good indicator to that adversary that an attack is imminent, Ranum has argued that “**The best thing that you could possibly do if you want to start World War III is launch a cyber attack** [...] When people talk about cyber war like it's a practical thing, what they're really doing is messing with the OK button for starting World War III. We need to get them to sit the f-k down and shut the f-k up.” [2] He is making a point similar to one

that I have made in the past: **Taking away an adversary's ability to make rational decisions could backfire**. [3] For example, Gregory Witol cautions that "attacking the decision maker's ability to perform rational calculations may cause more problems than it hopes to resolve." **Removing the capacity for rational action may result in completely unforeseen consequences**, including longer and bloodier battles than may otherwise have been." [4] **Cross-Domain Response** So, from a theoretical standpoint, I think his concerns are well founded. But the current state of U.S. policy may be cause for even greater concern. It's not just worrisome that a hypothetical blinding attack via cyberspace could send a signal of imminent attack and therefore trigger an irrational response from the adversary. What is also cause for concern is that **current U.S. policy indicates that "kinetic attacks"** (i.e. physical use of force) **are seen as potentially legitimate responses to cyber attacks**. Most worrisome is that **current U.S. policy implies that a nuclear response is possible**, something that policy makers have not denied in recent press reports. The reason, in part, is that the U.S. defense community has increasingly come to see cyberspace as a "domain of warfare" equivalent to air, land, sea, and space. The definition of cyberspace as its own domain of warfare helps in its own right to blur the online/offline, physical-space/cyberspace boundary. But thinking logically about the potential consequences of this framing leads to some disconcerting conclusions. If cyberspace is a domain of warfare, then it becomes possible to define "cyber attacks" (whatever those may be said to entail) as acts of war. But **what happens if the U.S. is attacked** in any of the other domains? **It retaliates**. But it usually does not respond only within the domain in which it was attacked. Rather, responses are typically "cross-domain responses"—i.e. a massive bombing on U.S. soil or vital U.S. interests abroad (e.g. think 9/11 or Pearl Harbor) might lead to air strikes against the attacker. Even more likely given a U.S. military "way of warfare" that emphasizes multidimensional, "joint" operations is a massive conventional (i.e. non-nuclear) response against the attacker in all domains (air, land, sea, space), simultaneously. The possibility of "kinetic action" in response to cyber attack, or as part of offensive U.S. cyber operations, is part of the current (2006) National Military Strategy for Cyberspace Operations [5]: (U) Kinetic Actions. DOD will conduct kinetic missions to preserve freedom of action and strategic advantage in cyberspace. Kinetic actions can be either offensive or defensive and used in conjunction with other mission areas to achieve optimal military effects. Of course, **the possibility that a cyber attack on the U.S. could lead to a U.S. nuclear reply** constitutes possibly the ultimate in "cross-domain response." And while this may seem far fetched, it **has not been ruled out by U.S. defense policy makers** and is, in fact, implied in current U.S. defense policy documents. From the National Military Strategy of the United States (2004): "The term WMD/E relates to a broad range of adversary capabilities that pose potentially devastating impacts. WMD/E includes chemical, biological, radiological, nuclear, and enhanced high explosive weapons as well as other, more asymmetrical 'weapons'. They may rely more on disruptive impact than destructive kinetic effects. For example, cyber attacks on US commercial information systems or attacks against transportation networks may have a greater economic or psychological effect than a relatively small release of a lethal agent." [6] The authors of a 2009 National Academies of Science report on cyberwarfare respond to this by saying, **Coupled with the declaratory policy on nuclear weapons** described earlier, **this statement implies that the United States will regard certain kinds of cyberattacks against the United States as being in the same category as nuclear, biological, and chemical weapons, and thus that a nuclear response** to certain kinds of cyberattacks (namely, cyberattacks with devastating impacts) **may be possible**. It also sets a relevant scale—a cyberattack that has an impact larger than that associated with a relatively small release of a lethal agent is regarded with the same or greater seriousness." [7]

Impacts: Cyber War = Space War

Cyberwarfare draws in space war

Coleman '10 (Kevin Coleman, Defense Tech Chief Cyber War Correspondent, Cyber War = Space War, <http://defensetech.org/2010/03/01/cyber-war-space-war/#ixzz1948Fvj1r>, March 1, 2010)

While the satellite broadband market slowed in 2009 because of the poor economy, it still increased. The market continues to expand after U.S. regulators outlined the national broadband plan that allows satellite operators to use their radio spectrum for Internet traffic. That is why cyber security professionals are so concerned about the convergence of cyber space and space. Its becoming increasingly evident that **any future war between modern militaries would be both a space war and a cyber war, in fact, they would be one and the same**. Russia, China, and the U.S. have all stated they don't want a space war, but are all preparing for one if one occurs. That sounds so familiar – oh wait a minute, didn't Russia, China and the U.S. say the same thing about cyber war? Yes, they did. Satellites in geostationary orbits provide broadband connectivity to businesses and customers. Those **satellites and their computer control ground stations present a viable target for offensive cyber actions. A hacker could disrupt or interfere with satellite control communications and could disrupt the delivery of broadband services. In the absence of such command signals, a satellite would malfunction**. Worldwide attention focused on China's successful anti-satellite missile test. While military officials question the scale and progress of the Chinese anti-satellite program, one has to wonder if China has already tested their anti-satellite cyber weapon. Military leaders are all too aware of the convergence of space and cyber space. An increasing percentage of **military operations occur in cyber space and are integrated with and dependent on communication satellite systems in outer space**.

Space war causes extinction

Mitchell et al '1

(Dr. Gordon, Associate Professor of Communication and Director of Debate at the University of Pittsburgh, ISIS Briefing on Ballistic Missile Defence, "Missile Defence: Trans-Atlantic Diplomacy at a Crossroads", No. 6 July, <http://www.isisuk.demon.co.uk/0811/isis/uk/bmd/no6.html>, July 2001)

The dizzying speed of space warfare would introduce intense 'use or lose' pressure into strategic calculations, with the spectre of split-second attacks creating incentives to rig orbiting. Death Start with automated 'hair trigger' devices. In theory, this automation would enhance survivability of vulnerable space weapon platforms. However, by taking the decision to commit violence out of human hands and **endowing computers with authority to make war, military planners could sow insidious seeds of accidental conflict**. Yale sociologist Charles Perrow has analyzed 'complexly interactive, tightly coupled' industrial systems such as space weapons, which have many sophisticated components that all depend on each other's flawless performance. According to Perrow, **this interlocking complexity makes it impossible to foresee** all the different ways such systems could fail. As Perrow explains, '[t]he odd term "normal accident" is meant to signal that, given the system characteristics, multiple and unexpected interactions of failures are inevitable'.³⁶ Deployment of space weapons with predelegated authority to fire death rays or unleash killer projectiles would likely make war itself inevitable, given the susceptibility of such systems to "normal accidents". It is chilling to contemplate the possible effects of a space war. According to retired Lt. Col. Robert M. Bowman, **even a tiny projectile reentering from space strikes the earth with such high velocity that it can do enormous damage- even more than would be done by a nuclear weapon** of the same size!³⁷ In the same Star Wars technology touted as a quintessential tool of peace, defence analyst David Langford sees one of the most destabilizing offensive weapons ever conceived: 'One imagines dead cities of microwave-grilled people'. Given this unique potential for destruction, it is not hard to imagine that **any nation subjected to space weapon attack would retaliate with maximum force, including use of nuclear biological, and/or chemical weapons. An accidental war sparked by a computer glitch in space could plunge the world into the most destructive military conflict ever seen.**

Impacts: Terror

insider threats real and preventing them k2 stop terror

Hall, 2014, [Strategic Intelligence Graduate]

(Caitlin Squire, March 20, "The Trusted Shadow and Trojan Horse of the United States Government" <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>)

From Department of Defense organizations to Fortune 500 companies, **the insider threat**, as defined above, **is one of the greatest challenges facing companies and government organizations. This statement is backed by dozens of publications, articles, and speeches made by government officials; furthermore, "each new study that is released further confirms that the malicious insider continues to pose a major threat to organizations in both the public and private sectors"**

(Blades 2010, 32). The Central Intelligence Agency, Federal Bureau of Investigation, Defense Security Service, and the President of the United States all acknowledge the significant threat an insider poses to the welfare and safety of the nation as a whole, especially as the government continues to accumulate intelligence.

Therefore, expanding knowledge on arguments and assessments that aid in defining an insider threat is important in order to understand and develop mitigations tactics for the insider threat. First, elaborating on what and who an insider could be identifiable as in the United States must be conducted. There are two categories of insider threats, the non-employee whom by virtue of technology is able to gain intelligence via a cyber-attack and then the employee. Due to the idea that “a company can often detect or control when an outsider (non-employee) tries to access company data either physically or electronically, and can mitigate the threat of an outsider stealing company property,” the unpredictable nature of the employee is the bigger threat (FBI 2013). The FBI acknowledges “the thief who is harder to detect and who could cause the most damage is the insider—the employee with legitimate access” (2013). Because of the threat an employee insider poses, namely with Greg Chung, Chi Mak, Robert Philip Hanssen, and Edward Snowden, President Barack Obama issued a national-threat policy in November 2012 putting individuals whom leak intelligence on par with terrorist activity and double agents. That being said, some experts and business executives argue that an insider threat is not always bad and that often times, the measures to prevent an insider attack is not worth the cost. Furthermore, there are numerous assessments provided by different agencies and subject matter experts regarding the reasons behind why an individual may be provoked to become an insider. An increasing number of Department of Defense agencies identify the insider threat as an audacious breach and significant issue that is a danger to United States national security; however, some argue that certain leaks are good. But is it possible that any leak of classified government information is good despite what American public opinion states? The Defense Security Service states, “arguably, ‘insiders’ have caused more damage than trained, foreign professional intelligence officers working on behalf of their respective governments” (2013). This in part is due to the fact that the insider has access to information without the need to go through several hurdles. Furthermore, because the theft of information from classified databases occurs autonomously, it “can go unnoticed for months or even years” until the insider is caught (FBI 2013). These leaks cost the United States government hundreds of millions of dollars and where some argue that there is no such thing as a good breach, others beg to differ. Steven Aftergood, a Federation of American Scientists government security expert, notes “there are such things as a good leak. Some classified things should be public” (Leonning 2013). In today’s day and age, there is an increasing need within the American populace for government transparency across the board; however, the line qualifying a leak as good versus bad becomes increasingly grey. Some American’s believe the leak caused by Edward Snowden was a good leak whereas numerous agencies within the intelligence community to include Keith Alexander, director of the NSA, note the leak caused “irreversible and significant damage” (Gjeltten 2013). Tom Gjeltten expands on the impact identifying that as a result of the leak, “terrorist groups are changing their communication methods” (2013). This is of momentous importance because if the United States intends on preventing terrorist attacks on American soil, then some programs need to remain hidden. On the other hand, Judge Dennis Saylor, a member of the Foreign Intelligence Surveillance Court that oversees the NSA, as well as James Clapper, the Director of National Intelligence, note that “the leaking of classified NSA documents by a former employee has ‘generated some of the debate’ that needs to happen in the U.S. over the surveillance program” (Nolan 2013). That being said, who then determines whether or not a leak is good or bad? There is no board or agency whose job is to determine the status of a leak and, as obvious with Edward Snowden, there will always be a debate on the issue. The issue, then, becomes that whether the leak of information is good or bad, the motivating factors provoking the individual to leak the information is threatening.

Impacts: Existential Threats

***insiders multiply existential threats – make future conflicts more dangerous
(ununderlined portion makes the arg we need to focus more on behavior monitoring –
CP?)***

Hall, 2014, [Strategic Intelligence Graduate]

(Caitlin Squire, March 20, “The Trusted Shadow and Trojan Horse of the United States Government” <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>)

Dealing with the insider is like dealing with a Trojan horse which is why the insider threat is so dangerous. With 4,917,751 individuals with a security clearance in the United States, finding an insider threat is like trying to find a needle in a bag of needles. The insider can be anyone in the work place and “[...] the unfortunate truth is that there can never be complete safeguards against surprise attacks because the number of targets and the ways in which they are vulnerable will always exceed the measure that can be taken to defend them” (Gaddis 2002). While the insider threat is not comparable to the threat of a nuclear attack or the launch of a weapon of mass destruction, it is of crucial importance. When the RQ-170 went down over Iran, the Iranian government refused to give it back to the United States which ended up being a serious matter seeing as the United States wanted to ensure that aircraft would never get into the hands of enemies. That event if comparable to the impact of an insider releasing information; if the enemy continues to obtain intelligence on United States tactics, techniques, and capabilities, then the United States starts to have a disadvantage should conflict occur with another country. Due to the impact, monetarily, strategically, and tactically, in which an insider can cause damage to the United States, steps must be taken in order to prevent, mitigate, and attempt to eliminate. With the poor economy and current government shutdown, this threat only has the potential to grow as American citizen’s fight against financial complications and anger towards the government. The issue is that there is no easy way to prevent the insider, rather mitigate or minimize the impact. There are several programs that could be implemented to not only draw awareness to the insider threat but call for periodic review boards and background checks. However, the insider is still a trusted shadow of the government and with the technological advancements in today’s society, numerous programs, if poor in nature, could be implemented and the threat would remain alive and kicking. Identifying that human behavior plays a major role affecting the detection and prevention of the insider can aid in narrowing the focus when creating programs that could be affective against the insider. That being said, future studies focusing on the insider threat should continue to aim in identifying good prevention techniques against the insider. These programs can be implemented to raise awareness to making various forms of technology illegal in the workplace. The insider threat will be around for years to come and seeing as the impact the insider has on national security is of crucial concern, future studies should continue to expand on identifying motives and acknowledging similarities behind former and future insiders.

Impacts: Grid Attack

the electrical grid is uniquely vulnerable – small attacks spill over

Angerholzer et al 2014 [MA international affairs, CEO and president of Center for the Study of the Presidency and Congress]

(Maxmillian, Securing the US electrical Grid: Understanding the Threats to the Most Critical of Critical Infrastructure, While Securing a Changing Grid"<https://www.thepresidency.org/sites/default/files/Grid%20Report%20July%202015%20First%20Edition.pdf>)

Protecting the physical security of the national electrical grid poses a serious challenge. The diffuse nature of the grid makes it exceedingly vulnerable to physical attacks from many angles. Additionally, the networked nature of the grid and reliance on critical nodes means that one small attack or incident has the potential to cause a cascading failure that affects a wide-ranging area. However, the interconnectedness of the grid also allows for redundancies and resiliency within the system. The energy grid has clear vulnerabilities that can be exploited by those who wish to attack the grid. Much of the electrical grid suffers from decaying and outdated infrastructure. Many of the major components, including transmissions, distributors, generators, and transformers, that make up the grid are over 25 years old. have undergone minor repairs to patch up issues in the past. In order to replace any damaged parts, or update the out of date components, replacements must be manufactured overseas with a 12-15 month lead-time. 112 This delay in accessibility to new components further highlights the importance of keeping the components up to date before an emergency arises. The majority of stations, transmissions, and distribution lines are located in remote areas above ground, making them easily accessible targets.113 Transmission systems are especially attractive targets based on their functional importance. Step up transformers increase voltage so the electricity can flow efficiently over long distances, and step-down transformers reduced voltage for consumption, both of these systems are critical in maintaining voltage levels in a substation to control the general transmission system.114 Substations, which often house transformers, are typically only protected by a chain link fence and a few surveillance cameras, both relatively easy to bypass, pinpointing a major lack of physical protection. In April of 2013, a group of people attacked a PG&E Metcalf substation in San Jose, California. The substation was near a highway, and the attackers were able to enter through manholes. They used assault rifles and fired over 112 Madeline Vale et al. "Briefing Report #1 - The Electrical Grid: Political & Regulatory Dynamics." Securing the Electrical Grid for the 21st Century. The Center for the Study of the Presidency and Congress. September 20, 2013. 113 Madeline Vale et al. "Briefing Report #5 – Physical Threats: Terrorism, Vandalism, & Weather." Securing the Electrical Grid for the 21st Century. The Center for the Study of the Presidency and Congress. April 1, 2014. Page 2. 114 Knapp, Eric D. , and Raj Samani. "Chapter 2 Smart Grid Network Architecture." In Applied Cyber Security and the Smart Grid: Implementing Security Controls into the Modern Power Infrastructure. : Newnes , 2013. . July 2014 – First Edition 51 100 shots, critically damaging over a dozen transformers.115 The attack was recorded on surveillance cameras, but the footage proved unhelpful in finding the attackers, and the cameras were clearly unhelpful in deterring the attack. Transmission components within the grid are regulated by the Federal Energy Regulatory Commission, FERC, and the North American Reliability Corporation, NERC. Following the Metcalf incident, in light of reports raising concerns about the physical security of the grid, NERC discussed new standards for the protection of critical sites and transmission equipment. A major portion of the debate surrounding these standards discussed balancing the need for security with the cost of hardening remote sites or providing round-the-clock surveillance and quick response at grid sites. These standards, currently being prepared for filing with FERC, requires security planning for the bulk power transmission system, and updated preparations for physical security. Distribution systems are regulated on the state level. These multiple different regulators may not have the same level of resources for addressing these security issues or

communicating concerns to utilities. Additionally, when the issue of cost recovery for security improvements is discussed, these state regulators will be the ones responsible for adjusting rate structures. It will also be vital for electrical, natural gas, and water utilities to work together with each other and the federal government to expand preparation capabilities, bolster information sharing techniques, stockpile spare equipment and engage in mutual assistance agreements to ensure a crisis could be handled efficiently. Electric grids offer a wide range of targets that can impart a great deal of damage on an entire system. Small-scale attacks can affect much greater systems because the entire grid is connected directly or indirectly. Once one component is compromised, an entire system can be subject to a cascading failure, impacting far more than the initial target.

Impacts: Kills Millions

a cyberattack affects millions – the plan would derail current improvements in the system

Angerholzer et al 2014 [MA international affairs, CEO and president of Center for the Study of the Presidency and Congress]

(Maxmillian, Securing the US electrical Grid: Understanding the Threats to the Most Critical of Critical Infrastructure, While Securing a Changing Grid"<https://www.thepresidency.org/sites/default/files/Grid%20Report%20July%202015%20First%20Edition.pdf>)

Even though SCADA systems are physically installed in secure locations throughout a utilities' facility, there are a variety of threats that can compromise that security. If an insider or an unauthorized individual gained access to the facility, they could use an infected USB stick, disconnect a cable, or install a key logger to expose the system. These threats could infect the system immediately or provide attackers with "backdoor" entry to the utility, in which a cyberattack could be used to damage the entire network. Many of the cyber threats include denial of service, data interception, unauthorized user access, data alteration and/or data-retransmission. Not only could these threats lead to a major blackout for millions of customers, but it could interrupt the ability for other sectors of critical infrastructure to function or allow highly sensitive material could be obtained. Securing against such challenges not only requires the development of improved security protocols for utility employees, but also improved behavioral analysis aimed at preventing or detecting unauthorized access or software installation—be it inadvertent or malicious. Electrical utilities and other critical infrastructure facilities must begin to implement various practices and methodologies that can secure SCADA systems from these threats. Utilities have begun to integrate Software Management and Documentation Systems (SMDS) into SCADA, which monitors all of the activities of the control system. SMDS can assist IT and OT operators with an application restoration following a catastrophic event; control who may use any SCADA application system; and can control which actions can be performed. Additionally, many utilities have begun to develop various Network Security Solutions which range from firewalls to "Demilitarized Zones" to physical "air-gaps," which prevent unwanted access to a network. Through the use of a Virtual Private Network tunnel (VPN) utilities can ensure the proper authentication and authorization of data transactions between different networks. VPN gives a utility private use of a public network through the development of an encrypted tunnel between the server and client. Although, when logging onto the VPN, the secondary device must have the same level of end-point protection; if there is a variation, it can create vulnerabilities to the VPN. To fully secure the VPN from unauthorized access, a high level of authentication must be implemented in all networked devices. Due to the high amount of threats to SCADA systems, utilities have also begun to implement detection methodologies to mitigate the effect of an attack. IT security systems have created Intrusion Detection Systems (IDS) which are designed to recognize intrusions based upon multiple factors including an unusual pattern of activity and communications attempted from an unusual or unauthorized address. The IDS creates a log of suspicious events, which system operators can inspect manually to determine true intrusions versus false alarms. Through the implementation of IDS, OT personnel have the ability to use firewalls to prevent the attack

from spreading, thus mitigating the overall damage the cyber threat could cause. In addition to technological solutions, securing networks will require an increased emphasis on behavioral analysis, background investigations, psychological profiling, and analysis of individual motives. These factors are key tools for detecting potential insider threats, while also understanding how potential adversaries may seek to target individuals who can provide access—purposefully or inadvertently—to vital networks.

Impacts: Grid/Cyber Attack

current standards key to avoid catastrophe

Angerholzer et al 2014 [MA international affairs, CEO and president of Center for the Study of the Presidency and Congress]

(Maxmillian, Securing the US electrical Grid: Understanding the Threats to the Most Critical of Critical Infrastructure, While Securing a Changing Grid"<https://www.thepresidency.org/sites/default/files/Grid%20Report%20July%2015%20First%20Edition.pdf>)

While grid security often focuses on external threats to the grid, expecting cyber and physical attacks to come from the outside, internal threats are just as dangerous. This insider threat can potentially be mitigated by adjusting the architecture of the system itself and maintaining high standards for personnel screening. Both actions must come from industry because there is such variation in system architecture and personnel across utilities. Theoretically, each utility will have a better understanding of its own unique insider threats, leading to better preparation and crisis management. The way a utility system is structured affects how it responds to threats. While each utility is (and probably should be, based on the different types discussed later) structured differently, there are some standards in the electric sector that utilities should follow. One such example is the ES-C2M2 (Electricity Subsector Cybersecurity Capability Maturity Model), a White House initiative that the electric power industry collaborated on with DOE and DHS. ES-C2M2 provides a model of “industry-vetted cybersecurity practices,” as well as an evaluation tool that allows utilities to compare themselves to the model. Using these protocols can improve utilities’ systems internally in order to protect against external threats. This architectural structure can open doors for a potentially more dangerous hazard: the insider threat that comes from personnel. Often disgruntled employees, these risky July 2014 – First Edition 134 personnel have greater access to the system and therefore greater power over it. This power can come in the form of cyber, such as an infected USB, or physical, such as destroying a critical piece of machinery. Such attacks can often be untraceable because there is no evidence of breaking into the system. There are many examples of this threat, and even more that for obvious reasons have never been released to the press. Many instances are simply unhappy employees lashing out, purposely attack the grid system. Others, though, are inadvertent, as employees are sent infected emails or given infected thumb drives by attackers, leaving the employee(s) to unwittingly harm the system. Intentional attacks are an issue, too, as DHS warns utilities that terrorists can easily gain insider access to the grid and conduct a cyber or physical attack from the inside. While the insider threat will never be eliminated, it can be mitigated by instituting regular personnel screening protocols. Utilities have already instituted some measure of personnel screening, but strengthening and improving this screening is necessary to risk mitigation. Increased screening may erode trust between employers and employees, as if employees were being accused of crimes they had not committed, but that is a necessary risk. Even the best, most loyal employees can be unintentionally carry viruses that can harm the grid. It is also necessary for personnel screening and changes to the system’s architecture to be primarily an industry-led initiative. The executive branch can issue some kind of executive order or policy directive that instructs industries to incorporate this screening somehow, but the actual implementation falls to utilities. The variation in utilities’ structures and needs affects how they can and should implement such a system.

Impacts: Nuclear Secrets

insiders can release nuke secrets – managers downplay the risk

Bunn and Sagan 2014 [Professor of Practice at the Harvard Kennedy School ; Caroline S.G. Munro Professor of Political Science and Senior Fellow at the Center for International Security and Cooperation at Stanford University]

(Matthew and Scott, American Academy of Arts and Sciences "A Worst Practices Guide to Insider Threats: Lessons from Past, p 3-4, Mistakes"<https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>)

Insider threats are perhaps the most serious challenges that nuclear security systems face.¹ All of the cases of theft of nuclear materials where the circumstances of the theft are known were perpetrated either by insiders or with the help of insiders; given that the other cases involve bulk material stolen covertly without anyone being aware the material was missing, there is every reason to believe that they were perpetrated by insiders as well. Similarly, disgruntled workers from inside nuclear facilities have perpetrated many of the known incidents of nuclear sabotage. The most recent example of which we are aware is the apparent insider sabotage of a diesel generator at the San Onofre nuclear plant in the United States in 2012; the most spectacular was an incident three decades ago in which an insider placed explosives directly on the steel pressure vessel head of a nuclear reactor and then detonated them.² While many such incidents, including the two just mentioned, appear to have been intended to send a message to management, not to spread radioactivity, they highlight the immense dangers that could arise from insiders with more malevolent intent. As it turns out, insiders perpetrate a large fraction of thefts from heavily guarded non-nuclear facilities as well.³ Yet organizations often find it difficult to understand and protect against insider threats. Why is this the case? Part of the answer is that there are deep organizational and cognitive biases that lead managers to downplay the threats insiders pose to their nuclear facilities and operations. But another part of the answer is that those managing nuclear security often have limited information about incidents that have happened in other countries or in other industries, and the lessons that might be learned from them. In the world of nuclear safety, sharing of incidents and lessons learned is routine, and there are regularized processes for it, through organizations such as the International Atomic Energy Agency (IAEA) and the World Association of Nuclear Operators (WANO). Nothing comparable exists in nuclear security.⁴

Parker, 2014, [Social Sciences Writer at Stanford News]

(Clifton B., April 24, "When it comes to security at nuclear facilities, danger likely lurks from within, Stanford scholar says", Stanford News, news.stanford.edu/news/2014/april/nuclear-security-risks-042414.html)

Insider threats are the most serious challenge confronting nuclear facilities in today's world, a Stanford political scientist says. In every case of theft of nuclear materials where the circumstances of the theft are known, the perpetrators were either insiders or had help from insiders, according to Scott Sagan and his co-author, Matthew Bunn of Harvard University, in a research paper published this month by the American Academy of Arts and Sciences. "Given that the other cases involve bulk material stolen covertly without anyone being aware the material was missing, there is every reason to believe that they were perpetrated by insiders as well," they wrote. And theft is not the only danger facing facility operators; sabotage is a risk as well, said Sagan, who is a senior fellow at Stanford's Center for International Security and Cooperation and the Caroline S.G. Munro Professor in Political Science. While there have been sabotage attempts in the United States and elsewhere against nuclear facilities conducted by insiders, the truth may be hard to decipher in an industry shrouded in security, he said. "We usually lack good and unclassified information about the details of such nuclear incidents," Sagan said. The most recent known example occurred in 2012 – an apparent insider sabotage of a diesel generator at the San Onofre nuclear facility in California. Arguably the most spectacular incident happened at South Africa's Koeberg nuclear power plant (then under construction) in South Africa in 1982 when someone detonated explosives directly on a nuclear reactor. Lessons learned In their paper, the authors offered some advice and insights based

on lessons learned from past insider incidents: Don't assume that serious insider threats are NIMO (not in my organization). Don't assume that background checks will solve the insider problem. Don't assume that red flags will be read properly. Don't assume that insider conspiracies are impossible. Don't assume that organizational culture and employee disgruntlement don't matter. Don't forget that insiders may know about security measures and how to work around them. Don't assume that security rules are followed. Don't assume that only consciously malicious insider actions matter. Don't focus only on prevention and miss opportunities for mitigation. The information for the research paper emanated from an American Academy of Arts and Sciences project on nuclear site threats, Sagan said. "It was unusual in that it brought together specialists on insider threats and risks in many different areas – including intelligence agencies, biosecurity, the U.S. military – to encourage interdisciplinary learning across organizations," he said. Sagan explained that the experts sought to answer the following questions: "What can we learn about potential risks regarding nuclear weapons and nuclear power facilities by studying insider threat experiences in other organizations? What kinds of successes and failures did security specialists find in efforts to prevent insider threats from emerging in other organizations?" 'Not perfect' He noted that only a few serious insider cases in the U.S. nuclear industry have arisen, thanks to rigorous "personal reliability" programs conducted by the Nuclear Regulatory Commission and the U.S. military for people with access to sensitive nuclear materials. But there is room for improvement, Sagan said. "These programs are effective," he said, "but they are not perfect. And relative success can breed overconfidence, even complacency, which can be a major cause of security breaches in the future." For example, the nuclear industry needs to do more research about how terrorist organizations recruit individuals to join or at least help their cause. It also needs to do a better job on distributing "creative ideas and best practices" against insider threats to nuclear partners worldwide. Sagan said the U.S. government is not complacent about the danger of insider threats to nuclear security, but the problem is complex and the dangers hard to measure. "Sometimes governments assume, incorrectly, that they do not face serious risks," he said. One worrisome example is Japan, he said. "Despite the creation of a stronger and more independent nuclear regulator to improve safety after the Fukushima accident in Japan, little has been done to improve nuclear security there," said Sagan. He added, "There is no personal reliability program requiring background checks for workers in sensitive positions in Japanese nuclear reactor facilities or the plutonium reprocessing facility in Japan." Sagan explained that some Japanese government and nuclear industry officials believe that Japanese are loyal and trustworthy by nature, and that domestic terrorism in their country is "unthinkable" – thus, such programs are not necessary. "This strikes me as wishful thinking," Sagan said, "especially in light of the experience of the Aum Shinrikyo terrorist group, which launched the 1995 sarin gas [chemical weapon] attack in the Tokyo subway."

Impacts: Insider Threats O/W

insider threats are the biggest danger - work around security and know gov weaknesses

Bunn and Sagan 2014 [Professor of Practice at the Harvard Kennedy School ; Caroline S.G. Munro Professor of Political Science and Senior Fellow at the Center for International Security and Cooperation at Stanford University]

(Matthew and Scott, American Academy of Arts and Sciences "A Worst Practices Guide to Insider Threats: Lessons from Past, p 38-44, Mistakes"<https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>)

Many individuals involved in the nuclear security field have backgrounds in engineering and nuclear safety, where the goal is to protect against natural disasters and accidents, not against reactive adversaries. This can produce a compliance-oriented approach to security: a belief that once systems are in place 34 that are assessed to be capable of beating the adversaries included in the design basis threat (DBT) on the pathways designers identified, the security system will be effective. But reactive adversaries

will observe the security systems and the pathways they protect against, and they will think of other pathways. Insider threats are a particularly dangerous form of reactive adversary because insiders are well placed to understand the organization's security procedures and their weaknesses. The best case to illustrate this point is that of Robert Hanssen, the senior FBI analyst convicted in 2001 on fifteen counts of espionage, in what the FBI has called "possibly the worst intelligence disaster in U.S. history."³⁸ According to the 2003 Department of Justice report on the case, Hanssen's initial decision to engage in espionage "arose from a complex blend of factors, including low self-esteem and a desire to demonstrate intellectual superiority, a lack of conventional moral restraints, a feeling that he was above the law, a lifelong fascination with espionage and its trappings and a desire to become a 'player' in that world, the financial rewards he would receive, and the lack of deterrence—a conviction that he could 'get away with it.'"³⁹ His espionage activities often raised alarm bells, but his insider advantage let him avoid detection in three key ways. First, Hanssen was capable of being uniquely reactive to counterintelligence investigations because of his placement within the FBI counterintelligence bureaucracy. Second, Hanssen was able to alter his contact procedures with his Russian associates whenever he felt that he was close to being caught; he was even able to search for his own name within the FBI internal database to monitor whether he was the subject of any investigation.⁴⁰ Third, Hanssen knew how to avoid movement within the FBI bureaucracy that would have subjected him to polygraph examinations.⁴¹ In other contexts, this problem—that insiders can observe and work around security measures—comes up again and again. In a study of insider crimes that might be analogous to insider thefts or attacks at nuclear facilities, the authors repeatedly found that the success of insider crimes depended on the perpetrators' observation of security vulnerabilities.⁴² The study of insider IT sabotage mentioned earlier noted that the insiders overwhelmingly took advantage of their knowledge of the IT security systems, creating access pathways for them—38 selves completely unknown to the organization—in other words, they invented ways to attack that the security planners had not known were possible.⁴³ There are several lessons here. First, security managers need to find creative people with a hacker's mindset to come up with a wide range of ways that insiders might try to beat the security system—and then develop security measures that will be effective against a broad range of possibilities. A security system adequate to defend against the first few pathways thought of by an unimaginative committee is not likely to be good enough against the real threat. Such uncreative vulnerability assessments were the target for Roger Johnston and his colleagues in the Vulnerability Assessment Team at Argonne National Laboratory; in their instructive and amusing set of "Security Maxims," they offer the "Thanks for Nothin'" maxim: "Any vulnerability assessment which finds no vulnerabilities or only a few is worthless and wrong."⁴⁴ Second, those with the most detailed information about how the organization protects itself against insider threats should be subject to especially strong reviews and monitoring to ensure that the organization is appropriately "guarding the guardians."

2NC Impacts: Turns Allied Cred

Insiders collapse Allied Cred.

Porter 14

(Michael Lawrence, Master in Security Studies, "Combating Insider Threats: An Analysis Of Current United States

Insider Threat Policies And Necessary Improvements," pg online @ [//ghs-ef\)](http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y)

The reason that this is so important is because of the potential damage these types of insiders can cause. Nidal Hassan, the Fort Hood shooter and an insider threat, entered the Reverse Soldier Readiness Processing Center at Fort Hood, Texas and killed 13 American service members⁵. Bradley Manning, an Army Private with a Top Secret clearance and an insider threat, published over 700,000 classified documents to Wikileaks⁶. Which as

Michelle Van Cleve, former head of U.S. counterintelligence under President George W. Bush, writes ultimately “had repercussions across the world, breaching confidences, embarrassing friends and allies, undermining US credibility, putting the lives of American soldiers and Afghan informants in danger and operations at risk.”

Circumvention Turn/Takeout

1NC

Whistleblower protections are a sham – the plan will be circumvented – channels are corrupted

Martin 7

(Brian, Published as a chapter in Brian Rappert and Caitriona McLeish (eds.), *A Web of Prevention: Biological Weapons, Life Sciences and the Governance of Research* (London: Earthscan, 2007), pp. 35-49. Pg online @ <http://www.bmartin.cc/pubs/07Rappert.html> //um-ef)

Worst of all, the slow, procedural and reactive processes of official channels put all attention on the treatment of the whistleblower, neglecting the organizational problems the whistleblower originally spoke out about. Even when the whistleblower is successful (e.g. in obtaining a generous compensation payment), the original problems are unaddressed. These problems with official channels - reprisals under the radar of laws, an imbalance of power in the whistleblower-organization conflict, slowness, a procedural orientation and lack of attention to the original organizational problem - explain their appalling record in helping whistleblowers. The shortcomings are well known to experienced advisers of whistleblowers (Devine, 1997; Martin, 1999a). Jean Lennane, for many years president of Whistleblowers Australia, says the only thing you can rely on concerning official channels is that they will not work. William De Maria, in the most significant study of whistleblowers' experiences with official bodies, found that they reported being helped in less than one out of ten approaches, and in many cases they were worse off (De Maria, 1999). Tom Devine (1997), in The Whistleblower's Survival Guide, the most comprehensive advice manual for US whistleblowers, finds serious flaws with even the most effective laws and agencies. The US has by far the longest experience with whistleblower protection, beginning during the 1970s. The pattern is that laws are passed but dodged by employers, un-enforced by agencies and subverted by courts. The Office of the Special Counsel, set up to receive whistleblowing disclosures from federal employees, seldom exercises its power to demand investigation of charges made by whistleblowers: The OSC's annual report for fiscal 1995 reveals that out of 333 whistleblowing disclosures, the office forwarded only two for agency investigation' (Devine, 1997, p. 68). Devine (2004, pp83-84) paints a gloomy picture: On balance, in practice U.S. statutory whistleblower laws have been Trojan horses, creating more retaliation victims than they helped achieve justice ... the system has been rigged so that realistically it routinely endorses retaliation. After Congress passed a stronger law in 1989 and bolstered it with amendments in 1994, the problems continued, according to Devine: ... the pattern of futility persists. Between passage of the 1994 amendments and September 2002, whistleblowers lost 74 of 75 decisions on the merits at the Federal Court of Appeals, which has a monopoly on judicial review of administrative decisions. (Devine, 2004, p. 85) The law is filled with loopholes and the court regularly interprets the law to favour the government. Meanwhile, in the private sector, there is seldom any legal protection to start with. One explanation for governments' enthusiasm for whistleblower protection is that laws give the appearance of dealing with the problem without any substantive change in the way organizations deal with dissent (Martin, 2003). Several governments have considered or passed whistleblower laws without any consultation with whistleblowers. Most whistleblowers know nothing about the track record of laws and agencies. With their belief in the system, many of them approach one agency and, after an unsatisfactory response, go on to another, sometimes trying half a dozen bodies in a futile quest for justice. Some of them eventually get in touch with a whistleblowers' group and find, to their surprise, that others have had identical experiences. The faith in official channels runs deep. It is to be expected that politicians and agency officials believe in them, but so do quite a few whistleblower activists who argue for stricter laws, better funded agencies and stronger enforcement.

Congressional oversight fails- Executive privilege means the FDA will just circumvent

HOUSE SUBCOMMITTEE 07 (US Senator Chuck Grassley, R- Iowa- Chairman of the Senate Judiciary Committee; (Tuesday, February 13, 2007; House Of Representatives, Subcommittee On Oversight And Investigations, Committee On Energy And Commerce; Washington, D.C., The Adequacy Of Fda To Assure The Safety Of The Nation's Drug Supply; <http://www.gpo.gov/fdsys/pkg/CHRG-110hhr35502/pdf/CHRG-110hhr35502.pdf>; 07/10/15) JG

My investigations of FDA issues have also revealed a deeply troubling disregard for Congress' responsibility to conduct oversight of the executive branch of Government, getting right to the heart of whether or not the checks and balances of the 225-year history of our Government are functioning properly, to see that the laws we passed are faithfully executed and to see that the money that we appropriate is spent in accordance with Congress intent. The FDA and the Department of Health and Human Services have put VerDate 11-SEP-98 15:43 Jun 06, 2007 Jkt 000000 PO 00000 Frm 00019 Fmt 6633 Sfmt 6633 Q:DOCS\110-5 SCOM1 PsN: SCOM1 16 up so much resistance to my efforts to find out what happened inside the Food and Drug Administration with a relatively new antibiotic called Ketek, that I can only wonder what there is to cover up. Every excuse under the sun has been used to create roadblocks, even in the face of congressional subpoenas requesting information and access to FDA employees. In denying access to documents responsive to the subpoenas, the Department and the Food and Drug Administration have claimed the official words "Prosecutorial deliberative process," another one "confidential communication," another one, "agency prerogative to determine who will be interviewed or testify before jurisdictional committees." That strikes right at the heart of the work you are doing here, Mr. Chairman, today. Yet, during my years in the Senate, my investigators have obtained access to every single one of these categories of so-called confidential information, even from HHS, as well as other executive branch agencies. So why now? Further, I asked the Congressional Research Service to look into the Department's policies regarding this matter and CRS told me that there is, in their words, "no legal basis" for the Department's executive branch assertions. Nevertheless, the Department and FDA not only withheld documents, that do not appear to be privileged, but they also won't say what has been withheld and why. The subpoenas compel a privilege log, but the Department and the FDA will not provide one. The Department and the FDA say that they have been responsive to the Finance Committee's Ketek investigation because they made available millions of pages of documents. But what they provided is quantity, not quality. They delivered hundreds of pages simply marked, for example, "57 pages removed" or "43 pages removed," and that is in attachments 1 through 5 that you will have. Other documents have whole pages, paragraphs and sentences redacted with no explanation for what has been held or redacted or why. In fact, listen to this, the FDA redacted some of the same documents differently and they even redacted one of my own letters to them on a different matter, and that is attachment 6. When I point out the absurdities in the Department's response to my request for documents and interviews related to Ketek, the Department argues it could not provide access to information and individuals related to criminal investigations, just like that was what I was trying to do. But I didn't ask for access to open criminal investigations. I don't want to jeopardize a criminal matter; you folks don't, either. The Department and the FDA know that, yet they keep using that excuse anyway.

Eliminating ITP costs massive amounts of capital – adjustments are difficult and time-consuming

Porter 14

(Michael Lawrence, Master in Security Studies, “Combating Insider Threats: An Analysis Of Current United States

Insider Threat Policies And Necessary Improvements,” pg online @ [//ghs-ef\)](http://repositories.tdl.org/asu-ir/bitstream/handle/2346.1/30135/PORTER-THESIS-2014.pdf?sequence=1&isAllowed=y)

Given the many insider threat-related challenges the CI Community faces, the United States has done a great deal to confront this dangerous enemy. Nonetheless, the CI Community must make additional changes due to weaknesses in the current legislative processes, organizational interactions, and other issues involved in this effort⁹⁹. As addressed in Chapter 3, the structure of the CI Community has adapted over the years, but the sad reality is that these changes happened largely as a result of failures in the system and kneejerk reactions designed to address specific instances of failure¹⁰⁰. Even then, the changes that do occur often do not come easily and are the result of extensive reform processes throughout the IC. The ever-present threat posed by insiders means that the US CI Community must routinely evaluate the process it operates under and look to better itself. Our CI specialists must address a range of persistent vulnerabilities to help strengthen the American security apparatus. The problem is that substantive reform is often very difficult to accomplish in the IC, and subsequently the CI Community, for two reasons. First, intelligence reform is usually more politically motivated than it is focused on, and motivated by, the need for substantive change¹⁰¹. Second, since the IC is a tool of the policy makers, who ultimately oversee these organizations, this often means that the people making decisions for the IC have little to no real understanding of the Intelligence process¹⁰². As Chapter 3 demonstrated, there were multiple reforms over the past 20 years that have helped mold the CI Community into an organization that could fight the insider threat. These changes however, were not the result of planned reform, they were reactionary movements to larger community failures that allowed insiders like Ames, Hanssen, and Hassan to exist. Politicians do not like huge failures for political reasons, so large high-profile events act as “motivation” for change, and to show their constituents that they are making things better¹⁰³. Policymakers drive the intelligence cycle. As the driving force, they should continually evaluate the systems in place, judging their effectiveness and adapting them as need be¹⁰⁴. Unfortunately, this is often not the priority of those in the policy community¹⁰⁵. The absolute certainty of the need for reforms in the CI Community begs the question, why have major substantive reforms not happened yet? The answer to this question relates to the challenges that intelligence reform faces: time, concession of power, and consensus. Time is a valuable commodity and one that has a dramatic impact on the actions of people everywhere. Whether it is rushing to meet a deadline or hanging on for the long run, time seems to dictate our lives, and this idea could not be truer for both the IC and the policy community. The reason that time is such a significant challenge to reform has to do with the nature of the IC and CI communities, the policy community, and the dramatically different understandings they have of time. First, in the IC there has traditionally been less sense of time-urgency, because before 9/11 intelligence was seen mostly as a long-run game, an endurance race. The challenges posed by agile extremist organizations have forced the IC to face a new paradigm in this arena. However, when it comes to collecting, analyzing, and exploiting so much information from the enemy, whether that is an insider threat, a nation-state he spies for, or an ITO supporting him, the operations tend to last for years. As intelligence professionals see it, steady analysis not rushed by political pressure is the key to success. Conversely, in Congress and the White House, politicians are rushed to make their mark by showing their constituents what they have accomplished. In this sense, they often view intelligence as a tool to gain large results in a short period of time. With the two operating under a different time frame there are bound to be confrontations¹⁰⁷. The second and most important way that time holds back reform is in the reform process itself. Given that reform will be drafted and incorporated by the policy community, the US Congress cannot simply “change.” Rather, there have to be bills written, voted on,

debated, passed, and signed into law. This all takes time—a very long time. To make matters worse, it is the legislature’s right to conduct an investigation into failures, or reasons for reform¹⁰⁸. As Berkowitz states, “Commissions take months to convene, staff, and complete their work. Experience shows that commissions require, on average, a year or two to report their results—and even more time to declassify their reports so they can be released for public discussion. During this time, any passion officials might have had for fixing intelligence ebbs and the public’s attention wanders to other matters.” Just one example of this is the September 11th Commission, which was formed a year after the attacks, releasing results two years later, and passing changes through Congress 10 months later¹⁰⁹. The problem here is that the IC has its most fervent reform supporters immediately after the failure, as was the case with Ames, Hanssen, and Manning, yet as time drags on, the supporters of reform begin to become busy with other things, and the intended reforms do not come to fruition¹¹⁰. The next major barrier to reform is cession of power. because giving up power is not what any agency, or leader, wants to do¹¹¹. This desire to maintain power often results in nothing more than long debates and very weak results, if any at all. An example of this is clear within the IC. In 2002, with the creation of the position of the NCIX, the Counterintelligence Enhancement Act of 2002 tasked the NCIX with developing the annual National CI Strategy. Developing this strategy would be based on the NTIPA as stated in Chapter 3. The problem is that the NTIPA and the CI Strategy are not based on the Director of National Intelligence’s National Intelligence Strategy (NIS), nor does the NIS say anything about CI¹¹². This is because with the creation of the NCIX in 2002, it was given the power of drafting the CI Strategy, while the DNI, created in 2004, does not have the power to “develop” any part of the CI strategy. This is one area where a small cession of power and cooperation between organizations could go a long way to unifying the role that the DNI has within the IC¹¹³. This tight hold on the CI Community has had drastic consequences for the office of the DNI, which was originally designed to provide leadership and guidance for all of the IC, but left weak and limited. Like time, consensus is a chief barrier to reform for the IC and policy community because of how the intelligence cycle works. However, consensus is probably the most important barrier because of the ways in which it can affect other barriers to reform. One of the key ways in which consensus is a challenge to reform has to do with the fact that consensus implies that both sides come to an agreement. As Berkowitz discusses, political compromise allows opponents to sabotage the creation of any new agency from the start by simply not agreeing to certain aspects of potential future laws¹¹⁴. This truly is a hurdle for reform because while politicians, and heads of agencies, can come with hands outstretched under the banner of reform, a “nay” vote or even language inserted into a bill that passes through the legislature can destroy consensus and weaken any real reforms.

The challenges posed by agile extremist organizations have forced the IC to face a new paradigm in this arena. However, when it comes to collecting, analyzing, and exploiting so much information from the enemy, whether that is an insider threat, a nation-state he spies for, or an ITO supporting him, the operations tend to last for years. As intelligence professionals see it, steady analysis not rushed by political pressure is the key to success. Conversely, in Congress and the White House, politicians are rushed to make their mark by showing their constituents what they have accomplished. In this sense, they often

view intelligence as a tool to gain large results in a short period of time. With the two operating under a different time frame there are bound to be confrontations¹⁰⁷. The second and most important way that time holds back reform is in the reform process itself. Given that reform will be drafted and incorporated by the policy community, the US Congress cannot simply “change.” Rather, there have to be bills written, voted on, debated, passed, and signed into law. This all takes time—a very long time. To make matters worse, it is the legislature’s right to conduct an investigation into failures, or reasons for reform¹⁰⁸. As Berkowitz

states, “Commissions take months to convene, staff, and complete their work. Experience shows that commissions require, on average, a year or two to report their results—and even more time to declassify their reports so they can be released for public discussion. During this time, any passion officials might have had for fixing intelligence ebbs and the public’s attention wanders to other matters.” Just one example of this is the September 11th Commission, which was formed a year after the attacks, releasing results two years later, and passing changes through Congress 10 months later¹⁰⁹. The problem here is that the IC has its most fervent reform supporters immediately after the failure, as was the case with Ames, Hanssen, and Manning, yet as time drags on, the supporters of reform begin to become busy with other things, and the intended reforms do not come to fruition¹¹⁰. The next major barrier to reform is cession of power, because giving up power is not what any agency, or leader, wants to do¹¹¹. This desire to maintain power often results in nothing more than long debates and very weak results, if any at all. An example of this is clear within the IC. In 2002, with the creation of the position of the NCIX, the Counterintelligence Enhancement Act of 2002 tasked the NCIX with developing the annual National CI Strategy. Developing this strategy would be based on the NTIPA as stated in Chapter 3. The problem is that the NTIPA and the CI Strategy are not based on the Director of National Intelligence’s National Intelligence Strategy (NIS), nor does the NIS say anything about CI¹¹². This is because with the creation of the NCIX in 2002, it was given the power of drafting the CI Strategy, while the DNI, created in 2004, does not have the power to “develop” any part of the CI strategy. This is one area where a small cession of power and cooperation between organizations could go a long way to unifying the role that the DNI has within the IC¹¹³. This tight hold on the CI Community has had drastic consequences for the office of the DNI, which was originally designed to provide leadership and guidance for all of the IC, but left weak and limited. Like time, consensus is a chief barrier to reform for the IC and policy community because of how the intelligence cycle works. However, consensus

is probably the most important barrier because of the ways in which it can affect other barriers to reform. One of the key ways in which consensus is a challenge to reform has

to do with the fact that consensus implies that both sides come to an agreement. As Berkowitz discusses, political compromise allows opponents to sabotage the creation of any new agency from the start by simply not agreeing to certain aspects of potential future laws¹¹⁴. This truly is a hurdle for reform because while politicians, and heads of agencies, can come with hands outstretched under the banner of reform, a “hay” vote or

even language inserted into a bill that passes through the legislature can destroy consensus and weaken any real reforms. Another major barrier to consensus is the secret nature of the IC. The reality is that the majority of the work that the IC does is classified, which can

be a problem for the policy community. The reason this level of secrecy is such a major issue is that members of the policy community do not normally have the clearance to see all the information necessary to make proper decisions about CI or any other reforms. This lack of information basically leaves the IC asking Congress to go along with their plans with a minimum amount of information and understanding of what the plans actually are¹¹⁵. In this way a call to reform without all the necessary components is not asking for consensus, but rather asking for acceptance by the few who have access to the intelligence, which

in the case of the Senate is a Select Committee of 15 individuals and in the House, 21 individuals. Finally, for the proper cession of power there must be consensus on the level of gains or losses, which can end up being a problem, especially for agencies or individuals not wishing to lose power. For example, when the office of the Director of National Intelligence was created, the policy makers

and the Department of Defense never could gain consensus as to the level of power the DNI would have, and the result of this was a DNI with very little power¹¹⁶. Ultimately, time, power struggles, and consensus will remain barriers to reform and until those barriers are overcome, the IC, the CI Community, and the policy community will continue to experience problems like those already seen. This continuing failure will waste time and effort—time that is already in short supply and could be used to stop insiders instead of allowing them to continue damaging the United States

And, even if they win the plan SHOULD be bipartisan, 2014 hearings prove the fiat of the plan guts the democrats’ opportunity to create a spectacle and take credit – ensures partisan fighting and backlash

Anderson and Kleinman 14

(Christine Anderson, Public Policy Fellow, POGO, and Avery Kleinman was the Beth Daley Impact Fellow for the Project On Government Oversight, “FDA Surveillance Threatened Whistleblowers,” pg online @ <http://www.pogo.org/blog/2014/02/fda-surveillance-threatened-whistleblowers.html> //um-ef)

The hearing revisited the media-dubbed case of the “FDA 9,” a group of Food and Drug Administration (FDA) physicians and scientists who wrote to Congress and the President in 2008 and 2009 warning that ineffective and unsafe devices were being approved by the FDA. The FDA whistleblowers described serious wrongdoing by mid-level and senior FDA officials who cut corners and overruled scientists. The FDA then began to spy on the whistleblowers—sweeping up whistleblowing disclosures to Congress, the Office of Special Counsel, and POGO. The hearing was timed with the release of a joint staff report by House Oversight and Government Reform Chairman Darrell Issa (R-Calif.) and Senate

Judiciary Ranking Member Chuck Grassley (R-Iowa), titled “Limitless Surveillance at the FDA: Protecting the Rights of Federal Whistleblowers.” The report concluded that the FDA lacked sufficient authorization to monitor the whistleblowers, unlawfully captured protected communications of the whistleblowers, failed to explain how ongoing monitoring was necessary to the investigation of a past leak, and did not adequately bolster

whistleblower protections in new policies. Ranking Member Elijah Cummings (D-Md.) introductory remarks voiced his discontent at being shut out of the drafting of the report. “We must protect our whistleblowers. I am committed to that, and we are all committed to that. **Unfortunately, the majority has taken a traditionally bipartisan issue, something that all committee members should be investigating together, and turned it into another partisan spectacle for which our committee has become well-known.**” Chairman Issa responded, “Whistleblowers made Senator Grassley and his staff aware of a problem, but independent investigation by the IG and by this committee—bipartisan investigation—have led us to the conclusions we will hear today.”

Their efforts to increase pharmacovigilance by using insiders furthers Foucault's notion of the laissez faire biopolitical security apparatus, ultimately giving the state more control in their totalitarian utopia

Langlitz 09 (Nicolas, an anthropologist and historian of science studying epistemic cultures of mind and life sciences. He is the author of *Neuropsychedelica: The Revival of Hallucinogen Research since the Decade of the Brain* (2012) and *Die Zeit der Psychoanalyse: Lacan und das Problem der Sitzungsdauer* (2005) Associate Professor in the Department of Anthropology at the New School for Social Research in New York “Pharmacovigilance and Post-Black Market Surveillance” *Social Studies of Science* 39/3 (June 2009) page 396-397 SSS and SAGE Publications sss.sagepub.com/content/39/3/395.full.pdf , cayla_)

I will briefly outline how pharmacovigilance has emerged in national and international regulatory systems to deal with unexpected side effects of officially licensed substances before shifting attention to how this problem is addressed in the ‘designer-drug underground’. Here, novel synthetic compounds and unknown psychoactive plant extracts are constantly being introduced to the grey and black markets without having undergone rigorous preclinical testing. The black market is subject to police interventions, but is excluded from the states’ regulatory structures promoting drug safety. However, the experimental drug scene developing and researching novel mind-altering agents has established its own way of dealing with unexpected side effects and untoward incidents. Like the American Food and Drug Administration (FDA), the European Medicines Evaluation Agency (EMA) and WHO, the independently managed, not-for-profit website Erowid () collects and processes data on adverse drug reactions of mostly unlicensed psychoactive compounds. This requires a corresponding ethos of vigilance among the self-experimenting drug users frequenting and contributing to this website. Though Erowid fulfils a broad range of different functions, I will focus on its collection and analysis of experience reports providing information on drug effects and risks to potential consumers. In so doing, I draw an analogy between postmarket surveillance of licensed drugs and what I will refer to as ‘post-black market surveillance’ of unauthorized and illicit pharmacological agents.² This analogy serves to render visible how the genealogically distinct top-down implementation of pharmacovigilance and the bottom-up emergence of post-black market surveillance driven by politically antagonistic forces generate functionally equivalent responses to the problem of drug safety in the shared matrix of ‘advanced liberalism’. Advanced liberalism is characterized by the dissemination of responsibility. The state has come to delegate the management of many risks to individuals and collectives. It has not withdrawn from politics, but it ‘governs at a distance’ by redirecting its citizens’ activities toward its own objectives (Rose, 1999: 49–50). One of the key elements of the political rationality of advanced liberalism is what Michel Foucault called security. In his 1977/78 lecture series *Security, Territory, and Population*, Foucault outlined the concept of security in opposition to discipline and law. The law constitutes a purely negative form of normativity, which prohibits certain acts on a certain territory, for example, the manufacture and sale of particular drugs in the US. Discipline ideally aims at a continuous panoptic observation of individuals responding even to minute deviations from a norm by disciplinary measures. Close monitoring of all people having to do with illicit substances can serve as an example. Drug scenes are infiltrated by undercover narcotics officers; dealers are prosecuted; potential consumers are tested for drug use; pharmaceutical companies and scientists are granted revocable licences for handling, producing, and/or marketing certain substances while being subject to regular supervision. Often, such disciplinary observation and legal sanctions work hand in hand. However, despite the establishment of a massive juridico-disciplinary apparatus, the ‘War on Drugs’ has failed to effectively repress drug trafficking and consumption of illegal substances in the US. In the licit sphere, state regulation of the drug market could not foreclose occasional drug disasters. Total control of society has remained a totalitarian utopia. As neither proscriptions nor continuous monitoring of individuals, companies and drugs could guarantee the desired outcomes, a third strategy was developed: security. The emergence of security as a form of government can be interpreted as a response to the limits of legal and disciplinary instruments. Here, the aim of total control is replaced by the modulation of a pre-existing milieu in order to regulate a population at large. While discipline is based on sustained interventions, security adopts – at least to a certain extent – a laissez faire attitude, only intervening as a last resort and after observation and evaluation of the specific tendencies of a given situation (Foucault, 2007: 1–86). As a key element of biopolitical government

(which aims at the promotion rather than the repression of life), Foucault's notion of security differs from the traditional sense of the term. It is not based on the restriction of civil liberties for the sake of protecting the population through preventive exclusion of malign agents. The **biopoliticized security apparatus** of the advanced liberal state **monitors the circulation of people, goods, information**, and so on, to regulate the chances and risks integral to these flows (Dillon & Lobo-Guerrero, 2008). The present paper analyses the functioning of this kind of **security in pharmaceutical economies dealing with substances that simultaneously foster and threaten the welfare of the population**. Aiming at modulation rather than tight control of drug markets, both **pharmacovigilance** and post-black market **surveillance conform to Foucault's notion of security**.

The control of medications gives the FDA biopolitical control over populations and epidemics—the AIDS movement proves

Langlitz 09 (Nicolas, an anthropologist and historian of science studying epistemic cultures of mind and life sciences. He is the author of *Neuropsychedelica: The Revival of Hallucinogen Research since the Decade of the Brain* (2012) and *Die Zeit der Psychoanalyse: Lacan und das Problem der Sitzungsdauer* (2005) Associate Professor in the Department of Anthropology at the New School for Social Research in New York “Pharmacovigilance and Post-Black Market Surveillance” *Social Studies of Science* 39/3 (June 2009) page 398-399 SSS and SAGE Publications sss.sagepub.com/content/39/3/395.full.pdf, cayla_)

Until the beginning of the 20th century, **states** showed little interest in what their citizens ingested. Since then, however, they **have begun to regulate the** hitherto uncontrolled **commerce in foods and drugs**. In the US, for example, **the Food and Drug Administration has come to serve as gatekeeper to the market** (Marks, 1997; Hiltz, 2003; Daemmrich, 2004). But – at least initially – the FDA lacked mechanisms for paying systematic attention to side effects of the drugs it had already approved. American doctors usually did not report back to the FDA. It dealt with the problem of side effects by demanding extensive and time-consuming premarket tests from pharmaceutical companies. In the case of the beta-blocker propranolol, for example, it took its manufacturer Ayerst almost 10 years to get approval (Daemmrich, 2004: 74). **The FDA gained its power and legitimacy through a number of drug scandals**, in which patients had been severely harmed by adverse drug reactions. As a result, **it came to see patients as vulnerable subjects in need of protection against industry**. This protection was **granted by setting up high hurdles to the market**. Of course, these measures were criticized from the beginning. The FDA was accused of hampering business interests, slowing down the development of new drugs, and keeping already developed drugs from patients for too long (Daemmrich, 2004: 29). In the 1980s, these attacks gained momentum. At the time, patient organizations based on diseases – especially the AIDS movement – became increasingly active in the US. Now **patients** whom the **FDA was meant to protect accused it of withholding life-saving medications from them**. Instead of being protected and patronized, **they wanted to be given the chance to try still experimental drugs in an otherwise hopeless situation**. Unwilling to bear with the delays caused by the FDA's due process, AIDS activists and allied scientists began to organize community-based therapeutic trials and underground tests of new unlicensed drugs in so-called guerrilla clinics (Epstein, 1996: 216–19; Marks, 1997: 229–48; Daemmrich, 2004: 96–103). However, when the FDA eventually gave in and accelerated the approval process this was not only due to the AIDS activists' media campaign (Abraham, 2007: 53). In fact, the vast majority of novel medicines that could now enter the marketplace faster did not serve to treat lifethreatening diseases, such as HIV infections.

Drug epidemics are examples of the state controlling the populations behaviors while excluding itself from the regulatory regime it sets up for others

Langlitz 09 (Nicolas, an anthropologist and historian of science studying epistemic cultures of mind and life sciences. He is the author of *Neuropsychedelica: The Revival of Hallucinogen Research since the Decade of the Brain* (2012) and *Die Zeit der Psychoanalyse: Lacan und das*

Problem der Sitzungsdauer (2005) Associate Professor in the Department of Anthropology at the New School for Social Research in New York “Pharmacovigilance and Post-Black Market Surveillance” Social Studies of Science 39/3 (June 2009) page 404-405 SSS and SAGE Publications sss.sagepub.com/content/39/3/395.full.pdf , cayla_)

The gradual criminalization of most drugs without acknowledged medical applications during the 20th century (alcohol, tobacco and coffee being the most prominent exceptions) recreated an uncontrolled drug market. While the FDA evolved as an efficient instrument to standardize manufacture and sale of food and drugs in the corporate world, by issuing licenses, seals of quality, and so on, the tightening of regulations also gave birth to a seemingly wild and unregulated zone of collective experimentation.¹² Since the 1980s, surveillance mechanisms such as the Drug Use Forecasting (DUF) system, the Arrestee Drug Abuse Monitoring (ADAM) programme, or the Researched Abuse, Diversion, and Addiction-related Surveillance (RADARS) system, which monitors prescription drug abuse, have kept watch on the epidemiology of widely abused substances. Their data files are kept in restricted archives, and their research findings are primarily meant to help policy-makers, regulatory agencies and pharmaceutical manufacturers to make decisions concerning problems of drug abuse (some of the results are also communicated to the scientific community through journal papers). These initiatives concentrate on epidemiological patterns of use of rather common and well-known illegal substances, such as cocaine, marijuana, methamphetamine and opiates. However, the sector of clandestine pharmaceuticals, like its law-abiding counterpart although at a much slower rate, continuously introduces new (or reintroduces old) drugs to the market. Even though human beings have tried out unknown drugs since prehistoric times, we have recently witnessed an accelerated rate at which novel substances enter the market. As Philip Jenkins points out, since the 1970s a new emerging ‘drug epidemic’ is diagnosed every 3 to 4 years by the Drug Enforcement Agency (DEA), while the media call for action (Jenkins, 1999: 2). By the mid 1980s, a number of synthetic drugs had already entered the marketplace in waves (methamphetamine, PCP, fentanyl, MDMA). At the more experimental fringes of the grey and black markets, the number of hallucinogens grew exponentially throughout the 20th century: Whereas in the 19th century the Western world knew only two psychedelic drugs, marijuana and peyote, by the 1950s it knew dozens, and today more than 200. Manufacturers circumvented prohibitive laws by modifying the molecular make-up of their drugs, producing substances with effects similar to those of their predecessors, but not covered by drug legislation: the law has always lagged behind. In 1986, the Reagan administration responded to the challenge of such designer drugs (a term coined around 1980 to designate new synthetic substances serving as ‘drugs of abuse’ [Jenkins, 1999: 7]) by establishing a more supple, but highly restrictive legal framework: the Controlled Substance Analogue Enforcement Act. Instead of explicitly listing all substances declared illegal, the so-called Analogs Act anticipated the development of new drugs replacing prohibited substances. Administrators pre-emptively illegalized all substances that were ‘substantially similar’ in structure or action to a controlled substance, presumably because they were unable to keep up with the flow of new inventions (Eisner, 1989: 128). Erowid can be interpreted as an assemblage exercising pharmacovigilance on the grey and black markets excluded from the regulatory regime established by the state. Analogous to WHO’s Uppsala Monitoring Centre or the FDA’s MedWatch, Erowid – among other things – collects and processes data on adverse drug reactions caused by newly introduced designer drugs or psychoactive plants. This kind of ‘consumer intelligence’ is based on experience reports sent in by the drug users themselves, instead of being mediated by physicians – a strategy also practiced by regulatory agencies since the mid 1980s (Daemmrich, 2004: 137).¹³ Erowid has extended ‘the scope of pharmacovigilance ... beyond the strict confines of detecting new signals of safety concerns’ on the legal drug market (as suggested by the World Health Organization [2002: 7]) by facilitating a regime of postmarket or post-black market surveillance within the virtual community of experimental drug users.

The FDA has empirically used the failures of its surveillance regime as a justification for further interventions and centralization of pharmacovigilance—bringing attention to FDA’s mistakes can never solve

Langlitz 09 (Nicolas, an anthropologist and historian of science studying epistemic cultures of mind and life sciences. He is the author of *Neuropsychedelia: The Revival of Hallucinogen Research since the Decade of the Brain* (2012) and *Die Zeit der Psychoanalyse: Lacan und das Problem der Sitzungsdauer* (2005) Associate Professor in the Department of Anthropology at the New School for Social Research in New York “Pharmacovigilance and Post-Black Market Surveillance” Social Studies of Science 39/3 (June 2009) page 411-412 SSS and SAGE Publications sss.sagepub.com/content/39/3/395.full.pdf , cayla_)

In the case of patients suffering from terminal diseases such as AIDS (at least in the early days of the epidemic) or amyotrophic lateral sclerosis, however, opting for ‘more security’ by requiring more preclinical research before marketing, means risking the lives and well-being of patients possibly profiting from newly developed medications. Here, the opposition between risk and security can only serve a polemical purpose.²⁰ In the 1980s, AIDS activists and the pharmaceutical industry pressed for an acceleration of the approval process. They asked the government to become more venturesome in light of unavoidable ignorance with respect to the future, risking unexpected side effects for the sake of the new drugs’ potential benefits. In the course of the subsequent deregulation in the 1990s, the FDA managed to halve its average review time. But the system of postmarket surveillance that

was supposed to make up for the resulting reduction of premarketing safety testing could not prevent a series of drug disasters, ranging from more than 50 deaths attributed to the anti-cholesterol medication Lipobay, to a significant increase of suicidal behaviour associated with selective serotonin reuptake inhibitor (SSRI) antidepressants, and to what at least one FDA official later suggested were thousands of heart attacks and strokes caused by the anti-inflammatory drug Vioxx (Graham, 2004; House of Commons Health Committee, 2005: 85–88). Even though the accumulation of serious incidents related to these substances was detected through pharmacovigilance, these events have been interpreted as failures of a postmarket surveillance regime, which is accused of having responded too late. Of course, although it serves as a means of coping with our structural ignorance of the future, **pharmacovigilance is bound to initiate interventions in a post hoc manner.** In the case of Vioxx, for example, which had received expedited review and approval, there had been early indications that patients taking the drug were suffering disproportionately from cardiovascular problems. Nevertheless, neither the manufacturer, Merck, nor the FDA took action to examine these problems systematically. Investigations even suggested that **Merck made an effort to actively conceal data** demonstrating the cardiovascular toxicity of its product. While the **FDA waited passively for data to accrue**, it took more than 5 years to instigate what would become the largest prescription drug withdrawal in history in 2004 (Fontanarosa et al., 2004; Angell, 2006; cf. Harris, 2004, 2006; Topol, 2004). Considering that the FDA would have had the authority to mandate a trial, this failure of pharmacovigilance cannot be justified by structural ignorance alone. At least in part, it must also be attributed to strategic ignorance in McGoey's (2007) sense.²¹ In the aftermath of the drug debacles of the early 2000s, the FDA and other regulatory agencies were accused of having failed to meet their responsibility to protect the population against drug dangers. American regulators responded to this criticism with two almost contradictory strategies, mirroring the incommensurable demands they faced. On the one hand, the **FDA tried to restore its authority by tightening its regulations.** Since then, the requirements for both pre- and postmarket testing have been raised significantly. The average time from application to approval was almost doubled after the withdrawal of Vioxx, and today the FDA tells pharmaceutical companies more often to conduct systematic studies of the safety of their medicines after they have already been licensed (Harris, 2005). Furthermore, it has been discussed whether drug makers will have to pay for independent continuing post-approval surveillance of their products (Harris, 2004). Here, **stricter regulations and an increase of centralized pharmacovigilance have been used in order to rebuild trust in drugs – and in the FDA.** On the other hand, to cover itself the **FDA has adopted a second strategy undermining this restoration of trust.** To avoid being blamed for unexpected adverse drug reactions, it has begun to issue warnings even if there is no clear evidence. Its new commissioner Lester Crawford said that the agency could no longer wait until possible risk is verified, but must communicate its uncertainty to the public. Often it does so by advising patients to speak to their doctors about questionable medications. But, as one medical practitioner said to the press, 'the physicians don't know what to tell the patients, either'. And a colleague of his added: **'They're just passing the blame onto the physician.** ... They're just trying to say that they warned us' (Harris, 2005).

The biomedical industrial complex works in tandem with the industries, military, and political system to normalize mental health practices at the expense of those considered “disabled” “abnormal” or “diseased”

Gomory et. al 10 (Tomi, Stephen E. Wong, Cohen Jeffrey R. Lacasse Associate professor at Florida State University, specializing in Homelessness, International Social Work, Mental Health, Mental Health & Substance Abuse, Philosophy of Science, Research Methods, Social Policy, Social Work Practice “Clinical Social Work and the Biomedical Industrial Complex” Journal of Sociology and Social Welfare, December 2010, page 2
diginole.lib.fsu.edu/cgi/viewcontent.cgi?article=1032&context=csw_faculty_publications ,
 cayla_)

When Relman (1980) introduced the phrase “**biomedical industrial complex**” to echo President Dwight Eisenhower’s famous 1960 warning about the influence of the military- industrial complex, he wished to emphasize the influence of large corporations on the medical system. Later writers, focusing on its psychiatric portion or counterpart and emphasizing its ideological elements such as medicalization, described a mental health-industrial complex (Duhl, Cummings, & Hynes, 1987), a psychiatric-industrial complex (Carpenter, 2001), or a psychopharmaceutical-industrial complex (Breggin, 1997; Murray, 2009). In accord with these authors, we **mean the reinforcing and interlocking connections between the pharmaceutical, biotechnological, and medical industries that—**together with academic experts in the helping professions, governmental funding and regulatory bureaucracies such as the National Institute of Mental Health (NIMH) and the Food and Drug Administration (FDA), and professional and family lobbies—**promote and support a biomedical model of psychosocial distress and disability.** Spending in the U.S. on mental health and substance abuse has been forecast to reach \$239 billion by 2014, of which \$72 billion is expected to be for psychotropic drugs (Levit et al., 2008). Critics of **the biomedical complex** observe that over the past fifty years it **has monopolized mental health practices to the detriment of** its ostensible **beneficiaries.** Its primary purpose seems to be “biomedical dominance” (Carpenter, 2001, p. 70), the successful inculcation of the view that a medicalized approach (conceptual, scientific, clinical, institutional) to psychosocial distress, disability, and disapproved behavior is valid and is the best

approach for everyone. Critics document that the approach obscures the differential benefits accruing especially to the leading players, theorized in most discussions to be large private corporations (especially but not exclusively pharmaceutical) and their allies in politics, the professions, and academia. These benefits translate into money, and therefore influence to recast all the issues involved, “to the extent of altering public perceptions as to what is occurring and why” (Turnock, 2009, p. 136). Some policy analysts have noted how **heads of corporations benefit lavishly but illicitly from the biomedical industrial complex** (e.g., Cassels, 2009), and at least one clinician (Murray, 2009), has argued that **the psychopharmaceutical-industrial complex leads many clients to adopt and internalize “disease-model messages . . . in ways similar to cult indoctrination”** (p. 283), that is, impervious to evidence and experience. These observations illustrate the complexity of the system, they are not meant to promote a conspiracy theory type of explanation. Our use of psychiatric- industrial complex and associated terms is meant to re-focus attention of social workers on the explicit and implicit functions and on the dynamic nature of a very large social system, and of their roles in it. It is **also meant to highlight interconnections between the constituent ideologies, professions, client populations, treatments, and institutions of the system, as well as connections between it and other large systems, such as criminal justice, welfare, education, and the military.**

FDA Advantage

FDA Fine Now

Claims that the FDA is in bed with big Pharma are alarmist and just flat wrong

LaMattina 13 (LaMattina, John- the president of Pfizer Research and Development and Forbes Contributor, covers news concerned with the Pharmaceutical Industry; 8/07/2013; Is The FDA Being Compromised By Pharma Payments?; <http://www.forbes.com/sites/johnlamattina/2013/08/07/is-the-fda-being-compromised-by-pharma-payments/>; Forbes.com; 08/07/15) JG

Is The FDA Being Compromised By Pharma Payments? ¶ Comment Now Follow Comments ¶ In touting an upcoming special issue of the Journal of Law, Medicine and Ethics (JLME), Donald W. Light of the School of Public Health, University of Medicine & Dentistry of NJ, wrote an article entitled “Risky Drugs: Why The FDA Cannot Be Trusted”. Last week I discussed one aspect of this article, Light’s challenge that 90% of FDA approved drugs of the last 30 years are no more effective than existing drugs. However, the bulk of his essay focuses not on his views about pharma’s competence but rather on his issues with the FDA. While I found a number of his comments troubling, the following stood out. ¶ “The forthcoming article in JLME also presents systematic, quantitative evidence that since the industry started making large contributions to the FDA for reviewing its drugs, as it makes large contributions to Congressmen who have promoted this substitution for publicly funded regulations, the FDA has sped up the review process with the result that drugs approved are significantly more likely to cause serious harm, hospitalizations, and deaths.” ¶ This is a pretty damning comment. Basically, Light is saying that pharma paid congressmen to sponsor legislation that results in the FDA being beholden to pharma for funding for its work. Implicit in this is that, as a result of these large “contributions”, the grateful FDA is rapidly approving medicines that are harmful. ¶ A bit of history would be helpful to show the actual reasons why the pharma industry makes “contributions” to the FDA. Few remember that back in the late 1980s there was a “drug lag” in the U.S. versus other parts of the world. Because of a lack of resources at the FDA, drugs were being approved at a much slower rate in the U.S. than in Europe. More than half of all drugs approved in the U.S. had been approved in Europe more than a year earlier. As a result, patients, physicians, advocacy groups, and pharmaceutical companies were all concerned that access to important new medicines was being denied to Americans. ¶ To solve this problem, Congress enacted the Prescription Drug User Fee Act (PDUFA) of 1992. PDUFA provided a mechanism whereby charges were levied on pharmaceutical companies for each new drug application (NDA) filed. The revenues from these “user fees” were used to hire 600 new drug reviewers and support staff. These new medical officers, chemists, pharmacologists, and other experts were tasked with clearing the backlog of NDAs awaiting approval. Consequently, the FDA was able to reduce review times of NDAs to 12 months for standard NDAs and to 6 months for priority applications that involved significant advances over existing treatment. As a result of PDUFA, the timing of U.S. drug approvals began to mirror that of the rest of the world. ¶ Congress clearly likes PDUFA as the act has been renewed five times since 1992. PDUFA-V was approved in 2012. Undoubtedly, this legislation helps to support the FDA and fuel needed growth. In 1995, The actual user fee charged to each company filing an NDA in 1995 was \$208,000. In 2014, the user fee will be

\$2,169,100. If you assume that as many as 50 NDAs are filed in a year, Congress is passing on \$100 million of FDA funding costs to the industry.¶ Despite Light's assertion, I can attest that pharma companies don't relish making these payments. The FDA is a government agency and should be funded entirely by the federal government. But pharma companies don't have a choice. If a company wants to bring a new medicine to patients, it has to pay the user fee just to get the drug reviewed. Furthermore, anyone who pays attention to FDA behaviors knows that the agency doesn't automatically approve NDAs. Just in the last few months, the FDA has rejected, in the form of complete response letters, an insomnia drug from Merck, a migraine drug from Allergan, and a kidney cancer drug from Aveo. In fact, any suggestion of the FDA being beholden to the pharmaceutical industry due to the PDUFA user fees is comical to those familiar with the drug review process.¶ So, why should anyone care about Light's views? Unfortunately, as an academic whose work is supported by the Safra Center for Ethics, his word carries a disproportionate amount of influence. These comments perpetrate the view that there is an unholy alliance between the FDA and the pharmaceutical industry, an alliance that threatens the health of patients. This might make for a Hollywood movie plot. Truth be told, such a conspiracy doesn't exist.

FDA Credible Now

The FDA is credible: controversy is just media and alarmist hyperbole

Butterworth 11 (Butterworth, Trevor- Director of Sense About Science, USA ; Why You Should Trust The FDA; Forbes Magazine; 9/19/2011; 08/07/15;
<http://www.forbes.com/sites/trevorbutterworth/2011/09/19/why-you-should-trust-the-fda-and-not-dr-oz/>) JG

If the reaction in the news media to Dr. Oz's absurd claims about the dangers of arsenic in apple juice has been enormously heartening (essentially the media's collective "Dr. Oz says this, but the FDA says that" narrative leaves the celebrity cardiothoracic surgeon looking like an unscrupulous and unethical quack), the disheartening part is that too many people will still choose to believe a television doctor who doesn't know his ass from his elbow in terms of chemistry, over the massed ranks of PhD's and toxicologists at the Food and Drug Administration.¶ This abysmal state of affairs was summed up by some fool on The View mouthing off about how we all should be grateful that Dr. Oz is looking out for our kids – as if the hundreds of millions of taxpayer dollars spent on a vast array of regulatory agencies simply didn't occur.¶ This "trust a TV-doc lunacy" is especially frustrating for me as I had the privilege to speak this summer at the FDA's 12th annual symposium on food safety and applied nutrition, which is jointly organized with Britain's Food and Environment Research Agency (Fera), and the Joint Institute for Food Safety and Applied Nutrition (JIFSAN) at the University of Maryland, College Park. The theme this year was "Dealing with Uncertainty in Risk-Based Decision Making and Response."¶ As I listened to presentation after presentation from scientists who spend their working days trying to protect the public from contamination in food, I was struck by the fact that the real story about what the FDA does is almost impossible to convey to the public. Certainly, in all the years I've been reporting on risk, I have never seen any story in the mainstream media that articulates the complexity of the science. And if you don't grasp that complexity, you just cannot understand how serious and scrupulous these scientists are when it comes to trying to protect the public.¶ This is why Dr. Oz, in refusing to acknowledge the simple, objective errors the FDA pointed out in the way his show measured arsenic, betrayed science. And when you betray science, it doesn't matter how much you protest that you are only looking to protect America's children. No one is protected by getting the science wrong.¶ But how do you communicate that betrayal to a public which simply doesn't understand chemistry (and probably shudders at the mere mention of the subject thanks to high school), doesn't think scientifically (i.e., mentally tests propositions for the ways in which they might be falsifiable), but reacts on a deep emotional level to the idea that the kids are in mortal danger?¶ What was notable – and praiseworthy – about the FDA's response was that it added a much more personalized message to its straightforward scientific criticism of Dr. Oz's claims. Donald Zink, Ph.D, senior science advisor at FDA's Center for Food Safety and Applied Nutrition (CFSAN), said what often goes unsaid in these media controversies. "As a parent and grandparent myself, I understand the concern over recent reports that arsenic has been found in apple juice," he said, before adding that years of testing at the FDA – and, more importantly, the way the FDA did its tests, left him without any cause for concern.¶ Now think about it: Dr. Zink is a microbiologist and biochemist specializing in food; how much microbiology and biochemistry do you really think Dr. Oz, a heart surgeon, knows?¶ More to the point, do you really think that the hundreds of parents at the FDA with

academic qualifications every bit as impressive as Dr. Oz's are somehow less reliable and less concerned about food safety than someone who has chosen to practice medicine on a daily television show? And finally, what is the likelihood that, in our age of massive food regulation, it just didn't cross anyone's mind to examine – and keep examining – apple juice?¶ The philosopher Arthur Schopenhauer warned that drama was as fundamental to journalism as it was to theater – and that journalists were like lap dogs, barking hysterically at everything that moved. It's time to see Dr. Oz as having crossed the canine rubicon – and having abandoned science for a barking role in the theater of the absurd.

FDA Cred Alt Causes

FDA cred shot

Dickson 13 – Virgil Dickson November 5, 2013 Regulatory and Policy Reporter at Modern Healthcare FDA credibility hurting due to budget issues, commissioner says - <http://www.modernhealthcare.com/article/20131105/NEWS/311059963>

Federal **budget cuts and budget uncertainty** are **hurting the credibility** of the Food and Drug Administration, agency Commissioner Dr. Margaret Hamburg said Tuesday. At a conference hosted by Bloomberg Government, Hamburg said the **stakeholders regulated by the FDA expect predictability and transparency** in how the agency conducts its oversight. And **that's been hard to deliver given the continuing federal budget wars**. One problem has been the **freeze on user fees paid by manufacturers** who want their products approved for safety and efficacy. **Because of** the budget **sequestration** cuts, **the FDA is set to lose \$85 million in user fees** in fiscal 2013, even though that money comes from regulated businesses, not from taxpayers. "You can't run agency as important as the FDA if you don't have predictability, if you don't know what budget you'll be given during the year, or if you don't know whether you can draw from certain resources or not," she said. **Increased responsibilities, such as regulating medical mobile apps**, also **have made the agency's work more challenging**. She said **the FDA has been "stretched thin for decades"**. Hamburg said as early next week **Congress will** vote a bill that would **increase her agency's authority to regulate compounding pharmacies**, following the more than 60 fungal infection-related deaths that occurred as the result of contaminated drugs made at the New England Compounding Center in Framingham, Mass. **"While more responsibility has been given to us, our budget has only expanded a little bit,"** she said.

Blood pressure safety data alt causes

Blankfield, 13 -- Robert, Case Western School of Medicine, European Journal of Preventive Cardiology, file:///C:/Users/Debate/Downloads/Credibility%20of%20the%20FDA.pdf

Why doesn't the FDA require the collection of cardiovascular safety data for medications that raise blood pressure? For new drug approvals, the FDA can require manufacturers to conduct safety trials after a drug is approved.⁵ Many of the drugs listed in Table 1 were approved so long ago that they are available generically. Even if the FDA desired the collection of safety data for these drugs, it is complicated to require manufacturers to obtain data for drugs that are available generically. The FDA lacks a legislative mandate to conduct research. Consequently, the **FDA lacks the financial resources to support prospective drug trials**. For the drugs listed in Table 1 for which safety data are inadequate, the **FDA might be able to support retrospective studies. There is precedent for this approach**. In collaboration with the Agency for Healthcare Research and Quality, the FDA supported two recently published retrospective studies regarding the cardiovascular safety of attention deficit disorder medications.^{6,7} The **credibility of the FDA has been damaged by multiple drug approvals** that occurred despite inadequate safety data. **Restoring the FDA's credibility depends, in part, upon the FDA requiring adequate morbid/mortal safety data** for new drug approvals when drugs raise BP, even though such requirements might increase the cost of drug development and/or slow down the development of new drugs. **Restoring the FDA's credibility also depends upon the FDA supporting the collection of morbid/mortal safety data for drugs that have already been approved but that raise BP**. Collecting safety data for drugs that have already been approved would be complicated.

Nonetheless, doing nothing – and thereby accepting the status quo – means tolerating drugs on the market that predictably increase the risk of serious adverse cardiovascular events. The longer the status quo persists, the more the credibility of the FDA diminishes.

alt causes to FDA legitimacy – data bending

McGarity and Vagner, 12 [JDs, UT law professors specializing in enviro law and tort]

(Thomas and Wendy, *Bending Science: How Special Interests Corrupt Public Health Research*, p. 22-34
https://books.google.com/books?hl=en&lr=&id=Ah6-__otORAC&oi=fnd&pg=PR7&dq=fda+AND+corrupt&ots=ToasirU8sq&sig=Xq04VSm0SyimbbjmKkvZpN9IPLU#v=onepage&q=fda%20corrupt&f=false)

Since data collection is merely the process of reporting observations to facilitate subsequent analysis, any shaping that occurs at that early stage typically equates to outright fraud. In the mid-1970s, the FDA appointed a special task force to investigate the integrity of the data the Searle Corporation had submitted to support new drug applications for two heavily used drugs. After studying the data extensively and performing site visits of the company’s laboratories, the task force concluded that the company had “made a number of deliberate decisions which seemingly were calculated to minimize the chances of discovering toxicity and/or to allay FDA concern.”⁵⁵ In another 1970s investigation, the FDA fortuitously learned from a former employee of the manufacturer of the drug MER-29 that upper-level company officials had ordered the employee to **change data** in animal studies that were submitted to the FDA in support of the new drug application.⁵⁶ Three of the company’s employees pleaded *nolo contendere* to charges that they had forged and manipulated the animal studies to minimize the apparent risks posed by MER-29.⁵⁷ As we learned in Chapter 3, the EPA during the same time period discovered that a testing contractor, Industrial Bio-Test Laboratories, had perpetrated systematic fraud in its routine pesticide testing operations.⁵⁸

alt causes to legitimacy – manufacturers skirt regs and the public loses interest

McGarity and Vagner, 08 [JDs, UT law professors specializing in enviro law and tort]

(Thomas and Wendy, *Bending Science: How Special Interests Corrupt Public Health Research*, p. 22-34
Harvard University Press https://books.google.com/books?hl=en&lr=&id=Ah6-__otORAC&oi=fnd&pg=PR7&dq=fda+AND+corrupt&ots=ToasirU8sq&sig=Xq04VSm0SyimbbjmKkvZpN9IPLU#v=onepage&q=fda%20corrupt&f=false)

-means even if whistleblower laws are lessened, public pressure lessens and huge drug companies dominate w/o enforced regs

Where Possible, Choose Ignorance One way for companies to avoid the dilemma of deciding whether to suppress damaging research findings is to avoid testing altogether.²³ As the handwritten notes on the agenda for a pharmaceutical company staff meeting revealingly noted: “If FDA asks for bad news, we have to give it, but if we don’t have it we can’t give it to them.”²⁴ The same is true for the information needed to resolve common law tort litigation. Huge gaps in scientific research relating to the impact of products and industrial activities on health and the environment serve as a testament to this tendency of many companies, consistent with rational

choice theory, to choose ignorance.²⁵ Even as late as 1984, an NAS panel found that **no toxicity testing** existed for more than 80 percent of all toxic substances used in commerce and by 1998, at least one-third of the toxic chemicals produced in the highest volumes still failed to satisfy **minimal testing standards** recommended by an international expert commission.²⁷ Anticipating the natural preference of some companies to resist safety research, Congress has enacted several product licensing statutes that require premarket health and safety testing as a condition to regulatory agency approval.²⁸ These statutes, however, apply only to pesticides, drugs, certain medical devices, and a small set of other suspect products.²⁹ For most other products and pollutants, affirmative testing requirements are effectively nonexistent.³⁰ Even when the authority does exist to require testing, the agencies generally need some limited evidence of harm before they can take meaningful postapproval regulatory action—a Catch-22 that reduces their ability to order more testing.³¹ The FDA, for example, has authority to require premarket testing of drugs and devices, but its postmarket testing authority has been quite limited until recently. A 2006 report of the NAS's Institute of Medicine noted that "once a drug is on the market, it can be difficult to compel sponsors or others to undertake appropriate comparative trials."³² Even when manufacturers have agreed to undertake postmarket clinical trials, they have not always completed them. The FDA reported in March 2006 that **65 percent** of the twelve hundred studies sponsors had agreed to undertake during several previous years had not even been initiated.³³ The result is that **dangerous drugs might have remained on the market while their manufacturers chose ignorance.** Examples include: Prozac—After a 1990 epidemiological study raised serious questions about Prozac's potential to cause some patients to commit suicide, an FDA advisory committee strongly recommended that the manufacturer conduct a large clinical study to probe the suicide question. The company hired a prominent scientist who met with the author of the earlier study, drew up protocols for the recommended study, and approached investigators about participating in the study. By then public pressure had subsided, and the company never conducted the more ambitious follow-up study. Without the study, the FDA was reluctant to take action to protect potential victims, and it did not require warnings on the high suicide risks that Prozac and similar drugs may have posed to children and adolescents until New York's attorney general brought a highly publicized lawsuit in 2004.³⁴

Plan doesn't go near far enough- alt causes to FDA inefficiency

Bloomberg 15- Bloomberg News is an international news agency headquartered in New York, United States and a division of Bloomberg L.P (The Editors- Bloomberg View; MAY 22, 2015; How to Fix the FDA: Carefully; 07/09/15;

<http://www.bloombergview.com/articles/2015-05-22/how-to-fix-the-fda-carefully>) JG

The process for approving new drugs in the U.S. takes a long time and costs a lot of money. But in trying to speed things up too much, Congress runs the risk of allowing drugs to reach the market that aren't necessarily safe. Some lawmakers -- led by Energy and Commerce Committee Chairman Fred Upton, a Republican from Michigan, and Diana DeGette, a Colorado Democrat -- assert that drugs are slow in coming because the Food and Drug Administration has been failing to innovate quickly enough. But last year the agency approved more new drugs than in any other year in almost two decades. In 2013, the median approval time for a new drug was about a year, an improvement over prior years and faster than that of the FDA's counterparts in Europe or Japan. Most new drugs in the U.S. now qualify for some form of expedited review. And two-thirds of drugs approved worldwide last year were first approved in the U.S. That doesn't mean the FDA can't be improved. The agency says it could do its job better if it had greater authority to hire staff directly. It also wants greater freedom from congressional rules that cap executive salaries at about a third of what drug companies pay. A bill that

may soon come up for a vote in the House would give the FDA both, as well as push to create still more avenues for expedited drug reviews.¶ But changing how the FDA operates can do nothing to shorten the long time -- almost 13 years -- that it takes a new drug to arrive at the FDA's doorstep. The discovery and development phase lasts an average of six and a half years, and clinical trials take six more.¶ Speeding up the first of these pre-FDA phases takes an investment in research. To encourage faster drug discovery, the House proposal would fund more research, granting the National Institutes of Health an extra \$10 billion over five years -- a timely injection of new money for an agency whose budget has been flat for a decade. But how can clinical trials be made to move faster without increasing the risk that unsafe drugs might be approved?¶ Congress wants to make it easier for drug companies to use changes in so-called biomarkers, such as cholesterol levels or plaque concentrations in the brain, as proxies for more traditional health outcomes that take longer to measure. It also wants the FDA to be more willing to accept clinical trials with fewer participants, and put more weight on evidence from outside the trials and testimony from patient groups.¶ Some of these ideas have promise. But the balance between political pressure and scientific caution is easily upset. Lawmakers need to give the FDA more flexibility without pushing it to weaken specific aspects of the approval process, especially clinical trials, in ways that the agency considers unsafe.¶ The legislation needs to be written to reflect this principle, and Congress will have to acknowledge that the gains from reform could well be modest and incremental. Modest change is the only safe kind.¶ To contact the senior editor responsible for Bloomberg View's editorials: David Shipley at davidshipley@bloomberg.net.

FDA Collapse Inev

backlash against the FDA is inevitable and the FDA fails anyway

Lamattina 14

(John, Forbes Contributor "Yale Study on FDA Approvals -- Informative or Irresponsible?" Forbes. 2/11/14.

www.forbes.com/sites/johnlamattina/2014/02/11/yale-study-on-fda-approvals-informative-or-irresponsible/)

The FDA is America's gatekeeper for access to new drugs. As such, it **gets a lot of scrutiny from the press, Congress, and generally anyone with a major stake in the decisions it makes. There are those who claim that the FDA is too lenient** in its decision making process **and that it unleashes unproven new drugs on an unsuspecting public** that presumes any medicine approved is safe and efficacious. **Others** will **assail the FDA as being far too conservative** and say that the agency is unnecessarily delaying access to new life-saving drugs because of its bureaucracy.¶ **Researchers at Yale** recently tried to bring more transparency to the FDA's decision making process by publishing a study entitled: "Clinical Trial Evidence Supporting FDA Approval of Novel Therapeutic Agents, 2005 – 2012". Here's the stated purpose of their study.¶ "Many patients and physicians assume that the safety and effectiveness of newly approved therapeutic agents is well understood; however, the strength of the clinical trial evidence supporting approval decisions by the US Food and Drug Administration (FDA) has not been evaluated."¶ Using the FDA's publicly available website, the Yale authors analyzed data for 188 novel therapeutic agents approved by the FDA over this period. Their results were highlighted in a Yale press release that trumpeted: "All FDA drug approvals not created equal". Lead author, Dr. Joseph Ross, summarized the results.¶ "We **found that** during the study period, **more than one-third of the drugs were approved on the basis of a single trial, without replication** and many other trials were small, short, and **focused on lab values, or some other surrogate metric of effect, rather than clinical endpoints like death.**..... **There was a lack of uniformity in the level of evidence the FDA used**..... Based on our study of the data, we cannot be certain that this expectation (FDA approval certifies safety

and efficacy) is necessarily justified, given the quantity and quality of variability we saw in the drug approval process.”¶ Needless to say, **these comments triggered numerous criticisms of the FDA** “All FDA drug approvals not created equal” was the lead for many stories covering this article. Others were more damning such as “Yale researchers chide the FDA for failing to enforce high R&D standards.” **Twitter also generated much comment and pharma critic Ben Goldacre’s remark was typical: “FDA approving new drugs on staggeringly weak evidence** as new JAMA paper shows.”

new congressional oversight report blasts the FDA

ANH 14

("Congress Chastises FDA: 'You're Not Listening!'" Alliance for Natural Health. 5/27/14.
www.anh-usa.org/congress-chastises-fda/)

“We found that FDA focused on perfecting their legal reasons for inaction,” a Senate committee wrote, “instead of protecting families.” Action Alert!¶ Last Friday, **the Senate Appropriations Committee criticized the FDA for ignoring doctors, patients, and** compounding **pharmacists** by issuing proposed new regulations on compounding pharmacies without sufficiently consulting these stakeholders. The language—which is worded stronger than any report language the ANH staff has previously seen—also directs the FDA to consult with interested parties before moving forward.¶ The Committee notes that the Food and Drug Administration has begun implementing the Compounding Quality Act by releasing guidances and working to appoint members to the Pharmacy Compounding Advisory Committee. **The Committee is concerned that the Food and Drug Administration is not meeting with any stakeholders before publicly releasing further guidance for public comment.** The Committee directs the Food and Drug Administration to meet with stakeholders to help inform the implementation of the Compounding Quality Act to ensure continued access to safe compounded drugs for which there is a clinical need.¶ The language scolding the FDA was inserted into a committee report at the request of Sen. Lamar Alexander (R-TN), who has committed himself to making sure stakeholders are heard: **“If FDA isn’t sitting down with doctors, patients, and pharmacists and communicating how it is implementing the law, then I will stay on FDA until it does.”**

Mercola Indict

Mercola’s a charlatan- his claims are unsubstantiated and hyperbolic

Barrett 14- retired psychiatrist, author, co-founder of the National Council Against Health Fraud, and the webmaster of Quackwatch (Barrett, Stephen; FDA Orders Dr. Joseph Mercola to Stop Illegal Claims; Quackwatch; <http://www.quackwatch.com/11Ind/mercola.html>; September 2, 2014.; 08/07/15) JG

Joseph Mercola, D.O., who practices in Schaumburg, Illinois, also operates one of the Internet's largest and most trafficked health information sites. In 2012, Mercola stated that his site had over 300,000 pages and is visited by "millions of people each day" and that his electronic newsletter has close 1,500,000 subscribers [1]. The site vigorously promotes and sells dietary supplements, many of which bear his name.¶ In 2004, Medical Economics reported that Mercola's practice employed 50 people and that he employed 15 people to run his newsletter, including three editors [2]. Much of his support has come from chiropractors who promote his newsletter from their Web sites. Two of his books hit the #2 sales rank on Amazon Books shortly after his newsletter plugged them for the first time.¶ For many years, Dr. Mercola and other staff members saw patients at his clinic, which was called the Optimal Wellness Center. However, in 2006, an article in Chicago Magazine reported that Mercola had stopped practicing medicine to focus on his Web site [3]. I did not see any mention of this on his Web site, and the site invited patients to come to his clinic—which was renamed Dr. Mercola's Natural Health Center—for detoxification, chiropractic, Dispensary, Emotional Freedom Technique (EFT), Functional Medicine Program, homeopathy, Neuro-Structural Integration Technique (NST), nutritional consultation, Nutritional Typing Test, thermography, Total Body Modification (TBM), and Active Isolated Stretching. In September 2014, the site announced that he had closed the clinic "in order to devote his full time and attention to research, education and increasing public awareness." [4]¶ Many of Mercola's articles make unsubstantiated claims and clash with those of leading medical and public health organizations. For example, he opposes immunization [5] fluoridation [6], mammography [7], and the routine administration of vitamin K shots to the newborn [8,9]; claims that amalgam fillings are toxic [10]; and makes many unsubstantiated recommendations for dietary supplements. Mercola's reach has been greatly boosted by repeated promotion on the "Dr. Oz Show."¶ Mercola's Profits¶ Mercola is very critical of drug company profits and proudly states:¶ Mercola.com does NOT accept any third-party advertising or sponsorship, and I am in no way tied into any pharmaceutical company or any other corporate "interest" whatsoever. So you get the real inside scoop on health issues, with practical advice that matters to you untainted by outside influence! [1]¶ He also states:¶ Mercola.com is not . . . a tool to get me a bigger house and car, or to run for Senate. I fund this site, and therefore, am not handcuffed to any advertisers, silent partners or corporate parents. . . . ¶ Profit generated from the sale of the products I recommend goes right back into maintaining and building a better site. A site that, startling as it may be with all the greed-motivated hype out there in health care land, is truly for you [11].¶ I don't doubt Mercola's sincerity—and I know nothing about how he allocates his income. But I recently made some interesting observations. The word "Mercola" on the labels of his "Dr. Mercola Premium Supplements" is service-marked. Records at the U.S. Patent and Trademark Office say that he began using the mark in commerce in 2000, applied to register it in 2009, and was granted registration in 2010. The registration address is for his home in South Barrington, Illinois, which the BlockShopper Chicago Web site states has 5,083 square feet and was purchased by Mercola in 2006 for \$2 million. The Bing Maps aerial view indicates that it is quite luxurious. ¶ In 2011, Mercola announced the formation of Health Liberty, a nonprofit coalition whose goals include promoting organic foods and targeting fluoridation, vaccination, genetically modified foods, and the use of amalgam fillings [12]. In a video accompanying the announcement, Mercola stated that he planned to donate \$1 million to catalyze the project. In addition to Mercola.com, The coalition members are:¶ National Vaccine Information Center (NVIC), which understates the benefits and exaggerates the risks of vaccination¶ Fluoride Action Network (FAN), the leading promoter of misinformation about fluoridation¶ Institute for Responsible Technology, which understates the benefits and exaggerates the risks of genetically modification of foods¶ Consumers for Dental Choice, which vigorously attacks amalgam use with misinformation, propaganda, lobbying, and lawsuits¶ Organic Consumers Association, which irresponsibly promotes unpasteurized milk and spreads false alarms about food irradiation, agricultural biotechnology, and vaccines.¶ The "health freedom" argument involves deception by misdirection. It focuses on individual freedom but does not consider how people who fail to protect their health put the rest of society at physical and/or financial risk. Failing to vaccinate, for example, decreases herd immunity so that contagious diseases spread more widely. In 2012, Mercola began calling his newsletter "Health Liberty Newsletter."¶ In 2013, Williamette Week reported that Mercola had donated a total of \$26,975 in cash and in-kind contributions that included polling and a YouTube video to support the efforts of the anti-fluoridation group that is opposing a fluoridation referendum in Portland, Oregon. The report also stated that "Mercola has questioned whether HIV causes AIDS, suggests that many cancers can be cured by baking soda, and warns parents not to vaccinate their children. He also says that animals are psychic." [13]¶ Better Business Bureau Report¶ Mercola markets his supplements through Mercola Health Resources, LLC. In 2011, after a customer complained that she thought a product she purchased was overpriced, I began checking whether the Better Business Bureau had received any complaints. I found that the company was rated C- on a scale of A+ through F. On February 1, 2012, the BBB reported that during the previous 36 months, there were 26 complaints—which is not an unusually high number for a high-volume business—but the report contained the following comments:¶ A recent review of consumer complaints filed with the BBB of Chicago & Northern Illinois against your Mercola Health Resources, LLC delineates a pattern of consumer allegations. Consumers are alleging that Mercola Health Resources does not honor the 100% money-back guarantee listed on your website. Customers have reported that refunds have not been provided for returns that were specifically covered under this guarantee. Consumers have also reported that they have experienced delivery issues. While www.mercola.com states that orders ship within 10 business days, consumers say they have waited much longer for their products. Customers allege that the company's service staff has been unable to provide explanations regarding this delay. Some consumers have also reported that Mercola provided them with shipment tracking numbers that were not valid with their respective carriers [14].¶ On November 26, 2013, I checked again and found that during the previous 36 months there had been 34 complaints, complaints but the Mercola Health Resources was rated A+.¶ FDA Warnings¶ In 2005, the FDA ordered Mercola and his Optimal Wellness Center to stop making illegal claims for products sold through his Web site [15]. The claims to which the FDA objected involved three products:¶ Living Fuel Rx, claimed to offer an "exceptional countermeasure" against cancer, cardiovascular disease, diabetes, autoimmune diseases, etc.¶ Tropical Traditions Virgin Coconut Oil, claimed to reduce the risk of heart disease and has beneficial effects against Crohn's disease, irritable bowel syndrome, and many infectious agents¶

Chlorella, claimed to fight cancer and normalize blood pressure.¶ In 2006, the FDA sent Mercola and his center a second warning that was based on product labels collected during an inspection at his facility and on claims made on the Optimum Wellness Center Web site [16]. This time the claims to which the FDA objected involve four products:¶ Vibrant Health Research Chlorella XP, claimed to "help to virtually eliminate your risk of developing cancer in the future."¶ Fresh Shores Extra Virgin Coconut Oil, claimed to reduce the risk of heart disease, cancer, and degenerative diseases.¶ Momentum Health Products Vitamin K2, possibly useful in treating certain kinds of cancer and Alzheimer's disease.¶ Momentum Health Products Cardio Essentials Nattokinase NSK-SD, claimed to be "a much safer and effective option than aspirin and other pharmaceutical agents to treating heart disease."¶ The warning letters explained that the use of such claims in the marketing of these products violates the Federal Food Drug and Cosmetic Act, which bans unapproved claims for products that are intended for curing, mitigating, treating, or preventing of diseases. (Intended use can be established through product labels, catalogs, brochures, tapes, Web sites, or other circumstances surrounding the distribution of the product.)¶ In 2011, the FDA ordered Mercola to stop making claims for thermography that go beyond what the equipment he uses (Medtherm2000 infrared camera) was cleared for. The warning letter said that statements on Mercola's site improperly imply that the Meditherm camera can be used alone to diagnose or screen for various diseases or conditions associated with the breast, they also represent that the sensitivity of the Meditherm Med2000 Telethermographic camera is greater than that of machines used in mammography. The statements to which the FDA objected included:¶ "Revolutionary and Safe Diagnostic Tool Detects Hidden Inflammation: Thermography"¶ "The Newest Safe Cancer Screening Tool"¶ "[b]ecause measuring inflammation through thermal imaging is a proactive, preventative method you can use for detecting disease, which significantly improves your chances for longevity and good health."¶ Additionally, thermograms provide: "Reliable and accurate information for diagnosis, treatment, and prognosisâ€"¶ "Yes, it's true. Thermograms provide you with early diagnosis and treatment assistance in such problems as cancer, inflammatory processes, neurological and vascular dysfunction, and musculoskeletal injury."¶ Thermography can benefit patients by detecting conditions including: Arthritis: "[d]ifferentiate between osteoarthritis and more severe forms like rheumatoid." Immune Dysfunction, Fibromyalgia and Chronic Fatigue, "Digestive Disorders: Irritable bowel syndrome, diverticulitis, and Crohn's diseaseâ€"¶ and "Other Conditions: including bursitis, herniated discs, ligament or muscle tear, lupus, nerve problems, whiplash, stroke screening, cancer and many, many others." [17]¶ In 2011, the Chicago Tribune reported that Mercola had not complied with the FDA's order and intended to "fight the FDA . . . if they decide to take it further." [18] In 2012, the Illinois Department of Financial and Professional Regulation asked Mercola to attend an informal conference to discuss a complaint that he was "making deceptive claims promoting thermography as a standalone diagnostic tool for detecting cancer and other diseases and is attacking the use of mammograms." Mercola's Web site still promotes thermography and trashes mammography, but the site stopped offering thermography appointments later that year—and Mercola's special report, "The Safe Breast Cancer Screening Test Your Doctor Isn't Telling You About," is no longer apparent.

No Pharma Link

Claims that the FDA is in bed with big Pharma are alarmist and just flat wrong

LaMattina 13 (LaMattina, John- the president of Pfizer Research and Development and Forbes Contributor, covers news concerned with the Pharmaceutical Industry; 8/07/2013; Is The FDA Being Compromised By Pharma Payments?;

<http://www.forbes.com/sites/johnlamattina/2013/08/07/is-the-fda-being-compromised-by-pharma-payments/>; Forbes.com; 08/07/15) JG

Is The FDA Being Compromised By Pharma Payments?¶ Comment Now Follow Comments ¶ In touting an upcoming special issue of the Journal of Law, Medicine and Ethics (JLME), Donald W. Light of the School of Public Health, University of Medicine & Dentistry of NJ, wrote an article entitled "Risky Drugs: Why The FDA Cannot Be Trusted". Last week I discussed one aspect of this article, Light's challenge that 90% of FDA approved drugs of the last 30 years are no more effective than existing drugs. However, the bulk of his essay focuses not on his views about pharma's competence but rather on his issues with the FDA. While I found a number of his comments troubling, the following stood out.¶ "The forthcoming article in JLME also presents systematic, quantitative evidence that since the industry started making large contributions to the FDA for reviewing its drugs, as it makes large contributions to Congressmen who have promoted this substitution for publicly funded regulations, the FDA has sped up the review process with the result that drugs approved are significantly more likely to cause serious harm, hospitalizations, and deaths."¶ This is a pretty damning comment. Basically, Light is saying that pharma paid congressmen to sponsor legislation that results in the FDA being beholden to pharma for funding for its work. Implicit in this is that, as a result of these large "contributions", the grateful FDA is rapidly approving medicines that are harmful.¶ A bit of history would be helpful to show the actual reasons why the pharma industry makes "contributions" to the FDA. Few remember that back in the late 1980s there was a "drug lag" in the U.S. versus other parts of the world. Because of a lack of

resources at the FDA, drugs were being approved at a much slower rate in the U.S. than in Europe. More than half of all drugs approved in the U.S. had been approved in Europe more than a year earlier. As a result, patients, physicians, advocacy groups, and pharmaceutical companies were all concerned that access to important new medicines was being denied to Americans.¶ To solve this problem, Congress enacted the Prescription Drug User Fee Act (PDUFA) of 1992. PDUFA provided a mechanism whereby charges were levied on pharmaceutical companies for each new drug application (NDA) filed. The revenues from these “user fees” were used to hire 600 new drug reviewers and support staff. These new medical officers, chemists, pharmacologists, and other experts were tasked with clearing the backlog of NDAs awaiting approval. Consequently, the FDA was able to reduce review times of NDAs to 12 months for standard NDAs and to 6 months for priority applications that involved significant advances over existing treatment. As a result of PDUFA, the timing of U.S. drug approvals began to mirror that of the rest of the world.¶ Congress clearly likes PDUFA as the act has been renewed five times since 1992. PDUFA-V was approved in 2012. Undoubtedly, this legislation helps to support the FDA and fuel needed growth. In 1995, The actual user fee charged to each company filing an NDA in 1995 was \$208,000. In 2014, the user fee will be \$2,169,100. If you assume that as many as 50 NDAs are filed in a year, Congress is passing on \$100 million of FDA funding costs to the industry.¶ Despite Light’s assertion, I can attest that pharma companies don’t relish making these payments. The FDA is a government agency and should be funded entirely by the federal government. But pharma companies don’t have a choice. If a company wants to bring a new medicine to patients, it has to pay the user fee just to get the drug reviewed. Furthermore, anyone who pays attention to FDA behaviors knows that the agency doesn’t automatically approve NDAs. Just in the last few months, the FDA has rejected, in the form of complete response letters, an insomnia drug from Merck, a migraine drug from Allergan, and a kidney cancer drug from Aveo. In fact, any suggestion of the FDA being beholden to the pharmaceutical industry due to the PDUFA user fees is comical to those familiar with the drug review process.¶ So, why should anyone care about Light’s views? Unfortunately, as an academic whose work is supported by the Safra Center for Ethics, his word carries a disproportionate amount of influence. These comments perpetrate the view that there is an unholy alliance between the FDA and the pharmaceutical industry, an alliance that threatens the health of patients. This might make for a Hollywood movie plot. Truth be told, such a conspiracy doesn’t exist.

Status Quo Solves FDA

FDA’s interim policy addresses all OIG recommendations (neg card)

OIG 14 (Department of Health and Human Services Office of Inspector General, Daniel R. Levinson, Inspector General for the Department of Health and Human Services Since 2008; Department of Health and Human Services Office of Inspector General Report, “Review of the Food and Drug Administration’s Computer Monitoring of Certain Employees in Its Center for Devices and Radiological Health”; This review was conducted by a 12-member team composed of individuals from OIG’s Immediate Office, Office of Audit Services, Office of Counsel to the Inspector General, Office of Evaluation and Inspections, Office of Investigations, and Office of Management and Policy (further methodology is given on page 23 of the pdf of the report); February 2014, OIG-12-14-01; <http://oig.hhs.gov/reports-and-publications/portfolio/20140226-FDA-Final.pdf>)/HB

FDA issued its interim computer-monitoring policy on September 26, 2013. In particular, the FDA's interim policy:

- establishes procedures requiring authorization by senior management and consultation with legal counsel;
- distinguishes between monitoring conducted at the behest of law enforcement and monitoring conducted for management purposes to minimize interference with law enforcement investigations;
- requires monitoring to be narrowly tailored in time, scope, and degree to accomplish the monitoring's objectives; and
- requires that the authorization describe the reason, factual basis, and scope of the monitoring.

Given this, FDA's interim policy addresses our five recommendations outlined above.²¹ HHS should determine whether all other individual OpDiv polices meet our recommendations above. HHS also should regularly review and, as necessary, update its Department-wide monitoring policies to ensure they are compatible with new and emerging technologies and methodologies. Information technology is continually changing, and a static monitoring policy could fail to address key implementation issues as capabilities evolve.

Econ Impact D

Empirics disprove the impact

Cooley 9

(Thomas-- Ph.D. in Economics, Professor of Economics and Dean of New York University's Stern School of Business, Financial booms and busts 'are inevitable'; Academic expects the next economic crisis to follow the same path as the one the world is experiencing now and it will involve a similar breakdown in confidence", South China Morning Post, November 25th 2009, December 1st 2009, Lexis Nexis,)

Another financial crisis is inevitable because booms and busts are simply part of the business cycle, a leading academic told a seminar organised by Hong Kong University of Science and Technology. Dr

Thomas F. Cooley, professor of economics and dean of New York University's Stern School of Business, recently spoke at a Global Finance Seminar Series event entitled "The Next Financial Crisis" at the Hong Kong Monetary Authority (HKMA) offices. Edmond Lau, executive director of the HKMA's monetary management department and a board member of the Treasury Markets Association, delivered opening remarks, while Reginald Chua, editor-in-chief of the South China Morning Post, later moderated a panel discussion between Cooley and K.K. Tse, executive vice-president of State Street Bank and Trust Company.

Cooley would not say when he thought **the next financial crisis would occur** but said it **definitely would come because booms and busts were part of the business cycle.** He said **the next crisis would have the same characteristics** and follow the same path as the present one - **flowing from a loss of confidence. "History is replete with examples of financial crises and bank panics,"** he said. **"Just in the United States alone, in the 20th century we had the panic of 1907, the stock market crash of 1929 and banking panics of the 1930s. Then we had a long period of relative success and calm, and then we had episodes such as the savings and loan crisis, and the failures of Continental Illinois Bank and Long Term Capital Management. "That's just in the US. In the past two decades we've had financial crises in Asia, Mexico,**

Chile, Sweden, Norway, Finland and Russia, so financial crises occur with some frequency, but what they don't do is occur with predictability." he said.

No escalation

Jervis 11

(Robert Jervis 11, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December 2011, "Force in Our Times," Survival, Vol. 25, No. 4, p. 403-425)

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic downturn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

Pharma not k Econ

Pharma not key to growth –it's a profit motivated deception

Light and Lexchin 12

(Donald W Light professor, Joel R Lexchin professor 1Department of Psychiatry, University of Medicine and Dentistry of New Jersey, 2250 Chapel Avenue, Cherry Hill, NJ 08002, USA; 2York University, School of Health Policy and Management, Toronto, Ontario, Canada, 8/11, http://www.pharmamyths.net/files/BMJ-Innova_ARTICLE_8-11-12.pdf)

Pharmaceutical research and development: what do we get for all that money? Data indicate that the widely touted "innovation crisis" in pharmaceuticals is a myth. The real innovation crisis, say Donald Light and Joel Lexchin, stems from current incentives that reward companies for developing large numbers of new drugs with few clinical advantages over existing ones. Since the early 2000s, industry leaders, observers, and policy makers have been declaring

that there is an innovation crisis in pharmaceutical research. A 2002 front page investigation by the Wall Street Journal reported, "In laboratories around the world, scientists on the hunt for new drugs are coming up dry . . . The \$400 billion a year drug industry is suddenly in serious trouble."¹ Four years later, a US Government Accounting Office assessment of new drug development reported that "over the past several years it has become widely recognized throughout the industry that the productivity of its research and development expenditures has been declining."² In 2010, Morgan Stanley reported that top executives felt they could not "beat the innovation crisis" and proposed that the best way to deal with "a decade of dismal R&D returns" was for the major companies to stop trying to discover new drugs and buy into discoveries by others.³ Such reports continue and raise the spectre that the pipeline for new drugs will soon run dry and we will be left to the mercies of whatever ills befall us.⁴ The "innovation crisis" myth
The constant production of reports and articles about the so called innovation crisis rests on the decline in new molecular entities (defined as "an active ingredient that has never been marketed . . . in any form"⁵) since a spike in 1996 that resulted from the clearance of a backlog of applications after large user fees from companies were introduced (fig 1↓). This decline ended in 2006, when approvals of new molecular entities returned to their long term mean of between 15 and 25 a year (fig 2↓).⁶ Even in 2005, an analysis of the data by a team at Pfizer concluded that the innovation crisis was a myth "which bears no relationship to the true innovation rates of the pharmaceutical industry."⁷ So why did the claims and stories not abate? A subsequent analysis also concluded that the innovation crisis was a myth and added several insights.⁸ Based on US Food and Drug Administration records, Munos found that drug companies "have delivered innovation at a constant rate for almost 60 years." The new biologicals have been following the same pattern "in which approvals fluctuate around a constant, low level."⁸ These data do not support frequently heard complaints about how hard it is to get any new drug approved. They also mean that neither policies considered to be obstacles to innovation (like the requirement for more extensive clinical testing) nor those regarded as promoting innovation (like faster reviews) have made much difference. Even the biotechnology revolution did not change the rate of approval of new molecular entities, though it changed strategies for drug development.⁹ Meanwhile, telling "innovation crisis" stories to politicians and the press serves as a ploy, a strategy to attract a range of government protections from free market, generic competition.¹⁰

Disease Impact D

No extinction

York 14

(Ian, head of the Influenza Molecular Virology and Vaccines team in the Immunology and Pathogenesis Branch of the Influenza Division at the CDC, PhD in Molecular Virology and Immunology from McMaster University, M.Sc. in Veterinary Microbiology and Immunology from the University of Guelph, former Assistant Prof of Microbiology & Molecular Genetics at Michigan State, "Why Don't Diseases Completely Wipe Out Species?" 6/4/2014, <http://www.quora.com/Why-dont-diseases-completely-wipe-out-species>)

But mostly diseases don't drive species extinct. There are several reasons for that. For one, the most dangerous diseases are those that spread from one individual to another. If the disease is highly lethal then the population drops, and it becomes less likely that individuals will contact each other during the infectious phase. Highly contagious diseases tend to burn themselves out that way.[¶] Probably the main reason is variation. Within the host and the pathogen population there will be a wide range of variants. Some hosts may be naturally resistant. Some pathogens will be less virulent. And either alone or in combination, you end up with infected individuals who survive.[¶] We see this in HIV, for example. There is a small fraction of humans who are naturally resistant or altogether immune to HIV, either because of their CCR5 allele or their MHC Class I type. And there are a handful of people who were infected with defective versions of HIV that didn't progress to disease.[¶] We can see indications of this sort of thing happening in the past, because our genomes contain many instances of pathogen resistance genes that have spread through the whole population. Those all started off as rare mutations that conferred a strong selection advantage to the carriers, meaning that the specific infectious diseases were serious threats to the species.

Whistleblowers Advantage

Solvency Answers

Alt Causes

Whistleblowers fail because of the lack of transparency in the SEC, not the lack of incentives

Cohan 14 (William D., American business writer. He has written books about the Wall Street industry and is a contributor to Vanity Fair, The Financial Times, Bloomberg BusinessWeek, The Atlantic, ArtNews, The Irish Times, The Washington Post, The New York Times, and Fortune Magazine, and author of ‘The Price of Silence: The Duke Lacrosse Scandal, the Power of the Elite, and the Corruption of Our Great Universities’ “William D Cohan on Wall Street whistleblowers” May 30, 2014 www.ft.com/cms/s/2/ce216134-e6c7-11e3-9a20-00144feabdc0.html , *cayla_*)

As a further harbinger of danger, Edwards points to the secret \$14m award the SEC made recently to an anonymous whistleblower at an unnamed financial institution. The SEC didn’t even reveal the nature of the wrongdoing the whistleblower uncovered, so both the company’s shareholders and the public remain in the dark about what was specifically uncovered and where. All that is known is that the SEC did bring a major enforcement action against a financial institution that resulted in a large penalty and the corresponding \$14m award to the whistleblower. “If you allow this – that the award can be made without naming the company or the type of fraud – it’s really nothing more than hush money,” she says. “How is it different? The SEC of course defends itself by saying, ‘We’re not revealing the name of the company or the nature of the fraud because we’re protecting the identity of the whistleblower.’ But the SEC is a disclosure agency, so they should have to establish that [not revealing the information] is really required in order to protect the whistleblower, if they’re going to in a sense subvert their mission . . . They really are not able to justify why they are silent about the name of the company or the nature of the fraud.” She believes the SEC’s failure to release publicly the details of the \$14m reward sends precisely the wrong message. “The one effect obviously it has is that it protects the reputation of the fraudulent corporation.” she adds. “[Reputational damage] is probably the main deterrent in cases like this, since there have been really no prosecutions of senior managers for fraud over a period of time on Wall Street. If even the name of the company is withheld by the SEC when it makes a bounty award, there’s no reputational risk, either. What’s the downside of trying to get away with it?” Dennis Kelleher, a former attorney at Skadden, Arps and now the CEO of Better Markets, Inc, a Washington-based non-profit organisation that is a leading advocate for tough banking regulations, says that the architects of the Dodd-Frank law – of whom he was one – were trying to balance the need for disclosure about financial wrongdoing with provisions to protect the whistleblower from public humiliation and retaliation. “The most important thing is to incentivise whistleblowers to come forward, and all the incentives previously were dramatically stacked against whistleblowers, and it’s still an incredibly high-risk action,” he says. Although critics remain, he thinks the new whistleblower provisions in Dodd-Frank strike the right balance. “I would be significantly more likely to encourage a whistleblower post-Dodd-Frank than pre-Dodd-Frank,” he says. Jordan Thomas, a former senior enforcement official at the SEC and now a partner at the law firm Labaton Sucharow, where he leads the firm’s whistleblower practice and represents Eric Ben-Artzi, agrees with Kelleher. He believes the fact that Dodd-Frank allows anonymity for whistleblowers facilitates the reporting of wrongdoing while offering them protection from retaliation, which is the point after all. “Essentially most whistleblower horror stories start with retaliation,” he says. “And to be retaliated against, you have to be known. The genius of Dodd-Frank was it created a way for people with knowledge to report without disclosing their identity to their employers or the general public. That has been a game changer because now people with knowledge are coming forward with a lot to lose, but they have a mechanism where they can report this misconduct without fear of retaliation or blacklisting.” He says the fact that the SEC could award \$14m to a single whistleblower whose identity has remained unknown, despite efforts by the media to uncover it, sends a powerful message that whistleblower identities will be protected. Maybe so. But then there is the message being sent by prosecutors who allow the big Wall Street banks to pay large fines to make their troubles disappear. Bea Edwards, for one, thinks that the government’s apparent policy of permitting Wall Street banks to purge their liability using their shareholders’ money will not deter bad behaviour. The fines – she specifically cites JPMorgan Chase’s \$13bn settlement last year with the government over its role in manufacturing and selling faulty mortgage-backed securities in the years leading up to the 2008 financial crisis – are merely seen as a cost of doing business, and are a major source of revenue for the US Treasury and a way for the SEC and the Justice Department, among others, to argue for a larger budget allocation from Congress. “It’s win-win for everybody [involved],” she fears. “The calculation for the bank is going to be, ‘OK, how much money can we make by doing this [bad behaviour] before we get caught?’ Are we going to be able to cover the fine, at the very least, and then make a fairly substantial profit and just pay the fine?” And that would explain why there aren’t any prosecutions, because if the DOJ starts prosecuting, then the gravy train kind of shuts down . . . Calculate how much money you can make doing ‘x’ or selling ‘y’ before getting caught at it, and what you think essentially you could settle for, and if what you can make is substantially more than what you can settle for, then you go forward. If getting caught means [there is] a whistleblower, then you just grind up that employee in the cost of doing business. If the employee whistleblower is lucky, he or she comes out of it with a successful anti-retaliation claim, three or four years after the blood was shed. Or the whistleblower, if successful, gets an amount of money that may make it possible to go on living – but it is certainly not an amount of money that caused real pain to a major financial institution on Wall Street.”

Alt cause to chilling of whistleblowers- no real legal protection

DW 15

(DW, US whistleblower laws offer no protection, <http://www.dw.com/en/us-whistleblower-laws-offer-no-protection/a-17391500>) JB

For years, would-be whistleblowers in the US intelligence community had no legal protections to shield them from retaliatory measures by their superiors. The Whistleblower Protection Act of 1989 covered most of the federal government with the glaring exception of the intelligence agencies. In an effort to close this legal gap, Congress passed the Intelligence Community Whistleblower Protection Act (ICWPA) a decade later. The law covers employees and contractors at the Central Intelligence Agency (CIA), the National Security Agency (NSA), the Defense Intelligence Agency (DIA), the National Imagery and Mapping Agency (NIMA) as well as the National Reconnaissance Office (NRO). But according to Thomas Drake, the act failed to adequately protect whistleblowers from retaliation. A former senior executive at the NSA, Drake blew the whistle on a failed surveillance program called Trailblazer. He used what the government calls "proper channels" to express his concerns about the program's exorbitant cost and its lack of privacy protections, reaching out to his immediate supervisor, the office of the inspector general, and the congressional intelligence committees. "I was reprimed against severely within the proper channels," Drake told DW. "I was identified as a troublemaker." Drake called the NSA's response to his whistleblowing activities "death by a thousand cuts administratively and bureaucratically," saying that the agency found ways to change his job and cut his responsibilities. Ultimately, the NSA re-organized the section he worked in, leaving him with nothing but a "paper title." Drake resigned from the agency in 2008.

Alt causes to FDA whistleblower intimidation- plan can't solve

Mercola 15- world-renowned physician and multiple New York Times bestselling author (Mercola, Dr. Joseph; 07/08/15; Shocking Story Reveals How the FDA Is Recklessly Abandoning Drug Safety - See more at: <http://healthimpactnews.com/2012/shocking-story-reveals-how-the-fda-is-recklessly-abandoning-drug-safety/#sthash.rJnRhWxM.dpuf>; Health Impact News; <http://healthimpactnews.com/2012/shocking-story-reveals-how-the-fda-is-recklessly-abandoning-drug-safety/>) JG

¶ Kavanagh was not surprised to learn about the agency's retaliation against the five whistleblowers, giving several examples of how they were personally intimidated, to the point of fearing for their lives, and the safety of their children!¶ "After FDA management learned I had gone to Congress about certain issues, I found my office had been entered and my computer physically tampered with," Kavanagh tells Rosenberg.¶ "... After I gave Representative Waxman's (D-CA) office a USB drive with evidence, FDA staff was admonished that it was prohibited to download information to USB drives. Then, after I openly reported irregularities in an antipsychotic drug review and FDA financial collusion with outsiders to Senator Grassley's office and the House Committee on Oversight and Government Reform, I was threatened with prison if I should release trade secret information to Congress... [T]he Food Drug and Cosmetics Act explicitly allows communication of trade secrets by FDA employees to Congress, but since most people are unaware of this, FDA management can use the threat of jail for violation of the Trade Secrets Act, not only to discourage reviewers, but in my case they got Senator Grassley's staff to destroy the evidence I provided them.¶ The threats, however, can be much worse than prison. One manager threatened my children – who had just turned 4 and 7 years old – and in one large staff meeting, I was referred to as a 'saboteur.' Based on other things that happened and were said, I was afraid that I could be killed for talking to Congress and criminal investigators."¶ We Now Know What Domestic Surveillance of Whistleblowers Looks Like ¶ The following video features attorney, Stephen Kohn, executive director of the National Whistleblowers Center and attorney for the FDA whistleblowers in the recently revealed FDA spy operation against them.¶ "For the first time, we now have a glimpse into what domestic surveillance of whistleblowers looks like in this country with the modern technological developments," Kohn says. "The agency [sought] to destroy the reputation of these whistleblowers forever."¶ - See more at: <http://healthimpactnews.com/2012/shocking-story-reveals-how-the-fda-is-recklessly-abandoning-drug-safety/#sthash.rJnRhWxM.dpuf>

SQ Solves

Status quo solves- Whistleblower Protection Enhancement Act of 2012 proves.

Canterbury 12, Director of Public Policy, is an experienced advocate, policy analyst, and public campaign strategist (Canterbury, Angela; Advocates Laud President Obama's Signing of Federal Whistleblower Reforms; 12/03/12; POGO; 06/12/15; www.pogo.org/about/press-room/releases/2012/20121203-advocates-laud-president-whistleblower-reforms.html?referrer=https://www.google.com/) JG

President Obama signed the Whistleblower Protection Enhancement Act (WPEA, S. 743) into law today, marking the finale of a more than decade-long campaign by the Make It Safe Coalition to restore and modernize federal whistleblower protections. The President's unwavering support of the WPEA, paired with Congress' sweeping endorsement by unanimous consent, demonstrates the strong mandate for a new day of accountability in the federal government. These reforms expand protections for federal employees who disclose wrongdoing and protect the public trust. ¶ Whistleblower advocates from organizations with diverse interests and ideologies who together waged a historic campaign for this landmark government accountability reform are enthusiastic about this victory for whistleblowers and taxpayers. ¶ Beth Moten, Legislative Director for American Federation of Government Employees, commented: "AFGE applauds the bipartisan, collaborative work of members of Congress, a diverse coalition of worker advocates and good government groups, and the Obama Administration resulting in the bill signed into law today. The Whistleblower Protection Enhancement Act provides many of the changes in law necessary to protect federal workers when they come forward to report fraud, waste, and wrongdoing in the workplace and to hold managers accountable when they retaliate. AFGE is especially pleased that the law applies to Transportation Security Officers, the federal workers dedicated to the safety of the flying public, and provides them with the same whistleblower protections as other federal workers." ¶ Tom Devine, Legal Director of Government Accountability Project, commented: "This reform took 13 years to pass, because it can make so much difference against fraud, waste and abuse. Over the years, earlier versions of this law had been called the Taxpayer Protection Act. Nothing could set a better context for fiscal cliff negotiations than a unanimous, bipartisan consensus to protect those who risk their careers to protect the taxpayers. The mandate for this law is that the truth is the public's business. The victory reflects strong bipartisan teamwork, as well as advocacy within the party, as Republicans often had to work harder at convincing wary colleagues. And it reflects relentless pressure from conservative stakeholders to whistleblowers and their champions throughout the last 13 years. Unique support came from President Obama, who was committed from day one of his term to signing this bill into law. Most Presidents have offered lip service for whistleblower rights, but President Obama fought to give them more teeth." ¶ Michael D. Ostrolenk, National Director of Liberty Coalition, commented: "With a lack of cooperation as a starting point in our present day political system, it's good to see a positive bi-partisan effort come to fruition. One cheer for President Obama, the Republican held House, and Democrat controlled Senate, and two cheers for the American people." ¶ Pete Sepp, Executive Vice President of National Taxpayers Union, commented: "Today an important chapter in the struggle to recognize whistleblowers for the tremendous service they provide taxpayers has been concluded. This bipartisan effort is proof positive that fiscal responsibility can be restored to Washington, one step at a time. We look forward to helping write the next chapter in the vital national conversation over how best to make government more efficient and accountable." ¶ Colleen M. Kelley, National President of National Treasury Employees Union, commented: "This bi-partisan effort represents a big step forward in restoring and modernizing whistleblower rights for federal workers. For example, it creates specific legal protection for scientific freedom, providing whistleblower protection rights to employees who challenge censorship, and makes it an abuse of authority to punish disclosures about scientific censorship. By protecting those who speak out, this law increases accountability and transparency in government." ¶ Angela Canterbury, Director of Public Policy for the Project On Government Oversight (POGO), commented: "Today marks a tremendous victory for a historic campaign for more government accountability. The reforms signed into law today will go a long way to change the fact that for far too long the truth about government wrongdoing could easily be suppressed through intimidation and retaliation against the truth-tellers. Federal workers will now have a fighting chance at justice when they face retaliation for blowing the whistle on waste, fraud, abuse, and other illegalities. Americans should be encouraged by this law's passage—it demonstrates extraordinary support for a better government that transcends the partisanship that so often characterizes Washington today. Today, the public's trust, health, and safety were put before politics." ¶ Keith Wrightson, Worker Safety and Health Advocate for Public Citizen's Congress Watch, commented: "President Obama and the 112th Congress have made a significant contribution to how civil employees will be treated when they identify workplace hazards. Civil employees can now live without fear of retaliation from their supervisors when disclosures are made." ¶ David Williams, President of Taxpayers Protection Alliance, commented: "This is a historic day for whistleblowers and taxpayers as the President signs the Whistleblower Protection Enhancement Act. Bi-partisan common sense prevailed and the country is one step closer to being a government of the people, by the people, for the people." ¶ Celia Wexler, Senior Washington Representative, Center for Science and Democracy, Union of Concerned Scientists, commented: "At a time when science seems to be routinely under attack in Congress, this legislative success is a breath of fresh air and a reminder that bipartisan cooperation is still possible. Passage of this bill will help American families, who depend on federal

agencies to protect them from unsafe drugs, defective consumer products, hazardous workplaces, and polluted air and water. But it also strongly supports the role of independent science as the foundation for federal policymaking. It sends a strong signal that federal scientists deserve respect.¶ The WPEA includes critically important upgrades to the broken system for federal whistleblowing to better serve taxpayers. Though it does not include every reform that we have sought and will continue to seek, the bill will restore and modernize government whistleblower rights by ensuring that legitimate disclosures of wrongdoing will be protected, increasing government accountability to taxpayers, and saving billions of taxpayer dollars by helping expose fraud, waste and abuse. Overall, the WPEA's provisions will restore free speech rights closed through arbitrary loopholes and create new protections for federal scientists and Transportation Security Administration officers. The bill also will strengthen due process rights, such as a two-year experiment in normal access to appeals courts (effectively breaking the Federal Circuit's monopoly on appellate review); provide compensatory damages; create whistleblower ombudsmen at Inspectors General offices; and strengthen authority by the U.S. Office of Special Counsel to help whistleblowers through disciplinary actions against those who retaliate and to file briefs in court supportive of whistleblower rights.¶ This hard fought victory could not have been achieved without the steadfast support of whistleblowers, advocates and nongovernmental organizations alike, who demonstrated a marathon commitment to the restoration of federal whistleblower protections throughout this more than a decade-long campaign. Congressional champions and their staff deserve praise and appreciation, especially retiring Sen. Daniel Akaka (D-Hawaii) and Rep. Todd Platts (R-Pa.), as well as Sens. Susan Collins (R-Maine), Charles Grassley (R-Iowa), Joseph Lieberman (I-Ct.), Claire McCaskill (D-Mo.), Patrick Leahy (D-Vt.) and Carl Levin (D-Mi.), and Reps. Darrell Issa (R-Calif.), Todd Platts (R-Pa.), Chris Van Hollen (D-Md.) and Elijah Cummings (D-Md.). A full list of Congressional sponsors can be viewed here: <http://bit.ly/TqyJCe>. We cannot thank the whistleblower community and these Congressional offices enough for their resolute commitment to the WPEA.

Uniqueness

WB Protections Up

their author concludes neg – internal whistleblower protections have increased hugely under Obama

Rubinfeld, 2013, [Reporter at WSJ.com's Corruption Currents covering news and trends concerning bribery, money laundering, sanctions breaches, whistleblowers and other issues of international corruption]

(Samuel, Jan 7, "Obama Expands Whistleblower Protections Amid Aggressive Enforcement" blogs.wsj.com/corruption-currents/2013/01/07/obama-expands-whistleblower-protections-amid-aggressive-enforcement/)

Is President Obama really waging, as critics contend, a war on whistleblowers? Jacquelyn Martin/Associated Press Former CIA officer John Kiriakou, left, is the first former CIA officer to be convicted of disclosing classified information to a reporter. The Obama administration has tried to prosecute more people under the Espionage Act than all previous presidencies combined, leading critics to proclaim that Obama is waging a “war on whistleblowers.” The World War One-era law was originally intended to prevent spies from getting a hold of national security information that could be used by the country’s enemies. The Obama administration prosecutions under the law, however, have concerned leaks to the media. The New York Times ran a profile over the weekend of the first former Central Intelligence Agency officer to be convicted of disclosing classified information to a reporter. At the same time, the rights and protections of some informants have expanded significantly during Obama’s first term in office, and the rights cover an increasing number of eligible people. “He’s done more to affirmatively protect whistleblowers than any other president,” said Angela **Canterbury**, director of public policy at the Project on Government Oversight, in an interview. She said that Obama wants to encourage internal reporting of wrongdoing. Obama believes that “if there are more protections for internal whistleblowers, there will be fewer leaks of national security information.” Canterbury said. “We share that belief, but that does not de-legitimize the need for external whistleblowers. Sometimes

information needs to be disclosed outside the government for there to be accountability,” she said. In the last few years, people blowing the whistle on securities violations won new rights, including access to a bounty, under the Dodd-Frank Act, federal contractors won new protections under the Whistleblower Protection Enhancement Act and intelligence and national security employees received protections under a presidential policy directive. “The directive on intelligence people is far and away more than anyone else has ever done,” Canterbury said. “That’s a remarkable action.” And buried in a defense bill were even more protections. A provision of the National Defense Authorization Act of 2013, signed into law late Wednesday, expanded protections for employees of the Defense Department and National Aeronautics and Space Administration. It also established a four-year “pilot program” to strengthen whistleblower protections for all other federal executive agency contractors and subcontractors.

Impact D

Food Safety Defense

FSMA solves for food security- whistleblowers aren't key

Taylor 15- contributing writer

(Michael, The Future is Now for the Food Safety Modernization Act, Food Safety News, <http://www.foodsafetynews.com/2015/03/the-future-is-now-for-the-food-safety-modernization-act/#.VaQmdJ3F98F>) JB

We all knew FSMA was a big deal when Congress passed it a little over four years ago. After a decade of illness outbreaks, import safety problems, and market disruptions that shook consumer confidence and imposed billions of dollars in costs on the food system, Congress mandated a paradigm shift to prevention — to establishing a modern system of food safety protection based not on reacting to problems but on preventing them from happening in the first place. That’s how we’ll achieve the food safety goals we all share — fewer illnesses, stronger consumer confidence in the system of protection, and a level playing field for American farmers and food companies. In addition to embracing these goals, Congress adopted a strong vision of how to achieve them. With broad input and support from industry and consumers alike, Congress said that a food safety system fit for the 21st century must be built on what the food industry itself has learned about how to make food safe and how to manage global supply chains, and it must harness the efforts of all food system participants — public and private, domestic and foreign — in a collaborative effort to see that those practical, effective, preventive measures are consistently followed. As big as that sounds — and it’s by far the biggest overhaul of the food safety system since the first national law was passed over a century ago — I don’t think any of us fully envisioned how much would have to be done and how much would have to change to make FSMA a success. The law itself spelled out the large number of regulations FDA must issue to establish the prevention framework. Indeed, FSMA made FDA responsible for some 50 specific deliverables in the form of rules, guidance for industry, new programs, and reports to Congress. FDA has been hard at work on these, with the major rules set to be final this year under court-ordered deadlines. You can see an inventory of what we’ve done since enactment of FSMA here on our FSMA web page. But we’ve learned that FSMA is about far more than new rules. It’s about how FDA changes fundamentally its approach to implementing food safety rules, including how FDA works with other governments and the food industry to achieve food safety success. That’s why FDA has devoted such huge effort over the past two years to rethinking every aspect of what will go into achieving high rates of compliance with the FSMA rules — for both home-grown and imported food — compliance that is

essential to food safety and to achieving the level playing field on food safety that American consumers and industry both demand.

Food Safety Impact D

Alt causes make food insecurity inevitable—water shortages, land degradation, deterioration of farming systems, climate change and competition between industrial and urban land users

The United Nations 11

(U.N, "Land degradation and water shortages threaten global food production
<http://www.un.org/apps/news/story.asp?NewsID=40533#.U1FCUmoo5Fc>) JB

28 November 2011 – Global food production is being undermined by land degradation and shortages of farmland and water resources, making feeding the world's rising population – projected to reach nine billion by 2050 – a daunting challenge, the United Nations Food and Agriculture Organization (FAO) said in a report unveiled today.¶ The past five decades have witnessed a significant rise in food production, but in many places the better yields have been associated with agricultural practices that have degraded the land and water systems, according to FAO's State of the World's Land and Water Resources for Food and Agriculture (SOLAW) report.¶ Farming systems "face the risk of progressive breakdown of their productive capacity under a combination of excessive demographic pressure and unsustainable agriculture use and practices," says the report.¶ Competition for land and water is increasing – including competition between urban and industrial users – as well as within the agricultural sector between livestock, staple crops, non-food crop, and biofuel production.¶ Climate change is expected to alter the patterns of temperature, precipitation and river flows upon which the world's food production systems depend, according to the report, which also notes that the problem could be more acute in developing countries, where quality land, soil nutrients and water are least abundant.¶ "The SOLAW report highlights that the collective impact of these pressures and resulting agricultural transformations have put some production systems at risk of breakdown of their environmental integrity and productive capacity." said Jacques Diouf, the FAO Director-General.¶ "These systems at risk may simply not be able to contribute as expected in meeting human demands by 2050. The consequences in terms of hunger and poverty are unacceptable. Remedial action needs to be taken now," he added.¶ Between 1961 and 2009, the world's cropland grew by 12 per cent, but agricultural production expanded 150 percent, thanks to a significant increase in yields of major crops, the report says.¶ One of the warning signs pointed out in the study is that rates of growth in agricultural production have been slowing in many areas and are currently only half of what they were at the height of the 'Green Revolution' – the period between the 1940s and the late 1970s when the world's agricultural productivity rose dramatically.¶ Overall, the report paints a picture of a world experiencing an increasing imbalance between availability and demand for land and water resources at the local and national levels.¶ The report for the first time provides a global assessment of the state of the planet's land resources.¶ A quarter of the land is highly degraded, while another eight per cent has moderate degradation, 36 per cent is classed as stable or slightly degraded and 10 per cent ranked as "improving."¶ The rest of Earth's land surface is either bare (around 18 per cent) or covered by inland water bodies (around two per cent).¶ Large parts of all the continents are experiencing land degradation, with particularly high incidence noted along the west coast of the Americas, across the Mediterranean region of Southern Europe and North Africa, the Sahel and the Horn of Africa, and throughout Asia.¶ The greatest threat is the loss of soil quality, followed by biodiversity loss and water resources depletion, the report notes.

Meltdown Impact D

Meltdowns don't cause lasting damage

Bosselman 07- Professor of Law Emeritus, Chicago-Kent College of Law

(Fred, "The New Power Generation: Environmental Law and Electricity Innovation: Colloquium Article: The Ecological Advantages of Nuclear Power," 15 N.Y.U. Env'tl. L.J. 1, 2007) JB

In 1986, an explosion at the Chernobyl nuclear power plant in the Ukraine caused the release of large amounts of radiation into the atmosphere.²⁴⁷ Initially, the Soviet government released little information about the explosion and tried to play down its seriousness, but this secrecy caused great nervousness throughout Europe, and fed the public's fears of nuclear power all over the [*46] world.²⁴⁸ Now a comprehensive analysis of the event and its aftermath has been made: In 2005, a consortium of United Nations agencies called the Chernobyl Forum released its analysis of the long-term effects of the Chernobyl explosion.²⁴⁹ The U.N. agencies' study found that the explosion caused fewer deaths than had been expected.²⁵⁰ Although the Chernobyl reactor was poorly designed and badly operated²⁵¹ and lacked the basic safety protections found outside the Soviet Union,²⁵² fewer than seventy deaths so far have been attributed to the explosion, mostly plant employees and firefighters who suffered acute radiation sickness.²⁵³ The Chernobyl reactor, like many Soviet reactors, was in the open rather than in an American type of pressurizable containment structure, which would have prevented the release of radiation to the environment if a similar accident had occurred.²⁵⁴ [*47] Perhaps the most surprising finding of the U.N. agencies' study was that "the ecosystems around the Chernobyl site are now flourishing. The [Chernobyl exclusion zone] has become a wildlife sanctuary, and it looks like the nature park it has become."²⁵⁵ Jeffrey McNeely, the chief scientist of the World Conservation Union, has made similar observations: Chernobyl has now become the world's first radioactive nature reserve... .²⁰⁰ wolves are now living in the nature reserve, which has also begun to support populations of reindeer, lynx and European bison, species that previously were not found in the region. While the impact on humans was strongly negative, the wildlife is adapting and even thriving on the site of one of the 20th century's worst environmental disasters.²⁵⁶ Mary Mycio, the Kiev correspondent for the Los Angeles Times, has written a fascinating book based on her many visits to the exclusion zone and interviews with people in the area.²⁵⁷ She notes that the fear that radiation would produce permanent deformities in animal species has not been borne out after twenty years; the population and diversity of animals in even some of the most heavily radiated parts of the exclusion zone is similar to comparable places that are less radioactive.²⁵⁸

Radiation impacts are exaggerated – Chernobyl disproves

Cravens, 07 – A published novelist

(Gwyneth, *The Power to Save the World*, pg. 99-100) JB

UNSCEAR also found that "the accident had a large negative psy-chological impact on thousands of people." Fear, born of ignorance of real risk coupled with anxiety about imagined harm, fostered epidemics of psychosomatic illnesses and elective abortions- perhaps as many as 200,000- because of dread of genetic mutants. Long-standing anxiety about government directives was exacerbated by the actions of Soviet officials during the first two years after the incident. Better management of the emergency, including adequate dissemination of facts, probably could have prevented much of this psychic damage, which also plagues war veterans and people displaced by natural disasters like major hurri-canes and floods. "Most of the world community agreed that the conclusions were what had been expected." Mettler said. "The Russians were in agreement. But at first, Ukraine and Belarus went nuts and claimed that all sorts of other things were happening. When we presented the findings in Vienna in 1992, the Ukrainians said that rates of TB, measles, and other diseases had gone up. I asked them and there for their data, and added, 'And, oh, by the way, include your data from the years preceding Chernobyl.' I got some data and had it translated and showed it to the audience. Certain diseases were down, others were up. So that data didn't support the Ukrainians' blanket statements. There was a great deal of discussion of thyroid cancer and leukemia. The claim that cancer rates in general went up didn't cut it for us, for a number of reasons. As I said, those separate groups, one in Hiroshima and one London, independently analyzed the data and made the conclusions. The conclusions have been borne out and continue to be borne out. There's been no change.

Nuclear Impact D

The NRC is keeping up to date with appropriate safety measures- no risk of failure

Kilisek and Anderson 15- Kilisek is a Global Energy & Natural Resources Analyst and Anderson is a writer

(Roman, Jared, US Nuclear Power Safety: Is the Glass Half Empty or Half Full?, <http://breakingenergy.com/2015/04/27/us-nuclear-power-safety-is-the-glass-half-empty-or-half-full/>) JB

For its part, the NRC says they have taken appropriate measures – without consideration of costs – to ensure US nuclear power plants operate safely while incorporating safety enhancement recommendations based on lessons learned from Fukushima. “The NRC concluded, based on the July 2011 report from a task force of senior managers, that U.S. nuclear power plants can continue to operate safely while the agency appropriately implements recommended enhancements. The NRC’s process set aside cost considerations in announcing firm new requirements for those enhancements within a year of the Fukushima accident,” NRC Public Affairs Officer Scott Burnell told Breaking Energy in an email. “The NRC process has appropriately incorporated new information since then [2011 Fukushima accident]. U.S. plants have already made great strides in enhancing their ability to maintain safety functions in the unlikely event they lose all a/c power,” Burnell added.

US nuclear reactors are very safe

NEI 15

(Nuclear Energy Institute, Safety: The Nuclear Energy Industry's Highest Priority, <http://www.nei.org/Master-Document-Folder/Backgrounders/Fact-Sheets/Safety-The-Nuclear-Energy-Industry-s-Highest-Prior>) JB

America’s 99 nuclear energy facilities are among the safest and most secure industrial facilities. Multiple automatic safety systems, the industry’s commitment to comprehensive safety procedures and stringent federal regulation keep nuclear energy facilities and neighboring communities safe. The U.S. Nuclear Regulatory Commission, an independent federal agency, strictly regulates commercial nuclear energy facilities. The agency evaluates performance in three strategic areas: reactor safety, radiation safety and security. NRC inspectors stationed at each facility provide oversight of operation, maintenance, equipment replacement and training. If the NRC believes a facility is unsafe, it will order it shut down. The industry and the NRC routinely analyze operational events worldwide to identify possible lessons for U.S. facilities. After the 2011 accident at the Fukushima Daiichi nuclear energy facility in Japan, the NRC issued new requirements and requested detailed information in several areas relevant to the accident in Japan. The industry is taking steps to implement the new requirements and to develop the information requested by the agency. The industry also has developed a diverse, flexible mitigation approach to address the major problem encountered at Fukushima: the loss of power to maintain effective cooling. Building on existing safety systems, the “FLEX” program involves stationing another layer of backup equipment at facility sites and regional depots. About 1,500 pieces of equipment have been purchased or ordered. All commercial nuclear energy facilities have emergency response procedures in the event of an accident or security event. These

procedures are evaluated regularly during drills involving facility personnel and local policy, fire and emergency management organizations. NRC and Federal Emergency Management Agency expert teams evaluate some of these drills. The nuclear energy industry is relentless in its pursuit of safety through quality facility construction, continuous preventive maintenance and ongoing reactor operator training. This approach doesn't just meet the standards created by the federal government—it exceeds them.

Environment Impact D

Environment resilient

Kareiva et al 12 – Chief Scientist and Vice President, The Nature Conservancy (Peter, Michelle Marvier -- professor and department chair of Environment Studies and Sciences at Santa Clara University, Robert Lalasz -- director of science communications for The Nature Conservancy, Winter, “Conservation in the Anthropocene,” <http://thebreakthrough.org/index.php/journal/past-issues/issue-2/conservation-in-the-anthropocene/>)

2. As conservation became a global enterprise in the 1970s and 1980s, the movement's justification for saving nature shifted from spiritual and aesthetic values to focus on biodiversity. Nature was described as primeval, fragile, and at risk of collapse from too much human use and abuse. And indeed, there are consequences when humans convert landscapes for mining, logging, intensive agriculture, and urban development and when key species or ecosystems are lost. But **ecologists** and conservationists **have grossly overstated the fragility of nature**, frequently arguing that once an ecosystem is altered, it is gone forever. Some ecologists suggest that if a single species is lost, a whole ecosystem will be in danger of collapse, and that if too much biodiversity is lost, spaceship Earth will start to come apart. Everything, from the expansion of agriculture to rainforest destruction to changing waterways, has been painted as a threat to the delicate inner-workings of our planetary ecosystem. The fragility trope dates back, at least, to Rachel Carson, who wrote plaintively in *Silent Spring* of the delicate web of life and warned that perturbing the intricate balance of nature could have disastrous consequences.²² Al Gore made a similar argument in his 1992 book, *Earth in the Balance*.²³ And the 2005 Millennium Ecosystem Assessment warned darkly that, while the expansion of agriculture and other forms of development have been overwhelmingly positive for the world's poor, ecosystem degradation was simultaneously putting systems in jeopardy of collapse.²⁴ The trouble for conservation is that **the data simply do not support the idea of a fragile nature at risk of collapse.** Ecologists now know that **the disappearance of one species does not necessarily lead to the extinction of any others, much less all others in the same ecosystem.** In many circumstances, **the demise of formerly abundant species can be inconsequential** to ecosystem function. **The American chestnut, once a dominant tree in eastern North America, has been extinguished by a foreign disease, yet the forest ecosystem is surprisingly unaffected. The passenger pigeon, once so abundant that its flocks darkened the sky, went extinct, along with countless other species from the Steller's sea cow to the dodo, with no catastrophic or even measurable effects.** These **stories of resilience are not isolated** examples -- **a thorough review of the scientific literature identified 240 studies of ecosystems following major disturbances** such as deforestation, mining, oil spills, and other types of pollution. **The abundance of plant and animal species as well as other measures of ecosystem function recovered,** at least partially, **in 173 (72 percent) of these studies.**²⁵ While global

forest cover is continuing to decline, it is rising in the Northern Hemisphere, where "nature" is returning to former agricultural lands.²⁶ Something similar is likely to occur in the Southern Hemisphere, after poor countries achieve a similar level of economic development. A 2010 report concluded that rainforests that have grown back over abandoned agricultural land had 40 to 70 percent of the species of the original forests.²⁷ Even Indonesian orangutans, which were widely thought to be able to survive only in pristine forests, have been found in surprising numbers in oil palm plantations and degraded lands.²⁸ **Nature is so resilient that it can recover rapidly from even the most powerful human disturbances. Around the Chernobyl nuclear facility,** which melted down in 1986, **wildlife is thriving,** despite the high levels of radiation.²⁹ In the Bikini Atoll, the site of multiple nuclear bomb tests, including the 1954 hydrogen bomb test that boiled the water in the area, the number of coral species has actually increased relative to before the explosions.³⁰ More recently, **the massive 2010 oil spill** in the Gulf of Mexico **was degraded and consumed by bacteria** at a remarkably fast rate.³¹ Today, coyotes roam downtown Chicago, and peregrine falcons astonish San Franciscans as they sweep down skyscraper canyons to pick off pigeons for their next meal. **As we destroy habitats, we create new ones:** in the southwestern United States a rare and federally listed salamander species seems specialized to live in cattle tanks -- to date, it has been found in no other habitat.³² Books have been written about the collapse of cod in the Georges Bank, yet recent trawl data show the biomass of cod has recovered to precollapse levels.³³ It's doubtful that books will be written about this cod recovery since it does not play well to an audience somehow addicted to stories of collapse and environmental apocalypse. Even that classic symbol of fragility -- the polar bear, seemingly stranded on a melting ice block -- may have a good chance of surviving global warming if the changing environment continues to increase the populations and northern ranges of harbor seals and harp seals. Polar bears evolved from brown bears 200,000 years ago during a cooling period in Earth's history, developing a highly specialized carnivorous diet focused on seals. Thus, the fate of polar bears depends on two opposing trends -- the decline of sea ice and the potential increase of energy-rich prey. The history of life on Earth is of species evolving to take advantage of new environments only to be at risk when the environment changes again. The wilderness ideal presupposes that there are parts of the world untouched by humankind, but today it is impossible to find a place on Earth that is unmarked by human activity. The truth is humans have been impacting their natural environment for centuries. The wilderness so beloved by conservationists -- places "untrammled by man"³⁴ -- never existed, at least not in the last thousand years, and arguably even longer.

Warming Impact D

Tipping points theory is wrong--zero data can reliably identify specific tipping points

Andrew C. **Revkin 9**, senior fellow at Pace University's Pace Academy for Applied Environmental Studies, has taught at Columbia's Graduate School of Journalism and the Bard College Center for Environmental Policy, March 29, 2009, "Among Climate Scientists, a Dispute Over 'Tipping Points'," The New York Times, online:
http://www.nytimes.com/2009/03/29/weekinreview/29revkin.html?_r=1&pagewanted=print

But **the idea that the planet is nearing tipping points** — thresholds at which change suddenly becomes unstoppable — **has driven a wedge between scientists who otherwise share deep concerns about** the implications of a human-warmed **climate**. Environmentalists and some climate experts are increasingly warning of **impending tipping points** in their efforts to stir public concern. The term confers a sense of immediacy and menace to potential threats from a warming climate — dangers that otherwise might seem too distant for people to worry about. **But** other

scientists say there is little hard evidence to back up specific predictions of catastrophe. They worry that the use of the term “tipping point” can be misleading and could backfire, fueling criticism of alarmism and threatening public support for reducing greenhouse gas emissions. “I think a lot of this threshold and tipping point talk is dangerous,” said Kenneth Caldeira, an earth scientist at Stanford University and the Carnegie Institution and an advocate of swift action to reduce carbon dioxide emissions. “If we say we passed thresholds and tipping points today, this will be an excuse for inaction tomorrow,” he said. While studies of climate patterns in the distant past clearly show the potential for drastic shifts, these scientists say, there is enormous uncertainty in making specific predictions about the future. In some cases, there are big questions about whether climate-driven disasters — like the loss of the Amazon or a rise in sea levels of several yards in a century — are even plausible. And even in cases where most scientists agree that rising temperatures could lead to unstoppable change, no one knows where the thresholds lie that would set off such shifts.

Mitigation and adaptation solves.

Mendelsohn 09 (Robert O., the Edwin Weyerhaeuser Davis Professor, Yale School of Forestry and Environmental Studies, Yale University, June 2009, “Climate Change and Economic Growth,” online: <http://www.growthcommission.org/storage/cgdev/documents/gcwp060web.pdf>)

The heart of the debate about climate change comes from a number of warnings from scientists and others that give the impression that human-induced climate change is an immediate threat to society (IPCC 2007a,b; Stern 2006). Millions of people might be vulnerable to health effects (IPCC 2007b), crop production might fall in the low latitudes (IPCC 2007b), water supplies might dwindle (IPCC 2007b), precipitation might fall in arid regions (IPCC 2007b), extreme events will grow exponentially (Stern 2006), and between 20–30 percent of species will risk extinction (IPCC 2007b). Even worse, there may be catastrophic events such as the melting of Greenland or Antarctic ice sheets causing severe sea level rise, which would inundate hundreds of millions of people (Dasgupta et al. 2009). Proponents argue there is no time to waste. Unless greenhouse gases are cut dramatically today, economic growth and well-being may be at risk (Stern 2006). These statements are largely alarmist and misleading. Although climate change is a serious problem that deserves attention, society’s immediate behavior has an extremely low probability of leading to catastrophic consequences. The science and economics of climate change is quite clear that emissions over the next few decades will lead to only mild consequences. The severe impacts predicted by alarmists require a century (or two in the case of Stern 2006) of no mitigation. Many of the predicted impacts assume there will be no or little adaptation. The net economic impacts from climate change over the next 50 years will be small regardless. Most of the more severe impacts will take more than a century or even a millennium to unfold and many of these “potential” impacts will never occur because people will adapt. It is not at all apparent that immediate and dramatic policies need to be developed to thwart long-range climate risks. What is needed are long-run balanced responses.

Groupthink Advantage

Groupthink Wrong

And, groupthink doesn't explain their scenario – intelligence is developed by individuals

Jervis 4

(Robert, Poli Sci Prof @ Colombia Univ, Consultant to the CIA, L.A. Times, 7/16, pg lexis//um-ef)

LOS ANGELES - In an unusual foray into psychological diagnostics, the Senate Intelligence Committee concluded last week that CIA analysts had succumbed to what it called a "groupthink" dynamic. According to the committee's report, the analysts suffered from a "collective presumption" that Iraq had acquired weapons of mass destruction and they blithely ignored any evidence to the contrary. **But was that indeed what happened?** "Groupthink" -- identified in the early 1970s by the late Yale psychologist Irving Janis -- refers to a process by which conformity grows out of deliberations in small groups. It can be quite powerful. The way Janis explained it, groupthink operates when individuals work closely together over a sustained period. It isn't merely that members of the group come to think alike but that they come to overvalue the harmonious functioning of the group. In their eagerness to reach consensus, they become inhibited from questioning established assumptions or from raising questions that might disturb their colleagues and friends. In this way, a group of intelligent individuals can confidently arrive at conclusions that are wildly removed from reality. Most social scientists agree that groupthink has contributed to many disastrous decisions in business, families and foreign policy. President John F. Kennedy and his top advisers, for instance, fell into a groupthink trap, believing that the landings of the Cuban exiles at the Bay of Pigs in April 1961 might overthrow Fidel Castro. Intense face-to-face meetings among the president's top foreign policy planners formed strong bonds that no one wanted to loosen. Richard Nixon's Watergate cover-up was in part maintained by the same dynamic. To many outsiders even at the time, it was obvious that the only way for Nixon to survive was to air the full truth early on. But the Nixon White House was a small group, closed-mouthed and predisposed to keeping everything secret. But although groupthink has played a part in past foreign policy decisions, it does not appear to explain the CIA's current intelligence failures. First of all, intelligence gathering is work done by individuals. Analysts read reports from the field and ask themselves how those reports fit with other reports and prevailing views, and then these individuals write their own summaries and conclusions for fellow analysts and superiors. Group discussions are generally built around what the individuals have come to believe. Furthermore, from what I have seen of them, intelligence analysts tend to be highly individualistic, if not intellectually combative. They have selected the career of an analyst rather than a more public and people-oriented career in part because they like to work on their own. There are, of course, some larger group meetings where members of the broader intelligence community convene. And as in any such group situations, there will be times when individuals shape the views they bring in anticipation of what they think will appeal to the others. But these meetings are not likely to be susceptible to groupthink. Many of them are large, which precludes the formation of close ties among participants. Indeed, many of the meetings are ad hoc, with different people participating at different times. Although the members probably know one another, the stability required for groupthink is rarely present. Finally, many intelligence officials these days -- unlike top political leaders -- are on guard against groupthink. They have read about decision-making pathologies and are wary of overvaluing the good feeling of the group. None of this is to say that the CIA's processes were as good as they should have been or that the desire not to rock the boat was absent. On the contrary, it appears that another dynamic was at work in this case. Intelligence officials, like the rest of us, hesitate to tell their bosses what they do not want to hear -- and may even, on occasion, convince themselves that alternative views are groundless. The Bush administration made it clear early on that it was seeking to prove the existence of WMD in Iraq -- not disprove it. The intelligence community was under pressure to deliver that evidence. There are lots of ways psychology can help explain what went wrong and how intelligence could be done better, but groupthink was not the main problem in this case.

Groupthink theory is wrong

Anthony **Hempell 4**, User Experience Consulting Senior Information Architect, "Groupthink: An introduction to Janis' theory of concurrence-seeking tendencies in group work., <http://www.anthonyhempell.com/papers/groupthink/>, March 3

In the thirty years since Janis first proposed the **groupthink** model, **there is still little agreement as to the validity of the model** in assessing decision-making behaviour (Park, 2000). **Janis' theory is often criticized because it does not present a framework that is suitable for empirical testing; instead, the evidence for groupthink comes from largely qualitative, historical or archival methods** (Sunstein, 2003). **Some critics go so far as to say that Janis's work relies on "anecdote, casual observation, and intuitive appeal rather than rigorous research"** (Esser, 1998, cited in Sunstein, 2003, p.142). While some studies have shown support for the groupthink model, the support tends to be mixed or conditional (Esser, 1998); some studies have revealed that a closed leadership style and external threats (in particular, time pressure) promote groupthink and defective decision making (Neck & Moorhead, 1995, cited by Choi & Kim, 1999); the effect of group cohesiveness is still inconclusive (Mullen, Anthony, Salas & Driskel, 1994, cited by Choi & Kim, 1999). Janis's model tends to be supported by studies that employ a qualitative case-study approach as opposed to experimental research, which tends to either partially support or not support Janis's thesis (Park, 2000). The lack of success in experimental validation of groupthink may be due to difficulties in operationalizing and conceptualizing it as a testable variable (Hogg & Hains, 1998; Park, 2000). Some researchers have criticized Janis for categorically denouncing groupthink as a negative phenomenon (Longley & Pruitt, 1980, cited in Choi & Kim, 1999). Sniezek (1992) argues that there are instances where concurrence-seeking may promote group performance. When used to explain behaviour in a practical setting, groupthink has been framed as a detrimental group process; the result of this has been that many corporate training programs have created strategies for avoiding groupthink in the workplace (Quinn, Faerman, Thompson & McGrath, 1990, cited in Choi & Kim, 1999). **Another criticism of groupthink is that Janis overestimates the link between the decision-making process and the outcome** (McCauley, 1989; Tetlock, Peterson, McGuire, Chang & Feld, 1992; cited in Choi & Kim, 1999). **Tetlock et al argue that there are many other factors between the decision process and the outcome. The outcome of any decision-making process, they argue, will only have a certain probability of success due to various environmental factors (such as luck).** A large-scale study researching decision-making in seven major American corporations concluded that decision-making worked best when following a sound information processing method; however these groups also showed signs of groupthink, in that they had strong leadership which attempted to persuade others in the group that they were right (Peterson et al, 1998, cited in Sunstein, 2003). Esser (1998) found that groupthink characteristics were correlated with failures; however cohesiveness did not appear to be a factor: groups consisting of strangers, friends, or various levels of previous experience together did not appear to effect decision-making ability. **Janis' claims of insulation of groups and groups led by autocratic leaders did show that these attributes were indicative of groupthink symptoms. Moorhead & Montanari conducted a study where they concluded that groupthink symptoms had no significant effect on group performance, and that "the relationship between groupthink-induced decision defects and outcomes were not as strong as Janis suggests"** (Moorhead & Montanari, 1986, p. 399; cited by Choi & Kim, 1999).

Congress Cant Solve

Congress can't solve groupthink

Posner and Vermeule, 7 – *Kirkland and Ellis Professor of Law at the University of Chicago Law School AND **professor at Harvard Law School (Eric and Adrian, Terror in the Balance: Security, Liberty, and the Courts p. 46-47)

The idea that Congress will, on net, weed out bad policies rests on an institutional comparison. The president is elected by a national constituency on a winner-take-all basis (barring the remote chance that the Electoral College will matter), whereas Congress is a summation of local constituencies and thus affords more voice to political and racial minorities. At the level of political psychology, **decisionmaking within the executive is prone to group polarization and other forms of groupthink or irrational panic,**⁵¹ **whereas the internal diversity of legislative deliberation checks these forces.** At the level of political structure, Congress contains internal veto gates and chokepoints—consider the committee system and the filibuster rule—that provide

minorities an opportunity to block harmful policies, whereas executive decisionmaking is relatively centralized and unitary. The contrast is drawn too sharply, because in practice the executive is a they, not an it Presidential oversight is incapable of fully unifying executive branch policies, which means that disagreement flourishes within the executive as well, dampening panic and groupthink and providing minorities with political redoubts.⁵² Where a national majority is internally divided, the structure of presidential politics creates chokepoints that can give racial or ideological minorities disproportionate influence, just as the legislative process does. Consider the influence of Arab Americans in Michigan, often a swing state in presidential elections. It is not obvious, then, that statutory authorization makes any difference at all. One possibility is that a large national majority dominates both Congress and the presidency and enacts panicky policies, oppresses minorities, or increases security in ways that have ratchet effects that are costly to reverse. If this is the case, a requirement of statutory authorization does not help. Another possibility is that there are internal institutional checks, within both the executive branch and Congress, on the adoption of panicky or oppressive policies and that democratic minorities have real influence in both arenas. If this is the case, then a requirement of authorization is not necessary and does no good. Authorization only makes a difference in the unlikely case where the executive is thoroughly panicky, or oppressively majoritarian, while Congress resists the stampede toward bad policies and safeguards the interests of oppressed minorities. Even if that condition obtains, however, the argument for authorization goes wrong by failing to consider both sides of the normative ledger. As for majoritarian oppression, the multiplicity of veto gates within Congress may allow minorities to block harmful discrimination, but it also allows minorities to block policies and laws which, although targeted, are nonetheless good. As for panic and irrationality, if Congress is more deliberative, one result will be to prevent groupthink and slow down stampedes toward bad policies, but another result will be to delay necessary emergency measures and slow down stampedes toward good policies. Proponents of the authorization requirement sometimes assume that quick action, even panicky action, always produces bad policies. But there is no necessary connection between these two things: expedited action is sometimes good, and panicky crowds can stampede either in the wrong direction or in the right direction. Slowing down the adoption of new policies through congressional oversight retards the adoption not only of bad policies, but also of good policies that need to be adopted quickly if they are to be effective.

Groupthink Impact D

No realistic scenario

Pillar, 13 -- Brookings Foreign Policy Senior Fellow

(Paul, "The Danger of Groupthink," The National Interest, 2-26-13, webcache.googleusercontent.com/search?q=cache:6rnyjYIVKY0J:www.brookings.edu/research/opinions/2013/02/26-danger-groupthink-pillar+&cd=3&hl=en&ct=clnk&gl=us)

David Ignatius has an interesting take on national security decision-making in the Obama administration in the wake of the reshuffle of senior positions taking place during these early weeks of the president's second term. Ignatius perceives certain patterns that he believes reinforce each other in what could be a worrying way. One is that the new team does not have as much "independent power" as such first-term figures as Clinton, Gates, Panetta and Petraeus. Another is that the administration has "centralized national security policy to an unusual extent" in the White House. With a corps of Obama loyalists, the substantive thinking may, Ignatius fears, run too uniformly in the same direction.

He concludes his column by stating that "by assembling a team where all the top players are going in the same direction, he [Obama] is perilously close to groupthink." We are dealing here with tendencies to which the executive branch of the U.S. government is more vulnerable than many other advanced democracies, where leading political figures with a standing independent of the head of government are more likely to wind up in a cabinet. This is especially true of, but not limited to, coalition governments. Single-party governments in Britain have varied in the degree to which the prime minister exercises control, but generally room is made in the cabinet for those the British call "big beasts": leading figures in different wings or tendencies in the governing party who are not beholden to the prime minister for the power and standing they have attained.

Ignatius overstates his case in a couple of respects. Although he acknowledges that Obama is "better than most" in handling open debate, he could have gone farther and noted that there have been egregious examples in the past of administrations enforcing a national security orthodoxy, and that the Obama administration does not even come close to these examples. There was Lyndon Johnson in the time of the Vietnam War, when policy was made around the president's Tuesday lunch table and even someone with the stature of the indefatigable Robert McNamara was ejected when he strayed from orthodoxy. Then there was, as the most extreme case, the George W. Bush administration, in which there was no policy process and no internal debate at all in deciding to launch a war in Iraq and in which those who strayed from orthodoxy, ranging from Lawrence Lindsey to Eric Shinseki, were treated mercilessly. Obama's prolonged—to the point of inviting charges of dithering—internal debates on the Afghanistan War were the polar opposite of this. Ignatius also probably underestimates the contributions that will be made to internal debate by the two most important

cabinet members in national security: the secretaries of state and defense. He says John Kerry “has the heft of a former presidential candidate, but he has been a loyal and discreet emissary for Obama and is likely to remain so.” The **heft matters, and Kerry certainly qualifies as a big** beast. Moreover, the discreet way in which a member of Congress would carry any of the administration’s water, as Kerry sometimes did when still a senator, is not necessarily a good indication of the role he will assume in internal debates as secretary of state. As for Chuck Hagel, Ignatius states “he has been damaged by the confirmation process and will need White House cover.” But now that Hagel’s nomination finally has been confirmed, what other “cover” will he need? It’s not as if he ever will face another confirmation vote in the Senate. It was **Hagel’s very inclination to flout orthodoxy, to arrive at independent opinions and to voice those opinions** freely that led to the fevered opposition to his nomination.

No Groupthink

No group think – data

Fuller et al ‘98

(Sally Rigs, School of Business Administration, University of Wisconsin and Ramon J. Aldag School of Business, University of Wisconsin—Madison, “Organizational Groupthink: Lessons from a Quarter Century of the Groupthink Phenomenon” *Organizational Behavior And Human Decision Processes*, Vol. 73, Nos. 2/3, February/March, pp. 163–184, 1998, http://liquidbriefing.com/twiki/pub/Dev/RefFuller1998/Organizational_tonypandy.pdf)

There could, of course, be a very simple explanation for this widespread acceptance: research relating to the phenomenon might be uniformly supportive. In fact, though, **our review of the groupthink literature** (Aldag and Fuller, 1993) **indicates** that this is not the case. For example, following that review, we noted that, . . . **most support for groupthink has come from retrospective case studies that have focused on decision fiascoes rather than comparing the decision-making processes associated with good versus bad decisions.** Experimental studies of groupthink have considered only a small portion of the model, often without a cohesive group and in situations inconsistent with Janis’s (1971, 1972, 1982, 1989) antecedents. Furthermore, **they have relied exclusively on student samples dealing with hypothetical or simulated decisions, with resultant problems for external validity. Military strategists, managers, politicians, or other “real-world” decision makers have never been used.** In the laboratory, many real-world group characteristics, including ongoing power relationships ORGANIZATIONAL TONYPANDY 167 and political maneuverings, have been necessarily ignored. Although student samples in laboratory settings may be valuable to address many issues relating to group problem solving, their use to examine groupthink is problematic. In addition, we have argued that **it is inappropriate to attempt to generalize from the “hot” decision situations characterizing the fiascoes (primarily major military policy decisions or groups facing natural disasters) on which early case evidence for groupthink was based.** We have also contended that **there is little support for the full groupthink model; in fact, in no study have all results been consistent with the model.** In addition, **Janis made no changes in, or additions to, the groupthink model despite evidence of the relevance of many additional variables, including group norms, the nature of the task, the degree of leader power, and stage of group development.** Indeed, our review of the research suggests that **the groupthink phenomenon per se lacks empirical support and rests on generally unsupported assumptions.** Failures to support groupthink predictions have regularly been viewed as evidence of partial support or as signals that the research methodology was flawed. In our view, **groupthink researchers and theorists have unwittingly acted, in Janis’s terms, as virtual mindguards of the groupthink phenomenon.**

Scheeringa 10

(Daniel, Was the Decision to Invade Iraq and the Failure of Occupation Planning a Case of Groupthink? Thesis submitted to the faculty of the Virginia Polytechnic Institute and State University in partial fulfillment of the requirements for the degree of Master of Arts In Political Science. pg. lexis)

In *Groupthink and Government*, Paul t“Hart undertakes a thorough examination of the theory. He examines the theory from social-psychological and political perspectives. He also applies groupthink theory to the Iran-contra scandal of the late 1980’s. In “Groupthink, Bay of Pigs and Watergate Reconsidered” Bertram Raven used groupthink theory to examine the decisions leading to the Watergate scandal. He concluded that while groupthink was a factor, other factors, such as Nixon’s influence and political considerations, also weighed on the group dynamic. Raven uses the Watergate example as evidence that groupthink does not necessarily lead to failure, which is the converse of the argument that failure is not necessarily caused by groupthink²⁴. In “Revisiting the Bay of Pigs and Vietnam Decisions 25 Years Later: How Well Has Groupthink Theory Stood the Test of Time?” Kramer contends that new historical information regarding Presidents Kennedy’s and Johnson’s decision-making processes shows 16

Informal checks on groupthink are sufficient

Kennedy 12

(Brandon Kennedy, University of Southern California Gould School of Law; M.A. Regional Studies: Middle East 2009, Harvard Graduate School of Arts and Sciences; B.A. Government 2009, Harvard University Gould School of Law Southern California Interdisciplinary Law Journal Spring, 2012 Southern California Interdisciplinary Law Journal 21 S. Cal. Interdis. L.J. “The Hijacking Of Foreign Policy Decision Making: Groupthink And Presidential Power In The Post-9/11 World pg lexis)

Neither the president nor the decision-making group members implement "hybrid" checks; the checks do, however, originate in the executive branch and directly affect the president and the group members. Hybrid checks relate to the bureaucratic machine and typically address the structural faults within the executive branch that can affect the core decision-making group. Although the president and his or her advisers constitute the insiders of the decision-making group, they ultimately belong [*676] to a larger organization - the executive branch - and thereby become part of the bureaucratic machine. 1. Inter-Agency Process The "inter-agency process" check involves getting approval for, or opinions about, a proposed decision from other agencies. n252 The inter-agency process is particularly common for national security and foreign policy decisions. n253 "Occasionally, it will operate at a higher level in principals' committees involving Cabinet-level or sub-Cabinet people and their deputies," thus directly checking the decision-making group members. n254 2. Intra-Agency Process Another similar check is the "intra-agency process," in which the circulation of proposed decisions within the agency empowers dissidents and harnesses a diversity of thinking. n255 If nothing else, the process catches errors, or at least increases the odds of avoiding them, given the number of people who must review or approve a document or decision within the agency. n256 3. Agency or Lawyer Culture The culture of a particular agency - the institutional self-awareness of its professionalism - provides another check. n257 "Lawyer culture" - which places high value on competency and adherence to rules

and laws - resides at the core of agency culture; n258 its "nay-saying" objectivity "is especially important in the small inner circle of presidential decision making to counter the tendency towards groupthink and a vulnerability to sycophancy." n259 [*677] 4. Public Humiliation A final check in this category is the "public humiliation" check. n260 This check only comes into play when the previous three have failed, and involves the threat to "'go public' by leaking embarrassing information or publicly resigning."

Russia Impact D

Conflicts will never go nuclear – prefer Russian generals

Ivashov 7

(Colonel General Leonid Ivashov, President of the Academy of Geopolitical Problems, 2007. Defense and Security, "Will America Fight Russia?" p. Lexis)

Numerous scenarios and options are possible. Everything may begin as a local conflict that will rapidly deteriorate into a total confrontation. An ultimatum will be sent to Russia: say, change the domestic policy because human rights are allegedly encroached on, or give Western businesses access to oil and gas fields. Russia will refuse and its objects (radars, air defense components, command posts, infrastructure) will be wiped out by guided missiles with conventional warheads and by aviation. Once this phase is over, an even stiffer ultimatum will be presented - demanding something up to the deployment of NATO "peacekeepers" on the territory of Russia. Refusal to bow to the demands will be met with a mass aviation and missile strike at Army and Navy assets, infrastructure, and objects of defense industry. NATO armies will invade Belarus and western Russia. Two turns of events may follow that. Moscow may accept the ultimatum through the use of some device that will help it save face. The acceptance will be followed by talks over the estrangement of the Kaliningrad enclave, parts of the Caucasus and Caspian region, international control over the Russian gas and oil complex, and NATO control over Russian nuclear forces. The second scenario involves a warning from the Kremlin to the United States that continuation of the aggression will trigger retaliation with the use of all weapons in nuclear arsenals. It will stop the war and put negotiations into motion.

We would crush them

Sharavin 7

(Alexander Sharavin, Director of the Institute of Political and Military Analysis, 2007. Defense and Security, "Will America Fight Russia?" p. Lexis)

The United States may count on a mass air raid and missile strike at objects of the Russian strategic nuclear forces and, perhaps, some objects of other branches of the Russian military. Plus, of course, at the military and political planning centers. Whatever targets may escape destruction on the first try will be bombed out of existence by repeated strikes. And Russia will have nothing to answer with. Even if some

elements of the strategic nuclear forces survive, they will fall prey to the American national missile defense. The American strategic missile forces in their turn will escape the war unscathed.

No Russia war---no motive or capability

Betts 13 Richard is the Arnold A. Saltzman Professor of War and Peace Studies @ Columbia. "The Lost Logic of Deterrence," Foreign Affairs, March/April, Vol. 92, Issue 2, Online

These continuities with the Cold War would make sense only between intense adversaries. Washington and Moscow remain in an adversarial relationship, but not an intense one. If the Cold War is really over, and the West really won, then continuing implicit deterrence does less to protect against a negligible threat from Russia than to feed suspicions that aggravate political friction. In contrast to during the Cold War, it is now hard to make the case that Russia is more a threat to NATO than the reverse. First, the East-West balance of military capabilities, which at the height of the Cold War was favorable to the Warsaw Pact or at best even, has not only shifted to NATO's advantage; it has become utterly lopsided. Russia is now a lonely fraction of what the old Warsaw Pact was. It not only lost its old eastern European allies; those allies are now arrayed on the other side, as members of NATO. By every significant measure of power -- military spending, men under arms, population, economic strength, control of territory -- NATO enjoys massive advantages over Russia. The only capability that keeps Russia militarily potent is its nuclear arsenal. There is no plausible way, however, that Moscow's nuclear weapons could be used for aggression, except as a backstop for a conventional offensive -- for which NATO's capabilities are now far greater. Russia's intentions constitute no more of a threat than its capabilities. Although Moscow's ruling elites push distasteful policies, there is no plausible way they could think a military attack on the West would serve their interests. During the twentieth century, there were intense territorial conflicts between the two sides and a titanic struggle between them over whose ideology would dominate the world. Vladimir Putin's Russia is authoritarian, but unlike the Soviet Union, it is not the vanguard of a globe-spanning revolutionary ideal.

whistleblowers neg updates

case

Whistleblowing bad

Whistleblowers are traitors, and the search for civil rights threatens the pre-eminence of the military-industrial complex

Vombatkere 13

(S.G. Vombatkere is a retired Major General, “Edward Snowden’s Wake-up Call : Cyber Security, Surveillance and Democracy”, Asian Tribune, <http://www.asiantribune.com/node/62920>, TMP)

Edward Snowden, in his courageous, principled expose, has brought out how USA's National Security Agency (NSA) has been spying on most nations in the world. This spying is clearly to establish or strengthen USA's political, economic and military global clout. India is the fifth-most spied-upon nation, even more than China and Russia. Considering that India is USA's strategic partner, spying on India is breach of faith. Iran tops the list (14 billion pieces of intelligence); then come Pakistan (13.5 billion), Jordan (12.7 billion), Egypt (7.6 billion), and India (6.3 billion). [Ref.1] It is piquant that India, USA's strategic partner, is in the “club” of Iran, Pakistan, Jordan and Egypt, where USA perceives “threat” to its global hegemony. USA has other strategic partners and doubtless they too are being spied upon, and many national leaders, notably of Turkey, Germany and Russia, have raised serious objections. But India is USA's junior and subservient strategic partner due to the long-term, built-in subservience of India's political and bureaucratic architects of the strategic alliance. There has been no official Indian protest and there is unlikely to be even a squeak on this sovereignty issue. However, people's voices have been raised, especially from within USA, against USA's presidentially-sanctioned, global electronic spying and surveillance. These voices are directed simultaneously at demanding recognition and protection of individual privacy rights, calling for accountability and transparency of U.S presidential and Congress decisions, and attempting to influence USA to pardon whistleblower Edward Snowden who is still in hiding. Snowden's expose on the heels of the commencement of the trial of that other courageous and righteous prisoner-of-conscience whistleblower Bradley Manning, is a grievous blow to the pride of NSA and the U.S establishment. Thus these whistleblowers are “traitors” who need to be punished severely because they have weakened USA against its “enemies”, self-created and self-imagined. Added to the list of “traitors” are the courageous people in The Guardian and Washington Post, like Laura Poitras and Glenn Greenwald, who actually brought Snowden's leaked information to public glare. It is now clearer than ever before that USA's official enemy is not this country or that, not Al Qaeda or Taliban, not this religion or that, but the spread of peace and real democracy, and the demands for human and civic rights, all of which threaten the pre-eminence of the military-industrial complex MNCs which run USA from behind a teflon curtain. Like all colonial powers of the past, this pre-eminence is based heavily on political, economic and military intelligence. In modern times it calls for surveillance and access to data and information from within and outside USA. Thus, U.S intelligence agencies would be particularly interested to access databases of various kinds, and real-time data as it is being created by land, ocean, aerial and space surveillance devices. ¶ With the kind of super-computing capability, global intelligence experience, and unparalleled military power and reach that USA possesses, this collated intelligence can be used for hegemonic aims.¶¶ These are stated in the Project for a New

American Century (PNAC) created in 1997 by a group of conservative American politicians, academics and policy brokers. PNAC aims to “shape a new century favourable to American principles and interests” and “make the case and rally support for American global leadership” [Ref.2].¶ Thus it is the business of every country to protect its databases from hackers, sleuths, mercenary spies and intelligence agents, who try to obtain intelligence by one or more of several fair or foul means.¶ System and data security The damage that can be wreaked by deliberate corruption or destruction of programs or data, or lifting of data without the knowledge of the rightful owner of the data, by illegal access into the operating system is enormous. For example, if the computer system of Indian Railways is tampered with, goods and passenger trains across the country can be brought to a halt, causing huge economic loss, with heightened accident risk. Or if, like NSA's Stuxnet program destroyed Iran's nuclear enrichment centrifuges, our nuclear power plants' systems are broken into, it can result in a nuclear disaster. Government of India (GoI) has listed “the civil aviation sector (ATC), railway passenger reservation system and communication network, port management, companies and organizations in power, oil and natural gas sectors, banking and finance and telecom sectors” as critical, apart from certain “strategic government departments such as space (ISRO), External Affairs Ministry (passport database), the Home Ministry's police and intelligence networks,.... the Prime Minister's Office (PMO), the NSCS and the Cabinet Secretariat”. [Ref.3]. Security of government data and data concerning its citizens is vital for any government. Government and private intelligence agencies (the services of the latter purchasable by the highest bidder) are engaged in acquiring or “mining” information from their own country and from other countries which are competitors in the political, economic or military senses. It is standard security practice, for instance, that computers which are connected to the internet are not connected with the LAN, so that there is no access to the system through the internet. Other security measures are physical security to ensure that data is not tampered with or copied by individuals who work within the system or obtain physical access to the system. However, for systems which are necessarily connected to the internet for their functioning (e.g., internet banking), it is a mere combination of motivation – money, display of capability, ideology, etc – and time-on-the-job, for an experienced hacker to crack firewall codes and find passwords to gain access to programs and data.¶ This has been demonstrated by hackers, detected and punished or not, who have broken into systems as varied as banks, strategic, military, scientific, technical or industrial databases around the world. Another method is to plant viruses or clandestinely embed special-purpose hardware and software into commercially supplied hardware devices and software systems to transmit data that passes through the system. Routinely, firewalls to prevent unauthorized access into systems, regular change of passwords at all levels within the system, and restricting physical access to system terminals are time-tested methods for system and data security.

Leaks hurt U.S. credibility and economy – the tech sector loses billions of dollars

Griffiths 7/3 (James Griffiths, Reporter for the South China Morning Post where he rights about Hong Kong politics, China, the internet, and security, with a degree in Law from the University of Liverpool, “Two years after Snowden, NSA revelations still hurting US tech firms in China: report,” South China Morning Post, 3 July 2015,

<http://www.scmp.com/tech/enterprises/article/1831657/nsa-spy-revelations-damaging-us-tech-firms-competitiveness-china>)

Revelations of digital surveillance by American spy agencies could end up costing US firms billions of dollars in lost business and lawmakers in Washington are falling short in their duty to address the issue, a US think tank has said. Tech firms, in particular, have underperformed in foreign markets following the leaks by former National Security Agency contractor Edward Snowden, according to a paper published by the Information Technology and Innovation Foundation. "Our original thought was once policy makers realised this was having an impact on business interests, they would take more aggressive action to address the concerns," Daniel Castro, ITIF vice president, told the South China Morning Post. He helped author the report. The ITIF predicted in 2013 that "even a modest drop" in the foreign market share for cloud computing could cost the US economy up to US \$35 billion by 2016. That now looks like a conservative estimate as the revelations of cyber-snooping have negatively affected "the whole US tech industry," the report said. Cloud computing firms and data centres have been some of the worst hit, with foreign companies choosing to avoid storing their data in the US following revelations about the NSA's digital surveillance programmes. A 2014 survey of British and Canadian businesses by Vancouver-based Peer 1 Hosting found that 25 per cent of respondents planned to pull data out of the US due to fears relating to data privacy. In February, Beijing dropped a number of major American tech firms from its official state procurement list, including network equipment maker Cisco Systems, Apple, and security firm McAfee. "The Snowden incident, it's become a real concern, especially for top leaders," Tu Xinquan, associate director of the China Institute of WTO Studies in Beijing, told Reuters in April. "In some sense, the American government has some responsibility for that. [China's] concerns have some legitimacy." The White House and US International Trade Administration declined to comment on the matter, when contacted by the Post. IBM, Microsoft and Hewlett-Packard have all reported diminished sales in China as a result of the NSA revelations, which first emerged in the summer of 2013. The NSA was found to have tapped into the servers of major internet players like Facebook, Google and Yahoo to track online communication, among other forms of digital surveillance.

[whistleblowers fail/backlash](#)

Whistleblowing fails – governments and organizations can undermine their reputations to illegitimate leaks.

Sawyer et al 6 (Kim R. Sawyer, Professor at the University of Melbourne's School of Historical and Philosophical Studies, Jackie Johnson, Professor at the University of Western Australia, and Mark Holub, Professor at the UWA Business School, "The Necessary Illegitimacy of the Whistleblower," 17 July 2006, <http://www.bmartin.cc/dissent/documents/Sawyeretal05.pdf>)

For the whistleblower, the negative correlation with the organization underscores their pragmatic legitimacy. And it is their whistleblowing that underscores their moral legitimacy and identity. Rothschild and Miethe (1999, p. 121) describe this well: "It became clear to us that for many of these individuals the act of whistle-blowing had become what sociologists refer to as a 'master status'. One's master status is the critical bedrock of one's personal identity; it is how we first label ourselves and are recognized by others. For most of our whistle-blowers, the experience of whistle-blowing and its aftermath have been so traumatic that their 'master status' is now defined by their act of whistle-blowing. Their new identity - one based on the act of whistle-blowing -

defines and engulfs nearly everything in their lives. Moral legitimacy takes over, and it is through moral legitimacy that the whistleblower expects their pragmatic legitimacy to be repaired. Whistleblowing then becomes a test of moral legitimacies, not just of the whistleblower and the organization, but of all their conferring entities. In the abstract, the moral legitimacy of whistleblowing is repeatedly reaffirmed. In increasing numbers, countries, states and organizations are adopting whistleblowing statutes to protect the unknown whistleblower. But in the particular, the story is different. **It is easy to undermine the moral legitimacy of a particular whistleblower by questioning their moral legitimacy in other areas.** While some have beatified whistleblowers,²² most would not view themselves in this way. They are just employees who reveal wrongdoing. Smearing the whistleblower is common. Smearing weakens the whistleblower's moral legitimacy and, by implication, the legitimacy of their whistleblowing. As Sawyer (2004, p.7) observes: "There are now good whistleblowers and bad whistleblowers. The good whistleblower is the whistleblower who lives in another country, or who works for another organization (preferably a competitor), or who blew the whistle 50 years ago. The bad whistleblower is the whistleblower in your own organization who blows the whistle now."

Company backlash means that whistleblowing fails – organizations fire or demote workers to destroy legitimacy and prevent further leaks.

Sawyer et al 6 (Kim R. Sawyer, Professor at the University of Melbourne's School of Historical and Philosophical Studies, Jackie Johnson, Professor at the University of Western Australia, and Mark Holub, Professor at the UWA Business School, "The Necessary Illegitimacy of the Whistleblower," 17 July 2006, <http://www.bmartin.cc/dissent/documents/Sawyeretal05.pdf>)

The **retaliation experienced by whistleblowers is well documented.** There are many case studies of prominent whistleblowers where the retaliation against whistleblowers is evidenced in its entirety.⁴ Case study information can also be extracted from the transcripts of formal inquiries, for example the Australian Senate Inquiry into Unresolved Whistleblowing Cases (1995).⁵ Systematic studies of whistleblowing show the scale and the scope of the retaliation. A 1990 study of 233 US whistleblowers cited in Grace and Cohen (1998) found that 90 percent had lost their jobs or were demoted, 27 percent faced lawsuits and 26 percent had psychiatric or medical referrals subsequent to blowing the whistle. A comprehensive survey of US whistleblowers by Rothschild and Miethe (1999) of 761 individuals finds that: • 69 percent of the whistleblowers lost their job or were forced to retire; • 64 percent received negative performance evaluations; • 68 percent had work closely monitored by supervisors; • 69 percent were criticized or avoided by co-workers; and • 64 percent were blacklisted from getting another job in their field. Whistleblowing and retaliation appear to co-exist. Indeed, Rothschild and Miethe (1999) find that whistleblowers experience reprisals regardless of their age, gender, educational attainment or years of employment in their current job. Only retaliations against African Americans appear to be at a higher rate than for other employees. Rothschild and Miethe (1999) identify three factors which influence retaliation: the supervisory status of the whistleblower; the degree of wrongdoing; and whether the whistleblower discloses to an external body. Reprisals are more likely if the whistleblower is a non-supervisor, if the wrongdoing is severe, and if the whistleblower blows the whistle to parties external to the organization. The incidence of retaliation against external whistleblowers is on average 10-15 percent higher than for internal whistleblowers. The Rothschild and Miethe (1999) study provides an insight into why

organizations retaliate against a whistleblower. By blowing the whistle, the whistleblower assumes a role different from other employees. Their identity is now defined by their whistleblowing, not by their prior performance. Their legitimacy is now the legitimacy of a whistleblower, not that of an employee. As a stakeholder, their legitimacy becomes important to the organization because it is negatively correlated with the legitimacy of the organization. And it is this negative correlation that determines the whistleblower's future. For an organization, its pragmatic legitimacy determines its operational viability. Organizations maintain their legitimacy with other entities through exchanges which increase the expected value of the other entity, through the joint influence of the organization and the other entity, and through shared values. For an individual, their pragmatic legitimacy can be similarly defined by their ability to exchange, influence and share values with other individuals and entities. When an organization retaliates against a whistleblower, they destroy the whistleblower's pragmatic legitimacy by destroying their ability to exchange, influence and share values with others. Dismissal, demotion, negative performance evaluations, and loss of authority all minimize the pragmatic legitimacy of the whistleblower. A notable US example is the case of James Alderson, the Chief Financial Officer of North Valley Hospital, who blew the whistle on the secret accounting practices of the Quorum Health Group. He could not have anticipated the consequences of his action. Within five days he was sacked, within three years he had filed a whistleblower lawsuit under the False Claims Act⁶, and in the next ten years his family lived in five different towns.⁷ Thirteen years after blowing the whistle, his case was settled. In the interim, the Hospital Corporation of America, the parent company of Quorum, had reimbursed the US government US\$840 million as a result of the whistleblower law suit. Alderson reflected "Yes, I would do it again. I can't believe it's over. But then again, it will never be over."⁸

Protections for people through "insider threat reforms" just promotes spying on colleagues, turns the chilling effect

Kuvachn 13, Writer, "Insider Threat" program promotes spying on colleagues", BORDC, <http://www.bordc.org/blog/insider-threat-program-promotes-spying-colleagues>, TMP)

On October 7, 2011 President Obama released Executive order 13587, presenting a program that was ignored by major media coverage until recently. The Executive Order purports to address "Structural Reforms to Improve the Security of Classified Networks and the Responsible Sharing and Safeguarding of Classified Information," embedded in which was his introduction of the Insider Threat Task Force. Until a recent article by McClatchy, however, it had gone largely unacknowledged by those concerned with the safety of whistleblowers in the post-Bradley Manning era. Even now, with the "Where in the world is Edward Snowden?" conversation, the Insider Threat Program remains largely outside the realm of discussion despite its enormous implications for government transparency and the rights of whistleblowers. The Insider Threat Program relies largely on one modus operandi: government-mandated snitching. Federal agency employees and their supervisors are instructed to be on the look-out for and report "high-risk persons or behaviors." Though this may seem vague, the program kindly clarifies that some specific instances that would prompt the categorization of individuals as "high-risk" would be stress, divorce or financial problems. The program is a psychological "If you see something, say something," which potentially criminalizes anyone in the workplace who may be in an emotional slump. An individual going through a tough divorce, suffering the loss of a loved one, or struggling to make ends meet then has become the vaguely dangerous INSIDER THREAT. I

offer no exaggeration in this language: the program turns federal agencies like the Peace Corps, the Social Security Administration and the Educational and Agricultural Departments into noir-like environments, where each individual is potentially more paranoid and more guilty than the next. Though the "indicators" that may potentially signify threats are vague and, one might argue, not an employer's business (let alone the government's), the Program renders such individual behavior in the workplace a matter of national security. Officials stated that Bradley Manning, for example, "exhibited behavior that could have forewarned his superiors that he posed a security risk" - perhaps they would argue the same for Edward Snowden, who had been a "trusted insider" before his leak. The general consensus seems to be that concerning oneself with co-workers' personal lives is necessary to the safety of our country. Let's assume that some co-workers had suspected that Manning and Snowden might be "up to no good." If these co-workers did not snitch under the Insider Threat Program, they are now required to turn themselves or others in for failing to report breaches in security. The danger here, as the news-breaking McClatchy article pointed out, is that a tendency towards dangerous "group think" develops, "the kind that was blamed for the CIA's erroneous assessment that Iraq was hiding weapons of mass destruction, a judgment that underpinned the 2003 U.S. invasion." In the midst of "group think" danger and general paranoia, the Insider Threat Program continues to be fairly ineffective. Edward Snowden's success in leaking NSA secrets stands as a prime example of this: the Insider Threat Program was fully operational, but Snowden still managed to release sensitive government information. Snowden's successful release of information may lead to an even more aggressive mutation of the Insider Threat Program, perhaps involving some material reward for snitches. The McClatchy article quotes Kel McClanahan, a Washington lawyer who specializes in national security law, as saying, "The only thing they haven't done here is reward [snitching]...I'm waiting for the time when you turn in a friend and you get a \$50 reward." Though the Insider Threat Program seems almost a caricature, it cannot be taken lightly. It stands as yet another breach of privacy under the Obama presidency, and one that will likely become more aggressive in days to come. In addition to requiring snitching, the program equates leaking information to journalists (whether classified or not) with espionage. Not only are governmental employees at risk of being classified as an "Insider Threat" for having a bad day, but the general public is at risk of losing the information passed along to the media by whistleblowers like Manning and Snowden.

squo solves

the squo solves- supreme court ruling on the mclean case solves whistleblower protection

Chow 3/2 (Kimberly, Ethics & Excellence Legal Fellow, NYU School of Law, "Supreme Court decision is a victory for whistleblowers and the media," Poynter, Reporters Committee for Freedom of the Press, <http://www.poynter.org/news/324045/supreme-court-decision-is-a-victory-for-whistleblowers-and-the-media/>, March 2, 2015, silbs)

Were media lawyers asleep at the wheel when a major whistleblower case came through the Supreme Court this term? While all eyes were turned on Jim Risen and efforts to revise Justice Department policies on when it subpoenas reporters, were we missing the potential for a major precedent affecting sources? At first glance, the ruling in January in favor of federal air marshal Robert MacLean, who leaked information to an MSNBC reporter, looks unremarkable, and it received little attention from media lawyers at a time when the focus was on Risen. The crux of

the Court's decision was that a Transportation Security Administration ban on the unauthorized disclosure of sensitive security information was a regulation, not a law. But the broader holding – that agencies can't just pass regulations that insulate themselves from whistleblowing – is much more striking. In reinforcing the federal protections given to whistleblowers, the Court recognized the valuable role whistleblowers play in holding the government accountable. By extension, the news media that reports on their disclosures also scored a victory. Hogan Lovells partner Neal Katyal, who represented MacLean on a pro bono basis, called the decision “very significant protection for whistleblowers.” But he also pointed to the key ways in which it advances public interest journalism. “The MacLean decision recognizes that the media can and does play an important role in uncovering government corruption, abuse, and, frankly, inanity,” said Katyal, a former acting U.S. Solicitor General. “This is a first-rate example of how the media helped get Robert MacLean's message out and potentially stop a catastrophic decision to remove air marshals at a time of high terrorist threat.” Under federal law protecting whistleblowers, employees who disclose information revealing violations of any law, rule, or regulation or a substantial and specific danger to public health and safety are shielded from termination for their actions. There is an exception for disclosures that are specifically prohibited by law. In 2002, the TSA promulgated regulations banning the unauthorized disclosure of “sensitive security information,” which included details of federal air marshal missions. Along came federal air marshal MacLean, who became alarmed in 2003 when TSA cutbacks resulted in an announcement that no air marshals would accompany overnight flights from Las Vegas from July to August of that year. With the cutbacks coming in the wake of Department of Homeland Security warnings of the imminent threat of further terrorist airplane hijackings, MacLean tried to alert a supervisor and administrators to the danger of such a decision, with no success. He then contacted an MSNBC reporter about the cancellations, and when the TSA faced resulting backlash from several members of Congress, it reversed its decision on the Las Vegas flights. But after discovering that MacLean was the source of the leak, the TSA fired him for disclosing sensitive security information without authorization. The case that ultimately made its way to the Supreme Court hinged on the question of whether MacLean was a protected whistleblower under the federal law, or whether he had given up that protection by whistleblowing in defiance of a law, which in this case, DHS argued, was the TSA regulation banning disclosures. At the Supreme Court, Chief Justice Roberts and Justices Scalia, Thomas, Ginsburg, Breyer, Alito, and Kagan all agreed that the TSA regulation was not a law. As evidence, they pointed to other examples in the whistleblower statute when Congress referred to a “law, rule, or regulation.” And they showed that they understood the value of the whistleblowing process when they held that calling regulations laws would frustrate the purposes of the whistleblower statute by allowing agencies to protect themselves from it merely by making up regulations that specifically prohibited all whistleblowing. “The Court was categorical in saying that agencies can't write their own exceptions to the Whistleblower Act,” Katyal emphasized. The Court's decision resoundingly supports the right to disclose official wrongdoing that is illegal or puts the public in substantial danger. Members of the news media work closely with whistleblowers to make their revelations public. But for whistleblowers to feel comfortable telling the media their concerns, they need to know that the law will protect them. The Court's clampdown on agencies' attempts to erode that protection is a victory for accountability. The ripples from the Court's holding will be felt around the government. With the government increasingly citing national security concerns as reasons to prosecute whistleblowers such as Edward Snowden and Chelsea Manning, it's important for potential leakers to understand where their protection begins and ends. While Manning has been prosecuted under the Espionage Act, a law passed by Congress, the Court's

clarification that only laws and not regulations can prohibit whistleblowing is a significant step in favor of government accountability. At the end of the day, MacLean's case was not one where the media was likely to play an amicus or other kind of supporting role because the issues were not within its particular areas of expertise. So the snoozing is excused. But news organizations – and the public – stand to benefit from his victory.

circumvention

definitional issues

"Insider threat" in the context of the law is defined far too broad, "curtailing the insider threat program" is 100% arbitrary

NCSC No date

("National Insider threat policy",

http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Policy.pdf , TMP)

"Insider Threat" means the threat that an insider will use his or her authorized access, wittingly or unwittingly, to do harm to the security of United States. This threat can include damage to the United States through espionage, terrorism, unauthorized disclosure of national security information, or through the loss or degradation of departmental resources or capabilities.

Vagueness of "the national insider threat policy" makes it impossible for effective curtailment

NCSC No date

- "common expectations" is arbitray
- "best practices" is arbitrary
- "Flexible implementation" is arbitrary
- "rights and liberty" is arbitrary

("National Insider threat policy",

http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Policy.pdf , TMP)

The National Insider Threat Policy aims to strengthen the protection and safeguarding of **classified information** by: establishing **common expectations**; institutionalizing executive branch **best practices**; and enabling **flexible implementation** across the executive branch. A. Policy **Executive Order 13587** directs United States Government executive branch departments and agencies (departments and agencies) to establish, implement, monitor, and report on the **effectiveness of insider threat programs** to protect classified national security information (as defined in Executive Order 13526; hereinafter classified information), and requires the development of an executive branch program for the deterrence, detection, and mitigation of insider threats, including the safeguarding of classified information from exploitation, compromise, or other unauthorized disclosure. Executive Order 12968 promulgates classified information access eligibility policy and establishes a uniform Federal personnel security program for employees considered for initial or continued access to classified information.

Consistent with Executive Orders 13587 and 12968, this policy is applicable to all executive branch departments and agencies with access to classified information, or that operate or access classified computer networks; all employees with access to classified information, including classified computer networks (and including contractors and others who access classified information, or operate or access classified computer networks controlled by the federal government); and all classified information on those networks. This policy leverages existing federal laws, statutes, authorities, policies, programs, systems, architectures and resources in order to counter the threat of those insiders who may use their authorized access to compromise classified information. Insider threat programs shall employ risk management principles, tailored to meet the distinct needs, mission, and systems of individual agencies, and shall include appropriate protections for **privacy, civil rights, and civil liberties.**

alternative issues

Alternative causes the plan wouldn't resolve ensure they'll still be exterminated – loopholes, definitions, and the burden of proof

Patrick 10

(Patricia Patrick, PhD, “Be Prepared Before You Blow the Whistle, Protection Under State Whistle-blowing Laws”, fraud magazine, <http://www.fraud-magazine.com/article.aspx?id=4294968656>, TMP)

STATE WHISTLE-BLOWING LAWS All the U.S. states have laws to protect public employees from retaliation. Most of the state whistle-blowing laws were **enacted to encourage public employees to report fraud, waste, and abuse in government agencies.** Some laws protect only public employees; others include government contractors and private-sector employees. Most of the states also have laws **covering private-sector employees. However,** many of these laws protect reports involving workplace safety. They were enacted decades ago to protect employees from retaliation when reporting occupational safety issues. Public and private employees can use them, but they might not apply to all situations. Over the years, reporting in other specific situations has been protected. Many states enacted anti-retaliation clauses for specific claims or industries. For example, Rhode Island has anti-retaliation clauses in statutes pertaining to gaming, nursing homes, health-care facilities, nonprofit hospitals, insurance fraud, health maintenance organizations; and asbestos abatement. Anti-retaliation clauses are designed to protect public and private employees working in specific cases. THE ESSENCE OF BLOWING THAT WHISTLE Whistle-blowing, as it relates to fraud, is the act of reporting fraud, waste, and abuse. Reporting any act of wrongdoing is considered whistle-blowing, regardless if it's reported by a public or private employee or to persons inside or outside of the victim organization. Anyone can report wrongdoing, but the level of protection an employee will receive will differ depending on whether they're public or private, to whom they report, the manner in which they report, the type of wrongdoing they report, and the law under which they report. Take the Texas Whistle-blower Act, for example. It protects public employees from retaliation who report violations of law to appropriate law enforcement agencies, providing the employee files a grievance within 90 days of when the employer's adverse employment action occurred or was discovered by the employee. The employee must initiate action under the grievance or appeal process of the governmental employer before filing a lawsuit. ¶ The employee must also report the violation in good faith, prove the retaliation is the result of the whistle-blowing, and identify the laws violated and the persons engaged in the violations. Employees can be compensated for their

losses, but the entity can defend itself by asserting its actions were unrelated to the whistle-blowing. This is an affirmative defense that can be asserted by any employer. Employers using an affirmative defense will admit they took the adverse personnel action but claim the action was due to events independent of the whistle-blowing. ¶ If you find Texas' Whistle-blowing Law daunting, you're probably not alone. My review of state-level lawsuits filed by whistle-blowers shows that it's difficult to receive protection under many of the state laws.¶ RESEARCH METHOD ¶ I selected a random sample of lawsuits from the statewide cases reported in the LexisNexis database between 1994 and 2009. I keyed in the search term "whistle-blower" and found 380 cases involving whistle-blowers who sued their employers for alleged retaliation following the reporting of a wrongful act.¶ I stratified the lawsuits chronologically by state and selected every fourth case to obtain a random sample of 95 cases. I conducted a content analysis of each case to identify: 1) the type of retaliation taken against the whistle-blower 2) the type of wrongdoing reported 3) the public policy issued 4) the outcome for the whistle-blower 5) the reason the whistle-blower won/lost the lawsuit 6) whether the whistle-blower was a public servant 7) the law used to file the case.¶ MOST WHISTLE-BLOWERS ARE FIRED **Seventy-four percent** of the whistle-blowers in my review **were terminated**. Another **6 percent** were **suspended** and **5 percent** were **transferred** against their wishes. **The remaining 15 percent were given poor evaluations, demoted or harassed**. The results, summarized in Exhibit 1 (below), indicate that retaliation occurs, although this review can't determine how often. 2010-SeptOct-WB-Fig1-types of retal Approximately 60 percent of the lawsuits were filed in the past 10 years; however, it's impossible to say why employees are increasingly turning to the courts to solve their problems. Perhaps employees are reporting wrongful acts more frequently and filing more frivolous lawsuits. It's also possible that employers are committing more acts of wrongdoing and retaliating more often. Then again, it's possible the rise is due to the increasingly litigious nature of American society. **The whistle-blowers in this sample didn't fare well in their lawsuits**. **Fifty-five percent lost their cases**. **Fourteen percent lost because they failed to prove their cases**. **Eleven percent failed to prove a causal connection between the alleged retaliation and the whistle-blowing**. Only 22 percent won their lawsuits. Of these, 2 percent were reinstated to their old jobs and 8 percent won damage awards. The remaining 23 percent of the cases were remanded for a new trial. To prevail, **employees will probably have to link their whistle-blowing to the retaliation**. This can be **difficult for employees** having problems in the workplace because employers will claim their adverse personnel actions were based on the **employees' poor performances** – **not the employees' decisions to blow the whistle**. **It's especially easy for employers to assert this claim if the person who conducted the retaliation claims no knowledge of the whistle-blowing**. GET TECHNICALITIES CORRECT ¶ Twenty-two percent of the whistle-blowers lost because they didn't comply with some technicality in the laws. As discussed previously, the laws are very specific on how whistle-blowers must report the wrongdoing. Failing to comply with any aspect of the law will result in a loss of protection. ¶ Six percent of the employees lost because they failed to exhaust all their internal remedies before reporting their concerns externally. Many laws require the employee to report internally first to give the employer an opportunity to correct the matter. This minimizes the potentially devastating impact that public reports can have on organizations when the claims don't have merit or could be handled more effectively internally. Internal reports can also allow the employer to conceal the unlawful activity, if they are so inclined. ¶ Another 5 percent lost because they failed to report the act of wrongdoing correctly. Some laws require the witness to report the wrongdoing in writing within a certain period of time after it's discovered. Other laws require the whistle-blower to state

the specific laws that were broken. The purpose of these requirements is to provide the employer with specificity so it can correct the problem.

Empirically, Whistleblower protections get circumvented

Zuckerman 12,

(Jason Zuckerman is Principal of Zuckerman Law and author of the Whistleblower Protection Law Blog. He serves as Plaintiff Co-Chair of the Whistleblower Subcommittee of the ABA Labor and Employment Law Section Employment Rights and Responsibilities Committee, "Congress Strengthens Whistleblower Protections for Federal Employees",

http://www.americanbar.org/content/newsletter/groups/labor_law/ll_flash/1212_abalel_flash/lel_flash12_2012spec.html, TMP)

On November 27, 2012, President Obama signed into law the **Whistleblower Protection Enhancement Act of 2012** (WPEA),¹ which will substantially strengthen whistleblower protections for federal whistleblowers. The legislation recognizes that whistleblowers are crucial in helping to expose waste, fraud, abuse, mismanagement and threats to public health and safety across the Federal government. Their disclosures save billions of dollars and even human lives. A recent study published by the Merit Systems Protection Board (MSPB) titled, "Blowing the Whistle: Barriers to Federal Employees Making Disclosures," found that, in 2010, approximately one-third of the individuals who felt they had been identified as a source of a report of wrongdoing perceived either threats or acts of reprisal, or both.² To ensure that federal employees will come forward with vital disclosures that make the government more efficient, transparent and accountable, the WPEA removes judicially-created loopholes that significantly narrowed the scope of protected whistleblowing under the Whistleblower Protection Act;³ enhances the remedies available to government whistleblowers who have suffered retaliation; strengthens the ability of the U.S. Office of Special Counsel (OSC)⁴ to hold managers accountable for retaliating against whistleblowers; affords whistleblower protections to all Transportation Security Administration (TSA) employees; and mandates broader outreach to inform federal employees of their whistleblower rights.⁵ Clarifying the Scope of Protected Disclosures When Congress enacted the Whistleblower Protection Act of 1989, it specifically protected "any disclosure" of covered forms of wrongdoing, i.e., any information that an individual reasonably believes evidences a violation of any law, rule, or regulation; gross mismanagement; a gross waste of funds; an abuse of authority; or a substantial and specific danger to public health or safety. See 5 U.S.C. § 2302(b)(8). **But** several Federal **Circuit decisions substantially narrowed the scope of protected conduct by creating loopholes that were contrary to Congressional intent.** Those decisions include: (1) *Horton v. Dep't of the Navy*,⁶ holding that disclosures to the alleged wrongdoer are not protected; (2) *Willis v. Dep't of Agriculture*, excluding from WPA protection a disclosure made as part of an employee's normal job duties;⁷ and (3) *Meuwissen v. Dep't of Interior*, holding that **disclosures of information already known are not protected.**⁸ As pointed out in a Senate report on the WPEA, these decisions were contrary to the plain meaning of the WPA and diverted attention from the real issue in WPA cases--whether the personnel action at issue in the case occurred because of the protected disclosure.

Espionage Act checks, and empirics prove even when one complies with protections, the government circumvents through loopholes in the courts

Greenberg 14,

(Jon Greenberg is a staff writer for pundit fact, two-time award winner from the Society of Professional Journalists for investigative reporting. "Greenwald: NSA leaker Snowden has no whistleblower protection", Pundit Fact, [http://www.politifact.com/punditfact/statements/2014/jan/07/glenn-greenwald/greenwald-nsa-leaker-snowden-has-no-whistleblower-/,](http://www.politifact.com/punditfact/statements/2014/jan/07/glenn-greenwald/greenwald-nsa-leaker-snowden-has-no-whistleblower-/) TMP)

Edward Snowden, the former National Security Agency contractor who revealed the reach of American intelligence into the private lives of its citizens, **is approaching a legal turning point.** He is at the midpoint in his one-year asylum granted by Russia. What lies beyond is uncharted territory. The New York Times editorial board said the government should grant Snowden clemency and a plea arrangement that contains a limited punishment. Others, including White House National Security Adviser Susan Rice, have said Snowden should return without conditions and "have his day in court." In the view of Glenn Greenwald, the investigative journalist who was one of the first to gain access to Snowden's stolen documents, **a fair trial is the last thing that awaits the whistleblower** if he comes back without a deal. "Under the Espionage Act, you're not allowed to come into court and say 'I was justified in disclosing this information'," Greenwald said on CNN's The Lead. "There is no whistleblower exception in the Espionage Act." Greenwald's debate with Ruth Marcus of the Washington Post made for good television. But we wanted to dig deeper into Greenwald's point about Snowden. There are two pieces to this puzzle. What does the law say and could Snowden reasonably expect to tell his side of the story in a trial? Limited protections for the intelligence community **The Espionage Act of 1917** makes it a crime punishable by death or imprisonment to share "**information relating to the national defense**" with anyone who might want to do harm to the United States. Snowden faces two counts of unauthorized communication under that law. **The Espionage Act contains no explicit whistleblower protection**, said Bob Turner, a national security expert at the University of Virginia who has been critical of Greenwald and thinks Snowden should face the death penalty. However, Turned noted that while the 1917 law is silent, a law passed in 1998, the Intelligence Community Whistleblower Protection Act, does provide government workers with options. Under that law, Snowden could have raised his concerns with the Inspector General's Office at the NSA or spoken to congressional intelligence committees. A separate federal law protects whistleblowers more generally but that only applies to sharing unclassified information, not the secret materials that Snowden had in hand. "Had Mr. Snowden taken his information to the House or Senate intelligence committees, that would clearly not have violated the Espionage Act," Turner said. "And if it did, his conduct would have been protected by the more recent 1998 whistleblower statute." But others familiar with this legal landscape told us that no matter what, Snowden was still vulnerable. **The Intelligence Community Whistleblower Protection Act**, for instance, **does not prohibit agencies** from retaliating against employees, said Elizabeth Goitein, co-director of the Brennan Center's Liberty and National Security Program at New York University School of Law. Goitein said President Barack Obama helped matters slightly when he issued a presidential order preventing retaliation against federal employees. But that order did not explicitly address the rights of contractors such as Snowden. And Goitein added, neither that directive nor the whistleblower law "bars the government from criminally prosecuting whistleblowers." In 2010, NSA staffer Thomas Drake tried to use proper channels to report allegations of improper contracting but wound up the target of an investigation, said Kathleen

McClellan, the national security and human rights counsel for the Government Accountability Project, a whistleblower advocacy group. "Drake followed the Intelligence Community Whistleblower law to a 'T'," McClellan said. "He went to the Department of Defense inspector general and both congressional intelligence committees and it did not protect him from retaliation." In fact, it made him the target of an investigation. "Federal agents wrongly went after Drake in pursuit of a separate matter and charged him with multiple felonies, according to a report from the Committee to Protect Journalists. "When it became clear that whatever Drake had shared with the press was either not classified or already in the public domain, the government's felony case collapsed. A federal judge said it was "unconscionable" that Drake and his family had endured "four years of hell."" Restrictions within the courtroom Greenwald said Snowden would not be allowed to justify his actions in court. On this front, we can't offer a definitive assessment. We don't know what matters government prosecutors would permit into the courtroom, and we don't know how a judge would rule on the government's motions. However, recent trials under the Espionage Act make it clear that Snowden could expect no guarantee that he would be able to tell a jury why his violations might serve the country's national interests. What he and his lawyers could present might be tightly constrained. "The executive branch has asserted the sole authority to determine what remains a secret," McClellan said. "The way these Espionage Act prosecutions have gone, it has not been fair to the defendants. It has not followed what you would expect in a traditional trial." Turner of the University of Virginia said he thinks public sympathy for Snowden is so broad, he might do fine with a jury. "All he needs to walk free is a single juror who views him as a 'hero'," Turner said. But whether any juror would hear a single reference to Snowden's claims to a higher purpose is also unclear. In 2012, a federal judge ruled that former CIA worker John Kiriakou could not present evidence about his reasons for going public with accounts of U.S. waterboarding during interrogations. Kiriakou was charged with disclosing classified information under the Espionage Act. "Any claim that he acted with a salutary motive, or that he acted without a subversive motive, when he allegedly communicated NDI (national defense information) to journalists is not relevant to this case," the judge wrote. The trial of leaker Bradley (now Chelsea) Manning -- who gave troves of classified information to WikiLeaks -- followed similar lines, with the important difference that those proceedings took place in a military courtroom. Our ruling Greenwald said that if Snowden returned to the United States, he would have no protections under the Espionage Act and would not be allowed to justify his actions in court. In terms of the law, Greenwald is literally correct. Two other legal documents, however, could have provided Snowden some potential protections before he shared classified information with the press. But once he did, no law offers Snowden any shelter.¶ Greenwald's further claim on what Snowden could say in his defense is less clear because it depends on what government prosecutors would do. We can't assess the accuracy of any statement about future outcomes. However, it is clear that there is ample precedent to show that Snowden would have no guaranteed opportunity to explain his motivations.¶ Folding in that ambiguity, we rate the claim Mostly True.

politics

link

whistleblowing is controversial in congress but Obama is a staunch opponent and has condemned twice as many whistleblowers than all other presidents combined

Gosztola 13 (Kevin, American journalist, author, and documentary filmmaker known for work on whistleblowers and national security, "Obama's Hawkish Policy on Leaks Was Adopted to Make an Example Out of Someone," <http://firedoglake.com/2013/07/21/obamas-hawkish-policy-on-leaks-was-started-to-make-an-example-out-of-someone/>, July 21, 2013, silbs)

Congress' role in supporting the administration's crackdown has been a key factor in enabling the prosecutions of leakers. After leaks on Obama's secret "kill list," covert cyber warfare against Iran and a CIA underwear bomb plot sting operation in Yemen, the Senate, led by the typically over-zealous chairwoman of the Senate Intelligence Committee, Dianne Feinstein, pushed anti-leaks proposals. The measures could have forced intelligence agency employees to surrender their pension benefits if they were found to have disclosed information without proper authorization and prohibited certain former intelligence agency employees from taking jobs as "consultants" or entering into contracts with media organizations. However, the proposals failed to pass because Sen. Ron Wyden decided to respond to the concerns of open government and press groups. Just as he did after WikiLeaks began to release the documents that Pfc. Bradley Manning, who is on trial at Fort Meade, provided to the media organization, Sen. Joe Lieberman renewed his call for an "anti-leaks" law in America. His call for the law went nowhere. Retired general James Cartwright is being investigated for his role in leaking information on cyber warfare against Iran and the Stuxnet virus. That the administration may go after a former high-ranking general is seen as an unprecedented escalation in the war on leaks. Unmentioned in the Times story is the development of a neo-McCarthyist "Insider Threat" program that encourages all government agency employees to look over their shoulder and inform on their colleagues if they see any "indicators" that their colleagues might be spies or individuals that would leak and forsake their duty to safeguard classified information. The crackdown on leaks that threatens press freedom and government employees' First Amendment rights has been possible particularly because Obama is a Democratic president. [The Bush] Justice Department prosecuted only one official under the Espionage Act for disclosing national security secrets, a Pentagon analyst first investigated in 2004 and convicted in 2006. As a conservative, President Bush would have faced a greater public backlash had he sought to imprison leakers, said Gabriel Schoenfeld, a senior scholar with the Hudson Institute, a conservative-leaning research organization. Mr. Bush "was not willing to spend the political capital," Mr. Schoenfeld said. "This president is very hawkish on this." Progressive or liberal forces, particularly those tied into the establishment, simply are unwilling to dissent and take issue with this aggressive policy as they would if Bush was still in power or if a Republican was president. (Of course, this statement applies to his expansion of executive power around drones and a global assassination program as well as top secret government surveillance programs that violate the Fourth Amendment.) Up until former NSA contractor Edward Snowden's disclosures on secret surveillance programs, it has not been unpopular for Obama to pursue leaks aggressively. A recent Quinnipiac poll of American voters, however, found that 55 percent considered Snowden to be a whistleblower (versus 34 percent who considered him to be a traitor). Snowden is charged with violating the Espionage Act, but this poll suggests, if he ever did go on trial in the US, the public would be much less supportive of his prosecution than the prosecution of Manning. Eight Americans have been charged under the

Espionage Act by the Obama administration for leaking (seven for leaking to the press). That is more than twice as many as all previous presidential administrations combined.

Obama loves the ITP and is extremely hostile towards whistleblowers

Ditz 13 (John, journalist, “The Obama Administration's Hostility to Whistleblowers Is Both Immoral and Illegal,” http://www.huffingtonpost.com/jason-ditz/obama-insider-threat_b_3588818.html, July 16, 2013, silbs)

Faced with a public backlash at the revelation of NSA surveillance against the average American citizen, the Obama Administration has responded with a new program, dubbed the "Insider Threat" program, which aims to preempt future whistleblowers from speaking out. The system works by encouraging government workers to rat out any coworkers they suspect of being potentially inclined to blow the whistle before any leaks are even attempted, with an eye toward rooting out potential "threats" and intimidating rank-and-file workers against even daring to risk revealing information about government crimes and abuses. It wasn't supposed to be this way. President Obama ran his initial campaign on a pledge for transparency and a promise to enhance whistleblower protection, both of which have been scrapped. Instead, the administration now forwards the narrative that whistleblowers by their very nature are a threat to national security, and that all government actions that aren't explicitly publicized by the White House are secrets as a matter of course. Government hostility to whistleblowers is nothing new, of course. Though the claims of grave danger stemming from making the public and "the enemy" (in many cases the two seem identical for the career bureaucrat) never pan out, whistleblowers have always faced threats both overt and covert, and attempted retaliation from all levels of government.

Obama has aggressively cracked down on whistleblowers- he'll fight any reform

Gosztola 13 (Kevin, American journalist, author, and documentary filmmaker known for work on whistleblowers and national security, “Obama’s Hawkish Policy on Leaks Was Adopted to Make an Example Out of Someone,” <http://firedoglake.com/2013/07/21/obamas-hawkish-policy-on-leaks-was-started-to-make-an-example-out-of-someone/>, July 21, 2013, silbs)

President Barack Obama’s administration has developed a reputation for aggressively prosecuting whistleblowers or individuals responsible for national security leaks. The policy adopted by the administration was influenced by former director of national intelligence, Dennis Blair, who requested a “tally of the number of government officials or employees who had been prosecuted for leaking national security secrets,” according to the New York Times. Sharon LaFraniere of the Times reports: In the previous four years, the record showed, 153 cases had been referred to the Justice Department. Not one had led to an indictment. That scorecard “was pretty shocking to all of us,” Mr. Blair said. So in a series of phone calls and meetings, he and Attorney General Eric H. Holder Jr. fashioned a more aggressive strategy to punish anyone who leaked national security information that endangered intelligence-gathering methods and sources. “My background is in the Navy, and it is good to hang an admiral once in a while as an example to the others,” said Mr. Blair, who left the administration in 2010. “We were hoping to get somebody and make people realize that there are consequences to this and it needed to stop.” [emphasis added] Such a comment from Blair is significant because critics of Obama’s policy on leaks (including this writer) have suggested the policy on leaks was about making an example out of someone in order to send a message to others in government not to leak or think about blowing the whistle on national security policies or programs. This comment would seem to validate that suggestion. Furthermore, one notices that the “aggressive strategy to punish anyone who leaked national

security information” does not seem to have been put together with any interest in whether it was the intent of individuals to “endanger intelligence-gathering methods and sources.” The unauthorized disclosures themselves would be enough to prove that an act had taken place that needed to be punished to the greatest extent possible and create a climate similar to what might result if the nation actually had an Official Secrets Act that purely criminalized unauthorized disclosures by security or intelligence employees regardless of intent. It was found that 153 leak cases had been referred to the Justice Department. Fourteen suspects had been identified, as of 2009. Zero of those had been prosecuted. Would it be possible to have 14 suspects and decide none of them needed to be prosecuted? The decision to become much more aggressive on leaks than the previous administration of President George W. Bush was a result of high-ranking officials in the Obama administration and pressure from Congress. The answer would, therefore, appear to be “no.”

Obama will push against the aff- he’s been the most aggressive of any president on national security leaks

Masnick 13 (Mike, editor and entrepreneur, CEO and founder of Techdirt, a weblog that focuses on technology news and tech-related issues, “Obama Administration Has Declared War On Whistleblowers, Describes Leaks As 'Aiding The Enemy'”
<https://www.techdirt.com/articles/20130620/18182823551/obama-administration-has-declared-war-leakers-claims-any-leak-is-aiding-enemy.shtml>, tech dirt, silbs, June 21, 2013, silbs)

None of that has happened. Instead, as we’ve discussed repeatedly, President Obama has been the most aggressive President ever in attacking whistleblowers and bringing the full weight of the law down on them. In fact, in 2012, rather than promote protecting whistleblowers in his campaign, the campaign bragged about how it cracked down on whistleblowers: President Obama has done more than any other administration to forcefully pursue and address leaks of classified national security information.... The Obama administration has prosecuted twice as many cases under the Espionage Act as all other administrations combined. Under the President, the Justice Department has prosecuted six cases regarding national security leaks. Before he took office, federal prosecutors had used the Espionage Act in only three cases.

the Enhancement Act proves Congress is doing everything it can to prevent intelligence leaks- protections are being cut

Wilmoth 12 (Mary Jane, Secretary, Treasurer, and Public Interest Law Fellow for the National Whistleblowers Center, “Congress Slams National Security Whistleblowers Again!”
<http://www.whistleblowersblog.org/2012/12/articles/government-whistleblowers/national-security/congress-slams-national-security-whistleblowers-again/>, December 19, 2012, silbs)

As part of a House/Senate Conference approved Tuesday, Congress passed an “Enhancement Act” for Department of Defense contractors. These contractors already had a right to go to federal court and obtain a jury trial. However, this new “Enhancement Act” creates a “National Security Exception” that does not exist in the current law. The new amendment states that whistleblower protections “shall not apply to any disclosure made by an employee of a contractor, sub-contractor, or grantee of an element of the intelligence community.” See section 827(e). The Committee members also approved an amendment to expand protection previously only available to employees of DOD contractors to cover employees of all federal contractors. Although this is a significant step forward, this amendment also exempted the intelligence

committee and has a four-year sunset provision. In other words, if Congress does not reenact it in four years it terminates.

Insider threat programs have massive support from the president and congress

GAO 15 (Government Accountability Office, “INSIDER THREATS DOD Should Strengthen Management and Guidance to Protect Classified Information and Systems,”
<http://www.gao.gov/assets/680/670570.pdf>, June 2015, silbs)

Since the 2010 disclosures, Congress and the President have taken actions to try to prevent additional unauthorized disclosures of classified information by insiders. In 2011, Congress—citing damage to national security, the effect on military operations, and harm to the reputation and credibility of the United States resulting from the 2010 disclosures—called for DOD to establish an insider-threat program.⁵ In 2011, the President issued Executive Order 13587 (E.O. 13587) that directed structural reforms to ensure responsible sharing and safeguarding of classified information on computer networks consistent with appropriate protections for privacy and civil liberties.⁶ In 2012, the President issued the national insider-threat policy that required agencies to implement insider-threat programs by May 2013.⁷ A 2014 House Committee on Armed Services report included a provision that GAO assess DOD’s efforts to protect information and systems from insider threats. The President also directed each agency’s insider-threat program to include six minimum standards: (1) designation of senior official(s); (2) information integration, analysis, and response; (3) insider-threat program personnel; (4) access to information; (5) monitoring user activity on networks; and (6) employee training and awareness.⁸

the Obama administration and congress are implementing stricter reforms to prevent leaks than ever

Hexis 14 (“Federal government hopes to protect itself from insider threats.”
<http://www.hexiscyber.com/news/hot-topics/federal-government-hopes-protect-itself-insider-threats>, Hexis Cyber Solutions, silbs)

The federal government is taking steps to prove its commitment to protecting itself from insider threats, going so far as to create an official agency specifically geared toward combating this type of network vulnerability. National Insider Threat Task Force created to face new challenges To this end, the Obama Administration created the National Insider Threat Task Force, which will bring together a variety of separate but related security disciplines (link is external) in an effort to curb breaches that originate from inside federal networks, Nextgov reported. According to task force director Patricia Larsen, employees on the new team will have to be a blend of counterintelligence analyst, human resources professional and information security professional. This blend will be critical, as the task force must find a way to navigate the technological and human landscape, rooting out "bad actors" without hamstringing the work routines of compliant workers. The move to contain insider threats comes after a year of cyberattacks on federal agencies that led to employees' personal data being stolen and sensitive government and military intelligence getting leaked to the public. Investigations into the breaches showed that attackers had considerable insider knowledge. Task force creation coincides with new bill passed by Congress The creation of the National Insider Threat Task Force is just one of many examples to which one could point as a sign of the growing importance of cybersecurity in the effort to keep the U.S. safe from its enemies. On the legislative side, The International Business Times reported that the Senate recently passed a bill called The Cybersecurity Act, which would give the

Department of Homeland Security and its partners to set standards (link is external) for how agencies and private entities should handle cybersecurity. The bill will establish guidelines for protecting workers' privacy, verifying third-party software and hardware, detect insider threats, protect data stored in the cloud and monitor the network for malicious activity. As part of the overall package of legislation, a greater number of agencies will be required to implement continuous monitoring solutions as part of a standard cybersecurity arsenal, and based on an early report, this will be a big part of what the task force does going forward. Nextgov explained that the task force will need to synthesize intelligence from a wide variety of sources, including the vast troves of network data that the continuous monitoring turns up. Big data analysis will be critical to refine the algorithms that define "normal" network activity and flags potential malicious activity.

congress is cracking down on whistleblowers- all reforms are a cover to increase classifies information security and to stifle leaks

Abbott 13 (Maxwell, Counsel for CMD, "Bills in Congress Crack Down on Whistleblowers," <http://www.truth-out.org/opinion/item/20777-bills-in-congress-crackdown-on-whistleblowers>, Truth Out, December 21, 2013, silbs)

President Obama was elected on a platform that included promises for increased transparency and openness in government. Despite this rhetoric, Obama has prosecuted more whistleblowers than any administration in history and overseen the massive growth of the NSA's surveillance apparatus. In November, the Senate (S. 1681) and House (H.R. 3381) Intelligence Committees each released their own version of the "Intelligence Authorization Act for Fiscal Year 2014." This was an opportunity for Congressional leadership to address one of the defining issues of our time and either take a stand for increased transparency or continue down an Orwellian path of pervasive secrecy. A review of each chamber's proposed legislation demonstrates that "1984" is the future. Stopping "Insider Threats" The bills contain provisions which will intensify efforts to stop whistleblowers or "insider threats," no doubt inspired by Edward Snowden and his release of sensitive NSA documents. The House version of the funding bill provides \$75 million of increased funding specifically for classified information protection. According to Tom Devine, Legal Director of the Government Accountability Project, "the 'insider threat' program is a cover for a witch hunt of whistleblowers." In a purported effort to demonstrate support for the principles of openness and transparency, the House and Senate Intelligence Committee bills will provide protections for "legitimate" whistleblowers. But the committees believe legitimacy in whistleblowing is not due to the accuracy of the information disclosed, how much harm it spares the American people, or how much it benefits the democratic process, but rather whether or not the information is reported to proper authorities, such as "lawmakers, inspectors general and intelligence community leaders." Notably missing from this list is the media, and history shows that whistleblowers who do use "proper channels" first are rarely rewarded.

Katko and other republicans will hate the plan- they're focused on security breaches resulting from insider threats and want to lock down on leaks

Weiner 15 (Mark, Washington correspondent, "Rep. John Katko chairs hearing on insider threat from airline, airport employees (watch live)," February 3, 2015, http://www.syracuse.com/news/index.ssf/2015/02/rep_john_katko_chairs_hearing_on_insider_threat_from_airline_airport_employees_w.html, silbs)

WASHINGTON, D.C. -- A month after authorities charged current and former Delta Airlines employees with smuggling 153 guns onto planes, U.S. Rep. John Katko wants to know how homeland security officials will prevent future insider threats from airline and airport employees. Katko, R-Camillus, on Tuesday will lead a House Homeland Security subcommittee hearing on the issue, the first time he will chair a hearing as a member of Congress. "This hearing stems from a recent series of security breaches in which loaded firearms were brought onto commercial airplanes by employees with airport access privileges," Katko said. "Fortunately, these incidents did not end in tragedy, but there is much to be learned from what occurred." The former federal organized crime prosecutor, elected in November, spent years tackling gang violence and guns on the streets of Syracuse. Now he will use that expertise as Congress asks how airline employees could run a gun smuggling operation between airports in Atlanta and New York City. Prosecutors said guns were smuggled past security and onto 20 flights from May to September. The smuggling succeeded because some airports allow airline baggage handlers, cleaning crews and other employees to bypass Transportation Security Administration screening checks, prosecutors said. U.S. Sen. Charles Schumer, D-N.Y., last month said it is "mind boggling" that all airline employees do not pass through TSA screening before entering planes. Katko's Subcommittee on Transportation Security will meet at 2 p.m. Tuesday to hear from witnesses that include Mark Hatfield, acting deputy administrator of the Transportation Security Administration, and Gary D. Perdue, the FBI's deputy assistant director of the counterterrorism division. Miguel Southwell, general manager of Hartsfield-Jackson Atlanta International Airport, also is due to testify Tuesday. "Nearly 14 years after 9/11, terrorists have adapted to our security protocols in ways that require us to be agile, resourceful and responsive," Katko said before the hearing. "I am confident we can improve access control and employee screening measures at our airports."

Intellectual Privacy HSS

1NC

1NC — Quantitative Privacy CP

United States federal intelligence and law enforcement agencies should be required to obtain an individualized Title III “super-warrant” in order to conduct surveillance using technologies that have the capacity to facilitate broad and indiscriminate surveillance that intrudes upon reasonable expectations of quantitative privacy.

The counterplan solves the case and is net-beneficial.

First, the counterplan’s technology-based approach is the best way to protect privacy.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Granting law enforcement unfettered access to twenty-first century surveillance technologies like aerial drones, DAS, and sweeping data collection efforts, implicates these same Fourth Amendment interests. n49 This does not mean that law enforcement should be barred from conducting searches using modern surveillance technologies. Instead, in the present, as in the past, n50 all that the Fourth Amendment requires is a set of policies and practices that limit the discretion of law enforcement, provide for meaningful judicial review, and effect a reasonable accommodation of both the legitimate interests of law enforcement in preventing, detecting, and prosecuting crime, and the privacy interests of citizens subject to surveillance. n51 Here [*71] again, the work of information privacy law scholars offers important guidance in striking that balance. n52

Until now, most proposals for defending Fourth Amendment interests in quantitative privacy have focused on a case-by-case method called the “mosaic theory.” n53 Under this approach, the Fourth Amendment is implicated whenever law enforcement officers gather “too much” information during the course of a specific investigation. n54 Critics of the mosaic theory have rightly wondered how courts will determine whether investigators have gathered too much information in any given case and how officers in the midst of ongoing investigations will know whether the aggregate fruits of their efforts are approaching a Fourth Amendment boundary. n55 The best solution that mosaic advocates have so far been able to muster is to draw bright, if arbitrary, lines based on how long officers use an investigative method or technology. n56 These kinds of solutions fail to satisfy because they are under inclusive, over inclusive, and also sidestep important conceptual and doctrinal questions. n57 We therefore propose an alternative.

Rather than asking how much information is gathered in a particular case, we argue here that Fourth Amendment interests in quantitative privacy demand that we focus on how information is gathered. In our view, the threshold Fourth Amendment question should be whether a technology has the [*72] capacity to facilitate broad and indiscriminate surveillance that intrudes

upon reasonable expectations of quantitative privacy by raising the specter of a surveillance state if deployment and use of that technology is left to the unfettered discretion of law enforcement officers or other government agents. n58 If it does not, then the Fourth Amendment imposes no limitations on law enforcement's use of that technology, regardless of how much information officers gather against a particular target in a particular case. n59 By contrast, if it does threaten reasonable expectations of quantitative privacy, then the government's use of that technology amounts to a "search," and must be subjected to the crucible of Fourth Amendment reasonableness, including judicially enforced constraints on law enforcement's discretion. n60

The form and timing of Fourth Amendment constraint under our proposal would depend upon the technology at issue, the law enforcement interests it serves, and the privacy interests it threatens. n61 The most common way to implement Fourth Amendment regulations is to require officers to secure warrants from a detached and neutral magistrate before engaging in a search. n62 For some technologies, that model will remain the best approach; but it is not the only alternative. Although ultimate authority to review constitutional sufficiency must remain with the judiciary as a constitutional matter, n63 our technology-centered approach allows for a range of more bespoke arrangements. For example, Congress might create a tailored regime along the lines of the Title III Wiretap Act. n64 Alternatively, [*73] a law enforcement agency might collaborate with civil liberties groups and other interested parties to develop regulations and administrative control structures n65 similar to the consent decrees that are often used to resolve constitutional challenges against police surveillance tactics and practices. n66 As part of these efforts, designers and developers of surveillance technologies might incorporate constraints on the aggregation and retention of data along with use and access limitations, providing a set of Fourth Amendment pre-commitments that preserve law enforcement interests while minimizing threats to privacy. n67

Second, the plan's "intellectual privacy" approach fails and risks oppression.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 ("Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards," *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

Although Richards aptly captures the dangers to intellectual freedom posed by technologically enhanced surveillance, we fear his policy prescriptions are both too narrow and too broad because they focus on "intellectual activities" as a necessary trigger and metric for judicial scrutiny of surveillance technologies. n45 Our concerns run parallel to arguments we have made elsewhere against the so-called "mosaic [*267] theory" of quantitative privacy n46 advanced by the D.C. Circuit n47 and four Justices of the Supreme Court in *United States v. Jones*. n48 Our argument there supports our objection here: by focusing too much on what information is gathered rather than how it is gathered, efforts to protect reasonable expectations of privacy threatened by new and developing surveillance technologies will disserve the legitimate interests of both information aggregators and their subjects.

One reason we are troubled by Richards's focus on "intellectual activities" as the primary trigger for regulating surveillance technology is that it dooms us to contests over which kinds of

conduct, experiences, and spaces implicate intellectual engagement and which do not. n49 Is someone's participation in a message board devoted to video games sufficiently intellectual to warrant protection? What about a telephone company's records showing that someone made twenty phone calls in ten minutes' time to a particular number without anyone picking up? Would we consider the route someone took going to the library an intellectual activity? Is it the form of the activity or what is being accomplished that matters most?

Setting aside obvious practical concerns, **the process of determining which things are intellectual necessarily raises the specter of oppression.** Courts and legislators would be required to select among **competing conceptions of the good life**, marking some "intellectual" activities as worthy of protection, while denying that protection to other "non-intellectual" activities. Inevitable contests over the content and scope of "intellectual privacy" will be, by their nature, subject to the whims and emergencies of the hour. n50 **In the face of terrorist threats, decisionmakers will surely promote a narrow definition of "intellectual privacy,"** one that is capable of licensing programs like Virtual Alabama and fusion centers. Historically, decisionmakers have limited civil liberties in times of crisis and reversed course in times of peace, n51 but the post-9/11 period shows no sign of the pendulum's swinging [*268] back. Given the nature of political and judicial decisionmaking in our state of perpetually heightened security, protection, even of "intellectual privacy," is most likely to be denied to the very outsiders, fringe thinkers, and social experimenters whom Richards is most concerned with protecting. n52

Finally, the counterplan solves the case but avoids the [Third Party Doctrine DA](#).

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 ("The Right to Quantitative Privacy," *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Among the strengths of our technology-centered approach is that it can guard against these concerns without needing to effect dramatic changes to the third-party doctrine. To see why, it is necessary to say a bit more about the doctrine's conceptual structure. Although it overstates matters a bit to suggest that the third-party doctrine relies on "the premise that an individual has no reasonable expectations of privacy in information voluntarily disclosed to third parties," n477 there is no doubt that the third-party doctrine has the same basic conceptual foundation as the public observation doctrine. Although the universe of persons with whom we share information about our movements in public is, at least in theory, larger than the universe of people with whom we share, say, information about our financial transactions, in both cases the act of sharing affects our reasonable expectations of privacy. As we have argued at length in this Article, however, **surveillance technology may raise Fourth Amendment issues independent of our expectations of privacy** in the discrete bits of information gathered by that technology. The result would not be any different just because the information is shared with a small group of people rather than the public at large. In either case, **Fourth Amendment interests in quantitative privacy will be implicated if the technology used to gather the information raises the specter of a surveillance state by facilitating programs of broad, indiscriminate surveillance.**

[*142] Let us return to the example of DAS. The System's core function is to aggregate data from diverse sources, including traffic cameras, toll cameras, surveillance cameras, cell phone providers, GPS-based services, credit card companies, banks, and internet service providers. Although most of the data coming into DAS when considered discretely would not implicate reasonable expectations of privacy under either the third-party doctrine or the public observation doctrine, DAS nevertheless epitomizes the surveillance state because its very function is to facilitate a program of broad and indiscriminate surveillance. Its deployment and use should therefore be subject to Fourth Amendment regulation.

The result should not be different if the aggregator is a private entity acting as a state-agent rather than the government itself. Take as an example the data broker Acxiom, which uses proprietary technology to collect and mine a mind-boggling array of data about people from various public and third-party sources, including social network activity, property records, public-health data, criminal justice sources, car rentals, credit reports, postal and shipping records, utility bills, gaming, insurance claims, divorce records, browsing habits compiled by behavioral advertisers, and purchasing histories gathered using vendor discount cards, among other sources. n478 Chris Hoofnagle has dubbed data brokers like Acxiom as "Big Brother's Little Helpers" because government and law enforcement are among their most important clients. n479 With this level of government engagement, there is little doubt that Acxiom and its kin are state agents, at least when conducting business for or on behalf of the government. n480 Thus, Acxiom's activities should be subject to Fourth Amendment review when it is acting as an arm of the government.

None of this requires abandoning or modifying the third-party doctrine. It remains true that we have no Fourth [*143] **Amendment complaint if a third party with whom we share information gathers that information in traditional ways and passes it along to the government.** There is also no Fourth Amendment issue just because investigators collect a detailed mosaic of personal information on a suspect. Rather, **it is the means that matter.** Thus, **the Fourth Amendment would not be implicated if a third party used pen registers or similar technology to gather evidence for the government because these technologies are too limited to facilitate the sort of broad and indiscriminate surveillance characteristic of a surveillance state.** n481 **By contrast, the data aggregation technologies deployed by Verizon and other telecommunications companies to provide the FBI and the NSA with "telephony metadata" for all calls "between the United States and abroad" and all calls "wholly within the United States, including local telephone calls" n482 implicate "different constitutional principles."** n483 **By virtue of their scale and scope, these data aggregation capacities epitomize a surveillance state when put at the service of government.** n484 **Verizon's use of these technologies at the behest government agencies should therefore be subject to Fourth Amendment regulation.**

2NC

Overview/Explanation

Instead of centering privacy protection on the *type of content* being collected, the counterplan adopts a technology-centered approach. If a particular technology has the capacity to facilitate broad and indiscriminate surveillance that intrudes upon reasonable expectations of quantitative privacy, it may only be used pursuant to an individualized warrant. This is a better way to protect privacy because it broadly regulates dangerous surveillance technologies — that’s Gray and Citron.

There are two net-benefits:

One — Oppression. The plan requires the government to define what counts as an “intellectual activity.” For example, do video games count? What about travel routes? Hashing out these definitions is inherently oppressive because it requires a subjective value judgment. This takes out and turns the case because government will inevitably lawyer away protections for the dissenters and deviants that the affirmative celebrates — that’s Citron and Gray.

Two — Third Party Doctrine DA. The plan overturns the doctrine by holding that intellectual records are protected even though they have been given over to a third party. The counterplan maintains the third party doctrine because it takes a technology-centered approach — that’s Gray and Citron.

They Say: “Permute – Do Both”

1. Links to Oppression DA. The perm still requires the government to define what *does* and *doesn’t* count as “intellectual.” Only the counterplan alone avoids these definitional battles.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 (“Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards,” *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

Richards might argue that his account of "intellectual privacy" and his definition of "intellectual activities" are sufficiently capacious to obviate these concerns. Yet this very capaciousness proves our point. Whether "intellectual privacy" and "intellectual activities" will be read narrowly or broadly, and for that matter, what might constitute a narrow or broad reading, inevitably will be contested just as hotly as the borders of inclusion and exclusion. To draw a loose parallel, the debates among legal positivists and natural law theorists did not abate when Hart expanded the

descriptive scope of positivism n53 or when Dworkin did the same for naturalism. n54 To the contrary, they simply expanded the number of battlefronts so that we now see bloody contests within both camps as well as between them.

2. Links to [Third Party Doctrine DA](#). The perm holds that records are protected even though they are turned over to a third party. Only the counterplan [alone](#) takes a technology-centered approach that leaves the third party doctrine intact.

3. [No Double Solvency](#). The counterplan [alone](#) is the best way to protect intellectual privacy. The perm is [net-worse](#).

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 (“Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards,” *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

Although we live in a world of total surveillance, we need not accept its dangers -- at least not without a fight. **As Richards rightly warns, unconstrained surveillance can be profoundly harmful to intellectual privacy. It would be wrong, however, to conflate symptom and cure. What is most concerning, for us is the rapid adoption of technologies that increasingly facilitate persistent, continuous, and indiscriminate monitoring of our daily lives. Although harms to intellectual privacy are certainly central to our understanding of the interests at stake, it is this specter of a surveillance state that we think ought to be the center of judicial, legislative, and administrative solutions, not the particular intellectual privacy interests of individuals.**

They Say: “Doesn’t Solve Intellectual Privacy”

1. The Counterplan [Casts a Wider Net](#). Focusing on the [technology used](#) rather than [content collected](#) is a more effective strategy for protecting privacy.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 (“Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards,” *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

The Supreme Court has acknowledged the weight of these sorts of concerns in the context of Fourth Amendment debates. For example, in *Kyllo v. United States*, the Court was invited to limit Fourth Amendment protection to activities in the home that can be regarded as "intimate." n55 Writing for the Court, Justice Scalia demurred precisely because he thought the Court had neither the qualifications nor the authority to determine what is and is not "intimate." n56 He

therefore focused on the invasiveness of the technology itself -- a heat detection device -- and its potential to render a wide range of activities in the home, whether "intimate" or not, subject to government surveillance. n57 By our lights, this is a wise path to follow. Although we find persuasive Richards's description of the harms inflicted by totalizing surveillance on intellectual privacy, we are not persuaded that the law should use "intellectual activities" as a trigger for judicial scrutiny or as a special category for judicial treatment any more than the Court should use "intimacy" as a signal for Fourth Amendment regulation.

Rather than assigning primary importance to "intellectual activities" and presumably providing less protection against the acknowledged [*269] perils of broader types of surveillance, the law's focus should be on the dangers of totalizing surveillance. Information privacy scholars n58 and surveillance studies theorists n59 alike have long adhered to this approach, and for good reason. Technologies like Virtual Alabama and the fusion-center network amass, link, analyze, and share mass quantities of information about individuals, much of which is quotidian. What is troubling about these technologies is not what information they gather, but rather the broad, indiscriminate, and continuous nature of the surveillance they facilitate. n60 Video cameras may be trained on street corners, drugstore aisles, or a school's bathroom entrances. The information they gather likely does not implicate intellectual activities. They nonetheless create and sustain the kind of surveillance state that is anathema to liberty and democratic culture. n61 Fusion centers rely upon data-broker dossiers, much of which has nothing to do with intellectual endeavors. There is no doubt, however, that continuously streaming all of this information into the information-sharing environment facilitates the sort of broad and indiscriminate surveillance that is characteristic of a surveillance state.

2. Prefer Issue-Specific Evidence. Regulating technologies is a better way to protect intellectual privacy.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 ("Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards," *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

There are two ways we might seek to protect quantitative privacy in an age of expanding surveillance technology. One strategy would focus on the aggregations of information assembled with respect to a particular person. This "mosaic" approach presents serious practical concerns along the lines we described with regard to intellectual privacy. n75 As Professor Orin Kerr asks, where would we draw the line between aggregations that are and are not too invasive? n76 How would we treat discrete aggregations assembled by different actors if the sum of those wholes would cross the invasiveness threshold, wherever it is drawn? n77 More importantly, we do not see how this approach could actually preserve reasonable expectations of quantitative privacy. The harm is done, after all, by being watched in a totalizing way -- or by the awareness that one might be so watched. n78 Limiting the scope of information dossiers does little to address those concerns. In light of these challenges, we have argued elsewhere for regulating the technologies

themselves. n79 Our arguments there strongly suggest that Richards's [*272] goal of protecting intellectual privacy would also be better served by adopting a technology-centered approach.

3. Err Neg. The counterplan solves *without* risking the DAs. They outweigh.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 (“Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards,” *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

Here again, we think that a technology-centered approach that seeks to protect quantitative privacy is far more promising. Not only would it avoid the constitutional and practical challenges of individual litigation based on the trigger and metric of intellectual privacy, a focus on the technology would also open the door to a wide range of alternative regulatory frameworks that could more efficiently and reliably strike a reasonable compromise between the legitimate interests of government and the privacy interests of citizens. n85 For example, an independent board of experts, such as the Privacy and Civil Liberties Oversight Board (PCLOB), could perform an analysis of the privacy and civil liberties risks posed by surveillance technologies. n86 PCLOB, now fully staffed, n87 could mandate safeguards for the use of surveillance technologies that raise the specter of a surveillance state and make recommendations based on their privileged access to security analyses, piercing the veil secrecy that Richards laments. n88 Board members, vetted for top-secret national security clearances, could attain a comprehensive view of domestic surveillance technologies that [*274] would enable them to recommend procedural protections for quantitative privacy to prevent governmental abuse. n89 Such procedural protections would by nature protect the intellectual privacy interests at the heart of Richards's proposal without the drawbacks of using intellectual privacy as a trigger and metric of action.

4. Only the Counterplan Solves. The plan doesn't go far enough to curtail the surveillance state.

Citron and Gray 13 — Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, and David Gray, Associate Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, 2013 (“Addressing The Harm Of Total Surveillance: A Reply To Professor Neil Richards,” *Harvard Law Review Forum* (126 Harv. L. Rev. F. 262), May, Available Online to Subscribing Institutions via Lexis-Nexis)

The continuous and indiscriminate surveillance they accomplish is damaging because it violates reasonable expectations of quantitative privacy, by which we mean privacy interests in large aggregations of information that are independent from particular interests in constituent parts of that whole. n68 To be sure, the harms that Richards links to intellectual privacy are very much at stake in recognizing a right to quantitative privacy. But rather than being a function of the kind of information gathered, we think that the true threats to projects of self-development and

democratic culture lie in the capacity of new and developing technologies to facilitate a surveillance state.

5. Prefer NSA-Specific Evidence. The counterplan better curtails harmful surveillance.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Recognizing a constitutional interest in quantitative privacy buttresses Fourth Amendment defenses against a surveillance state. Until now, practical limitations inherent to many investigative techniques, cultural constraints on mutual surveillance, and existing Fourth Amendment doctrines have provided a virtual guarantee that traditional investigative techniques would not produce the kind of broad and indiscriminate monitoring that raises the specter of a surveillance state. There simply are not enough police officers to follow all of us all of the time. As a society, we have stalwartly resisted the temptations of mutual surveillance that sustained many totalitarian states. Fourth Amendment doctrine has also preserved an archipelago of safe spaces and activities beyond the gaze of government agents. As a consequence, we have until now sustained a fairly stable balance between government power and private citizenship that allows us to pursue projects of self-development free from fear that the government is watching.
n485

Recent technological developments, such as the NSA's broad and indiscriminate data collection, aggregation, and retention programs, New York's Domain Awareness System, aerial drones, and GPS-enabled tracking devices threaten to alter this balance. By their nature, these technologies make possible the monitoring of everyone all the time. As consequence, granting the government unfettered access to these technologies opens the door to a surveillance state and the tyranny it entails. It is therefore at the point of unfettered access to those technologies that the Fourth Amendment should intervene. As we have argued here, this technology-centered approach to quantitative privacy holds great promise in our continuing efforts to strike a reasonable balance between the competing interests of law enforcement and citizen privacy while preserving the critical service of the Fourth Amendment as a bulwark against the rise of a surveillance state.

They Say: “CP Not Enforceable”

The counterplan solves — litigation will effectively enforce restrictions on surveillance tech.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota*

Law Review (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Fourth Amendment debates about quantitative privacy have so far been dominated by discussion of the "mosaic" theory. n249 Under the mosaic theory, Fourth Amendment interests would be determined on a case-by-case basis by assessing the quality and quantity of information about a suspect gathered in the course of a specific investigation. n250 The United States Court of Appeals for the District of Columbia adopted this approach in the predecessor to *Jones*. n251 The concurring opinions in *Jones* also appear to endorse the mosaic theory. n252 In the months after *Jones*, prominent quantitative privacy advocates have come forward to expand, explore, and defend the mosaic approach. n253 At the same time, the mosaic approach has been a target for pointed criticism on both doctrinal and practical grounds. n254 We think that the Fourth Amendment and the privacy issues at stake, as we have described them here, suggest taking a different tack.

In our view, the threshold Fourth Amendment question raised by quantitative privacy concerns is whether an investigative technique or technology has the capacity to facilitate broad programs of indiscriminate surveillance that raise the specter of a surveillance state if deployment and use of that technology is left to the unfettered discretion of government. n255 There are a number of ways that the Fourth Amendment status of a surveillance technique or technology could be determined. The most obvious would be for anyone who knows that he or she has been subject to surveillance by a novel technology, or dramatically improved existing technology, to file a civil suit seeking equitable relief or even damages. n256 In such an action, [*102] a court would first need to determine whether the technology at issue should be subject to Fourth Amendment regulation. Among the important factors that a court would need to consider are: (1) the inherent scope of a technology's surveillance capabilities, be they narrow or broad; (2) the technology's scale and scalability; and (3) the costs associated with deploying and using the technology. If a court finds that a challenged technology is capable of broad and indiscriminate surveillance by its nature, or is sufficiently inexpensive and scalable so as to present no practical barrier against its broad and indiscriminate use, then granting law enforcement unfettered access to that technology would violate reasonable expectations of quantitative privacy. n257

The critical goal, of course, will be to tailor an approach that satisfies Fourth Amendment standards by reflecting a clear understanding and appreciation of both the law enforcement and privacy interests at stake. n258

Once a surveillance technology has been identified as implicating the Fourth Amendment, and a reasonable approach to limiting law enforcement's access and discretion has been devised, subsequent litigants would have the option of challenging law enforcement's conformance with the regulatory scheme (be it a warrant regime or some other means), the constitutionality of law enforcement's conduct regardless of the scheme, or both. For students of criminal procedure, there is no surprise here. After all, defendants subject to physical searches of their homes are at liberty to challenge the constitutionality of local warrant procedures, n259 the constitutionality of a warrant, n260 and [*103] even the constitutionality of law enforcement's conduct during a warranted search. n261 Thus, although the technology-centered approach to conceptualizing and defending Fourth Amendment rights to quantitative privacy proposed here is novel, its application would not require straying from well-traveled litigation pathways.

They Say: “CP Creates Confusion”

The counterplan is better at line-drawing than the plan.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Critics contend that recognizing a quantitative dimension to Fourth Amendment privacy creates thorny practical challenges. n378 Among the most nettlesome is drawing lines between quanta of information that implicate reasonable expectations of privacy and those that do not. n379 Justice Scalia levels this charge in *Jones*, pointing out that Justice Alito's concurring opinion does not explain why short-term monitoring is acceptable but "a 4-week investigation is 'surely' too long." n380 Orin Kerr has echoed Justice Scalia's concerns. n381 Kerr has also expressed reservations about how to parse mosaics that are aggregated using a variety of techniques and technologies. n382

Although these line-drawing challenges may have some traction against a mosaic theory of quantitative privacy, n383 they have no bite at all against our technology-centered proposal. Whereas a case-by-case approach to quantitative privacy requires courts to evaluate the Fourth Amendment interests implicated by individual mosaics, a technology-centered approach interrogates the potential for abuse inherent in a given surveillance technology. As new surveillance technologies become available, courts will need to determine whether those technologies have the capacity to facilitate the sorts of broad programs of indiscriminate surveillance that raise constitutional concerns about a surveillance state. If a particular technology does not raise these concerns, then the Fourth Amendment simply does not apply. If it does, then the government will only be allowed to use that technology when it can meet the demands of Fourth [*127] Amendment reasonableness. n384 To be sure, assessments of reasonableness - by balancing the interests of law enforcement and citizens - present their own challenges; but they are both familiar and inherent to Fourth Amendment itself. n385 They are also downstream struggles. Under our approach, the upstream question of whether use of a technology constitutes a search at all is answered as a general matter for that technology rather than on a case-by-case basis. n386

The counterplan is more enforceable than the plan.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Our technology-centered approach also helps to clarify or resolve other practical challenges leveled against quantitative privacy. For example, in Jones, Justice Alito argues that, "longer term GPS monitoring in investigations of most offenses impinges on expectations of privacy." n393 This suggests that whether an investigative technology constitutes a Fourth Amendment search relates in part to the seriousness of the crime under investigation. As Justice Scalia rightly points out for the majority, "there is no precedent for the proposition that whether a search has occurred depends on the nature of the crime being investigated." n394 As our technology-centered approach makes clear, however, there is simply no argumentative clash here.

Justice Scalia is surely right that the nature of the offense being investigated has no relevance to the upstream question of whether law enforcement conduct constitutes a "search." Citizens do not possess greater expectations of privacy in less serious crimes. n395 The seriousness of an offense is, however, highly relevant to the downstream question of whether a search is "reasonable." n396 As we pointed out in Part III, assessing Fourth Amendment reasonableness is a matter of balancing citizen interests with those of law enforcement. Law enforcement naturally has a weightier interest in detecting and prosecuting more serious crimes than it does for minor offenses. n397 When weighing [*129] the reasonableness of a search, the seriousness of the offense being investigated is therefore relevant. n398 Likewise, courts can, and should, consider the seriousness of the offense being investigated as a factor when determining whether law enforcement officers acted reasonably during a search or seizure. n399 Thus, a court would be far more likely to grant a warrant for GPS-enabled tracking for a month if probable cause exists to believe both that the target is directing a large drug conspiracy and that the tracking will produce additional important evidence, as was in fact the case in Jones, but less likely to grant a similar warrant for a person suspected of perpetrating occasional minor speeding offenses.

Critics might grant us these points, but argue that our technology-centered approach comes with its own baggage. For example, a skeptic might argue that focusing on the technology begets its own line-drawing problems. n400 Specifically, they [*130] might argue that DAS and drones represent easy examples of technologies that raise quantitative privacy concerns, but that courts inevitably will confront technologies whose Fourth Amendment status is not as clear. These are not new problems for Fourth Amendment law, of course. n401 To the contrary, they are endemic to the reasonableness inquiry that lies at the heart of contemporary Fourth Amendment doctrine. n402 We therefore accept the inevitability of close cases. In doing so, however, we emphasize that the systemic burden of close cases will be much lighter under a technology-centered approach than they would be under a mosaic theory. That is because, whether it is a close call or not, once the Fourth Amendment status of a technology has been established, the threshold question of whether use of that technology constitutes a Fourth Amendment search does not need to be litigated in every case where the technology is used. By contrast, under a mosaic approach, whether a particular aggregation of information constitutes a search is a question that must be litigated de novo in every case because, like snowflakes, every mosaic will necessarily be unique. n403 We are also confident that the factors for evaluating the surveillance threat posed by a particular technology, such as scale, scope, and cost, are likely to be fewer and easier to apply with greater predictability than the many variables that would inform a mosaic analysis, where the idiosyncratic dispositions of judges likely would hold more than the usual sway. n404

They Say: “CP Gets Circumvented”

The counterplan *won't* get circumvented.

Gray and Citron 13 — David Gray, Professor of Law at the University of Maryland School of Law, holds a J.D. from New York University, and Danielle Keats Citron, Lois K. Macht Research Professor of Law at the University of Maryland School of Law, Affiliate Scholar at the Stanford Center on Internet and Society, Affiliate Fellow at the Yale Information Society Project, holds a J.D. from Fordham University, 2013 (“The Right to Quantitative Privacy,” *Minnesota Law Review* (98 Minn. L. Rev. 62), November, Available Online to Subscribing Institutions via Lexis-Nexis)

Critics of our technology-centered approach might also argue that law enforcement officers and agencies acting in their strategic modes will simply avoid Fourth Amendment regulation by making minor changes to regulated surveillance technologies in an ongoing game of "technological whack-a-mole." n405 Here again, these sorts of strategic games are not without precedent. For example, the advent of designer drugs has allowed [*131] manufacturers to simply change the chemical formulation of their products to avoid criminal liability - at least until the law catches up. n406 Similar games are played in the patent world. n407 The solution in these contexts is often to focus on function rather than precise chemical structure. n408 That same approach holds considerable promise in the present context to block attempts by law enforcement circumnavigate Fourth Amendment regulations. n409

This discussion does not exhaust all of the practical challenges that proposals to defend reasonable interests in quantitative privacy must face. It nevertheless provides good grounds for believing that they can be met, and that our technology-centered approach offers a far better alternative than proposals for case-by-case methods based on the mosaic theory.

Internet Liberalization Bad Northwestern

Curtailing surveillance liberalizes the internet

(**Castro 2015**, Daniel Castro, Director for the Center for Data Innovation at ITIF, Vice President of ITIF, member of the Federal Commerce Data Advisory Council, June 2015, Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness, Information Technology and Innovation Foundation, http://www2.itif.org/2015-beyond-usa-freedom-act.pdf?_ga=1.114044933.369159037.1433787396)

The ability of companies—both tech and traditional—to easily share data across borders has brought a vast array of benefits to countries, companies, consumers, and economies through increased efficiency, decreased costs, and improved services.²⁶ And yet nations have continued to erect barriers to cloud computing and cross-border data flows, much to their own detriment.²⁷ While some defenders of these policies have asserted that they are designed to increase the privacy or security of their citizens' data, it is clear that they are also motivated by misguided self-interest. By creating rules that advantage domestic firms over foreign firms, many countries believe they will build a stronger domestic tech industry or gain short-term economic value, such as jobs in domestic data centers. In reality, these policies unwittingly limit the ability of a country's own firms to innovate by shielding them from international competition.²⁸ These policies not only limit the number of services that a country's citizens and businesses can enjoy, but also harm that country's productivity and competitiveness.[¶] Some countries used U.S. surveillance laws to justify data protectionism even before Snowden's NSA revelations. For example, when Rackspace built data centers in Australia in 2012, an Australian competitor stirred up fears that the United States would use the Patriot Act to track Australian citizens as a means to force Rackspace out of Australia.²⁹ In addition, this same Australian company funded a report calling on Australian policymakers to impose additional regulations designed to put foreign cloud computing competitors at a disadvantage.³⁰ However, since the recent NSA revelations, the use of privacy concerns to justify protectionist barriers has grown significantly.[¶] Amid growing anti-U.S. sentiment, Europe has seen calls for data localization requirements, procurement preferences for European providers, and even a "Schengen area for data"—a system that keeps as much data in Europe as possible—as ways to promote deployment of cloud services entirely focused on the European market.³¹ France and Germany have even started to create dedicated national networks: "Schlandnet" for the former and the "Sovereign Cloud" for the latter.³² The French government has gone so far as to put €150 million (\$200 million) into two start-ups, Numergy and Cloudwatt, to create a domestic infrastructure independent of U.S. tech giants.³³ Furthermore, some groups have invoked U.S. cyberespionage to argue that European citizens are not adequately protected and are calling for the removal of the "safe harbor" agreement—an agreement that allows Internet companies to store data outside of the European Union. Yet if this were removed it would cut Europeans off from many major Internet services.³⁴ There is also an increasingly distressing trend of countries, such as Australia, China, Russia, and India, passing laws that prevent their citizens' personal information from leaving the country's borders—effectively mandating that cloud computing firms build data centers in those countries or risk losing access to their markets. For example, in 2014 Russia implemented and Indonesia began considering policies that would require Internet-based companies to set up local data centers.³⁵ These policies are often a veiled attempt to spur short term economic activity by creating data-center jobs. However, this benefit is often outweighed by the substantial cost of building unnecessary data centers, a cost that is eventually passed along to the country's citizens. Several U.S. tech giants, such as Apple and Salesforce, have already started to build their data centers abroad to appease foreign watchdogs and privacy advocates.³⁶ For example, Amazon started running Internet services and holding data in Germany for its European business partners in an effort to downplay threats of online spying.³⁷ Protectionist policies in China have further strained the U.S. tech industry. In January 2015, the Chinese government adopted new regulations that forced companies that sold equipment to Chinese banks to turn over secret source code, submit to aggressive audits, and build encryption keys into their products.³⁸ While ostensibly an attempt to strengthen cybersecurity in critical Chinese industries, many western tech companies saw these policies as a shot across the bow trying to force them out of China's markets. After all, the Chinese government had already launched a "de-IOE" movement—IOE stands for IBM, Oracle and EMC—to convince its state-owned banks to stop buying from these U.S. tech giants.³⁹ To be sure, the Chinese government recently halted this policy under U.S. pressure.⁴⁰ However, the halted policy can be

seen as a part of a larger clash between China and the United States over trade and cybersecurity. Indeed, these proposed barriers were in part a quid pro quo from China, after the United States barred Huawei, a major Chinese computer maker, from selling its products in the United States due to the fear that this equipment had “back doors” for the Chinese government.⁴¹ Since the Snowden revelations essentially gave them cover, Chinese lawmakers have openly called for the use of domestic tech products over foreign goods both to boost the Chinese economy and in response to U.S. surveillance tactics. This system of retaliation has not only led to a degradation of business interests for U.S. tech companies in China, but also disrupted the dialogue between the U.S. government and China on cybersecurity issues.⁴² **RECOMMENDATIONS**¶ The free and open Internet that powers the globally networked economy is dependent on the ability of individuals and companies to engage in commerce without geographic restrictions. To turn back the tide of technology protectionism, U.S. trade negotiators will need a stronger hand to play. They cannot go to other nations and tell them to not discriminate against U.S. tech firms if the U.S. intelligence system continues to follow policies that threaten their citizens and businesses. As a result, it is incumbent on the Congress and the Obama administration to take the lead in showing the world the best standards for transparency, cooperation, and accountability.

Controlled internet key to regime stability—Middle East proves

Cheng 11, Dean Cheng is the senior research fellow at the Heritage Foundation’s center for Asian Studies and Foreign Affairs. Cheng earned a bachelor's degree in politics from Princeton University in 1986 and studied for a doctorate at MIT. “Middle East Lessons for China: Internal Stability”, 3/21/11 <<http://www.heritage.org/research/reports/2011/03/middle-east-lessons-for-china-internal-stability>>

Chinese leadership worries in this regard predate the current turmoil in the Middle East. There have been growing numbers of “mass incidents” resulting from a range of factors, including growing income inequality exacerbated by regional disparities and concerns about corruption.^[4] Chinese analysts have noted that the situation is made worse by local officials’ failure either to take responsibility for their shortcomings or undertake remedial actions promptly. Zhou Yongkang’s comments regarding the need to “detect conflicts and problems early on” suggest that this remains a problem. Zhou, whose portfolio on the Politburo Standing Committee includes maintaining law and order, emphasized the ongoing need to improve “social management.”^[5] To this end, there have been some efforts by the CCP to undertake corrective measures. In particular, the corruption issue has led to several high-profile actions. In April 2010, the mayor of Zhuanghe (in Liaoning province in northeast China) was fired after he ignored a mass protest against corruption in city government. More recently, Chinese Railway Minister Liu Zhijun was fired as part of an investigation of graft within the ministry. Liu, who had held the post since 2003, is the most senior official to be investigated on corruption charges in five years. His dismissal on the eve of the National People’s Congress likely signals a renewed anti-corruption effort. The new wrinkle in the Chinese efforts to maintain social stability—and the CCP’s hold on power—is the Internet. The ability of netizens to connect via the Internet, organize protests, and communicate information has led to a growth in “Web mass incidents (wangluo qunti shijian).” The unrest in the Middle East provides an indication of where such protests might eventually lead if the security services are unable to curtail them. In this light, American decision makers need to think about American strategic communications efforts, especially with regard to China.

CCP collapse spurs Korean War with China and US draw-in

Perkinson 12, Jessica Perkinson (Hayes) works for the Propane Education and Research Council. She was formerly the program coordinator at the Center for Asian Studies at American University. She received her MA from American University in International Relations. “The Potential For Instability in the PRC: How The Doomsday Theory Misses the Mark”, 4/19/12, <http://aladinrc.wrlc.org/bitstream/handle/1961/10330/Perkinson_american_0008N_10238display.pdf?sequence=1>

Though the potential consequences of Chinese political instability for the international community are grave and vast, there are few regions of the world whose cooperation with China is more important than that of the United States. The hegemonic leader of the international system and of all major international institutions for more than the last two decades, the stability and continuation of the US’s growing cooperation with China are more critical to the stability of the entire global order than any other relationship. Because the United States continues to grow both its economic and security commitment not only with China, but with the entire East Asian region, it is increasingly critical that

China's government maintain a stable and secure internal environment. Various aspects of US national security that could be affected by Chinese political instability include its military commitment to East Asian countries such as South Korea, 94 Taiwan and Japan, its interests in the denuclearization of Iran, and the stability of its already volatile economy. Among the US's three military commitments in the East Asian region that could be affected by political instability in China, one that has grown rapidly in recent years and continues to reap benefits for the US is its alliance with South Korea. China plays a significant role in this alliance, as it continues to balance against North Korea and prevent South Korea from being pulled into a serious conflict with the North that would call for US intervention. In order to maintain stability on the Korean Peninsula, China has continued to grow its trade with North Korea to offset the effects of international sanctions that may drive North Korea to do something drastic. As is evident from Table 2, North Korea continues to rely on China's continued stability for its own stability, which in turn affects the stability, or at least predictability, of the North-South relationship. This is critical to US national security in order to avoid being pulled into a conflict on the Korean Peninsula in which the US would have to defend South Korea from North Korea, and possibly from a China sympathetic to the North Korean plight.

U-Censorship Now

China's increasing censorship now—new restrictions prove

Dou 15, Eva Dou writes about China's technology industry for The Wall Street Journal. She covers China's cybersecurity issues. Dou previously was the Journal's technology reporter in Taiwan, "China's Great Firewall Gets Taller", 1/30/15, < <http://www.wsj.com/articles/chinas-great-firewall-gets-taller-1422607143>>

China's **government has unveiled a smarter and stricter Internet filter, riling web users and widening the divide between China's Internet and the World Wide Web.** A recent upgrade to China's web filters, commonly referred to as the Great Firewall, has made it more difficult to use services called virtual private networks to circumvent the country's blocks to U.S. services like Google and Facebook. Chinese officials confirmed a crackdown on VPNs this week, saying that new measures were needed as the Internet evolved. In the past week, major VPN providers such as Astrill have reported disruptions to their services. The move is further indication of China's desire to create a parallel Internet environment that it can more easily control. The web filters serve a dual purpose of screening out content critical of the Chinese government and providing protection for China's own growing web firms against stronger overseas rivals. The upgraded firewall also comes as Beijing is calling for U.S. technology companies to submit to intrusive security inspections, according to U.S. business groups. This time, China appears to have made the blocking of VPN connections more automated and dynamic. said Liviu, who runs a VPN service based in Romania and requested his surname to be withheld to avoid reprisal. Whereas China's firewall previously blocked connections known to be VPNs, since late last year it also appears to automatically find and block connections that it thinks are likely to be VPNs, he said. "Now it seems they are doing it automatically," he said. "You can apply some clever rules for the firewalls that will not trigger blocks."

CCP insecure now—tightening restrictions

Cook 14 Sarah Cook is the Senior Research Analyst for East Asia at Freedom House. "Stability in China: Lessons from Tiananmen and Implications for the United States" 5/15/14, < <https://freedomhouse.org/article/stability-china-lessons-tiananmen-and-implications-united-states#.VbZRe9NVjZE>>

One consistent thread that emerges from the above research is the CCP's heightened sense of insecurity and perceived threat from a wide range of content and sources. This includes information that at first glance may not appear even remotely related to the political system, but whose circulation could have profound implications for the financial and physical well-being of both Chinese citizens and foreigners. This heightened sense of insecurity and the CCP's efforts to intensify control are partly in response to growing frustration over censorship among both media workers and the Chinese citizenry at large, as well as increasing distrust of state media, particularly among younger Chinese. Meanwhile, with more than half of China's population now accessing the internet, some political content going viral despite domestic censors' efforts, and Chinese citizens getting better at

finding ways around the so-called Great Firewall, the CCP's nervousness of overseas news trickling in has increased. Yet, as the Chinese authorities expand the targets of censorship, increase the cost of non-compliance, and issue arbitrary regulatory decisions, they also risk reinforcing the very trends they fear. In many cases, public discontent over censorship or injustice does not appear to have dissipated, even if it has been pushed underground, while the actions of the authorities have provoked anger and disillusionment. From this perspective, the regime's efforts at retaining its legitimacy and hold on power in the short-term may in fact be undermining them in the medium- to long-term. Based on the new CCP leadership's actions over the past year and a half, there appears little hope of the regime significantly and voluntarily loosening information controls. On the contrary, exercising such control seems to be an even higher priority and the focus of an even more concerted effort than under the previous leadership. Any policy responses by the United States should take this into consideration as their starting point. Rather than trying to convince the Chinese authorities that information openness is to their benefit, a more effective approach would be to identify points of leverage or loopholes that take advantage of weaknesses within the censorship apparatus or proactively pressure the Chinese government to change its behavior.

Censorship Key

Internet censorship is key to stop movements

Zhang and Yen 02 Erping Zhang is the executive director at the Association for Asian Research and a Mason Fellow at Harvard University. Kaishin Yen is a writer and graduate of Columbia's School of International Affairs. "Censorship— Communist China's 'Success Story'" 12/8/2002, <<http://www.asianresearch.org/articles/938.html>>

Since June 2002, over 2,400 Internet cafes in Beijing alone have been shut down for "security reasons" and the numbers are even higher in the rest of China. All Internet services are required to install filtering software to block prohibited sites and monitor some 45 million Chinese Internet users. Why is CCP marshaling so much energy and manpower to censor the Internet? Guo Liang of the Chinese Academy of Social Sciences in Beijing told the Committee to Protest Journalists (CPJ) a couple of years ago: "Mao Zedong said that to have power you need two things: the gun and the pen ... The Communist Party has the gun, but the Internet is now the pen. If they lose control of it, something will happen to challenge their authority." Incidentally, the CPJ lists Jiang Zemin among the top ten enemies of the world press. The Party has always known that media can alter reality in the minds of the people. As far back as the 1920s, when the CCP was still in its infancy, it had already set up a Department of Propaganda modeled after Stalin's system. In 1957, Mao began his first public purge of outspoken intellectuals. Millions were sent to jail, "re-education" camps and mental institutions for expressing their opinions. Thus began the CCP's success story of muzzling the people. Mao also tried to destroy traditional Chinese culture and values in an effort to better allow the foreign transplant of Communist ideology to take root and grow. The Anti-Confucius campaign in the early 70s, for example, was aimed at removing all Confucian influence on Chinese society through burning books and denunciation of the ancient and deeply ingrained teachings. Mao also censored information from outside sources, distrusting the motives of Western nations and believing that isolation, or "self-reliance," was in the best interests of China. The Chinese people did not have access to short-wave radios until he passed away in 1976 because listening to foreign radio stations was considered an act of treason. Mao's Bamboo Curtain successfully fended off almost all information and influence from overseas, particularly from the "revisionist" Soviet Union and the "imperialist" United States, for decades. In the early 80s, Deng Xiaoping initiated economic reforms in a move towards a market economy. When Deng realized a certain degree of freedom of conscience and expression also came with the package, there were some initial setbacks with dissidents arrested and a clampdown on free speech. Nonetheless, economic reform continued with marked success and free expression among the populace also continued to find its outlets throughout the 80's. All that was to come to an abrupt end, of course, on June 4, 1989 as students were butchered by soldiers on Tiananmen Square. To this day, despite its popular support, the democracy movement is denounced by the CCP as a "counter-revolutionary rebellion." Since that time, the Department of Propaganda has beefed up its role as both the CCP's news watchdog and generator of news. Every province in China, every city, and every workplace has a propaganda division to ensure that the press and other information outlets are consistent with the message or policy from Beijing. Foreign investors in China have also received instructions that they must allow the government to set up CCP branch committees in their joint venture corporations so that Chinese employees will not be contaminated by foreign "unhealthy elements."

The Internet is a valuable tool to challenge CCP rule- Shishou riots prove its on the brink now

O'Brien 09, Robert O'Brien is a 2008 graduate of George Washington University and a current Fulbright Scholar in the People's Republic of China. "How China's Angry Youth Use the Internet to Magnify Their Voices and Impact International Relations", August 2009, < <http://www.cartercenter.org/resources/pdfs/peace/china/CEG-review-issue3.pdf>>

While the public discourse on the Internet will not directly challenge CCP rule, it may complicate governance. The scale of public protests over official corruption is likely to be increased by public use of the Internet. This can be seen in the recent cases in Shishou, where already smoldering public resentment against local officials was ignited by the death of a 24 year old resident named Tu Yuangao. Local residents and the family of Tu Yuangao's considered his death suspicious, and rumors of police and government coverage sparked public protests. News and images of the event, transmitted online via Twitter postings and pictures, helped ignite public protests and precipitate much greater public participation than would have been possible without the Internet. It is reported that 40,000 protestors took to the streets, smashing police cars and fire trucks and setting the hotel alight. The government responded by sending in 10,000-armed military police. What this incident shows is that widespread discontent can be easily influenced by information online, and while it may not lead to an organized political opposition, it can increase government costs in maintaining order. Finally looking at a longer time frame the Internet may also aid in the development of civil society and bolster public policy discourse, leading to acute pressure for an increasingly participatory form of governance. As detailed by Yang Guobin in his article The Internet and Civil Society in China: a preliminary assessment, reforms in China have resulted in the emergence of a timid civil society as social organizations have proliferated, social organizations and individuals enjoy more autonomy, and a genuine public sphere has emerged. The Internet has played a central party in this development, creating greater space for public discourse. Despite challenges and weakness in each of these achievements, this overall trend increases the development of a freer civil society and strengthens deliberative mechanisms.

Controlled internet key to regime stability—Middle East proves

Cheng 11, Dean Cheng is the senior research fellow at the Heritage Foundation's center for Asian Studies and Foreign Affairs. Cheng earned a bachelor's degree in politics from Princeton University in 1986 and studied for a doctorate at MIT. "Middle East Lessons for China: Internal Stability", 3/21/11 <<http://www.heritage.org/research/reports/2011/03/middle-east-lessons-for-china-internal-stability>>

Chinese leadership worries in this regard predate the current turmoil in the Middle East. There have been growing numbers of "mass incidents" resulting from a range of factors, including growing income inequality exacerbated by regional disparities and concerns about corruption.^[4] Chinese analysts have noted that the situation is made worse by local officials' failure either to take responsibility for their shortcomings or undertake remedial actions promptly. Zhou Yongkang's comments regarding the need to "detect conflicts and problems early on" suggest that this remains a problem. Zhou, whose portfolio on the Politburo Standing Committee includes maintaining law and order, emphasized the ongoing need to improve "social management."^[5] To this end, there have been some efforts by the CCP to undertake corrective measures. In particular, the corruption issue has led to several high-profile actions. In April 2010, the mayor of Zhuanghe (in Liaoning province in northeast China) was fired after he ignored a mass protest against corruption in city government. More recently, Chinese Railway Minister Liu Zhijun was fired as part of an investigation of graft within the ministry. Liu, who had held the post since 2003, is the most senior official to be investigated on corruption charges in five years. His dismissal on the eve of the National People's Congress likely signals a renewed anti-corruption effort. The new wrinkle in the Chinese efforts to maintain social stability—and the CCP's hold on power—is the Internet. The ability of netizens to connect via the Internet, organize protests, and communicate information has led to a growth in "Web mass incidents (wangluo qunti shijian)." The unrest in the Middle East provides an indication of where such protests might eventually lead if the security services are unable to curtail them. In this light, American decision makers need to think about American strategic communications efforts, especially with regard to China.

AT: Econ turn

Censorship is key to keep Chinese internet companies competitive

Luckerson 14, Victor Luckerson is a technology reporter for Time Magazine. Previously he was the editor-in-chief of the Crimson White Newspaper, and recipient of numerous technology and journalism awards. He received his B.S. in Journalism from the University of Alabama. “Why China Is a Nightmare for American Internet Companies”, 2/27/14, <<http://time.com/10178/why-china-is-a-nightmare-for-american-internet-companies/>>

The censorship issue presents a quandary for tech companies that often espouse free speech as part of their core ethos. It could also be a financial problem, since abiding by the government’s often vague censorship directives can be expensive. “The existing Chinese microblogging sites have had to invest in huge armies of individuals who spend their time looking through the content and determining what should or shouldn’t be removed,” says Ryan Budish, a fellow at Harvard’s Berkman Center for Internet and Society. “You can’t exactly just move in there and do business. It’s a very different framework.” LinkedIn may be better positioned to succeed in China than its competitors because of the nature of its content. It’s not exactly known as a platform for mobilizing dissidents in the same way Twitter and Facebook are. That could mean less attention from the Chinese government and less man-hours needed to comb through potentially incriminating posts. Still, there are other issues that face American Internet companies in China. The country is already heavily connected online with a variety of its own social networks. Sina Weibo, a microblogging service that serves as a kind of hybrid of Facebook and Twitter, boasts 61.4 million daily active users. WeChat, a Chinese messaging and commerce service somewhat similar to WhatsApp, has 272 million monthly users worldwide. Because the government exerts so much control over the Internet, it can easily throttle loading speeds for newcomers so they can’t easily compete with these Chinese-owned incumbents. Google services have been slowed in this way in recent years, according to the Wall Street Journal. As American companies try to finagle their way into the People’s Republic, their Chinese counterparts will arrive on American shores this year. Sina Weibo has been quietly testing an English version of its social network and is reportedly prepping a U.S. IPO for the second quarter of this year. WeChat launched a promotional campaign earlier this year to lure in more American users. Long siloed off from each other, American and Chinese Internet firms may soon become direct competitors.

Chinese internet companies are key players in China’s economy

Lewis 5/16/15 Dev Lewis is the digital media and content coordinator at Gateway House. His research focus is China and India-China relations. “From Alibaba to Xiaomi, why Modi must chase China’s booming tech companies”, <http://qz.com/406335/from-alibaba-to-xiaomi-why-modi-must-chase-chinas-booming-tech-companies/#>

Xiaomi, now the fifth largest smartphone vendor in the world, has already sold more than 1 million units in India since it entered the market a year ago. It is such a craze that at its March launch event of its latest Mi 4 phone in New Delhi, it drew a crowd of thousands of young, Indian “fans” eager to be a part of the Xiaomi story. What makes these Chinese companies so special? They are competitive, use unique marketing means, and understand technology. Xiaomi has quickly become the “hipster” alternative to existing competitors in India such as Samsung and Micromax. It has generated a buzz on social media and has been selling phones through flash sales exclusively through Indian e-retailers. Xiaomi has less than 4% of the smartphone market share in India so far, and wants to grab a larger share. Building on Indian prime minister Narendra Modi’s Make in India push, Xiaomi now plans to set up a local manufacturing unit and service centres by the end of 2015. As a further endorsement of its serious intent in India, the venerable corporate titan Ratan Tata on April 27 announced an undisclosed personal investment into the company. China’s two largest internet giants, Alibaba Holdings Group, an e-commerce company, and Tencent Holdings, an internet services and entertainment company, have noticed Xiaomi’s India success. They are already big investors in Silicon Valley—and India’s young e-commerce space is alluring for them. Alibaba, flush from a \$25 billion IPO in New York in September last year—the world’s largest—announced it would invest \$575 million into One97’s Paytm, an Indian mobile wallet, similar to Alibaba’s own very successful Alipay. It is currently in talks with Micromax, India’s largest smartphone maker, for a 25% stake, amounting to \$1.25 billion, in Micromax. What changed from the China of pure copycat companies and technology? Service became the key. Tencent has been making its own inroads into India’s growing mobile space through its flagship messaging app, We Chat (Weixin in Chinese)—hugely successful in China with 396 million users. While Whatsapp and Facebook messenger are still the dominant mobile messaging apps in India, in just under a year We Chat grew by 2,350%, and now has 27% of India’s mobile messaging market. What changed from the

China of pure copycat companies and technology? Service became the key. China's first generation of internet companies—Tencent, Alibaba, and Baidu—are playing the game with unique, innovative consumer technologies. For instance, Alibaba's Alipay, introduced in 2004, allowed users without credit cards to shop online most Chinese didn't then have credit cards. Today, Alibaba's Alipay and Tencent's Tenpay handle over \$200 billion worth of transactions and make up 60% of mobile payment in China. Alibaba is a leader in biometric identification integration into mobile payment systems and is pioneering a facial recognition software called 'smile to pay.' All these services will be a part of the infrastructure that will create the world's first e-banks—completely online banks where all transactions are conducted virtually—five of which are expected to become operational in 2015, two of which are backed by Tencent and Alibaba. Alibaba is valued at \$253 billion, Tencent at \$135 billion and Baidu at \$80 billion. They have become crucial players in the Chinese economy, driving the country towards a private capital and consumption-driven economy.

!

CCP collapse spurs Korean War with China and US draw-in

Perkinson 12, Jessica Perkinson (Hayes) works for the Propane Education and Research Council. She was formerly the program coordinator at the Center for Asian Studies at American University. She received her MA from American University in International Relations. "The Potential For Instability in the PRC: How The Doomsday Theory Misses the Mark", 4/19/12, <http://aladinrc.wrlc.org/bitstream/handle/1961/10330/Perkinson_american_0008N_10238display.pdf?sequence=1>

Though the potential consequences of Chinese political instability for the international community are grave and vast, there are few regions of the world whose cooperation with China is more important than that of the United States. The hegemonic leader of the international system and of all major international institutions for more than the last two decades, the stability and continuation of the US's growing cooperation with China are more critical to the stability of the entire global order than any other relationship. Because the United States continues to grow both its economic and security commitment not only with China, but with the entire East Asian region, it is increasingly critical that China's government maintain a stable and secure internal environment. Various aspects of US national security that could be affected by Chinese political instability include its military commitment to East Asian countries such as South Korea, 94 Taiwan and Japan, its interests in the denuclearization of Iran, and the stability of its already volatile economy. Among the US's three military commitments in the East Asian region that could be affected by political instability in China, one that has grown rapidly in recent years and continues to reap benefits for the US is its alliance with South Korea. China plays a significant role in this alliance, as it continues to balance against North Korea and prevent South Korea from being pulled into a serious conflict with the North that would call for US intervention. In order to maintain stability on the Korean Peninsula, China has continued to grow its trade with North Korea to offset the effects of international sanctions that may drive North Korea to do something drastic. As is evident from Table 2, North Korea continues to rely on China's continued stability for its own stability, which in turn affects the stability, or at least predictability, of the North-South relationship. This is critical to US national security in order to avoid being pulled into a conflict on the Korean Peninsula in which the US would have to defend South Korea from North Korea, and possibly from a China sympathetic to the North Korean plight.

China's on the brink now—censorship is the only thing stabilizing the region

Shambaugh 15 David Shambaugh is a professor of political science and international affairs at George Washington University, and is one of the United States' most prominent experts on contemporary China. The Ministry of Foreign Affairs, named him the second-most influential China expert in the United States. "The Coming Chinese Crackup", 3/6/15, <<http://www.wsj.com/articles/the-coming-chinese-crack-up-1425659198>>

On Thursday, the National People's Congress convened in Beijing in what has become a familiar annual ritual. Some 3,000 "elected" delegates from all over the country—ranging from colorfully clad ethnic minorities to urbane billionaires—will meet for a week to discuss the state of the nation and to engage in the pretense of political participation. Some see this impressive gathering as a sign of the strength of the Chinese political system—but it masks serious weaknesses. Chinese politics has always had a theatrical veneer, with staged events like the congress intended to project the power and stability of the Chinese Communist Party, or CCP. Officials and citizens alike know that they are supposed to conform to these rituals, participating cheerfully and parroting back official slogans. This

behavior is known in Chinese as biaotai, “declaring where one stands,” but it is little more than an act of symbolic compliance. Despite appearances, China’s political system is badly broken, and nobody knows it better than the Communist Party itself. China’s strongman leader, Xi Jinping, is hoping that a crackdown on dissent and corruption will shore up the party’s rule. He is determined to avoid becoming the Mikhail Gorbachev of China, presiding over the party’s collapse. But instead of being the antithesis of Mr. Gorbachev, Mr. Xi may well wind up having the same effect. His despotism is severely stressing China’s system and society—and bringing it closer to a breaking point. Predicting the demise of authoritarian regimes is a risky business. Few Western experts forecast the collapse of the Soviet Union before it occurred in 1991; the CIA missed it entirely. The downfall of Eastern Europe’s communist states two years earlier was similarly scorned as the wishful thinking of anticommunists—until it happened. The post-Soviet “color revolutions” in Georgia, Ukraine and Kyrgyzstan from 2003 to 2005, as well as the 2011 Arab Spring uprisings, all burst forth unanticipated. China-watchers have been on high alert for telltale signs of regime decay and decline ever since the regime’s near-death experience in Tiananmen Square in 1989. Since then, several seasoned Sinologists have risked their professional reputations by asserting that the collapse of CCP rule was inevitable. Others were more cautious—myself included. But times change in China, and so must our analyses. The endgame of Chinese communist rule has now begun, I believe, and it has progressed further than many think. We don’t know what the pathway from now until the end will look like, of course. It will probably be highly unstable and unsettled. But until the system begins to unravel in some obvious way, those inside of it will play along—thus contributing to the facade of stability. Communist rule in China is unlikely to end quietly. A single event is unlikely to trigger a peaceful implosion of the regime. Its demise is likely to be protracted, messy and violent. I wouldn’t rule out the possibility that Mr. Xi will be deposed in a power struggle or coup d’état. With his aggressive anticorruption campaign—a focus of this week’s National People’s Congress—he is overplaying a weak hand and deeply aggravating key party, state, military and commercial constituencies. The Chinese have a proverb, waiying, neiruan—hard on the outside, soft on the inside. Mr. Xi is a genuinely tough ruler. He exudes conviction and personal confidence. But this hard personality belies a party and political system that is extremely fragile on the inside. Consider five telling indications of the regime’s vulnerability and the party’s systemic weaknesses. First, China’s economic elites have one foot out the door, and they are ready to flee en masse if the system really begins to crumble. In 2014, Shanghai’s Hurun Research Institute, which studies China’s wealthy, found that 64% of the “high net worth individuals” whom it polled—393 millionaires and billionaires—were either emigrating or planning to do so. Rich Chinese are sending their children to study abroad in record numbers (in itself, an indictment of the quality of the Chinese higher-education system). Just this week, the Journal reported, federal agents searched several Southern California locations that U.S. authorities allege are linked to “multimillion-dollar birth-tourism businesses that enabled thousands of Chinese women to travel here and return home with infants born as U.S. citizens.” Wealthy Chinese are also buying property abroad at record levels and prices, and they are parking their financial assets overseas, often in well-shielded tax havens and shell companies. Meanwhile, Beijing is trying to extradite back to China a large number of alleged financial fugitives living abroad. When a country’s elites—many of them party members—flee in such large numbers, it is a telling sign of lack of confidence in the regime and the country’s future. Second, since taking office in 2012, Mr. Xi has greatly intensified the political repression that has blanketed China since 2009. The targets include the press, social media, film, arts and literature, religious groups, the Internet, intellectuals, Tibetans and Uighurs, dissidents, lawyers, NGOs, university students and textbooks. The Central Committee sent a draconian order known as Document No. 9 down through the party hierarchy in 2013, ordering all units to ferret out any seeming endorsement of the West’s “universal values”—including constitutional democracy, civil society, a free press and neoliberal economics. A more secure and confident government would not institute such a severe crackdown. It is a symptom of the party leadership’s deep anxiety and insecurity.

China will curtail the firewall now- WTO pressure

Holden 14, Kevin Holden is a freelance journalist based in Asia. ****Internally cites the co-directors of the European Centre for International Political Economy and Andrew Nathan, an expert on Chinese Censorship Policies at Columbia University.** “Breaking through China’s Great Firewall”, 6/30/14, < <http://thediplomat.com/2014/07/breaking-through-chinas-great-firewall/>>

This new American resolve to publicly confront Chinese hackers could also portend a growing willingness in Washington to challenge the Great Firewall in the WTO. Yet Andrew Nathan, an expert on Chinese Internet censorship policies at Columbia University, suggests that Beijing might balk at a WTO ruling that strikes down its barriers to American newspapers, British news sites and Google’s provision of access to information across the World Wide Web. “I believe that information control is too important for the Chinese government to sacrifice it,” says Nathan, who also heads Columbia’s Center for the Study of Human Rights. But the co-directors of the European Centre for International Political Economy say the chances of China’s refusing to comply with a WTO decision against its cyber-blockades are virtually zero. China’s reputation as a member in good standing of the global group is too important, they say, to jeopardize in any way. The WTO is the leading guardian of China’s expansion into a trading superpower, they add, with the People’s Republic’s worldwide trade surpassing \$4 trillion last year. With the stakes so high, China cannot afford to risk being seen as resisting the group’s rules and rulings.

No L

Self-censorship checks rebellion- and even if, citizens criticize the local government not Beijing

Zhang 15 Yuxin Zhang is a Congressional aide. Previously, he was a research fellow at Asia Policy Point, a think tank in Washington, D.C. He is the executive director of the Heisei Sedai Association of Future Leaders of East Asia. He is a member of the National Committee on US-China Relations as well as Young Professionals in Foreign Policy. “China: Self-Censorship Displaces Western Threats”, 3/3/15, < <http://thediplomat.com/2015/03/china-self-censorship-displaces-western-threats/>>

But we have entered a new millennium. If one doesn’t see harsh criticisms about the Chinese central government on Weibo or WeChat, one would assume they are being removed by the Internet “supervisors” (wang-luo-guan-li-yuan) under the leaders’ instructions (ling-dao-zhi-shi). They are not. They don’t appear because most Chinese people don’t post them. Chinese society has moved into an era of self-censorship where people themselves automatically “purify” the Internet environment. There are too many interests at stake to attack the CCP online. You could lose your job. You would be “invited” to “drink a cup of tea” (qing-he-cha, meaning you’ll be asked to have a talk with some officials in the government). You may be held in detention. You might go to prison. Your life could be at risk. By the end of 2014, more than 500 million Chinese were online. Western academics are optimistic about this number, believing advances in digital communications will revolutionize China, even though Facebook, YouTube, and Google are all blocked. Their pivotal argument is that technology makes information flow and collective action easier, citing the Arab Spring as evidence. Transnational quantitative research suggests an association between exposure to the Internet and demands for democracy in the Middle East. Yet China is different. Like Egyptians or Tunisians, Chinese people harbor anger. The difference between China and the Middle East is that general disaffection in China is more likely to be directed at local government, instead of Beijing. Unlike people in the Middle East, Chinese use the Internet in a way that helps to consolidate the CCP’s rule. Rather than criticizing the CCP or the central government, Chinese nationals choose to vent their anger at local government. Additionally, the majority has successfully been convinced that there is such a thing as a “foreign force” harming China’s national interests. Chinese people are accustomed to what I call “patriocracy,” leadership inherited from one’s predecessor or the past. As a consequence they are not highly motivated to overthrow the central

government. As long as the mechanisms of self-censorship and propaganda continue to work effectively to stabilize Chinese society, the education minister need not worry.

Alt causes—intellectual property and a culture of innovation

Bao 13 Beibei Bao is a China analyst at the Rhodium Group. “How Internet Censorship Is Curbing Innovation in China”, 4/22/13, < <http://www.theatlantic.com/china/archive/2013/04/how-internet-censorship-is-curbing-innovation-in-china/275188/>>

The hindering effect of Internet control on homegrown innovation, as Meng sees it, is far-reaching yet less explicit than causing efficiency loss or service instability. When he studied at the prestigious Peking University in Beijing, the school charged (and still charges) students \$1.50 a month for unlimited domestic Internet use, but \$14.50 for unlimited access to the World Wide Web. Meng sensibly chose the lower rate. “I didn’t need to visit foreign websites,” he explained. “Nobody talked about them, and I didn’t feel curious about them at all. It wasn’t until I came to Wandou Labs that I felt like the world was flat.” Meng’s experience wasn’t at all unusual, and it reflects something deeper in China’s Internet policy. Bishop believes the Great Firewall is simply a symptom, not the cause, of much broader issues that are actually hampering creativity and innovation across the economy. “If people say ‘if only we didn’t have the Great Firewall, we would have innovation and creativity’, I think that’s actually not true,” said Bishop. “I think the fact the Great Firewall exists is indicative of a much broader approach to how you educate people and how you manage the economy.” Bishop’s point of view resonates with that of a few other sophisticated China observers, including Wang Haiyan, the China-born and U.S.-educated managing partner of the China India Institute, a Maryland-based consultancy. Wang said that China lacks the right mix of conditions that feed real innovation, including free flow of information from across society, strong intellectual property rights, and an education and culture that encourages people to think creatively and speak up for themselves. Web censorship, she said, is only part of the government’s efforts to control information flow.

No !

CCP decline will be peaceful—spurs needed social and economic reform

Lee 15 Peter Lee writes on East and South Asian affairs and their intersection with US foreign policy. Peter Lee blogs at China Matters and his columns appear in Asia Times Online and elsewhere. “Twilight of the CCP and Shambaughism”, 3/14/15, <<http://www.internationalpolicydigest.org/2015/03/14/twilight-of-the-ccp-and-shambaughism/>> //ak

But his objective, I believe, will be to leave a party/state/economic structure that cannot easily be screwed up even by a Chinese Gorbachev. If the CCP regime collapses, I believe the regime will degrade relatively gracefully—and the longer Xi is in power and can effectively advance his agenda, the more graceful that decline will be. In particular, I believe a failure of governance at the Center will be answered by the devolution of actual power to the coastal provinces: Guangdong, Shanghai etc. Without a strong Center to restrain them and by shedding the incubus of the poorer provinces, provincial heavyweights will pursue their own paths to political power and economic advantage—that may or may not involve appeasing the urban well-to-do with political liberalization or even the hollowing-out or sidelining of the CCP, locally and eventually at the national level. But my prediction is that in the near, medium, and long term, China will be run by jerks in suits. . . just like the rest of the world. It is also a process that has little to do with the central shibboleth of Shambaughism: the need for political as well as economic reform to rescue the PRC from its looming national cul-de-sac. Or as he put it in his op-ed: “Until and unless China relaxes its draconian political controls, it will never become an innovative society and a ‘knowledge economy’—a main goal of the Third Plenum reforms. The political system has become the primary impediment to China’s needed social and economic reforms. If Mr. Xi and party leaders don’t relax their grip, they may be summoning precisely the fate they hope to avoid.” But using political reform as a diagnosis of China’s ills, and its panacea, isn’t quite a logical and evidentiary slam dunk, in my opinion. Letting 100 flowers bloom may not be the only or even the most practical way of handling the big challenges and risks that China is facing.

No CCP collapse – economic strength and lack of dissent among students

Liu 11, Yao Liu is a PhD candidate at Stanford University, specializing in political science, China, and economic studies. He was formerly a junior policy analyst for the Federal Government of Canada and received a Masters of Arts from the University of Toronto.

“Governing the Restless and Young in Contemporary China: in Search for the Chinese Communist Party’s Ruling Logic”,
1/10/11<https://tspace.library.utoronto.ca/bitstream/1807/25769/5/Liu_Yao_201011_MA_thesis.pdf>//ak

Chen Yun’s “bird cage” logic has survived and thrived in the realm of post-Tiananmen university governance: the party-state simultaneously strengthened its control measures and expanded the zone of political opportunity and tolerance.¹³⁹ For example, the reestablishment of control institutions on campus is accompanied by the creation of new outlets such as the USVO program for political participation, and heightened internet monitoring is parallel with greater toleration of subtle anti-hegemonic political expressions. Furthermore, unprecedented economic development since 1989 has allowed the party-state to be ever more responsive to, and effective in managing, potential crises which could trigger student unrest. The CCP is also, to use the word of many students, “fortunate” to have such leaders as Hu and Wen, who are capable of utilizing the media to mediate psychologically between the party’s not-so-desirable control measures and an increasingly informed and self-centered generation of university students. More than twenty years of relative tranquility in Chinese universities, with several instantaneous but well-managed bursts of nationalistic sentiments, might well suggest that the party’s cage—both institutional and ideational—is well and alive. And it really seems to be so, according to some university students themselves. The four-city, seven-university survey shows that the majority of the student respondents believe that the party’s institutions are still playing significant roles in campus governance and student life. It also unequivocally suggests that “big political ideas” promoted by the party are perhaps genuinely endorsed by the majority of the student respondents (with political fear being ruled out through statistical test). Of course, as stated at the very outset, this thesis examines only one particular aspect in contemporary state-society relationship in China, which contains a patchwork of numerous, variegated aspects and elements. Yet, I hope, by examining the state-student relationship in relative detail, that I have shed a provocative new light on the ways of looking at the overall state-society relationship. In 2007, Yu Keping—one of President Hu’s key advisors, at least allegedly—wrote his famous article “Democracy is a Good Thing”, in which he argues that the party must achieve “dynamic stability” rather than “static stability” of the society, the former of which refers to channelling people’s desires and dissents, and the latter constraining them.¹⁴⁰ In the case of governing university students, the CCP has undoubtedly experimented with both constraining and channelling. And this might become increasingly manifest in the party’s overall approach to governing Chinese society—an approach that combines both “static control” and “dynamic control”, and an approach that increasingly resembles an ever growing “bird cage”.

Econ Turn

Internet freedom key to innovation and government austerity

Bao 13 Beibei Bao is a China analyst at the Rhodium Group. “How Internet Censorship Is Curbing Innovation in China”,
4/22/13, < <http://www.theatlantic.com/china/archive/2013/04/how-internet-censorship-is-curbing-innovation-in-china/275188/>>

In the eyes of Michael Li, founder and CEO of Chuangtouquan, this inefficiency costs China dearly, especially in the area of indigenous innovation. China’s lack of innovation derives partially from entrepreneurs not knowing enough about the latest trends, something attributable to the closed nature of the country’s Internet. Slow traffic -- even with tools to hop over the Great Firewall -- also hinders creativity. For example, if people are unable to watch videos without frequent buffering on YouTube, they may get frustrated in the process of seeking inspiration. “I didn’t need to visit foreign websites. Nobody talked about them, and I didn’t feel curious about them at all.” “In this Internet era, we invested so much money and effort to build an Intranet. This is very distressing,” Li said. *** The Chinese government has invested heavily to build the Great Firewall, part of what the Ministry of Public Security called the “Golden Shield Project” that kicked off in May 2001. The project is a complex system that monitors all levels of information flow within the state and across China’s borders. Its total cost remains a state secret, but the state-run China Central Television (CCTV) was quoted by one of the participating developers, Guangdong Hong’an Group, as saying that the investment had already reached 6.4 billion RMB, or \$770 million, in 2002.

CCP Turn

Internet freedom bolsters CCP rule

MacKinnon 10 Rebecca MacKinnon is the Director of the Ranking Digital Rights project at the New America Foundation, author of "Consent of the Networked: The Worldwide Struggle for Internet Freedom", and an adjunct lecturer at the University of Pennsylvania Law School and visiting affiliate at the Center for Global Communication Studies at UPenn's Annenberg School. She received her AB in government from Harvard University. "Networked Authoritarianism in China and Beyond: Implications for global Internet freedom" 10/11/10< http://iis-db.stanford.edu/evnts/6349/MacKinnon_Libtech.pdf>

In his book *Technological Empowerment: The Internet, State, and Society in China*, Yongnian Zheng points out that the success or failure of online activism in China depends on its scope and focus, and that some online activism – particularly at the local level, or targeting specific policy issues over which there are divisions or turf-wars between different parts of the government – can actually serve to bolster regime legitimacy.¹⁷ The most spectacularly unsuccessful online movements (and the ones leading to the most brutal crackdowns both online and offline) tend to be those that advocate various forms of political "exit," including calls for an end of one-party rule by the Chinese Communist Party, and greater political autonomy or independence for particular ethnic or religious groups. When a movement or group challenges the regime's overall legitimacy, the people involved with it can expect to be silenced – either through censorship, intimidation, or arrest depending on the situation – because all power-holders in the system have a common interest in doing so. "When the regime is threatened by challengers," Zheng writes. "The soft-liners and hard-liners are likely to stand on the same side and fight the challengers."¹⁸ On the other hand, successful online movements in China are usually characterized by what Zheng calls the 'voice' option, or what other¹⁶ Ibid., p. 243¹⁷ Yongnian Zheng, *Technological Empowerment: The Internet, State, and Society in China*, (Stanford University Press, 2008)¹⁸ Ibid., p. 164¹⁰ political scientists call the "cooperation option." Such online insurgencies actually provide ammunition to reformist leaders or liberal local bureaucrats in their power struggles against hard-line conservative colleagues. "Voice" activism helps reduce political risks to reformist officials, who can point to online sentiment and argue that without action or policy change there will be more unrest and public unhappiness. Zheng writes: "The voice does not aim to undermine or overthrow the state. Instead, through a voice mechanism, the state can receive feedback from social groups to respond to state decline and improve its legitimacy."¹⁹ Thus, rising levels of online activism in China cannot automatically be interpreted as a sign of regime instability or vulnerability. Nor do rising levels of online activism necessarily signal impending democratization. One must examine what kind of online activism is succeeding and what kind of online activism is failing. If "voice" activism is for the most part succeeding while "exit" activism is systematically being stifled and crushed – thanks to high levels of systematic censorship and surveillance, in addition to the lack of an independent or impartial judiciary – one can in fact conclude that the Chinese Communist Party has adapted to the Internet much more successfully than most Western observers realize. The "Iron Curtain 2.0" mentality criticized by Tsui may indeed have blinded many Western policymakers, human rights activists, and journalists to what is really happening in China. In 2005 New York Times columnist Nicholas Kristof wrote breathlessly: "it's the Chinese leadership itself that is digging the Communist Party's grave, by giving the Chinese people broadband."²⁰ Zheng's analysis, however, supports the opposite conclusion: that the Internet is a subtle and effective tool through which the CCP is actually prolonging its rule, bolstering its domestic power and legitimacy, while enacting no meaningful political or legal reforms.

Democracy Promotion

Negative

1nc

Obama cutting democracy promotion now—funding and UN address prove

Dettmer 14 Jaime Dettmer reports about Capitol Hill, U.S. politics and national security and the American intelligence community. Currently, as well as reporting on the Mideast for the Daily Beast, he broadcasts also for Voice of America, and has variously been based out of Beirut, Tripoli and Istanbul. “Obama To Cut Middle East Democracy Programs”, 1/2/14, <<http://www.thedailybeast.com/articles/2014/01/02/obama-administration-plans-decrease-in-funding-for-middle-east-democracy-promotion.html>>

A planned decrease by the Obama administration in funding for democracy promotion and election support in the Middle East is prompting alarm among activists. They say cuts are likely to be more severe than first realized and that the White House appears to be giving up on democracy in the region and downgrading its advancement as a policy priority. In the run-up to Christmas, State Department officials briefed American non-profits funded by the U.S. Agency for International Development (USAID) about cuts in funding. They were told no money was being earmarked for democracy and governance assistance programs in Iraq and that, for Egypt, the administration was adopting a wait-and-see approach until after a January 15 referendum on a newly-drafted constitution. No extra funding for democracy promotion is being earmarked for Libya, whose transition from autocracy following the toppling of Libyan strongman Muammar Gaddafi has been plagued by lawlessness. USAID democracy programs there were cut by about half last year, following the assault on the U.S. consulate in Benghazi that led to the deaths of ambassador Christopher Stevens and three other Americans. The total amount of foreign assistance requested by the Obama administration for the Middle East and North Africa for fiscal year 2014 is \$7.36 billion, a nine percent decrease from FY2013. Of that, \$298.3 million has been requested to support democracy and governance programming across the region, a cut of \$160.9 million from FY 2013. But those briefed last month by State Department officials say the decrease in funding is likely in effect to be harsher and that it may be masked when the administration goes through with plans to re-categorize so-called D&G funding by combining it with development programs. That will make it difficult to follow what actually has been spent on democracy promotion. “We had expected big cuts in D&G to the region soon,” says Cole Bockenfeld, director of Advocacy at the Project on Middle East Democracy, a Washington DC-based non-profit. “In many ways, there was already a widespread perception that this administration was giving up on promoting democracy in the Middle East, and major cuts to democracy funding will further confirm those fears.” Overall, he says, “there is clearly a diminished focus on democracy best illustrated by Obama’s speech at the United Nations General Assembly.”

Curtailing surveillance liberalizes the internet

(Castro 2015, Daniel Castro, Director for the Center for Data Innovation at ITIF, Vice President of ITIF, member of the Federal Commerce Data Advisory Council, June 2015, Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness, Information Technology and Innovation Foundation, http://www2.itif.org/2015-beyond-usa-freedom-act.pdf?_ga=1.114044933.369159037.1433787396)

The ability of companies—both tech and traditional—to easily share data across borders has brought a vast array of benefits to countries, companies, consumers, and economies through increased efficiency,

decreased costs, and improved services.²⁶ And yet nations have continued to erect barriers to cloud computing and cross-border data flows, much to their own detriment.²⁷ While some defenders of these policies have asserted that they are designed to increase the privacy or security of their citizens’ data, it is clear that they are also motivated by misguided self-interest. By creating rules that advantage domestic firms over foreign firms, many countries believe they will build a stronger domestic tech industry or gain short-term economic value, such as jobs in domestic data centers. In reality, these policies unwittingly limit the ability of a country’s own firms to innovate by shielding them from international competition.²⁸ These policies not only limit the number of services that a country’s citizens and businesses can enjoy, but also harm that country’s productivity and competitiveness.¶ Some countries used U.S. surveillance laws to justify data protectionism even before Snowden’s NSA revelations. For example, when Rackspace built data centers in Australia in 2012, an Australian competitor stirred up fears that the United States would use the Patriot Act to track Australian citizens as a means to force Rackspace out of Australia.²⁹ In addition, this same Australian company funded a

report calling on Australian policymakers to impose additional regulations designed to put foreign cloud computing competitors at a disadvantage.³⁰ However, since the recent NSA revelations, the use of privacy concerns to justify protectionist barriers has grown significantly. Amid growing anti-U.S. sentiment, Europe has seen calls for data localization requirements, procurement preferences for European providers, and even a “Schengen area for data”—a system that keeps as much data in Europe as possible—as ways to promote deployment of cloud services entirely focused on the European market.³¹ France and Germany have even started to create dedicated national networks: “Schlandnet” for the former and the “Sovereign Cloud” for the latter. ³² The French government has gone so far as to put €150 million (\$200 million) into two start-ups, Numergy and Cloudwatt, to create a domestic infrastructure independent of U.S. tech giants.³³ Furthermore, some groups have invoked U.S. cyberespionage to argue that European citizens are not adequately protected and are calling for the removal of the “safe harbor” agreement—an agreement that allows Internet companies to store data outside of the European Union. Yet if this were removed it would cut Europeans off from many major Internet services. ³⁴ There is also an increasingly distressing trend of countries, such as Australia, China, Russia, and India, passing laws that prevent their citizens’ personal information from leaving the country’s borders—effectively mandating that cloud computing firms build data centers in those countries or risk losing access to their markets. For example, in 2014 Russia implemented and Indonesia began considering policies that would require Internet-based companies to set up local data centers.³⁵ These policies are often a veiled attempt to spur short term economic activity by creating data-center jobs. However, this benefit is often outweighed by the substantial cost of building unnecessary data centers, a cost that is eventually passed along to the country’s citizens. Several U.S. tech giants, such as Apple and Salesforce, have already started to build their data centers abroad to appease foreign watchdogs and privacy advocates.³⁶ For example, Amazon started running Internet services and holding data in Germany for its European business partners in an effort to downplay threats of online spying.³⁷ Protectionist policies in China have further strained the U.S. tech industry. In January 2015, the Chinese government adopted new regulations that forced companies that sold equipment to Chinese banks to turn over secret source code, submit to aggressive audits, and build encryption keys into their products.³⁸ While ostensibly an attempt to strengthen cybersecurity in critical Chinese industries, many western tech companies saw these policies as a shot across the bow trying to force them out of China’s markets. After all, the Chinese government had already launched a “de-IOE” movement—IOE stands for IBM, Oracle and EMC—to convince its state-owned banks to stop buying from these U.S. tech giants. ³⁹ To be sure, the Chinese government recently halted this policy under U.S. pressure.⁴⁰ However, the halted policy can be seen as a part of a larger clash between China and the United States over trade and cybersecurity. Indeed, these proposed barriers were in part a quid pro quo from China, after the United States barred Huawei, a major Chinese computer maker, from selling its products in the United States due to the fear that this equipment had “back doors” for the Chinese government.⁴¹ Since the Snowden revelations essentially gave them cover, Chinese lawmakers have openly called for the use of domestic tech products over foreign goods both to boost the Chinese economy and in response to U.S. surveillance tactics. This system of retaliation has not only led to a degradation of business interests for U.S. tech companies in China, but also disrupted the dialogue between the U.S. government and China on cybersecurity issues.⁴² **RECOMMENDATIONS** The free and open Internet that powers the globally networked economy is dependent on the ability of individuals and companies to engage in commerce without geographic restrictions. To turn back the tide of technology protectionism, U.S. trade negotiators will need a stronger hand to play. They cannot go to other nations and tell them to not discriminate against U.S. tech firms if the U.S. intelligence system continues to follow policies that threaten their citizens and businesses. As a result, it is incumbent on the Congress and the Obama administration to take the lead in showing the world the best standards for transparency, cooperation, and accountability.

Internet liberalization is democracy promotion

Fontaine and Rogers 11—Richard Fontaine is the President of the Center for a New American Security (CNAS). He served as a Senior Advisor and Senior Fellow at CNAS from 2009-2012 and previously as foreign policy advisor to Senator John McCain for more than five years. He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. Will Rogers is a senior Fellow at the Center for a New American Security, “A Foreign Policy Imperative in the Digital Age,” Internet Freedom, July 2011,

<http://www.cnas.org/files/documents/publications/CNAS_InternetFreedom_FontaineRogers_0.pdf>

Thus far, the discussion among advocates and foreign policy practitioners has revolved around “Internet freedom,” a broad rubric that encompasses online freedoms, including the rights of expression and online organization, and the potentially transformative and hotly contested role of the Internet in promoting democratization. The U.S. government now has an Internet freedom agenda, with tens of millions of dollars to implement it. Both the Senate and the House of Representatives boast global Internet freedom caucuses. The Secretary of State has given two major addresses articulating principles and policies for Internet freedom, and newspapers and periodicals have repeatedly pointed to the use of online tools both for popular protest and as a means of repression. In the midst of the 2011 Arab Spring, President Obama went so far as to describe the ability to use social networking as a “core value” that Americans believe is “universal.” Internet freedom typically includes two dimensions. Freedom of the Internet denotes the freedoms of online expression, assembly and association – the extension to cyberspace of rights that have been widely recognized to exist outside it. Promoting freedom of the Internet merely expands to cyberspace a tradition of U.S. diplomatic and financial support for human rights abroad. Freedom via the Internet, the notion that new communications technologies aid the establishment of democracy and liberal society offline, is at once more alluring and hotly contested. Internet freedom in this sense has captured the imagination of many policymakers and experts who see in these technologies a tool for individuals to help move their societies away from authoritarianism and toward democracy. Though the links between democracy and Internet freedom are indirect and complex, nascent evidence suggests that new communications tools do matter in political change, and that both dissidents and dictators act on that basis.

Democracy promotion destabilizes key regions—leads to war

Epstein, Serafino, and Miko 07 Susan B. Epstein, Nina Serafino, and Francis Miko are all specialists in Foreign Policy and Trade Foreign Affairs, Defense, and Trade Division and frequently write analyses for congress. “Democracy Promotion: Cornerstone of U.S. Foreign Policy?”, 12/26/2007, < <https://www.fas.org/sgp/crs/row/RL34296.pdf>>

Another concern about democracy promotion is that it can have a destabilizing effect on an entire region. A 2005 Harvard Study concluded that “[Our] research shows that incomplete democratic transitions — those that get stalled before reaching the stage of full democracy — increase the chance of involvement in international war in countries where governmental institutions are weak at the outset of the transition.”²⁹ At times, the region can become unstable because the transitioning country initiates cross-border attacks, or may be the victim of these attacks, particularly if it has weak democratic institutions or a weak military.³⁰ While many democracy promotion proponents assert that democracies “don’t war with each other,” a critic on the democracy peace theory, Joanne Gowa of Princeton, contends that this theory has more to do with the alignment of interests and the bipolar balance in the world after World War II than democracy/peace characteristics that many today claim exist. She says that democratic peace is a Cold War phenomenon; that is, the available data show that democratic peace is limited to the years between 1946 and 1980.³¹ She additionally points out that there are nondemocracies that do not war with each other and may be able to constrain their leaders from embarking on military actions abroad about as effectively as democracies.³²

Uniqueness

Middle East Partnership Initiative decline indicative of broader trends

Slavin 14, Barbara Slavin is the Washington correspondent for Al-Monitor and a senior fellow at the Atlantic Council, where she focuses on Iran. “Obama administration downgrades signature Mideast democracy program”, 10/9/14, <<http://www.al-monitor.com/pulse/originals/2014/10/united-states-middle-east-democracy-program.html#ixzz3hUqhkmlj>>

Established in 2002, the US-Middle East Partnership Initiative (MEPI) touts on its website its work in “18 countries and territories” and contributions of more than \$600 million to “support civil society groups, political activists, and business leaders in their efforts for political and economic reform, government transparency, and accountability projects.” The site also says that “MEPI has recently increased programming significantly in countries undergoing democratic transitions in the wake of the Arab Spring — including Egypt, Libya, and Tunisia.” However, the program — founded by Liz Cheney when she was deputy assistant secretary of state and traditionally headed by a political appointee — is now run by a career foreign service officer and has been subsumed into the larger foreign aid bureaucracy that also handles security assistance. One of two offices MEPI long operated in the region — in Tunisia — is being moved from the region’s only successful new democracy to Morocco, a monarchy. “Unfortunately, MEPI seems to be in the process of being gutted and losing its identity.” Stephen McInerney, executive director of the Project on Middle East Democracy, told *Al-Monitor*. Compared with the George W. Bush administration, the Obama administration has always had a more nuanced approach to promoting democratic reforms in the Middle East. But it retained and even enlarged some Bush-era programs such as MEPI and used them as a platform to encourage the grassroots movements that shook the region’s autocracies starting in late 2010. In its first term, the Obama administration “decided to reinvent this agenda,” Tamara Wittes, a former deputy assistant secretary of state in charge of MEPI, told *Al-Monitor*. “It was not the ‘freedom agenda’ [of George Bush] but a different way of addressing the same set of issues.” As counter-revolution and chaos turned Arab Spring into winter, however, the US approach began to shift. The biggest setback came in Egypt, where Mohammed Morsi, the country’s first freely elected president, was overthrown by the military in 2013. Since then, Egypt has jailed tens of thousands of members and supporters of the now-outlawed Muslim Brotherhood and severely clamped down on freedom of association and expression by other dissident groups. McInerney attributes the reorganization of foreign aid to the Middle East to former US ambassador to Egypt Anne Patterson, who served in Egypt during a roller coaster period and faced strong Egyptian government opposition to US civil society promotion. During her tenure, 16 Americans who had been working for US organizations, including the International Republican Institute and Freedom House, were tried and convicted — most in absentia — of using foreign funds to foment unrest. Patterson left Egypt and was confirmed as assistant secretary of state for the Bureau of Near Eastern Affairs in late 2013. In her first interview after taking that position, she told *Al-Monitor* that it was “certainly no secret that we’re concerned about freedom of the press, freedom of association, all the fundamentals that are being thrown into question right now in Egypt,” but also said the United States would focus on promoting economic development. “The decline [in the emphasis on democracy promotion] accelerated over the past year — the time when Anne Patterson came back and became assistant secretary,” McInerney said. “MEPI’s demise is indicative of a broader backing off from supporting civil society and falling back into the old pattern of not antagonizing old allies.”

Executive discussions of democracy rarely translate into action

Goldfarb 14, Zachary Goldfarb is the Policy Editor at *The Washington Post*. He has primary responsibility for *Wonkblog* and the paper’s economics coverage, while also working on other public policy issues. Previously, he was a White House and economics correspondent. He graduated from the Woodrow Wilson School of Public and International Affairs at Princeton, where he was editor-in-chief of *The Daily Princetonian*. “Obama, like predecessors, faces tough choices on promoting democracy”, 6/4/14, <http://www.washingtonpost.com/politics/obama-like-predecessors-faces-tough-choices-on-promoting-democracy/2014/06/04/3d9cc4cc-ebfa-11e3-9f5c-9075d5508f0a_story.html>

But the truth is far more complicated. Obama, like presidents before him, has made uncomfortable choices in deciding when to promote democracy and when to compromise those principles for other interests. His soaring rhetoric Wednesday also creates expectations that he might find difficult to meet, given his hesitance to use military force and his attention to other pressing issues. Such tensions are on display this week, which marks the 25th anniversaries of Poland’s first free elections, which the United States supported, and of China’s brutal crackdown on democracy protesters in Tiananmen Square, which the United States largely ignored. Obama has used diplomacy and, on one occasion, military action to support democratic movements in places as varied as Libya, Burma and Ukraine. But more often, he has decided to work with regimes that are authoritarian (Saudi Arabia and China) or turning that way (Egypt and Russia) because of other U.S. priorities. “His democracy promotion is a study in schizophrenia — like foreign policy before him,” said Timothy J. Lynch, a University of Melbourne professor who has co-edited a book on U.S. democracy promotion. During Obama’s tenure, democracy has continued a long stagnation, with just 122 of 193 countries — or 63 percent — counting as representative democracies, according to Freedom House, a nonprofit watchdog group. That level has remained essentially constant since the mid-1990s, when democratic movements around the globe unleashed dozens of newly free

countries. “Obama seems to have under-reached,” Larry Diamond, a senior fellow at Stanford University’s Hoover Institution, said in an e-mail. “He clearly cares about democracy, civil society and human rights, and often speaks eloquently about these values. But at a time when these are clearly in retreat around the world, one sees little sense of an overall Obama strategy to renew global democratic progress and counter the efforts of Russia, China and Iran to suppress and subvert democratic movements worldwide.”

IL

Democracy promotion bad—

Backlash

Carothers 15 Thomas Carothers is the Vice President for Studies at Carnegie Endowment for International Peace. He received his J.D. and AB from Harvard University, and his MSc from the London School of Economics. Carothers is a leading authority on international support for democracy, human rights, governance, comparative democratization, and U.S. foreign policy relating to democracy and human rights. “Democracy Aid at 25: Time to Choose”, 1/13/15, <<http://carnegieendowment.org/2015/01/13/democracy-aid-at-25-time-to-choose>>

Closing of doors: When some governments that had previously allowed in significant amounts of prodemocracy aid began pushing back against it in the early 2000s, observers thought this might be a short-term phenomenon. The George W. Bush administration’s emphasis on democracy promotion in its intervention in Iraq, along with Western support for some of the civic groups that were active in the “color revolutions” in Georgia, Kyrgyzstan, and Ukraine, had triggered heightened sensitivities about democracy aid in various places, especially Russia and other post-Soviet countries. But even as the color revolutions faded into the past and a new U.S. president took a far less assertive stance on democracy promotion, the backlash kept growing. In just the past few years, dozens of governments, in every region of the world, have been taking a medley of formal and informal measures to block, limit, or stigmatize international aid for democracy and human rights, especially civil society support, political-party work, and election monitoring. Aid from the United States is sometimes the principal target, as in 2013 when the Bolivian government charged that USAID was meddling in politics and ordered it to leave the country. Yet the backlash is hitting other providers as well: To cite just one of many examples, the Hungarian government recently began harassing Hungarian civil society organizations for their acceptance of Norwegian government funding. Pushback—which is often strongest in countries where democratization is in trouble and outside assistance is most badly needed—has multiple negative effects. Most obviously, it often prevents democracy-aid providers from operating. Central Asian governments, for instance, decided about a decade ago to limit externally sponsored aid for civil society development, and looking around the region today one sees a greatly reduced pool of such aid. Restrictive measures by Egypt and some other Arab countries have similarly reduced outside support for nongovernmental organizations in their territories. Even when pushback does not reduce the amount of democracy aid that reaches a country, it may end up changing the type of democracy support that is offered. To avoid problems, democracy promoters may hold back from politically challenging types of assistance, such as aid for independent human-rights groups or media organizations, and limit themselves to soft-focus governance programming. Similarly, pushback may cause some activist groups receiving democracy aid from abroad to avoid activities that they fear their governments may find too challenging.

Competition from authoritarian states

Carothers 15 Thomas Carothers is the Vice President for Studies at Carnegie Endowment for International Peace. He received his J.D. and AB from Harvard University, and his MSc from the London School of Economics. Carothers is a leading authority on international support for democracy, human rights, governance, comparative democratization, and U.S. foreign policy relating to democracy and human rights. “Democracy Aid at 25: Time to Choose”, 1/13/15, <<http://carnegieendowment.org/2015/01/13/democracy-aid-at-25-time-to-choose>>

The troubles of Western democracies: The struggle of Western liberal democracy to maintain the unrivaled pride of place that it enjoyed in the 1990s also affects democracy aid. Democracy’s travails in both the United States and Europe have greatly damaged the standing of democracy in the eyes of many people around the world. In the United States, dysfunctional political polarization, the surging role of money in politics, and distortions in representation due to gerrymandering are particular problems. In Europe, the euro crisis, the rise of extremist parties, and challenges surrounding the social integration of minority communities are raising doubts about democracy’s health. At the same time, the growing self-confidence and assertiveness of other political systems,

especially authoritarian or semiauthoritarian regimes in China, Russia, Turkey, Ethiopia, and elsewhere, are making some people in transitional countries wonder whether the keys to decisive governance and economic dynamism do not in fact lie down some path other than that of liberal democracy. These developments inevitably weaken Western democracy-aid efforts. A U.S. group going abroad to offer advice and training on how to strengthen a country's parliament will face punishing questions about the credibility of its offerings given the manifest deficiencies and unpopularity of the U.S. Congress. The same will be true for a European group seeking to help another country bridge a sectarian divide based on religious differences. Of course, smart democracy assistance does not seek to export a particular national model but instead offers insights gleaned from comparative experiences and tries to help locals craft their own solutions. Nevertheless, all Western democracy promoters must work harder than before to establish their credibility in other parts of the world, and in some quarters (East Asia, for example) they sometimes barely receive a hearing. Moreover, they can no longer assume that their task is to help local actors move ahead with democracy. Instead, they now often face the harder, more fundamental task of convincing locals that democracy is preferable to other systems. Furthermore, Western democracy promoters are increasingly finding their efforts challenged and sometimes undercut by nondemocratic powers intent on influencing the political trajectories of other countries. A Western-sponsored anticorruption program in an African country may be outweighed by the deleterious effects on governance of a Chinese economic-aid package that creates perverse political-economy incentives. A program to help create a level playing field among political parties in an Arab country may be undermined by large streams of Iranian or Gulf money flowing to one of them. An undertaking to support free and fair elections in a Latin American country may be distorted by Venezuela's engagement aimed at tilting the elections toward a preferred candidate. Russia, China, Iran, the United Arab Emirates, Saudi Arabia, Venezuela, Qatar, Rwanda, Ethiopia, and other nondemocratic countries seeking heightened influence in the political life of their neighbors (or further afield) are not always bent on checking the influence of Western democracy-promotion efforts. And their actions are not necessarily aimed at promoting autocracy per se. But often they do cut against Western democracy aid and push other countries in an antidemocratic direction. Western democracy aid, having come of age at a time when it was often the dominant external form of political influence in most transitions, is now facing a markedly harsher, more competitive environment.

No momentum

Carothers 15 Thomas Carothers is the Vice President for Studies at Carnegie Endowment for International Peace. He received his J.D. and AB from Harvard University, and his MSc from the London School of Economics. Carothers is a leading authority on international support for democracy, human rights, governance, comparative democratization, and U.S. foreign policy relating to democracy and human rights. "Democracy Aid at 25: Time to Choose", 1/13/15, <<http://carnegieendowment.org/2015/01/13/democracy-aid-at-25-time-to-choose>>

A loss of democratic momentum: The global stagnation of democracy is one of the most significant international political developments of the past decade. Democracy's failure to keep expanding has hurt the democratic-assistance field in at least two ways. First, it has sapped energy and impetus. Democracy-aid providers know that tough cases in which transitions are blocked or never really get underway are facts of life. What compensates for them are the promising cases—the times and places when democracy does break through and gain a foothold. These exciting opportunities are crucial. They make other parts of the policy community take notice, and indeed give life and force to the whole democracy-assistance enterprise. Over the past ten years, the flow of such good news has slowed to a trickle. Stories about how the democratic spirit is manifesting itself in this or that surprising place have been cast into shadow by persistent democratic deficiencies or backsliding in Afghanistan, Hungary, Iraq, Mali, Russia, Sri Lanka, Thailand, and many other places. For a short time in 2011, the "Arab Spring" looked as if it might be the start of a new global democratic wave, but that initial burst of hope has given way to pessimism. Now, many Western policy makers and analysts are asking whether efforts to foster democracy in the Arab world even make sense given the instability and conflict that political change has brought. With the democratic cause stalled (or even losing ground) around the world, democracy-aid providers must battle a growing sense in the Western policy community that the historical moment for democracy aid has passed. Furthermore, the loss of democratic momentum raises questions in the wider policy community about the impact of democracy aid. The welter of factors that affect transitions makes it problematic to assess the effect of such aid based just on democracy's macro-level progress. Yet when democracy is on the rise in many places, democracy aid almost inevitably gains credibility by association. And when democracy is faring poorly in the world, hard questions about the effectiveness of democracy assistance are asked. Some recent or ongoing cases offer sobering examples of the limits of democracy aid: In Russia, long-term benefits from the wide range of Western

democracy programs that got underway in the 1990s and operated into the last decade—including rule-of-law aid, electoral aid, political-party building, work with independent media, and support for civil society—may not be entirely absent, but they are certainly limited at best. For years, Western aid providers held up Mali as one of Africa’s democratic success stories. Yet the vertiginous collapse of the Malian government in 2012 underlined how hollow even apparent success stories of democracy support can be. The United States and others have provided substantial rule-of-law aid to El Salvador for thirty years. Despite this, El Salvador today is notoriously beset by shockingly high crime levels that have overwhelmed its criminal-justice system.

Democracy promotion spurs international backlash

Carothers 06 Thomas Carothers is the Vice President for Studies at Carnegie Endowment for International Peace. He received his J.D. and AB from Harvard University, and his MSc from the London School of Economics. Carothers is a leading authority on international support for democracy, human rights, governance, comparative democratization, and U.S. foreign policy relating to democracy and human rights. “The Backlash Against Democracy Promotion”, March/April 2006, <<https://www.foreignaffairs.com/articles/2006-03-01/backlash-against-democracy-promotion>>

The most systematic and forceful resistance to Western democracy aid has come from Russia under Putin. The NGO law is just one of a series of recent actions Moscow has taken to constrain or challenge democracy-promotion groups. The Kremlin has also attacked the Organization for Security and Cooperation in Europe (OSCE) for its election-monitoring work in Russia and neighboring countries. Several U.S. democracy-promotion groups have experienced minor but pointed harassment from Russian authorities. Putin's government has criticized Russian NGOs working on human rights or other politically sensitive issues for accepting outside funds, and senior Russian officials have denounced external democracy aid as subversive and anti-Russian. President Putin has also taken to warning fellow autocrats in surrounding countries of the dangers of allowing such aid, and Russia has started building its own capacity to provide parallel forms of assistance, through election monitors and political consultants. Putin's supporters have cast his campaign against pro-democracy groups as a security imperative, asserting that the United States is trying to encircle Russia with pro-Western governments and subvert its political order. Russia is not the only country pushing back against Western democracy assistance; the resistance has become a widespread post-Soviet pastime. Uzbek President Islam Karimov is currently in the process of shutting down most of the Western democracy programs in his country, as well as most of the domestic NGOs that work on democracy issues: in 2005, more than 60 percent of Uzbekistan's active NGOs were put out of business. Articles in the state-controlled media have accused the United States of trying to undermine Uzbek sovereignty through the Trojan horse of democratization. Meanwhile, in Belarus, President Aleksandr Lukashenko has also forbidden most external political aid and has relentlessly stamped out political challengers and independent civil society. After first putting all foreign funding destined for local NGOs under state control, in 2003, Lukashenko banned foreign funding of any political or educational activities in the country. The Tajik government announced new regulations in April 2005 requiring foreign embassies and foreign organizations working in the country to give the authorities notice before making any contact with local political parties, NGOs, or media organizations. Government-controlled newspapers in Tajikistan have accused the United States of criminality in its support for Ukrainian and Kyrgyz activists and have praised Belarus for its resistance to Western interference. Nearby in Kazakhstan, President Nursultan Nazarbayev has enacted similarly tight restrictions on cooperation between foreign entities and Kazakh political parties. In a speech last September, he added his voice to the regional chorus warning foreign NGOs not to try to destabilize former Soviet states. The backlash against democracy aid has also started to spread outside the former Soviet Union. One enthusiastic participant is China. Last April, an article in the People's Daily condemned the United States' "democratic offensive" in the former Soviet Union and elsewhere as self-serving, coercive, and immoral. The following month, the Chinese Communist Party reportedly mapped out a strategy for resisting U.S. and European efforts to promote color revolutions in China and its neighborhood. Beijing has delayed the passage of a new law that would liberalize the rules on NGOs in the country and has cracked down on various local groups that receive foreign funding, including a human rights group supported by the National Endowment for Democracy (NED), a private foundation funded by the U.S. government devoted to supporting democracy worldwide. Beijing is also tightening restrictions on foreign media by stepping up measures to scramble external radio broadcasts and reversing an earlier decision to allow the local publication of foreign newspapers. Elsewhere in Asia, governments have enacted similar restrictions: in Nepal, for example, after 15 years of relative openness to Western democracy programs, the government recently issued new regulations sharply restricting such activities. The backlash is spreading to Africa as well. Zimbabwean President Robert Mugabe has driven out Western NGOs and forced the closure of many local groups that get external support, claiming that they are fronts through which Western "colonial masters" subvert the government. In December 2004, Zimbabwe's parliament passed legislation

prohibiting local NGOs from receiving any outside aid. Mugabe has not yet signed the bill but has kept up his rhetorical attacks on alleged Western meddling. Further north, Ethiopia expelled the IRI, the NDI, and IFES (formerly the International Foundation for Election Systems) prior to national elections last May. Prime Minister Meles Zenawi stated on Ethiopian television that "there is not going to be a 'Rose Revolution' or a 'Green Revolution' or any color revolution in Ethiopia after the election." And in Eritrea, the government enacted a new law last year forbidding local NGOs from engaging in any work other than relief activities and blocking them from receiving external support. In August, Asmara asked the U.S. Agency for International Development to cease operations in the country, stating that it was uncomfortable with the agency's activities, which include promoting citizen participation in economic and political life. In South America, Venezuelan President Hugo Chávez regularly blasts U.S. democracy promotion as being part of a Bush administration campaign to oust him. Chávez has accused groups such as the NED and the IRI of supporting the Venezuelan opposition and has intimidated many local NGOs that receive outside funding. And like Putin, Chávez is not content just to block U.S. aid at home. He has allegedly used his petrodollars to support anti-American parties and candidates in Bolivia, Ecuador, Peru, and elsewhere, in the hope of spreading what he calls his "Bolivarian Revolution." Although Chávez remains an extreme case, wariness of U.S. democracy promotion is rising in the region, which is rife with anti-Americanism and increasingly dominated by left-leaning governments. The rejection last year by the Organization of American States of a U.S. proposal to establish a new regional mechanism to monitor governmental compliance with democratic norms reflected this growing skepticism.

Impatient democratization causes instability—this is isolated from their generic democracy good arguments

Kupchan and Mount 09, Charles Kupchan is Professor of International Affairs in the School of Foreign Service and Government Department at Georgetown University. He is also Whitney H. Shepardson Senior Fellow at the Council on Foreign Relations. Kupchan was Director for European Affairs on the National Security Council during the first Clinton administration. Before joining the NSC, he worked in the U.S. Department of State on the Policy Planning Staff. Prior to government service, he was an Assistant Professor of Politics at Princeton University. Adam Mount is a Stanton Nuclear Security Fellow at the Council on Foreign Relations where he is writing a profile of nuclear disarmament in the United States. "The Autonomy Rule", Spring 2009, <<http://www.democracyjournal.org/pdf/12/Kupchan.pdf>>

Policies of impatient democratization, however, will do much more to impede than impel history's advance. From the Balkans to Iraq to the Palestinian territories, a rush to the ballot box has undercut moderates and stoked sectarian and ideological cleavages, not furthered the cause of political stability. Washington should continue to promote democracy by example and incentive. But if the United States insists on universal adherence to the Western order it oversees, it will only compromise its persuasive appeal and its ability to help ensure that liberal democracy ultimately wins the long struggle against alternative systems of government. Instead, the United States should take the lead in constructing a more pluralist international order. Were Washington to orchestrate the arrival of this next order, it would not denigrate the accomplishments of democracy, but rather demonstrate an abiding confidence in the values the West holds dear and in the ability of liberal forms of government to outperform and ultimately prevail against authoritarian alternatives. Cultivating new stakeholders, carefully devolving international responsibility to regional actors, and placing the international economy on a more stable footing will also allow democracy. The Autonomy Rule the United States the respite needed to focus on rebuilding the foundations of its own prosperity. The United States will be better off if it gets ahead of the curve and helps craft a new order that is sustainable than if it fights a losing battle against tectonic shifts in global politics. As Kissinger observes, "America needs to learn to discipline itself into a strategy of gradualism that seeks greatness in the accumulation of the attainable." The United States can steward the onset of this more diverse and inclusive world in a manner that remains consonant with the deepest American values. Doing so would help restore America's moral authority as a leading member of the community of nations, in the end making it more likely that other nations would be as respectful of America's preferences as America should be of theirs.

!

Third party mediation key to effective democracy promotion—aggressive practices just reinforce unstable regimes

Katulis 09, Brian Katulis is a Senior Fellow at American Progress, where his work focuses on U.S. national security policy in the Middle East and South Asia. Katulis has served as a consultant to numerous U.S. government agencies, private corporations, and nongovernmental organizations on projects in more than two dozen countries, including Iraq, Pakistan, Afghanistan, Yemen, Egypt,

and Colombia. "Democracy Promotion in the Middle East and the Obama Administration", 2009, <
<http://www.tcf.org/assets/downloads/tcf-Katulis.pdf>>

The set of conflicts that is most directly relevant to the goal of reviving democracy promotion efforts in the Middle East is internal divisions in countries. Several countries of the Middle East—including Iraq, Lebanon, and the Palestinian territories—lack a strong consensus over sharing power between leading factions. In some cases, such as Iraq, the tensions among competing factions remain quite strong,¹¹ and in other countries, such as Lebanon, the internal divides lurk beneath the surface and threaten to upset a tenuous balance. Oftentimes these divisions over power-sharing are directly linked to Brian Katulis' constitutionalism and the principles set out in basic laws organizing checks and balances and separation of powers within a system. U.S. cooperation with key actors such as the United Nations and support for mediation efforts of third-party countries and actors (as in the spring 2008 efforts by Arab countries to address internal divisions among the Palestinians and Lebanese) could be helpful for building a more solid foundation for advancing democratic governance in the region. For example, in the case of Iraq, ongoing disputes among the top factions over key questions related to power-sharing remain the central stumbling block for developing a solid foundation for democratic governance at national, provincial, and local levels. These disputes have not prevented democracy promotion efforts from continuing, with implementers providing important training, support, and advice for Iraqi civil society groups and political parties. But the absence of a national consensus and compact on the central issues of how to define the nature of the Iraqi state and how to share power has remained a major impediment to advancing Iraq's political transition. Many of these disputes over power-sharing and establishing the core constitutional principles are tied to underlying conflicts over power and resources. Helping set up the parameters for a deliberative discussion—one that engages broader populations—will necessarily take time. But instead of another mad rush to the next series of elections in Iraq—such as the one in 2005, when most Iraqis voted in a referendum on a constitution that they had not had a chance to read, let alone have much of a voice in developing—the United States could work with partners such as the United Nations and other actors to help societies suffering from sharp internal gaps bridge their divides. This second priority is a strategic necessity given the relative inattention and sporadic engagement of the Bush administration on several key fronts—Israeli-Palestinian, Israeli-Syrian, and Israeli-Lebanese tracks as well as the broader Arab-Israeli conflict. It is also vital for addressing some Middle East core issues that have hampered democracy development efforts, with some governments in the region using the unresolved Arab-Israeli conflict as an excuse to delay internal reform processes. The new administration may be inclined to breathe life into the Bush administration's moribund efforts begun at Annapolis in November 2007 to resolve the Israeli-Palestinian conflict, or it may prefer another negotiating format—but either way, it needs to move quickly. It will likewise be helpful if there is some momentum on various other fronts like the Israeli-Syrian track. In some cases, direct U.S. involvement in peace-making efforts may be limited, but Obama needs to be seen as playing a supportive role to interlocutors such as Turkey or Egypt that are playing important mediation roles.

Democracy promotion ineffectiveness inevitable- XOs

Bonicelli 14, Paul J. Bonicelli is the Executive Vice President at Regent University, and served as the Assistant Administrator for Latin America and the Caribbean of the United States Agency for International Development. ****Internally cites Guillermo O'Donnell, a prominent political scientist and recipient of many political science awards including the Prize for Lifetime Achievement from the International Political Science Association. "Obama's Executive Order on Immigration Makes It Harder to Promote Democracy Abroad", 11/21/14, < <http://foreignpolicy.com/2014/11/21/obamas-executive-order-on-immigration-makes-it-harder-to-promote-democracy-abroad/>>**

By protecting millions of illegal immigrants from deportation, Obama is refusing to execute the laws duly passed by the people's representatives. He is ignoring his constitutional requirement to enforce the law. It matters not that he claims to be motivated by compassion when his first duty is to our constitutional democracy (as he argued repeatedly to his own base for years who wanted him to act alone). Importantly, he asserted another reason for issuing the order and this matters very much for the watching international community — especially the collection of dictators the United States is trying to influence. The president says he is issuing the order because the Congress will not do what he wants. He wanted the Senate comprehensive immigration reform bill to pass but the House, as is their right as an independent branch of government, refused to comply. For most of the eight years of the Bush presidency, Democrats argued that Bush had no credibility internationally due the way terrorists were interrogated, his withdrawal from the Anti-Ballistic Missile Treaty, and the invasion of Iraq. Bush's opponents said that he had made it very hard if not impossible preach democracy to tyrants when he was behaving as one himself. Now the Democrats, according to their own logic during the Bush years, have a hypocrisy problem of their own that will impact foreign policy. After years of appointing "czars" and rewriting laws with his regulatory power, now he has simply ordered into being what the Congress expressly refused to do. It will be construed in the developing countries ruled by Chavistas, Mugabes, and the like as encouragement to continue ruling by fiat whenever a troublesome legislature refuses to rubber stamp their will. They do this all the time and we condemn it all the time; now they will have ready to hand a response to U.S. censure. Political scientist Guillermo O'Donnell developed theories of democratic consolidation, authoritarianism, and illiberal democracy during a lifetime of studying democratization. He examined much about emerging democracies in Latin America and has helped generations of scholars and practitioners understand what is happening and why it is happening in the politics of these countries. Of the many lessons to be learned from studying O'Donnell's work, one is that democracies around the world might have many faces and different expressions, but they can be divided into liberal and illiberal forms. In sum, elections matter greatly, but so does the way in which leaders govern. When elected leaders, especially executives, concentrate power, they pervert democracy and any founding documents that exist to limit and curb the uses of powers. When they mistake being elected as an excuse to rule alone, they begin to cross a line from liberal democracy to illiberal democracy. And then academics in the mold of O'Donnell start measuring how secure the democracy is, whether it is sliding backwards or stagnating, and what the electorate thinks of all of this. We will probably have a very rough two years now that the president has taken this step. And his party will have a momentous test on its hands if it seeks to defend his action.

Internet Freedom is an inadequate tool—5 reasons

Silva 13, Alberto J. Cerda Silva is an assistant professor of computer law at the University of Chile. He is a founding member and director of international affairs of the NGO Derechos Digitales. He is currently a Fulbright Scholar pursuing doctoral studies at Georgetown University Law Center with a thesis on human rights and Internet regulation in Latin America. "Internet Freedom is not Enough: Towards an Internet Based on Human Rights", <http://www.surjournal.org/eng/conteudos/getArtigo18.php?artigo=18,artigo_02.htm>

Although Internet Freedom represents progress, it has several limitations that make it inadequate. First, it is an approach that encapsulates concerns and prioritizes topics from a U.S. perspective and therefore lacks comprehensiveness. Second, it presents a narrow view of the relevance and synergies resulting from the interaction between the Internet and human rights. Third, it ignores that the Internet is an essentially private environment and therefore demands greater accountability

from the private sector. Fourth, it ignores Internet governance. Fifth, it prioritizes market needs rather than the respect for human rights. In the next sections, each of these objections shall be briefly reviewed.

Cyber freedom key to democracy—anonymity, freedom of expression, and

Torres 13 Manuel R. Torres is an Associate Professor at the Area of Political Science and Public Administration at the University of Pablo de Olavide en Sevilla. He is a Director of the Specialization Course in Analysis of Jihadist Terrorism, Insurgencies and Radical Movements of the UPO and a professor at the Master in Studies of Terrorism at the International University of Rioja (UNIR) and at the Master of Strategic Studies and International Security at the University of Granada. “INTERNET AS A DRIVER OF POLITICAL CHANGE: CYBER-PESSIMISTS AND CYBER-OPTIMISTS” January 2015, <
http://www.researchgate.net/profile/Manuel_R_Torres-Soriano/publication/258130256_INTERNET_AS_A_DRIVER_OF_POLITICAL_CHANGE_CYBER-PESSIMISTS_AND_CYBER-OPTIMISTS/links/0c960527161d0d818b000000.pdf>

The main reasons used by the cyber-optimists include: a. Giving power to isolated individuals. The new technologies facilitate and promote the circulation of information and the participation of the subjects in political issues. Cyberspace becomes a crucial instrument for citizens being able to apply pressure so as to obtain greater transparency and responsibility in the way their governments perform their actions¹¹. The net opens up new pathways for the exercising of a fundamental right to democracy such as the freedom of expression, enabling consumers to be not just the consumers of information furnished by the mass media. Through cyberspace, individuals can express themselves freely and without the mediation of the protagonists, which represents an enriching of the political debate because a greater number of participants with different perspectives join in. b. Promoting inter-group relations. New connections between individuals and groups are created, both inside and outside national borders. Internet manages to produce a “densification of the public sphere”, something that is necessary in order for a social uprising to become consolidated and move on towards a revolution¹². This form of technology becomes a key tool for collective action taking place within those societies that are lacking in freedom. Through the net, isolated individuals can see that others share their discontent, and at the same time they find a terrain in cyberspace that is suitable for effectively coordinating their actions. The capacity to reach a potentially limited audience even makes it possible for small groups, and particularly motivated activists, to be able to endow their initiatives with a mass dimension. The transforming power of Internet has been increasing, as new people become net users¹³. c. Local events take on international repercussions. Internet weakens the ability of political regimes to exercise effective control over the flows of information that cross their borders. The new technologies make it possible to evade government censorship, permitting local activists to inform international public opinion, and to become involved in the domestic affairs of their countries. Unlike the traditional mass media, net users can move around with greater anonymity than journalists, and be present at events and in scenarios that government censorship bans accredited professionals from. The illustrative materials and descriptions provided by those citizen-journalists end up feeding the information that other countries have, and they decisively contribute toward the international community getting involved in the fight against oppression and against the violation of human rights. The repressive apparatus of those regimes lose part of their effectiveness, because they are constrained by the global repercussions of their acts. This relaxing of coercion facilitates the consolidation of movements demanding a political response. d. Promoting the economic development and social modernisation on which democracy is established. Internet has become one of the key factors in commercial globalisation and the consequent more recent economic development. The net has not only made production and management costs less expensive, but it has also increased the volume and the speed at which information flows, having huge repercussions on the scientific innovation process and on business productivity¹⁴. The way this technology penetrates countries with dictatorial regimes ends up by causing a form of social and economic transformation that provides succour to pro-democratic movements. The new middle classes, arising under the auspices of the new information economy, end up becoming one of the most critical groups of the lack of freedom. The political elite is aware of this risk. However, they have to face up to the so-called “dictators’ dilemma”: either to choose political control or opt for the economic benefits that Internet offers.

The Internet is the best vehicle for unification around protests

Kouchner 10 Bernard Kouchner is the foreign minister of France and founder of Médecins Sans Frontières. “The Battle for the Internet”, 5/13/10, <<http://www.nytimes.com/2010/05/14/opinion/14iht-edkouchner.html>>

Yet, the distortions are the exception rather than the rule. The Internet is above all the most fantastic means of breaking down the walls that close us off from one another. For the oppressed peoples of the world, the Internet provides power beyond their wildest hopes. It is increasingly difficult to hide a public protest, an act of repression or a violation of human rights. In authoritarian and repressive countries, mobile telephones and the Internet have given citizens a critical means of expression, despite all the restrictions. However, the number of countries that censor the Internet and monitor Web users is increasing at an alarming rate. The Internet can be a formidable intelligence-gathering tool for spotting potential dissidents. Some regimes are already acquiring increasingly sophisticated surveillance technology. If all of those who are attached to human rights and democracy refused to compromise their principles and used the Internet to defend freedom of expression, this kind of repression would be much more difficult. I am not talking about absolute freedom, which opens the door to all sorts of abuses. Nobody is promoting that. I'm talking about real freedom, based on the principle of respecting human dignity and rights. Multilateral institutions like the Council of Europe, and nongovernmental organizations like Reporters Without Borders, along with thousands of individuals around the world, have made a strong commitment to these issues. No fewer than 180 countries meeting for the World Summit on the Information Society have acknowledged that the Universal Declaration of Human Rights applies fully to the Internet, especially Article 19, which establishes freedom of expression and opinion. And yet, some 50 countries fail to live up to their commitments. We should create an international instrument for monitoring such commitments and for calling governments to task when they fail to live up to them. We should provide support to cyber-dissidents — the same support as other victims of political repression. We should also discuss the wisdom of adopting a code of conduct regarding the export of technologies for censoring the Internet and tracking Web users. These issues, along with others, like the protection of personal data, should be addressed within a framework that brings together government, civil society and international experts. Another project is close to my heart. It will be a long and difficult task to implement it, but it is critical. It is to give the Internet a legal status that reflects its universality. One that recognizes it as an international space, so that it will be more difficult for repressive governments to use the sovereignty argument against fundamental freedoms. The battle of ideas has started between the advocates of a universal and open Internet — based on freedom of expression, tolerance and respect for privacy — against those who want to transform the Internet into a multitude of closed-off spaces that serve the purposes of repressive regimes, propaganda and fanaticism. Freedom of expression, said Voltaire, “is the foundation of all other freedoms.” Without it, there are no “free nations.” This universal spirit of the Enlightenment should run through the new media. The defense of fundamental freedoms and human rights must be the priority for governance of the Internet. It is everyone's business.

Democracy turn

Internet freedom leads to democracy

Fontaine and Rogers 11— Richard Fontaine is the President of the Center for a New American Security (CNAS). He served as a Senior Advisor and Senior Fellow at CNAS from 2009-2012 and previously as foreign policy advisor to Senator John McCain for more than five years. He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. Will Rogers is a senior Fellow at the Center for a New American Security, “A Foreign Policy Imperative in the Digital Age,” Internet Freedom, July 2011,

<http://www.cnas.org/files/documents/publications/CNAS_InternetFreedom_FontaineRogers_0.pdf>

It has become axiomatic to say that the Internet does not itself create democracies or overthrow regimes; people do. This is obviously true, but if new communications tools do matter — and there appears to be at least nascent evidence that they do — then they can play a role in several distinct ways. An important report issued by the United States Institute of Peace (USIP) presented a useful framework for examining how new communications technologies might affect political action. The paper identifies five distinct mechanisms through which the Internet might promote (or be used by regimes to block) democratic progress.³⁶ Here we deepen the analysis of these mechanisms and add two additional factors that affect them. The Internet may affect individuals, by altering or reinforcing their political attitudes, making them more attuned to political events, and enabling them to participate in politics to a greater degree than they could otherwise. This does not automatically translate into a more activist population; as the USIP study notes, it could actually make citizens more passive by diverting their attention away from offline political activism and toward less significant online activity.³⁷ Some have called this

“slacktivism,” exemplified by the millions of individuals who signed online petitions to end genocide in Darfur but who took no further action.³⁸ At the same time, individuals freely expressing themselves on the Internet are exercising a basic democratic right. As democracy scholar Larry Diamond points out, used in this way, the Internet can help “widen the public sphere, creating a more pluralistic and autonomous arena of news, commentary and information.”³⁹ It can also serve as an instrument through which individuals can push for transparency and government accountability, both of which are hallmarks of mature democracies.⁴⁰ New media might also affect intergroup relations, by generating new connections among individuals, spreading information and bringing together people and groups. (Some have worried about the opposite effect – the tendency of the Internet to polarize individuals and groups around particular ideological tendencies.)⁴¹ This may occur not only within countries, but also among them; the protests in Tunisia sparked a clear rise in political consciousness and activism across the Arab world – much of it facilitated by Internet-based communications and satellite television.⁴² It may also take place over a long period of time; Clay Shirky, an expert at New York University, argues that a “densifying of the public sphere” may need to occur before an uprising turns into a revolution.⁴³ New communications technologies could also affect collective action, by helping change opinion and making it easier for individuals and groups to organize protests in repressive countries. Unconnected individuals dissatisfied with the prevailing politics may realize that others share their views, which might form the basis for collective action.⁴⁴ Relatively small groups, elites or other motivated dissidents might use the Internet to communicate or organize protests. Even if the number of committed online activists is small, they might nevertheless disseminate information to the general population or inspire more widespread protests.⁴⁵ Again, it is important to distinguish such action from group “slacktivism,” as the successful protests in Egypt showed, the regime only began to teeter when thousands of citizens physically occupied Tahrir Square. Though initial protests may have been organized via Facebook, the Mubarak government would still be in power if the protests had been confined only to cyberspace.

Regime Strength turn

Internet activism good—slacktivism strengthens regimes

Christensen 12, Henrik Christensen is a political science researcher at Åbo Akademi University. “Simply slacktivism? Internet participation in Finland” March 2012, <http://www.researchgate.net/profile/Henrik_Christensen4/publication/261638212_Simply_slacktivism_Internet_participation_in_Finland/links/00b7d534e7b9cc0d6f000000.pdf>

A second critique considers the Internet participation to be the result of unwillingness among Internet activists to put in the efforts required to be genuinely politically involved (Morozov, 2009). According to Morozov (2009), slacktivism is the ideal type of activism for a lazy generation, who no longer bother with demonstrations when the rouse of the Internet is so much more appealing. According to this perspective, Internet participation does not reflect a genuine desire to influence political matters but is a comfortable way of pretending to care. This critique is often associated with the political commentator and author Malcolm Gladwell (2010), who in a column compared Internet participation via social media with the sit-ins organized by the civil rights movement in the US in the 1950s and 1960s. Unsurprisingly, he finds that Internet participation requires much less effort and often aim to receive social acknowledgement and praise rather than achieve political change. Most political activities would obviously compare unfavourably to such rare expressions of civic courage. Nonetheless, this accusation appears to make intuitive sense since many activities on social networks seem to be manifestations of good intentions but rarely reflect genuine commitment. Morozov (2011: 186) makes a similar point when he condemns individuals with only a cursory interest in the issues who comes together to save the world via the Internet. Some fear that the easily available Internet may lead citizens to substitute their traditional offline activities with online versions, which could be devastating for the effectiveness of participation (Putnam, 2000). According to this portrayal, the Internet attracts people who are not genuinely interested or capable of political participation, but more interested in putting up an appearance of interest by the push of a button. The link between offline and online participation has been examined in previous research. Most studies find a weak positive effect of online engagement on offline involvement (Boulianne, 2009; Christensen, 2011a), whereas others studies cast doubt on the effect of the Internet on civic engagement since any independent effect disappears when controlling for other factors such as socio-economic status and psychological involvement in politics (Bimber, 2001, p.61). Although the connections between offline and online

participation remain unclear, this line of critique is frequently used to dismiss Internet activism as slacktivism.

Iran Censorship DA NEG

1NC Shell

Iran internet censorship high now

CPJ 15 (<https://cpj.org/2015/04/10-most-censored-countries.php>, 10 Most Censored Countries, CPJ, Committee To Protect Journalists, a group that raises awareness to censorship rights in different countries, 2015)

Leadership: Ayatollah Ali Khamenei has been supreme leader since 1989. Hassan Rouhani has been president since August 2013. How censorship works: The government uses mass and arbitrary detention as a means of silencing dissent and forcing journalists into exile. Iran became the world's leading jailer of journalists in 2009 and has ranked among the world's worst jailers of the press every year since. Iranian authorities maintain one of the toughest Internet censorship regimes in the world, blocking millions of websites, including news and social networking sites. They are suspected of using sophisticated techniques, such as setting up fake versions of popular websites and search engines, and the regime frequently jams satellite signals. The situation for the press has not improved under Rouhani despite the hopes of U.N. member states and human rights groups. Rouhani also failed to uphold his campaign promise to reinstate the 4,000-member Association of Iranian Journalists, which was forced to close in 2009. Lowligh: Iranian authorities control coverage of certain topics by tightening the small circle of journalists and news outlets allowed to report on them. In February, Iran's Supreme National Security Council filed a lawsuit against conservative journalist Hossein Ghadyani and the newspaper he works for, Vatan-e Emrooz. The newspaper, which supports former President Mahmoud Ahmadinejad, had published four articles that criticized Iran's international nuclear negotiations and alleged corruption in the government's dealing with an oil company.

Internet Liberalization allows for dissent and protest

Filder 12 (the Doctor of Philosophy degree in Political Science in the Graduate College of The University of Iowa. "Dissent in digital: the Internet and dissent in authoritarian states"
<http://ir.uiowa.edu/cgi/viewcontent.cgi?article=3240&context=etd>)

Does the Internet facilitate anti-regime dissent within authoritarian states? I argue that the Internet fosters dissent mobilization through three factors: distance, decentralization and interaction. First, the Internet fosters dissent mobilization by allowing protesters to communicate relatively cheaply and instantaneously over great distances. While other communication mediums also reduce distance costs, the second factor, decentralization, allows dissenters to use the Internet to evade state controls and reduces the state's ability to restrict information flows. Third, the Internet's Interactive nature allows users to both become consumers and producers of information. Interactivity also fosters trust between users that can evolve into offline action. However, the empirical record consists almost entirely of open sourcenews reporting and qualitative studies, and there are few clear theoretical links between the traditional dissent and repression literatures and recent Internet mobilization theories. My goal in this project is to place a generalizable theory of Internet-mediated dissent within traditional mobilization context and more recent communication, computer science and legal literatures. I frame my theory of Internet mediated dissent through three components. The first component is Internet access as a mobilizing structure, in which I posit that Internet access creates conditions for social

mobilization that are difficult for regimes to counter. The second component is the effect of Internet censorship on Internet-facilitated dissent. For the third theoretical component, I assess that despite the type of censorship, increased Internet use eventually overwhelms the regime's capacity to censor information. I test my theoretical components through a series of large N cross national time series negative binomial regressions spanning 1999-2010. In the first test, I find that increased Internet access increased the likelihood of protest in non-democratic states. Results of the second tests are mixed: technical censorship has no effect on protest, soft controls decreased incidence of protest, and combined technical and soft programs increase the likelihood of protest, albeit the substantive effect is slight. In the third test, I hypothesize that Internet use eventually crosses a user threshold after which censorship is no longer effective. The results of the third test suggest that censorship is not effective regardless of Internet access levels. However, the influence of Internet use on protest tapers off once a specific threshold is reached. The dissertation proceeds as follows: in Chapter 2, I present literature review that frames my research question within previous empirical work. Next, in Chapter 3 I propose and illustrate my theory of Internet-mediated dissent. In Chapter 4, I test whether or not incidents of anti-regime protest increase as Internet use increases inside non-democratic states. I build on these results in Chapter 5, in which I test whether technical filters, soft controls or a combination of methods decrease the likelihood of protest inside non-democratic states, followed by a test for whether increasing Internet use overwhelms censorship programs. Finally, in chapter 6 I summarize my findings, discuss data complications, offer ideas for future research, and discuss the implications of this project.

Iran internet censorship is key to the Iran Deal – censorship key to public support of the Iran deal
Firstpost 7/10 (<http://www.firstpost.com/world/the-hierarchies-of-censorship-iranian-officials-use-banned-social-media-forums-2335990.html>, The hierarchies of censorship: Iranian officials use banned social media, Firstpost, really popular news site in the Middle East, authors remain anonymous, July 10, 2015)

Tehran: They are among the world's most popular websites and are vital diplomatic channels for Iranian officials involved in the nuclear talks. Yet Twitter, Facebook and YouTube remain banned in Iran. While Foreign Minister Mohammad Javad Zarif leads the way on social media -- his Twitter account has "Verified" blue tick status -- he is far from alone in seeing its benefits. Aides to President Hassan Rouhani tweet regularly on his behalf, as do officials from supreme leader Ayatollah Ali Khamenei's office -- most recently to restate Iran's "red lines" for a nuclear deal. This happens despite Twitter, Facebook and YouTube being among hundreds of sites that ordinary Iranians cannot access unless they install illegal software on their computers, smartphones and tablets. Iranian authorities filter access, citing inappropriate content as the reason for censorship. The restrictions are widely seen as outdated -- Rouhani wants to remove them and last year vetoed a plan to filter the hugely popular WhatsApp messaging service. Internet use is growing every year, with 45 million of Iran's 78 million population online regularly. The contradictions of censorship policies "no longer raise eyebrows, except those belonging to foreigners," according to Hooman Majd, an Iranian-American journalist and author of several books on modern Iran. "Any sophisticated politician -- and Zarif is certainly sophisticated -- understands that social media plays a big part in establishing a narrative," he said, noting that the minister uses Facebook in Farsi to message Iranians and Twitter in English to match diplomatic counterparts such as US Secretary of State John Kerry. "I don't think he thinks

too hard about the contradiction," Majd, who is covering the epic talks in Vienna for America's NBC News network, said of Zarif. Bid to 'win the public mind' "It is widely recognised, and conceded by the authorities, that Facebook has millions of Iranian members," he added. As if to prove Twitter's usefulness again, Zarif used it Thursday just moments before Kerry told reporters he was prepared to "call an end" to the talks in Vienna if "tough decisions" are not made. "We're working hard, but not rushed, to get the job done. Mark my words; you can't change horses in the middle of a stream." Zarif tweeted, adding the main #IranTalksVienna hashtag. Online video sharing has also played a part. At talks on July 3, Zarif used YouTube to set out Iran's position in the talks, just as he did before an earlier round of negotiations in 2014. Last week's video extended a promise of greater cooperation from Iran on global problems such as the Islamic State group, if a nuclear deal were reached. In English, Zarif said: "Getting to yes requires the courage to compromise, the self-confidence to be flexible, the maturity to be reasonable. Our common threat today is the growing menace of violent extremism and outright barbarism." Such direct diplomacy complements use of traditional media. To get his message across, Zarif has written columns for The New York Times and Financial Times urging a deal. By doing so he can shape the debate, said Abas Aslani, a well-known Iranian journalist covering the nuclear talks in Vienna. "Often in politics the narrative of an event is much more important than the event itself," said Aslani, acknowledging that cheap and easily available VPNs (Virtual Private Networks) neuter censorship. "Those who play a more active and influential role in different kinds of media are expected to win the public mind," he said of Zarif. "The presence of Iranian officials in media, traditional and new media, not only shouldn't be limited but also expanded."

Deal key to preventing Middle East War

Cirincione, 7/9/2015 (Joe, president of the Ploughshares Fund, "What You Need to Know About the Coming Deal With Iran," http://www.huffingtonpost.com/joe-cirincione/what-you-need-to-know-abo_b_7763516.html)

If Iran wants to build a nuclear weapon and the deal doesn't happen, is there any way to stop them? Does anyone really expect the U.S. to start a war with Iran by bombing their nuclear installations? That's why this diplomatic deal is so promising. It's not without risk, and there are going to be problems with it, but it is far better than all the alternatives. If the deal falls apart, especially if the U.S. is seen as the reason it falls apart - if Congress kills this deal - the sanctions regime will more or less collapse. Other countries aren't going to follow our lead. It doesn't matter if the Senate passes new sanctions. The other negotiating powers aren't going to go along with it. This does not just mean Russia and China. It is also Japan and South Korea and Europe; the people who buy Iran's oil. And that means that Iran's economy will start to recover. The inspections regimes that are in place will end. The restraints on Iran's program will end. They will start installing thousands more centrifuges, enriching thousands of pounds of uranium and getting closer and closer to a bomb. Whether they cross that line or not, they will clearly have the ability to build a weapon in a very short amount of time. That increases the risk of military action. If Israel attacks Iran, if we strike Iran, it won't be a neat, little overnight strike, or two or three days of strikes. This will be weeks of bombardment against their hardened nuclear facilities, their air defenses, their ports and airfields. It will kill thousands of Iranians. It will be the beginning of a major war with Iran. Former Secretary of Defense Robert Gates says that "if you think the war in Iraq was hard, an attack on Iran would, in my opinion, be a catastrophe." That is what we would be looking at; a major new war in the Middle East. That would be a disaster for the U.S., for Israel, and for the entire region.

Goes nuclear

James A. **Russell 2009** (Senior Lecturer, National Security Affairs, Naval Postgraduate School, "Strategic Stability Reconsidered: Prospects for Escalation and Nuclear War in the Middle East" IFRI, Proliferation Papers, #26, http://www.ifri.org/downloads/PP26_Russell_2009.pdf)

Strategic stability in the region is thus undermined by various factors: (1) asymmetric interests in the bargaining framework that can introduce unpredictable behavior from actors; (2) **the presence of non-state actors that introduce unpredictability into relationships between the antagonists;** (3) **incompatible assumptions about the structure of the deterrent relationship that makes the bargaining framework strategically unstable;** (4) **perceptions by Israel and the United States that its window of opportunity for military action is closing, which could prompt a preventive attack;** (5) the prospect that Iran's response to pre-emptive attacks could involve unconventional weapons, which could prompt escalation by Israel and/or the United States; (6) **the lack of a communications framework to build trust and cooperation among framework participants.** These systemic weaknesses in the coercive bargaining framework all suggest that escalation by any the parties could happen either on purpose or as a result of miscalculation or the pressures of wartime circumstance. Given these factors, **it is disturbingly easy to imagine scenarios under which a conflict could quickly escalate in which the regional antagonists would consider the use of chemical, biological, or nuclear weapons. It would be a mistake to believe the nuclear taboo can somehow magically keep nuclear weapons from being used in the context of an unstable strategic framework.** **Systemic asymmetries** between actors in fact **suggest** a certain increase in **the probability of war** – a war in which escalation could happen quickly and from a variety of participants. **Once such a war starts, events would likely develop a momentum all their own** and decision-making would consequently be shaped in unpredictable ways. The international community must take this possibility seriously, and muster every tool at its disposal to prevent **such an outcome**, which **would be an unprecedented disaster for the peoples of the region, with substantial risk for the entire world.**

U – Censorship Now

Iran internet censorship high now (already in 1NC shell)

CPJ 15 (<https://cpj.org/2015/04/10-most-censored-countries.php>, 10 Most Censored Countries, CPJ, Committee To Protect Journalists, a group that raises awareness to censorship rights in different countries, 2015)

Leadership: Ayatollah Ali Khamenei has been supreme leader since 1989. Hassan Rouhani has been president since August 2013. How censorship works: The government uses mass and arbitrary detention as a means of silencing dissent and forcing journalists into exile. Iran became the world's leading jailer of journalists in 2009 and has ranked among the world's worst jailers of the press every year since. Iranian authorities **maintain one of the toughest Internet censorship regimes in the world**, blocking millions of websites, including news and social networking sites. They are suspected of using sophisticated techniques, such as setting up fake versions of popular websites and search engines, and the regime frequently jams satellite signals. The situation for the press has not improved under Rouhani despite the hopes of U.N. member states and human rights groups. Rouhani also failed to uphold his campaign promise to reinstate the 4,000-member Association of Iranian Journalists, which was forced to close in 2009. Lowlight: Iranian

authorities control coverage of certain topics by tightening the small circle of journalists and news outlets allowed to report on them. In February, Iran's Supreme National Security Council filed a lawsuit against conservative journalist Hossein Ghadyani and the newspaper he works for, Vatan-e Emrooz. The newspaper, which supports former President Mahmoud Ahmadinejad, had published four articles that criticized Iran's international nuclear negotiations and alleged corruption in the government's dealing with an oil company.

Iran internet censorship in the status quo – especially high on news and society websites

Lee 13 (<https://www.washingtonpost.com/blogs/the-switch/wp/2013/08/15/heres-how-iran-censors-the-internet/>, Here's how Iran censors the Internet, Timothy B. Lee, policy writer and senior editor for Vox and the Washington Post, August 15, 2013)

Discussion of Internet censorship usually focuses on China and its "Great Firewall." But the Chinese Communist Party isn't the only regime that censors its Internet. Iran does too. Little is known about Iran's censorship system because Iranian citizens who probe the network from inside the country risk reprisals from the government. But earlier this year, two anonymous Iranians teamed up with Alex Halderman, a computer science professor at the University of Michigan, to conduct one of the first systematic studies of Iranian Internet censorship to be published outside Iran. Halderman presented his findings at a Tuesday talk at the Usenix Security conference in Washington, D.C. Iran has an extensive list of blacklisted sites. Users who attempt to visit a banned site see a notice that looks something like this: What gets censored? To find out, the researchers attempted to visit the sites on Alexa's top 500 lists in various categories. Almost half of the 500 most popular sites on the Internet are censored. Unsurprisingly, the theocratic Iranian regime censors pornographic Web sites most heavily. But a high percentage of sites in the "art," "society," and "news" categories are also blocked: In addition to banning particular sites, the Iranian network also filters traffic based on its content. In one test, the researchers created a file called sex.htm that was hosted outside the United States. Access to this page from inside Iran was blocked. The Iranian Internet is also configured to discourage the use of certain encrypted protocols. Web traffic is allowed through at full speed. Traffic that uses the encrypted SSH protocol, which can be used to "tunnel" other types of traffic out of the country, run at less than 20 percent of the network's full speed. Traffic the Iranian firewall doesn't recognize is throttled even more dramatically, and gets cut off altogether after about 60 seconds. The initial measurements were made in the weeks before the June 2013 elections, a time when the Iranian government was working to restrict the communications of the opposition. But after the election, they said, the throttling stopped, with all types of Internet traffic being transmitted at the same speed. Evidently, the throttling was a temporary measure to tamp down on dissent during a politically sensitive period. Unfortunately, even unthrottled Internet access is extremely slow. The researchers find that a "large amount of Iran's traffic passes through a centralized facility," where censorship filters are applied. Perhaps to avoid overwhelming this facility, or perhaps to limit access to high-bandwidth (and potentially subversive) video content, the government has established a nationwide speed limit of 128 kbps for users. That's about twice the speed of old-school dialup modems, and 50 times slower than a typical connection in the United States today. Iranian academics can request special permission for a faster connection. The pervasive censorship in Iran has led many Iranians to take countermeasures. Anti-censorship technologies such as Tor, FreeGate, Your Freedom, and Ultrasurf are widely used inside Iran, the researchers say. One of Halderman's colleagues describes an incident that occurred in April 2010 on Iran's Channel One. "The desktop of [a] machines [was] shown by mistake during news transition. In it,

there was a shortcut for Your Freedom anti-censorship tool." "This was widely mocked by many Iranian bloggers at that time," one of Halderman's Iranian co-authors said. But in a country where censorship is pervasive, it's not surprising that even those with close ties to the regime would have to resort to circumvention technologies to get their jobs done.

BEIRUT—Iran hasn't been shy about its bids to monitor, filter and block content on the Internet. Now it has taken the next leap, turning online censorship into an institution. In the past week, the government has announced it has formed a high council dedicated to cleansing the country's Internet of sites that threaten morality and national security, launching what amounts to a centralized command structure for online censorship. The Supreme Council of Cyberspace, created by decree last week by Supreme Leader Ayatollah Ali Khamenei, includes heads of intelligence, militia, security and the powerful Iranian Revolutionary Guard Corps, as well as media chiefs. Charged with supervising all cyberactivity, it will have the power to enact laws, according to state media. The body will have its own budget and offices, a member of the council said in an interview with state media on Wednesday. In announcing the council, Iran unites Internet-control initiatives that have previously been floated in state media. Along with other moves in the past week, it shows that the Islamic Republic, after long viewing the Internet as a minor nuisance, has fully embraced the view that Iran's vibrant online activity is a destabilizing threat. The Revolutionary Guards, or IRGC, said last week it has rolled out a secure internal network for high-level commanders, underscoring Tehran's concerns about outside threats to its government's online activities. Iran also announced in the past week that its "Cyber Army," as it styles its legion of government hackers and bloggers, has reached 120,000, a number impossible to corroborate but well above previous tallies. In an annual report released Monday, the group Reporters Without Borders ranked Iran the No. 1 enemy of the Internet in 2012. It was ahead of 11 other countries—including Saudi Arabia, Bahrain, Syria, China and Belarus—that the group says restrict Internet access, filter content and imprison bloggers. The Iranian council's mandate became clearer Wednesday when one of its members, conservative cleric Hamid Shahriari, said the council was the result of a year and a half of weekly meetings between security chiefs and Khamenei representatives. "We are worried about a portion of cyberspace that is used for exchanging information and conducting espionage," he said in an interview with the semiofficial Mehr news agency. "We have identified and confronted 650 websites that have been set up to battle our regime—39 of them are by opposition groups and our enemies, and the rest promote Western culture and worshiping Satan, and stoke sectarian divides," he said. He didn't name the sites or clarify whether they had already been filtered. Mr. Shahriari said the council would also "focus and facilitate positive aspects of the Internet, like business and trade." The Internet dominated a well-known Friday prayer sermon on March 9, which is televised from the campus of Tehran University. Ayatollah Ahmad Jannati, an 85-year-old cleric, called cyberspace a "very serious danger" and praised the new council, urging Iranians to comply with the government's laws and restrictions. The IRGC's new network—named Basir, or "Perceptive"—is a domestically built, secure telecommunication channel that will allow its highest-level officers to communicate and command brigades in the case of an attack, the guard's newspaper, Sobhe Sadegh, reported last week. "We are not in an imaginary state of threats and sanctions," Hossein Salami, the deputy commander in chief of the IRGC, said during the network's inauguration ceremony last week, according to Iranian media reports. "We must prepare." Israel has in recent weeks drummed up support for a possible attack on what it alleges are sites linked to nuclear-weapon production, a pursuit Iran denies. Iran is also worried about cyberattacks on its nuclear facilities, such as the 2010 Stuxnet virus that appeared aimed at disabling Iranian centrifuge

arrays. The IRGC's closed network appears to be separate from a national Internet that Iran's telecommunications company has said it expects to complete within a year, which leaders have billed as void of Western culture and un-Islamic content. The IRGC's public-relations department also announced last week that it had recruited and trained 120,000 cultural soldiers in the past three years to combat "a soft cyberwar" against Iran. Iranian officials had previously discussed the presence of these forces, but placed their number closer to 20,000. These "cybersoldiers" monitor online activity of opposition sites and dissidents, bombarding websites with comments and producing blog content in support of the regime and hacking emails and computers, according to a computer programmer in Iran employed by the telecommunication ministry. They report to various state bodies, including intelligence, judiciary and the IRGC, which in turn have top officials sitting on the new council. "These strong measures to confront the Internet recently prove two things: the Internet has been an extremely effective way of distributing information and the regime is frightened by it," said Ali Jamshidi, a Malaysia-based telecommunication expert with the opposition Green Movement, who monitors the so-called Cyber Army's attacks on opposition websites and dissident blogs. The IRGC began expanding its multi-billion dollar empire—which stretches from construction to energy and agriculture—to telecommunications in 2009, when it purchased 50% shares of Iran's national telecommunication company, effectively allowing it direct supervision on surveillance and censorship. The Internet, particularly social networking sites, and mobile phones helped Iranian activists to mobilize for anti-government protests after President Mahmoud Ahmadinejad's 2009 re-election prompted allegations of voting fraud. While the Islamic Republic has successfully crushed protests in the streets with heavy crackdowns, activism and anti-government sentiment is thriving online on Iranian blogs, opposition websites and chat rooms. Iranian cyber activists worry that the new tightening of rules will make their work even more difficult and expose their identities. "We will fight back and continue posting our opinions but our resources are very limited compared to what the Revolutionary Guards can do," said a female student activist in Iran.

Iran internet censorship high now – very slow liberalization now

Moghtader 14 (<http://www.reuters.com/article/2014/12/26/us-iran-internet-censorship-idUSKBN0K40SE20141226>, Iran expands 'smart' Internet censorship, December 26, 2014, Michelle Moghtader, Director of Global Development, has written for Reuters, CNN, The Huffington Post and Energy Intelligence Group)

Iran is to expand what it calls "smart filtering" of the Internet, a policy of censoring undesirable content on websites without banning them completely, as it used to, the government said on Friday. The Islamic Republic has some of the strictest controls on Internet access in the world, but its blocks on U.S.-based social media such as Facebook, Twitter and YouTube are routinely bypassed by tech-savvy Iranians using virtual private networks (VPNs). Under the new scheme, Tehran could lift its blanket ban on those sites and, instead, filter their content. The policy appears to follow President Hassan Rouhani's push to loosen some social restrictions, but it was not clear if it would mean more or less Internet freedom. Iranians on Twitter expressed concern that, as part of the new policy, the government would try to block VPN access to such sites. "Presently, the smart filtering plan is implemented only on one social network in its pilot study phase and this process will continue gradually until the plan is implemented on all networks," Communications Minister Mahmoud Vaezi said, according to official news agency IRNA. He appeared to be referring to Instagram, the photo-sharing site owned by Facebook, which is already being filtered, but not blocked. Instagram was initially available uncensored in Iran but

some user accounts were subsequently blocked, notably @RichkidsofTehran, a page full of photos of young, rich Iranians flaunting their wealth. In a cat-and-mouse game, another account dedicated to the same pursuits quickly appeared under the name @RichkidsofTeh. "Implementing the smart filtering plan, we are trying to block the criminal and unethical contents of the Internet sites, while the public will be able to use the general contents of those sites," Vaezi told a news conference. The policy would be fully in place by June 2015, he said. Iranian authorities are not only concerned about what might be considered morally dubious content, which in Iran could be anything from pornography to relatively innocuous images of women not wearing the mandatory Islamic dress, but also material that might be politically damaging. Social media were widely used in the anti-government protests of 2009 to organize and spread news about a movement that was eventually crushed by security forces. Under former president Mahmoud Ahmadinejad, Tehran floated the idea of replacing the Internet with a national intranet that would not be connected to the worldwide web and would be controlled by Iranian authorities, a plan that appears to have fizzled out.

Censorship now

Crawford No Date (<https://www.bestvpn.com/blog/12233/iran-plans-implement-smart-internet-censorship/>, Iran plans to implement 'smart' Internet censorship, Douglass Crawford, freelance writer, no date)

Although not as sophisticated or powerful as China's Great Firewall, the Iranian government imposes some of the strictest censorship in the world on its internet users. As present a large number of websites are blocked by a wide-scale blanket ban – so for example (at least in theory) websites such as Facebook, Twitter and YouTube simply cannot be accessed. In practice, many Iranians evade this rather clumsy censorship through the use of VPN, something which may have prompted President Hassan Rouhani to loosen social network restrictions and take a more nuanced approach. Under the new policy, which will come fully into force by June 2015, social media websites will become accessible, but some of their content will be filtered instead. Communications Minister Mahmoud Vaezi explained to a news conference, 'Implementing the smart filtering plan, we are trying to block the criminal and unethical contents of the internet sites, while the public will be able to use the general contents of those sites.' In addition to 'criminal and unethical contents,' the Tehran government wishes to block politically damaging material, as well images considered to be indecent (a concept which is much more broadly interpreted in Iran, an Islamic country, than it is in the West). In addition to these 'smart filters', the new policy aims to prevent evasion of state censorship by blocking VPN services. How effective this will be remain to be seen, but we are fairly confident that the technologies used to undermine similar such blocks in China will prove at least as effective in Iran.

Internet Liberalization Link

Internet Liberalization facilitates Dissent and Anti- Regime Protest (already in 1NC shell)

Filder 12 (the Doctor of Philosophy degree in Political Science in the Graduate College of The University of Iowa. "Dissent in digital: the Internet and dissent in authoritarian states"
<http://ir.uiowa.edu/cgi/viewcontent.cgi?article=3240&context=etd>)

Does **the Internet facilitate anti-regime dissent within authoritarian states**? I argue that **the Internet fosters dissent mobilization through three factors: distance, decentralization and interaction. First, the Internet fosters dissent mobilization by allowing protesters to communicate relatively cheaply and instantaneously over great distances.** While other communication mediums also reduce distance costs, **the second factor, decentralization, allows dissenters to use the Internet to evade state controls and reduces the state's ability to restrict information flows. Third, the Internet's Interactive nature allows users to both become consumers and producers of information. Interactivity also fosters trust between users that can evolve into offline action.** However, the empirical record consists almost entirely of open sourcenews reporting and qualitative studies, and there are few clear theoretical links between the traditional dissent and repression literatures and recent Internet mobilization theories. My goal in this project is to place a generalizable theory of Internet-mediated dissent within traditional mobilization context and more recent communication, computer science and legal literatures. I frame my theory of Internet mediated dissent through three components. The first component is **Internet access as a mobilizing structure**, in which I posit that **Internet access creates conditions for social mobilization that are difficult for regimes to counter.** The second component is the effect of Internet censorship on Internet-facilitated dissent. For the third theoretical component, I assess that despite the type of censorship, **increased Internet use eventually overwhelms the regime's capacity to censor information.** I test my theoretical components through a series of large N cross national time series negative binomial regressions spanning 1999-2010. In the first test, I find that **increased Internet access increased the likelihood of protest in non-democratic states.** Results of the second tests are mixed: technical censorship has no effect on protest, soft controls decreased incidence of protest, and combined technical and soft programs increase the likelihood of protest, albeit the substantive effect is slight. In the third test, I hypothesize that Internet use eventually crosses a user threshold after which censorship is no longer effective. The results of the third test suggest that censorship is not effective regardless of Internet access levels. However, the influence of Internet use on protest tapers off once a specific threshold is reached. The dissertation proceeds as follows: in Chapter 2, I present literature review that frames my research question within previous empirical work. Next, in Chapter 3 I propose and illustrate my theory of Internet-mediated dissent. In Chapter 4, I test whether or not incidents of **anti-regime protest increase as Internet use increases inside non-democratic states.** I build on these results in Chapter 5, in which I test whether technical filters, soft controls or a combination of methods decrease the likelihood of protest inside non-democratic states, followed by a test for whether increasing Internet use overwhelms censorship programs. Finally, in chapter 6 I summarize my findings, discuss data complications, offer ideas for future research, and discuss the implications of this project.

International countries will look up to the US and start copying our internet policies if we implement the plan and decrease our surveillance. This will end up spilling over and also effect Iran's internet policy, freeing their internet from censorship

Henry **Farrell 4/6**, associate professor of political science and international affairs at George Washington University, expert in a variety of topics, including norms, the politics of the Internet and international and comparative political economy, 4/6/15, "Why it's so hard to create norms in cyberspace," <http://www.washingtonpost.com/blogs/monkey-cage/wp/2015/04/06/why-its-so-hard-to-create-norms-in-cyberspace/>

So how does one build norms if they're so important? Therein lies the problem. Norms work best when they are not the simple product of actors' material self-interest. Persuading people to accept norms involves getting them to accept the values that the norms imply. **When actors have many shared values, norm building is easier. When actors have few shared values, then norm building is hard.** Furthermore, **if you want to persuade others to accept norms, you will have a hard time unless you are obviously and sincerely committed to those norms yourself. This creates two linked problems for the U.S. First – many other important countries do not share U.S. values regarding cybersecurity.** For example, **the U.S. has sought to promote an open and robust Internet.** Authoritarian and semi-authoritarian **countries** may **view an open** and robust **Internet as**

a threat to the stability of their governments. They would prefer an Internet that was not open, and that can be easily compromised if necessary to shore up their regimes. As Jack Goldsmith and Tim Wu have argued, this makes it hard to build treaties on cyber-related questions. It also makes it hard to build norms – there are not many common values that the U.S. can appeal to.¶ Second – the U.S.’s own commitment to many of its values has been called into question. The Snowden revelations appear to show, for example, that the NSA has tried to compromise basic cryptographic standards that are required for an open and robust Internet to work. This makes it hard for the U.S. to be an effective advocate for its norms. Some degree of hypocrisy is tolerable in international politics when others can turn a blind eye to it. However, when one’s secrets have been leaked, other states may neither want to, nor be able to, ignore the difference between the U.S.’s lofty normative aspirations, and its self-interested behavior. The result, all too often, is battles over norms where neither side is likely to persuade the other. For example, the U.S. and China are facing off over commercial cyber-espionage aimed to grab the trade secrets of firms located in other countries, and pass them on to one’s own businesses. The U.S. regards this as normatively unjustified, while other states regard it as an unexceptionable form of spying. The problem is that both sides’ position obviously stems from self interest. As Goldsmith says:¶ It is not surprising that the United States would seek to craft a nuanced rule about economic espionage that serves its interests. This happens all the time in international affairs. Nor is it surprising that so many nations are unimpressed with the United States’ attempt to limit the one form of economic espionage (theft of foreign corporate trade secrets to give to a local firm) that so obviously harms U.S. interests, especially since the United States engages in other forms of economic espionage.

Internal Plan decreases global censorship – curtailing surveillance spills over to cooperation and accountability, creating a global internet where nothing is censored

Castro 2015 (Daniel Castro, Director for the Center for Data Innovation at ITIF, Vice President of ITIF, member of the Federal Commerce Data Advisory Council, June 2015, Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness, Information Technology and Innovation Foundation, http://www2.itif.org/2015-beyond-usa-freedom-act.pdf?_ga=1.114044933.369159037.1433787396)

The ability of companies—both tech and traditional—to easily share data across borders has brought a vast array of benefits to countries, companies, consumers, and economies through increased efficiency, decreased costs, and improved services.²⁶ And yet nations have continued to erect barriers to cloud computing and cross-border data flows, much to their own detriment.²⁷ While some defenders of these policies have asserted that they are designed to increase the privacy or security of their citizens’ data, it is clear that they are also motivated by misguided self-interest. By creating rules that advantage domestic firms over foreign firms, many countries believe they will build a stronger domestic tech industry or gain short-term economic value, such as jobs in domestic data centers. In reality, these policies unwittingly limit the ability of a country’s own firms to innovate by shielding them from international competition.²⁸ These policies not only limit the number of services that a country’s citizens and businesses can enjoy, but also harm that country’s productivity and competitiveness.¶ Some countries used U.S. surveillance laws to justify data protectionism even before Snowden’s NSA revelations. For example, when Rackspace built data centers in Australia in 2012, an Australian competitor stirred up fears that the United States would use the Patriot Act to track Australian citizens as a means to force Rackspace out of Australia.²⁹ In addition, this same Australian company funded a report calling on Australian policymakers to impose additional regulations designed to put foreign cloud computing competitors at a disadvantage.³⁰ However, since the recent NSA revelations, the use of privacy concerns to justify protectionist barriers has grown significantly.¶ Amid growing anti-U.S. sentiment, Europe has seen calls for data localization requirements, procurement preferences for European providers, and even a “Schengen area for data”—a system that keeps as much data in Europe as possible—as ways to promote deployment of cloud services entirely focused on the European market.³¹ France and Germany have even started to create dedicated national networks: “Schlandnet” for the former and the “Sovereign Cloud” for the latter. ³² The French government has gone so far as to put €150 million (\$200 million) into two start-ups, Numergy and Cloudwatt, to create a domestic infrastructure independent of U.S.

tech giants.³³ Furthermore, some groups have invoked U.S. cyberespionage to argue that European citizens are not adequately protected and are calling for the removal of the “safe harbor” agreement—an agreement that allows Internet companies to store data outside of the European Union. Yet if this were removed it would cut Europeans off from many major Internet services. 34¶ There is also an increasingly distressing trend of countries, such as Australia, China, Russia, and India, passing laws that prevent their citizens’ personal information from leaving the country’s borders—effectively mandating that cloud computing firms build data centers in those countries or risk losing access to their markets. For example, in 2014 Russia implemented and Indonesia began considering policies that would require Internet-based companies to set up local data centers.³⁵ These policies are often a veiled attempt to spur short term economic activity by creating data-center jobs. However, this benefit is often outweighed by the substantial cost of building unnecessary data centers, a cost that is eventually passed along to the country’s citizens. Several U.S. tech giants, such as Apple and Salesforce, have already started to build their data centers abroad to appease foreign watchdogs and privacy advocates.³⁶ For example, Amazon started running Internet services and holding data in Germany for its European business partners in an effort to downplay threats of online spying.³⁷ Protectionist policies in China have further strained the U.S. tech industry. In January 2015, the Chinese government adopted new regulations that forced companies that sold equipment to Chinese banks to turn over secret source code, submit to aggressive audits, and build encryption keys into their products.³⁸ While ostensibly an attempt to strengthen cybersecurity in critical Chinese industries, many western tech companies saw these policies as a shot across the bow trying to force them out of China’s markets. After all, the Chinese government had already launched a “de-IOE” movement—IOE stands for IBM, Oracle and EMC— to convince its state-owned banks to stop buying from these U.S. tech giants. ³⁹ To be sure, the Chinese government recently halted this policy under U.S. pressure.⁴⁰ However, the halted policy can be seen as a part of a larger clash between China and the United States over trade and cybersecurity. Indeed, these proposed barriers were in part a quid pro quo from China, after the United States barred Huawei, a major Chinese computer maker, from selling its products in the United States due to the fear that this equipment had “back doors” for the Chinese government.⁴¹ Since the Snowden revelations essentially gave them cover, Chinese lawmakers have openly called for the use of domestic tech products over foreign goods both to boost the Chinese economy and in response to U.S. surveillance tactics. This system of retaliation has not only led to a degradation of business interests for U.S. tech companies in China, but also disrupted the dialogue between the U.S. government and China on cybersecurity issues.⁴² RECOMMENDATIONS¶ The free and open Internet that powers the globally networked economy is dependent on the ability of individuals and companies to engage in commerce without geographic restrictions. To turn back the tide of technology protectionism, U.S. trade negotiators will need a stronger hand to play. They cannot go to other nations and tell them to not discriminate against U.S. tech firms if the U.S. intelligence system continues to follow policies that threaten their citizens and businesses. As a result, it is incumbent on the Congress and the Obama administration to take the lead in showing the world the best standards for transparency, cooperation, and accountability.

I/L Censorship = Iran Deal

Iran internet censorship is key to the Iran Deal – censorship key to public support of the Iran deal (already in 1NC shell)

Firstpost 7/10 (<http://www.firstpost.com/world/the-hierarchies-of-censorship-iranian-officials-use-banned-social-media-forums-2335990.html>, The hierarchies of censorship: Iranian officials use banned social media, Firstpost, really popular news site in the Middle East, authors remain anonymous, July 10, 2015)

Tehran: They are among the world's most popular websites and are vital diplomatic channels for Iranian officials involved in the nuclear talks. Yet Twitter, Facebook and YouTube remain banned in Iran. While Foreign Minister Mohammad Javad Zarif leads the way on social media -- his Twitter account has "Verified" blue tick status -- he is far from alone in seeing its benefits. Aides to President Hassan Rouhani tweet regularly on his behalf, as do officials from supreme leader Ayatollah Ali Khamenei's office -- most recently to restate Iran's "red lines" for a nuclear deal. This happens despite Twitter, Facebook and YouTube being among hundreds of sites that ordinary Iranians cannot access unless they install illegal software on their computers,

smartphones and tablets. Iranian authorities filter access, citing inappropriate content as the reason for censorship. The restrictions are widely seen as outdated -- Rouhani wants to remove them and last year vetoed a plan to filter the hugely popular WhatsApp messaging service. Internet use is growing every year, with 45 million of Iran's 78 million population online regularly. The contradictions of censorship policies "no longer raise eyebrows, except those belonging to foreigners," according to Hooman Majd, an Iranian-American journalist and author of several books on modern Iran. "Any sophisticated politician -- and Zarif is certainly sophisticated -- understands that social media plays a big part in establishing a narrative," he said, noting that the minister uses Facebook in Farsi to message Iranians and Twitter in English to match diplomatic counterparts such as US Secretary of State John Kerry. "I don't think he thinks too hard about the contradiction," Majd, who is covering the epic talks in Vienna for America's NBC News network, said of Zarif. Bid to 'win the public mind' "It is widely recognised, and conceded by the authorities, that Facebook has millions of Iranian members," he added. As if to prove Twitter's usefulness again, Zarif used it Thursday just moments before Kerry told reporters he was prepared to "call an end" to the talks in Vienna if "tough decisions" are not made. "We're working hard, but not rushed, to get the job done. Mark my words; you can't change horses in the middle of a stream," Zarif tweeted, adding the main #IranTalksVienna hashtag. Online video sharing has also played a part. At talks on July 3, Zarif used YouTube to set out Iran's position in the talks, just as he did before an earlier round of negotiations in 2014. Last week's video extended a promise of greater cooperation from Iran on global problems such as the Islamic State group, if a nuclear deal were reached. In English, Zarif said: "Getting to yes requires the courage to compromise, the self-confidence to be flexible, the maturity to be reasonable. Our common threat today is the growing menace of violent extremism and outright barbarism." Such direct diplomacy complements use of traditional media. To get his message across, Zarif has written columns for The New York Times and Financial Times urging a deal. By doing so he can shape the debate, said Abas Aslani, a well-known Iranian journalist covering the nuclear talks in Vienna. "Often in politics the narrative of an event is much more important than the event itself," said Aslani, acknowledging that cheap and easily available VPNs (Virtual Private Networks) neuter censorship. "Those who play a more active and influential role in different kinds of media are expected to win the public mind," he said of Zarif. "The presence of Iranian officials in media, traditional and new media, not only shouldn't be limited but also expanded."

Lack of censorship is bad for the Iran deal – some government officials and media sources are already pressuring Rouhani about shutting down the Iran deal.

Moaveni 14 (http://foreignpolicy.com/2014/06/23/the-moderation-will-not-be-televised/?wp_login_redirect=0, The Moderation Will Not Be Televised, Azadeh Moaveni, staff writer for Foreign Policy, June 23, 2014)

In the highly polarized world of Iranian politics, state-run or state-affiliated media has long been a thorn in the side of moderate, reformist politicians. It pummeled former President Mohammad Khatami throughout his tenure, as he attempted to relax censorship and cut back on state intrusion into private lives, branding him a traitor to the revolution. In 2009, it slammed the protestors campaigning against what they called rigged presidential elections, portraying protest leaders as hooligans. And now, state media has trained its eye on Rouhani, the moderate president trying to resolve his country's nuclear standoff with the West. I Am Rouhani was just one salvo from the hard-line publicity machine that has set about besieging the Iranian president. A wide network of online news outlets and media producers — many affiliated with the IRGC — have attacked the

president's cultural and diplomatic initiatives for promoting immorality and endangering revolutionary values, as well as bargaining away Iran's rights to uranium enrichment. The Islamic Republic of Iran Broadcasting (IRIB), the government-funded state broadcaster and one of the country's most powerful institutions, has waged a particularly dedicated anti-Rouhani campaign. One early slight came last September, when the broadcaster arranged its coverage of the president's trip to the U.N. General Assembly for the same time as a major soccer match, ensuring that many Iranians would miss what the Rouhani administration hoped to bill as a signature diplomatic success. Then, in February, the head of the IRIB — Ezzatollah Zarghami, a former IRGC general sanctioned by the European Union for human rights violations — attempted to block a live interview with Rouhani from hitting the airwaves. A short delay arose after Rouhani reportedly asked for the antagonistic interviewer IRIB had sent to be replaced, and Zarghami responded by suspending the interview for an hour, leading the president to tweet in complaint, "Zarghami prevented live discussion w/ people on #IRIB1." The broadcaster's flagship news program, 20:30, has also taken Rouhani to task in multiple segments for his decision to relax Iran's stringent restrictions on independent magazines. One 20:30 reporter questioned the administration's decision to give clearance to Iran-e Farda ("Tomorrow's Iran"), asking whether "a publication that has been shut for 14 years for numerous violations and destructive actions" should be permitted to publish. The same reporter, in a segment earlier in May, also voiced his doubts about the decision to allow the publication of Zanan-e Emrouz ("Today's Women"), a magazine that has become a symbol of Rouhani's effort to resurrect civil society after the crackdown under former President Mahmoud Ahmadinejad. The segment described Shahla Sherkat, the publication's prominent editor, as an individual with "perverse views," and asked whether "allowing her to have a publication [was] in line with the promotion of Islamic and national values." The hard-liners' control of the state broadcaster gives them a powerful megaphone with which to reach the Iranian public. The hard-liners' control of the state broadcaster gives them a powerful megaphone with which to reach the Iranian public. In a survey conducted by the University of Pennsylvania, 96 percent of Iranians said that television was their most important source of information; of those respondents, 86 percent said that IRIB TV was the channel they watched most frequently. IRIB has spent vast resources in recent years producing a range of networks, both regional and national, to appeal to a wide segment of the electorate: Its elaborate historical dramas draw large audiences, and its news programming has the widest viewership of any Persian-language television network — even as it remains heavy-handed and often partisan. An array of hundreds of hard-line news websites and daily newspapers also peck at Rouhani on a daily basis. In January, Kayhan — a newspaper run by the hard-line figure Hossein Shariatmadari, who has ties to the intelligence services — accused Rouhani in an editorial of deceiving the Iranian public over the course of the nuclear negotiations. The article compared the ongoing nuclear talks with the Battle of Siffin, a seventh-century Muslim civil war in which a deadlocked negotiation was only resolved by an all-out attack. Tasnim News, a site linked with the Basij paramilitary force, published an essay in April warning Rouhani that "this is a weak government that is on its way to becoming a fully isolated one." And in May, a raft of hard-line outlets dedicated two days of coverage to the "We Are Worried" conference, which brought together opponents of Rouhani's nuclear negotiations — people like Fereydoon Abbasi, the former head of Iran's Atomic Energy Organization, who was quoted by the IRGC-affiliated Fars News as saying, "we shouldn't be smiling at those who are weakening our nation's interests." Unlike former President Khatami, who simply ignored these relentless attacks when in office, Rouhani appears to be successfully fighting back. In an interview on IRIB shortly after taking office, the president accused the broadcaster of "giv[ing] voice to radical forces and opposition,

broadcasting their news and damaging the reputation of the government in people's eyes." But Rouhani's attempt to quiet the hard-line media has also apparently won the backing of a higher power. A flurry of accounts from Iranian officials and news media suggest that Supreme Leader Ayatollah Ali Khamenei himself has stepped into the fray, ordering hard-line news outlets to stand down. Iranian Intelligence Minister Mahmoud Alavi said in a speech this month that Khamenei had grown dismayed with the media's "spreading of lies" and had "issued a stern warning to the media responsible" — and, when that didn't work, summoned the unnamed outlet's leadership, asking, "Why are you trying to weaken this government?" Ali Saeedi, the Supreme Leader's representative to the IRGC, also said last week that "news outlets and media affiliated with the Revolutionary Guards," are responsible for publishing "imprecise and reckless news." The comment added to the impression that the supreme leader himself may be working to shield Rouhani's government from further aggravation, as it attempts to negotiate an accord with the West over Iran's nuclear program. Perhaps due to Khamenei's support for Rouhani, the state media attacks today pale in comparison to the massive campaign against Khatami, who served from 1997 through 2005. In that era, IRIB and other media institutions ran what reformists called "the destruction room" — an organized command center from which they orchestrated a media campaign that questioned Khatami's loyalty to Islam and painted his diplomatic efforts as a stealthy bid to restore relations with the United States. This time around, the hard-line press has been conspicuously muted on the presence of senior American officials at the nuclear negotiations, something that would have ordinarily been grounds for a tremendous fuss — an indication that Khamenei is likely exercising his influence. But a July 20 deadline to reach an agreement looms. Should Rouhani and his negotiators fail — or should Khamenei either change his mind on backing a deal, or decide the government no longer needs protection — the president might once see the gloves really come off. If that happens, he may find that a low-budget documentary was the just the beginning.

Internet censorship key to make sure the Iran deal passes – if Iran censorship decreases that will lead to an uprising in Iran, which will end up destroying the deal

Offiler 14 (<http://eaworldview.com/2014/03/iran-analysis-supreme-leader-holocaust-cultural-question/>, Iran Special: The Supreme Leader, The Holocaust, and the Internal Culture War, Ben Offiler, March 22, 2014)

As Iranians celebrate Nowruz, the Supreme Leader marked the beginning of the Persian New Year by delivering the latest salvo in the assault on the Rouhani administration's efforts to open up cultural space in Iran. At the shrine of Shia's 8th Imam, Reza, in the northeastern city of Mashhad, the Supreme Leader declared that the question of "culture is even more important than [the] economy", indicating the significance of the tension between the Government and hardliners on this issue. See Iran Daily: Supreme Leader Declares "Year of Economy and Culture with National Determination and Jihadi Management" However, it was his next statement that may provoke the most attention: Ayatollah Khamenei used the example of the Holocaust to justify the imposition of constraints on cultural freedom inside Iran. In a display of supremely twisted logic, Khamenei put forward the thesis that no country in the world has absolute freedom. As proof, he cited the "censorship" of those who would deny or question the Holocaust as proof that Western nations also impose constraints on speech and writing. So, according to Khamenei, the Islamic Republic is within its rights to maintain its "redlines" when it comes to cultural matters. It takes a special kind of ignorance, insensitivity and spitefulness to co-opt one of the greatest crimes and

tragedies of the twentieth-century for one's own political agenda — especially when that agenda is to oversee the continued control of culture and the suppression of freedom of expression. Since the Presidency of Mahmoud Ahmadinejad — the half-comic, half-sinister bogeyman of Western governments — ended with a whimper last year, there have been fewer cases of Iranian government officials nonchalantly and callously referencing the Holocaust. To the contrary, one of the signs of the Rouhani Government's move toward "openness" was the recognition of the crime by Foreign Minister Mohammad Javad Zarif last autumn. The Supreme Leader has undone any advance. Western media, alongside those who argue that the current government in Tehran is no different from its predecessor, will report this latest pronouncement with gusto. So why make such a statement now, given that Western countries and Iran are in the midst of negotiations that could lead to a comprehensive nuclear deal? Beyond its reference to the Holocaust, the Supreme Leader's speech is an intervention the ongoing conflict between the Rouhani administration — in particular the President and the Islamic Guidance and Culture Ministry — and hardline political elements within the regime. Leading the charge against the government is the Islamic Revolutionary Guards Corps, which has resisted the government's policies on cultural issues since Rouhani's election. The battle between the "moderate" Rouhani government and its "hardline" opponents had been temporarily put to one side by the Supreme Leader: to protect the president's nuclear policy, Ayatollah Khamenei warned Rouhani against efforts to open up the domestic sphere on questions of culture. The tension did not disappear, however. Political tempers simmered and then boiled over as hardliners renewed criticism of Government officials. The Supreme Leader's latest proclamation moves him from referee to participant. It is a firm signal that, while he might stand behind Rouhani's nuclear negotiations, he is backing the hardline position on cultural questions. But again, why now? It is not unusual for Iranian politicians to use the New Year celebrations to send defiant messages to the West. But there was another equally important dimension to Khamenei's statement today — the clue to "a message within" was in his exaltation of the scale of demonstrations to mark the anniversary of the Revolution on 22 Bahman (February 11). This was not just exaltation. It was a sign of nerves: Almost five years after the mass protests following the disputed 2009 Presidential election — protests framed as "sedition" by the hard-line culture warriors — the Supreme Leader still feels compelled to claim large turnouts on big days in the Islamic Republic's history. These turnouts, he insists, show that the Iranian people reject foreign entreaties and manipulations to turn against their regime. At some points, that insistence passes assurance and approaches shaky insistence. All is well, no dissent here, all in Iran march for the system and the Supreme Leader. But what if all is not well? What if the frustrations and hopes of Iranians who marched in 2009 have not disappeared? What if anger and disillusionment has been fed by economic problems — problems that the Supreme Leader said today had not been handled effectively by the Government in its seven months in office? Khamenei is worried about the economy. And he is far from certain that, in difficulties, he can count on the support of his people. That is why he has come off the fence — Holocaust reference included — on the "culture war". And that points to more, rather than less, conflict within Iran in the near-future.

A2 Censorship Fails

Censorship in the Middle East works – status quo proves

Panah 13 (<http://mic.com/articles/73541/internet-censorship-is-reaching-a-whole-new-level-of-creepy-in-the-middle-east>, Internet Censorship is Reaching a Whole New Level Of Creepy in the Middle East, Hamid Yazdan Panah, policy analyst and writer for Mic and an attorney focused on immigration, November 14, 2013)

Censorship in the Middle East is constantly shifting in form. In many countries, repressive, violent state powers are being replaced with a more subtle form of state surveillance. In closed societies where censorship is the norm and information is limited, social media presents a compelling alternative for citizens who want to make their voices heard. Censorship in the Middle East continues to evolve and adapt in order to find new ways to silence dissidents. This battle for free speech marks the front lines of the struggle for a new Middle East, and the most alarming thing about it is the way some countries — most notably Iran — have started playing psychological games with dissidents. Essentially, social media in the Middle East gives users the ability to lift the curtain of censorship that has plagued the region for so long, and find like-minded individuals whose views don't meet with government approval. The Gulf states, for example, have a thriving underground social-media scene. An online activist who speaks the truth will quickly earn a strong following and have a platform for the expression of their views, one which can not so easily be taken away by authorities. Censorship is still a real, everyday concern for many prominent bloggers and social-media users. Rashid Saleh al-Anzi, 26, was sentenced to two years imprisonment for allegedly tweeting offensive remarks directed at emir Sheikh Sabah al-Ahmad al-Sabah of Kuwait in October 2012. Al-Anzi, who has more than 5,700 followers, is one of the many victims of censorship in a region that has been marked by tensions between modern outlets like Twitter, and repressive regimes. In Kuwait alone, one million accounts were registered in a country of 3.6 million inhabitants as of April 2012, according to Paris-based SemioCast, which compiles Twitter data. According to the Associated Press, a Qatari poet was sentenced to life in prison, for an Arab Spring-themed poem that was deemed offensive to the country's emir. Social media activist Said Yousif al-Muhafda, from Bahrain, was arrested for covering protests using his Twitter account. Muhafda was being held for “disseminating false information regarding the clashes between the security forces.” Ironically, he later tweeted a photo of his own arrest. Al-Muhafda was later acquitted of any charges, but Bahrain has continued its policy of strict censorship. “The authorities are placing extensive surveillance on social media, and several were arrested because of their online posts in an act that serves to intimidate others to move into self-censorship,” the Gulf Center for Human Rights and the Bahrain Center for Human Rights said in a statement. This is a common cycle: Activists who are censored or imprisoned become even more popular and influential, further frustrating the authorities' goal of silencing individuals and getting them out of the public eye. Even Turkey, which has long been the darling of many who believe in the so called “modernization” of the Middle East, has resorted to targeting Twitter users, with Prime Minister Tayyip Erdogan claiming that “social media is the worst menace to society,” Iran is an interesting example of a more subtle approach to censorship. With a tech-savvy society in which half of the population of 75 million is connected to the Internet, the regime has sought to find ways to curb internet freedom without resorting to heavy-handed tactics of censorship. After social media was used extensively during the 2009 post-election uprising, the regime took a multifaceted approach to control of the Internet. The Iranian regime created a “cyber police” force in 2011 to confront anti-

regime activities online. Other activists have reported the creation of fake Facebook profiles created to spy on the activities of users. Coupled with these tactics of surveillance is a plan outlined by the regime to present so-called “alternatives” to the internet in its current state. The regime plans to create what it has dubbed the “halal” Internet, which it says will be free of un-Islamic content. These methods are part of a comprehensive plan by the regime to justify censorship on political and religious grounds, going so far as to claim that using Western social media outlets will empower the enemies of Iran. These tactics are a sign of a more sophisticated approach to the issue of censorship, one which leaves room for surveillance and information-gathering on potential threats. Though Iran does have a history of violent repression of bloggers and online activists, including the murder of blogger Sattar Beheshti while in police custody, the regime's new approach to censorship demonstrates the high stakes of the struggle. The goal of the cyber police is to project their power over the individual, demonstrate their ability to monitor citizens' entire lives, and ultimately silence them. Those who refuse are silenced permanently, as Beheshti found out after he was taken into custody. In some cases censorship tactics used by Gulf countries have served to galvanize protest movements and calls for free speech, but the strategy of surveillance employed by Iran appears much more dangerous. While the Gulf model of censorship focuses on incarceration of the physical body, the Iranian model seeks to frame the use of social media as an ideological battle with a foreign enemy. Institutions which can force individuals to “self-censor” for fear of surveillance, or being labeled a foreign collaborator, are more effective and much more difficult to overcome. This type of censorship is hidden but ever-present, and creates a culture of fear, mistrust, and ultimately silence. Yet these barriers can be circumvented with technical strategies and cultural shifts. Iran continues to have a vibrant online society, which has so far resisted ideological or electronic restrictions. The citizens fighting for rights in the Gulf states have also shown that they are willing to stand up for their rights, whether on the streets or on Twitter. One thing that appears to be inevitable is the demographic shift in the region, with a new generation that is not only experiencing new freedoms using social media, but is also achieving political change through the Arab Spring.

A2 No Backlash

Internet liberalization will lead to backlash – emperics prove that exposure to Western culture lead to revolutions in the Middle East

Seifoddini 14

(https://tasmania.ethz.ch/index.php/Risks_of_political_instability_for_entrepreneurship_in_Iran, Risks of political instability for entrepreneurship in Iran, Amrollah Seifoddini, writer for innovation wiki, April 1, 2014)

Problem Iran is a developing country in middle-east which has experienced several periods of political instability throughout the history. Some people relate this continues changes to Iran's position in Middle East which is an oil rich region, **others include religion or freedom from dictatorship as causes for the instability**. In the past century, there was two revolutions in Iran which changed the political regime and structure of government. In the latest one, an Islamic government is born with a new philosophy and structure that we do not see in any other country in the world. This regime is in many ways in contract with the western world. This conflict divides people in Iran into two general party, one like to be more like west, one opposes western culture. In the recent years, **due to advancements of social media, Internet penetration, and change of taste in young people, the group interested in west has grown bigger and bigger**. At the recent presidential election, it was obvious that this reformist party is big enough to

compete with fundamentalists. In this situation, the future of regime and government is not well predictable for next decades and this means with every new government of Parliament, some new rules, laws and orders will change that affect many businesses. And if the whole regime changes, then the links and relations to other countries may change too. This instability makes the prediction of market in Iran really hard for some high-tech and costly industries at least.

AT: Next Prez

Impossible for next president to kill the Iran Deal

Tabin 7/17 (<http://www.thedailybeast.com/articles/2015/07/17/a-gop-president-won-t-stop-the-iran-deal.html>, John Tabin, staff writer for the Daily Beast, A GOP President Won't Stop the Iran Deal)

A number of Republican candidates and office holders say they can sink the nuke deal with Iran. In reality, they probably can't. No matter how what happens with the 2016 elections, the chances of the GOP blowing up the nuclear deal with Iran are extraordinarily slim. First off, it's not a treaty, so it doesn't need the approval of two-thirds of the Republican-controlled Senate. For a while this year, the Obama administration seemed to think they could cut Congress out of the process entirely, presumably using the executive waiver powers built into most of the relevant sanctions legislation; Obama initially threatened to veto Senator Bob Corker's bill to give Congress a vote on the deal. The veto threat was withdrawn, and Corker's bill passed both houses of Congress with near-unanimous support (only the very hawkish Republican Tom Cotton voted no), because the process it establishes is heavily weighted toward approving the deal. If Congress does nothing (or if action gets bottled up in committee), the deal is approved by default. If a resolution of approval fails, it's a symbolic rebuke with no legal force. And if a resolution of disapproval passes, it needs veto-proof support to actually block U.S. participation in the deal. That means the president would need to lose 13 Democrats in the Senate and 45 Democrats in the House (more if there are Republican defections in the other direction). That will, at the very least, be difficult. Before the deal, some Democrats cited a letter put out by the Washington Institute for Near East Policy, signed by a bipartisan group that includes five former Obama advisers, that laid out guidelines for an acceptable deal. The deal that's been struck clearly doesn't meet that bar; to take just one example, the letter demands that weapons inspectors "must have timely and effective access to any sites in Iran they need to visit in order to verify Iran's compliance with the agreement." The deal makes it possible for Iran to delay inspections for up to 24 days. Nonetheless, the White House is circulating an argument that the deal not only meets but exceeds the letter's benchmarks, and it's quite possible, even probable, that the requisite number of lawmakers will buy their assertions. And no matter what happens on Capitol Hill, the United Nations and the European Union will begin unwinding sanctions on Iran in short order; the UN will likely act even before Congress gets around to debating a disapproval resolution. And that makes things a lot trickier for the next president than some of the Republicans who want the job are letting on. Congress can pull the U.S. out of the deal; so can the next president. But at this point, Washington can do little to change the basic picture. "As President," Rick Perry said in a statement, "one of my first official acts will be to fully rescind this accord"—which, under a straightforward interpretation of "fully rescind," is not actually possible. Scott Walker at least said in his official campaign announcement on Monday that "we need to terminate the bad deal with Iran on day one, put in place crippling economic sanctions and convince our allies to do the same," which at least includes a nod toward the fact that the sanctions are an international issue. But with Iran open for business and European corporations eager to cash in, reviving the

sanctions regime internationally almost certainly can't be done in year one, much less on day one. If it's possible at all, it would require a multi-year process of documenting Iranian violations of the deal to rebuild the consensus that has until now left Iran isolated. White House protestations to the contrary, the snapback provisions in the deal do little to change that. To her credit, Carly Fiorina acknowledges this: "Even if Congress does vote this deal down, the rest of the world has moved on," she notes. Fiorina advocates U.S. sanctions on Iran's financial sector; that would have some bite, but without international cooperation it wouldn't undo much of what Iran gets from the deal. Other candidates are less candid: Ted Cruz echoes Walker's "day one" phrasing, and Marco Rubio promises to "re-impose sanctions" but glosses over the limits on Washington's ability to do so unilaterally. Congress can pull the U.S. out of the deal; so can the next president. But at this point, Washington can do little to change the basic picture: Tehran is getting a massive windfall. Newly un-sanctioned Quds Force General Qasem Soleimani will be freer to spread mayhem across the region (if not the world). And, most likely, nothing short of regime change will stop the Islamic Republic from getting the bomb in the long run.

AT Democracy/Dissent Turn

The AFF's got it the other way around – the deal actually helps democracy

Beinart 15 (<http://www.theatlantic.com/international/archive/2015/04/iran-nuclear-deal-democracy-akbar-ganji/390900/>, 'When a Nation Is Threatened, Democracy Is an Impossible Dream,' Peter Beinart, Peter Beinart is a contributing editor at The Atlantic and National Journal, April 20, 2015)

Last week, Akbar Ganji wrote one of the most important essays published since the signing of the framework nuclear deal with Iran earlier this month. It's partly important because of who Ganji is. Imprisoned in 2001 for accusing Iranian officials of orchestrating the murder of government critics, he penned a manifesto from jail calling for Iran to replace theocracy with democracy. After being released and leaving Iran, he launched a hunger strike on behalf of Iranian political prisoners in 2009. He's been called Iran's "preeminent political dissident." But it's also important because of what Ganji says. In the essay, he calls the framework deal "a great victory for Iran and Iranians, if we look at it from a democracy angle." Why? Because "when a nation such as Iran is threatened by the US and Israel for over two decades, and suffers from the most crippling economic sanctions in history, democracy becomes an impossible dream for its people, who live instead in terror and fear of war." If the United States and its allies "are truly interested in the development of democracy in Iran," he continues, "they should set aside military threats and economic sanctions. Peace and economic well-being is directly linked with democracy." In those sentences, Ganji challenges one of the most damaging myths in modern American foreign policy: that via war and cold war, America promotes freedom. As with so much else involving today's GOP, that myth is connected to the myth of Ronald Reagan. As hawks tell it, Reagan entered the White House in 1981, built up the American military, sent arms to anti-communist rebels, refused to negotiate arms-control deals, called the Soviet Union an "evil empire," and, presto, the Berlin Wall fell. It was America's escalation of the Cold War that liberated Eastern Europe. The problem with this story is that it ignores everything that happened between 1984 and 1989. In 1984, Reagan—alarmed that a NATO military exercise called Able Archer had brought the U.S. and U.S.S.R. close to accidental war, and worried that his bellicose policies were hurting his chances of reelection—began working to de-escalate the Cold War. "During my first years in

Washington,” Reagan wrote in his memoirs, “I think many of us in the administration took it for granted that the Russians, like ourselves, considered it unthinkable that the United States would launch a first strike against them. But the more experience I had with Soviet leaders and other heads of state who knew them, the more I began to realize that many Soviet officials feared us not only as adversaries but as potential aggressors who might hurl nuclear weapons at them in a first strike. ... Well, if that was the case, I was even more anxious to get a top Soviet leader in a room alone and try to convince him we had no designs on the Soviet Union and Russians had nothing to fear from us.” In January 1984, Reagan gave a speech declaring that, “Neither we nor the Soviet Union can wish away the differences between our two societies and our philosophies, but we should always remember that we do have common interests and the foremost among them is to avoid war and reduce the level of arms.” After meeting Soviet Foreign Minister Andrei Gromyko that September, the White House announced that, “The United States respects the Soviet Union’s status as a superpower ... and we have no wish to change its social system.” All this helps explain why, within hours of learning that Mikhail Gorbachev had become the Soviet Union’s new leader in March 1985, Reagan invited him to meet without preconditions. The White House dispatched Vice President George H.W. Bush to Moscow to declare that, “We should seek to rid the world of the threat or use of force in international relations.” When Reagan and Gorbachev met that fall, they talked for almost five hours and Reagan whispered to his Soviet counterpart, “I bet the hard-liners in both our countries are bleeding when we shake hands.” By 1987, Reagan had signed the Intermediate-Range Nuclear Forces (INF) treaty, the most sweeping arms-control deal of the Cold War. His rhetoric toward the Soviet Union also radically changed. It’s true that in June 1987 Reagan famously called on Gorbachev to “tear down” the Berlin Wall. But when asked the month before whether he still considered the Soviet Union an evil empire, Reagan replied, “No, I was talking about another time and another era.”

Iran deal is key to bolstering democracy as well as solving for a litany of other impacts

Parsi 6/30/2015 (<http://www.cnn.com/2015/06/30/opinions/iran-nuclear-talks-parsi/>, Iran's nuclear talks: Five reasons why a deal would be good for the U.S., Trita Parsi, founder and current president of the National Iranian American Council, author of Treacherous Alliance and A Single Roll of the Dice, 6/30/2015)

The criticism of the pending nuclear deal between Iran and world powers is intensifying. Opponents of the deal will spend millions of dollars on ads pushing the U.S. public and Congress to kill the deal in the next few days. But while a fortune already has been spent on nit-picking the ongoing talks, virtually nothing has been invested in developing an alternative, viable solution to limit Iran's nuclear activities. The reality is that the opponents of the deal don't have a solution, they only have criticism. And for many, the real value of the nuclear deal has been lost amid the barrage of condemnation surrounding the talks. Americans doubt talks will prevent Iranian nuclear weapon. It's worthwhile to remind ourselves why this deal is so important -- and why it would be a strategic mistake of Iraq War proportions to let this opportunity slip out of our hands. Preventing the bomb ... The two first objectives the deal would achieve are paramount: firstly, it will prevent an Iranian nuclear bomb; secondly, it will prevent a disastrous war with Iran. The limitations and inspections regime the deal would impose on the Iranian nuclear program will make it virtually impossible for Tehran to build a bomb. Were it to choose to go down that path, it would get caught almost instantaneously thanks to the new high-tech inspection instruments that will be installed at Iranian nuclear facilities. In addition, if evidence arises that Iran has begun nuclear activities at undeclared sites, then Iran will be obliged to provide access to those sites as

well. No other option comes even close to this deal when it comes to closing off all of Iran's paths to a bomb. Military action in particular is far inferior -- and far more risky. ... And a disastrous war. Moreover, the deal will prevent a war with Iran -- particularly important given that the absence of a solution to the nuclear standoff has caused the U.S. and Iran to gravitate towards a military confrontation. If the talks fail -- or are undermined -- Iran's nuclear program would unshackle, enabling Tehran to inch closer to a weapons option. That in turn, would increase the risk of an Israeli or American attack on Iranian targets, even though bombing the country's nuclear facilities would at best only slow the program a few years. The Iranians would hit back and soon enough, and the U.S. would be embroiled in yet another war in the Middle East with no end in sight. No wonder the Iran deal has broad support among the U.S. public. Unleashing Iran's moderates. Third, the deal will help unleash Iran's vibrant, young (the median age is 28!) and moderate society, which is continuously pushing Iran in a democratic direction. The deal enjoys solid support among the Iranian public as well as among Iranian civil society leaders, partly because they believe the deal "would enable political and cultural reforms." America benefits if the democratic aspirations of the Iranian people are increasingly met, because a more democratic Iran is a more moderate Iran. What's the deal with the Iran nuclear negotiations? This is particularly important at a time when the violent winds of religious radicalism are ravaging the Middle East and beyond. America is in desperate need of an injection of political moderation in the region. An Iran that moves towards democracy could provide that. A boost in the fight against ISIS Fourth, ISIS and other jihadist groups threaten both Iran and the U.S. Yet coordination and collaboration between the two against these violent terrorist organizations has been minimal because neither side has the political ability to expand coordination until the nuclear dispute has been settled first. A well-placed Iranian source told me recently that in a post-deal environment, Iran is ready to put in 40,000-60,000 ground troops to eliminate ISIS over the next three years. Ideally, the U.S. would provide air support, he explained. The source made clear the commitment would not be a quid pro quo to get a nuclear deal. Iran nuclear talks: 'Security of the world is at stake' If true, this would be the first commitment of ground troops by any state in the region to take on ISIS. But even short of this, Iran has already provided more support in the fight against ISIS than any of America's actual allies. There is near-consensus that airstrikes alone will not defeat ISIS. Ground troops are needed, but who will provide them? The American public is certainly not in the mood for putting more troops on the ground in Iraq. The Iraqi army has proven desperately inadequate. The nuclear deal may help square this circle. Deal gives America more options. Last but not least, the nuclear deal can help provide America with more options in the region in the sense that it reduces America's reliance on authoritarian Arab states such as Saudi Arabia -- which, despite being a key U.S. ally, has played a central role in spreading Islamic radicalism and jihadism. As Jeremy Shapiro and Richard Sokolsky recently pointed out, the Iran deal is not about getting into bed with Tehran. But it can be used to get out of bed with the Saudis. And with that, America's hands will be freer to truly deal with and defeat the threat of Islamic radicalism fomented by the Salafists in the Saudi kingdom. U.S., allies and Iran plan to miss June 30th nuclear talks deadline Former Chairman of the Joint Chiefs of Staff Admiral Mike Mullen put it best: "We need to re-examine all of the relationships we enjoy in the region, relationships primarily with Sunni-dominated nations. Detente with Iran might better balance our efforts across the sectarian divide." In the coming weeks, emotions will run high in the debate over the Iran deal. It will be critical to distinguish between the minutia and the truly essential. At historic moments like this, it is the bigger picture that counts.

Iran Censorship DA AFF

2AC

Iran censorship is ineffective and fails

Iran Times 14 (<http://iran-times.com/internet-filters-irritating-but-ineffective/>, Internet filters: Irritating but ineffective, October 10, 2014, International Iran Times, news source about Iran)

A Spanish reporter visiting Tehran to check out Internet censorship concludes that it is a pain in the neck but doesn't really stop anyone with persistence from getting to content he or she wants to see. Ana Cardenas, a foreign correspondent with the Spanish news agency EFE, says confronting Internet censorship is “a daily struggle for many Iranians.” But, in the end, she says, “they can access all the online content they wish”—whether that be politics or porn. It is estimated that Iranian authorities block access to more than 5 million web pages, including popular social networks such as Facebook, Twitter and YouTube, but also pornography, religious topics, issues like women's rights and any media considered hostile to the Islamic Republic. Needless to say, sites of human rights organizations and dissidents are among those blocked. However, according to the government's own figures, at least 4 million Iranians have Facebook accounts. Other sources raise that figure to 15 million in a country of 78 million inhabitants. The most followed Face-book pages in Iran are reported to be those of singer Shadmehr Aghili, a Persian pop singer based in Los Angeles who has almost two million “likes,” the London-based and banned Farsi entertainment channel Manoto TV, and Colombian musical icon Shakira, who is followed by more than 1.5 million Iranians but has no ties to Iran at all. BMW, Mercedes-Benz, Zara and Gucci are the most-followed brands on social networks. In the sports category, first place goes to Spanish soccer club FC Barcelona, with 800,000 followers, while Real Madrid comes second with about 700,000 fans. Millions of Iranians also have accounts on Instagram, and upload videos on Vimeo or YouTube. Even Foreign Minister Mohammad-Javad Zarif has a frequently updated Twitter account, which can claim 200,000 followers. But all these figures do not mean restrictions are non-existent. Cardenas writes, “The barriers make the simple act of accessing the Internet a considerable headache, while surfing the Web, exchanging programs or downloading files become challenging missions that can only be accomplished by experts who know how to breach the firewall.” Internet penetration in Iran is generally put at 55 percent, the second-highest in the Middle East, right behind Israel. The government itself estimates that the country has 45 million active Internet users. A survey recently released by the Ministry of Youth and Sports says that 70 percent of Iranian youth surfing the Internet use anti-filters. “Every week I see a dozen customers to install anti-filters,” a computer engineer who preferred to remain unnamed told Cardenas. “Six years ago [after the post-election disorders], these problems increased,” the engineer said, explaining that “there are several types of anti-filters, but the most popular ones are the VPN [Virtual Private Network] or proxy technologies,” which connect users to the Internet through servers located outside Iran. Millions of Iranian computers sport the logos of Psiphon, Freegate, Ultra Soft, Tor or other programs that allow users to navigate the web freely—and undetected. Cardenas writes, “These programs may remain in use for weeks, sometimes even months, before the authorities manage to locate and block them, prompting users to find another program or an update.” There are also people who hire foreign companies for specific VPN services, some of which are supported by a US government fund to help IT companies stay ahead of censorship by Iran and other authoritarian regimes. “Internet censorship is ridiculous. If people want to see pornographic photos or political websites, they will do so

without problems,” a young network expert, who also requested to remain anonymous, told Cardenas. He said he has “many customers who are very religious,” for whom he installs VPN because they consider the government’s practices too restrictive. Besides of the annoying task of keeping the anti-filters constantly updated, the government’s censorship can cause many inconveniences for Internet surfers. For example, the Adobe program (used by many online videos) does not work through a proxy, since it cannot identify the user. Other problems include installation of legally-licensed software or, for example, the drivers for a newly purchased printer, which cannot be installed correctly. “Surfing the web has become a game of tag in which huge amounts of time and effort are wasted,” concludes Cardenas. “Rather than actually preventing access, censorship simply complicates the matter a bit.” In an interview with US National Public Radio (NPR) in New York last month, Foreign Minister Zarif tackled the testy topic of censorship. He said: “A large segment of Iranian population who are very traditional believe that it is the job of the government, the responsibility of the government, to create social conditions that are safe—that the children, when they go on the Internet, do not face profanity, do not face prostitution, do not face pornography—so that it is the job of the government to create a barrier for them, to create that social security net for them. “And the debate in Iran on how this can be done is an ongoing debate. It’s far from being settled. It’s clear where I stand on that debate, but I do not, nor does the government, determine the outcome of a domestic, social debate. It’s a social debate that needs to be addressed. Even when we introduced high-speed mobile Internet, there were a lot of objections from more traditional centers in Iran. “So that’s an ongoing process and I hope at the end of the day, from my perspective as an Iranian citizen, not necessarily as an Iranian official, that one day these platforms will be free.”

Alt Cause – Next US Republican president will kill Iran deal anyways

Toosi 7/14 (How a Republican president could kill the Iran deal,

<http://www.politico.com/story/2015/07/gop-president-iran-deal-kill-120077.html>, Nahal Toosi, Nahal Toosi is a foreign affairs correspondent at POLITICO, 7/14/2015)

If the next president hates the nuclear deal with Iran, he (or she) can undo it after taking office. The dilemma: Use blunt force? Or go for a soft kill? Story Continued Below The accord reached this week in Vienna promises broad sanctions relief to Iran in exchange for significant curbs on its nuclear program. The agreement has taken years to negotiate, involves seven countries as well as the European Union and the United Nations, and relies upon the expertise of scientists as well as diplomats. But at the end of the day, the “deal” is at most a political arrangement — not a treaty or other form of signed legal document. That means that the presidential candidates who have threatened to cancel the deal — so far all of them Republicans — can keep their promise by using the presidency’s executive authority to reimpose suspended U.S. sanctions on Iran and withdrawing from panels involved in implementing the accord. That abrupt approach may be quick, but it also carries risks. For one thing, a sudden U.S. withdrawal could anger the European and Asian countries also involved in the deal, making them less inclined to reimpose their own sanctions on a country they consider an alluring trading partner. The international business community may resist efforts to once again seal off a youthful, well-educated nation with vast energy reserves. And Iran could respond to the U.S. move by resuming elements of its nuclear program, which the West has long suspected is aimed at making weapons. “If we try to reimpose sanctions on Iran and no one follows, then we have the worst of all worlds,” said Robert Einhorn, a former Iran nuclear negotiator at the State Department. Instead, even the deal’s most ardent critics say, a new president might be better off taking a more subtle, longer-term approach, one

that involves laying the groundwork to ultimately convince the world that Iran — through perceived violations, intransigence, foot-dragging or whatever a president chooses to highlight — has left the U.S. no choice but to quit the deal. “You say it’s a bad deal, but you don’t just rip up the deal,” said Mark Dubowitz, executive director of the Foundation for Defense of Democracies. The first step for a newly inaugurated president would be to order a review of the accord, which will already have been in effect for roughly a year and a half. It’s possible the Iranians will have been accused of violating the deal by the time a new president takes office, so a review could tally those transgressions to sow doubts in the minds of the American public about the soundness of the agreement. Depending on how major the violations are, the U.S. might also be able to convince other nations that the deal isn’t working. Even if the Iranians haven’t committed any or many notable violations, there are other factors a president could point to. Take the regional situation: If Iran, either directly or through proxies, has escalated its interference in other countries in the Middle East, a president could blame the nuclear deal by saying it has given Tehran economic leverage to pursue mischief outside its borders. America’s Arab allies, who have watched Iran make inroads everywhere from Syria to Lebanon to Iraq, have long argued that the Iranian government will take advantage of sanctions relief to funnel more money toward its regional aggression. Here, a U.S. president — and a hawkish Congress — also has the option of leveling new sanctions on Iran that aren’t necessarily tied to its nuclear program but rather to its support for terrorist groups. (Existing sanctions that target Iran over its support for terrorism and its abuses of human rights won’t be lifted under the nuclear deal.) At the very least, the new sanctions will increase the tension between the U.S. and Iran, possibly even leading to a backlash from Tehran that boosts the U.S. president’s standing. Dubowitz said it’s critical that the U.S. sanctions target in particular the Iranian Revolutionary Guard Corps, the powerful military unit that controls a large chunk of the Iranian economy and is behind much of the country’s interference in other states. At the same time that the U.S. is adding sanctions, it should remind the international business community of the riskiness of doing business in Iran, Dubowitz added. How U.S. allies in the region — especially Israel — feel about the deal in 2017 and beyond could also affect a U.S. president’s ability to make a case against the Islamic Republic. If Israel’s leaders insist that the accord is not working and can point to intelligence or other evidence that backs up their claim that gives added credence to the president’s decision to walk away from the agreement. (Already on Tuesday, Prime Minister Benjamin Netanyahu ripped the deal as “a historic mistake.”) Not that any of this is simple or predictable. A president determined to get rid of the deal, but unwilling to do so through an abrupt withdrawal, could find that it will take longer than one term, or even two, to make his case to the world. He might even find it hard to get his own administration on board. “Even if you get a total nut job in the Oval Office, you’re going to have a policy fight internally,” arms control expert Jeffrey Lewis said. “Regardless of what Republicans say, they tend to do things that are much more moderate because it’s hard to move the government.” At least one Republican presidential candidate appears to be taking this reality into account. New Jersey Gov. Chris Christie said earlier this month that although he was disturbed by President Barack Obama’s efforts to strike a deal with Iran, he wouldn’t promise to undo it if elected. His stance was far more cautious than that of other GOP White House contenders such as Florida Sen. Marco Rubio and Wisconsin Gov. Scott Walker, who have said they’d revoke the deal unless it meets their more stringent requirements. “I’m not one of those guys who’s going to say to you, ‘On Day One, I will abrogate the agreement,’” Christie told a group of Republicans in New Hampshire. “On Day One, I will look into and try to decide what to do with the agreement, depending on where we are at that moment. Because, by the way, it’s not just us involved anymore. We have a number of our allies around the world who’re at that table

as well, and sanctions are most effective when not only we do it, but the other allies do it.” Still, it’s not unprecedented for an administration to abandon an agreement signed by a predecessor. Even if the agreement rose to the level of a treaty, a U.S. president has so much power in the realm of foreign policy that he could withdraw from it, the way George W. Bush left the 1972 Anti-Ballistic Missile Treaty with Russia. America’s 1994 nuclear deal with North Korea, meanwhile, died a slow and painful death after years of alleged violations by both sides. AP Photo One potential wild card in the Iran case is whether the U.N. Security Council will pass a resolution that gives the deal some binding status under international law, said Tyler Cullis, a legal fellow with the National Iranian American Council, a group that supports the talks. Although a president could in theory simply disregard such a resolution, he would be taking the risk of putting the U.S. in violation of international law if he unilaterally withdraws without a lawful justification. Dubowitz, one of the most vocal skeptics of the Iran talks, insisted that if he were president his goal wouldn’t be to outright destroy a deal but to try to ensure that Iran never achieves nuclear weapons capability. He doubts the current deal does that because, he says, Iran will be able to expand its economic might as sanctions fade, making it even easier for it to resume nuclear activity once restrictions on its program start to drop off after the first 10 years of the agreement. So he envisions a 10-year timeline to strengthen America’s hand against Iran, one that would involve a U.S. president laying the groundwork for his successor and making some new demands from Iran. The president could insist, for instance, that if within five years U.N. inspectors cannot verify that Iran’s nuclear program is entirely peaceful, then the restrictions on Iran’s nuclear activities that would have dropped off after year 10 would stay on. It might not make for an easy soundbite on the 2016 campaign trail, but this longer-term approach could ultimately yield a less-dangerous Iran without undermining America’s international standing. “There’s always a quicker way, but the question is, ‘Is there a smarter way to accomplish your objective?’” Dubowitz said. ““I hope all our candidates are thoughtful in how they deal with what I think is increasingly an incredibly difficult situation for the next president to handle. This deal is going to leave the next president with an excruciatingly difficult decision: either to accept an Iranian bomb or to bomb Iran.”

Iran won’t launch a nuke—only interested for defensive purposes

Shanahan 15 (Roger Shanahan; Jan. 8th 2015; ANU’s National Security College and is a non-resident fellow at the Lowy Institute for International Policy; “Would Iran Start a Nuclear War?”; National Interest; <http://nationalinterest.org/blog/the-buzz/would-iran-start-nuclear-war-11995>) jskullz

¶ The language is dramatic but the posts lack much by the way of reasoned argument. Don’t get me wrong, I’m a devoted counter-proliferator and think that a nuclear-armed Iran should be stopped simply to avoid other states seeking to do the same. But I disagree with the view advocated by Andy Nikolich and others that a nuclear-armed Iran will seek to use those weapons to become more regionally influential or to launch them against Israel.¶¶ (Recommended: 5 Iranian Weapons of War Israel Should Fear) ¶¶ The main reason I oppose such views is because they lack intellectual rigour. Firstly, simply having nuclear weapons doesn’t make anyone more influential. Pakistan and India are no more influential following their acquisition of a nuclear capability than they were before it. Influence comes through a range of media, and Iran has always understood that in many ways it’s an outsider in the region—ethnically, linguistically and religiously different from its Arab and Turkic neighbours. Hence its reliance on allies and proxies to exert influence—and that wouldn’t change if it became a nuclear-capable country.¶¶ Second, Andy’s argument is predicated on Iran’s seeing a nuclear weapon as simply an offensive weapon. The reality is that nuclear weapons are often the ultimate defensive weapon. Tehran could look east and see how Islamabad’s nuclear capability has stopped it from going to war with India, and it could look west and see how Tel Aviv’s undeclared capability has deterred its neighbours from invading it. Its nuclear capability hasn’t stopped conflict or guaranteed military success for

Israel, as it has faced two intifadas, invaded Gaza, had to withdraw from southern Lebanon and fought a short but bloody war against Hezbollah in 2006. But none of those have been existential threats. ¶ ¶ (Recommended: Five Israeli Weapons of War Iran Should Fear) ¶ ¶ The argument follows that Tehran sees a nuclear capability as the ultimate shield, rather than as a potential sword. Having been invaded by the British and the Soviets in World War II, and then suffering through eight years of a war with Iraq backed by its Arab neighbours and some in the West that cost hundreds of thousands of lives, it's easy to see the logic of Tehran viewing a nuclear weapon as the ultimate shield. ¶ ¶ In order to protect the Islamic Revolution the leadership seeks to guarantee its survival from external attack first and foremost and a nuclear weapon would do that. Any preemptive use of such weapons would be nearly guaranteed to receive more in return and hence end the rule of those charged with ruling in accordance with God's will. Again, there seems to be no reason why the Supreme Leader would seek to do such a thing. Some have argued that a strain of Shi'a millenarianism would see Iran loose off volleys of nuclear weapons in order to set the conditions to hasten the arrival of the Awaited Imam. There's no explanation of how that would follow, nor evidence of any support for such a concept by the Supreme Leader, who is in charge of Iran's nuclear file. ¶ ¶ (Recommended: 5 Israeli Weapons of War ISIS Should Fear) ¶ ¶ Andy claims that Iran exhibits "a determination to leverage the anticipated benefits of that [nuclear] investment" and that it seeks a nuclear capability "because of the prestige, power and authority which Iran believes such weapons would give it, both regionally and beyond." What he doesn't do is explain exactly what he sees those benefits to be, nor how he sees Tehran achieving power and authority as a nuclear state. I agree that Tehran seeks regional influence commensurate with how it views its rightful place in the international system. But I don't see how having a nuclear capability achieves that other than by safeguarding it from existential threats. Rather, I'd argue that Iranian national power, and hence that of the Islamic Revolution, will be furthered by leveraging its enormous potential economic and human capabilities. In many ways that's what its Gulf neighbours truly fear. ¶

Dissent is key to democracy – censorship takes this dissent away

Atkins 11 (<http://www.times-standard.com/general-news/20110730/democracy-and-dissent-go-together>, Democracy and dissent go together, Linda Atkins, Staff Writer for the Times Standard, 7/30/11)

Throughout the history of our country, dissent has been important to bringing change to our government. Without dissent and protest, we would still be English citizens, people would still own other people as slaves, and women would not have the vote. Promoting a world view that doesn't allow citizens to protest the actions of their government is to take on the philosophy of all of the despots and dictators who kept their citizens silenced and afraid of retribution. Democracy is a living form of government that embraces the right of its citizens to protest decisions that they disagree with. A governing body taking a vote is sometimes just the beginning of the process. As an elected official, I have the duty to listen to and encourage the people of Eureka to speak out when their representatives act in ways that the public disagrees with. I consider those people who show up to speak to our council week after week as involved and caring citizens who want to be a part of shaping our community. Others have dismissed these citizens' concerns because they continue to come to our meetings and voice their ideas. I don't understand that reasoning. Somehow, their very involvement at our meetings bothers some who would prefer that the community just shut up and let them do whatever they want, without the complaint from the citizenry. I agree that participating in a democracy means that we continue to work with the people with whom we disagree in order to come to future compromises that benefit our community. I would never refuse to work with, or treat badly, council members or staff with whom I've had disagreements. I expect the people I work with to have the same resilience. Politics is often a rough-and-tumble exercise. Dissent and protest stretch our ability to take criticism and should lead us to examine what it is that people are upset about, not simply dismiss their complaints as unimportant. Unlike some past council members, I don't have the capacity to know what the people who are not communicating with me are thinking. During the protest of the city's recent action, I received overwhelming input against the action the city had taken. I responded to that input by encouraging the citizens to express themselves. Talking to fellow citizens and circulating petitions are time-honored ways for people to express their concerns. I

will continue to support the people of Eureka actively participating in their government. I think that increased participation is the key to solving many of the issues that face our city today. Innovative ideas about how to address problems often come from outside of a bureaucracy, because it sometimes takes a different perspective to come up with alternative solutions. The stifling of citizen involvement cuts us off from others' viewpoints and leaves us with no new information with which to make our decisions. I want to encourage the people of Eureka to continue to give input to their elected officials about decisions that are important to our community. Don't be discouraged by the disregard of your concerns from some in the community; you know you were heard because of the nature of their response to your vocal protest in their July 22 My Word. It sometimes takes sustained communication to convince some elected officials that the public should not be ignored. I don't believe that, as a public official, I somehow know better than my fellow citizens what the correct direction is to move our city forward. I rely on all of you to help steer my decisions in a way that will help to bring positive changes and open communication between all people in our city. I challenge my fellow council members to join me in becoming aware of our use of the divisive language that has become so popular in our country today. It's easy to slip into this destructive habit of dismissing the people we disagree with. Dissent and protest represent the health of our democracy, while dismissal and divisiveness represent its deterioration. I will continue to speak up when I think something is wrong or when I disagree with a decision. I will continue to encourage others to do so, too. The framers of our democracy were very wise to include the right to dissent and protest in our governing documents. These rights allow our democracy to remain a strong and vibrant form of government.

Iran democracy key to preventing Middle East conflicts and terrorism

6/30/2015 (<http://www.cnn.com/2015/06/30/opinions/iran-nuclear-talks-parsi/>, Iran's nuclear talks: Five reasons why a deal would be good for the U.S., Trita Parsi, founder and current president of the National Iranian American Council, author of Treacherous Alliance and A Single Roll of the Dice, 6/30/2015)

Third, the deal will help unleash Iran's vibrant, young (the median age is 28!) and moderate society, which is continuously pushing Iran in a democratic direction. The deal enjoys solid support among the Iranian public as well as among Iranian civil society leaders, partly because they believe the deal "would enable political and cultural reforms." America benefits if the democratic aspirations of the Iranian people are increasingly met, because a more democratic Iran is a more moderate Iran. What's the deal with the Iran nuclear negotiations? **This is particularly important at a time when the violent winds of religious radicalism are ravaging the Middle East and beyond. America is in desperate need of an injection of political moderation in the region. An Iran that moves towards democracy could provide that.**

Uniqueness

Iran Censorship Declining Now

Strictness of Iran censorship policies decreasing rapidly

Azizi 15 (<http://www.al-monitor.com/pulse/originals/2015/02/iran-books-culture-minister-publishing-ali-jannati.html#>, Iranian writers welcome decline of censorship, Arash Azizi, writer, journalist and broadcaster. Based in London, he currently hosts one of the most-watched news shows in Iran, 2/10/15)

When Iran's President Mahmoud Ahmadinejad faced off with his primary opponent, Mir-Hossein Mousavi, in a heated televised debate in 2008, the unyielding leader conceded at least one point. When Mousavi criticized the state for its arbitrary book censorship under Ahmadinejad, the president responded, "Yes, I agree with you on that. I have written to the culture minister and warned him about this." After eight difficult years of strict censorship under President Mahmoud Ahmadinejad, Iranian writers say that literary freedom is increasing under the new administration. Simply put, the eight years of Ahmadinejad's presidency were some of the toughest for Iran's publishing community. Facing a massive increase in censorship and harassment, many writers simply gave up trying. In 2013, President Hassan Rouhani came to power, promising to inject new life into the country's cultural scene. He seems to have made good on at least one of his promises, and many writers and publishers have told Al-Monitor that book censorship has eased considerably. Speaking last week at an annual book award ceremony in Tehran, Rouhani criticized the arbitrary censorship of books and said he prefers to transfer the task of book supervision to the publishing industry itself. It is hard to overstate how beleaguered Iran's writers and publishers felt during the eight years under Ahmadinejad. The Islamic Republic has never been a bastion of freedom of expression, but during that time, things were taken to a different level. Under President Mohammad Khatami (1997-2005), especially his first term, the vast majority of restrictions on book publishing were lifted. The complicated power structure in Iran meant that writers could still face persecution, but Khatami's Ministry of Culture and Islamic Guidance actually stood by their side in most cases. "We'd go to the courts and defend the books that had been published," Khatami's Deputy Culture Minister Ali Asghar Ramezanpoor told Al-Monitor. After years of censorship, leftists could finally buy works by Marx and Lenin while reinvigorated journalists wrote books criticizing the highest figures in the establishment. All this came to a rather abrupt end when Ahmadinejad took power. His hard-line Culture Minister Mohammad Hossein Safar-Harandi immediately annulled many of the permissions issued by his predecessor. "This huge wall was raised and we felt like we had zero chances to publish any book," Anita Yarmohammadi, one of Iran's up-and-coming young novelists, told Al-Monitor. Ramezanpoor, who headed the ministry's powerful culture department, remembers the first weeks of the Ahmadinejad administration very well. He was repeatedly called to court to answer for the books he had allowed to be published. These were not only controversial titles like "Veil and the Male Elite: A Feminist Interpretation of Islam" by Moroccan Fatema Mernissi or journalist Akbar Ganji's "The Red Eminence and the Grey Eminences." Ramezanpoor also remembers being questioned, bizarrely, over a book about human biology. The new censors were uncomfortable with how words like "guardian" or "leadership" had been employed to describe blood cells, as the words are also used to describe the position of Iran's supreme leader. The ministry's culture department was to be headed by people like Parviz Mohsen, who said those who complained about censorship "were actually against the entire regime of the Islamic Republic," or Bahman Dorri, who once headed the publishing department of the Iranian

Revolutionary Guard Corp (IRGC) and who had penned titles like “The Absolute Guardianship of the Jurist is a Pillar of the Religion.” Veteran publishers, such as feminist Shahla Lahiji, described that era as being worse than the war-torn 1980s. The works of foreign writers such as William Faulkner, Federico Garcia Lorca and Gabriel Garcia Marquez were banned, despite having been best-selling favorites for years. Classics of modern Persian literature, from Sadeq Hedayat to Forough Farokhzad, also faced difficulties. Bizarrely, even the works of Khawja Abdullah Ansari, a Persian Sufi of the 11th century Herat, faced restrictions. Less than two years into the Rouhani administration, things are very different. New Culture Minister Ali Jannati, while not necessarily known as a Reformist, has a distinction of being “quite open-minded,” as Ramezanpoor has complimented him. It helps that his father is one of the staunchest hard-line figures of the establishment, Ayatollah Ahmad Jannati. For actions such as openly speaking out against Internet censorship, Jannati has now become a favorite target of the hard-liners. His father has repeatedly said that he disapproves of his son, and he is touted as the next in line of ministers that the conservative-dominated parliament threatens to impeach. But while Internet and press censorship makes a lot of headlines, the easing of censorship over books has happened quietly and without much controversy. “People in all echelons and levels of the ministry have changed,” Ramezanpoor said. “Ahmadinejad had appointed people with backgrounds in the IRGC, military or judiciary. Now, once more, we have literary-minded people working in the ministry.” This progress is in line with what Jannati promised at the outset. Criticizing the previous administration, he said, “People without the necessary knowledge used to stop some books from publication with their empty excuses,” joking, “If the Quran hadn’t come from God, they would even ban that.” New Deputy Culture Minister Abbas Salehi promised an answer to all applications for publication permits within 30 days and an end to arbitrary bans. Reports show that so far, he has mostly made good on the promise. “It’s like a miracle,” said Yarmohammadi. “My new novel got a response in less than a month. And they only wanted a few changes.” Nikoo Khakpoor, a novelist living in London and Tehran, told Al-Monitor, “One of the great things is that they let us talk to the reviewers once more to see what their concerns are. The wall has been lifted.” Eminent literary figure and translator Arsalan Fasihi told Al-Monitor, “Things have become a lot better.” Many of his translations of Orhan Pamuk, the Turkish Nobel laureate, are now coming out after having been barred from publication for close to a decade. He said that Pamuk is to visit Iran this month for the launch of the Persian translation of his first book, “Cevdey Bey and His Sons.” As always, optimism must be tempered with caution. Tahmine Milani, a well-known director, was recently summoned to court to answer for a book that has been published legally — a well-known tactic of the Ahmadinejad years that the new administration has promised to stop. The latest work by Iran’s premier novelist, Mahmood Dowlatabadi, has not received a permit, despite having already been published and celebrated in English and German. Ramezanpoor said that the hard-liners could start targeting this renewed freedom. He’s not terribly hopeful for the long term. But many prefer to be hopeful for now. “It is like this big dam has been removed and the river is flowing once more.” Yarmohammadi muses. “I see the coming days full of energy and life.”

Iran Censorship Fails

Iran censorship is ineffective and fails

Iran Times 14 (<http://iran-times.com/internet-filters-irritating-but-ineffective/>, Internet filters: Irritating but ineffective, October 10, 2014, International Iran Times, news source about Iran)

A Spanish reporter visiting Tehran to check out Internet censorship concludes that it is a pain in the neck but doesn't really stop anyone with persistence from getting to content he or she wants to see. Ana Cardenas, a foreign correspondent with the Spanish news agency EFE, says confronting Internet censorship is “a daily struggle for many Iranians.” But, in the end, she says, “they can access all the online content they wish”—whether that be politics or porn. It is estimated that Iranian authorities block access to more than 5 million web pages, including popular social networks such as Facebook, Twitter and YouTube, but also pornography, religious topics, issues like women’s rights and any media considered hostile to the Islamic Republic. Needless to say, sites of human rights organizations and dissidents are among those blocked. However, according to the government’s own figures, at least 4 million Iranians have Facebook accounts. Other sources raise that figure to 15 million in a country of 78 million inhabitants. The most followed Face-book pages in Iran are reported to be those of singer Shadmehr Aghili, a Persian pop singer based in Los Angeles who has almost two million “likes,” the London-based and banned Farsi entertainment channel Manoto TV, and Colombian musical icon Shakira, who is followed by more than 1.5 million Iranians but has no ties to Iran at all. BMW, Mercedes-Benz, Zara and Gucci are the most-followed brands on social networks. In the sports category, first place goes to Spanish soccer club FC Barcelona, with 800,000 followers, while Real Madrid comes second with about 700,000 fans. Millions of Iranians also have accounts on Instagram, and upload videos on Vimeo or YouTube. Even Foreign Minister Mohammad-Javad Zarif has a frequently updated Twitter account, which can claim 200,000 followers. But all these figures do not mean restrictions are non-existent. Cardenas writes, “The barriers make the simple act of accessing the Internet a considerable headache, while surfing the Web, exchanging programs or downloading files become challenging missions that can only be accomplished by experts who know how to breach the firewall.” Internet penetration in Iran is generally put at 55 percent, the second-highest in the Middle East, right behind Israel. The government itself estimates that the country has 45 million active Internet users. A survey recently released by the Ministry of Youth and Sports says that 70 percent of Iranian youth surfing the Internet use anti-filters. “Every week I see a dozen customers to install anti-filters,” a computer engineer who preferred to remain unnamed told Cardenas. “Six years ago [after the post-election disorders], these problems increased,” the engineer said, explaining that “there are several types of anti-filters, but the most popular ones are the VPN [Virtual Private Network] or proxy technologies,” which connect users to the Internet through servers located outside Iran. Millions of Iranian computers sport the logos of Psiphon, Freegate, Ultra Soft, Tor or other programs that allow users to navigate the web freely—and undetected. Cardenas writes, “These programs may remain in use for weeks, sometimes even months, before the authorities manage to locate and block them, prompting users to find another program or an update.” There are also people who hire foreign companies for specific VPN services, some of which are supported by a US government fund to help IT companies stay ahead of censorship by Iran and other authoritarian regimes. “Internet censorship is ridiculous. If people want to see pornographic photos or political websites, they will do so without problems,” a young network expert, who also requested to remain anonymous, told Cardenas. He said he has “many customers who are very religious,” for whom he installs VPN

because they consider the government's practices too restrictive. Besides of the annoying task of keeping the anti-filters constantly updated, the government's censorship can cause many inconveniences for Internet surfers. For example, the Adobe program (used by many online videos) does not work through a proxy, since it cannot identify the user. Other problems include installation of legally-licensed software or, for example, the drivers for a newly purchased printer, which cannot be installed correctly. "Surfing the web has become a game of tag in which huge amounts of time and effort are wasted," concludes Cardenas. "Rather than actually preventing access, censorship simply complicates the matter a bit." In an interview with US National Public Radio (NPR) in New York last month, Foreign Minister Zarif tackled the testy topic of censorship. He said: "A large segment of Iranian population who are very traditional believe that it is the job of the government, the responsibility of the government, to create social conditions that are safe—that the children, when they go on the Internet, do not face profanity, do not face prostitution, do not face pornography—so that it is the job of the government to create a barrier for them, to create that social security net for them. "And the debate in Iran on how this can be done is an ongoing debate. It's far from being settled. It's clear where I stand on that debate, but I do not, nor does the government, determine the outcome of a domestic, social debate. It's a social debate that needs to be addressed. Even when we introduced high-speed mobile Internet, there were a lot of objections from more traditional centers in Iran. "So that's an ongoing process and I hope at the end of the day, from my perspective as an Iranian citizen, not necessarily as an Iranian official, that one day these platforms will be free."

Iran censorship isn't doing anything – people virtually have access to everything because of web encryption

Franceschi-Bicchierai 5/7/2015 (<http://motherboard.vice.com/read/irans-smart-instagram-censorship-isnt-that-smart>, Iran's 'Smart' Instagram Censorship Isn't That Smart, Lorenzo Franceschi-Biccheirai, staff writer for Vice, May 7, 2015)

In October of last year, the Iranian government blocked a popular Instagram page called the Rich Kids of Tehran that featured scantily-clad young Iranian women and luxury cars. In a country where internet censorship is widespread and sophisticated—as well as heavily circumvented by tech savvy citizens—the block did not come as a surprise. But it was much more than routine. When Iran blocked access to that page, it showed that it was capable of and willing to use a censorship technique that its government officials had been touting for years: smart filtering. Iran's internet is often referred to as the "filtnet" due to the government's heavy hand when it comes to blocking political dissent and online content deemed offensive to the country's conservative religious views. The entirety of Google, Facebook, Twitter, and YouTube have been inaccessible within the country for years. But over the past two years, government officials have been talking about a technique called smart filtering, in which only certain parts of a social network or website are blocked, leaving the rest freely accessible. Instagram has long been the last Western internet service to remain untouched—and smart filtering might be the reason why. "The lack of HTTPS on Instagram allowed Iran to not only filter content on the platform, but also find out who is browsing what." However, it turns out smart filtering isn't actually that smart. Iran's ability to block only certain Instagram profiles, rather than having to block the entire social network, was mostly aided by Instagram's lack of encryption, according to a new report published on Thursday. "The lack of HTTPS on Instagram allowed Iran to not only filter content on the platform, but also find out who is browsing what," Frederic Jacobs, an independent security researcher, told Motherboard. The smart filtering of Instagram, which was done through

the use of Deep Packet Inspection (DPI)—a technology that can monitor which websites users are accessing on a network, and flag unencrypted traffic intended for specific pages or sites—was only possible because most of Instagram’s API was not encrypted with HTTPS, according to Jacob’s analysis. The report also shows that Iranian censors were mostly worried about blocking pages of Western celebrities like Justin Bieber and Madonna, as well as profiles that contained provocative pictures of women. The latter included fashion brands such as Vogue and even VICE’s own i-D magazine. Bizarrely, there was very little censorship of political or reformist content, nor did the censors do a very thorough job, according to the two authors of the report, Mahsa Alimardani, an Iranian Internet researcher, and Jacobs. Sometimes, for example, the Instagram page of a fashion brand was blocked while its corresponding site wasn’t and viceversa. “It’s really incoherent,” Alimardani told Motherboard. “I’m not sure who or what does the filtering but it seems like it’s some random guy sitting there and going ‘OK, Justin Bieber, we don’t like him we’re going to filter him.’” But sometime during the last two weeks, Jacobs noticed, Instagram expanded its use of encryption to include more parts of its API and app. Thanks to this change, Iranian censors cannot easily block only certain profiles anymore, since they are all loaded over HTTPS, Jacobs explained. With the switch to HTTPS, Instagram effectively made Iran’s smart filtering obsolete. In fact, the pages that Jacobs and Alimardani found were blocked during their analysis in early April are now accessible, according to a test performed for Motherboard by Nariman Gharib, an Iranian researcher based in London. With the switch to HTTPS, Instagram effectively made Iran’s smart filtering obsolete. “This is a brilliant example of why Internet services should deploy HTTPS,” Jacobs said, adding that it’s now an “all or nothing” situation for Iran: either the censors block the entire Instagram domain and app, like they do with Twitter or Facebook, or they’ll have to resort to more sophisticated and costly techniques such as doing man-in-the-middle attacks using fake or bogus digital certificates. There is, however, one more possibility: although Iran can no longer block entire pages, it can block specific photographs posted to a user’s profile page. This is because photos are still loaded over an unencrypted connection, according to Jacobs. In fact, this might already be happening. Users inside of Iran who visit the page of Iranian actress Golshifteh Farahani, for example, can only see some pictures, according to Gharib, who accessed the page through a proxy in Iran. Instagram did not respond to Motherboard’s request for comment, but the company has long said that it has been working to expand its implementation of HTTPS. It’s unclear why it took so long, however, given that Facebook and Twitter have been fully encrypted for years. “I definitely think that took way longer than it should have,” Jacobs said, but added that he doesn’t know enough about the challenges Instagram’s engineers faced to blame them for the delay. “The Iranian government is realizing that their censorship policy isn’t working.” The Committee to Determine Instances of Criminal Content (CDICC), also known as the Filtering Committee, did not respond to questions sent via its website’s contact form. “The Iranian government is realizing that their censorship policy isn’t working,” Alimardani said. “They have no control over the system they’re trying to control. By trying something like intelligent filtering they’re trying to regain their foothold in censorship.” Yet, thanks to web encryption, this attempt might be already failing.

Uniqueness Alt Cause – Iranians Can Easily Bypass

Iranians finding new ways to bypass censorship

McCullagh 09 (<http://www.cnet.com/news/iranians-find-ways-to-bypass-net-censors/>,
Iranians find ways to bypass Net censors, Declan McCullagh, Senior Staff Writer for CNET, June 17, 2009)

A new generation of Iranians has found ways to bypass the country's notoriously censorial Internet restrictions and disseminate details about Iran's internal turmoil in the wake of the recent election. In technical circles, at least, Iran is well-known for erecting one of the world's most restrictive Internet blockades, second only to China in its scope. Certain blogs are cordoned off, politically unacceptable keywords are blocked, and Web sites like Facebook, MySpace, Flickr, the BBC, and YouTube remain--at least at the moment--off-limits. That has complicated the task of distributing videos and e-mail descriptions of the hundreds of thousands of demonstrators marching in the streets to protest the reelection of President Mahmoud Ahmadinejad. Supporters of reformist leader Mir Hossein Mousavi have alleged that the election was a fraud. But the government's censors have been unable to staunch every data leak. "The bottom line is that a lot of information is still getting out," says Zahir Janmohamed, advocacy director of the Middle East and North Africa for Amnesty International USA. Watch CBS Videos Online Harry Smith of CBS News speaks with Steve Grove, director of news video at YouTube, about the role YouTube is playing in Iran as the country tries to crack down on news organizations. Some of the online restrictions appeared around the time of the election: that's when Facebook, BBC English (BBC Persia was already blocked), Technorati.com, and YouTube were added to the verboten-in-Iran list. One report says that YouTube's traffic from Iran has dropped by 90 percent in the last few days, and another says that Yahoo Messenger was blocked early Wednesday. Unconfirmed reports from Iran say Twitter.com is also blocked. One way around the government's online blockades is to find the electronic equivalent of a detour, which involves using something known as a proxy server. Here's how it works: Normally, a Web browser makes a connection directly to a Web site's Internet address. But that address can be easily discovered and added to the government's blacklist. The trick is to redirect Web browsing through a proxy, which could be a permanent commercial service or someone volunteering his or her computer temporarily. Then, instead of the relatively easy task of blocking Facebook.com or YouTube.com, the Iranian government has the far more difficult job--in practice, an impossible one--of identifying and blacklisting thousands of individual proxy servers. In the last few days, Web sites like proxysetupforiran.blogspot.com have sprouted, as have exhortations to engage in a bit of social activism by creating your own proxy server, complete with detailed instructions on how to do it. Twitter is abuzz with information on how to set up proxies and tips on how to keep addresses known to correspond to Iranian government computers from using them. Other sites have suggested filter-bypassing utilities like a Firefox plug-in that bypasses bans on connecting to Flickr.com or software called FreeAccess Plus that claims to circumvent restrictions on YouTube, MySpace, and some Persian-language sites blocked by Iran. Using Tor to stay anonymous Similarly, Iranian usage of the Tor anonymizing network has spiked. "We have seen a doubling of Tor users from IP addresses in Iran over the last few days," says Andrew Lewman, executive director of The Tor Project. Think of Tor as a far more complex and powerful version of a proxy server; once a computer with the right software installed connects to the Tor network, the rest of the connection becomes very difficult for even government agencies to monitor. Unlike some Web-based anonymizers or proxy servers, Tor can handle instant messaging communications as well. Watch CBS Videos Online Iran has a history of riots and protests. Students rioted in 1999 and 2003, but were put down quickly. The difference this time is the Internet. Bob Orr reports. Tor's public addresses can be blocked, of course, but enterprising individuals can set up private entry points. "You act as a secure relay into the Tor network," Lewman says, referring to private entry points. "From someone watching it, it looks like an SSL session between a browser and a web server, so it doesn't stand out. We look like SSL by design, because who's going to suspect a web browser?" (SSL stands for Secure Sockets Layer, the standard method of encrypting Web

connections to banks or credit card companies. There have been reports that Iran is blocking SSL too.) A Web site called iran.whyweprotest.net has recommended Iranians use Tor to cloak their identities and bypass government filters; a related one called TorIR.org offers instructions on how to configure the software for most common Web browsers. Daniel Calingaert, deputy director of programs at Freedom House, a human rights group, says Iranian authorities have been focused on jamming phones and satellite connections and have not paid as much attention to the Internet. "They're still focused on cat and mouse games with satellite broadcasting," Calingaert says. "They had jammed BBC Persia, which is probably the most respected and known source of news. And then we've heard that BBC moved to different frequencies. A lot of people are able to get it. It varies based on time of day and neighborhood." Janmohamed, from Amnesty International USA, says that because SMS text messages are curbed, Iranians have been using the Twitter application on mobile phones as an alternative. And now, he believes, the government has begun to pay attention. "When I look at the pattern of arrests from Saturday to today, initially you had the Mousavi supporters, the Calvin Klein activists--the urban elites--and now you're getting people of all different backgrounds," he says. "They're cracking down on a wider group of people." According to the OpenNet Initiative, a collaboration of Harvard University, the University of Toronto, the University of Cambridge, and Oxford University, Iran "uses the commercial filtering package SmartFilter--made by the U.S.-based company, Secure Computing--as the primary technical engine of its filtering system." McAfee now owns Secure Computing and sells the software as McAfee SmartFilter; a product description boasts of "a proven repository of more than 25 million blockable websites across more than 90 categories." (A U.S. economic embargo against Iran prohibits software licensing and the company has said in the past that the software is pirated. McAfee did not immediately respond to a request for comment on Wednesday. Harvard law professor Jonathan Zittrain, an OpenNet contributor, wrote in a blog post this week that "today Iran runs its own home-grown filtering software.) Even if Iranians can't always secure a reliable Internet connection to the outside world, they nevertheless have a potent voice: the Iranian and Persian diaspora, amounting to millions of former residents living abroad. It just takes one e-mail message with a video or photo attached for the contents to rocket around the diaspora and eventually end up on a place like TehranBureau.com. In a pinch, a simple phone call to a family member abroad can be transcribed for a Twitter feed. Freedom House's Calingaert says: "What makes this situation different from others and is driving a lot of it is that you have a very large and vibrant online and blogger community of Iranians outside the country." "People are really bypassing channels though Facebook and Twitter and contacting their cousins," Amnesty's Janmohamd adds. "You've got one of the largest Iranian diasporas in Los Angeles. Information is getting out there."

Iran citizens have the capabilities and tools to bypass internet censorship

Ya'ar 13 (<http://www.israelnationalnews.com/News/News.aspx/168898#.Vbpxp25Vikp>, Exclusive: Hacker Says Iranian Censorship Can Be Bypassed, Chana Ya'ar, staff writer for Israel National News, June 6, 2013)

An Israeli hacker says it's easy to bypass the tight Iranian government censorship wrapped around media and the Internet as 50 million citizens head for the polls this Friday. "In these days of relying on high-level Internet services we often forget that people were able to communicate even in the old days of intelligence before global data networks covered nearly every square meter of the planet," hacker "D." told Arutz Sheva in an exclusive interview on Thursday morning. "Iran is quite tricky, and even owning a regular TV satellite dish can get you into jail

and any type of out-of-the-norm radio transmission will immediately draw attention. But you don't need anything special. No Internet, no access to satellite phones or anything like that." Nevertheless, it is quite possible to get information about the elections and what else is happening in the country out of Iran, D. said. And it doesn't take a rocket scientist to do it -- just a little old-fashioned ingenuity. "People today are just spoiled, and if the images of the Gmail interface come up too slow, they are unable to communicate across borders," D. added with a chuckle. "Text is apparently no longer enough – people want HD video. Otherwise they don't take things for real." The hacker went on to explain that the current restrictions placed on the Internet by the Iranian government are a "known situation and not the first time Iran makes it nearly impossible to communicate raw data which is not disguised as regular HTTP web traffic." However, he added, there are "tricks that can be applied to any anonymity network, like FreenetProject..." and numerous others. "I hope that certain organizations will become involved and make sure that all the videos taken by people's smartphones will actually end up on YouTube," he smiled. Cell phones are indeed being monitored. The Internet is under surveillance. The Independent Media Review and Analysis (IMRA) watchdog organization on Thursday quoted Ali Bangi, director of ASL 19, as saying Iranian authorities have changed their deep packet inspection, and block all packets pre-emptively until proven innocent. Likewise the government has blocked the ports used by Virtual Private Networks (VPNs) – a tool used by Iranians and journalists to circumvent government censors. This has hampered the use of the TOR, a tool for anonymous Internet use. The Twitter social networking web site reported to the Committee to Protect Journalists (CPJ) that its recent video about imprisoned journalists was no longer accessible in Iran – but that presidential candidates and the Supreme Leader all operate social media accounts. Dozens of local journalists have been jailed and numerous web sites and newspapers have been banned. Of the hundreds of international journalists who applied to the Ministry of Culture and Islamic Guidance for visas to cover this week's election, few were allowed to pass muster. Those granted permission were required to work with a government approved "fixer" who makes the arrangements for interviews, translators, drivers, technicians, permits and other red tape. In the past three weeks, the Islamic Republic has also invaded tens of thousands of Google's Gmail accounts, according an announcement Thursday by the search engine company. Most of the data theft victims were Iranian or used Farsi in their emails, which were violated through phishing, which installs a virus into a user's computer that records one's Gmail user name and password when one clicks on a link in an email. The information is then sent to a server monitored by the Iranian government.

I/L

Alt Causes - Next Prez

Alt Cause – Next US Republican president will kill Iran deal anyways

Toosi 7/14 (How a Republican president could kill the Iran deal,

<http://www.politico.com/story/2015/07/gop-president-iran-deal-kill-120077.html>, Nahal Toosi,

Nahal Toosi is a foreign affairs correspondent at POLITICO, 7/14/2015)

If the next president hates the nuclear deal with Iran, he (or she) can undo it after taking office.

The dilemma: Use blunt force? Or go for a soft kill? Story Continued Below The accord reached this week in Vienna promises broad sanctions relief to Iran in exchange for significant curbs on its nuclear program. The agreement has taken years to negotiate, involves seven countries as well as the European Union and the United Nations, and relies upon the expertise of scientists as well

as diplomats. But at the end of the day, the “deal” is at most a political arrangement — not a treaty or other form of signed legal document. That means that the presidential candidates who have threatened to cancel the deal — so far all of them Republicans — can keep their promise by using the presidency’s executive authority to reimpose suspended U.S. sanctions on Iran and withdrawing from panels involved in implementing the accord. That abrupt approach may be quick, but it also carries risks. For one thing, a sudden U.S. withdrawal could anger the European and Asian countries also involved in the deal, making them less inclined to reimpose their own sanctions on a country they consider an alluring trading partner. The international business community may resist efforts to once again seal off a youthful, well-educated nation with vast energy reserves. And Iran could respond to the U.S. move by resuming elements of its nuclear program, which the West has long suspected is aimed at making weapons. “If we try to reimpose sanctions on Iran and no one follows, then we have the worst of all worlds,” said Robert Einhorn, a former Iran nuclear negotiator at the State Department. Instead, even the deal’s most ardent critics say, a new president might be better off taking a more subtle, longer-term approach, one that involves laying the groundwork to ultimately convince the world that Iran — through perceived violations, intransigence, foot-dragging or whatever a president chooses to highlight — has left the U.S. no choice but to quit the deal. “You say it’s a bad deal, but you don’t just rip up the deal,” said Mark Dubowitz, executive director of the Foundation for Defense of Democracies. The first step for a newly inaugurated president would be to order a review of the accord, which will already have been in effect for roughly a year and a half. It’s possible the Iranians will have been accused of violating the deal by the time a new president takes office, so a review could tally those transgressions to sow doubts in the minds of the American public about the soundness of the agreement. Depending on how major the violations are, the U.S. might also be able to convince other nations that the deal isn’t working. Even if the Iranians haven’t committed any or many notable violations, there are other factors a president could point to. Take the regional situation: If Iran, either directly or through proxies, has escalated its interference in other countries in the Middle East, a president could blame the nuclear deal by saying it has given Tehran economic leverage to pursue mischief outside its borders. America’s Arab allies, who have watched Iran make inroads everywhere from Syria to Lebanon to Iraq, have long argued that the Iranian government will take advantage of sanctions relief to funnel more money toward its regional aggression. Here, a U.S. president — and a hawkish Congress — also has the option of leveling new sanctions on Iran that aren’t necessarily tied to its nuclear program but rather to its support for terrorist groups. (Existing sanctions that target Iran over its support for terrorism and its abuses of human rights won’t be lifted under the nuclear deal.) At the very least, the new sanctions will increase the tension between the U.S. and Iran, possibly even leading to a backlash from Tehran that boosts the U.S. president’s standing. Dubowitz said it’s critical that the U.S. sanctions target in particular the Iranian Revolutionary Guard Corps, the powerful military unit that controls a large chunk of the Iranian economy and is behind much of the country’s interference in other states. At the same time that the U.S. is adding sanctions, it should remind the international business community of the riskiness of doing business in Iran, Dubowitz added. How U.S. allies in the region — especially Israel — feel about the deal in 2017 and beyond could also affect a U.S. president’s ability to make a case against the Islamic Republic. If Israel’s leaders insist that the accord is not working and can point to intelligence or other evidence that backs up their claim that gives added credence to the president’s decision to walk away from the agreement. (Already on Tuesday, Prime Minister Benjamin Netanyahu ripped the deal as “a historic mistake.”) Not that any of this is simple or predictable. A president determined to get rid of the deal, but unwilling to do so through an abrupt withdrawal, could find that it will take longer

than one term, or even two, to make his case to the world. He might even find it hard to get his own administration on board. “Even if you get a total nut job in the Oval Office, you’re going to have a policy fight internally,” arms control expert Jeffrey Lewis said. “Regardless of what Republicans say, they tend to do things that are much more moderate because it’s hard to move the government.” At least one Republican presidential candidate appears to be taking this reality into account. New Jersey Gov. Chris Christie said earlier this month that although he was disturbed by President Barack Obama’s efforts to strike a deal with Iran, he wouldn’t promise to undo it if elected. His stance was far more cautious than that of other GOP White House contenders such as Florida Sen. Marco Rubio and Wisconsin Gov. Scott Walker, who have said they’d revoke the deal unless it meets their more stringent requirements. “I’m not one of those guys who’s going to say to you, ‘On Day One, I will abrogate the agreement,’” Christie told a group of Republicans in New Hampshire. “On Day One, I will look into and try to decide what to do with the agreement, depending on where we are at that moment.” Because, by the way, it’s not just us involved anymore. We have a number of our allies around the world who’re at that table as well, and sanctions are most effective when not only we do it, but the other allies do it.” Still, it’s not unprecedented for an administration to abandon an agreement signed by a predecessor. Even if the agreement rose to the level of a treaty, a U.S. president has so much power in the realm of foreign policy that he could withdraw from it, the way George W. Bush left the 1972 Anti-Ballistic Missile Treaty with Russia. America’s 1994 nuclear deal with North Korea, meanwhile, died a slow and painful death after years of alleged violations by both sides. AP Photo One potential wild card in the Iran case is whether the U.N. Security Council will pass a resolution that gives the deal some binding status under international law, said Tyler Cullis, a legal fellow with the National Iranian American Council, a group that supports the talks. Although a president could in theory simply disregard such a resolution, he would be taking the risk of putting the U.S. in violation of international law if he unilaterally withdraws without a lawful justification. Dubowitz, one of the most vocal skeptics of the Iran talks, insisted that if he were president his goal wouldn’t be to outright destroy a deal but to try to ensure that Iran never achieves nuclear weapons capability. He doubts the current deal does that because, he says, Iran will be able to expand its economic might as sanctions fade, making it even easier for it to resume nuclear activity once restrictions on its program start to drop off after the first 10 years of the agreement. So he envisions a 10-year timeline to strengthen America’s hand against Iran, one that would involve a U.S. president laying the groundwork for his successor and making some new demands from Iran. The president could insist, for instance, that if within five years U.N. inspectors cannot verify that Iran’s nuclear program is entirely peaceful, then the restrictions on Iran’s nuclear activities that would have dropped off after year 10 would stay on. It might not make for an easy soundbite on the 2016 campaign trail, but this longer-term approach could ultimately yield a less-dangerous Iran without undermining America’s international standing. “There’s always a quicker way, but the question is, ‘Is there a smarter way to accomplish your objective?’” Dubowitz said. ““I hope all our candidates are thoughtful in how they deal with what I think is increasingly an incredibly difficult situation for the next president to handle. This deal is going to leave the next president with an excruciatingly difficult decision: either to accept an Iranian bomb or to bomb Iran.”

Censorship Bad

Iran Democracy/Dissent Good

Dissent is key to democracy – censorship takes this dissent away

Atkins 11 (<http://www.times-standard.com/general-news/20110730/democracy-and-dissent-go-together>, Democracy and dissent go together, Linda Atkins, Staff Writer for the Times Standard, 7/30/11)

Throughout the history of our country, dissent has been important to bringing change to our government. Without dissent and protest, we would still be English citizens, people would still own other people as slaves, and women would not have the vote. Promoting a world view that doesn't allow citizens to protest the actions of their government is to take on the philosophy of all of the despots and dictators who kept their citizens silenced and afraid of retribution. Democracy is a living form of government that embraces the right of its citizens to protest decisions that they disagree with. A governing body taking a vote is sometimes just the beginning of the process. As an elected official, I have the duty to listen to and encourage the people of Eureka to speak out when their representatives act in ways that the public disagrees with. I consider those people who show up to speak to our council week after week as involved and caring citizens who want to be a part of shaping our community. Others have dismissed these citizens' concerns because they continue to come to our meetings and voice their ideas. I don't understand that reasoning. Somehow, their very involvement at our meetings bothers some who would prefer that the community just shut up and let them do whatever they want, without the complaint from the citizenry. I agree that participating in a democracy means that we continue to work with the people with whom we disagree in order to come to future compromises that benefit our community. I would never refuse to work with, or treat badly, council members or staff with whom I've had disagreements. I expect the people I work with to have the same resilience. Politics is often a rough-and-tumble exercise. Dissent and protest stretch our ability to take criticism and should lead us to examine what it is that people are upset about, not simply dismiss their complaints as unimportant. Unlike some past council members, I don't have the capacity to know what the people who are not communicating with me are thinking. During the protest of the city's recent action, I received overwhelming input against the action the city had taken. I responded to that input by encouraging the citizens to express themselves. Talking to fellow citizens and circulating petitions are time-honored ways for people to express their concerns. I will continue to support the people of Eureka actively participating in their government. I think that increased participation is the key to solving many of the issues that face our city today. Innovative ideas about how to address problems often come from outside of a bureaucracy, because it sometimes takes a different perspective to come up with alternative solutions. The stifling of citizen involvement cuts us off from others' viewpoints and leaves us with no new information with which to make our decisions. I want to encourage the people of Eureka to continue to give input to their elected officials about decisions that are important to our community. Don't be discouraged by the disregard of your concerns from some in the community; you know you were heard because of the nature of their response to your vocal protest in their July 22 My Word. It sometimes takes sustained communication to convince some

elected officials that the public should not be ignored. I don't believe that, as a public official, I somehow know better than my fellow citizens what the correct direction is to move our city forward. I rely on all of you to help steer my decisions in a way that will help to bring positive changes and open communication between all people in our city. I challenge my fellow council members to join me in becoming aware of our use of the divisive language that has become so popular in our country today. It's easy to slip into this destructive habit of dismissing the people we disagree with. Dissent and protest represent the health of our democracy, while dismissal and divisiveness represent its deterioration. I will continue to speak up when I think something is wrong or when I disagree with a decision. I will continue to encourage others to do so, too. The framers of our democracy were very wise to include the right to dissent and protest in our governing documents. These rights allow our democracy to remain a strong and vibrant form of government.

Dissent is a key part of democracy and progress – emperics prove

Bhargava 14 (<http://www.thehindu.com/opinion/op-ed/the-importance-of-dissent-in-democracy/article6123745.ece>, The importance of dissent in democracy, Pushpa M. Bhargava, staff writer for the Hindu, 6/30/14)

On October 31, 1570, Martin Luther nailed on the door of a church in Germany 95 objections to the Catholic faith that led to the emergence of Protestantism. Soon after, Galileo Galilei challenged the Church by stating that the Earth and other planets revolve round the Sun. He died under house arrest. In 1927, Heinrich Wieland received the Nobel Prize for Chemistry for discovering a structure of cholic acid which was proven to be wrong within a year. In 1959, Severo Ochoa and Arthur Kornberg shared a Nobel Prize for the discovery of enzymes that carry out the synthesis of RNA and DNA in living organisms. It turned out that these enzymes were not the right ones. In fact, the history of progress of mankind is a history of informed dissent; much of creative activity of high quality in all areas of human endeavour at any given time has been a reflection of such dissent. Today we favour democracy as the most acceptable form of governance because a citizen has a right to dissent without fear of victimisation — as long as such dissent does not lead to inhuman or unconstitutional action. By contrast, dissent in an authoritarian, dictatorial or colonial regime could lead to the severest of punishments — loss of life — as happened in colonial India, Hitler's Germany or Stalin's USSR. Platform for dissent. In a democracy, non-governmental organisations provide a platform to civil society to dissent in an informed and reasoned manner. They provide a mechanism for the ruled to keep a check on the rulers. There are of course NGOs that engage in illegal or objectionable activities using Indian and/or foreign funds, much like how 34 per cent of newly elected MPs in Parliament have criminal cases against them. Just as the majority of MPs do not have cases against them, a large proportion of our NGOs operate transparently and legally. The power that NGOs wield has increased concurrently with the increased demand for real and operational democracy. If it were not for our NGOs, we would not have the system of obligatory declaration of assets, now required by all those aspiring to be MPs. We would also not have the the Right to Information Act or the Protection of Plant Varieties and Farmers' Rights Act. Denigrating good NGOs would therefore imply that our democracy is only notional and not functional. Such denigration would smack of a dictatorial attitude. The recent Intelligence Bureau report on the "Concerted efforts of select foreign funded NGOs to 'take down' Indian development projects" casts serious aspersions on some of our best NGOs and distinguished citizens. The report also alleges that these NGOs would have a negative impact on GDP growth by 2-3 per cent by stalling, through agitation,

development projects such as nuclear power plants, uranium mines, coal-fired power plants, GMOs, projects by POSCO and Vedanta, hydel projects, and “extractive industries” in the north-east. By casting unwarranted and unproven aspersions on highly reputed NGOs such as Greenpeace and Nobel Prize-winning Amnesty International, and individuals such as Suman Sahai, Vandana Shiva, Aruna Rodrigues, Prashant Bhushan, Udayakumar, Admiral Ramdos and Praful Bidwai, the IB has indirectly indicted every individual and NGO that has voiced reasoned dissent in the interest of our country and its people, within our constitutional framework. Such an attitude on the part of the IB makes a mockery of our democracy. What is wrong in receiving funds from well-meaning individuals or bona fide organisations abroad who want to help a worthwhile cause in India? Doesn't the Indian government, for example, help worthwhile causes in Afghanistan? In fact, the Bureau should have looked at the damage caused by government funding to organisations like Salwa Judum in Chhattisgarh. Medha Patkar's Narmada Bachao Andolan started as a fully justified campaign on June 12 against the illegal raising of the height of the Sardar Sarovar dam from 122 to 139 metres, which will adversely impact over 2.5 lakh people engaged in various occupations. We know from past experience that nothing will be done for those who stand to be displaced by this move. But IB would probably condemn the above campaign in its next report. Let us look at how specious and ridiculous the arguments in the IB report are.

Iran democracy key to preventing Middle East conflicts and terrorism

Parsi 6/30/2015 (<http://www.cnn.com/2015/06/30/opinions/iran-nuclear-talks-parsi/>, Iran's nuclear talks: Five reasons why a deal would be good for the U.S., Trita Parsi, founder and current president of the National Iranian American Council, author of Treacherous Alliance and A Single Roll of the Dice, 6/30/2015)

Third, the deal will help unleash Iran's vibrant, young (the median age is 28!) and moderate society, which is continuously pushing Iran in a democratic direction. The deal enjoys solid support among the Iranian public as well as among Iranian civil society leaders, partly because they believe the deal "would enable political and cultural reforms." America benefits if the democratic aspirations of the Iranian people are increasingly met, because a more democratic Iran is a more moderate Iran. What's the deal with the Iran nuclear negotiations? **This is particularly important at a time when the violent winds of religious radicalism are ravaging the Middle East and beyond. America is in desperate need of an injection of political moderation in the region. An Iran that moves towards democracy could provide that.**

Iran democracy will spill-over to the rest of the Middle East – emperics prove

A shift in the tone of the research on democratization occurred between the 1950s and 1960s to the 1980s and 1990s (Shin 1994). While the earlier period was characterized by searches for the “conditions and prerequisites” of democracy, research in the past decade has emphasized the dynamics of the democratic transition and consolidation. For the examination of the large literature on democratization, a useful classification is based on geographic scale. Global or macro-level perspectives examine democratization as part of a large-scale process eventually reaching all peoples in all states. The process may be related either to an independent causal factor or can be self-generating. Meso-level or regional perspectives such as that of Deegan (1994) hold that, since the globe is a mosaic of different regions and states, some regional contexts are more amenable to political change than others. An identification of the factors by region will facilitate an understanding of why some contexts are mostly democratic (Europe) while other contexts are not (Middle East). Micro-level or state-oriented views such as that of McDonough et al. (1986) examine the conditions promoting democracy cross-nationally. By correlating independent economic and social characteristics with broad indicators of democracy, a general cross-sectional model is expected to predict where future democratizing trends are likely to be seen. One global perspective views the spread of democracy as the political outcome of the spread of capitalism from its European core in the centuries after 1500. The succession of world leaders (the Netherlands in the 17th century, the United Kingdom in the 18th and 19th centuries, and the United States in the 20th century) have each promoted a respective global ideology (Modelski and Perry 1991; Taylor 1996). The economic-political relationship is reciprocal with the success of democratic/capitalist states enabling these states to laud democracy as a superior form of organization. The stable, bipolar system of the Cold War collapsed in 1989 and with it fell the only concerted opposition, that of communism, to a world-system of democratic states. **At a regional or meso-level, certain types of regionally-clustered states are more susceptible to democratization than other regions due both to internal conditions and to “snowballing” or contagion effects from neighbors.** The internal conditions in neighboring countries have a lot in common, and provide similar impetus toward regime transition along the lines argued in the so-called “social requisites of democracy” school emanating from the work of Lipset (1959,1994) and others. The essential indicator, a growing GDP/capita, reflects a widening of the middle class, an increase in educational levels, urbanization and an economy that is industrializing and diversifying. In a global economic downturn, developing countries become especially attractive as sites for capital investment as a strategy to reduce costs and maintain profits in an increasingly competitive world-economy. Foreign investment in semi-peripheral states can be a “Trojan horse” because the social and political consequences of deeper incorporation into the world-economy can thus undermine authoritarian regimes.

Democracy solves extinction – key to prevent security threats, economic collapse, civil war, terrorism, proliferation, and weapons of mass destruction

Halperin 11 (Morton, Senior Advisor of the Open Society Institute, “Democracy is Still Worth Fighting For,” Unconventional Wisdom, http://www.foreignpolicy.com/articles/2011/01/02/unconventional_wisdom?page=0,6)

For there is one thing the neocons get right: As I argue in *The Democracy Advantage*, **democratic governments are more likely than autocratic regimes to engage in conduct that advances U.S. interests and avoids situations that pose a threat to peace and security. Democratic states are more likely to develop and to avoid famines and economic collapse. They are also less likely to become failed states or suffer a civil war. Democratic states are also more likely to cooperate in dealing with security issues, such as terrorism and proliferation of weapons of mass destruction.**

Iran democracy key to economy

Milani 10 (<http://www.tandfonline.com/doi/pdf/10.1162/0163660054026533>, U.S. Foreign Policy and the Future of Democracy in Iran, Abbas Milani Director of Iranian studies , Stanford University b Codirector of the Hoover Institution's Iran Democracy Project, 1/7/10)

Individually, these seven pillars seem insignificant, but together they can go a long way in shaping a strategy that can serve both the national interests of the United States as well as the will of the Iranian people. For Iran, democracy is no longer just a political ideal, but a sheer economic necessity. Only a democratic Iran can attract the requisite investments needed to solve Iran's endemic unemployment problems. For the United States, particularly during the second Bush administration, it has become the avowed centerpiece of U.S. policy in the Middle East. Ultimately, a successful U.S. strategy must assist the democratic movement and have the patience for the Tehran regime to collapse under its own inconsistencies. Internationally, part of the regime's raison d'etre and legitimacy in the eyes of its Hizballah flanks rests in its commitment to anti-Americanism. At the same time, in obvious contradiction to its self-ascribed anti-U.S. role, Tehran increasingly seeks a security guarantee or promise that the United States will not seek to overthrow the regime. It also wants and needs U.S. approval for the flow of capital desperately needed to solve Iran's economic woes. In this sense, Iran and the United States are both in a dilemma. The U.S. government wants to engage without strengthening the regime. The Islamic Republic, on the other hand, wants to achieve its goals without forfeiting its claim to be the sole Muslim country standing up to the world's superpower. The delicacy of the current U.S. position lies precisely in the fact that Washington must, with deft and calculated magnanimity, allow the regime to accomplish its inherently contradictory goals while wagering that the inconsistency in the Islamic Republic's position will open a gate for the Trojan horse of democracy to pass through.

Censorship Economy Turn

Iran will become key to the global economy after the deal is passed

Rosenfeld, Ward and Brennen 7/14/14 (Everett, Marguerite and Morgan, writers for CNBC, "Iran deal: Corporate winners from the nuclear agreement", <http://www.cnbc.com/2015/07/14/iran-deal-corporate-winners-from-the-nuclear-agreement.html>)//BW

Iran and six world powers reached an agreement on Tuesday to lift sanctions against the Islamic Republic, and while U.S. and Iranian leaders have heralded the deal as a victory, the real winners could be corporations across the globe. Iran holds the world's fourth-largest proved crude reserves and the second-largest natural gas reserves, according to the U.S. Energy Information Administration, so energy firms will be some of the clear beneficiaries of the deal. Most of those gains may not go to American companies, however, as they weigh the political costs of doing business with Tehran—especially considering the skepticism from Congress, according to Alireza Nader, senior international policy analyst at the Rand Corp. "Most likely European and Asian energy companies will see an increase in business—so companies like Total and Shell," Nader said. "For American energy companies, it's going to be tougher for them to go back in Iran." A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Morteza Nikoubazl | Reuters A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Other parts of the energy industry are also likely to benefit, including tankers and oilfield services, experts told CNBC. Citi Research analyst Chris Wetherbee said the opening of Iran is a "net

positive" for international tanker firms, because Iran's aging fleet won't be able to compete, and more energy supplies will be on the market. Companies like Scorpio Tankers and Navios Maritime Acquisition saw their stocks rise Tuesday. In a note published by Barron's, Simon Wong of investment firm Gabelli wrote that an agreement would "open investment opportunities in the country's oil and gas sector." That would likely benefit oilfield service firms like Schlumberger, Weatherford International and Halliburton. Earlier this year, Schlumberger pleaded guilty to violating U.S. sanctions related to Iran, agreeing to a three-year period without any operations in Iran. A spokeswoman told CNBC that the company was not in a position to comment on Tuesday's deal. While the energy industry may be the most obvious beneficiary of an Iran deal, banks will also stand to benefit, experts told CNBC. "All of the major banking institutions in the industrial world will try to finance and facilitate increased trade with Iran," Christopher Whalen, senior managing director at Kroll Bond Rating Agency, told CNBC. "It's a big country, (and) they are very Western-focused. Iranians are consumers of everything. You can anticipate anything from industrial equipment to consumer products will definitely be bought, and will definitely be financed." As for which U.S. banks stand to benefit, Whalen said the gains will be concentrated among some of the top financial institutions—Citibank, JPMorgan, Goldman Sachs and Morgan Stanley. Those banks, he said, will likely work to facilitate the shipment of goods and services to Iran, taking on a trade finance function, and supporting project finance. They may also reach out to Iranian banks about sovereign business, Whalen added. But American banks aren't the only ones that stand to benefit from a reduction of Iranian sanctions, Whalen said, explaining that they'll compete against European and Asian banks for the business. If sanctions on Iran's use of SWIFT (the financial messaging system that transmits and tracks international transactions) are lifted, then new financial sector opportunities could also open, experts said. "The SWIFT sanctions are more important at this point than any other type of sanctions because it affects all manner of industry and agriculture," Djavad Salehi-Isfahani, an economist at Virginia Tech, told CNBC earlier this year. Telecommunications firms may also be early winners, Blaise Misztal, director of national security at the Bipartisan Policy Center, said. Other industries could also benefit from the Iran deal. PSA Peugeot Citroen told Reuters that it's in advanced talks on an Iranian car-making venture with Iran Khodro and expects rapid progress. The political deal struck in Vienna "should clear the way for significant progress in our discussions," Peugeot's Africa and Middle East chief, Jean-Christophe Quemard, said in an emailed statement Tuesday. General Electric, which does business in Iran through its health-care division, could also consider expanding in the country. "We look forward to reviewing the details of the agreement reached and will watch the regulatory landscape that may unfold," the company said in a statement.

Internet censorship detrimental to the economy – China proves

Hoffman 13 (http://www.huffingtonpost.com/lindsay-hoffman/internet-censorship-a-thr_b_4395167.html, Internet Censorship: A Threat to Economic Progress in China?, Lindsay Hoffman, Professor of Communication and Political Science, University of Delaware, 12/06/2013)

Social media platforms such as Twitter and Facebook have helped to ignite an information revolution by allowing individuals around the world to use the Internet for communicating, learning, teaching, and protesting. However, these endless possibilities pose a threat to oppressive governments, and as a result, technology use has been severely limited in some nations. The

Chinese government's strict regulation of Internet exemplifies these limitations within the context of an increasingly powerful nation. **While the incredible economic progress of China over the past several decades suggests it is a threat to the status of the United States as the world's superpower, censorship may stop upward progress in its tracks.** The expansion of the Internet in recent years has rendered this technology necessary to the day-to-day lives of people throughout China and the world, and that dependence has become a significant tool of power for oppressive governments. Beyond establishing a great firewall to block thousands of sites from being accessed within China, the government also works to prevent opposition on social media websites and blogs. The government listens to what citizens are saying online, thereby enabling officials "to address issues and problems before they get out of control" (see Rebecca MacKinnon's book, "Consent of the Networked"). In early September, a Chinese judge re-interpreted Internet restrictions so that any individual spreading "slanderous rumors" on the Internet that are seen by 5,000 people or shared by 500 people could face up to 10 years in prison. This stricter interpretation of Internet limitations indicates that an open Internet China is not on the immediate horizon. Google Chairman Eric Schmidt recently made headlines when he visited Hong Kong and suggested that China's prevention of free expression online may pose a threat to continuing economic progress for the country. Although many people may not connect the Internet to economic success, Schmidt suggests that the limitations placed on online speech by Chinese officials will prevent the country from overcoming the "middle-income trap." This occurs when countries move up from a place of poverty but are unable to further progress, leaving them trapped on a plateau below higher-income nations. Schmidt seems to be a celebrant, as his words echo the notion that the Internet "has the power to determine outcomes" for people, countries, and the entire world, although McChesney argues that this perspective is "ultimately unsatisfactory" in a complex reality (see McChesney's "Digital Disconnect"). Schmidt criticized the 500-repost rule as well as other restrictions placed on citizens' words and behavior on the Internet by the Chinese government. He suggested that in order to solve economic problems such as unemployment, nations require the "entrepreneurs" and "innovation" that an open Internet encourages. As the Chairman for such an economically successful company as Google understands, individuals must be allowed to think of fresh ideas when they use their technology. Extensive firewalls and harsh punishments for certain forms of expression prevent citizens from being able to make creative and helpful economic contributions through the Internet. Schmidt's warning to the Chinese government seems intended to persuade the Chinese government that there may be negative consequences of a closed and restrictive Internet that they had not previously considered. The tireless attempts to maintain power over citizens through Internet regulation and censorship may actually be threatening the economic power of the nation in an increasingly technological world. The Chinese government may soon discover that when you hold on to something too tightly, it is far more likely to slip right out of your hands.

Global economic decline causes nuclear war

Hutchinson 14 (Martin, Business and Economics Editor at United Press International, MBA from Harvard Business School, former international merchant banker, 1-3-14, "The chilling echoes of 1914, a century on" Wall Street Journal) <http://online.wsj.com/articles/william-galston-secular-stagnation-may-be-for-real-1409095263>,

The years before 1914 saw the formation of trade blocs separated by high tariff barriers. Back then, the world was dominated by several roughly equivalent powers, albeit with different strengths and weaknesses. Today, the world is similarly multi-polar. The United States is in a position of clear leadership, but China is coming up fast. Europe is weaker than it was, but is still a force to be reckoned with. Japan, Russia, Brazil, India are also too powerful to ignore. A hundred years ago, big international infrastructure projects such as the Berlin-Baghdad Railway, and before it the Suez Canal, were built to protect favored trading.

Today's equivalent may be the bilateral mining partnerships forged between, for instance, China and mineral-rich African states. Today, the World Trade Organization offers some defence against tariffs. But protectionism could become entrenched if prolonged economic stagnation leads countries to pursue their own narrow interests. Germany, Austria, Russia and France lost between 20 and 35 percent of national output between 1913 and 1918, according to Angus Maddison's data used in Stephen Broadberry's "The Economics of World War One: A Comparative Analysis". British GDP declined in 1914 and 1915, but grew 15 percent over the four years, as did the U.S. economy. The 37 million military and civilian casualties may tell a more accurate story but if history were to repeat itself, the global conflict could be both more universal and more destructive. Nuclear weapons proliferate. Warped diplomatic anger could lead to the deployment of chemical and biological devices. Electromagnetic pulses could wipe out our fragile electronic networks. Like the assassination of Archduke Ferdinand that sparked World War One, the catalyst for cataclysm might be something quite surprising. A global run on bank and other investment assets or an outbreak of hyperinflation, maybe? These threats get more serious the more policymakers pump up equity, bond, property and banking bubbles. If global wealth evaporates, or is proven to be an illusion, today's largely cordial global entente could be smashed with precipitous speed.

Impact Stuff from Iran Ptx file

NEG Impact

Deal Good

Deal key to preventing Middle East War (already in 1NC shell)

Cirincione, 7/9/2015 (Joe, president of the Ploughshares Fund, “What You Need to Know About the Coming Deal With Iran,” http://www.huffingtonpost.com/joe-cirincione/what-you-need-to-know-abo_b_7763516.html)

If Iran wants to build a nuclear weapon and the deal doesn't happen, is there any way to stop them? Does anyone really expect the U.S. to start a war with Iran by bombing their nuclear installations?¶ That's why this diplomatic deal is so promising. It's not without risk, and there are going to be problems with it, but it is far better than all the alternatives.¶ If the deal falls apart, especially if the U.S. is seen as the reason it falls apart - if Congress kills this deal - the sanctions regime will more or less collapse. Other countries aren't going to follow our lead. It doesn't matter if the Senate passes new sanctions. The other negotiating powers aren't going to go along with it.¶ This does not just mean Russia and China. It is also Japan and South Korea and Europe; the people who buy Iran's oil. And that means that Iran's economy will start to recover. The inspections regimes that are in place will end. The restraints on Iran's program will end. They will start installing thousands more centrifuges, enriching thousands of pounds of uranium and getting closer and closer to a bomb.¶ Whether they cross that line or not, they will clearly have the ability to build a weapon in a very short amount of time. That increases the risk of military action.¶ If Israel attacks Iran, if we strike Iran, it won't be a neat, little overnight strike, or two or three days of strikes. This will be weeks of bombardment against their hardened nuclear facilities, their air defenses, their ports and airfields. It will kill thousands of Iranians. It will be the beginning of a major war with Iran.¶ Former Secretary of Defense Robert Gates says that "if you think the war in Iraq was hard, an attack on Iran would, in my opinion, be a catastrophe." That is what we would be looking at; a major new war in the Middle East. That would be a disaster for the U.S., for Israel, and for the entire region.

Deal resolves the reasons for aggression—creates a more moderate Iran

Traub 7/21 (James Traub; July 21, 2015; fellow of the Center on International Cooperation; The Nuke Deal to End the Revolution; Foreign Policy; <http://foreignpolicy.com/2015/07/21/the-iran-nuke-deal-to-end-the-revolution-obama-policy/>) jskullz

¶ That level of alarmism is ludicrous, even by Netanyahu's standards, both because Iran's military capacities are very modest and because its ambitions are regional, not global. Nevertheless, Iran represents a special kind of danger to the world because, like revolutionary France, if not like Nazi Germany, it seeks to expand its area of control not simply as a matter of state interest but of ideological conviction. Iran is a revolutionary force bent on upending a regional status quo. And while France exhausted itself through perpetual warfare, ultimately discrediting the principles of the revolution, Iran's leaders have largely fought through proxies, preserving their standing, as well as the nation's manpower. Indeed, the very fact that Supreme Leader Ali Khamenei has given his blessing to the nuclear deal is a sign of the suppleness that has preserved the revolution after more than 35 years.¶ The regime is unlikely to destroy itself, and

the Iraq War should have cured even the most reckless soul of the belief that outside forces can institute regime change without cataclysmic results. The question then is, what actions by outsiders — if any — are most likely to reduce the potency of Iran's revolutionary ideology and thus curb its adventurous foreign policy? How, that is, can Iran come to resemble other ambitious-but-responsible emerging powers, like India or Turkey?¶¶ Could the nuclear deal itself begin to bring that about? In conversations I had starting in the summer of 2009, officials in President Barack Obama's administration expressed the very guarded hope that a new, more respectful approach to Iran might ultimately lead to just such an outcome. Now that Obama has gained the nuclear deal he sought, he is careful to say, as he did to the New York Times' Thomas Friedman, that he has no expectations of a kinder, gentler Iran. The president has learned quite a few painful lessons over the years about the intransigence of America's rivals (think of Russia in Ukraine or China in the South China Sea). What's more, he knows very well that both Netanyahu and many of his Persian Gulf allies regard his Iran policy as recklessly naive. There's no reason to compound the problem by putting forward overly optimistic scenarios.¶¶ There are, in fact, few grounds for optimism. As many commentators have noted, some portion of the \$100 billion to \$150 billion in bank funds to be unfrozen as sanctions are lifted will almost certainly go to the Iran's Revolutionary Guard or Hezbollah. Even absent that windfall, so long as Iran's Sunni adversaries, above all the Saudis, remain obsessed with countering Teheran's influence, both real and imagined, Iran can be counted on to support Shiite groups in Iraq, Lebanon, Yemen, and Syria.¶¶ In the short run, therefore, the nuclear deal is likelier to make matters worse rather than better, and the president may spend more of his remaining time in office countering Iran's aggressive moves than he will summoning its better angels, as the New York Times' editorial page recently urged him to do.¶¶ But what about the long run? What about changes, not in the behavior of the regime but in its ideological foundations — and thus in the balance of power between state and society? Is it reasonable to think that the nuclear deal might help tip Iran toward moderation? I think it is, and I imagine that Obama thinks so too, even if you won't catch him saying so.¶¶ Revolutions need adversaries. The best argument for ending the decades-long sanctions on Cuba was that inveterate American enmity had offered the Castros the perfect pretext for preserving their autocratic rule. Normalizing relations would unleash forces that would undermine the legitimacy of the communist regime and strengthen liberal forces. That process has only just begun, but it holds out far more promise of turning Cuba into a country that respects the international order than did the policy of endless antagonism. Iran, like Cuba, has used virulent anti-Americanism to preserve its grip over an increasingly restless citizenry.¶¶ The mullahs can still muster crowds to shout "Death to America," but they aren't as large as they once were. Unlike Cuba, Iran has a robust and growing middle class that is desperate to travel to and trade with the West. That class elected the moderate Hassan Rouhani as president in 2013. And it is this aspirational class that will ultimately be the agent of social transformation in Iran.¶¶ Of course, there are arguments on the other side. Cuba is dead broke and needs the lifeline from the West, whereas the nuclear deal is about to loose a cataract of revenue on Iran. If the United States really wants to tip the balance between the theological state and an increasingly aspirational Iranian society, therefore, Washington should keep tightening the screws of sanctions until the citizens rise up against their rulers — as then-President Ronald Reagan did by raising the ante of military spending until the Soviets bankrupted themselves. Nevertheless, that seems less likely to dislodge the mullahs from power than the dynamic of economic freedom.¶¶ Revolutionary societies don't last forever; they are eventually undone by their own contradictions. Mao gives way to Deng; Andropov to Gorbachev and then to Yeltsin (and then, alas, to Putin). Sometimes the United States confronts such regimes, sometimes it contains them, and sometimes it tries to

furnish an exit ramp. Until now, Washington has focused its policy toward Iran on the first two of those options. Now it is trying the third. It's a gamble. It is, however, vastly preferable to the alternatives.

Deal prevents nuke—all paths prevented and sanctions easy to reinstate

Lewis 7/14 (Jeffery Lewis; July 14 2015; director of the East Asia Nonproliferation Program at the James Martin Center for Nonproliferation Studies; “**It’s a Damn Good Deal**”; Foreign Policy; <http://foreignpolicy.com/2015/07/14/its-a-damn-good-deal-iran-nuclear-agreement-joint-comprehensive-plan-of-action/>) jskullz

The reduction in centrifuges remains substantial — the limits are the same as those reported when the framework was announced. Moreover, little worries I had, like whether Iran would agree to remove piping and other infrastructure along with the centrifuges themselves, were resolved favorably.¶ The Vienna Plan also provides a path to resolve the outstanding issues with the International Atomic Energy Agency regarding Iran’s past covert nuclear weapons program (known delicately as “possible military dimensions”) and provides a public description of something U.S. officials had only described in private — a R&D schedule that limits Iran’s development of new centrifuges over the next eight to 10 years.¶ And, if like me you think “breakout,” or the time it would take to turn nuclear material into one bomb, is a dumb measure, the agreement also has lots of provisions to deal with “sneak-out,” or an attempt to get a bomb covertly. These provisions include granting inspectors access to military sites and monitoring of centrifuge workshops and uranium mines. But this shouldn’t be a surprise: It was in the bag in Lausanne.¶ It is worth looking at this chart issued by the Supreme Leader’s office showing all his “red lines” in the talks. It turns out the Iranians gave in on several of them and found rather creative solutions to a few others. You can make your own list, but I think they compromised on (1, 3, 5, 7, 8, and 9): [img removed]¶ What had to be resolved in Vienna was the tricky issue of sanctions. It was always clear that there would have to be an implementation period so that Iran could say sanctions came off “immediately” while the United States could claim the opposite.¶ One of the amazing things is how many of the pearl-clutching stories about how the agreement was going off the rails turned out to be nonsense. Most of these were written by the New York Times’ David E. Sanger, and they won’t age well: see 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10.¶ One story said the administration was going to back off what looked like a hard cap on how much enriched uranium Iran could have at any one time. I called it the Great LEU Panic of June 2015. Sure enough, Iran is limited to “300 kg of up to 3.67% enriched UF6 (or the equivalent in different chemical forms).” The rest of Iran’s stockpile must be sold or diluted. I told you so.¶ The real issues in Vienna were how to re-impose sanctions if the deal collapsed, as well whether to lift the United Nations’ arms embargo and the sanctions on Iran’s missile programs.¶ The mechanism to re-impose sanctions, — called “snapback” by people who don’t wear baseball caps — is pretty clever. Any of the parties can raise an issue within a Joint Commission created to administer the agreement. If the party is unsatisfied, it then can notify the U.N. Security Council. The Security Council has 30 days to act — and if it does nothing, the sanctions are automatically re-imposed. That gives the United States and other parties the ability to blow up the deal and return to sanctions regime with no chance for Russia or China to veto.¶ The arms embargo and missile sanctions were trickier. The Iranians argued that those were only imposed as punishment for nuclear activities — and that they should come off as part of any deal. It’s a fair point, but rather too lawyerly for the situation. Iran’s missile program was part of the possible military dimensions to its nuclear program. And Iran is also engaged in several proxy wars in Middle East at the moment. One of the main reasons for being concerned about Iran’s past nuclear weapons work is how aggressive a nuclear-armed Iran might become. It should have been obvious to anyone in Tehran that the United States wasn’t going to agree to a flood of new arms and missile technologies.¶ The compromise, again, was obvious. U.N. sanctions will come off over time — reportedly five years in the case of the arms embargo and eight years in terms of the missile program — but national and other international restrictions stay. President Barack Obama will not waive U.S. sanctions for missile proliferation, terrorism, and human rights. Moreover, Iran remains outside the Missile Technology Control Regime, the cartel of suppliers that controls missile technologies. As a practical matter, Iran’s missile suppliers are still limited to North Korea — something already prohibited by sanctions — and entities already sanctions- busting.¶ That said, it probably makes sense to think about a follow-on agreement limiting Iran’s development of ballistic and cruise missiles as well as how to deal with a deteriorating regional security situation that has many U.S. allies understandably nervous. If Obama ignores these concerns, he will be handing his opponents back at home an issue that they will only too happily use to club him over the head.¶ Remember how House Republicans have repeatedly voted to repeal, defund, or deform the Affordable Care Act?

Fought all the way to the Supreme Court, twice?¶ The fight over the Iran deal is going to make the Obamacare battles look like two preppies slap-fighting over a cucumber sandwich.¶ Congress now has 60 days to review the deal and pass a resolution of disapproval that would remove the president's authority to waive sanctions on Iran. Obama has said he will veto such a measure, if his opponents can find the votes, which will give Congress another, shorter period to attempt to override the veto.¶ Even if the deal survives the congressional review period, you can expect a lot of leaks.¶ Much of the arguments in Washington to date have focused on making the process look disorganized or chaotic. At one point, Sanger moaned on Twitter that Mozart wrote Symphony No. 36 in less time than diplomats have been in Vienna for the last round of talks. Fellow nuke wonk Alicia Dressman noted, more than a little sarcastically, that she was going to miss his "poignant observations quarantined from relevance."¶ Good news, Alicia! He's not going away. The leaks are going to shift to how Iran is doing this or that. You kids may not remember this, but more than 20 years ago the Clinton administration — yes, Hillary's husband was president back then — struck a similar deal with North Korea to freeze its plutonium production infrastructure. Immediately the leaks began: North Korea is cheating! (North Korea probably was cheating, by the way, but just not in the ways alleged by opponents. That's another problem with the Beltway noise-machine.)¶ The low point was when satellite images showed a large, underground facility under construction near a place called Kumchang-ri. Someone at the Defense Intelligence Agency decided it was a covert underground nuclear reactor — based mostly on the military unit responsible for digging. No one else thought it was a reactor because, well, it was just a hole in the ground. Not surprisingly, this got leaked to the New York Times, which ran the headline: "North Korea Site an A-Bomb Plant, U.S. Agencies Say." (Guess who the author was?)¶ Never mind that it wasn't true. One agency, singular, said that; the others were unconvinced. But when something is on page A1 of the New York Times, it becomes true. The United States negotiated access to the site, which turned out to be empty. The site was "unsuitable" for a nuclear reactor and "not well designed" for a reprocessing facility. It was kind of a mini-Iraq, but where we had the good sense not to invade.¶ I've told this story over at 38North, but the point is that the Clinton administration realized too late that they needed to reinforce the 1994 Agreed Framework with other deals, starting with North Korea's ballistic missile program. It makes sense to start thinking now about regional security issues, including Iran's missile program, once this deal comes under monthly attack.¶ It is possible that the Iranians will cheat. It is also possible that they will insist on tendentious readings of certain provisions. And, although I hate to break it to you, we might not be perfect ourselves. One of my favorite passages in the agreement is an oblique acknowledgement by the Iranians that there is no telling what sort of stunt Sen. Tom Cotton and his friends might pull. (Paragraph 26. Check it out.) Even two committed parties may find that they disagree about how to implement an agreement. That's normal.¶ But there will also be a cottage industry in Washington, D.C., for the next decade dedicated to manufacturing one crisis after another to try to derail this agreement. We've already seen a series of press conferences by the National Council for Resistance in Iran, a.k.a. the MEK, making one allegation or another. I had to debunk one about a secret centrifuge plant that NCRI claimed was churning out LEU from the basement of the site printing national ID cards.

Deal ensures no nuke—the alternative is war

Jaffe 7/15 (Greg Jaffe; July 15 2015; Military expert for the Washington Post, citing Barack Obama, president of the United States; Obama says only alternative to a nuclear deal with Iran is war; Washington Post; http://www.washingtonpost.com/politics/obamas-defense-of-the-iran-deal-comes-with-a-tough-love-message/2015/07/15/a7614b4a-2b04-11e5-bd33-395c05608059_story.html) jskullz

President Obama's defense of the complex and painstakingly negotiated nuclear deal that his administration reached with Iran boiled down to a simple, if controversial, contention: The only real alternative to the deal was war.¶ Obama returned to that conclusion repeatedly Wednesday at a news conference that stretched for more than one hour.¶ "Without a deal," he said in his opening statement, "we risk even more war in the Middle East."¶ A few minutes later, in response to a reporter's question, Obama dismissed concerns that the House and Senate might vote down the deal, forcing him to use his presidential veto. Wouldn't a rejection of the deal by lawmakers make him question its wisdom?¶ "Either the issue of Iran obtaining a nuclear weapon is resolved diplomatically through a negotiation or it's resolved through force, through war," Obama countered. "Those are — those are the options."¶ What about those who argued that Obama should have employed more diplomatic, economic or military leverage to get a "better deal" from the intransigent Iranians?¶ "What does that mean?" Obama asked rhetorically. "If the alternative is that we should bring Iran to heel through military force, then those critics should say so. And that will be an honest debate."¶ The president's news conference in the White House's East Room came a day after his negotiators concluded contentious marathon talks with Iran. The deal they reached to limit Iran's nuclear enrichment program — more than six years in the making — was swiftly condemned by virtually every major Republican presidential candidate.¶ A spokesman for House Speaker John A. Boehner (R-Ohio) said Wednesday that Obama, in defending the deal, had shown himself to be "hopelessly disconnected from reality." Israeli Prime Minister Benjamin Netanyahu, addressing his country's parliament a few hours before Obama spoke, left open the possibility of military action against Iran.¶ "We will reserve our right to defend ourselves against all of our enemies," Netanyahu said. "We have strength, and it is great and mighty."¶ The president responded with a defense of the nuclear agreement that was equal parts pugilistic and legalistic. Obama was briefed on the progress of the

negotiations with Iran as often as twice a day and had amassed a detailed knowledge of the 109-page agreement and the additional 47 pages of annexes. He drew on that knowledge the way an experienced courtroom lawyer might rely on case-law expertise to answer criticisms that the deal didn't last long enough; that it wouldn't prevent the Iranians from covertly producing a nuclear weapon; that it still allowed the Iranians some nuclear enrichment capacity and therefore didn't go far enough. He seemed eager to address every question.¶ "Have we exhausted [all the] Iran questions here?" Obama said at one point. "I am really enjoying this Iran debate. . . . Go ahead. Go ahead."¶ President Obama took questions on the deal with Iran in the East Room of the White House on July 15. Here are key moments from that speech. (AP)¶ A few minutes later, Obama picked up a piece of paper from the lectern in front of him, eager to keep talking about the deal. "Okay," he said. "I made some notes about many of the arguments — the other arguments that I've heard here."¶ Obama's defense of the deal wasn't designed to win over dug-in critics, whom he dismissed as illogical and unrealistic. His audience was an American public worried about the threat posed by a nuclear-armed Iran but also exhausted by more than 14 years of war in Iraq and Afghanistan.¶ Obama has speculated in recent weeks that the nuclear deal could empower moderates in Iran who are eager for better relations with the rest of the world. "What I'd say to them is this offers a historic opportunity," he told the New York Times in an interview Tuesday.¶ Such hopeful talk was largely absent Wednesday from Obama's news conference, which focused on the dangers posed by Iran and the need to prevent the country from acquiring a nuclear weapon. "This has been a Democratic priority, this has been a Republican priority, this has been Prime -Minister Netanyahu's priority," Obama said.¶ Obama hit on almost all the major criticisms of the deal during the news conference.¶ Republicans have criticized the deal for allowing Iran as many as 24 days before it grants inspectors access to military sites that could house covert programs. The delay could give Iran enough time to conceal illegal activity, critics said. Obama dismissed the charges as unrealistic and not grounded in science.¶ "This is not something you hide in a closet," Obama said of the centrifuges and other sensitive equipment needed to make weapons-grade uranium. "This is not something you put on a dolly and kind of wheel off somewhere."¶ Even if the Iranians had moved nuclear material from the site, Obama said, inspectors would find it. "Your high school physics will remind us that leaves a trace," he said. "And so we'll know, in fact, there was a violation of the agreement."¶ Other critics have charged that the deal would pave Iran's path to a bomb by lifting some of the most onerous restrictions on its nuclear energy program after 10 years.¶ "That's a good one," Obama said.¶ He countered that the inspections would still be in place 20 years from now. So, too, would Iran's Non-Proliferation Treaty commitments. Iran would be about one year away from developing enough fuel for a nuclear bomb — a longer time frame than its current two to three months.

Deal key to prevent "sneak-out"

Acton 7/16 (James M. Acton; July 16 2015; Co-director of the Nuclear Policy Program at the Carnegie Endowment for International Peace; Iran Ain't Gonna Sneak Out Under This Deal; Foreign Policy; <http://carnegieendowment.org/2015/07/16/iran-ain-t-gonna-sneak-out-under-this-deal/idh7>) jskullz

Nonetheless, where verification is concerned, the details do matter and we really should be debating the finer points of the Iran deal's verification provisions. (See: Annex I, Sections L, M, N, O, P, Q, and R — yes, it's that detailed.) In assessing whether these arrangements are "good enough," the best place to start is with the following question: If Iran decides to cheat, how would it go about doing so?¶ Iran's leadership would have three options and, in deciding between them, it would presumably choose the pathway that maximized its chances of success.¶ First, Iran could overtly renounce all its nonproliferation commitments chuck out international inspectors, and build the bomb loudly and proudly. The Nuclear Nonproliferation Treaty contains a clause that allows states to withdraw under "extraordinary" circumstances and, even though JPCOA doesn't have any such provision, there can be no certainty that Iran won't abrogate it anyway. No verification system can prevent this scenario, but what almost certainly can deter it is the threat of American weaponry hitting Iran before Ayatollah Khamenei can say "death to."¶ The second, more likely scenario would be for Iran to use its declared nuclear materials and facilities for bomb-building: the much-discussed "breakout scenario." Many of the Iran deal's limits are intended to make breakout much more time consuming than it would currently be — and that's a good thing. Ultimately, however, breakout still isn't all that likely. Declared facilities are subject to International Atomic Energy Agency (IAEA) monitoring and . As a result, Iran understands it would almost certainly be caught quickly if it attempted breakout.¶ Iran's third option would be to build a secret parallel nuclear program dedicated to military purposes — sneak-out. Detecting small clandestine enrichment plants is difficult and Tehran might view sneak-out as its most attractive option. Indeed, Iran has tried to sneak-out before. Repeatedly. It failed to declare three out of the four facilities in which it has

enriched uranium (the Kalaye Electric Factory, the Fordow Fuel Enrichment Plant near Qom, and the Pilot Fuel Enrichment Plant at Natanz) in accordance with IAEA rules.¶ “Anytime, anywhere” access is often advocated as the solution to detecting secret facilities — in fact, Secretary of Energy Ernest Moniz, an MIT physicist and one of the U.S. negotiators, said back in April that the United States expected it. The Iran deal doesn’t provide for it, however, as critics, including Sen. Tom Cotton, have noted (rather gleefully, at that).¶ So, what access provisions does the deal contain?¶ It does allow the IAEA to go anywhere — including military sites — if there is evidence of undeclared facilities hosting nuclear activities. But, if Iran declined to grant access, a complicated dispute resolution negotiation process would ensue under which Iran would have to negotiate first with the IAEA and then with the Joint Commission created to oversee implementation of the deal. This process could take up to 24 days. (on day 25, if Iran still refused access, it would be in non-compliance with the agreement and sanctions could be re-introduced.)¶ Fortunately for the JCPOA, the refrain of an “anytime, anywhere” access may make for a great soundbite, but its utility is overstated by Cotton and other critics of the agreement. An access delay — even one of 24 days — wouldn’t make any material difference to the IAEA’s ability to detect undeclared nuclear activities.¶ When IAEA inspectors search for undeclared nuclear activities they look for tiny traces of nuclear material on surfaces. Fortunately for them, nuclear material lingers. And, modern detection technology is so amazingly effective that miniscule traces of nuclear material can be detected years after nuclear activities took place. Countries have tried to sanitize facilities completely to remove every last trace of nuclear material. Iran did so at the Kalaye Electric Factory after its secret nuclear program was revealed in 2002. Syria tried the same thing in 2007 after Israel bombed its plutonium production reactor at Al Kibar. In both cases, the IAEA still managed to detect nuclear material. Those findings were critical to persuading the organization’s governing body to make a formal finding of non-compliance against both Iran and Syria.¶ Perhaps Iran has learned from its past mistakes and could do a better job of cleaning up nuclear material in the future and keeping its program secret. But, what’s clear is that perfect cleanup — if it were possible — would take many months. After just 24 days, the IAEA would have little difficulty detecting the residue from undeclared nuclear activities.¶ So, here’s the bottom line: The Iran deal doesn’t provide for anytime, anywhere access, but it does facilitate timely access anywhere — and that’s what needed for effective verification.¶ But wait, as they say on QVC, there’s more!¶ Not only is anytime, anywhere access not necessary, it’s also not sufficient. In other words, its inclusion might have placated (a few) critics, but would not be enough, by itself, for effective verification. After all, it would be physically impossible for the IAEA to inspect every building where Iran could conceivably be hiding clandestine nuclear activities.¶ What the IAEA actually needs is some preliminary evidence about where a secret nuclear facility might be lurking. The much-discussed but little-understood Additional Protocol was developed precisely for that purpose and the JCPOA obliges Iran to accept it, first voluntarily and subsequently on a legally binding basis. But, the JCPOA goes beyond the Additional Protocol in two innovative and important ways.¶ First, IAEA monitoring will be extended to declared yellowcake (the precursor material to the feedstock for enrichment) and to declared centrifuge components. This measure will deter Iran from diverting this material and equipment to a secret program. Iran could, of course, try to acquire yellowcake or centrifuge components secretly instead — but doing so would create more opportunities for detection.¶ Second, the deal also creates a “Procurement Working Group” to oversee the import of all equipment and material that either is used or could be used for nuclear purposes. The intelligence communities of the United States and its friends spend considerable resources monitoring Iranian imports. If they discover that Iran has obtained any items that should have been declared but weren’t, they will have acquired clear evidence of secret nuclear activities in Iran. They could hand this evidence to the IAEA, which could conduct inspections to investigate further.¶ All in all, therefore, the JCPOA provides for some impressive verification provisions to guard against sneak-out. That said, no one should be under any illusions. Detecting small, undeclared centrifuge plants is difficult and there is no guarantee of success. But, perfection is the not right metric against which to assess a nonproliferation agreement. The real question is whether sneak-out is more likely with a deal or without one. And here the answer is clear: sneak-out would be much more likely without a deal, because the IAEA’s powers to detect clandestine facilities would be much more limited.

Iran deal does not lead to proliferation

Pashakhanlou 7/14/15 (Arash Heydarian, Postdoctoral Teaching Fellow in Politics & International Relations at University of Bath, “Beyond the Iran deal: nuclear proliferation is a myth”, <http://theconversation.com/beyond-the-iran-deal-nuclear-proliferation-is-a-myth-42441/BW>)

After nearly two years of incremental and painstaking negotiations, a full deal on Iran’s nuclear programme has at last been struck. In a feat of diplomacy and patience, Iran and the P5+1 – the

US, the UK, France, Germany, Russia and China – have managed to construct a deal that limits Iran’s nuclear activity and the sanctions imposed on it. Early reactions deemed this a “new chapter of hope” in more ways than one; not just a victory for diplomacy, but a major victory in the efforts against nuclear weapons proliferation. This is somewhat misguided. In reality, however, even a nuclear-armed Iran would not have meant that a nuclear weapons proliferation among states was underway. Proliferation, after all, means rapid spread. And whereas nuclear weapons have proliferated “vertically”, with existing nuclear states adding to their existing nuclear arsenals, there has not been a “horizontal” nuclear weapons proliferation – that is, a fast spread of these weapons to new nations. On the contrary, nuclear weapons have spread slowly across the world, even though academics, politicians and the media frequently discuss horizontal nuclear weapons proliferation as if it was a matter of fact. Currently, there are only nine states in the world with nuclear weapons among the UN’s 193 members: the US (since 1945), Russia (since 1949), the UK (since 1952), France (since 1960), China (since 1964), India (since 1974), Israel (since 1979, unofficial), Pakistan (since 1998) and North Korea (since 2006). Other countries have dropped off the list. South Africa joined the nuclear club in the 1980s, but dismantled its weapons in the early 1990s. Belarus, Kazakhstan and Ukraine inherited nuclear weapons from the Soviet Union when they became independent states after the Cold War, but they transferred their nuclear arsenal to Russia in the 1990s. In other words, only a handful of countries in Europe, Asia and North America possess these weapons, while Africa, Australasia and Latin America are devoid of nuclear weapons states. In fact, the number of nuclear weapons states has actually decreased ever since the 1990s. And even though the Pakistani nuclear weapons scientist Abdul Qadeer Khan confirmed the existence of a global nuclear black market which purportedly provided nuclear technology, expertise, and designs to various countries, including Libya, no horizontal nuclear weapons proliferation has taken place. Libya eventually voluntarily renounced its secret nuclear weapons efforts in December 2003. Argentina, Brazil, South Korea, and Taiwan have also shelved their nuclear weapons programs. As of now, there are 31 countries with nuclear power plant units in operation; countries such as Australia, Canada, and Japan are widely believed to have the technological sophistication to become nuclear weapons states in relatively short amount of time should they want to – but they have not pursued that path. In other words, even though there have been opportunities for nuclear weapons proliferation across a range of new states, such a development has not materialised. All of the available evidence thus unanimously suggests that no horizontal nuclear weapons proliferation has taken place throughout the 70 years that these weapons have existed. Claims to the contrary lack basis, whether they are made for political or economic reasons, sheer ignorance, or for any other purposes. Horizontal nuclear weapons proliferation is a bogeyman that does not exist. If we are to devise sound strategies and policies regarding nuclear weapons we have to ground them in existing reality. Recognising that there is no horizontal nuclear weapons proliferation is a good place to start.

Deal necessary to prevent nuclear annihilation—get the foot in the door for future reforms

Cirincione, president of the Ploughshares Fund, **7/9/2015**

(Joe, "What You Need to Know About the Coming Deal With Iran,"

http://www.huffingtonpost.com/joe-cirincione/what-you-need-to-know-abo_b_7763516.html)

What about Iran's support for terrorism, human rights record, it's recognition of Israel? Is that in any way part of these negotiations?¶ These are deeply troubling aspects of Iran's regional behavior. This is not a pleasant regime. Iran executes about a thousand people a year, more than any other country in the world. They support Hamas and Hezbollah, who are foes of our ally, Israel. We disapprove of a lot of Iran's behavior in the region, but that's not what this negotiation is about.¶ As I wrote earlier this year, "Iran's deplorable record is not a reason to walk away. It is the very reason we must hammer out an iron-clad agreement to ensure Iran cannot get its hands on a nuclear bomb."¶ We negotiate with untrustworthy or "evil" governments all of the time. One of the greatest achievements of the 20th century was our ability to work with the Soviet Union, a country that Reagan called an "evil empire," to avoid nuclear annihilation. That moniker was well deserved. Stalin's purges murdered millions of Russians. Political opponents were rounded up, given show trials and executed. They were sent to gulags where they were worked to death or simply disappeared. His successors supported scores of groups fighting against America and our allies.¶ But cooperation with the Soviets not only prevented a nuclear war, it also led to a series of security, economic and political agreements that helped stabilize the world and led to the gradual demise of the Soviet empire.¶ When Nixon toasted Mao in Beijing in 1972, the Chinese Communist Party was arming the North Vietnamese, who had killed over 2,000 American soldiers in Vietnam the previous year. But the relationship they brokered shifted global relations and resulted in dramatic changes in China that have made better lives for hundreds of millions of Chinese.¶ Negotiating with corrupt, brutal and often despicable governments is necessary to prevent even greater evils. This time, we are doing it to make sure that a dangerous regime does not get the bomb. Certainly that is an endeavor that is worth our effort.¶ If we try to load every single one of our concerns into this negotiation, we will break the table. You can't possibly resolve all those issues at once, so we are taking care of the most threatening, which is the nuclear program. As bad as Iran's behavior is, it might be worse if they actually got a nuclear weapon. And then we'll see if this opens up new channels of communication, and avenues for addressing these other issues.¶ If there is a good deal, or a good enough deal, over time that will have some kind of moderating influence on the Iranian government, on its behavior in its neighborhood and also on domestic issues as well?¶ I do think that, and I'm informed by human rights activists and civic activists inside Iran.¶ Research conducted by experts from the International Campaign for Human Rights in Iran, has shown that Iranians themselves believe that a nuclear agreement between Iran and world powers will lead to internal political and cultural reforms in Iran. A recent report shows that "sixty-one percent [of Iranians] believe a deal would enable political and cultural reforms, as a politically strengthened Rouhani administration could now turn its focus to such issues."¶ The Executive Director of the Campaign, Hadi Ghaemi, believes that the nuclear agreement will "will have the potential to validate voices of moderation and embolden those who have called for a loosening of the political and cultural environment in Iran." Indeed, the Campaign asserts that, "every poll undertaken has confirmed Iranian society's strong support for the nuclear negotiations, and the resounding electoral win of the centrist Hassan Rouhani reflects society's desire for greater political and social freedoms."¶ Activists inside Iran see it as a beginning. As a way to empower Rouhani, who campaigned not just on economic stimulation, but on opening up freedoms for the Iranian people, and establishing a more moderate

government. They think this will empower him and could be the opening that they're looking for.¶ That's why you saw these massive crowds greet even the interim agreement in April. Foreign Minister Zarif was mobbed on the way home from the airport not because they reached some complicated agreement on inspections and the nuclear program, but because they see this as a ray of hope, the beginning of change in the regime. Whether that will happen, we don't know. That will require a lot of struggle. But yes, I think this deal could be the beginning of big change inside Iran, and in Iran's relationship with us and its neighbors, including Israel.¶ Are the U.S. and its negotiating partners hypocrites in these negotiations? In that all of them possess nuclear weapons, and no one has called Israel on their nuclear arsenal?¶ This is a point the Iranians make quite often. The five permanent members of the Security Council all have nuclear weapons. The U.S. and Russia have thousands of nuclear weapons, about ninety six percent of all the weapons in the world. So this is a point.¶ Israel has somewhere around one hundred weapons in an undeclared arsenal. This is also a point.¶ But there are other means of addressing these arsenals, in the United Nations and in the Nonproliferation Treaty process, but we're not talking about those now, we're talking about the Iranian program. The Iranians swore when they signed the Nonproliferation Treaty, that they would not undertake nuclear weapons research. We caught them building secret facilities, in violation of the treaty. That's why sanctions were imposed, that's why we are talking about it now.¶ Is it an hypocrisy problem? Do we have a problem, as long as we are maintaining thousands of weapons and telling Iran they can't have one? Yes, but the legal and diplomatic arguments outweigh that at this point, and they're on our side. We are going to stop this program - and that may create the diplomatic and political space for us to further reduce our own obsolete nuclear arsenal.

Israel Strike Impact

Israel strikes cause extinction

Masko, 2/9/12

[Dave Masko is an Air Force News veteran who's filed stories from Washington, D.C., the Middle East, the Balkans and Europe. These days, he's a freelance writer based in Florence, Oregon. Masko's articles have appeared in European Stars and Stripes, The Washington Post, Rolling Stone and other publications. From 1977-1999 he was a reporter for the Defense Department, <http://www.huliq.com/10282/iran-nuclear-ambitions-alarming-israel-brink-war-say-experts>]

There's always been the danger of something "going nuclear" in our fragile world where countries such as Iran and Israel seem to like rattling sabers at each other was once viewed as "same old, same old," by political science experts when referring to these countries threats of war remaining the same. However, it's not same old, same old, when President Obama told NBC News in a TV interview Feb. 5 that while he does not think Israel has decided whether to attack Iran, the United States is "going to be sure that we work in lockstep as we proceed to try to solve this... hopefully diplomatically." Thus, if Israel does attack Iran's nuclear facilities and war breaks out, "even a small-scale, regional nuclear war could produce as many direct fatalities as all of World War II and disrupt the global climate for a decade or more, with environmental effects that could be devastating for everyone on Earth, university researchers have found," stated a report on the University of California Los Angeles website aasc.ucla.edu; while pointing to "a team of scientists" at Rutgers, the State University of New Jersey; the University of Colorado at Boulder and UCLA who've researched the implications of such an attack. What's at stake for the world? Overall, the stakes could not be any greater for a world that fears war after more than 20 years of

sabre rattling by Israel over Iran's nuclear ambitions. In turn, President Obama and other world leaders seem very concerned that it's not if but when "an Israeli military attack on the Islamic Republic of Iran" will leave in its wake a new war in the Middle East, with more terrorism worldwide laced with even broader economic woes at a time when many countries are already at a breaking point. Moreover, the top U.S. intelligence official told Congress Jan. 31 – in an annual report about threats facing the nation – that "Iran's leaders seem prepared to attack U.S. interests overseas, particularly if they feel threatened by possible U.S. action." Jim Clapper, director of National Intelligence, also told the Senate Intelligence Committee Jan. 31 in an MSNBC TV report that America "now faces many interconnected enemies, including terrorists, criminals and foreign powers, who may try to strike via nuclear weapons or cyberspace, with the movement's Yemeni offshoot and 'lone wolf' terror attacks posing key threats." Middle East nuclear confrontation feared "While a regional nuclear confrontation – such as the one feared between Iran and Israel – among emerging third-world nuclear powers might be geographically constrained," report this noted team of U.S. scientists, "the environmental impacts could be worldwide." Thus, even the great Atlantic Ocean – that sits between the U.S. and the Middle East – would not buffer the "fallout" that will be in the "global atmosphere" impacting an already fragile world climate situation. While these conclusions of dark days ahead for the world if the so-called "nuclear genie gets out of the bottle" -- by U.S. scientists during a meeting of the American Geophysical Union – was back in 2006, the UCLA website that presented these nuclear war fears, has updated such conclusions about a clear and present danger of possible nuclear confrontation if Israel attacks Iran, and as of Feb. 9, 2012, the news from Israel is not good at all, state experts.

Prolif Module

Proliferation is an existential threat—Iran deal is necessary to generate modeling and political will

Plame Wilson 15 (Valerie Plame Wilson; May 13 2015; former CIA covert nonproliferation officer; Looking Forward, Nuclear Proliferation Is Still Greatest Existential Threat We Face; Huffington Post; http://www.huffingtonpost.com/valerie-plame-wilson/nuclear-proliferation-existential-threat_b_7118460.html) jskullz

As a former covert CIA operative, specializing in counter-proliferation, I still believe that the spread of nuclear weapons and the risk of their use is the greatest existential threat we face. Twenty-six years after the end of the Cold War, the world still has more than 15,000 nuclear weapons. Whatever other issues people care about -- poverty, the environment, inequality and so many others -- if we don't get this one right, and soon, nothing else will matter.¶ We are at a crossroads on this issue and the decisions we make over the next 10 years will set us on a course either toward the elimination of all nuclear weapons or toward expanding arsenals and proliferation.¶ There are some disturbing trends.¶ All of the nuclear countries are investing heavily, or planning to do so, in modernizing their forces and/or expanding their arsenals. President Obama is proposing a massive overhaul of the U.S. nuclear arsenal that the Congressional Budget Office (CBO) estimates will cost \$1 trillion over the next 30 years. Russia has already begun a major upgrade of its arsenal. China is ramping up each leg of its nuclear triad, India is close to having a full nuclear triad with the addition of a nuclear submarine to its forces, and North Korea continues to develop its nuclear capability. Perhaps most worrisome is Pakistan, which has the fastest-growing nuclear arsenal and is plagued by persistent political instability and extremist elements.¶ In addition to developing new types of weapons, nuclear weapons countries also appear to be taking steps toward establishing the dangerous nuclear high-alert posture that the United States and Soviet Union adopted during the Cold War (and still maintain) -- shortening the decision time for launch and increasing the risk that nuclear weapons will be used in conflict, by accident or through unauthorized launch.¶ Longstanding regional conflicts involving nuclear-armed countries remain unresolved and tensions high, including on the South Asian Peninsula, the Korean Peninsula and the Middle East. Relations between Russia and the West have spiraled dangerously downward; Russia has even threatened to use nuclear force to defend its annexation of Crimea.¶ Meanwhile, terrorists are working to get their hands on the bomb. This danger has risen as states have failed and ungoverned zones have spread, especially in the Middle East and Africa. In the last two decades there have been dozens of incidents of nuclear explosive materials being lost or stolen. The so-called "Islamic State" group has already seized low-grade nuclear material

from a facility in Mosul.¶ These are very difficult challenges. But there are also significant factors that could provide opportunities for progress.¶ A final agreement with Iran would verifiably prevent it from developing a nuclear bomb. It would negate a long-standing leading argument of opponents to Global Zero -- that Iran and countries like it would never agree to forgo nuclear weapons. And it provides a model -- multilateral negotiations and intrusive verification -- for pursuing global reductions in nuclear arsenals.

Iran deal failure is a disaster—causes regional instability, nuclear proliferation, and escalation

Kaye 7/7 (Dalia Dassa Kaye; July 7th 2015; Director, Center for Middle East Public Policy; Senior Political Scientist, PhD in political science; “The Middle East After Vienna”; Foreign Affairs; <https://www.foreignaffairs.com/articles/iran/2015-07-07/middle-east-after-vienna>)
jskullz

The first and most dangerous scenario is that Tehran could break out of the interim nuclear agreement, the Joint Plan of Action, which has essentially frozen Iran’s nuclear program for nearly two years. With no promise of lasting and more significant sanctions relief, Iran may decide to resume its nuclear enrichment program at levels that reduce the time it would need to weaponize its nuclear program. Iran could still remain in the Nuclear Non Proliferation Treaty and come dangerously close to developing the capabilities to quickly break out if there is no international agreement placing further restrictions and inspections on its activities. To make matters worse, unless it is clear that Iran is at fault for the breakdown in nuclear talks, the current broad international support for sanctions against Iran could weaken. U.S. sanctions against Iran have proven effective because of the backing they have garnered among key oil-importing countries such as China, India, South Korea, and Japan. International sanctions have, by some estimates, cut Iran’s oil exports by more than half in recent years, costing Iran up to \$40 billion in revenue annually. Continued unilateral American sanctions and secondary U.S. sanctions on countries and institutions doing business with Iran following the breakdown of a deal would likely continue to keep U.S. and European companies away from Iran. But other key international powers, and even some in Europe, may tire of self-imposed restrictions, especially if Iran appeared to have negotiated in good faith. So, Iran could find itself less isolated over time, especially if Congress rejected the deal, leaving the United States to blame for the failure. Indeed, this is the worst-of-both-worlds outcome—few constraints on Iran’s nuclear program and dissipating international pressure on Iran.¶ A return to military escalation with Iran is also more likely in a no-deal Middle East. Iranian hardliners’ arguments that the West was never really interested in a deal with Iran will appear vindicated, undermining the leverage and influence of more pragmatic Iranian factions who were associated with the failed negotiations. This could lead to an expansion of Iran’s already destabilizing regional activism, particularly in Iraq, Syria, and in its relationship with Hezbollah. Israel and Hezbollah are not currently interested in another conflict, but at some point in time Hezbollah may perceive attacking Israel as a useful distraction from its losses in Syria. Military escalation between Israel and Hezbollah with Iranian-supplied missiles, could happen quickly. Hezbollah attacks on Sunni insurgent groups fighting the Assad regime close to Israel’s border could also mistakenly hit an Israeli target, leading Israel to retaliate. Israel would be more concerned about maintaining its deterrence posture in a regional context where Iran’s nuclear program was unchecked, leading to harsh retaliation against any missile strike that could also quickly escalate into a broader conflict. ¶ And of course, Israeli

leaders are likely to return to open threats about military options against Iran's nuclear facilities should Iran resume its enrichment program to levels that bring it closer to a weapons capability that crosses Israeli red lines. Pressures on neighboring states to consider nuclear programs of their own would also likely increase, even if concerns about the intentions and ability of neighboring countries like Saudi Arabia to pursue nuclear weapons capability are largely overblown.

Economy Module

Iran deal leads to an increase in US business – banking sector

Rosenfeld, Ward and Brennen 7/14/14 (Everett, Marguerite and Morgan, writers for CNBC, "Iran deal: Corporate winners from the nuclear agreement", <http://www.cnbc.com/2015/07/14/iran-deal-corporate-winners-from-the-nuclear-agreement.html>)//BW

Iran and six world powers reached an agreement on Tuesday to lift sanctions against the Islamic Republic, and while U.S. and Iranian leaders have heralded the deal as a victory, the real winners could be corporations across the globe. Iran holds the world's fourth-largest proved crude reserves and the second-largest natural gas reserves, according to the U.S. Energy Information Administration, so energy firms will be some of the clear beneficiaries of the deal. Most of those gains may not go to American companies, however, as they weigh the political costs of doing business with Tehran—especially considering the skepticism from Congress, according to Alireza Nader, senior international policy analyst at the Rand Corp. "Most likely European and Asian energy companies will see an increase in business—so companies like Total and Shell," Nader said. "For American energy companies, it's going to be tougher for them to go back in Iran." A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Morteza Nikoubazl | Reuters A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Other parts of the energy industry are also likely to benefit, including tankers and oilfield services, experts told CNBC. Citi Research analyst Chris Wetherbee said the opening of Iran is a "net positive" for international tanker firms, because Iran's aging fleet won't be able to compete, and more energy supplies will be on the market. Companies like Scorpio Tankers and Navios Maritime Acquisition saw their stocks rise Tuesday. In a note published by Barron's, Simon Wong of investment firm Gabelli wrote that an agreement would "open investment opportunities in the country's oil and gas sector." That would likely benefit oilfield service firms like Schlumberger, Weatherford International and Halliburton. Earlier this year, Schlumberger pleaded guilty to violating U.S. sanctions related to Iran, agreeing to a three-year period without any operations in Iran. A spokeswoman told CNBC that the company was not in a position to comment on Tuesday's deal. While the energy industry may be the most obvious beneficiary of an Iran deal, banks will also stand to benefit, experts told CNBC. "All of the major banking institutions in the industrial world will try to finance and facilitate increased trade with Iran," Christopher Whalen, senior managing director at Kroll Bond Rating Agency, told CNBC. "It's a big country, (and) they are very Western-focused. Iranians are consumers of everything. You can anticipate anything from industrial equipment to consumer products will definitely be bought, and will definitely be financed." As for which U.S. banks stand to benefit, Whalen said the gains will be concentrated among some of the top financial institutions—Citibank, JPMorgan, Goldman Sachs and Morgan Stanley. Those banks, he said, will likely work to facilitate the shipment of goods and services to Iran, taking on a trade finance function, and supporting project finance. They may also reach out to Iranian banks about sovereign business, Whalen added. But American banks aren't the only ones that stand to benefit from a reduction of Iranian sanctions, Whalen

said, explaining that they'll compete against European and Asian banks for the business. If sanctions on Iran's use of SWIFT (the financial messaging system that transmits and tracks international transactions) are lifted, then new financial sector opportunities could also open, experts said. "The SWIFT sanctions are more important at this point than any other type of sanctions because it affects all manner of industry and agriculture," Djavad Salehi-Isfahani, an economist at Virginia Tech, told CNBC earlier this year. Telecommunications firms may also be early winners, Blaise Misztal, director of national security at the Bipartisan Policy Center, said. Other industries could also benefit from the Iran deal. PSA Peugeot Citroen told Reuters that it's in advanced talks on an Iranian car-making venture with Iran Khodro and expects rapid progress. The political deal struck in Vienna "should clear the way for significant progress in our discussions," Peugeot's Africa and Middle East chief, Jean-Christophe Quemard, said in an emailed statement Tuesday. General Electric, which does business in Iran through its health-care division, could also consider expanding in the country. "We look forward to reviewing the details of the agreement reached and will watch the regulatory landscape that may unfold," the company said in a statement.

AT: Israel Strike

No Israeli strike—if Bibi was serious he'd had bombed Iranian facilities more than a decade ago

Keck 15 (Zachary Keck; Feb. 9 2015; managing editor of The National Interest.; "5 Resasons Israel Won't Attack Iran"; National Interest; <http://nationalinterest.org/commentary/five-reasons-israel-wont-attack-iran-9469?page=2>) jskullz

1. You Snooze, You Lose¶ First, if Israel was going to strike Iran's nuclear facilities, it would have done so a long time ago. Since getting caught off-guard at the beginning of the Yom Kippur War in 1973, Israel has generally acted proactively to thwart security threats. On no issue has this been truer than with nuclear-weapon programs. For example, Israel bombed Saddam Hussein's program when it consisted of just a single nuclear reactor. According to ABC News, Israel struck Syria's lone nuclear reactor just months after discovering it. The IAEA had been completely in the dark about the reactor, and took years to confirm the building was in fact housing one.¶ Contrast this with Israel's policy toward Iran's nuclear program. The uranium-enrichment facility in Natanz and the heavy-water reactor at Arak first became public knowledge in 2002. For more than a decade now, Tel Aviv has watched as the program has expanded into two fully operational nuclear facilities, a budding nuclear-research reactor, and countless other well-protected and -dispersed sites. Furthermore, America's extreme reluctance to initiate strikes on Iran was made clear to Israel at least as far back as 2008. It would be completely at odds with how Israel operates for it to standby until the last minute when faced with what it views as an existential threat.¶

AT: NPT Turn

No NPT breakdown—secondary agreements, lack of capacity, and no interest

Esfiandary and Tabatabai 4/28 (Dina Esfiandary and Ariane Tabatabai; Dina Esfiandary is a McArthur Fellow in the Centre for Science and Security Studies at King's College London. Ariane Tabatabai is a visiting assistant professor in the Security Studies Program at the Georgetown University School of Foreign Service and a columnist for The Bulletin of the Atomic

Scientists; “Why an Iran deal won’t lead to nuclear proliferation”; Washington Post; www.washingtonpost.com/blogs/monkey-cage/wp/2015/04/28/why-an-iran-deal-wont-lead-to-nuclear-proliferation/) jskullz

First, the entire region, except for nuclear-armed Israel, is party to the NPT. This means that they’ve already legally given up the nuclear weapon option. Moreover, nuclear weapon states can’t legally provide them nuclear weapons either. Second, many countries have safeguards agreements and some, the additional protocol, in place. This means that their programs are under close International Atomic Energy Agency (IAEA) scrutiny. ¶ ¶ None of these states have expressed an interest in reprocessing, which closes the plutonium path to the bomb. Some have even foregone enrichment, which blocks the uranium path to the bomb. That’s the case for the UAE. But some states, such as Saudi Arabia and Turkey, want to reserve “the right” to enrich. Riyadh went further and stated it wanted whatever Iran got out of the negotiations, including enrichment. ¶ ¶ Saudi Arabia, Turkey, Egypt, Jordan and the UAE are all dependent on foreign suppliers and expertise for their programs. They lack the human capacity for the programs. Foreign involvement makes it difficult, though not impossible, to covertly develop a nuclear weapon. This means that suppliers also need to do their due diligence and ensure that buyers use their equipment for purely peaceful purposes.

AT: Bomb Good

Iran bomb increases risk of nuclear miscalc

Dokos 12 (Thanos Dokos; Sep 2012; Director-General of the Hellenic Foundation for European & Foreign Policy (ELIAMEP); Why Kenneth Waltz is Both Right & Wrong About the ‘Iranian Bomb’; ELIAMP; <http://www.isn.ethz.ch/Digital-Library/Publications/Detail/?id=153731>) jskullz

At the heart of the views of the Waltz school is a simple, extrapolation from the non-use of nuclear weapons in the U.S.-Soviet context to the future non-use of those weapons in other regions. This analogy overlooks the unique combination of circumstances that has helped to ensure nuclear peace over the past decades. The non-use of nuclear weapons has rested upon particular geopolitical and technical factors: cautious leadership (despite the harsh rhetoric of both sides); the fact that neither national survival nor territorial integrity was immediately at stake and that neither power has ever been at war with the other; the lack of common borders, thereby lessening flash points for conflict and impeding escalation; and adequate technical means to prevent accidental detonation and the unauthorized use of nuclear weapons. Without these features, mere fear of nuclear destruction, though itself quite important, might not have sufficed. For example, the probability of the use of nuclear weapons as a result of miscalculation or loss of control during a crisis cannot be easily dismissed. The lack of secure second-strike forces and reliable C4I systems in most new nuclear weapon states and the adoption of launch-on-warning (LOW) postures as a consequence, could result to strategic instability and could increase the probability of the use of nuclear weapons due to miscalculation. And however small the risk of each individual scenario may be, one should also consider the cumulative risk of all the possible dangers arising from additional nuclear proliferation. The prospect of a nuclear “accident” or miscalculation would, therefore, be much higher in a proliferated world, as tensions between India and Pakistan have demonstrated in the past. The Middle East is probably a different case, mainly because Israel and Iran are not geographically contiguous states, nor do they constitute an existential threat for the other side (although many Israelis would take issue with that statement). Waltz also argues that “Israel’s regional nuclear monopoly has long fueled instability in the Middle East. It is Israel’s nuclear arsenal, not Iran’s desire for one, that has contributed most to the current crisis. Power, after all, begs to be balanced. What is surprising about the Israeli case is that it has taken so long for a potential balanced to emerge.” He also suggests that “Current tensions are best viewed not as the early stages of a relatively recent Iranian nuclear crisis but rather as the final stages of a decades-long Middle East nuclear

crisis that will only end when a balance of military power is restored.” This is a rather surprising statement. Israeli policies and actions, especially in connection with the Palestinian problem, often have had destabilizing consequences for the region, but its “nuclear behavior” can hardly be described as irresponsible or destabilizing (this doesn’t imply, of course, that efforts for a NWFZ in the Middle East should be abandoned). As a result, the only full-fledged effort to acquire nuclear weapons by a Middle Eastern state was motivated by Saddam’s regional ambitions, not concern about Israel’s nuclear arsenal. Similarly, Tehran’s current security policies, including its strong interest in the development of a nuclear weapon capability and its regional aspirations, antedate the Islamic revolution and are rooted in Persian nationalism and the country’s historical sense of regional leadership, not Israel’s nuclear capability. Iran’s nuclear programme is also motivated, among other, by some legitimate security concerns, including the experience of its war with Iraq, when Iraq used chemical weapons on a large scale against Iran with the international community protesting very weakly, and fears about regime survival. Post 9/11, influential groups inside Iran were concerned that the U.S. intended to change its regime by force. Indeed, it is possible that the Iranian leadership reached the conclusion that if a regime was considered by the U.S. as a member of the ‘Axis of Evil’ and did not possess a nuclear capability, a fate similar to Saddam Hussein’s could be expected, whereas if the country did have a nuclear weapon capability, like North Korea, it stood a reasonable chance of getting financial support and even regime survival guarantees from the US and the international community. Finally, one should also consider Iranian leadership’s distrust towards the West, mainly as a result of a sense of humiliation caused by a long colonial experience. At the same time it is probably true that since late 2003, with the U.S. entangled in an Iraqi (and increasingly an Afghan) quagmire, draining American resources and reducing its influence in the region and worldwide and in view of the domestic situation in Lebanon and Palestine, a permissive regional environment for spoiling strategies and the lack of a functioning regional security architecture in the Gulf region, the Iranian leadership saw a window of opportunity to increase the country’s geopolitical weight and establish Iran as a pivotal regional power. It is possible that the acquisition of a nuclear weapon capability may increase not only Iran’s self-confidence, but also its propensity for brinkmanship and risk-taking. Iranian official rhetoric, often bombastic in style, will not help in this context. At the global level, there is little doubt that further proliferation would make the strategic chessboard more complex whilst at the same time multiplying risks and complicating strategic decision-making. There is also growing concern that the open nuclearization of Iran could also, in combination with other negative developments, deal a serious –even deadly– blow to the NPT regime. Although one can speculate whether Iran’s nuclearization will be the ‘hair that broke the camel’s back’, Christoph Bertram rightly points out that ‘anyone seeing in an Iranian bomb a key factor which might prompt Saudi Arabia, Egypt or other countries to obtain one as well needs to explain why for 40 years the Israeli bomb has not had that effect.’ Waltz agrees that “If an atomic Israel did not trigger an arms race then, there is no reason a nuclear Iran should now” (a rather controversial statement in view of his conviction that the real cause of the Middle Eastern crisis has been the Israeli nuclear monopoly).

Iran nuke causes runaway prolif and nuclear war

Lindsay and Takeyh 10 (James M. Lindsay and Ray Takeyh; Lindsay is Senior Vice President, Director of Studies, and Maurice R. Greenberg Chair at the Council on Foreign Relations, Takeyh is a Middle East scholar, former United States Department of State official, and a Senior Fellow at the Council on Foreign Relations; *After Iran Gets the Bomb*; Foreign Affairs; <https://www.foreignaffairs.com/articles/persian-gulf/2010-02-22/after-iran-gets-bomb>) jskullz

Containing a nuclear Iran would not be easy. It would require considerable diplomatic skill and political will on the part of the United States. And it could fail. A nuclear Iran may choose to flex its muscles and test U.S. resolve. Even under the best circumstances, the opaque nature of decision-making in Tehran could complicate Washington's efforts to deter it. Thus, it would be far preferable if Iran stopped -- or were stopped -- before it became a nuclear power. Current efforts to limit Iran's nuclear program must be pursued with vigor. Economic pressure on Tehran must be maintained. Military options to prevent Iran from going nuclear must not be taken off the table. But these steps may not be enough. If Iran's recalcitrant mullahs cross the nuclear threshold, the challenge for the United States will be to make sure that an abhorrent outcome does not become a catastrophic one. This will require understanding how a nuclear Iran is likely to behave, how its neighbors are likely to respond, and what Washington can do to shape the perceptions and actions of all these players. MESSIANIC AND PRAGMATIC Iran is a peculiarity: it is a modern-day theocracy that pursues revolutionary ideals while safeguarding its practical interests. After three decades of experimentation, Iran has not outgrown its ideological compunctions. The founder of the

Islamic Republic, Ayatollah Ruhollah Khomeini, bequeathed to his successors a clerical cosmology that divides the world between oppressors and oppressed and invests Iran with the mission of redeeming the Middle East for the forces of righteousness. But the political imperative of staying in power has pulled Iran's leaders in a different direction, too: they have had to manage Iran's economy, meet the demands of the country's growing population, and advance Iran's interests in a turbulent region. The clerical rulers have been forced to strike agreements with their rivals and their enemies, occasionally softening the hard edges of their creed. The task of governing has required them to make concessions to often unpalatable realities and has sapped their revolutionary energies. Often, the clash of ideology and pragmatism has put Iran in the paradoxical position of having to secure its objectives within a regional order that it has pledged to undermine.¶ To satisfy their revolutionary impulses, Iran's leaders have turned anti-Americanism and a strident opposition to Israel into pillars of the state. Tehran supports extremist groups, such as Hamas, Hezbollah, and the Islamist militias opposing U.S. forces in Iraq. The mullahs have sporadically attempted to subvert the U.S.-allied sheikdoms of the Persian Gulf. But the regime has survived because its rulers have recognized the limits of their power and have thus mixed revolutionary agitation with pragmatic adjustment. Although it has denounced the United States as the Great Satan and called for Israel's obliteration, Iran has avoided direct military confrontation with either state. It has vociferously defended the Palestinians, but it has stood by as the Russians have slaughtered Chechens and the Chinese have suppressed Muslim Uighurs. Ideological purity, it seems, has been less important than seeking diplomatic cover from Russia and commercial activity with China. Despite their Islamist compulsions, the mullahs like power too much to be martyrs.¶ Iran's nuclear program has emerged not just as an important aspect of the country's foreign relations but increasingly as a defining element of its national identity. And the reasons for pursuing the program have changed as it has matured. During the presidencies of Hashemi Rafsanjani and Muhammad Khatami, nuclear weapons were seen as tools of deterrence against the United States and Saddam Hussein's regime, among others. The more conservative current ruling elite, including President Mahmoud Ahmadinejad and the Revolutionary Guards, sees them as a critical means of ensuring Iran's preeminence in the region. A powerful Iran, in other words, requires a robust and extensive nuclear infrastructure. And this may be all the more the case now that Iran is engulfed in the worst domestic turmoil it has known in years: these days, the regime seems to be viewing its quest for nuclear self-sufficiency as a way to revive its own political fortunes.¶ Going nuclear would empower Iran, but far less than Tehran hopes. Iran's entry into the nuclear club would initially put Tehran in a euphoric mood and likely encourage it to be more aggressive. The mullahs would feel themselves to be in possession of a strategic weapon that would enhance Iran's clout in the region. They might feel less restrained in instigating Shiite uprisings against the Arab sheikdoms in the Persian Gulf. But any efforts to destabilize their Sunni neighbors would meet the same unsuccessful fate as have similar campaigns in the past. Iran's revolutionary message has traditionally appealed to only a narrow segment of Shiites in the Persian Gulf. Sporadic demonstrations in Bahrain and Saudi Arabia have not sought to emulate Iran's revolution; rather, they have been an outlet for Shiites to express their economic and political disenfranchisement.¶ A nuclear Iran might also be tempted to challenge its neighbors in the Persian Gulf to reduce their oil production and limit the presence of U.S. troops on their territories. However, obtaining nuclear weapons is unlikely to help Iran achieve these aims, because nuclear weapons, by definition, are such a narrow category of arms that they can accomplish only a limited set of objectives. They do offer a deterrent capability: unlike Saddam's Iraq, a nuclear Iran would not be invaded, and its leaders would not be deposed. But regime security and power projection are two very different propositions. It is difficult to imagine Sunni regimes yielding to a resurgent Shiite state, nuclear or not; more likely, the Persian Gulf states would take even more refuge under the U.S. security umbrella. Paradoxically, a weapon that was designed to ensure Iran's regional preeminence could further alienate it from its neighbors and prolong indefinitely the presence of U.S. troops on its periphery. In other words, nuclear empowerment could well thwart Iran's hegemonic ambitions. Like other nuclear aspirants before them, the guardians of the theocracy might discover that nuclear bombs are simply not good for diplomatic leverage or strategic aggrandizement.¶ Likewise, although the protection of a nuclear Iran might allow Hamas, Hezbollah, and other militant groups in the Middle East to become both more strident in their demands and bolder in their actions, Israel's nuclear arsenal and considerable conventional military power, as well as the United States' support for Israel, would keep those actors in check. To be sure, Tehran will rattle its sabers and pledge its solidarity with Hamas and Hezbollah, but it will not risk a nuclear confrontation with Israel to assist these groups' activities. Hamas and Hezbollah learned from their recent confrontations with Israel that waging war against the Jewish state is a lonely struggle.¶ The prospect that Iran might transfer a crude nuclear device to its terrorist protégés is another danger, but it, too, is unlikely. Such a move would place Tehran squarely in the cross hairs of the United States and Israel. Despite its messianic pretensions, Iran has observed clear limits when supporting militias and terrorist organizations in the Middle East. Iran has not provided Hezbollah with chemical or biological weapons or Iraqi militias with the means to shoot down U.S. aircraft. Iran's rulers understand that such provocative actions could imperil their rule by inviting retaliation. On the other hand, by coupling strident rhetoric with only limited support in practice, the clerical establishment is able to at once garner popular acclaim for defying the West and oppose the United States and Israel without exposing itself to severe retribution. A nuclear Iran would likely act no differently, at least given the possibility of robust U.S. retaliation. Nor is it likely that Iran would become the new Pakistan, selling nuclear fuel and materials to other states. The prospects of additional sanctions and a military confrontation with the United States are likely to deter Iran from acting impetuously.¶ A nuclear Iran would undeniably pose new dangers in the Middle East, especially at first, when it would likely be at its most reckless. It might thrash about the Middle East, as it tried to press the presumed advantages of its newfound capability, and it might test the United States' limits. But the mullahs will find it difficult to translate Iran's nuclear status into a tangible political advantage. And if Washington makes clear that rash actions on their part will come at a high cost, they will be far less likely to take any.¶ THE RIPPLES IN THE REGION¶ In assessing the consequences of Iran's nuclearization, it is important to consider not only how Iran is likely to act but also how other states will react to this outcome -- and what the United States could do to influence their responses. Iran's nuclearization would not reduce Washington to passively observing events in the region. Washington would retain considerable ability to shape what Iran's neighbors do and do not do.¶ The nightmare scenario that could be unleashed by Iran's nuclearization is easy to sketch. Israel would go on a hair-trigger alert -- ready to launch a nuclear weapon at a moment's notice -- putting both countries minutes away from annihilation. Egypt, Saudi Arabia, and Turkey would scramble to join the nuclear club. The

Nonproliferation Treaty (NPT) would collapse, unleashing a wave of nuclear proliferation around the globe.

AFF a2 Impact

Deal Bad

Iran deal leads to nuclear proliferation

Rogin 6/24/14 (Josh, writer for Bloomberg, “Clinton Defense Chief: Iran Deal Could Spark Proliferation”, <http://www.bloombergview.com/articles/2015-06-24/clinton-defense-chief-iran-deal-could-spark-proliferation>)/BW

Gulf Arab powers are likely to respond to President Barack Obama’s pending nuclear deal with Iran by developing their own nuclear programs, former Defense Secretary William Cohen said Wednesday. He said they don’t trust either the Iranians or the United States to protect their interests. “The administration’s intent was to have a counter-proliferation program. And the irony is, it may be just the opposite,” he told a meeting of Bloomberg reporters Wednesday morning. As Secretary of State John Kerry prepares to meet Iranian leaders for the final push toward a comprehensive nuclear deal with Iran, there’s growing angst in countries like Saudi Arabia, the United Arab Emirates, Qatar and Israel about the deal, which will leave Iran with significant uranium enrichment capabilities and may not give the international community the right to inspect all of Iran’s nuclear facilities. The administration argues that a deal with Iran will remove the need for other regional powers to pursue their own nuclear enrichment and weapons programs. Cohen said the region doesn’t see it that way. “Once you say they are allowed to enrich, the game is pretty much up in terms of how do you sustain an inspection regime in a country that has carried on secret programs for 17 years and is still determined to maintain as much of that secrecy as possible,” said Cohen, who was a Republican lawmaker from Maine before serving under President Clinton from 1997 to 2001. Other regional powers are further skeptical of the international community’s ability to enforce any deal with Iran because the Obama administration has lost credibility in the region, according to Cohen. He said America’s relationships in the region were damaged in 2013, when President Obama backed away from striking Syria after telling Gulf allies he would do so, even though the Assad regime had crossed his “red line” on chemical weapons. “It was mishandled and everybody in the region saw how it was handled. And I think it shook their confidence in the administration. ... The Saudis, the UAE and the Israelis were all concerned about that,” Cohen said. “They are looking at what we say, what we do, and what we fail to do, and they make their judgments. In the Middle East now, they are making different calculations.” Cohen acknowledged that without a nuclear deal, Iran could have the ability to expand its nuclear activities with no restrictions, leading to an even more dangerous situation for the U.S. and the region. He doesn’t agree with some lawmakers, such as Senator Tom Cotton, who argue that a military strike on Iran’s nuclear facilities could be a solution. Cohen said that if a deal is reached, there will be significant international momentum for implementing the deal and lifting sanctions against Iran. The drive to do business in Iran will be alluring, especially to European countries, who have been eager to return to Iran but have been held back by the U.S.-led sanctions. Iranian officials have said that if the U.S. is the only country left with sanctions on Iran, that would amount to America sanctioning itself. “I anticipate this deal will be done. I think Congress is going to be hard-pressed to reject it,” said Cohen. “Congress, the only chance it has to influence it is now, before it’s signed.” Cohen disagrees with those who believe that a nuclear deal will mollify Iran. He is skeptical that giving Iran large economic benefits will lead to significant reform in the Islamic Republic. “Most people that I know believe that Iran will continue to be a revolutionary country, and that’s what bothers all of the others in the region, that this is going to continue the expansion of power, that they will be at a disadvantage, and they can’t count on the United States,” he said. Overall, countries in the Middle East have lost confidence in the Obama administration, Cohen said, in part because the U.S. has failed to articulate a clear vision for America’s role in the world in the 21st century. That may not be resolved in the remainder of this administration. “There’s a lot of worry about U.S. leadership and what we’ll do next. You couple that with the Iran situation, and you could see there’s a lot of nervousness now about where we are,” he said. “That’s something the next president will have to deal with.”

Iran deal leads to global proliferation and hurts the economy

Yashar, 7/2/15 (Ari, writer for Israel Nation News, "Experts Warn Iran Deal Will Kill Nuclear Non-Proliferation",

<http://www.israelnationalnews.com/News/News.aspx/197588#.VaVjMRNViko//BW>

Foreign policy experts warned this week that if the US proves itself unable to enforce a hard line against Iran's pursuit of nuclear power, America will be rendered unable to oppose nuclear proliferation on a global scale. The experts were speaking at the Heritage Foundation on Tuesday, reports the Washington Free Beacon, in an event just a week ahead of the extended July 7 deadline for a nuclear deal between world powers and Iran over the latter's controversial nuclear program. "The fundamental problem is that we're giving ground on what has been a principle of US non proliferation policy for 70 years, which (views) the spread of enrichment and reprocessing to any country, even our allies, as a problem," said Matthew Kroenig, associate professor at Georgetown University. "What this Iran deal does is make an exception, not just for any country, but for Iran, a country that's continually cheating on its agreements. So in the wake of the deal, I think it becomes very hard for us to go to our allies and say, 'we trust Tehran with this technology, but we don't trust you.'" Brian Finaly, vice president of the Washington DC-based think tank Stimson Center, added to Kroenig's troubling assessment. "As we understand how the world is changing, it is certainly impacting how we manage the proliferation threat, and I believe that getting out in front of this, thinking beyond the limited ability of the state to control proliferation in the future, is going to be essential to successful non-proliferation efforts," warned Finaly. He explained that non-state actors such as multinational companies can play a role in preventing nuclear crises, noting on the conflict between India and Pakistan in the 1980s. "A group of very senior level executives from an array of companies got together and sent a very clear message to the Indian Prime Minister: 'this crisis is bad for business and if we decide to leave India, we will not return,'" Finlay said. That warning "had the ultimate effect of, I think, contributing significantly to the easing of nuclear tensions between the two countries, and it returned to semi-regular relations between the two countries," he added. Regarding economic incentives, experts have warned that the current sanctions regime against Iran has not been tough enough to have an effect, as the Iranian GDP grew 3% in 2014. Just this Monday Iranian officials announced that 13 tons of gold had been repatriated as part of sanctions relief, bringing the total in unfrozen assets since the November 2013 interim deal was signed to just under \$12 billion.

Deal causes runaway prolif—breakdown of non-proliferation treaty

Pletka 7/14 (Danielle Pletka; July 14 2015; vice president for foreign and defense policy studies at the American Enterprise Institute; "8 Unplanned Results of the Iran Deal"; Politico; www.politico.com/magazine/story/2015/07/eight-unplanned-results-of-the-iran-deal-120129.html?ml=tl_38_b) jskullz

4. The beginning of the end of the NPT Like any set of rules, the Nuclear Non-Proliferation Treaty is only as good as its members make it. Once, a country that hid behind the NPT to violate safeguards agreements and work on nuclear weapons faced the certainty of international punishment. That is what happened to North Korea. With this deal, the exact reverse is happening with Iran. After using the treaty to advance its nuclear weapons program, Iran is now being pardoned, rehabilitated and allowed to keep its nuclear infrastructure. We can expect other countries — especially those most worried about Iran's rising power in the Middle East — to emulate Iran in using the NPT as cover for advancing their own nuclear weapons programs.

Deal causes Israeli first strike—escalates to nuclear war

Worral 15 (Eric Worral; Apr 28 2015; Writer for Breitbart; “Israel Will Strike Iran First To Thwart Nuclear Attack”; Breitbart; <http://www.breitbart.com/big-government/2015/04/28/israel-will-strike-iran-first-to-thwart-nuclear-attack/>) jskullz

Israel is not in a pleasant situation. Every day, her arch enemy Iran draws closer to refining enough uranium to build 100s of nuclear weapons.¶ Every day the Iranian program becomes more difficult to dislodge – as the uranium is concentrated, the number of centrifuges required to complete the process decreases, allowing the remaining refining operation to be moved to smaller and more covert facilities.¶ America, ostensibly Israel’s ally, is rumoured to have ordered US warships to shoot down Israeli aircraft, should a strike on Iran appear to be in progress. According to Israeli newspapers, President Obama thwarted a planned 2014 Israeli attack against Iranian nuclear facilities, by threatening to shoot down the Israeli bombers.¶ America is currently sending additional warships to the Persian Gulf – ostensibly to blockade Iranian supply runs to rebels in Yemen, but if rumours of President Obama’s threat against Israel are correct, perhaps also to reinforce US firepower, should Israel decide to mount an attack against Iran.¶ There is no doubt an attack is on the drawing board – the Israeli Defence Force admitted they are training for an attack on Iran, in a recent interview with The Times of Israel.¶ Iran may pose a grave existential threat to Israel – at least Israel believes they do and they appear to have good reasons for their concerns. According to an Israeli report written in 2008, Iran regularly state that Israel will shortly be wiped from the face of the Earth.¶ Regardless of whether the Iranian threats are as bad as is claimed, or whether Iran actually means what they say, the Iranian nuclear programme will provide Iran with the means to fulfill this terrifying threat.¶ Iran is currently purchasing an advanced Russian air defence system – which will further complicate the job of attacking Iran, should Israel choose to mount an attack.¶ If Israel does decide to mount an attack against Iran, they will run a gauntlet – they will have to fly long distances, over hostile Syria, and other unfriendly countries. They will potentially face a massive counterattack from the growing American presence in the Persian Gulf. When they finally reach Iran, they will suffer even more casualties from the advanced Russian anti-aircraft systems, which will shortly be operational.¶ And when a handful of Israeli aircraft finally reach their targets, the surviving Israeli warplanes will have to somehow inflict sufficient damage on heavily armoured nuclear facilities, some of which are buried hundreds of feet underground, to prevent them from being repaired.¶ There is only one kind of bomb in Israel’s arsenal, which can fulfill this military requirement.¶ A weak Iran deal, if it is ratified, will in my opinion be a lot more than a diplomatic failure – for the reasons I have provided, I believe it may trigger a nuclear war.

Despite the nuclear deal, Iran is still belligerent

Tamara Cofman **Wittes, 7/14**, senior fellow and the director of the Center for Middle East Policy at Brookings, July 14, 2015 , “An Iran deal won’t stabilize the messy Middle East — but maybe Arab states can”, [//Zabner](http://www.brookings.edu/blogs/markaz/posts/2015/07/14-iran-nuclear-deal-us-middle-east-wittes?utm_campaign=Brookings+Brief&utm_source=hs_email&utm_medium=email&utm_content=20603985&_hsenc=p2ANqtz-8OoJpmi79Mwck0F_5tTOKCv1XJfIYeJ47JNQR5QW97ziIJXupWdf3uk6CVwG7J8s6yfOL7tId6NVq5eYPDMYrvARu3NA&_hsmi=20603985)

Iran's proclivity for regional meddling is longstanding, and the chaotic politics of the Arab world since 2011 has given the Islamic Republic unprecedented opportunities to insert itself into local politics in destabilizing ways. In my recent congressional testimony, and in remarks to the Herzliya Conference in Israel last month, I explained my view that Iran's regional troublemaking is likely to grow worse in coming years, regardless of a deal over the nuclear program. I said: In fact, whether there's a nuclear deal or not, I predict we will see a more aggressive approach by Iran in a host of arenas around the region, where the upheaval has given them greater opportunities than before. If there is a nuclear deal, the hardline elements within the Iranian regime, those most opposed to a deal, are also those with the greatest interest and investment in regional troublemaking. They are likely to use their ability to make noise regionally to try and compensate for the power disadvantages they see inherent in a deal — and they are likely to have a green light from the Supreme Leader to do so, because he will want to compensate them for their unhappiness with a deal. If there's no deal on the nuclear issue, however, then the Iranian leadership will want to scale up its regional assertions of power for a different reason: in order to solidify or even strengthen its current regional power position in advance of whatever tougher American / Israeli / Sunni Arab efforts it anticipates to contain it. I stand by that prediction. While sanctions relief will give Iran considerably more resources, it has never lacked motivation for its assertions of power, and it continues to face ample opportunity. As my Herzliya panel partner, Meir Javandefar, revealed at the conference, Iran's sanctions-induced economic hardship in recent years has not prevented Iran from spending billions of dollars and its own soldiers' lives keeping Bashar al-Assad in power. So yes, Iranian meddling across the region will get worse in the wake of an Iran deal— but it was going to get worse anyway. The real question about Iran's regional behavior is not, therefore, whether a nuclear deal is too dangerous for the Middle East because it will give Iran more ability to make trouble. Trouble, in case you haven't noticed, is not lacking in the Middle East, and Iran is one major source (though not, to be sure, the only one). The real question is what the United States and America's Arab allies are prepared to do about it. Note that, in my view, America's Arab allies have an essential role to play here, independent of the United States. Read on to see what I mean.

The deal changes nothing

Suzanne **Maloney, 7/15**, interim deputy director of the Foreign Policy program at the Brookings Institution and a senior fellow in the Brookings Center for Middle East Policy, July 15, 2015, Brookings, "For the U.S. and Iran, a nuclear accord upends old assumptions", http://www.brookings.edu/blogs/markaz/posts/2015/07/15-iran-deal-diplomacy-sanctions-rouhani-beginning?utm_campaign=Brookings+Brief&utm_source=hs_email&utm_medium=email&utm_content=20624082&_hsenc=p2ANqtz-9SEY60r2pRxxjZc8Zu75XmCIZT-sdnEWMIAMc36o-qhMilxtyiusrW5bawoJ6D5CCKUxda4qPpcueDZOOFQw4TxorWVg&_hsmi=20624082
//Zabner

But though the negotiating process itself has ended, the factors that undermine its relationship with the world have not. The deal will not put an end to the dispute over Iran's nuclear ambitions. The agreement will now undergo an excruciating dissection in both capitals, with every word of the 159-page English language text probed for signs of leniency or capitulation. Then, if it survives legislative scrutiny (as it is likely to do), a laborious implementation process will ensure that the issue remains a major preoccupation for each of the states that is a party to the agreement, as well as a source of continuing frictions and suspicions between Washington and Tehran. Nor do Washington's other differences with Tehran appear to be nearing a more auspicious conclusion. Only the most credulous optimist can assert that a nuclear deal will somehow produce an Iranian epiphany about the horrific and destabilizing consequences of its assistance to Bashar Al Assad. Tehran's approach to extending its regional influence, via the funding and direction of violent proxies across the region, will continue to exacerbate instability in Iraq, Yemen, Lebanon, and beyond, while fueling the geostrategic rivalry with Saudi Arabia and the related

sectarian tensions. This week's resumption of a trial of a Washington Post reporter underscores that Iran's unjust detention of American citizens for months or even years will likely continue as well. The same streets where Iranians celebrated a deal yesterday were the scenes of anti-American and anti-Israeli protests, where both flags were burnt in effigy, only a few days ago. Perhaps most importantly, as I'll argue in a follow-up piece tomorrow examining the uncertain prospects for new beginnings, the underlying logic of Islamic regime is unlikely to be altered significantly by the resolution of the nuclear impasse. The nuclear agreement was a transactional decision for Iranian leaders, not a transformational one, and the odds against the moderation of the Iranian system remain overwhelmingly stacked against the establishment of the revolution's elusive Thermidor.

Turn—the Iran bill is problematic and shouldn't pass—concedes too much nuclear power to Iran

Edelman and Takeyh 7/17, Eric Edelman, undersecretary of defense for policy from 2005 to 2009, is a scholar in residence at Johns Hopkins School of Advanced International Studies. Ray Takeyh is a senior fellow at the Council on Foreign Relations., “On Iran Congress should just say no,” Washingtonpost, 7/17/15, http://www.washingtonpost.com/opinions/on-iran-congress-should-just-say-no/2015/07/17/56e366ae-2b30-11e5-bd33-395c05608059_story.html

After two years of painstaking diplomacy, the Obama administration has finally concluded a nuclear agreement with Iran. A careful examination of the Joint Comprehensive Plan of Action (JCPOA) reveals that it concedes an enrichment capacity that is too large; sunset clauses that are too short; a verification regime that is too leaky; and enforcement mechanisms that are too suspect. No agreement is perfect, but at times the scale of imperfection is so great that the judicious course is to reject the deal and renegotiate a more stringent one. The way for this to happen is for Congress to disapprove the JCPOA. Prior to the 2013 interim accord, the Obama administration's position rested on relatively sensible precepts. The United States insisted that, given Iran's practical needs, it should only have a symbolic enrichment program of a few hundred centrifuges, and that the Islamic republic could not be considered a member of the Nuclear Non-Proliferation Treaty (NPT) in good standing until it secured the trust and confidence of the international community in the peaceful nature of its program. These were not just U.S. aspirations but also the position of members of the “P5+1” powers — the five U.N. Security Council members plus Germany. These prudent parameters were overtaken by a cavalcade of concessions that began in 2013. The administration soon brandished the notion of a one-year breakout period that would allow Iran to maintain a substantial enrichment apparatus, in effect abandoning the goal of preventing development of an Iranian nuclear capability in favor of managing its emergence. The much heralded one-year breakout period will only shrink over time as the JCPOA concedes that Iran can begin phasing out its primitive centrifuges in favor of more advanced ones. Even more troublesome is the agreement's stipulation that after its limits expire, the “Iranian nuclear program will be treated in the same manner as that of any other non-nuclear weapon state party to the NPT.” This means that Iran can proceed with the construction of an industrial-sized nuclear infrastructure similar to that of Japan. At that time, Iran could easily sprint to the bomb without risking timely detection. In the coming weeks, the administration will justify its concessions by professing that the agreement establishes an unprecedented inspections regime. The verification measures of the JCPOA rely on “managed access” whereby the International Atomic Energy Agency has to first offer credible evidence of untoward activity and then negotiate with Iran for timely access to the suspect facility. This certainly falls short of the inspection modality pledged by Energy Secretary Ernest Moniz, the administration's chief nuclear physicist, who said in April that “we expect to have anywhere, anytime access.” Under the current arrangement, the likely response to Iranian mischief will be prolonged negotiations mired in arcane detail over at least a three-week period. In as little as a few months, Iran will for all intents and purposes no longer be a sanctioned country. Although elaborate and protracted procedures are in place for the re-imposition of the U.N. Security Council sanctions resolutions, the economic sanctions imposed by the European Union and the United States — always the most essential ones — will be rolled back quickly and will not be easily reconstituted. The European oil embargo, international banking restrictions and efforts to segregate Iran from the global economy will be suspended. And the notion that U.S. business will be left out of the commercial march to Iran because congressionally imposed U.S.

sanctions will remain in place is itself undermined by a loophole in the deal allowing “non-U.S. entities that are owned or controlled by a U.S. person to engage in activities with Iran that are consistent with this JCPOA.” **The JCPOA stands as one of the most technologically permissive arms-control agreements in history.** All is not lost, however, and with sensible amendments the accord can be strengthened. The United States should return to the table and insist that after the expiration of the sunset clause, the P5+1 and Iran should vote on whether to extend the agreement for an additional 10 years. A majority vote every 10 years should determine the longevity of the agreement, not an arbitrary time-clock. Further, the JCPOA has usefully stressed that all of Iran’s spent fuel from its heavy-water reactor will be shipped out permanently. A similar step should be taken with Iran’s enriched uranium. The revised agreement should also limit Iran to the first-generation centrifuges and rely on “anytime, anywhere access.” These and other such measures could help forestall an Iranian bomb and stem the proliferation cascade in the Middle East that this agreement is likely to trigger. At this late date, the only way that the agreement can be reopened and amended is for Congress to first reject it. At that time, the Obama administration or its successor can return to the table and confess that given the absence of a bipartisan foundation of support in the United States, **key provisions of the agreement have to be reconsidered.** At the end of such a process, the United States may yet be able to obtain a viable accord that reliably alters Iran’s nuclear trajectory.

Bomb Good

Iran bomb good—no prolif or terrorism, and prevents escalatory war with Israel and other states

Waltz 12 (Kenneth N. Waltz; July/Aug 2015; Political Science prof at Columbia and one of the single most influential international relations scholars; Why Iran Should Get the Bomb; Foreign Affairs <https://www.foreignaffairs.com/articles/iran/2012-06-15/why-iran-should-get-bomb>)
jskullz

The third possible outcome of the standoff is that Iran continues its current course and publicly goes nuclear by testing a weapon. U.S. and Israeli officials have declared that outcome unacceptable, arguing that a nuclear Iran is a uniquely terrifying prospect, even an existential threat. Such language is typical of major powers, which have historically gotten riled up whenever another country has begun to develop a nuclear weapon of its own. Yet so far, every time another country has managed to shoulder its way into the nuclear club, the other members have always changed tack and decided to live with it. In fact, by reducing imbalances in military power, new nuclear states generally produce more regional and international stability, not less. ¶ Israel’s regional nuclear monopoly, which has proved remarkably durable for the past four decades, has long fueled instability in the Middle East. In no other region of the world does a lone, unchecked nuclear state exist. It is Israel’s nuclear arsenal, not Iran’s desire for one, that has contributed most to the current crisis. Power, after all, begs to be balanced. What is surprising about the Israeli case is that it has taken so long for a potential balancer to emerge. ¶ Of course, it is easy to understand why Israel wants to remain the sole nuclear power in the region and why it is willing to use force to secure that status. In 1981, Israel bombed Iraq to prevent a challenge to its nuclear monopoly. It did the same to Syria in 2007 and is now considering similar action against Iran. But the very acts that have allowed Israel to maintain its nuclear edge in the short term have prolonged an imbalance that is unsustainable in the long term. Israel’s proven ability to strike potential nuclear rivals with impunity has inevitably made its enemies anxious to develop the means to prevent Israel from doing so again. In this way, the current tensions are best viewed not as the early stages of a

relatively recent Iranian nuclear crisis but rather as the final stages of a decades-long Middle East nuclear crisis that will end only when a balance of military power is restored. ¶ UNFOUNDED FEARS ¶ One reason the danger of a nuclear Iran has been grossly exaggerated is that the debate surrounding it has been distorted by misplaced worries and fundamental misunderstandings of how states generally behave in the international system. The first prominent concern, which undergirds many others, is that the Iranian regime is innately irrational. Despite a widespread belief to the contrary, **Iranian policy is made not by "mad mullahs" but by perfectly sane ayatollahs who want to survive** just like any other leaders. Although Iran's leaders indulge in inflammatory and hateful rhetoric, they show no propensity for self-destruction. It would be a grave error for policymakers in the United States and Israel to assume otherwise. ¶ Yet that is precisely what many U.S. and Israeli officials and analysts have done. Portraying Iran as irrational has allowed them to argue that the logic of nuclear deterrence does not apply to the Islamic Republic. If Iran acquired a nuclear weapon, they warn, it would not hesitate to use it in a first strike against Israel, even though doing so would invite massive retaliation and risk destroying everything the Iranian regime holds dear. ¶ Although it is impossible to be certain of Iranian intentions, it is far more likely that if Iran desires nuclear weapons, it is for the purpose of providing for its own security, not to improve its offensive capabilities (or destroy itself). Iran may be intransigent at the negotiating table and defiant in the face of sanctions, but it still acts to secure its own preservation. Iran's leaders did not, for example, attempt to close the Strait of Hormuz despite issuing blustery warnings that they might do so after the EU announced its planned oil embargo in January. The Iranian regime clearly concluded that it did not want to provoke what would surely have been a swift and devastating American response to such a move. ¶ Nevertheless, even some observers and policymakers who accept that the Iranian regime is rational still worry that a nuclear weapon would embolden it, providing Tehran with a shield that would allow it to act more aggressively and increase its support for terrorism. Some analysts even fear that Iran would directly provide terrorists with nuclear arms. The problem with these concerns is that they contradict the record of every other nuclear weapons state going back to 1945. History shows that when countries acquire the bomb, they feel increasingly vulnerable and become acutely aware that their nuclear weapons make them a potential target in the eyes of major powers. This awareness discourages nuclear states from bold and aggressive action. Maoist China, for example, became much less bellicose after acquiring nuclear weapons in 1964, and India and Pakistan have both become more cautious since going nuclear. There is little reason to believe Iran would break this mold. ¶ As for the risk of a handoff to terrorists, no country could transfer nuclear weapons without running a high risk of being found out. U.S. surveillance capabilities would pose a serious obstacle, as would the United States' impressive and growing ability to identify the source of fissile material. Moreover, countries can never entirely control or even predict the behavior of the terrorist groups they sponsor. Once a country such as Iran acquires a nuclear capability, it will have every reason to maintain full control over its arsenal. After all, building a bomb is costly and dangerous. It would make little sense to transfer the product of that investment to parties that cannot be trusted or managed. ¶ Another oft-touted worry is that if Iran obtains the bomb, other states in the region will follow suit, leading to a nuclear arms race in the Middle East. But the nuclear age is now almost 70 years old, and so far, fears of proliferation have proved to be unfounded. Properly defined, the term "proliferation" means a rapid and uncontrolled spread. Nothing like that has occurred; in fact, since 1970, there has been a marked slowdown in the emergence of nuclear states. There is no reason to expect that this pattern will change now. Should Iran become the second Middle Eastern nuclear power since 1945, it would hardly signal the start of a landslide. When Israel acquired the bomb in the 1960s, it was at war with many of its neighbors. Its nuclear arms were a much bigger threat to the Arab world than Iran's program is today. **If an atomic Israel did not trigger an arms race then, there is no reason a nuclear Iran should now**. ¶ REST ASSURED ¶ In 1991, the historical rivals India and Pakistan signed a treaty agreeing not to target each other's nuclear facilities. They realized that far more worrisome than their adversary's nuclear deterrent was the instability produced by challenges to it. Since then, even in the face of high tensions and risky provocations, the two countries have kept the peace. Israel and Iran would do well to consider this precedent. If Iran goes nuclear, Israel and Iran will deter each other, as nuclear powers

always have. There has never been a full-scale war between two nuclear-armed states. **Once Iran crosses the nuclear threshold, deterrence will apply, even if the Iranian arsenal is relatively small. No other country in the region will have an incentive to acquire its own nuclear capability, and the current crisis will finally dissipate, leading to a Middle East that is more stable than it is today.**

Defense

Iran won't launch a nuke—only interested for defensive purposes

Shanahan 15 (Roger Shanahan; Jan. 8th 2015; ANU's National Security College and is a non-resident fellow at the Lowy Institute for International Policy; "Would Iran Start a Nuclear War?"; National Interest; <http://nationalinterest.org/blog/the-buzz/would-iran-start-nuclear-war-11995>) jskullz

¶ The language is dramatic but the posts lack much by the way of reasoned argument. Don't get me wrong, I'm a devoted counter-proliferator and think that a nuclear-armed Iran should be stopped simply to avoid other states seeking to do the same. But I disagree with the view advocated by Andy Nikolic and others that a nuclear-armed Iran will seek to use those weapons to become more regionally influential or to launch them against Israel.¶¶ (Recommended: 5 Iranian Weapons of War Israel Should Fear) ¶¶ The main reason I oppose such views is because they lack intellectual rigour. Firstly, simply having nuclear weapons doesn't make anyone more influential. Pakistan and India are no more influential following their acquisition of a nuclear capability than they were before it. Influence comes through a range of media, and Iran has always understood that in many ways it's an outsider in the region—ethnically, linguistically and religiously different from its Arab and Turkic neighbours. Hence its reliance on allies and proxies to exert influence—and that wouldn't change if it became a nuclear-capable country.¶¶ Second, Andy's argument is predicated on Iran's seeing a nuclear weapon as simply an offensive weapon. The reality is that nuclear weapons are often the ultimate defensive weapon. Tehran could look east and see how Islamabad's nuclear capability has stopped it from going to war with India, and it could look west and see how Tel Aviv's undeclared capability has deterred its neighbours from invading it. Its nuclear capability hasn't stopped conflict or guaranteed military success for Israel, as it has faced two intifadas, invaded Gaza, had to withdraw from southern Lebanon and fought a short but bloody war against Hizbullah in 2006. But none of those have been existential threats.¶¶ (Recommended: Five Israeli Weapons of War Iran Should Fear) ¶¶ The argument follows that Tehran sees a nuclear capability as the ultimate shield, rather than as a potential sword. Having been invaded by the British and the Soviets in World War II, and then suffering through eight years of a war with Iraq backed by its Arab neighbours and some in the West that cost hundreds of thousands of lives, it's easy to see the logic of Tehran viewing a nuclear weapon as the ultimate shield.¶¶ In order to protect the Islamic Revolution the leadership seeks to guarantee its survival from external attack first and foremost and a nuclear weapon would do that. Any preemptive use of such weapons would be nearly guaranteed to receive more in return and hence end the rule of those charged with ruling in accordance with God's will. Again, there seems to be no reason why the Supreme Leader would seek to do such a thing. Some have argued that a strain of Shi'a millenarianism would see Iran loose off volleys of nuclear weapons in order to set the conditions to hasten the arrival of the Awaited Imam. There's no explanation of how that would follow, nor evidence of any support for such a concept by the Supreme Leader, who is in charge of Iran's nuclear file.¶¶ (Recommended: 5 Israeli Weapons of War ISIS Should Fear) ¶¶ Andy claims that Iran exhibits "a determination to leverage the anticipated benefits of that [nuclear] investment" and that it seeks a nuclear capability "because of the prestige, power and authority which Iran believes such weapons would give it, both regionally and beyond." What he doesn't do is explain exactly what he sees those benefits to be, nor how he sees Tehran achieving power and authority as a nuclear state. I agree that Tehran seeks regional influence commensurate with how it views its rightful place in the international system. But I don't see how having a nuclear capability achieves that other than by safeguarding it from existential threats. Rather, I'd argue that Iranian national power, and hence that of the Islamic Revolution, will be furthered by leveraging its enormous potential economic and human capabilities. In many ways that's what its Gulf neighbours truly fear.¶

Censorship Good—Russian Scenario

1NC Russian Regime Collapse

Russian Internet Censorship Suppress Dissent and Create Support for Putin's Regime

Pfeifer 15 (Ezekiel Pfeifer, a journalist with seven years of experience covering international politics, business, and culture, in Moscow, Russia. He is also the director of IMR (Institute of Modern Russia) international relations division. 'Why doesn't Russia Censor The Internet like China' <https://www.linkedin.com/in/ezeikielpfeifer>)

Last April, Russian president Vladimir **Putin's** spokesman Dmitry Peskov gave an interview on state TV in which he talked about the president's use of technology. Peskov said the president does not have a **mobile phone** ("Putin doesn't use smileys—people have to call and report to him."), but **he does actively use the Internet.** This was something new: in 2011, Peskov said that Putin rarely used the Internet, in contrast to then-president Dmitry Medvedev, whose use of social media and enthusiasm for technology became one of his best-known (and most widely ridiculed) traits. Peskov said that Putin would not be joining Medvedev in creating personal accounts on Facebook or Twitter, because "There is no need, for now... **he faces no problems whatsoever with delivering his point of view to people.**" Why is it that Putin has no problem getting his message out? The reason, of course, is that **most of what Russians see and hear is Putin's point of view and Putin's point of view only.** Ninety percent of Russian citizens watch the TV news, **and television in the country has been monopolized by state-controlled channels, which primarily show Putin,** Putin, Putin. But Russians are also increasingly getting their news online. A poll last June showed that 24 percent of Russians read about current events on the Internet, up from just 9 percent in 2009. Overall use of the Web is also on the rise: last October, a poll showed that 65 percent of Russians use the Internet, an increase from 48 percent in 2011. From Peskov's comments, it can be inferred that as **the Internet becomes more widely used and begins to rival television in its reach, the Kremlin will attempt to make Putin's voice one of the only voices heard there as well.** In order to prepare for this scenario, **the Russian government is building the infrastructure it would need to stifle dissent online more broadly than it already does.** This can be thought of as scaffolding for Russia's own version of the Great Chinese Firewall. The Kremlin has already built a much shorter firewall than China operates, blocking select materials, such as the blog of opposition leader Alexei Navalny. It also uses hybrid tactics to eliminate unwanted online resources and combat what it sees as threats to Putin's authority, such as Western news reports and critical political commentators. But while the Russian government is steadily constructing the scaffolding for a taller firewall, it has shown no intention of matching the height of China's defensive structure, for a variety of reasons. As with television, **Putin recognizes the massive potential impact of the Internet.** Just last month, at a meeting of a pro-Kremlin Internet lobby group, Putin said "in the near future, the influence of these technologies"—referring to a range of online startups presented to him—"will be simply enormous." He's almost certainly wary of the possibilities. As a KGB officer **in the 1980s, he watched how the freer information flows** of glasnost **helped bring about the collapse of the Soviet Union, a fate that he clearly wants his own authoritarian regime to avoid.** Part of what makes the Internet so potentially virulent in Putin's eyes is its Western origins—last year he called it a "CIA project." At a meeting of the Federal Security Service last month, Putin ordered officers to continue their efforts to "rid Russian cyberspace of illegal and criminal materials" and to "more actively use modern technologies for this purpose." (It should be noted that Putin also said he was "not speaking of limiting online freedom." He said people should not be prevented from "communicating online and posting legal, permissible, and proper information.") **Putin's fear-mongering about the dangers lurking on the Internet seems to have had a major impact on public opinion: a recent study showed that 49 percent of Russians think the Internet should be censored and 42 percent think foreign countries are using the Internet against Russia.** Over the last three years, the Russian government has enacted more and more onerous Internet restrictions, and has justified them mostly by citing security concerns. Under a law passed last year, foreign Internet companies will be required to store Russians' personal data on servers inside the country beginning in September 2015, due to state concerns about the West using such information to aid in anti-Kremlin conspiracies. There are now four different state Internet blacklists, two of which are ostensibly related to security: a list of web pages containing extremist materials, and a list of pages containing calls for unsanctioned gatherings. (The other two blacklists contain web pages that violate copyright rules and pages containing child pornography or information about suicide methods or illegal drugs.) **In the last six months, officials have floated various new measures that would further strengthen state control of the RuNet** for security reasons. **These include creating a "kill switch," which would cut Russia off from the World Wide Web** in an emergency, and bringing the .ru and .pф domains completely under state management. These measures have not become laws but were likely floated

as a way for the Kremlin to gauge the reaction of the public and elites. No matter what the Kremlin's economic calculations are, **chances are it doesn't feel the need to crack down harder online in order to contain political threats, because the opposition is already so weakened.** One other area of concern for the Kremlin is online media and commentary, and it has taken steps to restrict some websites it doesn't like and to neutralize the influence of others. In a few cases, the government has simply blocked access to whole websites—opposition media Kasparov.ru, Grani.ru, and Ej.ru—but more often it uses subtler tools. Recent exposés have revealed the work of infamous pro-Kremlin Internet trolls, who are paid to leave huge numbers of comments on Western news websites and social media pages criticizing the Russian opposition and praising Kremlin policies. Another tactic has been cooption: In recent years, highly influential RuNet sites such as the social network VK and news website Lenta.ru were brought under the control of Putin-friendly managers, after previously being known for their independence. In Russia's parliament, lawmakers passed a measure requiring bloggers with over 3,000 subscribers to register as media outlets, making them targets of stricter regulation. A recent leak of messages attributed to a young Kremlin official revealed that the government also has sway over Internet companies that it does not control directly. In one of the leaked messages, the official, Timur Prokopenko, tries to help a Kremlin-friendly movie star deal with a scandal involving Russian Internet giant Yandex. Prokopenko tells the star to get in touch if he needs help, saying, "We're close with Yandex right now, they're very attentive to us." Another leaked message contains an exchange between Prokopenko and the general director of online news agency RBC, Nikolai Molibog (who confirmed the authenticity of the leaked messages). In the exchange, Prokopenko notes his displeasure at a report about a rally for the federalization of Siberia, to which Molibog responds that he will "be more careful." The leak underscores the difficulty inherent in trying to limit the influence of the Internet, however. After all, the messages were susceptible to being hacked because they were online—many government officials use online communication just like the rest of us, because it's so convenient. The same group of hackers who released the Prokopenko messages, known as Anonymous International, also leaked emails of Deputy Prime Minister Arkady Dvorkovich last year, and the group says it has two terabytes of data, much of it files about people "close to Vladimir Putin." Had this occurred in China, the government would likely have blocked all news reports about the leaked messages. Why didn't the Russian government do this? Part of the explanation may be logistical. China reportedly employs over two million people to monitor online activities, manpower that would be very difficult for Russia to match. Even as a percentage of the population, the equivalent number in Russia would be over 200,000, and the government likely cannot spend the money necessary to support that number of Internet monitors. The Kremlin has successfully forced businesses to take on some of the expense and logistics of enforcing Internet restrictions, by requiring the installation of Internet filtration technology. But recently, Internet providers balked at the expense of a new filter proposed by lawmaker Yelena Mizulina aimed at protecting children from certain online materials, and the initiative has been shelved. The overall economic impact of blocking large portions of the Internet is likely also a concern for the Kremlin. In China, the blockage of widely used resources like Gmail is taking a greater and greater toll on the business environment. Given the current sanctions by the West and the low price of oil, Russia can ill-afford to make conditions for doing business even worse by barring the use of popular websites. The Kremlin might think such damage can be offset by the economic opportunities presented by international isolation. If companies like Google, Facebook, and Twitter abandon the Russian market due to the near-impossible task of storing Russians' data on local servers, the Kremlin might hope the vacuum will be filled by domestic equivalents like Yandex and VK. Indeed earlier this month, Russia's communications minister presented a plan to boost support for Russian software companies as part of a drive to increase domestic production of all manner of goods. No matter what the Kremlin's economic calculations are, chances are it doesn't feel the need to crack down harder online in order to contain political threats, because the opposition is already so weakened. This is partly due to the increase in censorship that occurred after the mass political protests of 2011–2012. Over the past year, since the Ukraine crisis began, there has been another uptick in Internet censorship as well as online propaganda, due to state paranoia about the possibility of a Maidan-like revolution overthrowing the Putin regime. **So far, these efforts have been effective politically, helping to produce record-high approval ratings for Putin. The scathing anti-Western propaganda and the vitriol produced by pro-Kremlin trolls create an atmosphere of intimidation that** security analyst Andrei Soldatov says **is the central feature of the Kremlin's system for controlling the Internet.** In other words, the government doesn't need to block a huge amount of online material, because it effectively intimidates people into not posting things they otherwise might. A recent government statement banning a popular type of meme is a prime example of this strategy at work. No one expects the government to actually root out every single one of these memes and order them deleted, but people will likely think twice about posting them now. This fear of getting in trouble, either with the law or with peers, neighbors, or family, keeps people quiet. It's the same principle that led Soviet citizens to avoid saying controversial things in case the KGB was listening or neighbors were eavesdropping. But this constant spooking of people may not suffice in the future. If the economy continues to worsen and political dissent rises, the Kremlin will likely combine this intimidation with more blunt methods, like building up its Internet firewall. Political developments over the next few years will determine just how high the firewall will go, and only a successor to Putin is likely to consider knocking down the wall and the scaffolding altogether.

Internet Liberalization Facilitate Dissent and Anti-Regime Protest

Filder 12 (the Doctor of Philosophy degree in Political Science in the Graduate College of The University of Iowa. "Dissent in digital: the Internet and dissent in authoritarian states"
<http://ir.uiowa.edu/cgi/viewcontent.cgi?article=3240&context=etd>)

Does **the Internet facilitate anti-regime dissent within authoritarian states?** I argue that **the Internet fosters dissent mobilization through three factors: distance, decentralization and interaction. First, the Internet fosters dissent mobilization by allowing protesters to communicate relatively cheaply and instantaneously over great distances.** While other communication mediums also reduce distance costs, **the second factor, decentralization, allows dissenters to use the Internet to evade state controls and reduces the state's ability to restrict information flows. Third, the Internet's**

Interactive nature allows users to both become consumers and producers of information. Interactivity also fosters trust between users that can evolve into offline action. However, the empirical record consists almost entirely of open sourcenews reporting and qualitative studies, and there are few clear theoretical links between the traditional dissent and repression literatures and recent Internet mobilization theories. My goal in this project is to place a generalizable theory of Internet-mediated dissent within traditional mobilization context and more recent communication, computer science and legal literatures. I frame my theory of Internet mediated dissent through three components. The first component is Internet access as a mobilizing structure, in which I posit that Internet access creates conditions for social mobilization that are difficult for regimes to counter. The second component is the effect of Internet censorship on Internet-facilitated dissent. For the third theoretical component, I assess that despite the type of censorship, increased Internet use eventually overwhelms the regime's capacity to censor information. I test my theoretical components through a series of large N cross national time series negative binomial regressions spanning 1999-2010. In the first test, I find that increased Internet access increased the likelihood of protest in non-democratic states. Results of the second tests are mixed: technical censorship has no effect on protest, soft controls decreased incidence of protest, and combined technical and soft programs increase the likelihood of protest, albeit the substantive effect is slight. In the third test, I hypothesize that Internet use eventually crosses a user threshold after which censorship is no longer effective. The results of the third test suggest that censorship is not effective regardless of Internet access levels. However, the influence of Internet use on protest tapers off once a specific threshold is reached. The dissertation proceeds as follows: in Chapter 2, I present literature review that frames my research question within previous empirical work. Next, in Chapter 3 I propose and illustrate my theory of Internet-mediated dissent. In Chapter 4, I test whether or not incidents of anti-regime protest increase as Internet use increases inside non-democratic states. I build on these results in Chapter 5, in which I test whether technical filters, soft controls or a combination of methods decrease the likelihood of protest inside non-democratic states, followed by a test for whether increasing Internet use overwhelms censorship programs. Finally, in chapter 6 I summarize my findings, discuss data complications, offer ideas for future research, and discuss the implications of this project.

Russian Collapse would lead to Instability, Economic Collapse, Refugee, and Bloodshed- that would Spillover to Eastern Europe

Motyl 15 (ALEXANDER J. MOTYL is professor of political science at Rutgers University-Newark, as well as a writer and painter. He served as associate director of the Harriman Institute at Columbia University from 1992 to 1998. A specialist on Ukraine, Russia, and the USSR, and on nationalism, revolutions, empires, and theory. "Preparing for the Imminent collapse of Russia" <http://www.worldaffairsjournal.org/users/alexander-j-motyl>)

A just-published report by Russia's premier political analyst, Lilia Shevtsova, has important implications for the post-Soviet states in general and Ukraine in particular. Titled "Russia XXI: The Logic of Suicide and Rebirth," the report was released by the Moscow Carnegie Center in January 2013. Shevtsova, who together with democratic reformer Grigory Yavlinsky shares the distinction of having been born and raised in the West Ukrainian city of Lviv, chairs the center's Russian Domestic Politics and Political Institutions Program and is the author of, among many other books, Putin's Russia and Russia—Lost in Transition. When Shevtsova speaks, Western policymakers and academics listen—and post-Soviet dictators should listen. XXI" report has good news for democrats and well-wishers of Russia: Vladimir Putin's days as Russia's dictator are numbered. According to Shevtsova, "The Russian system is beginning to decay. It cannot sustain the crumbling status quo, nor can it be certain of finding a new incarnation for itself. The only real questions are what stage of decay the system is in, whether the agony of its demise has already started, and, if so, how long it will last." To be sure, the system still has some resources, if not to revive itself, then to draw out its death, and that survival instinct could take a nasty, even bloody, form." That last sentence suggests that the demise of Putin's fascistoid regime could take on nasty forms with profoundly deleterious consequences for Russia and Russians: The system no longer has adequate resources to manage society through means of mass coercion and force; the resources required for that are being quickly depleted. By opting for harsher management instruments, the regime will significantly truncate its

own support base. **By suppressing the relatively moderate opposition**, which is trying to express itself openly and constitutionally, and by rejecting constitutional rights and freedoms, **the Kremlin itself will breed a radical and destructive opposition** that will act clandestinely and opt for violent methods. It is the Kremlin that is shoving these differences of opinion and opposing viewpoints into a revolutionary niche. **In its attack on pluralism, the regime** is not only radicalizing the conflict and accelerating the political cycle, it is also **reducing the chances of reaching an agreement between the opposition** and a part of the ruling elite. As it tries to shift responsibility for the use of force to all of the elite, the Kremlin impairs the chances for the formation of a pragmatic wing ready for a peaceful exit from the Russian system. No less serious is the fact that the current ruling elite, feeling that it has been cornered and apparently beginning to understand the nature of the challenges, has started to consciously pursue a policy that will deepen the degradation of society, preserve its atomization, and provoke ethnic and social hatreds. This is the goal of the Kremlin's propaganda and policy: to prevent society's consolidation against the authorities and to provoke conflicts and tensions that make the authorities the arbitrator. If this policy is successful, Russia is doomed. In order to forestall such a dire outcome, says Shevtsova, it is imperative for the democratic opposition to get its act together as soon as possible: The agenda for the upcoming political season contains a few objectives. One of them is consolidating the opposition and formulating an agenda that is responsive to the challenges posed by a more repressive regime. Another objective is integrating political and socioeconomic demands. Yet another is uniting all of the opposition factions **and the moderates within the system ready for change under the banner of universal democratic demands and the peaceful transformation of the system**. The fast-paced events of the day and the degradation of the system may call for some ad hoc changes to the agenda, but one objective remains paramount under any circumstances: the pledge by all participants in the political process to renounce personalized power and to step down from positions of power in case of electoral defeat. This has never happened in Russian history. If Russia finally manages to do it, it will have reached its "end of history" and the beginning of a new one. Note that Shevtsova's analysis could be applied, word for word, to Ukraine, Belarus, Kazakhstan, and a number of other dysfunctional post-Soviet authoritarian regimes. Just as these regimes emerged from similar political and economic circumstances that may loosely be termed the "Soviet and post-Soviet legacy," so, too, these regimes are likely to break down, collapse, or crack up for the same reasons, the primary one being their systemic unsustainability. Moreover, just as these regimes emerged pretty much at the same time, so, too, they are likely to vanish at the same time. Indeed, one can easily imagine that **the collapse of** any one of them—and especially of **Putin's regime—will immediately have spillover effects** in the others, **producing a chain reaction of regime breakdowns similar to the collapse of communism** that swept East Central Europe in the course of six months in 1989. Domino theory redux, anyone? As Shevtsova warns us, **Russia's collapse** could be peaceful and lead to democratic consolidation or it **could be bloody and spell Russia's doom**. Exactly the same outcomes face post-Yanukovich Ukraine, post-Lukashenko Belarus, and post-Nazarbayev Kazakhstan. It is conceivable that we'll witness, within the next five or so years, a wave of democratic transitions in the entire post-Soviet space or a wave of bloody breakdowns. The former scenario would be wonderful, but, as Shevtsova says, it can happen if and only if the democrats prepare for it accordingly. **The latter scenario—breakdown—would be a disaster** for everyone concerned. Its consequences—**instability, economic collapse, refugees, bloodshed—would definitely spill over into East Central Europe** and, despite the iron curtain set up by the Schengen-zone countries, into the core of the European Union as well. Smart Western policymakers might consider asking themselves whether they're doing enough to prevent that doomsday scenario from happening. The wrong way to proceed is to try to prop up doomed regimes, even if they export gas. The right way is to start working with the democratic oppositions in preparation for the day the dictators disappear. It's too late for the regimes in Russia, Belarus, and, probably, Kazakhstan to change: they've been around for too long and they're too entrenched. It may not be too late for the significantly younger and less entrenched Yanukovich regime to try to change its spots and avoid an ignominious end. All Yanukovich need do is free Yulia Tymoshenko and Yuri Lutsenko, sell his palatial estates outside Kyiv, tell his son Sasha to go back to dentistry, fire the thuggish Minister of Education Dmitri Tabachnik, and retire before the 2015 presidential elections. Oh, and read Shevtsova's excellent report now, when he could learn a thing or two about survival—and not several years from now, when he's in the slammer or on the lam.

1NC Russian Terrorism

The Threat of Terrorism is high
