Stewart '14 [Scott, supervisor for Stratfor's analysis of terrorism and security issues, former special agent with the U.S. State Department for 10 years and was involved in hundreds of terrorism investigations, "Examining the Terrorist Threat from America's Southern Border," July 24, https://www.stratfor.com/weekly/examining-terrorist-threat-americas-southern-border]

Changes in Terrorist Dynamics Another factor to consider is the changes in the way militant groups have operated against the United States since 9/11. Because of increased counterterrorism operations and changes in immigration policies intended to help combat terrorist travel, it has become increasingly difficult for terrorist groups to get trained operatives into the United States. Even jihadist groups such as al Qaeda in the Arabian Peninsula have been forced to undertake remote operations involving bombs placed aboard aircraft overseas rather than placing operatives in the country. This indicates that the group does not have the ability or the network to support such operatives. In addition to remote operations launched from its base in Yemen, al Qaeda in the Arabian Peninsula has also undertaken efforts to radicalize grassroots operatives residing in the United States, equipping them with easy-to-follow instructions for attack through its English-language magazine, Inspire. This focus on radicalizing and equipping grassroots operatives is also reflected in the fact that the majority of the attacks and failed plots inside the United States since 2001 have involved such grassroots operatives rather than trained terrorists. These operatives are either U.S. citizens, such as Nidal Hasan, Dzhokhar Tsarnaev and Faisal Shahzad, or resident aliens such as Najibullah Zazi. Failed shoe bomber Richard Reid was traveling on a British passport (no U.S. visa required) and the would-be underwear bomber, Umar Farouk Abdulmutallab, had obtained a valid U.S. visa. The operatives had the ability to legally reside in the United States or to enter the country legally without having to sneak across the border from Mexico.

A system that authorizes easier migration of labor to the United States would likely decrease the incentive for circumventing the immigration laws. More liberal admissions grounds that allow workers and migrants who lack family members in the United States to lawfully enter into this nation would be a good first step. To this end, narrower inadmissibility grounds in the U.S. immigration laws would be more realistic than the current blanket exclusions that, for example, bar the immigration of poor and working people from the developing world.44 With relaxation of the inadmissibility grounds, the nation could devote scarce enforcement resources to efforts to bar the entry into the United States of criminals, terrorists, and other serious dangers to society. As seen in other areas of law enforcement, more focused immigration law enforcement has a greater likelihood of rooting out public safety risks than scattershot efforts that infringe on the civil rights of large numbers of people.45 Moreover, more carefully crafted immigration enforcement is less likely to frighten **immigrant communities**—the very communities whose **assistance is essential if the United States truly seeks to successfully combat global terrorism** and crime generally. Unfortunately, the "war on terror" following September 11, 2001 has almost undoubtedly chilled Arabs and Muslims living in the United States from cooperating with the government in counter-terrorism efforts.46

US immigration enforcement is ineffective- too incompetent to solve terrorism

Johnson 2-13-15 [Kevin R. Johnson, Professor of Public Interest Law and Chicana/o Studies, University of California at Davis School of Law, "Possible Reforms of the U.S. Immigration Laws," http://www.chapmanlawreview.com/wp-content/uploads/2014/09/Johnson.pdf]

The American immigration bureaucracy frequently is accused of being unfair and biased. Many commentators and jurists currently express a lack of respect and confidence in the agencies that enforce the immigration laws. The Immigration and Naturalization Service (INS), which until the spring of 2003 possessed primary responsibility for enforcing the immigration laws, had long been criticized as excessively focused on enforcement and being inefficient, arbitrary, and incompetent.30 The new Department of Homeland Security (DHS) appears as enforcement-oriented as the old INS. This is not altogether surprising because the agency, as its name connotes, was created with the primary purpose of better protecting "homeland security," not serving the needs of immigrants. Nor has the dismantling of the INS seen any dramatic improvement in the efficiency of immigration operations.31 Unless the DHS is reformed so that it better balances its enforcement and service functions, pouring increasing resources into the agency is unlikely to improve matters. For example, additional increases to funding to increase the number of Border Patrol officers without significantly providing sufficient training for them is likely to make matters worse, not better.32 In addition, the decisions of the immigration courts and Board of Immigration Appeals (BIA) have been the subject of sustained criticism.33 The Board has long been challenged for, among other things, a lack of independence and neutrality. Other criticisms run the gamut from poor quality rulings (most charitably attributed to a high volume of matters to review), to bias against noncitizens, to simple incompetence. Such criticism increased after the BIA changed its procedures in 2002 to expedite its rulings in an attempt to reduce a large backlog of appeals.34

Deportation kills counter-terror cooperation that's key to solve attacks

Homeland Security News Wire 5-11-15 [News service specializing in threats to U.S. security, "DHS deportations undermine efforts to get immigrants to provide leads on radical suspects," http://www.homelandsecuritynewswire.com/dr20150511-dhs-deportations-undermine-efforts-to-get-immigrants-to-provide-leads-on-radical-suspects]

DHS counterterrorism teams rely on cooperation from immigrant communities to obtain leads on radical individuals and pending terrorism plots, but many of these communities are becoming more wary of federal law enforcement as the number of deportations increase. DHS chief Jeh Johnson met last Thursday with immigrant rights groups in Brooklyn, where he encouraged them to work with DHS to fight terrorism. "The global terrorist threat has evolved to a new place," Johnson said. "The global terrorist threat is more decentralized, it's more defuse, it's more complex. We see now terrorist organizations making effective use of social media, the Internet, films." Camille Meckler, the director of legal initiatives at the New York Immigration Coalition, attended last week's meeting. She said DHS officials wanted immigrant groups and communities to report suspicious activity, but the agency failed to present a program to facilitate the reporting. She added that immigrants are concerned with reaching out to DHS, much of whose work revolves around tracking and deporting undocumented immigrants. "We welcome and encourage any opportunity for meaningful dialogue," Meckler told Huffington Post. "But at the same time, I think it needs to be said that the onus is on DHS to make sure that these dialogs are meaningful. … The trust has been significantly eroded. Immigrant communities are against terrorism just like any other community. They want to be safe and they want their neighbors to be safe, but it's on the government to restore that trust." Following the 9/11 attacks, the federal government stepped up efforts to track undocumented immigrants and secure the southern U.S. border. DHS launched Secure Communities in 2008, which urged local law enforcement to share fingerprint data with DHS's Immigration and Customs Enforcement. Immigrant rights groups complained about the program, saying it bred distrust of local police by connecting police with deportation officials. President Barack Obama canceled the program last year and focused deportation efforts on undocumented immigrants who have been convicted of violent crimes. Abraham Paulos, the director of Families for Freedom, a New York human rights group that helps people fight deportation, said about DHS combating terrorism while enforcing immigration laws, that if DHS had focused more on terrorism and less on deportation, immigrant communities might be more willing to work with the agency. "It's ironic that you've got them coming in and trying to get information from our communities even as they're detaining and deporting us at an alarming rate," Paulos told Huffington Post. "That trust is just not going to be there. You can't have it both ways."

Ashcroft's warning to the "terrorists among us" summarizes the Justice Department's clear policy of using the immigration enforcement bureaucracy as a means of preventatively detaining and perceived "terrorists." Immigration law already provided an effective tool for widespread detention and removal of noncitizens. Therefore, simple changes in immigration enforcement practices, rather than changes to law or regulation, truly account for the bulk of the most troubling post-September 11 changes to the immigration landscape.

In recent years, the politics of immigration have been in a state of considerable flux. Although only months before the 2012 election the Republican Party and its presidential nominee officially embraced policies aimed at inducing large-scale "self-deportation" by unauthorized migrants, in the wake of the election leading Republicans exhibited a widely noted change of heart, facilitating the Senate's bipartisan adoption of sweeping comprehensive immigration reform legislation.1 Since then, legislative reform efforts in Congress have stalled, leaving the prospects for significant immigration reform legislation deeply uncertain. However, even if Congress eventually embraces comprehensive immigration reform, the sprawling immigration enforcement system that has emerged in recent decades appears certain not just to endure, but to extend its reach. The reform frameworks advanced by the Obama Administration and leading members of Congress, while committing to legalize millions of unauthorized migrants, all pledge major expansions in border security and immigration control.2 Although the particular forms of regulation remain in flux, any reforms that occur undoubtedly will include an aggressive, continuing commitment to large-scale enforcement measures.3

The consequences have been transformative, as federal officials now place unprecedented emphasis on direct post-entry enforcement within the United States. Over half of all individuals removed in recent years have been deported from inside the United States.61 Since 1999, deportation of individuals with criminal convictions has been the government's highest stated interior enforcement priority, and the number of individuals removed on criminal grounds has increased accordingly.62 Of the 391,000 individuals removed in 2011, almost half had a prior conviction, compared to three percent in 1986.63 Moreover, as the U.S. economy has slumped since 2008 and the number of unauthorized migrants has dropped—and as southwestern border enforcement strategies have increasingly emphasized criminal prosecution rather than immediate expulsion—the number of informal, "voluntary" returns without formal removal orders, which typically occur at or near the territorial border, has plummeted.64 As a result of these shifts, lawfully present noncitizens have become immigration enforcement targets to a greater extent than ever before, and the number of formal removals arising from interior enforcement activities now significantly dwarfs the number of informal returns arising from apprehensions at or near the territorial border.65

Immigrants are less likely to commit crimes or to be incarcerated than native-born Americans. A 2007 study by the Immigration Policy Center found that the incarceration rate for immigrant men ages 18 to 39 in 2000 was 0.7 percent, while the incarceration rate for native-born men of the same age group was 3.5 percent. While the foreign-born share of the U.S. population grew from 8 percent to 13 percent between 1990 and 2010, FBI data indicate that violent crime rates across the country fell by about 45 percent, while property crime rates fell by 42 percent.

As conceptualized by John Gilliom and Torin Monahan, surveillance involves "the systematic monitoring, gathering, and analysis of information in order to make decisions, minimize risk, sort populations, and exercise power."112 In this Section, I identify and analyze a series of specific **surveillance practices** and technologies that **have become increasingly important components of immigration enforcement strategies**. The processes and technologies that comprise the information infrastructure of immigration enforcement enable new approaches to four distinct sets of surveillance activities: identification, screening and authorization, mobility tracking and control, and information sharing. 1. Identification Perhaps as much as anything else, the recent expansion of immigration enforcement has helped spark heightened attention to identification—and in particular, the deployment of systems that seek to authenticate or verify the identity of a particular individual ("Is this person who she says she is?") or to ascertain the identity of an unknown individual ("Who is

this person?" or "Who generated this biometric?").113 Identification mechanisms, of course, have always been a central element of immigration regulation. While one's identity ordinarily plays no role in most aspects of day-to-day life for either noncitizens or U.S. citizens, rules governing admissibility or deportability necessarily require authorities to accurately identify and determine the particular individuals who are eligible for admission or subject to deportation.114 Debates over the proper role and scope of identification systems for immigration regulation purposes—including most prominently, in recent decades, the potential role of a mandatory, standardized national ID card—have accordingly persisted and recurred over many generations.115

In this Article, I theorize and assess this underappreciated transformation of the techniques and technologies of immigration enforcement—their swift proliferation, enormous scale, likely entrenchment, and broader meanings. Situating this reconfiguration within a larger set of developments concerning surveillance and technology, I explain how these technologies have transformed a regime of immigration control, operating primarily upon noncitizens at the territorial border, into part of a more expansive regime of migration and mobility surveillance, operating without geographic bounds upon citizens and noncitizens alike. The technologies that enable this immigration surveillance regime can, and do, bring great benefits. However, their unimpeded expansion erodes the practical mechanisms and legal principles that have traditionally constrained aggregations of power and protected individual autonomy, as similarly illustrated in current debates over surveillance in other settings. In the immigration context, those constraints have always been less robust in the first place. Accordingly, I urge more constrained implementation of these technologies to preserve zones where immigration surveillance activities do not take place and to ensure greater due process and accountability when they do. A complete understanding of immigration enforcement today must account for how the evolution of enforcement institutions, practices, and meanings has not simply increased the number of noncitizens being deported but has effected a more basic transformation in immigration governance. The institutions of immigration surveillance are becoming integrated into the broader national surveillance state very rapidly. As that reconfiguration proceeds, scholars, policymakers, advocates, and community members need to grapple more directly with its implications.

Evaluating the plan through a policymaking lens is key to combat immigration surveillance

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

Technology, as Erin Murphy has explained, "alters—rather than just mechanizes—the relationship between the individual and the state."323 With the introduction of new surveillance and dataveillance technologies, the traditional relationships between individuals and the institutions of immigration control are being reconfigured in fundamental ways for both noncitizens and U.S. citizens alike. And yet, compared to other aspects of the expansion of immigration enforcement, these shifts in migration and mobility surveillance have garnered exceedingly little attention, analysis, or concern—even as vigorous debates about surveillance and dataveillance by public and private institutions have emerged in

other settings. These shifts have not simply contributed to a regime of mass enforcement, in which hundreds of thousands of noncitizens have faced detention and deportation. More fundamentally, the evolution of immigration enforcement institutions, practices, and meanings has also contributed to a more basic transformation of the nature of immigration governance—with implications for noncitizens and U.S. citizens alike. By recounting and analyzing this transformation and its consequences, this Article highlights the need for scholars, advocates, policymakers, and other observers to devote greater attention and scrutiny to the onset of the immigration surveillance state and its rapid integration into the broader national surveillance state.

US agriculture is strong now

Caspers-Simmet 2-24-15 [Jean, writer for AgriNews.com, "US economy slowly improving, farm economy weathering low prices," http://www.agrinews.com/news/iowa_news/us-economy-slowly-improving-farm-economy-weathering-low-prices/article_ef6f69b6-b9bb-5e2c-9734-4ee78c3ece79.html]

The farm economy, which experienced some of its highest real income levels since the 1970s from 2009-13, is weathering lower crop prices, said David Oppedahl, senior business economist with the Federal Reserve Bank of Chicago. Oppedahl, who directs the Chicago Fed's survey of agricultural banks on land values and credit conditions, spoke at last week's Money Smart Ag Conference at Hawkeye Community College. With economic turmoil in other parts of the world, the exchange value of the U.S. dollar has strengthened but it is still far below its 2002 peak, Oppedahl said. U.S. trade is exceeding earlier peaks and while imports are greater than exports, the margin is tightening with oil and agriculture playing a role. A stronger dollar means U.S. exports are more expensive, which is a factor contributing to USDA's projection that agricultural exports will be down in 2015, although ag exports, which have been at record levels, will continue to be strong. "With a rising middle class around the world and more mouths to feed, agricultural exports will continue to grow in the long term," Oppedahl said. What happens in agriculture is important to the Chicago Federal Reserve because it remains the backbone of the economy, Oppedahl said. The states which make up the Chicago Fed, Iowa and most of Illinois, Indiana, Michigan and Wisconsin, are leaders in corn, soybean, hog, egg, dairy and beef production. Fed stakeholders are commercial banks that make agriculture. Increasing surpluses have brought lower corn and soybean prices, Oppedahl said. Dairy and hog prices, which finished the year very strong, have started falling. Indications are that high cattle prices may be headed down in the coming year. "Everyone in agriculture needs land and that's why we follow farmland value carefully," Oppedahl said. "It accounts for over 75 percent of the sector's asset value and is an indicator of agriculture's health. Farmland values affect collateral values and portfolio quality and have an impact on lending institutions." Dramatically declining land values were a factor in the 1980s farm crisis, but Oppedahl said this downturn won't be as dramatic. The Chicago Federal Reserve released its most recent farmland value survey on Feb. 12, two days after Oppedahl's speech. The Seventh Federal Reserve District reported an annual decrease of 3 percent in "good" farmland values for 2014, marking the first yearly decline since 1986. Farmland values in the fourth quarter of 2014 remained largely the same as in the third quarter, according to survey respondents from 224 banks across the District. Farmland values were down 2 percent for the district as a whole for the July 1 to Oct. 1, 2014 quarter. Iowa values were down 7 percent for 2014 and 1 percent for the fourth quarter after dropping 6 percent in the third quarter, according to the survey. Cash rents, which lag behind land values, have headed up in recent years and have started to come down as well. Net farm income while down is relatively strong, Oppedahl said. Government farm payments are lower but more risk management tools available to farmers. Credit conditions on agricultural loans have improved in recent years because of strong farm income with only about 2 percent of loans in troubled status, although in 2014 conditions have weakened some, Oppedahl said. Real farm sector assets and equity are at record levels. Interest rates are low but will likely climb slowly in the next few years. "While it's an uncertain future, it's not the 1980s," Oppedahl said. "The fundamentals are mixed on the direction of farmland values, but remain positive for the longer term."

Immigration policies can't solve agriculture

Perkowski 2-26-15 [Mateusz Perkowski, reporter for The Capital Press, "Expert: Immigration reform won't fix farm labor shortage," http://www.capitalpress.com/Nation_World/Nation/20150226/expert-immigration-reform-wont-fix-farm-labor-shortage]

Immigration policy reforms cannot overcome broader economic forces that are reducing farm labor supplies, an expert says. Shortages of farm labor will likely persist in the long term regardless of possible changes to immigration law, according to an agricultural economist. U.S. immigration policy is often cited as a key factor in the availability of farm workers, but larger economic forces are reducing the agricultural labor pool, said Ed Taylor, a professor at the University of California-Davis who is studying the phenomenon. "Hoping the workers come back is a non-starter," he said at the recent Oregon Wine Symposium in Portland, Ore. The number of potential farm workers is falling due to changes in Mexico that are beyond the control of U.S. lawmakers or immigration regulators, Taylor said. Immigration policy can't solve the farm labor problem unless there enough people to do the work, he said. The birthrate in Mexico is falling fast and has now roughly "converged" with the U.S. average of about two children per woman, Taylor said. Mexico has also invested in schools in recent decades, significantly boosting the years of education received by young people and steering them toward other occupations, he said.

Once again it seems to me that the appropriate response is "maybe, but maybe not." Though climate change can cause plenty of misery and deserves to be mitigated for that reason alone, it will not necessarily lead to armed conflict. The political scientists who track war and peace, such as Halvard Buhaug, Idean Salehyan, Ole Theisen, and Nils Gleditsch, are skeptical of the popular idea that people fight wars over scarce resources. Hunger and resource **shortages are** tragically **common** in sub-Saharn countries such as Malawi, Zambia, and Tanzania, **but wars** involving them **are not**. Hurricanes, floods, droughts, and tsunamis (such as the disastrous one in the Indian Ocean in 2004) do not generally lead to armed conflict. The American dust bowl in the 1930s, to take another example, caused plenty of deprivation but no civil war. And while temperatures have been rising steadily in Africa during the past fifteen years, civil wars and war deaths have been falling. Pressures on access to land and water can certainly cause local skirmishes, but a genuine war requires that hostile forces be organized and armed, and that depends more on the influence of bad governments, closed economies, and militant ideologies than on the sheer availability of land and water. Certainly any connection to terrorism is in the imagination of the terror warriors: terrorists tend to be underemployed lower-middle-class men, not subsistence farmers. As for genocide, the Sudanese government finds it convenient to blame violence in Darfur on desertification, distracting the world from its own role in tolerating or encouraging the ethnic cleansing. In a regression analysis on armed conflicts from 1980 to 1992, Theisen found that conflict was more likely if a country was poor, populous, politically unstable, and abundant in oil, but not if it had suffered from droughts, water shortages, or mild land degradation. (Severe land degradation did have a small effect.) Reviewing analyses that examined a large number (N) of countries rather than cherry-picking one or two, he concluded, "those who foresee doom, because of the relationship between resource scarcity and violent internal conflict, have very little support in the large-N literature." Salehyan adds that relatively inexpensive

advances in water use and agriculture practices in the developing world can yield massive increases in productivity with a constant or even shrinking amount of land, and that better governance can mitigate the human costs of environmental damage, as it does in developed democracies. Since the state of the environment is at most one ingredient in a mixture that depends far more on political and social organization, **resource wars are far from inevitable**, even in a climate-changed world.

Status quo solves food insecurity

Lewis 1-10-14 [Kim, international broadcaster for VOA News, "Expanded Research Puts Global Food Security on the Horizon," http://www.voanews.com/content/cgiar-agriculture-food-africa-asia-maize-rice-nutrient-crops-research-scientists/1827211.html]

Scientists and food experts have high hopes in achieving global food security as the Cinsultatvie Group on Internnational Agricultural Research (CGIAR) recently announced a billion-dollar funding milestone.¶ The world's largest agriculture research partnership says funding for research and development went from $500 million dollars in 2008 to $1 billion dollars in 2013.¶ CGIAR partners around the world conduct research to reduce poverty in rural areas to overcome complex challenges in areas such as climate change, water scarcity, land degradation and chronic malnutrition. The new funding allows the consortium to expand their focus on their 16 global research programs in developing policies and technologies. ¶ The increased funding has also allows the partnership to commit to providing 12 million African households with sustainable irrigation; saving 1.7 million hectares of forest from destruction; and providing 50 million poor people with access to highly nutritious food crops. Two major crops that have already been improved upon due to expanded research are maize and rice.¶ "Results of those changes, for example, have allowed for a large expansion in the work on drought tolerant maize, particularly in Africa, and in Asia on flood tolerant rice, where the fruits of research have gotten into the hands of farmers in a very, very rapid way," says Jonathan Wadsworth, executive secretary of the CGIAR Fund Council.¶ He uses rice as an example. Four years after the release of new types of rice that withstand temporary flooding in Asia, he said over four million farm families are reaping the benefits.¶ "In Africa, on drought tolerant maize, hundreds of thousands of farmers are now using varieties which give them a harvest even in times of drought," says Wadsworth.¶ In severe drought conditions of sub-Saharan Africa and in the Sahel region, agroforestry is being incorporated into the production of maize production. ¶ In looking ahead into the year 2014, Wadsworth sees challenges throughout the agriculture production cycle. However, scientists are already meeting these challenges head on.¶ "I think one thing which we have shown in the CGIAR is that food security is not only a question of the amount of food, it's also to do with the quality of the food which is produced and available both to rural households, and to urban population," he explains.¶ He points out that one of the areas that CGIAR has been developing over the last few years and will expand on this year is increasing the nutritional value of staple crops to ensure higher levels of protein, micro-nutrients, and vitamins that are essential to the health of the population, particularly for pregnant and lactating women, and children.¶ He highlights new research done in Latin America that has yielded new types of sweet potato. Now more nutrient-enriched, this crop has been introduced in Africa, and the high levels of vitamin A in the sweet potato will improve the vitamin A deficient diets in many African countries.

Seedstock '14 [Seedstock is a news service covering food sustainability and farming, works with governmental agencies and private stakeholders, "U.S. to See More Urban Farming in 2015 as Economics Improve, Consumer Demand Increases and More Incentives are Added," 12-10-14, http://seedstock.com/2014/12/10/u-s-to-see-more-urban-farming-in-2015-as-economics-improve-

consumer-demand-increases-and-more-incentives-are-added/]

Urban agriculture is expected to maintain strong growth in the United States in 2015 as cities and states provide more incentives, more start-up farmers enter the field, smaller operations improve their profitability and consumer demand for locally grown food remains strong, according to Seedstock.com. The growth outlook for land, production and jobs connected with urban farming was generated from Seedstock's recent annual conference at UCLA where more than 250 farmers, entrepreneurs, policy makers, investors and others gathered to hear experts discuss current factors driving robust local food systems in dozens of urban settings across the country. "Urban agriculture will truly emerge as one of this country's most visible economic and cultural forces in 2015. We'll see strong job growth, continued innovation, more commercial-scale farming in cities and greater production numbers of locally grown food," said Robert Puro, co-founder of Seedstock, the nation's leading information, consulting and networking company promoting innovation in urban and sustainable agriculture. Direct to consumer local food sales via community supported agriculture (CSA), farmers markets and farm stands increased from approximately $600 million to $1.2 billion from 1997 to 2007. USDA estimates that farm-level value of local food sales totaled about $4.8 billion in 2008 (1.7 percent of revenue from all farm production) and are expected to continue double-digit growth into 2015 and beyond. The top five trends or changes for urban and sustainable agriculture in the U.S. in 2015, according to Seedstock, are: More government incentives, primarily through land-use policy changes, job training and economic programs. For example, a new law in California authorizes tax breaks for land-owners who lend their property to urban farmers. Cities across the U.S. are approving similar policies to stimulate more commercial-scale urban farming. An increase in aggregation and distribution centers catering to smaller farm operations. The U.S. Department of Agriculture set aside millions of dollars in the last farm bill to support these efforts, mostly through marketing assistance. Demand for locally grown food will continue to increase among consumers. Grocers, such as Whole Foods Market, have already placed heavy emphasis on marketing locally grown produce. Locally sourced meats, seafood and produce will remain the top trends in 2015 among the nation's chefs, according to a survey by the National Restaurant Association. The rise of local food business incubators. Grocers and restaurants won't be the only buyers of locally grown produce. Consumers already are looking to buy more regionally produced food products, which is prompting more business start-ups. In 2015, Los Angeles will open its first food production business incubator to provide entrepreneurs a staging area to develop, market and scale their fledgling food businesses. More controlled-environment farms. Hydroponic and aquaponic farming are increasing – driven by a scarcity of affordable land in urban areas, reductions in the costs of technology and local food demand. The popularity of an indoor-ag conference in Las Vegas, and government incentives to convert abandoned buildings to farms are two indicators this industry is taking off. Also, more rooftop gardens will appear in more urban areas. "As start-up costs go down and consumer demand continues to climb, the U.S. will continue to see many more people enter the field of urban, sustainable farming," Puro said. "You also can't overlook the significant societal change we're witnessing – more and more young people are abandoning the typical office job or changing their career search to do something good for the environment. They are discovering they can make a decent living by growing food in or near urban areas on smaller plots." Another key to continued growth in urban, sustainable farming is education. Groups like Seedstock have become necessary to new farmers who need resources and networking. As highlighted in one of Seedstock's recent articles, a variety of factors will determine whether an individual urban agriculture operation will be profitable. "Smaller farms can face greater financial risks because their liabilities are not spread over as large an area as an industrial-scale farm, or they don't enjoy the same economies of scale when it comes to purchasing supplies," Puro said. "Those obstacles are beginning to fade as technology improves, more small farms emerge and entrepreneurs figure out the right business model. As a result, financing is becoming more available and profits are being realized."

In 2013, investors were hungry for food companies as record-low interest rates led them to seek out dividend-paying stocks. This interest in food stocks helped the sector to a 22% gain for the year as of mid-October,1 outpacing the S&P 500® Index's 19% increase. But with interest rates possibly on the rise, will food stocks lose their appeal?¶ Not necessarily, says Brad Sorensen, Director of Market and Sector Analysis at the Schwab Center for Financial Research. Three factors are leaning in food stocks' favor:¶ Stable prices. Global commodity prices may be nearing the end of an extended upward trend, so any resulting price stability could boost food makers' profits. "These companies operate in a pretty low-margin environment, so any cost savings certainly benefits them," Brad says.¶ Low sensitivity to interest rate changes. Historically, food stocks haven't been as affected by higher interest rates as other consumer staples because demand for food stays relatively constant.¶ Long-term outlook. The United Nations expects the world population to add almost one billion people over the next 12 years.2 Given how closely food sales are linked with population growth, Brad believes equity investors should consider food companies as part of their long-term core portfolio.

Empirics prove- global food security can survive crises

FPD '13 [Food Product Design, multi-media brand focused on the application of science based ingredients that drive innovative & compliant food and beverage products for the consumer market, "Despite Challenges, Global Food Security Stable," http://www.foodproductdesign.com/news/2013/07/despite-challenges-global-food-security-stable.aspx]

Global food security has remained largely stable over the past year despite challenges, including food price volatility, new areas of political unrest, the ongoing European economic crisis, and a severe summer drought in the Midwestern U.S. and Eastern Europe, according to the Global Food Security Index 2013 Report from Economist Intelligence Unit.¶ While the global average food security score remained virtually unchanged in the latest index (53.5) compared with a year ago (53.6), some notable trends emerged. Developing countries made the greatest food security gains in the past year. Ethiopia, Botswana and the Dominican Republic led the way, rising eight places on average in the global food security rankings, based largely on greater food availability and income growth.¶ High-income countries still dominate the top 25% of the index, but falling national incomes hurt food security in many cases, especially in countries on the periphery of Europe. The United States retained the top ranking in the 2013 GFSI, with some shifts in the Top 10 group resulting in Norway taking the second spot, and France the third.¶ "Prices for some key food crops, especially grains, spiked last year, raising food costs globally," said Leo Abruzzese, global forecasting director for the Economist Intelligence Unit. "Fortunately, those prices have retreated in the last six months, although they remain higher than they were just a few years ago. The EIU expects the prices of wheat and other grains to fall further during 2013, which is good news for global food security."¶ The GFSI, developed by the EIU and sponsored by DuPont is intended to deepen the dialogue on food security by examining the core issues of food affordability, availability and quality across a set of 107 developed and developing countries worldwide. The dynamic benchmarking model evaluates 27 qualitative and quantitative indicators which collectively create the conditions for food security in a country.¶ The 2013 Global Food Security Index builds on the insights from last year's assessment and includes two new indicators—corruption and urban absorption capacity, and two new countries—Ireland and Singapore.¶ Key findings from this year's index include:¶ Overall average food security remained consistent with last year. No region's score improved dramatically, but Sub-Saharan Africa showed the biggest gain, climbing by around one point in the index. Last year's drought in some key growing regions will have reduced food security for a period of time, as grain prices rose, although that trend eased later in the year.

Food shortages don't cause war

Allouche '11 [Jeremy, professor at MIT, Research Fellow, Water Supply and Sanitation at the Institute for Development Studies, "The sustainability and resilience of global water and food systems: Political analysis of the interplay between security, resource scarcity, political systems and global trade," Food Policy, Vol. 36, S3-S8, January, online]

The question of resource scarcity has led to many debates on whether scarcity (whether of food or water) will lead to conflict and war. The underlining reasoning behind most of these discourses over food and water wars comes from the Malthusian belief that there is an imbalance between the economic availability of natural resources and population growth since while food production grows linearly, population increases exponentially. Following this reasoning, neo-Malthusians claim that finite natural resources place a strict limit on the growth of human population and aggregate consumption; if these limits are exceeded, social breakdown, conflict and wars result. Nonetheless, it seems that most empirical studies do not support any of these neo-Malthusian arguments. Technological change and greater inputs of capital have dramatically increased labour productivity in agriculture. More generally, the neo-Malthusian view has suffered because during the last two centuries humankind has breached many resource barriers that seemed unchallengeable. Lessons from history: alarmist scenarios, resource wars and international relations In a so-called age of uncertainty, a number of alarmist scenarios have linked the increasing use of water resources and food insecurity with wars. The idea of water wars (perhaps more than food wars) is a dominant discourse in the media (see for example Smith, 2009), NGOs (International Alert, 2007) and within international organizations (UNEP, 2007). In 2007, UN Secretary General Ban Ki-moon declared that 'water scarcity threatens economic and social gains and is a potent fuel for wars and conflict' (Lewis, 2007). Of course, this type of discourse has an instrumental purpose; security and conflict are here used for raising water/food as key policy priorities at the international level. **In the Middle East**, presidents, prime ministers and foreign ministers have also used this bellicose rhetoric. Boutrous Boutros-Gali said; 'the next war in the Middle East will be over water, not politics' (Boutros Boutros-Gali in Butts, 1997, p. 65). The question is not whether the sharing of transboundary water sparks political tension and alarmist declaration, but rather to what extent water has been a principal factor in international conflicts. The evidence seems quite weak. Whether by president Sadat in Egypt or King Hussein in Jordan, none of these declarations have been followed up by military action. The governance of transboundary water has gained increased attention these last decades. This has a direct impact on the global food system as water allocation agreements determine the amount of water that can used for irrigated agriculture. The likelihood of conflicts over water is an important parameter to consider in assessing the stability, sustainability and resilience of global food systems. None of the various and extensive databases on the causes of war show water as a casus belli. Using the International Crisis Behavior (ICB) data set and supplementary data from the University of Alabama on water conflicts, Hewitt, Wolf and Hammer found only seven disputes where water seems to have been at least a partial cause for conflict (Wolf, 1998, p. 251). In fact, about 80% of the incidents relating to water were limited purely to governmental rhetoric intended for the electorate (Otchet, 2001, p. 18). As shown in The Basins At Risk (BAR) water event database, more than two-thirds of over 1800 water-related 'events' fall on the 'cooperative' scale (Yoffe et al., 2003). Indeed, if one takes into account a much longer period, the following figures clearly demonstrate this argument. According to studies by the United Nations Food and Agriculture Organization (FAO), organized political bodies signed between the year 805 and 1984 more than 3600 water-related treaties, and approximately 300 treaties dealing with water management or allocations in international basins have been negotiated since 1945 (FAO, 1978 and FAO, 1984). The fear around water wars have been driven by a Malthusian outlook which equates scarcity with violence, conflict and war. **There is** however **no** direct **correlation between water scarcity and transboundary conflict.** Most specialists now tend to agree that the major issue is not scarcity per se but rather the allocation of water resources between the different riparian states (see for example Allouche, 2005, Allouche, 2007 and [Rouyer, 2000]). Water rich countries have been involved in a number of disputes with other relatively water rich countries (see for example India/Pakistan or Brazil/Argentina). The perception of each state's estimated water needs really constitutes the core issue in transboundary water relations. Indeed, whether this scarcity exists or not in reality, perceptions of

the amount of available water shapes people's attitude towards the environment (Ohlsson, 1999). In fact, some water experts have argued that scarcity drives the process of co-operation among riparians (Dinar and Dinar, 2005 and Brochmann and Gleditsch, 2006). In terms of international relations, **the threat of water wars** due to increasing scarcity **does not make** much **sense in the light of the recent historical record.** Overall, the water war rationale expects conflict to occur over water, and appears to suggest that violence is a viable means of securing national water supplies, an argument which is highly contestable. The debates over the likely impacts of climate change have again popularised the idea of water wars. The argument runs that climate change will precipitate worsening ecological conditions contributing to resource scarcities, social breakdown, institutional failure, mass migrations and in turn cause greater political instability and conflict (Brauch, 2002 and Pervis and Busby, 2004). In a report for the US Department of Defense, Schwartz and Randall (2003) speculate about the consequences of a worst-case climate change scenario arguing that water shortages will lead to aggressive wars (Schwartz and Randall, 2003, p. 15). Despite growing concern that climate change will lead to instability and violent conflict, the evidence base to substantiate the connections is thin ([Barnett and Adger, 2007] and Kevane and Gray, 2008).

No food wars- empirics prove

Salehyan '07 [Idean, Professor of Political Science, University of North Texas, "The New Myth About Climate Change," Foreign Policy, Summer, http://www.foreignpolicy.com/story/cms.php?story_id=3922]

First, aside from a few anecdotes, there is little systematic empirical evidence that resource scarcity and changing environmental conditions lead to conflict. In fact, several studies have shown that an abundance of natural resources is more likely to contribute to conflict. Moreover, even as the planet has warmed, the number of civil wars and insurgencies has decreased dramatically. Data collected by researchers at Uppsala University and the International Peace Research Institute, Oslo shows a steep decline in the number of armed conflicts around the world. Between 1989 and 2002, some 100 armed conflicts came to an end, including the wars in Mozambique, Nicaragua, and Cambodia. If global warming causes conflict, we should not be witnessing this downward trend. Furthermore, if famine and drought led to the crisis in Darfur, why have scores of environmental catastrophes failed to set off armed conflict elsewhere? For instance, the U.N. World Food Programme warns that 5 million people in Malawi have been experiencing chronic food shortages for several years. But famine-wracked Malawi has yet to experience a major civil war. Similarly, the Asian tsunami in 2004 killed hundreds of thousands of people, generated millions of environmental refugees, and led to severe shortages of shelter, food, clean water, and electricity. Yet the tsunami, one of the most extreme catastrophes in recent history, did not lead to an outbreak of resource wars. Clearly then, there is much more to armed conflict than resource scarcity and natural disasters.

Extinction impossible and ahistorical

Posner 05 [Richard A., Judge U.S. Court of Appeals 7th Circuit, Professor at the Chicago School of Law, "Catastrophe: Risk and Response," 1-1-05 http://goliath.ecnext.com/coms2/gi_0199-4150331/Catastrophe-the-dozen-most-significant.html#abstract]

Yet the fact that Homo sapiens has managed to survive every disease to assail it in the 200,000 years or so of its existence is a source of genuine comfort, at least if the focus is on extinction events. There have been enormously destructive plagues, such as the Black Death, smallpox, and now AIDS,

but **none has come close** to destroying the entire human race. There is a biological reason. Natural selection favors germs of **limited lethality**; they are fitter in an evolutionary sense because their genes are more likely to be spread if the germs do not kill their hosts too quickly. The AIDS virus is an example of a lethal virus, wholly natural, that by lying dormant yet infectious in its host for years maximizes its spread. Yet there is no danger that AIDS will destroy the entire human race. The likelihood of a natural pandemic that would cause the extinction of the human race is probably even less today than in the past (except in prehistoric times, when people lived in small, scattered bands, which would have limited the spread of disease), despite wider human contacts that make it more difficult to localize an infectious disease. The reason is improvements in medical science. But the comfort is a small one. Pandemics can still impose enormous losses and resist prevention and cure: the lesson of the AIDS pandemic. And there is always a lust time. That the human race has not yet been destroyed by germs created or made more lethal by modern science, as distinct from completely natural disease agents such as the flu and AIDS viruses, is even less reassuring. We haven't had these products long enough to be able to infer survivability from our experience with them. A recent study suggests that as immunity to smallpox declines because people am no longer being vaccinated against it, monkeypox may evolve into "a successful human pathogen," (9) yet one that vaccination against smallpox would provide at least some protection against; and even before the discovery of the smallpox vaccine, smallpox did not wipe out the human race. What is new is the possibility that science, bypassing evolution, will enable monkeypox to be "juiced up" through gene splicing into a far more lethal pathogen than smallpox ever was.

Disease extinction claims are hype

Fitzpatrick '10 [Michael Fitzpatrick, General Practitioner at Barton House Health Center, "Pandemic Flu: Public Health and the Culture of Fear," November, http://www.rsis.edu.sg/NTS/resources/research_papers/NTS%20Working%20Paper2.pdf]

Projections by leading public health officials of rates of disease and death from pandemic flu on a catastrophic scale had a major impact. While WHO experts such as Keiji Fukuda speculated that global death rates would be in the millions, if not tens of millions, television reports featured images of the 1918-19 pandemic and accounts of the devastating effects of that (historically unprecedented) viral pestilence.10 Patients fearful for their own healtn and that of their children, their elderly relatives, and family members with chronic illnesses sought medical advice and whatever preventative measures were available. There is however little evidence that raising awareness of the emerging threat of swine flu had any protective value. Given the rapid spread of the virus, it appears than none of the measures taken in the early 'containment' phase of the outbreak, such as more assiduous hand-washing, face masks, social distancing measures (school closures, etc.) and the provision of prophylactic antivirals to contacts had an appreciable effect on its spread. Pregnant women, deemed to be particularly at risk, were particularly susceptible to pandemic fears - and their anxieties were subsequently compounded by the development of vaccines that rival scaremongers claimed were unsafe. It soon emerged that early reports from Mexico provided unreliable figures for deaths resulting from swine flu and an uncertain number of cases of infection to use as a denominator with which to calculate the mortality rate. As it also became clear that most cases were mild, projections for the impact of the pandemic were steadily scaled down." In July, British authorities anticipated that 30 per cent of the population (19 million people) would become infected, with a complication rate of 15 per cent, a hospitalisation rate of 2 per cent and a death rate between 0.1 per cent and 0.35 per cent (between 19,000 and 65,000 people). By September the figure of 19,000 had become the worst-case scenario; the following month this was reduced to 1,000. In December, the official report on the mortality statistics for the first six months of the pandemic in England estimated a mortality rate of 0.026 per cent (138 confirmed deaths, and cases of swine flu in 1 per cent of the population), a rate substantially lower than the most optimistic scenario of six months earlier.12 The contrast with earlier influenza pandemics was dramatic: the death rate in 1918-19 was 2-3 per cent, and that in the less severe pandemics of 1957-58 and 1967-68 around 0.2 per cent. In the judgement of the Hine Report, ministers and officials placed excessive faith in mathematical modelling. They had come to regard this as 'hard, quantitative science' that could provide 'easily understandable figures' which had the aura of appearing 'scientifically very robust'.13 Though the mathematicians had warned, at the first pandemic planning meeting in April, that in the absence of reliable data **their modelling capability was low**, they were under pressure from the politicians to 'produce forecasts'. The high level of uncertainty surrounding these projections does not seem to have deterred the modellers from producing them or the politicians from projecting them into the public realm. The Hine Report observes that by the end of the first wave of swine flu cases in September, sufficient data were available to guarantee accurate modelling of the second wave. However, official statements still sought to warn against complacency about future dangers and did

nothing to allay the anxieties provoked by earlier doomsday scenarios. The Hine Report is critical of the public promotion of 'reasonable worst-case scenarios', which imply 'a reasonably likely event', focusing in particular on CMO Professor Liam Donaldson's July statement. The report says: The English CMO's citing of the 'reasonable worst-case' planning assumption of 65,000 fatalities on 16 July 2009 was widely reported in headlines in somewhat alarmist terms.14 It seems unfair to blame the media for the alarmist tone of their reports, when it was echoed by the newly appointed health minister Andy Bumham, who told parliament that the swine flu pandemic could no longer be controlled and that there could be 100,000 cases a day by the end of August. It is striking that British authorities chose to promote such gloomy projections at a time when other prominent health figures had already declared such figures improbable. A month earlier, on the occasion of declaring the swine flu outbreak a global pandemic, WHO chief Margaret Chan had already recognised that most cases were mild and that she did not expect to see a sudden and dramatic jump in severe or fatal infections.15 While the Hine Report is generally highly congratulatory of the UK response to the swine flu pandemic, it suggests that the authorities may have adhered too strictly to the contingency plan they had developed over the previous decade to cope with the emergence of an influenza pandemic on the scale of the 1918-19 outbreak. As a result they 'did not consider sufficiently the possibility that a pandemic might be **far less severe'** than the one envisioned in that contingency plan. Their response was 'tailored to the plan, not the nature of the virus' and thus lacked flexibility. The report tentatively suggests that the authorities might consider as an alternative approach, a policy of preparing for the most likely outcome, while being prepared to monitor and change tack as necessary. The **alarmist response** to the swine flu outbreak reflects the **wider trend** of the past decade in which **'crying wolf** has emerged as the appropriate official response to diverse real and imaginary threats, from the millennium bug to bioterrorism, obesity to global warming.'5 For the authorities, the over-riding principle is to avoid blame for unforeseen disasters, by always **proclaiming the worst-case scenario** and repeating the mantra 'prepare for the worst, hope for the best'. From this perspective, rational contingency planning gives way to scaremongering. Instead of making discreet preparations for probable, predictable emergencies (snow in winter, drought in summer), the authorities engage in speculation about the grimmest possible eventualities (massive loss of life resulting from disease or climate change) with the aim of promoting more responsible behaviour and healthier lifestyles.17 Rather than communicating realistic assessments of risk to the public, the authorities engage in sharing their anxieties and promoting fears. Instead of guiding practical professional interventions in response to real social problems, politicians and public health officials engage in dramatic posturing.

No economic recession now

Schweppe 5-13-15 [Sarah, assistant editor at The Cheat Sheet, a daily news publication, "Is It Time to Worry About the Health of the U.S. Economy?" http://www.cheatsheet.com/politics/is-the-u-s-economy-slipping-into-another-recession.html/?a=viewall]

While we're supposed to be in a period of recovery from the Great Recession, the economy has been lagging more than expected lately. Does this lack of growth mean we're slipping back into a recession? If we are, it's not one similar to what we saw in 2008 because the unemployment rate isn't soaring up. Rather growth has been stalling this year, enough to make the Federal Reserve question whether to hike interest rates in June as it has said it wants to. ADVERTISING Growth stalled a lot in the winter. Annual gross domestic product growth dropped to 0.2%, and according to the Atlanta Fed's GDPNow model, it's only increased to 0.9% since. And the

Washington Post suspects that any positive growth in the first quarter could be revised now that we know the U.S. trade deficit grew to the highest level in more than six years in March. The gap increased 43.1% to $51.4 billion, according to the Commerce Department, exceeding the estimates of 70 economists surveyed by Bloomberg. Foreign goods, capital goods, and consumer products were purchased at record rates, while demand for petroleum dropped. Those facts are what make economists nervous, but employment growth may be keeping us from falling into a real recession. How is this affecting jobs? Despite adding 591,000 jobs this year, the the unemployment rate remained unchanged at 5.4%, according to the U.S. Bureau of Labor Statistics. In April, the number of unemployed persons (8.5 million) stayed about the same as the previous month. Overall, the unemployment rate went down by 0.8 percentage point for the month, and the number of unemployed dropped by 1.1 million for the month. "We see this report as reducing concerns that weak first-quarter growth represents a loss of economic momentum," Michael Gapen, chief U.S. economist at Barclays in New York, said to Reuters. The BLS said in its latest report that total nonfarm payroll employment increased by 223,000 in April, slightly below the monthly average of 257,000 jobs added over the past year. Though it's not as strong as economists would like, this growth is probably still enough that to keep the Fed on track to raise interest rates, a sign that they think the economy is safely recovering.

No impact to the economy

Brandt and Ulfelder '11 [Patrick T. Brandt, Ph.D. in Political Science from Indiana University, Assistant Professor of Political Science in the School of Social Science at the University of Texas at Dallas, Jay Ulfelder, Ph.D. in political science from Stanford University, "Economic Growth and Political Instability," April, Social Science Research Network, online]

These statements anticipating political fallout from the global economic crisis of 2008–2010 reflect a widely held view that economic growth has rapid and profound effects on countries' political stability. When economies grow at a healthy clip, citizens are presumed to be too busy and too content to engage in protest or rebellion, and governments are thought to be flush with revenues they can use to enhance their own stability by producing public goods or rewarding cronies, depending on the type of regime they inhabit. When growth slows, however, citizens and cronies alike are presumed to grow frustrated with their governments, and the leaders at the receiving end of that frustration are thought to lack the financial resources to respond effectively. The expected result is an increase in the risks of social unrest, civil war, coup attempts, and regime breakdown. Although it is pervasive, the assumption that countries' economic growth rates strongly affect their political stability has not been subjected to a great deal of careful empirical analysis, and evidence from social science research to date does not unambiguously support it. Theoretical models of civil wars, coups d'etat, and transitions to and from democracy often specify slow economic growth as an important cause or catalyst of those events, but empirical studies on the effects of economic growth on these phenomena have produced mixed results. Meanwhile, the effects of economic growth on the occurrence or incidence of social unrest seem to have hardly been studied in recent years, as empirical analysis of contentious collective action has concentrated on political opportunity structures and dynamics of protest and repression. This paper helps fill that gap by rigorously re-examining the effects of short-term variations in economic growth on the occurrence of several forms of political instability in countries worldwide over the past few decades. In this paper, we do not seek to develop and test new theories of political instability. Instead, we aim to subject a hypothesis common to many prior theories of political instability to more careful empirical scrutiny. The goal is to provide a detailed empirical characterization of the relationship between economic growth and political instability in a broad sense. In effect, we describe the conventional wisdom as seen in the data. We do so with statistical models that use smoothing splines and multiple lags to allow for nonlinear and dynamic effects from economic growth on political stability. We also do so with an instrumented measure of growth that explicitly accounts for endogeneity in the relationship between political instability and economic growth. To our knowledge, ours is the first statistical study of this relationship to simultaneously address the possibility of nonlinearity and problems of endogeneity. As such, we believe this paper offers what is probably the most rigorous general evaluation of this argument to date. As the results show, some of our findings are surprising. Consistent with conventional assumptions, we find that social unrest and civil violence are more likely to occur and democratic regimes are more susceptible to coup attempts around periods of slow economic growth. At the same time, our analysis shows no significant relationship between variation in growth and the risk of civil-war onset, and results from our analysis of regime changes contradict the widely accepted claim that economic crises cause transitions from autocracy to democracy. While we would hardly pretend to have the last word on any of these relationships, our findings do suggest that the relationship between economic growth

and political stability is neither as uniform nor as strong as the conventional wisdom(s) presume(s). We think these findings also help explain why the global recession of 2008–2010 has failed thus far to produce the wave of coups and regime failures that some observers had anticipated, in spite of the expected and apparent uptick in social unrest associated with the crisis.

Immigration won't save the economy

Bingham '14 [John Bingham is a reporter for the Daily Telegraph, citing a study of OECD immigration, "Mass Immigration Not the Secret to Economic Growth, Says OECD," http://www.amren.com/news/2014/06/mass-immigration-not-the-secret-to-economic-growth-says-oecd/]

Mass immigration has brought little or no overall financial benefit to the UK and other countries, a study by the club of the world's leading economies has concluded. Evidence from around the world over the last 50 years shows that immigrants are not a "panacea" to boost economic growth but nor are they a "major burden" on the taxpayer, new analysis by the Organisation for Economic Co-operation and Development (OECD) finds. Overall, the fiscal impact of migration in OECD countries has been "broadly neutral" with taxes paid by new arrivals usually matching what they receive in benefits, it finds. Although in some countries the amount immigrants contribute to the public purse exceeds what they receive, new arrivals contribute less overall than the existing population, because many are less well paid. It comes in marked contrast to the findings of a report by University College London last year which concluded that European migrants contributed £8.8 billion more to the British taxpayer than they received over a 16-year period. Campaigners for tougher immigration restrictions said it amounted to a "nail in the coffin" of the argument that immigration provides a major economic boost to Britain. "Measuring the impact of migration on the public purse is a complex task," the study by Jean-Christophe Dumont, head of the OECD's International Migration Division, concludes. "Nevertheless, over the past 50 years migrants appear to have had a broadly neutral impact in OECD countries. "In other words, the cost of whatever state benefits they received was largely covered by the taxes they paid." "Where migrants did have a fiscal impact, it rarely exceeded plus or minus 0.5 per cent of GDP. "But while the impact of immigrants on the public purse is, broadly speaking, neutral, it is less favourable than that of native-born people.

The economy is resilient

Lanman '14 [Scott, business reporter for Bloomberg News, "Growth Surge Shows Resilient U.S. as Mediocrity Reigns Overseas," 12-23-14, http://www.bloomberg.com/news/articles/2014-12-23/growth-in-u-s-shows-flexibility-as-mediocrity-reigns-overseas]

America's recovery is picking up speed while much of the rest of the world settles into what the International Monetary Fund's Christine Lagarde calls the "new mediocre." As Europe verges on recession, Japan's economy sinks from a consumption-tax increase and China is weighed down by stimulus-induced leverage, the U.S. grew at a 5 percent annual pace in the third quarter that was the fastest since 2003, revised government figures showed today. The U.S. comeback rests on three pillars, according to Torsten Slok, chief international economist at Deutsche Bank AG: The Federal Reserve pushed more aggressively than its peers with record monetary easing. The economy has more built-in flexibility, with labor-market conditions that make it easier to trim or expand workforces. And the financial system has been restored to relative health. "The policy response was swifter and deeper," said Slok, who's based in New York and formerly worked at the IMF. In addition, the U.S. economy "is simply more dynamic and resilient," with greater competition and openness to the rest of the world, Slok said. Another reason: The U.S. has rid itself of the drag from slowing fiscal spending, after cutbacks at the federal, state and local levels spanning the past four years, according to Jay Bryson, global economist at Wells Fargo Securities LLC in Charlotte, North Carolina. IMF Forecasts "Fiscal policy has kind of gotten out of the way," said Bryson, who worked as a Fed economist in the 1990s. The IMF in October projected the U.S. would have the fastest growth among major advanced economies in 2015 at 3.1 percent, ahead of nations including

Germany at 1.5 percent and Japan at 0.8 percent. The stagnation prompted IMF Managing Director Lagarde last month to exhort Group of 20 leaders at a summit in Brisbane, Australia, to use all tools at their disposal to avoid what she called a "new mediocre" period of sub-par growth. Since the IMF forecasts were made, the European Central Bank's outlook worsened and Japan reported its economy contracted in the third quarter, while Russia faces the worst crisis since its 1998 default, amid plunging oil prices. The U.S. isn't completely alone in showing economic strength. British household spending helped drive GDP in the U.K. to its seventh straight quarter of growth in the three months through September, with a 0.7 percent advance from the previous period, the government said today. The performance reflects greater economic flexibility than most of Europe, Wells Fargo's Bryson said. "The Bank of England was pretty aggressive, at least early on, in terms of providing stimulus as well," he said. While the American consumer leads the rebound in the world's largest economy, lagging growth overseas may be restraining investment in U.S.-produced equipment. Orders for durable goods, those meant to last at least three years, unexpectedly dropped in November from the previous month, according to Commerce Department data. Demand for computers, metals and electrical equipment declined or was little changed last month. Export Share Still, cooling demand overseas may not be much of a drag on U.S. growth. Exports made up just 0.6 percentage point of last quarter's 5 percent expansion in GDP, while domestic consumption contributed 2.2 percentage points. As a share of GDP, imports and exports "are relatively low for the U.S., at least relative to most other countries in the world," Slok said. "If the U.S. grows, that's actually good for the U.S. and it's good for the rest of the world," he said. "But if the rest of the world has relatively slow growth, the impact on the U.S. is much smaller." What keeps the U.S. economy going? Flexibility and creativity, says Bryson. "The U.S. economy is more flexible than other economies in the world," he said. Moreover, "we still remain the bastion of new intellectual ideas that get applied economically. It's the most creative economy in the world."

The economy is recovering- labor markets are improving

CNN Money 6-5-15 ["America has added over 1 million jobs in 2015," http://money.cnn.com/2015/06/05/news/economy/may-jobs-report-280000-added/]

In a good sign for people looking for work, the U.S. economy gained 280,000 jobs in May. Economists surveyed by CNNMoney projected there would only be 222,000 jobs gains. The unemployment rate ticked up slightly in May to 5.5%, according to the Labor Department. That increase is a sign that more people returned to look for work in May, economists say. "It's a strong report, stronger than we had expected," says Jesse Hurwitz, senior economist at Barclays. "The U.S. labor market strength remains very much in tact." May's jobs report is welcome news after the winter slowdown. The economy actually contracted in the first three months of this year, sparking concerns that hiring would taper off. Show me the wage growth: On Thursday, the International Monetary Fund expressed concern over the U.S. job market, especially how worker pay isn't going up much. Wages grew only 2.3% in May, well below the 3.5% wage growth the Federal Reserve wants to see. Still, that beat expectations in May and is the highest level in nearly two years. Wages remain the last major economic measure to turn the corner and make significant progress. "Employers recognize that in order to attract skilled workers, they need to increase wages," says Sharon Stark, managing director at D.A. Davidson. May's job gains are a good omen for wage growth. Many experts say that pay should pick up as it gets harder and harder to find workers. March was the worst month of job growth this year, but the Labor Department revised up March's job gains from 85,000 to 119,000 on Friday. April's job gains were revised down slightly to 221,000. May brings more high quality jobs: Job gains were across the board in May too. A number of high-quality job areas made meaningful progress. In fact, service-sector job growth so far this year has outpaced the gains from the same time last year, according to Luke Tilley, chief economist at Wilmington Trust Investment Advisors in Delaware. Health care increased by 47,000 jobs, while business services -- which includes marketing and accounting jobs -- gained 63,000 jobs. Construction also had a good month, adding 17,000 new jobs, according to the Labor Department. The one drag is energy companies. They continued to slash jobs due to low gas and oil prices. Mining and drilling jobs dropped by 17,000 in May -- the fifth consecutive month of energy job losses. But overall, the job market made strong gains. It's timely progress for the economy as the Federal Reserve board meets on June 17. The Fed is widely expected not to raise its main interest rate in June, but Fed Chair Janet Yellen will speak to the press and offer her outlook on the economy. If conditions continue to improve, interest rates could rise for the first time in about a decade -- another healthy sign for America's economy.

The economy is fundamentally strong

Mutikani 5-29-15 [Lucia, writer for Business Insider, "U.S. economy likely shrank in first quarter, but fundamentals strong," http://www.businessinsider.com/r-us-economy-likely-shrank-in-first-quarter-but-fundamentals-strong-2015-5]

The U.S. economy likely contracted in the first quarter as it buckled under the weight of unusually heavy snowfalls and a resurgent dollar, but activity since has rebounded modestly. The government is expected to report on Friday that gross domestic product shrank at a 0.8 percent annual rate instead of

growing at the 0.2 percent pace it estimated last month, according to a Reuters survey of economists. A larger trade deficit and a smaller accumulation of inventories by businesses than previously thought will probably account for much of the expected downward revision. With growth estimates so far for the second quarter around 2 percent, the economy appears poised for its worst first half performance since 2011. Economists, however, caution against reading too much into the expected slump in output. They argue the GDP figure for the first quarter was held down by a confluence of temporary factors, including a problem with the model the government uses to smooth the data for seasonal fluctuations. "The weakness in the U.S. recovery is not like a cart losing its wheels because the labor market remains healthy and housing activity is picking up," said Thomas Costerg, a U.S. economist at Standard Chartered Bank in New York.

Jervis '11 [Robert Jervis, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December, "Force in Our Times," Survival, Vol. 25, No. 4, p. 403-425]

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

No economic war impact

Katoch '09 [Rajan Katoch, Institute for Defence Studies and Analyses, New Delhi The Global Economic Crisis Some Strategic Implications, First Published: August 2009]

Despite the above factors, the situation is not the same as in the 1930s, and in today's world, it is highly improbable that the global economic crisis could lead to a world war as it did then. The international order is relatively more stable, with all major powers working with greater coordination, and mostly seeking to stick to the status quo. Learning from experience, the current national economic

policy responses are better formulated, and therefore the economic crisis is unlikely to reach the severity of and linger on for as long as the Great Depression. The greater role being played by fora like the G20 in seeking solutions to the crisis indicates the recognition amongst the key players from both industrialised and developing countries that a broad consensus is needed to move forward. And finally, all this is backed by the hard fact of the overwhelming military dominance of the US; this acts as a force for stability. Localised conflicts remain possible; perhaps a serious threat arising out of collapse of critical states at worst, but a world war—most unlikely.

Ext- Econ resilient

The US economy is resilient

Hamilton '09 [Brian, CEO of Sageworks, Inc., member of the Texas Society of Certified Public Accountants, "The United States Will be Just Fine," http://www.tscpa.org/Currents/EconomyCommentary.asp]

There is probably something in humans and in every generation that makes us think that the problems we face are uniquely difficult. Much has been written about the economy and, if you accept certain assumptions from what you read, you might think that we are in the midst of a global depression. Yet, it is important to put the current economy in perspective. We might even try reviewing and analyzing some objective data. Last quarter, GDP fell at a rate of 0.5%, which means that the total value of goods and services produced in the U.S. fell by a half of one percentage point last quarter over the previous quarter. (1) For the first two quarters of this year, GDP grew by 0.9% and 2.8%, indicating that economic growth is relatively flat this year, but that it is not falling off a cliff. This isn't the first time GDP has fallen and it won't be the last. A decrease in GDP after almost 6 years of increases is not positive, but almost predictable. No economy grows indefinitely and consistently; there are always temporary lapses. In fact, if you consider the media coverage of the economy over the past year and the consequent way people have been scared, it is remarkable that anyone is buying anything. Some would say that we cannot only look at GDP, so let's look at other factors. Interest rates remain at historically low levels. (2) This means that if you want to borrow money, you can borrow money inexpensively as a bus iness or as a person. Loan volume in the country, according to the FDIC and contrary to what you read about the credit crisis, actually increased last quarter compared to the same quarter last year. (3) Someone is getting loans and they are not paying excessive interest rates for them. How about employment? According to the Bureau of Labor Statistics, unemployment sits at 6.7%. At this time last year, unemployment was 4.7%. The decrease in employment is not favorable, but historically an unemployment rate of 6.7% is not close to devastating. The 50-year historical rate of unemployment is 5.97%. (4) Most economists agree that the natural rate of unemployment, which is the lowest rate due to the fact that people change jobs or are between jobs, is around 4%. So, today we sit at 2.7% above that rate. Once again, the very recent trend is not good but it is certainly not horrifying. I have noticed many recent media references to the Great Depression (the period of time between late 1929 and around 1938 or so, depending upon the definitions used and personal inclinations). It might be illuminating to note that by 1933, during the height of the Depression, the unemployment rate was 24.9%. During that same time period, GDP was falling dramatically, which created a devastating impact on the country. Americans have good hearts and empathize (as they should) with those who are unemployed, yet it would be easy to go too far in our assumptions on how the working population is currently affected in aggregate. If 6% of the people are unemployed, approximately 94% of the people are working. We should always shoot for full employment, but why would we view our efforts as poor when we don't quite make that mark? A good student might try to get straight A's, but getting an occasional "B" or "C" won't end the world. Look at personal income today Personal income is income received by individuals from all sources, including employers and the government. Personal income rose last quarter compared to a year ago according to the Bureau of Economic Analysis. Compared to five years ago, personal income has risen by 32.1% . Even considering that inflation was 18.13% over this period, people are generally making more money than they used to. This is another one of those statistics that can easily get bent to fit a story. You often hear things like "personal income fell last month by 23%", but writers tend to leave larger and more important statistics out. In this case, wouldn't you be more interested in trends over a quarter or a year? using isolated statistics to fit your view is something that has become accepted and rarely challenged. Next, there is inflation The inflation rate measures the strength of the dollar you hold today as compared to a year ago. The inflation rate is currently 3.66%. Over the past 50 years, the inflation rate has averaged about 4.2% . Inflation remains well within control. Yet, would you be surprised to read a story next month citing an X% jump in inflation over the last day, month? I wouldn't be. (Ironically, the one thing about the economy that is alarming from a historical standpoint is our national debt, which gets some but not enough media coverage. We now owe $10.6 trillion and have become a debtor nation over the past several decades. We now depend on the goodwill and investments of outside countries, while we continue to spend more than we

make). Now, the skeptics reading this will undoudebtly point to other (I believe, far lesser) statistics that validate their gloomy view of the economy and the direction of the country. I ask the reader: if people are employed, are making good wages, can borrow inexpensively, hold a dollar that is worth largely what it was worth a year or five years ago, and live in a country where the value of goods and services is rising, tell me exactly where the crisis is? There is no doubt that the economy has slowed, but slowness does not equal death. It is true that the financial markets are a mess (and the depreciation of the value of equities is both scary and bad), but analysts typically go too far in ascribing the fall of the financial markets with the fall of a whole economy. The markets are an important component of the economy, but the markets are not the totality of the economy. No one can say whether conditions will worsen in the future. However, we have learned that the United States economy has been tremendously resilient over the past 200 years and will probably remain so, as long as the structural philosophies that it has been built upon are left intact. Americans are hard-working and innovative people and the country will be just fine.

Plan can't solve indirect surveillance

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

Especially over the past decade, these direct post-entry enforcement programs have been supplemented by a growing number of indirect enforcement initiatives.85 These indirect initiatives restrict access to rights, benefits, and services on the basis of immigration or citizenship status, thereby requiring both public and private actors—including social service agencies, educational institutions, hospitals, driver's license bureaus, employers, landlords, and transportation carriers—to verify immigration and citizenship status to make eligibility determinations. These initiatives enforce immigration law indirectly insofar as they are not always intended primarily to apprehend potentially deportable individuals but nevertheless seek to encourage "self-deportation."86 They also can facilitate direct enforcement by collecting and storing information that later can be used to identify and arrest potentially deportable individuals. Indirect enforcement programs can operate more directly when they require reporting of individuals suspected to be potentially deportable to immigration officials.87

Federal action alone fails- other actors will continue crackdowns

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

This emphasis on interoperability in immigration governance has been particularly great as the federal institutions involved in immigration regulation have become more fragmented. With the creation of the Department of Homeland Security, most immigration policy functions were transferred from a single agency within the Department of Justice (the INS) to multiple agencies within DHS (USCIS, CBP, and ICE)—even as other immigration-related functions have remained vested within the Department of Justice, Department of State, Department of Health and Human Services, and Department of Labor. Moreover, as immigration control activities have proliferated in a variety of new state, local, and private

institutions, and the overall scale of enforcement has skyrocketed, the number of public and private actors performing immigration enforcement functions has grown exponentially. In this context, the post-2001 emphasis on information sharing for national security purposes has also given a boost to initiatives to make the technological systems used for immigration control by different agencies interoperable with each other and more widely accessible to different actors involved in immigration enforcement.158

Undocumented migration is inevitable- current policies don't deter immigrants

To this point, the addition of incremental enforcement measures has had a limited impact on undocumented immigration from Mexico.15 The U.S. government simply has been unable to keep migrants—who are so determined that they are willing to risk their lives—from unlawfully entering, and remaining in, the country.16 It makes little sense from an immigration or security standpoint to simply continue to throw resources at fortifying the borders, increasing border enforcement, and engaging in the futile attempt to keep all undocumented immigrants out of the country. The U.S. government has engaged in limited efforts to remove noncitizens who lawfully entered the country on temporary visas, such as students and tourists, but overstayed their terms. Visa overstays likely constitute somewhere between twenty-five and forty percent of the undocumented population.17 Increased monitoring of nonimmigrant visa holders after September 11 does not appear to have had much of an impact on reducing visa overstays. Raids and increased interior enforcement pursued by the Bush administration also have not reduced the undocumented population in the United States.18

State and local governments also have been active in adopting indirect enforcement initiatives.95 For example, some jurisdictions have supplemented IRCA with employer sanctions regimes of their own, for which the Supreme Court has recently held that IRCA itself leaves some room.96 Other indirect initiatives go well beyond employer sanctions laws by significantly expanding the circumstances in which eligibility criteria for various services and benefits are based on citizenship or immigration status. These initiatives have dramatically expanded the categories of public and private actors that are placed in the position of collecting, storing, verifying, and disseminating immigration and citizenship status information, together with large quantities of other personal information, on a day-to-day basis.97

Issue?”

Immigration Regulation Is a Federal Power: State and local police are not required to enforce federal immigration laws. The federal government and its agencies are the authorities responsible for enforcement of immigration law. "The power to regulate immigration is unquestionably a federal power."4 With such power, the federal government has enacted laws, such as the Immigration and Naturalization Act (INA), that regulate a person's entry into the United States, his or her ability to remain in the country, and numerous other aspects of immigration. But these federal laws do not contain any provisions that "require state law enforcement agencies to assist in enforcing the INA." This was the conclusion of a memorandum of opinion by the U.S. attorney for the Southern District of California dated February 5, 1996. Even where Congress has the authority under the Constitution to pass laws requiring or prohibiting certain acts, it lacks the power directly to compel the state to require or prohibit those acts.5 Congress "may not directly force states to assume enforcement of administrative responsibilities constitutionally vested in the federal government."6 Therefore, federal law does not require state agencies to assist the federal government in enforcement of immigration laws.

Ag robots solve farm productivity and worker shortages

LDL Voice 4-30-15 [Load Delivered Voice is a communication outlet for Load Delivered Logistics is a technology-enabled third-party logistics (3PL) firm, “Using Robots to Combat the Farm Labor Shortage,” http://www.loaddelivered.com/blog/communications/using-robots-to-combat-the-farm-labor-shortage/]

During the last century, there were an estimated 3 million migrant and seasonal farm workers in the U.S., but that number has declined significantly to around 1 million today. Despite offering better wages in recent years, farms are struggling to attract workers due to the nature of the work. People don’t want to take on back-breaking labor when there are other options available. Farms now face up to a 30 percent shortage of workers, and that number may increase if they don’t adjust the way they do business (CNBC). Fortunately, technological advances are making it possible for robots to handle laborious farming tasks, which could benefit U.S. farms that are currently struggling with a labor shortage. Enter the Robots To offset the labor shortage, many farms have turned to technology as

a solution. Growers of corn and other commodity crops led the charge on this front, replacing most of their workers decades ago with giant combines and other machines used to cut and gather grain. Now, we're seeing the emergence of robots that can perform more tedious jobs like picking produce and plants. A Spanish company recently developed what they call an Agrobot, an automated harvester that automates the process of picking small produce like strawberries. This 14-armed machine uses high-powered computing, color sensors, and small metal baskets to gently pluck ripe strawberries, ignoring any unripe fruit in its path. Devices that handle tasks like planting vegetable seedlings, harvesting lettuce, transplanting roses, and pulling weeds are also emerging. These mechanized solutions that assume delicate tasks formerly only possible by human workers could have a huge impact on the fresh-produce industry (The Wall Street Journal). Added Value Though this new technology has a high upfront cost, the return on investment can be significant. For example, each Agrobot currently costs $100,000, but the cost of leaving a field unpicked due to no workers available can be a lot more expensive—sometimes resulting in millions of dollars lost. Mechanization of the fresh-produce industry could especially help California produce farmers, who are struggling with a devastating drought. Farming robots can also drastically increase speed of operations. Tanimura & Antle Fresh Foods Inc., one of the country's largest vegetable farms, found that they could reduce work hours for growing romaine and celery by up to 15 percent with an automated tool that transplants seedlings from greenhouse to field (The Wall Street Journal). Getting tasks like these done faster frees up worker hours that can be used for other important tasks, further increasing productivity. Weeding robots, such as LettuceBot by Blue River Technology, are also being developed, which could potentially reverse the use of harmful herbicides that threaten the health of insect and animal life. These robots bring more precision through spot spraying weeds, rather than blanket spraying entire fields (Earth Island Journal).

Raising the minimum wage is an economic silver bullet

Solomon '14 [Marty Solomon is a retired University of Kentucky professor of business and economics, "Marty Solomon: $15 minimum wage would be economic silver bullet," http://www.kentucky.com/2014/11/17/3542896_marty-solomon-15-minimum-wage.html?rh=1]

Despite corporate profits near all-time highs and the stock market's record levels, middle class incomes have fallen. The disparity between rich and the rest has never been greater. The average income of the 400 richest Americans is $130,000 an hour. The average income of the top million taxpayers is $800 an hour. Yet the average American earns $24 an hour. While the bottom 40 percent of Americans earn 7 percent of the income, the top 1 percent earns 20 percent. This disparity seems to be the new normal. What is the answer? Many things have been tried — stimulus, quantitative easing, earned income credits — yet most Americans have been left out. **There is** something that has not been tried and could make an immense difference — **a silver bullet**. Drum roll, please. **It's the $15 minimum wage for workers 18 or older**. Today 40 percent of households earn less than $25,000 a year. That is $11 an hour and that's poverty for a family of four, so even a $10.10 minimum wage seems too puny. But a $15 minimum wage could change things overnight. Guess what? None of America's millions of adult full-time workers would be in poverty. Imagine that. And guess what else? It would pump at least $400 billion annually into the economy, creating enormous demand for retail, housing and autos; requiring businesses to increase hiring, and, at the same time, permit millions of American families to enjoy a better standard of living. Billions in welfare payments would be saved; federal income tax revenues would rise, helping to reduce the federal deficit. State income tax revenues would also increase.

Plumer '14 [Brad, senior editor at Vox.com, where he oversees the site's science, energy, and environmental coverage, "America is running out of farm workers. Will robots step in?" July 2, http://www.vox.com/2014/7/2/5861274/americas-running-out-of-farmworkers-will-robots-help]

Labor-saving techniques have been a mainstay of agriculture since the very beginning. Farmers have always tried to do more with less. To take one example: The recent growth of "no-till farming," which involves less plowing and more herbicides to kill weeds, has reduced demand for labor on some farms. But if a massive farmworker shortage really is on the way in the decades ahead, those labor-saving techniques will have to have to expand massively. Enter the machines. In recent years, companies have been developing driverless tractors guided by GPS. Or drones that can monitor plant health from afar. Or sensors that can automatically figure out where fields need water. Or fully autonomous cow milkers. In Australia, there are even robots that herd cows and sheep around: Robots are slowly expanding into other areas, too. Blue River Technology is developing a robot that uses sensors and algorithms to identify weeds and pluck them. In 2012, the company unveiled a prototype that can thin out lettuce crops in order to give the remaining plants room to grow — a task that usually requires dozens of workers. Fruit-picking is another area where robots could make a real difference. New Scientist notes that the state of Washington produces 17 billion apples each year — each one plucked by a human hand. A labor shortage would threaten that harvest. So a research team at Washington State University is spending the next five years developing a robot to do the job. That said, there are certainly skeptics. At the Oxford Farming Conference in the United Kingdom in January, some experts argued that many existing ideas for agricultural robots would take decades to catch on — if at all. A lot will depend on how quickly the price of human labor rises and how fast the price of machines falls. But if they do catch on, how would this shake out economically? In a 2012 presentation, Taylor and his colleague Diane Charlton looked at the lessons from "shake-and-catch" machines that surround a tree and shake out the fruits or nuts into a large basket. Whenever these machines have been adopted, they note, they typically displace large numbers of low-skilled foreign workers with a few native-born workers with high-school or college degrees. That suggests that a larger-scale shift to farm robots could be a boon to domestic farm workers (studies have found that 23 percent of US farm worker families are below the poverty line). But Taylor and Charlton noted that a shift to robot farmers would likely have other effects as well. The US may see increased demand for higher-skilled agricultural laborers from abroad, for instance.

Robots solve agricultural productivity

Merritt '14 [Ginger, holds a degree in agricultural journalism from the University of Missouri, "Can Ag Robots Clear The Obstacles?" July 9, http://www.precisionag.com/institute/can-ag-robots-clear-the-obstacles-pa-institute-content/]

That scenario might seem far-fetched and futuristic, but with automation in agriculture exploding, it might not be so off-base. Technological advances in agriculture are growing by leaps and bounds, and farmers and agricultural companies are boarding the ag robotic train. They see a bright future. "I picture a small shed in the corner of every 160-acre field with a tractor and a multi-purpose tillage/planter/sprayer tool," said Todd Golly, Winnebago, MN, farmer. "The tractors will be fully autonomous, identically built for cost savings." Industry experts can see that vision, too. Jorge Heraud, CEO of Blue River Technologies, said that ag robotics is a complicated topic, but he believes it will take the industry by storm. "Ag robotics will be everywhere," he said. "The question is when." Mike Gomes, Topcon director of agriculture business development, agrees that the ag robotics industry is strong and growing. He said he sees agriculture transforming from one machine per operator to many machines per operator. "We're ready to help the industry move on to the next levels of automation," he said. From the cotton gin in the 1830s to the monster combines of current day, agriculture has undergone a technology revolution that is not even close to ending. One of the first ways that robotics made their way into agriculture was in the form of autosteer in tractors. "Our farm, like many others, has used autosteer for years; this was probably the first form of widely accepted 'robotic' technology," Golly said. Farmers have fully embraced that technology and are welcoming more updates and equipment that make their everyday lives easier. "We have now moved into using fully autonomous unmanned aerial systems for crop scouting," said Golly, who farms his family's 7,000-acre corn and soybean farm in southern Minnesota. "We can scout hundreds of acres in the time it used to take to do only a few." Ag robotics increase efficiency on the farm. Many experts feel that one of the biggest ways this technology can help the industry is in the form of labor, which is becoming increasingly difficult to secure, especially in the labor-intensive fruit and vegetable fields. The amount of manual labor in agriculture lends itself to robotics, Heraud said, and his work at Blue River Technologies in California recognizes that opportunity. Their lettuce bot will mechanically thin the fields — a task that is currently done by humans. Heraud said that using robots for this type of work not only answers the labor-shortage call but performs at a higher level. "The better you thin the lettuce, the more uniform stand you have and the more yield you get," he said. "So, we have created this machine that can thin much better than a human can." Blue River currently has three lettuce bots in operation that are hired by farmers and operated by Blue River staff. The company has only been working on the technology for a little more than a year, but the robot is already in its third generation. Heraud said that they are rolling the equipment out in this way to ensure that the farmer gets the best results from the machines in its early stages of development. "It's very possible that we will mass produce this robot, but the first thing that needs to happen is to get the technology stable," he said.

Tobe '14 [Frank, "Will agricultural robots arrive in time to keep fruit and vegetable costs down?" July 11, http://robohub.org/will-agricultural-robots-arrive-in-time-to-keep-fruit-and-vegetable-costs-down/]

The race has been slow-going up until now. Farmers are very pragmatic and cost conscious. They have gradually moved toward precision agriculture (AKA satellite farming or site specific crop management (SSCM)). (Precision agriculture is farming management based on observing and responding to intra-field variations.) But they have not yet embraced robotics. They are beginning to experiment with data from aerial robots, kits that enable self-driving of tractors, and advanced GPS and communications systems, but for a variety of reasons have not moved past the experimental phase. If and when new robotic products do their jobs efficiently, reliably and economically AND low-cost labor cannot be found, farmers will change their methods and begin to deploy robots. They haven't needed to until now. The only real questions are (1) whether the robots will be funded, developed, field tested and produced in time, (2) will these new devices do their jobs properly and economically, or (3) will consumer prices need to rise to compensate for higher wages because no robots could be adapted to the work? Here are some of the factors effecting change: Migrant labor: Farm wages in Mexico are rising, giving jobs to those that used to go to the US for work Other less gruelling jobs are becoming available within Mexico and in the US, providing choices where there were few before Fewer migrant workers are coming to the US each year States are passing and enforcing stricter immigration laws deterring undocumented workers Income is a major factor in the migration away from farming: Farm production expenses in the US average $109,359 per year per farm while less than 1 in 4 of the farms produce gross revenues in excess of $50,0003 Use of robots: Researchers are forecasting expansion of the agricultural robot market from $817 million in 2013 to an anticipated $16.3 billion by 20204 Robotic harvesting, irrigation, pruning, weeding and thinning devices are being field-tested all around the world Robotic spraying and seeding have been going on in Japan and Australia for years Driverless tractors are beginning to be deployed and provide less compaction than do traditional tractors Robotic cow milking systems are making inroads in the US Nurseries are beginning to use pick-and-place robots Aerial observation robots will likely add to the precision of the global precision agricultural movement once FAA regulations are in place in late 2015 ABB, KUKA and Yaskawa have made little inroads in the industry although they do provide robots to help make farm tools and tractors and material handling equipment Fanuc, KUKA and Adept have a presence in food sorting and processing but not in growing or harvesting Other drivers: Using LED lighting has enabled year-around indoor farming which further enables the metrics for greenhouse robotic processing Better and more specific crop, chemical, air and soil sensors – all at low cost – enables better understanding of crop variability and improves precision methods Learning systems and big data processing help farmers overlay more and more data to understand their farms better and make their precision methods more accurate Swarm technologies and better telematic systems can optimize equipment and control swarm activity, e.g., variable rate swath control to save on seed, minerals, fertilizer and herbicides by reducing overlapping Governmental funding in the US has been paltry: the USDA has awarded grants totaling $4.5 million for robotics research. Growers Associations and large ag equipment producers have given research grants or done internal R&D supplementing the USDA. Venture capital firms, in a quest to incubate new technology for the industry, have invested $71.1 million in 8 ag-related start-up companies in the last two years5. European public-private-partnerships for various agricultural projects (shown below) has been sufficient to give an edge to EU ag equipment providers as well as start-up companies.

Even with this good news, it is essential to dig into the numbers to understand what they mean both for families still struggling to make ends meet and for the work we still need to do to create more jobs at higher wages. We have further to go — especially given a long-term unemployment rate that is still too high and wages that have been stagnant for decades — but our challenges should not distract us from understanding the progress we have made. Skeptics point to the higher unemployment indicated by a broader gauge of unemployment and underemployment that includes people involuntarily working part time and those who have not looked for a job recently but who still want to work. But this criticism ignores that this measure is always higher than the official unemployment rate and that it has also come down steadily, falling by more than 5 percentage points from its peak in early 2010. Another claim is that the only reason unemployment has fallen is because people are dropping out of the workforce, what economists call a decline in the participation rate. In fact, since October the participation rate has been stable, so the 1.1-percentage-point decline in unemployment since then stems entirely from more people finding jobs. It is true that the participation rate has fallen over the course of the recession and recovery. But it is important to put that fact in context. According to a range of studies, including our own analysis at the Council of Economic Advisers, about half of the decline is due to the beginning of a retirement boom as the first baby boomers turned 62 and became eligible for Social Security benefits in 2008. This fully anticipated economic event will continue to put downward pressure on the participation rate for decades. The retirement boom is layered on top of other trends unrelated to

aging, such as the decline in participation by men between ages 25 and 54 since the 1950s and the decline by women in those same prime working years since the late 1990s. In fact, a 2006 study by economists at the Federal Reserve that considered these trends projected that the labor force participation rate would fall to 62.9 percent this year, almost exactly its current level. Of course, in addition to these trends, whenever the unemployment rate is elevated, the participation rate will be lower, as people seek further schooling, delay reentering the workforce after leaving for reasons such as caring for a newborn, or get discouraged and stop looking for work. These effects have likely been exacerbated by the unique challenges associated with the worst recession since the Great Depression, but they have diminished as the labor market healed, and further healing will continue to push the participation rate up, roughly offsetting the continued decline due to the population aging. Correctly diagnosing the challenges we face points us to what we can do to spur more job creation, raise wages and bring more people into the labor market. First, Congress should take steps to invest in infrastructure, extend unemployment insurance benefits and reauthorize the Export-Import Bank. In the absence of action from Congress, President Obama will press forward by using his executive authority to expand credit in mortgage markets, speed the permitting of infrastructure projects, launch new hubs of manufacturing innovation and attract foreign investment. While a strong overall recovery is the most powerful solution to long-term unemployment, we should not overlook some of the unique challenges the long-term unemployed can face. That is why this year the president required the federal government to improve its hiring practices, announced new grants to expand some of the most promising public-private efforts to connect the long-term jobless with work, and rallied some of the nation's largest employers to commit to best practices for hiring the long-term unemployed. Second, a stronger economy will help raise wages, and, conversely, **higher wages will help strengthen the economy. That is why it is essential to raise the minimum wage**. While Congress has waited to act, many states and businesses are moving ahead. At the same time, investments in everything from preschool to college will raise longer-term wage growth.

Higher wages bolsters the economy

Perez et al '14 [U.S. Secretary of Labor Tom Perez was sworn in on July 23, 2013, as the nation's 26th secretary of labor. Tom Harkin is a Democratic senator from Iowa. George Miller, a Democrat, is U.S. representative for California's 11th congressional district and former chairman of the Education and the Workforce Committee, "Raise minimum wage; working people should not live in poverty," October 10, http://www.cnn.com/2014/10/10/opinion/perez-harkin-miller-minimum-wage/]

Every day for low-wage workers is filled with struggle and anxiety. We have heard from and visited with people making heartbreaking decisions about which bill to pay, which meal to skip, which growing child will get a pair of shoes this season and whether to buy a gallon of milk or a gallon of gas. For many of us, an unexpected car repair is an inconvenience; for a minimum-wage worker, it is a catastrophe. The national minimum wage of $7.25 per hour is unconscionably low. It is an affront to our values, and it has remained unchanged for more than five years. During that time, the cost of food, utilities, transportation and other essentials has gone up, but low-wage workers' paychecks have remained the same. In fact, the purchasing power of the minimum wage has been eroding steadily (PDF) since its peak in the late 1960s. Today's minimum wage would have to be well above $10 per hour to equal the purchasing power of the minimum wage in 1968. Too many low-wage workers must rely on public assistance just to keep their heads above water. Raising the minimum wage would allow up to 3.6 million people to come off the food stamp rolls. These workers would have the dignity and satisfaction of buying food with their own paychecks while American taxpayers would no longer have to pony up billions of dollars to subsidize the large companies that build wealth for shareholders on the backs of their workers. Fortunately, many businesses are turning away from this low-road business model. Poll after poll shows that employers -- especially small businesses -- are rallying around $10.10. We've seen it firsthand in visits to these businesses, where they know that higher wages strengthen their bottom line by increasing employee loyalty, retention and productivity. Businesses also know that they need customers with money in their pockets. When working families get a raise, they don't stash it in offshore tax havens. They pump it right back into their local economies at the grocery store, hardware store or auto body shop. Increasing the minimum wage boosts consumer demand, growing our economy and helping communities thrive. Henry Ford understood this. A century ago, long before there was a federally mandated minimum wage, he doubled the pay of the workers on his assembly line because he thought they should be able to afford the very cars they were making. He said, "If we can distribute high wages, then that money is going to be spent and it will serve to make storekeepers and distributors and manufacturers and workers in other lines more prosperous. ... Countrywide high wages spell countrywide prosperity."

AFF Answers- Ag Robots

Ag robots fail- raises costs for producers and consumers

LDL Voice 4-30-15 [Load Delivered Voice is a communication outlet for Load Delivered Logistics is a technology-enabled third-party logistics (3PL) firm, "Using Robots to Combat the Farm Labor Shortage," http://www.loaddelivered.com/blog/communications/using-robots-to-combat-the-farm-labor-shortage/]

Though the use of farming robots brings increased efficiencies and long-term cost savings to farmers, it does have some disadvantages. The need for maintenance and repair can be costly, especially while some of these technologies are still being developed. High up-front costs of purchasing the new machines will likely be passed along the supply chain, resulting in higher prices for consumers in the short term. Additionally, some worry that robots will eliminate farming jobs that are still needed and give an unfair advantage to large growers that have more money to invest in such products.

Robot workers fail- immigrants solve agriculture best

Smith '13 [Scott, head of futures research lab Changeist, reporter for Quartz, a news publication, "Robotic farm workers won't improve food prices or labor costs," July 24, http://qz.com/106838/robotic-farm-workers-wont-improve-food-prices-or-labor-costs/]

One government estimate places the size of the illegal workforce in agriculture at just under 50% between 2007 and 2009, or roughly 1.5 million workers, according to the National Center for Farmworker Health. Labor costs make up 42% of variable costs for fruit and vegetable production in the US, according to the US Department of Agriculture's Economic Research Service (ERS). Withdrawing this low-cost source of maintenance, picking and packing labor, much of which is paid below minimum wage, could fuel rising commodity costs for farm-grown food at a point when the US consumer is still very sensitive to food price increases. Add to this an already shrinking immigrant pool from which to draw, eroded by Mexico's improving economy for one, and farmers are increasingly in need of new, predictable, and price-stable forms of farm labor—all of which, a shiny new worker on wheels is promised to provide. Luckily for them, robotics specialists have been increasingly happy to oblige with new creations that pick everything from lettuce to soft fruits to mushrooms to cotton, at a rate that their inventors promise can increase efficiency twenty-fold, drastically reducing the number of workers needed to cover the same acreage. Additionally, they aren't just picking, but planting, thinning, weeding, and even spraying pesticides from unmanned aerial vehicles, the latter of which becomes easier when removing humans from the mix, avoiding fears of contamination and illness through exposure to these chemicals. Robots even open up possibilities of changing the shape of the farm itself, automatically managing indoor hydroponic farms, for example. (Some are even considering how robotic farming could be applied in space.) Look, 3D Oranges! Some of the big technology shifts that have accelerated the development of farm robots have been in the allied fields of machine learning and machine vision. Robotics researchers have focused, in part, in recent years on teaching their creations how to spot a ripe strawberry, for example, and then gently remove it, skipping the unripe ones along the way. Companies such as Vision Robotics are teaching multi-armed orange picking units to capture 3D images of orange trees, and the fruit hiding in them, to pass on to grabber arms, while Stanford-launched Blue River's robots are learning to visually spot weeds and inject lethal doses of fertilizer into them. Still, researchers admit farm beds and planting techniques will have to be altered to meet some of this technology half way, creating new costs in order to accommodate these new forms of labor. Additionally, the handling expertise that a knowledgeable picker gains, which tells him or her just how lightly to twist a pickable peach, wine grape, or hot pepper in order to collect it without bruising, will take more time to perfect. And, the knowledge gained by experienced pickers of a particular field or orchard's condition aren't captured either by machine labor. Whose paycheck are we lowering, anyway? The direct costs of shifting from human to robotic farm labor aren't yet favorable enough to make the return on investment incredibly attractive—some first-generation industrial units cost upward of $1 million, far more than the workers they replace (and some workers will still be needed, a la Amazon, to "manage" the devices). What they do provide is a lack of unionization headaches, a stable workforce that isn't susceptible to seasonality, reactionary legislators, or the vagaries of a militarized border. Robotic farm labor represents an area where particularly populist politicians might find themselves in an uncomfortable position, decrying both illegal immigration and falling wages. As some have pointed out in the recent debate about technology and labor, automation is already eating into the wages of workers in industrialized markets, and turning farming over to much higher levels of automation is not, in the case of the US economy, going to free labor to pursue higher skilled work. It may in fact further erode the immigrant base that in past eras refreshed our culture, and even today helps prop up the economy itself. There are elements of the

agricultural economy that will undoubtedly benefit from robotic labor. In the best case, a complementary economy might emerge, exposing some farm workers to opportunities to manage and maintain higher levels of automation, and not simply live in an either/or world of robot vs human. A close look at the new innovations touted in automated agriculture shows that, while amazing advances are being made, and new efficiencies found, bringing these costly units up to a level of skill and insight that an experienced farm worker possesses requires forging a huge number of difficult algorithms. The promise of even lower cost food and fewer legal headaches shouldn't mask the complexity of developing and deploying technology that can do the job required. We will be getting a greater array of machine labor on the farm in the very near future, but, breathless headlines aside, it probably won't be panacea that both engineers and politicians hope for.

Ag robots aren't flexible enough to solve

Merritt '14 [Ginger, holds a degree in agricultural journalism from the University of Missouri, "Can Ag Robots Clear The Obstacles?" July 9, http://www.precisionag.com/institute/can-ag-robots-clear-the-obstacles-pa-institute-content/]

Topcon is working with a number of industry recognized original equipment manufacturers (OEMs), like AGCO, to supply on-board technology. Any new technology has limitations, and Harvest Automation's Kawola said the challenges are not small. "Ag has been historically slow to adapt new technology," he said. "There's a bias to do things the way your father did. The flip-side is that in ag, once you establish that a product is good, there's a camaraderie among farmers to share advice. They will tell their friends about the good and warn them about the bad." Kawola also said that companies building the technology need to be mindful to create it in a way that does not change the skill set needed to operate it. "We track usage and training levels on our robots, and we know that 90% of the instructions put into the robots are Spanish," he said. "The point is that the technology companies have to build the technology so that the use of the tech on the farm is as easy as possible." Another limiting factor in ag robotics is price. Technology needs to be at the point where the cost is right, Blue River's Heraud said. "The bar is set high in the Midwest when it comes to farming," he said. "People have been working on making ag the best it can be through large, efficient equipment." John Deere's Keim also sees money as an issue when implementing these new technologies, along with keeping up with the different technology available. "There are different price points for this technology," she said. "It's not anything different than what the automobile industry faces; the industry has to get the technology down to a price point that makes sense. "When considering unmanned equipment, even if it is small, safety is a concern that is top-of-mind for companies like Deere. "When a machine is running without an operator, safety obviously needs to be of utmost concern," Keim said. Schildroth said that ag robotics are limited by their lack of human intuition — the situations that humans would see and be able to take care of on their own. If a row unit plugs up, a farmer would quickly fix it and get it running again. The robot has to have a way to correct situations like those on its own without calling someone into the field every 10 minutes. Another challenge is that every farmer does things differently, said Schildroth, but the robots would respond the same every time, which causes farmers to lose some of their ability to customize. Grower Golly also sees this obstacle when thinking about the future of ag robotics. "The issue with the ag industry itself is the fact that it is so varied," Golly said. "We have so many crops and so many management systems that it's difficult to make a one size fits all solution that works and is affordable for all farmers.

AFF Answers- Minimum wage

A higher minimum wage won't solve the economy- effects are small

Patton '14 [Mike, Certified Financial Planner, economic analyst for Forbes, "The Facts On Increasing The Minimum Wage," 11-16-14, http://www.forbes.com/sites/mikepatton/2014/11/26/the-facts-on-the-minimum-wage-increase/]

Would raising the minimum wage to $15 per hour help our economy? Follow along as I provide some facts (data is from 2012-13). The total U.S. labor force was roughly 158.7 million. About 47%, or 75.3 million workers, were paid an hourly wage. Of all hourly workers about 4.7%, or 3.54 million, earned a wage equal to or below the minimum wage. For our discussion, let's assume the entire group earned the minimum wage. If you multiply the number of workers who earned the minimum wage by the current minimum wage, you'd get the total wages earned by this group (3.54 million X $7.25 = $26.1 million). If everyone of these workers received an increase to $15 per hour, the total wage earned by this group would be $54.0 million. This represents an increase of $27.9 million. If 100% of this income was spent on products and services, it would only equate to 1.25% of total U.S. GDP. Here's my point. This increase, even if completely spent (which is doubtful), would not be very significant. Therefore, in my view, the economic benefit "argument" is a red herring. What should a worker be paid? How Much Should a Worker

Be Paid? Most agree that a worker should be paid what he or she is worth. In other words, a worker should be paid a wage commensurate with the skills required for the job. Under this assumption, the minimum wage argument is weak. Why? First, in a true, free-market economy (which is not what we have), the labor market would set the rate of pay for all jobs based on a number of factors. Consider this. Should a 16 year old flipping burgers at McDonald's be paid the same as a 30 year old single mother working as a certified nursing assistant? Currently, these vocations receive about the same wage. What does the single mother's maternal status have to do with her rate of pay? Nothing really. But this is the type of argument we find today. It's all about the poor, suffering, and needy and how the government will fix all of our woes. Don't misunderstand, I feel for these people, regardless of the circumstances which brought them to a difficult place. Even if it's all their own doing. I'm simply trying to make a point that economics are blind to emotion. There is another possible downside to a drastic increase in this wage. Raising the minimum wage from $7.25 to $15.00 could put pressure on other lower-paying jobs which pay slightly more than the existing minimum. This could cause stress in the compensation structure of many small businesses. In fact, any mandate from the government which increases the cost of doing business could result in a number of consequences, mostly negative. First, it could cause prices to rise as businesses attempt to protect profit margins. Next, it could cause a loss of jobs if the business is forced to reduce expenses, again, to maintain profitability. It could also lead to an increase in automation, depending on the specific job. Finally, it could have little or no effect on small businesses, if an adequate profit margin already exists and the owner is willing to absorb the additional expense. Conclusion Even though it's true that raising the minimum wage would result in more money for those who receive it, because it is so low (hence the word minimum), **it would have very little effect on the U.S. economy**. Therefore, I think this is more about class envy than anything else. And, like so many arguments today, you can't overlook the political component.

CP can't solve the economy

Royer '14 [Jordan, Vice President for External Affairs in the Seattle office of the Pacific Merchant Shipping Association, "A $15 minimum wage won't be anyone's silver bullet," March 6, http://crosscut.com/2014/03/15-minimum-wage-kshama-sawant-socialist/]

First, raising the minimum wage so high locally could bring a number of unintended consequences with the potential to hurt those we want to help. It's already very difficult for young people to get employment experience. At $15 per hour, summer jobs will be all the more difficult to get, making it almost impossible for young people to find work and develop a work ethic through their experience. I worry that this move so quickly will make the problem worse. A more moderate increase at the national or state level would be a better option. Second, large corporations can probably absorb the immediately higher costs. Our local restaurants and retail businesses will have a much tougher time. Will this result in closures or fewer yet more experienced employees? Will employer participation in healthcare be reduced or eliminated to absorb the increased cost? And will companies be willing to take a chance on young people or immigrants with limited English skills? The mayor's task force on income inequality has been debating and receiving briefings from experts about the effects of raising the minimum wage since the beginning of the year. The challenge for Seattle is that no one has raised it to $15 so quickly. Even SeaTac's Prop. 1 only impacts certain economic sectors and exempts small businesses and those with a union contract. Some people point to San Francisco's minimum wage as an example of what we should do here. At $10.74, it's the highest in California, but only a little over a dollar more than the State of Washington's. And although San Francisco has implemented a minimum wage bump alongside rent control to make the city more affordable for working people, they are suffering more and more from the relentless march of gentrification. The reason is simple: The city's blue-collar family wage jobs left long ago. Seattle still has plenty of decisions about minimum wages left on its plate: What should our minimum wage be? Will it be phased in over time? Is total compensation counted in the minimum? Will businesses with labor contracts be exempt? Will there be other exemptions for non-profits, types of industry, or size? Will the city include some sort of tax relief for small businesses as part of the package? Rather than debate whether Seattle should pick $15 or $11 or $25 though, it might be better to discuss the problem in a larger context. How do we help people move up the economic ladder? Still, there are plenty of good jobs available in the Northwest — and no, they're not all tech companies. Many are in maritime and manufacturing, which, though they may start at $10 an hour, will hire first time job seekers and people with limited English skills. Aging workforces mean these sectors are desperate for new people, so advancement can come quickly as skills are learned. Unfortunately, over the last 30 years, we've made access to the higher rungs much more difficult. States have divested from higher education, creating huge increases in tuition. (The University of California system used to be free!) Marginal tax rates have been reduced, giving governments less money to invest in the kinds of infrastructure that, in the 1950s and 60s, became the basis of American prosperity. The workplace has changed dramatically and different skills are required, but without government investment in training and education, we are falling behind. Our frustration about that is understandable and valid, but our problems won't be solved merely through a higher minimum wage. We must also look to tax policy and investment in workforce training and education. So far, the $15 Now! debate has not included any discussion of how we get people access to these resources. My hope is that we refocus on the larger, more effective strategy of growing jobs and job training; of connecting people to new careers and rebuilding the Northwest's middle class. Because the minimum wage should not be the final wage for anybody. It is meant to be that first rung of the ladder.

Higher wages cause economic tradeoffs- doesn't help the market

Hansen '14 [Jay, spent 30 years as a COO of North Technology Group, covers economics for The Week, "The economic case for keeping the minimum wage at $7.25," October 17, http://theweek.com/articles/443077/economic-case-keeping-minimum-wage-725]

As for the prediction that the economy would benefit from extra cash in the pockets of some low-income workers, it defies common sense to think this is a critical factor. After all, total minimum wage payments are just about one-third of 1 percent of total GDP. Even if the liberal argument that extra income will be spent, therefore helping the economy, is 100 percent true, we're only talking about a few billion dollars in America's $15 trillion economy. But in the end, many Democratic politicians and idealistic progressives don't make a macroeconomic case for raising the minimum wage. Theirs is a moral argument. It's just not fair to pay such a low wage, they say. People can't live on $7.25 an hour. In essence, they view a higher minimum wage as an anti-poverty program. Ironically, free-market economists have the same goal — to help the poor. However, they know there are much more efficient ways of achieving the same end. President Obama wants to raise the federal minimum wage from $7.25 to $10.10 — a 39 percent increase. But cash that goes into one pocket must come out of another. Business owners with lots of minimum-wage employees would undeniably see their costs skyrocket. Maybe they'll compensate by raising the prices at the fast-food restaurant they own, which would hurt many poor and middle-class families who would ultimately pay higher prices at these restaurants. There is no free lunch — the money to pay for a big wage hike has to come from somewhere. But more critically, the bedrock economic principle of the interconnected relationship between supply and demand comes into play. Simply stated, if the price of a good increases, the demand for that good decreases. If the price goes down, demand goes up. Labor is a good, too. When the price of low-priced labor increases, employer demand for that labor decreases, while employee demand for those jobs increases. That means more workers will be chasing even fewer openings. Those jobs will pay more — but fewer employees will benefit. Let's look at the example of workers in the food-service industry. Of the 3.3 million (4.3 percent) in America who earned the federal minimum wage of $7.25 or less in 2013, about 1.5 million were in the food preparation and serving related occupations. What happens to them if the U.S. increases the federal minimum wage to $10.10 per hour? Both economic theory and common sense tells us that demand for those workers will decrease. Now, liberals and conservatives alike point to plenty of studies that "prove" their side of the argument. On the left, this article from Think Progress sums it up well. Or, as the above CBO study concluded, a government-mandated wage increase would cause the loss of many existing jobs, but ultimately create a net economic gain. On the right, a recent and very thorough study by the American Action Forum showed that in the states that raised the minimum wage in January of this year, by May, 129,200 jobs had been lost in the food service industry. Yet, at all other wage levels, the number of jobs increased. It's easy to drown in the noise of the arguments on both sides. Besides, belief (on both sides) usually trumps good science. So here, again, is the key point: The law of supply and demand tells us that when the price of low-priced labor increases, employer demand for that labor decreases. A big minimum wage hike will cost many minimum-wage earners their jobs.

TSA Northwestern

Privatization

Privatization worse

The TSA would just privatize its screening if the plan occurred

Jansen 14 (Bart, covers transportation primarily at the Federal Aviation Administration, the Transportation Security Administration, the National Transportation Safety Board and Congress, "Airports: Privatizing TSA security remains challenging", July 29th, http://www.usatoday.com/story/money/business/2014/07/29/tsa-airports-privatize-montana-kansas-city/13316121/)CDD

The TSA was created to standardize and improve airport security after the 9/11 terrorist attacks. But the agency has the Screening Partnership Program for airports that prefer to hire private contractors, so long as they maintain the same level of security as the TSA. Congress would like to expand the program beyond the current 18 airports — the largest in San Francisco and Kansas City — that handle a combined 4.5% of all passengers nationwide. But after a 2012 law made the application process easier so more airports could participate, lawmakers say the results are still balky. "There is no reason why (the program) cannot be expanded to create even greater efficiencies under a risk-based system," said Rep. Richard Hudson, R-N.C., and the panel chairman. William Benner, the program's director, said the agency promoted the program by meeting in January with about 100 contract companies. The TSA also met with vendors at two industry meetings in June. Benner said the agency's goal is now to get from application to contract award within a year. "That is a very aggressive timeline," Benner said. "Are we getting better? I'm convinced we are." But Cindi Martin, director of Glacier Park International Airport in Montana, described her application process that began in October 2009 and is finally scheduled to end in August with the arrival of private screeners. "We are seeing the light at the end of what has been a very long tunnel," Martin said. "Despite the frustrating length of time through the fits and starts in the process and lack of communication from TSA, we could do it all again."

The private contractors would securitize further

Ron Paul 11 (You know who he is, "Ron Paul: The TSA Is Not Above The Law!", July 5th, http://www.ronpaul.com/2011-07-05/ron-paul-the-tsa-is-not-above-the-law/comment-page-1/)CDD

The press reports are horrifying: 95 year-old women humiliated; children molested; disabled people abused; men and women subjected to unwarranted groping and touching of their most private areas; involuntary radiation exposure. If the perpetrators were a gang of criminals, their headquarters would be raided by SWAT teams and armed federal agents. Unfortunately, in this case the perpetrators are armed federal agents. This is the sorry situation ten years after the creation of the Transportation Security Administration. The requirement that Americans be forced to undergo this appalling treatment simply for the "privilege" of traveling in their own country reveals much about how the federal government feels about our liberties. The unfortunate fact that we put up with this does not speak well for our willingness to stand up to an abusive government. Many Americans continue to fool themselves into accepting TSA abuse by saying "I don't mind giving up my freedoms for security." **In fact, they are giving up their liberties and not receiving security in return**. Last week, for example, just days after an elderly cancer victim

was forced to submit to a cruel and pointless TSA search, including removal of an adult diaper, a Nigerian immigrant somehow managed stroll through TSA security checks and board a flight from New York to LA — with a stolen, expired boarding pass and an out-of-date student ID as his sole identification! He was detained and questioned, only to be released to do it again 5 days later! We should not be surprised to find government ineptitude and indifference at the TSA. At the time the TSA was being created I strongly opposed federalization of airline security. As I wrote in an article back in 2001: "Congress should be privatizing rather than nationalizing airport security. The free market can and does produce excellent security in many industries. Many security-intensive industries do an outstanding job of maintaining safety without depending on federal agencies. Nuclear power plants, chemical plants, oil refineries, and armored money transport companies all employ private security forces that operate very effectively. No government agency will ever care about the bottom-line security and profitability of the airlines more than the airlines themselves. Airlines cannot make money if travelers and flight crews are afraid to fly, and in a free market they would drastically change security measures to prevent future tragedies. In the current regulatory environment, however, the airlines prefer to relinquish all responsibility for security to the government, so that they cannot be held accountable for lapses in

Privatization of security fuels the military industrial complex- turns the aff

Turley 14 (Jonathan, the Shapiro Professor of Public Interest Law at George Washington University, "Big money behind war: the military-industrial complex", 1/11, http://www.aljazeera.com/indepth/opinion/2014/01/big-money-behind-war-military-industrial-complex-20141473026736533.html)CDD

The new military-industrial complex is fuelled by a conveniently ambiguous and unseen enemy: the terrorist. Former President George W Bush and his aides insisted on calling counter-terrorism efforts a "war". This concerted effort by leaders like former Vice President Dick Cheney (himself the former CEO of defence-contractor Halliburton) was not some empty rhetorical exercise. Not only would a war maximise the inherent powers of the president, but it would maximise the budgets for military and homeland agencies. This new coalition of companies, agencies, and lobbyists dwarfs the system known by Eisenhower when he warned Americans to "guard against the acquisition of unwarranted influence… by the military-industrial complex". Ironically, it has had some of its best days under President Barack Obama who has radically expanded drone attacks and claimed that he alone determines what a war is for the purposes of consulting Congress. Investment in homeland security companies is expected to yield a 12 percent annual growth through 2013 - an astronomical return when compared to other parts of the tanking economy. Good for economy? While few politicians are willing to admit it, we don't just endure wars we seem to need war - at least for some people. A study showed that roughly 75 percent of the fallen in these wars come from working class families. They do not need war. They pay the cost of the war. Eisenhower would likely be appalled by the size of the industrial and governmental workforce committed to war or counter-terrorism activities. Military and homeland budgets now support millions of people in an otherwise declining economy. Hundreds of billions of dollars flow each year from the public coffers to agencies and contractors who have an incentive to keep the country on a war-footing - and footing the bill for war. Across the country, the war-based economy can be seen in an industry which includes everything from Homeland Security educational degrees to counter-terrorism consultants to private-run preferred traveller programmes for airport security gates. Recently, the "black budget" of secret intelligence programmes alone was estimated at $52.6bn for 2013. That is only the secret programmes, not the much larger intelligence and counterintelligence budgets. We now have 16 spy agencies that employ 107,035 employees. This is separate from the over one million people employed by the military and national security law enforcement agencies. The core of this expanding complex is an axis of influence of corporations, lobbyists, and agencies that have created a massive, self-sustaining terror-based industry. The contractors In the last eight years, trillions of dollars have flowed to military and homeland security companies. When the administration starts a war like Libya, it is a windfall for companies who are given generous contracts to produce everything from replacement missiles to ready-to-eat meals. In the first 10 days of the Libyan war alone, the administration spent roughly $550m. That figure includes about $340m for munitions - mostly cruise missiles that must be replaced. Not only did Democratic members of Congress offer post-hoc support for the Libyan attack, but they also proposed a permanent authorisation for presidents to attack targets deemed connected

to terrorism - a perpetual war on terror. The Department of Homeland Security (DHS) offers an even steadier profit margin. According to Morgan Keegan, a wealth management and capital firm, investment in homeland security companies is expected to yield a 12 percent annual growth through 2013 - an astronomical return when compared to other parts of the tanking economy.

TSA reforms favors private contractors- prevents any effective reform

An exclusive scoop, ABC News is reporting that the Transportation Security Administration failed to stop undercover agents in 67 out of 70 recent probes of TSA screening. These agents carried fake weapons through checkpoints at major airports across the country and were not stopped. ABC reports that Jeh Johnson was "apparently so frustrated by the findings he sought a detailed briefing on them last week at TSA headquarters." Johnson has good reason to be frustrated: Such a high failure rate is unacceptable. The inspector general's report is not available publicly and will likely be classified for security reasons. This should not stop Congress, however, from investigating this matter and reviewing the remedial actions that are being taken. Importantly, it exposes the reality that government screeners are not necessarily the right answer to airport screening. Almost all European countries and Canada use private airport screeners. In the United States, airports have the right to opt out of TSA-administered screening through the Screening Partnership Program, which swaps out TSA screeners in favor of private contractors with TSA oversight.

New TSA reform would be worse- private contracted reform treat employees and customers horribly

Lasky 14 (Steve Lasky, Nicholls State University, Editorial Director of Security Technology Executive, Security Dealer & Integrator magazines and SecurityInfoWatch.com, "TSA Screeners Under Attack", http://www.securityinfowatch.com/blog/11299735/tsa-screeners-under-attack,2/14/14, 8/2/15, MEM)

Gerry Connelly, a House Democrat from Virginia has been among the most vocal political critics of the TSA in recent months. During a committee hearing on the TSA's Screening Partnership Program, Connelly said he didn't appreciate agents "barking orders" at people in airports, adding the less polite an agent is, the more likely they are to encounter resistance from the public Connelly went on to say that there was no excuse for someone barking orders continuously at the public at any airport in America who is an employee of the federal government, or a contractor for the federal government. Connelly said he'd lose his job if I treated the public that way. Rep. John Mica, R-Fla, who is head of the Oversight and Government Reform subcommittee on government operations, said last week he plans legislation "one way or the other" to privatize all federal screeners within two years. Like many critics of the agency who want to take the screening process away, Mica is in favor of leaving TSA in charge of gathering intelligence, setting standards and running audits. "If you come to Orlando airport or Sanford airport, **what is going on is almost criminal to American citizens, the way they are treated**," said Mica. "This is the mess we've created." But not all aviation security experts are ready to throw TSA screeners under the bus. Even those who have been sharp critics of the aviation industry's security infrastructure don't follow the lead of those calling for private sector intervention. Billie Vincent, a veteran of the Federal Aviation Administration and whose last position in the FAA was the director of the Office of Civil Aviation Security from 1982 to 1986, does not agree that the present system has failed. "The current U.S. TSA aviation security (AVSEC) system is far superior to the pre-9/11 AVSEC system that resulted in the deaths of almost 3,000 people. That is not to say that elements of the current TSA AVSEC system cannot be improved. Airports, airlines, and selective members of Congress that are advocating a return to a privatized AVSEC system are not doing so with the primary purpose of improving AVSEC – they have other motives," warns Vincent. "Other proponents are laboring under the mistaken impression that privatization would improve AVSEC. However, **privatizing the current TSA AVSEC system makes absolutely no sense whatsoever and would essentially be reverting to the failed pre-9/11 AVSEC system and all of its attendant problems**," concludes Vincent.

Money wasted on private contractor TSA reform- waste billions and distort public perception

The Transportation Security Administration's (TSA) airport screening program also provides cost reviews of federal and contractor employees. TSA created the Screening Partnership Program (SPP) to allow commercial airports an opportunity to use contractor screeners instead of federal employees.[172] In 2009, GAO reported on a TSA contractor study that "concluded that passenger screening at [airports staffed by contractors] has historically cost from 9 to 17 percent more than at [airports staffed by federal employees], and [contractor] screeners performed at a level that was equal to or greater than that of federal [employees]."[173] GAO highlighted limitations in TSA's methodology and made recommendations to correct future reviews.[174] Two years later, GAO revisited TSA's cost and performance reviews and reported that TSA claimed that airports with contractor screeners "would cost 3 percent more to operate in 2011 than airports using federal screeners."[175] Another comparative cost analysis, however, arrived at a different conclusion. The House Committee on Transportation and Infrastructure issued an analysis in June 2011 finding that: 1) taxpayers would save $1 billion over five years if the nation's top 35 airports operated as efficiently as the San Francisco International airport under the SPP program, and 2) SPP screeners are 65 percent more efficient than their TSA federal counterparts.[176] All of these government study examples illustrate the difficulty in comparing costs, and the contradictory results that can result from disparate methodologies. Until the government creates a system to accurately estimate the cost of performing commercial services, the public will never know the actual savings that could have been realized.

Rapiscan Systems lobbied aggressively to win a major contract with the Transportation Security Administration to provide X-ray body scanners at airports, only to lose the contract in 2013 after the company failed to deliver software to protect the privacy of passengers. Rapiscan now has a friend on the inside. Earlier this month, Rapiscan lobbyist Christopher Romig took a job with the House Appropriations Committee's Homeland Security Subcommittee, which oversees the TSA budget. During the previous push for a TSA contract, Rapiscan employed Michael Chertoff, former Secretary of Homeland Security, who now works as a pundit and a homeland security industry consultant through his firm the Chertoff Group. According to the *Huffington Post*, Rapiscan previously spent as much as $271,500 on lobbying per year to help secure business with the TSA. Romig's shift through the revolving door was first noted by Legistorm. In his last lobbying filing statement, Romig disclosed that he lobbied Congress on "aviation, port and border security," as well as the "budget and appropriation." All areas he will now supervise as a professional staff member.

WASHINGTON -- After the attempted Christmas Day underwear bombing of a jetliner in 2009, former Homeland Security Secretary Michael Chertoff blanketed cable news to reiterate his long-standing **support for the adoption of full body scanners at airports.** His revelation on CNN that Rapiscan Systems, the manufacturer of those machines, had been a client of his consulting firm sparked criticism that his advocacy was self-serving. Airport security is not the only area in which Chertoff might offer advice that aids his bottom line -- and, more importantly, CNN is not his only listener. The Chertoff Group boasts a rich and mostly secret client list of intelligence and security companies, as previously detailed by The Huffington Post, that benefit financially from the global war on terror through government contracts and policies. The founder of that firm now has the ear of potential White House candidate Jeb Bush. The former two-term Florida governor has assembled a foreign policy advisory team laden with officials who served in his father's and brother's presidential administrations and have since spun through the revolving door into the world of influence peddling. They are consultants, lobbyists, lawyers and corporate board members for business interests eager to be heard by the man who might become the 45th president of the United States. Besides Chertoff himself, they include former CIA Director Michael Hayden, who works for the Chertoff Group, and former National Security Advisor Stephen Hadley, retired Adm. Robert Natter and Tom Ridge, the first Homeland Security secretary -- the latter three all run their own consulting firms. **All of these men also sit on the boards of companies ready to reap huge rewards from defense, intelligence and security contracts.**

TSA reform of body scanners just get circumvented by profit driven companies and support heteronormativity claims

With all the commotion over the invasiveness of the naked-body scanners used by the United States Transportation Security Administration (TSA), one question that has been ignored is who is profiting from TSA's use of the body scanners? Mark Hemingway and Tim Carney at *The Examiner* discovered the shameful answer: George Soros, Michael Chertoff, and a number of lobbyists. Both Soros and Chertoff are profiting from the naked-body scanners by way of the company Rapiscan, whose contract is worth $173 million. Lobbyists for this company include Susan Carr, a former senior legislative aide to Rep. David Price (D-N.C.) who is coincidentally chairman of the Homeland Security Subcommittee. Former Homeland Security secretary Michael Chertoff was "flacking for Rapiscan," writes Tim Carney of *The Examiner*: After the undie-bomber attempt on Christmas 2009, Chertoff went on a media tour promoting the use of these scanners, without disclosing that he was getting paid by Rapiscan, one of the two companies currently contracted by TSA to take a nude picture of you at the airport. Just days after the attempted Christmas attack, the *New York Times* explained: Screening technologies with names like millimeter-wave and backscatter X-ray can show the contours of the body and reveal foreign objects. Such machines, properly used, are a leap ahead of the metal detectors used in most airports, and supporters say they are necessary to keep up with the plans of potential terrorists. "If they'd been deployed, this would pick up this kind of device," Michael Chertoff, the former homeland security secretary, said in an interview…. Another notable connection to Rapiscan is leftist billionaire George Soros, who owned 11,300 shares of OSI Systems, Inc., the company that owns Rapiscan. Nova Tea Party Patriots writes, "OSI's stock has appreciated considerably over the course of the year." In response to *The Examiner's* report of George Soros' share in Rapiscan, *Media Matters* (another of Soros' funded projects) seized on the report and mocked the writer. *The Blaze* reports that *Media Matters* argued that "11,300 shares are only 'six one-hundredths of one percent' of the company's total stock. However, once *The Examiner* reported that George Soros owned the shares of the OSI Systems, Soros coincidentally sold all 11,300 shares of the company. *The Blaze* writes, "A funny thing happened between Tuesday and Wednesday: the site detailing Soros' OSIS investments now shows that Soros owns zero shares of the company." Hemingway responded to Soros' abrupt decision to sell the shares: It would be nice if he did this as a response to public pressure, but it seems equally likely that as an investor he simply realized the political tide was turning against the company and the stock may drop as a result. To be fair, the sale of George Soros' stocks is said to have taken place between July 1 and September 30: *The Blaze* spoke with a representative from gurufocus.com, the site referenced by Hemingway and Media Matters. According to the representative, Soros owned the OSIS stock at the end of the second quarter and sold it under the third quarter. That puts the sale sometime between July 1 and September 30. The representative said the site first updated the information yesterday, which explains the change in the amount of stock owned. Perhaps Soros' connections at the very least encouraged the website to update the information immediately following *The Examiner's* report. Meanwhile, **Rapiscan reportedly knows how to "play ball in Washington to increase its profits.**" Facing obstacles related to dealing with homeland security, Rapiscan opened an office in Washington and hired a number of outside lobbyists and agency-specific federal marketing and sales staff, reports *The Examiner*. As a result, the company made $40 million in sales to the United States government, compared to $8 million in 2004. In addition to **Rapiscan, a number of other companies are profiting from the TSA body scanners.** Of those companies is L-3 Communications, a major contractor with the Department of Homeland Security. Carney explains, "L-3 employs three different lobbying firms including Park Strategies, where former Sen. Al D'Amato, R-N.Y., plumps on the company's behalf. Back in 1989, President George H. W. Bush appointed D'Amato to the President's Commission on Aviation Security and Terrorism following the bombing of Pan Am Flight 103. Also on Park's L-3 account is former Appropriations staffer Kraig Siracuse." *The Examiner* writes, "When Defense Daily reported on Price's appropriations bill last winter, the publication noted 'Price likes the budget for its emphasis on filing gaps in aviation security, in particular the whole body imaging systems.' " Another full-body scanner contractor was the American Science and Engineering company. Lobbying for this company includes Tom Blank, a former deputy for the TSA; Chad Wolf, an assistant administrator at TSA and an aide to Sen. Kay Bailey Hutchison. Hutchison is on the Transportation and Defense subcommittees of Appropriations. Likewise, another lobbyist for the American Science and Engineering Company is former Democratic Rep. Bud Cramer.

A2: Privatization

Plan solves- Contractors are still under TSA regulation

Burns 10 (Bob, member of the TSA blog writing staff, "Airports Who Opt out of TSA Screening are Still Regulated by TSA", Nov 19th, http://blog.tsa.gov/2010/11/airports-who-opt-out-of-tsa-screening.html)CDD

Airports Who Opt out of TSA Screening are Still Regulated by TSA There has been a lot of confusion after a recent report that the Orlando Sanford Airport (SFB) has requested to opt out of TSA screening. Any commercial airport can apply to TSA's Screening Partnership Program (SPP), which has been around since the inception of TSA. After approval from TSA and a competitive bidding process, SPP allows airports to transition to private screeners **while**

maintaining TSA oversight and the corresponding increased level of security implemented since 9/11. So… if an airport applies and is accepted into the SPP program, they receive the same screening from a private company instead of TSA officers. That's the only difference. All commercial airports are regulated by TSA whether the actual screening is performed by TSA or private companies. So TSA's policies – including advanced imaging technology and pat downs – are in place at all domestic airports.

The aff can never solve-airports are seen as simultaneously as in and out of the law-can't account for biopolitical spaces that hold refugees and security threats

Feldman 7-Leonard, associate professor for political science at CUNY-Hunter College, PhD in political science from University of Washington ("Terminal Exceptions: Law and Sovereignty at the Airport Threshold", Law, Culture, and the Humanities, vol. 3 no.2 , Sage Publications) HC

1. The Airport as Heterotopia As a site for the strategic deployment of sovereignty, the airport is an important space. The international gateway airport, as much as the territorial borderline between two nation-states, is a border or boundary space, in which entry is controlled, and where people are sorted into categories such as citizens, residents, legitimate visitors, refugees and undocumented aliens. This sorting is performed by sovereign state power. Agamben, for instance, writes that in "the zones d'attentes in French international airports in which foreigners asking for refugee status are detained . . . an apparently innocuous space . . . actually delimits a space in which the normal order is de facto suspended and in which whether or not atrocities are committed depends not on law but on the civility and ethical sense of the police who temporarily act as sovereign."44 At international gateway airports such as JFK, border guards and customs officials perform the rituals of sovereignty. These deployments of sovereignty lead some analysts to note the similarities between airports and camps. As Gillian Fuller argues, "The camp, like the airport, is built for transit . . . Both airport and camp constitute zones of exception, each are framed by a rhetoric of emergency . . . One facilitates movement and the other denies it, yet both are zones of perpetual transit and futuristic promise."45 Indeed, the US airport, all the more so in this post-9/11 world, contains within it spaces of exception in which sovereign authorities (customs officials, INS agents, police) confront refugees, aliens, and suspected security threats as bare life. In "secured" spaces, interrogation rooms and holding areas, through mechanisms of surveillance, biometric identification, and profiling, 46 sovereign power and bare life meet in a zone that is in some ways outside the operation of normal law. The airport is thus a kind of relay point through which various technologies of surveillance and control are deployed. However, the airport is a complex, multifaceted space. For one thing, it is also a kind of public sphere, in which people of diverse ethnicities, nationalities and citizenships mingle. Furthermore, the airport as a space of mobility and placelessness is also taken to be a paradigm of a certain kind of cosmopolitan homelessness. Finally, add to mobility, placelessness and the cosmopolitan, the increasing centrality of consumption in the contemporary airport. The airport might thus function as what Michel Foucault calls a heterotopia. 47 Heterotopias are real spaces, as opposed to utopias, but they are outside the normal order of the everyday. Foucault suggests that "the heterotopia is capable of juxtaposing in a single real place several spaces, several sites that are in themselves incompatible." Airports do this, increasingly, by combining mobility and escape with security and control. Furthermore, "heterotopias always presuppose a system of opening and closing that both isolates them and makes them penetrable. In general the heterotopic site is not freely accessible like a public place. Either the entry is compulsory, as in the case of entering a barracks or a prison, or else the individual has to submit to rites and purifications." (Though obvious, it is perhaps worth mentioning that security screening has taken on the trappings of a purification ritual.) Heterotopias are also in a kind of dialogue with the everyday spaces around them, which they "reflect and speak about." It is this complexity of and within the airport, its bringing together of so many of the key themes of modern life – mobility and surveillance, consumption and diversity, sovereignty and vulnerability – that makes it a rich metaphor for the larger political community. It is a space distinct from everyday life that reflects and comments on the broader spaces of modern life.48

Airports are a form of disciplinary space that have complex intersections-the aff reduces discipline to the tangible and tangible

McMahon 12-John, PhD candidate and Fellow at the Center for Global Ethics and Politics at The Graduate Center-CUNY, ("Normalizing Gender, Performing the State: Disciplinary Power and Biopower at the Airport Security Checkpoint", submitted in requirement for graduate degree at The Graduate Center-CUNY,
http://www.academia.edu/2367414/Normalizing_Gender_Performing_the_State_Disciplinary_Power_and_Biopower_at_the_Airport_Security_Checkpoint**) HC**

Finally, Foucault discusses the network of rank and circulation created in disciplinary space. The "unit" of discipline is not territory or place but rank, "the place one occupies in a classification:" "[d]iscipline is an art of rank, a technique for the transformation of arrangements" that "individualizes bodies by a location that does not give them a fixed position, but distributes them and circulates them in a network of relations" (Foucault 1995, 145–146).That is, there is a kind of dynamism to disciplinary spaces, held together by gradations of rank and the production of hierarchical grids. Airport security checkpoints enact this hierarchal circulation. A set of intersecting gradations distributes individuals: the TSA agents compared to travelers or airport and airline employees compared to travelers, for example. The travelers themselves are also disaggregated into a hierarchy. Many airlines and airports have pre-screening programs that enable regular, and often wealthy passengers to pass through a special security line. Most airports in the US create separate security screening lines for 'experienced' travelers compared to other groups, such as the 'family and medical liquid line' (Hall 2011). Some travelers, depending on their biographical and consumer record and/or irregularities in the initial screening arc selected for secondary screening. Travelers are subject to racial and behavioral profiling. In all of these ways, the various individuals at the airport are distributed into a complex hierarchy of rank and then circulated through the disciplinary space. Taken together, we can see the way that the spatiality of airport security reproduces that of disciplinary sites described by Foucault. The airport security checkpoint can be understood as another of Foucault's useful, "complex spaces" that are at the same time architectural, functional, and hierarchal (1995. 148). There is another way to analyze disciplinary spaces, however: via the 'means of correct training.' I now turn to this elaboration of disciplinary power. The first component of Foucault's means of correct training is the means of hierarchal observation. Here, an architecture of light and visibility is created. This architecture, instead of being premised on enclosure and confinement, involves the seeing of individuals in order to subjectivize and transform them**. Often, this architecture constructs an optics of seeing without being seen** (Foucault 1995. 170 173).

Airports are biopolitical-all passengers are treated en masse, even with some differentiations

McMahon 12-John, PhD candidate and Fellow at the Center for Global Ethics and Politics at The Graduate Center-CUNY, ("Normalizing Gender, Performing the State: Disciplinary Power and Biopower at the Airport Security Checkpoint", submitted in requirement for graduate degree at The Graduate Center-CUNY,
http://www.academia.edu/2367414/Normalizing_Gender_Performing_the_State_Disciplinary_Power_and_Biopower_at_the_Airport_Security_Checkpoint**) HC**

Given this understanding of biopower and biopolitics, the biopower-full aspects of the airport security checkpoint are clear. The kind of 'security' enacted at the checkpoint is, I argue, biopolitical. Power at airport security does indeed seek to disallow/disqualify death; the explicit goal of airport security is to keep people safe from death-causing acts at the same time it acts to normalize and allows the

productive circulation of people and goods. Inherent to this is the production of a set of dangers, with airport security arbitrating between the freedom of travel and mobility and the security of travelers, all with reference to the danger of terrorism. There are (at least) three other ways in which the airport security checkpoint can be understood as a site of biopower. First, it **treats travelers as a massed population: all are subject to the same basic techniques of power, even if some differentiation occurs. 5**

Airports are uniquely biopoltical and disciplinary in nature

McMahon 12-John, PhD candidate and Fellow at the Center for Global Ethics and Politics at The Graduate Center-CUNY, ("Normalizing Gender, Performing the State: Disciplinary Power and Biopower at the Airport Security Checkpoint", submitted in requirement for graduate degree at The Graduate Center-CUNY,
http://www.academia.edu/2367414/Normalizing_Gender_Performing_the_State_Disciplinary_Power_and_Biopower_at_the_Airport_Security_Checkpoint**) HC**

The convergence and interpenetration of disciplinary power and biopower. This convergence at the airport security checkpoint suggests a slight modification of Foucault's understanding of the relationship between disciplinary power and biopower. He describes the two techniques as operating at different levels, with a different scale, and with different instruments as they are mutually articulated. It is as though disciplinary power and biopower do not ever actually 'touch;' that is, the may operate together but there is always some gap (in scale, technique, instrument, etc.) between the two powers. They may coexist in the same space, as with the rationally-planned town, or intersect in their mutual knowledge-effect, as with sexuality, but they do not actually physically converge at or in the same instrumentality or articulation of power.I argue for a somewhat different kind of intersection than Foucault. My claim is that, at least at the airport security checkpoint, the instrumentality and articulation of power deploys, in the very same apparatus and flow of power forces, both disciplinary power and biopower. Instead of co-existing with a gap between them, in this space the two forms of power permeate and amplify each other. The security checkpoint, I claim, signals a shift from an understanding of co-presence and mutuality to one of interpenetration and apparatus.9 Disciplinary power and biopower come from different 'directions,' but in the airport security apparatus, any gap between them closes even as they continue to operate on a different scale. I thus recast what Foucault calls the "triangle" of "sovereignty, discipline, and governmental management [biopolitics of population]" (Foucault 2007, 107) in terms of an apparatus.

No terminal solvency-all differences will be smoothed over and can't solve for extralegal concerns like holding areas which reduce to bare life

Salter 7-Mark, full professor at the School of Political Studies, University of Ottawa ("Governmentalities of an Airport: Heterotopia and Confession", International Political Sociology, vol. 1 no. 1 , Project Muse) HC

Fuller and Harley argue that, similar to the prison or the clinic, the disciplinary tactics of the airport are made possible through a logic of exceptionality: ''in our need to move, we submit to a series of invasive procedures and security checks that are becoming more pervasive and yet are still rationalized through a discourse of exception only at the airport''' (2005:44). Modern international airports are borders, where claims to citizenship, immigration, and refugee status are adjudicated.

Moreover, the bordering or sorting process takes place throughout the terminal in the airline check-in lines for economy and business class travelers, the customs lines for foreigners and nationals, the frequent flyer lounges, and deportation holding cells. The utility of a heterotopic analysis, in the face of competing models of a ''non-space'' stems from the attention Foucault pays to the contradictory elements in these spaces. Following Lisle's discussion of mediated power at the airport, heterotopias are deceptive in that they ''seem to be pure and simple openings, but [. . .] hide curious exclusions'' (2003:26). In the judicial trial, the accused is the author of his/her testimony, but not the final arbiter of truth about themselves. In the clinic, the patient is the author of the symptoms and history, but not the final arbiter of the diagnosis. So too in the airport, a traveler is the author of one's identity, but not the final arbiter of his/her belonging or mobility. The space of transit is fragmented so that arriving, departing, accompanying, and supporting staff are all hidden from one another. The connection of domestic to foreign is also smoothed by an international uniform language of iconic signs, and in the cases of Ben Gurion and Incheon airports, great walls of stones that simulate a solid boundary between inside and outside. As engaged critics, we must take note not simply of travelers eager to limit their time in the airport through frequent flyer and trusted traveler programs but also those travelers reluctantly hustled out of the airport aboard ''deportation class'' (Walters 2002). Although a primary function of the airport is security, the most fundamental policing functions are conducted out of sight. Many of the gates and check-points that structure mobilities in the airport are invisible (Adey 2004a, 2004b). Indeed, given most airports' detachment from urban space, travelers have already been ''pre-cleared,'' if only by their ability to arrive at the airport itself. Lloyd argues that the space of the airport has been configured into a space of consumption so that ''the figure of global traveler is allied to the global consumer, whereas the national citizen's ''othered'' figures, the homeless person and refugee, are precluded by consumption practices . . . This imagescape of free mobility in the international terminal is markedly different from the backstage containment of national others in identity checks, detention, and deportation that takes place within the very same institution'' (2003:106). The airport attempts to make all of these incongruous forces appear smooth and systematic, as if all travelers were safe, all planes on time and all policing efficient. Analyzing the airport as a heterotopia leads to three insights: the disaggregation of sovereignty and territory, the importance of confession and surveillance at the airport, and the hidden dynamics of airport security screening.

Pat-downs

Pat-downs worse

Strip searches are psychologically disturbing

Costello 12 – Professor from Milwaukee and intersex trans man who is married to an intersex trans woman [Cary Gabriel Costello, "TSA Body Scanning and the Trans Body," 3-25-12, Accessed 8-1-15, http://trans-fusion.blogspot.com/2012/03/tsa-body-scanning-and-trans-body.html] ~~*thelasthall@gmail.com*~~

I was taken aside for a patdown. I asked that this be done in privacy, and was taken to a room by two TSA (cis) male agents. One blocked the closed and locked door, and the second stood in front of me. They asked me to answer yes or no, did I have any medical implants or a pacemaker, and I said no. I was then given a through full body patdown, which took some time. The agent doing the patdown seemed concerned that I was concealing something under my shirt. I could have explained what the issue was, but the TSA agent, while acting thus far in a detached and professional manner, had not given me any opportunities to speak spontaneously, but just allowed me to answer yes or no to his questions. The question he asked me next was whether I was wearing a back brace. I said no. The TSA agent then asked me to open my shirt. While I am uncomfortable revealing my chest wearing just my binder, I did so. The two TSA agents then stared at my chest in the binder for a while. The TSA agent doing the patdown finally asked me what my garment was. I said that it was a chest binder, which I wore because I was a trans gender man. The agent said, "A what?" I had to explain what that meant. The agents looked both dubious and uncomfortable. I was extremely concerned that I was going to be asked to remove the binder, but, after some silent staring and thinking, the TSA agent told me he would screen the garment for explosives with swabs while I was wearing it. While less humiliating for me than being forced to reveal my breasts, the screening for explosives involved having the agent thoroughly rub a series of small swabs over the entire surface of the binder: sides, back and front. **This was quite psychologically disturbing for me.** The TSA agent's expression was one of controlled distaste. After my binder was indeed found not to be a terrorist weapon, I was allowed to leave. The process was not only humiliating, but time consuming, and I had to rush for my plane.

Pat-downs are a physical intrusion on trans bodies

Beusman 14 – Jeezbel [Callie Beusman, "Air Travel Is Even More of a Nightmare When You're Trans," May 27th 2014, http://jezebel.com/air-travel-is-even-more-of-a-nightmare-when-youre-trans-1582143419] ~~*thelasthall@gmail.com*~~

According to documents recently obtained by Al Jazeera, "trans people have been required to undergo pat-down searches by officers of the opposite gender, reveal or remove items such as chest binders and prosthetic penises and defend challenges to their gender identities and their right to opt out of body scans, among other problems." Troublingly, the logic of a strict restrictive gender binary is literally built into the system — the body scan machines used at most airports feature blue and pink start buttons, which activate special computer algorithms meant to screen male and female passengers, respectively. If a passenger is misgendered, or if s/he has body characteristics of more than one gender, it might register as an "anomaly." This was the case in one specific case at LAX, in which a trans woman was selected for a secondary screening after the machine registered a "groin anomaly." She's repeatedly misgendered in the subsequent report: T5 PM shift — a transgender male passenger alarmed that AIT for a groin anomaly. The passenger had breast implants but also a penis which lead to the IO assuming is [sic] was a female with a groin anomaly. The passenger presented himself as female so the RPD was conducted by a female LTSO. Such institutionalized insensitivity can lead to aggressive and humiliating behavior on the part of the TSA officer. In one particularly harrowing example, which took place in Las Vegas in 2012, a transgender passenger was repeatedly denied the right to opt out of going through the security body scanners (something all passengers have the right to do), then subjected to a "very uncomfortable and longer-than-usual pat-down" by an officer of the opposite gender. "Overall," the complaint reads, "this was one of the most uncomfortable and terrifying experiences of my life." **This wasn't an isolated incident or a surprising oversight** — other complaints from trans passengers detail the same sort of mistreatment. For instance, a

second passenger, a trans man who wears a brace around his chest, missed his flight after undergoing an "inappropriate and exaggerated" pat-down; a third — also a trans man — was forced to remove his strap-on and put it through the X-ray machine despite telling the TSA officer that "this item is as much a part of [him] as a prosthetic leg or arm would be to an amputee." And, in a 2011 memo from LAX, a TSA officer details the way in which he refused to let a trans woman be screened by a fellow woman, misgendering her thoughtlessly and callously: [Redacted] approached me stating that there was a male who's stating that he's identifying his self [sic] as female. I told him that we have to screen him as he presents his self [sic]... He was speaking with LTSO telling him that he wants to be screened by a female and identifies his self [sic] as a female. He also stated that if he was to be screened by a male he would feel violated. I explained to the male passenger that he would have to be screened by a male. The fear of finding oneself the receiving end of this breed of horrible ignorance is something that actively discourages trans people from flying. As trans-rights advocate Kole Myrick told Al Jazeera:"What if I am packing [wearing a prosthetic] but I still have a female gender marker? They're going to think I'm hiding something down my pants to get through security... I'm kind of an open book [but] I want my privacy if it's a private matter."

TSA policies don't account for trans people/gender non-conforming people

Kai, a 19-year-old college student from the Midwest, identifies as third gender. Kai, who withheld a last name and prefers to be referred to by "they" instead of "he" or "she," might never know why they were selected for a pat-down search during a trip with their family. At a small Florida airport, Kai's family was returning from vacation when something - the baggy sweatshirt Kai was wearing? The behaviors Kai exhibits due to Asperger's? A security staff member's flash of paranoia on a slow day? - bought Kai a trip to the pat-down room. "I walked through security just fine, through the metal detector," said Kai. "The guy who was standing on the other side looked at me for a really long moment without saying anything and then was like, 'I think we should pat you down,' and sort of mumbled about my sweatshirt." It is TSA policy that travelers undergoing pat-downs be searched by a security staff member of the same gender that the traveler is presenting, but **it is unclear how such a policy might provide for non-binary gender identities**. (TSA's internal track record does not speak well for its gender protocols. Last year, the agency paid a five-figure settlement to former employee Ashley Yang, a trans woman who was forced to present as a man while she was on the clock. Yang was reportedly fired for using the women's bathroom.) "They spent several minutes basically arguing about who should give me the pat-down, while I was standing there," said Kai. "They were loudly arguing in the middle of the airport, all the while my family standing by, including my little sister, who I was not out to at the time." "I have Asperger's, so I find it very difficult to explain myself. I didn't know what to do," said Kai. Kai was fortunate to be traveling with their family, whom Kai describes as "very supportive." But what is eerie about Kai's experience is that, like Walid, it's anyone's guess which of Kai's attributes will make Kai a target. "I feel like I'm singled out because my gender is one issue," said Kai. At the same time, "I feel nervous because of habits I have because of being autistic, that it will attract the attention of security." An ongoing survey by the National Center for Lesbian Rights of travelers' complaints about gender discrimination at airport security points to potential problems at Philadelphia International Airport, George Bush Intercontinental Airport, John Wayne Airport, Charlotte Douglas International Airport, San Francisco International Airport, Los Angeles International Airport, Southwest Florida International Airport and Indianapolis International Airport. Complaints included being outed in front of other passengers, being subject to inappropriate comments about gender and having to undergo a body scan without the alternative of a pat-down search, among others. Some respondents identified as male, some as female, some as neither exclusively male or female. But their gender identities, at least by some measures, are ultimately irrelevant in post-9/11 America, where - as Walid and Kai have already discovered - there may soon be as many ways to be a suspect as there are to be yourself.

Pat downs continue to ignore different gender identities

Flying while trans is an act of bravery. Transgender travelers are disproportionately targeted for questioning and pat-downs as a result of Transportation Security Administration (TSA) policies that lead to us being "outing" as trans. Outed in airports – big, crowded, public spaces. Yeah, it sucks. The National Center for Transgender Equality (NCTE) has been doing a great job focusing on how TSA policy can negatively impact transgender and gender non-conforming folks. The new body scanners that caused such a big public outcry have been especially dangerous for trans travelers, who have been targeted for questioning and invasive pat-downs because of perceived discrepancies between their body scan and gender presentation. **The TSA recently released software upgrades so that the scanners will no longer show explicit images of a person's body**. But NCTE has pointed out we don't know if these changes will have a positive impact for trans folks. In fact, the changes might not fix the problem for us at all, since it appears TSA officers need to tell the new software if travelers are male or female. Now a TSA pilot program is raising concerns. Agents conduct mandatory short interviews with travelers, which have been dubbed "chat-downs" (someone at the TSA's feeling clever). Agents will be looking for signs of nervousness and concealment, which should raise red flags for trans folks – I know I feel damn nervous and like I'm hiding something when I fly as a result of TSA policies. Keisling on the new technique: "The TSA continues to do a good job of making transgender people uncomfortable at airports. The TSA already employs interview-style interventions at airports across the country, and the TSA's intent to explore and possibly expand this program is worrisome. " The TSA has been loving discriminatory "security" measures since 9/11, when the agency instated policies targeting people seen as Muslim or Arab. The requirement that you gender presentation match the gender on your ID was especially frightening for trans folks. Clearly, the trans community isn't the only group of marginalized folks being unfairly treated, but we're one of the groups facing the brunt of the security state. These sorts of policies have a real impact. I've been fairly lucky while flying – I've gone through an extra scan because of TSA agents' gender confusion, but that's it. I have friends who have been searched and interrogated for hours. They've been publicly outed and then had to teach some basic gender theory to TSA agents. The agents themselves are also put in confusing and uncomfortable situations when they're not offered the adequate training on working with trans travelers. **Often they have to pat down someone of a different gender, when policy states all pat-downs are supposedly same-gender**. NCTE is asking that folks file complaints with the TSA's Office of Civil Rights and Liberties and the Department of Homeland Security Office for Civil Rights and Civil Liberties if they experience discrimination. They're also encouraging folks to share their stories with NCTE to aid in advocacy efforts. Frustratingly, there aren't great options for trans folks to avoid being targeted in the short term. Once more from Keisling: "Unfortunately, when forced to pick between two traumatic experiences (an invasive pat-down or a body-scan), there are no great options for transgender people. With what we know about the scanners, trans people who go through are disproportionately selected for pat-downs anyway. The best thing transgender and gender non-conforming people can do is learn about the process and their rights, and make the choices that are best for their personal situation. We encourage transgender people to read NCTE's guide on air travel safety."

The very possibility of pat downs and scrutiny of identity documents contributed to m any participants engaging in w hat I refer to as identity normalizing strategies. **These normalizing strategies often consisted of the deliberate construction of a normatively gendered presentation of self**. . . . A few individuals in m y study changed their gendered appearance to coincide with their identity documents that still listed their sex assigned at birth and which often had outdated photos. . . . Almost all of the individuals I interviewed . . . described engaging in bodywork and presentation rituals in order to appear non-threatening in regards to all aspects o f their identities (Kelly 2011). These identity management strategies require adding a metalevel analysis of the social production of gender. It is axiomatic in the theories that inform much thought about gender, at least

in the humanities and social sciences, that gender is performed rather than expressed, that gender is an effect rather than a cause, that gender is produced through social relations rather than through willful acts of individuals. But at the airport, successfully negotiating the different and contradictory ways that gender has been securitized requires a performance of a performance.

Should we simply frisk hands, feet, and suspect areas OR should we allow staff to scan faster over certain low-risk locations? The former suggestion may eventually lead to personnel with contamination on certain body locations to go completely undetected. The latter would increase the MDA (minimum detectable activity) and may lead to an increase in low-level contamination incidents being undetected.

The logic of the Secure Flight program assumes that the gender marker on a piece of ID will lessen confusion—reducing the number of false positive matches to the government watch lists—rather than generate it. But for transgender passengers at the airport, a perceived mismatch between the gender marker on their ID and the gender they present is flagged as an anomaly. And at the airport, an anomaly is an event that automatically triggers higher levels of scrutiny. In the ominous moment when "identification threat" looms as transgender passengers approach the security area, their vulnerability stems from the gender norms operationalized and backed by the force of law at the airport. Conversely, in the eyes of security agents, if something about a passenger's gender appears odd, she is treated as a potential social threat (Billies 2010: 2. As a result of the Secure Flight program, travelers whose gender marker on their identity document does not reflect an airline employee's or TSA agent's perception of their gender—in its embodied totality—risk facing humiliating interrogations, sexually assaultive pat downs, outing to colleagues, even denial of travel. Blogger Katherine Cross presents a phenomenological account of identification threat: As I engaged in the ritual striptease meant to appease the airline gods at Denver International Airport, standing at the bin that I had claimed as my own with an advert I paid no attention to staring at m e from its bottom , a TSA agent walked up to me. I was depositing m y grey blazer in the bin, m y belt soon to follow, and I grew nervous, m y throat tightening as it often does on security lines. But all that the blue uniformed m an did was smile at m e and say "Good morning to ya, ma'am ." At that moment I knew . . . that I was safe. For now (Cross 2011). In response to the Secure Flight program , the leading transgender rights organization tells its constituents in a widely circulated "know your rights" flyer th a t they have the right to "travel in any gender you wish, whether or not it matches the gender marker on your identification." But, this advisory adds, "the TSA suggests that transgender travelers carry a letter from their doctor" (National Center for Transgender Equality 2010).

How so? Simply approach the travel document checker and let them know that you don't have your ID. At this point, you will be asked a simple randomly computer generated question such as: "What is the average annual rainfall in the Amazon basin?" Seriously though… You'll be able to fly as long as you provide us with some information that will help us determine you are who you say you are. If you're willing to provide some additional information, we have other means of substantiating your identity, such as using publicly available databases. If we can confirm your

identity, you'll be cleared to go through security, and you may or may not have to go through some additional screening.

Body scanners don't stop terror attacks- Empirics and lab tests prove

Sankin 14 (Aaron, writer covering politics at the Daily Dot, "New study proves just how worthless TSA airport body scanners really are", August 22nd, http://www.dailydot.com/politics/tsa-rapiscan-body-scanner-study/)CDD

Full-body scanners used for years at airports across the U.S. are even worse than previously believed—in fact, according to new research, they are easily tricked, which may have allowed passengers to smuggle guns, bombs, and other contraband through airport security. More troubling, researchers say, the study reaveals a severe lack rigorous testing of security systems by the Transportation Security Administration (TSA). When the TSA pulled Rapiscan 1000 airport security scanners from airports last summer, it did so out of privacy concerns. However, according to a report released earlier this week by a team of researchers from U.C. San Diego, University of Michigan, and Johns Hopkins University, anyone with knowledge of how the scanners work could have easily slipped weapons past security checkpoints. The results of the study are being presented this week at the USENIX Security Symposium in San Diego, Calif. While the agency had spent over a billion dollars deploying the scanners at more than 160 airports around the country, an outcry over the scanners' ability to show the airport security personnel manning the machine an outline of passengers' "junk" eventually led to the government scrapping the system, which was the primary means of ensuring security on airplanes from 2009 through 2013. When the scanners first rolled out, the results of tests of their efficacy conducted both by Rapiscan and government officials were never made public due to security concerns, nor were any units of the full-body, backscatter X-ray machines made available for third-parties to run their own independent trials. Now that the machines are no longer in wide use in airports—they are still, however, common in government faciliteis around the country like courthouses and prisons—the researchers picked up a used one on eBay (where else?) and decided to take it for a spin. What they discovered was shocking. "In laboratory tests with a real machine, we were able to conceal guns, knives, and explosive simulants in such a way that they were not visible to the scanner operator," the report reads. "We also studied the cyberphysical security of the machine and were able to show how an attacker could subvert the operator console software so that it would be possible to conceal all types of contraband." They discovered that, while the machines did a good job of identifying most smuggled items, anyone with a familiarity with how the technology works—or who even just bought a unit of their own on eBay—could easily conceal weapons by hiding them in specific places on the body or covering them with other material to fool the machines into not being able to distinguish the contraband from the passenger's body. On the machines, the person's body reads as white and all external items read as black. Here's what it looks like when the scanner detects someone attempting to smuggle a handgun tucked into the front of his pants: After running their own tests, the researchers discovered that by taping a pistol to the outside of a passenger's leg just above the knee or sewing it into the same spot inside of a pants legs, the gun doesn't show up at all. The items could be discovered if the passengers were scanned from the side, not just the front or back; however, TSA guidelines don't require all passengers to be scanned from the side because that would significantly increase the amount of wait time at airport security check lines. Another strategy, which worked well with knives, is to tape the weapon to the passenger's body and then cover it with a material that will read as the same color as a human body, such as a polytetrafluoroethylene like Teflon. The researchers found that it was possible to use a slight variation on this strategy to smuggle plastic explosives, which require a metallic detonator in order to go off. These problems neatly solve each other: we attached a detonator, consisting of a small explosive charge in a metal shell, directly over our subject's navel. Since the detonator is coated in metal, it absorbs X-rays quite well and mimics the look of the navel in the final image The team also discovered that it's possible to attack the machines to disable much of their functionality. The software on the scanner they purchased lacked any password protection or software verification, and the lock to the cabinet where the computer is housed could be picked in "under ten seconds with a commercially available tool," meaning an attacker could potentially infect a scanner with malware without much difficulty. None of these stratagies would likely occur to an attacker who hadn't done his or her homework. But someone who was both sophisticated and prepared could have use techniques like these to sneak virtually whatever they wanted onto airplanes for years. "Our results suggest that while the ... [machine] is effective against naïve attackers, it is not able to guarantee either efficacy or privacy when subject to attack by an attacker who is knowledgeable about its inner workings," the authors argued. Luckily, due to the privacy concerns, the TSA scrapped the Rapiscan machines in favor of ones based on millimeter wave technology, which likely lack many of the same vulnerabilities identified in this study. Even so, the change doesn't instill the report's authors with much confidence about the overall level of security across the nation's airline transit network. "The problems that we identified in our study point to a lack of rigorous public testing," study co-author Stephen Checkoway explained in an email to the Daily Dot. "In particular, it demonstrates a lack of adaptive, adversarial thinking. That is, it was tested against adversaries who naively conceal contraband under their clothing but not against adversaries who adapt their concealment techniques to the detection system." "I think that this sort of secret testing is counterproductive and ultimately harms security," Checkoway added.

Rose coined the phrase "securitization of identity " to describe how "subjects are locked into circuits o f control through the multiplication of sites w here the exercise o f freedom requires proof of legitimate identity " (Rose 1999: 240). The linking o f identity with security does not depend on a single entity collecting all possible information; it depends, instead, on particular entities in particular contexts collecting only the information most useful for the particular risks being assessed. Thus, the securitization of identity is "dispersed and disorganized" across a "variety of sites and practices" (243, 242). The securitization o f identity is an example o f w hat Mariana Valverde and Michael Mopas call "targeted governance" (2004). While state entities once operated with the belief that social problem s could be solved through large-scale state intervention, targeted governance focuses the resources of the neoliberal state—concerned not with welfare but with risk management—in as efficient a manner as possible. In practice, this has meant an ever greater reliance on information and surveillance technologies which allow the now m ore limited activities of governance to be carried out, it is believed, with m ore precision: "a 'smart,' specific side-effects free, information-driven utopia o f governance" (2004: 239). Because the security calculus of state actors holds that m ore identifying information about individuals means less risk, the development of presum - ably infallible techniques for identity verification has been enrolled in the quest for perfect information. In the United States, the airport has become one of most intensely securitized sites of identity verification (Lyon 2007).

TSA Body Scanners Michigan 7

Case

SQ Solves: Scanners/ATR

The aff's criticism of body scanners is outdated—the TSA removed photographic imaging in 2013, effectively solving their transphobia impacts.

Nixon '13 (Ron, Washington correspondent for the New York Times who covers the impact of regulatory and legislative policy on the consumer, "T.S.A. to Remove Invasive Body Scanners," *nytimes.com,* http://www.nytimes.com/2013/01/19/us/tsa-to-remove-invasive-body-scanners.html)

WASHINGTON — After years of complaints by passengers and members of Congress, the Transportation Security Administration said Friday that it would begin removing the controversial full-body scanners that produce revealing images of airline travelers beginning this summer. The agency said it canceled a contract, originally worth $40 million, with the maker of the scanners, Rapiscan, after the company failed to meet a Congressional deadline for new software that would protect passengers' privacy. Since going into widespread use nearly three years ago, the scanners have been criticized by passengers for being too invasive and are the subject of lawsuits from privacy groups. The T.S.A. began deploying the scanners in 2010, after an attempt by Umar Farouk Abdulmutallab, a Nigerian citizen, to blow up a Detroit-bound Northwest Airlines flight by setting off explosives hidden in his underwear. The T.S.A. said that 174 of the machines are currently being used at airport checkpoints around the country. Another 76 are housed at a storage facility in Texas. Rapiscan will be required to pay for removing the scanners. In a statement, Deepak Chopra, the company's president, said the decision to cancel the contract and remove the scanners was a "a mutually satisfactory agreement with the T.S.A." The company said that scanners would be used at other government agencies. The removal of the Rapiscan scanners does not mean that all full-body scanners will be removed from airport security checkpoints. A second type of full-body scanner does not produce revealing images. Instead, **it makes an avatar-like projection on security screens.**

No internal link—the body scanners opposed by the aff are long gone; in 2013 the TSA replaced them with new ones that only display a generic human-shaped image and therefore prevent gendered discrimination.

Overton '13 (Gail, senior editor of *Laser Focus World* with 20 years of marketing and engineering experience in photonics and telecommunications, PHOTONICS "APPLIED: DEFENSE AND SECURITY: Will full-body scanners keep you safe and secure?", *Laser Focus World.* http://www.laserfocusworld.com/articles/print/volume-49/issue-03/features/photonics-applied--defense-and-security--will-full-body-scanners.html)

Elias adds that in addition to backscatter x-ray safety concerns, passengers being screened were also concerned about privacy issues, citing the "revealing" nature of the images acquired by these scanners. As a result, the TSA has required that privacy algorithms be applied to the images produced by commercial systems, or in the case of millimeter-wave systems, that images be eliminated entirely for viewing and replaced by Automated Target Recognition (ATR) software that only indicates the visual presence of a threat (see Fig. 1). FIGURE 1. To eliminate images that show physical human body detail, full-body scanners such as this millimeter-wave example now use Automated Target Recognition (ATR) software that displays a generic image that either flags the operator to the presence of a possible threat (a) or indicates no threat (b).*(Courtesy of Transportation Security Administration)* Just recently (January 2013), a Bloomberg article reported that the TSA plans to remove x-ray backscatter-based Rapiscan units from OSI Systems (Hawthorne, CA) because the company failed to write software to make passenger images less revealing. The TSA plans to replace the systems with millimeter-wave scanners from L-3 Communications Holdings (New York, NY) that do include adequate privacy software.

Status quo solves—the TSA has already recognized the aff's concern and taken steps to remedy the problem.

TSA '14 (Transport Security Administration, agency of US Department of Homeland Security, "Transgender Travelers," tsa.gov, https://www.tsa.gov/traveler-information/transgender-travelers)

TSA recognizes the concerns members of the transgender community may have with undergoing the security screening process at our Nation's airports and is committed to conducting screening in a dignified and respectful manner. These travel tips will explain the various screening processes and technologies travelers may encounter at security checkpoints. Making Reservations: Secure Flight requires airlines to collect a traveler's full name, date of birth, gender and Redress Number (if applicable) **to significantly decrease the likelihood of watch list misidentification**. Travelers are encouraged to use the same name, gender, and birth date when making the reservation that match the name, gender, and birth date indicated on the government-issued ID that the traveler intends to use during travel. Packing a Carry-on: All carry-on baggage must go through the screening process. If a traveler has any medical equipment or prosthetics in a carry-on bag, the items will be allowed through the checkpoint after completing the screening process. Travelers may ask that bags be screened in private if a bag must be opened by an officer to resolve an alarm. Travelers should be aware that prosthetics worn under the clothing that alarm a walk through metal detector or appear as an anomaly during Advanced Imaging Technology (AIT) screening may result in additional screening, to include a thorough pat-down. Travelers may request a private screening at any time during the security screening process. Contacting TSA in Advance of Travel: Travelers may contact TSA prior to a flight through the TSA Contact Center at 1-866-289-9673 and TSA-ContactCenter@dhs.gov. Private Screening: Screening can be conducted in a private screening area with a witness or companion of the traveler's choosing. A traveler may request private screening or to speak with a supervisor at any time during the screening process. Travel Document Checker: The traveler will show their government-issued identification and boarding pass to an officer to ensure the identification and boarding pass are authentic and match. Transgender travelers are encouraged to book their reservations such that they match the gender and name data indicated on the government-issued ID. Walk Through Metal Detector: Metal detectors are in use at all airports. Advanced Imaging Technology (AIT): Screening with advanced imaging technology is voluntary and travelers may "opt out" at any time. Travelers who "opt out" of the AIT screening are required to undergo a thorough pat-down by an officer of the same gender as the traveler presents. New Advanced Imaging Technology Software: TSA has upgraded all millimeter wave advanced imaging technology units with new software called Automated Target Recognition to further enhance privacy protections by **eliminating the image of an actual traveler and replacing it with a generic outline of a person.** Pat-Down: A pat-down may be performed if there is an alarm of the metal detector, if an anomaly is detected using advanced imaging technology, if an officer determines that the traveler is wearing non-form fitting clothing, or on a random basis. If a pat-down is chosen or otherwise necessary, private screening may be requested. Pat-downs are conducted by an officer of the same gender as presented by the individual at the checkpoint. Prosthetics: A TSA Officer may ask you to lift/raise your clothing to screen a prosthetic (only if doing so would not reveal a sensitive area). Sensitive areas should not be exposed during the screening process. Behavior Detection Program: Behavior Detection Officers screen travelers using non-intrusive behavior observation and analysis techniques to identify potentially high-risk passengers. Officers are designated to detect individuals exhibiting behaviors that indicate they may be a threat to aviation and/or transportation security. Individuals exhibiting specific observable behaviors may be referred for additional screening, which can include a pat-down and physical inspection of carry-on baggage. TSA recognizes that exhibiting some of these behaviors does not automatically mean a person has terrorist or criminal intent. Referrals for additional screening are solely based on specific observed behaviors.

As recently as February 1, 2011, TSA began testing new AIT technology in attempts to further passenger privacy. n43 The new machines, unlike the full-body scanners previously

used in airports [*187] across the United States, n44 do not produce passenger-specific images but rather indicate the position of potentially harmful items on generic outlines of people. n45 The software used on AIT machines at airports, referred to as Automated Target Software (ATR), does not include the ability to store the images. n46 The new software was first tested in Las Vegas, Atlanta, and Washington, D.C. n47 As of July 20, 2011, TSA announced that over the course of the following months they would install ATR software for millimeter wave AIT technology on all millimeter wave units in the field. n48 Testing for similar software on the backscatter units began in the fall of 2011. n49 Because the images are no longer passenger-specific, there is not a need for a separate TSA officer to view the images in a closed room. n50 If certain areas on the image look like a passenger is harboring threatening items, those areas require additional screening. n51 The new technology obviously presents less of a problem and challenge to the Fourth Amendment than the previous body-scanner technology because images no longer produce revealing passenger-specific images, but questions of reasonableness still remain.

According to the Department of Homeland Security, airport personnel using Advanced Imaging Technology (AIT) that does not have the new ATR software will post signs informing passengers [*188] what type of AIT -- backscatter or millimeter wave -- is used with a sample image. n52 Airport personnel will also inform passengers they may decline the body-scan in exchange for a pat-down. n53 Airports using the new pilot ATR software will also post signs with a sample ATR image informing passengers of the type of AIT being used, as well as their right to decline the AIT unit in exchange for a pat-down. n54 The images with the ATR software, as already mentioned, are generic as opposed to passenger specific, and for that reason the TSO reviews the image with the passenger. n55 If a passenger's body-scan produces an anomaly or a particular area of the body produces an ambiguous scan--for example a suspicious item picked up in the thigh area--the pat-down will only target that area. n56 If the anomaly is not isolated and the scan produces multiple ambiguous areas, a passenger could be subjected to a full physical screening. n57

ATR technology is necessary in order to prevent terrorist threats while preserving citizens' constitutional right to privacy.

Stancombe 11 [Brittany R. Stancombe, associate at Waller Law, "Comment: Fed Up With Being Felt Up: The Complicated Relationship Between The Fourth Amendment And Tsa's "Body Scanners" And "Pat-Downs," 2011 Cumberland Law Review, lexisnexis]//JIH

Advanced Imaging Technology units with Automated Target Software as primary screening, however, are arguably constitutional. Instead of producing an image with graphic details of a passenger's private areas, ATR software only provides a generic outline of a passenger, while still highlighting areas on a person's body that could be a potential threat. n264 If the AIT units are the best way to protect airplanes during this particular day and age, arguably using them is the best way to meet that need. It can also be argued that the level of intrusiveness is not so blatant as to cause privacy concerns. While the machine still technically undresses a passenger, Transportation Security Officers would no longer be able to see areas most people are not comfortable showing complete strangers. If the body scan produces any anomalies, then, and only then, is the passenger subject to further, more

probing screening, which is consistent with the Third Circuit's reasoning in Hartwell. n265 [*211]

The enhanced pat-downs currently being practiced by Transportation Security Officers is characterized by more probing screening. Pat-downs as primary screening, while they have not been held as unconstitutional, seem unconstitutional based on current caselaw. Once again, the reasonableness must be weighed when considering the level of intrusiveness and degree of privacy the search involves. n266 A pat-down can come as a result of a passenger opting-out of a body scan or by setting off an alarm in the metal detector or body scan. n267 With a pat-down, passengers' private areas are often touched as a result. n268 As seen earlier, the level of intrusiveness must be balanced with the state's interest and means of going about that interest. n269

The government must continue to attempt to protect the privacy interests of their citizens. On an average day, a police officer may not simply strip search any individual they so please. Requiring passengers to either bare all in a body-scan or allow a complete stranger to pat-down one's private areas in order to board an airplane is simply unreasonable and not narrowly tailored. AIT units should be a secondary form of screening once a passenger has sounded an alarm after walking through the metal detector. Only AIT units loaded with ATR software should be used to provide the utmost respect for passenger's privacy while also pursuing the legitimate government goal of preventing terrorist attacks. Ideally, security should focus more on behavioral detection, leading to suspicion of terrorist activities based on suspect mannerisms and behaviors. In a post-9/11 world though, it would seem that watching and questioning people in airports for suspicious activity is simply not enough. Israel, however, has seemed to make it work just fine. n270 Beni Tal, head of a security consulting firm in Tel Aviv, said, in reference to 9/11, "American security has been sleeping well for years. . . . Now they have woken up forever." n271

The TSA began installing ATR software in 2011 in order to secure increased privacy.

In FY2011, TSA began installing Automated Target Recognition (ATR) software in its deployed millimeter wave machines, both to allay continuing concerns regarding privacy and to improve screening efficiency. With the introduction of ATR, TSA is working toward the eventual elimination of human image viewers. In the future, TSA plans to rely primarily or exclusively on ATR for threat detection, which automatically reviews and analyzes images for concealed threats. In 2011, TSA upgraded all deployed millimeter wave scanners with ATR software. The ATR algorithms are currently undergoing operational evaluations in which they are being tested sideby- side with existing image review procedures. The ATR displays show only a generic body outline identifying locations of potential concealed threats rather than a full body image. If no threats are detected, the ATR monitor displays no image and an “OK” appears on screen against a green background (see Figure 3). TSA plans to include ATR capabilities in all future millimeter wave AIT procurements.12 TSA has

not announced whether a similar system will be developed or implemented for X-ray backscatter imagers.

The TSA has completely phased out the technology that the aff isolates – ATR software preserves privacy.

Quirk 13 [Mary Beth Quirk, journalist at The Consumerist, "TSA Replaces Backscatter Airport Scanners With Technology That Won't Show Your Private Bits," May 31, 2013, http://consumerist.com/2013/05/31/tsa-replaces-backscatter-airport-scanners-with-technology-that-wont-show-your-private-bits/]//JIH

We've come a long way, baby, and it seems the days of worrying over whether or not Transportation Security Administration agents were snickering at your nude image on an airport scanner are over. The backscatter scanners are gone — so now we can get back to worrying about what kind of funk we're picking up in our socked feet during the security line walk instead.

The TSA told Congress in a letter yesterday from TSA head John Pistole that as of May 16, the agency was setting up airport scanners with software called Automatic Target Recognition. That software only shows generic images of travelers, whereas the offending Advanced Imaging Technology, or backscatter technology, had ticked everyone off with its somewhat detailed nudies.

The TSA had a June 1 deadline and it beat it, as all 250 airports with backscatter scanners have been effectively switched out for the new technology. You'll still walk through a full-body scan that uses radio waves, but there likely won't be as many privacy concerns and probably no health concerns, CNN reports.

Removal of backscatter imaging means that images can't be saved or profiled – solves biometrics.

Abini 14 [Deema B. Abini, attorney in Los Angeles, CA, "Traveling Transgender: How Airport Screening Procedures Threaten The Right To Informational Privacy," 2014, lawreview.usc.edu/wp-content/uploads/Abini-PDF.pdf]//JIH

The TSA has not provided to the public any specific details regarding the science behind ATR software. Evidently, "passengers are able to view the same outline that the TSA officer sees" and "a separate TSA officer is no longer required to view the image in a remotely located viewing room," meaning that the TSA officer conducting the screening is physically present with the subject.40 Images of AIT displays provided by the TSA include two color-coded start buttons, either of which can commence the scanning of a subject: one pink and one blue.41 Presumably, the TSA officer must determine the subject's gender and select the appropriate start button,42 prompting the software to highlight any differences between the form of a typical body of that sex and the individual subject's body as potential threats.43

With the introduction of ATR, the TSA began working toward the eventual elimination of the use of TSA employees to review actual images of screening subjects for threats, instead relying on ATR for threat detection.44 As of September 2012, ATR algorithms were being evaluated side-by-side with previous image review procedures to assess the viability of such a shift.45 In response to perceived privacy and efficiency improvements, Congress enacted the Federal Aviation Administration Modernization Reform Act of 2012, mandating that "any advanced imaging technology used for the screening of passengers . . . (A) is equipped with and employs automatic target recognition software; and (B) complies with such other requirements as the Assistant Secretary determines necessary to address privacy considerations."46

Originally, the date by which the TSA was to be in full compliance was June 1, 2012, but that date was extended to June 1, 2013.47 The TSA had given backscatter unit manufacturer Rapiscan until the extended date of compliance to devise an ATR software upgrade compatible with its units, but Rapiscan determined it would be unable to meet that deadline.48 Thus, in January 2013, the TSA ended its contract with Rapiscan and pledged to exclusively use millimeter wave machines equipped with ATR software by June 1, 2013.49 The remaining several hundred backscatter units were indeed removed from airports by late May 2013.50

TSA Not Gendered
If your gender identity or appearance does not match your ID it does not matter for TSA

National Center for Transgender Equality 2015 (http://transequality.org/know-your-rights/airport-security; Know Your Rights |Airport Security;7/21/15;lmm)

All passengers 18 years of age or older are required to provide proof of identity at check-in and at the security checkpoint. TSA rules require that you provide your name, gender, and date of birth when making an airline reservation. The name, gender, and date of birth must match the government-issued photo ID you will provide when passing through security. The Secure Flight program checks this information against government watch lists, and gender information is used to eliminate false matches with the same or similar names – **not to evaluate a person's gender. If you have different names or genders listed on different ID, you can choose which to provide, so long as you bring photo ID that matches your reservation. TSA Travel Document Checkers will check as you enter security to ensure that information on your ID matches your boarding pass. It does not matter whether your current gender presentation matches the gender marker on your ID or your presentation in your ID photo,** and TSA officers should not comment on this. Sometimes travelers have their tickets booked for them by other people. When this happens, you should make sure that the person booking your tickets uses the information on the government-issued ID you plan to use at the airport. The gender marker on your boarding pass must match the government-issued photo ID you show the TSA Travel Document Checker.

Pat-downs are always an option and you will be accommodated according to your gender identity. In addition private screening and a present witness checks any or all abuse the aff claims is occurring.

National Center for Transgender Equality 2015 (http://transequality.org/know-your-rights/airport-security; Know Your Rights |Airport Security;7/21/15;lmm)

At checkpoints using body scanners, a pat-down is the only alternative to being scanned. A pat-down may also be required if an anomaly is identified by the machine, if your clothing is very loose, or on a random basis. TSA pat-downs can be very invasive. Children 12 and under should receive a modified, less-intrusive pat-down under the observation and direction of their parents if necessary. If you choose a pat-down to avoid the AIT machines or if the TSA agents require one for another reason, the pat-down must be performed by an officer of the same gender as the traveler. This is based on your gender presentation. So, for instance, transgender women should be searched by female officers, and transgender men should be searched by male officers. The gender listed on your identification documents and boarding passes should not matter for pat-downs, and you should not be subjected to personal questions about your gender. If TSA officers are unsure who should pat you down, they should ask you discreetly and respectfully. If you encounter any problem, ask to speak to a supervisor and clearly and calmly state how you should be treated. Travelers may ask for a private screening at any time. You may take a witness of your choosing with you when you are being privately screened.

The most effective way to prevent terrorism is to ensure terrorists cant get to the airport- this means the Secure Flight Program is critical

Bucci, Carafano, and Stimson 14— Director, Douglas and Sarah Allison Center for Foreign Policy Studies; Vice President, Foreign and Defense Policy Studies; Manager, National Security Law Program and Senior Legal Fellow (Steven Bucci, James Jay Carafano, and Charles Stimson, "Terrorism," Heritage foundation, 2014, http://solutions.heritage.org/terrorism/). WM

Improve the prevention of terrorist travel. The problem in stopping terrorist travel to the U.S. is not airport screening per se; attempting to turn every airport into another Maginot Line or Fort Knox is going to fail at some point. Instead, the best way to discourage terrorist plots is to frustrate groups and individuals **before they begin**. As long as terrorism exists, free nations have to do a better job of thwarting terrorist travel. Would-be murderers like Umar Farouk Abdulmutallab (the Detroit-bound Christmas bomber) should not be allowed near an airliner, and **the best way to accomplish this goal is to ensure that potential terrorists are carefully vetted by intelligence analysts before they ever get to the airport**. Of course, security at the airport and on airplanes is also important because it is the last line of defense, and suspicious travelers should be subject to greater but appropriate levels of scrutiny, inspection, and surveillance. In order to plug the gaps in preventing terrorist travel, the U.S. should improve visa security coordination between the Departments of State and Homeland Security, support the Federal Flight Deck Officer program that allows trained pilots to carry firearms, speed up **deployment of the Secure Flight program**, step up implementation of REAL ID, and expand the Visa Waiver Program.

Secure Flight is key to coordinate across agencies to effectively combat terror

Marshall 11— (Patrick, "TSA's Secure Flight curbed risk, calmed travelers," GCN, delivers technology assessments, recommendations, and case studies, Oct 24, 2011, http://gcn.com/Articles/2011/10/17/TSA-Secure-Flight-Profile-Main.aspx). WM

The Sept. 11 attacks changed many aspects of Americans' lives. At the top of the list, of course, was air travel.

The immediate impact was long security lines in airports. And the longer-term challenge was for the Transportation Security Administration to develop a system for confirming the identity of passengers and ensuring that planes could not be used for acts of terrorism in the future. At the same time, the goal was to achieve this end without unduly inconveniencing legitimate travelers.

Initially, the airlines themselves shouldered the task. But, said Stacey Fitzmaurice, director of TSA's Secure Flight program, "It became evident that having each airline conduct its own

watchlist-matching process was creating inconsistencies across the industry and limiting the ability of the U.S. government to try to coordinate operational responses in advance."

Officials were also concerned about having so much potentially sensitive personal information about citizens in the hands of private carriers. "There was a need to find a single government program that could bring this in-house, do it consistently and reduce the need for the distribution of that sensitive information," Fitzmaurice said.

The 9/11 Commission and Congress agreed. The commission recommended that TSA take over responsibility for watchlist matching from the airlines. And in 2004 Congress passed the Intelligence Reform and Terrorism Prevention Act, which implemented the commission's recommendation and created the Secure Flight program.

Hurdles to clear

When Fitzmaurice took over the project in 2006, it had been foundering a bit, mostly over privacy concerns. After the 9/11 Commission report, Fitzmaurice said, "There was a desire to build this watchlist-matching program that was really beyond just watchlist matching. There were desires to look into commercial datasets. There were desires to collect a lot more information on passengers. Those efforts really were unsuccessful in getting this program off the ground because of significant criticism that the program faced in terms of trying to be too invasive, especially from a privacy standpoint."

Fitzmaurice said the first thing the newq team did was to take a step back and reassess the program's core mission. "We realized we only needed this minimal amount of information and we're only going to retain it for a short period of time," she said. "We locked in those core principles and then built a system around that."

The team did extensive analysis of what information would be the most effective and, at the same time, the least intrusive. "I can't get into the exact details of this, but it is not just exact name matching," Fitzmaurice said. "It is a complex type of matching looking at variations of names and other things to be able to come up with matches that we're confident about."

Privacy wasn't, of course, the only issue TSA team had to resolve. Given the potential life-or-death consequences of failure, the Secure Flight system needed to have ultra-high availability, and that meant building a system with sufficient redundancy. "We needed to make sure that Secure Flight was not going to have any single points of failure," Fitzmaurice said.

Accordingly, Secure Flight runs two complete operations centers in two undisclosed secure locations. The operations centers are identically configured with redundant components, and in the event that one center experiences a failure of any sort the system will automatically switch all operations to the other site.

The massive amounts of data to be processed were also major challenges. "Every day we see 2 million to 2.5 million passengers come through," Fitzmaurice said. "And we had a requirement for a program to actually be matching 72 hours in advance, so we're really looking at three days' worth of data. That's upwards of 6 million passengers at any given time that are being vetted by Secure Flight."

Finally, the system had to be able to do its job on very short notice. “The nature of the airline business is that they can have a passenger walk up to the ticket counter and want to get on an aircraft within the next hour,” Fitzmaurice said. “Also we needed to design a system that would be capable of handling high-priority requests and be able to process and accurately vet those passengers within seconds.”

Cost and impact

It’s much easier to nail down the costs of the Secure Flight program than its effects. Fitzmaurice ballparks the cost for getting the system up and running at $285 million, including planning, initial hardware purchases, software development, program management and support activities.

Although the government does not release figures on the numbers of suspected terrorists identified by the Secure Flight program, Fitzmaurice said, “we feel very strongly that Secure Flight has **absolutely improved the security** of commercial air travel as well as the overall experience of the traveler. Secure Flight is a behind-the-scenes watchlist-matching effort that will clear well over 99 percent of passengers automatically and before they ever check in for their flights. It will eliminate the need for them to have any other interaction at the airports for the purposes of matchups.”

Fitzmaurice said Secure Flight has also been a game changer for TSA. “Secure Flight is able to allow TSA on a daily basis to coordinate in advance operational responses,” she said. “When the watchlist matching was being done by the carriers, this type of information was really not available until the last minute when the passenger was there at the airport and getting ready to travel.”

Secure flights is the best measure to check against terrorism

McNeill 09— homeland security policy analyst (Jena Baker McNeill, “Secure Flight Program Creates Safer Skies,” Heritage Foundation, April 1, 2009, http://www.heritage.org/research/reports/2009/04/secure-flight-program-creates-safer-skies). WM

On March 31, the Department of Homeland Security (DHS) announced the implementation of Secure Flight-a program to screen flight passenger data and flag possible terrorists before they board a commercial airplane. DHS should be commended for implementing such a smart security measure. Secure Flight expands America's capacity to find possible terrorists while minimizing the impact on the airline industry and protecting the rights and privacy of individuals. DHS and Congress should use this program as a model for future airline security efforts and take steps to ensure its full implementation.

Checking Passengers

Prior to 9/11, the individual airlines screened passengers for security risks. This system was known as the Computer Assisted Prescreening Passenger System (CAPPS). CAPPS,

however, was limited: The only datasets that could be screened for security risks were the passenger's form of payment and travel itinerary.

After all of the 9/11 hijackers boarded airplanes under the CAPPS system, the need for a new approach was clear. In fact, the 9/11 Commission Report emphasized that the aviation industry lacked adequate means to screen all commercial flight passengers against known or suspected terrorists watch lists. After a contentious debate over the best way to use this passenger data while protecting civil liberties, the idea for Secure Flight was developed.

Secure Flight checks a passenger's data against a federal database of the FBI Terrorist Screening Center-a center that integrates all available information on known or suspected terrorists into a central repository. While alternative proposals considered prior to Secure Flight would have tasked the airline industry with this screening process, under this program the airlines' only charge is to gather basic information (full name, date of birth, and gender) when the passenger makes a reservation.

Why **Secure Flight Works**

Implementation of Secure Flight is a positive step toward addressing a glaring security gap left open since 9/11. It produces the following benefits:

Keeps Americans safer. Secure Flight ensures that known or suspected terrorists are prevented from boarding commercial airplanes in the U.S. And since the Transportation Security Administration (TSA) is performing the screening, passenger data can be compared against a classified list rather than the unclassified list that is now shared with airlines-making certain that the right people are prohibited from boarding.

Minimizes impact on industry. Because TSA performs the screening itself, the airline industry does not have to make costly upgrades or major changes that might harm an already struggling industry. Prior to Secure Flight, an alternative plan, known as CAPPS2, would have cost the airline industry over $1 billion in logistical upgrades. Secure Flight will be significantly cheaper-it is estimated to cost approximately $630 million-and has already received far more favorable reviews from the airlines themselves.

Maintains privacy and civil liberties. Under Secure Flight, TSA-not outside entities-will check watch lists. This means that information privacy is maximized by decreasing the possibility that private data will wind up in the wrong hands. Furthermore, Secure Flight helps tackle some of the civil rights concerns associated with watch lists by minimizing misidentification. On many occasions, under the current system, those who have a name similar to someone on the watch list have been prohibited from boarding an airplane. This misidentification is minimized when airlines, during the ticket purchasing process, obtain the traveler's gender and date of birth. Furthermore, if an individual is wrongfully prohibited from boarding an airplane, he can use the DHS's Traveler's Redress Inquiry Program to address the error.

Going Forward

Going forward, **DHS and Congress should continue to implement Secure Flight** and work together to expand other programs that increase airline security while shedding those that do not. These steps include:

Ensure full implementation of Secure Flight. TSA has now implemented Secure Flight with four volunteer aircraft carriers. DHS says that they are going to add more carriers in the next few months, with 100 percent implementation on both domestic and international flights by 2010. Congress should fully fund this program and DHS should ensure 100 percent implementation.

Expand the Visa Waiver Program. The Visa Waiver Program-which allows passengers from member countries to travel to the U.S. without the need for a visa-increases air travel security by acquiring information about foreign travelers before they even reach U.S. soil. Furthermore, the information sharing and security agreements that go along with visa waiver membership help the U.S. and its member countries to fight terrorism around the globe-all while expanding the U.S. economy and improving America's image abroad.

Scrap the 100 percent air cargo mandate. The 100 percent air cargo screening mandate is an example of the wrong kind of policies for the airline industry. This mandate would require 100 percent screening of cargo transported by passenger aircraft. TSA is not likely to meet the three-year deadline given for implementation-the mandate requires enormous structural changes. Furthermore, there is nothing to indicate that this program would produce any security gains. But every indication suggests that this mandate will have a tremendous impact on the supply chain by hindering efforts to move goods around the United States. Congress should reassess the need for such a policy.

The Right Kind of Security Policies

Implementing the right kinds of aviation security policies will ensure that Americans can travel freely and safely with the knowledge that their privacy and civil liberties are being maintained. DHS deserves kudos for designing a program-Secure Flight-that achieves these goals.

Secure Flight is the best method for risk assessment

Stellin 13— (Susan, "Security Check Now Starts Long Before You Fly," The New York Times, OCT. 21, 2013, http://www.nytimes.com/2013/10/22/business/security-check-now-starts-long-before-you-fly.html?_r=0). WM

The T.S.A., which has been criticized for a one-size-fits-all approach to screening travelers, said the initiatives were needed to make the procedures more targeted.

"Secure Flight has successfully used information provided to airlines to identify and prevent known or suspected terrorists or other individuals on no-fly lists from gaining access to airplanes or secure areas of airports," the security agency said in a statement. "Additional risk assessments are used for those higher-risk passengers."

The plan is perceived as too small scale- If there's going to be a TSA bill, its got to be a crackdown- anything that makes it to the table but is less than a crackdown enrages both sides

Jenkins 15— Senior advisor at the non-profit RAND corporation(Brian Michael, "TSA flunked its security test big time — Now what?," The Hill, June 15, 2015, http://thehill.com/blogs/pundits-blog/homeland-security/244957-tsa-flunked-its-security-test-big-time-now-what). WM

The failure of Transportation Security Administration (TSA) agents to detect 67 out of 70 weapons or fake explosives smuggled through airport security checkpoints by the TSA's own inspectors renews questions about the agency's ability to protect the country's airlines. A failure rate of 95 percent also provides a new opportunity for attack by the TSA's many foes and rekindles the hostility many Americans have not just for the TSA, but for what they see as an increasingly intrusive and untrustworthy federal government.

Without knowing more about the details of the undercover tests, it is hard to judge the precise nature of the apparent security breakdown, but in any context, a 95 percent failure rate — the repeated news story headline — is shockingly unacceptable.

There is one slender ray of good news: Department of Homeland Security inspectors found the cracks in the system, not terrorists. However, this is far outweighed by the bad news: A highly publicized failure of this magnitude destroys the illusion of security, and yes, for those who criticize airport security as being merely for show, illusion is a useful component of security. Security checkpoints, here and abroad, have almost never caught terrorists; the screeners find enough weapons — over 2,000 in 2014 — to create an impression that they are on their game. And that deters terrorists.

Whatever TSA's critics may think of airport security, terrorists seem to take it very seriously. Faced with an array of greater intelligence efforts — even the perception of increased security at the airport, the possible presence of air marshals on any flight, locked and armored cockpit doors, and passengers ready to take on anyone threatening the plane — they seem to have just about abandoned hijacking airplanes as a viable terrorism tactic.

Over the long run, attempts to sabotage airliners also have declined, but terrorists have not stopped trying to smuggle explosives aboard airliners, and sometimes they have succeeded. In an attempt to foil security, they build small devices that can be concealed in ways that will make them undetectable to all but the most intrusive searches. To find the most artfully concealed explosive devices on the most dedicated suicide bombers would require a full-body search. This vulnerability is hard to close, but forcing terrorists to operate at this level of technical sophistication and commitment is still an achievement.

The recent TSA testing failure is not merely a public relations problem. Firing one or more top officials may temporarily satisfy Washington's bloodlust, but will not solve the problem

of performance. Appointing a new director does not immediately improve performance. That would be the task of the new director. A failing grade in this round of tests also should not lead to a wholesale reorganization of TSA. Getting the wiring diagram right will not by itself improve performance.

Those who despise the TSA for various reasons, most of which are unrelated to airline security, **will take perverse delight in its failure and use it for political capital**. **Some will want to punish the TSA by cutting its budget**. If $7 billion a year delivers a lousy 5 percent success rate, they will argue, what are we paying for?

The plan sparks a political firestorm -- social conservatives backlash, pits religious liberty against sexual freedom

Walters '15 Edgar, Texas Tribune - ""Bathroom Bills" Pit Transgender Texans Against GOP" 4/4

Social conservatives say the bills, which have been referred to the House State Affairs Committee, are designed to protect people from assault in public restrooms. "**I've got four granddaughters, and I'm not interested in anybody that has a question about their sexuality to be stepping in on them," said state Rep. Dan Flynn, R-Canton**, who co-authored Riddle's bills. Neither Riddle nor Peña could be reached for comment. **There are roughly 700,000 transgender people in the United States, or less than 1 percent of the population, according to estimates from the Williams Institute, a research center at the UCLA School of Law. For Flynn and other conservatives, that means transgender advocates are fighting a battle that would benefit only a small group of people over the concerns of a majority. "I think it's unbecoming of anyone to want to make others uncomfortable," Flynn said. "It's unfortunate that there are those who want to push their agenda that's contrary to the majority public position." The controversy is part of a larger fight over how states should meet their obligation to protect both minority groups and religious liberty.** The Florida Legislature is considering a bathroom bill similar to Riddle's. And in Indiana and Arkansas, public backlash over laws to protect religious freedom forced the states' governors to sign amended versions that included protections for gays and lesbians. **Religious freedom proposals that lack such protections — including Senate Joint Resolution 10 by state Sen. Donna Campbell, R-New Braunfels — have been filed in Texas.**

Surprisingly, despite all of the negative Internet commentary and Congressional complaining about the Transportation Security Administration, the majority of U.S. travelers have a positive opinion of the agency. Not only that, but people who fly, and who are exposed to TSA screening, have an even more positive opinion than people who rarely or never fly. According to a Gallup poll released Wednesday, 54% of Americans think the TSA is doing either an excellent or a good job of handling security screening at airports. Moreover, among Americans who have flown at least once in the past year, 57% have an excellent or good opinion of the agency. As far as TSA effectiveness at preventing acts of terrorism on U.S. airplanes, 41% think the screening procedures are extremely or very effective. Another 44% think the procedures are somewhat effective. That number varies little for people who fly somewhat regularly and people who rarely or never fly. The poll was conducted with telephone interviews July 9th through July 12. Gallup interviewed 1,014 adults living in all 50 states and the District of Columbia. Interestingly, younger Americans "have significantly more positive opinions of the TSA than those who are older," Gallup said, noting that 67% of people between 18 and 29 rate the agency as excellent or good. This may be because young people fly more frequently, or it may be because that for young people TSA screening, first implemented in 2001, has been part of their flying experience for the majority of their lives.

Absent a specific threat, security measures cost rather than save PC

Before an attack occurs, or **when a long period of time has passed between attacks, politicians have little incentive to enact good security measures. They have limited time and political capital, and the incentive is to spend it on measures that are popular with the general public or that benefit powerful interest groups. Neither the public nor interest groups are likely to push hard for effective security measures when there is no immediate fear of attack.**

Powerful lobbies will fight for the plan -- intrusive TSA screenings interfere with travel and tourism

'TIS THE SEASON TO LOBBY THE GATEKEEPERS: Going Grinch on the Transportation Security Administration is most en vogue, as grumpy travelers quietly, but sincerely consider chucking their removed shoes at unwitting agents inspecting their semi-naked photos taken by a newfangled millimeter wave machines into which these folks *may* have accidentally dumped 3.4 ounces of shampoo just to see if, oh, the wiring shorts out. Of course, we exaggerate (slightly), although travel this time of year ain't exactly a bowl of noses like cherries. **Fear not, however: Several companies and organizations are rushing a small army of federally registered lobbyists to your aid in a bid to make your airport security experience less harried, a Center for Responsive Politics review of lobbying disclosure filings indicates**. **Among them is the U.S. Travel Association, a relatively new group composed of dozens of hospitality companies, tourism entities, travel agencies and the like. Through the year's first nine months, the U.S. Travel Association has spent more than $1.1 million lobbying the federal government — including the TSA — on a variety of issues, including "TSA screening," "TSA airport operations" and "international and domestic registered traveler programs." That's nice. But say you have a specific concern — like a prosthetic. You probably don't want some wiseacre asking you to remove your belt, your coat and your metallic fibula. Take heart in knowing that the Amputee Coalition of America has this year lobbied the TSA regarding "transportation issues for persons with limb loss." Grandma get run over by a reindeer? Need to get what's left of her back to the family plot in Sheboygan? *Do not* pull a Weekend at Bernie's. Do thank the National Funeral Directors Association for lobbying the TSA this year on the issue of "transportation of human remains on commercial passenger aircraft."** And take heed in knowing that wherever the friendly skies may take you for the holidays, lobbyists aren't far away. **This humble blogger, for example, will today travel from Washington Reagan National Airport (the Metropolitan Washington Airports Authority has spent $150,000 on lobbying this year) on American Airlines (parent company AMR Corp. has spent $4.52 million) to the city of San Antonio ($149,600 in lobbying) via Dallas/Fort Worth International Airport ($200,000 in lobbying).**

Demands to abolish airport security are part and parcel of the logic of neoliberal privatization

Jilani '14 Zaid, writer for Alternet, "Why Is Ezra Klein's Vox Parroting Right-Wing Talking Points About Privatizing the TSA?" **5/29**

http://www.alternet.org/media/why-ezra-kleins-vox-parroting-right-wing-talking-points-about-privatizing-tsa

Between 2011 and 2012, despite aggressive and sustained opposition from right-wing politicians and pundits, 45,000 transportation security officers at the Transportation Security Administration won their first-ever labor contract, thanks to a hardened organizing drve by the American Federation of Government Employees. It's no surprise that the agency soon came under intense attack from Republicans and D.C. lobbyists who normally utter nary a word about civil liberties. These Republicans, like Rep. John Mica (R-FL), whose campaign coffers are lined with cash from private security contractors who want to displace the TSA, made clear that their goal was to privatize the agency – meaning they were okay with security procedures some viewed as intrusive, but they wanted profit-making, non-unionized corporations to be the ones doing these searches, not one of America's newest unionized public workforces**. Earlier this week, Vox.com – a new website run by wunderkind Ezra Klein that promises to "explain the news" in an objective manner setting itself apart from supposedly more ideological media on the left and right – piled onto this campaign by publishing an article called "The Case for Abolishing The TSA**." To the piece's author, Dylan Matthews, abolishing the TSA isn't a tough call – rather, it's just a matter of objective data that shows the agency is virtually a waste of resources, and that the responsibility of airline security should be privatized and carried out by the airlines themselves. "It's worth remembering that the inconvenience and injustice of the TSA's activities exists for literally no reason," he writes. "Airline security is, so far as we can tell, totally useless." To defend reaching this conclusion, Matthews cites a variety of sources. First, he points to Bruce Schneier, a cryptographer who he refers to as a security expert. The source Matthews links to is not a peer-reviewed paper or journal article, but rather a statement Schneier made in a debate. The debate is not over abolishing the TSA, persay, but rather about TSA's post-9/11 security measures. While Schneier argues that the TSA has not apprehended any terrorists since 9/11, he does not argue for the agency's abolition. On the contrary, he writes that "aircraft require a special level of security for several reasons: they are a favoured terrorist target; their failure characteristics mean more deaths than a comparable bomb on a bus or train; they tend ot be national symbols; and they often fly to foreign countries where terrorists can operate with more impunity. But all that can be handled with pre-9/11 security." The next set of sources Matthews uses is a literature review by professors Cynthia Lum and

Leslie Kennedy, of George Mason University and Rutgers, respectively. Matthews writes that these professors studied the research on airport security and found that while the TSA has prevented hijackings, it "didn't reduce attacks, but encouraged would-be hijackers to attack through other means." He concludes, "Additional research done after the review has similarly concluded that the screenings are, in effect, a wash." Actually, that's not what Lum and Kennedy conclude. I know this because I emailed them and asked. Here's what Kennedy had to say about Matthews's article: "We did not argue for abolishing the TSA. That is the reporter's conclusion not ours. We simply reported on the effectiveness of airport screening which we found, based on the research, was quite high. Our research was not focused on the TSA per se but, obviously, based on our findings, it would make no sense to get rid of airport screening." And here is what Lum had to say: "I agree with Prof Kennedy. This is an incorrect interpretation of our research." In other words, **none of the researchers Matthews cited actually agree with him that the TSA is useless or should be abolished – even as he is basing his conclusion almost entirely on the idea that the research shows that he is right. Well, not entirely. Towards the end of his piece, Matthews cites some odd political figures to validate his idea that abolishing the TSA isn't outside of mainstream political thought: What to do, then? Simple: just abolish the agency. This is hardly an extreme proposal; members of Congress, including influential figures like Senator Rand Paul (R-Kentucky) and Congressman John Mica (R-Florida), have endorsed it. The Cato Institute's Chris Edwards wants to privatize the TSA and devolve its responsibilities to airports, but that preserves far too much of the status quo. Better would be to make security the responsibility of individual airlines, so as to allow competition on that dimension. It's mind-boggling how Matthews can view a proposal as not extreme because the Cato Institute – which publishes tracts opposing child labor laws – endorses it. The same goes for Sen. Rand Paul (R-KY), a right-libertarian who once questioned the Civil Rights Act on national television. And as was noted above, Mica is a close ally of private security firms whose behavior is just as intrusive as any government agency, and is hardly a champion of civil liberties (he recently voted for an NSA bill that liberties proponents decried as "fake reform"). Lastly, asking that individual airlines compete to provide security runs afoul of the basic history of private corporations and public safety. Yes, competition is a powerful motivation that has driven real innovation in the market – firms want business, and will often seek better products in order to win over the public. The problem is, this incentive doesn't really work out with respect to safety. Private firms see their top motivation as making the most money as possible – even if that means compromising safety.** Yes, a bomb exploded on an airplane can be very bad for business. But corporate accountants have often been caught weighing the odds of a public safety disaster versus the cost of making safety improvements. **In the 1970's, it was revealed that Ford Motor Company was aware of a design flaw in its Ford Pinto cars that could result in people burning to death. It refused to pay for a redesign of the cars, deciding that it'd be cheaper to pay off lawsuits that resulted from potential deaths. This cost-benefit analysis is completely different from what the TSA and other public**

safety agencies do – their goal is zero deaths, not whatever is cheaper for shareholders.

This impulse to regulate optimum societal outcomes through market-based approaches terminates in the absolute demolition of social value

Harvey '5 David, David Harvey is the Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York. "A Brief History of Neoliberalism" http://messhall.org/wp-content/uploads/2011/09/A-Brief-History-of-Neoliberalism.pdf, xdi

To presume that markets and market signals can best determine all allocative decisions is to presume that everything can in principle be treated as a commodity. Commodification presumes the existence of property rights over processes, things, and social relations, that a price can be put on them, and that they can be traded subject to legal contract. The market is presumed to work as an appropriate guide––an ethic––for all human action. In practice, of course, every society sets some bounds on where commodification begins and ends. Where the boundaries lie is a matter of contention. Certain drugs are deemed illegal. The buying and selling of sexual favours is outlawed in most US states, though elsewhere it may be legalized, decriminalized, and even state-regulated as an industry. Pornography is broadly protected as a form of free speech under US law although here, too, there are certain forms (mainly concerning children) that are considered beyond the pale. In the US, conscience and honour are supposedly not for sale, and there exists a curious penchant to pursue 'corruption' as if it is easily distinguishable from the normal practices of influence-peddling and making money in the marketplace. The commodification of sexuality, culture, history, heritage; of nature as spectacle or as rest cure; the extraction of monopoly rents from originality, authenticity, and uniqueness (of works or art, for example)––these all amount to putting a price on things that were never actually produced as commodities.17 There is often disagreement as to the appropriateness of commodification (of religious events and symbols, for example) or of who should exercise the property rights and derive the rents (over access to Aztec ruins or marketing of Aboriginal art, for example). Neoliberalization has unquestionably rolled back the bounds of commodification and greatly extended the reach of legal contracts. It typically celebrates (as does much of postmodern theory) ephemerality and the short-term contract––marriage, for example, is understood as a short-term contractual arrangement rather than as a sacred and unbreakable bond. The divide between neoliberals and neoconservatives partially reflects a difference as to where the lines are drawn. The neoconservatives typically blame 'liberals', 'Hollywood', or even 'postmodernists' for what they see as the dissolution and immorality of the social order, rather than the corporate capitalists (like Rupert Murdoch) who actually do most of the damage by foisting all manner of sexually charged if not salacious material upon the world and who continually flaunt their pervasive preference for short-term over long-term commitments in their endless pursuit of profit. But there are far

more serious issues here than merely trying to protect some treasured object, some particular ritual or a preferred corner of social life from the monetary calculus and the short-term contract. **For at the heart of liberal and neoliberal theory lies the necessity of constructing coherent markets for land, labour, and money, and these, as Karl Polanyi pointed out, 'are obviously not commodities . . . the commodity description of labour, land, and money is entirely fictitious'. While capitalism cannot function without such fictions, it does untold damage if it fails to acknowledge the complex realities behind them**. Polanyi, in one of his more famous passages, puts it this way: **To allow the market mechanism to be sole director of the fate of human beings and their natural environment, indeed, even of the amount and use of purchasing power, would result in the demolition of society.** For the alleged commodity 'labour power' cannot be shoved about, used indiscriminately, or even left unused, without affecting also the human individual who happens to be the bearer of this peculiar commodity. In disposing of man's labour power the system would, incidentally, dispose of the physical, psychological, and moral entity 'man' attached to that tag. Robbed of the protective covering of cultural institutions, human beings would perish from the effects of social exposure; they would die as victims of acute social dislocation through vice, perversion, crime and starvation. **Nature would be reduced to its elements, neighborhoods and landscapes defiled, rivers polluted, military safety jeopardized, the power to produce food and raw materials destroyed. Finally, the market administration of purchasing power would periodically liquidate business enterprise, for shortages and surfeits of money would prove as disastrous to business as floods and droughts in primitive society.**18 The damage wrought through the 'floods and droughts' of fictitious capitals within the global credit system, be it in Indonesia, Argentina, Mexico, or even within the US, testifies all too well to Polanyi's final point. But his theses on labour and land deserve further elaboration.

Only a decision-making calculus that privileges working class LIFE OVER neoliberal valorization of CAPITAL can DE-LINK economic growth from environmental destruction -- failure to articulate this political calculus results in planetary devastation

Harvey '5 David, David Harvey is the Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York. "A Brief History of Neoliberalism" http://messhall.org/wp-content/uploads/2011/09/A-Brief-History-of-Neoliberalism.pdf, xdi

The imposition of short-term contractual logic on environmental uses has disastrous consequences. Fortunately, views within the neoliberal camp are somewhat divided on this issue. While Reagan cared nothing for the environment, at one point characterizing trees as a major source of air pollution, Thatcher took the problem seriously. She played a major

role in negotiating the Montreal Protocol to limit the use of the CFCs that were responsible for the growing ozone hole around Antarctica. She took the threat of global warming from rising carbon dioxide emissions seriously. Her environmental commitments were not entirely disinterested, of course, since the closure of the coalmines and the destruction of the miners' union could be partially legitimized on environmental grounds. Neoliberal state policies with respect to the environment have therefore been geographically uneven and temporally unstable (depending on who holds the reins of state power, with the Reagan and George W. Bush administrations being particularly retrograde in the US). The environmental movement, furthermore, has grown in significance since the 1970s. It has often exerted a restraining influence, depending on time and place. And **in some instances capitalist firms have discovered that increasing efficiency and improved environmental performance can go hand in hand. Nevertheless, the general balance sheet on the environmental consequences of neoliberalization is** almost **certainly negative. Serious though controversial efforts to create indices of human well-being including the costs of environmental degradations suggest an accelerating negative trend since 1970 or so. And there are enough specific examples of environmental losses resulting from the unrestrained application of neoliberal principles to give sustenance to such a general account. The accelerating destruction of tropical rain forests since 1970 is a well-known example that has serious implications for climate change and the loss of biodiversity. The era of neoliberalization also happens to be the era of the fastest mass extinction of species in the Earth's recent history**.27 **If we are entering the danger zone of so transforming the global environment, particularly its climate, as to make the earth unfit for human habitation, then further embrace of the neoliberal ethic and of neoliberalizing practices will surely prove nothing short of deadly**. The Bush administration's approach to environmental issues is usually to question the scientific evidence and do nothing (except cut back on the resources for relevant scientific research). But his own research team reports that the human contribution to global warming soared after 1970. The Pentagon also argues that global warming might well in the long run be a more serious threat to the security of the US than terrorism.28 Interestingly, **the two main culprits in the growth of carbon dioxide emissions these last few years have been the powerhouses of the global economy, the US and China** (which increased its emissions by 45 per cent over the past decade). In the US, substantial progress has been made in increasing energy efficiency in industry and residential construction. The profligacy in this case largely derives from the kind of consumerism that continues to encourage high-energy-consuming suburban and ex-urban sprawl and a culture that opts to purchase gas-guzzling SUVs rather than the more energy-efficient cars that are available. Increasing US dependency on imported oil has obvious geopolitical ramifications. In the case of China, the rapidity of industrialization and of the growth of car ownership doubles the pressure on energy consumption. China has moved from selfsufficiency in oil production in the late 1980s to being the second largest global importer after the US. Here, too, the geopolitical implications are rife as China scrambles to gain a foothold in the Sudan, central Asia, and the Middle East to secure its oil supplies. But China also has vast rather low-grade coal supplies

with a high sulphur content. The use of these for power generation is creating major environmental problems, particularly those that contribute to global warming. Furthermore, given the acute power shortages that now bedevil the Chinese economy, with brownouts and blackouts common, there is no incentive whatsoever for local government to follow central government mandates to close down inefficient and 'dirty' power stations. The astonishing increase in car ownership and use, largely replacing the bicycle in large cities like Beijing in ten years, has brought China the negative distinction of having sixteen of the twenty worst cities in the world with respect to air quality.29 The cognate effects on global warming are obvious. As usually happens in phases of rapid industrialization, **the failure to pay any mind to the environmental consequences is having deleterious effects everywhere. The rivers are highly polluted, water supplies are full of dangerous cancer-inducing chemicals**, public health provision is weak (as illustrated by the problems of SARS and the avian flu), **and the rapid conversion of land resources to urban uses or to create massive hydroelectric projects (as in the Yangtze valley) all add up to a significant bundle of environmental problems that the central government is only now beginning to address**. China is not alone in this, for the rapid burst of growth in India is also being accompanied by stressful environmental changes deriving from the expansion of consumption as well as the increased pressure on natural resource exploitation. **Neoliberalization has a rather dismal record when it comes to the exploitation of natural resources. The reasons are not far to seek. The preference for short-term contractual relations puts pressure on all producers to extract everything they can while the contract lasts. Even though contracts and options may be renewed there is always uncertainty because other sources may be found. The longest possible time-horizon for natural resource exploitation is that of the discount rate (i.e. about twenty-five years) but most contracts are now far shorter. Depletion is usually assumed to be linear, when it is now evident that many ecological systems crash suddenly after they have hit some tipping point beyond which their natural reproduction capacity cannot function**. Fish stocks––sardines off California, cod off Newfoundland, and Chilean sea bass––are classic examples of a resource exploited at an 'optimal' rate that suddenly crashes without any seeming warning. 30 Less dramatic but equally insidious is the case of forestry.

Our alternative is to call for a paradigm shift in social relations towards a more equitable distribution of resources. This is a decision-making framework that recognizes a material foundation for autonomy as a prerequisite to democratic communication.

A More Equal Distribution of Resources **Emma Goldman describes anarchism as "an order that will guarantee to every human being free access to the earth and full enjoyment of the necessities of life"** (1907, 68). Rocker (1938) describes the effects of acute inequality in the distribution of resources: **Our present economic system, leading to a mighty accumulation of social wealth in the hands of a privileged minority and to a continuous impoverishment of the great masses of the people . . . sacrificed the general interests of human society to the private interests of individuals** and thus systematically undermined the relationship between man and man [sic]. People forgot that industry is not an end in itself, but should be only a means to insure to man his material subsistence and to make accessible to him the blessings of a higher intellectual culture. Where industry is everything and man is nothing begins the realm of ruthless economic despotism whose workings are no less disastrous than political despotism. (2)19 Although Rocker wrote in 1938, the polarization of wealth20 and the elevation of industry (or business/corporate interests) over human interests remain true.21 **An equal distribution of economic power or resources is fundamental to equalizing power relationships**. One anarchist, Fotopoulos (2008), describes this necessary "economic democracy . . . as the authority of the people *demos* in the economic sphere, implying the existence of economic equality in the sense of an equal distribution of economic power" (442). Without equal power relations brought about by a fairly equal distribution of wealth, the individual autonomy advocated by deep democracy and anarchism cannot be operationalized. Each Person Directly Participates in Decisions Affecting Her or His Life (Autonomy) Anarchism's and deep democracy's call for a more equal distribution of resources helps to create the conditions necessary for autonomy. Perhaps the single most important foundation of anarchist thought is autonomy, as described by Anna Goldman (2010): [Anarchism is] based in the understanding that we are best qualified tomake decisions about our own lives.Anarchists believe that we must all control our own lives,making decisions collectively about matters, which affect us. Anarchists believe and engage in direct action. (para 7) Several scholars have analyzed the importance of autonomy to human experience. Although Paulo Freire (1970) does not describe himself as an anarchist, his analysis of autonomy in regards to determining one's own thoughts and actions is often quoted by anarchists such as Spring (2008). Freire (1970) discusses the **death that occurs without autonomy: Overwhelming control—is necrophilic; it is nourished by love of death, not life. Based on a mechanistic, static, naturalistic, spatialized view of consciousness; it transforms students into receiving objects. It attempts to control thinking and action, leads men to adjust to the world, and inhibits their creative power**. (64) Freire's description of overwhelming control resonates with Mr. Jackson's description of his experience in an urban school, with students being "tested to death" under the current policies. A number of scholars22 note that **without equal power relationships, there is little autonomy; without autonomy, authentic communication becomes impossible.**

We are not a critique of capitalism but rather the hegemony of neoclassical economics which places profit-motive above human well-being. Our alternative embraces a form of cooperative economics to drive an economy for the people by the people with a proven track-record of success. Our alternative empowers the autonomy of the many to end the stranglehold of power by the few. Our approach understand the fundamental prerequisite of democratizing the workplace to altering material relations of power

Globalization has failed humanity. In the sixty years since the launching of its main instruments, the World Bank and International Monetary Fund, global trade has expanded twelve-fold and economic growth fivefold, yet the gap between rich and poor also widened and **the number of poor is greater than ever**. To question globalization is to question capitalism, the former being a deepening of the latter. As a contribution to the ongoing debate **we propose transforming globalizing capitalism into something much better by directly altering production relations, primarily by democratizing workplaces**. Many critics of globalization who disagree on other matters endorse some form of workplace democracy as part of any viable alternative. Among available models of alternatives to capitalism, we have borrowed much from David Schweickart's "economic democracy" and Michael Albert and Robin Hahnel's "participatory planning." We put a Schweickart-like democratization **before** processes like participatory planning. What may also set us apart is our claim that **cooperativization can eliminate globalizing capitalism's worst features**. We shall not defend all aspects of Mondragón. **By "the Mondragón model" we mean the network of co-ops associated with the town of Mondragón in the Basque country of Northern Spain. "Model" for us primarily refers to its framers' principles, which have made the network worth emulating**. As it happens, deviations from some of these principles have also long been underway. Mondragón can be sustainably generalized only if **restored** to its principles, we'll hold. Invoking this rectified model as vanguard, we'll argue such a democratizing movement can transform for the better the production relations underpining globalization. To liberate co-operative labor from capitalism itself, some options opened by cooperativization must be engaged in a second stage of "de-marketization." After sketching it we'll consider some objections. **1. Mondragón and the Degeneration Problem** Since the beginnings of capitalism worker co-ops have haunted it as its own built-in opposite, bearing hopes for a non-capitalist future. Relative to such hopes, they have inevitably "degenerated" by failing or by becoming capitalist. Mondragón is itself on the latter trajectory. The paradigm degeneration occurred in the Rochdale co-operative founded in England in 1844 when, to finance purchase of a

new mill in 1859, it took on investor members. They outvoted worker members and in three years converted the co-op to a conventional firm. Carefully avoiding **that** form of degeneration, a more recent co-op fell into yet another. In 1921, 125 dedicated Scandinavian cooperativists put up $1,000 for equal numbers of stock shares and started Olympia Veneer Company, the first of many plywood co-ops in the Pacific northwest. (Berman; Lutz & Lux, Ch. 8; Pencavel) Thanks to the efficiency of co-operative labor, share values skyrocketed. Instead of taking in new owner-members, however, they hired wage workers to work their individual shares. In 1954 the 23 remaining members voted to sell out, at around $625,000 gain each, to the U.S. Plywood Corporation, a conventional firm. A capitalist success, Olympia failed as a co-op, because of wage labor (violating the one-worker-one-vote rule) and because ownership was of individually sellable stock shares. So, despite its egalitarian impulse, Olympia's self-destruction was present at the start. The **Mondragón co-ops avoid this degeneration by** separating **ownership, which varies in value, from voting, which is strictly equal. Instead of buying stock, new applicants advance labor to pay the membership fee. Roughly a year's salary, this loan by members starts an "individual capital account" (ICA) to which monthly and year-end profits and losses are credited or debited. (Thomas & Logan 1982, p. 136) Unlike stock shares, ICAs are neither accumulable nor sellable and carry only one vote.** Being both individually recoupable upon leaving yet available meanwhile for collective investment, they constitute a sort of bank inside each co-op. Rights attach solely to membership and terminate when members retire or leave. There being no non-worker owners, co-ops remain whole solely in the hands of their active workforces, avoiding the Rochdale error. A co-op could be sold, but only by a hard-to-muster two-thirds of a general assembly vote, and this has never happened. **The "salary" spread from lowest to highest, currently 1 to 6, is based on an agreed job rating index. "Salary" is in scare quotes since members, not being** employees**, receive no wages or salaries. Rather, they have the following rights of owners and managers: 1) monthly and annual profit distributions; 2) 6% annual interest on their loans to the co-op; 3) a vote on** un**distributed funds; 4) access to all records; and 5) a vote on policy and managers**. Mondragón has outlasted Olympia as a co-op by 20 years, due partly to separating voting rights from ownership rights. The network started in 1956 with a small stove factory built by five former students of a vocational teacher, a priest named José María Arizmendiarrieta. Unions were banned but agricultural co-op laws allowed workers to own their workplaces. Basque solidarity facilitated fund-raising. The movement faced a crisis in 1958 when Madrid declared members to be self-employed, hence ineligible for state health and unemployment benefits. Turning adversity around they created their own **cheaper** system. (Huet) In 1959, with this system's reserves, founders started the Caja Laboral Popular to give banking, entrepreneurial and health services to the four then-existing co-ops. (Since post-Franco Spain offered state health coverage, the network no longer provides its own health services.) Focusing on domestic appliances and machine tools for the protected Spanish market, the network steadily expanded. The network has repeatedly proved its value. In the 1980-83 recession, the Basque country lost 20% of its jobs. Nearby firms laid off massively or closed. Many co-ops took pay cuts up to 11%, and five co-ops closed. Yet, thanks to job transfers in the network, **virtually no layoffs were made in the co-ops**, stabilizing the region's economy. (Clamp) The costly network-underwritten re-tooling was quite beyond the individual co-ops. Then a one-two punch hit with opening of Spain's

market to Europe in 1986 and to the world in 1989. We visited in 1989. It was a decisive moment. Network appliances were suddenly up against major German and French brands. This presented a fateful choice: directly compete with multinationals or follow the Italian co-ops into niche markets? Re-tooling this time was judged too costly so in 1991 over 100 co-ops, organized up to then by regions and linked through the Caja, re-organized in three sectors as Mondragón Co-operative Corporation. This allowed speedy, centralized decisions typical of the multinational competition. **As of 2003, MCC had over 66,000 employees operating over 160 co-ops in three sectors: 135 industrial, 6 financial, and 14 distribution. In both sales and workforce, MCC is the Basque country's largest business corporation and Spain's seventh largest. The three sectors are backed by the Caja, housing, service, research, education and training co-ops. Mondragón University, founded in 1997, integrates technology with cooperativism in a multi-lingual environment for over 4,000 students. As a "second degree" co-op like the Caja its board is partly nominated by its own members (students and faculty), partly by the co-ops is serves. Other second degree co-ops include technology and management schools, and research institutes. Core industrial co-ops make an array of high-tech and durable goods for world markets including robots, machine-tools, appliances, auto parts, buses, and elevators. The network's supermarket, Eroski, partnering with a French chain, has become Spain's third largest grocery retailer and largest domestically owned one. Eroski's hybrid equity structure joins employees with customers as co-investors. (MCC 2002) Typical of worker co-ops, and unlike most capitalist firms, all Mondragón co-ops devote 10% of all profits to community needs.** With a few exceptions — the Fagor group with some 5,000 members — most successful co-ops "hive off" related progeny after reaching 500 or so members. Beyond that number economies of scale do not make up for weakening of face-to-face production. Progeny take their own collective risk but infra-network competition is foreclosed by contracts with MCC committing all new co-ops to uniform principles of job creation, shared capital, and democratic structure. Usually "profit" is income after all costs, **including** labor costs. But in a worker co-op, profit is income after all non-labor costs. For labor is not a "cost" but a mutual sharing of each member's capital. Since labor time is neither bought nor sold, a co-op's workers together share all profit and losses. Not more than 30% of losses may be debited to a co-op's undivided account. Democracy is central and turns on membership. **Ultimate control of production, income spread, and board seats lies in the yearly general assembly. It elects the board of directors (**consejo rectoral**) which appoints management. The assembly elects a watchdog council (**consejo de vigilencia**) to monitor management and a social council (**consejo social**). Subject to board and management approval, the social council indexes jobs within the 1 to 6 spread based on demands for experience, training, responsibility, and hardship. In individual grievances over pay scale and social welfare its decisions are binding. A Mondragón-like co-op re-unites in** one **person the functions of worker, manager and owner. Capitalism consigns these functions to** three **separate persons. To personify these functions is to impose on the three groups thus constituted an imperative that pits them against the other two. Re-uniting these functions** in each member **abolishes the conflict among the three groups.** In this re-combination, however, one typical "function" does **not** re-appear when a firm becomes a co-operative: that of capitalist itself. Their only function is to "furnish capital." But this is not a distinct contribution to

production. **Workers can exercise entrepreneurship and either hire capital or capitalize a Mondragón-like co-op with their own labor.** Capitalists **as such** make **no** irreplaceable contribution, Schweickart notes (2002, p. 33), and since profits should go only to those who do, he concludes they deserve none. Thus while workers assume manager and owner functions, the capitalist side of the owner function — vestigial under capitalism — drops out altogether with cooperativization. Finally **Mondragón works** better **at the capitalists' own game than do capitalist firms! Concluding his two-factor comparative study, Henk Thomas writes: "Productivity and profitability are higher for co-operatives than for capitalist firms. It makes little difference whether the Mondragón group is compared with the largest 500 companies, or with small-and medium-scale industries; in both comparisons the Mondragón group is more productive and more profitable."** (Thomas 1982, p. 149) Studies of job creation, worker compensation, and job security yield similar results. (Thomas & Logan; Bradley & Gelb) **Central to our argument for cooperativization, is the persistant indication in available research that** the closer **workplaces get to Mondragón-like co-operative labor,** the more **productive and profitable they are. Summarizing forty-three economic studies of self-management, Levine and Tyson conclude worker participation in management usually boosts productivity, but especially** when combined with other elements of self-managed cooperative labor, **such as: 1) profit-sharing; 2) guaranteed long-term job security; 3) small wage spread; and 4) guaranteed worker rights.** (pp. 205-214) To these Mondragón adds the potent element of worker ownership. So, instead of tapping the power of liberated co-operative labor with one or two such elements, Mondragón unites all of them at once. Such co-ops outstrip all types of capitalist firms in productivity not in spite of being democratic but **to the extent** that they are. But Mondragón has not been true to its impetus. Is it a model? Three sets of degenerative practices make it less worth emulating and endanger its economic superiority. The practices, and remedies, are: (1) When demand increases, the co-ops often hire non-member wage labor. MCC recently persuaded local legislators to raise the ceiling on "contract" labor to 30%. (Köhler) And if a co-op applies, MCC may allow it up to 40% non-member workers. (Huet) Illegal "eventuales" or temporaries — mostly female — are not counted in the 30% quota for "contract" labor, and make up a substantial percent of workforces. In some co-ops over 40% of work may be done by non-members. The overall percentage is unknown since MCC no longer gives out membership figures. Collective exploitation of wage labor encourages more of it, membership limits, and sell-outs. Ruling out the false benefits of wage labor will in the long run be a benefit. (2) MCC is using women as a reserve army of labor. True, on the gender division of labor women do slightly better at MCC than in capitalist firms (Hacker & Elcorobairutia) and have a major presence in management. But blue collar work remains largely male. This second-class labor pool is incompatible with cooperativism. Solutions include: observing the one-worker-one-vote rule, gender integration of all co-ops and jobs; and child-care in workplaces. (Ferguson, pp. 94-99) These practices would probably boost productivity by fully engaging women's talents. (3) There are **un**necessary sacrifices of

cooperativism. In 1999 external non-voting capital stakes were 13% of MCC equity. (Köhler) This is due to joint ventures and acquisition (or start-up) of many capitalist enterprises abroad, mostly in Latin America. Vague assurances that cooperativization is "on the agenda" are extended to such workers. (Logue) This perilous mixing of co-op with external investor capital contravenes co-operative principles. Worker alienation is rampant. (Kasmir) Social councils are underutilized. (Clamp) Unionization is under discussion. (Huet) Work-floor democracy is a complex issue. In the mid-1960s the network studied Scandinavian work groups to replace Taylor's "scientific management" — up to then dominant on the work-floor. Ironically Ulgor workers voted down the innovation in favor of the assembly line! (Thomas & Logan) In in89 Total Quality Management was introduced with other disempowering practices: just-in-time inventorying, work-movement monitors, and swing shifts. Studying effects, George Cheney concluded that the changes threaten Mondragón's "organizational integrity" as a "value-based" rather than "market-based" firm. This "neo-cooperativism" trend "privileges an externally driven form of participation, in marked contrast with [one]…in which workplace democracy is justified primarily or significantly in terms of the benefits for the employees and the organization as a whole." Yet while members may not often **exercise** their powers over their work-lives and managers, they **have** them. In 2001 although the social council at Fagor — the largest and oldest co-operative — issued a blistering critique of MCC's evolution, it continued. Centralized decision-making has made meaningful consideration of alternatives harder. An observer sadly concluded that the Fagor dissidents were "not confident [they] can provide an alternative — they worry MCC is correct that survival in the global market requires compromises of critical co-operative principles." (Huet) True, islands of cooperativization **will** be gradually re-absorbed. (Köhler) But global competitiveness does **not** demand wage workers or marginalizing women or preempting opposition. On the contrary, the more elements of liberated (self-managed) cooperative labor, the more productivity and profitability. MCC managers' faith in the **economic** value of cooperativism waned, yet the evidence still suggests that the network could both compete globally and: stop all wage labor; introduce gender democracy; cease joint ventures with external capital; resume start-ups (e.g. by co-operativizing foreign subsidiaries); encourage unions for the external solidarity they provide; and allow social councils equal say with management in setting all work-floor regimes. Long-term competitive advantage would likely result. And the network would re-emerge as a model. This model is for now salvageable. Worker co-ops survive as such "longer than comparable capitalist firms," and Mondragón's innovations have vastly lengthened their life-expectancy. But cooperativization will have enough time to construct "a better world" only if it is a part of building an alternative **economy**. For such co-ops usually become capitalist not because they are co-operative, but because, in isolation, they are not co-operative **enough**. **2. Unravelling Capitalism by Liberating Cooperative Labor** Mondragón leads three sets of movements that are already building the cooperative production part of that economy — despite being under siege and lacking in coordination. In the vanguard with Mondragón are three other **networks** of co-operatives that engage **all** elements of co-operative production. In Italy's Emiglia-Romagna region three networks represent some 2,700 co-ops of all kinds employing 150,000 worker-owners. (Rosen & Young 1991, p. 172; Melman p. 370) Europe generally is having a worker co-op boom: 83,000 such enterprises in 42 countries now employ 1.3 million people, well over double those so employed in 1982. (CECOP) Growing in Canada's maritime provinces since fishing

co-operatives were started in 1927, the Co-op Atlantic federation of 166 purchasing, retailing, producer, housing and fishing co-ops employs about 5,850 workers. (GEO #16 & #17) Japan's Seikatsu network of consumer and producer cooperatives now includes 225,000 households. (GEO #12) National federations — including the new U.S. federation — are linking in a single body to facilitate global inter-co-operation. (CICOPA; GEO #60, 62) A much larger set of movements engages **some** but not all elements of liberated co-operative labor. **A growing number of trade unions demand worker participation in decision-making; Germany's** mitbestimmung **laws require board representation of workforces. (Melman, Ch. 9 & 11) The vigorous ESOP movement, though U.S.-based, is now international. Since 1974, tax breaks go to U.S. firms that loan workers money to buy company stock, re-paying with earnings. Participants in ESOPs or other employer stock plans number 20.3 million or 15.8% of private-sector employees. (Kruse) There are related movements to open books and share profits, equity, and decision-making with workers.** Much larger still, a third tier embraces much of humanity's rural half. Village-based agricultural and light-industrial production use social property. (Bayat) In a sample of Indian villages, 14 to 23 percent of all income came from use of common property resources, rising to 84 to 100 percent of the income of the poor. (Jodha) Also in this tier are: consumer, marketing, agricultural, electrical and housing, co-ops; community economic development initiatives; the community banking movement; the non-governmental organization sector; and the "social and solidarity economy" movement. This last-named movement — called **"the people's economy" in Asia** — **unites** the others. It **aims to democratize not only production, but distribution, and investment. Some advocates envision "living in networks of solidarity economy," in effect, leaving capitalism by: earning a living in a worker co-op, buying food in a fair-trade food co-op, saving and investing through a credit union, etc. At the 2004 World Social Forum at Mumbai, the movement declared the solidarity economy "is not a sector of the economy…but should be instead the subject and main agent of a social, economic, political and cultural transformation."** (www.alliance21.org) Direct economic attacks against this movement are underway, especially in the campaign to dissolve socially-owned non-governmental property into exclusive private property. Indivisible joint property is the main resource for a range of associations from poor villages to wealthy first-world worker co-ops. But such resources threaten globalization by keeping cheap labor out of reach of multi-nationals, themselves offering autonomous alternatives to them. Typical of the attack was Mexico's president Salinas de Gortari's 1992 abolition of protection of ejidos, a communal land tenure form. In 1994 NAFTA's opening of Mexico's vast corn market to cheap, subsidized corn added the second pincer that has since been squeezing farmers off the land and into urban poverty. Mexico's struggle to restore the patrimony of communal lands stolen in the conquest continues. Other weapons against social property include: biopiracy of genetic material, theft-by-patenting of indigenous medicine, and commodifying culture. Such "accumulation by dispossession." (Harvey pp. 145-149) is being resisted in Mexico, Ecuador, Bolivia, Colombia, Nepal and elsewhere. **By "cooperativization"**

we mean not only intercooperation within and among the three tiers of the cooperative labor movement, nor only restoration of social property, but everywhere replacing the hierarchical and coercive relations typical of capitalist production and consumption by voluntary cooperative associations. Cooperativization also advances from the consumer side. Conscientious consumers are drawn to "buy co-op." The "fair trade" movement's demand for democratically produced goods will in time elicit profitable production of them. Naomi Klein cautions however, that unless the fair trade movement demands improved labor conditions, it merely sanitizes the existing system. **Supported by conscientious consumers the democratic economy can displace capitalist firms. And as it becomes obvious to workers that their own labor, not capital, creates profit. Subjection to capital will no longer be seen as a necessary condition for making a living. The spreading production relations, by directly meeting needs, will undo capitalism's worst aspects.** This productivity advantage is likely due to harmonizing of conflicting imperatives. Absent rewards, workers in capitalist firms withhold their skills. By contrast workers in democratic firms, no longer pitted against each other, have strong incentives to share skills. And since effectively exercising collective creativity is pleasurable (Graeber p. 260), management supervision is less necessary, a big savings. (Fitzroy & Kraft) Also lifted is the even greater burden of supporting absentee shareholders. Co-ops thus have a flexibility, financial buoyancy, and re-investment potential lacking capitalist firms. (Jones & Svejnar, pp. 449-465) Members are not resentfully slow, care for equipment, avoid waste, and reduce downtime and absenteeism. Large-scale production still needs skilled managers, but direct market feedback, freed of "noise" from managers with inimical interests, allows faster remedy of management errors. (Estrin, Jones, Svejnar, pp. 40-61; Levin, p. 28) If productivity increases **along with** greater workplace democracy, an important corollary follows: firms tapping more of the power of liberated co-operative labor will have advantage over those tapping less. The more elements of the rectified Mondragón model in workers' hands, relative to non-co-ops, the greater their advantage, other factors equal. Less democratic firms will be compelled to democratize. Thus just **by pursuing profit, capitalist relations of production will tend to unravel. Capitalists may be powerless to end such threats to their hegemony.**

Even if there is no concrete alternative to plutocracy, using the debate space to criticize inequality incentivizes research practices that are more attuned to everyday human life and the impact of economics on ecological systems -- only this move can prioritize the solidarity of vulnerable communities

(Rob, Rachel Carson Professor of English, University of Wisconsin-Madison, Slow Violence and the Environmentalism of the Poor, pgs. 14-16)

How do we bring home-and bring emotionally to life-threats that take time to wreak their havoc, threats that never materialize in one spectacular, explosive, cinematic scene? Apprehension is a critical word here, a crossover term that draws together the domains of perception, emotion, and action. To engage slow violence is to confront layered predicaments of apprehension: to apprehend-to arrest, or at least mitigate-often imperceptible threats requires rendering them apprehensible to the senses through the work of scientific and imaginative testimony. An influential lineage of environmental thought gives primacy to immediate sensory apprehension, to sight above all, as foundational for any environmental ethics of place. George Perkins Marsh, the mid-nineteenth-century environmental pioneer, argued in *Man and Nature* that "the power most important to cultivate and at the same time, hardest to acquire, is that of seeing what is before him." Aldo Leopold similarly insisted that "we can be ethical only toward what we can see.'?' But what happens when we are unsighted, when what extends before us-in the space and time that we most deeply inhabit-remains invisible? How, indeed, are we to act ethically toward human and biotic communities that lie beyond our sensory ken? What then, in the fullest sense of the phrase, is the place of seeing in the world that we now inhabit? What, moreover, is the place of the other senses? How do we both make slow violence visible yet also challenge the privileging of the visible? Such questions have profound consequences for the apprehension of slow violence, whether on a cellular or a transnational scale. Planetary consciousness (a notion that has undergone a host of theoretical formulations) becomes pertinent here, perhaps most usefully in the sense in which Mary Louise Pratt elaborates it, linking questions of power and perspective, keeping front and center the often latent, often invisible violence in the view. Who gets to see, and from where? When and how does such empowered seeing become normative? And what perspectives-not least those of the poor or women or the colonized-do hegemonic sight conventions of visuality obscure? Pratt's formulation of planetary consciousness remains invaluable because it allows us to connect forms of apprehension to forms of imperial violence." Against this backdrop, 1want to introduce the third central concern of this book. Alongside slow violence and the environmentalism of the poor, the chapters that follow are critically concerned with the political, imaginative, and strategic role of environmental writer-activists. Writer-activists can help us apprehend threats imaginatively that remain imperceptible to the senses, either because they are geographically remote, too vast or too minute in scale, or are played out across a time span that exceeds the instance of observation or even the physiological life of the human observer. In a world permeated by insidious, yet unseen or imperceptible violence, imaginative writing can help make the unapparent appear, making it accessible and tangible by humanizing drawn-out threats inaccessible to the immediate senses. Writing can challenge perceptual habits that downplay the damage slow violence inflicts and bring into imaginative focus apprehensions that elude sensory corroboration. The narrative imaginings of writer-activists may thus offer us a different kind of witnessing: of sights unseen. To allay states of apprehension-trepidations, forebodings, shadows cast by the invisible-entails facing the challenge, at once

imaginative and scientific, **of giving the unapparent a materiality upon which we can act**. Yet poor communities, often disproportionately exposed to the force fields of slow violence-be they military residues or imported e-waste or the rising tides of climate change-are the communities least likely to attract sustained scientific inquiry into causes, effects, and potential redress. Such **poor communities are abandoned to sporadic science at best and usually no science at all**; they are also disproportionately subjected to involuntary pharmaceutical experiments. Indeed, when such communities raise concerns, they often become targets of well-funded antiscience by forces that have a legal or commercial interest in manufacturing and disseminating doubt." Such embattled communities, beset by officially unacknowledged hazards, must find ways to broadcast their inhabited fears, their lived sense of a corroded environment, within the broader global struggles over apprehension. It is here that writers, filmmakers, and digital activists may play a mediating role in helping counter the layered invisibility that results from insidious threats, from temporal protractedness, and from the fact that the afflicted are people whose quality of life-and often whose very existence-is of indifferent interest to the corporate media.

Neoliberalist re-structuring of TSA turns the aff -- causes plan rollback and worse intrusion in the future

Atkins '14 Dante, writer for DailyKos, "**No, Vox, let's not abolish the TSA** 6/1

http://www.dailykos.com/story/2014/06/01/1303006/-No-Vox-let-s-not-abolish-the-TSA#

Let's game this scenario out a little bit. **Matthews envisions a scenario where more carefree travelers like himself who have less regard for their own personal safety will have airlines that choose to offer no security screenings so people like him can show up to a flight 20 minutes beforehand and walk right onto the plane. Will it actually turn out that way? Probably not. Because safety is paramount, the far likelier result is a scenario where this hypothetical free-market system actually results in airlines competing against each other to outdo each other on security protocols**. So the likelihood is that the free-market-competition scenario wouldn't result in less security anyway, especially in a litigious society where low-level security protocols would likely result in very high-priced lawsuits. But let's say, for the sake of argument, that there were an airline out there that specifically chose to appeal to customers who believed that the security theater of the TSA is all hogwash and were desperate for a security-free experience. **Theoretically, there might be an economic opportunity there—until the first incident of hijacking or terrorism aboard a low-security airline. When that happens, airlines would once again start falling all over themselves to offer even more stringent**

security procedures to appeal to a very scared public. And perhaps, after a decade or more, when the memory of the most recent devastating tragedy fades away, the cycle would begin again. The bottom line is that Matthews' suggestion for how we should run security at airports would not create the paradise he desires. Instead, it would leave us with a privatized hellscape where mass casualty incidents cyclically alter the free-market selling points that airlines use to attract customers. Perhaps that's an ideal libertarian paradise. But given the choice between that and the scanner? I take the scanner.

The 1AC is corporate pseudoscience used to distort the risks of market controls that de-emphasizes the risks created by corporations –treat with skepticism

Perelman '5 Michael, Professor of Economics at CSU-Chico, "Manufacturing Discontent: The Trap of Individualism in Corporate Society" Pluto Press p.1 xdi

The corporate sector has also been enormously successful in using pseudoscience to distort the nature of the risks that corporations impose on society. Chapter 7 explains how such tactics are destroying what is left of the already-frayed regulatory system. **The distortion of risk assessment is particularly clear when comparing the regulations imposed to protect people from terrorism with the regulations used to protect us from corporate-imposed risk, which has taken many, many times more lives than terrorism. The corporate sector has succeeded in hobbling the consumer's right to know about the dangers posed by pollution or by unsafe products, such as a large part of the food supply.** If the consumer is king, he is a beggarly sort of king. I close this discussion by considering the precautionary principle as an antidote to the corporate attack on regulation.

Try or die -- the current global economic order that relies on mass unemployment treats production as an end, placing the accumulation of wealth above the material necessities of living that abstracts finance from the vital process of living -- this guarantees extinction

Dyer-Witheford '1 Nick, Associate Professor in the Faculty of Information and Media Studies at the University of Western Ontario, "The New Combinations: Revolt of the Global Value-Subjects" The New Centennial Review, Volume 1, Number 3, Winter 2001, pp. 155-200 (Article) [muse], xdi

Negri, Paolo Virno, Michael Hardt, and Maurizio Lazaratto and others suggest that in the consideration of "general intellect" it is not enough to focus on the accumulation of the "fixed capital" of advanced machines.40 The critical factor is rather the variable possibilities of the human subjectivity that continues—in indirect and mediated rather than direct, hands-on form—to be critical in this high-technology apparatus. This subjective element is

variously termed "mass intellect," "immaterial labour," or, in Franco Berardi's formulation, "the cognitariat."41 These terms designate the **human "know-how"**—technical, cultural, linguistic, and ethical—that **supports the operation of the** high-tech **economy**, especially evident in the informational, communicational, and aesthetic aspects of contemporary high-tech commodity production. **The question thus becomes how far capital can contain** what Jean-Marie Vincent calls "**this plural, multiform constantly mutating intelligence" within the structures of the world market**.42 One crucial arena in which these issues focus is the Net—or, more generally, the digital information systems indispensable to globalized capital. As Vincent puts it, "general intellect" is in fact "a labour of networks and communicative discourse." In effect, it is not possible to have a "general intellect" without a great variety of polymorphous communications, sequences of communication in the teams and collectivities work, communications to use in a creative fashion the knowledge already accumulated, communications to elaborate and record new knowledge.43 If we for a moment entertain—as Marx did—the conceit that the world market constitutes an enormous capitalist "metabolism," then **capital's communication network already constitutes a sort of primitive nervous system. If we had to identify a main site for this ganglion we would name first the digital networks of the international financial system. This system only responds to money signals: it does not receive and cannot process information about life destruction, biosphere hazard, or social degradation except as investment risk or opportunity. It thus operates on the basis of an extremely simple set of signal inputs, which although efficient for operations of accumulation are potentially lethal to the life-fabric of the planet. The information transmitted from this reptilian system then cascades down through a whole series of workplace and consumer information systems, to constitute the operating intelligence of the world market** as a whole. A critical role is played by **the commercial media**, which translate the signals received from this primary level into a series of representations comprehensible at an everyday level by individual subjects. Thus corporate media, acting through mundane and well-known responses to marketing demographic and advertising revenues, construct matrix-like simulations that **convert the abstract valuations of capital back into a series of sensuously apprehensible stories, narratives, characters, and news stories, so that it indeed seems as if the world as ordered, identified, and prioritized by global money is the "real" world—so that**, for example, **television** and journalism **show a planet almost solely inhabited by affluent value subjects with a lively interest in stock market fluctuations and constant traumatic lifestyle and household design choices.**

Neoliberal thinkers control the framing of policy discussions – you should be highly skeptical of their defenses of this ideology

Ross Prof of Education U British Columbia **2010** E. Wayne Resisting the Common-nonsense of Neoliberalism: A Report from British Columbia Workplace #17 http://firgoa.usc.es/drupal/files/ross.pdf

Public debates in the corporate media about education (and other social goods) are framed in ways that serve the interests of elites. For example, in BC free market neoliberals in think tanks such as the Fraser Institute and in the dominant media outlets (particularly Canwest Global Communications, Inc.) have been successful in framing discussions on education in terms of accountability, efficiency, and market competition. 1 A frame is the central narrative, the organizer, for making sense of particular issues or problems (e.g., problem definition, origin, responsible parties) and solutions (e.g., policy). The frame is presented as common sense, thus the assumptions underlying the frame are typically unquestioned or at least under-analyzed.

Sites of political alignment are mutually exclusive -- they chose the state, we choose the workplace -- the alternative is the collapse of growth impulse into fascism

Stone and Bowman '11 Betsy Bowman and Bob Stone, scholar-activists and co-founders of the Center for Global Justice "Cooperativization on the Mondragón Model As Alternative to Globalizing Capitalism" 11/15 http://www.globaljusticecenter.org/2011/11/15/cooperativization-on/

Struggle should *start* at the site of labor's original alienation and cooperativization can empower workers now. Waiting for capitalism's final collapse in order to abolish all markets has failed and — absent grassroots democracy — may well invite chaos or fascism. (Schweickart 2003, p. 177) While such networks cannot guarantee a global democracy, it seems certain that *without* them there is little hope of replacing markets with inter-communication among workers and farmers — who together constitute the world's vast majority. **Cooperativization, then, is first on the agenda.**

Our alternative is a prerequisite -- starting points are mutually exclusive

Harvey '5 David, David Harvey is the Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York. "A Brief History of Neoliberalism" http://messhall.org/wp-content/uploads/2011/09/A-Brief-History-of-Neoliberalism.pdf

There is a tendency to take up the issue of alternatives as if it is about describing some blueprint for a future society and an outline of the way to get there. Much can be gained from such exercises. **But we first need to initiate a political process that can lead us to a point where feasible alternatives, real possibilities, become identifiable**. There are two main paths to take. We can engage with the plethora of oppositional movements actually existing and seek to distil from and through their activism the essence of a broad-based oppositional programme. Or **we can resort to theoretical and practical enquiries into our existing condition (of the sort I have engaged in here) and seek to derive alternatives through critical analysis.** To take the latter path in no way presumes that existing oppositional movements are wrong or somehow defective in their understandings. By the same token, **oppositional movements cannot presume that analytical findings are irrelevant to their cause. The task is to initiate dialogue between those taking each path and thereby to deepen collective understandings and define more adequate lines of action**.

The federal policy PROCESS of implementing business-as-usual change to transit policy is ideologically mired in neoliberal decision-making to advantage corporate interests -- the permuation hijacks the alternative

Harvey '5 David, David Harvey is the Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York. "A Brief History of Neoliberalism" http://messhall.org/wp-content/uploads/2011/09/A-Brief-History-of-Neoliberalism.pdf

Behind these major shifts in social policy lie important structural changes in the nature of governance. Given the neoliberal suspicion of democracy, a way has to be found to integrate state decision-making into the dynamics of capital accumulation and the networks of class power that are in the process of restoration, or, as in China and Russia, in formation. Neoliberalization has entailed, for example, increasing reliance on public–private partnerships (this was one of the strong ideas pushed by Margaret Thatcher as she set up 'quasi-governmental institutions' such as urban development corporations to pursue economic development). **Businesses and corporations not only collaborate intimately with state actors but even acquire a strong role in writing legislation, determining public policies, and setting regulatory frameworks (which are mainly advantageous to themselves). Patterns of negotiation arise that incorporate business and sometimes professional interests into governance through close and sometimes secretive consultation.** The most blatant example of this was the persistent refusal of Vice-President Cheney to release the names of

the consultative group that formulated the Bush administration's energy policy document of 2002; it almost certainly included Kenneth Lay, the head of Enron––a company accused of profiteering by deliberately fostering an energy crisis in California and which then collapsed in the midst of a huge accounting scandal. The shift from government (state power on its own) to governance (a broader configuration of state and key elements in civil society) has therefore been marked under neoliberalism.11 In this respect the practices of the neoliberal and developmental state broadly converge. **The state typically produces legislation and regulatory frameworks that advantage corporations, and in some instances specific interests** such as energy, pharmaceuticals, agribusiness, etc. In many of the instances of public–private partnerships, particularly at the municipal level, the state assumes much of the risk while the private sector takes most of the profits. If necessary, furthermore, the neoliberal state will resort to coercive legislation and policing tactics (anti-picketing rules, for example) to disperse or repress collective forms of opposition to corporate power. Forms of surveillance and policing multiply: in the US, incarceration became a key state strategy to deal with problems arising among discarded workers and marginalized populations. The coercive arm of the state is augmented to protect corporate interests and, if necessary, to repress dissent. None of this seems consistent with neoliberal theory. The neoliberal fear that special-interest groups would pervert and subvert the state is nowhere better realized than in Washington, where armies of corporate lobbyists (many of whom have taken advantage of the 'revolving door' between state employment and far more lucrative employment by the corporations) effectively dictate legislation to match their special interests. While some states continue to respect the traditional independence of the Civil Service, this condition has everywhere been under threat in the course of neoliberalization. **The boundary between the state and corporate power has become more and more porous. What remains of representative democracy is overwhelmed, if not totally though legally corrupted by money power.**

Past resistance to capital have rested on flawed suppositions -- our 1nc Stone and Bowman evidence indicates that the Mondragon model for democratizing workplaces represents a fundamental paradigm shift from classical Marxist tactics -- their evidence assuming abstract political radicalism doesn't apply, and even if the alternative isn't utopia it's the best first step

Stone and Bowman '11 Betsy Bowman and Bob Stone, scholar-activists and co-founders of the Center for Global Justice "Cooperativization on the Mondragón Model As Alternative to Globalizing Capitalism" 11/15
http://www.globaljusticecenter.org/2011/11/15/cooperativization-on/

Apocalyptic revolutionism that followed "laws of history" to state power proved a disappointment. Cooperativization breaks our present impasse yet avoids the old errors. No utopia is before us and no reversal of gains is ruled out. But **it seems to us there is a clear first step.**

The notion that there is no alternative to neoliberalism is an ideological smokescreen of neoliberalism -- it disguises the political question of possibility through the lens of cultural preference

Harvey '5 David, David Harvey is the Distinguished Professor of Anthropology and Geography at the Graduate Center of the City University of New York. "A Brief History of Neoliberalism" http://messhall.org/wp-content/uploads/2011/09/A-Brief-History-of-Neoliberalism.pdf

How was neoliberalization accomplished, and by whom? The answer in countries such as Chile and Argentina in the 1970s was as simple as it was swift, brutal, and sure: a military coup backed by the traditional upper classes (as well as by the US government), followed by the fi erce repression of all solidarities created within the labour and urban social movements which had so threatened their power. But the neoliberal revolution usually attributed to Thatcher and Reagan after 1979 had to be accomplished by democratic means. For a shift of this magnitude to occur required the prior construction of political consent across a su ffi ciently large spectrum of the population to win elections. What Gramsci calls 'common sense' (de fi ned as 'the sense held in common') typically grounds consent. Common sense is constructed out of longstanding practices of cultural socialization often rooted deep in regional or national traditions. It is not the same as the 'good sense' that can be constructed out of critical engagement with the issues of the day. Common sense can, therefore, be profoundly misleading, obfuscating or disguising real problems under cultural prejudices. 1 Cultural and traditional values (such as belief in God and country or views on the position of women in society) and fears (of communists, immigrants, strangers, or 'others') can be mobilized to mask other realities. Political slogans can be invoked that mask speci fi c strategies beneath vague rhetorical devices. **The word 'freedom' resonates so widely within the common-sense understanding of Americans that it becomes 'a button that elites can press to open the door to the masses' to justify almost anything. 2 Thus could Bush retrospectively justify the Iraq war. Gramsci therefore concluded that political questions become 'insoluble' when 'disguised as cultural ones'.** 3 In seeking to understand the construction of political consent, we must learn to extract political meanings from their cultural integuments. So how, then, was su ffi cient popular consent generated to legitimize the neoliberal turn? The channels through which this was done were diverse. Powerful ideological in fl uences circulated through the corporations, the media, and the numerous institutions that constitute civil society –– such as the universities, schools, churches, and professional associations. The 'long march' of neoliberal ideas through these institutions that Hayek had envisaged back in 1947, the organization of think-tanks (with corporate backing and funding), the capture of certain segments of the

media, and the conversion of many intellectuals to neoliberal ways of thinking, created a climate of opinion in support of neoliberalism as the exclusive guarantor of freedom. These movements were later consolidated through the capture of political parties and, ultimately, state power. Appeals to traditions and cultural values bulked large in all of this. An open project around the restoration of economic power to a small elite would probably not gain much popular support. But a programmatic attempt to advance the cause of individual freedoms could appeal to a mass base and so disguise the drive to restore class power. Furthermore, once the state apparatus made the neoliberal turn it could use its powers of persuasion, co-optation, bribery, and threat to maintain the climate of consent necessary to perpetuate its power. This was Thatcher's and Reagan's particular forte, as we shall see. **How, then, did neoliberalism negotiate the turn to so comprehensively displace embedded liberalism? In some instances, the answer largely lies in the use of force (either military, as in Chile, or fi nancial, as through the operations of the IMF in Mozambique or the Philippines). Coercion can produce a fatalistic, even abject, acceptance of the idea that there was and is, as Margaret Thatcher kept insisting, 'no alternative'.** The active construction of consent has also varied from place to place. Furthermore, as numerous oppositional movements attest, consent has often wilted or failed in di ff erent places. But we must look beyond these in fi nitely varied ideological and cultural mechanisms –– no matter how important they are –– to the qualities of everyday experience in order to better identify the material grounding for the construction of consent. And it is at that level –– through the experience of daily life under capitalism in the 1970s –– that we begin to see how neoliberalism penetrated 'common-sense' understandings. The e ff ect in many parts of the world has increasingly been to see it as a necessary, even wholly 'natural', way for the social order to be regulated. **Any political movement that holds individual freedoms to be sacrosanct is vulnerable to incorporation into the neoliberal fold.** The worldwide political upheavals of 1968, for example, were strongly in fl ected with the desire for greater personal freedoms. This was certainly true for students, such as those animated by the Berkeley 'free speech' movement of the 1960s or who took to the streets in Paris, Berlin, and Bangkok and were so mercilessly shot down in Mexico City shortly before the 1968 Olympic Games. They demanded freedom from parental, educational, corporate, bureaucratic, and state constraints. But the '68 movement also had social justice as a primary political objective.

Micro-level labor conflict resulting from fewer people doing more work breeds micro-level backlash against the primacy of future capital accumulation over present everyday life, opening up space for coalition-building and macropolitical restructuring

Dyer-Witheford '1 Nick, Associate Professor in the Faculty of Information and Media Studies at the University of Western Ontario, "The New Combinations: Revolt of the Global Value-Subjects" The New Centennial Review, Volume 1, Number 3, Winter

Marxian crisis theory shows how **difficulties in synchronizing activities around this circuit make capital liable to continuous breakdown and restructuring**. The autonomist perspective emphasizes how these **crises are, at root, problems in capital's control over human subjects, both cause and effect of contested social relations.** Thus, for example, **we can add to the work struggles at the point of production poor people's movements that challenge the exclusion from consumption of the un- and underemployed, the multifarious mobilizations against the underfunding and degradation of the welfare state, and the green challenges to corporate environmental destruction. These contestations can link and interact with each other, producing a circulation of struggles that both mirrors and subverts the circulation of capital**. These combinations can occur in sequences that start at different points and run in different directions. Indeed, in one sense it is a mis-formulation to speak of the linking of these movements as if each were external to the other, for in some ways **the relation is** more **a "Russian doll" affair in which each conflict discovers others nested within it**. So, for example, **every crisis in the sphere of social reproduction reveals within itself a crisis of productive relations (stressed and exploited teachers, graduate students, doctors, nurses), and every workplace is discovered as a site of environmental issues, and all of these in turn contain an issue of the public consumption of mis- and dis-information generated by a commercial media.**

Framing micropolitical networks as actants of power is crucial to understand how "political events" become historically constructed through the accumulation of "common sense" about what is and is not possible

Bleiker '3 Roland, Professor of International Relations, University of Queensland "Discourse and Human Agency" Contemporary Political Theory. Avenel: Mar 2003.Vol. 2, Iss. 1; pg. 25

Confronting the difficulties that arise with this dualistic dilemma, I have sought to advance a positive concept of human agency that is neither grounded in a stable essence nor dependent upon a presupposed notion of the subject. The ensuing journey has taken me, painted in very broad strokes, along the following circular trajectory of revealing and concealing: discourses are powerful forms of domination. They frame the parameters of thinking processes. They shape political and social interactions. Yet, discourses are not invincible. They may be thin. They may contain cracks. By moving the gaze from epistemological to ontological spheres, one can explore ways in which individuals use these cracks to escape aspects of the discursive order. To recognize the potential for human agency that opens up as a result of this process, one needs to shift foci again, this time from concerns with Being to an inquiry into tactical behaviours. Moving between various hyphenated identities, individuals use ensuing mobile subjectivities to engage in daily acts of dissent, which gradually transform societal values. Over an extended period of time, such tactical expressions of human agency gradually transform societal values. By returning to epistemological levels, one can then conceptualize how these transformed discursive practices engender processes of social change. **I have used everyday forms of resistance to illustrate how discourses not only frame and subjugate our thoughts and behaviour, but also offer possibilities for human agency. Needless to say, discursive dissent is not the only practice of resistance that can exert human agency. There are many political actions that seek immediate changes in policy or institutional structures, rather than 'mere' shifts in societal consciousness. Although**

some of these actions undoubtedly achieve results, they are often not as potent as they seem. Or, rather, their enduring effect may well be primarily discursive, rather than institutional. Nietzsche (1982b, 243) already knew that **the greatest events 'are not our loudest but our stillest hours.' This is why he stressed that the world revolves 'not around the inventors of new noise, but around the inventors of new values.' And this is why, for Foucault too, the crucial site for political investigations are not institutions, even though they are often the place where power is inscribed and crystallized. The fundamental point of anchorage of power relations, Foucault claims, is always located outside institutions, deeply entrenched within the social nexus. Hence, instead of looking at power from the vantage point of institutions, one must analyse institutions from the standpoint of power relations** (Foucault, 1982, 219-222).

Eric Stanley explains two historical examples of anti-queer violence…

Stanley 11—Eric A. Stanley, Ph.D. in History of Consciousness, UC Santa Cruz, UC President's Postdoctoral Fellow at UCSD, "Captive Genders: Trans Embodiment and the Prison Industrial Complex," edited by Eric A. Stanley and Nat Smith, AK Press, pg. 1-2, AR—AD: 7/20/15

We always felt that the police were the real enemy.—Sylvia Rivera Bright lights shattered the dark anonymity of the dance floor. The flicker warned of the danger of the coming raid. Well experienced, people stopped dancing, changed clothing, removed or applied makeup, and got ready. **The police entered, began examining everyone's IDs, and lined up the trans/gender-non-conforming folks to be "checked" by an officer in the restroom to ensure that they were wearing the legally mandated three pieces of "gender appropriate clothing."** Simultaneously **the cops started roughing up people, dragging them out front to the awaiting paddy wagon. In other words, it was a regular June night out on the town for trans and queer folks in 1969 New York City.** As the legend goes, that night the cops did not receive their payoff or they wanted to remind the patrons of their precarious existence. In the shadows of New York nightlife, the Stonewall Inn, like most other "gay bars," was owned and run by the mafia, which tended to have the connections within local government and the vice squad to know who to bribe in order to keep the bar raids at a minimum and the cash flowing. **As the first few captured queers were forced into the paddy wagon, people hanging around outside the bar began throwing pocket change at the arresting officers; then the bottles started flying and then the bricks. With the majority of the patrons now outside the bar, a crowd of angry trans/queer folks had gathered and forced the police to retreat back into the Stonewall.** As their collective fury grew, **a few people uprooted a parking meter and used it as a battering ram in hopes of knocking down the bar's door and escalating the physical confrontation with the cops.** A tactical team was called to rescue the vice squad now barricaded inside the Stonewall. They eventually arrived, and **the street battle raged for two more nights.** In a blast of radical collectivity, **trans/gender-non-conforming folks, queers of color, butches, drag queens, hair-fairies, homeless street youth, sex workers, and others took up arms and fought back against the generations of oppression that they were forced to survive.**1 **Forty years later**, on a similarly muggy June night in 2009, **history repeated itself. At the Rainbow Lounge**, a newly opened gay bar in Fort Worth, Texas, **the police staged a raid, verbally harassing patrons, calling them "faggots" and beating a number of customers. One patron was slammed against the floor, sending him to the hospital with brain injuries, while seven others were arrested. These instances of brutal force and the administrative surveillance**

that trans and queer folks face today are not significantly less prevalent nor less traumatic than those experienced by the Stonewall rioters of 1969, however the ways this violence is currently understood is quite different. **While community vigils and public forums were held in the wake of the Rainbow Lounge raid, the immediate response was not to fight back, nor has there been much attempt to understand the raid in the broader context of the systematic violence trans and queer people face under the relentless force of the prison industrial complex** (PIC).2

We do not understand these narratives as two separate temporal categories, rather we recognize that these unjustified acts of anti-queer violence are part of a society anti-queerness. The 1AC does not go far enough—these forms of violence are not derived from airport security, but the prison industrial complex. Their affirmation is not radical and falls prey to the motivation of status quo queer political organizations.

Stanley 11—Eric A. Stanley, Ph.D. in History of Consciousness, UC Santa Cruz, UC President's Postdoctoral Fellow at UCSD, "Captive Genders: Trans Embodiment and the Prison Industrial Complex," edited by Eric A. Stanley and Nat Smith, AK Press, pg. 3-4, AR—AD: 7/20/15

I start with the Stonewall riot not because it was the first, most important, or last instance of radical refusal of the police state. Indeed, the riots at San Francisco's Compton's Cafeteria in 1966 and at Los Angeles's Cooper's Doughnuts in 1959 remind us that the history of resistance is as long as the history of oppression. However, **what is unique about the Stonewall uprising is that, within the United States context, it is made to symbolize the "birth of the gay rights movement."** Furthermore, dominant **lesbian, gay, bisexual, and transgender** (LGBT) **political organizations** like the Human Rights Campaign (HRC) and the National Gay and Lesbian Task Force (NGLTF) **attempt to build an arc of progress starting with the oppression of the Stonewall moment and ending in the current time of "equality" evidenced by campaigns for gay marriage, hate crimes legislation, and gays in the military. Captive Genders works to undo this narrative of progress, assimilation, and police cooperation by building an analysis that highlights the historical and contemporary antagonisms between trans/queer folks and the police state.**4 This collection argues that **prison abolition must be one of the centers of trans and queer liberation struggles. Starting with abolition we open questions often disappeared by both mainstream LGBT and antiprison movements.** Among these many silences are the radical trans/queer arguments against the proliferation of hate crimes enhancements. Mainstream LGBT organizations, in collaboration with the state, have been working hard to make us believe that hate crimes enhancements are a necessary and useful way to make

trans and queer people safer. Hate crimes enhancements are used to add time to a person's sentence if the offense is deemed to target a group of people. However, hate crimes enhancements ignore the roots of harm, do not act as deterrents, and reproduce the force of the PIC, which produces more, not less harm. Not surprisingly, in October 2009, when President Obama signed the Matthew Shepard and James Byrd, Jr. Hate Crimes Prevention Act into law, extending existing hate crimes enhancements to include "gender and sexuality," there was no mention by the LGBT mainstream of the historical and contemporary ways that the legal system itself works to deaden trans and queer lives. As antidote, **this collection works to understand how gender, sexuality, race, ability, class, nationality, and other markers of difference are constricted, often to the point of liquidation, in the name of a normative carceral state.** Among the most volatile points of contact between state violence and one's body is the domain of gender. An understanding of these connections has produced much important activism and research that explores how non-trans women are uniquely harmed through disproportionate prison sentences, sexual assault while in custody, and nonexistent medical care, coupled with other forms of violence. **This work was and continues to be a necessary intervention in the ways that prison studies and activism have historically imagined the prisoner as always male and have until recently rarely attended to the ways that gendered difference produces carceral differences.** Similarly, **queer studies and political organizing**, along with the growing body of work that might be called trans studies—while attending to the work of gender, sexuality, and more recently to race and nationality—**has (with important exceptions) had little to say about the force of imprisonment or about trans/queer prisoners.** Productively, we see this as both an absence and an opening for those of us working in trans/queer studies to attend—in a way that centers the experiences of those most directly impacted—to the ways that **the prison must emerge as one of the major sites of trans/queer scholarship and political organizing.**5 In moments of frustration, excitement, isolation, and solidarity, Captive Genders grew out of this friction as a rogue text, a necessarily unstable collection of voices, stories, analysis, and plans for action. What these pieces all have in common is that they suggest that **gender, ability, and sexuality as written through race, class, and nationality must figure into any and all accounts of incarceration, even when they seem to be nonexistent.** Indeed, the oftentimes ghosted ways that gender and heteronormativity function most forcefully are in their presumed absence. In collaboration and sometimes in contestation, **this project offers vital ways of understanding not only the specific experience of trans and queer prisoners, but also more broadly the ways that regimes of normative sexuality and gender are organizing structures of the prison industrial complex.** To be clear, Captive Genders is not offered as a definitive collection. Our hope is that it will work as a space where conversations and connections can multiply with the aim of making abolition flourish.

The alternative is trans-prison abolitionism. We use the example of the Stonewall Riots to catalyze a radical movement against the prison industrial complex which structures the surveillance state today.

Stanley 11—Eric A. Stanley, Ph.D. in History of Consciousness, UC Santa Cruz, UC President's Postdoctoral Fellow at UCSD, "Captive Genders: Trans Embodiment and the Prison Industrial Complex," edited by Eric A. Stanley and Nat Smith, AK Press, pg. 3-4, AR—AD: 7/20/15

Living through these forms of domination are also moments of devastating resistance where people working together are building joy, tearing down the walls of normative culture, and opening space for a more beautiful, more lively, safer place for all. Captive Genders remembers these radical histories and movements as evidence that our legacies are fiercely imaginative and that our collective abilities can, and have, offered freedom even in the most destitute of times.11 In the face of the overwhelming violence of the PIC, abolition—and specifically a trans/queer abolition—is one example of this vital defiance. **An abolitionist politic does not believe that the prison system is "broken" and in need of reform; indeed, it is, according to its own logic, working quite well. Abolition necessarily moves us away from attempting to "fix" the PIC and helps us imagine an entirely different world—one that is not built upon the historical and contemporary legacies of the racial and gendered brutality that maintain the power of the PIC.** What this means is that abolition is not a response to the belief that the PIC is so horrible that reform would not be enough. Although we do believe that the PIC is horrible and that reform is not enough, **abolition radically restages our conversations and our ways of living and understanding as to undo our reliance on the PIC and its cultural logics.** For us, **abolition is not simply a reaction to the PIC but a political commitment that makes the PIC impossible. To this end, the time of abolition is both yet to come and already here. In other words, while we hold on to abolition as a politics for doing anti-PIC work, we also acknowledge there are countless ways that abolition has been and continues to be here now.** As a project dedicated to radical deconstruction, abolition must also include at its center a reworking of gender and sexuality that displaces both heterosexuality and gender normativity as measures of worth.12 **The Stonewall uprising itself must be remembered and celebrated as a moment of a radical trans/queer abolitionist politic that built, in those three nights, the materiality of this vision.** As both a dream of the future and a practice of history, we strategize for a world without the multiple ways that our bodies, genders, and sexualities are disciplined. Captive Genders is also a telling of a rich history of trans/queer struggle against the PIC, still in the making. **This is an invitation to remember these radical legacies of abolition and to continue the struggle to make this dream of the future, lived today.**

A2: Perm

We must question the foundation of all political processes—if the 1AC truly changes the politic, then they have become complicit with a system that subjects queer subjects to an operation of violence that underlies every decision. The result is a near life position that frames queer populations as nonexistent and legitimates unending discursive colonization and war which always renders subjects abject.
Stanley 11—Eric A. Stanley, Ph.D. in History of Consciousness, UC Santa Cruz, UC President's Postdoctoral Fellow at UCSD, "Near Life, Queer Death Overkill and Ontological Capture," Social Text 107 s Vol. 29, No. 2 Summer 2011, pg. 13-15, AR—AD: 7/20/15

If for Agamben bare life expresses a kind of stripped- down sociality or a liminal space at the cusp of death, then near life names the figuration and feeling of nonexistence, as Fanon suggests, which comes before the question of life might be posed. Near life is a kind of ontocorporal (non) sociality that necessarily throws into crisis the category of life by orientation and iteration. This might better comprehend not only the incomprehensible murders of Brazell, Paige, and Weaver, but also the terror of the dark cell inhabited by the queer survivor of the Holocaust who perished under "liberation."33 Struggling with the phenomenology of black life under colonization, Fanon opens up critical ground for understanding a kind of near life that is made through violence to exist as nonexistence. For Fanon, **violence is bound to the question of recognition** (which is also the im/possibility of subjectivity) **that apprehends the relationship between relentless structural violence and instances of personal attacks evidenced by the traumatic afterlives left in their wake.** For Fanon, the Hegelian master/slave dialectic, as theoretical instrument for thinking about recognition, must be reconsidered through the experience of blackness in the French colonies. For Fanon, Hegel positions the terms of the dialectic (master/slave) outside history and thus does not account for the work of the psyche and the historicity of domination like racialized colonization and the epidermalization of that power. In other words, for Fanon, when the encounter is staged and the drama of negation unfolds, Hegel assumes a pure battle. Moreover, by understanding the dialectic singularly through the question of self- consciousness, Hegel, for Fanon, misrecognizes the battle as always and only for recognition. Informed by Alexandre Kojève and Jean- Paul Sartre, Fanon makes visible the absent figure of Enlightenment assumed by the Hegelian dialectic. For Fanon, **colonization is not a system of recognition but a state of raw force and total war. The dialect cannot in the instance of colonization swing forward and offer the self- consciousness of its promise. According to Fanon, "For Hegel there is reciprocity; here the master laughs at the consciousness of the slave. What he wants from the slave is not recognition but work."**34 Hegel's dialectic that, through labor, offers the possibility of self- consciousness, for the colonized is frozen in a state of domination and nonreciprocity.35 **What is at stake for Fanon, which is also**

why this articulation is helpful for thinking near life, is not only the bodily terror of force; ontological sovereignty also falls into peril under foundational violence. This state of total war, not unlike the attacks that left Brazell, Paige, and Weaver dead, is at once from without — the everyday cultural, legal, economic practices — and at the same time from within, by a consciousness that itself has been occupied by domination. For Fanon, the white imago holds captive the ontology of the colonized. The self/Other apparatus is dismantled, thus leaving the colonized as an "object in the midst of other objects," embodied as a "feeling of nonexistence."36 **While thinking alongside Fanon on the question of racialized difference, violence, and ontology, how might we comprehend a phenomenology of antiqueer violence expressed as "nonexistence"?** It is not that we can take the specific structuring of blackness in the French colonies and assume it would function the same today, under U.S. regimes of antiqueer violence. However, **if both desire and antiqueer violence are embrocated by the histories of colonization, then such a reading might help to make more capacious our understanding of antiqueer violence today as well as afford a rereading of sexuality in Fanon's texts.** Indeed, Fanon's intervention offers a space of nonexistence, neither master nor slave, written through the vicious work of epistemic force imprisoned in the cold cell of ontological capture. This space of nonexistence, or near life, forged in the territory of inescapable violence, allows us to understand the murders of queers against the logics of aberration. **This structure of antiqueer violence as irreducible antagonism crystallizes the ontocorporal, discursive, and material inscriptions that render specific bodies in specific times as the place of the nothing. The figuration of near life should be understood not as the antihuman but as that which emerges in the place of the question of humanity.** In other words, this is not simply an oppositional category equally embodied by anyone or anything. **This line of limitless inhabitation, phantasmatically understood outside the intersections of power, often articulated as "equality," leads us back toward rights discourse that seeks to further extend (momentarily) the badge of personhood. The nothing, or those made to live the death of a near life, is a break whose structure is produced by, and not remedied through, legal intervention or state mobilizations. For those who are overkilled yet not quite alive, what form might redress take, if any at all?**

Gender Disclosure CP

Counterplan Text: The Unites States federal government should eliminate the requirement for gender disclosure within the Secure Flight Program and remove the male and female identifiers within automated target recognition programs.

Removing the software designating gender for ATR scanners solves for unnecessary patdowns and improves airport efficiency.

Bohling 14 [Alissa Bohling, a freelance journalist based on the west coast and the recipient of a 2013 Excellence in Online Journalism Award from the National Lesbian & Gay Journalists Association, "Exclusive: Transgender travelers singled out in TSA screenings, docs show," May 26, 2014, http://america.aljazeera.com/articles/2014/5/26/groin-anomalies-andpatdownstravelingwhiletrans.html]//JIH

Freedom of Information Act (FOIA) requests netted civil rights complaints, incident reports and internal memos and emails from the DHS's Office for Civil Rights and Civil Liberties and the Transportation Security Administration. They show that trans people have been required to undergo pat-down searches by officers of the opposite gender, reveal or remove items such as chest binders and prosthetic penises and defend challenges to their gender identities and their right to opt out of body scans, among other problems.

A 2011 UCLA study estimated that about 700,000 U.S. adults are transgender, or 0.3 percent of the adult population. An estimate by the Transgender Law Center put the number higher, at 2 to 5 percent of the population. But gender identity and expression are not fixed categories, and many trans people choose to keep their gender identities private. Attempts to survey the transgender population have begun only recently. Data on trans children is even less certain, although a new study is underway at Case Western Reserve University.

The body scan machines used at most airports nationwide feature pink and blue start buttons, which activate computer algorithms designed to screen female and male passengers. If a TSA officer presses the wrong button or if a passenger has body characteristics of more than one gender, unexpected body shapes may register as anomalies. These are considered potential threats and prompt an additional screening in the form of a pat-down. At Los Angeles International Airport (LAX) in 2012, a trans woman was selected for a secondary screening after the body scanner identified a "groin anomaly." During the pat-down search, drugs were found in her pocket, and she was arrested.

The screening problems chronicled in the documents confirm concerns long held by transgender people and their supporters, like Portland, Oregon, resident Joy, who asked that her last name be withheld. Last year she took a long-awaited trip to Europe without her partner because he had fears about going through security. "Since he has not had bottom surgery," she said, "I think the fear was, 'What's going to happen when I don't have all the body parts that they expect?' I got home, and I thought, he cannot be the only person that is concerned about this." She co-organized an informational session on trans people and the TSA held in March at the Portland branch of the Q Center, an LGBT organization.

The firsthand accounts in the TSA records include a complaint from a trans passenger who was searched by an officer of the opposite gender at Las Vegas' McCarran Airport in August 2012; the traveler called the incident "one of the most uncomfortable and terrifying experiences of my life."

At Louisville International Airport in Kentucky the same month, a trans man who wore a brace around his chest missed his flight after being selected for a pat-down screening that the subsequent complaint described as inappropriate and exaggerated. At LAX, also in 2012, another trans man wearing a strap-on was required to remove it and put it through the X-ray machine despite his telling the TSA officer that "this item is as much a part of her [sic] as a prosthetic leg or arm would be to an amputee," according to an email the officer wrote to the airport's TSA customer-service manager.

In an incident described by an LAX transportation security manager in a July 2011 memo, another passenger at LAX told the manager she identified as female and "if he [sic] was to be screened by a male he would feel violated." The manager insisted three times that the passenger's gender presentation was male; the passenger was ultimately screened by a male.

Parker and Lutz 09— (Lisa and BJ, "Flying Is Getting More Personal," NBC Chincago, Aug 12, 2009, http://www.nbcchicago.com/traffic/transit/secure-flight-air-travel-tsa-rules-53005547.html#ixzz3hC8shtHs). WM

That reasoning is a new TSA program called "Secure Flight," which transfers the responsibility of pre-screening passengers from the airlines to the TSA. Secure Flight requires that airlines get your birthdate and gender so you can be prescreened agasinst a government watch list.

"If consumers do not include this information, they may face delays at the airport, and our goal is to communicate and educate our customers across the board that this day is coming and they are going to have to add this additional information," said Orbitz Vice-President of Governmental Affairs Brian Hoyt.

A major goal of the program is to prevent mismatches like that kind that happened to a Burr Ridge teen last year at the Miami International Airport.

Omar Jano and his mother Martha said that the TSA's mistaken detention of Omar last year -- because his name resembled one on the watch list -- terrified their family. And Jano is not alone. Mistaken detentions have played out thousands of times; most famously perhaps with Massachusetts Sen. Ted Kennedy. He has been detained six times because his name is close to a suspected terrorist's alias.

Not everyone's convinced that Secure Flight will improve the screening process.

"It may make life a little harder, but I suspect that the people who are on the no-fly list aren't giving their real names when they fly anyway," said Chicago attorney Gerald Jenkins.

Jenkins works with the Cyber Privacy Project, which says that making travelers hand over their birthdates is a step too far toward government control of travel. The right to travel is a constitutionally protected freedom, the Cyber Privacy Project says, which should not be encroached upon by the feds.

"The government already has your name and they have the ability to search you**. I'm not sure** that **adding** birthdays and **gender to that list** of intrusions that the federal government already has **creates any extra security**," Jenkins said.

Date of Birth disclosure is sufficient to solve false matches in the Secure Flight Program.

University of Texas Health Science Center at San Antonio ND—(an institute of health science education and research, "General Secure Flight Questions"). WM

What happens if a name matches the watch list?

If a passenger's name is a match to the watch list, Secure Flight will then compare the passenger's date of birth and gender information to the date of birth and gender information of the watch list entry. Usually, this will result in a determination that based on the additional information, the passenger no longer matches a watch list entry

Gender requirements don't boost security

Hilkevitch 09— (Jon, "New airport security rules to require more personal information," Chicago Tribune, March 09, 2009, http://articles.chicagotribune.com/2009-03-09/news/0903080245_1_no-fly-lists-personal-data-passengers). WM

Passengers making airline reservations soon will be required to provide their birth date and their sex in addition to their names as part of aviation security enhancements the 9/11 Commission recommended. The information provided at the time seats are booked must exactly match the data on each traveler's ID.

The new program, called Secure Flight, shifts responsibility for checking passenger names against "watch lists" from the airlines to the Transportation Security Administration. Only passengers who are cleared to fly by the TSA will be given boarding passes.

Personal data on most passengers will be retained for no more than seven days, agency officials said.

But privacy advocates say the changes amount to a system of government control over travel. U.S. airlines carry about 2 million passengers per day. Opponents also have protested that **combing through personal information won't result in better security**.

TSA systems focus attention on innocuous anomalies due to specialization of scans to gender – unnecessary for risk evaluation.

Abini 14 [Deema B. Abini, attorney in Los Angeles, CA, "Traveling Transgender: How Airport Screening Procedures Threaten The Right To Informational Privacy," 2014, lawreview.usc.edu/wp-content/uploads/Abini-PDF.pdf]//JIH

Intimate information pertaining to the bodies of transgender travelers demands the highest level of protection because of its highly sensitive nature and neither the plaintiffs' inclusion in certain categories nor the protections the government uses to minimize the potential harm associated with disclosure should limit its protection. Arguments can be made on either side with respect to whether the TSA's screening policy is narrowly tailored or whether less restrictive means are feasible. On the one hand, the screening of passengers is undoubtedly necessary in order to further the government's interest in air security. The TSA would contend that new screening technologies and procedures, developed in reaction to new threats, are essential components of maintaining security. It would also assert that it is in the best position to know what security measures are essential and if better ones exist.

On the other hand, the necessity of the screening measures employed by the TSA is called into question by their reported inefficacy, prompting the question whether other screening alternatives could produce the same or better results while minimizing the intrusion on privacy. Experts have testified that the TSA's new screening procedures, aptly nicknamed "security theater," all too often generate false positives that "divert agents' attention from real risks while focusing their attention on innocuous anomalies."207

Allowing for increased privacy in relation to gender still allows for effective airport security.

Abini 14 [Deema B. Abini, attorney in Los Angeles, CA, "Traveling Transgender: How Airport Screening Procedures Threaten The Right To Informational Privacy," 2014, lawreview.usc.edu/wp-content/uploads/Abini-PDF.pdf]//JIH

In this informational privacy calculus, compelling interests lie on both sides of the equation. However, the government's information safeguards are rendered useless in light of security weaknesses, and the TSA's screening procedures could likely be made less intrusive without sacrificing efficacy, which suggests that the informational privacy interest trumps the government's interest in disclosure.

Additionally, an appreciation of the all-or-nothing fallacy, or the argument that privacy and security are mutually exclusive, further supports this conclusion.215 The fallacy has become so pervasive that many immediately associate increased security with being inconvenienced or having their privacy invaded.216 The true choice, however, "is not between a security measure and nothing, but between a security measure with oversight and regulation and a security measure at the sole discretion of executive officials."217

The balancing of interests here, especially considering the implications of the all-or-nothing fallacy, indicates that something must be done to cease the intrusion on the informational privacy rights of transgender travelers.

Text: The United States federal government should

-repeal the REAL ID Act and eliminate the requirement for listing gender on driver's licenses and state ID cards.

-further update the passport gender marker policy to allow for certification of gender change by licensed therapists, psychologists, and nurse practitioners, and to eliminate remaining burdensome procedural requirements.

- eliminate computer matching of gender data in all remaining data-matching programs.

-issue an updated Model State Vital Statistics Act that provides for gender change on birth certificates based on certification from a mental health or medical provider, without proof of specific medical or surgical procedures and without a court order

- review all new government forms and updates to forms to eliminate collection of gender data in cases where it does not serve a clear programmatic purpose.

In today's world, identification documents are needed to travel, open bank accounts, start new jobs, purchase alcohol, and even to purchase some cold medicines. Recent voter suppression efforts by some state legislatures have made voting an activity in which trans people without accurate ID may face unfair difficulties. Historically, state and federal governments have imposed intrusive and burdensome requirements—such as proof of surgery and court orders—that have made it impossible for many trans people to obtain accurate and consistent ID. For many people, financial barriers, medical contraindications or simply a lack of medical need for surgeries make

these requirements impossible to satisfy. As a result, out of those National Transgender Discrimination Survey respondents who had transitioned, only one-fifth (21%) had been able to update all of their IDs and records with their new gender. One-third (33%) had not updated any IDs or records. At the time of the survey, only 59% had been able to update their gender on their driver's license or state ID; 49% had updated their Social Security Record; 26% their passport; and just 24% their birth certificate.1 The survey results also confirmed what most trans people already knew—that gender-incongruent identification exposes people to a range of negative outcomes, from denial of employment, housing, and public benefits to harassment and physical violence.2 Because of the work done by NCTE and activists around the country, this trend is now reversing quickly. About half of states no longer impose such burdensome requirements for driver's licenses and state IDs and growing numbers are streamlining procedures. NCTE has worked with the American Association of Motor Vehicles Agencies to educate state agencies about current best practices. Since 2010, onerous requirements for gender change on federal documents and records such as passports and green cards have also been eliminated. State-level efforts have won improvements in birth certificate laws and policies in California, Oregon, New York, Connecticut, Maryland, Vermont, Washington State and the District of Columbia. These developments represent a growing recognition that older, more restrictive policies have served little, if any, purpose, and that reasonable policies enabling everyone to obtain accurate and consistent ID best serve both government agencies and individuals. There is still more to do, however. While eliminating the most draconian requirements for ID change, many existing federal and state policies are still unduly burdensome in requiring medical certifications from physicians, rather than accepting certifications from therapists or other non-physician health providers, or simply from the individuals themselves. In addition to ID documents, other government records and programs unintentionally cause the disclosure of information about a person's transgender status without their consent. Chief among these are computer matching programs used by the Social Security Administration (SSA) for identity verification, which have outed individuals when gender data is inconsistent between records. In response to NCTE's efforts, SSA announced in 2011 that it would halt gender matching in its Social Security Number Verification System, the largest matching service used by private employers. This change alone has prevented workplace problems for many trans people. However, automated gender matching has not yet been eliminated in other SSA programs used to share data with state programs and other entities. Government should not needlessly compel the disclosure of a person's medical history or transgender status. The federal government has taken important steps to end these problems and should act promptly to modernize and harmonize policies across agencies. Ultimately, listing gender on driver's licenses, state ID cards and many other documents is simply unnecessary and should be eliminated.

National Center for Transgender Equality, 11- (the nation's leading social justice advocacy organization winning life-saving change for transgender people.) "Policy Brief: Birth Certificate Gender Markers" Transequality.org, 2011 http://transequality.org/issues/resources/a-blueprint-for-equality-id-documents-and-privacy-2015 //droneofark

A birth certificate is an important document used to prove one's identity and citizenship. For those who can afford one, a passport can serve the same purposes. However, the ability to change one's sex designation on birth certificates remains an important issue for many transgender people. As lawyers at Lambda Legal point out, states have varying procedures for updating these documents, and a few actually prohibit changing the gender marker on birth certificates. Many states model their policies for amending birth certificates on the Model Vital Statistics Act and Regulations (or Model Law). Currently being revised, the Model Law is developed by consultation between the state and federal governments and was last updated in 1992. The Model Law is intended to be a guide for states, so that states can model their own vital statistics laws and regulations after its suggestions. What's wrong with these laws? The 1992 Model Law says that a person wanting to change their sex on their birth certificate should present a court order certifying that their sex "has been changed by surgical procedure." There are three problems with this approach, which many states still use. First, the requirement of a court order can create a barrier to those transgender people who don't have enough money to hire a lawyer or who don't have enough knowledge to navigate the legal system on their own. Also, some courts are hesitant to issue orders amending birth certificates that were issued by another state, creating problems for transgender people who want to change their birth certificate after they move away from the state where they were born. Second, the Model Law's requirement of "a surgical procedure" in every case is at odds with the medical community. The World Professional Association for Transgender Health (WPATH) recognizes that different patients will have different medical needs. Surgical treatments may be necessary and appropriate for some transgender individuals, but not for others. The Model Law' ignores the differing needs of transgender communities. Third, the Model Law does not say what the new birth certificate should look like after the proper documentation is submitted. Ideally, the state would create a new birth certificate that reflects the amended gender, and some states do this. However, other states simply change the existing birth certificate, issuing one that shows the previous gender, while others designate on the new birth certificate that the gender has been changed. These approaches out transgender people whenever birth certificates are used to verify their identity. NCTE's Proposal: An updated version of the Model Law is currently being developed by a group of state officials coordinated by the National Center for Health Statistics (a part of the CDC). NCTE and allies have been advocating with NCHS to change this outdated and restrictive policy about amending birth certificate sex designation. Specifically, NCTE has suggested that NCHS make three changes in its revisions of the Model Law based on approaches developed by some states and federal agencies. The revised Model Law should allow people to change the sex designation on their birth certificate by submitting the required documentation directly to the vital statistics agency, rather than requiring a court proceeding. This will eliminate the unnecessary costs and other obstacles sometimes associated with going through the state court systems. The revised Model Law should not require proof of specific medical procedures in order to amend birth certificates. Instead, the Model Law should reflect contemporary standards of care, and require only that an individual's physician certify that

the individual has completed the treatment the physician deems necessary to achieve gender transition. This change would recognize that different people have different medical needs, and avoid disclosure of any confidential medical information. The revised Model Law should make clear that a new birth certificate should be issued after an individual presents the proper documentation, rather than a birth certificate that shows the original gender designation or states that the gender has been changed. These recommendations reflect a growing trend in state and federal policies. The Department of State modernized its policy on passports in 2009, and the policy for "Consular Reports of Birth Abroad," which are federal birth certificates for U.S. citizens born outside of the U.S., also no longer requires proof of surgery. Recent legislation in Vermont adopted the same approach for that state's birth certificates, and a similar bill is being considered in California. NCTE will continue to advocate for these changes in the new Model Law, and support the work of activists at the state level. Ensuring that transgender people are able to change their identity documents to reflect their gender identity is a major priority for NCTE.

The TSA is responsive and can be reformed- policy action empirically makes steps towards solving transphobia

Tobin 10— (Harper Jean Tobin, "An update on TSA," **National Center for Transgender Equality**, AUGUST 3, 2010, http://transequality.org/blog/an-update-on-tsa). WM

Over the last several months, **NCTE has been working with the** Transportation Security Administration (**TSA) to address** concerns about privacy and **harassment of transgender travelers in airport security screening.** This has included creating and updating informational resources for the community about TSA's Secure Flight program and airport body scanners, and bringing TSA officials to speak with community members at our Policy Conference this spring. It has also included **educating TSA** about the trans community, and making recommendations for **nondiscrimination policies and training**. Recently we had the opportunity, along with other privacy advocates, to see a demonstration of TSA's body scanner machines. The demonstration did not allay our basic concerns about the current use of this technology, but it did clarify some things. We learned that TSA's backscatter machines (one of the two types used) are set to use an automatic image filter to mute the resolution of the body scan – but that even the filtered image could be enough to out someone as trans. We learned that, **in response** to privacy concerns, the software capacity of the scanners to store and transfer images of travelers is now completely removed from the machines when they are installed in airports. And we learned that officers viewing the scans are trained only to report the presence of an anomalous object on a body scan to officers at the security checkpoint; figuring out what the object is is supposed to be left entirely to officers at the checkpoint. **We are encouraged** that **TSA is looking seriously at** automated threat detection **systems that are less privacy-invasive**, but also concerned that the agency's massive investment in the current machines will make a swift transition to alternative methods of primary screening unlikely. A measure in Congress to limit use of the scanners, though it passed the House last year, died in the Senate. Senators Klobuchar and Bennett recently introduced a bill that, instead of banning primary use of body scanners, would make it mandatory nationwide. The prospects for the Klobuchar-Bennett bill are uncertain. Meanwhile, TSA continues to use Recovery Act funds to place scanners in airports around the country, and to step up its PR offensive in support of the scanners. In April, NCTE joined the Electronic Privacy Information Center (EPIC), the ACLU, Public Citizen and many other organizations in petitioning the Department of Homeland Security to suspend the deployment of body scanners for primary screening. DHS refused, and EPIC is now seeking a court order to limit use of the scanners, asserting violations of privacy and religious exercise, as well as failure to follow proper regulatory procedures in deploying the scanners. That lawsuit is now pending in court, and may be for some time. NCTE continues to receive occasional reports of inappropriate or harassment treatment of transgender travelers at security checkpoints, and to communicate about these issues with TSA. To date, NCTE has not received any reports of problems for transgender people associated with TSA's Secure Flight program, which collects travelers' name, date of birth and gender at the time of booking to check against government watch lists. NCTE will keep working to ensure that transgender Americans have no reason to be afraid of flying.

Legal Methods work- TSA training as a result of legal action proves

Leff 11— (Lisa, "TSA Transgender Training At LAX," Huffington Post, 10/04/2011, http://www.huffingtonpost.com/2011/08/04/tsa-transgender-training-_n_918838.html). WM

SAN FRANCISCO -- The Transportation Security Administration said Thursday that its managers at Los Angeles International Airport are undergoing mandatory sensitivity training after a transgender employee alleged she was ordered to dress like a man, pat down male passengers and use the men's restroom.

Ashley Yang, 29, who spent two years as a security checkpoint screener at LAX, was fired last summer after co-workers observed her using the women's room, according to a copy of her termination letter obtained by The Associated Press. She contested the firing, resulting in a settlement that mandated the training.

"Ashley lives her life as a woman. Her co-workers recognized her as a woman. Passengers recognized her as a woman. But her employer didn't," said attorney Kristina Wertz of the San Francisco-based Transgender Law Center, which helped her file a civil rights complaint. "She was asked to hide who she was just in order to earn a living."

The settlement, reached in December and completed last month, also called for Yang to receive five months of back pay and a five-figure award for pain and suffering.

TSA spokesman Nico Melendez said he could not discuss details of the case because of privacy rules. But he confirmed that the required training of managers started this summer and was ongoing.

"It's part of the world we live in today," he said. "We need to be aware of transgender issues not only for our co-workers, but for passengers." LAX, with a staff of 2,500 security officers, has as many as 100 managers, according to Melendez.

TSA responsiveness proves policy engagement is effective to combat TSA transphobia

Cannes 12— (Lexie, "Transgender travelers vs the Transportation Security Administration (TSA)," DECEMBER 16, 2012, http://lexiecannes.com/2012/12/16/transgender-travelers-vs-the-transportation-security-administration-tsa/). WM

Indeed, the very first thing you see is this:

"TSA **recognizes the concerns members of the transgender community may have** with undergoing the security screening process at our Nation's airports and is committed to conducting screening in a dignified and respectful manner."

The webpage contains travel tips and explains the screening process for trans people. But most importantly, I thought, was this section:

"**Reporting** Travel **Issues** or Concerns

Travelers who believe they have experienced unprofessional conduct at a security checkpoint are encouraged to request a supervisor at the checkpoint **to discuss the matter**

immediately or to submit a concern to TSA's Contact Center at: TSA-ContactCenter@dhs.gov.

Travelers who believe they have experienced discriminatory conduct because of a protected basis **may file a concern** with TSA's Office of Civil Rights & Liberties, Ombudsman and Traveler Engagement. **Travelers may also file discrimination concerns** with the Department of Homeland Security (DHS) Office for Civil Rights and Civil Liberties."

Yes, that's correct, the TSA suggests you ask for a supervisor immediately at the checkpoint if there is a problem.

No, I'm not going to say the system is perfect, but I'm arguing **headway has been made and means are available for transgender people to help improve the system**.

I'm also suggesting that comments about the TSA on the internet may not reflect how things really are.

Text

The Transportation Security Administration, while retaining its surveillance oversight, should increase outreach to encourage all airports to apply for the Screening Partnership Program (SPP) and expedite their approval if it will not compromise security, detrimentally affect cost efficiency, or detrimentally affect screening effectiveness of passengers or property. The TSA should set minimum levels of security standards and operational procedures, but give the private screeners the flexibility to provide the security in new, different, innovative, and creative ways. The TSA should develop staffing resources based on the operational requirements for each airport and the choice of screening companies should be based largely on technical capabilities and performance, not on cost

The counterplan solves the case --- expands private sector participation without undermining a strong federal role that is critical to maintain security

Hudson, 14 --- Representative in Congress From the State of North Carolina, and Chairman, Subcommittee on Transportation Security (7/29/2014, Richard, "EXAMINING TSA'S MANAGEMENT OF THE SCREENING PARTNERSHIP PROGRAM," HEARING before the SUBCOMMITTEE ON TRANSPORTATION SECURITY of the COMMITTEE ON HOMELAND SECURITY HOUSE OF REPRESENTATIVES ONE HUNDRED THIRTEENTH CONGRESS SECOND SESSION, http://www.gpo.gov/fdsys/pkg/CHRG-113hhrg92898/html/CHRG-113hhrg92898.htm, JMP)

Mr. Hudson. The Committee on Homeland Security, Subcommittee on Transportation Security, will come to order. The subcommittee is meeting today to hear testimony on TSA's management of the Screening Partnership Program. I recognize myself for an opening statement. I would like to thank our witnesses for their participation in this hearing. We know your time is valuable, and we appreciate you taking the time to be here with us today. The long-term success of TSA's Screening Partnership Program is a priority for many Members of Congress and stakeholders around the country who understand the private sector is highly capable of providing efficient and effective screening services. Unfortunately, TSA's actions over the last few years seem to demonstrate that it does not share this goal. This hearing is an opportunity to examine the problems and current--that currently exist with the program and **encourage TSA to take steps to enable more airports to choose private-sector screening**. To be clear, **this does not mean airports that participate in SPP are opting out of robust Federal oversight and regulations, which were severely lacking before 9/11**. It means opting to use qualified private vendors to carry out day-to-day screening functions, which **lets TSA concentrate on setting and enforcing security standards**. Eighteen domestic airports currently participate in SPP. The law requires that contract screeners meet the

same qualifications and receive commensurate pay and benefits to their Federal counterparts. SPP is a voluntary program, and airports must apply to participate. Under the FAA Modernization and Reform Act of 2012, unless an airport's participation in SPP would hurt security or drive up costs, TSA must approve all new applications. This 2012 provision revived an otherwise lifeless SPP application process after the TSA administrator announced he would not expand the program unless there was a clear and substantive advantage to do so. While I have great respect for Administrator Pistole, as far as I am concerned, there will always be at least three clear and substantial advantages to privatized screening. No. 1, the private sector operates more efficiently than the Federal Government and can save precious taxpayer dollars. No. 2, the private sector provides better consumer service, which is severely lacking in many of our Nation's screening checkpoints. No. 3, while private screening--or with the private screening, TSA can stop dealing with the time-consuming human resources issues that come with managing a workforce of over 50,000 screeners. This is not to imply that TSA has not made progress over the last few years. Under Mr. Pistole's leadership, TSA is becoming more risk-based and efficient through programs like TSA PreCheck. However, PreCheck operates just as well at SPP airports, including San Francisco International Airport, one of the largest and busiest airports in the country. There is no reason why SPP cannot be expanded to create even greater efficiencies under a risk-based system. In order to move forward with additional SPP airports in a constructive manner, several concerns need to be addressed in the near term. First, TSA has established a methodology for calculating Federal cost estimates for each new SPP contract based on requirements in the FAA Modernization Act, but that methodology does not include Federal retirement benefits, which we know to be a huge cost burden. TSA is also using the average screener's salary for its FCEs, but is allowing vendors to bid the minimum screener salaries, which may be unsustainable and cause significant issues in the long term. Second, **TSA's Screening Partnership Program office does not conduct the level of outreach to airport operators as it should**. To that end, TSA must make immediate changes that would include educating new airports on the benefits of SPP, communicating early and often with airports that are transitioning to SPP, and consulting the airport directors at existing SPP airports when selecting vendors for initial awards and contract recompetes. These are simple, but crucial, changes, and **the only barrier to action is TSA's well-known resistance to expanding SPP**. I look forward to discussing these and many other issues with our witnesses today to ensure the program is working and prepared to expand to additional airports.

The counterplan is mutually exclusive with the plan and necessary to address any emerging security threats --- turns the case

Laing, 14 (7/29/2014, Keith, "Lawmakers spar with TSA union over private airport security," http://thehill.com/policy/transportation/213673-lawmakers-tsa-union-spar-over-private-airport-security, JMP) *****Note --- Rep. Richard Hudson (R-N.C.)**

Hudson said privatization program did not allow airports to skimp on security.

"To be clear, this does not mean airports that participate in SPP are opting out of robust federal oversight and regulations, which were severely lacking before 9/11," he said. "It means opting to use qualified private vendors to carry out day-to-day screening functions, which lets TSA concentrate on setting and enforcing security standards."

The North Carolina lawmaker said he was open to "simple but crucial" changes to the program, such as increasing outreach to airports about their ability to request to participate.

But he added that "the only barrier to action is TSA's well-known resistance to expanding SPP."

TSA's Screening Partnership Program Director William Benner disputed the idea that the agency has blocked the expansion of the privatization program, saying the agency has allowed 31 airports to opt-out of using its personnel, however.

"The SPP is a voluntary program whereby airports may apply for SPP status and employ private security companies to conduct airport screening according to TSA standards," Benner said.

"Participation depends on interest from airport operators," he continued. "Since the program began in 2004, 31 airports have applied, including the original statutory five pilot airports. Of those 31, 18 are currently participating in the SPP program, and either have private contract screeners in place or are in the process of transitioning to contract screeners."

Benner added that even airports that successfully opt-out of using TSA personnel still had to meet the agency's standards for protecting U.S. airline passengers.

"Regardless of whether an airport has private or federal employees conducting passenger screening operations, **TSA maintains overall responsibility for transportation security**," he said. **"As new and emerging threats are identified, we must be able to adapt and modify our procedures quickly to protect the traveling public.** Federal Security Directors oversee the contracted security screening operations to ensure compliance with Federal security standards throughout the aviation network."

AT: Perm Do the CP

Permutation severs --- the counterplan does not reduce or transfer TSA authority and oversight in any way --- it merely expedites the approval of legitimate applications for the SPP.

Reject severance --- prevents testing the opportunity costs of the plan with counterplans and disadvantages.

SPP program maintains federal surveillance oversight --- that's Hudson and Lain.

SPP maintains federal oversight and requirements

TSA, 15 (4/7/15, "Program Overview: Screening Partnership Program," https://www.tsa.gov/stakeholders/program-overview, JMP)

The Aviation and Transportation Security Act, or ATSA, required TSA to establish pilot projects at up to five airports where screening would be performed by employees of qualified private companies **under federal oversight**. The law required those contract screeners to **meet all the requirements applicable to federal screeners**, and required the program be in place no later than Nov. 19, 2002.

TSA's Screening Partnership Program (SPP) grew out of a two-year pilot program with five airports. Since the conclusion of the pilot program in 2004, all U.S. airports with commercial service have been eligible to apply to SPP, which uses qualified private screening companies to provide screening services under federal oversight. Twenty-one airports are currently participating in the program. A new application process was implemented in Feb. 2012.

SSP still requires federal standards and oversight

TSA, 15 (1/2/2015, "Screening Partnership Program; Merging Private-sector Expertise and Public-sector Know How," https://www.tsa.gov/stakeholders/screening-partnership-program, JMP)

Merging Private-sector Expertise and Public-sector Know How

The Aviation Transportation Security Act (ATSA) of 2001 required TSA to conduct a pilot program with up to five airports where screening would be performed by private contractors under federal oversight. At the conclusion of the pilot in 2004, TSA created the Screening Partnership Program (SPP).

Currently, 21 airports have been awarded a contract and are participating in the program. Airport directors may submit their application to participate in SPP to TSA at any time. **Private contract companies must adhere to TSA's security standards and contract screeners must meet ATSA requirements** applicable to federally employed screeners.

AT: Permutation Do Both

This permutation is net worse ---

A) The counterplan alone solves the case --- it guarantees the SPP is sufficiently expanded to ensure airport security. The counterplan is what their plan would have been if they didn't twist it to try and be topical --- vote negative to preserve policy precision.

B) Maintaining the existing TSA oversight surveillance role is necessary to ensure security and preempt any new threats. That's Hudson and Laing.

Can't "do both" because they are mutually exclusive --- the counterplan maintains the TSA's role in surveillance oversight --- the plan curtails it. That's our 1nc evidence. Reject severance --- prevents testing the opportunity costs of the plan with counterplans and disadvantages.

2nc Solvency

Framing issue --- almost all of their 1ac evidence is over a decade old and is calling for a privatized airport security process that the TSA initiated with the Screening Partnership Program and is expanded by mandate of the counterplan. You should disregard all evidence that doesn't assume the SPP AND the counterplan's expanded reform.

The counterplan solves --- lets SPP deal with personnel issues, but retains TSA leadership on security issues --- this division of responsibility is best and promotes accountability

VanLoh, 14 --- director of aviation for the Kansas City Aviation Department (7/29/2014, Mark, "EXAMINING TSA'S MANAGEMENT OF THE SCREENING PARTNERSHIP PROGRAM," HEARING before the SUBCOMMITTEE ON TRANSPORTATION SECURITY of the COMMITTEE ON HOMELAND SECURITY HOUSE OF REPRESENTATIVES ONE HUNDRED THIRTEENTH CONGRESS SECOND SESSION, http://www.gpo.gov/fdsys/pkg/CHRG-113hhrg92898/html/CHRG-113hhrg92898.htm, JMP)

Good afternoon, Mr. Chairman and Members of the Transportation Security Subcommittee. My name is Mark VanLoh and I am the director of aviation for the city of Kansas City, Missouri. Thank you for inviting me to appear before you today to discuss the Airport Screener Partnership Program.

First, I want to describe Kansas City International Airport. It is one the country's major medium-hub airports and serves approximately 10 million annual passengers. Designed in the late 1960's, it has three separate semi-circular passenger terminals that are not connected. The lack of a central concourse also creates the need for multiple security screening locations and does not allow for central security screening that is common with more modern airports. Several hundred screeners at several checkpoints are employed to perform passenger screening.

My testimony today addresses the Screener Partnership Program based upon Kansas City's nearly 12 years of experience under the program since it began in 2002.

Kansas City was selected by TSA in 2002 under the ``pilot program'' along with 4 other airports--San Francisco, Rochester, Tupelo, and Jackson Hole.

It is a partnership that has worked extremely well at Kansas City. I have been an airport operator for 30 years, and in my view the Screening Partnership Program has provided a level of screening services and security protection at least as good as, we think better than, the levels that TSA would have provided using Federal personnel. And, it has done so with operational efficiency and high levels of customer satisfaction. My counterparts at other airports are often envious of our record of service and security. I am always pleased to brag about it.

Often I am asked by the public what an airport director does and on what issue we spend the most time during a normal day. It is not security or safety or airline negotiations but employee issues. With 500 employees, a considerable portion of the day consists of employee performance reviews, labor relations/grievance hearings, disciplinary actions, family medical leaves, random drug screening reviews, and other personnel issues. I cannot imagine what amount of time is consumed by TSA with over 50,000 employees. In my opinion, the majority of efforts by the TSA should be focused on intelligence gathering to reduce the threat against aviation and then issuing policy and procedures to protect our industry not on personnel issues. At Kansas City,

the SPP provider handles all the personnel issues leaving TSA to oversee security. The operator and overseer are different entities. **This results in built-in accountability and allows each do what they can and should do best.**

The advantages of the Screening Partnership Program can be summarized as follows:

enhanced flexibility and efficiencies in personnel use and deployment.

greater flexibility to respond to increased or decreased service requirements.

greater flexibility to cross-train and cross-utilize personnel.

not subject to Federal employee ``hiring freezes'' and employment caps. As an aside, during the recent sequestration, while other airports with Federal staff were subjected to Federal restrictions, we at Kansas City operated normally with no disruptions.

More effective in dealing with non-performers. This may sound a bit insensitive but we all know that the job requires an inordinate amount of attention and personal skills. Occasionally an employee may be hired that probably shouldn't be in that position. We can all tell the screeners that enjoy their job and want to be there. The SPP provider is able to make changes with minimal disruption to the mission. A high degree of customer service awareness is critical. We all want our passengers to enjoy their airport experience.

The private screening company has greater flexibility than the Federal Government to re-deploy screeners on short notice, to reschedule screener shifts to and from off-hours, and to add or delete screening checkpoints on short notice.

Based on our nearly 12 years of experience under the private screening program, I can report that the Screening Partnership Program has been very effective in providing high-quality service to our passengers at a level of security equal to, if not better than, the level that would be provided at the airport using Federal Government employees.

The SPP has been great for Kansas City from the beginning, but has caused me great concern lately given the issues surrounding the rebid of the contract. We are now almost 4 years outside the expiration of the most recent contract. Even through the uncertainty of not knowing if they will have a job after each holiday season, our screeners have maintained their high level of service and dedication. It is my understanding that this solicitation is now in the Court of Federal Claims for the third time. The low bidder selected by TSA included across-the-board pay cuts as well as cuts in hours to all screeners now working at the airport. Meanwhile TSA recently announced pay raises for Federal screeners at other airports but selected this low bidder in Kansas City based on this treatment of our existing workforce.

Even with the contract award issues, I firmly believe the program has worked well for Kansas City; there are a number of areas in which the program could be improved.

First, TSA needs to be more flexible in its supervision of private- screening companies so as to better foster improvements and innovation. TSA should set minimum levels of security standards and operational procedures, but give the private screeners the flexibility to provide the security in new, different, innovative, and creative ways. However, as we understand it, TSA requires Federal and private screeners to operate under the same procedures, including centralized

procedures for screener hiring and assessments, and coordination or hiring through TSA headquarters. I do not believe that the law requires a one-size-fits- all approach.

Second, TSA should develop staffing resources based on the operational requirements for each airport, not on arbitrary system-wide staffing caps based on the National models it uses for the Federal workforce. Such an approach would more effectively account for the unique requirements of each airport, including part-time and efficient full-time screener schedules. Again, one size doesn't fit all. For example, staffing requirements for Kansas City International Airport, which does not have a single central security location, will be markedly different than the requirements for airports that have centralized security screening facilities.

Third, there needs to be greater coordination with the airport operator. More can be done to get the airport operator's input in the operational procedures, staffing, and other critical activities. For example in TSA's contested contract award that I mentioned above, TSA recently chose to replace Kansas City's long-time private screening company through the bid process, yet never asked Kansas City for our input on the incumbent's prior performance.

Fourth, the choice of screening companies should be based largely on technical capabilities and performance, not on cost. Basing selection primarily on cost considerations we will return us to the poorly performing system that existed pre-9/11 where contracts were generally awarded to the lowest-cost bidder, manned by screeners who lacked experience, critical skills, and performance incentives. TSA needs to ensure that the selection is truly a ``best value".

In conclusion, the Screening Partnership Program has worked well at Kansas City International Airport. **It has shown that private screeners under the direct oversight of the TSA will perform excellent security and customer service and at reasonable costs.** Mr. Chairman, this concludes my prepared remarks. I would be pleased to address any questions you and the Members of the subcommittee may have.

Expansion of SPP --- under TSA oversight --- solves and allows TSA to still maintain airport security

Spaude, 6/6/15 --- currently a member of the Young Leaders Program at The Heritage Foundation (Ryan, "Time for Congress to Expand Private Airport Screeners," http://wtpcnews.com/2015/06/time-for-congress-to-expand-private-airport-screeners/#.VbbPqPmGPD8, JMP)

Monday was another "red letter" day for the Transportation Security Administration (TSA)—and not in a good way.

Earlier this week, ABC News reported that undercover agents in the Department of Homeland Security (DHS) successfully smuggled fake explosives and weapons through 67 of 70 checkpoints in a secret nationwide exercise. The agents, dubbed a Red Team by the department, adopted tactics commonly used by terrorists to thwart the TSA in major airports across the country.

As a result, the acting director of the TSA received his pink slip from Secretary Jeh Johnson on Monday night. Johnson immediately called on the TSA to "revise its standard operating procedures" and reassess how it manages America's airline security.

This disappointing news reveals a major shortcoming in the current structure of the TSA. Now more than ever, the U.S. must reform the agency to make airport security more efficient, less costly, and more responsive to the needs of officials and the general public.

One solution is to expand the Screening Partnership Program (SPP). Created in 2001, SPP allows private airport screeners to **operate under the oversight of the TSA**. Private personnel check bags, screen passengers, and manage daily affairs while **meeting the same standards originally enacted by Congress** after 9/11.

At the start of this year, a total of 21 airports in the U.S. received approval to use private contractors under SPP. A study by the House Transportation and Infrastructure Committee found that private screeners were up to 65 percent more efficient than federal workers. In addition, taxpayers could save $1 billion over five years if the nation's top 35 airports adopted SPP procedures.

While every airport has the ability to pursue changes under SPP, the government has made it difficult for them to do so. Congress had to reprimand the TSA in 2012 for holding up the approval of new SPP contracts. Using a flawed assessment, TSA officials reported that private screeners would cost more than the "government knows best" status quo in several airports. Outside groups criticized the calculations, stating that SPP is actually less expensive and just as safe.

A main source of savings with SPP is the reduced turnover of employees and improved on-the-job morale. Research shows that private contractors are better able to retain and keep workers, who perform their jobs just as effectively as government workers, if not more effectively. And if a contractor's performance falls short, it can and should be replaced.

Canada and numerous European countries currently utilize private contractors in their airports, with great success. In these nations, the government sets the security standards while allowing the private sector to manage the screening process and improve the overall experience for travelers.

In light of its failure to prevent 95 percent of the recent Red Team probes, the TSA should consider a number of possible reforms to how it handles airline security. The most important of these changes is an expansion of the SPP to more airports, so that private screeners can work with federal officials to ensure that Americans remain safe in the air at all times.

The TSA should say goodbye to personnel management and refocus its efforts on overseeing the actual security of our airports.

Solvency --- Terrorism

Expanding SPP with TSA oversight will improve security screening

Inserra, 6/2/15 --- specializes in cyber and homeland security policy, including protection of critical infrastructure, as research assistant at the Heritage Foundation (David, "TSA Failures Point to Need for Private Airport Security," http://dailysignal.com/2015/06/02/tsa-failures-point-to-need-for-private-airport-security/, JMP)

In an exclusive scoop, ABC News is reporting that the Transportation Security Administration failed to stop undercover agents in 67 out of 70 recent probes of TSA screening. These agents carried fake weapons through checkpoints at major airports across the country and were not stopped.

ABC reports that Jeh Johnson was "apparently so frustrated by the findings he sought a detailed briefing on them last week at TSA headquarters."

Johnson has good reason to be frustrated: Such a high failure rate is unacceptable.

The inspector general's report is not available publicly and will likely be classified for security reasons. This should not stop Congress, however, from investigating this matter and reviewing the remedial actions that are being taken.

Importantly, it exposes the reality that government screeners are not necessarily the right answer to airport screening.

Almost all European countries and Canada use private airport screeners. In the United States, airports have the right to opt out of TSA-administered screening through the Screening Partnership Program, which swaps out TSA screeners in favor of private contractors **with TSA oversight**. SPP has been found to result in screening that is more efficient, more customer friendly, less costly, and more secure.

With all these benefits and the precedent set by Europe and Canada, SPP is a no-brainer. Sadly, the program is subject to burdensome regulations and bureaucratic processes that limit its use.

So while Congress should ensure that the TSA fixes the current holes in airport screening, lawmakers should also consider expanding SPP as a longer term solution to improve transportation security.

TSA Oversight Good

TSA oversight is critical to determine the most effective contractors and ensure safety and cost effectiveness.

Mark **Bell** Acting Deputy Inspector General for Audits, U.S. Dept. of Homeland Security, Office COGR **14** (Committee on oversight and government reform) TSA OVERSIGHT: EXAMINING THE SCREENING PARTNERSHIP PROGRAM HEARING BEFORE THE SUBCOMMITTEE ON GOVERNMENT OPERATIONS OF THE COMMITTEE ON OVERSIGHT AND GOVERNMENT REFORM HOUSE OF REPRESENTATIVES ONE HUNDRED THIRTEENTH CONGRESS SECOND SESSION JANUARY 14, 2014 Serial No. 113–95 https://www.oig.dhs.gov/

At the time of the GAO audit, TSA had improved its screener performance measures, but GAO concluded that it could benefit from monitoring private versus Federal screener performance. In April 2012, TSA added measures to better address the strategic goals and

mission of screening in its assessments of screener performance at private and Federal airports. However, TSA did not separately monitor private screener and Federal screener performance. It made efforts to monitor screener performance at individual SPP airports, but these efforts did not provide information on SPP performance as a whole or across years, which made it difficult to identifY program trends. GAO noted that consistent monitoring of SPP versus non-SPP performance would help ensure that the screening and protection at SPP airports matched or exceeded that at non-SPP airports, and would ensure that SPP airports were operating as intended. GAO recommended TSA develop guidance for SPP applicants that included 1) TSA's criteria and process for assessing whether SPP participation would compromise security or detrimentally affect screening cost-efficiency or effectiveness; 2) how TSA would obtain and analyze cost information on screening cost-efficiency and effectiveness and the implications of airports not responding to related application questions; and 3) specific examples of additional information airports should consider providing to help TSA assess their suitability for SPP. GAO also recommended that TSA develop a mechanism to regularly monitor private versus Federal screener performance. TSA concurred with both recommendations. Conclusion Through our audit, we determined that TSA needed to improve some aspects of its administration of SPP to help avoid the risk of not selecting the best contractor to provide screening services. Because administration includes in-depth examination of airport applications and private contractor offers, which requires detailed calculations and analysis, TSA should ensure that decisionmakers have accurate information. TSA has taken steps to fully document its decisions on SPP applications and procurements and to improve its quality assurance procedures, including cost estimating and application document reviews.

Oversight is key

GAO 12 Government Accountability Office SCREENING PARTNERSHIP PROGRAM: TSA Should Issue More Guidance to Airports and Monitor Private versus Federal Screener Performance GAO-13-208: Published: Dec 6, 2012. Publicly Released: Dec 6, 2012. http://www.gao.gov/products/GAO-13-208

Since implementation of the Screening Partnership Program (SPP) in 2004, 29 airports have applied to the program, citing various advantages and relatively few disadvantages. Of the 25 approved, 16 are participating in the program, 6 are currently in the contractor procurement process, and the remainder withdrew from participation because their commercial airline services were discontinued. In 2011, the Transportation Security Administration (TSA) denied applications for 6 airports because, according to TSA officials, the airports did not demonstrate that participation in the program would "provide a clear and substantial advantage to TSA security operations." After enactment of the Federal Aviation Administration Modernization and Reform Act of 2012 (FAA Modernization Act) in February 2012, TSA revised its SPP application, removing the "clear and substantial advantage" question. Four of the 6 airports that had been denied in 2011 later reapplied and were approved. In GAO's survey and in interviews with airport operators (of SPP and non-SPP airports) and aviation stakeholders, improved customer service and increased staffing flexibilities were most commonly cited as advantages or potential advantages of the SPP. Individual Federal Security Directors we interviewed cited reduced involvement in human resource management as an advantage; however, TSA generally remains neutral regarding the SPP. Few disadvantages were cited; however, some airport operators cited satisfaction with federal screeners and concerns with potential disruption from the transition to private screening services. TSA has developed some resources to assist SPP applicants; however, it has not provided guidance to assist airports applying to the program. Consistent with the FAA Modernization Act, TSA's revised SPP application requested that applicants provide information to assist TSA in determining if their participation in the SPP would compromise security or detrimentally affect the cost-efficiency or screening effectiveness of passengers and property at their airport. TSA also developed responses to frequently asked questions and has expressed a willingness to assist airports that need it. However, TSA has not issued guidance to assist airports with completing applications and information on how the agency will assess them. Three of five airport operators who applied using the current application stated that **additional guidance is needed** to better understand how to respond to the new application questions. **Developing guidance could better position airports** to evaluate whether they are good candidates for the SPP. TSA recently improved its screener performance measures, but could benefit from monitoring private versus federal screener performance. In April 2012, TSA added measures to ensure that the set of measures it uses

to assess screener performance at private and federal airports better addresses its airport screening strategic goals and mission. However, TSA does not monitor private screener performance separately from federal screener performance. Instead, **TSA conducts efforts to monitor screener performance at individual SPP airports**, but these efforts do not provide information on SPP performance as a whole or across years, which makes it difficult to identify program trends. A mechanism to consistently monitor SPP versus non-SPP performance would better position TSA to ensure that the level of screening services and protection provided at SPP airports continues to match or exceed the level provided at non-SPP airports, thereby ensuring that SPP airports are operating as intended. Why GAO Did This Study TSA maintains a federal workforce to screen passengers and baggage at the majority of the nation's commercial airports, **but also oversees a** workforce of private screeners at airports who participate in the SPP. The SPP allows commercial airports to use private screeners, provided that the level of screening matches or exceeds that of federal screeners. In recent years, TSA's SPP has evolved to incorporate changes in policy and federal law, prompting enhanced interest in measuring screener performance. GAO was asked to examine the (1) status of SPP applications and airport operators', aviation stakeholders', and TSA's reported advantages and disadvantages of participating in the SPP; (2) extent to which TSA has provided airports guidance to govern the SPP application process; and (3) extent to which TSA assesses and monitors the performance of private and federal screeners. GAO surveyed 28 airport operators that had applied to the SPP as of April 2012, and interviewed 5 airport operators who have not applied and 1 airport operator who applied to the SPP after GAO's survey. Although not generalizable, these interviews provided insights. GAO also analyzed screener performance data from fiscal years 2009-2011. This is a public version of a sensitive report that GAO issued in November 2012. Information that TSA deemed sensitive has been redacted. What GAO Recommends **GAO recommends that the TSA Administrator develop guidance for SPP applicants** and a mechanism to monitor private versus federal screener performance. **TSA concurred** with the recommendations.

Congress supports the counterplan

Laing, 14 (7/29/2014, Keith, "Lawmakers spar with TSA union over private airport security," http://thehill.com/policy/transportation/213673-lawmakers-tsa-union-spar-over-private-airport-security, JMP)

The chairman of the House panel that oversees transportation security issues accused the Transportation Security Administration (TSA) on Tuesday of blocking efforts to privatize airport security checkpoints.

"Under the FAA Modernization and Reform Act of 2012, unless an airport's participation in [Screening Partnership Program] would hurt security or drive up costs, TSA must approve all new applications," Rep. Richard Hudson (R-N.C.) said during a hearing of the House Homeland Security Committee's Transportation Security Subcommittee.

"While I have great respect for [TSA] Administrator [John] Pistole, as far as I am concerned, there will always be at least three clear and substantial advantages to privatized screening," Hudson continued. "Number one, the private sector operates more efficiently than the federal

government and can save precious taxpayer dollars. Number two, the private sector provides better customer service, which is severely lacking at many of our nation's screening checkpoints. And number three….with private screening, TSA can stop dealing with the time-consuming human resources issues that come with managing a workforce of over 50,000 screeners."

The SPP program is designed to allow airports to opt-out of utilizing TSA security personnel if they can prove they can provide the same level of protection with private workers at lower costs. The requests have to be approved by TSA, however, which has led to friction between GOP lawmakers and the TSA.

Republicans have championed the effort to privatize airport security for several years because they argue that many of the TSA's techniques, including its pat down hand searches and X-ray scanners, invade the privacy of airline passengers.

The TSA has come under fire often in recent year for its treatment of elderly and child passengers.

TSA is reforming now – specific to operational effectiveness – their ev. doesn't account for new developments

Monzon 6/17/15 – News Writer at United Press International (Tomas, TSA audit reveals no terrorist ties for 73 airline workers, UPI, http://www.upi.com/Top_News/US/2015/06/17/TSA-audit-reveals-no-terrorist-ties-for-73-airline-workers/3011434477493/)//JJ

A Transportation Security Administration audit has confirmed that 73 airline employees earlier suspected of terrorist ties have **no such connections.** The audit, published June 4 by the Department of Homeland Security, explained that the TSA was unable to link the 73 airline employees to terrorists, although DHS had determined they had terrorist ties. DHS used a list not available to the TSA, leading DHS to conclude that TSA "is not authorized under current interagency watchlisting policy to receive certain terrorism-related category codes". Appearing before the Homeland Security subcommittee on transportation, TSA deputy assistant Stacey Fitzmaurice ultimately confirmed that the agency found **no ties** between **terrorism and the workers**. Committee chairman and Representative John Katko, R-N.Y. criticized the TSA for its lethargy in producing this information. Fitzmaurice said the TSA used the FBI's watch list, which, he argued, contains **more reasonable data** than that of the National Counterterrorism Center, a rawer data set that DHS used to produce its report. The TSA does not have access to NCTC's data. Inspector General for Homeland Security John Roth explained that it took 18 months for the agency to clear legal obstacles and run the names of the aviation workers against the NCTC list. NCTC carried out the comparison itself once authorization was secured. To **prevent future problems**, Katko pushed House leaders Tuesday to pass his **reform bill HR2750**, "Improved Security Vetting for Aviation Workers Act of 2015". Additionally, Fitzmaurice and the TSA are still working on gaining full access to NCTC's list. The news of TSA wanting access to an intelligence database comes just as **TSA chief** Melvin Carraway was **reassigned** after an investigation revealed widespread failures with airport security. In 70 tests performed by DHS, 67 attempts at sneaking fake weapons into airports were successful. At the time, DHS Secretary Jeh Johnson called for TSA to **reevaluate** its **screening equipment** and **review** its **operating procedures**.

Alt cause – lack of federal trust

Frauenfelder 6/8/15 – founder of Boing Boing and the founding editor-in-chief of MAKE, editor-in-chief of Cool Tools and co-founder of Wink Books (Mark, Federal gov't doesn't trust TSA enough to inform it of airline employees with links to terrorism, Boing Boing, http://boingboing.net/2015/06/08/federal-govt-doesnt-trust.html)//JJ

According to a recently-released Government Accountability Office report, the "TSA did not identify 73 individuals with terrorism-related category codes because TSA is **not authorized** to receive all terrorism-related information under **current interagency watchlisting policy**." The federal government **doesn't place enough trust** in its own anti-terrorism administration to give it a list of people with terrorism-related category codes employed by airlines and airport vendors. "**Without complete** and

accurate information, TSA risks credentialing and providing unescorted access to secure airport areas for workers with potential to harm the nation's air transportation system," the report found.

The issue is not the TSA – it's interagency policy

Jesse 6/9/15 – associate editor of Allen B West, citing a Guardian report (Michelle, TSA hired 73 people on the terror watch list; reason why is MIND-BLOWING, Allan B West, http://allenbwest.com/2015/06/tsa-hired-73-people-on-the-terror-watch-list-reason-why-is-mind-blowing/)//JJ

The Guardian explains WHY these 73 individuals slipped through the cracks to stand watch at our nation's security checkpoints: TSA did not identify these individuals through its vetting operations because it is not authorized to receive all terrorism-related categories under **current interagency watch-listing policy**," the DHS document stated, adding that the agency had "acknowledged that these individuals were cleared for access to secure airport areas despite representing a potential transportation security threat". In other words, the TSA **isn't allowed** to get every bit of information available about applicants, unless the applicants report it themselves. It's up to the applicant to report information that could likely disqualify them from TSA employment. Yeaaahh. Got it. Turns out, even if information comes in after someone's hired on at the TSA, the **TSA doesn't always get that info**. All of this will be cold comfort to travelers lining up through security for their summer vacations. The silver lining – or the "gift" if you choose to see it that way – is this provides yet another stunning example of how increased government spending does NOT equal a better job done or necessarily help keep us safer. Despite almost $100 billion spent since 2011, the TSA continues to bring us lapse after lapse. Indeed, it appears that some of these gaps are a result of the very **bloated bureaucracy** that was supposed to keep us safer.

FBI aviation surveillance solves – specifically their private warrant

Perdue 2/3/15 – Deputy Assistant Director, Counterterrorism Division at the FBI (Doug, Statement Before the House Committee on Homeland Security, Subcommittee on Transportation Security, Washington, D.C., the FBI, https://www.fbi.gov/news/testimony/fbis-role-in-access-control-measures-at-our-nations-airports)//JJ

In conjunction with our partners, the FBI's Counterterrorism Division's (CTD) Civil Aviation Security Program (CASP) is **extensively involved** in efforts to **uncover and prevent terrorist operations** to attack or exploit civil **aviation** in the United States. The FBI has special agents and task force officers assigned as **airport liaison agents** (ALAs) at **each** of the nation's **TSA-regulated airports** in order to respond to aviation-related incidents and threats, participate in **joint FBI-TSA airport vulnerability** assessments, and interact with **interagency** and **private sector stakeholders** at airports around the country on exercises, threat mitigation, and other issues to protect the traveling public. The FBI's CASP and ALA program were created in 1990 to formalize the Bureau's investigative, intelligence, and liaison activities at the nation's airports. CASP is located in the FBI's National Joint Terrorism Task Force with a focus on **supporting and enhancing efforts** to prevent, disrupt, and defeat acts of **terrorism directed toward civil aviation**, and to provide counterterrorism preparedness **leadership and assistance** to **federal, state, and local agencies** responsible for civil aviation security. One of CASP's primary responsibilities is to provide program management and support to the FBI's ALAs. In addition, CASP represents the FBI on aviation security policy matters, provides guidance and training to the field, and **supports national aviation security** initiatives and mandates. I would like to go over briefly CASP's efforts to mitigate the insider threat at America's airports.

The airline industry is extremely resilient to shocks

Carlisle 15 – Chief Operating Officer at Goshawk (Andy, Airport business resilience: Plan for uncertainty and prepare for change, Journal of Airport Management, Volume 9, p. 118-132, 1/1/15)//JJ

In recent years, there has been sustained turbulence in markets around the world. Economies are emerging from recession, but the pace of recovery is mixed while geopolitical uncertainty and security threats appear to be increasing. In a connected world, problems rarely remain geographically isolated, which means there is continued economic uncertainty in many major global markets. However, uncertainty is **not always negative**. The pace of technological change is rapid; the influence of mobile and digital platforms extends across all areas of business, including aviation. While such developments are generally positive, change itself creates uncertainty and new technology can be a disruptive influence. Airport managers and investors must balance the drive toward commercial optimisation against the inherent investment risk in realising new opportunities; these challenges are magnified in a market that has a more uncertain and variable outlook. Airport business models are adapting to this new reality, and there is increased recognition of the **need for flexibility**, **creativity**, and **vigilance** in **planning**, **building**, **managing**, and **financing airports.** The most effective counterbalance to future uncertainty is to develop business models that are **resilient**, but **not resistant, to change**. In this context, business resilience means managing risk and capitalising on opportunity. It involves **preparing and organizing** for change, and being ready to change direction when **unexpected events occur**, or the **operating environment changes.** It is adopting a mind-set of surprises being the 'new normal', and realising that it's not a question of 'if ' the unexpected will happen, but rather 'when will it happen?', 'what will happen?', and 'are we prepared?'. Resilience, then, is strength with flexibility, and focus with situational awareness. Many airport operators are adapting to this new normal and recognizing the need for **greater flexibility**, creativity, **global awareness**, and social awareness in the management of airports. While there are limitations to flexibility in an infrastructure-intensive business, this paper considers some of the measures that can be taken to optimise airport financial performance in a dynamic market where rapid change has the potential to disrupt existing business models.

Increased airport security now and no terror threat

Ross and Schwartz 1/13/15 – ABC news chief correspondent AND **chief investigative producer (Brian and Rhonda, US Steps Up Airport Security After Al Qaeda's 'Hidden Bomb' Recipe, ABC News, http://abcnews.go.com/International/us-steps-airport-security-al-qaedas-hidden-bomb/story?id=28194349)//JJ

American airports are **increasing security measures across the country** in the wake of dual terrorist attacks in Paris and the publication by al Qaeda of what counterterrorism experts say appears to be the most detailed, and potentially lethal, bomb recipe ever to be sent to their followers. The **top security chiefs** for major **American airlines** have been briefed about the troubling publication, according to a senior U.S. law enforcement official. Department of Homeland Security Secretary Jeh Johnson said Monday the **T**ransportation **S**ecurity **A**dministration has **stepped up** random **searches** of travelers and carry-on luggage in addition to **enhanced screening** that was ordered this summer at "certain foreign airports." Johnson said there is "**no specific, credible threat**" of an attack on the U.S. like what happened in Paris last week, but said that incident, along with others in Canada and Australia, and "the recent public calls by terrorist organizations for attacks on Western objectives, including aircraft, military personnel, and government installations and civilian personnel" made the need for **increased security** at American airports and elsewhere "self-evident." The bomb-making recipe, published in the most recent edition of the al Qaeda in the Arabian Peninsula (AQAP) English-language magazine in December, is a detailed guide to making the explosive, getting through security and even where to sit on the plane. "We spared no effort in simplifying the idea in such we made it 'another meal prepared in the kitchen' so that every determined Muslim can prepare," the magazine says, in an apparent reference to earlier versions of bomb-making instructions called "How to Build a Bomb in the Kitchen of Your Mom." "This group, AQAP, is absolutely determined… to try and [carry] out an attack on a U.S.-bound airplane," said Matt Olsen, former Director of the National Counterterrorism Center and current ABC News consultant. "The prospect of AQAP trying to get a bomb on an airplane has been, for the past several years, at the **top of the list** for concerns of the U.S. counterterrorism community. After reviewing the recipe, explosives expert Kevin Barry said it appeared to be one of the most "sophisticated" non-metallic explosives devices he's seen, which could especially be a problem for smaller airports that don't employ high-tech

body imaging security devices. AQAP, the al Qaeda branch based in Yemen, previously attempted to bring down an American airliner on Christmas Day 2009, but the would-be bomber couldn't get the device to detonate. That bomber, Umar Farouk Abdulmuttalab, reportedly crossed paths in Yemen with one of the men who executed the Paris terror attack last week. Last week the State Department updated its Worldwide Caution travel alert to all Americans abroad. "Recent terrorist attacks, whether by those affiliated with terrorist entities, copycats, or individual perpetrators, serve as a reminder that U.S. citizens need to maintain a high level of vigilance and take appropriate steps to increase their security awareness," the alert said.

Kesten 15 TSA Head Reassigned After Agency Fails 95 Percent Of Airport Security Tests AP | By LOU KESTEN Posted: 06/01/2015 10:37 pm EDT staff writer for ABC News & Business Insider, http://www.huffingtonpost.com/2015/06/01/tsa-security-reforms-jeh-_n_7489558.html

WASHINGTON (AP) — Homeland Security Secretary Jeh Johnson on Monday reassigned the leader of the Transportation Security Administration and directed the agency to **revise airport security procedures, retrain officers and retest screening equipment** in airports across the country. The TSA's acting administrator, Melvin Carraway, is being reassigned to a different job in the Department of Homeland Security. Acting Deputy Director Mark Hatfield will lead the agency until a new administrator is appointed. The directives come after the agency's inspector general briefed Johnson on a report analyzing vulnerabilities in airport security — specifically, the ability to bring prohibited items through TSA checkpoints. Johnson would not describe the results of the classified report, but said he takes the findings "very seriously." ABC News first reported Monday that undercover agents were able to smuggle prohibited items, such as mock explosives or weapons, through TSA checkpoints in 67 out of 70 attempts. ABC cited anonymous officials who had been briefed on the inspector general's report. In a statement issued Monday evening, Johnson said, "The numbers in these reports never look good out of context, but they are a critical element in the continual evolution of our aviation security." Johnson said he had directed TSA to take several corrective steps, including: —**Immediately revising standard operating procedures for screening.** —**Conducting training for all transportation security officers**, and intensive training for all supervisory personnel. —**Retesting and re-evaluating the screening equipment** currently in use at airports across the United States. —**Continuing to conduct random covert testing**. Johnson said that in the longer term, he has directed TSA and DHS to "examine adopting new technologies to address the vulnerabilities identified by the Inspector General's testing." The Homeland Security chief said that over the last year, "TSA screened a record number of passengers at airports in the United States, and ... seized a record number of prohibited items." Still, he said, the agency was "constantly testing and adapting the systems we have in place." Johnson also called on the Senate to confirm President Barack Obama's choice to lead the TSA, Coast Guard Vice Adm. Pete Neffenger.

Legislation is coming to solve the aff

Ybarra 15 By Maggie Ybarra - The Washington Times - Tuesday, June 16, 2015 http://www.washingtontimes.com/news/2015/jun/16/tsa-tells-congress-airport-workers-alleged-terror-/?page=all Maggie Ybarra is military affairs and Pentagon correspondent "TSA tells Congress that airport workers with alleged terror ties posed no real threat"

There is no excuse for that type of behavior when the nation's security is at stake, said Rep. Kathleen Rice of New York, the subcommittee's ranking Democrat. "It strikes me as sloppy, and there's no place for sloppiness when we're dealing with the security of our nation's aviation system," she said. "We strive for a security system that's airtight and precise — and in order to achieve that, our information must be airtight, everything we do must be precise." Ms. Fitzmaurice said the TSA is still working on getting full access to the U.S. intelligence database used by the inspector general's office to associate the workers with security concerns. Lawmakers livid over the security blunder said they were prepared to pass legislation designed to improve the vetting for aviation workers since the agency appears incapable of addressing its security gaps. "The reality is that in this post 9/11 world, the terrorist threat is metastasizing and we, as a nation, must remain responsive to any holes in the security of our transportation systems and ensure that the protocols keep pace with the ever-evolving threat landscape," said House Committee on Homeland Security Chairman Michael McCaul on Tuesday. "Improving the vetting of the aviation workers who have access to these sensitive areas of airports can help close another backdoor vulnerability at our nation's airports." Mr. McCaul is a sponsor of a bill that would boost information sharing between the TSA and other intelligence agencies. That bill would also

require the agency to issue guidance by the end of the year on how TSA inspectors should annually reviewing airport badging office procedures for applicants seeking access to sensitive areas of airports. The effort to reform the TSA comes as Coast Guard Vice Adm. Peter Neffenger prepares to take over as head of the troubled agency, having received Monday the voice vote approval of the Senate Homeland Security and Governmental Affairs Committee. Sen. Ron Johnson, Wisconsin Republican and the panel chairman, described him as "well qualified and well suited for the task" of leading the agency. Vice Adm. Neffenger will replace acting TSA deputy director Mark Hatfield, who stepped in for acting TSA Administrator Melvin Carraway after he was reassigned. Mr. Carraway left the top position in early June after an internal investigation by the Department of Homeland Security Office of the Inspector General showed how easy it was to slip weapons and explosive materials past airport screeners. Investigators were able to bypass security while in possession of dangerous material 67 times out of 70 tests. Vice Adm. Neffenger acknowledged the agency's troubles in a recent congressional hearing and said that those woes disturbed him. If confirmed, he promised to make it an immediate priority to pinpoint highlighted security gaps and look systematically at the issues that led to them.

Introduced by Rep. Richard Hudson (R-NC), chairman of the House Transportation Security Subcommittee in July 2013, HR 2719 was approved unanimously by the House in December of that year. Following introduction of companion legislation by Sen. Kelly Ayotte (R-NH) and unanimous Senate passage, the legislation as amended unanimously passed the House. "As chairman, I set out to increase transparency and accountability at TSA while keeping travelers safe and saving our tax dollars," Hudson said in a statement. "This law is an important step that will root out the waste at TSA and increase safety by ensuring that the most effective, cost-efficient security tools are implemented. Despite Washington's gridlock, the bipartisan support of this law shows that Republicans and Democrats can work together to solve problems." The Transportation Security Acquisition Reform Act introduces greater transparency and accountability for the Transportation Security Administration (TSA) spending decisions through a series of commonsense reforms. Specifically, it requires TSA to: **Develop and share** with the public **a** strategic **5-year** technology investment **plan**; **Share key information with Congress** on technology acquisitions, including cost overruns, delays, or technical failures within 30 days of identifying the problem; **Establish principles for managing equipment** in inventory to eliminate expensive storage of unusable or outdated technologies, and **Report on its goals for contracting** with small businesses. The legislation stated that, "TSA has not consistently implemented Department of Homeland Security policies and government best practices for acquisition and procurement; TSA has only recently developed a multiyear technology investment plan, and has underutilized innovation opportunities within the private sector, including from small businesses; and has faced challenges in meeting key performance requirements for several major acquisitions and procurements, resulting in reduced security effectiveness and wasted expenditures." The legislation also requires the TSA administrator not later than 180 days after the date of enactment of the Transportation Security Acquisition Reform Act, develop and submit to Congress a strategic 5-year technology investment plan that may include a classified addendum to report sensitive transportation security risks, technology vulnerabilities or other sensitive security information; and to the extent possible, publish the plan in an unclassified format in the public domain." The plan shall include an analysis of transportation security risks and the associated capability gaps that would be best addressed by security-related technology, including consideration of the most recent quadrennial homeland security review; a set of security-related technology acquisition needs that is prioritized based on identified risk and associated capability gaps. In addition, the law also requires planned technology programs and projects with defined objectives, goals, timelines and

measures; an analysis of current and forecast trends in domestic and international passenger travel; an identification of currently deployed security-related technologies that are at or near the end of their lifecycles; an identification of test, evaluation, modeling and simulation capabilities, including target methodologies, rationales and timelines necessary to support the acquisition of security-related technologies that are expected to meet specific needs; an identification of opportunities for public-private partnerships, small and disadvantaged company participation, intragovernment collaboration, university centers of excellence and national laboratory technology transfer; and an identification of the administration's acquisition workforce needs for the management of planned security-related technology acquisitions, including consideration of leveraging acquisition expertise of other federal agencies. Further, the law requires an identification of the security resources, including information security resources, that will be required to protect security-related technology from physical or cyber theft, diversion, sabotage or attack; an identification of initiatives to streamline the Administration's acquisition process and provide greater predictability and clarity to small, medium and large businesses, including the timeline for testing and evaluation; an assessment of the impact to commercial aviation passengers; a strategy for consulting airport management, air carrier representatives, and federal security directors whenever an acquisition will lead to the removal of equipment at airports, and how the strategy for consulting with such officials of the relevant airports will address potential negative impacts on commercial passengers or airport operations; and, in consultation with the National Institutes of Standards and Technology, an identification of security-related technology interface standards, in existence or if implemented, that could promote more interoperable passenger, baggage and cargo screening systems.

Wang 15 Shocking TSA failures lead to agency shakeup 06/01/15 10:41 PM http://www.msnbc.com/msnbc/shocking-tsa-failures-lead-agency-shakeup By Joy Y. Wang – staff writer for Newsvine

President Obama nominated Coast Guard Vice Admiral Pete Neffenger to be the next administrator of the Transportation Security Administration. "I urge the Senate to confirm this nomination as quickly as possible," Homeland Security Secretary Johnson said in a statement Monday. The investigation at the nation's airports involved so-called "Red Teams" of undercover agents who posed as passengers. They concealed various fake contraband in an attempt to smuggle them through security checkpoints. At one point, an agent triggered an alarm and was patted down, but the TSA agent failed to find a fake explosive taped to the pesudo-terrorist's back. Undercover agents have conducted similar investigations during the past 13 years, and, in the past, they have been able to smuggle weapons through security screenings. What's remarkable in the most recent incident is the frequency with which they were able to bypass TSA security. "The numbers in these reports never look good out of context, but they are a critical element in the continual evolution of our aviation security," Homeland Security officials said in a statement. Carraway's reassignment is part of the larger response announced hours after the embarrassing report became public. Johnson went on to enumerate various ways in which the he has directed the TSA to reform, including revision of standard operating procedures, additional training of TSA officers, and the continuation of "random covert testing," among other actions. Some measures are reportedly already in place. "It's disturbing news. The question is how we can best mitigate that that vulnerability in a way that doesn't prohibit the free movement of people and goods," John Pistole, a former TSA administrator, told NBC News' Tom Costello. "That's just something that there's no perfect answer for."

Harding 15 July 21, 2015 6:30 am Robert Harding Rep. John Katko unveils bill to reform TSA's employee screening process at U.S. airports http://auburnpub.com/blogs/eye_on_ny/rep-john-katko-unveils-bill-to-reform-tsa-s-employee/article_0a90568a-2ee2-11e5-ae3b-8b6dd976a08c.html Robert Harding is an American businessman. He was the nominee for secretary of the Transportation Security Administration. Harding is a retired Major General.

Gaps in airline and airport employee screening has been a major focus of U.S. Rep. John Katko's work on the House Homeland Security Subcommittee on Transportation Security. And now, **he has introduced legislation** to address the issue. Katko, R-Camillus, unveiled the Airport Access Control Security Improvement Act Monday. The goal of the bill is to reform the Transportation Security Administration's screening process for airline and airport employees by requiring the agency to develop procedures for risk-based vetting and providing additional law enforcement

resources to screen employees. The measure also contains an **oversight plan** which will allow Congress to track airport and airline employee screening improvements. "As threats to our aviation sector continue to evolve, common sense reforms •— such as clearly differentiating between individuals authorized to have access to secure areas, and those who do not, or requiring criminal background checks that cover an extended history — will go a long way in ensuring safety at our airports," Katko said. The introduction of the bill comes after Katko has chaired hearings on potential security gaps in the screening process for employees at U.S. airports. The first hearing he led in February focused on a Delta Airlines employee's involvement in a gun smuggling operation and internal security procedures at airports. Following that hearing, Katko sponsored two bills — the TSA Office of Inspection Accountability Act and the Gerardo Hernandez Airport Security Act — to boost airport security. **Both measures were approved by the House in February**. The security issues were raised again in June when a report revealed that 73 aviation workers had potential ties to terrorism. The finding led to Katko and others calling on TSA to address vulnerabilities in the screening of airline and airport employees. Katko also introduced legislation, the Improved Vetting for Aviation Workers Act, that would bolster the TSA's ability to conduct criminal background checks of potential aviation employees and requires the Department of Homeland Security, TSA and the Interagency Policy Committee to develop best practices for expanding the employee vetting process. At a House Homeland Security Subcommittee on Transportation Security hearing in June, Katko wasn't pleased with TSA's response to the employee screening issues. Katko's latest action on aviation employee screening comes after authorities found a drug smuggling ring was operating out of Dallas/Fort Worth International Airport. Four people arrested for their alleged involvement in the operation worked at the airport or knew an employee at the airport who could bypass security. "This incident, along with others over the last few months, have highlighted concerning gaps in employee vetting and screening procedures," Katko said. "These vulnerabilities need to be addressed in order to safeguard the traveling public."

Global Airport Privatization Now

Airport privatization growing globally

Global Airport Privatization Wave Continues

The last few months have seen **a number of significant airport privatization developments**, with large-scale programs announced in Greece and Spain, and a number of privatized terminal projects announced in the Western Hemisphere.

The biggest news was Spain's mid-June announcement that it will sell to investors 49% of state-owned AENA Aeropuertos, which owns all of the country's 46 commercial airports and two heliports. The privatization will have two parts, with 28% of the shares offered to investors via an initial public offering and another 21% offered to strategic investors via a competitive bidding process. The sales are expected to take place by November. A new airport regulatory framework will also be established. AENA Aeropuertos, the world's largest airport group, has been estimated as having a market value of $21 billion.

The Greek government is doing something similar. Its Hellenic Republic Asset Development Fund announced that 37 state-owned regional airports will be privatized under 30-year concessions. Two packages of airports are being offered, each including seven core airports.

Inspiratia Infrastructure reported last month that HRADF is currently assessing binding bids, with the assistance of a team of technical and financial advisors that include Citigroup Global Markets and Lufthansa. Greece is also seeking bids to finance, develop, and operate a new $1 billion airport at Heraklion, with a bid deadline of November 11th

The French government last month announced that it will sell a 49.99% stake in state-owned Toulouse-Blagnac Airport in southwestern France. The national government owns 60% of the airport, with another 25% owned by the Toulouse Chamber of Commerce. There has been talk of similar privatizations of the Lyon and Nice airports.

The only negative privatization news I've seen from Europe was the decision by Slovenia's Prime Minister, shortly before the July 13th elections, to suspend privatization of 15 assets, including the country's international airport in Ljubljana. The plan had been to offer 75.5% of the airport, and expressions of interest were solicited back in March.

Three Western Hemisphere developments signal no waning of airport privatization on this side of the Atlantic. The Peruvian government has awarded a 40-year concession to the Kunter Wasi consortium to design, finance, build, and operate a replacement airport for tourist city Cuzco. The consortium is a joint venture of Argentina's Corporacion America and Andino Investment Holdings. The airport is expected to cost $538 million to build, on a greenfield site 29 km from Cuzco, the jumping-off point for tourists to the Inca ruins at Machu Picchu.

Mexico appears to be getting close to going forward with a $9.2 billion replacement for the country's largest airport, Benito Juarez serving Mexico City. The master plan developed by consulting firm Arup calls for four runways and one terminal with a capacity of 30 million annual passengers, to be completed by 2018. The ultimate plan would have six runways and two terminals, to accommodate 60 million passengers by mid-century. Given the huge cost of the airport, some form of privatization or public-private partnership arrangement is likely.

Finally, the Jamaican government is moving forward with a 30-year concession to modernize its second-largest airport, Norman Manley International, serving the capital city of Kingston. The privatization would follow the model used a decade ago to modernize Sangster International Airport in Montego Bay, the country's primary tourism airport. Submissions were due July 30th, with the goal of awarding the concession in 2015.

TSA is a key part of the US protection against terrorism – 9/11 happened b/c TSA didn't exist (fact, TSA was established November 19, 2001)

DHS (Department of Homeland Security), **6-29**-2015, "Preventing Terrorism and Enhancing Security," No Publication, http://www.dhs.gov/preventing-terrorism-and-enhancing-security

The Department of Homeland Security (DHS) and its many partners across the federal government, public and private sectors, and communities across the country and around the world have worked since 9/11 to build a new homeland security enterprise to better mitigate and defend against dynamic threats, minimize risks, and maximize the ability to respond and recover from attacks and disasters of all kinds. Together, these efforts have provided a strong foundation to protect communities from terrorism and other threats, while safeguarding the fundamental rights of all Americans. While threats persist, our nation is stronger than it was on 9/11, more prepared to confront evolving threats, and more resilient in the face of our continued challenges. Progress Made Since 9/11 Protecting the United States from terrorism is the founding mission of the Department of Homeland Security. While America is stronger and more resilient as a result of a strengthened homeland security enterprise, threats from terrorism persist and continue to evolve. Today's threats do not come from any one individual or group. They may originate in distant lands or local neighborhoods. They may be as simple as a home-made bomb or as sophisticated as a biological threat or coordinated cyber attack. More and more, state, local, and tribal law enforcement officers, as well as citizens, businesses, and communities are on the front lines of detection and prevention. Protecting the nation is a shared responsibility and everyone can contribute by staying informed and aware of the threats the country faces. Homeland security starts with hometown security—and we all have a role to play. Building the Homeland Security Enterprise Fusion Centers: DHS supports state and major urban area fusion centers through personnel, training, technical assistance, exercise support, security clearances, connectivity to federal systems, technology, and grant funding. Nationwide Suspicious Activity Reporting Initiative: An administration effort to train state and local law enforcement to recognize behaviors and indicators related to terrorism, crime and other threats; standardize how those observations are documented and analyzed; and enhance the sharing of those reports with law enforcement across the country. Grant Funding: Since fiscal year 2003, DHS has awarded more than $31 billion in preparedness grant funding based on risk to build and sustain targeted capabilities to prevent, protect against, respond to, and recover from threats or acts of terrorism. Preventing Terrorist Travel and Improving Passenger Screening Advance Passenger Information and Passenger Name Record Data: To identify high-risk travelers and facilitate legitimate travel, DHS requires airlines flying to the United States to provide Advance Passenger Information and Passenger Name Record (PNR) Data prior to departure. During 2008 and 2009, PNR helped the United States identify individuals with potential ties to terrorism in more than 3,000 cases, and in fiscal year 2010, approximately one quarter of those individuals denied entry to the United States for having ties to terrorism were initially identified through the analysis of PNR. Visa Security Program: Through the Visa Security Program (VSP), with concurrence from the Department of State, ICE deploys trained special agents overseas to high-risk visa activity posts in order to identify potential terrorist and criminal threats before they reach the United States. The VSP is currently deployed to 19 posts in 15 countries. Pre-Departure Vetting: DHS has strengthened its in-bound targeting operations to identify high-risk travelers who are likely to be inadmissible to the United States and to recommend to commercial carriers that those individuals not be permitted to board a commercial aircraft through its Pre-Departure program. Since 2010, CBP has identified over 2,800 passengers who would likely have been found inadmissible upon arrival to the United States. Secure Flight: Fulfilling a key 9/11 Commission recommendation, DHS fully implemented Secure Flight in 2010, in which TSA prescreens 100 percent of passengers on flights flying to, from, or within the United States against government watchlists before travelers receive their boarding passes. Prior to Secure Flight, airlines were responsible for checking passengers against watchlists. Through Secure Flight, TSA now vets over 14 million passengers weekly. Enhanced Explosives Screening: Prior to 9/11, limited federal security requirements existed for cargo or baggage screening. Today, TSA screens 100 percent of all checked and carry-on baggage for explosives. Through the Recovery Act and annual appropriations, TSA has accelerated the deployment of new technologies to detect the next generation of threats, including Advanced Imaging Technology units, Explosive Detection Systems, Explosives Trace Detection units, Advanced Technology X-Ray systems, and Bottled Liquid Scanners. Strengthening Surface Transportation Security Visible Intermodal Prevention and Response Teams: TSA has 25 multi-modal Visible Intermodal Prevention and Response (VIPR) Teams working in transportation sectors across the country to prevent or disrupt potential terrorist planning activities. Since the VIPR program was created in 2008, there have been over 17,700 operations performed. Baseline Surface Transportation Security Assessments: Since 2006, TSA has completed more than 190 Baseline Assessments for Security Enhancement for transit, which provides a comprehensive assessment of security programs in critical transit systems. Strengthening Global Supply Chain Security Air Cargo Screening: Fulfilling a requirement of the 9/11 Act, 100 percent of all cargo transported on passenger aircraft that depart U.S. airports is now screened commensurate with screening of passenger checked baggage and 100 percent of high risk cargo on international flights bound for the United States is screened. Container Security Initiative: The Container Security Initiative (CSI), currently operational in 58 foreign seaports in 32 countries, identifies and screens U.S.-bound maritime containers that pose a potential risk.

An airplane terror attack would cause a sudden recession – 9/11 proves

Nanto 05 (Dick K. Nanto, Specialist in Industry and Trade, "9/11 Terrorism: Global Economic Costs", 10/5/2005, CRS Report for Congress,

http://digital.library.unt.edu/ark:/67531/metacrs7725/m1/1/high_res_d/RS21937_2004Oct05.pdf, DJE)

Following the terrorist attacks, the already weak international economy was weakened further. The aftershocks of 9/11 were felt immediately in foreign equity markets, in tourism and travel, in consumer attitudes, and in temporary capital flight from the United States. Central banking authorities worldwide reacted by injecting liquidity into their financial systems. Still, the downturn in business conditions became more generalized and most of the world dropped into a synchronous recession — from 4.1% world economic growth in 2000 to 1.4% in 2001 (a growth rate of less than 2% for the world is considered to be recessionary). By late 2002, aggressive reflationary fiscal and monetary policy in the United States and a booming Chinese economy led the recovery. As shown in Figure 2, the 2001 recession turned into a weak economic recovery with world growth of 1.9% in 2002 and 2.7% in 2003 — still anemic when compared with the growth rate of 2.3% in 1998 during the worst of the Asian financial crisis. For 2004, the recovery picked up speed and its strength broadened with growth at 4%, even though by mid-2004, the world was hit with petroleum prices exceeding $40 per barrel of which $6 to $10 was a "security premium" caused primarily by instability and uncertainty in the Middle East. Still, in most markets, there appeared to be a general dissipation of geopolitical concerns and a steady decline in post-9/11 terrorism fears. How much did 9/11 bring down world growth rates? Prior to 9/11, a major econometric forecasting firm expected real GDP for the world (185 countries) to grow at 2.8% in 2001 and 3.1% in 2002. After 9/11, world GDP actually grew by 1.4% in 2001 and 1.9% in 2002. In the aftermath of 9/11, therefore, actual growth came in at approximately 1 percentage point below expectations. Not all of this, of course, can be attributed to 9/11, but a 1 percentage point decline in global GDP amounted to about $300 billion less in world production and income in 2002. Subsequent terrorist attacks also have affected economic growth abroad. An Australian study pointed out the negative macroeconomic consequences of terrorism for developing nations because of reduced trade, investments, and tourism. The 2002 Bali bombings reduced Indonesia's growth rate by an estimated 1 percentage point.

Economic decline causes war, multiple warrants and studies

Royal 10 (Jedediah, Director of Cooperative Threat Reduction at the U.S. Department of Defense, 2010, Economic Integration, Economic Signaling and the Problem of Economic Crises, in Economics of War and Peace: Economic, Legal and Political Perspectives, ed. Goldsmith and Brauer, p. 213-215)

Less intuitive is how **periods of economic decline may increase the likelihood of external conflict**. Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behaviour of interdependent stales. Research in this vein has been considered at systemic, dyadic and national levels. Several notable contributions follow. First, on the systemic level. **Pollins** (20081 **advances Modclski and Thompson's** (1996) **work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of a pre-eminent power and** the often **bloody transition** from one pre-eminent leader to the next. As such, **exogenous shocks such as economic crises could usher in a redistribution of relative power** (see also Gilpin. 19SJ) **that leads to uncertainty about power balances, increasing the risk of miscalculation** (Fcaron. 1995). Alternatively, **even a** relatively **certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power** (Werner. 1999). Separately. **Pollins** (1996) also **shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among** major, medium and small **powers**, although he suggests that the causes and connections between global economic

conditions and security conditions remain unknown. Second, on a dyadic level. **Copeland's** (1996. 2000) **theory of trade expectations suggests that 'future expectation of trade' is a significant variable in understanding** economic conditions and **security behaviour of states**. He argues that **interdependent states are likely to gain pacific benefits** from trade so long **as they have an optimistic view of future trade relations**. However, **if the expectations of future trade decline**, particularly for difficult to replace items such as energy resources, **the likelihood for conflict increases**, as **states will be inclined to use force to gain access to** those **resources. Crises could potentially be the trigger** for decreased trade expectations either on its own or **because it triggers protectionist moves** by interdependent states.4 Third, others have considered the link between economic decline and external armed conflict at a national level. **Mom berg and Hess** (2002) **find a strong correlation between internal conflict and external conflict, particularly during** periods of economic **downturn**. They write. The linkage, between internal and external conflict and prosperity are strong and mutually reinforcing. **Economic conflict lends to spawn internal conflict, which** in turn **returns the favour**. Moreover, the **presence of a recession tends to amplify** the extent to which international and **external conflicts** self-reinforce each other (Hlomhen? & Hess. 2(102. p. X9> **Economic decline has also been linked with an increase in the likelihood of terrorism** (Blombcrg. Hess. & Wee ra pan a, 2004). **which has the capacity to** spill across borders and **lead to external tensions**. Furthermore, **crises** generally **reduce the popularity of a sitting government**. "Diversionary theory" suggests that, **when facing unpopularity arising from economic decline**, sitting **governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect.** Wang (1996), DcRoucn (1995), and Blombcrg. Hess, and Thacker (2006) find supporting evidence showing that **economic decline and use of force are** at least indirecti) **correlated**. Gelpi (1997). Miller (1999). and Kisangani and Pickering (2009) suggest that **Ihe tendency towards diversionary tactics arc greater for democratic** states than autocratic states, due to the fact that **democratic leaders are** generally **more susceptible to being removed from office** due to lack of domestic support. **DeRouen** (2000) has **provided evidence showing that periods of weak economic performance in the United States,** and thus weak Presidential popularity, **are** statistically **linked to an increase in the use of force**. In summary, recent economic scholarship positively correlates economic integration with an increase in the frequency of economic crises, whereas **political science scholarship links economic decline with external conflict** al systemic, dyadic and national levels.' This implied connection between integration, crises and armed conflict has not featured prominently in the economic-security debate and deserves more attention.

Despite TSA misconduct, Dems still strongly support airport security- plan costs Obama his political capital

Maya **Rhodan**, 11-22-**2010**, "Partisan Divide Greets New Report on Airport Screener Misconduct," TIME, http://swampland.time.com/2013/08/03/partisan-divide-greets-new-report-on-airport-screener-misconduct/

Federal airport security screeners were investigated for misconduct 9,622 times from 2010 to 2012, after an array incidents, from screeners falling asleep on the job to letting relatives go around screening lines to inappropriately touching airplane passengers. Depending on whom you ask on Capitol Hill, this is either an alarming crisis or an expected footnote for a huge workforce with an enormous task. “These findings are especially hard to stomach since so many Americans today are sick of being groped, interrogated, and treated like criminals when passing through checkpoints,” said Republican Rep. Jeff Duncan of South Carolina, at a hearing on the Transportation Security Agency July 31. “If ‘Integrity’ is truly a core value, then, TSA, prove it.” “TSA employee misconduct is

on the rise — and this is intolerable," Democratic Rep. Ron Barber said in a statement to TIME. "TSA's first and foremost responsibility is to ensure the safety and security of travelers in a professional manner — and it is simply unacceptable to allow a single bag or a single person go unscreened." Some Democrats at the hearing, however, sided with the TSA officers, who many said were not to be judged by the actions of a few "bad apples." Bennie Thompson, a ranking Democratic member of the committee, from Mississippi said, "The vast majority of TSOs are hardworking, dedicated, diligent federal employees." The TSA employs about 56,000 security personnel who work at 450 airports across the country. In a July 30 report, the Government Accountability Office found there has been a 26 percent increase in cases of misconduct over the past three years. According to the report, the majority of the cases fell under two categories of misconduct, "attendance and leave" and "screening and security." Unexcused absences, tardiness, and failure to follow leave procedure accounted for 32 %, or 3,117, of the total misconduct cases. Failure to follow screening procedure, bypassing screening, and sleeping on duty made up 20 percent, or 1,936 total cases according to the report. In one instance in the report, an officer was seen neglecting to stop the conveyor belt after every piece of luggage to review the x-ray images of what's inside; in another an officer left his or her security checkpoint to assist a family member with a bag, a bag the officer later walked through the security checkpoint without screening and handed to the relative. The bag was found to have contained prohibited items, though the items are not specified in the GAO report. In a statement, David Cox, the president of the American Federation of Government Employees, the union that represents the TSA, said the report has misrepresented the conduct of TSA employees. "TSA critics on Capitol Hill seize every opportunity to give the agency and its dedicated workforce a black eye, even when the facts to not support their arm-waving displays of false outrage," Cox said in a statement. "They want to drag us back, as a nation, to the pre-9/11 practice of using poorly trained, minimum wage rent-a-cops to protect the flying public from terrorists." The agency has also tried to defend itself, blaming a handful of bad apples. "Every time we have one knucklehead that decides he's going to do something bad it tarnishes the image of our organization, TSA Deputy Administrator John Halinski said at the hearing. "I have my people on the line 365 days of the year and they know if they fail someone can die." Nearly half of the reported cases of misconduct resulted in letters of reprimand that describe the conduct and why it is subject to disciplinary action. Thirty-one percent resulted in definite suspension, and 17% led to termination, according to the GAO. The rest were subject to a multitude of outcomes, including indefinite suspension. "I think this report shows something very positive," says Rick Mathews, the director of the National Center for Security and Preparedness at the University at Albany. "It shows that the TSA is looking for these things and when people are doing wrong they're being punished." "The frequency of these actions is so low that it more than likely dissuades bad people from even trying to breach security," he added.

Elections

Curtailing TSA surveillance goes against the will of the public – they like it

Reed 12 (Ted Reed, journalist who covers the airline industry, "Surprise Gallup Poll: People Think TSA Does A Good Job", 8/9/2012, http://www.forbes.com/sites/tedreed/2012/08/09/surprise-gallup-poll-people-think-tsa-does-a-good-job/, DJE)

Surprisingly, despite all of the negative Internet commentary and Congressional complaining about the Transportation Security Administration, the majority of U.S. travelers have a positive opinion of the agency. Not only that, but people who fly, and who are exposed to TSA screening, have an even more positive opinion than people who rarely or never fly. According to a Gallup poll released Wednesday, 54% of Americans think the TSA is doing either an excellent or a good job of handling security screening at airports. Moreover, among Americans who have flown at least once in the past year, 57% have an excellent or good opinion of the agency. As far as TSA effectiveness at preventing acts of terrorism on U.S. airplanes, 41% think the screening procedures are extremely or very effective. Another 44% think the procedures are somewhat effective. That number varies little for people who fly somewhat regularly and people who rarely or never fly. The poll was conducted with telephone interviews July 9th through July 12. Gallup interviewed 1,014 adults living in all 50 states and the District of Columbia. Interestingly, younger Americans "have significantly more positive opinions of the TSA than those who are older," Gallup said, noting that 67% of people between 18 and 29 rate the agency as excellent or good. This may be because young people fly more frequently, or it may be because that for young

people TSA screening, first implemented in 2001, has been part of their flying experience for the majority of their lives. Criticism of the TSA seems to come primarily from two sources. One is Internet sites, where reporting standards are generally not at the same level as newspapers, where reporters are taught to consider what is told to them with skepticism and to seek responses to charges. On Wednesday, some sites were repeating charges by a man who said that his wife was admitted to the emergency room for treatment after TSA agents at Fort Lauderdale-Hollywood International Airport harassed her and subjected her to closed door screening after metal in her bra set off an alarm. The man said his wife was subject to a brutal rape three years ago and is still recovering from the psychological impact. Without denigrating the man or his wife in any way, it is possible to say that the TSA is put into a difficult situation when such charges are posted with little or no fact checking by reporters. As for Congress, the House Homeland Security Committee's Transportation Security Subcommittee recently convened a hearing on the topic: "Breach of Trust: Addressing Misconduct Among TSA Screeners." According to About.com, "It didn't take (committee chairman) Rep. Mike Rogers (R-Alabama) long to set the tone for the day, saying in his opening statement: "Stealing from checked luggage; accepting bribes from drug smugglers; sleeping or drinking while on duty — this kind of criminal behavior and negligence has contributed significantly to TSA's shattered public image." Now there is a poll to show that in fact, TSA does not have actually have a bad public image. And here, it is worth mentioning that the public image of Congress is not so good, perhaps reflecting a tendency to be excessively critical of perceived enemies rather than to seek compromise and solve problems.

Even more specifically, passing the plan favors private contractors that would replace the TSA – this promotes neolib market competition

Dan **Tracy**, 9-23-**2014**, "Sanford International Airport to replace TSA with private security," OrlandoSentinel, http://www.orlandosentinel.com/travel/os-tsa-sanford-privatize-20140923-story.html

Sanford International Airport to get private security. TSA going out, private contractor coming in. Private guards will take over security at Orlando Sanford International Airport early next year — a move U.S. Rep. John Mica and airport Director Larry Dale predict will result in more passenger-friendly service and shorter lines. But even with privatization, the people staffing the security checkpoints in Sanford most likely will be the same ones who are doing it now for the federal Transportation Security Administration. The main difference is they will be reporting to Trinity Technology Group, the Manassas, Va., company that just won a $24 million, 60-month contract to check passengers before they catch their flights in Sanford. The roughly 200 TSA officers now working at Sanford must be offered the first shot at Trinity positions, according to federal law. And Trinity is required to offer roughly equivalent wages and benefits. Mica, a Republican from Winter Park, and Dale maintain that Trinity — and other private-security companies, for that matter — will save money by having fewer managers as well as having more flexibility in firing poor performers. "I just believe private industry can do better than the government," said Dale, who predicted Trinity guards will be more courteous and attentive to passengers, and its management will be more flexible in scheduling workers to reduce lines during peak travel times. TSA spokeswoman Sari Koshetz would not comment on criticisms by Dale and Mica, saying only that the agency had five complaints and dozens of compliments last year from the more than 1.8 million passengers who went through Sanford. The switch, which includes a four-month transition that starts Oct. 1, comes more than four years after Dale started pushing to replace TSA. TSA's pre-check screening program -- in effect at 118 U.S. airports -- aims for speedy processing of select passengers who have paid a fee, been fingerprinted and undergone a computer security check. Trinity already provides security at smaller airports, such as Sioux Falls, S.D.; Santa Rosa, Calif.; and Tupelo, Miss., among others. The Sanford airport handles nearly 2 million passengers annually. Although long lines at security have rarely been a problem in Sanford, Dale has often complained that TSA was difficult to deal with and overly bureaucratic. With the change, the TSA will continue to oversee security at Sanford airport, but Trinity will run the day-to-day operations. Just like TSA, the

Trinity employees will confirm tickets belong to the correct travelers, as well as check passengers for contraband, such as explosives, and run the scanning machines. Trinity officials would not comment Tuesday to the Orlando Sentinel. TSA officers who do not sign on with Trinity can apply for other government positions or retire, Koshetz said. With the changeover, 19 airports nationally now have private security; the largest are San Francisco International, Kansas City International and Greater Rochester International in New York. In Florida, Key West International Airport has a private force, and Sarasota Bradenton International Airport is moving toward one. The board of Orlando International Airport, which 35 million travelers passed through last year, has been considering a switch to private security for 18 months. A 10-member panel was supposed to make a recommendation last fall but has yet to vote on a suggestion for the board. Orlando International spokeswoman Carolyn Fennell said, "They are still evaluating the information they have gathered." At Orlando, TSA made several changes to decrease the lines passengers face at the checkpoints after the review was started. As a result, travelers move through security more quickly than in years past, according to TSA statistics. TSA usually screens 50,000 travelers and 38,000 checked bags daily at the airport. TSA was created after the terrorists attacks of 9-11. Private security previously worked at airports. Leading the charge against TSA has been Mica, who helped draft the legislation that created the agency. He has been pushing Orlando International to fire TSA, too, arguing it is bloated and top-heavy with management. Mica also was instrumental in passing a law almost two years ago that made it easier for airports to opt out of TSA. He said he was "pleased" that Sanford was going private and hopes other airports, including Orlando, follow.

Race Advantage

Utilitarianism is good for policy makers – leads to the most benefits over harms

Manuel **Velasquez**,, 8-1-**2014**, "Calculating Consequences: The Utilitarian Approach to Ethics," Markkula Center For Applied Ethic, http://www.scu.edu/ethics/practicing/decision/calculating.html

Calculating Consequences: The Utilitarian Approach to Ethics Developed by Manuel Velasquez, Claire Andre, Thomas Shanks, S.J., and Michael J. Meyer Imagine that the U.S. Central Intelligence Agency gets wind of a plot to set off a dirty bomb in a major American city. Agents capture a suspect who, they believe, has information about where the bomb is planted. Is it permissible for them to torture the suspect into revealing the bomb's whereabouts? Can the dignity of one individual be violated in order to save many others? Greatest Balance of Goods Over Harms If you answered yes, you were probably using a form of moral reasoning called "utilitarianism." Stripped down to its essentials, utilitarianism is a moral principle that holds that the morally right course of action in any situation is the one that produces the greatest balance of benefits over harms for everyone affected. So long as a course of action produces maximum benefits for everyone, utilitarianism does not care whether the benefits are produced by lies, manipulation, or coercion. Many of us use this type of moral reasoning frequently in our daily decisions. When asked to explain why we feel we have a moral duty to perform some action, we often point to the good that will come from the action or the harm it will prevent. Business analysts, legislators, and scientists weigh daily the resulting benefits and harms of policies when deciding, for example, whether to invest resources in a certain public project, whether to approve a new drug, or whether to ban a certain pesticide. Utilitarianism offers a relatively straightforward method for deciding the morally right course of action for any particular situation we may find ourselves in. To discover what we ought to do in any situation, we first identify the various courses of action that we could perform. Second, we determine all of the foreseeable benefits and harms that would result from each course of action for everyone affected by the action. And third, we choose the course of action that provides the greatest benefits after the costs have been taken into account. The principle of utilitarianism can be traced to the writings of Jeremy Bentham, who lived in England during the eighteenth and nineteenth centuries. Bentham, a legal reformer, sought an objective basis that would provide a publicly acceptable norm for determining what kinds of laws England should enact. He believed that the most promising way of reaching such an agreement was to choose that policy that would bring about the greatest net benefits to society once the harms had been taken into account. His motto, a familiar one now, was "the greatest good for the greatest number." Over the years, the principle of utilitarianism has been expanded and refined so that today there are many variations of the principle. For example, Bentham defined benefits and harms in terms of pleasure and pain. John Stuart Mill, a great 19th century utilitarian figure, spoke of benefits and harms not in terms of pleasure and pain alone but in terms of the quality or intensity of such pleasure and pain. Today utilitarians often describe benefits and harms in terms of the satisfaction of personal preferences or in purely economic terms of monetary benefits over monetary costs. Utilitarians also differ in their views about the kind of question we ought to ask ourselves when making an ethical decision. Some utilitarians maintain that in making an ethical decision, we must ask ourselves: "What effect will my doing this act in this situation have on the general balance of good over evil?" If lying would produce the best consequences in a particular situation, we ought to lie. Others, known as rule utilitarians, claim that we must choose that act that conforms to the general rule that would have

the best consequences. In other words, we must ask ourselves: "What effect would everyone's doing this kind of action have on the general balance of good over evil?" So, for example, the rule "to always tell the truth" in general promotes the good of everyone and therefore should always be followed, even if in a certain situation lying would produce the best consequences. Despite such differences among utilitarians, however, most hold to the general principle that morality must depend on balancing the beneficial and harmful consequences of our conduct. - See more at: http://www.scu.edu/ethics/practicing/decision/calculating.html#sthash.7QghnbgB.dpuf

TURN, stopping the NSA means an alternative which involves even more federal surveillance and racial profiling elsewhere – those with Muslim backgrounds would be detained more than others

Josh **Gerstein**, 11-24-20**10**, "Alternative to TSA pat-downs: More background checks," POLITICO, http://www.politico.com/news/stories/1110/45559.html

If Americans don't want the government touching their "junk" to improve air security, the alternative may well be greater scrutiny of passengers' travel histories and personal backgrounds, security experts say. The public backlash against the aggressive pat-downs the federal government rolled out this month could put more pressure on the government to introduce security measures previously rejected on privacy grounds, including in-depth interrogations of travelers at airports, government scrutiny of passengers' airline information, and even creation of a secure, standardized national ID card. "The question is, which kind of privacy do you want to have?" said Stewart Baker, a top Department of Homeland Security official during the Bush administration. "This has been a pretty searing experience for DHS. Obviously, we're not going to do more in this area [of physical checks] and it would be welcome if we could do less….The alternative is to look for terrorists in advance." That approach to security, Baker said, calls for singling out suspicious passengers and subjecting them to intense questioning. "We're going to gather information about people we're going to encounter hours before they arrive. We'll compare names and travel partners to lists of people, not just no-fly lists, but anyone who's suspect one way or another," Baker said. "One hundred and ninety-nine people spend 30 seconds in primary [screening] getting an ID check and moved on, but one person in 200 gets an hour of screening, reviewing their personal effects, and an interrogation that's very free ranging." This kind of system might do away with some of the more jarring images at airport security checkpoints – uniformed Transportation Security Administration officers thoroughly frisking nuns and young children. "Grandma from Dubuque is probably not going to get identified as a risk," Baker said. "She spends 30 seconds and gets waved through." "With a little more information on all passengers, and more careful screening of those who raise red flags, the TSA shakedown of pregnant women, small children and nuns in habit could be made less necessary, or at least less intrusive," Shannen Coffin, a former legal counsel to Vice President Dick Cheney, wrote at National Review Online. While there have been complaints about other TSA security rules, including a requirement to remove shoes and strict limits on liquids and gels in carry-on luggage, no TSA procedure has generated as much blowback as the newly adopted procedures, including high-tech body scanners that can penetrate clothing and searches some passengers have compared to sexual molestation. The use of the scanners, which produce detailed images, produced some protest from privacy advocates and Muslim groups who object on modesty grounds. But those protests didn't receive as much attention as the more assertive pat-downs. Fran Townsend, who was one of Bush's security advisers, said the American psyche and culture views the laying on of hands by anyone in authority as far more serious invasion of privacy than investigating a passenger's background, submitting him or her to X-rays or searching their belongings. "We associate in this country, because of our Constitution, the physical touching of people by government or law enforcement as a thing we do only to criminals," Townsend said. "All of sudden grandma goes through and she's getting groped. She's resentful because it's not what she thinks of as her country…I think Americans want to be supportive of counterterror measures but they need to be persuaded that what is being asked of them is fair, reasonable and effective." Gauging public reaction to the pat-downs and body-scans has been tricky: An ABC News/Washington Post poll out Monday found roughly a 50-50 split on whether the pat-downs were a good idea, with about two-thirds supporting use of the body scanners. A USA Today/Gallup poll of Americans who travel at least twice a year found 71 percent thought use of the combined technology was "worth it," but 57 percent said they were either angry or bothered by the new pat-downs. The Obama administration's decision not to publicize the new pat-downs in advance may also have hurt support for the technology. Gallup found travelers nearly evenly split, 48 percent to 47 percent, on whether pat-downs would or would not help find potential terrorists like the Nigerian who allegedly boarded a Detroit-bound jetliner last Christmas Day and tried to detonate explosives hidden in his underwear. Some don't like to be touched, but others are troubled by the idea of a security officer in a separate room examining an image of their body. Others don't mind those intrusions, but draw the line at authorities scrutinizing their travel history, travel partners or interrogating them about where they're going and why. In 2003, privacy advocates, fearing "big brother" intrusions, convinced Congress to block TSA access to itineraries and related information on domestic air travelers, though the government does review information for international

flights. A new version of the domestic program gives TSA more limited information, including the names, birth dates and gender information of passengers. One terrorism expert said the public reaction to the new pat-downs is not surprising, but privacy advocates cannot fairly object to every technique that could be used to improve air security. "If you walk up to somebody in your office and do [a pat-down], you will be arrested. There's something peculiar about lots of people lining up to be sexually assaulted," noted Ben Wittes of the Brookings Institution. However, "you can't take the position that there should be no profiling, no intrusive searches, and it's ridiculous to treat old ladies the same as young men. Those three ideas will not go together," Wittes said. "At some point, you have to make honest choices about what kind of intrusions you're more or less worried about, or you have to be open and honest about saying, 'I'm willing to lose this number of airplanes a year.'…This does have a quality about it of people flatly refusing to make serious choices." Wittes also said the overall judgment on what privacy invasions are acceptable have to be made by society and not individual travelers. Otherwise, terrorists will "choose the one most conducive to they're getting through," he said. Chris Calabrese of the American Civil Liberties Union said his group supports traditional police work to keep planes safe. "What we've never said no to is focusing on individual criminals and individual dangers, going back to good old-fashioned law-enforcement techniques to arrest [suspects] before they even get to the airport," he said. The ACLU and other groups objected to the collection of airline itinerary information because it amounted to assembling a vast database on lawful unthreatening travelers in what would likely be an unsuccessful effort to find a few suspected terrorists intent on doing harm. "A lot of our concern was around mass surveillance – this idea that if you collect all this information on everybody and apply some computer algorithm to it, data mine it, and suddenly signs of a terrorist are going to pop out," Calabrese said. "There's no science to back that up." He added that grand jury subpoenas are available to seek itinerary data on suspects in legitimate criminal investigations. The ACLU, which had for decades opposed all airport security checkpoints as unconstitutional suspicionless searches, dropped that stance after September 11, Calabrese said. The new battle over pat-downs and scans has allied some conservatives and civil libertarians – up to a point. "The federal fondling is an unconstitutional search and seizure…. We have lost a level of our freedom in order to retain a level of our freedom and that ought to outrage every American whether you fly on an airplane or not," former Gov. Mike Huckabee (R-Ark.) told Fox News Tuesday. "Do we really think that we're going to be safer because a 5-year-old boy has his genitals looked at?" However, conservatives are again calling for profiling as an alternative to the enhanced checks. "What we've got to do, whether we like it or not, is to discern who is likely to be a person with an intent," Huckabee said. "We'd profile everybody but we would quit selling or buying machines." But Calabrese and others warn that an identity-based system that relies on racial or religious profiles would be ineffective and violate travelers' rights. "Terrorists are smart," he said. "They identify and work around the profiling,". Moving to a system that looks more at travelers' backgrounds and less at what they may be wearing or carrying would also require another important change: greater certainty that a passenger actually is whom he or she claims to be. Baker noted that Congress's effort to move to a more secure system based on state-issued driver's licenses, Real ID, was repeatedly rolled back by Congress and the Bush and Obama administrations. "As long as it's possible to get a fake driver's license, an identity-based security system doesn't work," he said.

The TSA would just be replaced with private security which insulates the government from accountability

Thompson 10 (Mark Thompson, writer, "Profiling, Political Correctness, and Airport Security", 11/29/2010, Ordinary Times, http://ordinary-gentlemen.com/blog/2010/11/29/profiling-political-correctness-and-airport-security/, DJE)

I must take issue with Erik's recent post on airport security in which he argued for abolishing the TSA, replacing it with privatized airport security, and adopting an Israeli "profiling" approach to airport security. With regards to Erik's points regarding privatization, I must say that I largely agree with mistermix's response at Balloon Juice. Erik capably answers a number of those objections in a follow-up post here, although I think he still falls short, particularly since he seems to acknowledge that privatized security firms would still primarily be contractors of the airports, which are typically government or quasi-government entities unto themselves (and which, due to their nature, are typically even more immune to democratic accountability than other government entities). That fact is, I think, fatal to his argument since under his proposed regime, the ultimate "customer" of the contractors is a government entity rather than travellers and taxpayers. One of these contractors' primary functions would thus be to further insulate the hiring government entity from accountability. This goes to one of my longtime hobby horses: the benefits of the private sector are destroyed when (typically due to some form of government intervention) the customer and the consumer are two distinctly different entities. But I wanted to focus more on Erik's argument for Israeli-style profiling, which he suggests is unrealistic in the US because

"political correctness will not protect us from being groped, but it will protect us from being profiled.." My issue is not so much with the concept of Israeli-style profiling as it is with the concept that political correctness is the primary obstacle to its implementation, which suggests race, ethnicity, or religion should be a major factor in a profiling regime. Erik has quite rightly gotten some pushback against the notion of profiling based on such factors; as Greg Sargent has correctly noted, such sentiments mean that "it's not really accurate to say that the new conservative anthem is 'don't touch my junk.' It's more like, 'touch his junk.' That doesn't seem very libertarian."

Three alt causes to racial profiling

1. Muslim profiling

Madiha **Shahabuddin**. **2/16**/2015. "The More Muslim You Are, the More Trouble You Can Be": 1 How Government Surveillance of Muslim Americans2 Violates First Amendment Rights." http://www.chapmanlawreview.com/wp-content/uploads/2014/09/Shahabuddin.pdf (really long book analysis).

And in July 2014, it was revealed that the U.S. National Security Agency (NSA) had—at the minimum—spied on five "politically active" Muslim American leaders, including a past Bush administration official, a successful attorney, a Rutgers professor, a former California State University professor, and an executive director of the Council on American-Islamic Relations (CAIR).46 At the root of these investigations is the tool of profiling, which allows the NYPD, FBI, or other governmental entity to target certain groups of individuals solely based upon their religious affiliation and pursue an almost carte blanche "fishing expedition" for evidence condemning the targeted Muslim of some link to terrorist activity.47 Justification for this treatment of Muslim American communities has come from the idea that the post-9/11 era calls for "urgent" action to thwart mass destruction that can come from a potential terror attack, and therefore—as the argument goes—constitutional infringements like this are a "small price to pay for [America's] safety." 48

2. Mosque surveillance

Center for Constitutional Rights, 7-7-20**14**, "Suspicionless Surveillance of Muslim Communities and the Increased Use and Abuse of Muslim Informants" Center for Constitutional Rights, http://www.ccrjustice.org/sites/default/files/assets/files/CCR_CERD_ShadowReport_Surveillance-20140708.pdf. Page 3.

Since 9/11, the Federal Bureau of Investigation (FBI) has greatly expanded the use of informants who, at the FBI's behest, infiltrate communities and spy on the activities of millions of law-abiding Americans. In 2008, the FBI disclosed that it had 15,000 informants on its payroll, the most the agency has ever had in history.13 The FBI has targeted Arab, Muslim, and South Asian communities for surveillance and investigation by informants.14 A vast number of the FBI's informants are recruited to infiltrate mosques, businesses, and organizations within those communities and to report back on the activities of innocent individuals.15 The FBI frequently asks informants to monitor activities within the community without any reasonable suspicion that there is criminal activity afoot – a practice that is sanctioned by FBI guidelines.16 The FBI aggressively targets men of Arab, Muslim, and South Asian descent and attempts to get them to become informants against their own communities. Although a spokesperson for the FBI has stated that its agents are prohibited from using threats or coercion to recruit informants, 17 the

Attorney General's guidelines regarding the use of confidential informants do not explicitly ban this practice.18 Many individuals have publicly recounted how FBI agents threatened them with baseless terrorism charges or deportation in an attempt to coerce them into becoming informants, or have brought charges against them in retaliation for their refusal to work as informants.19 Organizations that engage in outreach and provide legal services to individuals within Arab, Muslim, and South Asian communities have also reported to us that the FBI's practice of using intimidation tactics to recruit informants among Muslim men is widespread.

3. War on terror overseas

Zia **Ahmad**, 10-1-**2014**, "War on terror overseas leading to widespread Islamophobia at home," Australasian Muslim Times, http://www.amust.com.au/2014/10/war-on-terror-overseas-leading-to-widespread-islamophobia-at-home/

War on terror overseas leading to widespread Islamophobia at home. With the so called war on terror ramping up in the Middle East, and in the wake of the widespread police raids on Muslim homes in Sydney and Brisbane last month and in Melbourne this week, community tensions seem to be on the boil. Community leaders have warned that the alarming headlines and beat up stories in the media and vilification of Muslims by radio shock jocks and on social media is creating an atmosphere of fear and hatred in the Australian society that may lead to violence and rioting on our suburban streets. There have been a number of Islamophobic attacks directed specially on Muslim women who are easily identifiable with their Islamic dress code. Since the launching of the Islamophobia Register Australia, a large number of reports have been received ranging from verbal abuse, to threats and attacks oIDL threat imagen property as well as assaults on persons. An anonymous threat letter was issued purportedly by Australian Defence League threatening the bombing of the Lakemba Mosque, the Auburn Mosque and the Grand Mufti of Australia. Since the incident of stabbing of two Victorian police officers and death of the assailant, Victorian police have revealed a rise in unreported attacks on Muslim women. The NSW Police Force has urged the community to report all attacks, no matter how minor or trivial, to the police and has warned that it will not tolerate targeting of individuals on identifiable characteristics including race, religion, ethnicity etc. On 25 September a 21 year old man was arrested and charged after walking into Al-Faisal College in Minto armed with a knife asking if it was a "Muslim School." On 26 September a 66 year old man was arrested in Logan, South of Brisbane and charged for verbally assaulting a Muslim women wearing a niqab telling her "you are a Muslim, go back to your country." To date there are three reports of Mosques being vandalised in Queensland, the Mareeba Mosque spray painted with anti-Muslim slogans, Logan Mosque in Kingston dumped with anti-Muslim flyers and Holland Park Mosque in Brisbane dumped with a dead pig head. There have been attacks on mistaken identity as well. On 25 September, a young man with a beard, not a Muslim, was allegedly abused and threatened with beheading by a carload of Anti-Muslim teens at traffic lights on a Gold Coast Street. There have also been reports of false attacks. A 41 year old naval officer claimed last week that he was assaulted by two Middle Eastern men outside his Bella Visa home, but the police deemed the report to be false. Islamophobia Register Australia has been launched to help capture all incidents of Islamophobia and anti-Muslim sentiments in Australia. Submit a report (all information submitted will be kept strictly confidential) via the Islamic Register Australia Facebook page by sending a private message: www.fb.com/islamophobiaregisteraustralia or email islamophobiaregister@gmail.com . The register classifies Islamophobia incidents into the following groups: Assaults or attacks on persons of Muslim background. Attacks on Muslim property or institutions. Verbal abuse and hate speech/social media abuse. Unwarranted harassment or interrogation at airports by authorities. Any form of discrimination in a public or private environment.

Trans Advantage

TSA changes are an improvement for transgendered travelers

Ford 13 (Zack Ford, editor of ThinkProgress LGBT at the Center for American Progress Action Fund, "Victory For Transgender Privacy: TSA Abandons 'Nude' Body Scanners", 1/18/2015, Think Progress, http://thinkprogress.org/lgbt/2013/01/18/1471481/victory-for-transgender-privacy-tsa-abandons-nude-body-scanners/, DJE)

In what is an important victory for the transgender community, the U.S. Transportation Security Administration has announced it will remove all body scanners that show nearly nude images from airports. The TSA had already removed 76 of the machines and will now remove the remaining 174, though they may still be used in other government offices where privacy is not a concern like it is in airports. Congress had set a deadline for OSI Systems to develop software for

the scanners to produce generic passenger images instead of the the nearly nude images, but the company was unable to meet the timeline. Scanners produced by other companies that have managed to adjust the software will continue to be used. The invasion of privacy caused by the machine was particularly invasive for transgender people, who were considered suspicious if their genitalia did not match their presentation. Even the software change utilized by the remaining body scanners, which are manufactured by L-3, use "blue" and "pink" indicators for gender that can still cause confusion (and thus concern) for trans passengers. As a result, they can be disproportionately selected for invasive pat downs. The TSA is planning to expand its PreCheck program, in which passengers share more personal data before arriving at the airport but can then go through metal detectors instead of body scanners.

The aff does nothing against surveillance at border checkpoints. This is an alt cause – their evidence

Redden 13

Stephanie M., Carleton University, Canada and London School of Economics and Political Science, UK, 6-1-2013, "The End Of The Line Feminist Understandings Of Resistance To Full-Body Scanning Technology," International Feminist Journal Of Politics Issn: 1461-6742 Date: 06/2013 Volume: 15 Issue: 2 Page: 234-253 //MV

Magnet and Rodgers (2011: 1; see also Johnson 2006: 6) also make clear that it is essential to consider how this technology not only differently affects women, but also how other 'marginalized subjects' are affected. They note that: ... transgender individuals, people with disabilities, and those with particular religious affiliations are rendered newly or differently legible. As such, their application to airport security generates new implications for who are allowed to move through, and who are afforded justice within, contemporary cultural and transnational spaces. (Magnet and Rodgers 2011: 7) This differentiated legibility of bodies is **nowhere more visible** than in the interactions between gender and identity at border security points. As Currah and Mulqueen (2011: 559) have recently highlighted, the classification of individuals by the State according to gender metrics produces less certainty for queer, transgender and other bodies whose realities do not map onto the State's dichotomous understandings of gender, as 'securitizing gender does not necessarily secure identity, and may indeed destabilize it'. The intense gender-based interrogations and pat downs that these individuals often undergo as their bodies are seen as threatening suggest the deeply problematic and essentializing nature of full-body scanner technologies and other security practices, whereby a clear gender marker is understood to be a sign of positive identification. Shepherd and Sjoberg (2012: 15) importantly argue that 'both the introduction of WBI scanners in airports and the ways in which this technology has been linked to trans- bodies are forms of discursive violence'. They explain that with the use of these scanners: the visibility of trans- bodies has become both pronounced and contested, arguing that this is in itself a form of discursive violence and, further, that such strategies are productive of cisprivilege, which functions to position trans- bodies as different, deviant and dangerous and simultaneously as vulnerable and in need of protection. (Shepherd and Sjoberg 2012: 13)

Even after the plan, the largest alt cause to transphobia still remains – religion

Cruz 15 (Eliel Cruz, writer on religious topics, "The church's devaluation of trans lives is violence", 4/7/2015, Religion News Service,http://elielcruz.religionnews.com/2015/04/07/churchs-devaluation-trans-lives-violence/, DJE)

Some Christians' talk on the transgender community has been nothing short of ugly. Everyone's favorite Pope has likened the trans community to nuclear weapons. The Bible Research Institute of the Seventh-day Adventist Church called trans identities a "sophisticated form of homosexuality." And Southern Baptists have chimed in with "stern but necessary critique" on "trangenderism." These remarks only serve to dehumanize the trans community and fear monger Christians into mobilizing against them. The majority of the disagreements are against proper pronoun and restroom usage. (It seems to the extent that LGB individuals are seen as sex acts, trans persons are seen as genitals.) But while Christians have been busy debating on whether or not trans persons should be allowed to gender appropriate restrooms, trans people have been dying. A staggering nine trans persons (most of them trans women of color) have been murdered in the United States and Canada just in 2015. Those are just the ones recorded, as many trans individuals get misgendered (wrongly ID'd as the sex assigned at birth) and many more go unreported. Then there are suicides. 41% of trans adults say they've attempted suicide in their lifetime, according to a study by the Williams Institute. Also, 57% of trans youth have reported to have attempted suicide when coming from rejecting families. Many report high levels of depression and other mental health issues. The stress of gender dysphoria (having dissociation with your body) is only increased when having to deal with workplace and societal discrimination and harassment. This harassment is rooted in the dehumanization and devaluing of trans lives. Christians need to end, not add to, this ugly story, a narrative that goes against the Jesus Story. Perhaps one of the most perplexing things Jesus did while on earth was continually surround Himself with those society marginalized. Every person is created in the image of God and as such should be revered as a creation of our almighty God. Undoubtedly, given His track record, Jesus would welcome in trans persons — He would house them, feed them, wash their feet. How can we defend our anti-trans actions when looking at the Jesus story? Just last month, a debate over bathrooms in North Carolina reached embarrassing heights. Reverend Flip Benham and a group of "Christians" stood outside a women's restroom attempting to deny entrance to trans women, Raw Story reported. The uproar was over a nondiscrimination ordinance North Carolina proposed, and eventually voted against, that would have allowed transgender people to use gender appropriate restrooms. During the protests, Benham called one 17 year old trans girl "a pervert and a punk" when she attempted to use the restroom. How is this reflective of the Gospel? What this shows to the rest of the world is how completely out of depth many Christians are with gender and sexuality conversations. This bathroom panic is completely unfounded. Experts have thoroughly debunked the biggest myths perpetuated about the trans community — including that non trans people are in danger with trans persons when using the same restroom. There has been not been a single reported case of that happening. In contrast, there have been countless cases of harassment of trans persons for using the restroom. So, when Christians demean trans people, prohibiting them from basic rights, they are actively contributing to the harassment trans people face. It's cause and effect. If we truly cared about the danger the trans community faces, we wouldn't be dehumanizing them. Instead, we would act like Jesus and invite trans people in. We would educate ourselves to the issues surrounding the trans community, and actively work to end disparities such as trans violence and homelessness. As it stands, we Christians have not been known to speak out. We have been known as those who have stayed silent to the violence and dehumanization trans people face. We've rallied a mob and have harassed and shunned children made in the image of God. And as a result, trans people have died. We must step up for our trans brothers and sisters. They can't wait any longer.

The aff's criticism of the TSA fails to understand workers as humans and replicates the same injury that they criticize

Buchanan 10 (Matt Buchanan, columnist, "How TSA Agents Really Feel About Touching Your Balls", 11/22/2010, Gizmodo, http://gizmodo.com/5696210/how-tsa-agents-really-feel-about-groping-you, DJE)

Burning hatred for the TSA is easy populism. And they keep making it easier. But how do the men and women of the TSA really feel about what they have to do? Seventeen of them speak their mind. Here's a few of the comments agents told Flying With Fish. One says: "It is not comfortable to come to work knowing full well that my hands will be feeling another man's private parts, their butt, their inner thigh. Even worse is having to try and feel inside the flab rolls of obese passengers and we seem to get a lot of obese passengers!" And another, from a veteran now working at the TSA: "I served a tour in Afghanistan followed by a tour in Iraq. I have been hardened by war and in the past week I am slowly being broken by the constant diatribe of hateful comments being lobbed at me. While many just see a uniform with gloves feeling them for concealed items I am a person, I am a person who has feelings. I am a person who has served this country. I am a person who wants to continue serving his country. The constant run of hateful comments while I perform my job will break me down faster and harder than anything I encountered while in combat in the Army." Race Advantage

The TSA would just be replaced with private security and insulate the government from accountability

Thompson 10 (Mark Thompson, writer, "Profiling, Political Correctness, and Airport Security", 11/29/2010, Ordinary Times, http://ordinary-gentlemen.com/blog/2010/11/29/profiling-political-correctness-and-airport-security/, DJE)

I must take issue with Erik's recent post on airport security in which he argued for abolishing the TSA, replacing it with privatized airport security, and adopting an Israeli "profiling" approach to airport security. With regards to Erik's points regarding privatization, I must say that I largely agree with mistermix's response at Balloon Juice. Erik capably answers a number of those objections in a follow-up post here, although I think he still falls short, particularly since he seems to acknowledge that privatized security firms would still primarily be contractors of the airports, which are typically government or quasi-government entities unto themselves (and which, due to their nature, are typically even more immune to democratic accountability than other government entities). That fact is, I think, fatal to his argument since under his proposed regime, the ultimate "customer" of the contractors is a government entity rather than travellers and taxpayers. One of these contractors' primary functions would thus be to further insulate the hiring government entity from accountability. This goes to one of my longtime hobby horses: the benefits of the private sector are destroyed when (typically due to some form of government intervention) the customer and the consumer are two distinctly different entities. But I wanted to focus more on Erik's argument for Israeli-style profiling, which he suggests is unrealistic in the US because "political correctness will not protect us from being groped, but it will protect us from being profiled.." My issue is not so much with the concept of Israeli-style profiling as it is with the concept that political correctness is the primary obstacle to its implementation, which suggests race, ethnicity, or religion should be a major factor in a profiling regime. Erik has quite rightly gotten some pushback against the notion of profiling based on such factors; as Greg Sargent has correctly noted, such sentiments mean that "it's not really accurate to say that the new conservative anthem is 'don't touch my junk.' It's more like, 'touch his junk.' That doesn't seem very libertarian."

Utilitarianism is good for policy makers – leads to the most benefits over harms

Manuel **Velasquez**,, 8-1-**2014**, "Calculating Consequences: The Utilitarian Approach to Ethics," Markkula Center For Applied Ethic, http://www.scu.edu/ethics/practicing/decision/calculating.html

Calculating Consequences: The Utilitarian Approach to Ethics Developed by Manuel Velasquez, Claire Andre, Thomas Shanks, S.J., and Michael J. Meyer Imagine that the U.S. Central Intelligence Agency gets wind of a plot to set off a dirty bomb in a major American city. Agents capture a suspect who, they believe, has information about where the bomb is planted. Is it permissible for them to torture the suspect into revealing the bomb's whereabouts? Can the dignity of one individual be violated in order to save many others? Greatest Balance of Goods Over Harms If you answered yes, you were probably using a form of moral reasoning called "utilitarianism." Stripped down to its essentials, utilitarianism is a moral principle that holds that the morally right course of action in any situation is the one that produces the greatest balance of benefits over harms for everyone affected. So long as a course of action produces maximum benefits for everyone, utilitarianism does not care whether the benefits are produced by lies, manipulation, or coercion. Many of us use this type of moral reasoning

frequently in our daily decisions. When asked to explain why we feel we have a moral duty to perform some action, we often point to the good that will come from the action or the harm it will prevent. Business analysts, legislators, and scientists weigh daily the resulting benefits and harms of policies when deciding, for example, whether to invest resources in a certain public project, whether to approve a new drug, or whether to ban a certain pesticide. Utilitarianism offers a relatively straightforward method for deciding the morally right course of action for any particular situation we may find ourselves in. To discover what we ought to do in any situation, we first identify the various courses of action that we could perform. Second, we determine all of the foreseeable benefits and harms that would result from each course of action for everyone affected by the action. And third, we choose the course of action that provides the greatest benefits after the costs have been taken into account. The principle of utilitarianism can be traced to the writings of Jeremy Bentham, who lived in England during the eighteenth and nineteenth centuries. Bentham, a legal reformer, sought an objective basis that would provide a publicly acceptable norm for determining what kinds of laws England should enact. He believed that the most promising way of reaching such an agreement was to choose that policy that would bring about the greatest net benefits to society once the harms had been taken into account. His motto, a familiar one now, was "the greatest good for the greatest number." Over the years, the principle of utilitarianism has been expanded and refined so that today there are many variations of the principle. For example, Bentham defined benefits and harms in terms of pleasure and pain. John Stuart Mill, a great 19th century utilitarian figure, spoke of benefits and harms not in terms of pleasure and pain alone but in terms of the quality or intensity of such pleasure and pain. Today utilitarians often describe benefits and harms in terms of the satisfaction of personal preferences or in purely economic terms of monetary benefits over monetary costs. Utilitarians also differ in their views about the kind of question we ought to ask ourselves when making an ethical decision. Some utilitarians maintain that in making an ethical decision, we must ask ourselves: "What effect will my doing this act in this situation have on the general balance of good over evil?" If lying would produce the best consequences in a particular situation, we ought to lie. Others, known as rule utilitarians, claim that we must choose that act that conforms to the general rule that would have the best consequences. In other words, we must ask ourselves: "What effect would everyone's doing this kind of action have on the general balance of good over evil?" So, for example, the rule "to always tell the truth" in general promotes the good of everyone and therefore should always be followed, even if in a certain situation lying would produce the best consequences. Despite such differences among utilitarians, however, most hold to the general principle that morality must depend on balancing the beneficial and harmful consequences of our conduct. - See more at: http://www.scu.edu/ethics/practicing/decision/calculating.html#sthash.7QghnbgB.dpuf

3 Alt Causes to profiling

1. Muslim profiling

Madiha **Shahabuddin**. **2/16**/2015. "The More Muslim You Are, the More Trouble You Can Be": 1 How Government Surveillance of Muslim Americans2 Violates First Amendment Rights." http://www.chapmanlawreview.com/wp-content/uploads/2014/09/Shahabuddin.pdf (really long book analysis).

And in July 2014, it was revealed that the U.S. National Security Agency (NSA) had—at the minimum—spied on five "politically active" Muslim American leaders, including a past Bush administration official, a successful attorney, a Rutgers professor, a former California State University professor, and an executive director of the Council on American-Islamic Relations (CAIR).46 At the root of these investigations is the tool of profiling, which allows the NYPD, FBI, or other governmental entity to target certain groups of individuals solely based upon their religious affiliation and pursue an almost carte blanche "fishing expedition" for evidence condemning the targeted Muslim of some link to terrorist activity.47 Justification for this treatment of Muslim American communities has come from the idea that the post-9/11 era calls for "urgent" action to thwart mass destruction that can come from a potential terror attack, and therefore—as the argument goes—constitutional infringements like this are a "small price to pay for [America's] safety." 48

2. Mosque surveillance

Center for Constitutional Rights, 7-7-20**14**, "Suspicionless Surveillance of Muslim Communities and the Increased Use and Abuse of Muslim Informants" Center for Constitutional Rights,

Since 9/11, the Federal Bureau of Investigation (FBI) has greatly expanded the use of informants who, at the FBI's behest, infiltrate communities and spy on the activities of millions of law-abiding Americans. In 2008, the FBI disclosed that it had 15,000 informants on its payroll, the most the agency has ever had in history.13 The FBI has targeted Arab, Muslim, and South Asian communities for surveillance and investigation by informants.14 A vast number of the FBI's informants are recruited to infiltrate mosques, businesses, and organizations within those communities and to report back on the activities of innocent individuals.15 The FBI frequently asks informants to monitor activities within the community without any reasonable suspicion that there is criminal activity afoot – a practice that is sanctioned by FBI guidelines.16 The FBI aggressively targets men of Arab, Muslim, and South Asian descent and attempts to get them to become informants against their own communities. Although a spokesperson for the FBI has stated that its agents are prohibited from using threats or coercion to recruit informants, 17 the Attorney General's guidelines regarding the use of confidential informants do not explicitly ban this practice.18 Many individuals have publicly recounted how FBI agents threatened them with baseless terrorism charges or deportation in an attempt to coerce them into becoming informants, or have brought charges against them in retaliation for their refusal to work as informants.19 Organizations that engage in outreach and provide legal services to individuals within Arab, Muslim, and South Asian communities have also reported to us that the FBI's practice of using intimidation tactics to recruit informants among Muslim men is widespread.

1. War on terror overseas

Zia **Ahmad**, 10-1-**2014**, "War on terror overseas leading to widespread Islamophobia at home," Australasian Muslim Times, http://www.amust.com.au/2014/10/war-on-terror-overseas-leading-to-widespread-islamophobia-at-home/

War on terror overseas leading to widespread Islamophobia at home. With the so called war on terror ramping up in the Middle East, and in the wake of the widespread police raids on Muslim homes in Sydney and Brisbane last month and in Melbourne this week, community tensions seem to be on the boil. Community leaders have warned that the alarming headlines and beat up stories in the media and vilification of Muslims by radio shock jocks and on social media is creating an atmosphere of fear and hatred in the Australian society that may lead to violence and rioting on our suburban streets. There have been a number of Islamophobic attacks directed specially on Muslim women who are easily identifiable with their Islamic dress code. Since the launching of the Islamophobia Register Australia, a large number of reports have been received ranging from verbal abuse, to threats and attacks oIDL threat imagen property as well as assaults on persons. An anonymous threat letter was issued purportedly by Australian Defence League threatening the bombing of the Lakemba Mosque, the Auburn Mosque and the Grand Mufti of Australia. Since the incident of stabbing of two Victorian police officers and death of the assailant, Victorian police have revealed a rise in unreported attacks on Muslim women. The NSW Police Force has urged the community to report all attacks, no matter how minor or trivial, to the police and has warned that it will not tolerate targeting of individuals on identifiable characteristics including race, religion, ethnicity etc. On 25 September a 21 year old man was arrested and charged after walking into Al-Faisal College in Minto armed with a knife asking if it was a "Muslim School." On 26 September a 66 year old man was arrested in Logan, South of Brisbane and charged for verbally assaulting a Muslim women wearing a niqab telling her "you are a Muslim, go back to your country." To date there are three reports of Mosques being vandalised in Queensland, the Mareeba Mosque spray painted with anti-Muslim slogans, Logan Mosque in Kingston dumped with anti-Muslim flyers and Holland Park Mosque in Brisbane dumped with a dead pig head. There have been attacks on mistaken identity as well. On 25 September, a young man with a beard, not a Muslim, was allegedly abused and threatened with beheading by a carload of Anti-Muslim teens at traffic lights on a Gold Coast Street. There have also been reports of false attacks. A 41 year old naval officer claimed last week that he was assaulted by two Middle Eastern men outside his Bella Visa home, but the police deemed the report to be false. Islamophobia Register Australia has been launched to help capture all incidents of Islamophobia and anti-Muslim sentiments in Australia. Submit a report (all information submitted will be kept strictly confidential) via the Islamic Register Australia Facebook page by sending a private message: www.fb.com/islamophobiaregisteraustralia or email islamophobiaregister@gmail.com . The register classifies Islamophobia incidents into the following groups: Assaults or attacks on persons of Muslim background. Attacks on Muslim property or institutions. Verbal abuse and hate speech/social media abuse. Unwarranted harassment or interrogation at airports by authorities. Any form of discrimination in a public or private environment.

Trans Advantage

Even after the plan, the largest alt cause to transphobia still remains – religion

Cruz 15 (Eliel Cruz, writer on religious topics, "The church's devaluation of trans lives is violence", 4/7/2015, Religion News Service,http://elielcruz.religionnews.com/2015/04/07/churchs-devaluation-trans-lives-violence/, DJE)

Some Christians' talk on the transgender community has been nothing short of ugly. Everyone's favorite Pope has likened the trans community to nuclear weapons. The Bible Research Institute of the Seventh-day Adventist Church called trans identities a "sophisticated form of homosexuality." And Southern Baptists have chimed in with "stern but necessary critique" on "trangenderism." These remarks only serve to dehumanize the trans community and fear monger Christians into mobilizing against them. The majority of the disagreements are against proper pronoun and restroom usage. (It seems to the extent that LGB individuals are seen as sex acts, trans persons are seen as genitals.) But while Christians have been busy debating on whether or not trans persons should be allowed to gender appropriate restrooms, trans people have been dying. A staggering nine trans persons (most of them trans women of color) have been murdered in the United States and Canada just in 2015. Those are just the ones recorded, as many trans individuals get misgendered (wrongly ID'd as the sex assigned at birth) and many more go unreported. Then there are suicides. 41% of trans adults say they've attempted suicide in their lifetime, according to a study by the Williams Institute. Also, 57% of trans youth have reported to have attempted suicide when coming from rejecting families. Many report high levels of depression and other mental health issues. The stress of gender dysphoria (having dissociation with your body) is only increased when having to deal with workplace and societal discrimination and harassment. This harassment is rooted in the dehumanization and devaluing of trans lives. Christians need to end, not add to, this ugly story, a narrative that goes against the Jesus Story. Perhaps one of the most perplexing things Jesus did while on earth was continually surround Himself with those society marginalized. Every person is created in the image of God and as such should be revered as a creation of our almighty God. Undoubtedly, given His track record, Jesus would welcome in trans persons — He would house them, feed them, wash their feet. How can we defend our anti-trans actions when looking at the Jesus story? Just last month, a debate over bathrooms in North Carolina reached embarrassing heights. Reverend Flip Benham and a group of "Christians" stood outside a women's restroom attempting to deny entrance to trans women, Raw Story reported. The uproar was over a nondiscrimination ordinance North Carolina proposed, and eventually voted against, that would have allowed transgender people to use gender appropriate restrooms. During the protests, Benham called one 17 year old trans girl "a pervert and a punk" when she attempted to use the restroom. How is this reflective of the Gospel? What this shows to the rest of the world is how completely out of depth many Christians are with gender and sexuality conversations. This bathroom panic is completely unfounded. Experts have thoroughly debunked the biggest myths perpetuated about the trans community — including that non trans people are in danger with trans persons when using the same restroom. There has been not been a single reported case of that happening. In contrast, there have been countless cases of harassment of trans persons for using the restroom. So, when Christians demean trans people, prohibiting them from basic rights, they are actively contributing to the harassment trans people face. It's cause and effect. If we truly cared about the danger the trans community faces, we

wouldn't be dehumanizing them. Instead, we would act like Jesus and invite trans people in. We would educate ourselves to the issues surrounding the trans community, and actively work to end disparities such as trans violence and homelessness. As it stands, we Christians have not been known to speak out. We have been known as those who have stayed silent to the violence and dehumanization trans people face. We've rallied a mob and have harassed and shunned children made in the image of God. And as a result, trans people have died. We must step up for our trans brothers and sisters. They can't wait any longer.

The aff does nothing against surveillance at border checkpoints. This is an alt cause – their evidence

Redden 13

Stephanie M., Carleton University, Canada and London School of Economics and Political Science, UK, 6-1-2013, "The End Of The Line Feminist Understandings Of Resistance To Full-Body Scanning Technology," International Feminist Journal Of Politics Issn: 1461-6742 Date: 06/2013 Volume: 15 Issue: 2 Page: 234-253 //MV

Magnet and Rodgers (2011: 1; see also Johnson 2006: 6) also make clear that it is essential to consider how this technology not only differently affects women, but also how other 'marginalized subjects' are affected. They note that: ... transgender individuals, people with disabilities, and those with particular religious affiliations are rendered newly or differently legible. As such, their application to airport security generates new implications for who are allowed to move through, and who are afforded justice within, contemporary cultural and transnational spaces. (Magnet and Rodgers 2011: 7) This differentiated legibility of bodies is **nowhere more visible** than in the interactions between gender and identity at border security points. As Currah and Mulqueen (2011: 559) have recently highlighted, the classification of individuals by the State according to gender metrics produces less certainty for queer, transgender and other bodies whose realities do not map onto the State's dichotomous understandings of gender, as 'securitizing gender does not necessarily secure identity, and may indeed destabilize it'. The intense gender-based interrogations and pat downs that these individuals often undergo as their bodies are seen as threatening suggest the deeply problematic and essentializing nature of full-body scanner technologies and other security practices, whereby a clear gender marker is understood to be a sign of positive identification. Shepherd and Sjoberg (2012: 15) importantly argue that 'both the introduction of WBI scanners in airports and the ways in which this technology has been linked to trans- bodies are forms of discursive violence'. They explain that with the use of these scanners: the visibility of trans- bodies has become both pronounced and contested, arguing that this is in itself a form of discursive violence and, further, that such strategies are productive of cisprivilege, which functions to position trans- bodies as different, deviant and dangerous and simultaneously as vulnerable and in need of protection. (Shepherd and Sjoberg 2012: 13)

TSA changes are an improvement for transgendered travelers

Ford 13 (Zack Ford, editor of ThinkProgress LGBT at the Center for American Progress Action Fund, "Victory For Transgender Privacy: TSA Abandons 'Nude' Body Scanners", 1/18/2015, Think Progress, http://thinkprogress.org/lgbt/2013/01/18/1471481/victory-for-transgender-privacy-tsa-abandons-nude-body-scanners/, DJE)

In what is an important victory for the transgender community, the U.S. Transportation Security Administration has announced it will remove all body scanners that show nearly nude images from airports. The TSA had already removed 76 of the machines and will now remove the

remaining 174, though they may still be used in other government offices where privacy is not a concern like it is in airports. Congress had set a deadline for OSI Systems to develop software for the scanners to produce generic passenger images instead of the the nearly nude images, but the company was unable to meet the timeline. Scanners produced by other companies that have managed to adjust the software will continue to be used. The invasion of privacy caused by the machine was particularly invasive for transgender people, who were considered suspicious if their genitalia did not match their presentation. Even the software change utilized by the remaining body scanners, which are manufactured by L-3, use "blue" and "pink" indicators for gender that can still cause confusion (and thus concern) for trans passengers. As a result, they can be disproportionately selected for invasive pat downs. The TSA is planning to expand its PreCheck program, in which passengers share more personal data before arriving at the airport but can then go through metal detectors instead of body scanners.

The aff's blanket denouncement of the TSA fails to understand workers as humans and replicates the same injury that they criticize

Buchanan 10 (Matt Buchanan, columnist, "How TSA Agents Really Feel About Touching Your Balls", 11/22/2010, Gizmodo, http://gizmodo.com/5696210/how-tsa-agents-really-feel-about-groping-you, DJE)

Burning hatred for the TSA is easy populism. And they keep making it easier. But how do the men and women of the TSA really feel about what they have to do? Seventeen of them speak their mind. Here's a few of the comments agents told Flying With Fish. One says: "It is not comfortable to come to work knowing full well that my hands will be feeling another man's private parts, their butt, their inner thigh. Even worse is having to try and feel inside the flab rolls of obese passengers and we seem to get a lot of obese passengers!" And another, from a veteran now working at the TSA: "I served a tour in Afghanistan followed by a tour in Iraq. I have been hardened by war and in the past week I am slowly being broken by the constant diatribe of hateful comments being lobbed at me. While many just see a uniform with gloves feeling them for concealed items I am a person, I am a person who has feelings. I am a person who has served this country. I am a person who wants to continue serving his country. The constant run of hateful comments while I perform my job will break me down faster and harder than anything I encountered while in combat in the Army." There's far more over at Flying With Flsh, but it's something to keep in mind this week while traveling—while you totally have the right to be angry about security theater, you don't have to be a prick about to the people just doing their jobs, either. Solvency/Race advantage turn

TURN, stopping the NSA means an alternative which involves even more federal surveillance and racial profiling elsewhere – those with Muslim backgrounds would be detained more than others

Josh **Gerstein**, 11-24-20**10**, "Alternative to TSA pat-downs: More background checks," POLITICO, http://www.politico.com/news/stories/1110/45559.html

If Americans don't want the government touching their "junk" to improve air security, the alternative may well be greater scrutiny of passengers' travel histories and personal backgrounds,

security experts say. The public backlash against the aggressive pat-downs the federal government rolled out this month could put more pressure on the government to introduce security measures previously rejected on privacy grounds, including in-depth interrogations of travelers at airports, government scrutiny of passengers' airline information, and even creation of a secure, standardized national ID card. "The question is, which kind of privacy do you want to have?" said Stewart Baker, a top Department of Homeland Security official during the Bush administration. "This has been a pretty searing experience for DHS. Obviously, we're not going to do more in this area [of physical checks] and it would be welcome if we could do less….The alternative is to look for terrorists in advance." That approach to security, Baker said, calls for singling out suspicious passengers and subjecting them to intense questioning. "We're going to gather information about people we're going to encounter hours before they arrive. We'll compare names and travel partners to lists of people, not just no-fly lists, but anyone who's suspect one way or another," Baker said. "One hundred and ninety-nine people spend 30 seconds in primary [screening] getting an ID check and moved on, but one person in 200 gets an hour of screening, reviewing their personal effects, and an interrogation that's very free ranging." This kind of system might do away with some of the more jarring images at airport security checkpoints – uniformed Transportation Security Administration officers thoroughly frisking nuns and young children. "Grandma from Dubuque is probably not going to get identified as a risk," Baker said. "She spends 30 seconds and gets waved through." "With a little more information on all passengers, and more careful screening of those who raise red flags, the TSA shakedown of pregnant women, small children and nuns in habit could be made less necessary, or at least less intrusive," Shannen Coffin, a former legal counsel to Vice President Dick Cheney, wrote at National Review Online. While there have been complaints about other TSA security rules, including a requirement to remove shoes and strict limits on liquids and gels in carry-on luggage, no TSA procedure has generated as much blowback as the newly adopted procedures, including high-tech body scanners that can penetrate clothing and searches some passengers have compared to sexual molestation. The use of the scanners, which produce detailed images, produced some protest from privacy advocates and Muslim groups who object on modesty grounds. But those protests didn't receive as much attention as the more assertive pat-downs. Fran Townsend, who was one of Bush's security advisers, said the American psyche and culture views the laying on of hands by anyone in authority as far more serious invasion of privacy than investigating a passenger's background, submitting him or her to X-rays or searching their belongings. "We associate in this country, because of our Constitution, the physical touching of people by government or law enforcement as a thing we do only to criminals," Townsend said. "All of sudden grandma goes through and she's getting groped. She's resentful because it's not what she thinks of as her country…I think Americans want to be supportive of counterterror measures but they need to be persuaded that what is being asked of them is fair, reasonable and effective." Gauging public reaction to the pat-downs and body-scans has been tricky: An ABC News/Washington Post poll out Monday found roughly a 50-50 split on whether the pat-downs were a good idea, with about two-thirds supporting use of the body scanners. A USA Today/Gallup poll of Americans who travel at least twice a year found 71 percent thought use of the combined technology was "worth it," but 57 percent said they were either angry or bothered by the new pat-downs. The Obama administration's decision not to publicize the new pat-downs in advance may also have hurt support for the technology. Gallup found travelers nearly evenly split, 48 percent to 47 percent, on whether pat-downs would or would not help find potential terrorists like the Nigerian who allegedly boarded a Detroit-bound jetliner last Christmas Day and tried to detonate explosives hidden in his underwear. Some don't like to be touched, but others are troubled by the idea of a security officer in a separate room examining an image of their body. Others don't mind those intrusions, but draw the line at authorities scrutinizing their travel history, travel partners or interrogating them about where they're going and why. In 2003, privacy advocates, fearing "big brother" intrusions, convinced Congress to block TSA access to itineraries and related information on domestic air travelers, though the government does review information for international flights. A new version of the domestic program gives TSA more limited information, including the names, birth dates and gender information of passengers. One terrorism expert said the public reaction to the new pat-downs is not surprising, but privacy advocates cannot fairly object to every technique that could be used to improve air security. "If you walk up to somebody in your office and do [a pat-down], you will be arrested. There's something peculiar about lots of people lining up to be sexually assaulted," noted Ben Wittes of the Brookings Institution. However, "you can't take the position that there should be no profiling, no intrusive searches, and it's ridiculous to treat old ladies the same as young men. Those three ideas will not go together," Wittes said. "At some point, you have to make honest choices about what kind of intrusions you're more or less worried about, or you have to be open and honest about saying, 'I'm willing to lose this number of airplanes a year.'…This does have a quality about it of people flatly refusing to make serious choices." Wittes also said the overall judgment on what privacy invasions are acceptable have to be made by society and not individual travelers. Otherwise, terrorists will "choose the one most conducive to they're getting through," he said. Chris Calabrese of the American Civil Liberties Union said his group supports traditional police work to keep planes safe. "What we've never said no to is focusing on individual criminals and individual dangers, going back to good old-fashioned law-enforcement techniques to arrest [suspects] before they even get to the airport," he said. The ACLU and other groups objected to the collection of airline itinerary information because it amounted to assembling a vast database on lawful unthreatening travelers in what would likely be an unsuccessful effort to find a few suspected terrorists intent on doing harm. "A lot of our concern was around mass surveillance – this idea that if you collect all this information on everybody and apply some computer algorithm to it, data mine it, and suddenly signs of a terrorist are going to pop out," Calabrese said. "There's no science to back that up." He added that grand jury subpoenas are available to seek itinerary data on suspects in legitimate criminal investigations. The ACLU, which had for decades opposed all airport security checkpoints as unconstitutional suspicionless searches, dropped that stance after September 11, Calabrese said. The new battle over pat-downs and scans has allied some conservatives and civil libertarians – up to a point. "The federal fondling is an unconstitutional search and seizure…. We have lost a level of our freedom in order to retain a level of our freedom and that ought to

outrage every American whether you fly on an airplane or not," former Gov. Mike Huckabee (R-Ark.) told Fox News Tuesday. "Do we really think that we're going to be safer because a 5-year-old boy has his genitals looked at?" However, conservatives are again calling for profiling as an alternative to the enhanced checks. "What we've got to do, whether we like it or not, is to discern who is likely to be a person with an intent," Huckabee said. "We'd profile everybody but we would quit selling or buying machines." But Calabrese and others warn that an identity-based system that relies on racial or religious profiles would be ineffective and violate travelers' rights. "Terrorists are smart," he said. "They identify and work around the profiling,". Moving to a system that looks more at travelers' backgrounds and less at what they may be wearing or carrying would also require another important change: greater certainty that a passenger actually is whom he or she claims to be. Baker noted that Congress's effort to move to a more secure system based on state-issued driver's licenses, Real ID, was repeatedly rolled back by Congress and the Bush and Obama administrations. "As long as it's possible to get a fake driver's license, an identity-based security system doesn't work," he said.

SPOT-only run if it's the SPOT plan!

Curtailing SPOT does not solve for racial TSA security check pat downs – the two are different

Hugh **Handeyside**, **3-19**-2015, "Be careful with your face at airports (Opinion)," CNN, http://www.cnn.com/2015/03/19/opinions/handeyside-tsa-spot-program/

Through a program called Screening Passengers by Observation Techniques, or SPOT, the TSA employs thousands of "behavior detection officers" who scrutinize travelers to look for signs of "mal-intent" in airport screening areas. The officers typically spend less than 30 seconds scanning an average passenger for over 90 behaviors the TSA associates with stress, fear or deception. When the officers perceive clusters of such behaviors in any given individual, they refer that person for secondary inspection and questioning. The SPOT program relies on theories about "micro-expressions," involuntary facial expressions that supposedly appear for milliseconds despite one's efforts to conceal them. Behavior detection officers look for such micro-expressions while scanning passengers' faces or engaging in casual conversation with them. It's as nutty as it sounds. Setting aside that the officers' perception of these behaviors is inherently subjective, there's just no evidence that deception or "mal-intent" can reliably be detected through observation, especially in an unstructured setting like an airport screening area. The fact that many people find such settings inherently stressful only compounds the problem. If TSA's behavior detection officers look for stress in a stressful environment, they're going to find it, along with plenty of false positives. Just about everyone outside the TSA who has reviewed the SPOT program has decided that it's unscientific and a waste of money. An exhaustive review by the Government Accountability Office found the SPOT program lacked a scientific basis, that the behavioral indicators it relied on were subjective, and that the TSA had no effective means to test its effectiveness. In no uncertain terms, the GAO recommended that Congress curtail funding for the program. An independent scientific advisory group that reviewed the SPOT program also concluded that "no scientific evidence exists to support the detection or inference of future behavior, including intent." And during a congressional hearing on the program, Republican Rep. Richard Hudson of North Carolina observed, "To my knowledge, there has not been a single instance where a behavior detection officer has referred someone to a law enforcement officer and that individual turned out to be a terrorist." Rep. Michael McCaul of Texas, the Republican chairman of the House Homeland Security Committee, stated, "I am concerned that TSA will continue to spin its wheels with this program instead of developing a more effective and efficient approach." Despite this withering criticism, SPOT remains in place and has cost taxpayers well over $1 billion (that's with a b) since its inception in 2007. Repeat: over a billion dollars on a misguided program that doesn't work. Equally troubling is that SPOT has given rise to persistent allegations of racial and ethnic profiling -- an unfortunately inevitable result when law enforcement or border agents single people out based on hasty, gut-level judgments about them. Allegations of profiling by behavior detection officers have come not only from travelers, but also from numerous other officers. Over 30 behavior detection officers at Boston Logan International Airport said that profiling was rampant there. One of the officers told reporters, "They just pull aside anyone who they don't like the way they look -- if they are black and have expensive clothes or jewelry, or if they are Hispanic." Another officer submitted an anonymous complaint saying, "The behavior detection program is no longer a behavior-based program, but it is a racial profiling program." The TSA has not revealed what, if any, steps it has taken to ensure that unlawful profiling does not occur in airport screening. Nor has TSA explained why -- despite overwhelming evidence to the contrary -- SPOT contributes meaningfully to aviation security. That's why the ACLU submitted an FOIA request to TSA seeking information on its use of behavior detection. We've received no response, so we're taking the TSA to court to get the information the public needs to fully evaluate it. People expect that when they travel, they will be screened for weapons or explosives that could bring down an airplane. They don't expect -- nor should they -- that officers will make probing judgments about their intentions based on little more than their facial expressions, or that they will be stopped, questioned and perhaps even searched because of their race or ethnicity. It's time for TSA to explain and justify the SPOT program. Or better yet, listen to those who say it's a waste of money and scrap it entirely.

Alt cause to racial profiling – plan does not solve TSA pat downs and “anomalies” on scanners

Drew **Mackenzie**, **7-22**-2015, "Racial Profiling Charges Leveled over TSA Hair Pat-Downs," Newsmax, http://www.newsmax.com/US/TSA-pat-downs-hair-African-Americans/2015/04/01/id/635817/

Racial Profiling Charges Leveled over TSA Hair Pat-Downs By Drew MacKenzie | Wednesday, 01 Apr 2015 01:20 PM Short URL| Email Article| Comment| Contact| Print| A A The Transportation Security Administration is studying its policy on hair pat-downs after receiving complaints that African-American women are being targeted at airports. The TSA launched an investigation after being contacted by the American Civil Liberties Union (ACLU), and now the agency has reached an informal agreement with the advocacy group "to enhance officer training" on the pat-downs, according to The Hill. "Racial profiling is not tolerated by TSA," the agency said in a statement. "Not only is racial profiling prohibited under DHS (Department of Homeland Security) and agency policy, but it is also an ineffective security tactic." The ACLU office in northern California had filed a complaint on behalf of Malaika Singleton, who claimed she was improperly singled out for searches in 2013 at airports in Los Angeles and Minneapolis. The civil rights organization alleged that Singleton, a California resident, was targeted for extra airport screening by TSA officials because of her hairstyle, The Hill reported. "The humiliating experience of countless black women who are routinely targeted for hair pat-downs because their hair is 'different' is not only wrong, but also a great misuse of TSA agents' time and resources," said Novella Coleman, an ACLU attorney in California. TSA officials usually conduct pat-downs, including possibly the probing of a woman's hair, when airport screeners identify "anomalies" on X-ray scanners. But the ACLU said that rule left open the potential for racial profiling against African-American women, The Hill noted. "When TSA agents are faced with ambiguous evidence or forced to apply subjective rules, it is more likely that they will unconsciously interpret the circumstances in a way that is consistent with racial stereotypes," the civil liberties group said. "Both the United States and California Constitutions prohibit unreasonable searches and selective enforcement of the law based on race. And although the law has carved out exceptions for airport screening, a search must still be tailored to detect threats to security. "That legal requirement cannot be satisfied when there is no clear policy for detecting threats to security. In this case, TSA agents were unable to provide a uniform reason to justify these searches when asked to articulate such a policy." Plan does not solve racial profiling programs such as NSEERS, OFL, and TSA screening

Wade J. Henderson, Esq., President and CEO, The Leadership Conference on Civil and Human Rights, March 2011, "Restoring a National Consensus: The Need to End Racial Profiling in America" The Leadership Conference, http://www.civilrights.org/publications/reports/racial-profiling2011/racial_profiling2011.pdf

The 9/11 terrorist attacks on the World Trade Center and the Pentagon were carried out by Arabs from Muslim countries. In response to the attacks, the federal government immediately engaged in a sweeping counterterrorism campaign focused on Arabs and Muslims, and in some cases on persons who were perceived to be, but in fact were not, Arabs or Muslims, such as Sikhs and other South Asians. That focus continues to this day. The federal government claims that its anti-terrorism efforts do not amount to racial profiling, but the singling out for questioning and detention of Arabs and Muslims in the United States, as well as selective application of the immigration laws to nationals of Arab and Muslim countries, belie this claim.¶ A prime example of a federal program that encourages racial profiling is the National Security Entry-Exit Registration System (NSEERS), implemented in 2002.44 NSEERS requires certain individuals from predominantly Muslim countries to register with the federal government, as well as to be fingerprinted, photographed, and interrogated. A report issued in 2009 by the American Civil Liberties Union (ACLU) and the Rights Working Group had this to say about NSEERS:¶ More than seven years after its implementation, NSEERS continues to impact the lives of those individuals and communities subjected to it. It has led to the prevention of naturalization and to the deportation of individuals who failed to register, either because they were unaware of the registration requirement or because they were afraid to register after hearing stories of interrogations, detentions and deportations of friends, family and community members. As a result, well-intentioned individuals who failed to comply with NSEERS due to a lack of knowledge or fear have been denied "adjustment of status" (green cards), and in some cases have been placed in removal proceedings for willfully" failing to register."45¶ Despite NSEERS' near explicit profiling based on religion and national origin, federal courts have held that the program does not violate the Equal Protection

Clause of the Constitution, and that those forced to participate in the program have not suffered violations of their rights under the Fourth or Fifth Amendments to the U.S. Constitution, which protect against unreasonable search and seizure and guarantee due process, respectively.46¶ Another example of a federal program that involves racial profiling is Operation Front Line (OFL). The stated purpose of OFL,47 which was instituted just prior to the November 2004 presidential election, is to "detect, deter, and disrupt terror operations."48 OFL is a covert program, the existence of which was discovered through a Freedom of Information Act lawsuit filed by the American-Arab Anti-Discrimination Committee and the Yale Law School National Litigation Project.49¶ According to the 2009 ACLU/Rights Working Group report, data regarding OFL obtained from the Department of Homeland Security show that:¶ an astounding seventy-nine percent of the targets investigated were immigrants from Muslim majority countries. Moreover, foreign nationals from Muslim-majority countries were 1,280 times more likely to be targeted than similarly situated individuals from other countries. Incredibly, not even one terrorism-related conviction resulted from the interviews conducted under this program. What did result, however, was an intense chilling effect on the free speech and association rights of the Muslim, Arab and South Asian communities targeted in advance of an already contentious presidential election.50¶ Lists of individuals who registered under NSEERS were apparently used to select candidates for investigation in OFL.51 Inasmuch as the overwhelming majority of those selected were Muslims, OFL is a clear example of a federal program that involves racial profiling. Moreover, because OFL has resulted in no terror-related convictions, the program is also a clear example of how racial profiling uses up valuable law enforcement resources yet fails to make our nation safer.52¶ Although Arabs and Muslims, and those presumed to be Arabs or Muslims based on their appearance, have since 9/11 been targeted by law enforcement authorities in their homes, at work, and while driving or walking,53 airports and border crossings have become especially daunting. One reason for this is a wide-ranging and intrusive Customs and Border Patrol (CBP) guidance issued in July 2008 that states, "in the course of a border search, and absent individualized suspicion, officers can review and analyze the information transported by any individual attempting to enter …. the United States."(Emphasis added)54 In addition, the standard to copy documents belonging to a person seeking to enter the U.S. was lowered from a "probable cause" to a "reasonable suspicion" standard.55 Operating under such a broad and subjective guidance, border agents frequently stop Muslims, Arabs, and South Asians for extensive questioning about their families, faith, political opinions, and other private matters, and subject them to intrusive searches. Often, their cell phones, laptops, personal papers and books are taken and reviewed.¶ The FBI's Terrorist Screening Center (TSC) maintains a list of every person who, according to the U.S. government, has "any nexus" to terrorism.56 Because of misidentification (i.e., mistaking non-listed persons for listed persons) and over-classification (i.e., assigning listed persons a classification that makes them appear dangerous when they are not), this defective "watch-list" causes many problems for Muslims, Arabs, and South Asians seeking to enter the United States, including those who are U.S. citizens.¶ The case of Zabaria Reed, a U.S. citizen, Gulf War veteran, 20-year member of the National Guard, and firefighter, illustrates the problem. Trying to reenter the U.S. from Canada where he travels to visit family, Reed is frequently detained, searched, and interrogated about his friends, politics, and reasons for converting to Islam. Officials have handcuffed Reed in front of his children, pointed weapons at him, and denied him counsel.57¶ In 2005, a lawsuit—Rahman v. Chertoff—was filed in federal district court in Illinois by nine U.S. citizens and one lawful permanent resident, none of whom had any connection to terrorist activity.58 The plaintiffs—all of whom are of South Asian or Middle Eastern descent— alleged that they were repeatedly detained, interrogated, and humiliated when attempting to re-enter the U.S. because their names were wrongly on the watch-list, despite the fact that they were law abiding citizens who were always cleared for re-entry into the U.S. after these recurring and punitive detentions.59¶ In May 2010, the court dismissed the case, finding that almost all of the disputed detentions were "routine," meaning that border guards needed no suspicion at all to undertake various intrusions such as pat-down frisks and handcuffing for a brief time.60 Further, the court held that where the stops were not routine, the detentions, frisks, and handcuffings were justified by the placement of the individuals on the TSC's database—even when the listing may have been a mistake.61¶ Notwithstanding the adverse decision in the Rahman case, and the continuation of these practices on a national level, it is important to note that there have been certain positive changes in government policy since 2005. Specifically, a standard of "reasonable suspicion" is now used before a name can be added to the TSC's database, which marks a sharp departure from the essentially "standardless" policy previously in effect.62¶ Individuals wearing Sikh turbans or Muslim head coverings are also profiled for higher scrutiny at airports. In response to criticism from Sikh organizations, the Transportation Security Administration (TSA) recently revised its operating procedure for screening head coverings at airports. The current procedure provides that:¶ All members of the traveling public are permitted to wear head coverings (whether religious or not) through the security checkpoints. The new standard procedures subject all persons wearing head coverings to the possibility of additional security screening, which may include a patdown search of the head covering. Individuals may be referred for additional screening if the security officer cannot reasonably determine that the head area is free of a detectable threat item. If the issue cannot be resolved through a pat-down search, the individual will be offered the opportunity to remove the head covering in a private screening area.63¶ Despite this new procedure, and TSA's assurance that in implementing it "TSA does not conduct ethnic or religious profiling, and employs multiple checks and balances to ensure profiling does not happen,"64 Sikh travelers report that they continue to be profiled and subject to abuse at airports.65¶ Amardeep Singh, director of programs for the Sikh Coalition and a second-generation American, recounted the following experience in his June 2010 testimony before the Subcommittee on the Constitution, Civil Rights, and Civil Liberties of the House Judiciary Committee:¶ Two months ago, my family and I were coming back to the United States from a family vacation in Playa Del Carmen, Mexico. At Fort Lauderdale Airport, not only was I subjected to extra screening, but so was [my 18 month-old son Azaad]. I was sadly forced to take my son, Azaad, into the infamous glass box so that he could [be] patted down. He cried while I held him. He did not know who that stranger was who was patting him down. His bag was also thoroughly searched. His Elmo book number one was searched. His Elmo book number two was searched. His minimail truck was searched. The time spent waiting for me to grab him was wasted time. The time spent going through

his baby books was wasted time. I am not sure what I am going to tell him when he is old enough and asks why his father and grandfather and soon him—Americans all three—are constantly stopped by the TSA 100% of the time at some airports.66

SPOT regulations itself are not the problem – procedures are based on facial expressions only – means removing it would not solve for racial profiling

Denver Post Editorial Board, 11-17-**2013**, "Face it, TSA: Behavioral screening is failing," Denver Post, http://www.denverpost.com/editorials/ci_24533526/face-it-tsa-behavioral-screening-is-failing

Face it, TSA: Behavioral screening is failing By The Denver Post Editorial Board POSTED: 11/17/2013 05:01:00 PM MST34 COMMENTS Lines form in the security area at Denver International Airport as Transportation Security Administration workers check passengers. Lines form in the security area at Denver International Airport as Transportation Security Administration workers check passengers. (Kathryn Scott Osler, Denver Post file) Is it possible to spot suspicious passengers at airports based on their behavior, even their most subtle facial expressions? Not consistently or reliably, according to a report from the Government Accountability Office released last week that recommended funding be discontinued for a Transportation Security Administration program that has cost nearly $1 billion. The program is called Screening Passengers by Observation Technique, or SPOT, and involves training "behavior detection officers" and stationing them at airports. But the takeway from the report was unequivocal: See SPOT fail. After an exhaustive review of existing studies, the GAO concluded there was no scientific evidence that the SPOT program worked much better, if better at all, than chance screenings of passengers. In other words, a system that simply screens passengers based on random automated selection, the kind of system many countries use in their customs entry points, would probably work just as well. The underpinning of the SPOT system is based on something called FACS, or the Facial Action Coding System, developed by psychologists in the late 1970s to identify emotions through "micro-expressions" in the face. These quick, subtle expressions do seem to exist, but the science does not appear to be so exact that emotions — or motives — can be read with certainty on a regular basis. "TSA has not demonstrated that (behavior-detection officers) can consistently interpret the SPOT behavioral indicators," the report said. "The subjectivity of the SPOT behavioral indicators and variation in BDO referral rates raise questions about the continued use of behavior indicators for detecting passengers who might pose a risk to aviation security." More troubling, though, is that TSA officials implemented the SPOT program despite the fact there was no solid scientific foundation on which to base it.

T – Substantial (Only for SPOT)

A. Interpretation:

Less than 10% is insubstantial – this is the lowest percentage we could find in a monetary context

Mickels 8 (Alissa, JD Candidate – Hastings College of Law, "Summary of Existing US Law Affecting Fourth Sector Organizations", 7-17, http://www.fourthsector.net/attachments/7/original/Summary_of_US_Law_Affecting_FS.pdf?1229493187)

Substantial v. insubstantial: Modern courts consider competition with commercial firms as "strong evidence of a substantial nonexempt purpose." Living Faith, Inc. v. Comm'r, 60 T.C.M. 710, 713 (1990). Although the tax court has held that the definition of insubstantial is **fact specific**, it has found that **less than ten percent** of a charity's total efforts is **"insubstantial"**. World Family Corp. v. Comm'r, 78 T.C. 921 (1982), where as unrelated business activity generating one-third of an organizations revenue does not qualify for tax-exempt status. Orange County Agric. Soc'y, Inc. v. Comm'r, 55 T.C.M. 1602, 1604 (1988), aff'd 893 F.2d 647 (2d Cir. 1990). However, this may be changing after an increasing emphasis on commensurate test.

B. Violation: The aff is insubstantial

The TSA's budget is just over 7 billion dollars – this isn't even the entirety of the US' domestic surveillance budget

HBC 13 (House Budget Committee, "The Transportation Security Administration and the Aviation-Security Fee", 12/10/2013, House.gov, http://budget.house.gov/news/documentsingle.aspx?DocumentID=364049, DJE)

The Transportation Security Administration (TSA) was established by the Aviation and Transportation Security Act of 2001 to "protect the nation's transportation systems to ensure freedom of movement for people and commerce." Although TSA has security responsibilities in all forms of transportation, its main focus is aviation security. TSA has just over 55,600 full-time equivalents (FTE), the vast majority of which are passenger and baggage screeners in the Aviation Security program. (By contrast, fewer than 700 FTEs are involved in Surface Transportation Security.) In recent years, TSA has received around $5.7 billion in mandatory and discretionary appropriations, which—together with spending authority from offsetting collections—gives the agency an annual budget of more than $7 billion. Aviation Security takes the lion's share of this budget, and its funding is used for passenger- and baggage-screening operations, screener salaries and benefits, and contracts with private screeners, among other activities.

TSA's SPOT program only costs around $200 million annually. That's barely more than 2% of the agency's budget. There is no way this can be considered substantial.

GAO 13 (Government Accountability Office, "TSA Should Limit Future Funding for Behavior Detection Activities", November 2013, http://www.gao.gov/assets/660/658923.pdf, DJE)

In October 2003, TSA began testing its primary behavior detection activity, the SPOT program, and during fiscal year 2007, TSA deployed Page Behavior Detection Activities the program to 42 TSA regulated airports. By fiscal year 2012, about 3,000 BDOs were deployed to 176 of the more than 450 TSA regulated airports in the United States. From fiscal years 2011 through 2012, an estimated 1.3 billion people passed through checkpoints at the 176 SPOT airports. TSA has expended approximately $200 million annually for the SPOT program since fiscal year 2010, and a total of approximately $900 million since 2007. BDOs represent one of TSA's layers of security. In addition to BDOs, other layers of security include travel document checkers, who examine tickets, passports, and other forms of identification; transportation security officers (TSO), who are responsible for screening passengers and their carry-on baggage at passenger checkpoints using X-ray equipment, magnetometers, advanced imaging technology, and other devices; as well as for screening checked baggage; and random employee screening, among others.

C. Topicality is a voter for limits – they massively under-limit the topic by allowing for reduction in surveillance of individuals, minor alterations in texts surveillance laws, or even miniscule budget cuts. This massively skews the debate in the aff's favor.

(more evidence contextualizing how small SPOT is)

Just one of the US' domestic surveillance agencies, the NSA, has a budget of around $10 billion

CNN 13 (CNN Money, 6/7/2013, "What the NSA costs taxpayers", http://money.cnn.com/2013/06/07/news/economy/nsa-surveillance-cost/, DJE)

The National Security Agency's activities are classified. And so is its annual budget. As a result, it's impossible to say exactly how much money the NSA is given to conduct its surveillance efforts -- which Americans learned this week has recently included collecting phone call data and monitoring online activities. That's because the NSA, a Defense Department agency created in 1952, falls under the category of a "black" program in the federal budget, a term applied to classified efforts. The NSA is one of at least 15 intelligence agencies, and combined the total U.S. intelligence budget in 2012 was $75 billion, said Steve Aftergood, director of the government secrecy program at the Federation of American Scientists, a nonpartisan think tank that analyzes national and international security issues. The intelligence budget includes funding for both classified and unclassified activities. Funding for classified programs has tracked the upward trend in defense spending over the past decade, according to an analysis of fiscal year 2012 Defense Department budget request by Todd Harrison of the Center for Strategic and Budgetary Assessments. Aftergood estimates about 14% of the country's total intelligence budget -- or about $10 billion -- goes to the NSA. His reasoning: In 1996, the NSA budget was leaked, and it accounted for about 14% of the budget that year. "I am confident that the real figure is within $2 billion of that $10 billion estimate," he said. Gordon Adams, a former White House budget

official for national security, said he wouldn't be surprised if NSA's resources are "well north" of $20 billion a year.

Terrorist threats exist now and TSA key to prevent terrorists from bringing weapons onto planes – plan eliminates this

Krishnadev **Calamur**, **1-23**-2015, "TSA Agents Discovered 2,212 Guns At Airport Checkpoints In 2014," NPR.org, http://www.npr.org/sections/thetwo-way/2015/01/23/379325043/tsa-agents-discovered-2-212-firearms-at-airport-checkpoints-in-2014

The Transportation Security Administration found more than 2,000 firearms at the nation's airports last year — the overwhelming majority of them loaded, the Department of Homeland Security said today. TSA agents discovered 2,212 firearms — or a little more than six a day — in carry-on bags; 83 percent of them were loaded, the department said. The number was a 22 percent increase from 2013, when 1,813 firearms were discovered. The number of firearms discovered at TSA checkpoints has risen nearly every year since 2005. Also last year, the department said, more than 1,400 "firearm components, replica firearms, stun guns, and other similar dangerous objects were discovered" in carry-on luggage. The top five airports for firearms discoveries are: Dallas/Fort Worth International (120 firearms), Hartsfield-Jackson Atlanta International Airport (109), Phoenix Sky Harbor International Airport (78), Houston's George Bush Intercontinental Airport (77) and Denver International Airport (70). Agents discovered not just small firearms, but a grenade and an assault rifle (unloaded) with three loaded magazines. "In many cases, people simply forgot they had these items," the TSA said in its blog reviewing the data. Agents also found a disassembled .22-caliber gun in a carry-on bag at New York's John F. Kennedy International Airport. The gun's various components were found hidden inside a PlayStation 2 console. Agents also stopped a 94-year-old man who tried to enter the checkpoint at New York's LaGuardia Airport with a loaded .38-caliber revolver clipped to his belt. Other interesting discoveries: An 8.5" knife was discovered in an enchilada at the Charles M. Schulz–Sonoma County Airport. The TSA noted that "While this was a great catch, the passenger's intent was delicious, not malicious, and she was cleared for travel." A 3-inch knife concealed inside a laptop's hard drive caddy. A saw blade in a Bible, a cell phone knife case, a lipstick stun gun.

TSA is a key part of the US protection against terrorism – 9/11 happened b/c TSA didn't exist (fact, TSA was established November 19, 2001)

DHS (Department of Homeland Security), **6-29**-2015, "Preventing Terrorism and Enhancing Security," No Publication, http://www.dhs.gov/preventing-terrorism-and-enhancing-security

The Department of Homeland Security (DHS) and its many partners across the federal government, public and private sectors, and communities across the country and around the world have worked since 9/11 to build a new homeland security enterprise to better mitigate and defend against dynamic threats, minimize risks, and maximize the ability to respond and recover from attacks and disasters of all kinds. Together, these efforts have provided a strong foundation to protect communities from terrorism and other threats, while safeguarding the fundamental rights of all Americans. While threats persist, our nation is stronger than it was on 9/11, more prepared to confront evolving threats, and more resilient in the face of our continued challenges. Progress Made Since 9/11 Protecting the United States from terrorism is the founding mission of the Department of Homeland Security. While America is stronger and more resilient as a result of a strengthened homeland security enterprise, threats from terrorism persist and continue to evolve. Today's threats do not come from any one individual or group. They may originate in distant lands or local neighborhoods. They may be as simple as a home-made bomb or as sophisticated as a biological threat or coordinated cyber attack. More and more, state, local, and tribal law enforcement officers, as well as citizens, businesses, and communities are on the front lines of detection and prevention. Protecting the nation is a shared responsibility and everyone can contribute by staying informed and aware of the threats the country faces. Homeland security starts with hometown security—and we all have a role to play. Building the Homeland Security Enterprise Fusion Centers: DHS supports state and major urban area fusion centers through personnel, training, technical assistance, exercise support, security clearances, connectivity to federal systems, technology, and grant funding. Nationwide Suspicious Activity Reporting Initiative: An administration effort to train state and local law enforcement to recognize behaviors and indicators related to terrorism, crime and other threats; standardize how those observations are documented and analyzed; and enhance the sharing of those reports with law enforcement across the country. Grant Funding: Since fiscal year 2003, DHS has awarded more than $31 billion in preparedness grant funding based on risk to build and sustain targeted capabilities to prevent, protect against, respond to, and recover from threats or acts of terrorism. Preventing Terrorist Travel and Improving Passenger Screening Advance Passenger Information and Passenger Name Record Data: To identify high-risk travelers and facilitate legitimate travel, DHS requires airlines flying to the United States to provide Advance Passenger Information and Passenger Name Record (PNR) Data prior to departure. During 2008 and 2009, PNR helped the United States identify individuals with potential ties to terrorism in more than 3,000 cases, and in fiscal year 2010, approximately one quarter of those individuals denied entry to the United States for having ties to terrorism were initially identified through the analysis of PNR. Visa Security Program: Through the Visa Security Program (VSP), with concurrence from the Department of State, ICE deploys trained special agents overseas to high-risk visa activity posts in order to

identify potential terrorist and criminal threats before they reach the United States. The VSP is currently deployed to 19 posts in 15 countries. Pre-Departure Vetting: DHS has strengthened its in-bound targeting operations to identify high-risk travelers who are likely to be inadmissible to the United States and to recommend to commercial carriers that those individuals not be permitted to board a commercial aircraft through its Pre-Departure program. Since 2010, CBP has identified over 2,800 passengers who would likely have been found inadmissible upon arrival to the United States. Secure Flight: Fulfilling a key 9/11 Commission recommendation, DHS fully implemented Secure Flight in 2010, in which TSA prescreens 100 percent of passengers on flights flying to, from, or within the United States against government watchlists before travelers receive their boarding passes. Prior to Secure Flight, airlines were responsible for checking passengers against watchlists. Through Secure Flight, TSA now vets over 14 million passengers weekly. Enhanced Explosives Screening: Prior to 9/11, limited federal security requirements existed for cargo or baggage screening. Today, TSA screens 100 percent of all checked and carry-on baggage for explosives. Through the Recovery Act and annual appropriations, TSA has accelerated the deployment of new technologies to detect the next generation of threats, including Advanced Imaging Technology units, Explosive Detection Systems, Explosives Trace Detection units, Advanced Technology X-Ray systems, and Bottled Liquid Scanners. Strengthening Surface Transportation Security Visible Intermodal Prevention and Response Teams: TSA has 25 multi-modal Visible Intermodal Prevention and Response (VIPR) Teams working in transportation sectors across the country to prevent or disrupt potential terrorist planning activities. Since the VIPR program was created in 2008, there have been over 17,700 operations performed. Baseline Surface Transportation Security Assessments: Since 2006, TSA has completed more than 190 Baseline Assessments for Security Enhancement for transit, which provides a comprehensive assessment of security programs in critical transit systems. Strengthening Global Supply Chain Security Air Cargo Screening: Fulfilling a requirement of the 9/11 Act, 100 percent of all cargo transported on passenger aircraft that depart U.S. airports is now screened commensurate with screening of passenger checked baggage and 100 percent of high risk cargo on international flights bound for the United States is screened. Container Security Initiative: The Container Security Initiative (CSI), currently operational in 58 foreign seaports in 32 countries, identifies and screens U.S.-bound maritime containers that pose a potential risk.

The reason why there's no evidence of TSA foiling plots is because TSA acts as the root deterrent – powerful terrorists no longer try – but if TSA is curtailed then terrorists would act- without the TSA, private security fails to prevent terrorism – 9/11 is the empiric proof

Joseph **Straw**, Corky Siemaszko, 2-8-**2012**, "Push for more private security guards at airports," NY Daily News, http://www.nydailynews.com/news/private-security-guards-called-airports-article-1.1019531

Private security companies like those that failed to stop the 9/11 hijackers could be manning more airport checkpoints under a new bill heading for President Obama's desk. Rep. Pete King (R-L.I.), who wrote the provision and whose district lost 150 people in the attacks, said it was a compromise aimed at saving the Transportation Security Administration from Tea Party types who want to destroy the agency altogether. "Some people wanted to completely emasculate the TSA. I did it to protect the TSA — this way, security ultimately remains with the TSA," King told the Daily News. King, who heads the House Homeland Security Committee, insisted security will not be compromised — and that the TSA will still call the shots in airports that hire private screeners. "It doesn't hurt to have competition," he said. "It can put some pressure on TSA to do a better job." But King's bill is drawing howls from critics who say we've learned nothing from 9/11. "How quickly we forget," Sen. Joseph Lieberman (I-Conn.) said in a statement criticizing the item in the bill. "We have already tried an aviation security system run by private contractors. It very tragically did not work." Incredulous Democrats also ripped the bill. Rep. Jerry Costello (D-Ill.), a former cop, said, "I think if we're going to start contracting out the security of the flying public, then why don't we contract out the FBI or DEA or Secret Service or Capitol Hill police?" The TSA was created after the Sept. 11 attacks and took over the task of screening passengers and luggage from the private firms hired by the airlines. In recent years, however, the TSA has been hit with harsh criticism for intrusive searches and by Tea Party politicians who say it costs too much — especially now that the screeners are unionizing. Sen. Rand Paul (R-Ky.) recently unleashed a broadside at the TSA after he refused to submit to a patdown and was blocked from boarding a plane. Under pressure from the right in Congress, King drafted a bill last year requiring the Homeland Security Department to allow contract screeners unless it finds the change would hurt security. The bill languished for months, but was dropped into unrelated Federal Aviation Administration legislation passed by the House and Senate this month. Currently, there are private screeners at just 16 airports, the largest of which is San Francisco International Airport. Many fliers at Kennedy Airport said they don't want rent-a-cops manning security checkpoints. "After what happened to us on 9/11, I don't mind [that\] the TSA scanners are there," said Angela Franklin, 65, of Freeport, L.I. "I think it should stay that way. I had a son who survived 9/11."

A2: TSA doesn't evaluate effectiveness – they do – study shows the effectiveness of RMAT, a terrorism risk modeling tool

Morral, Andrew R., 20**12**, "Modeling Terrorism Risk to the Air Transportation System: An Independent Assessment of TSA's Risk Management Analysis Tool and Associated Methods," No Publication, http://www.rand.org/pubs/monographs/MG1241.html

Abstract RAND evaluated a terrorism risk modeling tool developed by the Transportation Security Administration and Boeing to help guide program planning for aviation security. This tool — the Risk Management Analysis Tool, or RMAT — is used by TSA to estimate the terrorism risk-reduction benefits attributable to new and existing security programs, technologies, and procedures. RMAT simulates terrorist behavior and success in attacking vulnerabilities in the domestic commercial air transportation system, drawing on estimates of terrorist resources, capabilities, preferences, decision processes, intelligence collection, and operational planning. It describes how the layers of security protecting the air transportation system are likely to perform when confronted by more than 60 types of attacks, drawing on detailed blast and other physical modeling to understand the damage produced by different weapons and attacks, and calculating expected loss of life and the direct and indirect economic consequences of that damage. This report describes RAND's conclusions about the validity of RMAT for TSA's intended uses and its recommendations for how TSA should perform cost-benefit analyses of its security programs. Key Findings Risk Management Analysis Tool (RMAT) Appears to Capture the Key Features Relevant to Security at Most Airports With good information about an adversary's capabilities and intentions, the RMAT defender model can provide credible and useful estimates of the likelihood of detecting and interdicting an adversary. RMAT has proven to be of great value to the Transportation Security Administration (TSA) in driving a more sophisticated understanding of terrorism risks to the air transportation system. The RMAT Model Has Some Gaps Even if the conceptual models on which RMAT is built were sound and comprehensive, the input data requirements exceed what subject matter experts or science can estimate with precision, and the imprecision of those estimates is subject to unknown sources and ranges of error. RMAT may not be well suited for the kinds of exploratory analysis required for high-stakes decision support, because of its reliance on a large number of uncertain parameters and conceptual models.

Terror DA Impacts

Another terrorist attack involving a plane would cost the economy billions

Balvanyos and Lave 05 (Tunde Balvanyos, Supervising Planner in the San Diego office of Parsons Brinckerhoff, a global infrastructure strategic consulting, planning, engineering and program/construction management organization, Lester B. Lave, economist, "THE ECONOMIC IMPLICATIONS OF TERRORIST ATTACK ON COMMERCIAL AVIATION IN THE USA", 9/4/2005, http://www.usc.edu/dept/create/assets/002/51831.pdf, DJE)

The air transportation system is an attractive target for terrorists. Using widely available weapons, terrorists could shoot down a passenger airliner. This disruption would be magnified if the attack caused terror in the general population and led government officials, the media, and the public to engage in costly preventive actions. Although various defenses could be mounted against attacks by missiles, rocket propelled grenades, and high powered rifles, no countermeasure could protect against all of them or even be completely successful against MANPADS. The immediate effect of shooting down an airliner would be hundreds of deaths and a cost to the airline of about $1 billion for the aircraft and payments to the survivors of deceased passengers, as well as reduced demand for all air services. Reduction in demand for air services depends on how the government, the media and the general public react to the attack. An unsuccessful attack could generate similar reaction from the public resulting in similar losses in transportation and related business. Closing

an airport for more than a few days would throw thousands of people out of work and generate losses to the surrounding businesses and those who depend on the airport and air transport of freight. Closing US airspace immediately after the attack would cause diversion of flights, stranded passengers, and major costs to the airlines and travelers. There are two major components to the economic cost of a successful terrorist attack. The direct cost for the downed aircraft and lives lost would be about $1 billion per aircraft. The indirect cost would result from operating losses to the airlines and loss of consumer welfare as some people would not fly. These amounts would depend on the length of any interruption in air travel and the public's long term reaction to terrorist threat to flying. The indirect economic cost would be greater than the direct cost and would depend on how the government reacts (investing in countermeasures and/or closing airports) and how the public reacts (measured in reduction in travel demand). While the cost of countermeasures and airport closures can be estimated, the main determinant of long term costs, the reaction of the public, is unpredictable. If a terrorist managed to shoot down a large passenger aircraft and this resulted in grounding all aircraft for 2.5 days (as was the case after 9/11), the loss to the economy would be $1 billion per air craft (including compensation for the dead passengers) (RAND), $1.6 billion in reduced airline and associated spending, and $4.75 billion in losses to business and leisure passengers. The total cost of $6.3 billion per 2.5 days (or $2.5 billion per day) makes a ground attack against commercial aircraft a tempting target. There are few areas in the USA where a lone terrorist with readily available weapons could inflict such a high cost on the economy, and possibly cause widespread terror.

A 9/11 style attack would disrupt a multitude of industries

Nanto 05 (Dick K. Nanto, Specialist in Industry and Trade, "9/11 Terrorism: Global Economic Costs", 10/5/2005, CRS Report for Congress, http://digital.library.unt.edu/ark:/67531/metacrs7725/m1/1/high_res_d/RS21937_2004Oct05.pdf, DJE)

The 9/11 attacks were part of Al Qaeda's strategy to disrupt Western economies and impose both direct and secondary costs on the United States and other nations. The immediate costs were the physical damage, loss of lives and earnings, slower world economic growth, and capital losses on stock markets. Indirect costs include higher insurance and shipping fees, diversion of time and resources away from enhancing productivity to protecting and insuring property, public loss of confidence, and reduced demand for travel and tourism. In a broader sense, the 9/11 attacks led to the invasions and occupations of Afghanistan and Iraq (and the Global War on Terrorism) and perhaps emboldened terrorists to attack in Bali, Spain, Morocco, and Saudi Arabia. A policy question for Congress is how to evaluate the costs and benefits of further spending to counter terrorism and its economic impact. This report will be updated periodically.

An airplane terror attack would cause a sudden recession – 9/11 proves

Nanto 05 (Dick K. Nanto, Specialist in Industry and Trade, "9/11 Terrorism: Global Economic Costs", 10/5/2005, CRS Report for Congress, http://digital.library.unt.edu/ark:/67531/metacrs7725/m1/1/high_res_d/RS21937_2004Oct05.pdf, DJE)

Following the terrorist attacks, the already weak international economy was weakened further. The aftershocks of 9/11 were felt immediately in foreign equity markets, in tourism and travel, in consumer attitudes, and in temporary capital flight from the United States. Central banking authorities worldwide reacted by injecting liquidity into their financial systems. Still, the downturn in business conditions became more generalized and most of the world dropped into a synchronous recession — from 4.1% world economic growth in 2000 to 1.4% in 2001 (a growth rate of less than 2% for the world is considered to be recessionary). By late 2002, aggressive reflationary fiscal and monetary policy in the United States and a booming Chinese economy led the recovery. As shown in Figure 2, the 2001 recession turned into a weak economic recovery with world growth of 1.9% in 2002 and 2.7% in 2003 — still anemic when compared with the growth rate of 2.3% in 1998 during the worst of the Asian financial crisis. For 2004, the recovery picked up speed and its strength broadened with growth at 4%, even though by mid-2004, the world was hit with petroleum prices exceeding $40 per barrel of which $6 to $10 was a "security premium" caused primarily by instability and uncertainty in the Middle East. Still, in most markets, there appeared to be a general dissipation of geopolitical concerns and a steady decline in post-9/11 terrorism fears. How much did 9/11 bring down world growth rates? Prior to 9/11, a major econometric forecasting firm expected real GDP for the world (185 countries) to grow at 2.8% in 2001 and 3.1% in 2002. After 9/11, world GDP actually grew by 1.4% in 2001 and 1.9% in 2002. In the aftermath of 9/11, therefore, actual growth came in at approximately 1 percentage point below expectations. Not all of this, of course, can be attributed to 9/11, but a 1 percentage point decline in global GDP amounted to about $300 billion less in world production and income in 2002. Subsequent terrorist attacks also have affected economic growth abroad. An Australian study pointed out the negative macroeconomic consequences of terrorism for developing nations because of reduced trade, investments, and tourism. The 2002 Bali bombings reduced Indonesia's growth rate by an estimated 1 percentage point.

Despite TSA misconduct, Dems still strongly support airport security

Maya **Rhodan**, 11-22-**2010**, "Partisan Divide Greets New Report on Airport Screener Misconduct," TIME, http://swampland.time.com/2013/08/03/partisan-divide-greets-new-report-on-airport-screener-misconduct/

Federal airport security screeners were investigated for misconduct 9,622 times from 2010 to 2012, after an array incidents, from screeners falling asleep on the job to letting relatives go around screening lines to inappropriately touching airplane passengers. Depending on whom you ask on Capitol Hill, this is either an alarming crisis or an expected footnote for a huge workforce with an enormous task. "These findings are especially hard to stomach since so many Americans today are sick of being groped, interrogated, and treated like criminals when passing through checkpoints," said Republican Rep. Jeff Duncan of South Carolina, at a hearing on the Transportation Security Agency July 31. "If 'Integrity' is truly a core value, then, TSA, prove it." "TSA employee misconduct is on the rise — and this is intolerable," Democratic Rep. Ron Barber said in a statement to TIME. "TSA's first and foremost responsibility is to ensure the safety and security of travelers in a professional manner — and it is simply unacceptable to allow a single bag or a single person go unscreened." Some Democrats at the hearing, however, sided with the TSA officers, who many said were not to be judged by the actions of a few "bad apples." Bennie Thompson, a ranking Democratic member of the committee, from Mississippi said, "The vast majority of TSOs are hardworking, dedicated, diligent federal employees." The TSA employs about 56,000 security personnel who work at 450 airports across the country. In a July 30 report, the Government Accountability Office found there has been a 26 percent increase in cases of misconduct over the past three years. According to the report, the majority of the cases fell under two categories of misconduct, "attendance and leave" and "screening and security." Unexcused absences, tardiness, and failure to follow leave procedure accounted for 32 %, or 3,117, of the total misconduct cases. Failure to follow screening procedure, bypassing screening,

and sleeping on duty made up 20 percent, or 1,936 total cases according to the report. In one instance in the report, an officer was seen neglecting to stop the conveyor belt after every piece of luggage to review the x-ray images of what's inside; in another an officer left his or her security checkpoint to assist a family member with a bag, a bag the officer later walked through the security checkpoint without screening and handed to the relative. The bag was found to have contained prohibited items, though the items are not specified in the GAO report. In a statement, David Cox, the president of the American Federation of Government Employees, the union that represents the TSA, said the report has misrepresented the conduct of TSA employees. "TSA critics on Capitol Hill seize every opportunity to give the agency and its dedicated workforce a black eye, even when the facts to not support their arm-waving displays of false outrage," Cox said in a statement. "They want to drag us back, as a nation, to the pre-9/11 practice of using poorly trained, minimum wage rent-a-cops to protect the flying public from terrorists." The agency has also tried to defend itself, blaming a handful of bad apples. "Every time we have one knucklehead that decides he's going to do something bad it tarnishes the image of our organization, TSA Deputy Administrator John Halinski said at the hearing. "I have my people on the line 365 days of the year and they know if they fail someone can die." Nearly half of the reported cases of misconduct resulted in letters of reprimand that describe the conduct and why it is subject to disciplinary action. Thirty-one percent resulted in definite suspension, and 17% led to termination, according to the GAO. The rest were subject to a multitude of outcomes, including indefinite suspension. "I think this report shows something very positive," says Rick Mathews, the director of the National Center for Security and Preparedness at the University at Albany. "It shows that the TSA is looking for these things and when people are doing wrong they're being punished." "The frequency of these actions is so low that it more than likely dissuades bad people from even trying to breach security," he added.

Curtailing TSA surveillance goes against the will of the public – they like it

Reed 12 (Ted Reed, journalist who covers the airline industry, "Surprise Gallup Poll: People Think TSA Does A Good Job", 8/9/2012, http://www.forbes.com/sites/tedreed/2012/08/09/surprise-gallup-poll-people-think-tsa-does-a-good-job/, DJE)

Surprisingly, despite all of the negative Internet commentary and Congressional complaining about the Transportation Security Administration, the majority of U.S. travelers have a positive opinion of the agency. Not only that, but people who fly, and who are exposed to TSA screening, have an even more positive opinion than people who rarely or never fly. According to a Gallup poll released Wednesday, 54% of Americans think the TSA is doing either an excellent or a good job of handling security screening at airports. Moreover, among Americans who have flown at least once in the past year, 57% have an excellent or good opinion of the agency. As far as TSA effectiveness at preventing acts of terrorism on U.S. airplanes, 41% think the screening procedures are extremely or very effective. Another 44% think the procedures are somewhat effective. That number varies little for people who fly somewhat regularly and people who rarely or never fly. The poll was conducted with telephone interviews July 9th through July 12. Gallup interviewed 1,014 adults living in all 50 states and the District of Columbia. Interestingly, younger Americans "have significantly more positive opinions of the TSA than those who are older," Gallup said, noting that 67% of people between 18 and 29 rate the agency as excellent or good. This may be because young people fly more frequently, or it may be because that for young people TSA screening, first implemented in 2001, has been part of their flying experience for the majority of their lives. Criticism of the TSA seems to come primarily from two sources. One is Internet sites, where reporting standards are generally not at the same level as newspapers, where reporters are taught to consider what is told to them with skepticism and to seek responses to charges. On Wednesday, some sites were repeating charges by a man who said that his wife was admitted to the emergency room for treatment after TSA agents at Fort Lauderdale-Hollywood International Airport harassed her and subjected her to closed door screening after metal in her bra set off an alarm. The man said his wife was subject to a brutal rape three years ago and is still

recovering from the psychological impact. Without denigrating the man or his wife in any way, it is possible to say that the TSA is put into a difficult situation when such charges are posted with little or no fact checking by reporters. As for Congress, the House Homeland Security Committee's Transportation Security Subcommittee recently convened a hearing on the topic: "Breach of Trust: Addressing Misconduct Among TSA Screeners." According to About.com, "It didn't take (committee chairman) Rep. Mike Rogers (R-Alabama) long to set the tone for the day, saying in his opening statement: "Stealing from checked luggage; accepting bribes from drug smugglers; sleeping or drinking while on duty — this kind of criminal behavior and negligence has contributed significantly to TSA's shattered public image." Now there is a poll to show that in fact, TSA does not have actually have a bad public image. And here, it is worth mentioning that the public image of Congress is not so good, perhaps reflecting a tendency to be excessively critical of perceived enemies rather than to seek compromise and solve problems.

TSA is popular and publicly supported—effectiveness and counterterrorism

Frank **Newport and** Steve **Ander**, Gallup news, Inc., 8-8-20**12**, "Americans' Views of TSA More Positive Than Negative," Gallup, http://www.gallup.com/poll/156491/americans-views-tsa-positive-negative.aspx)//GV

PRINCETON, NJ -- Despite recent negative press, a majority of Americans, 54%, think the U.S. Transportation Security Administration is doing either an excellent or a good job of handling security screening at airports. At the same time, **41% think TSA screening procedures are extremely or very effective at preventing acts of terrorism** on U.S. airplanes, with most of the rest saying they are somewhat effective. Thinking now about the TSA, the government agency that handles security screening at U.S. airports, do you think the TSA is doing an excellent, good, only fair, or poor job?How effective do you think the TSA's screening procedures are at preventing acts of terrorism on U.S. airplanes? The TSA in recent months has come under increased scrutiny, with some members of Congress calling for the agency to be privatized or disbanded. However, the current survey results, from Gallup interviewing conducted July 9-12, indicate that the average American has a more positive than negative impression of the TSA, even if the average American is not totally confident in the effectiveness of its procedures. Overall, Fliers' Opinions Similar to Non-Fliers' Just over half of Americans report having flown at least once in the past year. These fliers have a slightly better opinion of the job TSA is doing than those who haven't flown. Fifty-seven percent of those who have flown at least once and 57% of the smaller group who have flown at least three times have an excellent or good opinion of the TSA's job performance. That compares with 52% of those who have not flown in the past year. There is little difference in opinions about the effectiveness of TSA's screening procedures by flying status; between 40% and 42% of non-fliers, as well as of those who have flown at least once and those who have flown at least three times, believe the procedures are at least very effective. Perceptions of Transportation Security Administration, by Number of Commercial Air Trips in Past Year Perceptions of TSA Effectiveness, by Number of Commercial Air Trips in Past Year Parents of Minors and Non-Parents Have Similar Views Adults' opinions are not related to whether they have a child under age 18 at home, with both parents and non-parents expressing similar views about the TSA. This is potentially important, given that the TSA instituted revised screening procedures for children under 12 in the fall of 2011 -- the result of the agency's efforts to establish risk-based security management for its screening operations. Perceptions of the U.S. Transportation Security Administration, by Whether Respondent Has a Child Under 18 at Home Perceptions of TSA Screening Effectiveness, by Whether Respondent Has a Child Under 18 at Home Opinions, Flying Behavior Vary Across Ages Younger Americans have significantly more positive opinions of the TSA than those who are older. These differences may partly reflect substantial differences in flying frequency, with 60% of 18- to 29-year-olds reporting having flown within the last year, compared with 33% of those 65 years and older. Perceptions of the U.S. Transportation Security Administration, by Age Group Perceptions of TSA Screening Effectiveness, by Age Group Flown on Commercial Airliner in Past Year, by Age Group When the TSA was formed in late 2001, Americans who are now 18 to 29 were between 7 and 18 years old, meaning that their flying experience has been mostly in an environment in which increased airport security and TSA screening procedures are the norm. Bottom Line The American public gives the TSA a generally good report card, with a slight majority rating its overall job performance in positive terms. The fact that Americans who fly have a slightly more positive opinion of the agency than those who haven't flown recently suggests that experience with the TSA at airports does not detract from this image and may enhance it. Opinions about the effectiveness of the TSA are mixed, although most Americans and U.S. air travelers say the procedures are at least somewhat effective at preventing terrorism.

TSA popular—Americans put a higher priority on combating terrorism than protecting privacy

Jon **Cohen and** Ashley **Halsey,** Washington Post staff writers, 11-23-20**10**, "Poll: Nearly two-thirds of Americans support full-body scanners at airports," No Publication, http://www.washingtonpost.com/wp-dyn/content/article/2010/11/22/AR2010112205514.html)//GV

Nearly two-thirds of Americans support the new full-body security-screening machines at the country's airports, as most say they put higher priority on combating terrorism than protecting personal privacy, according to a new Washington Post-ABC News poll. THIS STORY Protests of TSA airport pat-downs, body scanners don't delay Thanksgiving travel At BWI, one man's campaign to 'Travel With Dignity' Scanner protests appear to fizzle among holiday travelers View All Items in This Story But half of all those polled say enhanced pat-down searches go too far. The uproar over the new generation of security technology, and the frisking of those who refuse it, continued Monday with Homeland Security Secretary Janet Napolitano saying the new measures are necessary for public safety. "There is a continued threat against aviation involving those who seek to smuggle powders and gels that can be used as explosives on airplanes," she said. "The new technology is designed to help us identify those individuals." According to the Transportation Security Administration, less than 3 percent of travelers receive the pat-downs. But Napolitano said the **TSA would "listen to concerns.** Of course we will make adjustments or changes when called upon, but not changes or adjustments that will affect the basic operational capability that we need to have to make sure that air travel remains safe." One possibility that could generate public support is the use of profiling at airports, where the TSA would single out specific passengers for extra screening based on available information. **Overall, 70 percent of Americans back the idea, which has been floated as an alternative.** White House spokesman Robert Gibbs sought to reassure the traveling public that "the evolution of the security will be done with the input of those who go through the security." But he said that safe travel remains the higher priority. Some people upset with the TSA's techniques have waged an Internet-based campaign urging people to refuse to use the scanners on Wednesday, one of the busiest travel days of the year. Coupled with bad winter weather forecasts across the Midwest, their efforts may delay Thanksgiving week travel. In response to growing criticism, two unions representing some TSA personnel are running full-page newspaper ads Tuesday and sending e-mails defending workers to frequent fliers. While the harshest critics have suggested that enhanced pat-downs amount to sexual assault, union officials said screeners are merely carrying out orders issued by the TSA. More than 400 of the controversial scanning machines have been put to use at 70 of 450 U.S. airports since October, though the majority of passengers are not being asked to use them. The scanners, which penetrate clothing to produce outlines of the naked human body, are in use at all three of the Washington region's major airports. In development for several years, the machines use backscatter and millimeter wave technology intended to reveal nonmetallic security threats that wouldn't be caught by traditional step-through metal detectors.

Complainers exaggerate – when surveyed, majority of Americans have a positive opinion of TSA – public understands TSA exists for a very important reason

Ted **Reed**, 10-23-**2012**, "Remember 9/11? TSA Finally Takes Off the Gloves, Reminds Critics of Reality.," Forbes, http://www.forbes.com/sites/tedreed/2012/10/23/remember-911-tsa-finally-takes-off-the-gloves-reminds-critics-of-reality/

The Transportation Security Administration has taken off the gloves and started to respond more aggressively to the constant barrage of criticism – as well it should. Last week, in an opinion piece in the Rockland County Times, published in a close-in New York City suburb, TSA spokeswoman Lisa Farbstein responded to a critical column by area resident Diane Dimond, a syndicated columnist. "Perhaps the next time Diane and her family fly out of a New York-area airport to a fun vacation spot, they'll look out the car window at the New York skyline minus the Twin Towers and remember some of the true facts about TSA and why it exists," Farbstein wrote. Dimond "criticized the very security measures that were designed to keep passengers safe —to help ensure that there is not another 9/11 in her back yard," said Farbstein, who answered about a dozen criticisms, point-by-point. Among them: it is inconvenient, undignified and an invasion of your privacy to be forced to remove your shoes, jackets and belts, take off your belt and take your computer from its case. TSA agents "treat all of us like we're new arrivals at a prison camp." The lines are too long and some agents seem to stand around doing nothing. While the criticisms are familiar, the aggressive response is new. In fact, the TSA responds to multiple daily attacks, most far less coherent than Dimond's**. Critics include travelers who make up stories;**

members of Congress who seek political gain and bloggers, tweeters and other self-promoters aware that the best way to be noticed and collect Internet hits is to express outrage. The outrage business, it must be said, is a growth business, thriving in the age of new media. Last week, radio talk show host Dana Loesch tweeted about an incident at the Phoenix airport. Loesch claimed she was sexually molested after a sensor showed traces of explosives on her. She was upset that the incident took place in private: she had requested a public screening. Earlier,in June, Loesch and her husband were detained by the TSA in Providence, R.I., after he allegedly underwent intrusive screenings because sensors detected traces of explosives on him. Perhaps we should conclude that TSA agents are engaged in a nationwide plot to harass the couple whenever possible. Or perhaps explosive pixie dust suddenly finds them whenever they head to the airport. Clearly, they are outliers among the 650 million people TSA screens annually. Last year, about one tenth of one percent of those filed complaints. The truth is that, for all of the complaints, most U.S. travelers have a positive opinion of the TSA. According to a Gallup poll released in August**, 54% of Americans think TSA is doing** either an excellent or **a good job of handling airport screening. Among Americans who have flown** at least once in the past year**, 57% have an excellent or good opinion of the agency**. In other words, the more you see them, the better you like them. Of course, TSA is not perfect. It employs 62,000 people, a few of whom have stolen from the luggage they are paid to inspect. The annual $8.1 billion budget seems high: the same work was done for far less by private firms before Sept. 11. The firms followed federal guidelines, which sadly did not prevent box cutters on airplanes. The TSA is very visible to millions of travelers, some of whom have had a bad day by the time they get to the airport. And of course the agency is overseen by a dysfunctional Congress, whose 535 members bring a love of the limelight, vastly differing agendas and an inability to compromise. Probably the biggest problem is that, unfortunately, we really don't know how much screening is enough and how much is too much. Eleven years later, that is something we are still learning.

Neolib Links

The aff's criticism of airport security neglects to balance privacy with other values – this is dangerous because it furthers neoliberalism

Simon **Dawes**. 20**11**. "Privacy and the public/private dichotomy." University of Georgia Libraries.

The framework of contextual integrity is outlined as a way of predicting people's reactions to newly introduced systems or practices. While such a system or practice that reduced control or access would normally give rise to calls from some of an invasion of privacy, the embracing of that same technology by others would either weaken this call or lead to the interpretation that privacy is just not that important anymore. A consideration of the integrity of this context would, however, take into account the effect on control and access as part of a package of what Nissenbaum refers to as 'values, ends and purposes', where the effect on other values such as security, ends such as efficiency, and purposes such as communication would also be taken into account. To this framework of contextual integrity, Nissenbaum adds an augmented approach, which does not preclude challenges to these context-appropriate norms or internal 'values, ends and purposes'. The augmented approach to contextual integrity compares entrenched normative practices against 'novel practices resulting from newly deployed socio-technical devices and systems' on the basis of how effective each is at achieving relevant contextual values (2010: 166). A violation of contextual integrity would be identified if the 'values, ends and purposes' argued to be inherent to a particular context were deemed to be negatively affected. So if a new technologically-mediated practice led to less control over one's personal information, and increased the access of others to that information, the integrity of the context would not necessarily have been violated if control and access were not particularly important features of the context, or if the new practice was more effective or efficient at achieving values that were. If the new practice was shown to harm any of the values, ends or purposes specific to the context, however, a violation of contextual integrity would have occurred. This is meant to tackle head on not only the approach to privacy that focuses on control and access, but that which poses the problem of balancing privacy with other values (notably security). Seeing privacy as always-already in relation to other values moves us away from having to negotiate a trade-off between values, where privacy may have to be sacrificed to make way for a more pressing concern. If one accepts privacy as a right to context-appropriate flows, then these norm-governed flows will already have been calibrated with the entire array of context-based 'values, ends and purposes', such as safety and control (2010: 188). An example cited is the increased scrutiny at airports, where travellers have to identify themselves numerous times, have their bodies patted down by security staff, sometimes after the removal of certain items of clothing, and have their luggage X-rayed and sometimes rooted through. In response to a nine-country survey on people's views on surveillance to which Nissenbaum refers, only 2 to 18 per cent felt that their privacy was not respected by airport officials (2010: 188–9). Nissenbaum

suggests that this is because what we understand by 'privacy' is actually tempered in the specific context of air travel by our fear of terrorism and disapproval of drug smuggling. We would interpret this kind of treatment in most other contexts, however, as an invasion of our privacy, because it would in most circumstances violate our expectations or contextual norms. The ostensible focus on context, however, rests upon a fundamental dismissal of the public/private dichotomy as a foundational basis for normative conceptions of privacy (2010: 116). Her justification for this dismissal is the speed of recent technological developments, which have led to an increased capacity to survey in public, to aggregate data from numerous public and private records, and to mediated interactions on social networking sites which problematize categorization along public-private lines at a rate which has 'produced a schism between experience and expectation' (2010: 231). Technological developments in the aggregation and dissemination of information have radically altered flows of information, and increased the amount of information about a 'data subject' that can be accessed, as well as the number of people who can access that information. Nissenbaum is right to criticize those who seek to limit privacy concerns to 'private information', because it is not the nature of the information itself (whether highly personal or not) that is necessarily the issue, but the potential to increase the importance of information (or for data to become knowledge). It could be impersonal information already available in public records or otherwise published, but if information is aggregated from numerous sources to create a deep archive of information about data subjects, and then made available to a far greater number of people than before, this could indeed cause anxieties 'in the name of privacy'. A focus on arbitrary distinctions between private and public information, as often happens in court proceedings, would miss the significance of these changes and not see this as a threat to privacy, whereas approaching this within the framework of contextual integrity would mean flagging up this kind of new practice as a violation. Because all information flows are normgoverned, whether in our homes or in a park, contextual integrity can be maintained or violated in any context (2010: 189), so transcending the reductive distinction between public and private places. This radical altering of flows of information, she argues, reveals faultlines not before considered significant (2010: 119), as well as the inconsistency of boundaries and the fuzziness of distinctions (2010: 101). It is not the social constructedness or variability of the dichotomy which she sees as problematic (2010: 121), however, but the assumption that it continues to be possible to divide the world into public and private in the face of socio-technical systems that so greatly expand the power of information (2010: 126). She argues that contextual integrity displaces the public/private framework because it resolves, for instance, the 'problem of privacy in public', but one could equally resolve what is actually the problem of legal interpretations of 'privacy problems' in 'public places' by criticizing the reductive reading of the dichotomy, and prescribing a more protean and mobile appreciation of the distinction2

Even more specifically, passing the plan favors private contractors that would replace the TSA – this promotes neolib market competition

Dan **Tracy**, 9-23-**2014**, "Sanford International Airport to replace TSA with private security," OrlandoSentinel, http://www.orlandosentinel.com/travel/os-tsa-sanford-privatize-20140923-story.html

Sanford International Airport to get private security. TSA going out, private contractor coming in. Private guards will take over security at Orlando Sanford International Airport early next year — a move U.S. Rep. John Mica and airport Director Larry Dale predict will result in more passenger-friendly service and shorter lines. But even with privatization, the people staffing the security checkpoints in Sanford most likely will be the same ones who are doing it now for the federal Transportation Security Administration. The main difference is they will be reporting to Trinity Technology Group, the Manassas, Va., company that just won a $24 million, 60-month contract to check passengers before they catch their flights in Sanford. The roughly 200 TSA officers now working at Sanford must be offered the first shot at Trinity positions, according to federal law. And Trinity is required to offer roughly equivalent wages and benefits. Mica, a Republican from Winter Park, and Dale maintain that Trinity — and other private-security companies, for that matter — will save money by having fewer managers as well as having more flexibility in firing poor performers. "I just believe private industry can do better than the government," said Dale, who predicted Trinity guards will be more courteous and attentive to passengers, and its management will be more flexible in scheduling workers to reduce lines during peak travel times. TSA spokeswoman Sari Koshetz would not comment on criticisms by Dale and Mica, saying only that the agency had five complaints and dozens of compliments last year from the more than 1.8 million passengers who went through Sanford. The switch, which includes a four-month transition that starts Oct. 1, comes more than four years after Dale started pushing to replace TSA. TSA's pre-check screening program -- in effect at 118 U.S. airports -- aims for speedy processing of select passengers who have paid a fee, been fingerprinted and undergone a computer security check. Trinity already provides security at smaller airports, such as Sioux Falls, S.D.; Santa Rosa, Calif.; and Tupelo, Miss., among others. The Sanford airport handles nearly 2 million passengers annually. Although long lines at security have rarely been a problem in Sanford, Dale has often complained that TSA was difficult to deal with and overly bureaucratic. With the change, the TSA will continue to oversee security at Sanford airport, but Trinity will run the day-to-day operations. Just like TSA, the Trinity employees will confirm tickets belong to the correct travelers, as well as check passengers for contraband, such as explosives,

and run the scanning machines. Trinity officials would not comment Tuesday to the Orlando Sentinel. TSA officers who do not sign on with Trinity can apply for other government positions or retire, Koshetz said. With the changeover, 19 airports nationally now have private security; the largest are San Francisco International, Kansas City International and Greater Rochester International in New York. In Florida, Key West International Airport has a private force, and Sarasota Bradenton International Airport is moving toward one. The board of Orlando International Airport, which 35 million travelers passed through last year, has been considering a switch to private security for 18 months. A 10-member panel was supposed to make a recommendation last fall but has yet to vote on a suggestion for the board. Orlando International spokeswoman Carolyn Fennell said, "They are still evaluating the information they have gathered." At Orlando, TSA made several changes to decrease the lines passengers face at the checkpoints after the review was started. As a result, travelers move through security more quickly than in years past, according to TSA statistics. TSA usually screens 50,000 travelers and 38,000 checked bags daily at the airport. TSA was created after the terrorists attacks of 9-11. Private security previously worked at airports. Leading the charge against TSA has been Mica, who helped draft the legislation that created the agency. He has been pushing Orlando International to fire TSA, too, arguing it is bloated and top-heavy with management. Mica also was instrumental in passing a law almost two years ago that made it easier for airports to opt out of TSA. He said he was "pleased" that Sanford was going private and hopes other airports, including Orlando, follow.

EIA is delighted to announce the launch of its SCAnR™ (Six Channel Analysis – Realtime). SCAnR is a multimodal model that has been integrated with a Realtime Cognitive Conversation (RC2) approach to deliver a gold standard, research-driven solution to help those professionals involved in behavioural analysis and high stake communications. SCAnR and RC2 are core to curriculum for the new Certificate in Behavior Analysis and Investigative Interviewing (BAII). The foundations, models and skills employed by SCAnR served as the foundation for the behavioral assessment and anti-terrorism approaches used by professionals from over 60 federal/state/corporate organizations. The uniqueness is the combination of: Realtime behavior analysis across all 6 communication channels (without technology interfaces) Impact and results achieved within 3 minutes of conversation Orienting towards 27 research validated deception indicators across the 6 channels (Archer & Lansley [August 2015] : under review) Uses a unique algorithm to define ‘cluster’ significance of those deception indicators Unpredictable framework of non-oppressive probes within a casual cognitive conversation process that ’amplifies’ leakage across all channels (due to cognitive/emotional load) only from those who are lying Uses realtime data – clean of discriminating bias (including ethnic, racial, religious profiling) Can be used in laboratory settings, post event, for detailed analysis to inform more formal/serious processes Counter-measure proof – knowing these techniques will not insulate you from those we have trained Proficiency achieved within 24 hours of intense training.

(Inside Science) -- Around the world, airport security teams attempt to identify terrorists by spotting nonverbal cues such as fidgeting or facial expressions that are believed to reveal deception. But according to many researchers, this approach just doesn't work. In 2013 the Government Accountability Office analyzed the U.S. program known as Screening of Passengers by Observation Techniques, or SPOT, and found no evidence that the technique used in the U.S. is effective. European airports also have programs based on detecting nonverbal cues. "My observations of the things that were going on at airports was that they were at best useless, and at worst were actually stopping security agents from doing their job," said Tom Ormerod, a psychologist at the University of Sussex in the U.K. "The U.K. government said, 'Listen, if you think the current method's no good, why don't you try to develop a better one?'" Ormerod took his government up on the challenge. With Coral Dando, a police-officer-turned-psychologist at the University of Wolverhampton in the U.K., he developed a new screening method called "Controlled Cognitive Engagement." At major airports in Europe, CCE detected more than 20 times as many mock passengers as an existing method used to screen passengers for long-haul international flights. The mock passengers were given fake documents and cover stories. What's the secret of CCE? Get people talking. With the new method, security agents engage passengers in what feels like a casual conversation, provided you're telling the truth. If you're lying, the conversation is a series of traps. The interview starts with open-ended questions, such as "Tell me a little about the family members you may be visiting," then continues with targeted questions based on prior answers. Agents ask several sets of questions on different topics. The whole process takes about three minutes, the same as the traditional method it was compared against. An algorithm helps agents come up with unique questions for each passenger. Because the questions are different each time, deceitful passengers have no way to fully prepare. "We set out to develop an interviewing method that would be essentially benign for regular passengers; it would be just like a conversation," said Ormerod. "But if you were being deceptive, at some point during that interview you would come under challenge where you would think, 'hang on a second, given what I've just said, and given the question they've just asked me, I ought to know the answer to this. And they know I ought to know the answer.'" If agents notice that interviewees become evasive and uninformative, they flag passengers to bump them up to a more intensive level of screening. The researchers compared CCE to a method currently being used to screen passengers for certain long-haul international flights. With the existing method, security personnel ask a series of rote questions and watch for nonverbal cues of deception. This procedure is one of many security screening steps that passengers must go through before getting on an airplane. At each airport in the study, which were all in Europe, the researchers trained a group of security agents to use CCE. All but two of the 79 trainees passed a two-week training course, and then they began screening all their passengers using CCE. Other agents in the same airport continued to use the older method. Unbeknownst to the security agents, the researchers sent 204 mock passengers through security. To increase motivation, the researchers paid the mock passengers twice as much if they made it through security without being caught. These individuals were considered "caught" if agents flagged them for further security screening. Agents who used CCE caught 66 percent of mock passengers. Those who used the traditional method flagged three percent for further scrutiny. Also, it seems unlikely that practice improves a liar's deception. The mock passengers who were given the chance to pass security multiple times were repeatedly caught by agents using CCE. To ensure that the CCE interviews were not too demanding for genuine passengers, the researchers asked some people about their impressions of the experience after screening. This part of the experiment is unpublished, but Dando said that passengers did not find CCE any more stressful or unpleasant than the traditional method. The study was published online November 3 in the Journal of Experimental Psychology: General. CCE's use can extend beyond airport surveillance, to areas such as job interviews or law enforcement interrogations, according to Ormerod. The technique could even help doctors evaluate what they are told by patients who may be forgetful, frightened or confused. Dando believes it's a myth that behavioral signs such as facial expressions and body language are reliable indicators of deception. "The problem with the myths is that they assume that everybody behaves the same way when they're being deceptive, and they don't," said Dando. Judee Burgoon, director of human communication research at the University of Arizona in Tucson, agrees that unpredictable questions are a powerful way of detecting liars, but she is not ready to dismiss nonverbal cues. Burgoon is developing automated devices to detect cues such as eye movements that are too subtle for humans to spot, and she suspects CCE would work even better in combination with such tools. While the CCE approach shows promise, she said, "Nothing should be implemented without more validation." Tim Levine, a communication professor who studies deception at Korea University in Seoul, advised a swifter rollout. "If you take the results at face value, they're jaw-dropping," said Levine. He would like to see more details about the technique, and he questioned whether the interviews were as simple for honest

passengers as the researchers believe. However, he pointed out that as long as the new method doesn't increase the rate at which honest passengers are mistakenly flagged, it won't do any harm. Because the results are so promising, Levine believes airports should start using CCE right away, and continue to track how the method performs. At two major airports in Europe, that's exactly what's happening. The security agents at these airports who were trained in CCE are continuing to screen passengers using the new method, and, according to the researchers, the agents have enjoyed the new technique. "It changed their lives from being a series of rote questions, to actually talking to customers and using their minds," said Dando.

APA 14 (American Psychology Association, 11/6/14, "New Airport Security Screening Method More Than 20 Times as Successful at Detecting Deception, Research Finds," http://www.apa.org/news/press/releases/2014/11/airport-security.aspx, rmf)

WASHINGTON — Airport security agents using a new conversation-based screening method caught mock airline passengers with deceptive cover stories more than 20 times as often as agents who used the traditional method of examining body language for suspicious signs, according to new research published by the American Psychological Association. In experiments spanning eight months, **security agents** at eight international airports in Europe **detected dishonesty in 66 percent of the deceptive mock passengers using the new screening method, compared to just 3 percent for agents who observed signs thought to be associated with deception, including lack of eye contact, fidgeting and nervousness. The suspicious-signs screening method is widely used in airports in the United States**, United Kingdom and many other countries, **even though it has not been proven to be effective in laboratory or real-life settings**, said researcher Thomas Ormerod, PhD, head of the School of Psychology at the University of Sussex in England. "The suspicious-signs method almost completely fails in detecting deception," Ormerod said. "In addition, it costs a lot of money, absorbs a lot of time and gives people a false sense of security." The new Controlled Cognitive Engagement method (CCE), which is based on previous laboratory studies, had the highest rate of deception detection in the first large-scale study of screening methods conducted in a real-life airport setting. **This could have important implications for thwarting terrorist attacks and catching other criminals, according to the research**. The study, which was funded in part by the British government, was published in APA's Journal of Experimental Psychology: General®. Ormerod previously worked with the British government to improve security at athletic venues during the 2012 London Olympics. "The U.K. government gave us a challenge that if we didn't think the current airport screening method worked well, then we should come up with a better one," said Ormerod, who conducted the research with Coral Dando, PhD, a psychology professor at the University of Wolverhampton and former London police officer. In the CCE method, security agents engage in friendly, informal conversation by asking passengers seemingly unrelated and unpredictable questions about knowledge the passenger should possess. The agent then gauges whether a passenger's responses become more evasive or erratic. "If you're a regular passenger, you're just chatting about the thing you know the best — yourself," Ormerod said. "It shouldn't feel like an interrogation." In one example, an agent might ask a passenger the name of his high school principal and the travel time to his destination. It didn't matter if the agents knew the truthful

answers to the questions because they were examining verbal cues from the passenger, such as shorter and more evasive responses to straightforward questions, Ormerod said. In the study, 79 security agents received one week of classroom training in the CCE method, followed by a week of on-the-job training. A control group of 83 agents received no additional training. The lessons covered myths about deception detection and ways to build rapport and gather information from passengers. The bulk of the research occurred at Heathrow Airport outside London, with other screening experiments conducted at two other British airports (Gatwick and Manchester) and airports in Paris, Amsterdam, Frankfurt, Zurich and Milan. Researchers recruited 204 mock passengers (113 male, 91 female), including college acting students and undercover police detectives. Participants were paid 60 pounds (approximately $97) to participate, along with an additional 60 pounds if they avoided detection by security agents. Each mock passenger had a week to research a different deceptive cover story so he or she would be more convincing when questioned. For example, one recruit was instructed to say he was a telecommunications engineer traveling from England to Chicago for an international amateur fencing competition. The mock passengers had realistic tickets and joined genuine passengers in security lines, where their screenings were recorded. If a mock passenger was caught, he or she was flagged in a computer system for further questioning at the gate, but all mock passengers turned around after passing through security and left the airport. A control group included 204 genuine passengers (113 male, 91 female) who were asked after their screenings if the recordings could be used in the research. The CCE technique requires greater focus by security agents, who must think of different questions in each interview, rather than repeating scripted questions about luggage or travel plans in the suspicious-signs method that could be rehearsed by criminals seeking to avoid detection, the study noted. **The risk of racial profiling also is reduced with the CCE method because it is applied in the same way to all passengers, unlike the suspicious-signs method, which is based on observation of physical characteristics, Ormerod said.** The average screening time was the same for agents using CCE or the suspicious-signs method, but agents using the CCE method asked fewer questions, with both genuine and mock passengers speaking at greater length to them. But mock passengers gradually spoke less and revealed less information as they were asked more questions that might reveal their deception. Screening agents trained in the CCE method improved in their ability to catch deceptive mock passengers during the study, increasing from 60 percent during the first month to 72 percent in the sixth month. The agents in the suspicious-signs group, however, performed worse over time, dropping from 6 percent in the first month to zero in the sixth month.

Counterplan solves entirety of the AFF and offers an alternative to racist and transphobic TSA policies.

Collins 14 (Nathan, 11/14/14, Pacific Standard, "To Find Suspicious Travelers, Try Talking to Them," http://www.psmag.com/health-and-behavior/find-suspicious-travelers-try-talking-them-94318, rmf)

By now, it's safe to say that the Transportation Security Administration's behavioral detection officers—agents trained to detect suspicious behavior simply by watching people—aren't very effective. Still, the TSA would like to have tools for detecting potential threats beyond current body scanners, which have their own problems. Now, a pair of English researchers report a new interview approach that could help tell the difference between liars and others. Lie detection is a controversial subject historically, and a field perhaps dominated more by the hope that it's

possible than particularly strong scientific research. Though a few prominent scientists think we can detect lies using physiological measurements or facial expressions, most think that interview techniques are more effective for identifying prevaricators. Interviews, the thinking goes, are more mentally taxing on liars than truth tellers, and they yield more opportunities for liars to contradict themselves. On the other hand, an interview must last long enough to set traps and make them work. "In contrast to current practice, we propose that security agents should not be trained to identify specific behaviors associated with deception." Thomas Ormerod and Coral Dando's solution is to engage passengers in brief, friendly conversations that elicit fairly detailed accounts of individuals' travel plans and backgrounds. Those conversations are meant to be quite flexible, so that officers can probe details of a passenger's story as they come up. Key to the approach is to let the traveler do most of the talking, giving agents more information to go on when evaluating a passenger's truthfulness. This contrasts with other methods such as "suspicious signs," which emphasizes a fixed set of questions with generally shorter answers and which often emphasize supposed behavioral tells over information gathering. To see if their approach worked, the pair went into London Heathrow Airport and a few others and trained 79 officers in their method, called Controlled Cognitive Engagement (CCE). Another 83 trained in the suspicious-signs method also took part. To test the methods, Ormerod and Dando recruited 204 people and gave them one goal: con their way past airport security agents using falsified boarding passes and false identities. The agents' goal was to stop as many of the fakes as they could—a particularly difficult challenge since the fakes had blended in with legitimate air travelers who showed up simply to catch a flight. The contrast between methods was stark. Agents trained in CCE stopped two-thirds of the mock passengers, compared with a dismal three percent stopped by agents using suspicious signs, which is standard protocol at many airports around the world. Meanwhile, agents using CCE stopped only three percent of real passengers who agreed afterwards to participate in the study—about the same false-positive rate as the suspicious signs method. "Our results have implications for practitioners, both in security screening, and more generally for professional lie catchers such as police officers and court officials," Ormerod and Dando write in the Journal of Experimental Psychology: General. "In contrast to current practice, we propose that security agents should not be trained to identify specific behaviors associated with deception." Instead, agents should work to draw out potential inconsistencies through conversation, they argue.

Isis will attack us by plane!

Al-Qaeda terrorists could attack an American flight any time, the former CIA deputy director confesses in a new book. Michael Morrell also said that if they aren't dealt with, the Islamic State is likely to stage another 9/11 attack. The Al-Qaeda in the Arabian Peninsula (AQAP) and its notorious chief bomb maker, Ibrahim al-Asiri remain probably the biggest threat to the US, claims the retired number two at the CIA, Michael Morrell, in a new book: The Great War of Our Time: the CIA's Fight Against Terrorism from Al-Qaida to ISIS. The Yemen-based AQAP, an offshoot of Al-Qaeda, has enough resources to crash a passenger jet, Morrell said. "To put it bluntly, I wouldn't be

surprised if Al-Qaeda in the Arabian Peninsula tomorrow brought down a US airliner traveling from London to New York or from New York to Los Angeles or anywhere else in the United States," the Telegraph cites Morrell's book. The US hasn't been exactly effective so far in dealing with another terrorist entity, the Islamic State, Morell said, because "it's very hard to do." "If we don't get ISIS under control, we're going to see that kind of attack," the kind of attack Al-Qaeda launched on 9/11, Morell told USA TODAY. The former CIA executive served during the most tragic terror events of the last two decades: both 9/11 attacks on American soil and the London bombings on July 7, 2005. Morrell used to be the CIA's chief liaison with British intelligence (2003-2006).

WASHINGTON – Islamic State terrorists who want to enter the United States are much more likely to try to fly on a commercial airline than sneak across the Southwest border, homeland security officials told a House panel Wednesday. "More than a decade after the terrorist attacks on September 11, 2001, terrorists continue to focus on commercial aviation as their primary target of interest," said Troy Miller, acting assistant commissioner for U.S. Customs and Border Protection. RELATED: Obama says he has authority for militant campaign The number of people that federal officials have encountered at the Southwest border who are on the terrorist watch list is "minimal" compared to how many are trying to enter on commercial planes, said John P. Wagner, assistant commissioner in the Office of Field Operations at Customs and Border Protection. "You're talking 10s (encountered at the border) versus thousands (in commercial aviation)," Wagner told members of the House Homeland Security Subcommittee on Border and Maritime Security.

Extinction outweighs—any action we can take to stop it is worth it.

Sandberg et al 08 (Anders Samberg, James Martin Research Fellow @ Oxford University, Milan M. Ćirković, Senior research associate @ the Astronomical Observatory of Belgrade, Jason G. Matheny, PhD candidate in Health Policy and Management at Johns Hopkins Bloomberg School of Public Health, 2008, Bulletin of the Atomic Scientists, "How can we reduce the risk of human extinction?," http://thebulletin.org/how-can-we-reduce-risk-human-extinction, rmf)

Humanity could be extinguished as early as this century by succumbing to natural hazards, such as an extinction-level asteroid or comet impact, supervolcanic eruption, global methane-hydrate release, or nearby supernova or gamma-ray burst. (Perhaps the most probable of these hazards, supervolcanism, was discovered only in the last 25 years, suggesting that other natural hazards may remain unrecognized.) Fortunately the probability of any one of these events killing off our species is very low--less than one in 100 million per year, given what we know about their past

frequency. **But as improbable as these events are, measures to reduce their probability can still be worthwhile**. For instance, investments in asteroid detection and deflection technologies cost less, per life saved, than most investments in medicine. While an extinction-level asteroid impact is very unlikely, **its improbability is outweighed by its potential death toll.** The risks from anthropogenic hazards appear at present larger than those from natural ones. Although great progress has been made in reducing the number of nuclear weapons in the world, **humanity is still threatened by the possibility of a global thermonuclear war and a resulting nuclear winter.** We may face even greater risks from emerging technologies. **Advances in synthetic biology might make it possible to engineer pathogens capable of extinction-level pandemics.** The knowledge, equipment, and materials needed to engineer pathogens are more accessible than those needed to build nuclear weapons. And unlike other weapons, pathogens are self-replicating, allowing a small arsenal to become exponentially destructive. **Pathogens have been implicated in the extinctions of many wild species**. Although most pandemics "fade out" by reducing the density of susceptible populations, pathogens with wide host ranges in multiple species can reach even isolated individuals**. The intentional or unintentional release of engineered pathogens with high transmissibility, latency, and lethality might be capable of causing human extinction.** While such an event seems unlikely today, the likelihood may increase as biotechnologies continue to improve at a rate rivaling Moore's Law. Farther out in time are technologies that remain theoretical but might be developed this century. Molecular nanotechnology could allow the creation of self-replicating machines capable of destroying the ecosystem. And advances in neuroscience and computation might enable improvements in cognition that accelerate the invention of new weapons. A survey at the Oxford conference found that concerns about human extinction were dominated by fears that new technologies would be misused. These emerging threats are especially challenging as they could become dangerous more quickly than past technologies, outpacing society's ability to control them. As H.G. Wells noted, "Human history becomes more and more a race between education and catastrophe." Such remote risks may seem academic in a world plagued by immediate problems, such as global poverty, HIV, and climate change. But as intimidating as these problems are, they do not threaten human existence. In discussing the risk of nuclear winter, Carl Sagan emphasized the astronomical toll of human extinction: A nuclear war imperils all of our descendants, for as long as there will be humans. Even if the population remains static, with an average lifetime of the order of 100 years, over a typical time period for the biological evolution of a successful species (roughly ten million years), we are talking about some 500 trillion people yet to come. By this criterion, the stakes are one million times greater for extinction than for the more modest nuclear wars that kill "only" hundreds of millions of people. There are many other possible measures of the potential loss--including culture and science, the evolutionary history of the planet, and the significance of the lives of all of our ancestors who contributed to the future of their descendants. **Extinction is the undoing of the human enterprise.** There is a discontinuity between risks that threaten 10 percent or even 99 percent of humanity and those that threaten 100 percent. For disasters killing less than all humanity, there is a good chance that the species could recover. **If we value future human generations, then reducing extinction risks should dominate our considerations**. Fortunately, most measures to reduce these risks also improve global security against a range of lesser catastrophes, and thus deserve support regardless of how much one worries about extinction. These measures include: Removing nuclear weapons from hair-trigger alert and further reducing their numbers; Placing safeguards on gene synthesis equipment to prevent synthesis of select pathogens; Improving our ability to respond to infectious diseases, including rapid disease surveillance, diagnosis, and control, as well as accelerated drug

development; Funding research on asteroid detection and deflection, "hot spot" eruptions, methane hydrate deposits, and other catastrophic natural hazards; Monitoring developments in key disruptive technologies, such as nanotechnology and computational neuroscience, and developing international policies to reduce the risk of catastrophic accidents.

Prioritize even a 1% risk of extinction—the value of the lives saved is massive and outweighs.

Bostrom 13—philosophy @ University of Oxford (Nick, 2013, Global Policy, Volume 4, Issue 1, "Existential Risk Prevention as Global Priority," http://www.existential-risk.org/concept.pdf, rmf)

Holding probability constant, risks become more serious as we move toward the upper-right region of Figure 2. For any fixed probability, existential risks are thus more serious than other risk categories. But just how much more serious might not be intuitively obvious. One might think we could get a grip on how bad an existential catastrophe would be by considering some of the worst historical disasters we can think of—such as the two world wars, the Spanish flu pandemic, or the Holocaust—and then imagining something just a bit worse. Yet if we look at global population statistics over time, we find that these horrible events of the past century fail to register (Figure 3). But even this reflection fails to bring out the seriousness of existential risk. **What makes existential catastrophes especially bad** is not that they would show up robustly on a plot like the one in Figure 3, causing a precipitous drop in world population or average quality of life. Instead, their significance **lies primarily in the fact that they would destroy the future**. The philosopher Derek Parfit made a similar point with the following thought experiment: I believe that if we destroy mankind, as we now can, this outcome will be much worse than most people think. Compare three outcomes: 1. Peace. 2. A nuclear war that kills 99 per cent of the world's existing population. 3. A nuclear war that kills 100 per cent. 2 would be worse than 1, and 3 would be worse than 2. Which is the greater of these two differences? Most people believe that the greater difference is between 1 and 2. I believe that the difference between 2 and 3 is very much greater. The Earth will remain habitable for at least another billion years. Civilisation began only a few thousand years ago. If we do not destroy mankind, these few thousand years may be only a tiny fraction of the whole of civilised human history. The difference between 2 and 3 may thus be the difference between this tiny fraction and all of the rest of this history. If we compare this possible history to a day, what has occurred so far is only a fraction of a second (Parfit, 1984, pp. 453–454). **To calculate the loss associated with an existential catastrophe, we must consider how much value would come to exist in its absence.** It turns out that the ultimate potential for Earth-originating intelligent life is literally astronomical. One gets a large number even if one confines one's consideration to the potential for biological human beings living on Earth. If we suppose with Parfit that our planet will remain habitable for at least another billion years, and we assume that at least one billion people could live on it sustainably, then the potential exist for at least 10^{16} human lives of normal duration. **These lives could also be considerably better than the average contemporary human life, which is so often marred by disease, poverty, injustice, and various biological limitations that could be partly overcome through continuing technological and moral progress.** However, **the relevant figure is not how many people could live on Earth but how many descendants we could have in total**. One lower bound of the number of biological human life-years in the future accessible universe (based on current cosmological estimates) is 10^{34} years.7 Another estimate, which assumes that

future minds will be mainly implemented in computational hardware instead of biological neuronal wetware, produces a lower bound of 10^{54} human-brain-emulation subjective life-years (or 10^{71} basic computational operations) (Bostrom, 2003).8 If we make the less conservative assumption that future civilisations could eventually press close to the absolute bounds of known physics (using some as yet unimagined technology), we get radically higher estimates of the amount of computation and memory storage that is achievable and thus of the number of years of subjective experience that could be realised.9 Even if we use the most conservative of these estimates, which entirely ignores the possibility of space colonisation and software minds, we find that **the expected loss of an existential catastrophe is greater than the value of 10^{16} human lives.** This implies that the expected value of reducing existential risk by a mere one millionth of one percentage point is at least a hundred times the value of a million human lives. The more technologically comprehensive estimate of 10^{54} humanbrain-emulation subjective life-years (or 10^{52} lives of ordinary length) makes the same point even more starkly. Even if we give this allegedly lower bound on the cumulative output potential of a technologically mature civilisation a mere 1 per cent chance of being correct, we find that **the expected value of reducing existential risk by a mere one billionth of one billionth of one percentage point is worth a hundred billion times as much as a billion human lives**. One might consequently argue that even the tiniest reduction of existential risk has an expected value greater than that of the definite provision of any 'ordinary' good, such as the direct benefit of saving 1 billion lives. And, further, that the absolute value of the indirect effect of saving 1 billion lives on the total cumulative amount of existential risk—positive or negative—is almost certainly larger than the positive value of the direct benefit of such an action.10

Util good—best and most moral decision calculus.

Bostrom 02—philosophy @ University of Oxford (Nick, 2002, "Existential Risks Analyzing Human Extinction Scenarios and Related Hazards," http://www.nickbostrom.com/existential/risks.html, rmf)

Previous sections have argued that **the combined probability of the existential risks is very substantial**. Although there is still a fairly broad range of differing estimates that responsible thinkers could make, it is nonetheless arguable that because the negative utility of an existential disaster is so enormous, **the objective of reducing existential risks should be a dominant consideration when acting out of concern for humankind as a whole**. It may be useful to adopt the following **rule of thumb** for moral action; we can call it Maxipok: **Maximize the probability of an okay outcome, where an "okay outcome" is any outcome that avoids existential disaster.** At best, this is a rule of thumb, a prima facie suggestion, rather than a principle of absolute validity, since there clearly are other moral objectives than preventing terminal global disaster. Its usefulness consists in helping us to get our priorities straight. Moral action is always at risk to diffuse its efficacy on feel-good projects[24] rather on serious work that has the best chance of fixing the worst ills. The cleft between the feel-good projects and what really has the greatest potential for good is likely to be especially great in regard to existential risk. Since the goal is somewhat abstract and since existential risks don't currently cause suffering in any living creature[25], there is less of a feel-good dividend to be derived from efforts that seek to reduce them. This suggests an offshoot moral project, namely to reshape the popular moral perception so as to give more credit and social approbation to those who devote their time and resources to benefiting humankind via global safety compared to other philanthropies. Maxipok, a kind of satisficing rule, is different from Maximin ("Choose the action that has the best worst-case outcome.")[26]. Since we cannot completely eliminate existential risks (at any moment we could be sent into the dustbin of cosmic history by the advancing front of a vacuum phase transition triggered in a remote galaxy a billion years ago) using maximin in the present context has the consequence that we should choose the act that has

the greatest benefits under the assumption of impending extinction. In other words, maximin implies that we should all start partying as if there were no tomorrow. While that option is indisputably attractive, it seems best to acknowledge that **there just might**

WASHINGTON — After years of complaints by passengers and members of Congress, the Transportation Security Administration said Friday that it would begin removing the controversial full-body scanners that produce revealing images of airline travelers beginning this summer. The agency said it canceled a contract, originally worth $40 million, with the maker of the scanners, Rapiscan, after the company failed to meet a Congressional deadline for new software that would protect passengers' privacy. Since going into widespread use nearly three years ago, the scanners have been criticized by passengers for being too invasive and are the subject of lawsuits from privacy groups. The T.S.A. began deploying the scanners in 2010, after an attempt by Umar Farouk Abdulmutallab, a Nigerian citizen, to blow up a Detroit-bound Northwest Airlines flight by setting off explosives hidden in his underwear. The T.S.A. said that 174 of the machines are currently being used at airport checkpoints around the country. Another 76 are housed at a storage facility in Texas. Rapiscan will be required to pay for removing the scanners. In a statement, Deepak Chopra, the company's president, said the decision to cancel the contract and remove the scanners was a "a mutually satisfactory agreement with the T.S.A." The company said that scanners would be used at other government agencies. The removal of the Rapiscan scanners does not mean that all full-body scanners will be removed from airport security checkpoints. A second type of full-body scanner does not produce revealing images. Instead, it makes an avatar-like projection on security screens. The T.S.A. said those machines, which should be in airports by June, will allow quicker scans than those using X-rays. "This means faster lanes for the traveler and enhanced security," the agency said.

TSA is key to protect against dangerous weapons, explosives, and innovate in security technologies.

John S. **Pistole,** 3-5-20**12**, "Counterterrorism, Risk-Based Security and TSA's Vision for the Future of Aviation Security," Transportation Security Administration, https://www.tsa.gov/press/speeches/counterterrorism-risk-based-security-and-tsa%E2%80%99s-vision-future-aviation-security

Remember that before September 11, 2001, there was:¶ No cohesive system in place to check passenger names against terrorist watch lists in advance of flying;¶ Only limited technologies in place for uncovering a wide array of threats to passengers or aircraft;¶ No comprehensive federal requirements to screen checked or carry-on baggage;¶ Minimal in-flight security on most flights; and,¶ From a coordination standpoint, before 9/11 there was a lack of timely intelligence-sharing, in both directions — from the federal level down to the individual airports, as well as from an individual airport up to the national level.¶ I came to TSA more than a year and a half ago, having worked the previous 26 years in a variety of positions within the FBI. That experience with a range of partners inside the law enforcement and intelligence communities helped shape my approach to solidifying TSA's place within the national counterterrorism continuum.¶ Every day, we strive to ensure our operational planning and decision making process is timely, efficient and as coordinated as possible — and critically, based on intelligence. We work to share critical information with key industry stakeholders whenever appropriate, and we are constantly communicating with our frontline officers through shift briefings held several times a day.¶ Thanks to the effective partnerships we've forged with industry stakeholders, with our airline and airport partners, and with law enforcement colleagues at every level, TSA has achieved a number of significant milestones during its first 10 years of service.¶ These include matching 100 percent of all passengers flying into, out of, and within the United States against government watch lists through the Secure Flight program.¶ It includes screening all air cargo transported on passenger planes domestically and, as you know, we work closely with our international partners every day to screen 100% of high-risk inbound cargo on passenger planes. We're also working hard with these same partners to screen 100% of allinternational inbound cargo on passenger planes by the end of this year.¶ And it also includes improving aviation security through innovative technology that provides advanced baggage screening for explosives.¶ Since their inception in 2005 through February 2012, we have also conducted more than 26,000 Visible Intermodal Prevention and Response or VIPR operations. We have 25 multi-modal VIPR teams working in transportation sectors across the country to prevent or disrupt potential terrorist planning activities.¶ Additionally, since 2006, TSA has completed more than 190 Baseline Assessments for Security Enhancement for transit, which provides a comprehensive assessment of security programs in critical transit systems.¶ We are seeing the benefits of how these important steps — combined with our multiple layers of security including cutting-edge technology — keep America safe every day.¶ Since our standup in 2002, we have screened nearly six billion passengers. Our front line officers have detected thousands of firearms and countless other prohibited items and we have prevented those weapons from entering the cabin of an aircraft.¶ In fact, more than 10 years after 9/11, TSA officers still detect, on-average, between three and four firearms every day in carry-on bags at security checkpoints around the country.¶ Deploying advanced, state-of-the-art technologies continue to factor significantly into our multi-layered approach to transportation security. In particular, we continue to see the efficacy of Advanced Imaging Technology, or AIT, machines at hundreds of passenger security checkpoints around the United States.¶ From February 2011 to June 2011, the Office of the Inspector General (OIG) assessed the manner in which TSA inspects, maintains and operates backscatter units used in passenger screening.¶ The OIG found that TSA was in compliance with standards regarding radiation exposure limits and safety requirements. As a result of intensive research, analysis, and testing, TSA concludes that potential health risks from screening with backscatter X-ray security systems are minuscule.¶ While there is still no

perfect technology, AIT gives our officers the best opportunity to detect both metallic and non-metallic threats including improvised explosive devices such as the device Umar Farouk Abdulmutallab attempted to detonate on Christmas Day, 2009.¶ As manufacturers continue enhancing the detection capability and strengthening the privacy features of their machines, we maintain the ability to upgrade the software used on them to stay ahead of the rapidly shifting threat landscape. Maintaining a high level of adaptability enables us to keep an important technological advantage.¶ Throughout 2011, this and other technologies helped our officers detect hundreds of prohibited, dangerous, or illegal items on passengers.¶ These "good catches" as we call them, illustrate how effective our people, process and technology are at finding concealed metallic and non-metallic items concealed on a passenger or in their bags.¶ In an ongoing effort to help educate the traveling public, we highlight many of these good catches every week in blog posts uploaded to TSA.gov. I hope some of you have seen these. They have included incidents of items concealed in shoes, to weapons hidden in a hollowed out book, to ceramic knives, to exotic snakes strapped to a passenger's leg. As strange as some of these tales may be, they are a stark reminder that now — more than 10 years after the September 11, 2001, attacks — people are still trying to bring deadly weapons onto aircraft. And our officers are detecting numerous weapons every day and keeping them off of planes.¶ Less than one month ago in fact, over Presidents Day weekend in February, our officers detected 19 guns in carry-on bags at various checkpoints around the country. In total, 1,306 guns were detected at airport checkpoints in 2011.

TSA had a busy year in 2014, screening more than 653 million passengers in 2014 (about 1.8 million per day), which is 14.8 million more passengers than last year.∂ 2,212 firearms were discovered in carry-on bags at checkpoints across the country, averaging more than six firearms per day. Of those, 1,835 (83 percent) were loaded. Firearms were intercepted at a total of 224 airports; 19 more airports than last year.∂ There was a 22 percent increase in firearm discoveries from last year's total of 1,813.

New technology has lowered transportation costs and increased trade and capital flows across nations. But the same technology that has fostered international economic growth has also allowed terrorism to spread easily among countries whose interests are tightly interwoven. Terrorism is no longer solely a local issue. Terrorists can strike from thousands of miles away and cause vast destruction. The effects of terrorism can be terrifyingly direct. People are kidnapped or killed. Pipelines are sabotaged. Bombers strike markets, buses, and restaurants with devastating effect. But terrorism inflicts more than human casualties and material losses. It can also cause serious indirect harm to countries and economies by increasing the costs of economic transactions—for example, because of enhanced security measures to ensure the safety of employees and customers or higher insurance premiums. Terrorist attacks in Yemen on the USS Cole in 2000 and on the French tanker Limburg in 2002 seriously damaged that country's shipping industry. These attacks contributed to a 300 percent rise in insurance premiums for ships using that route and led ships to bypass Yemen entirely (Enders and Sandler, 2012). In this article we explore the economic burden of terrorism. It can take myriad forms, but we focus on three: national income losses and growth-[slowing]~~retarding~~ effects, dampened foreign direct investment, and disparate effects on international trade.

The Screening Process∂ Private Screening: Screening can be conducted in a private screening area with a witness or companion of the traveler’s choosing. A traveler may request private screening or to speak with a supervisor at any time during the screening process.∂ Travel Document Checker: The traveler will show their government-issued identification and boarding pass to an officer to ensure the identification and boarding pass are authentic and match. Transgender travelers are encouraged to book their reservations such that they match the gender and name data indicated on the government-issued ID.∂ Walk Through Metal Detector: Metal detectors are in use at all airports.∂ Advanced Imaging Technology (AIT): Screening with advanced imaging technology is voluntary and travelers may “opt out” at any time. Travelers who “opt out” of the AIT screening are required to undergo a thorough pat-down by an officer of the same gender as the traveler presents.∂ New Advanced Imaging Technology Software: TSA has upgraded all millimeter wave advanced imaging technology units with new software called Automated Target Recognition to further enhance privacy protections by eliminating the image of an actual traveler and replacing it with a generic outline of a person.

Speaking For Others

Speaking on behalf of trans people is bad – reinforces this generic/simplistic narrative.

McBee '12 (Thomas Page; 8/6/12; former masculinity expert for Vice; Salon, "Trans, but not like you think" http://www.salon.com/2012/08/07/trans_but_not_like_you_think/)

Just last week I got a birth certificate from North Carolina Vital Records that put a state seal on a tale that began before I could talk. "Thomas Page McBee," it says, under "Certificate of Live Birth," and then, there's the word I spent thousands of dollars, a major surgery, two trips to probate court, two physicals, a doctor's letter, plus the 80 oily milligrams of testosterone self-shot into my thigh every week to achieve: male. When I tore open the envelope it took my breath away, much like seeing my reflection every morning — the growing pronouncement of my jaw, the square sideburns, the scruff on my cheek, the pecs and biceps ballooning steadily with each workout — I tear up sometimes, I'm so floored by the rightness of it all. I held my birth certificate, my heart galloping, and I felt born again at the age of 31. Maybe you think you've heard my story before: I knew I wasn't a girl before I knew much of anything. There were the years of private, simmering mirror-hate; the jealous glances at men, the coveting of facial hair and biceps. As trans people become more visible, our stories have narrowed into a neat narrative arc: born in the wrong body, pushed to the brink of suicide/sanity/society, the agonized decision to begin hormone treatment/surgeries for the reward of ending up ourselves and looking "normal," which ends in a lesson about the tenacity of the human spirit, the gorgeous triumph of believing in yourself. This is all true. But for me, and many others, it's also more complicated than that. I don't think I was born in the wrong body. I am not "finally myself." I've never spent a day being anyone else. Mine is another story, a real and complex story, and one, by definition, that's not as easy to tell. - - - - - - - - - - I've been thinking about Lana Wachowski since she released a video clip promoting her new film, "Cloud Atlas," last week. In an age when Chaz Bono yuks it up with David Letterman and the frontman for rock band Against Me! created a frenzy when she came out earlier this year as Laura Jane Grace Gabel, Wachowski surely knew that the video clip would garner attention, requests to be interviewed, before-and-after photos, fans' gushes of loyalty or turncoat transphobia. Even for those lucky trans folks not facing a daily threat of violence, this is a strange time: one where we find our portrayals hovering between soft-focus empathy and tawdry headlines. Despite reportedly being several years into her transition, which has been discussed in print and gossiped about openly since the early-2000s, the famously tight-lipped Wachowski has never addressed her gender identity publicly, even when "raising eyebrows" at red-carpet events in pearl earrings and dresses. So here she is, in this promotional behind-the-scenes video, meant to address the making of her new film. "Hi,

I'm Lana," she says simply, seated beside her directing partner and brother. It's a blink-and-you-miss-it moment, a wide smile and that's it. No baby picture montage, no recounting suicide attempts, no bloody footage of surgery. Hers is not that kind ,.of story. She goes on to get down to the business at hand. When she describes the new film, her pink dreads shake like flags in the wind. "I'm Lana," she says. I hope that's the sound of a tide turning. - – – – – – – – - Don't get me wrong. Some trans people feel that they've suffered a birth defect, tantamount to a missing limb. For some folks, "trapped in the wrong body" is a precise description. I don't fault anyone their language or their vision of themselves. I don't tell anyone else's story. But I do think that the typical trans narrative — the one you see on talk shows or in long human-interest stories in popular magazines — is dumbed down for your consumption because it's presumed that people who aren't trans don't think about their gender identity. Even more darkly, there's an unspoken assumption: that trans people are strange, untranslatable. There's something so fundamentally confusing about the trans experience, the logic goes, that we need to make our stories really, really palatable for you to understand us. But I've found the opposite to be true. I write a column for the Rumpus exploring themes related to my transition, and the people who email me or the friends who start conversation over drinks about their own genders are almost always not trans. We talk about the ways expectations of masculinity and femininity inform and stifle us, or how we've all grown from teenage bravado informed by those concepts into unique adults, unafraid to be who we are. Because of that sense of dialogue (inevitable Internet trolls and ignorant menace aside), I've come to believe that non-trans folks are not only capable of metabolizing more than the schlocky softball celebrity interviews and stark mirror-in-a-mirror documentary shots, but are hungry for real conversation. Gender is part of everyone's life, we're all negotiating the line between what we're expected to be and who we are. In that spirit, then, I'll tell you the whole story. - – – – – – – – – - I believe I was born in the right body; transgender, yes, but there's nothing "wrong" with me. For 10 years I was a boyish, short-haired kid, as equally interested in skateboards as poetry. As a teenager, I cultivated a guy-but-better gallantry that won me girlfriends and a few manageable bullies. There were signs that the center wouldn't hold: the way I felt caught off-guard if my reflection materialized in a window, my insistence on getting a hot shave at the barber, the ace bandage flattening my chest. Like a lot of people, I understood even at a young age that gender was a spectrum, with "hyper-masculine" and "hyper-feminine" on the extreme poles, and a million shades of potential expression between them. I knew I was masculine, but saw myself as artistic, rebellious, indifferent to alpha posturing. I loved the ruggedness of James Dean and the romanticism of the Beats. For the most part, I felt OK about myself. Anyway, in my baseball hat and jeans, I looked like all the skinny boys I was friends with. I knew I wasn't a woman, not like my girlfriends or sister or mother. Not like my friends, even the tomboy punk-rock straight girls or the swaggering butch lesbians. But I looked at most of the men in my midst and didn't see myself in their jockeying power dynamics or aversion to hugs. Even later, as I befriended guys just as baffled by masculinity as I was, I didn't connect my growing discomfort in my body to the reality of their physical differences. I didn't feel like a man exactly, and I figured, once I knew trans men in college, that hormones weren't for me. It was easier to imagine dressing like the fantasy guy I saw in countless mirrors than it was to imagine an actual life of men's rooms and shoulder claps. It was my breasts that troubled me the most: they were lost pilgrims, afloat on my frustrated body. My attempts to hide them grew more elaborate by the day, and my frustration with their shape made getting dressed an angry hurricane of discarded, too-tight T-shirts. By the time I'd moved to Oakland in my early 20s, I'd decided I would have chest-reconstruction surgery as soon as I could save up enough money to do so. Maybe, I figured, that would fix the growing reality that I no longer "passed" as a teenage boy, that every "ma'am" thrown my way tarnished my sparkle. So, one foggy June morning in 2008, a surgeon sculpted pecs where there once were breasts. I lost, in the process, five pounds of flesh; I awoke feeling a much heavier burden lifted. But something was wrong. I thought maybe I could find peace by lifting weights, jumping rope to keep trim and hide my hips, wearing V-necks that showed off my flat chest. I went swimming shirtless in the Caribbean, trying to occupy some unicorn space. I tried, with growing desperation, to both love my body and be myself. I even wrote about it for Salon: I'm not a man or a woman, I said. But pronouns made me bristle, and I didn't understand yet that I could look like a man and be whomever I wanted on that grand spectrum. I didn't think that, just like you, I have a gender identity that's growing and evolving, that I'm tasked with finding my authentic place in a jumble of stereotypes and expectations. What makes a man? I thought, looking at myself. It was my body that showed me. They call it dysphoria, but it feels to me like watching yourself become a stranger. Maybe you've known you're making a mistake: a bad marriage, the wrong career path, something that becomes clearer and more potent daily. My reflection seemed to be going in the wrong direction: rounding where it shouldn't have been, thinning where it should have thickened. Every trans person has a breaking point, and mine came two years after top surgery, when I expected to see myself and found a woman standing before me, instead. As much as I didn't connect with the cultural expectations of Being a Man, I knew that I'd grown up and become one. I was going to have to figure out how to bridge the gap. I'd done so many sit-ups and spent so much time in quiet reflection, tailoring shirts to fit my bird chest that I knew, in that last-puzzle-piece way of an epiphany, that loving myself meant allowing my body to change. I had a primal sense of home, and I knew exactly what it looked like. My body needed me. A few months later, I began injecting testosterone. - – – – – – – – – - Here we are, over a year later. I love the way my face has blended into

something familiar, how I've met the guy I saw every time I squinted at the mirror. I am indeed the male-bodied version of myself, the same romantic, tattooed guy. I wish I could explain to the 23-year-old looking in the mirror that I needn't have worried: my body knew. My gender hasn't changed since I was a teenager. I'm very much my own man. I don't know how Lana Wachowski feels, but I hope that the relative quiet of both her "introduction" and the reaction to it signal a growing awareness that we're entitled to our stories, however we want to tell them. Maybe we don't need to hand out sugar pills anymore. "I'm Lana," she said, and smiled. It was an act of faith to leave it there, in two words and a shake of that hair. Consider the story told.

Metal Detectors

Metal detectors will still be set off by prosthetics—patdowns will still happen—means they can't solve their impacts

TSA 14

(TSA, 12/22/14, TSA, "Transgender Travelers," https://www.tsa.gov/traveler-information/transgender-travelers, 8/2/15, SM)

Packing a Carry-on: All carry-on baggage must go through the screening process. If a traveler has any medical equipment or prosthetics in a carry-on bag, the items will be allowed through the checkpoint after completing the screening process. Travelers may ask that bags be screened in private if a bag must be opened by an officer to resolve an alarm**. Travelers should be aware that prosthetics worn under the clothing that alarm a walk through metal detector** or appear as an anomaly during Advanced Imaging Technology (AIT) screening **may result in additional screening, to include a thorough pat-down**. Travelers may request a private screening at any time during the security screening process.

Metal detectors would still pick up binding materials and prostheses

You have the right to wear what you wish. Certain types of clothing, shoes, binding materials, prostheses or jewelry may cause you to receive additional scrutiny. Remove outerwear before you get to the security checkpoint. Airport metal detectors are extremely sensitive and may be set off by piercing jewelry, underwire or metal boning in clothing, and many shoes.

Framing

Preventing extinction outweighs structural violence

Bostrom 12

(Mar 6, Nick, director of the Future of Humanity Institute at Oxford, recipient of the 2009 Gannon Award, "We're Underestimating the Risk of Human Extinction," interview with Ross Andersen, freelance writer in D.C., http://www.theatlantic.com/technology/archive/2012/03/were-underestimating-the-risk-of-human-extinction/253821/)

Some have argued that we ought to be directing our resources toward humanity's existing problems, rather than future existential risks, because many of the latter are highly improbable. You have responded by suggesting that existential risk mitigation may in fact be a dominant moral priority over the alleviation of present suffering. Can you explain why? Bostrom: Well suppose you have a moral view that counts future people as being worth as much as present people. You might say that fundamentally it doesn't matter whether someone exists at the current time or at some future time, just as many people think that from a fundamental moral point of view, it doesn't matter where somebody is spatially---somebody isn't automatically worth less because you move them to the moon or to Africa or something. A human life is a human life. If you have that moral point of view that future generations matter in proportion to their population numbers, then you get this very stark implication that existential risk mitigation has a much higher utility than pretty much anything else that you could do. There are so many people that could come into existence in the future if humanity survives this critical period of time---we might live for billions of years, our descendants might colonize billions of solar systems, and there could be billions and billions times more people than exist currently. Therefore, even a very small reduction in the probability of realizing this enormous good will tend to outweigh even immense benefits like eliminating poverty or curing malaria, which would be tremendous under ordinary standards.

Webster's 10 Webster's New World College Dictionary Copyright © 2010 by Wiley Publishing, Inc., Cleveland, Ohio. Used by arrangement with John Wiley & Sons, Inc. http://www.yourdictionary.com/curtail#websters

Curtail transitive verb
to cut short; reduce; abridge

2. THE PLAN DOES NOT CURTAIL—the aff would just switch everyone over to metal detectors—that's still surveillance

3. THE AFFIRMATIVE INTERPRETATION IS BAD FOR DEBATE

Limits are necessary for negative preparation and clash, and their interpretation makes the topic too big. It allows any aff that just changes their surveillance protocol. For example it would allow an aff that would change the NSA backdoor program to a front door programs.

4. T IS A VOTER because the opportunity to prepare promotes better debating

Research is used to commodify pain narratives and damage representations to reproduce oppression with the justification of the academy

Tuck and Yang 14 [Eve, & K.W., 2014, "R-Words: Refusing Research." In n D. Paris & M. T. Winn (Eds.) Humanizing research: Decolonizing qualitative inquiry with youth and communities https://faculty.newpaltz.edu/evetuck/files/2013/12/Tuck-and-Yang-R-Words_Refusing-Research.pdf]

Urban communities, and other disenfranchised communities. Damage-centered researchers may operate, even benevolently, within a theory of change in which harm must be recorded or proven in order to

convince an outside adjudicator that reparations are deserved. These reparations presumably take the form of additional resources, settlements, affirmative actions, and other material, political, and sovereign adjustments. Eve has described this theory of change as both colonial and flawed, because it relies upon Western notions of power as scarce and concentrated, and because it requires disenfranchised communities to posi-tion themselves as both singularly defective and powerless to make change (2010). Finally, Eve has observed that "won" reparations rarely become reality, and that in many cases, communities are left with a narrative that tells them that they are broken.Similarly, at the center of the analysis in this chapter is a concern with the fixation social science research has exhibited in eliciting pain stories from com-munities that are not White, not wealthy, and not straight. Academe's demon-strated fascination with telling and retelling narratives of pain is troubling, both for its voyeurism and for its consumptive implacability. Imagining "itself to be a voice, and in some disciplinary iterations, the voice of the colonised" (Simpson, 2007, p. 67, emphasis in the original) is not just a rare historical occurrence in anthropology and related fields. We observe that much of the work of the academy is to reproduce stories of oppression in its own voice. At first, this may read as an intolerant condemnation of the academy, one that refuses to forgive past blunders and see how things have changed in recent decades. However, it is our view that while many individual scholars have cho-sen to pursue other lines of inquiry than the pain narratives typical of their disciplines, novice researchers emerge from doctoral programs eager to launch pain-based inquiry projects because they believe that such approaches embody what it means to do social science. The collection of pain narratives and the theories of change that champion the value of such narratives are so prevalent in the social sciences that one might surmise that they are indeed what the academy is about. In her examination of the symbolic violence of the academy, bell hooks (1990) portrays the core message from the academy to those on the margins as thus: No need to hear your voice when I can talk about you better than you can speak about yourself. No need to hear your voice. Only tell me about your pain. I want to know your story. And then I will tell it back to you in a new way. Tell it back to you in such a way that it has become mine, my own. Re-writing you I write myself anew. I am still author, authority. I am still colonizer the speaking subject and you are now at the center of my talk. (p. 343) Hooks's words resonate with our observation of how much of social science research is concerned with providing recognition to the presumed voiceless, a recognition that is enamored with knowing through pain. Further, this passage describes the ways in which the researcher's voice is constituted by, legitimated by, animated by the voices on the margins. The researcher-self is made anew by telling back the story of the marginalized/subaltern subject. Hooks works to untangle the almost imperceptible differences between forces that silence and forces that seemingly liberate by inviting those on the margins to speak, to tell their stories. Yet the forces that invite those on the margins to speak also say, "Do not speak in a voice of resistance. Only speak from that space in the margin that is a sign of deprivation, a wound, an unfulfilled longing. Only speak your pain" (hooks, 1990, p. 343).

{YOU CAN INSERT THE ALT OF YOUR CHOOSING HERE; THIS JUST AN EXAMPLE} We must not attempt to redeem this world but refuse the demand for redemption, of ourselves or this world. Instead we need to tear everything down. Do not ask what will come next. The world beyond cannot be access except through a refusal to be held hostage to this one.

Halberstam 13 [Jack Halberstam, Prof. English @ USC, 2013, "The Wild Beyond: With and For the Undercommons" in The Undercommons: Fugitive Planning & Black Study, p. 5-6]

It ends with love, exchange, fellowship. It ends as it begins, in motion,¶ in between various modes of being and belonging, and on the way to¶ new economies of giving, taking, being with and for and it ends with¶ a ride in a Buick Skylark on the way to another place altogether. Surprising,¶ perhaps, after we have engaged dispossession, debt, dislocation¶ and violence. But not surprising when you have understood that¶ the projects of "fugitive planning and black study" are mostly about¶ reaching out to find connection; they are about making common¶ cause with the brokenness of being, a brokenness, I would venture to¶ say, that is also blackness, that remains blackness, and will, despite all,¶ remain broken because this book is not a prescription for repair. If we do not seek to fix what has been broken, then what? How do we resolve¶ to live with brokenness, with being broke, which is also what Moten¶ and Harney call "debt." Well, given that debt is

sometimes a history of¶ giving, at other times a history of taking, at all times a history of capitalism¶ and given that debt also signifies a promise of ownership but never delivers¶ on that promise, we have to understand that debt is something that¶ cannot be paid off. Debt, as Harney puts it, presumes a kind of individualized¶ relation to a naturalized economy that is predicated upon exploitation.¶ Can we have, he asks, another sense of what is owed that does not¶ presume a nexus of activities like recognition and acknowledgement,¶ payment and gratitude. Can debt "become a principle¶ of elaboration"? Moten links economic debt to the brokenness of being in the interview¶ with Stevphen Shukaitis; he acknowledges that some debts¶ should be paid, and that much is owed especially to black people by¶ white people, and yet, he says: "I also know that what it is that is¶ supposed to be repaired is irreparable. It can't be repaired. **The only¶ thing we can do is tear this shit down completely and build something¶ new."** The undercommons do not come to pay their debts, to¶ repair what has been broken, to fix what has come undone.¶ If you want to know what the undercommons wants, what Moten¶ and Harney want, what black people, indigenous peoples, queers and¶ poor people want, what we (the "we" who cohabit in the space of the¶ undercommons) want, it is this – **we cannot be satisfied with the recognition¶ and acknowledgement generated by the very system that¶ denies** a) that anything was ever broken and b) that we deserved to¶ be the broken part; so **we refuse to ask for recognition** and instead we¶ want to **take apart, dismantle, tear down the structure** that, right now,¶ limits our ability to find each other, to see beyond it and to access the¶ places that we know lie outside its walls. We cannot say what new¶ structures will replace the ones we live with yet, because once we have¶ torn shit down, we will inevitably see more and see differently and¶ feel a new sense of wanting and being and becoming. What we want¶ after "the break" will be different from what we think we want before¶ the break and both are necessarily different from the desire that issues¶ from being in the break.

Refusal is the first step to the undercommons

Halberstam 13 [Jack Halberstam, Prof. English @ USC, 2013, "The Wild Beyond: With and For the Undercommons" in The Undercommons: Fugitive Planning & Black Study, p. 8]

The path to the wild beyond is paved with refusal. In The Undercommons¶ if we begin anywhere, we begin with **the right to refuse what has¶ been refused to you.** Citing Gayatri Spivak, Moten and Harney call¶ this refusal the "first right" and it is a game-changing kind of refusal¶ in that it signals the refusal of the choices as offered. We can understand¶ this refusal in terms that Chandan Reddy lays out in Freedom¶ With Violence (2011) – for Reddy, gay marriage is the option that cannot¶ be opposed in the ballot box. While we can circulate multiple critiques¶ of gay marriage in terms of its institutionalization of intimacy,¶ when you arrive at the ballot box, pen in hand, you only get to check¶ "yes" or "no" and the no, in this case, could be more damning than the¶ yes. And so, you must refuse the choice as offered.

We should view trans individuals holistically—they are not victims and their identity should not predicated off of their victimhood

In my opinion, allies are an important component of any group. They add numbers, they add voices, and in some cases, they bring a certain amount of power that is lacking because of the way that a particular group is seen in the "mainstream," where the group is trying to gain at least equality, if not acceptance.∂That last contribution is unfortunate, but true. Without allies, many groups would not be able to move forward as rapidly and as successfully as they do with outside support. Allies are an important component of any movement. I have written about allies before, but I think it's always a good time to revisit the topic, so I would like to outline what I consider to be five important attributes of trans allies:∂1. A trans ally acknowledges his/her/hir own power and privilege and is aware of it, but also acknowledges ours. In other words, a trans ally understands that **we are not victims and don't need rescuing**, but also understands that the support of allies is beneficial to our community.∂Trans allies prefer to help us develop and utilize our personal power in situations where they have it and we don't, rather than take over and wield their own power while we are silenced. I have done many co-presentations with non-trans allies (who are all fantastic, by the way), and a couple of time, I have felt almost used as a poster child to make a point about the injustices to which trans people are subjected.∂While I appreciate the recognition of those injustices, and while I appreciate that non-trans people just learning about the topic might be more open to receiving this information from another non-trans person, I also feel that **this drains my own personal power and removes my voice** – and I do have one – from the conversation.∂Of course, not all trans people have the same level of personal power, and for each of us, the amount of power we have depends on the situation at hand. But when we do have it, we need to be able to use it.

Trans experiences should be shared by those who experience it—speaking for others means that some of the information is not conveyed correctly

The aff portrays trans individuals as victims—that places them into a position of receiving pity, which is disempowering and humiliating

Gubb 13

I assure you that trans people, on the whole, are not crazy. We are coherent, sane. We just want something and we're looking to get it. If wanting something is insanity, we'd better lock up everyone on Earth.∂ When **trans people** are treated under the assumption that what they have is a disease, they are not given the respect their choice deserves. **They are subtly shunted into the role of "victim"** which is where most mental health patients reside. **No, we are not victims. We are not sick. We just are who we are. We don't need or want your pity. It'd be** disempowering and humiliating to accept it.∂ First and foremost, we are people.

Placing individuals in the position of the "victim" of the oppressor plays into the politics of wounded attachments. This destroys the ability of the individual to create pragmatic change, as their very identity and agency is based off of the suffering the oppressed places on them

Abbas 2010 [Asma, Professor and Division Head in Social Studies, Political Science, Philosophy at the Liebowitz Center for International Studies at Bard College at Simon's Rock, Liberalism

and Human Suffering: Materialist Reflections on Politics, Ethics, and Aesthetics, London: Palgrave Macmillan, pg. Pg. 133- 136]

There is a fundamental reciprocity between how sufferers represent themselves, or are represented, and the way in which their subjectivities and those of the injurers are theorized in various political programs. Together, they determine the form of agency that is granted to the victim within any paradigm. In many theoretical attempts at redeeming victims, the work of the wounded remains attached to an imputed aspiration for agency modeled on the "health" of the agent qua perpetrator, bystander, and rescuer. Seeing the wounded as agency-impaired affirms the definition of victim as inadequate subject. There can be no justice done to the experience of suffering in its particularity if the only choice is to define it in relation to—even when only as the antithesis of—normalized healthy sovereign action. Critiques of liberalism that build on responses to orientalism and other colonial discourses are suspicious of the mechanics of the identification of victims. For them, the victim status precludes any status beyond that of the object of an action, necessitates powerlessness, and imposes slave morality.20 An inevitable result is the object's own resignation to its "assigned" lack of subjectivity.21 In these criticisms, the question of naming becomes inextricable from representation. It follows that the need and validity of representing the victims, the oppressed, the third world, is doubted and, finally, rejected. However, these challenges still remain attached to a relation to health as agency and to agency as health. An example is the call that victims and agents are not mutually exclusive—something to the effect that victims can be agents, too. Mohanty, for one, tells us of cottage-industry working women in Narsapur who "are not mere victims of the production process, because they resist, challenge, and subvert the process at various junctures."22 What is implicit in the "not mere victim" reaction? It brings to mind Martha Nussbaum's claim that victimization does not preclude "agency."23 Clearly at work in Mohanty's account is a defensiveness that ends up condoning and affirming the dominant notion of agency it opposes. Occupying very different locations on the philosophical spectrum, Mohanty and Nussbaum seem closer in their gut reaction than their avowals would suggest. Why is a victim merely a victim? What does it tell us regarding how we understand victimization? These reactions betray an inability to factor in the mode of practice that is suffering, which may spurn the redemption of the victim on the terms of health and agency, liberal style. These thinkers highlight how voice and representation are so frequently framed in terms of agency, where agency itself becomes linked to representation: the victims or nonagents need representation, and they are redeemed by obviating representation and granting a voice all in one fell swoop. In my view, this link between agency and the authenticity of voice is a dubious one. It is on this suspect convergence that Spivak makes an important intervention. In "Can the Subaltern Speak?" she concludes that the subaltern cannot speak, an answer that, in dismissing Western intellectuals who "make space" for the subaltern to speak, reinstates a project of rethinking representation and the victim's experience. Spivak's analysis is more nuanced than Mohanty's, which rejects the very need and validity of this representation. Spivak takes issue with Foucault's wish to let the subaltern speak "in their own voice," which does not take seriously the notion that they have no voice as yet, and that this speechlessness is what defines the subaltern. She saves the notion of representation by arguing that, in the absence of a language of their own, there is no alternative but to represent the subaltern in a way that is sensitive to their silence.24 As I argued in Chapters 2 and 3, the fetish of voice itself must be subject to a suspicion, since it serves those who thrive on its consolations more than those who are bid speak and must do so in order to write themselves in. This is not to say that that the "victim"—its discursive and material reality—does not need redressal in a liberatory politics. Far from that, one can see it as a representation—a Darstellung and a Vorstellung— that has to itself be a subject of any social theoretical endeavor that is materialist in its imperative to make conditions (for the possibility of change) out of necessities. Liberal fictions and power structures need victims; unwittingly or not, they sustain them as they are themselves nourished by the latter's surplus suffering. Interestingly, the same Nietzsche who inspires a suspicion of the agent is also someone who forces a consideration of the material history, weight, and imperatives of agency, and of the terms and labor of its overcoming. It is more than a coincidence that Nietzsche's transition from the slave revolt in the first essay of On the Genealogy or Morals to the story of guilt, ressentiment, and punishment in the second essay, involves the myth of the doer behind the deed.25 This transition is about suffering. Nietzsche's views on subjects and subjection suggest not merely that there is no doer but that the core of human existence is the suffering of that doing—that the subject is, in any case, subject to itself and its deeds. (As far as the fictive nature of the subject is concerned, Nietzsche drives home the very brutally material nature of fictions— are fictions ever merely fictions?) The centrality of the agent in liberalism's focus on suffering is manifest in the necessity of an agent as the cause or remedy of suffering. This raises the question of which fiction is more enduring in the liberal framework: the agent who causes the injury or the victim who is injured with that agency? In both cases, liberalism's attention is clear. In its keenness to see as good for liberal justice only the suffering that can be traced to a sanctioned agent, it makes victims into objects of the action. While neither of these options exhausts the

possibilities in reality, they do necessitate each other. This is why the agent looms so large, even in the imaginations of critics of liberalism, that it holds the promise, in its potential idealist-linguistic overcoming, of the undoing of the stigmatizing victim identity it spawns. However, the sufferer subjected to the fictions of agency and of the production of injury suffers these fictions through her labors of sustaining and unwriting them.

Only body scanners can detect explosives and other nonmetallic weapons—metal detectors fail

Grabell 11

(Michael, 12/22/11, ProPublica, "Just How Good Are the TSA's Body Scanners?" http://www.propublica.org/article/just-how-good-are-the-tsas-body-scanners, 8/2/15, SM)

The TSA says **the body scanners are the best technology available and an improvement by leaps and bounds over the metal detectors, which cannot detect explosives or other nonmetallic weapons**.∂ The agency says its body scanners have found more than 300 dangerous or illicit items -- everything from a loaded .380-caliber Ruger handgun to exotic snakes that a man tried to smuggle inside his pants.∂ Last month, TSA administrator John Pistole boasted to Congress that a scanner had picked up a piece of Nicorette gum. And in Buffalo recently, a passenger who was caught with a ceramic knife after a pat-down admitted that he had opted out of the scanner because he figured it would find the knife.∂ Although the TSA's machines have yet to find an explosive, screeners frequently come across bottles of alcohol and drugs, which could easily have been a powder or liquid explosive, spokesman Greg Soule said.∂ Two homeland security officials, who asked not be identified speaking about vulnerabilities, said **recent intelligence that terrorists are considering implanting explosives inside their bodies shows that the scanners are forcing would-be suicide bombers to adapt their methods**. The body scanners see only underneath clothing, not inside the body. Carrying out an attack with an implanted weapon, the officials said, would be technically more difficult than if an attacker had a bomb strapped to their chest.

TSA is key to protect against dangerous weapons, explosives, and innovate in security technologies.

John S. **Pistole,** 3-5-20**12**, "Counterterrorism, Risk-Based Security and TSA's Vision for the Future of Aviation Security," Transportation Security Administration, https://www.tsa.gov/press/speeches/counterterrorism-risk-based-security-and-tsa%E2%80%99s-vision-future-aviation-security

Remember that before September 11, 2001, there was:¶ No cohesive system in place to check passenger names against terrorist watch lists in advance of flying;¶ Only limited technologies in place for uncovering a wide array of threats to passengers or aircraft;¶ No comprehensive federal requirements to screen checked or carry-on baggage;¶ Minimal in-flight security on most flights; and,¶ From a coordination standpoint, before 9/11 there was a lack of timely intelligence-sharing, in both directions — from the federal level down to the individual airports, as well as from an individual airport up to the national level.¶ I came to TSA more than a year and a half ago, having worked the previous 26 years in a variety of positions within the FBI. That experience with a range of partners inside the law enforcement and intelligence communities helped shape my approach to solidifying TSA's place within the national counterterrorism continuum.¶ Every day, we strive to ensure our operational planning and decision making process is timely, efficient and as coordinated as possible

— and critically, based on intelligence. We work to share critical information with key industry stakeholders whenever appropriate, and we are constantly communicating with our frontline officers through shift briefings held several times a day.¶ Thanks to the effective partnerships we've forged with industry stakeholders, with our airline and airport partners, and with law enforcement colleagues at every level, TSA has achieved a number of significant milestones during its first 10 years of service.¶ These include matching 100 percent of all passengers flying into, out of, and within the United States against government watch lists through the Secure Flight program.¶ It includes screening all air cargo transported on passenger planes domestically and, as you know, we work closely with our international partners every day to screen 100% of high-risk inbound cargo on passenger planes. We're also working hard with these same partners to screen 100% of allinternational inbound cargo on passenger planes by the end of this year.¶ And it also includes improving aviation security through innovative technology that provides advanced baggage screening for explosives.¶ Since their inception in 2005 through February 2012, we have also conducted more than 26,000 Visible Intermodal Prevention and Response or VIPR operations. We have 25 multi-modal VIPR teams working in transportation sectors across the country to prevent or disrupt potential terrorist planning activities.¶ Additionally, since 2006, TSA has completed more than 190 Baseline Assessments for Security Enhancement for transit, which provides a comprehensive assessment of security programs in critical transit systems.¶ We are seeing the benefits of how these important steps — combined with our multiple layers of security including cutting-edge technology — keep America safe every day.¶ Since our standup in 2002, we have screened nearly six billion passengers. Our front line officers have detected thousands of firearms and countless other prohibited items and we have prevented those weapons from entering the cabin of an aircraft.¶ In fact, more than 10 years after 9/11, TSA officers still detect, on-average, between three and four firearms every day in carry-on bags at security checkpoints around the country.¶ Deploying advanced, state-of-the-art technologies continue to factor significantly into our multi-layered approach to transportation security. In particular, we continue to see the efficacy of Advanced Imaging Technology, or AIT, machines at hundreds of passenger security checkpoints around the United States.¶ From February 2011 to June 2011, the Office of the Inspector General (OIG) assessed the manner in which TSA inspects, maintains and operates backscatter units used in passenger screening.¶ The OIG found that TSA was in compliance with standards regarding radiation exposure limits and safety requirements. As a result of intensive research, analysis, and testing, TSA concludes that potential health risks from screening with backscatter X-ray security systems are minuscule.¶ While there is still no perfect technology, AIT gives our officers the best opportunity to detect both metallic and non-metallic threats including improvised explosive devices such as the device Umar Farouk Abdulmutallab attempted to detonate on Christmas Day, 2009.¶ As manufacturers continue enhancing the detection capability and strengthening the privacy features of their machines, we maintain the ability to upgrade the software used on them to stay ahead of the rapidly shifting threat landscape. Maintaining a high level of adaptability enables us to keep an important technological advantage.¶ Throughout 2011, this and other technologies helped our officers detect hundreds of prohibited, dangerous, or illegal items on passengers.¶ These "good catches" as we call them, illustrate how effective our people, process and technology are at finding concealed metallic and non-metallic items concealed on a passenger or in their bags.¶ In an ongoing effort to help educate the traveling public, we highlight many of these good catches every week in blog posts uploaded to TSA.gov. I hope some of you have seen these. They have included incidents of items concealed in shoes, to weapons hidden in a hollowed out book, to ceramic knives, to exotic snakes strapped to a passenger's leg. As strange as some of these tales may be, they are a stark reminder that now — more than 10 years after the September 11, 2001, attacks — people are still trying to bring deadly weapons onto aircraft. And our officers are detecting numerous weapons every day and keeping them off of planes.¶ Less than one month ago in fact, over Presidents Day weekend in February, our officers detected 19 guns in carry-on bags at various checkpoints around the country. In total, 1,306 guns were detected at airport checkpoints in 2011.

TSA security has made it increasingly difficult for terrorists to sneak explosives onto planes—makes attacks less likely to succeed

(Larry, 11/22/10, Scientific American, "What is the Best Approach to Aviation Security?" http://www.scientificamerican.com/article/aviation-security-ait-pat-down/, 8/2/15, SM)

How much progress has been made with regard to air travel security since 9/11?∂ If you take the long view on this, security has had an effect on the number of hijacking attempts and airline sabotage attempts. There is no question that, as a consequence of screening measures and other factors, **the number of attempts by terrorists has significantly declined over the years**. In the 1970s and 1980s we were looking at a terrorist hijacking or an attempted terrorist sabotage of an aircraft something close to **once a month**. If you look at the post-9/11 environment, clearly there have been plots and failed attempts, but **we're looking at one of these incidents per year.** We have obliged our adversaries to make smaller devices and use exotic substances to try to conceal them, and that renders them far less reliable. Yes, Richard Reid made it onto a plane with his shoe bomb, and Abdulmutallab made it on with his underpants bomb, but the bombs didn't work. So **we've decreased the number of attempts and increased their operational difficulty**. That is a positive result, but we're running into this dilemma now as the devices get smaller and concealment gets better—the terrorists will work this out. The challenge is how do we deal with that in our society in a way that is acceptable to society?

AT 95% Failure Rate

THERE'S STILL 5% OF TERRORISTS WHO COULD GET THROUGH AND DETONATE A BOMB ON AN AIRPLANE. A 95% failure rate is better than a 100% failure rate with metal detectors at detecting nonmetallic weapons. **Metal detectors are no longer enough*. If we get rid of body imaging technology, we leave our country vulnerable to an attack.***

The Red Team test results are high on purpose—they make the tests as difficult humanly possible to identify vulnerabilities—not indicative of real terrorists getting through security

Undercover investigators posing as legitimate airline passengers for TSA and the IG also managed to smuggle fake explosives and other prohibited weapons through checkpoints in 95 percent of trials, the IG reported.∂ ∂ The series of tests were conducted by DHS "Red Teams" who pose as passengers attempting to deliberately defeat TSA airport screeners and technology.∂ ∂ During the latest covert testing, TSA screeners failed 67 out of 70 tests (or 96 percent of the time) performed by Red Team members who were able to get weapons past TSA airport security checkpoints.∂ ∂ **The results aren't altogether surprising because clandestine Red Team tests like this are supposed to stress the screening process in order to improve it**, but such undercover penetration testing since at least 2007 have repeatedly uncovered the same problems. It's the same concept that's central to large scale emergency preparedness drills performed by DHS and other federal and state and local agencies to determine where the "stress points" are in the response to catastrophic events.∂ ∂ TSA's problems in detecting firearms during recent covert penetration testing raises serious concerns given the fact that 2014 was the fifth consecutive year in which TSA screeners discovered record-setting numbers of firearms, 2,212 -- more than six firearms per day -- discovered in carry-on bags at airport security checkpoints across the country, This

represented a 22 percent increase in firearm discoveries from last year's total of 1,813, according to TSA.∂ ∂ The successively record-breaking number of passengers trying to slip by TSA screeners with a handgun in a carry-on bag also comes at a time when the threat of homegrown Islamist jihadists is growing.∂ ∂ Of the 2,212 firearms found in carry-on bags in 2014, 83 percent were loaded and dozens had a round chambered. Firearms were intercepted at a total of 224 airports; 19 more airports than last year.∂ ∂ Of the 1,813 firearms TSA screeners found in carry-on bags in 2013, 1,477 (81 percent) were loaded. Firearms were intercepted at a total of 205 airports with Atlanta on top of the list for the most firearms intercepted (111).∂ ∂ Firearms confiscated by TSA screeners at 199 airports in carry-on bags in 2013 was a 16.5 percent increase (257) over the 1,556 firearms -- or more than four firearms a day -- discovered in 2012. A whopping 78.7 percent (1,215) were loaded and dozens had a round chambered.∂ ∂ The number of handguns confiscated in 2012 was up from the 1,320 handguns discovered by TSA screeners in 2011, which in turn was up from the 1,123 firearms screeners found in 2010.∂ ∂ As in the previous four years, the majority of handguns found in carry-on bags were loaded and many had a bullet chambered.∂ ∂ A record number of firearms discovered in one day was set on June 4, 2014, when 18 firearms were discovered at airports across the country in carry-on bags, breaking the previous record of 13 set in 2013, TSA said.∂ ∂ Among the "artfully concealed" firearms TSA found in 2014 was a disassembled .22 caliber firearm discovered in a carry-on bag at John F. Kennedy International Airport. Various components of the gun were found hidden inside a PlayStation 2 console.∂ ∂ An assault rifle with three loaded magazines was discovered at the Dallas Love Field checkpoint.∂ ∂ A loaded folding-stock rifle with two loaded magazines was discovered in a carry-on bag at Dallas/Fort Worth International Airport.∂ ∂ A 94-year-old man attempted to enter the checkpoint at LaGuardia Airport with a loaded .38 caliber revolver clipped to his belt.∂ ∂ A loaded 380. caliber firearm was discovered strapped to a passenger's ankle after walking through a metal detector at Cincinnati/Northern Kentucky International Airport.∂ ∂ A loaded 380. caliber firearm was discovered in the rear pocket of a San Antonio International Airport passenger during advanced imaging technology screening.∂ ∂ "We know that the adversary innovates and we have to push ourselves to capacity in order to remain one step ahead," a TSA official wrote on the agency's blog in March 2013. "**[O]ur testers often make these covert tests as difficult as possible.**"∂ ∂ In a 2013 hearing on Capitol Hill, then-TSA administrator John Pistole described the **Red Teams as "super terrorists" who know precisely which weaknesses to exploit.**∂ ∂ **"[Testers] know exactly what our protocols are. They can create and devise and conceal items that … not even the best terrorists would be able to do**," Pistole told lawmakers.

Aviation Terrorism Impacts

Aviation terrorism has huge economic repercussions for the US—we would lose $2.5 billion for each day airports are shut down

Balvanyos and Lave 05

(Tunde, Lester B., 9/4/05, University of Southern California, "The Economic Implications of Terrorist Attack on Commercial Aviation in the USA," based upon work supported by the United States Department of Homeland Security through the Center for Risk and Economic Analysis of Terrorism Events (CREATE), http://www.usc.edu/dept/create/assets/002/51831.pdf, 8/2/15, SM)

The air transportation system is an attractive target for terrorists. Using widely available∂ weapons, terrorists could shoot down a passenger airliner. This disruption would be∂ magnified if the attack caused terror in the general population and led government∂ officials, the media, and the public to engage in costly preventive actions. Although∂ various defenses could be mounted against attacks by missiles, rocket propelled grenades,∂ and high powered rifles, no countermeasure could protect against all of them or even be∂ completely successful against MANPADS.∂ The immediate effect of shooting down an airliner would be hundreds of deaths and a∂ cost to the airline of about $1 billion for the aircraft and payments to the survivors of∂ deceased passengers, as well as reduced demand for all air services. Reduction in∂ demand for air services depends on how the government, the media and the general∂ public react to the attack. An unsuccessful attack could generate similar reaction from∂ the public resulting in similar losses in transportation and related business. Closing an∂ airport for more than a few days would throw thousands of people out of work and∂ generate losses to the surrounding businesses and those who depend on the airport and air∂ transport of freight. Closing US airspace immediately after the attack would cause∂ diversion of flights, stranded passengers, and major costs to the airlines and travelers.∂ There are two major components to the economic cost of a successful terrorist attack.∂ The direct cost for the downed aircraft and lives lost would be about $1 billion per∂ aircraft. The indirect cost would result from operating losses to the airlines and loss

of∂ consumer welfare as some people would not fly. These amounts would depend on the∂ length of any interruption in air travel and the public's long term reaction to terrorist∂ threat to flying. The indirect economic cost would be greater then the direct cost and∂ would depend on how the government reacts (investing in countermeasures and/or∂ closing airports) and how the public reacts (measured in reduction in travel demand).∂ While the cost of countermeasures and airport closures can be estimated, the main∂ determinant of long term costs, the reaction of the public, is unpredictable.∂ If a terrorist managed to shoot down a large passenger aircraft and this resulted in∂ grounding all aircraft for 2.5 days (as was the case after 9/11), the loss to the economy∂ would be $1 billion per air craft (including compensation for the dead passengers)∂ (RAND), $1.6 billion in reduced airline and associated spending, and $4.75 billion in∂ losses to business and leisure passengers. The total cost of $6.3 billion per 2.5 days (or∂ $2.5 billion per day) makes a ground attack against commercial aircraft a tempting target.∂ There are few areas in the USA where a lone terrorist with readily available weapons∂ could inflict such a high cost on the economy, and possibly cause widespread terror.∂ We classify the long-term response to a terrorist attack on an airliner into three general∂ scenarios. First, even a successful attack could be regarded as one of the unfortunate∂ aspects of living in the 21st century. Some additional protection would be provided to∂ airports, but air transportation would go on as before. Second, airports and airliners∂ could be given the best available protection against attacks. This second scenario would cover a range of possible defenses. All would include anti-missile defense systems on∂ airliners. In addition, protection against rocket propelled grenades (RPG) and large∂ caliber (LC) rifles would range from improved patrols and security around airports to∂ keeping people far enough away from the airport to keep them out of range. The latter∂ would be impossible for some airports (Chicago Midway) and extremely expensive for∂ others. One example where something like this has been done is that a community∂ adjoining LAX was purchased by the airport and evacuated. However, while these∂ defense measures may serve as deterrent, there is not one sure way of protecting all∂ aircraft from all weapon systems. Therefore, successful attack would still be possible. In∂ the third scenario, all non-military aviation could be suspended for a period ranging from∂ days to years.∂ The first scenario would be least costly, unless the terror attacks managed to bring down∂ more than a few (large aircraft each year. At $1 billion per successful attack, the direct∂ dollar costs would be less than the other two alternatives, assuming that the commercial∂ aviation would operate normally with the same load factors, despite the terror attacks..∂ The second scenario involves equipping all commercial airliners with a laser-jammer∂ system to deter missiles. The ten-year life-cycle cost for developing, installing, operating∂ and supporting laser-jammer countermeasures are estimated to be $40 billion (RAND).∂ This system would be effective against some, but not all shoulder fired missiles, and∂ would not help against RPGs or LC rifles. To guard against the latter, airport security∂ and patrols could be strengthened or, in the extreme, airport perimeters could be extended∂ at least one-mile so that a terrorist at the fence would be at least 1-2 miles away aircraft∂ taking off, landing or taxiing. Flight path would be restricted and flights would be∂ scheduled for daylight hours only. Airports embedded in urban areas would be the∂ hardest to protect. Private vehicles would be barred from the airport. These airport∂ restrictions are likely to be more expensive than equipping all aircraft with∂ countermeasures.∂ The third scenario, ending commercial aviation temporarily, is estimated to cost $2.5∂ billion per day in lost revenue to airlines and their suppliers and losses to passengers as∂ estimated by consumer surplus. In addition, the regional economy around each airport∂ would suffer from lack of business and not being able to ship cargo in or out. Shut down∂ of US exports and imports by air would add to mounting costs. **The national economy∂ would suffer a slower growth rate and reduced productivity from not having air∂ transportation available.∂** **I**f it were possible, the most valuable DHS program would be one that prevented all∂ attacks. That is impossible. If it were possible, the next most attractive program would∂ be one that protected all aircraft in case of an attack. That is impossible; partial∂ protection is possible.The most costly option would be grounding all commercial flights.∂ While these are significant costs, if the public loses confidence in flying and few people∂ are willing to fly, the airline losses and costs to the economy would be higher than the∂ other three programs.

Generic Econ Scenario

Domestic terrorism deters foreign direct investment – even small attacks crush investor confidence

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. "The Toll of Terrorism" http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm

Scaring off investors Increased terrorism in a particular area tends to depress the expected return on capital invested there, which shifts investment elsewhere. This reduces the stock of productive capital and the flow of productivity-enhancing technology to the affected nation. For example, from the mid-1970s through 1991, terrorist

incidents reduced net foreign direct investment in Spain by 13.5 percent and in Greece by 11.9 percent (Enders and Sandler, 1996). In fact, the initial loss of productive resources as a result of terrorism may increase manyfold because potential foreign investors shift their investments to other, presumably safer, destinations. Abadie and Gardeazabal (2008) showed that a relatively small increase in the perceived risk of terrorism can cause an outsized reduction in a country's net stock of foreign direct investment and inflict significant damage on its economy. We analyzed 78 developing economies over the period 1984–2008 (Bandyopadhyay, Sandler, and Younas, 2014) and found that on average **a relatively small increase** in a country's domestic terrorist incidents per 100,000 persons **sharply reduced** net foreign direct investment. There was a similarly large reduction in net investment if the terrorist incidents originated abroad or involved foreigners or foreign assets in the attacked country. We also found that greater official aid flows can substantially offset the damage to foreign direct investment—perhaps in part because the increased aid allows recipient nations to invest in more effective counterterrorism efforts. Most countries that experienced above-average domestic or transnational terrorist incidents during 1970–2011 received less foreign direct investment or foreign aid than the average among the 122 in the sample (see table). It is difficult to assess causation, but the table suggests a troubling association between terrorism and depressed aid and foreign direct investment, both of which are crucial for developing economies. It is generally believed that there are higher risks in trading with a nation afflicted by terrorism, which cause an increase in transaction costs and tend to reduce trade. For example, after the September 11 attacks on New York City and the Washington, D.C., area, the U.S. border was temporarily closed, holding up truck traffic between the United States and Canada for an extended time. Nitsch and Schumacher (2004) analyzed a sample of 200 countries over the period 1960–93 and found that when terrorism incidents in a pair of trading countries double in one year, trade between them falls by about 4 percent that same year. They also found that when one of two trading partners suffers at least one terrorist attack, it reduces trade between them to 91 percent of what it would be in the absence of terrorism. Blomberg and Hess (2006) estimated that terrorism and other internal and external conflicts retard trade as much as a 30 percent tariff. More specifically, they found that any trading partner that experienced terrorism experienced close to a 4 percent reduction in bilateral trade. But Egger and Gassebner (2015) found more modest trade effects. Terrorism had few to no short-term effects; it was significant over the medium term, which they defined as "more than one and a half years after an attack/incident." Abstracting from the impact of transaction costs from terrorism, Bandyopadhyay and Sandler (2014b) found that terrorism may not necessarily reduce trade, because resources can be reallocated. If terrorism disproportionately harmed one productive resource (say land) relative to another (say labor), then resources would flow to the labor-intensive sector. If a country exported labor-intensive goods, such as textiles, terrorism could actually lead to increased production and exportation. In other words, although terrorism may reduce trade in a particular product because it increases transaction costs, its ultimate impact may be either to raise or reduce overall trade. These apparently contradictory empirical and theoretical findings present rich prospects for future study. Of course terrorism has repercussions beyond human and material destruction and the economic effects discussed in this article. Terrorism also influences immigration and immigration policy. The traditional gains and losses from the international movement of labor may be magnified by national security considerations rooted in a terrorism response. For example, a recent study by Bandyopadhyay and Sandler (2014a) focused on a terrorist organization based in a developing country. It showed that the immigration policy of the developed country targeted by the terrorist group can be critical to containing transnational terrorism. Transnational terrorism targeted at well-protected developed countries tends to be more skill intensive: it takes a relatively sophisticated terrorist to plan and successfully execute such an attack. Immigration policies that attract highly skilled people to developed countries can drain the pool of highly skilled terrorist recruits and may cut down on transnational terrorism.

FDI Key to the US Econ

Foreign direct investment competitiveness is vital to sustained economic recovery

Kornecki '13 [L. PhD in Economics, Prof Embry-Riddle Aeronautical University's College of Business. "Inward FDI in the United States and its policy context" Columbia FDI Profiles, 2/4/13 http://www.vcc.columbia.edu/files/vale/documents/US_IFDI_-_FINAL_-_REVISED_Feb_4_2013.pdf]

Inward foreign direct investment (IFDI) represents an **integral part** of the United States (U.S.) economy, with its stock growing from US$ 83 billion in 1980 to US$ **3.5 trillion** in 2011. The United States, which had earlier been primarily a home for multinational enterprises (MNEs) rather than a host for affiliates of foreign MNEs, has become a preferred host country for FDI since the 1980s. Foreign MNEs have contributed robust flows of FDI into diverse industries of the U.S. economy, and total FDI inflows reached US$ 227 billion in 2011, **equivalent to 15% of global inflows**, the single largest share of any economy. Inflows of FDI, with a peak of US$ 314 billion in 2000 and another of US$ 306 billion in 2008, have been an important factor contributing to sustained economic growth in the United States. The recent financial and economic crises negatively impacted FDI flows to the United States and opened a period of major uncertainty. The effectiveness of government policy responses at both the national and international levels in addressing the financial crisis and its economic consequences will play a crucial role for creating favorable conditions for a rebound in FDI inflows. Inward foreign direct investment is an essential component of the U.S. economy, contributing to **production**, **exports** and **high-paying jobs** for the country's workers. As the world's largest economy, the United States is well positioned to participate in the increasingly **competitive international environment** for FDI that has emerged as both advanced and developing economies have recognized the value of such investment. The U.S. hosts the largest stock of IFDI among the world's economies and continues to be at the **top as a destination for** inward FDI flows.

Multiple shocks on econ after terror attacks—foreign direct investment, infrastructure, trade

Sandler and Ender 10

(Todd Sandler, Professor of International Relations and Economics at the University of Southern California, Walter Enders, Bidgood Chair of Economics and Finance at the University of Alabama, July 2010, http://www.utdallas.edu/~tms063000/website/Econ_Consequences_ms.pdf)

Terrorism can impose costs on a targeted country through a number of avenues. Terrorist incidents have economic consequences by diverting foreign direct investment (FDI), destroying infrastructure, redirecting public investment funds to security, or limiting trade. If a developing country loses enough FDI, which is an important source of savings, then it may also experience reduced economic growth. Just as capital may take flight from a country plagued by a civil war (see Collier et al., 2003), a sufficiently intense terrorist campaign may greatly reduce capital inflows (Enders and Sandler, 1996). Terrorism, like civil conflicts, may cause spillover costs 2 among neighboring countries as a terrorist campaign in a neighbor dissuades capital inflows, or a regional multiplier causes lost economic activity in the terrorism-ridden country to resonate throughout the region.1 In some instances, terrorism may impact specific industries as 9/11 did on airlines and tourism (Drakos, 2004; Ito and Lee, 2004). Another cost is the expensive security measures that must be instituted following large attacks – e.g., the massive homeland security outlays since 9/11 (Enders and Sandler, 2006, Chapter 10). Terrorism also raises the costs of

doing business in terms of higher insurance premiums, expensive security precautions, and larger salaries to at-risk employees.

Counterplan Text: The Transportation Security Administration should include transgender competence in its basic training curriculum for airport security screeners and other Transportation Security Officers but should not eliminate body scanning technology.

Restrictions on screening and increased training solve

National Center for Transgender Equality 15 (NCTE, the prime advocates for trans-equality, June 29th, 2015, "A Blueprint for Equality: The Right to Travel (2015)," http://transequality.org/sites/default/files/docs/resources/NCTE_Blueprint_2015_Travel.pdf //MV)

In recent years, many Americans have been disturbed by the decision of the Transportation Security Agency (TSA) to implement airport screening procedures that are far more intrusive than anything previously seen in the United States. These techniques—which often include intrusive body searches of passengers—present especially serious concerns for transgender people, who can be outed against their will only to face bias and harassment. These screening procedures can be especially traumatic for transgender children. In the National Transgender Discrimination Survey—which includes data collected before these more intrusive techniques were introduced—nearly one in five transgender travelers reported having been harassed or disrespected by airport security screeners or other airport workers.1 In 2011, the TSA began phasing in new screening technology that replaces electronic viewing of images of passengers' unclothed bodies with automated detection of potentially hazardous objects. This technology mitigates some privacy concerns but has not changed the frequent use of intrusive pat-downs. NCTE continues to hear troubling stories from transgender travelers about their treatment by TSA, as well as by officials at U.S. border crossings. While NCTE has long worked with TSA to promote better staff training, respond to individual complaints, and educate the trans traveling public, the agency's lack of transparency and persistent use of invasive and unproven security procedures are a continuing cause for concern. Policy Advances • The Transportation Security Administration (TSA) updated all scanners to show only a generic body outline rather than images of passengers' actual bodies. (2013) Needed Policy Changes • **The Transportation Security Administration should adopt more effective and less intrusive airport screening protocols that reduce the frequency of pat-downs and do not require additional screening of transgender travelers based solely on their personal characteristics, prosthetics, or clothing.** • **The Transportation Security Administration should include transgender competence in its basic training curriculum for airport security screeners and other Transportation Security Officers.** • U.S. Customs and Border Protection (CBP) should include transgender competence in its basic training curriculum for CBP agents. See Immigration Reform for more on border enforcement and other immigration policies

HRC 09

(1/11/09, HRC with the Obama-Biden Transition Project, "Amend Standard Operating Procedures for Screening Transgender Travelers," http://otrans.3cdn.net/9b84b65a94186d2175_6dm6bnyc6.pdf, 8/2/15, SM)

Issue∂ Transportation Security Administration's ("TSA") Standard Operating Procedures for screening∂ commercial airline passengers invade the personal and medical privacy of transgender travelers.∂ Short Answer∂ TSA should issue a comprehensive policy amending its Standard Operating Procedures ("SOP") for∂ screening by prohibiting discrimination against transgender individuals, providing transgender∂ individuals a choice as to gender of the screener, and **incorporating transgender-specific concerns∂ into TSA employees' training**.∂ Background∂ Current SOPs used by TSA to ensure that passengers do not bring any contraband materials onto∂ airplanes require that some passengers sacrifice a certain level of privacy in order to ensure the public∂ safety. TSA employees thoroughly screen selected passengers of the same sex for enhanced screening∂ through use of hand-held metal detectors and pat-downs.1∂ TSA has attempted to deal with∂ complaints over time-consuming and privacy-invasive security measures through the adoption of∂ new technologies. Today, TSA also uses next generation x-ray machines, such as the Rapiscan∂ Secure 1000, to perform security on passengers that require enhanced screening because of a∂ perceived "anomaly."∂ Despite these efforts, the current SOPs do not adequately address the privacy concerns of the∂ transgender community. As TSA employees only screen passengers of the same sex, a transgender∂ individual whose identity documents do not match his or her current gender presentation might∂ encounter uncomfortable and embarrassing situations when he or she is searched by a screener who∂ TSA believes to be of the "same sex," regardless of the transgender passenger's preference.2∂ Furthermore, x-ray machines such as the Rapiscan Secure 1000, as well as other advanced imaging∂ technologies used by the TSA, could expose transgender individuals to greater invasions of privacy to∂ a screener of the "same sex" because the machine may expose a transgender individual's bindings,∂ prostheses, or other devices used as part of his or her gender presentation. Although TSA's current∂ SOPs permit individuals with "medical conditions" to take "equipment, aids, and devices…through∂ security checkpoints once cleared through screening," a complete screening may require a∂ transgender individual to remove some or all of these devices in front of the TSA screener in order to∂ clear security.3∂ Given such an embarrassing situation, presenting the transgender individual with a∂ choice as to the gender of the screener would alleviate some of the anxiety of travel.∂ 1∂ TRANSP. SEC. ADMIN., TSA: Passenger Security Checkpoints, http://www.tsa.dhs.gov/travelers/airtravel/∂ assistant/editorial_1049.shtm.∂ 2∂ See id. TSA states that enhanced screening must be performed by a member of the same sex except in "extraordinary∂ circumstances" but does not define what types of extraordinary circumstances qualify.∂ 3∂ TRANSP. SEC. ADMIN., TSA: Travelers with Disabilities and Medical Conditions, http://www.tsa.gov/travelers/airtravel/∂ specialneeds/index.shtm. TSA states that all "[i]tems used to augment the body for medical and cosmetic reasons such as∂ mastectomy products, prosthetic breasts, bras or shells containing gels, saline solution, or other liquids" are permitted∂ through the security checkpoint. Id. ∂ HRC Exec. Recomm./TSA/Screening Trans. Trav.∂ TSA employees are not trained to understand the unique travel concerns of transgender passengers.∂ For example, TSA employees should be explicitly informed that devices used to augment a∂ transgender individual's physical appearance must be permitted through the security checkpoint.∂ **Employees that are not adequately trained to respond to these needs may cause emotional trauma∂ and embarrassment to a transgender traveler, especially in situations where a transgender individual∂ must expose their bindings and prostheses to the TSA screener. TSA screeners should be trained to∂ handle these situations appropriately.**∂ Recommendation∂ The Under Secretary for Border and Transportation Security of the Department of Homeland∂ Security should issue a policy that would prohibit discrimination against transgender travelers solely∂ based on gender identity or expression. In addition, the Under Secretary should issue explicit∂ guidance to its employees on the proper SOPs for transgender passengers and require all TSA∂ security personnel to undergo training with respect to the needs of transgender travelers.

These sorts of policies have a real impact. I've been fairly lucky while flying – I've gone through an extra scan because of TSA agents' gender confusion, but that's it. I have friends who have been searched and interrogated for hours. They've been publicly outed and then had to teach some basic gender theory to TSA agents. **The agents themselves are also put in confusing and uncomfortable situations when they're not**

offered the adequate training on working with trans travelers. Often they have to pat down someone of a different gender, when policy states all pat-downs are supposedly same-gender.♂ NCTE is asking that folks file complaints with the TSA's Office of Civil Rights and Liberties and the Department of Homeland Security Office for Civil Rights and Civil Liberties if they experience discrimination. They're also encouraging folks to share their stories with NCTE to aid in advocacy efforts.

CP Avoids Links to PTX

Avoids the link to politics—Schumer supports training TSA officers to solve individual and sensitive passenger needs

Frischling 12 (Steven, covering aviation and transportation security issues since September 15, 2001, spent more than a decade-and-a-half as a full-time photojournalist, social commerce strategies and solutions for global travel brands, along with researching aviation and transportation security, "Is The TSA's New Passenger Advocate Role A Good Thing?," http://flyingwithfish.boardingarea.com/2012/10/20/is-the-tsas-new-passenger-advocate-role-a-good-thing/ **//rck)**

In introducing the RIGHTS Act Sen. Schumer stated "Since the TSA Won't Voluntarily Put in Place Passenger Advocates, We'll Mandate They Do." Under the RIGHTS Act, the TSA was to establish the Office for Passenger Support, Require a TSA Passenger Advocate be on duty at all times, the agency place visible signage at all checkpoints and gates advising traveling that an Advocate is available, real-time complaint resolution be implemented and that advance notification for passengers with disabilities or medical conditions be pre-arranged for expedited screening that allows for proper screening without causing hardship for the passenger in need of special screening. Following the legislation introduced by Senators Schumer and Collins the TSA has created a new in airport job position, which was recently supported by Homeland Security Secretary Janet Napolitano and approved by the TSA's Office of Security Operations. The new passenger facing position is the Passenger Support Specialist (PSS) Position, which will soon be recruited, trained and deployed into every airport in the United States. The role of the PSS will requires the acting Officer convey the TSA's standard operating procedures to the passenger in need of assistance and clearly explain what that means in any given particular situation. The PSS will act as the primary point of contact for resolving passenger related screening complaints quickly, on site, and enhance the passengers experience with the agency … additionally the PSS on duty must respond to passenger requests for assistance within five minutes. Training for the PSS position will initially be 10 hours, with recurrent 1-to-2 hour sessions. Training for the role of PSS will address understanding the basics of customer service, the individual needs of passengers with disabilities, Civil Rights and enhancing the TSA's public image. The course work for those undertaking the PSS role will have a heavy emphasis on conflict resolution, sensitivity to passengers wit special needs and effective communications.

If a traveler has any medical equipment or prosthetics in a carry-on bag, the items will be allowed through the checkpoint after completing the screening process. Travelers may ask that bags be screened in private if a bag must be opened by an officer to resolve an alarm**. Travelers should be aware that prosthetics worn under the clothing that alarm a walk through metal detector** or appear as an anomaly during Advanced Imaging Technology (AIT) screening **may result in additional screening, to include a thorough pat-down**. Travelers may request a private screening at any time during the security screening process.

The review also was asked to determine if additional risk-based security measures, resource reallocations, new investments or policy changes are necessary. The request came after U.S. Sen. Charles Schumer (D-NY) and Brooklyn District Attorney Ken Thompson urged the DHS secretary to re-evelaute airport security following a gun running scheme at both New York airports by a former Delta Airlines employee who allegedly smuggled 153 weapons, most were purchased in Georgia and headed for Brooklyn, with the help of airline employees on commercial flights. The bust recovered weapons that ranged from AR-15 and AK-47 assault weapons to handguns in December, according to the Brooklyn DA. "When guns are as easy to carry on board a plane as a neck pillow, then we have a serious problem," Schumer said. "Today's announcement by Secretary Johnson is a prompt response and a significant first step to closing the gaping loopholes in airport security, especially with regard to reducing access points and enhancing criminal background checks. More is needed and we will work with DHS and stakeholders to press for further security improvements."

U.S. companies' eagerness to please the EU affects their leverage in a place like Russia or China, and undermines their principled calls for a global Internet. Just as we've seen the emergence of company best practices to minimize how information is censored, we need best practices to minimize risks in where it is stored. Companies should take the following steps: Avoid localizing in a repressive country whenever possible. When Yahoo! entered Vietnam, to meet performance needs without enabling the government's Internet repression, it based its servers in Singapore. Explore global solutions. Companies like Apple and Google have started encrypting more data by default to minimize inappropriate access by any government. This doesn't solve everything, but it's a step forward for user privacy. Minimize exposure. If you must have an in-country presence, take steps to minimize risk by being strategic in what staff and services you locate there. Embrace transparency. A growing number of companies have increased transparency by issuing reports on the number of government requests they receive. They should also publish legal requirements like localization, so that people understand the underlying risks to their data. Work together. Companies should coordinate advocacy in difficult markets through organizations like the Global Network Initiative. Tech companies can take a proactive, collective approach, rather than responding reactively when their case hits the headlines. We can only expect localization demands to increase—and business pressures to pull in the opposite direction. While the political dynamics have shifted, companies should still have respect for human rights—and the strength of the global Internet—at the forefront of decisions over where to store their data.

Big data bad

Big data is ineffective and dangerous

Hardy 13 - Quentin Hardy is a reporter, providing analysis on technology, economics and global business. Citing Kate Crawford, who is a Principal Researcher at Microsoft Research New York City, a Visiting Professor at MIT's Center for Civic Media, and a Senior Fellow at NYU's Information Law Institute. ("Why Big Data Is Not Truth," http://bits.blogs.nytimes.com/2013/06/01/why-big-data-is-not-truth/ 6/1/2013) STRYKER

The word "data" connotes fixed numbers inside hard grids of information, and as a result, it **is easily mistaken for fact**. But including bad product introductions and wars, we have many examples of bad data causing big mistakes. **Big Data raises bigger issues**. The term suggests assembling many facts to create greater, previously unseen truths. It suggests the certainty of math. That promise of certainty has been a hallmark of the technology industry for decades. With Big Data, however, there are even more hazards, some human and some inherent in the technology. Kate Crawford, a researcher at Microsoft Research, calls the problem "Big Data fundamentalism — the idea with larger data sets, we get closer to objective truth." Speaking at a conference in Berkeley, Calif., on Thursday, she identified what she calls "six myths of Big Data." Myth 1: Big Data is New In 1997, there was a paper that discussed the **difficulty of visualizing Big Data**, and in 1999, a paper that discussed the **problems of gaining insight from the numbers in Big Data**. That indicates that two prominent issues today in Big Data, display and insight, had been around for awhile. "But now it's reaching us in new ways," because of the scale and prevalence of Big Data, Ms. Crawford said. That also means it is a widespread social phenomenon, like mobile phones were in the 1990s, that "generates a lot of comment, and then disappears into the background, as something that's just part of life." Myth 2: Big Data Is Objective Over 20 million Twitter messages about Hurricane Sandy were posted last year. That may seem sufficient for a picture of whom the storm affected. However, the 16 percent of Americans on Twitter tend to be younger, more urban and more affluent than the norm. "Very few tweets came out of Breezy Point, or the Rockaways," Ms. Crawford said. "These were very privileged urban stories." And some people, privileged or otherwise, put information like their home addresses on Twitter in an effort to seek aid. That sensitive information is still out there, even though the threat is gone. That means that **most data sets**, particularly where people are concerned, **need references to the context in which they were created**. Myth 3: Big Data Doesn't Discriminate "Big Data is neither color blind nor gender blind," Ms. Crawford said. "We can see how it is used in marketing to segment people." Facebook timelines, stripped of data like names, can still be used to determine a person's ethnicity with 95 percent accuracy, she said. Information like sexual orientation among males is also relatively easy to identify. (Women are tougher to pinpoint.) That information can be used to determine what kind of advertisements, for example, that people receive. It's important to remember that whenever people start creating data sets, these become fallible human tools. "Data is something we create, but it's also something we imagine," Ms. Crawford said. Myth 4: Big Data Makes Cities Smart "**It's only as good as the people using it**," Ms. Crawford said. Many of the sensors that track people as they manage their urban lives come from high-end smartphones, or cars with the latest GPS systems. "Devices are becoming the proxies for public needs," she said, "but **there won't be a moment** where everyone has access to the same technology." In addition, moving cities toward digital initiatives like predictive policing, or creating systems where people are seen, whether they like it or not, can promote lots of tension between individuals and their governments. Sorry, IBM. Take that, Cisco. That goes for you, too, Microsoft, Ms. Crawford's employer. All these big technology companies have Smart Cities initiatives. Myth 5: Big Data Is Anonymous A study published in Nature last March looked at 1.5 million phone records that had personally identifying information removed. It found that just four data points of when and where a call was made could identify 95 percent of individuals. "With just two, you can identify 50 percent of them," Ms. Crawford said. "With a fingerprint, you need 12 data points to identify somebody." Likewise, smart grids can spot when your friends come over. Search engine queries can yield health data that would be protected if it came up in a doctor's office. Myth 6: You Can Opt Out Last December, Instagram, the photo-sharing site, changed its terms of service to allow it to share customer's photos more broadly, even use images in ads. What it didn't have was a paid option, in which a person could, for a fee, not be part of that. Even if that option existed, Ms. Crawford said, this would imply a two-tier system — people who could afford to control their data and those who could not. "Besides," she said, given the ways that information can be obtained in these big systems, "what are the chances that your personal information will never be used?" Before Big Data disappears into the background as another fact of life, Ms. Crawford said, "We need to think about how we will navigate these systems. Not just individually, but as a society."

big data ineffective

Big data doesn't solve disease—predictions are too difficult and the bar for entry is too low

White 15 - Michael White is a systems biologist at the Department of Genetics and the Center for Genome Sciences and Systems Biology at the Washington University School of Medicine in St. Louis, where he studies how DNA encodes information for gene regulation. ("The Ethical Risks of Detecting Disease Outbreaks With Big Data," http://www.psmag.com/health-and-behavior/ethical-risks-of-detecting-disease-outbreaks-with-big-data 2/24/2015) STRYKER

One of the most urgent ethical issues that the researchers identify lies at what they call "the nexus of ethics and methodology." The ethical issue can be reduced to one question: **Do these methods actually work**? Ensuring that the methods work "is an ethical, not just a scientific, requirement," the researchers note. Unlike some other social media experiments, a flawed public health monitoring program can cause serious physical and economic harm to large numbers of people. Digital disease detection programs are relatively easy to set up compared to traditional disease monitoring systems, which means **there is a risk that the bar for entering this field might be dangerously low.** An **under-prediction** of a disease outbreak can result in complacency and lack of preparedness by health officials or the public. An **over-prediction** could cause panic, misallocation of limited supplies of vaccines or medical resources, and, as some reactions to the recent Ebola outbreak demonstrated, damaging stigmatization of people or communities who don't pose a risk. As the physicist Niels Bohr once noted, **prediction is hard**—especially about the future. Big data programs and algorithms often perform well when they're used to "predict" the existing data that was used to help build them, but then do poorly when confronted with new data. That's where digital disease detection tools that use social media data often run into trouble. **Google Flu Trends** looked impressive in its initial report in 2009, where it was used to retroactively predict flu activity of previous years. But it **largely missed the two waves of H1N1 swine flu that hit** later **in 2009**. As the Google Flu researchers wrote, "Internet search behavior changed during pH1N1, particularly in the categories 'influenza complications' and 'term for influenza'"—two search terms that are particularly important in the algorithm. The program also **over-predicted the severity of the 2011-12 flu season by 50 percent**.

Big data doesn't solve healthcare – multiple barriers and empirics prove

**predictive analytics/comparative data are referring to the same idea of large databases with patient information i.e. big data in general

Crockett 14 (David, Ph.D. from University of Colorado in medicine, Senior Director of Research and Predictive Analytics at Health Catalyst, "3 Reasons Why Comparative Analytics, Predictive Analytics, and NLP Won't Solve Healthcare's Problems", https://www.healthcatalyst.com/3-reasons-why-comparative-analytics-predictive-analytics-and-nlp-wont-solve-healthcares-problems/)

Comparative **Data Doesn't Drive Improvement** We've had comparative data for **years** in the U.S. healthcare system and it hasn't moved the needle towards better, at all. In fact, the latest OECD data ranks the U.S. even **worse than we've ever been** on healthcare quality and cost. Comparative data, like the OECD, is interesting and certainly worth looking at, but it's far from enough to drive improvements in an organization down to the individual patient. To drive that sort of change, you have to get your head and hands dirty in your own data ecosystem, not somebody else's that is at best a rough facsimile of your organization. There are too many variables and variations in healthcare delivery right now that add **too much noise** to the data to make comparative analytics as valuable as some pundits advocate. We don't even have an industry standard and clinically precise definition of patients that should be included (and excluded from routine management) in a diabetes registry, much less the other 15 chronic diseases and syndromes we should be managing.

Predictive Analytics Fails to Include Outcomes We've also had predictive analytics supporting risk stratification for years in healthcare, particularly in case management, **but without outcomes data, what are we left to predict**? Readmissions. That's a sad state of affairs. Before we start believing that predictive analytics is going to change the healthcare world, we need to understand how it works, technically and programmatically. Without protocol and patient-specific outcomes data, **predictive analytics is largely vendor smoke and mirrors** in all but a very small number of use cases.

The emergence of AIDS led to a theory that other viruses would spring from tropical rain forests to wreak revenge on humankind for its ecological sins. That, at least, was the implication of Laurie Garrett's 1994 book, The Coming Plague: Newly Emerging Diseases in a World Out of Balance. The most prominent candidate was Ebola, the hemorrhagic fever that starred in Richard Preston's The Hot Zone, published the same year. Writer Stephen King called the book "one of the most horrifying things I've ever read." Right on cue, Ebola appeared again in the Congo in 1995, but it soon disappeared. Far from being a harbinger, HIV was the only new tropical virus to go pandemic in 50 years.¶ In the 1980s British cattle began dying from **mad cow** disease, caused by an infectious agent in feed that was derived from the remains of other cows. When people, too, began to catch this disease, predictions of the scale of the epidemic quickly turned terrifying: Up to 136,000 would die, according to one study. A pathologist warned that the British "have to prepare for perhaps thousands, tens of thousands, hundreds of thousands, of cases of vCJD [new variant Creutzfeldt-Jakob disease, the human manifestation of mad cow] coming down the line." Yet the total number of deaths so far in the UK **has been 176**, with just five occurring in 2011 and none so far in 2012.¶ **In 2003 it was SARS**, a virus from civet cats, that ineffectively but inconveniently led to quarantines in Beijing and Toronto amid predictions of global Armageddon. **SARS subsided within a year**, after killing just 774 people. In 2005 it was bird flu, described at the time by a United Nations official as being "like a combination of global warming and HIV/AIDS 10 times faster than it's running at the moment." The World Health Organization's official forecast was 2 million to 7.4 million dead. In fact, by late 2007, when the disease petered out, the death toll was roughly 200. In 2009 it was Mexican swine flu. WHO director general Margaret Chan said: "It really is all of humanity that is under threat during a pandemic." The outbreak proved to be a normal flu episode.¶The truth is, a new global pandemic is growing less likely, not more. Mass migration to cities means the opportunity for viruses to jump from wildlife to the human species has not risen and has possibly even declined, despite media hype to the contrary. Water- and insect-borne infections—generally the most lethal—**are declining** as living standards slowly improve. It's true that casual-contact infections such as colds are thriving—but **only by being mild enough that their victims can soldier on** with work and social engagements, thereby allowing the virus to spread. Even if a lethal virus does go global, the ability of medical science to sequence its genome and devise a vaccine or cure **is getting better** all the time.

Burnout and variation check

York 14 (Ian, head of the Influenza Molecular Virology and Vaccines team in the Immunology and Pathogenesis Branch of the Influenza Division at the CDC, PhD in Molecular Virology and Immunology from McMaster University, M.Sc. in Veterinary Microbiology and Immunology from the University of Guelph, former Assistant Prof of Microbiology & Molecular Genetics at Michigan State, "Why Don't Diseases Completely Wipe Out Species?" 6/4/2014, http://www.quora.com/Why-dont-diseases-completely-wipe-out-species)

But mostly **diseases don't drive species extinct.** There are **several reasons** for that. For one, the most dangerous diseases are those that spread from one individual to another. If the disease is **highly lethal**, then the population drops, and it becomes **less likely that individuals will contact each other** during the infectious phase. Highly contagious diseases tend to **burn** themselves **out** that way.¶ Probably the main reason is variation. Within the host and the pathogen population there will be a wide range of variants. Some hosts may be **naturally resistant.** Some pathogens will be **less virulent**. And either alone or in combination, you end up with infected individuals who **survive**.¶ We see this in HIV, for example. There is a small fraction of humans who are naturally resistant or altogether immune to HIV, either because of their CCR5 allele or their MHC Class I type. And there are a handful of people who were infected with defective versions of HIV that didn't progress to disease. ¶ We can see indications of this sort of thing happening in the past, because our genomes contain many instances of **pathogen resistance genes** that have **spread through the whole population.** Those all started off as rare mutations that conferred a **strong selection advantage to the carriers,** meaning that the specific infectious diseases were serious threats to the species.

Indicts

Skepticism

You should be generally skeptical of their evidence – it overstates the value of big data – studies prove data is mostly irrelevant now

Aslett 13 (Matt, research director for 451 research, formerly the Deputy Editor of monthly magazine Computer Business Review and ComputerWire's daily news service, "Big data reconsidered: it's the economics, stupid", https://451research.com/report-short?entityId=79479&referrer=marketing)

For the past few years the data management industry has been in the grip of a fever related to 'big data' – a loosely defined term that has been used to describe analysis of large volumes of data, or analysis of unstructured data, or high-velocity data, or social data, or predictive analytics, or exploratory analytics or all of the above – and more besides. The expectations for the potential of big data to revolutionize the data management and analytics industry are **great and inflated**, to the extent that it is easy to become disillusioned. A quick check of recent news **headlines suggests** that big data has the potential to solve world hunger, defeat terrorism, close the gender gap, bring about world peace, cure cancer and identify life on Mars. We don't doubt that data management and analytics will have a critical role to play in efforts related to all those issues, but there is clearly a gap between the potential of big data and the extent to which related technologies have been adopted to date. For example, interviews from TheInfoPro, a service of 451 Research, with storage professionals indicate that big data accounted for just 3% of the total data storage footprint in 2012 – **and the exact same percentage in 2013**. While we believe that the big data trend has the potential to revolutionize the IT industry by enabling new business insight based on previously ignored and underutilized data, it is clear that **big data is also massively over-hyped**.

Ext—Current Freedom Act Solves

New Freedom Act is sufficient to solve US's global credibility gap.

HRW '15

Human Rights Watch is an independent, international organization that works as part of a vibrant movement to uphold human dignity and advance the cause of human rights for all. "Strengthen the USA Freedom Act" - May 19, 2015 - http://www.hrw.org/news/2015/05/19/strengthen-usa-freedom-act

As the Senate considers the USA Freedom Act this week, policymakers should strengthen it by limiting large-scale collection of records and reinforcing transparency and carrying court reforms further. The Senate should also take care not to weaken the bill, and should reject any amendments that would require companies to retain personal data for longer than is necessary for business purposes. It has been two years since the National Security Agency (NSA) whistleblower Edward Snowden unleashed a steady stream of documents that exposed the intention by the United States and the United Kingdom to "collect it all" in the digital age. These revelations demonstrate how unchecked surveillance can metastasize and undermine democratic institutions if intelligence agencies are allowed to operate in the shadows, without robust legal limits and oversight. **On May 13,** the US House of Representatives approved the USA Freedom Act of 2015 by a substantial margin. The bill represents the latest attempt by Congress to rein in one of the surveillance programs Snowden disclosed—the NSA's domestic bulk phone metadata collection under Section 215 of the USA Patriot Act. The House vote followed a major rebuke to the US government by the US Court of Appeals for the Second Circuit, which ruled on May 7 that the NSA's potentially nationwide dragnet collection of phone records under Section 215 was unlawful. Section 215 is set to expire on June 1 unless Congress acts to extend it or to preserve specific powers authorized under the provision, which go beyond collection of phone records. Surveillance reforms are long overdue and can be accomplished while protecting US citizens from serious security threats. Congress and the Obama administration should end all mass surveillance programs, which unnecessarily and disproportionately intrude on the privacy of hundreds of millions of people who are not linked to wrongdoing. But reforming US laws and reversing an increasingly global tide of mass surveillance will not be easy. Many of the programs Snowden revealed are already deeply entrenched, with billions of dollars of infrastructure, contracts, and personnel invested. Technological capacity to vacuum up the world's communications has outpaced existing legal frameworks meant to protect privacy. The Second Circuit opinion represents an improvement over current law because it establishes that domestic bulk collection of phone metadata under Section 215 of the Patriot Act cannot continue. Section 215 allows the government to collect business records, including phone records, that are "relevant" to an authorized investigation. The court ruled that the notion of "relevance" could not be stretched to allow intelligence agencies to gather all phone records in the US. However, the opinion could be overturned and two other appeals courts are also considering the legality of the NSA's bulk phone records program. The opinion also does not address US surveillance of people not in the US. Nor does it question the underlying assumption that the US owes no privacy obligations to people outside its territory, which makes no sense in the digital age and is inconsistent with human rights law requirements. Even if the Second Circuit opinion remains good law, congressional action will be necessary to address surveillance programs other than Section 215—both domestic and those affecting people outside the US—and to create more robust institutional safeguards to prevent future abuses. The courts cannot bring about reforms to increase oversight and improve institutional oversight on their own. Human Rights Watch has supported the USA Freedom Act because it is a modest, if incomplete, first step down the long road to reining in the NSA excesses. Beyond ending bulk records collection, the bill would begin to reform the secret Foreign Intelligence Surveillance Act (FISA) Court, which oversees NSA surveillance, and would introduce new transparency measures to improve oversight. In passing the bill, the House of Representatives also clarified that it intends the bill to be consistent with the Second Circuit's ruling, so as to not weaken its findings. The bill is no panacea and, as detailed below, would not ensure comprehensive reform. It still leaves open the possibility of large-scale data collection practices in the US under the Patriot Act. It does not constrain surveillance under Section 702 of the FISA Amendments Act nor Executive Order 12333, the primary legal authorities the government has used to justify mass surveillance of people outside US borders. And the bill does not address many modern surveillance capabilities, from mass cable tapping to use of malware, intercepting all mobile calls in a country, and compromising the security of mobile SIM cards and other equipment and services. **Nonetheless,** passing a strong USA Freedom Act would be a long-overdue step in the right direction. It would show that Congress is willing and able to act to protect privacy and impose oversight over intelligence agencies in an age when technology makes ubiquitous surveillance possible. Passing this bill **would** also help **shift the debate in the US and globally** and would distance the United States from other countries that seek to make mass surveillance the norm. On a global level, other governments may already be emulating the NSA's approach, fueling an environment of impunity for mass violations of privacy. In the last year, France, Turkey, Russia, and other countries have passed legislation to facilitate or expand large-scale surveillance. If the USA Freedom Act passes, it

would be the first time Congress has affirmatively restrained NSA activities since the attacks of September 11. Key supporters of the bill have vowed to take up reforms to other laws next, including Section 702 of the FISA Amendments Act.

Google Flu Trends is launching a new model in the United States for the coming 2014/2015 flu season. The important difference is that it is going to incorporate CDC flu data - which rather ruins its original idea. Google Flu Trends (GFT) was launched in 2008 to predict how many cases of flu are likely to occur based on "aggregate search data". The premise used by the model was that there is a correlation between the number of cases of flu and the number of searches on the topic of flu. So rather than collect data from doctors and hospitals about people showing symptoms you can instead look for searches using terms associated with flu such as "cough" or "fever". Initially the model worked well. Not only did it provide accurate estimates of the number of cases of flu, it did so ahead of those from the CDC (Centers for Disease Control and Prevention). But over time Google's model **started to overpredict** the incidence of flu, due to what could be interpreted as a **positive feedback effect**. Heightened media attention to flu when the incidence of flu rises leads to more people googling flu related terms. For the 2012/2013 flu season the GFT prediction exceeded the number of "real" flu cases by 95%. Responding to the research that revealed this anomaly Google adjusted the model for the 2013/2014 flu season (see the details in Google Updates Flu Model but **it continued to overpredict.** So a more drastic remedy was sought. According to Christian Stefansen, Senior Software Engineer, in a post on the Google Research blog announcing "brand new engine" for GFT, for the coming flu season in the US, Google is substituting a: "more robust model that learns continuously from official flu data". While this may well improve the model's accuracy, **the fact that it uses actual data defeats the idea** that flu could be predicted solely on the basis of Internet users search behavior. If the new model works well, it won't be nearly as interesting a finding as the success of the old model.

Big data analysis is ineffective—

A. Selection bias

If data subjects have the opportunity to opt out of inclusion in a database or if certain individuals' records are otherwise excluded, a class of problems often called [*522] **"selection bias"** may arise. n227 Selection bias may occur when **the subset of individuals studied is not representative of the patient population of interest**. n228 This kind of selection bias could manifest, for example, if a disproportionate number of people of one ancestry or economic class opt out of participating in a database. n229 It can likewise exist if individuals with certain behavior traits that might be important in some studies--such as diet, exercise, smoking status, and alcohol or drug

consumption--choose not to participate or cannot access medical facilities in which studies take place. n230 Selection bias can **distort assessments** of measures such as disease prevalence or exposure risk because study estimates will differ systematically from the true values of these measures for the target population. n231 That is, the estimates will not be generalizable from the research subjects to the larger population about which analysts wish to draw conclusions. n232 Another, more subtle kind of selection bias, which is also called "**collider-stratification bias**," n233 "collider-bias," n234 or "M-bias," n235 is specific to causal-effect studies. n236 These studies typically seek to measure the average beneficial effect on patients of a particular treatment or the average harmful effect on individuals of a particular exposure. n237 Collider-stratification bias occurs in analyzing study data when the analysis is conditioned on (e.g., stratified by) one or more levels of a variable that is a common effect (a "collider") of both the treatment/exposure variable and the outcome variable or that is a common effect of a cause of the treatment/exposure and a cause of the outcome. n238 Consider the following classic example. Commonly, **some patients are lost to follow-up**, and thus outcome measurements that would be essential for research purposes are unavailable. The data from these patients cannot be included in studies. Both the treatment and outcome at issue may influence which patients stop seeking medical care. Patients may fail to return for follow-up both because the treatment is unpleasant (treatment factor) and because they actually feel better and don't see a need to return to their doctors (an outcome factor). The loss of these study subjects can create a **spurious statistical association between the treatment/exposure variable and the outcome variable** that becomes mixed with and distorts the true causal effect of the former on the latter. n239 Because collider-stratification bias is associated with [*523] the exclusion of some patients from a study, it is categorized as a type of selection bias. n240

B. Confounding bias

Hoffman and Podgurski 13 - Sharona Hoffman is a Edgar A. Hahn Professor of Law and Professor of Bioethics and Co-Director of Law-Medicine Center at Case Western Reserve University School of Law. In observational causal-effect studies, confounding bias (confounding) **may be an even greater concern than selection bias**. n241 "Classical" confounding occurs because of the presence of a common cause of the treatment/exposure variable and the outcome variable. n242 Confounding is different from collider-stratification bias because it involves a common cause of the treatment/exposure and outcome variables rather than a common effect of the variables. n243 The following hypothetical illustrates classical confounding. Suppose a physician's treatment choices are influenced by the severity or duration of a patient's disease, which also influence the outcome of treatment. n244 Thus, patients at a later stage of a disease may receive one treatment (treatment A) and those who are at an earlier stage may receive a different therapy (treatment B). At the same time, sicker patients may have worse treatment outcomes than healthier individuals. Unless such a common cause, which is called a "confounding variable" or "confounder," is adjusted for appropriately during statistical data analysis, it may induce a spurious association between the treatment variable and the outcome variable, which distorts estimation of the true causal effects of treatments. n245 In other words, **researchers may reach incorrect conclusions** regarding the efficacy of the two treatments because of the confounding variable: **the degree of sickness** suffered by patients receiving the different therapies. Treatment A may appear to be less effective than treatment B not because it is in fact an inferior therapy but because so many of the patients receiving treatment A are in a late stage of the disease and would not do well no matter what treatment they received. This particular form of confounding, called "confounding by indication," is especially challenging to adjust for, because it may involve multiple factors that influence physicians' treatment decisions. n246 **Socioeconomic factors and patient lifestyle choices** may also be confounders. Those who lack financial resources or adequate health coverage may select less expensive treatments not because those are the best choices for them but because those are the only affordable options. n247 Low income may also separately lead to poor health for reasons such as poor nutrition or financial stress. In the case of preventive care, a treatment's perceived benefits may be amplified because health-oriented individuals interested in the intervention also pursue exercise, low-fat diets,

and other health-promoting behaviors. These patients' impressive outcomes thus would not be associated solely with the preventive measure. n248

C. Measurement bias

Measurement biases arise from **errors in measurement and data collection**. n262 Observational study results may be compromised if the biomedical records that are analyzed contain such errors. Measurement errors occur for a variety of reasons. Measurement instruments might not be calibrated properly or might lack sufficient sensitivity to detect differences in relevant variables. n263 Storage time or conditions for biological samples might be different and might affect study results. n264 To the extent that researchers solicit and record patients' own accounts and memories, the subjects' **ability to recall** details may be influenced by the questioner's competence, patience, and apparent sympathy or by the degree to which the patient perceives the topic to be important and relevant to her life. n265 In addition, patients may have **impaired memories** or may **lie** in response to questions if they are embarrassed about the truth. n266 Accurate measurement may be further hindered by **incomplete, erroneous, or miscoded EHR data that obfuscates true values**. n267 In causal-effect studies, errors in measurement of the treatment/exposure and the outcome are most problematic when they are associated (dependent) and when they are differential, that is, when the treatment affects the measurement error for the outcome or the outcome affects the measurement error for the treatment. n268 For example, differential measurement error could occur in a study of the effect of treatment A on dementia, if the use of A was determined only by interviewing study participants, because dementia affects subjects' ability to recall whether and how they were treated. n269 **Mismeasurement of confounding variables** also impedes adjustments intended to eliminate confounding bias. n270

Healthcare prediction can't be scaled up – no motivation and structural problems

The **buzzword fever** around predictive analytics will likely continue to rise and fall. Unfortunately, lacking the proper infrastructure, staffing and resource to act when something is predicted with high certainty to happen, we fall short of the full potential of harnessing historic trends and **patterns in patient data**. In other words, without the **willpower** for clinical intervention, any predictor – no matter how good – is not fully utilized.

Ext—Big Data Bad

Big data is unnecessary—it's not needed to important discoveries and is often a distraction

Big data holds the promise of harnessing huge amounts of information to help us better understand the world. But when talking about big data, there's a **tendency to fall into hyperbole**. It is what compels contrarians to write such tweets as "Big Data, n.: the belief that any sufficiently large pile of s--- contains a pony." Let's deflate the hype. 1. "Big data" has a clear definition. The term "big data" has been in circulation since at least the 1990s, when it is believed to have originated in Silicon Valley. IBM offers a seemingly simple definition: Big data is characterized by the four V's of volume, variety, velocity and veracity. But the term is thrown around so often, in so many contexts — science, marketing, politics, sports — that its meaning has become vague and ambiguous. There's general agreement that ranking every page on the Internet according to relevance and searching the phone records of every Verizon customer in the United States qualify as applications of big data. Beyond that, there's much debate. Does big data need to involve more information than can be processed by a single home computer? If so, marketing analytics wouldn't qualify, and neither would most of the work done by Facebook. Is it still big data if it doesn't use certain tools from the fields of artificial intelligence and machine learning? Probably. Should narrowly focused industry efforts to glean consumer insight from large datasets be grouped under the same term used to describe the sophisticated and varied things scientists are trying to do? There's a lot of confusion, and industry experts and scientists often end up talking past one another. 2. Big data is new. By many accounts, big data exploded onto the scene quite recently. "If wonks were fashionistas, big data would be this season's hot new color," a Reuters report quipped last year. In a May 2011 report, the McKinsey Global Institute declared big data "the next frontier for innovation, competition, and productivity." It's true that today we can mine massive amounts of data — textual, social, scientific and otherwise — using complex algorithms and computer power. But big data has been around for a long time. It's just that exhaustive datasets were more exhausting to compile and study in the days when "computer" meant a person who performed calculations. Vast linguistic datasets, for example, go back nearly 800 years. Early biblical concordances — alphabetical indexes of words in the Bible, along with their context — allowed for some of the same types of analyses found in modern-day textual data-crunching. The sciences also have been using big data for some time. In the early 1600s, Johannes Kepler used Tycho Brahe's detailed astronomical dataset to elucidate certain laws of planetary motion. Astronomy in the age of the Sloan Digital Sky Survey is certainly different and more awesome, but it's still astronomy. Ask statisticians, and they will tell you that they have been analyzing big data — or "data," as they less redundantly call it — for centuries. As they like to argue, big data isn't much more than a sexier version of statistics, with a few new tools that allow us to think more broadly about what data can be and how we generate it. 3. Big data is revolutionary. In their new book, "Big Data: A Revolution That Will Transform How We Live, Work, and Think,"Viktor Mayer-Schonberger and Kenneth Cukier compare "the current data deluge" to the transformation brought about by the Gutenberg printing press. If you want more precise advertising directed toward you, then yes, big data is revolutionary. Generally, though, **it's likely to have a modest and gradual impact** on our lives. **When a phenomenon or an effect is large, we usually don't need huge amounts of data** to recognize it (and science has traditionally focused on these large effects). As things become more subtle, bigger data helps. It can lead us to smaller pieces of knowledge: how to tailor a product or how to treat a disease a little bit better. If those bits can help lots of people, the effect may be large. But revolutionary for an individual? Probably not. 4. Bigger data is better. In science, some admittedly mind-blowing big-data analyses are being done. In business, companies are being told to "embrace big data before your competitors do." But **big data is not automatically better**. Really big datasets can be a **mess**. Unless researchers and analysts can reduce the number of variables and make the data more manageable, they get quantity without a whole lot of quality. Give me some quality medium data over bad big data any day. And let's not forget about bias. There's a common misconception that throwing more data at a problem makes it easier to solve. But if there's an inherent bias in how the data are collected or examined, a bigger dataset doesn't help. For example, if you're trying to understand how people interact based on mobile phone data, a year of data rather than a month's worth doesn't address the limitation that certain populations don't use mobile phones. Many interesting questions can be explored with little datasets. Big data has refined our idea of six degrees of separation: Facebook has shown that it's actually closer to four degrees. But the first six-degrees study was done by psychologist Stanley Milgram using a lot of cleverness and a small number of postcards. Furthermore, although it's exciting to have massive datasets with incredible breadth, too often they lack much in the way of a temporal dimension. To really understand a phenomenon, such as a social one, we need datasets with large historical sweep. We need long data, not just big data. 5. Big data means the end of scientific theories. Chris Anderson argued in a 2008 Wired essay that big data renders the scientific method obsolete: Throw enough data at an advanced machine-learning technique, and all the correlations and relationships will simply jump out. We'll understand everything. But you can't just go fishing for correlations and hope they will explain the world. If you're not careful, **you'll end up with spurious correlations**. Even more important, to contend with the "why" of things, we still need ideas, hypotheses and theories. If you don't have good questions, your results can be silly and meaningless. Having more data won't substitute for thinking hard, recognizing anomalies and exploring deep truths.

Tamer Chair of Biomedical Research at St. Jude Children's Research Hospital, "How much could refuges help us recover from a global catastrophe?" in Futures, published online 18 Nov 2014, Science Direct)

That leaves pandemics and cobalt bombs, which will get a longer discussion. While there is little published work on human extinction risk from pandemics, it seems that **it would be extremely challenging for any pandemic**—whether **natural or** man-made—to leave the people in a specially constructed refuge as the **sole survivors**. In his introductory book on pandemics (Doherty, 2013, p. 197) argues:¶ "**No pandemic is likely to wipe out the human species.** Even without the protection provided by modern science, we survived **smallpox, TB, and the plagues of recorded history.** Way back when human numbers were **very small,** infections may have been responsible for some of the **genetic bottlenecks** inferred from evolutionary analysis, but there is **no formal proof** of this."¶ Though some authors have **vividly described worst-case scenarios** for engineered pandemics (e.g. Rees, 2003 and Posner, 2004; and Myhrvold, 2013), it would take a **special effort** to infect people in **highly isolated locations**, especially the 100+ "**largely uncontacted" peoples who prefer to be left alone.** This is not to say it would be impossible. A madman intent on annihilating all human life could use cropduster-style delivery systems, flying over isolated peoples and infecting them. Or perhaps a pandemic could be engineered to be delivered through animal or environmental vectors that would reach all of these people.

Still, there is more evidence that a serious pandemic is not imminent. In 1976 there was an outbreak of an H1N1 swine virus in Fort Dix, N.J., which showed human-to-human transmission but did not go on to become a highly virulent strain. This virus was very similar to regular swine influenza viruses and did not show a high affinity for the human host.Although the swine virus currently circulating in humans is different from the 1976 virus, it is most likely not more virulent than the other seasonal strains we have experienced over the last several years. **It lacks an important molecular signature** (the protein PB1-F2) which was present in the 1918 virus and in the highly lethal H5N1 chicken viruses. If this virulence marker is necessary for an influenza virus to become highly pathogenic in humans or in chickens -- and some research suggests this is the case -- then the current swine virus, like the 1976 virus, doesn't have what it takes to become a major killer. Since people have been exposed to H1N1 viruses over many decades, **we likely have some cross-reactive immunity** against the swine virus. While it may not be sufficient to prevent illness, **it may very well dampen the impact of the virus on mortality**. I would postulate that by virtue of this "herd immunity," even a 1918-like H1N1 virus could never have the horrific effect it had in the past. The most likely outcome is that the current swine virus will become another (fourth) strain of regular seasonal influenza.

U.S. companies' eagerness to please the EU affects their leverage in a place like Russia or China, and undermines their principled calls for a global Internet. Just as we've seen the emergence of company best practices to minimize how information is censored, we need best practices to minimize risks in where it is stored. Companies should take the following steps: Avoid localizing in a repressive country whenever possible. When Yahoo! entered Vietnam, to meet performance needs without enabling the government's Internet repression, it based its servers in Singapore. Explore global solutions. Companies like Apple and Google have started encrypting more data by default to minimize inappropriate access by any government. This doesn't solve everything, but it's a step forward for user privacy. Minimize exposure. If you must have an in-country presence, take steps to minimize risk by being strategic in what staff and services you locate there. Embrace transparency. A growing number of companies have increased transparency by issuing reports on the number of government requests they receive. They should also publish legal requirements like localization, so that people understand the underlying risks to their data. Work together. Companies should coordinate advocacy in difficult markets through organizations like the Global Network Initiative. Tech companies can take a proactive, collective approach, rather than responding reactively when their case hits the headlines. We can only expect localization demands to increase—and business pressures to pull in the opposite direction. While the political dynamics have shifted, companies should still have respect for human rights—and the strength of the global Internet—at the forefront of decisions over where to store their data.

My new book has an odd intellectual provenance-it starts with me being wrong. Back in the fall of 2008, I was convinced that the open global economic order, centered on the unfettered cross-border exchange of goods, services, and ideas, was about to collapse as quickly as Lehman Brothers. A half-decade later, the closer I looked at the performance of the system of global economic governance, the clearer it became that **the meltdown I had expected had not come to pass**. Though the advanced industrialized economies suffered prolonged economic slowdowns, at the global level there was **no great surge in trade protectionism, no immediate clampdown on capital flows, and, most surprisingly, no real rejection of neoliberal economic principles**. Given what has normally transpired after severe economic shocks, this outcome was damn near miraculous. Nevertheless, most observers have remained deeply pessimistic about the functioning of the global political economy. Indeed, scholarly books with titles like No One's World: The West, The Rising Rest, and the Coming Global Turn and The End of American World Order have come to a conclusion the opposite of mine. Now I'm trying to understand how I got the crisis so wrong back in 2008, and **why so many scholars continue to be wrong now.**

Global economic governance institutions guarantee resiliency

Daniel W. **Drezner 12**, Professor, The Fletcher School of Law and Diplomacy, Tufts University, October 2012, "The Irony of Global Economic Governance: The System Worked," http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf

Prior to 2008, numerous foreign policy analysts had predicted a looming crisis in global economic governance. Analysts only reinforced this perception since the financial crisis, declaring that we live in a "G-Zero" world. This paper takes a closer look at the global response to the financial crisis. It reveals a more optimistic picture. Despite initial shocks that were actually more severe than the 1929 financial crisis, global economic governance structures responded quickly and robustly. Whether one measures results by economic outcomes, policy outputs, or institutional flexibility, **g**lobal **e**conomic **g**overnance has displayed surprising resiliency since 2008. Multilateral economic institutions performed well in crisis situations to reinforce open economic policies, especially in contrast to the 1930s. While there are areas where governance has either faltered or failed, on the whole, the system has worked. Misperceptions about global economic governance persist because the Great Recession has disproportionately affected the core economies – and because the efficiency of past periods of global economic governance has been badly overestimated. Why the system has worked better than expected remains an open question. The rest of this paper explores the possible role that the distribution of power, the robustness of international regimes, and the resilience of economic ideas might have played.

Emerging economies make competitiveness decline inevitable and alt causes overwhelm their internal link

CNN ‘10

[http://finance.fortune.cnn.com/2010/10/01/david-rubenstein-u-s-is-losing-its-competitive-edge/?section=magazines_fortune]

Ever since China's economy surpassed Japan's this past summer, speculation has escalated over when the country might take over the United States as the world's largest. The estimate has ranged from 2030 to 2035, the latter date being the one Carlyle Group co-founder David Rubenstein highlighted at a forum Wednesday in Washington DC of some of the day's biggest newsmakers.¶ Rubenstein says the U.S. faces the harsh possibility of losing some of its competitive edge amid the rapid rise of emerging economics – in particular, China. The U.S. overwhelmingly dominates the private equity and venture capital industries worldwide, the prominent investor notes. China and other emerging economies have become eager players and companies such as private equity firm Carlyle have increasingly been spending more time in these regions. To date, Carlyle has invested $3 billion in China, he says.¶ But several pressing factors are threatening America's competitive edge**. Rubenstein lists huge deficits and government debt, high unemployment, and widening income disparities.**¶ His remarks echo what other business executives have said recently. In a report released by the World Economic Forum in August, the U.S. slipped a notch down the ranks of competitive economies – falling behind Sweden and Singapore, which rose to the No. 1 and No. 2 spots, respectively.¶ The report, which combines economic data and a survey of more than 13,500 business executives, commended the U.S. for its innovation, excellent universities and flexible labor market. But what has hurt America's competitiveness, in particular, is the country's huge deficits and rising government debt. **While China ranked far below the U.S. at No. 27, the Asian powerhouse outperformed all major developing economies.**¶ **"We have to recognize as Americans that we're not going to be as dominant a force in the global economy as we have been**," Rubenstein says, adding that unless the U.S. lowers its debts and deficits, improves joblessness and narrow widening income gaps, future generations will have a lower quality and less affluent lifestyle.¶ Facing the inevitable decline¶ Rubenstein couldn't have been more straight-to-the point about the depths of America's economic turmoil. But perhaps more important, he points out that **it's** virtually **inevitable** that China and even India might eventually surpass the U.S. economy – simply because they're just bigger**, not necessarily richer.**

[James, correspondent for *The Atlantic Monthly,* studied economics at Oxford University as a Rhodes Scholar. He has been an editor of *The Washington Monthly* and of *Texas Monthly,* and from 1977 to 1979 he served as President Jimmy Carter's chief speechwriter. His first book, *National Defense*, won the American Book Award in 1981; he has written seven others. “How America Can Rise Again”, Jan/Feb edition, http://www.theatlantic.com/doc/201001/american-decline]

This is new. Only with America’s emergence as a global power after World War II did the idea of American “decline” routinely involve falling behind someone else. Before that, it meant falling short of expectations—God’s, the Founders’, posterity’s—or of the previous virtues of America in its lost, great days.

"The new element in the '50s was the constant comparison with the Soviets," Michael Kazin told me. Since then, external falling-behind comparisons have become not just a staple of American self-assessment but often a crutch. If we are concerned about our schools, it is because children are learning more in Singapore or India; about the development of clean-tech jobs, because it's happening faster in China. ¶ Having often lived outside the United States since the 1970s, I have offered my share of falling-behind analyses, including a book-length comparison of Japanese and American strengths (More Like Us) 20 years ago. But at this point in America's national life cycle, I think the exercise is largely a distraction, and that Americans should concentrate on what are, finally, our own internal issues to resolve or ignore. ¶ Naturally there are lessons to draw from other countries' practices and innovations; the more we know about the outside world the better, as long as we're collecting information calmly rather than glancing nervously at our reflected foreign image. For instance, if you have spent any time in places where tipping is frowned on or rare, like Japan or Australia, you view the American model of day-long small bribes, rather than one built-in full price, as something similar to baksheesh, undignified for all concerned. ¶ Naturally, too, it's easier to draw attention to a domestic problem and build support for a solution if you cast the issue in us-versus-them terms, as a response to an outside threat. In *If We Can Put a Man on the Moon …*, their new book about making government programs more effective, William Eggers and John O'Leary emphasize the military and Cold War imperatives behind America's space program. "The race to the moon was a contest between two systems of government," they wrote, "and the question would be settled not by debate but by who could best execute on this endeavor." Falling-behind arguments have proved convenient and powerful in other countries, too. ¶ But whatever their popularity or utility in other places at other times, falling-behind concerns seem too common in America now. As I have thought about why overreliance on this device increasingly bothers me, I have realized that it's because my latest stretch out of the country has left me less and less interested in whether China or some other country is "overtaking" America. The question that matters is not whether America is "falling behind" but instead something like John Winthrop's original question of whether it is falling short—or even falling apart. This is not the mainstream American position now, so let me explain. ¶ First is the simple reality that one kind of "**decline" is inevitable** and therefore not worth worrying about. China has about **four times** as many people as America does. Someday its economy will be larger than ours. Fine! A generation ago, its people produced, on average, about one-sixteenth as much as Americans did; now they produce about one-sixth. That change is a huge achievement for China—and a plus rather than a minus for everyone else, because a business-minded China is more benign than a miserable or rebellious one. When the Chinese produce one-quarter as much as Americans per capita, as will happen barring catastrophe, their economy will become the world's largest. **This** will be good for them but **will not mean "falling behind" for us.** We know that for more than a century, the consciousness of decline has been a blight on British politics, though it has inspired some memorable, melancholy literature. There is no reason for America to feel depressed about the natural emergence of China, India, and others as world powers. But second, and more important, America may have reasons to feel actively optimistic about its prospects in purely relative terms. ¶ **The Crucial American Advantage** ¶ Let's start with the more modest claim, that China has ample reason to worry about its own future. Will the long-dreaded day of reckoning for Chinese development finally arrive because of environmental disaster? Or via the demographic legacy of the one-child policy, which will leave so many parents and grandparents dependent on so relatively few young workers? Minxin Pei, who grew up in Shanghai and now works at Claremont McKenna College, in California, has predicted in *China's Trapped Transition* that within the next few years, tension between an open economy and a closed political system will become unendurable, and an unreformed Communist bureaucracy will finally drag down economic performance. ¶ America will be better off if China does well than if it flounders. **A prospering China will mean a bigger world economy with more opportunities and** probably **less turmoil—**and a China likely to be more cooperative on environmental matters**.** But whatever happens to China, prospects could soon brighten for America. The American culture's particular strengths could conceivably be about to assume new importance and give our economy new pep. International networks will matter more with each passing year. As the one truly universal nation, the United States continually refreshes its connections with the rest of the world—through languages, family, education, business—in a way **no other nation does**, or will. The countries that are comparably open—Canada, Australia—aren't nearly as large; those whose economies are comparably large—Japan, unified Europe, eventually China or India—aren't nearly as open. The simplest measure of whether a culture is dominant is whether outsiders want to be part of it. At the height of the British Empire, colonial subjects from the Raj to Malaya to the Caribbean modeled themselves in part on

Englishmen: Nehru and Lee Kuan Yew went to Cambridge, Gandhi, to University College, London. Ho Chi Minh wrote in French for magazines in Paris. These days the world is full of businesspeople, bureaucrats, and scientists who have trained in the United States. ¶ Today's China attracts outsiders too, but in a particular way. Many go for business opportunities; or because of cultural fascination; or, as my wife and I did, to be on the scene where something truly exciting was under way. The Haidian area of Beijing, seat of its universities, is dotted with the faces of foreigners who have come to master the language and learn the system. But true immigrants? People who want their children and grandchildren to grow up within this system? Although I met many foreigners who hope to stay in China indefinitely, in three years I encountered only two people who aspired to citizenship in the People's Republic. From the physical rigors of a badly polluted and still-developing country, to the constraints on free expression and dissent, to the likely ongoing mediocrity of a university system that emphasizes volume of output over independence or excellence of research, the realities of China heavily limit the appeal of becoming Chinese. Because of its scale and internal diversity, China (like India) is a more racially open society than, say, Japan or Korea. But China has come nowhere near the feats of absorption and opportunity that make up much of America's story, and it is very difficult to imagine that it could do so—well, ever. ¶ Everything we know about future industries and technologies suggests that they will offer ever-greater rewards to flexibility, openness, reinvention, "crowdsourcing," and all other manifestations of individuals and groups keenly attuned to their surroundings. Everything about American society should be hospitable toward those traits—and should foster them better and more richly than other societies can. The American advantage here is broad and atmospheric, but it also depends on two specific policies that, in my view, are the absolute pillars of American strength: continued openness to immigration, and a continued concentration of universities that people around the world want to attend. ¶ Maybe I was biased in how I listened, but in my interviews, I thought I could tell which Americans had spent significant time outside the country or working on international "competitiveness" issues. If they had, they predictably emphasized those same two elements of long-term American advantage. "My favorite statistic is that one-quarter of the members of the National Academy of Sciences were born abroad," I was told by Harold Varmus, the president of the Memorial Sloan-Kettering Cancer Center and himself an academy member (and Nobel Prize winner). "We may not be so good on the pipeline of producing new scientists, but **the country is still a very effective magnet."** ¶ "We scream about our problems, but as long as we have the immigrants, and the universities, we'll be fine," James McGregor, an American businessman and author who has lived in China for years, told me. "I just wish we could put LoJacks on the foreign students to be sure they stay." While, indeed, the United States benefits most when the best foreign students pursue their careers here, we come out ahead even if they depart, since they take American contacts and styles of thought with them. Shirley Tilghman, a research biologist who is now the president of Princeton, made a similar point more circumspectly. "U.S. higher education has essentially been our innovation engine," she told me. "I still do not see the overall model for higher education anywhere else that is better than the model we have in the United States, even with all its challenges at the moment." Laura Tyson, an economist who has been dean of the business schools at UC Berkeley and the University of London, said, "It can't be a coincidence that so many innovative companies are located where they are"—in California, Boston, and other university centers. "There is not another country's system that does as well—although others are trying aggressively to catch up." ¶ Americans often fret about the troops of engineers and computer scientists marching out of Chinese universities. They should calm down. Each fall, Shanghai's Jiao Tong University produces a ranking of the world's universities based mainly on scientific-research papers. All such rankings are imprecise, but the pattern is clear. Of the top 20 on the latest list, 17 are American, the exceptions being Cambridge (No. 4), Oxford (No. 10), and the University of Tokyo (No. 20). Of the top 100 in the world, zero are Chinese. ¶ "On paper, China has the world's largest higher education system, with a total enrollment of 20 million full-time tertiary students," Peter Yuan Cai, of the Australian National University in Canberra, wrote last fall. "Yet China still lags behind the West in scientific discovery and technological innovation." The obstacles for Chinese scholars and universities range from grand national strategy—open economy, closed political and media environment—to the operational traditions of Chinese academia. Students spend years cramming details for memorized tests; the ones who succeed then spend years in thrall to entrenched professors. Shirley Tilghman said the modern American model of advanced research still shows the influence of Vannevar Bush, who directed governmental science projects during and after World War II. "It was his very conscious decision to get money into young scientists' hands as quickly as possible," she said. This was in contrast to the European "Herr Professor"

model, also prevalent in Asia, in which, she said, for young scientists, the "main opportunity for promotion was waiting for their mentor to die." Young Chinese, Indians, Brazilians, Dutch know they will have opportunities in American labs and start-ups they could not have at home. This will remain America's advantage, unless we throw it away.

Kendall offered few details about the program, which he plans to elaborate on soon. In his speech, Kendall said the acquisition process, which has been blamed for slowing down the pace of government programs, was not as big a concern as investment in new technology, especially in light of foreign competition. Russia and China are "building things that are designed to be effective against the power projection capabilities of the United States and of our allies," he said. "And they're doing a reasonably good job of it, particularly China." The shrinking defense budget and cuts to research and development in particular are a source of deep concern to him, Kendall said. Such cuts were tantamount to "delaying modernization," he said. "As we delay modernization, we basically lose the time that it takes us to get things into the force," he said. Kendall also added that the Pentagon's budget would try and invest more in technology that moves capabilities forward. His remarks echoed those of Defense Secretary Chuck Hagel, who spoke on the same topic at a conference in Rhode Island Wednesday. Hagel also stressed the need for American companies to innovate in order to keep pace with the rest of the world. "We cannot assume, as we did in the 1950s and '70s, that the Department of Defense will be the sole source of key breakthrough technologies," he said.

This erosion reflects troubling trends in many of the factors that underpin U.S. competitiveness. This set of factors, as identified in the work of Michael Porter, Mercedes Delgado, Christian Ketels, and Scott Stern, includes macro and micro components. From a macro perspective, a competitive nation requires sound monetary and fiscal policies (such as manageable government debt levels), strong human development (good health care and K–12 education systems), and effective political institutions (rule of law and effective law-making bodies). Macro foundations create the potential for long-term productivity, but actual productivity depends on the microeconomic conditions that affect business itself. A competitive nation exhibits a sound business environment (including modern transport and communications infrastructure, high-quality research institutions, streamlined regulation, sophisticated local consumers, and effective capital markets) as well as strong clusters of firms and supporting institutions in particular fields, such as information technology in Silicon Valley and energy in Houston. Competitive nations develop companies that adopt advanced operating and management

practices. In a large country like the U.S., many of the most important drivers of competitiveness rest at the regional and local levels, not the national level. Though federal policies surely matter, microeconomic drivers tied to regions—such as roads, universities, pools of talent, and cluster specialization—are crucial. Assessing the U.S. through this lens, **we see significant cracks in its economic foundations**, with particularly troubling deterioration in macro competitiveness. Problems include levels of government debt not seen since World War II; health care and primary education systems whose results are neither world-class nor reflective of the large sums spent on them; and a polarized and often paralyzed political system (especially at the federal level) that makes decisions only when facing a crisis. In micro competitiveness, eroding skills in the workplace, inadequate physical infrastructure, and rising regulatory complexity increasingly offset traditional strengths such as innovation and entrepreneurship. Our HBS alumni survey provided an original and timely assessment of overall competitiveness and the strengths and weaknesses of the U.S. The findings were sobering. (See the chart "Evaluating the U.S. Business Environment," in the article "Choosing the United States," HBR March 2012.) Respondents perceived the United States as already weak and in decline with respect to a range of important factors: the complexity of the national tax code, the effectiveness of its political system, basic education, macroeconomic policies, and regulation. Some current American strengths, such as logistics and communications infrastructure and workforce skill levels, were seen as declining. America's unique strengths in entrepreneurship, higher education, and management quality were intact, but these strengths must overcome growing weaknesses in many other areas.

tech not key to competitiveness

Technological innovation isn't key to competition—the Halo effect is false

Easterly 9 - William Easterly is Professor of Economics at New York University and Co-director of the NYU Development Research Institute, which won the 2009 BBVA Frontiers of Knowledge in Development Cooperation Award. ("Tiger Woods thoughtfully explodes "Halo Effect" myth in development," http://aidwatchers.com/2009/12/tiger-woods-thoughtfully-offers-to-explode-%E2%80%9Chalo-effect%E2%80%9D-myth-in-development/ 12/14/2009) STRYKER

Our expectation that celebrities will be model citizens, contrary to vast evidence, is based on the Halo Effect. The Halo Effect is the idea that someone that is really, really good at one thing will also be really good at other things. We thought because Tiger was so good at being a golfer, he also must be very good at to have and to hold, forsaking all others, keeping thee only unto her as long as you both shall live... What Tiger considerately did for our education was to show how **the Halo Effect is a myth**. This blog has a undying affection for those psychological foibles that cause us to strongly believe in mythical things, and the Halo Effect is a prime example (and the subject of a whole book on its destructive effects in business.) Why would marital fidelity and skillful putting have any correlation? OK fine and good, but many of you are asking: What the Vegas Cocktail Waitress does this have to do with development? The Halo Effect was discussed in a previous blog, but when assaulting psychological biases, you can never repeat the attack enough. Not to mention that we all remember the psychology literature more easily when illustrated by a guy with 10 mistresses. So if we observe a country is good at say, **technological innovation, we assume that this country is also good at other good things** like, say, **visionary leadership**, freedom from corruption, and a culture of trust. Since the latter three are imprecise to measure (and the measures themselves may be contaminated by the Halo Effect), we lazily assume they are all good. But actually, there are plenty of examples of successful innovators with mediocre leaders, corruption, and distrustful populations. The US assumed world technological leadership in the late 19th century with presidents named Chester Arthur and Rutherford B. Hayes, amidst legendary post-Civil War graft. Innovators include both trusting Danes and suspicious Frenchmen. The false Halo Effect makes us think we understand development more than we really do, when we think all good things go together in the "good" outcomes. The "Halo Effect" puts heavy weight on some explanations like "visionary leadership" that **may be spurious**. More subtly, it leaves out the more complicated cases of UNEVEN determinants of success: why is New York City the world's premier city, when we can't even manage decent airports (with 3 separate failed tries)? The idea that EVERYTHING is a necessary condition for development is **too facile**. The principles of specialization and comparative advantage suggest **you DON"T have to be good at everything all the time**.

Ext—Current Freedom Act Solves

New Freedom Act is sufficient to solve US's global credibility gap.

HRW '15

Human Rights Watch is an independent, international organization that works as part of a vibrant movement to uphold human dignity and advance the cause of human rights for all. "Strengthen the USA Freedom Act" - May 19, 2015 - http://www.hrw.org/news/2015/05/19/strengthen-usa-freedom-act

As the Senate considers the USA Freedom Act this week, policymakers should strengthen it by limiting large-scale collection of records and reinforcing transparency and carrying court reforms further. The Senate should also take care not to weaken the bill, and should reject any amendments that would require companies to retain personal data for longer than is necessary for business purposes. It has been two years since the National Security Agency (NSA) whistleblower Edward Snowden unleashed a steady stream of documents that exposed the intention by the United States and the United Kingdom to "collect it all" in the digital age. These revelations demonstrate how unchecked surveillance can metastasize and undermine democratic institutions if intelligence agencies are allowed to operate in the shadows, without robust legal limits and oversight. **On May 13,** the US House of Representatives approved the USA Freedom Act of 2015 by a substantial margin. The bill represents the latest attempt by Congress to rein in one of the surveillance programs Snowden disclosed—the NSA's domestic bulk phone metadata collection under Section 215 of the USA Patriot Act. The House vote followed a major rebuke to the US government by the US Court of Appeals for the Second Circuit, which ruled on May 7 that the NSA's potentially nationwide dragnet collection of phone records under Section 215 was unlawful. Section 215 is set to expire on June 1 unless Congress acts to extend it or to preserve specific powers authorized under the provision, which go beyond collection of phone records. Surveillance reforms are long overdue and can be accomplished while protecting US citizens from serious security threats. Congress and the Obama administration should end all mass surveillance programs, which unnecessarily and disproportionately intrude on the privacy of hundreds of millions of people who are not linked to wrongdoing. But reforming US laws and reversing an increasingly global tide of mass surveillance will not be easy. Many of the programs Snowden revealed are already deeply entrenched, with billions of dollars of infrastructure, contracts, and personnel invested. Technological capacity to vacuum up the world's communications has outpaced existing legal frameworks meant to protect privacy. The Second Circuit opinion represents an improvement over current law because it establishes that domestic bulk collection of phone metadata under Section 215 of the Patriot Act cannot continue. Section 215 allows the government to collect business records, including phone records, that are "relevant" to an authorized investigation. The court ruled that the notion of "relevance" could not be stretched to allow intelligence agencies to gather all phone records in the US. However, the opinion could be overturned and two other appeals courts are also considering the legality of the NSA's bulk phone records program. The opinion also does not address US surveillance of people not in the US. Nor does it question the underlying assumption that the US owes no privacy obligations to people outside its territory, which makes no sense in the digital age and is inconsistent with human rights law requirements. Even if the Second Circuit opinion remains good law, congressional action will be necessary to address surveillance programs other than Section 215—both domestic and those affecting people outside the US—and to create more robust institutional safeguards to prevent future abuses. The courts cannot bring about reforms to increase oversight and improve institutional oversight on their own. Human Rights Watch has supported the USA Freedom Act because it is a modest, if incomplete, first step down the long road to reining in the NSA excesses. Beyond ending bulk records collection, the bill would begin to reform the secret Foreign Intelligence Surveillance Act (FISA) Court, which oversees NSA surveillance, and would introduce new transparency measures to improve oversight. In passing the bill, the House of Representatives also clarified that it intends the bill to be consistent with the Second Circuit's ruling, so as to not weaken its findings. The bill is no panacea and, as detailed below, would not ensure comprehensive reform. It still leaves open the possibility of large-scale data collection practices in the US under the Patriot Act. It does not constrain surveillance under Section 702 of the FISA Amendments Act nor Executive Order 12333, the primary legal authorities the government has used to justify mass surveillance of people outside US borders. And the bill does not address many modern surveillance capabilities, from mass cable tapping to use of malware, intercepting all mobile calls in a country, and compromising the security of mobile SIM cards and other equipment and services. **Nonetheless,** passing a strong USA Freedom Act would be a long-overdue step in the right direction. It would show that Congress is willing and able to act to protect privacy and impose oversight over intelligence agencies in an age when technology makes ubiquitous surveillance possible. Passing this bill **would** also help **shift the debate in the US and globally** and would distance the United States from other countries that seek to make mass surveillance the norm. On a global level, other governments may already be emulating the NSA's approach, fueling an environment of impunity for mass violations of privacy. In the last year, France, Turkey, Russia, and other countries have passed legislation to facilitate or expand large-scale surveillance. If the USA Freedom Act passes, it would be the first time Congress has affirmatively restrained NSA activities since the attacks of September 11. Key supporters of the bill have vowed to take up reforms to other laws next, including Section 702 of the FISA Amendments Act.

To support the interpretation that America's problems are cyclical, not structural, one could point to the facts that labor productivity has held up in America and corporate profits hit record highs in 2010. Unfortunately, that snapshot masks deeper signs of an incipient competitiveness problem—one that began before the Great Recession and in some ways contributed to it. The problem shows up in a range of economic performance measures as well as in the trajectories of the underlying factors that drive competitiveness. Productivity. America's long-run rate of growth in labor productivity was strong relative to that of other advanced economies in the late 1990s and early 2000s, but it began to trail off before the financial crisis. Productivity has been sustained since the crisis largely by rising unemployment and falling workforce participation, **ominous signs for U.S. competitiveness**. Job creation. Even more unsettling is the country's job-creation picture. Long-term growth in private-sector employment has dipped to historically low levels, a trend that started well before the Great Recession. (See the exhibit "Disappearing Job Growth.") In industries exposed to international competition, job growth has virtually stopped. Wages. American wages have been under pressure for more than a decade. In 2007, before the downturn, U.S. median household income stood below 1999 levels in real terms—and has fallen even more since. In the two decades prior to 2007, median income grew, but at an anemic annual rate of just 0.5%. Most affected have been middle- and lower-income workers, many of whom are more exposed to international competition today than ever before.

Business columnist for the Star, a Canadian newspaper, "David Olive: Will the economy get worse?," http://www.thestar.com/printArticle/598050, AM

Should we brace for another Great Depression? No. The notion is ludicrous. **Conditions will forever be such that the economic disaster that helped define the previous century will never happen again.** So why raise the question? Because it has suited the purposes of prominent folks to raise the spectre of a second Great Depression. Stephen Harper has speculated it could happen. Barack Obama resorted to apocalyptic talk in selling his economic stimulus package to the U.S. Congress. And British author Niall Ferguson, promoting his book on the history of money,

asserts "there will be blood in the streets" from the ravages dealt by this downturn. Cue the famished masses' assault on a latter-day Bastille or Winter Palace. As it happens, the current economic emergency Obama has described as having no equal since the Great Depression has not yet reached the severity of the recession of 1980-82, when U.S. unemployment reached 11 per cent. The negativism has become so thick that Robert Shiller was prompted to warn against it in a recent New York Times essay. Shiller, recall, is the Yale economist and author of Irrational Exuberance who predicted both the dot-com collapse of the late 1990s and the likely grim outcome of a collapse in the U.S. housing bubble. Shiller worries that the Dirty Thirties spectre "is a cause of the current situation – because the Great Depression serves as a model for our expectations, damping what John Maynard Keynes called our `animal spirits,' reducing consumers' willingness to spend and businesses' willingness to hire and expand. The Depression narrative could easily end up as a self-fulfilling prophecy." Some relevant points, I think: **LOOK AT STOCKS** Even the prospects of a small-d depression – defined by most economists as a 10 per drop in GDP for several years – are slim. In a recent Wall Street Journal essay, Robert J. Barro, a Harvard economist, described his study of 251 stock-market crashes and 97 depressions in 34 nations dating back to the mid-19th century. He notes that only mild recessions followed the U.S. stock-market collapses of 2000-02 (a 42 per cent plunge) and 1973-74 (49 per cent). The current market's peak-to-trough collapse has been 51 per cent. Barro concludes the probability today of a minor depression is just 20 per cent, and of a major depression, **only 2 per cent.** LOOK AT JOBS NUMBERS In the Great Depression, GDP collapsed by 33 per cent, the jobless rate was 25 per cent, 8,000 U.S. banks failed, and today's elaborate social safety net of state welfare provisions did not exist. In the current downturn, GDP in Canada shrank by 3.4 per cent in the last quarter of 2008, and in the U.S. by 6.2 per cent. A terrible performance, to be sure. But it would take another 10 consecutive quarters of that rate of decline to lose even the 10 per cent of GDP that qualifies for a small-d depression. Allowing that 1,000 economists laid end to end still wouldn't reach a conclusion, their consensus view is economic recovery will kick in next year, if not the second half of this year. The jobless rate in Canada and the U.S. is 7.2 per cent and 8.1 per cent, respectively. Again, the consensus among experts is that a worst-case scenario for U.S. joblessness is a peak of **11 per cent**. There have been no bank failures in Canada. To the contrary, the stability of Canadian banks has lately been acclaimed worldwide. Two of America's largest banks, Citigroup Inc. and Bank of America Corp., are on government life support. But otherwise the rate of collapse of U.S. lenders outside of the big "money centre" banks at the heart of the housing-related financial crisis has been only modestly higher than is usual in recessionary times. LOOK AT INTERVENTIONS In the Great Depression, Herbert Hoover and R.B. Bennett, just prior to the appearance of the Keynesian pump-priming theories that would soon dominate modern economic management, obsessed with balanced budgets, seizing upon precisely the wrong cure. They also moved very slowly to confront a crisis with no precedent. (So did Japan's economic administrators during its so-called "lost decade" of the 1990s.) Most earlier U.S. "panics" were directly tied to abrupt collapses in stock or commodity values not accompanied by the consumer-spending excesses of the Roaring Twenties and greatly exacerbated by a 1930s global trade war. Today, only right-wing dead-enders advance balanced budgets as a balm in this hour of economic emergency. In this downturn, governments from Washington to Ottawa to Beijing have been swift in crafting Keynesian stimulus packages. Given their recent legislative passage – indeed, Harper's stimulus package awaits passage – the beneficial impact of these significant jolts is only beginning to be felt. And, if one believes, as I long have, that this is a financial crisis – the withholding of life-sustaining credit from the economy by a crippled global banking system – and not a crisis with origins on Main Street, then the resolution to that banking failure may trigger a much faster and stronger economic recovery than anyone now imagines. tune out the static It's instructive that there was much talk of another Great Depression during the most painful recession since World War II, that of **1980-82.** Indeed, alarmist talk about global systemic collapses has accompanied just about every

abrupt unpleasantness, including the Latin American debt crisis of the 1980s, the Mexican default in 1995, the Asian currency crisis of the late 1990s, financial havoc in **Argentina** early this decade, and even the failure of U.S. hedge fund Long-Term Capital Management in the late 1990s. Modern economic **recoveries tend to be swift and unexpected.** The nadir of the 1980-82 downturn, in August 1982, kicked off the greatest stock-market and economic boom in history. And no sooner had the dot-com and telecom wreckage been cleared away, with the Dow Jones Industrial Average bottoming out at 7,286 in October 2002, than the next stock boom was in high gear. It reached its peak of 14,164 – 2,442 points higher than the previous high, it's worth noting – **just five years later.** look at the big picture Finally, **the case for a sustained economic miasma is difficult to make.** You'd have to believe that the emerging economic superpowers of China and India will remain **for years in the doldrums** to which they've recently succumbed; that oil, steel, nickel, wheat and other commodities that only last year skyrocketed in price will similarly fail to recover, despite continued global population growth, including developing world economies seeking to emulate the Industrial Revolutions in China and South Asia.

US not key to global economy – decoupling is for real

Wassener 9

Wassener, MSC in IR, 9—London School of Economics and Political Science, MSc , International Relations, Politics (Bettina, In Asia, a Derided Theory Returns, 1 July 2009, http://query.nytimes.com/gst/fullpage.html?res=9C0CEFDE163EF932A35754C0A96F9C8B63)

HONG KONG -- For a while, when the global economic crisis was at its worst, it was a dirty word that only the most provocative of analysts dared to use. Now, the D-word -- decoupling -- is making a comeback, and nowhere more so than in Asia. Put simply, the term refers to the theory that emerging countries -- whether China or Chile -- will become more independent of the ups and downs in the United States as their economies become stronger and more sophisticated. For much of last year, the theory held up. Many **emerging economies** had **steered clear of investments that dragged down a string of banking behemoths in the West**, and saw nothing like the turmoil that began to engulf the United States and Europe in 2007. But then, last autumn, when the collapse of Lehman Brothers caused the global financial system to convulse and consumer demand to shrivel, emerging economies around the world got caught in the downdraft, and the D-word became mud. Now, the tables are turning again, especially in Asia, where many emerging economies are showing signs of a stronger recovery than in the West. And economists here have begun to use the D-word in public once again. **"Decoupling is happening for real**," **the chief Asia-Pacific economist at Goldman Sachs in Hong Kong**, Michael Buchanan, **said in a recent interview**. Or as the senior Asia economist at HSBC, Frederic Neumann, said, "Decoupling is not a dirty word." To be sure, the once sizzling pace of Asian economic growth has slowed sharply as exports to and investments from outside the region slumped. Across Asia, millions of people have lost their jobs as business drops off and companies cut costs and output. Asia is heavily dependent upon selling its products to consumers in the United States and Europe, and many executives still say a strong U.S. economy is a prerequisite for a return to the boom of years past. Nevertheless, the theory of decoupling is back on the table. **For the past couple of months, data from around the world have revealed a growing divergence between Western economies and those in much of Asia**, notably China and India. The World Bank last week forecast that the economies of the euro zone and the United States would contract 4.5 percent and 3 percent, respectively, this year -- in sharp contrast to the 7.2 percent and 5.1 percent economic growth it forecasts for China and India. **Forecasts from the Organization for Economic Cooperation and Development** that **were** also **published last week backed up this general trend**. Major statistics for June, due Wednesday, are expected to show manufacturing activity in China and India are on the mend. By contrast, purchasing managers' indexes for Europe and the United States are forecast to be merely less grim than before but still show contractions. Why this diverging picture? **The crisis hit Asia much later**. **While the U.S. economy began languishing in** 20**07**, **Asian economies were still doing well right up until the collapse of Lehman Brothers** last September. What followed was a rush of stimulus measures -- rate cuts and government spending programs. In Asia's case, these came soon after things soured for the region; in the United States, they

came much later in the country's crisis. Moreover, **developing** Asian **economies were in pretty good shape when the crisis struck**. The last major crisis to hit the region -- the financial turmoil of 1997-98 -- forced governments in Asia to introduce overhauls that ultimately left them with lower debt levels, more resilient banking and regulatory systems and often large foreign exchange reserves. Another crucial difference is that **Asia**, unlike the United States and Europe, **has not had a banking crisis**. Bank profits in Asia have plunged and some have had to raise extra capital **but there have been no major collapses and no bailouts**. ''The single most important thing to have happened in Asia is that there has not been a banking crisis,'' said Andrew Freris, a regional strategist at BNP Paribas in Hong Kong. ''Asia is coming though this crisis with its banking system intact. Yes, some banks may not be making profits -- but **it is cyclical and not systemic**.'' The lack of banking disasters also has meant that, unlike in Europe and the United States, **Asian governments have not had to spend cash to clean the balance sheets of faltering banks**. In other words, all of the stimulus spending is going into the economy. The effect is greater and more immediate. Add to that the fact that companies and households in Asia are typically not burdened with the kind of debt that is forcing Americans and Europeans to cut back consumption and investment plans. Asians are generally big savers; those in developing nations have limited health care and pension systems to fall back on. So they put aside cash for retirement, sickness and their children's education, rather than maxing out multiple credit cards. Paul Schulte of Nomura said this difference was leading to a long-term shift.

Mass Media influences our perception of Islam

The role of media is to shape opinions and presenting a particular version as reality. Media are also believed and expected to portray a fair picture on any issues occur both at local and international level. However, in portraying Islam especially after the September 11 attacks, a number of research found that International media tend to negatively depict Islam by associating it with terrorism (Zulkifli, 2009; Winegar, 2008; Gerges, 2003). Issues concerning the way international media, specifically in the US and UK, equate Islam with terrorism have been tremendously debated. Research showed that after the September 11 attack, terrorism has been repeatedly associated with Islam by most of the international media. Dr. Natasha Hamilton-Hart, a lecturer in Singapore National University once said that the definition of terrorism at the moment is too narrow because it only depicts Islam and Muslims in an irrelevant manner (Berita Harian, June 5th 2008:10). The attacks on the World Trade Center in New York and Pentagon on September, 11th 2001 have given a massive impact to the whole world. The impact on the United States (US) was much bigger in various aspects including economics and military as well as the US credibility as the most powerful nation in the world. This has led the US to take revengeful actions against those who were targeted to be responsible for the attack, thus making this an opportunity for the US to do anything on anyone they dislike despite of disagreement made by International society against the US (The Star, Jan 19th , 2002:15). The US has made an initiative hunting and targeting any parties involved in a so called terrorism. The first step taken besides arresting few targeted individuals was to attack Afghanistan in which the ruler was claimed to have an affiliation with terrorists who were responsible for the September 11 attacks. In relation to this, the issue of fighting against terrorism has been the most important agenda prioritized by international media. The mass media in the US and its counterpart, UK such as Cable News Network (CNN), British Broadcasting Corporation (BBC), some mainstream news magazines namely Newsweek and TIME as well as other media have played a significant role in influencing the whole world to morally support the US in protesting against terrorism. Obviously, western countries are prone to identify terrorism with certain groups that are labeled as extremists, militants or Muslim extremists (Zulkifli, 2009). Winegar (2008) said that such an effort today is seen to focus on Muslim groups which coincidentally accused to be responsible for the September 11 attacks, and this badly affects the whole Muslim society worldwide due to an accusation made by the US government on Islam through most of western media for the tragedy at the World Trade Center. Mahathir (2003) claimed that there is an extension of negative stereotype, discrimination and hatred towards Muslims by International media, especially after the September 11. Hashim (2009) conducted a full content analysis on the labeling attitude of Islam and terrorism in US TIME news magazine for six month period right after the attacks found that the labeling attitude tendency in this magazine was remarkably high. He also proposed on a lengthier and more thorough content analysis done on this news magazine for more precise results. In analyzing discourse elements of the media portraying issues related to terrorism, Picard and Paul D. Adams in Biernatzki (2002) has displayed how media practitioners namely journalists in their reporting of violent acts, have options in choosing words that are either straightforward

descriptions, on the other hand, or that contain implicit judgments about the act, on the other. While Kumar (2008), in his content analysis study of western media found five negative discursive frames that have been employed to represent Muslims, Arabs and the Middle East post September 11. These frames are: 1) Islam is a monolithic religion. 2) Islam is a uniquely sexist religion. 3) The "Muslim mind" is incapable of rationality and science. 4) Islam is inherently violent. 5) The West spreads democracy, Islam spawns terrorism.

Plan won't deter Islamophobia – Fear incentivizes reproduction in politics and the media

Andrea Elizabeth **Cluck**, MA from University of Georgia, 20**12**, "ISLAMOPHOBIA IN THE POST-9/11 UNITED STATES: CAUSES, MANIFESTATIONS, AND SOLUTIONS", https://getd.libs.uga.edu/pdfs/cluck_andrea_e_201208_ma.pdf

In addition to the historical and psychological factors already discussed, various elements within contemporary society also contribute to Islamophobia -- for example, some politicians and media pundits both play a role in perpetuating contemporary anti-Muslim sentiment. Although a detailed discussion of the ways in which politicians and the mass media perpetuate Islamophobia is beyond the scope of the present work, one reason why both groups uphold Islamophobic stereotypes should be discussed here: personal gain. Simply put, some individuals utilize Islamophobia as a currency for personal advancement, including gaining money or societal influence. They are able to do so because genuine Islamophobia does exist; there are Americans who fear or dislike Muslims because of ignorance or erroneous information. Some Americans may fear Muslims, for examples because they mistakenly believe the actions of violent extremists are representative of the aspirations of the majority of Muslims.203 There are other people, however, who do not necessarily believe the stereotypes about Muslims, but nevertheless deliberately perpetuate them, or at least capitalize on those already in existence, in order to achieve personal gain. Deliberately perpetuating negative stereotypes about Islam and Muslims can be done for a variety of reasons, of which we will discuss three: to gain political leverage during elections, to make money through perpetuating Islamophobia in popular media, and to situate the West in a position of power against Muslims. First, Mohamed Nimer notes that "in political seasons, fear of Islam and Muslims has proven to be a useful mobilizer across party lines. The rumor about President (then Senator) Obama's being secretly Muslim serves as a vivid illustration." It was used to dissuade Democrats and Republicans alike from voting for Obama; and Obama quickly moved to disprove the allegations. Nimer notes that rather than "using his old Muslim ties as an added advantage for any future president who might be dealing heavily with the Muslim world, the senator mobilized supporters, including his church pastor, to provide witness that he is not a Muslim but a practicing Christian." 204 This indicates that "Muslim" is such a pejorative label in the United States today that no good could be salvaged from the situation and Obama had to distance himself from the signifier completely.205 Aside from politicians, media pundits can also utilize Islamophobia for personal gain. Exacerbating Islamophobia can be extremely lucrative; a good deal of money is to be made from books, television shows, films, and countless other creative ventures linking Islam to terrorism. There is truth to the saying "if it bleeds, it leads." A story about an interfaith potluck dinner at a local mosque is not very exciting and unlikely to make the nightly news. Alleged Muslim sleeper cells in the United States are far more newsworthy, however, regardless of the credibility of the claims. To give a concrete example of how polemics can generate cash, at least one of Robert Spencer's popular, controversial works on Islam was a New York Times Bestseller for several weeks.206 In addition to gains at a more personal level for politicians and pundits, Edward Said notes that a widespread policy of Islamophobia puts the West itself in a position of superiority, a position of power, in relation to the Islamic world. In Covering Islam, he discusses this power differential at length. He points out that an "anti-Islam campaign virtually eliminates the possibility of any sort of equal dialogue between Islam and the Arabs."207 Although Americans assume that there is a degree of objectivity in journalism, Said argues that this is often not the case with Islam, and that "all discourse on Islam has an interest in some authority or power;" he takes care in the book to identify the "various groups in society that have an interest in 'Islam' such as academia, the government, corporations, and the media.208 Hence, it should be taken into account that Islamophobia does not just happen on an individual level among ill-informed individuals, but rather the institutionalized manipulation of Islamophobia for personal gain does exist, and happens in order to achieve political gain, to make money through the popular media, and to perpetuate Western superiority. In summary, historically the primary causal factors of American Islamophobia were Europe's initial contact with Islam, the Puritan worldview, later American religio-political beliefs, Americans' contact with the Muslim world, American art and literature,

and finally, later American religious movements. Today, main factors driving Islamophobia include its manipulation for political gain, for financial gain via the mass media, and finally, for the perpetuation of Western superiority.

Definition Edit
Domestic surveillance is the acquisition of nonpublic information concerning United States persons.

US person defined

3 Federal law and executive order define a U.S. person as "a citizen of the United States, an alien lawfully admitted for permanent residence, an unincorporated association with a substantial number of members who are citizens of the U.S. or are aliens lawfully admitted for permanent residence, or a corporation that is incorporated in the U.S." (NSA, undated). Although this definition would therefore allow information to be gathered on U.S. persons located abroad, our objective was to examine the creation of a domestic intelligence organization that would focus on—and whose activities would center around—individuals and organizations located inside the United States . Though such an agency might receive information about U.S. persons that was collected abroad by other intelligence agencies, it would not collect that information itself.

1) **Violation** – The affirmative interpretation is bad for debate
Their plan curtails surveillance on all suspected terrorist. Not all suspected terrorist are U.S persons, especially abroad.

The war on terror and fear of Islam are rhetorical strategies to preclude critique of neoliberalism – their representations shut down movements while ensuring error replication

The second observation is over the ambivalence shown by Western governments and political parties in the USA. **Democracy is good**, the mantra goes, **but we also desire stability and** so we **are concerned about succession** and chaos that may accompany the deposition of Mubarak in Egypt. **Conservatives, long the champions of 'freedom' and 'democracy'** around the world (but perhaps not in Florida!), **find themselves critical of Obama's stance calling for change and respect for the wishes of 'the people' of Egypt.** Even these calls for change by the Administration are tempered by concerns over the transition. **After all, Mubarak was a valued ally** (translate: a willing instrument of our foreign policy) and Egypt a recipient of our foreign aid (translate: we fund their military) – they should not be abandoned so quickly. Other absolute rulers in the region are watching us to see how we respond to this 'democratic' threat. Similar themes emerge: what is this movement for change and who will assume the mantle of leadership. After all, we cannot just legitimize the aspirations of the dispossessed and the claims against tyrants we have put into place and propped up for many years, even decades – that would describe so many countries around the world and potentially herald a Jacobin moment in each. **We only wish to demonize and overthrow our enemies, not our allies**. **How best to do that if not to invoke images of** Taliban-like governments in waiting eager to seize control, thereby worrying about **the rising role of** what we call **Islamists** in the region. Images of another Iran are offered us to caution for calm and patience regarding Egypt. Nationalist forces and national liberation movements during the period from the end of World War II through the Vietnam War era and beyond were either supported by the USA if that movement called for deposing a government unfriendly to US interests – for example, funding the Contra war against Sandinista Nicaragua, or were vilified as 'communist' or worse if they opposed dictators friendly towards the USA – fostering rebellion in the Congo and the overthrow and assassination of Lumumba, and the overthrow of Mosaddeq in Iran followed by the installation of Mohammad Reza Shah come to mind (see Berberoglu, 2000 on the politics of national liberation struggles).¶ The case of the successful coup in Iran in 1953, which served as a blueprint for a successful coup in Guatemala in 1954 and the failed Bay of Pigs intervention in Cuba in 1961, is instructive in the current situation for two reasons. First, the harsh rule of the USA-supported Shah left an animosity among the Iranian people that culminated in an Islamic revolution in 1979 steeped in the hatred of the USA. So long as we were pre-occupied by our Cold War against the Soviet Union and the Warsaw Pact countries, and so long as Iran was kept in check by our ally Saddam Hussein in Iraq, that country was not a primary concern of the USA. Second, our memory of the Iranian situation and hostage taking after the overthrow of the Shah informs our political response and assessment of any post-Mubarak Egypt. Our government fails to see how this popular anti- American rhetoric is born out of an association with a hated regime propped up by American guns and money. The image of a group like the Moslem Brotherhood taking part in discussions of a post-Mubarak Egypt and visions of the Ayatollah led revolution in Iran and the unenlightened rule of the Taliban in Afghanistan (Langman, 2005) fuel our fears.¶ **Since** the events of **9/11 the West in general and the USA in particular have used the specter of Islam as our excuse and justification for our foreign (and domestic) policies**. **That cataclysmic event vaulted a neo-conservative world view front and center**, which lead to a willingness to use military power unilaterally and without regard to international norms in order to rectify and restore American and European interests as the US Government has defined them. Our official understanding of anti-western terrorism is that it is a direct result of Islam's rejection of western liberalism and a rejection of the freedom and conspicuous consumption of non-Islamic nations. **By framing the response as a 'war on terrorism' the US Government obscures the anti-communal nature of its position**. By anti-communal, I mean that **neo-liberalism rejects the rights of those who embody**

difference **even as it purports to defend a system of democracy rooted in difference**. Clearly, there is no uniform definition of Arab (David, 2007) but it is clear that **there has been an attempt to both create a singular Muslim identity and then strip it of its symbols** (Byng, 2010) **in the creation and embodiment of this external threat**. Only by raising the specter of an Islamic regime, with all its implied hostility to the West, can our current political leaders rationalize a measured and hesitant response to the opposition movement in Egypt, and in so doing urge that the transition from Mubarak does not leave a power vacuum.¶ Once again we fail to recognize or choose to ignore the fact that legitimate grievances against despotic regimes will lead, in turn, to legitimate grievances against states and governments that support and maintain those regimes in power. The anger of the Iranian people amid the memory of US involvement in installing and supporting the Shah is ignored, and in its place we identify the Islamic nature of the revolution as the root cause of the animosity against this country. **We now seem to ignore the poverty and repression sustained by US aid for a leader whose main value was to be a powerful instrument of our foreign policy** and a proxy in an important region (not to mention a willing partner through rendition and the application of torture illegal in the USA). **The signals are clear. The overthrow of the government in Tunisia, the responses to popular protest in Jordan and Yemen, and current events in Egypt all point to a growing willingness by citizens to challenge the existing order that ensures widespread poverty**, aggregates wealth and power among a very few, and in this way to resist the forces of social control in demonstrating and demanding real change. **By labeling this opposition as 'Islamist' and demonizing its goals western governments can ignore legitimate claims and dismiss popular protest.**¶ And so we return to the situation in the USA. We face persistent unemployment that promises to be devastating for a generation of workers too old to retrain and too young to partake of years of retirement – especially as the conservatives in Congress mean to strip bear the underpinning of the social supports making that retirement possible. On some level **the willingness and eagerness of** these same **conservative forces to advocate for the continuation of the Mubarak regime reveals the true nature of their domestic social political agenda**. **There are no appeals to poverty alleviation, no sense that there is a social responsibility of society to all citizens**, and no compassion for those dealt a harsh blow by the policies of its government and the working of its economy. **This is true in their response to events in Egypt, and apparently true as these politicians contemplate policies and budget cuts to social spending in the USA.**

The impact is extinction – neoliberal social organization ensures extinction from resource wars, climate change, and structural violence – only accelerating beyond neoliberalism can resolve its impacts

At the begin-ning of the second dec-ade of the Twenty-First Cen-tury, **global civilization faces a new breed of cataclysm**. These com-ing apo-ca-lypses ridicule the norms and organ-isa-tional struc-tures of the polit-ics which were forged in the birth of the nation-state, the rise of cap-it-al-ism, and a Twen-ti-eth Cen-tury of unpre-ced-en-ted wars. 2. **Most significant is the**

break-down of the planetary climatic system. In time, **this threatens the continued existence of the** present global **human population**. Though this is the most crit-ical of the threats which face human-ity, **a series of** lesser but **potentially equally destabilising problems exist along-side** and inter-sect with **it**. **Terminal resource depletion, especially in water and energy** reserves, **offers the prospect of mass starvation, collapsing economic paradigms, and new hot and cold wars**. **Continued financial crisis has led governments to embrace the** para-lyz-ing **death spiral policies of austerity, privatisation of social welfare services, mass unemployment, and stagnating wages. Increasing automation in production processes** includ-ing 'intel-lec-tual labour' **is evidence of the secular crisis of capitalism, soon to render it incapable of maintaining current standards of living** for even the former middle classes of the global north. 3. In con-trast to these ever-accelerating cata-strophes, **today's politics is beset by an inability to generate the** new ideas and **modes of organisation necessary to transform our societies to confront** and resolve the **coming annihilations**. While crisis gath-ers force and speed, polit-ics with-ers and retreats. In this para-lysis of the polit-ical ima-gin-ary, the future has been cancelled. 4. Since 1979, **the hegemonic global political ideology has been neoliberalism**, found in some vari-ant through-out the lead-ing eco-nomic powers. In spite of the deep struc-tural chal-lenges the new global prob-lems present to it, most imme-di-ately the credit, fin-an-cial, and fiscal crises **since 2007 – 8, neoliberal programmes have** only **evolved** in the sense of deep-en-ing. **This continuation** of the neo-lib-eral pro-ject, or neo-lib-er-al-ism 2.0, **has begun to apply another round of structural adjustments**, most sig-ni-fic-antly in the form of encour-aging new and aggress-ive incur-sions by the private sec-tor into what remains of social demo-cratic insti-tu-tions and ser-vices. **This is in spite of the immediately negative** eco-nomic and social **effects of such policies**, and the longer term fun-da-mental bar-ri-ers posed by the new global crises.

The alternative articulates a "counter-conduct" – voting neg pushes towards a* cooperative conduct *that organizes individuals around a collectively shared* commons *– affirming this conduct creates a new heuristic that de-couples government from the demand for competition and production

This indicates to what extent we must take on board in our own way the main lesson of neo-liberalism: **the subject is always to be constructed**. **The whole question is** then **how to articulate subjectivation with resistance to power**. Now, precisely this issue is at the heart of all of Foucault's thought. However, as Jeffrey T. Nealon has recently shown, part of the North American secondary literature has, on the contrary, stressed the alleged break between Foucault's research on power and that of his last period on the history of subjectivity.55 According to the 'Foucault consensus', as Nealon aptly dubs it, the successive impasses of the initial neo-structuralism, and then of the totalizing analysis of panoptical power, led the 'last Foucault' to set aside the issue of power and concern himself exclusively with the aesthetic invention of a style of existence bereft of any political dimension. Furthermore, if we follow this de-politicizing reading of Foucault, the aestheticization of ethics anticipated the neo-liberal mutation precisely by making self-invention a new norm. In reality, far from being oblivious of one another, the issues of power and the subject were always closely articulated, even in the last work on modes of subjectivation. If one concept played a decisive role in this respect, it was 'counter-conduct', as developed in the lecture of 1 March 1978.56 This lecture was largely focused on the crisis of the pastorate. It involved identifying the specificity of the 'revolts' or **'forms of resistance of conduct'**

that are the correlate of the pastoral mode of power. If such forms of resistance are said to be 'of conduct', it is because they are forms of resistance to power as conduct and, as such, **are themselves forms of conduct opposed to** this **'power-conduct'**. **The term 'conduct'** in fact **admits of two meanings**: **an activity that consists in conducting others**, or **'conduction'**; **and the way one conducts oneself under the influence of this activity of conduction**.57 **The idea of 'counter-conduct'** therefore **has the advantage of directly signifying a 'struggle against the procedures implemented for conducting others', unlike the term 'misconduct', which only refers to the passive sense of the word**.58 **Through 'counter-conduct', people seek both to escape conduction by others and to define a way of conducting themselves towards others**.¶ **What relevance might this observation have for** a reflection on **resistance to neo-liberal governmentality**? It will be said that the concept is introduced in the context of an analysis of the pastorate, not government. **Governmentality**, at least **in its** specifically **neo-liberal form**, precisely **makes conducting others through their conduct towards themselves its real goal**. **The peculiarity of** this conduct towards oneself, **conducting oneself as a personal enterprise, is that it immediately and directly induces a certain conduct towards others**: **competition with others**, regarded as so many personal enterprises. Consequently, counter-conduct as a form of resistance to this governmentality must correspond to a conduct that is indivisibly a conduct towards oneself and a conduct towards others. One cannot struggle against such an indirect mode of conduction by appealing for rebellion against an authority that supposedly operates through compulsion external to individuals. If 'politics is nothing more and nothing less than that which is born with resistance to governmentality, the first revolt, the first confrontation',59 it means that ethics and politics are absolutely inseparable.¶ To the subjectivation-subjection represented by ultra-subjectivation, we must oppose a subjectivation by forms of counter-conduct. **To neo-liberal governmentality as a specific way of conducting the conduct of others, we must** therefore **oppose a no less specific double refusal**: **a refusal to conduct oneself towards oneself as a personal enterprise and a refusal to conduct oneself towards others in accordance with the norm of competition**. As such, the double refusal is not 'passive disobedience'.60 For, **if it is true** that the **personal enterprise's relationship to the self immediately and directly determines a certain kind of relationship to others** – **generalized competition** – **conversely, the refusal to function as a personal enterprise**, which is self-distance **and a refusal to line up in the race for performance, can only practically occur on condition of establishing cooperative relations with others, sharing and pooling**. In fact, **where would be the sense in a self-distance severed from any cooperative practice**? At worst, a cynicism tinged with contempt for those who are dupes. At best, simulation or double dealing, possibly dictated by a wholly justified concern for self-preservation, but ultimately exhausting for the subject. Certainly not a counter-conduct. All the more so in that **such a game could lead the subject, for want of anything better, to take refuge in a compensatory identity**, which at least has the advantage of some stability by contrast with the imperative of indefinite self-transcendence. **Far from threatening the neo-liberal order, fixation with identity**, whatever its nature, **looks like a fall-back position for subjects weary of themselves**, for all those who have abandoned the race or been excluded from it from the outset. **Worse, it recreates the logic of competition at the level of relations between 'little communities'**. **Far from being valuable in itself**, independently of any articulation with politics, **individual subjectivation is bound up at its very core with collective subjectivation**. In this sense, sheer aestheticization of ethics is a pure and simple abandonment of a genuinely ethical attitude. **The invention of new forms of existence can only be a collective act**, **attributable to the** multiplication and **intensification of cooperative counter-conduct**. A collective refusal to 'work more', if only local, is a good example of an attitude that can pave the way for such forms of counter-conduct. In effect, it breaks what André Gorz quite rightly called the 'structural complicity' that binds the worker to capital, in as much as 'earning money', ever more money, is the decisive goal for both. It makes an initial breach in the 'immanent constraint of the "ever more", "ever more rapidly"'.61¶ **The genealogy of neo-liberalism** attempted **in this book teaches** us that **the new global rationality is** in **no** wise an **inevitable fate shackling humanity**. Unlike Hegelian Reason, it is not the reason of human

history. **It is itself wholly historical** – that is, **relative to strictly singular conditions that cannot legitimately be regarded as untranscendable.** The main thing is to understand that nothing can release us from the task of promoting a different rationality. That is why the belief that the financial crisis by itself sounds the death-knell of neo-liberal capitalism is the worst of beliefs. It is possibly a source of pleasure to those who think they are witnessing reality running ahead of their desires, without them having to move their little finger. It certainly comforts those for whom it is an opportunity to celebrate their own past 'clairvoyance'. At bottom, it is the least acceptable form of intellectual and political abdication. Neo-liberalism is not falling like a 'ripe fruit' on account of its internal contradictions; and traders will not be its undreamed-of 'gravediggers' despite themselves. Marx had already made the point powerfully: 'History does nothing'.62 **There are only human beings who act in given conditions and seek through their action to open up a future for themselves**. **It is up to us to enable a new sense of possibility** to blaze a trail. The **government** of human beings **can be aligned with horizons other than those of maximizing performance, unlimited production and generalized control**. **It can sustain itself with self-government that opens onto different relations with others than** that of **competition between 'self-enterprising actors'**. The **practices of 'communization' of knowledge, mutual aid and cooperative work can delineate the features of a different world reason. Such an alternative reason cannot be better designated than by the term reason of the commons**.

Terror risk is high- maintaining current surveillance is key

Inserra, 6-8-2015

David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation, 6-8-2015, "69th Islamist Terrorist Plot: Ongoing Spike in Terrorism Should Force Congress to Finally Confront the Terrorist Threat," Heritage Foundation, http://www.heritage.org/research/reports/2015/06/69th-islamist-terrorist-plot-ongoing-spike-in-terrorism-should-force-congress-to-finally-confront-the-terrorist-threat

On June 2 in Boston, Usaamah Abdullah Rahim drew a knife and attacked police officers and FBI agents, who then shot and killed him. Rahim was being watched by Boston's Joint Terrorism Task Force as he had been plotting to behead police officers as part of violent jihad. A conspirator, David Wright or Dawud Sharif Abdul Khaliq, was arrested shortly thereafter for helping Rahim to plan this attack. This plot marks the 69th publicly known Islamist terrorist plot or attack against the U.S. homeland since 9/11, and is part of a recent spike in terrorist activity. The U.S. must redouble its efforts to stop terrorists before they strike, through the use of properly applied intelligence tools. The Plot According to the criminal complaint filed against Wright, Rahim had originally planned to behead an individual outside the state of Massachusetts,[1] which, according to news reports citing anonymous government officials, was Pamela Geller, the organizer of the "draw Mohammed" cartoon contest in Garland, Texas.[2] To this end, Rahim had purchased multiple knives, each over 1 foot long, from Amazon.com. The FBI was listening in on the calls between Rahim and Wright and recorded multiple conversations regarding how these weapons would be used to behead someone. Rahim then changed his plan early on the morning of June 2. He planned to go "on vacation right here in Massachusetts…. I'm just going to, ah, go after them, those boys in blue. Cause, ah, it's the easiest target."[3] Rahim and Wright had used the phrase "going on vacation" repeatedly in their conversations as a euphemism for violent jihad. During this conversation, Rahim told Wright that he planned to attack a police officer on June 2 or June 3. Wright then offered advice on preparing a will and destroying any incriminating evidence. Based on this threat, Boston police officers and FBI agents approached Rahim to question him, which prompted him to pull out one of his knives. After being told to drop his weapon, Rahim responded with "you drop yours" and moved toward the officers, who then shot and killed him. While Rahim's brother, Ibrahim, initially claimed that Rahim was shot in the back, video surveillance was shown to community leaders and civil rights groups, who have confirmed that Rahim was not shot in the back.[4] Terrorism Not Going Away This 69th Islamist plot is also the seventh in this calendar year. Details on how exactly Rahim was radicalized are still forthcoming, but according to anonymous officials, online propaganda from ISIS and other radical Islamist groups are the source.[5] That would make this attack the 58th homegrown terrorist plot and continue the recent trend of ISIS playing an important role in radicalizing individuals in the United States. It is also the sixth plot or attack targeting law enforcement in the U.S., with a recent uptick in plots aimed at police. While the debate over the PATRIOT Act and the USA FREEDOM Act is taking a break, the terrorists are not. The result of the debate has been the reduction of U.S. intelligence and counterterrorism capabilities, meaning that the U.S. has to do even more with less when it comes to connecting the dots on terrorist plots.[6] Other legitimate intelligence tools and capabilities must be leaned on now even more. Protecting the Homeland To keep the U.S. safe, Congress must take a hard look at the U.S. counterterrorism enterprise and determine other measures that are needed to improve it. Congress should: Emphasize community outreach. Federal grant funds should be used to create robust community-outreach capabilities in higher-risk urban areas. These funds must not be used for political pork, or so broadly that they no longer target those communities at greatest risk. Such capabilities are key to building trust within these communities, and if the United States is to thwart lone-wolf terrorist attacks, it must place effective community outreach operations at the tip of the spear. Prioritize local cyber capabilities. Building cyber-investigation capabilities in the higher-risk urban areas must become a primary focus of Department of Homeland Security grants. With so much terrorism-related activity occurring on the

Internet, local law enforcement must have the constitutional ability to monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working on integrating intelligence and law enforcement activities. Full integration will require overcoming inter-agency cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Maintain essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Clear-Eyed Vigilance The recent spike in terrorist plots and attacks should finally awaken policymakers—all Americans, for that matter—to the seriousness of the terrorist threat. Neither fearmongering nor willful blindness serves the United States. Congress must recognize and acknowledge the nature and the scope of the Islamist terrorist threat, and take the appropriate action to confront it.

Surveillance is critical to stopping terror threats

Lewis 14 [James Andrew Lewis, Director and Senior Fellow of the Technology and Public Policy Program at the CSIS, December 2014, "Underestimating Risk in the Surveillance Debate", Center for Strategic and International Studies, http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf pg 10-11 jf]

Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents. Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios. In one instance, an attack is detected and stopped before it could be executed. U.S. forces operating in Iraq discover a bomb-making factory. Biometric data found in this factory is correlated with data from other bombings to provide partial identification for several individuals who may be bomb-makers, none of whom are present in Iraq. In looking for these individuals, the United States receives information from another intelligence service that one of the bombers might be living in a neighboring Middle Eastern country. Using communications intercepts, the United States determines that the individual is working on a powerful new weapon. The United States is able to combine the communications intercept from the known bomb maker with information from other sources—battlefield data, information obtained by U.S. agents, collateral information from other nations' intelligence services—and use this to identify others in the bomber's network, understand the plans for bombing, and identify the bomber's target, a major city in the United States. This effort takes place over months and involves multiple intelligence, law enforcement, and military agencies,

with more than a dozen individuals from these agencies collaborating to build up a picture of the bomb-maker and his planned attack. When the bomb-maker leaves the Middle East to carry out his attack, he is prevented from entering the United States. An analogy for how this works would be to take a 1,000-piece jigsaw puzzle, randomly select 200 pieces, and provide them to a team of analysts who, using incomplete data, must guess what the entire picture looks like. The likelihood of their success is determined by how much information they receive, how much time they have, and by experience and luck. Their guess can be tested by using a range of collection programs, including communications surveillance programs like the 215 metadata program. What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects. This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine.

Terrorists will use bioweapons- guarantees extinction

Cooper 13

(Joshua, 1/23/13, University of South Carolina, "Bioterrorism and the Fermi Paradox," http://people.math.sc.edu/cooper/fermi.pdf, 7/15/15, SM)

We may conclude that, when a civilization reaches its space-faring age, it∂ will more or less at the same moment (1) contain many individuals who seek to cause large-scale destruction, and (2) acquire the capacity to tinker with its own genetic chemistry. This is a perfect recipe for bioterrorism, and, given the many very natural pathways for its development and the overwhelming∂ evidence that precisely this course has been taken by humanity, it is hard to∂ see how bioterrorism does not provide a neat, if profoundly unsettling, solution∂ to Fermi's paradox. One might object that, if omnicidal **individuals** are∂ successful in releasing **highly virulent** and **deadly genetic malware** into the∂ wild, they are still unlikely to succeed in killing everyone. However, even if∂ every such mass death event results only in a high (i.e., not total) kill rate and∂ there is a large gap between each such event (so that individuals can build up∂ the requisite scientific infrastructure again**), extinction would be inevitable**∂ regardless. Some of the engineered bioweapons will be more successful than∂ others; the inter-apocalyptic eras will vary in length; and post-apocalyptic∂ environments may be so **war-torn, disease-stricken, and impoverished of genetic variation that they may culminate in true extinction events even if the initial cataclysm 'only' results in 90% death rates**, since they may cause the∂ effective population size to dip below the so-called "minimum viable population."∂ This author ran a Monte Carlo simulation using as (admittedly very∂ crude and poorly informed, though arguably conservative) estimates the following∂ Earth-like parameters: bioterrorism event mean death rate 50% and∂ standard deviation 25% (beta distribution), initial population 1010, minimum∂ viable population 4000, individual omnicidal act probability 10−7 per annum,∂ and population growth rate 2% per annum. One thousand trials yielded an∂ average post-space-age time until extinction of less than 8000 years. This is∂ essentially instantaneous on a cosmological scale, and varying the parameters∂ by quite a bit does nothing to make the survival period comparable with the∂ age of the universe.

Iyer 6/19/**2015** (Deepa; Charleston Shooting is domestic terrorism; america.aljazeera.com/opinions/2015/6/charleston-shooting-is-domestic-terrorism.html; kdf)

A gun rampage. A hate crime. An act of domestic terrorism. The shooting deaths of nine people in the historic Emanuel African Methodist Episcopal Church in downtown Charleston, South Carolina, on Wednesday night must be characterized as all three. While we await further information about the suspect, Dylann Roof, and as we mourn with the families of the victims, it is important that we categorize this tragedy accurately. Roof, apprehended by police on Thursday, is a 21-year-old white man. Before he opened fire on a group of adults and children who had gathered for Bible study, Roof apparently told the congregation, "You rape our women and you're taking over our country. And you have got to go." According to his roommate Dalton Tyler, he had planned something like this attack for six months. "He was big into segregation and other stuff," Tyler told ABC News. "He said he wanted to start a civil war. He said he was going to do something like that and then kill himself." **The Charleston shooting is a violent act of racial hatred, intended to terrorize and intimidate black people**. It exists on the alarming spectrum of other acts of hate in places of worship, including the bombing of the 16th Street Baptist Church in Birmingham, Alabama, in 1963; the spate of arsons against African-American churches in the late 1990s in the South; the anti-Semitic graffiti regularly sprawled on the walls of synagogues and murders at Jewish community centers; the burning of Korans and throwing of Molotov cocktails at mosques; the vandalism of Hindu temples; and the 2012 shooting of six Sikh worshippers at a gurdwara in Oak Creek, Wisconsin, by a white supremacist. Indeed, acts of violence are perpetrated regularly in this country, on the streets and in places of worship, and on the basis of racial bias, sexual orientation, religious bias, ethnicity, disability, gender bias and gender identity. Annual reports from the Federal Bureau of Investigation (FBI) and the Bureau of Justice Statistics (BJS) sketch a national landscape filled with hate crimes against people, including assaults and homicides, and property, including vandalism to places of worship or cross-burnings. The BJS reports that the percentage of hate crimes involving violence increased from 78 percent in 2004 to 90 percent in 2011 and 2012. Meanwhile, the Southern Poverty Law Center has been tracking the organized activities of anti-immigrant, anti-gay, anti-Muslim and anti-government "patriot" groups, many of which are forming in response to changing American racial demographics, immigration patterns and the election of a black president. They are motivated by the belief that the balance of power will shift away from white Americans — a sentiment apparently voiced by Roof when he said "you are taking over," before opening fire at the church. These domestic right-wing hate groups should not be taken lightly. Their ideologies of white supremacy and white nationalism are seeping into mainstream political activity and rhetoric, and influencing "lone wolves" who are committing the majority of hate violence in the country.

Ending calls to decrease domestic surveillance makes any chance of federal authorities to investigate that terrorism impossible – they lead to worse anti-black racism

Deirdre **Griswold**, 7-14-20**15**, "As Black churches burn, where are the feds?," Workers World, http://www.workers.org/articles/2015/06/29/as-black-churches-burn-where-are-the-feds/

As of June 29, six Black churches in the South have either been destroyed or suffered severe damage from fires since Charleston. At least three are confirmed to have been caused by arson, according to the Southern Poverty Law Center. The loss to the people of these communities comes to hundreds of thousands of dollars. **Worse, the torchings are a threat of further violence to a people whose painful**

history at the hands of white exploiters still resonates so strongly. The first burning deemed by fire marshals to be arson destroyed the College Hills Seventh Day Adventist Church in Knoxville, Tenn., on June 22. The Knoxville fire department said the arsonist set multiple fires on the church's property. The church's van was also burned. The very next day, a fire in the sanctuary of God's Power Church of Christ in Macon, Ga., was also blamed on arson. And the day after that, a fire was deliberately set at the Briar Creek Baptist Church in Charlotte, N.C., that destroyed an education wing meant to house a summer program for children. The gymnasium and sanctuary burned, causing an estimated $250,000 in damage. That same week, three other Southern Black churches — in Tennessee, Florida and South Carolina — also suffered fires, although two may have had natural causes. Investigations are continuing. **After what happened in Charleston, S.C., there can be little doubt that the arson fires were set by white supremacists, whose outpourings of hate in print and on the Internet call again and again for violence against people of color, using at best flimsily disguised language and at worst the vilest and most degrading terms. One might think that mass murder of the type that happened in Charleston would immediately lead to arrests of those advocating race war against Black people. We have seen many examples in recent years of elaborate sting operations set up by the FBI and local police authorities to ensnare Black militants on charges of plotting terrorist acts — which government agents had encouraged and facilitated. But just as with the murders of the three civil rights workers in 1964 — James Chaney, Andrew Goodman and Michael Schwerner — by members of the Ku Klux Klan, the authorities have not intervened to stop such attacks**, even though it is logical to assume that, in this day and age of wide surveillance, they have knowledge of them.

The federal and local governments ramped up efforts to combat domestic terrorism of all kinds in the wake of the 1995 Oklahoma City bombing that killed 168 people. A few months following the 9/11 attacks, FBI official Dale Watson testified before the Senate Intelligence Committee that "right-wing groups continue to represent a serious terrorist threat." But Johnson, German, and others assert that **federal counterterrorism programs since 9/11 have focused overwhelmingly on the perceived threat from Islamic extremism**. That includes the Obama administration's "countering violent extremism" strategy, which "revolves around impeding the radicalization of violent jihadists," according to a 2014 Congressional Research Service report. **The attack in Charleston underscored "the failure of the federal government to keep closer tabs" on right-wing extremists,** argues Gerald Horne, a historian and civil rights activist at the University of Houston**. But the focus may soon increase. In February, CNN reported that DHS circulated an intelligence assessment that focused on the domestic terror threat posed by right-wing extremists**. Kurzman and Schanzer also point to **a handout from a training program sponsored by the Department of Justice, cautioning that the threat from antigovernment extremism "is real."**

The Phineas Priesthood is a Christian based terrorist organization that uses violence to promote its many hateful messages. Despite their supposed Christian roots, the Priesthood preaches hate **to virtually everyone that is different from them**. They protest interracial relationships, homosexuality, abortion, Judaism, multiculturalism, and taxation. They desire **a Christian-only nation composed solely of whites**. Members of the Priesthood have carried out attacks on abortion clinics and doctors in the past, and are **labeled as a terrorist organization by the FBI.**

Much like the Phineas Priesthood, this terrorist organization spins religious texts to harm others. They often use violence to combat abortion and homosexual activity, as seen in their attacks on gay night clubs and abortion clinics. Their most notorious member, Eric Rudolph, planted a bomb at the 1996 Olympic Games in Atlanta, Georgia, killing two people and injuring 150. In 2005, Rudolph explained, without remorse, that the bombing was a necessary action, carried out to criticize the government for its, "abortion on demand" viewpoints. Rudolph has also confessed to the bombings of two abortion clinics and one gay nightclub.

By far the most notorious organization on this list, the Klu Klux Klan has been wreaking havoc since 1865 with the end of the United States Civil War. Founded by Confederate veterans, the group sought to restore white supremacy by assaulting freed slaves and those that aided them. They assassinated prominent African Americans, including politicians, religious figures, and community leaders.Today, the Klu Klux Klan focuses on illegal immigrants, homosexuals, urban criminals, and African Americans. The Klan laid forth the groundwork for nearly every white supremacist group that exists today, and as such should be held accountable for their actions as well. This includes the murder and assault of thousands of individuals throughout their history, and frequent property crimes against minority households.

Case turn

The aff's portrayal of terrorism as only an islam-related phenomenon reinforces neoconservative stereotypes and hides white terrorism- turns the case

Henderson '13 (Alex Henderson, July 24th, 2013, 10 of the Worst Terror Attacks by Extreme Christians and Far-Right White Men, http://www.alternet.org/tea-party-and-right/10-worst-terror-attacks-extreme-christians-and-far-right-white-men, AZ)

From Fox News to the Weekly Standard, **neoconservatives have tried to paint terrorism as a largely or exclusively Islamic phenomenon.** Their message of Islamophobia has been repeated many times since the George W. Bush era: Islam is inherently violent, Christianity is inherently peaceful, and there is no such thing as a Christian terrorist or a white male terrorist. But the facts don't bear that out. Far-right white male radicals and extreme Christianists are every bit as capable of acts of terrorism as radical Islamists, and to pretend that such terrorists don't exist does the public a huge disservice. Dzhokhar Anzorovich Tsarnaev and the late Tamerlan Anzorovich Tsarnaev (the Chechen brothers suspected in the Boston Marathon bombing of April 15, 2013) are both considered white and appear to have been motivated in part by radical Islam. And many terrorist attacks in the United States have been carried out by people who were neither Muslims nor dark-skinned. When white males of the far right carry out violent attacks, neocons and Republicans typically describe them as lone-wolf extremists rather than people who are part of terrorist networks or well-organized terrorist movements. Yet many of the terrorist attacks in the United States have been carried out by people who had long histories of networking with other terrorists. In fact, most of the terrorist activity occurring in the United States in recent years has not come from Muslims, but from a combination of radical Christianists, white supremacists and far-right militia groups.

Clinton is likely to win 2016, but it's close – recent poll proves – surveillance will be a key factor

Glenza 6/23 [Jessica Glenza, Breaking News Reporter at Guardian News & Media, "Hillary Clinton on course to win presidential election, poll says", http://www.theguardian.com/us-news/2015/jun/23/hillary-clinton-presidential-election-poll, June 23rd, 2015//Rahul]

Hillary Clinton is on course to win the Democratic primary and would go on to trounce her Republican opponents, according to a new poll. The NBC News/Wall Street Journal poll found that the former secretary of state was the first choice for nominee of 75% of her party, with Vermont socialist Bernie Sanders far behind on 15%. Analysis Clinton v Bush: America is getting the dynastic matchup it said it didn't want Despite rivals' protestations, Hillary Clinton and Jeb Bush enjoy the support of their own party's voters. But the other party's dynasty candidate? Not a chance Martin O'Malley, the former Maryland governor, was on 2%, while Lincoln Chafee, the former governor of Rhode Island, polled less than 1%. Former Virginia senator Jim Webb, who has not yet formally declared he is running, was on 4%. According to the poll, 92% of likely Democratic voters said they could see themselves supporting Clinton. The poll asked 1,000 likely voters about their opinions on potential presidential candidates, both Republican and Democrat. It showed Clinton polling at 48% to 40% against her closest Republican contender, former Florida governor Jeb Bush, the brother of former president George W Bush and son of former president George HW Bush. Against the Florida senator Marco Rubio, Clinton polled 50% against 40%. And against Wisconsin governor Scott Walker she polled 51% to 37%. Among Republican primary voters, the poll showed Bush ahead with 22% of the vote. Walker was next with 17% and Rubio third

with 14%. Retired neurosurgeon Ben Carson had 11%, while former Arkansas governor Mike Huckabee (9%), libertarian senator Rand Paul (7%), former Texas governor Rick Perry (5%), New Jersey governor Chris Christie (4%) and Texas senator Ted Cruz (4%) were all in single figures. The poll is likely to encourage the Clinton camp, whose campaign got off to a rough start when questions arose about Clinton's use of personal email as secretary of state, this spring. But it is possible that early polls may not reflect the true strength of Clinton's challengers. On Tuesday, Clinton urged businesses to stop selling images with the Conferdate flag on them, in the wake of the attack on a black church in Charleston Republican pollster Bill McInturff told the Wall Street Journal that Clinton had "the strongest and most advantageous" standing among Democrats he had seen in 35 years of campaign polling. "She starts with advantages among very important groups," he said. McInturff conducted the poll with Democrat Fred Yang. Clinton's high rankings could be buoyed by increasingly positive support numbers for her 2008 rival Barack Obama, whose approval rating is up by 8 percentage points to 48% since September 2014, when it hit an all-time low of 40% according to the same polls. Among Republican candidates, Bush and Rubio remain neck and neck, with 75% and 74% of respondents saying they could see themselves supporting the candidates in a Republican primary. Bush pulls away slightly in favorability rankings, pulling 5% ahead of Walker with 22%, and 8% ahead of Rubio. Most see Clinton as a moderate candidate (58%) who is trustworthy because of her "experience and background" (59%). Respondents were fairly split over which party the next president should be from, with Republicans scoring 36% and Democrats 39%. Ongoing concerns going into the election could set the mood for the campaign. A "decline in traditional moral values" was rated as the most alarming trend in America of all respondents (25%), seconded by possible terrorist attacks on the US (18%), while corporate and wealthy individuals' influence over elections was rated as the most disconcerting facet of the upcoming campaign (33%).

Polls show most people support mass surveillance – plan means people think Dems are soft on terror

Dickerson 13 [John Dickerson, is a Slate political columnist and author of On Her Trail. Read his series on the presidency and on risk. "Why Americans Don't Fear the NSA", http://www.slate.com/articles/news_and_politics/politics/2013/06/nsa_domestic_surveillance_american_voters_trust_the_government_to_fight.html, June 7th, 2013//Rahul]

Polls suggest that people often support measures to catch terrorists that infringe on civil liberties. In a New York Times/CBS poll taken after the Boston Marathon bombing, 78 percent of people said surveillance cameras were a good idea. A CNN poll taken a month later showed the same support for cameras, but that poll indicated that there were limits. People were asked if they would allow "expanded government monitoring of cell phones and email to intercept communications" to catch suspected terrorists. Fifty-nine percent said they would not be OK with that. The disclosure this week that the NSA was monitoring huge numbers of phone calls made in the Verizon network is operationally very similar to the disclosure in 2006 that it was doing the same thing. In 2006, people were mostly comfortable with the idea. A Fox News poll found a small majority, 52 percent, supported the collection of massive amounts of phone data, and 41 percent opposed it. CBS, ABC, and CNN polls at the same time also found majority support, but a Newsweek poll found that 53 percent said that monitoring metadata goes too far. (The fact that the Bush administration, unpopular at the time, had collected the phone information without court approval or without notifying Congress could have influenced these numbers; that's not the case here.) Update, June 11, 2013: Since this piece was published, the first polls have come out evaluating public opinion about the NSA's activities. It turns out the public is even more supportive of snooping than they were in 2006, when the agency's collection of metadata was first discovered. According to a Washington Post-Pew Research poll, 56 percent of Americans consider the NSA accessing telephone records of millions of Americans "acceptable," while 41 percent call the practice "unacceptable." What has changed is the partisan makeup of who holds which position. In this poll, 69 percent of Democrats say terrorism investigations, not privacy, should be the government's main concern, an 18-percentage-point jump from early January 2006, when the NSA's activity under the George W. Bush administration was first reported. Compared with that time, Republicans' focus on privacy has increased 22 points. Polling suggests the distinction people draw is between the narrow targeting of suspects versus targeting the broader public. In 2006, when CBS asked people if they would be OK with phone surveillance if the government thought they had a suspect, 69 percent approved. If the surveillance was just a sweep of

ordinary Americans? Sixty-eight percent opposed that. Five years later, CBS found roughly the same result. In 2011, 65 percent of those polled said they were willing to let government agencies monitor telephone calls and emails of suspicious people, but when asked about a broader phone snooping "of ordinary Americans on a regular basis" 72 percent said they would disapprove of such surveillance. So support for the activities recently disclosed lies in whether people think they're a big fishing expedition or tied to specific work that has stopped terrorism. It's almost certain that we won't know for sure whether these ongoing surveillance efforts paid off in a way that connects them with specific terrorist suspects. Rep. Mike Rogers, the chairman of the House Intelligence Committee says they did. (Reuters has reported the attack Rep. Rogers was referring to was aimed at the New York City subway.) Sen. Dianne Feinstein, the chairwoman of the Senate Intelligence Committee, also said the surveillance had foiled several terrorist plots. Reports that the monitoring of computer systems has provided the bulk of the information in the president's daily intelligence briefing are likely to make people think that this is useful information worth gathering. Republican leaders who have jumped on each new development in the IRS or Benghazi scandals have been nearly mute in response to these latest disclosures. Republican Sen. Rand Paul spoke out against the program, but his colleague Sen. Marco Rubio defended it. Without a strong political force to keep pushing this story, it's unlikely to stay in the public consciousness in a way that will be politically damaging. If the public is not outraged, it may very well be because they trust these lawmakers when they say these measures are necessary to stop terrorism. That's an aberration from the normal public attitude where more than three-quarters of Americans tell pollsters they don't trust government. It's the exact opposite of what has happened in the IRS investigation. Any Democrat who suggests the extra IRS scrutiny of conservative groups was warranted will find himself sitting alone on the bench. These latest revelations do expose President Obama and Vice President Biden as having highly malleable views. As a candidate, Barack Obama was righteous in denouncing Bush-era policies, saying they jeopardized the rights and ideals of all Americans and that there was not sufficient congressional oversight. He criticized the president for monitoring Americans who did nothing wrong. Biden can be seen here in 2006 pounding on President Bush for collecting phone records indiscriminately. But if Americans believe these programs are part of a long-standing (successful) effort to thwart a major terrorist attack on American soil, it's unclear whether there will be any penalty to pay for the change of heart. The other controversies in Washington appear to have weakened the public's view of the president's honesty. That may be because his answers have been unsatisfying. He learned about the IRS mishap and Justice Department targeting journalists on the news. That may have been proper—he has direct control over neither—but polls show his disconnection has contributed to the view he's not being honest. In the aftermath of the attack on the U.S. consulate in Benghazi, Libya, administration answers have been fuzzy and evolving. In this case, though, the president supported the NSA activities as soon as the news broke. Since polls show the public trusts him on the issue of fighting terrorism above all other issues, his fast and forceful defense may cause people to give him the benefit of the doubt. In a perverse way it's even possible to imagine that the NSA revelations, by stealing a few news cycles from developments on the IRS investigation and allowing the president to present himself as protector of the American people, may wind up helping the president's standing with the American people. Not even the NSA saw that coming.

That swings the election to the GOP

Toosi 6/23 – Nahal, foreign affairs correspondent at POLITICO. ("Democrats work to blunt GOP attacks on global affairs in 2016," 6/23/15, http://www.politico.com/story/2015/06/democrats-work-to-blunt-gop-attacks-on-global-affairs-in-2016-119305.html#ixzz3fyM1NpUm)

On Tuesday, a progressive network of foreign affairs experts released a document aimed in part at influencing the White House race, one of several formal and informal attempts in the works aimed at shaping an already lively back-and-forth on America's role in the world.¶ Story Continued Below¶ The Truman National Security Project's platform touches on subjects ranging from countering violent extremism to upgrading the U.S. energy grid. At times deeply wonky and somewhat idealistic, the paper calls for ambitious American leadership at a time of "blurring borders" and "contested spaces."¶ The Truman platform comes amid growing recognition that foreign policy and national security, which rarely decide presidential elections, may play an outsized role this time for at least two key reasons: the U.S. economy is less of a concern and the rise of the Islamic State terrorist group in an increasingly tumultuous Middle East.¶ With the election still a year and a half away, Democrats insist they have plenty of confidence and time to prepare. The Democratic front-runner for president is, after all, former Secretary of State Hillary Clinton, who can boast more foreign policy and national security experience than any of the many candidates on the GOP side.¶ Still, there is a lingering worry that Republican allegations that President Barack Obama has diminished America's stature will overshadow Democratic efforts to promote solutions to a host of global challenges.¶ "It's incumbent on progressives and on Democrats to put forward a compelling, clear, forward-looking affirmative vision," said Michael Breen, executive director of the Truman Project.¶ NEW YORK, NY - JUNE 18: Knesset member Michael Oren speaks during his book release party for 'Ally: My Journey Across the American-Israeli Divide' at Gerson Lehrman Group on June 18, 2015 in New York City. (Photo by Donald Bowers/Getty Images for GLG)¶ Former Israeli envoy under fire for essay on Obama's Muslim roots¶ ADAM B. LERNER¶ Republicans have traditionally

been viewed by voters as stronger on national security, but the turmoil following the U.S. invasion of Iraq briefly helped give Democrats the advantage In more recent years, however, the Republicans have rebounded: A Gallup poll last September that asked which party would better protect the U.S. against terrorism gave the GOP a 23-point edge.¶ Those numbers weigh on Democrats, some of whom have been engaged in formal and unofficial efforts to change the trajectory.¶ Over the past year, some 40 Democratic foreign policy wonks have been meeting informally every six weeks or so to discuss the challenges facing the party and a future administration. The so-called "Unison group," named after the Virginia town in which an early meeting was held, doesn't plan to issue papers or take official positions, and it is not affiliated with a campaign. Participants work both in and out of government but attend meetings in their personal capacity.¶ Still, the sessions give attendees ideas to chew over that they can potentially use to advise campaigns. The group was born out of the recognition that Democrats need to come up with innovative, out-of-the-box ideas even when they are in control of the executive branch — and that they shouldn't just leave that work to the Obama administration.¶ Vikram Singh, one of the group's coordinators, said that although Democrats realize they face a challenge on foreign policy and national security in 2016, they don't feel that Republicans have put forth much in the way of alternatives.¶ He and others said that Republican calls for tougher policies and better leadership, for example, haven't been accompanied by concrete pledges, say, to send U.S. combat troops to Syria to fight the Islamic State.¶ "When you dig in to what Republicans are saying, they have a really hard time," said Singh, who also is a vice president at the left-leaning Center for American Progress.¶ Foreign policy and national security wonks on the right have long assumed those issues will be a major part of the 2016 election, and they have launched their own initiatives aimed at influencing the race. Perhaps the best known is the John Hay Initiative, which brings together more than 250 experts and former senior officials, has some 23 working groups and has helped staff some of the Republican campaigns.

Clinton key to stop all global wars and problems

Hodes and Emerson 15 [Paul Hodes and Peter Emerson, Paul W. Hodes of Concord is a former U.S. representative. Peter V. Emerson grew up in Hanover and is a member of a family that has maintained an active farm in Candia for more than 300 years. "My Turn: Who else but Hillary can manage world's problems?", http://www.concordmonitor.com/news/politicalmonitor/15722816-95/my-turn-who-else-but-hillary-can-manage-worlds-problems, February 22nd, 2015//Rahul]

The world is becoming increasingly unstable and unpredictable, and therefore often far more threatening and dangerous to America and to American citizens at home and abroad. Looking but a few years down the road; there will be less food, less potable water and fewer basic human necessities for most of the world's exponentially expanding population. Consequently, there will be more violence, civil strive and war. Unfortunately, many Americans are geographically and geopolitically challenged. Many still believe that America dominates the world and that we are neither dependent upon the international community nor subject to events occurring outside our borders. In short, many still hold opinions based on a world order long ago dismantled. We are now interconnected and interdependent upon every region of the world. Thus international stability and our continued prosperity are under attack in our shrinking world: ■ The continued advance of the Islamic State has already further destabilized an already precarious order in the unstable Middle East ■ The escalation of the Israeli-Palestinian stalemate with almost daily outbreaks of killings and retaliation. ■ Iran's continued nuclear program ■ The slowing of the Chinese economy and the potential head-on conflict over the Diaoyu Islands in China and the Senkaku islands in Japan. ■ The postponement of the election in Africa's largest democracy, Nigeria, a success for Boko Haram ■ Greece's possible default on its debt and the impact on the European Union ■ North Korea's continued militaristic posture and nuclear capabilities ■ Declining crop production in critical areas around the world And the list goes on and on and on. So what do these events mean to a waitress in New Hampshire, a farmer in Iowa, a rancher in Montana, an avocado grower in California, a high-tech entrepreneur in Massachusetts, a fisherman in Maine, a single mother in Harlem, a pensioner in Phoenix, a widower in Washington, our neighbors, family and friends? It means that events in other countries, often far away, spill into and through our borders. Americans are part of a new global order – or too frequently global disorder – that challenges our traditional notions of American exceptionalism and leadership. International crises that emerge anew each day directly affect the prices of our food, gas, health care, etc. – our domestic tranquility and our national security. All these events affect the bottom-line of all American households. So when we cut through the clutter of lies and gross distortions of the facts – all meant to create fear – to weigh and examine who's capable of making a dent in these seemingly intractable problems and challenges, there is only one person who is capable of managing them. Please note that we did not say solve these intractable problems because that would be impossible. But managing problems and challenges, that's possible. Although we promised not to join the chorus of those asking Secretary Clinton to run for president, we have taken a sober look at the world's condition, the prognosis for the future and America's position in the world, and **Hillary Clinton is the only one who can manage the problems that others see as unmanageable.** But given our pledge, we are reluctant to ask her to run for president, so we urge her to look around the world and within this extraordinary country of ours and ask herself, "Who else can accomplish what I can accomplish?"

Terror DA

Terror risk is high- maintaining current surveillance is key

On June 2 in Boston, Usaamah Abdullah Rahim drew a knife and attacked police officers and FBI agents, who then shot and killed him. Rahim was being watched by Boston's Joint Terrorism Task Force as he had been plotting to behead police officers as part of violent jihad. A conspirator, David Wright or Dawud Sharif Abdul Khaliq, was arrested shortly thereafter for helping Rahim to plan this attack. This plot marks the 69th publicly known Islamist terrorist plot or attack against the U.S. homeland since 9/11, and is part of a recent spike in terrorist activity. The U.S. must redouble its efforts to stop terrorists before they strike, through the use of properly applied intelligence tools. The Plot According to the criminal complaint filed against Wright, Rahim had originally planned to behead an individual outside the state of Massachusetts,[1] which, according to news reports citing anonymous government officials, was Pamela Geller, the organizer of the "draw Mohammed" cartoon contest in Garland, Texas.[2] To this end, Rahim had purchased multiple knives, each over 1 foot long, from Amazon.com. The FBI was listening in on the calls between Rahim and Wright and recorded multiple conversations regarding how these weapons would be used to behead someone. Rahim then changed his plan early on the morning of June 2. He planned to go "on vacation right here in Massachusetts…. I'm just going to, ah, go after them, those boys in blue. Cause, ah, it's the easiest target."[3] Rahim and Wright had used the phrase "going on vacation" repeatedly in their conversations as a euphemism for violent jihad. During this conversation, Rahim told Wright that he planned to attack a police officer on June 2 or June 3. Wright then offered advice on preparing a will and destroying any incriminating evidence. Based on this threat, Boston police officers and FBI agents approached Rahim to question him, which prompted him to pull out one of his knives. After being told to drop his weapon, Rahim responded with "you drop yours" and moved toward the officers, who then shot and killed him. While Rahim's brother, Ibrahim, initially claimed that Rahim was shot in the back, video surveillance was shown to community leaders and civil rights groups, who have confirmed that Rahim was not shot in the back.[4] Terrorism Not Going Away This 69th Islamist plot is also the seventh in this calendar year. Details on how exactly Rahim was radicalized are still forthcoming, but according to anonymous officials, online propaganda from ISIS and other radical Islamist groups are the source.[5] That would make this attack the 58th homegrown terrorist plot and continue the recent trend of ISIS playing an important role in radicalizing individuals in the United States. It is also the sixth plot or attack targeting law enforcement in the U.S., with a recent uptick in plots aimed at police. While the debate over the PATRIOT Act and the USA FREEDOM Act is taking a break, the terrorists are not. The result of the debate has been the reduction of U.S. intelligence and counterterrorism capabilities, meaning that the U.S. has to do even more with less when it comes to connecting the dots on terrorist plots.[6] Other legitimate intelligence tools and capabilities must be leaned on now even more. Protecting the Homeland To keep the U.S. safe, Congress must take a hard look at the U.S. counterterrorism enterprise and determine other measures that are needed to improve it. Congress should: Emphasize community outreach. Federal grant funds should be used to create robust community-outreach capabilities in higher-risk urban areas. These funds must not be used for political pork, or so broadly that they no longer target those communities at greatest risk. Such capabilities are key to building trust within these communities, and if the United States is to thwart lone-wolf terrorist attacks, it must place effective community outreach operations at the tip of the spear. Prioritize local cyber capabilities. Building cyber-investigation capabilities in the higher-risk urban areas must become a primary focus of Department of Homeland Security grants. With so much terrorism-related activity occurring on the Internet, local law enforcement must have the constitutional ability to monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working on integrating intelligence and law enforcement activities. Full integration will require overcoming inter-agency cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Maintain essential

counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Clear-Eyed Vigilance The recent spike in terrorist plots and attacks should finally awaken policymakers—all Americans, for that matter—to the seriousness of the terrorist threat. Neither fearmongering nor willful blindness serves the United States. Congress must recognize and acknowledge the nature and the scope of the Islamist terrorist threat, and take the appropriate action to confront it.

Surveillance is critical to stopping terror threats

Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents. Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios. In one instance, an attack is detected and stopped before it could be executed. U.S. forces operating in Iraq discover a bomb-making factory. Biometric data found in this factory is correlated with data from other bombings to provide partial identification for several individuals who may be bomb-makers, none of whom are present in Iraq. In looking for these individuals, the United States receives information from another intelligence service that one of the bombers might be living in a neighboring Middle Eastern country. Using communications intercepts, the United States determines that the individual is working on a powerful new weapon. The United States is able to combine the communications intercept from the known bomb maker with information from other sources—battlefield data, information obtained by U.S. agents, collateral information from other nations' intelligence services—and use this to identify others in the bomber's network, understand the plans for bombing, and identify the bomber's target, a major city in the United States. This effort takes place over months and involves multiple intelligence, law enforcement, and military agencies, with more than a dozen individuals from these agencies collaborating to build up a picture of the bomb-maker and his planned attack. When the bomb-maker leaves the Middle East to carry out his attack, he is prevented from entering the United States. An analogy for how this works would be to take a 1,000-piece jigsaw puzzle, randomly select 200 pieces, and provide them to a team of analysts who, using incomplete data, must guess what the entire picture looks like. The likelihood of their success is determined by how much information they receive, how much time they have, and by experience and luck. Their guess can be tested by using a range of collection programs, including communications surveillance programs like the 215 metadata program. What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use

to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects. This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine.

Terrorists will use bioweapons- guarantees extinction

Cooper 13

(Joshua, 1/23/13, University of South Carolina, "Bioterrorism and the Fermi Paradox," http://people.math.sc.edu/cooper/fermi.pdf, 7/15/15, SM)

We may conclude that, when a civilization reaches its space-faring age, it∂ will more or less at the same moment (1) contain many individuals who seek to cause large-scale destruction, and (2) acquire the capacity to tinker with its own genetic chemistry. This is a perfect recipe for bioterrorism, and, given the many very natural pathways for its development and the overwhelming∂ evidence that precisely this course has been taken by humanity, it is hard to∂ see how bioterrorism does not provide a neat, if profoundly unsettling, solution∂ to Fermi's paradox. One might object that, if omnicidal **individuals** are∂ successful in releasing **highly virulent** and **deadly genetic malware** into the∂ wild, they are still unlikely to succeed in killing everyone. However, even if∂ every such mass death event results only in a high (i.e., not total) kill rate and∂ there is a large gap between each such event (so that individuals can build up∂ the requisite scientific infrastructure again**), extinction would be inevitable**∂ regardless. Some of the engineered bioweapons will be more successful than∂ others; the inter-apocalyptic eras will vary in length; and post-apocalyptic∂ environments may be so **war-torn, disease-stricken, and impoverished of genetic variation that they may culminate in true extinction events even if the initial cataclysm 'only' results in 90% death rates**, since they may cause the∂ effective population size to dip below the so-called "minimum viable population."∂ This author ran a Monte Carlo simulation using as (admittedly very∂ crude and poorly informed, though arguably conservative) estimates the following∂ Earth-like parameters: bioterrorism event mean death rate 50% and∂ standard deviation 25% (beta distribution), initial population 1010, minimum∂ viable population 4000, individual omnicidal act probability 10−7 per annum,∂ and population growth rate 2% per annum. One thousand trials yielded an∂ average post-space-age time until extinction of less than 8000 years. This is∂ essentially instantaneous on a cosmological scale, and varying the parameters∂ by quite a bit does nothing to make the survival period comparable with the∂ age of the universe.

The aff's noble attempt to restore democratic values re-entrenches authoritarianism and the neoliberal state – turns case

Morozov 11

(Evgeny Morozov, contributing editor at the New Republic and the author of To Save Everything, Click Here: The Folly of Technological Solutionism, *The Net Delusion*, pgs. ix-xvii)

For anyone who wants to see democracy prevail in the most hostile and unlikely environments, the first decade of the new millennium was marked by a sense of bitter disappointment, if not utter disillusionment. **The seemingly inexorable march of freedom** that began in the late 1980s has not only come to a halt but **may have reversed its course.**¶ Expressions like "freedom recession" have begun to break out of the think-tank circuit and enter the public conversation. In a state of quiet desperation, **a growing number of Western policymakers began to con- cede** that **the Washington Consensus**—that set of dubious policies that once promised a neoliberal paradise at deep discounts—**has been superseded** by the Beijing Consensus, which boasts of delivering quick- and-dirty prosperity without having to bother with those pesky institutions of democracy.¶ The West has been slow to discover that the fight for democracy wasn't won back in 1989. For two decades it has been resting on its laurels, expecting that Starbucks, MTV, and Google will do the rest just fine. Such **a laissez-faire approach to democratization has proved rather toothless against resurgent authoritarianism**, which has masterfully adapted to this new, highly globalized world. Today's authoritarianism is of the hedonism- and consumerism-friendly variety, with Steve Jobs and Ashton Kutcher commanding far more respect than Mao or Che Guevara. No wonder the West appears at a loss. While the Soviets could be liberated by waving the magic wand of blue jeans, exquisite coffee machines, and cheap bubble gum, one can't pull the same trick on China. After all, this is where all those Western goods come from.¶ Many of the signs that promised further democratization just a few years ago never quite materialized. The so-called color revolutions that swept the former Soviet Union in the last decade produced rather ambiguous results. Ironically, it's the most authoritarian of the former Soviet republics—Russia, Azerbaijan, Kazakhstan—that found those revolutions most useful, having discovered and patched their own vulnerabilities. My own birthplace, Belarus, once singled out by Condoleezza Rice as the last outpost of tyranny in Europe, is perhaps the shrewdest of the lot; it continues its slide into a weird form of authoritarianism, where the glorification of the Soviet past by its despotic ruler is fused with a growing appreciation of fast cars, expensive holidays, and exotic cocktails by its largely carefree populace.¶ **The wars in Iraq and Afghanistan**, which were **started**, if anything, **to spread the gospel of freedom and democracy, have lost much of their initial emancipatory potential** as well, further **blurring the line between "regime change" and "democracy promotion."** Coupled with Washington's unnecessary abuses of human rights and rather frivolous interpretations of international law, these two wars gave democracy promotion such a bad name that anyone eager to defend it is considered a Dick Cheney acolyte, an insane idealist, or both.¶ It is thus easy to forget, if only for therapeutic purposes, that the West still has an obligation to stand up for democratic values, speak up about violations of human rights, and reprimand those who abuse their office and their citizens. Luckily, by the twenty-first century the case for promoting democracy no longer needs to be made; even the hardest skeptics agree that a world where Russia, China, and Iran adhere to democratic norms is a safer world.¶ That said, **there is still very little agreement on the kind of methods and policies the West needs to pursue to be most effective in promoting democracy.** As the last few decades have so aptly illustrated, good intentions are hardly enough. **Even the most noble attempts may easily backfire, entrenching authoritarianism** as a result. The images of horrific prisoner abuse at Abu Ghraib were the result, if only indirectly, of one particular approach to promoting democracy. It did not exactly work as advertised.¶ Unfortunately, as the neoconservative vision for democratizing the world got discredited, nothing viable has come to fill the vacuum. While George Bush certainly overdid it with his excessive freedom- worshiping rhetoric, his successor seems to have abandoned the rhetoric, the spirit, as well as any desire to articulate what a post-Bush "freedom agenda" might look like.¶ But there is more to **Obama's silence** than just his reasonable attempt to present himself as anti-Bush. Most likely his silence **is a sign of an extremely troubling bipartisan malaise: the growing Western fatigue with the project of promoting democracy**. **The project suffers** not just **from** bad publicity but also from **a deeply rooted intellectual crisis**. The resilience of authoritarianism in places like Belarus, China, and Iran is not for lack of trying by their Western "partners" to stir things up with an expectation of a democratic revolution. Alas, **most** such **Western initiatives flop, boosting the appeal of** many **existing dictators, who excel at playing up the threat of foreign mingling in their own affairs**. To say that there is no good blueprint for dealing with modern authoritarian- ism would be a severe understatement.¶ Lost in their own strategizing, **Western leaders are pining for** something that has guaranteed effectiveness. Many of them look back to the most impressive and most unambiguous triumph of democracy in the last few decades: **the peaceful dissolution of the Soviet Union**. Not surprisingly—and who can blame them for seeking to bolster their own self-confidence?—they tend to exaggerate their own role in precipitating its demise.

Focusing on specific manifestations of the surveillance state ignores the cultural normalization of surveillance writ large.

Surveillance has become a growing feature of daily life. In fact, it is more appropriate to **analyze the culture of surveillance, rather than address exclusively the violations committed by the corporate-**

surveillance state. In this instance, **the surveillance and security state is one that not only listens, watches and gathers massive amounts of information through data mining** necessary for identifying consumer populations **but also acculturates the public into accepting the intrusion of surveillance technologies and privatized commodified values into all aspects of their lives**. **Personal information is willingly given over to social media and other corporate-based websites and gathered daily as people move from one targeted web site to the next across multiple screens and digital apparatuses.** As Ariel Dorfman points out, "**social media users gladly give up their liberty and privacy, invariably for the most benevolent of platitudes and reasons**," all the while endlessly shopping online and texting.7A **This collecting of information might be most evident in the video cameras that inhabit every public space from the streets, commercial establishments and workplaces to the schools our children attend as well as in the myriad scanners** placed at the entry points of airports, stores, sporting events and the like. ¶ Yet **the most important transgression may** not only **be happening through** the unwarranted watching, listening and collecting of information but also **in a culture that normalizes surveillance by upping the pleasure quotient and enticements for consumers who use the new digital technologies and social networks to simulate false notions of community and to socialize young people into a culture of security and commodification in which their identities, values and desires are inextricably tied to a culture of private addictions, self-help and commodification**.

Social inequality causes extinction – produces background of structural violence that makes conflict and environmental collapse inevitable

Tamás Szentes, a Professor Emeritus at the Corvinus University of Budapest. "Globalisation and prospects of the world society" 4/22/08
http://www.eadi.org/fileadmin/Documents/Events/exco/Glob.___prospects_-_jav..pdf

It' s a common place that human society can survive and develop only in a lasting real peace. Without peace countries cannot develop. Although since 1945 there has been no world war, but --numerous local wars took place, --terrorism has spread all over the world, undermining security even in the most developed and powerful countries, --arms race and militarisation have not ended with the collapse of the Soviet bloc, but escalated and continued, extending also to weapons of mass destruction and misusing enormous resources badly needed for development, --**many "invisible wars" are suffered by the poor** and oppressed people, **manifested in mass misery, poverty, unemployment, homelessness, starvation** and malnutrition, epidemics and poor health conditions, **exploitation and oppression**, racial and other discrimination, physical terror, organised injustice, disguised forms of violence, the denial or regular infringement of the democratic rights of citizens, women, youth, ethnic or religious minorities, etc., **and** last but not least, **in the degradation of human environment**, which means that --the "war against Nature", i.e. the disturbance of ecological balance, wasteful management of natural resources, and large-scale pollution of our environment, is still going on, causing also losses and fatal dangers for human life. **Behind** global terrorism and **"invisible wars" we find striking international and intrasociety inequities and distorted development patterns , which tend to generate social as well as international tensions**, thus **paving the way for unrest and "visible" wars**. It is a commonplace now that peace is not merely the absence of war. The prerequisites of a lasting peace between and within societies involve not only - though, of course, necessarily -

demilitarisation, but also a systematic and gradual elimination of the roots of violence, of the causes of "invisible wars", of the structural and institutional bases of large-scale international and intra-society inequalities, exploitation and oppression. Peace requires a process of social and national emancipation, a progressive, democratic transformation of societies and the world bringing about equal rights and opportunities for all people, sovereign participation and mutually advantageous co-operation among nations. It further requires a pluralistic democracy on global level with an appropriate system of proportional representation of the world society, articulation of diverse interests and their peaceful reconciliation, by non-violent conflict management, and thus also a global governance with a really global institutional system. Under the contemporary conditions of accelerating globalisation and deepening global interdependencies in our world, **peace** is indivisible in both time and space. It cannot exist if reduced to a period only after or before war, and **cannot be safeguarded in one part of the world when some others suffer visible or invisible wars**. Thus, peace requires, indeed, a new, demilitarised and democratic world order, which can provide equal opportunities for sustainable development. "Sustainability of development" (both on national and world level) is often interpreted as an issue of environmental protection only and reduced to the need for preserving the ecological balance and delivering the next generations not a destroyed Nature with overexhausted resources and polluted environment. However, **no ecological balance can be ensured, unless the deep international development gap and intra-society inequalities are substantially reduced**. Owing to global interdependencies there may exist hardly any "zero-sum-games", in which one can gain at the expense of others, but, instead, the "negative-sum-games" tend to predominate, in which everybody must suffer, later or sooner, directly or indirectly, losses. Therefore, the actual question is not about "sustainability of development" but rather about the "sustainability of human life", i.e. survival of mankind – because of ecological imbalance and globalised terrorism. When Professor Louk de la Rive Box was the president of EADI, one day we had an exchange of views on the state and future of development studies. We agreed that development studies are not any more restricted to the case of underdeveloped countries, as the developed ones (as well as the former "socialist" countries) are also facing development problems, such as those of structural and institutional (and even system-) transformation, requirements of changes in development patterns, and concerns about natural environment. While all these are true, today I would dare say that besides (or even instead of) "development studies" we must speak about and make "survival studies". While the monetary, financial, and debt crises are cyclical, we live in an almost permanent crisis of the world society, which is multidimensional in nature, involving not only economic but also socio-psychological, behavioural, cultural and political aspects. **The narrow-minded, election-oriented, selfish behaviour motivated by thirst for power and wealth,** which still characterise the political leadership almost all over the world, **paves the way for the final, last catastrophe**. One cannot doubt, of course, that great many positive historical changes have also taken place in the world in the last century. Such as decolonisation, transformation of socio-economic systems, democratisation of political life in some former fascist or authoritarian states, institutionalisation of welfare policies in several countries, rise of international organisations and new forums for negotiations, conflict management and cooperation, institutionalisation of international assistance programmes by multilateral agencies, codification of human rights, and rights of sovereignty and democracy also on international level, collapse of the militarised Soviet

bloc and system-change3 in the countries concerned, the end of cold war, etc., to mention only a few. Nevertheless, the crisis of the world society has extended and deepened, approaching to a point of bifurcation that necessarily puts an end to the present tendencies, either by the final catastrophe or a common solution. **Under the circumstances provided by rapidly progressing science and technological revolutions, human society cannot survive unless such profound intra-society and international inequalities prevailing today are soon eliminated**. Like a single spacecraft, the Earth can no longer afford to have a 'crew' divided into two parts: the rich, privileged, wellfed, well-educated, on the one hand, and the poor, deprived, starving, sick and uneducated, on the other. Dangerous 'zero-sum-games' (which mostly prove to be "negative-sum-games") can hardly be played any more by visible or invisible wars in the world society. Because of global interdependencies, the apparent winner becomes also a loser. The real choice for the world society is between negative- and positive-sum-games: i.e. between, on the one hand, continuation of visible and "invisible wars", as long as this is possible at all, and, on the other, transformation of the world order by demilitarisation and democratization. No ideological or terminological camouflage can conceal this real dilemma any more, which is to be faced not in the distant future, by the next generations, but in the coming years, because of global terrorism soon having nuclear and other mass destructive weapons, and also due to irreversible changes in natural environment.

The alternative articulates a "counter-conduct" – voting neg pushes towards a *cooperative conduct* that organizes individuals around a collectively shared *commons* – affirming this conduct creates a new heuristic that de-couples government from the demand for competition and production

Dardot & Laval 13

(Pierre Dardot, philosopher and specialist in Hegel and Marx, Christian Laval, professor of sociology at the Universite Paris Ouest Nanterre La Defense, *The New Way of the World: On Neoliberal Society*, pgs. 318-321)

This indicates to what extent we must take on board in our own way the main lesson of neo-liberalism: **the subject is always to be constructed**. **The whole question is** then **how to articulate subjectivation with resistance to power**. Now, precisely this issue is at the heart of all of Foucault's thought. However, as Jeffrey T. Nealon has recently shown, part of the North American secondary literature has, on the contrary, stressed the alleged break between Foucault's research on power and that of his last period on the history of subjectivity.55 According to the 'Foucault consensus', as Nealon aptly dubs it, the successive impasses of the initial neo-structuralism, and then of the totalizing analysis of panoptical power, led the 'last Foucault' to set aside the issue of power and concern himself exclusively with the aesthetic invention of a style of existence bereft of any political dimension. Furthermore, if we follow this de-politicizing reading of Foucault, the aestheticization of ethics anticipated the neo-liberal mutation precisely by making self-invention a new norm. In reality, far from being oblivious of one another, the issues of power and the subject were always closely articulated, even in the last work on modes of subjectivation. If one concept played a decisive role in this respect, it was 'counter-conduct', as developed in the lecture of 1 March 1978.56 This lecture was largely focused on the crisis of the pastorate. It involved identifying the specificity of the 'revolts' or **'forms of resistance of conduct'** that are the correlate of the pastoral mode of power. If such forms of resistance are said to be 'of conduct', it is because they are forms of resistance to power as conduct and, as such, **are themselves forms of conduct opposed to** this **'power-conduct'**. **The term 'conduct'** in fact **admits of two meanings**: **an activity that consists in conducting others**, or **'conduction'**; **and the way one conducts oneself under the influence of this activity of conduction**.57 **The idea of 'counter-conduct'** therefore **has the advantage of directly signifying a 'struggle against the procedures implemented for conducting others', unlike the term 'misconduct', which only refers to the passive sense of the word**.58 **Through 'counter-conduct', people seek both to escape conduction by others and to define a way of conducting themselves**

towards others.¶ What relevance might this observation have for a reflection on resistance to neo-liberal governmentality? It will be said that the concept is introduced in the context of an analysis of the pastorate, not government. Governmentality, at least in its specifically neo-liberal form, precisely makes conducting others through their conduct towards themselves its real goal. The peculiarity of this conduct towards oneself, conducting oneself as a personal enterprise, is that it immediately and directly induces a certain conduct towards others: competition with others, regarded as so many personal enterprises. Consequently, counter-conduct as a form of resistance to this governmentality must correspond to a conduct that is indivisibly a conduct towards oneself and a conduct towards others. One cannot struggle against such an indirect mode of conduction by appealing for rebellion against an authority that supposedly operates through compulsion external to individuals. If 'politics is nothing more and nothing less than that which is born with resistance to governmentality, the first revolt, the first confrontation',59 it means that ethics and politics are absolutely inseparable.¶ To the subjectivation-subjection represented by ultra-subjectivation, we must oppose a subjectivation by forms of counter-conduct. To neo-liberal governmentality as a specific way of conducting the conduct of others, we must therefore oppose a no less specific double refusal: a refusal to conduct oneself towards oneself as a personal enterprise and a refusal to conduct oneself towards others in accordance with the norm of competition. As such, the double refusal is not 'passive disobedience'.60 For, if it is true that the personal enterprise's relationship to the self immediately and directly determines a certain kind of relationship to others – generalized competition – conversely, the refusal to function as a personal enterprise, which is self-distance and a refusal to line up in the race for performance, can only practically occur on condition of establishing cooperative relations with others, sharing and pooling. In fact, where would be the sense in a self-distance severed from any cooperative practice? At worst, a cynicism tinged with contempt for those who are dupes. At best, simulation or double dealing, possibly dictated by a wholly justified concern for self-preservation, but ultimately exhausting for the subject. Certainly not a counter-conduct. All the more so in that such a game could lead the subject, for want of anything better, to take refuge in a compensatory identity, which at least has the advantage of some stability by contrast with the imperative of indefinite self-transcendence. Far from threatening the neo-liberal order, fixation with identity, whatever its nature, looks like a fall-back position for subjects weary of themselves, for all those who have abandoned the race or been excluded from it from the outset. Worse, it recreates the logic of competition at the level of relations between 'little communities'. Far from being valuable in itself, independently of any articulation with politics, individual subjectivation is bound up at its very core with collective subjectivation. In this sense, sheer aestheticization of ethics is a pure and simple abandonment of a genuinely ethical attitude. The invention of new forms of existence can only be a collective act, attributable to the multiplication and intensification of cooperative counter-conduct. A collective refusal to 'work more', if only local, is a good example of an attitude that can pave the way for such forms of counter-conduct. In effect, it breaks what André Gorz quite rightly called the 'structural complicity' that binds the worker to capital, in as much as 'earning money', ever more money, is the decisive goal for both. It makes an initial breach in the 'immanent constraint of the "ever more", "ever more rapidly"'.61¶ The genealogy of neo-liberalism attempted in this book teaches us that the new global rationality is in no wise an inevitable fate shackling humanity. Unlike Hegelian Reason, it is not the reason of human history. It is itself wholly historical – that is, relative to strictly singular conditions that cannot legitimately be regarded as untranscendable. The main thing is to understand that nothing can release us from the task of promoting a different rationality. That is why the belief that the financial crisis by itself sounds the death-knell of neo-liberal capitalism is the worst of beliefs. It is possibly a source of pleasure to those who think they are witnessing reality running ahead of their desires, without them having to move their little finger. It certainly comforts those for whom it is an opportunity to celebrate their own past 'clairvoyance'. At bottom, it is the least acceptable form of intellectual and political abdication. Neo-liberalism is not falling like a 'ripe fruit' on account of its internal contradictions; and traders will not be its undreamed-of 'gravediggers' despite themselves. Marx had already made the point powerfully: 'History does nothing'.62 There are only human beings who act in given conditions and seek through their action to open up a future for themselves. It is up to us to enable a new sense of possibility to blaze a trail. The government of human beings can be aligned with horizons other than those of maximizing performance, unlimited production and generalized control. It can sustain itself with self-government that opens onto different relations with others than that of competition between 'self-enterprising actors'. The

practices of 'communization' of knowledge, mutual aid and cooperative work can delineate the features of a different world reason. Such an alternative reason cannot be better designated than by the term reason of the commons.

Obama can hold off a veto now – but his political capital is key

Walsh and Barrett 7/16 (Deirdre, Senior Congressional Producer for CNN, Ted, senior congressional producer for CNN Politics, "WH dispatches Joe Biden to lock down Iran deal on Capitol Hill," CNN, 7/16/2015, http://www.cnn.com/2015/07/15/politics/iran-deal-white-house-democrats-congress/)//duncan

Two days after the Iran deal was unveiled, **the** Obama **administration's sales job is in full swing.**¶ Vice President Joe Biden traveled to Capitol Hill on Wednesday to convince House Democrats to support the deal, while a small group of senators were invited to the White House to get their questions answered directly from officials who sat across from the Iranians at the negotiating table. Biden meets with Senate Democrats of the Foreign Relations Committee on Thursday.¶ House lawmakers said Biden was candid about the strengths and weaknesses of the compromise deal. One described his behind closed doors pitch.¶ "I'm going to put aside my notes and talk to you from my heart because I've been in this business for 45 years," Biden said in his opening comments, according to Rep. Bill Pascrell, D-New Jersey, who attended the session.¶ "I'm not going to BS you. I'm going to tell you exactly what I think," the vice president reportedly said.¶ Obama got a boost from the leader of his party in the chamber when Minority Leader Nancy Pelosi formally announced Thursday that she was backing the deal.¶ SInce Republicans in the House and Senate are firmly against the Iran nuclear deal -- announced by President Barack Obama on Tuesday -- **the administration is cranking up its campaign to sway concerned Democrats to back the agreement.**¶ Under legislation that allows Congress to review the agreement, the White House needs to secure enough votes from members of his own party to sustain the President's promised veto on an resolution of disapproval -- 145 in the House and 34 in the Senate.¶ After the session with Biden, several House Democrats stressed that while the process is just beginning, right now **the administration likely has the votes to sustain the President's veto on a resolution to block the deal.**¶ "I'm confident they will like it when they understand it all," the vice president told reporters on his way into the session, beginning what will be a two month campaign culminating in a vote, expected in September.¶ Democrats, both for and against the deal, praised Biden's presentation.¶ "Joe Biden was as good as I've seen him," Rep. John Larson, D-Connecticut, told CNN. "I thought he did an excellent job."¶ Texas Democratic Rep. Henry Cuellar said Biden is a "master of detail" and helped clarify some concerns he had about the verification provisions in the deal, but he still planned to carefully study it and said he was undecided.¶ Pascrell also cited the verification issue as a potential sticking point but said he is leaning 'yes' on the agreement.¶ "On our side of the aisle **there is concern and skepticism shared by a number of members but an openness to be persuaded** if the facts take them that way," Rep. Gerry Connolly of Virginia said. "I think (Biden) made some real progress on behalf of the administration today."¶ But Democratic Rep. Steve Israel of New York, a former member of Democratic leadership, told reporters he wasn't sold yet.¶ "For me, I still have some very significant questions with respect to lifting of the embargo on conventional arms. And missiles. The (International Atomic Energy Agency) verification process for me is not any time anywhere, I think there are some very significant delays built into that," Israel said.¶ Larson noted that both Biden's presentation, along with Hillary Clinton's a day earlier, who he said spoke favorably about the deal, helped lay the groundwork for most Democrats to back the White House.¶ At the same time on Wednesday that the President held a news conference trying to persuade the public he had brokered an strong and effective deal with Iran, Sen. Joe Manchin, a Democrat from West Virginia, and a handful of other senators, were in a separate part of the White House meeting with some of the President's top negotiators, who had just returned from Vienna.¶ "I was very satisfied with an awful lot of the answers we received," Manchin told CNN.¶ **The intimate meeting for senators was another example of the White House's effort to shore up support in the Senate where leaders believe as many as 15 Democrats could oppose the deal.** If they did, it could provide Senate Republicans the votes needed to override a veto of the disapproval resolution and

scuttle the deal.¶ But Manchin, a centrist who has close relations with senators on both sides of the aisle, said at this point he has not detected major blowback from Senate Democrats to the deal.¶ "At caucus yesterday I didn't get a reading there is hard, hard opposition. I did not," he said.¶ In fact, Manchin said he thought Republicans actually might struggle getting the 60 votes they will need to pass the disapproval resolution, much less the dozen or so votes that might be needed to sustain a veto.¶ One key senator whose position will be closely monitored by the White House and his colleagues from both parties on the Hill, is Sen. Chuck Schumer of New York, the third-ranking Democrats who is poised to become the Democratic leader in the next Congress. Schumer has many Jewish voters in his state who are wary of the impact of the Iran agreement on the security of Israel. Schumer said he is skeptical of the deal and won't decide whether to support it before doing his homework.¶ "I will sit down, I will read the agreement thoroughly and then I'm gonna speak with officials -- administration officials, people all over on all different sides," he said when asked about his decision-making process. "Look, this is a decision that shouldn't be made lightly and I am gonna just study this agreement and talk to people before I do anything else."¶ Sen. John McCain, R-Arizona, a leading critic of the agreement with Iran, said "**the pressure will be enormous from the administration," as it tries to keep Democrats from defecting**. As chairman of the Armed Services Committee, McCain said he intends to hold hearings to demonstrate what he calls the "fatal flaws" in the deal.¶ House **conservatives** speaking at a forum sponsored by the Heritage Foundation, a conservative think tank, one after another ripped the Iran deal. But they **conceded that ultimately they may not be able to block it.¶ "**The game is rigged in favor of getting this done" Ohio Rep. Jim Jordan said.

Obama wants national security exemptions – plan costs political capital

Kevin **Gosztola** is an American journalist, author, and documentary filmmaker known for work on whistleblowers, Wikileaks, national security, secrecy, civil liberties, and digital freedom, September 11 20**13**, "Obama Administration Dishonestly Wants Public to Believe It Voluntarily Declassified Secret NSA Documents", CommonDreams.org, http://www.commondreams.org/views/2013/09/11/obama-administration-dishonestly-wants-public-believe-it-voluntarily-declassified

The reality is the Obama administration has specifically sought to exclude national security policies and/or intelligence activities from its public commitment to openness and transparency. The Associated Press reported in March that, though the "Obama administration answered more requests from the public to see government records under the Freedom of Information Act last year," more than ever it is now citing "legal exceptions to censor or withhold the material" in order to "protect national security and internal deliberations." Agencies invoking a record number of national security exemptions included ODNI, the Pentagon, the CIA, the Department of Homeland Security and the Justice Department. The FOIA lawsuits by the ACLU and EFF were an effort to challenge the Obama administration, which has presided over a growing body of secret law. In addition to previously refusing to release secret legal interpretations of a section of the PATRIOT Act, it has fought the release of information on the legal basis for placing a suspected terrorist on a "kill list." It has refused to support regularly declassifying FISA court rulings at least in part or in some other form. The Justice Department has fought the release of two key memos from the Justice Department on when the government has the authority to use GPS tracking. And, when Obama issued "cybersecurity" policy directive that purportedly wrestled with when the US government can and cannot engage in cyber warfare, that remained classified until it was revealed by Snowden.

Failure will spur prolif and war with Iran – the plan tanks Obama's ability to hold off Congress

Beauchamp 14 (Zack – B.A.s in Philosophy and Political Science from Brown University and an M.Sc in International Relations from the London School of Economics, former editor of TP Ideas and a reporter for ThinkProgress.org. He previously contributed to Andrew Sullivan's The Dish at Newsweek/Daily Beast, and has also written for Foreign Policy and Tablet magazines, now writes for Vox , "How the new GOP majority could destroy Obama's nuclear deal with Iran," http://www.vox.com/2014/11/6/7164283/iran-nuclear-deal-congress,)

There is one foreign policy issue on which the GOP's takeover of the Senate could have huge ramifications, and beyond just the US: Republicans are likely to try to torpedo President Obama's ongoing efforts to reach a nuclear deal

with Iran. And they just might pull it off. November 24 is the latest deadline for a final agreement between the United States and Iran over the latter's nuclear program. That'll likely be extended, but it's a reminder that the negotiations could soon come to a head. Throughout his presidency, **Obama has prioritized these negotiations**; he likely doesn't want to leave office without having made a deal. But if Congress doesn't like the deal, or just wants to see Obama lose, it has the power to torpedo it by imposing new sanctions on Iran. Previously, Senate Majority Leader Harry Reid used procedural powers to stop this from happening and save the nuclear talks. But Senate Majority Leader Mitch McConnell may not be so kind, and he may have the votes to destroy an Iran deal. If he tries, we could see one of **the most important legislative fight**s **of Obama's presidency.** Why Congress can bully Obama on Iran sanctions At their most basic level, the international negotiations over Iran's nuclear program (they include several other nations, but the US is the biggest player) are a tit-for-tat deal. If Iran agrees to place a series of verifiable limits on its nuclear development, then the United States and the world will relax their painful economic and diplomatic sanctions on Tehran. "The regime of economic sanctions against Iran is arguably the most complex the United States and the international community have ever imposed on a rogue state," the Congressional Research Service's Dianne Rennack writes. To underscore the point, Rennack's four-page report is accompanied by a list of every US sanction on Iran that goes on for 23 full pages. The US's sanctions are a joint Congressional-executive production. Congress puts strict limits on Iran's ability to export oil and do business with American companies, but it gives the president the power to waive sanctions if he thinks it's in the American national interest. "In the collection of laws that are the statutory basis for the U.S. economic sanctions regime on Iran," Rennack writes, "the President retains, in varying degrees, the authority to tighten and relax restrictions." The key point here is that Congress gave Obama that power — which means they can take it back. "You could see a bill in place that makes it harder for the administration to suspend sanctions," Ken Sofer, the Associate Director for National Security and International Policy at the Center for American Progress (where I worked for a little under two years, though not with Sofer directly), says. "You could also see a bill that says the president can't agree to a deal unless it includes the following things or [a bill] forcing a congressional vote on any deal." Imposing new sanctions on Iran wouldn't just stifle Obama's ability to remove existing sanctions, it would undermine Obama's authority to negotiate with Iran at all, sending the message to Tehran that Obama is not worth dealing with because he can't control his own foreign policy. So **if Obama wants to make a deal with Iran, he needs Congress to play ball**. But it's not clear that Mitch McConnell's Senate wants to. Congress could easily use its authority to kill an Iran deal To understand why the new Senate is such a big deal for congressional action on sanctions, we have to jump back a year. In November 2013, the Obama administration struck an interim deal with Iran called the Joint Plan of Action (JPOA). As part of the JPOA, the US agreed to limited, temporary sanctions relief in exchange for Iran limiting nuclear program components like uranium production. Congressional Republicans, by and large, hate the JPOA deal. Arguing that the deal didn't place sufficiently serious limits on Iran's nuclear growth, the House passed new sanctions on Iran in December. (There is also a line of argument, though often less explicit, that the Iranian government cannot be trusted with any deal at all, and that US policy should focus on coercing Iran into submission or unseating the Iranian government entirely.) Senate Republicans, joined by more hawkish Democrats, had the votes to pass a similar bill. But in February, Senate Majority leader Harry Reid killed new Iran sanctions, using the Majority Leader's power to block consideration of the sanctions legislation to prevent a vote. McConnell blasted Reid's move. "There is no excuse for muzzling the Congress on an issue of this importance to our own national security," he said. So now that McConnell holds the majority leader's gavel, it will remove that procedural roadblock that stood between Obama and new Iran sanctions. To be clear, it's far from guaranteed that Obama will be able to reach a deal with Iran at all; negotiations could fall apart long before they reach the point of congressional involvement. But if he does reach a deal, and Congress doesn't like the terms, then they'll be able to kill it by passing new sanctions legislation, or preventing Obama from temporarily waiving the ones on the books. And make no mistake — imposing new sanctions or limiting Obama's authority to waive the current ones would kill any deal. If Iran can't expect Obama to follow through on his promises to relax sanctions, it **has zero incentive to limit its nuclear program**. "If Congress adopts sanctions," Iranian Foreign Minister Javad Zarif told Time last December, "the entire deal is dead." Moreover, it could fracture the international movement to sanction Iran. The **U**nited **S**tates is far from Iran's biggest trading partner, so it depends on international cooperation in order to ensure the sanctions bite. If it looks like the US won't abide by the terms of a deal, **the broad-based international sanctions regime could collapse**. Europe, particularly, might decide that going along with the sanctions is no longer worthwhile. "Our ability to coerce Iran is largely based on whether or not the international community thinks that we are the ones that are being constructive and [Iranians] are the ones that being obstructive," Sofer says. "If they don't believe that, then the international sanctions regime falls apart." This could be one of the biggest fights of Obama's last term It's true that Obama could veto any Congressional efforts to blow up an Iran deal with sanctions. But a two-thirds vote could override any veto — and, according to Sofer, an override is entirely within the realm of possibility. "There are plenty of Democrats that will

probably side with Republicans if they try to push a harder line on Iran," Sofer says. For a variety of reasons, including deep skepticism of Iran's intentions and strong Democratic support for Israel, whose government opposes the negotiations, Congressional Democrats are not as open to making a deal with Iran as Obama is. Many will likely defect to the GOP side out of principle. The real fight, Sofer says, will be among the Democrats — those who are willing to take the administration's side in theory, but don't necessarily think a deal with Iran is legislative priority number one, and maybe don't want to open themselves up to the political risk. These Democrats "can make it harder: you can filibuster, if you're Obama you can veto — you can make it impossible for a full bill to be passed out of Congress on Iran," Sofer says. **But it'd be a really tough battle, one that would consume a lot of energy and lobbying effort that Democrats might prefer to spend pushing on other issues.** "I'm not really sure they're going to be willing to take on a fight about an Iran sanctions bill," Sofer concludes. "I'm not really sure that the Democrats who support [a deal] are really fully behind it enough that they'll be willing to give up leverage on, you know, unemployment insurance or immigration status — these bigger issues for most Democrats." So if the new Republican Senate prioritizes destroying an Iran deal, **Obama will have to fight very hard to keep it** — without necessarily being able to count on his own party for support. And the stakes are enormous: **if Iran's nuclear program isn't stopped peacefully, then the most likely outcomes are either Iran going nuclear, or war with Iran**. The administration believes a deal with Iran is their only way to avoid this horrible choice. That's why it's been **one of the administration's top priorities** since day one. It's also why this could become one of the biggest legislative fights of Obama's last two years.

Nuke war

Stevens 13 (Philip Stevens, associate editor and chief political commentator for the Financial Times, Nov 14 2013, "The four big truths that are shaping the Iran talks," http://www.ft.com/cms/s/0/af170df6-4d1c-11e3-bf32-00144feabdc0.html)

The who-said-what game about last weekend's talks in Geneva has become a distraction. The six-power negotiations with Tehran to curb Iran's nuclear programme may yet succeed or fail. But wrangling between the US and France on the terms of an acceptable deal should not allow the trees to obscure the forest. The organising facts shaping the negotiations have not changed.¶ The first of these is that Tehran's acquisition of a bomb would be more than dangerous for the Middle East and for wider international security. It would most likely set off a **nuclear arms race** that would see **Saudi Arabia, Turkey and Egypt** signing up to the **nuclear club**. The nuclear **n**on-**p**roliferation **t**reaty would be shattered. A future regional conflict could **draw Israel into launching a pre-emptive nuclear strike.** This is not a region obviously susceptible to **cold war disciplines of deterrence**.¶ The second **ineluctable reality** is that Iran has mastered the nuclear cycle. How far it is from building a bomb remains a subject of debate. Different intelligence agencies give different answers. These depend in part on what the spooks actually know and in part on what their political masters want others to hear. The progress of an Iranian warhead programme is one of the known unknowns that have often wreaked havoc in this part of the world.¶ Israel points to an imminent threat. European agencies are more relaxed, suggesting Tehran is still two years or so away from a weapon. Western diplomats broadly agree that Ayatollah Ali Khamenei has not taken a definitive decision to step over the line. What Iran has been seeking is what diplomats call a breakout capability – the capacity to dash to a bomb before the international community could effectively mobilise against it.¶ The third fact – and this one is hard for many to swallow – is that neither a negotiated settlement nor the air strikes long favoured by Benjamin Netanyahu, Israel's prime minister, can offer the rest of the world a watertight insurance policy.¶ It should be possible to construct a deal that acts as a plausible restraint – and extends the timeframe for any breakout – but no amount of restrictions or intrusive monitoring can offer a certain guarantee against Tehran's future intentions.¶ By the same token, bombing Iran's nuclear sites could certainly delay the programme, perhaps for a couple of years. But, assuming that even the hawkish Mr Netanyahu is not proposing permanent war against Iran, **air strikes would not end it.**¶ You cannot bomb knowledge and technical expertise. To try would be to empower those in Tehran who say the regime will be safe only when, like North Korea, it has a weapon. So when Barack Obama says the US will never allow Iran to get the bomb he is indulging in, albeit understandable, wishful thinking.¶ The **best the** international **community can hope** for is that, in return for a relaxation of sanctions, Iran will make a judgment that it is better off sticking with a threshold capability. To put this another way, if Tehran does step back from the nuclear brink it will be because of **its own calculation of the balance of advantage.**¶ The fourth element in this dynamic is that Iran now has a leadership that, faced with the severe and growing pain inflicted by sanctions, is **prepared to talk**. There is nothing to say that Hassan Rouhani, the president, is any less hard-headed than previous Iranian leaders, but he does seem ready to weigh the options.

The president of the United States should eliminate exemptions for surveillance practices for national security and counterterrorism purposes

Executive can take action to curtail surveillance

Straw 14 (Joesph Straw-Published: Friday, January 17, 2014, 6:58 AM Updated: Saturday, January 18, 2014, 1:01 AM "Obama calls for modest constraints on NSA surveillance programs" http://www.nydailynews.com/news/politics/obama-calls-constraints-nsa-surveillance-article-1.1582758)

Regardless of how we got here," Obama said, "the task before us now is greater than simply repairing the damage done to our operations or preventing more disclosures from taking place in the future."¶ National Security Agency leaker Edward Snowden revealed last year that the government legally — but secretly — forces phone companies to turn over billions of records on Americans' calls and stores them.¶ Obama said the NSA will continue to vacuum up billions of U.S. phone call logs, but the government will set up a new, outside entity to store the data.¶ "We have to make some important decisions about how to protect ourselves and sustain our leadership in the world while upholding the civil liberties and privacy protections our ideals and our Constitution require," he said in a speech at Justice Department headquarters.¶ Among his proposals:¶ - Require the government to get approval from a judge before it searches the data, except in emergencies.¶ - Continue NSA monitoring of foreign terror suspects' email accounts, but with protections for the privacy of data on innocent Americans caught in the dragnet.¶ - Establish a panel of public advocates, who would argue before the secret Foreign Intelligence Surveillance Court to protect civil liberties in high-profile cases.¶ Obama asked Congress to approve the establishment of the advocate panel. He would pursue the remainder of his plans by executive order, he said, but welcomed Congress to make his proposals law.¶ Responding to one of Snowden's most embarrassing revelations — that the NSA has eavesdropped on the personal cell phones belonging to close allies like German Chancellor Angela Merkel — Obama said that friendly leaders' phones will not be tracked except when doing so is critical to national security.

Prez Powers key to check global hotspots

South China Morning Post 2K (South China Morning Post 12/11/00 ProQuest [Newspaper] "Position of Weakness)

A weak president with an unclear mandate is bad news for the rest of the world. For better or worse, the person who rules the United States influences events far beyond the shores of his own country. Both the global economy and international politics will feel the effect of political instability in the US. The first impact will be on American financial markets, which will have a ripple effect on markets and growth across the world. A weakened US presidency will also be felt in global hotspots across the world. The Middle

East, the conflict between India and Pakistan, peace on the Korean peninsula, and even the way relations between China and Taiwan play out, will be influenced by the authority the next US president brings to his job.¶ There are those who would welcome a weakening of US global influence. Many Palestinians, for example, feel they would benefit from a less interventionist American policy in the Middle East. Even within the Western alliance, there are those who would probably see opportunities in a weakened US presidency. France, for example, might feel that a less assertive US might force the European Union to be more outward looking.¶ But the dangers of having a weak, insecure US presidency outweigh any benefits that it might bring. US global economic and military power cannot be wished away. A president with a shaky mandate will still command great power and influence, only he will be constrained by his domestic weakness and less certain about how to use his authority. This brings with it the risks of miscalculation and the use of US power in a way that heightens conflict. There are very few conflicts in the world today which can be solved without US influence. The rest of the world needs the United States to use its power deftly and decisively. Unfortunately, as the election saga continues, it seems increasingly unlikely that the next US president will be in a position to do so.

Secret unwarranted surveillance of mosques proves plan will be circumvented by state and local agencies

Goldman et. al, 2013

(Adam is a analyst for the Associated Press. "NYPD designates mosques as terrorism organizations." http://bigstory.ap.org/article/nypd-designates-mosques-terrorism-organizations. Date Accessed- 07/13/15. Anshul Nanda.)

They're terrorists. They all must be fanatics," said Abdul Akbar Mohammed, the imam for the past eight years at the Masjid Imam Ali K. Muslim in Newark. "That's not right."¶ NEW YORK (AP) — The New York Police Department has secretly labeled entire mosques as terrorist organizations, a designation that allows police to use informants to record sermons and spy on imams, often without specific evidence of criminal wrongdoing.¶ Designating an entire mosque as a terrorism enterprise means that anyone who attends prayer services there is a potential subject of an investigation and fair game for surveillance.¶ Since the 9/11 attacks, the NYPD has opened at least a dozen "terrorism enterprise investigations" into mosques, according to interviews and confidential police documents. The TEI, as it is known, is a police tool intended to help investigate terrorist cells and the like.¶ Many TEIs stretch for years, allowing surveillance to continue even though the NYPD has never criminally charged a mosque or Islamic organization with operating as a terrorism enterprise.¶ The documents show in detail how, in its hunt for terrorists, the NYPD investigated countless innocent New York Muslims and put information about them in secret police files. As a tactic, opening an enterprise investigation on a mosque is so potentially invasive that while the NYPD conducted at least a dozen, the FBI never did one, according to interviews with federal law enforcement officials.¶ The strategy has allowed the NYPD to send undercover officers into mosques and attempt to plant informants on the boards of mosques and at least one prominent Arab-American group in Brooklyn, whose executive director has worked with city officials, including Bill de Blasio, a front-runner for mayor.¶ De Blasio said Wednesday on Twitter that he was "deeply troubled NYPD has labelled entire mosques & Muslim orgs terror groups with seemingly no leads. Security AND liberty make us strong."¶ The revelations about the NYPD's massive spying operations are in documents recently obtained by The

Associated Press and part of a new book, "Enemies Within: Inside the NYPD's Secret Spying Unit and bin Laden's Final Plot Against America." The book by AP reporters Matt Apuzzo and Adam Goldman is based on hundreds of previously unpublished police files and interviews with current and former NYPD, CIA and FBI officials.¶ The disclosures come as the NYPD is fighting off lawsuits accusing it of engaging in racial profiling while combating crime. Earlier this month, a judge ruled that the department's use of the stop-and-frisk tactic was unconstitutional.¶ The American Civil Liberties Union and two other groups have sued, saying the Muslim spying programs are unconstitutional and make Muslims afraid to practice their faith without police scrutiny.¶ Both Mayor Mike Bloomberg and Police Commissioner Raymond Kelly have denied those accusations. Speaking Wednesday on MSNBC's Morning Joe, Kelly reminded people that his intelligence-gathering programs began in the wake of 9/11.¶ "We follow leads wherever they take us," Kelly said. "We're not intimidated as to wherever that lead takes us. And we're doing that to protect the people of New York City."¶ ___¶ The NYPD did not limit its operations to collecting information on those who attended the mosques or led prayers. The department sought also to put people on the boards of New York's Islamic institutions to fill intelligence gaps.¶ One confidential NYPD document shows police wanted to put informants in leadership positions at mosques and other organizations, including the Arab American Association of New York in Brooklyn, a secular social-service organization.¶ Linda Sarsour, the executive director, said her group helps new immigrants adjust to life in the U.S. It was not clear whether the department was successful in its plans.¶ The document, which appears to have been created around 2009, was prepared for Kelly and distributed to the NYPD's debriefing unit, which helped identify possible informants.¶ Around that time, Kelly was handing out medals to the Arab American Association's soccer team, Brooklyn United, smiling and congratulating its players for winning the NYPD's soccer league.¶ Sarsour, a Muslim who has met with Kelly many times, said she felt betrayed.¶ "It creates mistrust in our organizations," said Sarsour, who was born and raised in Brooklyn. "It makes one wonder and question who is sitting on the boards of the institutions where we work and pray."¶ ___¶ Before the NYPD could target mosques as terrorist groups, it had to persuade a federal judge to rewrite rules governing how police can monitor speech protected by the First Amendment.¶ The rules stemmed from a 1971 lawsuit, dubbed the Handschu case after lead plaintiff Barbara Handschu, over how the NYPD spied on protesters and liberals during the Vietnam War era.¶ David Cohen, a former CIA executive who became NYPD's deputy commissioner for intelligence in 2002, said the old rules didn't apply to fighting against terrorism.¶ Cohen told the judge that mosques could be used "to shield the work of terrorists from law enforcement scrutiny by taking advantage of restrictions on the investigation of First Amendment activity."¶ NYPD lawyers proposed a new tactic, the TEI, that allowed officers to monitor political or religious speech whenever the "facts or circumstances reasonably indicate" that groups of two or more people were involved in plotting terrorism or other violent crime.¶ The judge rewrote the Handschu rules in 2003. In the first eight months under the new rules, the NYPD's Intelligence Division opened at least 15 secret terrorism enterprise investigations, documents show. At least 10 targeted mosques.¶ Doing so allowed police, in effect, to treat anyone who attends prayer services as a potential suspect.

Plan won't deter Islamophobia – Fear incentivizes reproduction in politics and the media

Andrea Elizabeth **Cluck**, MA from University of Georgia, 20**12**, "ISLAMOPHOBIA IN THE POST-9/11 UNITED STATES: CAUSES, MANIFESTATIONS, AND SOLUTIONS", https://getd.libs.uga.edu/pdfs/cluck_andrea_e_201208_ma.pdf

In addition to the historical and psychological factors already discussed, various elements within contemporary society also contribute to Islamophobia -- for example, some politicians and media pundits both play a role in perpetuating contemporary anti-Muslim sentiment. Although a detailed discussion of the ways in which politicians and the mass media perpetuate Islamophobia is beyond the scope of the present work, one reason why both groups uphold Islamophobic stereotypes should be discussed here: personal gain. Simply put, some individuals utilize Islamophobia as a currency for personal advancement, including gaining money or societal influence. They are able to do so because genuine Islamophobia does exist; there are Americans who fear or dislike Muslims because of ignorance or erroneous information. Some Americans may fear Muslims, for examples because they mistakenly believe the actions of violent extremists are representative of the aspirations of the majority of Muslims.203 There are other people, however, who do not necessarily believe the stereotypes about Muslims, but nevertheless deliberately perpetuate them, or at least capitalize on those already in existence, in order to achieve personal gain. Deliberately perpetuating negative stereotypes about Islam and Muslims can be done for a variety of reasons, of which we will discuss three: to gain political leverage during elections, to make money through perpetuating Islamophobia in popular media, and to situate the West in a position of power against Muslims. First, Mohamed Nimer notes that "in political seasons, fear of Islam and Muslims has proven to be a useful mobilizer across party lines. The rumor about President (then Senator) Obama's being secretly Muslim serves as a vivid illustration." It was used to dissuade Democrats and Republicans alike from voting for Obama; and Obama quickly moved to disprove the allegations. Nimer notes that rather than "using his

old Muslim ties as an added advantage for any future president who might be dealing heavily with the Muslim world, the senator mobilized supporters, including his church pastor, to provide witness that he is not a Muslim but a practicing Christian." 204 This indicates that "Muslim" is such a pejorative label in the United States today that no good could be salvaged from the situation and Obama had to distance himself from the signifier completely.205 Aside from politicians, media pundits can also utilize Islamophobia for personal gain. Exacerbating Islamophobia can be extremely lucrative; a good deal of money is to be made from books, television shows, films, and countless other creative ventures linking Islam to terrorism. There is truth to the saying "if it bleeds, it leads." A story about an interfaith potluck dinner at a local mosque is not very exciting and unlikely to make the nightly news. Alleged Muslim sleeper cells in the United States are far more newsworthy, however, regardless of the credibility of the claims. To give a concrete example of how polemics can generate cash, at least one of Robert Spencer's popular, controversial works on Islam was a New York Times Bestseller for several weeks.206 In addition to gains at a more personal level for politicians and pundits, Edward Said notes that a widespread policy of Islamophobia puts the West itself in a position of superiority, a position of power, in relation to the Islamic world. In Covering Islam, he discusses this power differential at length. He points out that an "anti-Islam campaign virtually eliminates the possibility of any sort of equal dialogue between Islam and the Arabs."207 Although Americans assume that there is a degree of objectivity in journalism, Said argues that this is often not the case with Islam, and that "all discourse on Islam has an interest in some authority or power;" he takes care in the book to identify the "various groups in society that have an interest in 'Islam' such as academia, the government, corporations, and the media.208 Hence, it should be taken into account that

Islamophobia does not just happen on an individual level among ill-informed individuals, but rather the institutionalized manipulation of Islamophobia for personal gain does exist, and happens in order to achieve political gain, to make money through the popular media, and to perpetuate Western superiority. In summary, historically the primary causal factors of American Islamophobia were Europe's initial contact with Islam, the Puritan worldview, later American religio-political beliefs, Americans' contact with the Muslim world, American art and literature, and finally, later American religious movements. Today, main factors driving Islamophobia include its manipulation for political gain, for financial gain via the mass media, and finally, for the perpetuation of Western superiority.

The first link is democratization – the aff's insistence on "fixing" democracy and reinstituting democratic values only re-entrenches the status quo – previous attempts to expand or "improve" democracy created abusive governments – Even good intent devolves into expansions of the neoliberal state by encouraging political homogenization and cooperation with the Enlightened democracies of the West -

The second link is normalization – the aff's focus on this specific instance of state surveillance obscures and aids the progression of corporate surveillance – it's much easier to attack the existence of physical video cameras rather than deconstruct the cultural normalization of surveillance and its implications, most obvious in the realm of social media, wherein false notions of community lead individuals to willingly hand over their personal info and lives to corporations – the single refusal of state surveillance in the face of increasing corporate surveillance is simply a way to mask the deregulation of the market by global corporations

These demarcations may sound clear and simple, and yet both Islamophobia and anti-Americanism are on the rise. Anti-Muslim feelings in the United States have increased, especially after the terrorists attacks of September 11, 2001 (hereafter referred to as 9/11). Between one-fourth and one-third of Americans hold negative views of Islam and Muslims.1 Opinion leaders, especially on Internet blogs, talk radio, and cable television are increasingly using harsh language to refer to the Islamic faith. Franklin Graham, Jerry Falwell and Pat Robertson, religious leaders often courted by elected officials and politicians, have called Islam "a wicked religion", the Prophet Muhammad "a terrorist," and Muslims "worse than Nazis." A global survey of world public opinion about the United States in November 2005 revealed that uneasy feelings were mutual. In five major Muslim-majority countries, from 51 percent to 79 percent of the respondents expressed unfavorable view of the United States.2 There is a circular cause and effect relationship between Islamophobia and anti-Americanism. Consider the following sequence of events starting arbitrarily with 9/11: the strike by Al-Qaeda left thousands of people dead and injured and triggered the most remarkable anti-Muslim violence in American history and the most vocal wave of anti-Islam rhetoric in the West. The attack is then used to justify the invasion of two Muslim-majority countries: Afghanistan and Iraq, where hundreds of thousands of people have been killed or injured. And this unleashed a wave of terrorist attacks against vulnerable targets of U.S. allies around the world (the bombing of establishments frequented by nationals of U.S. allies in Bali, Indonesia, Casablanca, Morocco, Riyadh, Saudi Arabia, Istanbul, Turkey, Madrid, Spain, London, United Kingdom). We've also witnessed increased American pressures on Muslims here and abroad, including human rights abuses and the use of torture in

the name of national security. Revelations about such practices at Abu Garib and other U.S. holding facilities inflamed anti-American sentiments and may have contributed to the resurgence of al-Qaeda and Taliban in Iraq and Afghanistan. So the pattern is clear: Terrorist attacks against Americans are followed by anti-Muslim rhetoric and policy. This in turn reinforces anti-American sentiment and provokes a new round of terrorist attacks. For those who seek to promote reconciliation, it is pointless to ask which of the two phenomena began first. What is more important is to recognize the positive relationship between the two, namely, as Islamophobia increases, anti-Americanism is strengthened and vice versa.

Congress Repeal FISA CP

(FISA repeal CP k2 Solv) Courts fail to protect rights—in February, Supreme Court deemed surveillance abuse as "speculative" and dropped the case—only Congress solves

Kaminski 13 (Margot Kaminski is the executive director of the Information Society Project at Yale Law School, "Prism's legal basis: how we got here and what we can do to get back," The Atlantic, June 7, 2013, http://www.theatlantic.com/national/archive/2013/06/prisms-legal-basis-how-we-got-here-and-what-we-can-do-to-get-back/276667/)

The first instinct might be to look to federal courts to protect our constitutional rights. But in February of this year, the Supreme Court effectively closed that avenue of recourse at least with respect to PRISM in Clapper v. Amnesty International. The majority of the Court found that the group of lawyers, journalists, and human rights advocates who challenged the constitutionality of the law that authorizes PRISM could not show that they had been injured by it. The Court explained that the alleged surveillance was too speculative; the group could not get into court unless it showed that surveillance of its members was "certainly impending." One might think that a new lawsuit could show that surveillance is "certainly impending," because we now know that the PRISM program exists. But this is not clear. Any plaintiffs would probably still face the significant hurdle of showing that the government has spied on them in particular, or their foreign correspondents. And while the existence of a similarly pervasive spying program led the Ninth Circuit to find that a similar lawsuit could proceed, that case came down before the recent Supreme Court opinion. **The best solution**, then, **is Congress**. Congress must repeal the FISA Amendments Act, which it regrettably reauthorized in 2012. Otherwise the revelation that the government can and does spy on Americans through Internet companies will chill expression, chill free association, and threaten our society's growing reliance on cloud computing for everything from intimate communications to business transactions. And Congress should reevaluate the secrecy surrounding our entire foreign intelligence-gathering system, because if the past two days have shown anything, it is that lack of oversight leads to extraordinary abuses.

Betts and Sezer 14 (Jennifer Betts, Sakir Sezer, writers for Queen's University Belfast, http://www.researchgate.net/profile/Jennifer_Betts/publication/263013766_Ethics_and_Privacy_in_National_Security_and_Critical_Infrastructure_Protection/links/02e7e539963e847cdb000000.pdf, Ethics and Privacy in National Security and Critical Infrastructure Protection, May 2014)

Privacy by Design [3] is well documented and was recognised in October 2010 as the global standard at the International Conference of Data Protection and Privacy Commissioners. Its developer has co-authored a paper outlining Privacy Protective Surveillance (PPS) [5], a privacy protective alternative to current counter-terrorist surveillance. Based on the Privacy by Design framework, it utilizes current technology tools combining cryptography with machine learning

techniques. PPS [5] has three main technological components. Firstly, 'intelligent virtual agents' search online and transactional databases for suspicious activities. If suspicious activity is detected, any associated personal information associated with it would be encrypted and flagged up for further investigation. Secondly, a system using "Secure Multi-Party Computation methods" would interrogate the encrypted data searching for links between activities and individuals. "Homomorphic encryption" is the suggested encryption method. This would be valuable in allowing data to be analysed while still encrypted, although it is an area requiring technical expertise to decide on its practicality for this purpose. Finally, "probabilistic graphical models", Cavoukian gives the example of Bayesian networks, would perform inferential analysis on the anonymised data to calculate the likelihood of a terrorist threat from the previous analysis of suspicious linked activities. It is only at this point that a warrant would be sought to decrypt any personally identifiable information. The reputation of internet companies such as Google and Facebook have been damaged by the release of the Snowden files. Public trust has been further eroded following media reports that they accepted sums of money from the NSA for their co-operation [24]. Cavoukian believes PPS could improve public perception if, ultimately, internet companies were able to use the methodology to carry out anti-terrorist surveillance on their users' data without having to hand it over to the government. PPS avoids the mining of vast sums of data looking for previously unknown patterns of behaviour. While this can be useful for marketing and profiling for targeted advertising, it produces too many false positives for mass surveillance. The specifically targeted nature of the PPS data analysis technique could therefore help to restore public trust. The proposed methodology attempts to address the ethical area of privacy and trust. Well designed and developed "probabilistic graphical models" could achieve targeted data analysis that would minimise the risk of false positive results and the data of innocent internet users being exposed. Analysis has only been conducted on encrypted data up to the point where there is sufficient suspicion for a warrant to be requested. At the stage where a warrant is issued and data unencrypted, further privacy safeguards could restrict access to the data. The model enables a minimisation of human contact with personally identifiable information that could be further developed. V. CONCLUSION The release of the Snowden files have moved ethical concerns in relation to privacy and trust to a new political level. The ethical concerns of society today shape the policies and legislation of tomorrow, although the events of 2013 have produced a political urgency not generally associated with the slow progress of policy and legislation normally the subject of prolonged consultation and debate. Privacy concerns related to mass data surveillance cannot be fully addressed by politicians and governments. Nor, we believe, should they be. Our paper presents an ethical challenge to researchers and the technology industry. We highlight how a privacy impact assessment tool can be used in critical infrastructure protection to measure the effectiveness of technical security solutions. We also identify the PPS solution with which it is possible to develop policies and technologies that can prevent mass data surveillance violating the privacy a majority of law-abiding citizens have a right to expect. The availability of these solutions challenges policy makers, researchers, engineers and industry to progress their implementation with the objective of promoting and protecting both national security and privacy. If there is not a willingness to do this, we have to ask ourselves why?

Courts will 'narrow' rulings in digital surveillance as applying to pre-digital technology --- Riley sent a signal

Re 14 (Richard M. – Assistant Professor of Law at UCLA Law School, "Narrowing Precedent and the Digital Fourth Amendment," in Res Judicata, 11-24-14, https://richardresjudicata.wordpress.com/2014/11/24/narrowing-precedent-and-the-digital-fourth-amendment/)

My new paper, "Narrowing Precedent in the Supreme Court," is now posted online. (Thanks to LTB for publicizing it!) The basic idea is that the Supreme Court frequently narrows its precedents, including in "liberal" directions, and that doing so is often both legitimate and desirable. In this post, I'd like to make a prediction: in the near future, we are going to see **a lot of narrowing in the area of digital surveillance** and the Fourth Amendment. Here's the paper's abstract, broken into paragraphs: "Narrowing" occurs when a court declines to apply a precedent even though, in the court's own view, the precedent is best read to apply. In recent years, the Roberts Court has endured withering criticism for narrowing in areas such as affirmative action, abortion, the exclusionary rule, campaign finance, and standing. This practice— often called "stealth overruling"—is widely condemned as deceptive, as well as contrary to stare decisis. On reflection, however, narrowing is not stealthy, tantamount to overruling, or even uncommon. Instead, narrowing is a distinctive feature of Supreme Court practice that has been accepted and employed by virtually every Justice. Besides promoting traditional stare decisis values like correctness, fidelity, and candor, legitimate narrowing represents the decisional-law analogue to the canon of constitutional avoidance. As a rule, an en banc appellate court, including the Supreme Court, engages in legitimate narrowing when it adopts a reasonable reading of precedent without contradicting background legal principles. Under this rule, most if not all instances of narrowing during the Roberts Court are readily defensible—including frequently overlooked decisions by the Court's more liberal members. Moreover, prominent cases involving narrowing can be grouped into four categories: experimental narrowing, narrowing rules, narrowing to overrule, and aspirational narrowing. Far from being unusual or unwarranted, narrowing is a mainstay of Supreme Court practice— and a good thing, too. In the paper, one type of narrowing I discuss pertains to defeasible holdings–that is, holdings that can be read as containing implicit exceptions or limitations. This kind of narrowing is **likely to be relevant in future digital Fourth Amendment cases**. The reason is that pre-digital holdings are often written broadly, but **without digital technologies in mind**. Some might cite this circumstance as a reason to conclude that the best reading of the old cases is that **they just don't apply** to then-unforeseen digital technologies. For people who hold that view, pre-digital cases can simply be distinguished, without resorting to narrowing. In the recent Supreme Court case Riley v. California, the Court seemed to take that view, in that it declined to "extend" a pre-digital case to new digital technologies. However, many sophisticated lawyers have taken a broader view of pre-digital cases. Before Riley, for instance, many judges, commentators, and scholars believed that precedents like United States v. Robinson empowered police to search any object on the person of an arrestee. Period. For the many people holding that view–some of whom may have been on the Supreme Court–Riley narrowed Robinson by reasonably reading its expressly "categorical" holding as **implicitly limited to pre-digital technologies**. For instance, in rejecting the argument "that a search of all data stored on a cell phone is 'materially indistinguishable' from searches … of physical items," the Court didn't parse Robinson or any other precedent. Instead, the Court said: "That is like saying a ride on horseback is materially indistinguishable from a flight to the moon." Because smart phones were "nearly inconceivable just a few decades ago," when Robinson and related cases "were decided," the Court was **unconstrained by precedent**. Shortly after Riley, I suggested that the Supreme Court had **effectively signaled to lower courts** that other pre-digital precedents were **susceptible to similar treatment**. To be sure, "vertical" narrowing–that is, a lower court's narrowing of a higher court's precedent–is generally more objectionable than the Supreme Court's "horizontal" narrowing of its own precedent. That's partly because the Supreme Court can overrule its own cases, whereas lower courts can't just reject the contents of the US Reports. Yet Riley points toward a special context in which vertical narrowing makes sense. In cases involving **new**

technologies and the Fourth Amendment, trial courts and courts of appeals seem to have **special license** to draw on Riley's **treatment of digital technologies in reading Supreme Court precedents narrowly**. This kind of pro-defendant narrowing is already happening and is **bound to accelerate**. The most visible recent examples have involved the third-party doctrine. Cases like Smith v. Maryland have long been widely understood to mean that consumers have no reasonable expectation of privacy in their telephone records. Period. But Smith of course predates the modern digital world and so is susceptible to narrowing on that ground. In my view, narrowing provides the best way of understanding recent arguments, like Judge Leon's in Klayman v. Obama, that find Smith inapplicable in light of new technologies. As Judge Leon put it, modern cell phones and the **new surveillance technologies** that track them "are unlike anything that could have been conceived" when Smith was decided. Therefore, Smith's ostensibly broad holding is defeasible. We can expect even **more decisions in this vein** in the years ahead, including from the Supreme Court. On reflection, there's nothing odd about all this. It's how precedent often changes: visibly, without overruling, **and with ample legitimacy**.

The plan overrules Smith v. Maryland

Baker 14 (Stewart – former Assistant Secretary for Policy at the United States Department of Homeland Security, "The third grade and third-party doctrine," in the Washington Post, 1-22-14, https://www.washingtonpost.com/news/volokh-conspiracy/wp/2014/01/22/the-third-grade-and-third-party-doctrine/)

Randy Barnett argues that NSA's metadata program is bad because the government will use the information to target people for their political views and to embrace mission creep. His solution is to leave the metadata in the hands of the phone company. But really, what good would that do? Suppose that, as Randy fears, Congress wakes up one day and decides to use phone metadata to suppress dissent and gun ownership across America. The fact that the data is stored in four or five phone companies' databases rather than NSA's will forestall the Dark Night of Fascism for, oh, about 90 minutes. For the sake of that speedbump, we should give up our ability to identify cross-border terror plots? Randy's solution to that problem is to **overrule** a line of Supreme Court cases (**Smith v. Maryland**) holding that no one has a reasonable expectation of privacy in information they've disclosed to a third party. With Smith v. Maryland set aside, the government would need a search warrant to see the metadata.

*Overruling **uniquely decimates** Court legitimacy*

Kozel 10 (Randy J. – Associate Professor of Law at the University of Notre Dame, "ARTICLE: Stare Decisis as Judicial Doctrine," 67 Wash & Lee L. Rev. 411, 2010, LexisNexis)

A more widely debated example comes from Planned Parenthood of Southeastern Pennsylvania v. Casey, where the Court rejected the argument that Roe v. Wade's central holding should be overruled. n302 The majority was frank in its desire to protect the Court's "capacity to exercise the judicial power and to function as the Supreme Court of a Nation dedicated to the rule of law." n303 It explained that the Court's "power lies . . . in its legitimacy, a product of substance and perception that shows itself in the people's acceptance of the [*463] Judiciary as fit to determine what the Nation's law means and to declare what it demands." n304 That legitimacy, in turn, "depends on making legally principled decisions under circumstances in which their principled character is sufficiently plausible to be accepted by the Nation." n305 And while the country ordinarily tolerates the Court's occasional need to revisit precedents, where a decision "resolve[s] the sort of intensely divisive controversy reflected in Roe and those rare, comparable cases," that decision must receive "equally rare precedential force to counter the inevitable efforts to overturn it and to thwart its implementation." n306 Casey thus made clear that at least in "rare" situations of acute "national controversies," the Court will be **extraordinarily reluctant** to overrule its precedents based on concerns over perceived legitimacy. n307

Judicial credibility is critical to democracy, the environment, and gun control

Jawando, Vice President of Legal Progress at the Center for American Progress, 15

(Michele, Sean Wright is the Policy Analyst for Legal Progress at the Center, "Why Courts Matter," https://www.americanprogress.org/issues/civil-liberties/report/2015/04/13/110883/why-courts-matter-2/)

No matter the issue—whether it's marriage equality, voting rights, **health care**, or **immigration**—the U.S. federal courts play a **vital role** in the lives of all Americans. There are two types of courts: state and federal. The federal courts are those established to decide disagreements that concern the Constitution, congressional legislation, and certain state-based disputes. Although most Americans are familiar with the lifetime appointment of justices on the U.S. Supreme Court, many are surprised to learn that more than 900 judges have lifetime appointments to serve on lower federal courts, where they hear many more cases than their counterparts on the Supreme Court. Each year, the Supreme Court reviews around 100 of the most significant cases out of the nearly 30 million cases resolved by state and federal courts. These courts hear the majority of cases and, most of the time, they have the final say. That is why, along with the Supreme Court's justices, the judges who sit on the nation's federal district and circuit courts are so important. At any given time, there are vacancies on U.S. federal courts that need to be filled. If they are not filled, federal caseloads get backlogged, and as a result, Americans' access to justice is limited. As of March 9, 2015, there were 50 current vacancies on U.S. federal courts. These seats have been vacant for a total of 22,222 days, resulting in a backlog of 29,892 cases. The Administrative Office of the United States Courts has designated 23 of these pending vacancies as judicial emergencies, meaning that filling them is a critical task. As the Center for American Progress has noted, "in practical terms," these are the judicial districts "where judges are overworked and where justice is being significantly delayed for the American public." The Constitution dictates that the president appoints federal judges while the Senate advises and consents on these appointments. The result is a delicate balance between the desires of the White House, deference to home-state senators, and the power of the party that controls the Senate. Recently, politics has played a big role in the pace at which judicial nominees are confirmed. In an attempt to slow President Barack Obama's effect on the federal courts, Senate Republicans have obstructed the president's judicial nominees at unprecedented levels by attempting to prevent or delay a vote through filibustering a record number of nominees and making them await confirmation for long periods of time. The reason many Senate Republicans have played politics with President Obama's judicial nominees is because they know the **dramatic impact** the judiciary can have on policies, including marriage equality and reproductive choice. The fewer judges that President Obama appoints to fill federal judicial vacancies, the greater leverage the next president will have in deciding the make-up of these courts. Yet in the face of unprecedented obstruction, President Obama has made great strides to fill vacancies and to ensure that federal judges meaningfully reflect the dynamic diversity of the nation. A diverse federal bench improves the quality of justice and instills confidence that judges understand the **real-world** implications of their decisions. Americans have different backgrounds, as well as an assorted set of professional, educational, and life experiences. It is important that the federal courts reflect the diversity of the public they serve. As Supreme Court Justice Sonia Sotomayor once wrote, "The dynamism of any diverse community depends not only on the diversity itself but on promoting a sense of belonging among those who formerly would have been considered and felt themselves outsiders." Furthermore, scholars have found that judges often change their minds during the deliberative process. In one study, researchers concluded that having a woman on the panel affected "elements of both deliberation and bargaining—alternative perspectives, persuasive argument, and horse trading." Not only do the federal courts play a **vital role** in preserving democracy, but who sits on the courts has an effect too. This issue brief examines the ways in which our federal courts influence **important policy issues** and illustrates how judges' decisions are often aligned with the legal philosophy of the presidents who appoint them. This fact drives home one of the reasons why courts matter: The decisions of federal judges have repercussions on people's lives. Through its review of how the federal courts affect three specific policy issues—**gun violence**, **money in politics**, and **voting rights**—this issue brief shines a light on how important the federal courts are for the progressive community. Federal courts affect the issues that progressives care about Gun violence Gun violence has become all too familiar in America. However, research shows that reasonable gun control efforts decrease its occurrence. In particular, the Center for American Progress has determined that there is "a clear link between high levels of gun violence and weak state gun laws," and that "the 10 states with the weakest gun laws collectively have an aggregate level of gun violence that is more than twice as high—104 percent higher, in fact—than the 10 states with the strongest gun laws."In short, evidence shows that with more guns, there are more gun deaths. U.S. federal courts **play a significant role** in determining whether states can impose **reasonable gun regulations**. For 70 years, the Supreme Court never took a case that dealt with the Second Amendment and the right to bear arms. But in 2008, in District of Columbia v. Heller, five Supreme Court justices appointed by Republican presidents changed course, holding that the Second Amendment protects an individual's right to possess a firearm unconnected with militia service. Four justices appointed to the Court by Democratic presidents disagreed. Less than one day after the decision, gun rights activists began to flood courts with lawsuits that challenged any and all gun regulations. According to the Law Center to Prevent Gun Violence, since the Heller decision, federal and state courts have issued more than 700 decisions on Second Amendment challenges. In many of these cases, judges appointed by Republican presidents have struck down gun regulations, while judges appointed by Democratic presidents have interpreted the Supreme Court's decision **less broadly** and upheld them. For example, there is an ongoing debate over the states' right to impose regulations on applicants for concealed-carry permits. Prior to Heller, many states required a permit applicant to show "good cause" or a "justifiable need" to carry a gun in public. After reviewing these common-sense laws, panels of the U.S. Courts of Appeals for the 7th and 9th Circuit struck them down. In Peruta v. County of San Diego, two judges appointed by Republican presidents struck down California's requirement that concealed-carry permit applicants show "good cause" before carrying guns in public, with the majority

interpreting the Second Amendment in an expansive manner. This prompted Judge Sidney Thomas, who was appointed by a Democratic president, to author a vigorous dissent: This case involves California's "presumptively lawful" and longstanding restrictions on carrying concealed weapons in public and, more specifically, an even narrower question: the constitutionality of San Diego County's policy of allowing persons who show good cause to carry concealed firearms in public. When we examine the justification provided for the policy, coupled with Heller's direction, our conclusion must be that the County's policy is constitutional. Unfortunately, the majority never answers the question posed. Instead, in a sweeping decision that unnecessarily decides questions not presented, the majority not only strikes down San Diego County's concealed carry policy, but upends the entire California firearm regulatory scheme. The majority opinion conflicts with Heller, the reasoned decisions of other Circuits, and our own case law. Therefore, I must respectfully dissent. As Judge Thomas noted, other courts have upheld state laws that **promote public safety**. Judges on the Courts of Appeals for the 2nd, 3rd, and 4th Circuit have found that laws requiring permit applicants to show **"good cause"** do not interfere with the Second Amendment and instead promote balancing gun use with safety. In each of the decisions, judges appointed by Democratic presidents upheld longstanding permit regulations that are utilized by states across the country. The Heller decision emboldened gun rights groups. One particular organization, the Second Amendment Foundation, or SAF, has adopted a legal strategy of "swinging for the fences and often making very broad constitutional arguments."[xxiv] Alan Gottlieb, the SAF's founder, has said, "Our feeling is strike while the iron is hot … [t]hen weave [the case law] into a spider web that's strong enough so our opponents can't get through it." Money in politics America's representative democracy rests on the notion that elected officials are responsive to the people who elect them. Currently, however, political campaigns and elections are dominated by large amounts of money from individuals, corporations, and special interests that politicians rely on to run for office. During the 2014 election cycle, mega-donors dominated spending, with the top 100 campaign donors pouring in nearly enough money to match some 4.75 million small donors combined.[xxvi] The Center for Responsive Politics found that "just 666,773 individuals had donated more than $200 to campaigns, parties and political action committees in the 2014 election cycle." This means that only 0.2 percent of the population financed the midterm elections. This is concerning because, as a recent study detailed, "the preferences of economic elites … have far more independent impact upon policy change than the preferences of average citizens do." New research makes clear that members of Congress are more likely to meet with a constituent if they say they are a campaign donor. As Adam Lioz wrote in The American Prospect, "[T]he wealthy prefer policies that make them even richer … and government responds almost exclusively to their preferences. He who pays the piper calls the tune." Why has the United States seen such an expansion of special interest money in its electoral system? One does not have to look much further than **the federal courts**. In a series of high-profile decisions, the Supreme Court has turned campaign finance law upside down. In a 1976 case known as Buckley v. Valeo, the Supreme Court determined that spending money for political campaign purposes was a form of speech protected by the First Amendment. This money-is-speech rationale was used to strike down portions of the campaign finance reforms that followed the Watergate scandal. It has also been used to open the floodgates for more money in politics. In the now infamous Citizens United v. Federal Election Commission, five justices appointed by Republican presidents held that, although entities such as corporations could not contribute directly to individual political campaigns, they could contribute unlimited amounts of money to independent political action committees, or PACs. This decision caused an "explosion of political money," epitomized by the continued growth of super PACs—independent entities that can raise unlimited amounts of money from corporations, unions, and individuals but are prohibited from coordinating with a political candidate's campaign. This ruling prompted an impassioned dissent by Justice John Paul Stevens and three justices appointed by Democratic presidents. They lamented that, "While American democracy is imperfect, few outside the majority of this Court would have thought its flaws included a dearth of corporate money in politics." The Supreme Court continued to loosen restrictions on campaign funding in McCutcheon v. Federal Election Commission, in which the same five justices appointed by Republican presidents struck down the aggregate campaign contribution limits, which restricted how much money a donor could contribute to all candidates for federal office combined. The Court held that this limitation was a violation of the First Amendment. In McCutcheon, four justices appointed by Democratic presidents dissented and would have upheld the reasonable contribution limits that Congress imposed. The lower federal courts have been obligated to follow the decision, prompting one federal judge to exclaim, "Today's reality is that the voices of 'we the people' are too often drowned out by the few who have **great resources."** These two opinions bookend the campaign finance revolution that has taken place under Chief Justice John Roberts. All told, the Roberts Court has struck down seven campaign finance regulations. This revolution has had dire consequences. To campaign finance expert Richard Briffault, "[t]he rise of **super PACs** suggests that the real impact of Citizens United may be the re-validation of the **unlimited use** of private wealth generally in elections, not just spending by corporations and unions." The last presidential election is a **case in point**. During the 2012 election cycle, super PACs "spent more than $1 billion, including more than $300 million contributed by donors whose identities were never disclosed." These amounts triple the amounts spent by outside groups in either 2008 or 2010. And it seems that the amount of money corporations and shady super PACs spend on elections will only continue to increase. Unfortunately, Justice Stephen Breyer's concern in McCutcheon appears to be prophetic: "Where enough money calls the tune, the general public will not be heard." Voting rights In the years of Jim Crow and segregation, voters faced overt challenges to their right to vote, including grandfather clauses, poll taxes, literacy tests, and blatant intimidation and violence. In response to these oppressive and undemocratic practices, legal protections, such as the Voting Rights Act, or VRA, of 1965, were passed in order to help ensure that eligible voters could exercise their right to vote. The VRA has been called the nation's most powerful civil rights law. However, as a nation, we are still far from ensuring that all Americans have equal access to the polls. According to the Brennan Center for Justice, in 2013 alone, 33 states introduced at least 92 restrictive voting bills. On top of that, researchers found that higher voter turnout among minorities in a given state increased the likelihood that the state would propose restrictive voting laws. These restrictive measures have been found to have a disproportionate effect on people of color, those for whom English is a second language, young people, the indigent, and the elderly. U.S. federal courts play a large role in enforcing the laws that protect voters from discrimination and intimidation. In 2013, in Shelby County v. Holder, five Supreme Court justices appointed by Republican presidents gutted the VRA by ruling that the formula stipulated in Section 4(b) to determine which states were subject to Section 5 "preclearance" before the implementation of changes to state or local voting laws was unconstitutional. The ruling made it harder for the federal government, including the courts, to hold states accountable for discriminatory voting practices. The four justices appointed by Democratic presidents wanted to keep the VRA protections in place. Although Shelby County was a setback for voters, other sections of the VRA still exist and are being used to fight voting-related discrimination and to require states to provide appropriate assistance to large populations of eligible voters that speak foreign languages. Recently in Texas, a federal judge who was appointed by a Democratic president determined that the state's new voting law intentionally discriminated against communities of color, violated the VRA, and constituted an unconstitutional poll tax that could disenfranchise nearly 600,000 registered Texans. For this reason, America's federal courts will continue to determine how to apply these protections in order to help ensure that

all voters have an equal right to vote. Conclusion In 1929, legendary civil rights lawyer Charles Hamilton Houston said, "A lawyer's either a social engineer or … a parasite on society." He described a social engineer as "a highly skilled, perceptive, sensitive lawyer who [understands] the Constitution of the United States and [knows] how to explore its uses in the solving of problems of … local communities" and in "bettering conditions of the underprivileged citizens." In this light, Houston believed that lawyers should use their training and their prestige in the community to better society and to promote justice. When articulating the ideal temperament of a judge, President Obama evoked Houston's sentiments by listing "empathy" as a key trait. Collectively, this means that judges must understand the real-world implications of legal decisions. This is a critical ability because the federal courts have an impact on every issue that affects Americans' daily lives. U.S. federal courts ensure **equality**, **defend civil rights**, **protect the environment**, **affect the health of America's democracy,** and **keep the nation safe.** While Americans often feel that the federal courts are untouchable, it is important to know that they can play a large role in how these courts rule, as those responsible for filling the benches of U.S. federal courts are responsive to the democratic process and the input of American citizens. Presidents nominate judges who share their beliefs and values. And because they serve for life, federal judges have a huge impact on the issues that affect the lives of all Americans. Control of the Senate also matters, as senators are responsible for confirming or rejecting the president's nominees. Senators play a large role in identifying lawyers for the White House to nominate and can control the pace of the nomination process. The first step in the process toward confirming judges who understand the real-world implications of legal decisions is to continue working to appoint judges who meaningfully reflect America's diverse experiences. The United States needs its courts to be staffed with Houston's social engineers—those who faithfully adhere to the rule of law but who are equally faithful to their constitutional obligations to promote justice and fairness. Instead of siding with **ideological pursuits**, America's judges must uphold **the Constitution and the nation's laws.**

Strong gun control measures are key to Latin-American Relations, U.S.-Mexico Relations, and preventing Latin American instability

Sweig 13 – Julia E., Nelson and David Rockefeller Senior Fellow for Latin America Studies and Director for Latin America Studies @ the Council on Foreign Relations, "A Strategy to Reduce Gun Trafficking and Violence in the Americas" http://www.cfr.org/arms-industries-and-trade/strategy-reduce-gun-trafficking-violence-americas/p31155

The flow of high-powered weaponry from the **U**nited **S**tates to Latin America and the Caribbean **exacerbates soaring rates of gun-related violence in the region** and **undermines U.S. influence** in the Western Hemisphere. Though the Senate rejected measures to expand background checks on firearms sales, reinstate a federal assault-weapons ban, and make straw purchasing a federal crime, **the Obama administration can still take executive action** to reduce the **availability and trafficking of assault weapons and ammunition in the Americas.** The Problem With the launch of the Merida Initiative in 2007, the U.S. and Mexican governments agreed to a regional security framework guided by the principle of shared responsibility. Among its domestic obligations, the **U**nited **S**tates committed to intensify its efforts to combat the illegal trafficking of weapons and ammunition to Mexico and elsewhere in the Americas. Six years later, **little has changed**: the U.S. civilian firearms market continues to supply the region's transnational criminal networks with high-powered weaponry that is purchased with **limited oversight**, especially from unlicensed individuals at gun shows, flea markets, pawn shops, and on the Internet. Lax U.S. gun laws **enable straw purchasers**, including those under investigation in Operation Fast and Furious, to legally procure thousands of AK-47 and AR-15 variants every year and traffic them across the border to sell them illegally to criminal factions. U.S. government data highlights the problem. The Bureau of Alcohol, Tobacco, Firearms and Explosives' (ATF) Web-based firearm trace request and analysis system, eTrace, enables law enforcement officials to collaborate with ATF to track the path of recovered weapons from the manufacturer or importer though the distribution chain to the first retail purchase. Over 70 percent of the ninety-nine thousand weapons recovered by Mexican law enforcement since 2007 **were traced to U.S. manufacturers and importers.** Likewise, 2011 eTrace data for the Caribbean indicates that over 90 percent of the weapons recovered and traced in the Bahamas and over 80 percent of those in Jamaica came from the United States. The ATF has not released data for Central America, but the numbers are likely similar. The UN Office on Drugs and Crime reports that easy access to firearms is a **major factor influencing homicide trends in Latin America and the Caribbean**; the gun-related homicide rate in Latin America exceeded the global average in 2010 by **more than 30 percent**. The World Bank estimates that crime and violence cost Central America nearly 8 percent of its GDP when accounting for the costs of law enforcement, security, and health care. The U.S. government has empowered law enforcement in the region to recover and investigate the source of weapons used by

criminal factions. In December 2009, the ATF introduced the Spanish version of eTrace. Since 2012, the State Department has funded the Organization of American States' (OAS) program to provide firearm-marking equipment and training to law enforcement in twenty-five countries. Yet, these efforts notwithstanding, Mexican authorities intercepted **only 12.7 percent of the roughly 250,000 guns smuggled into Mexico between 2010 and 2012**, while the ATF intercepted **no more than 2 percent**. In effect, the **U**nited **S**tates undermines its own efforts at preventing arms trafficking with its unwillingness to strengthen oversight of the firearms industry and lukewarm support for multilateral agreements. The United States is one of three countries that have not ratified the Inter-American Convention Against the Illicit Manufacturing of and Trafficking in Firearms, Ammunition, Explosives, and Other Related Materials (CIFTA). In addition to requiring parties to criminalize the illegal manufacture, import, or export of high-powered weapons, the treaty encourages information exchange and cooperation on initiatives including the marking and tracing of weapons and the identification of criminal transit routes. President Bill Clinton signed CIFTA in 1997 and submitted it for ratification to the Senate, where it has lingered for over a decade. Likewise, although the United States voted in favor of the United Nations' Arms Trade Treaty in April 2013, it has yet to sign or ratify the treaty. Given the political complexity of legislative action to reduce arms trafficking, Latin American governments have moved to disarm criminal networks by tightening their own gun codes: Mexico prohibits the sale of handguns with calibers greater than .38 and Colombia bans civilians from carrying firearms in Medellin and Bogota. Brazil, Mexico, and El Salvador have implemented gun buyback programs. At the 2012 Summit of the Americas, heads of state demanded a new approach to the failed war on drugs, including greater efforts to disarm criminal networks. U.S. allies have repeatedly urged the **U**nited **S**tates to reinstate the federal assault-weapons ban and take action against weapons trafficking. Their patience—and the **U**nited **S**tates' **credibility** as a responsible partner—**is waning**. U.S. action will strengthen those regional heads of state who want to work with the United States and who also regard lax U.S. gun laws as fueling violence and **anti-Americanism among their own publics**. Across the board, Latin American governments are turning toward the Community of Latin American and Caribbean States and the Union of South American Nations, which **pointedly exclude the United States,** to handle regional political and security dilemmas. Stronger action to regulate the southward flow of weapons represents an opportunity for the Obama administration to enhance U.S. relevance in the region, especially at the early stages of new regional institutions and security protocols. Recommendations In the absence of major legislative action, the Obama administration should pursue the following executive and diplomatic actions—consistent with the Second Amendment—to reduce the trafficking of firearms that contribute to crime and violence across the Americas: Expand nationwide the state-level multiple-sale reporting requirement for assault weapons. In 2011, the Obama administration adopted a federal rule that requires gun dealers in California, Texas, Arizona, and New Mexico to report sales of more than two semiautomatic rifles to the same person within a five-day period. Unintentionally, the rule shifted gun sales to states not covered by the requirement, prompting the need for improved oversight of all suspicious semiautomatic firearm sales. Incorporate strategies to reduce existing stocks of illegal firearms into U.S.-Brazil dialogue on defense and security. As home to the two largest firearms industries in the hemisphere, the United States and Brazil have a mutual interest in incorporating this topic into their ongoing bilateral policy dialogues. For example, sharing best practices regarding gun buyback programs in border regions on the U.S.-Mexican and Brazilian-Bolivian borders will build mutual confidence between the two largest Hemispheric powers. Exclude firearms and ammunition products from the Export Control Reform Initiative. As currently crafted, President Barack Obama's reform initiative may make it easier for U.S. manufacturers to export military-style weapons to allies. Liberalizing export restrictions on firearms poses a serious security risk to the Americas; potential reexport of firearms without U.S. oversight could jeopardize local law enforcement efforts to keep weapons from criminal groups and rogue security forces in the region. Apply the "sporting test" standards of the 1968 Gun Control Act. This provision prohibits the import of weapons not "suitable or readily adaptable for sporting purposes," including but not limited to military-style firearms. Throughout the 1990s, under Presidents George H.W. Bush and Bill Clinton, the ATF adhered to the sporting test guidelines, preventing thousands of assault weapons from entering the U.S. firearms market. Enforcement of the test lapsed under President George W. Bush and has not been reestablished under President Obama. Continue to support federal, state, and local initiatives to improve regulation of the U.S. civilian firearms market. As grassroots organizations prepare their long-term legislative strategies, the White House should back state and local legislation, based on reforms in Maryland and Connecticut, which bans the sale of assault rifles and high-capacity magazines, broadens existing background check requirements for firearm purchases, and modernizes gun-owner registries by requiring, among others, that buyers submit their fingerprints when applying for a gun license. While piecemeal regulation of the U.S. civilian firearms market does not represent a comprehensive solution, passage of state and local measures, including gun buyback programs, will reduce the number of weapons in circulation and available for smuggling and generate momentum for a broader federal approach over the long run. Conclusion Strengthening U.S. gun laws will not eliminate gun violence in Latin America, where weak judiciaries and police forces, the proliferation of gangs and black markets, and deep inequality exacerbate violent conflict. Nonetheless, lax U.S. gun regulations do **enable international trafficking**. While the effects of tighter regulation will not be felt overnight, such steps **will offset widespread regional views that the United States remains indifferent to its own role in exacerbating one of Latin America's most significant challenges.** Although

recent federal gun control measures have run aground on congressional opposition, the Obama administration retains considerable leeway in the foreign policy arena, where concerted action can help U.S. allies in Latin America make the case to their constituents and to other skeptical governments that the **U**nited **S**tates **can be a legitimate partner in combating transnational crime**. At a juncture in U.S.-Latin American relations that again features both **tension and opportunity,** these actions will demonstrate that the **U**nited **S**tates is prepared, if imperfectly, to **fulfill its shared responsibility for regional security and enhance American standing and positive influence in Latin America.**

"Hemispheric Defense in the 21ST Century, 2013

As the previous chapter demonstrates, for the past two hundred years the principal cause of **concern** for U.S. defense policymakers and planners thinking about **Latin America** has been **the prospect that great powers** outside the Western Hemisphere **could exploit the** military **weakness and** internal **security challenges of the states** within it **to threaten U.S. security**. While there is reason for optimism about the future of Latin America,58 there is also cause for concern. The region faces enduring obstacles to economic59 and political development60 as well as signi□cant internal security challenges. As General John Kelly, the commander of U.S. Southern Command (SOUTHCOM)61 noted in his March 2013 posture statement before Congress, Latin America: □I□s a region of enormous promise and exciting opportunities, but it is also one of persistent challenges and complex threats. It is a region of relative peace, low likelihood of interstate con□icts, and overall economic growth, yet is also home to corrosive criminal violence, permissive environments for illicit activities, and episodic political and social protests.62 The instability and non-traditional security challenges that General Kelly cites provide potential opportunities for the United States' **major rivals to** (borrowing a term from Monroe's declaration) "**interpose**" themselves **into the region and**, by so doing, **threaten regional stability and U.S. security**. Two discernible trends suggest that current and prospective **Eurasian rivals** could seek to exploit regional conditions and dynamics in ways that could impose immense costs on the United States and **divert** its **attention from** more **distant theaters overseas**. The first trend is **a return to a heightened level of competition among the "great powers"** following two decades of U.S. dominance. The second trend concerns the growing cost of projecting power by traditional military means due to the proliferation of "anti-access/area-denial" (A2/AD) capabilities in general, and precision-guided munitions (PGMs) in particular. These trends suggest that, despite a possible decline in relative U.S. power, external forces will continue to □nd it beyond their means to threaten the hemisphere through traditional forms of power projection. Far more likely is a return of a competition similar to that which the United States engaged in with the Soviet Union during the Cold War. During that period both powers sought to avoid direct con□ict with the other, given the risks of escalation to nuclear con□ict. Instead each focused primarily on gaining an advantage over the other through the employment of client states and non-state groups as proxies. Proxies were employed for reasons other than avoiding a direct clash, such as gaining positional advantage (e.g., enabling the sponsor to establish bases in its country, as the Soviets did in Cuba). Proxies were also employed as a means of diverting a rival's attention from what was considered the key region of the competition and to impose disproportionate costs on a rival (e.g., Moscow's support of □orth Vietnam as a means of drawing o□ U.S. resources from Europe). This chapter outlines trends in the Western Hemisphere security environment that outside powers may seek to exploit to advance their objectives in ways that threaten regional stability and U.S. security. This is followed by a discussion of how these external powers might proceed to do so. Seeds of Instability Crime, Illicit Networks, and Under-Governed Areas Latin America has a long history of banditry, smuggling, and organized crime. As in the case of Pancho Villa and the 1916-1917 Punitive Expedition, these activities have occasionally risen to a level at which they in□uence U.S. national security calculations. Rarely, however, have these activities been as pervasive and destabilizing as they are today. Although a wide variety of illicit activity occurs in Latin America, criminal organizations conducting drug tra□cking are the dominant forces in the Latin American underworld today, accounting for roughly □□0 billion per year63 of an estimated □100 billion in annual illicit trade.6□ Since the Colombian cartels were dismantled in the 1990s, this lucrative trade has been dominated by powerful Mexican cartels whose operations extend across the length and breadth of Mexico, as well as up the supply chain into the cocaine-producing regions of the Andean Ridge and through their wholesale and retail drug distribution networks across the United States.65 The cartels, along with countless smaller criminal organizations, comprise what the head of SOUTHCOM has described as, □a□n interconnected system of arteries that traverse the entire Western Hemisphere, stretching across the Atlantic and Paci□c, through the Caribbean, and up and down □orth, South, and Central America . . . □a□ vast system of illicit pathways □that is used□ to move tons of drugs, thousands of people, and countless weapons into and out of the United States, Europe, and Africa with an e□ciency, payload, and gross pro□t any global transportation company would envy.66 That being said, the drug tra□cking underworld is by no means a monolithic entity or cooperative alliance. Rather, it is a fractious and brutally competitive business in which rival entities are constantly and literally □ghting to maximize their share of the drug trade and for control of the critical transshipment points, or plazas, through which it □ows. To attack their competitor's operations and protect their own operations from rivals and the Mexican government's crackdown that began in 2006, the cartels have built up larger, better armed, and more ruthless forces of hired gunmen known as sicarios. Using the billions of dollars generated by their illicit activities, they have acquired weapons and equipment formerly reserved for state armies or state-sponsored insurgent groups, including body armor, assault ri□es, machine guns, grenades, landmines, anti-tank rockets, mortars, car bombs, armored vehicles, helicopters, transport planes, and—perhaps most remarkably—long-range submersibles.67 The cartels' pro□ts have also enabled them to hire former police and military personnel, including members of several countries' elite special operations units68 and, in several cases, active and former members of the U.S. military.69 These personnel bring with them—and can provide to the cartels—a level of training and tactical pro□ciency that can be equal or superior to those of the government forces they face. As a result of this pro□ciency and the military-grade weapons possessed by the cartels, more than 2,500 Mexican police o□cers and 200 military personnel were killed in confrontations with organized crime forces between 2008 and 2012 along with tens of thousands of civilians.70 In the poorer states of Central America, state security forces operate at an even greater disadvantage.71 While their paramilitary forces enable the cartels to dominate entire cities and large remote areas through force and intimidation, they are not the only tool available. The cartels also leverage

their immense wealth to buy the silence or support of police and government o□cials who are often presented with a choice between plata o plomo—"silver or lead." According to the head of the Mexican Federal Police, around 2010 the cartels were spending an estimated □100 million each month on bribes to police.72 By buying o□ o□cials—and torturing or killing those who cannot be corrupted—the cartels have greatly undermined the e□ectiveness of national government forces in general and local police in particular. This, in turn, has undermined the con□dence of the population in their government's willingness and ability to protect them. Through these means and methods the cartels have gained a substantial degree of de facto control over many urban and rural areas across Mexico, including major cities and large swathes of territory along the U.S.-Mexico border. In many of these crime-ridden areas the loss of con□dence in the government and police has prompted the formation of vigilante militias, presenting an additional challenge to government control.73 Meanwhile, in the "northern triangle" of Central America (the area comprising Guatemala, Honduras, and El Salvador through which the cartels transship almost all cocaine bound for Mexico and the United States) the situation is even more dire. Approximately 90 percent of crimes in this area go unpunished, while in Guatemala roughly half the country's territory is e□ectively under drug tra□ckers' control.7□ Further south, similar pockets of lawlessness exist in coca-growing areas in Colombia, Venezuela, Ecuador, Peru, and Bolivia. In Colombia and along its borders with Venezuela, Ecuador, and Peru, much of the coca-growing territory remains under the control of the Revolutionary Armed Forces of Colombia, or FARC. A guerrilla organization founded in the 1960s as a Marxist-Leninist revolutionary movement dedicated to the overthrow of the Colombian government, the FARC embraced coca growing in the 1990s as a means of funding its operations and has subsequently evolved into a hybrid mix of left-wing insurgent group and pro□t-driven cartel.76 This hybrid nature has facilitated cooperation between the FARC and ideological sympathizers like the Bolivarian Alliance, Hezbollah, Al Qaeda in the Islamic Maghreb, and other extremist groups77 as well as with purely criminal organizations like the Mexican cartels. Although the FARC has been greatly weakened over the past decade and no longer poses the existential threat to the Colombian government that it once did, it remains □rmly in control of large tracts of coca-producing jungle, mostly straddling the borders between Colombia and FARC supporters Venezuela and Ecuador. In summary, organized crime elements have exploited under-governed areas to establish zones under their de facto control. In so doing they pose a signi□cant and growing threat to regional security in general and U.S. interests in particular. As SOUTHCOM commander General Kelly recently observed: □T□he proximity of the U.S. homeland to criminally governed spaces is a vulnerability with direct implications for U.S. national security. I am also troubled by the signi□cant criminal capabilities that are available □within them□ to anyone—for a price. Transnational criminal organizations have access to key facilitators who specialize in document forgery, trade-based money laundering, weapons procurement, and human smuggling, including the smuggling of special interest aliens. This criminal expertise and the ability to move people, products, and funds are skills that can be exploited by a variety of malign actors, including terrorists.78 Hezbollah and the Bolivarian Alliance Hezbollah in Latin America □on-state entities recognized by the U.S. as terrorist organizations also operate in the region, most notably Lebanon-based Hezbollah, an Iranian client group. Hezbollah maintains an active presence in the tri-border area (TBA) of South America— the nexus of Argentina, Brazil, and Paraguay—stretching back to the 1980s. The TBA has traditionally been under-governed and is known by some as "the United □ations of crime."79 Eight syndicate groups facilitate this activity in South America's so-called "Southern Cone," overseeing legitimate businesses along with a wide range of illegal activities to include money laundering, drug and arms traf- □cking, identity theft and false identi□cation documents, counterfeiting currency and intellectual property, and smuggling. □ot surprisingly they are linked to organized crime and to non-state insurgent and terrorist groups, such as the FARC.80 Estimates are that over □12 billion in illicit transactions are conducted per year, a sum exceeding Paraguay's entire GDP by a substantial amount.81 Hezbollah achieved notoriety in the region in 1992 when it bombed the Israeli embassy in Argentina. This was followed with the bombing of the AMIA Jewish community center in Buenos Aires two years later. Like many other terrorist organizations, as Hezbollah expanded it established relationships with drug cartels82 that it supports in a variety of ways. For example, the cartels have enlisted Hezbollah, known for its tunnel construction along the Israeli border, for help in improving their tunnels along the U.S.-Mexican border. In 2008, Hezbollah helped broker a deal in which one of Mexico's major drug cartels, Sinaloa, sent members to Iran for weapons and explosives training via Venezuela using Venezuelan travel documents. 83 As the locus of the drug trade and other illegal cartel activities moved north into Central America and Mexico, Hezbollah has sought to move with it with mixed success. In October 2011, Hezbollah was linked to the e□orts of an Iranian-American to conspire with Iranian agents to assassinate the Saudi ambassador to the United States. The plot involved members of the Los Zetas Mexican drug cartel.8□ The would-be assassin, Mansour Arbabsiar, had established contact with his cousin, a Quds Force85 handler, Gen. Gholam Shakuri. The plot is believed by some to be part of a wider campaign by the Quds Force and Hezbollah to embark on a campaign of violence extending beyond the Middle East to other Western targets, including those in the United States.86 In early September 2012, Mexican authorities arrested three men suspected of operating a Hezbollah cell in the Yucatan area and Central America, including a dual U.S.-Lebanese citizen linked to a U.S.-based Hezbollah money laundering operation. 87A few months later, in December 2012, Wassim el Abd Fadel, a suspected Hezbollah member with Paraguayan citizenship, was arrested in Paraguay. Fadel was charged with human and drug tra□cking and money laundering. Fadel reportedly deposited the proceeds of his criminal activities—ranging from □50-200,000 per transaction—into Turkish and Syrian bank accounts linked to Hezbollah. In summary, Hezbollah has become a □xture in Central and Latin America, expanding both its activities and in□uence over time. It has developed links with the increasingly powerful organized crime groups in the region, particularly the narco cartels, along with radical insurgent groups such as the FARC and states like Venezuela who are hostile to the United States and its regional partners. Hezbollah's principal objectives appear to be undermining U.S. in□uence in the region, imposing costs on the United States, and generating revenue to sustain its operations in Latin America and elsewhere in the world. These objectives are shared by Iran, Hezbollah's main state sponsor. The Bolivarian Alliance As noted above, geographic, economic, and cultural factors have traditionally helped to prevent the emergence in Latin America of any real military rival to the United States. Although there are no traditional military threats in the region, there are indigenous states whose actions, policies, and rhetoric challenge regional stability and U.S. security. Over the past decade, several states have come together to form the Bolivarian Alliance of the Americas (ALBA), an organization of left-leaning Latin American regimes whose overarching purpose is to promote radical populism and socialism, foster regional integration, and reduce what they perceive as Washington's "imperialist" influence in the region.89 Since its founding by Hugo Chavez of Venezuela and Fidel Castro of Cuba in December 200□, the Bolivarian Alliance has expanded to include Antigua and Barbuda, Bolivia, Dominica, Ecuador, □icaragua, and Saint Vincent and the Grenadines. Although the members of the Bolivarian Alliance are militarily weak and pose almost no traditional military threat to the United States or its allies in the region,90 they challenge American interests in the region in other ways. First, they espouse an anti-American narrative that finds substantial support in the region and consistently oppose U.S. efforts to foster cooperation and regional economic integration.91 Second, in their efforts to undermine the government of Colombia, which they consider to be a U.S. puppet, ALBA states provide support and sanctuaries within their borders to coca growers, drug traffickers, other criminal organizations, and the FARC.92 Links to Hezbollah have also been detected.93 Perhaps of greatest concern, they have aligned themselves closely with Iran, inviting it and Syria to participate as "observer states" in the alliance. Other worrisome ALBA activities involve lifting visa requirements for Iranian citizens and hosting large numbers of Iranian diplomats and commercial exchange members that some observers believe to be Iranian intelligence and paramilitary Quds Force operatives.9□ By hosting and cooperating with both foreign agents and violent non-state actors, the ALBA states have come to function as critical nodes in a network of groups hostile to the United States. A Coming Era of Proxy Wars in the Western Hemisphere? History shows that Washington has often emphasized an indirect approach to meeting challenges to its security in Latin America. Yet the United States has not shied away from more direct, traditional uses of force when interests and circumstances dictated, as demonstrated over the past half century by U.S. invasions of the Dominican Republic (1965), Grenada (1983), and Panama (1989) and the occupation of Haiti (199□).Yet several trends seem likely to raise the cost of such operations, perhaps to prohibitive levels. Foremost among these trends is the diffusion of precision-guided weaponry to state and non-state entities. 92 The Second Lebanon War as "Precursor" War A precursor of this trend can be seen in the Second Lebanon War between Israel and Hezbollah.95 During the con□ict, which lasted less than □ve weeks, irregular Hezbollah forces held their own against the highly regarded Israeli Defense Force (IDF), demonstrating what is now possible for non-state entities to accomplish given the proliferation of militarily-relevant advanced technologies. Hezbollah's militia engaged IDF armor columns with salvos of advanced, man-portable, antitank guided missiles and other e□ective anti-armor weapons (e.g. rocket-propelled grenades (RPGs) with anti-armor warheads) in great numbers. When the IDF employed its ground forces in southern Lebanon, its armored forces su□ered severe losses; out of the four hundred tanks involved in the □ghting in southern Lebanon, forty-eight were hit and forty damaged.96 Hezbollah's defensive line was also well equipped with latest-generation thermal and low-/ no-light enhanced illumination imaging systems, while frontline units were connected to each other and higher command elements via a proprietary, □ber-optic based communications network, making collection of communications tra□c by Israeli intelligence extremely di□cult. Perhaps most important, Hezbollah possessed thousands of short- and medium- range rockets, often skillfully hidden below ground or in bunkers that made detection from overhead surveillance platforms nearly impossible. During the brief con□ict Hezbollah's forces □red some four thousand unguided rockets of various types that hit Israel. Hezbollah's rocket inventory enabled its forces to attack targets throughout the northern half of Israel. Over nine hundred rockets hit near or on buildings, civilian infrastructure, and industrial plants. Some two thousand homes were destroyed, and over □fty Israelis died with several thousand more injured. The casualties would undoubtedly been greater if between 100,000 and 250,000 Israeli civilians had not □ed their homes. Haifa, Israel's major seaport had to be shut down, as did its oil re□nery.97 Hezbollah also employed several unmanned aerial vehicles for surveillance of Israel, as well as C-802 anti-ship cruise missiles used to attack and damage an Israeli corvette. 98 The G-RAMM Battlefield The brief war between Israel and Hezbollah suggests that future irregular forces may be well-equipped with enhanced communications, extended-range surveillance capabilities, and precision-guided rockets, artillery, mortars and missiles (G-RAMM) 99 able to hit targets with high accuracy at ranges measured from the tens of kilometers perhaps up to a hundred kilometers or more. In projecting power against enemies equipped in this manner and employing these kinds of tactics U.S. forces—as well as other conventional forces— will find themselves operating in a far more lethal battlefield than those in either of the Gulf wars or in stability operations in Afghanistan and Iraq. Moreover, currently constituted conventional forces typically depend on large fixed infrastructure (e.g., military bases, logistics depots, ports, airfields, railheads, bridges) to deploy themselves and sustain combat operations. These transportation and support hubs also serve as the nodes through which internal commerce and foreign trade moves within a country. This key, fixed infrastructure will almost certainly prove far more difficult to defend against irregular forces armed with G-RAMM weaponry. Indeed, had Hezbollah's "RAMM" inventory had only a small fraction of G-RAMM munitions, say 10-20 percent, it would have been able to in□ict far greater damage than it did historically to Israeli population centers, key government facilities, military installations, and essential commercial assets such as ports, air□elds, and industrial complexes. An irregular enemy force armed with G-RAMM capabilities in substantial numbers could seriously threaten Latin American governments as well as any U.S. (or external great power) forces and support elements attempting a traditional intervention operation. Implications for the U.S. and Other Major Powers The preceding narrative suggests that the combat potential of irregular forces is likely to increase dramatically in the coming years. As this occurs, the cost of operating conventional forces—especially ground forces—and defending key military support infrastructure is likely to rise substantially. Given these considerations the United States and other major powers external to the Western Hemisphere will have strong incentives to avoid the use of conventional forms of military power, particularly large ground forces, in favor of employing irregular proxy forces to advance their interests. Moreover, the high cost and questionable bene□t of the campaigns in Afghanistan and Iraq are likely to create strong domestic opposition in the United States to such operations for some time to come. This must be added to the United States' greatly diminished □scal standing that has led to large cuts in planned investments in defense. These factors suggest that Washington will be much less likely to engage in direct military action in Latin America in the coming years than historically has been the case. At the same time, rivals of the United States like China and Russia may be incentivized by these trends, as well as the United States' overwhelming military dominance in the Western Hemisphere, to avoid the direct use of force to expand their in□uence in Latin America. Instead, like some of the Bolivarian Alliance members, they appear likely to follow the path taken by the Soviet Union during the Cold War and Iran today: supporting non-state proxies to impose disproportionate costs on the United States and to distract Washington's resources and attention from other parts of the world. This is not to say that Beijing, Moscow, and Tehran would eschew future opportunities to **establish bases in Latin America**. As in the past, such bases can support efforts to accomplish several important objectives. They can, for example, further insulate a Latin American regime from the threat of direct U.S. military intervention, since **Washington would have to account for the possibility that the conflict would lead to a direct confrontation with a more capable and potentially nuclear-armed power**.100 Bases in the hemisphere can also enable external powers to conduct military assistance activities, such as training, more easily. Electronic surveillance of the United States and Latin American states could be accomplished more cheaply and e□ectively from forward positions. Finally, certain kinds of military capabilities, such as long-range **ballistic missiles and attack submarines**, could be pro□tably stationed in Latin America by powers external to that region, particularly if they intended to create the option of initiating con□ict at some future date. These reasons, among others, have made preventing an extra-hemispheric power from establishing bases in Latin America an enduring U.S. priority. Players in a Latin American Great Game Given current trends, **several powers external to the region may**, either now or over the coming decade, **have both the motive and the means to employ both state and non-state proxies** in Latin American to achieve their interests. Principal among them is Iran, which is already engaged in supporting

proxies against the United States and its partners in the Middle East and has long been developing proxies in Latin America. Additionally, there are reasons to think that China and Russia may be interested in cultivating and supporting Latin American proxies as well.

History proves --- the court has gradually narrowed rulings on surveillance to preserve legitimacy but avoided ruling on the scope --- the AFF reverses that

Martin 11 (Gus – Professor of Criminal Justice Administration at California State University, Dominguez Hills, *The SAGE Encyclopedia of Terrorism, Second Edition*, p. 213-214)

The Foreign Intelligence Surveillance Act (FISA) was passed in 1978 to provide a statutory framework for foreign and domestic intelligence electronic surveillance. Although FISA has been established law for some time, new controversies surrounding the law and its implementation have arisen in the post-9/11 United States. Background Following the disclosure of domestic intelligence abuses by President Richard M. Nixon in the political scandal known as Watergate, the U.S. Senate Select Committee to Study Governmental Operations with Respect to Intelligence Activities was established; it became known as the Church Committee because of its chairman, Senator Frank Church (D—ID). The Church Committee concluded, among other things, that the body of law regarding electronic surveillance was "**somewhat uncertain**." For example, the Fourth Amendment to the U.S. Constitution that protects against warrantless search and seizure was addressed as it applies to electronic surveillance in a 1928 U.S. Supreme Court case, Olmstead v. United States. The Court ruled that Fourth Amendment protection only applied to tangible things and not intan-gibles such as a conversation. However, in its 1967 decision in Katz v. United States, the Supreme Court reversed this decision. Although the Katz decision held that a search warrant is required for electronic surveillance even to capture conversations without physical intrusion, the ruling recognized the president's constitutional authority to authorize warrantless surveillance and "did not extend [the requirement] to cases involving national security." Title III of the 1968 Omnibus Crime Control and Safe Streets Act regulates surveillance wiretaps in criminal investigations. The Church Committee expressed concern that Title III was not clear about a national security exception to warrant requirements for electronic surveillance. In United States v. United States District Court (1972), known as the Keith case, the Supreme Court **narrowed** its earlier position on warrantless electronic surveillance, writing that, to satisfy the Fourth Amendment, "prior judicial approval is required for the type of domestic security surveillance involved in this case." However, the Court expressed **no opinion** as to "the scope of the President's surveillance power with respect to activities of foreign powers, within or without this country." Subsequent rulings **further narrowed the scope** of warrantless surveillance and drew a brighter line between surveillance warrants in domestic and foreign security intelligence. Nevertheless, there was little statue law supporting the federal courts. Therefore, subsequent to the Senate Watergate Report and the Church Committee Reports (the Church Committee reported on a variety of matters), the U.S. Congress passed, and President Jimmy Carter signed, FISA.

UQ—AT: Gay Marriage

Robust political science research proves Supreme Court thumper is backwards --- creates consensus of support for gay marriage --- Bush v. Gore, previous gay rights rulings and empirical research

Ura 13 (Joseph D. – Pacific Standard reporter, "Supreme Court Decisions in Favor of Gay Marriage Would Not Go 'Too Far, Too Fast'," in Pacific Standard, 6-20-13, http://www.psmag.com/politics-and-law/supreme-court-tk-60537)

Though much of the public may sharply disagree with a decision of the Supreme Court, the decisions of the Court tend to **lead public opinion** over the long run.

In some respects, the moment seems ripe for the Court to make a bold move in favor of homosexuals' constitutional rights—as well as their material and symbolic well-being. **Polls conducted by nearly every major survey research organization in the country now show majority support for legally recognizing same-sex marriage**. Equally as important, survey data shows **rapid growth** in support for same-sex marriage in recent years. For example, a Gallup poll conducted last month found that 53 percent of Americans agreed that same-sex marriages "should be ... recognized by the law as valid, with the same rights as traditional marriages" (including 70 percent of 18- to 29-year-olds). Only 45 percent said that same-sex marriage "should not" be valid.

When Gallup first polled the public about gay marriage in 1996, only 27 percent of Americans favored legal same-sex unions. In less than two decades, support for same-sex marriage rights has effectively doubled, and strong support for marriage equality among younger Americans suggests that the trend toward support for same-sex marriage will continue. A decision in favor of marriage equality would therefore probably **begin with majority support that is likely to grow over the coming years**.

Still, some supporters of marriage equality worry that the trend in public support toward same-sex marriage may be undermined by a pair of strongly worded pro-equality decisions. In particular, they worry such decisions might produce a backlash against gay marriage that would reverse the trend in public opinion toward support for gay rights and provoke changes in public policy that work against marriage equality. This fear has found a public voice on the Supreme Court in Justice Ruth Bader Ginsberg, who has publicly claimed that other prominent decisions of the Court on social issues—most notably Roe v. Wade (1973)—"moved too far, too fast," creating political tides that worked against the Court's purposes. The New York Times' Adam Liptak reports some speculation that this line of thinking may lead justices who support marriage equality to avoid the issue in the present cases and wait until some later date to address the constitutional status of same-sex marriage rights.

However, practical political concerns about the prospects of a backlash in support of gay rights following Supreme Court decisions advancing marriage equality are **misplaced**. Indeed, **research in political science provides strong reasons to suspect that the Supreme Court may, in fact, lead public opinion over the long-run**. This general pattern is evident in the public's responses to the Supreme Court's landmark case addressing homosexuals' sexual rights, Lawrence v. Texas (2003). Together, both the general pattern of public responses to Supreme Court decisions and the dynamics of responses to the Court's prior gay rights cases argue that fears that the Court might undermine support for gay rights by robustly embracing marriage equality have the issue backwards. If a majority of the Supreme Court's justices lead on same-sex marriage, **Americans are likely to follow**.

JUSTICE GINSBERG'S UNEASE ABOUT the Court outpacing public opinion on social issues reflects a classic worry about American judicial power. Writing in Democracy in America, Alexis de Tocqueville noted the Court's dependence on the goodwill of its constituents:

[The] power [of the Supreme Court] is immense, but it is power springing from opinion. They are all-powerful, so long as the people consent to obey the law; they can do nothing when they scorn it. Now, of all powers, that of opinion is hardest to use, for it is impossible to say exactly where its limits come. Often it is as dangerous to lag behind as to outstrip it.

The federal judges ... must know how to understand the spirit of the age, to confront those obstacles that can be overcome, and to steer out of the current when the tide threatens to carry them away....

Though the Constitution provides the Supreme Court and its justices with substantial buffers against the whims of popular sentiment, the Court ultimately depends on public opinion to preserve its institutionalintegrity and to ensure compliance with its decisions.

Echoes of this sentiment are evident in Supreme Court decisions since the 19th century. In United States v. Lee (1882), Justice Miller wrote, "[the Supreme Court's] power and influence rest solely upon the public sense of ... confidence reposed in the soundness of [its] decisions and the purity of [its]

motives." Likewise, Justice Frankfurter emphasized, "The Court's authority—possessed of neither the purse nor the sword—ultimately rests on sustained public confidence in its moral sanction" (Baker v. Carr 1962). Justice O'Connor also shared the idea that "The Court's power lies ... in its legitimacy, a product of substance and perception that shows itself in the people's acceptance of the Judiciary as fit to determine what the Nation's law means" (Planned Parenthood v. Casey 1992).

Together, these statements suggest the logic of Justice Ginsberg's comments. When the Court "outstrips" public opinion by making decisions contrary to the "spirit of the age," it invites said opinion to turn against the Court and its decisions—and their policy implications. **But this view of the Supreme Court's relationship with public opinion is substantially wrong and almost precisely backwards both as a general matter and in regard to the Court's prior gay rights cases**.

AN **ARRAY OF RESEARCH in political science**—due substantially to James Gibson of Washington University, Gregory Caldeira of Ohio State University, and their collaborators—shows that the Supreme Court's legitimacy is not dependent on agreement on individual questions of policy between the Court and the public. Instead, judicial legitimacy rests on the public's perception that the Court uses fair procedures to make principled decisions—as compared to the strategic behavior of elected legislators. These perceptions are supported by a variety of powerful symbols representing the close association between the Supreme Court and the law and its impartiality, such as black robes, the image of blind justice, and the practice of calling the members "justices."

The public's response to the Supreme Court's decision in Bush v. Gore, which resolved the contested presidential election in 2000, is perhaps the classic example of the nature and influence of the Court's legitimacy. Despite the bitter partisan conflict that precipitated the case, the enormous political implications of the decision, the blatant partisan divisions on the Court, and the harsh tone of the dissenting justices, **the best evidence available indicates that the public's loyalty to the Supreme Court did not diminish as a result of the case**. In particular, neither Democrats nor African-Americans significantly turned against the Court after the decision.

Judicial legitimacy is not merely a curiosity. It has powerful effects on American politics; Americans' deep loyalty to the Supreme Court helps insulate it from efforts by those in the elected branches of government to curb or control judicial independence. Additionally—and more importantly here—the Supreme Court's robust legitimacy in the public mind has important consequences for how the Court's decisions interact with the public's policy attitudes.

When the Supreme Court speaks on an issue, the weight of its "moral sanction" rests on a particular side of the relevant policy debate. Its decision enters public debate and—as the political scientist Ralph Lerner theorized nearly half a century ago—allows the "modes of thought lying behind [its] legal language" to "transfer to the minds of the citizens." As a result, the Court unbalances public debate and, over the long run, pulls public opinion toward its policy positions.

Though much of the public may sharply disagree with a decision of the Supreme Court—producing an initial backlash against the policy implications of a particular ruling or set of rulings—the decisions of the Court tend to lead public opinion over the long run. In a recent analysis of more than 50 years of data on Americans' collective responses to Supreme Court decisions, I find that **public responses to important Supreme Court decisions were typically marked by a negative response in public opinion in the short-term that decays and is replaced by a long-run movement in public opinion toward the positions adopted by the Court**.

In other words, on average, there is a backlash in public opinion against important decisions of the Supreme Court. However, these negative responses are relatively short lived. Over the long run, backlash against the Court's decisions tends to be replaced by significant movement toward positions taken by the Supreme Court.

The public's reaction to Miranda v. Arizona (1966), the landmark Supreme Court decision which held that police must inform criminal suspects of their constitutional rights to remain silent and to have a lawyer present during any questioning, is indicative of this pattern. The public's initial reaction to Miranda was strongly negative. Shortly after the decision was handed down in 1966, a poll conducted by the Opinion Research Corporation asked Americans about their views regarding "the Supreme Court's decision in the Miranda case." A majority of Americans (56 percent) agreed that "police should again be allowed to be tougher with suspects than they can be now" while only 32 percent agreed that "the present restrictions on the police—since the Court's decision—are correct and fair." New York University law professor Barry Friedman writes, "Between 1965 and 1968, polls showed a jump from 48 percent to 63 percent of Americans who thought the courts were too lenient with criminal defendants."

And yet, in the years since Miranda was handed down, an overwhelming majority of Americans have come to embrace the decision. A survey conducted in 2000 by Princeton Survey Research Associates and Newsweek found that 85 percent of Americans agreed with the "recent decision upholding 'Miranda Rules' [Dickerson v. United States(2000)] requiring police to inform arrested suspects of their rights to remain silent and to have a lawyer present during any questioning." University of Texas law professor Justin Driver summarizes the clear implication: "There can be little doubt, then, that the Supreme Court in this instance expanded the public's conception of criminal defendants' rights."

SIMILAR PATTERNS ARE EVIDENT surrounding the Supreme Court's most important decision expanding gay rights—Lawrence v. Texas, which, in 2003, invalidated state laws which prohibited same-sex sexual activities. Since 1977, Gallup has occasionally asked Americans, "Do you think gay or lesbian relations between consenting adults should or should not be legal?" (In 2008, Gallup replaced the term "homosexuals" with "gay and lesbian.") It has posed this question at least annually since 2001. In addition

to these annual assessments of public support for legal homosexual relations, Gallup also included it in several surveys throughout the second half of 2003 and into 2004.

The sporadic implementation of this question makes it very difficult to get a true sense of the dynamics of public support for this element of gay rights prior to 2001. But the more regular use of this question in Gallup surveys since then provides a reasonably clear picture of the recent history of Americans' attitudes toward legal same-sex sex as well as a window into the public's response to Lawrence v. Texas. The graph below shows the percentage of Gallup poll respondents, from May 2001 through May 2013, saying that homosexual (or gay and lesbian) relations should be legal.

Americans' changing responses to Gallup's "homosexual relations" question show the backlash and legitimation pattern. Public support for legal homosexual relations had bounced through the mid-50s in 2001 and 2002, peaking at 60 percent immediately before Lawrence in May 2003. Within three weeks, Gallup found that support for legal same-sex sex had dropped 10 percent. A few months later, in January 2004, support bottomed out at 46 percent, before beginning a reasonably steady climb. By May 2007, support had effectively rebounded to its pre-Lawrence level. Since then, support for legal homosexual relations has generally grown, reaching an all-time high of 65 percent in May 2013.

Public opinion about the issue of legal homosexual relations is complicated. It is colored by the changing context of larger debates over gay rights, the cultural context of homosexually, generational replacement, demographic change, and a variety of political events. Attributing all variance in Gallup's assessment of Americans' changing attitudes on this issue to a single Supreme Court case is, at best, an oversimplification.

Nevertheless, the survey data help shed some light on the validity of fears that the Supreme Court may permanently damage the cause of gay rights by over-reaching in the pending marriage equality cases. At a minimum, the Gallup data show that the Court's decision to invalidate state sodomy laws in Lawrence did no lasting damage to the public's support for gay rights. Changes in public opinion after Lawrence may also indicate that the Supreme Court's action has helped support a long-run trend in public opinion toward greater support for gay rights.

LOOKING AHEAD TO DECISIONS in Windsor and Perry, Justice Ginsberg's fears of undermining social change by moving "too far, too fast" seem out of place. A pair of majority opinions strongly in favor of marriage equality may well prompt a temporary backlash in public opinion, but it is unlikely that such a backlash would be permanent. **It is also unlikely that any resulting backlash against the policy implications of the decisions would injure the legitimacy of the Court or enable a successful effort to reverse the Court's decisions via constitutional amendment. Both the Supreme Court and its decisions for marriage equality would successfully weather any storm stirred by the marriage cases.**

More importantly, though, pro-equality decisions would not merely survive. Instead, the evidence suggests that they would thrive in the long run. By offering its authoritative voice to validate the constitutional claims of homosexual couples seeking legal recognition of their unions, the Supreme Court may alter the terms of public debate and gradually lead public opinion toward greater acceptance of same-sex marriage.

No gay marriage thumper --- religious right doesn't care because it was a 5-4 decision --- we have a leading activist

Drucker 15 (David M. – Washington Examiner reporter, "Religious liberty activist: Supreme Court decision paves way for legalized polygamy," in the Washington Examiner, 6-30-15, http://www.washingtonexaminer.com/religious-liberty-activist-supreme-court-decision-paves-way-for-legalized-polygamy/article/2567290)

Her message to them: It's going to get a whole lot worse, possibly for years, before it gets better. Fowler LaBerge, married to husband Jim LaBerge since 2011, lives near Nashville.

Examiner: You said when we last talked that your side was **losing the debate**. Are you surprised that, less than a year later, same sex marriage is the law of the land?

Fowler LaBerge: What surprises me is maybe not even the Supreme Court's ruling but the level of social, political celebration, **as if it was an overwhelming majority of the court**. Seeing the White House used as a piece of propaganda as if this is now universally understood as our public policy, that is probably what surprises me the most, the willingness of huge sectors of the media and the population to be **fully coopted by one side of the conversation**.

Examiner: What did you think of the legal reasoning the majority used in reaching its decision?

Fowler LaBerge: The reasoning given now opens the possibility of those who are interested in polygamous or poly-amorous marriage. There is nothing in the decision that would now prevent the argument being made that polygamous or poly-amorous relationships ought not also be available to all citizens of the United States.

Examiner: How should Christians, and indeed, all Americans view this court decision, if they disagreed with it?

Fowler LaBerge: A lot of people point to this as similar to the Roe v. Wade decision and the answer to, how do I respond to it. If, as a Christian I am convicted that life deserves protection, that, even though Roe v. Wade is the law of the land, I continue to raise my conscientious objection to that at every opportunity and I continue to work within appropriate ways to at least limit it if not seek to have it overturned. That is the reasoned approach that I would expect most Christians who I engage with … that's the approach they will look for.

Examiner: Does this decision **undermine the Supreme Court's legitimacy?**

Fowler LaBerge: I do not agree that it undermines their legitimacy. **It's a 5-4 ruling**. I think people should read the dissents.

Court is beyond criticism on ACA ruling --- issue of statutory interpretation

Blumstein 15 (James – University Professor of Constitutional Law and Health Law & Policy at Vanderbilt University Law School, "Some Reflections on King v. Burwell," Casetext, 7-6-15, https://casetext.com/posts/some-reflections-on-king-v-burwell)

The posture in King was altogether different. The issue was legislative interpretation, **not constitutional interpretation**: statutory interpretation is undoubtedly within the Court's job description, **and the Court's legitimacy is beyond criticism in that sphere**. Further, the Court was not in confrontation with the other branches. It was asked to referee a dispute that pitted the IRS, an executive branch agency, against Congress, which (if plaintiffs prevailed) would be empowered to determine whether a problem existed and if so how to resolve it.

No one heard about the ACA decision, it's an election issue, not a judicial one

Enten 15 (Harry – senior political writer and analyst for FiveThirtyEight, "Obamacare As A Political Issue Isn't Going Away," in 538, 6-25-15, http://fivethirtyeight.com/datalab/obamacare-as-a-political-issue-isnt-going-away/)

The Supreme Court "saved" Obamacare on Thursday, upholding tax subsidies for federal health care exchanges. And, indeed, it's difficult to see how the law could be overturned. But the political debate is likely to live on — half of Americans say there's room for further discussion of the Affordable Care Act (ACA), and the court's ruling is unlikely to change that. The Supreme Court has "saved" the ACA before. In 2012, the court ruled that the law's individual mandate to buy insurance was constitutional (as a tax). At the time, Americans were split on the ruling, with 46 percent in favor and 46 percent opposed, according to a Fox News poll. But a bump in the percentage of Americans in favor of the law did follow the court's decision. Still, that bump was temporary. It wasn't until the error-plagued HealthCare.gov rollout in fall 2013 that opposition to Obamacare hit its peak, at 55 percent, in the Pollster.com aggregate. Since that point, the law has settled back into its longtime pattern: Opposition is a little greater than support, though neither side has a clear majority. As Mollyann Brodie, Kaiser Family Foundation's executive director of public opinion and survey research, said on a conference call Thursday, **the public has not been paying much attention to this case**. That is, **there is little reason to believe Thursday's decision will be a game changer**. A plurality of Americans believe that the law should still be debated. In a Kaiser Family Foundation (KFF) poll taken earlier this month, 49 percent of Americans held this view, and 45 percent thought we should move on to debate other topics. In a May CNN survey, 53 percent said it was too soon to call Obamacare a success or failure. Most Americans are in wait-and-see mode. Now, of course, it's possible that this 2015 Supreme Court health care ruling will be different. It's the second landmark decision upholding the law, and so could be more likely than the 2012 ruling to convince Americans that the debate should end. But even if that does happen, we're still dealing with a Republican base that's firmly against it. Back in 2012, Mitt Romney kept hammering away at Obamacare. The most recent KFF survey had opposition at 69 percent among Republicans, and other polls have had it higher. After Thursday's Supreme Court decision, many Republican candidates for president came out forcefully against the ruling. That should keep the debate polarized and makes it unlikely that favorable views of the law will climb too quickly. Obamacare will be an issue in the 2016 campaign.

No ACA thumper --- people disagree but not with the Court

McArdle 15 (Megan – Bloomberg News reporter, "McArdle: ACA issue raises questions on legitimacy of public debate," The Salt Lake Tribune, 6-25-15, LexisNexis)

Yes, subsidies will remain available on federal health-care exchanges. So the Supreme Court ruled Thursday, in a 6-3 opinion written by Chief Justice John Roberts.

The justices might have come close to overturning the whole law in 2012, but pulled back because they feared the political fallout of destroying the Obama administration's signature legislative initiative, the Patient Protection and Affordable Care Act. Similar concerns would surely be at play here, even if the justices actually thought that the plaintiff was right on the merits.

The ruling itself is pretty simple, and I'll let the chief justice sum it up: "Petitioners' plain-meaning arguments are strong, but the Act's context and structure compel the conclusion that Section 36B allows tax credits for insurance purchased on any Exchange created under the Act. Those credits are necessary for the Federal Exchanges to function like their State Exchange counterparts, and to avoid the type of calamitous result that Congress plainly meant to avoid."

I'll point out a cultural and political implication of this ruling and the drama leading up to it. Some supporters of the law declared that they were going to take their ball and go home if the Supreme Court didn't agree with their interpretation of the statute. These people wasted their time: With a 6-3 ruling, the call was not so close that the posturing pushed it over. But these people did have one effect: They eroded something in civic life that we can't afford to lose. By pretending that the Supreme Court and the rule of law were at risk in this ruling, they strained the already frayed fabric of civil society.

Obviously, there are places and times when a nation's political institutions are so corrupt and compromised that a patriotic citizen is duty-bound to try to destroy them rather than let them continue. But that place is not the America of 2015, and the time is not "when I am afraid that the court will disagree with me about one clause of a program I think is really important." Your country needs a functioning Supreme Court, and the civic support that legitimizes it, more than it needs any government program, including the health-care act.

This is something that liberals will become well aware of Friday or Monday, when the court is expected to rule in favor of a broad constitutional right to marriage, including for same- sex couples. I'm a libertarian so, as you'd expect, I find that agreeable. On the other hand, as a matter of constitutional theory, I expect the ruling to be a weak outgrowth of the absurd "emanations and penumbras" seeping out of all the sexual liberty cases of the 1960s, for which I can find little actual basis in either the text or intent of the Constitution. In other words, I think it will probably be a bad ruling for a good cause, which is why conservatives who sincerely believe this to be a bad cause will have a right to be mad.

What they should not do is to go into the sort of shameful tantrum we've seen from liberals on the subject of King, where they declare that a ruling against them would be a naked abuse of partisan political power by which the court has thoroughly invalidated any claim it ever had to political legitimacy. The losing side will always be displeased, but let's keep some perspective: Bush v. Gore should not cost the court its standing. Neither should Citizens United. A case like King v. Burwell should certainly not.

We are **politically fragile** right now, yet neither side is going away. As we discovered in 1861, at the national scale, there's no such thing as a tidy no-fault divorce. That's why the more divided we get, the more vitally important it is to have common institutions that both sides agree to abide with, however much it may chafe at certain moments.

Yet instead of recognizing that, we are increasingly trying to destroy those institutions whenever it seems to offer temporary political advantage. However much you dislike the behavior of Congress, or the Supreme Court, or the president, you would like it even less if they **really did lose political legitimacy**. Because it wouldn't just be you who threw off the shackles of custom and civic restraint and disregarded rulings you disliked. Those villains on the other side would do the same.

I'm satisfied with the ruling the court got, and how the justices arrived at it. **The court is doing fine**. But the last six months have certainly cast **doubt** on the **political legitimacy** of our public debate.

No pushback on ACA --- no expectation of legitimacy loss

Feldman 15 (Noah – Professor of Constitutional and International Law at Harvard, "Court's war on FDR continues with Obama: Bloomberg View," in Bloomberg View, 4-20-15, http://www.oregonlive.com/opinion/index.ssf/2015/04/courts_war_on_fdr_continues_wi.html)

Why has Obama's experience been so different? The judiciary has lots of Bush appointees, but no more so than when Clinton faced a judiciary filled during the 12 years of the Reagan and George H.W. Bush presidencies.

The difference, I think, is that the conservative wing of the judiciary has been experimenting with activism -- and has found that the court's **legitimacy is unaffected** and that there is **no pushback** as there was under Roosevelt.

In retrospect, Bush v. Gore was the opening act. The court gave the election to George W. Bush, and **public respect for the institution didn't decline**.

The Affordable Care Act was Act 2. Scholars and court watchers were sure that the arguments against the individual insurance mandate were preposterous -- until lower courts began to adopt them and, ultimately, four justices voted to hold the mandate unconstitutional. Liberals criticized the court, but **that didn't meaningfully affect the institution's legitimacy**. It helped that liberals, too, want the court to be activist, for example by creating a constitutional right to gay marriage. That makes it harder for liberals to criticize activism per se, as opposed to conservative activism.

By the time environmental protection and Internet regulation came along, the paradigm had been set. The U.S. Court of Appeals for the D.C. Circuit has been watching the Supreme Court closely. It rejected Obama's proposed net neutrality regulation promulgated by the FCC in January 2014. Now the administration's signature clean coal regulation will be challenged in the same court.

The federal district judge in Texas who has single-handedly blocked Obama's executive orders on immigration was following a script.

Conservatives may argue that Obama's policy initiatives are more radical than those of presidents who came before. Don't believe it. The arguments used to block Obama's policies have generally started out seeming totally implausible -- only to be adopted by activist conservative judges. Unless the public responds by thinking less of the court, expect judicial activism from the right to continue, joining judicial activism from the left as a mainstay of American political life.

Precedent is key to court legitimacy

Fowler & Jeon 8 (James H. – Professor of Political Science at UC San Diego, and Sangick – Ph.D. in political science from Stanford University, "The authority of Supreme Court precedent," in Social Networks, Volume 30, Issue 1, January 2008, http://www.sciencedirect.com/science/article/pii/S0378873307000378)

Legal historians suggest that justices in the 19th Century responded to the crisis of legitimacy by **strengthening the norm of stare decisis**, a legal norm inherited from English common law that encourages judges to follow precedent by letting the past decision stand (Friedman, 1985, pp. 127–133). In order to foster compliance and enhance the institutional reputation of the Court, stare decisis was implemented to place decision-making in the domain of neutral legal principles and the "accumulated experience of many judges responding to the arguments and evidence of many lawyers" (Landes and Posner, 1976, p. 250) rather than at the whim of the personal preferences of individuals. To this day, the justices of the Supreme Court are aware of the inherent weakness of the federal judiciary and place high value on **maintaining** their institutional and decisional **legitimacy** through the use of **precedent** (Ginsburg, 2004, Powell, 1990 and Stevens, 1983). Recognizing that legitimacy is essential to achieve their policy objectives, the members of the Court justify their substantive rulings through court opinions, which allow the justices to demonstrate how their decisions are consistent with existing legal rules and principles established in prior cases (see Hansford and Spriggs, 2006, pp. 24–30). Because it is the application of existing precedents that creates the perception of judicial decision-making to be procedurally neutral and fair (Tyler and Mitchell, 1994), these opinions are often considered to be the source of the Court's power (Epstein and Knight, 1998 and Segal and Spaeth, 2002).

The Court's perceived legitimacy depends upon the interpretive method it uses --- stare decisis

Healy 8 (Thomas – Professor of Law at Seton Hall Law School , "SYMPOSIUM: STARE DECISIS AND NONJUDICIAL ACTORS: STARE DECISIS AND THE CONSTITUTION: FOUR QUESTIONS AND ANSWERS," 83 Notre Dame L. Rev. 1173, 2008, LexisNexis)

The explanation, I think, lies in the concept of legitimacy. The federal courts have the power to decide cases within their jurisdiction and to interpret the laws that apply in those cases. n146 In order for this power to be effective, the courts must have the power not only to reach whatever conclusions they think are required by law, but also to justify those conclusions as legitimate. After all, the power to decide cases would not mean much if courts could not explain why those decisions were legitimate and entitled to respect. This is especially true in light of the courts' lack of power to enforce their decisions. Because they rely on the legislative branch for funding and on the executive branch for enforcement, courts can ensure the effectiveness of their decisions only by offering justifications that will legitimize [*1200] those decisions. n147 Hamilton made this clear when he said that the courts "have neither Force nor Will, but merely judgment." n148 So how does this lead to a conclusion that courts must have the power to choose the interpretive methodology by which they decide cases? The answer is that **methodology is the key to legitimacy**. In any field of rational inquiry where one wants to ensure the legitimacy of one's conclusions, control over methodology is essential. Consider the sciences. A researcher attempting to answer a question will devote considerable energy to determining the proper methodology. n149 And when she reports her results, she will often spend as much time explaining and defending that methodology as the actual results. Or consider historical research. If a historian deviates from accepted methodology, her conclusions are not likely to be accepted as legitimate by other historians. n150 The same principle applies to legal inquiry. A court that wants to ensure the legitimacy of its legal conclusions will pay particular attention to the interpretive methodology it uses to generate those conclusions. [*1201] This helps explain why Supreme Court Justices expend so much energy debating the proper method of constitutional interpretation. n151 They recognize that the perceived legitimacy of the Court's interpretations depends upon its choice of **methodology**. And because the effectiveness of the power to decide cases depends upon the perceived legitimacy of those decisions, courts must have the power to choose the interpretative methodology they think will maximize legitimacy. n152 It is therefore an understatement to say that "the power to decide how to decide" is "ancillary" to the judicial power. The former power is instead central to the latter power.

The plan saps the court's judicial integrity --- a vital part of legitimacy

Paulsen 8 (Michael S. – Distinguished University Chair and Professor at University of St. Thomas School of Law, "SYMPOSIUM: PRECEDENT & THE ROBERTS COURT: PERSPECTIVES ON THE DOCTRINE OF STARE DECISIS: DOES THE SUPREME COURT'S CURRENT DOCTRINE OF STARE DECISIS REQUIRE ADHERENCE TO THE SUPREME COURT'S CURRENT DOCTRINE OF STARE DECISIS?," 86 N.C.L. Rev. 1165, 2008, LexisNexis)

The final factor in Casey's stare decisis analysis is a wide-ranging one that occupies several pages and consumes a great deal of the Casey Court's rhetorical attention. It goes by various names, but might usefully, if imprecisely, be termed "judicial integrity." n114 It is reflected in that part of Casey's discussion that emphasizes how "frequent overruling would overtax the country's belief in the Court's good faith," how overruling "under fire" a "watershed" decision "would **subvert the Court's legitimacy**"; how the country would suffer a "loss of confidence in the judiciary" if those who were "tested by following" the Court's decision found that they had paid a price for nothing; and how the "promise of constancy, once given," binds the Court and breaching it "would be nothing less than a breach of faith." n115 I have criticized this grandiose, vain, self-absorbed cluster of notions in other writing n116 and continue to think that criticism warranted. But here I would like merely to describe this factor as accurately as possible, for purposes of promoting assessment (which I make in the next Part of this Article) of whether the doctrine of stare decisis the Court has fashioned satisfies the standards the Court has set for itself. Shorn of the Court's overwrought formulations, the "judicial integrity" factor asks an understandable question: whether, even if a precedent is thought erroneous, it would seem arbitrary, capricious, or fickle for the Court to be changing its mind too often or

too readily (especially if its decisions change along with personnel changes) or to be changing its interpretation in response to public, or political, or even scholarly criticism or pressure. Would this not, sometimes, look bad? Might it even be bad - unfair, in some sense, [*1199] for the Court to change its mind, especially as a result of political or personnel changes?

Legitimacy Key – 2NC

The court panders to legitimacy—integral to decisions

Wells 7 (Michael L. Wells; 2007; Marion and W. Colquitt Carter Chair in Tort and Insurance Law at Washington and Lee University school of Law; "'Sociological Legitimacy' in Supreme Court Opinions"; Washington and Lee Law Review; http://law2.wlu.edu/deptimages/Law%20Review/64-3Wells.pdf) jskullz

The Court's effort to secure public acceptance runs into problems because the United States is a heterogeneous society. Opinion leaders disagree among themselves about what the judiciary should do, and their disagreements are echoed in the public at large. Accordingly, the Court faces a tougher challenge than some other social actors. Hotels and restaurants can aim for a segment of the market, and the freshman can hone in on one or two fraternities. The politician will probably calculate that his chances of success are greater if he ignores part of the electorate in order to strengthen his appeal to the rest of it. If the Court is to maintain its status as the impartial voice of the Rule of Law, it cannot mimic the politician. It must undertake the harder task of convincing a broad cross section of the public that it acts legitimately in handing down decisions, even the ones that reach especially controversial results like those in Bush v. Gore, 134 Roe v. Wade, 135 and Brown v. Board of Education. 136 In pursuing this aim, the Court engages in appearance management, generating a gap between the reasons that do the work of deciding cases and the reasons that appear in its opinions. The array of plausible reasons that are typically available provides the Court with opportunities to increase the chances for winning broad acceptance for a decision, or at least to soften the opposition from those who find fault with the substantive outcome. Though the legal elites and other leaders that make up the bulk of the audience for opinions may disagree among themselves as much about what interpretive techniques are legitimate in constitutional cases as about the legitimacy of particular substantive decisions, there is a key difference between methodological and substantive quarrels. Unlike most disputes about substance, the disagreement over methodology is not between mutually exclusive sets of reasons, such that the Court must choose one to the detriment of the other. Most of the opinion leaders who influence public views of the Court agree that certain kinds of reasoning furnish legitimate grounds for constitutional rulings, though that consensus is coupled with controversy about other techniques.

That shapes court decisions and ideological trends—empirical data proves

Klarman observes that Supreme Court justice, "rarely hold views that deviate far from dominant public opin- ion" (2004, 6). Our goal has been to explain why this pat- tern exists. To date, even those who argue that the Court responds to public opinion have acknowledged that the empirical relationship between public opinion and Court decisions may be spurious, as both may respond to the same social

forces (Flemming, Bohte, and Wood 1997; Link 1995; Mishler and Sheehan 1996). We argue, how- ever, that the public mood directly constrains the justices' behavior and the Court's policy out comes, even after con- trolling for the social forces that influence the public and the Supreme Court. Our findings make several contributions to the de- bate over public opinion and judicial policy. First, we attempt to overcome what has been the primary obstacle to effectively evaluating how public opinion might directly affect the U.S. Supreme Court. We develop an empirical strategy to control for the impact of the broader societal currents that shape the attitudes of both justices serving on the high court and the mass public. Next, we have offered a unique theoretical proposition specifying why the justices, in balancing the incentive to follow public opinion against their own preferences, should be consis- tently mindful of the public's mood in cases presumed to be nonsalient. For salient cases, by contrast, we find that the Court is much more likely to act as a counter majori- tarian force and decide along ideological lines. While this result is consistent with our theoretical expectations, the current analysis does not allow us to conclude whether the Court is ignoring public opinion on these high-profile cases or whether the news coverage that made these cases salient reflects the Court's deviation from public mood. We also offer initial suggestive evidence that confidence in the Court corresponds with how closely nonsalient decisions align with public opinion. In other words, the public's awareness of the Court's behavior and the jus- tices' incentives to consider the context of public opinion may be greater than previously thought. We believe these are important avenues for future investigation. The results also carry important implications for the role of the Supreme Court in American politics. In a re- cent letter to Congress, the Justice Department, and the White House, a group of prominent law professors, practitioners, and former judges urge considerable reforms to the selection of the high court's members, including regular biennial appointments of new justices to the Court. 36 36 Available from www.scotusblog.com/wp/wp-content/uploads/ 2009/02/judiciary-act-of-2009.doc. The stated motivation for this particular proposal follows the contention that, "appointments to the Court are made so infrequently as to diminish the likelihood that the Court's many important policy decisions will reflect the moral and political values of the contemporary citi- zens they govern." Proposals of this nature demonstrate the persistence of a belief that as the tenure of justices in- creases, so do the antidemocratic tendencies of the Court. We hope our results help refine this debate. It is important to note that the justices' collective political preferences ex hibit the greatest impact on case outcomes among both salient and nonsalient cases. Thus, we concur with Giles, Blackstone, and Vining (2008) that the degree of respon- siveness to public mood (in our view through strategic behavior and attitudinal change) may not provide the requisite accountability that many critics of the federal judicial selection system seek. Yet, not only do justices have reason to believe that ignoring the public may compromise public confidence in the Court, but also the Court's decisions—at least for nonsalient cases—consistently respond to changes in public opinion. The prevailing tides of public sentiment create an active, meaningful con straint on many of the tangible policies that emanate from the U.S. Supreme Court.

Spillover – 2NC

Spillover—legitimacy is shaped by public opinion—trust deficit in other areas affects overall perception.

Burke 13 (Kevin Burke; Aug. 23rd 2013; Trial judge and president of the American Judges Association, trial judge of the year by the Minnesota chapter of the American Board of Trial Advocates in 2005; Public Official of the Year by Governing magazine in 2004; the Distinguished Service Award from the National Center for State Courts in 2002; and the Director's Community Leadership Award from the Federal Bureau of Investigation in 1997; "How Low Public Trust Threatens the Legitimacy of Court Decisions"; Procedural Fairness; http://proceduralfairnessblog.org/2013/08/23/how-low-public-trust-threatens-the-legitimacy-of-court-decisions/) jskullz

Trust is an essential component of procedural fairness, which, in turn, has been shown to be a key source of legitimacy for decision-makers. All public institutions now face serious skepticism from the public about their trustworthiness. However, a trust deficit – and the resulting lack of legitimacy – are of particular threat to the judiciary. Legitimacy is essential if courts are to be respected and, indeed, if court orders are to be obeyed. Simply put, failure to maintain and enhance the legitimacy of court decisions imperils the judiciary as an institution and the vital role assigned to the judiciary in our Constitutional tradition. The threat is real. Today, 75% of the American public thinks judges' decisions are, to a moderate to significant extent, influenced by

their political or personal philosophy. Of course, judges have a range of philosophical views and exercise discretion, so some differences of opinion among judges are to be expected. But 75% of the American public also believes judges' decisions are, to a moderate to significant extent, influenced by their desire to be appointed to a higher court. Two recent articles explain the potentially grave implications. First, Politico recently published a contribution by law professors Charles Geyh and Stephen Gillers advocating for a bill to make the Supreme Court adopt a code of ethics. They argue: [I]t would be a mistake for the Court to view the [ethics] bill as a challenge to its power. It is rather an invitation. No rule is thrust on the justices. Under the … bill, the justices are asked to start with the code governing other federal judges, but are then free to make 'any amendments or modifications' they deem 'appropriate.' A response that says, in effect, 'We won't do it because you can't make us' will hurt the court and the rule of law. Second, Linda Greenhouse, a regular commentator on the New York Times Blog "Opinionator," recently wrote this post about the Foreign Intelligence Surveillance Court entitled Too Much Work?. Greenhouse writes: As Charlie Savage reported in The Times last month, Chief Justice John G. Roberts Jr. has used that authority to name Republican-appointed judges to 10 of the court's 11 seats. (While Republicans in Congress accuse President Obama of trying to "pack" the federal appeals court in Washington simply by filling its vacant seats, they have expressed no such concern over the fact that the chief justice has over-weighted the surveillance court with Republican judges to a considerably greater degree than either of the two other Republican-appointed chief justices who have served since the court's creation in 1978.) What do these two pieces mean for judges? Both articles highlight how the judiciary itself, if not careful, can contribute to the erosion of public trust in our decisions. To be sure, the erosion of the legitimacy of judicial decisions is not entirely the fault of the Supreme Court, nor of judges in general. The media, for example, often refers to which President appointed a judge as a shorthand way to explain a decision. But that is, in part, why Ms. Greenhouse's piece is important. The Chief Justice is recognized as a brilliant man. He and every other judge in the United States know the inevitable shorthand the media will use to describe judges and to explain their decisions. And so the Chief Justice, the members of the United States Supreme Court, indeed every judge in this country needs to be particularly sensitive to what we are doing that might either advance trust in courts or contribute to the erosion of the legitimacy of our courts. The bottom line is: Appearances make a difference. There will be decisions by judges at every level of court that test the public's trust in our wisdom. It is therefore imperative that judges act in a manner that **builds a reservoir of goodwill so that people will stand by courts when a decision is made with which they disagree**. There may have been an era when trust in the wisdom and impartiality of judicial decisions could be taken as a given. But if there was such an era, we no longer live in it. Trust and legitimacy today must be earned.

Results from this survey experiment provide futher support for our hypothesized dynamic: ideological disagreement depresses Supreme Court legitimacy. This replication is important for two reasons. First, because of the experimental design, our inferences regarding the impact of

disagreement on legitimacy do not suffer from concerns with endogeneity. Respondents were randomly assigned to the ideological direction of the decision, thus removing reverse causation as an alternative explanation for the effects uncovered. Second, we examined the influence of a single decision, so the size of the effects found is quite impressive and reinforces the importance of Court policymaking for citizen judgments of legitimacy. Conclusion Our examination of the ideological foundations of Supreme Court legitimacy in the American public has produced the following important substantive conclusions and implications that contribute to the broader literature on institutional evaluation and legitimacy. The Supreme Court should not be assumed to be objectively conservative in its contemporary policymaking. Even when tracking the full range of its policy outputs, the contemporary Court can be characterized as moderate or slightly right-of-center. And when examining the contemporary Court's policymaking in salient decisions, the contemporary Court has actually rendered more liberal than conservative decisions. Thus, as we have emphasized, there are rational bases for citizens perceiving the contemporary Court as a conservative, moderate, and 23 To provide a robustness check on these results, we substituted a 7-point ideological self-identification scale for the policy preferences(support for monitoring) variable. The pattern of results was nearly identical, although the effect of the treatment for "extremely conservative" respondents was only marginally significant ($p < .10$),and the magnitude of the effects was slightly smaller, as would be expected given the greater abstraction inherent in the general ideology item relative to the specific policy preference item. IDEOLOGICAL FOUNDATIONS OF SUPREME COURT LEGITIMACY 197 even liberal policymaker. Moreover, as data from a national survey show, significant proportions of liberals, moderates, and conservatives perceive the contemporary Court as being liberal, moderate, or conservative; ideological disagreement with the Court comes from all points on the ideological spectrum. These findings underscore the need to assess individuals' subjective ideological disagreement with the Court's policymaking, which requires matching up one's own ideological preferences with his or her perceptions of the ideological tenor of the Court's policymaking.

The question of the stability of the Court's legitimacy is a matter of practical as well as theoretical import. A fragile Court is likely to act differently from a secure Court; or, more precisely, justices with heightened concerns about institutional legitimacy might even shape their votes in highly salient cases so as to protect their institution. 1 More generally, if an elemental function of the Supreme Court is to check majority opinion when it runs amok, then the so-called countermajoritarian dilemma is quite a dilemma indeed. Without a reservoir of goodwill, the Court is even more vulnerable than indicated by the many formal we aknesses of the institution. That support for the Supreme Court would be so volatile runs counter to the conventional wisdom on the sources of the Court's legitimacy. Court attitudes are typically thought of as 1 Crawford (2012) reports that Chief Justice Roberts acted strategically to protect the Court's legitimacy during the opinion - writing process for National Federation of Independent Business v. Sebelius , changing his vote from one to strike down th e Affordable Care Act to one preserving the legislation's constitutionality. T - 1 - obdurate because they are grounded in slow - moving attributes of citizens: more general support for democratic institutions and processes, levels of information and knowledge about the Court, and, to a much lesser degree, overall satisfaction with the institution's performance (Gibson and Caldeira 2 009). Moreover, according to the theory of "value - based regeneration" – the process by which performance dissatisfaction recedes and Court attitudes revert to their grounding in support for democratic institutions and processes (Mondak and Smithey 1997) – short - term detours do not last long. Court support is not invariant – the literature reports a number of instances in which institutional support for a court has changed (e.g., Gibson and Caldeira 2009, on change in support for the Supreme Court that resul t ed from the controversy over the Alito nomination). Still, a puzzle exists: How can the recent decline in satisfaction with the performance of the Supreme Court be reconciled with theoretical and empirical work suggesting that such support is resistant to short - term dissatisfaction with the rulings of the institution? The key to answering this question has to do with understanding the connection

between performance evaluations and institutional support. The conventional wisdom is that the relationship is "sticky," with diffuse support (a "reservoir of goodwill") only diminishing after a sustained series of performance disappointments (e.g., Baird 2001; Gibson and Caldeira 1992). However, it turns out that a set of scholars – the "specific-support revisionists" – has emerged who question whether diffuse support really is resistant to alteration by changes in specific support. Initiated largely by Bartels and Johnston (2013), and joined more recently by Christenson and Glick (2014) (and, to a lesser and somewhat different degree, Nicholson and Hansford 2014), this view posits a far stronger relationship between specific and diffuse support than heretofore thought. For example, Bartels and Johnston (2013, 196, emphasis in original) - 2 - conclude: ". . . we examined the influence of a single decision, so the size of the effects found is quite impressive and reinforces the importance of Court policymaking for citizen judgments of legitimacy." It is one thing to argue that accumulated grievances can undermine judicial legitimacy, or to suggest that blockbuster Supreme Court rulings, like Bush v. Gore, could have consequences for the Court's diffuse support. It is quite another to claim that each unpopular Court decision — particularly each run-of-the-mill decision — is potentially dangerous to the institution's health. If legitimacy cannot protect the institution when it makes unpopular decisions, then the Court must be understood as less independent of the majority because its legitimacy is so dependent upon satisfying the policy preferences of its constituents

Legitimacy effects court decision—justices are afraid of backlash and noncompliance

The particular problem of the U.S. Supreme Court 3 is that it is heavily dependent upon legitimacy for its efficacy and survival. As all undergraduates learn, the federal courts have neither the power of the purse (carrots) nor the sword (sticks) and are therefore uncommonly dependent upon voluntary compliance from their constituents. 4 Moreover, and perhaps even more important, the U.S. Supreme Court is particularly vulnerable to backlashes against its decisions because it often rules against the preferences of the majority, 5 and because, as an institution, it is unusually dependent upon the actions of other actors and institutions. The Supreme Court has little meaningful inherent or constitutional jurisdiction; instead, it gets its power to decide issues from ordinary legislation. What Congress giveth, Congress can take th away. Even the fundamental structure of the institution – e.g., the number of justices on the Court – can change (and has throughout American history). Without legitimacy, the Supreme Court can be punished for the disagreeable decisions it makes, and/or those decisions can be ignored (for an important analysis of the Court/Congressional relations, see Clark 2011). The justices of Court are keenly aware of the importance of legitimacy to their institution, often discussing the concept in their rulings. For example, Justices O'Connor, Souter, and Kennedy, in their well-known opinion in Planned Parenthood v. Casey (1992) write: The Court's power lies, rather, in its legitimacy, a product of substance and perception that shows itself in the people's acceptance of the Judiciary as fit to determine what the Nation's law means, and to declare what it demands . . . The Court must take care to speak and act in ways that allow people to accept its decisions on the terms the

Court claims for them, as grounded truly in principle, not as compromises with social and political pressures having, as such, no bearing on the principled choices that the Court is obliged to make. Thus, the Court's legitimacy depends on making legally principled decisions under circumstances i n which their principled character is sufficiently plausible to be accepted by the Nation (865 - 866).

Turns Case – 2NC

Turns the case—Legitimacy key to enforcement—other branches ignore the plan.

Hamilton 12 (Eric Hamilton; Aug. 30th 2012; J.D. Candidate, Stanford Law School; "Politicizing the Supreme Court"; Stanford Law Review; http://www.stanfordlawreview.org/online/politicizing-supreme-court) jskullz

Congress and the President have belittled the Court. President Obama told the public at the 2010 State of the Union address that "the Supreme Court reversed a century of law" with its Citizens United decision and suggested that the Court opposed honest elections. The ensuing image was even more damaging. With 48 million Americans watching, the camera panned to a cadre of expressionless Supreme Court Justices sitting in the front row while lawmakers sitting next to them rose to their feet and applauded.[15] Presidents Obama and Bush and members of Congress have derided the Court for its "unelected" nature, with President Obama publicly wondering before the health care decision whether "an unelected group of people would somehow overturn a duly constituted and passed law."[16] Judges lack clear defenses. Judges would risk their credibility if they shouted back at the President, appeared on the Sunday morning talk shows, or held a press conference after a decision. Unlike speeches from members of Congress and the President, Supreme Court proceedings are difficult to follow without legal training. The media coverage of the Supreme Court can be incomplete or inaccurate. FOX News and CNN famously misunderstood Chief Justice Roberts' oral opinion and misreported that the individual mandate had been invalidated. The publicly available audio recordings of oral arguments contribute little to public understanding of the Court. Even before the decision, the Republican Party doctored audio clips of Solicitor General Don Verrilli coughing and pausing during oral argument to suggest in an ad suggesting that the health care law was indefensible.[17] Politicization of the Court is dangerous because it primes the public for a power grab by the political branches. If the Court loses authority to check political power and make unpopular decisions, it cannot enforce the Constitution with the same effectiveness. Without enforcement of the Constitution, Congress is free to invade constitutional rights and exceed its lawful powers. The Supreme Court came frighteningly close to losing some of its independence when the Court made politically significant decisions striking down parts of the New Deal, and President Franklin D. Roosevelt responded with the Court-packing plan. His arguments alleged misconduct by the Court. The Courts, however, have cast doubts on the ability of the elected Congress to protect us against catastrophe by meeting squarely our modern social and economic conditions. . . . The Court has been acting not as a judicial body, but as a policy-making body. . . . We have, therefore, reached the point as a nation where we must take action to save the Constitution from the Court and the Court from itself. We must find a way to take an appeal from the Supreme Court to the Constitution itself.[18] Roosevelt's words from seventy-five years ago could be repeated today by Court opponents. In his recent presidential primary campaign, Newt Gingrich promised to employ the tactics of early state constitutions by ignoring disagreeable Court decisions and ordering Justices to testify to congressional committees.[18] Proposals to invade the Court's independence ignore the Framers' fears for enforcement of the Constitution without the Supreme Court. Madison believed if the legislature and executive united behind a law and convinced the public that it was in their interest, the people could not properly judge its constitutionality, even if it was patently unconstitutional. The "passions" of the people on the particular issues would prevail over well-reasoned constitutional judgment.[20]

Latin American insecurity causes great power intervention – outweighs other existential threats

Ellis, Research Professor of Latin American Studies, 12-8-14

(Dr. R. Evan, PhD in Poli Sci, Prof @ the Strategic Studies Institute, U.S. Army War College, "Strategic Insights: The Strategic Relevance of Latin America for the United States," DOA: 1-29-15, http://www.strategicstudiesinstitute.army.mil/index.cfm/articles/The-Strategic-Relevance-of-Latin-America/2014/12/08, ava)

From October 12-14, 2014, the city of Arequipa, Peru, was host to this year's largest unnoticed meeting of senior government officials from across the Western Hemisphere: the 11th annual Defense Ministerial Summit of the Americas. The meeting brought together Ministers of Defense and their equivalents from 34 nations from the Western Hemisphere to discuss and coordinate positions on defense and security topics important to the region. Yet in the U.S. media, almost the only mention of the gathering was a reference that the U.S. Secretary of Defense would ask the assembled leaders for "specific contributions" to the struggle against the terrorist group the Islamic State of Iraq and the Levant (ISIL) in the Middle East.1 In the game of geopolitics, Latin America has long been, and continues to be, the "minor leagues." One can debate whether senior U.S. officials visit or talk about Latin America and the Caribbean frequently enough, or whether programs such as Plan Colombia, Plan Merida, the Central America Regional Security Initiative, and the Caribbean Basin Security Initiative are sufficient. Yet from Washington DC, Latin American and Caribbean challenges, such as drugs, organized crime, and border issues just do not seem to "stack up" to the immediate, **existential threats** confronting the United States elsewhere in the world: Ebola, the fight against ISIL, a resurgent China, and a newly assertive Russia. **Frighteningly**, in decisions about how the United States should focus its resources and attention in the pursuit of global security in the post-Cold War era, this logic is almost ubiquitous. It is also **shortsighted** and potentially creates grave risks for U.S. national security. This essay argues that both those who argue for greater U.S. attention to Latin America's problems and those who argue the need to focus resources elsewhere, have it wrong. While Latin America and the Caribbean face important challenges, such as transnational crime, governance, and development issues in the post-Cold War world, U.S. policymakers and analysts too seldom think in strategic terms about Latin America in the way that they do toward other parts of the world. Applying such a strategic lens to Latin America, the region's core strategic value to the United States derives not from individual problems in the region itself (although it is certainly in the U.S. interest to address such issues). Rather, the principal strategic imperative of Latin America for the United States historically has been, and continues to be, its geographic and economic connectedness to this country and, by extension, the potential for a powerful extra-hemispheric actor to use the region to harm the United States or impair its ability to act in other parts of the world in the event of a future conflict. The rise of China and its projection onto the global stage, coupled with Russia's increasingly bold reassertion of its imperial ambitions, increases the undesirable possibility of a serious **conflict** between the United States, and one or both of these actors. Yet, while strategists regularly ponder the political and military dimensions of how such conflicts could play out in Asia, **it is unthinkable** that a power with global political, economic, and military ties, such as Russia or China, would allow the United States to engage it in its own region without taking **the fight to the U.S. "backyard" as well.** In short, there is a worrisome disconnect between the possible conflicts that U.S. strategic planners for other theaters see on the horizon, and the focus of planners responsible for assessing **Latin America** and the Caribbean. The later tend to evaluate the risks to the United States in terms of the challenges coming from the region, but not those potentially coming through the region as a product of developments in other parts of the world. Things were not always so. During the Cold War, U.S. planners instinctively saw the Americas as an arena where the Soviet Union would seek to act as part of its global struggle with the West. Concerns over of a U.S. rival acting against the United States through proxy states in Latin America and the Caribbean was manifest in U.S. attempts to contain Cuba, and to prevent pro-Soviet regimes from coming to power in Nicaragua, El Salvador, Guatemala, and the Dominican Republic, among others. It is not politically correct in the "enlightened" and globalized post-Cold War world to contemplate peer competitors acting against the United States through sympathetic regimes or poorly governed spaces within the Western Hemisphere, and yet the incentives for such a rival to do so have not changed: 1. The presence of such a threat forces the United States to divert resources and attention from actions in other theaters. 2. U.S. trade and financial interdependence with the region allows an adversary to harm the United States economically or undermine the sustainability of U.S. efforts elsewhere without acting directly against the United States. 3. The geographic proximity to the United States gives an adversary the option to resupply forces or hold U.S. targets at risk from the region during a global conflict. While neither Russia nor China can be expected to openly threaten the United States in the near term, both are significantly **strengthening economic and military positions in the region**, and they are moving toward a posture in which a conflict with the United States is no longer unthinkable. While the United States works to peacefully cohabit the globe with these states, it is the duty of those responsible for U.S. national security to contemplate how such actors might move

against the United States in the Western Hemisphere in time of conflict, and how the United States should respond during such a conflict, and mitigate risk in the period prior to it. In 2008, when tensions escalated between Russia and the United States over the civil war in Georgia, Russia sent the United States a powerful message by sending two **nuclear-capable** Tu-160 bombers to Venezuela **to conduct flights in the Caribbean**, followed 3 months later by the arrival of a naval flotilla led by the Russian cruiser, Peter the Great. In 2014, as tensions with the United States and Europe heated up again over the crisis in the Ukraine, **Russia indicated its intention to establish facilities for the resupply of Russian naval vessels in Cuba, Venezuela, and/or Nicaragua**, as well as the reactivation of the Soviet-era listening facility in Lourdes, Cuba. Even if such actions are "bluffs," each should be a wake-up call to U.S. policymakers and planners about the threats posed to U.S. security through willing collaborators, or poorly governed spaces in the hemisphere. Neither is Russia the only extra-regional power building alliances and constructing positions close to the United States. For example, in the past decade, the People's Republic of China (PRC) has significantly expanded its commercial presence in the region by providing gifts and investing in projects in the Caribbean at a level that is way out of proportion to the value of the region to China as a market or a source of commodities. Some of these projects include: the expansion of Hutchison Whampoa's container shipping facility at Freeport, Bahamas, less than 100 miles from the U.S. coastline; the planned construction of an additional shipping facility at Goat Island, Jamaica; the expansion of port facilities in Santiago, Cuba; and, $10 billion for hotel and gambling resorts on the tiny island of Nassau, Bahamas, to name just a few. Beyond economic interactions, the PRC also quietly built its military relationships in the region through significantly expanded arms sales, as well as regular visits by Chinese military leaders, education and training activities, and a growing military presence in the region. Indeed, this presence has evolved from multilateral humanitarian activities such as, participation in the United Nations Stabilization Mission in Haiti multilateral peacekeeping mission from 2004-12, to the conduct of combat exercises with the Chilean, Argentine, and Brazilian navies in 2013. China's increasing willingness to engage with Latin America in an increasingly bold fashion has also been manifested in the diplomatic initiatives of Chinese leader Xi Jinping. His first trip to the region in June 2013, after he assumed the Presidency, focused on 11 bilateral summit meetings in three states, all north of the Panama Canal, while his second trip concentrated exclusively on states which have troubled relations with or actively oppose the United States. Although the PRC has not pursued defense alliances or base access agreements in the Western Hemisphere, the combination of its commercial presence and political and military relationships give it the ability to conduct military operations from the hemisphere relatively rapidly should hostilities with the United States cause it to do so. Chinese companies such as Hutchison Whampoa, China Shipping, and COSCO, for example, have detailed knowledge of Latin America's port facilities and their support capabilities from years of operating there. In evacuating personnel from both Somalia and Libya, Chinese commercial airlines and shipping companies have shown that they will not hesitate to collaborate with the Chinese People's Liberation Army if needed to support China's national interest. Even short of military actions, in time of war, potential adversaries such as Russia and China could use their economic leverage or intelligence on the region's leaders to persuade governments to deny cooperation to the United States with respect to passage through their territorial waters, aircraft overflight rights, or use of their facilities to support U.S. military operations. Beyond Russia and China, the aggressive public diplomacy of Iran's previous President, Mahmoud Ahmadinejad, serves as a reminder that the region's proximity to the United States is also an attraction for mid-level powers. For example, Iranian actions include the use of Venezuela to introduce agents into the region, the establishment of factories in Venezuela and financial institutions in that country, as well as in Ecuador for evading sanctions, and the recruitment of youth for religious indoctrination from countries from Nicaragua to Colombia. For those who doubt that the states of Latin America would "dare" to provide assistance to an extra-regional power against the United States, I offer five responses: 1. States such as Cuba and Venezuela, and perhaps others, have already done so, apparently based on the belief that there is no price to pay for their actions; 2. Some regimes may calculate that they can avoid provoking a response by representing their actions as "neutrality" in the face of a U.S. conflict with geopolitical rivals; 3. There is little in the recent track record of the United States in Latin America to suggest that it reliably supports its allies, or imposes significant costs on those who work against it; 4. Parts of the hemisphere, such as the southern cone, are thousands of miles distant, and a world away from Washington; and, 5. Short of a nuclear war in which all sides would lose, it is not unthinkable that the United States could fail to prevail in a standoff with a future Chinese-Russian coalition, ushering in a new "truly multipolar" era, making a bet against the United States more rational than many in Washington like to imagine. While the idea that adversaries could act against the United States from Latin America is not new, the senior decisionmakers and planners who assess conflict scenarios in other parts of the world may not have the detailed inputs from Latin American experts to understand how adversary actions in this hemisphere could impact the effective and sustained U.S. prosecution of a military campaign abroad. Reciprocally, while Latin American analysts presumably focus on threats like drugs, organized crime, and minor terrorist incidents, it is not clear that they regularly examine how actions by near-peer competitors in other theaters could affect their own area of responsibility. In the short term, the greatest need regarding U.S. security in the Western Hemisphere is not more money, but different thinking. It is difficult to identify a senior U.S. policymaker or prominent analyst who analyzes Latin America and the Caribbean with the strategic analysis that luminaries such as Henry Kissinger, Zbigniew Brzezinski, and Brent Scowcroft apply to Asia, the Middle East, or Europe. Indeed, it is difficult to identify a major recent essay done by Kissinger, Brzezinski, or Scowcroft themselves focused on Latin America and the Caribbean. From a U.S. Department of Defense (DoD) perspective, it is imperative that Latin American and Caribbean experts be included in the "strategic thinking" that is done about Russia, China, Iran, and other extra-hemispheric actors and the associated national security challenges that extra-hemispheric actors pose in other theaters. Such inclusion would help those responsible for those theaters to understand in a specific and realistic fashion how the economic, political, and military positions of a contemplated adversary in the Western Hemisphere could impact the U.S. ability to mount a timely and sustained response to that adversary in the non-Western Hemisphere location from which the crisis emanates. Reciprocally, knowledgeable senior personnel integrated into U.S. planning in other theaters should be embedded in the planning and decisionmaking processes for those responsible for the "Western Hemisphere," i.e., U.S. Southern Command (USSOUTHCOM) and U.S. Northern Command (USNORTHCOM), so that the threat matrix that they plan for is not limited solely to the threats of drugs, gangs, and organized crime "on the horizon" in Latin America and the Caribbean, but those which could flow out of a significant conflict with a global competitor in Europe, Asia, or the Middle East. One important place to incorporate such "cross-fertilization" between regions is the wargaming done by the DoD and other U.S. Government organizations. Such exercises by U.S. Southern Command and U.S. Northern Command should include scenarios involving major conflicts in other theaters, with determined adversaries such Russia, China, or even Iran, seeking to act in the Western Hemisphere to distract, delay, or undermine the U.S. effort against them, or otherwise harm the United States in its own "neighborhood." Additionally, wargames for commands such as U.S. Central Command (USCENTCOM), U.S. Pacific Command (USPACOM), or U.S. European Command (USEUCOM) should include realistic play in the Western hemisphere that could impact the arrival or sustainability of U.S. and coalition forces available in their own theater, and even the level of cooperation of coalition partners coming from the Western Hemisphere. Ideally, such USCENTCOM, USPACOM, and USEUCOM exercises should also integrate U.S. Western Hemisphere allies with a stake in the outcome including Canada, and where possible, Mexico, Colombia, and Chile, among others. Doing so would have the added benefit of strengthening U.S. relations with its security partners in the Western Hemisphere by bringing them into U.S. global planning processes as stakeholders, and not as mere resource providers or supplicants. Beyond wargaming, an important component of the strategic-level response to the challenge presented by extra-regional actors in the hemisphere should be additional analysis about who are the extra-hemispheric "strategic partners" of the United States in Latin America and the Caribbean, as well as what is the "strategic terrain" of the region. This includes identifying key countries, groups, and economic sectors under varying scenarios, and on a recurring basis, as well as physical terrain. As an example, as aid to Colombia decreases, with that nation surrounded by Bolivarian Alliance for the Peoples of Our America regimes opposed to U.S. interests in the region, we may wish to consider how the "loss" of that country as a close political partner, one willing to cooperate with the United States across a range of security and law enforcement issues, would impact U.S. influence in South America. Similarly, as the Mexican government of Enrique Peña Nieto seeks improved relations with the PRC, we may wish to examine how a

Mexico that is less resistant to the economic and political advances of the PRC would impact the U.S. position in Central America and the Caribbean. Looking to the Caribbean in a similar fashion, the United States may wish to consider what would happen if it lost the strong cooperation of the Dominican Republic (or even became politically estranged from its own Puerto Rico) in a Caribbean basin increasingly inundated by extra-regional actors, including the Russian positions in Nicaragua and Cuba, the Chinese commercial ports in Freeport and Goat Island, the Chinese built satellites and telecommunications infrastructures, and the significant Chinese military relationships with virtually all of the nations which recognize it in the Caribbean basin, including Venezuela, Suriname, Guyana, Cuba, Jamaica, and Trinidad and Tobago. Finally, U.S. strategic thinkers should consider how the United States can work more effectively with other extra-regional partners as part of its strategic response in the Western Hemisphere. These include, but are not limited to, states such as Japan and India, whose political systems, economic practices, and global objectives may be more aligned with those of the United States, and who are less inclined to use their positions within Latin America against the United States in a time of conflict. In the current era of global commerce and interdependence, it would be difficult, and probably counterproductive, for the United States to attempt to prevent states of the region from developing economic, political, and military relationships with extra-hemispheric actors. It can however, intelligently use its commercial leverage and "soft power" to support the strengthening of positions in the region by those extra-regional actors most friendly to the United States and most aligned with Western international norms on issues of trade, international finance, and protection of intellectual property. Such thoughts are not a roadmap, but merely, to provoke a greater discourse. The problem in Washington, DC, is arguably not the absence of bright people and deep thinkers, but rather, in focusing on the very real problems of the region itself, too few of them consider the strategic dimension of Latin America and the Caribbean in the new era of emerging geopolitical rivals and global interdependence in the security and commercial domains. The purpose of this essay is not to argue for a significant redirection of material resources toward Latin America, or to impose a new "Cold War" mentality on the region. Rather, it is to offer constructive recommendations for what responsible U.S. leaders and planners should consider, even as the United States continues to work toward productive and harmonious relationships with global actors such as Russia and China, and even as it continues to work with the region on the issues of democracy, development, security, and governance that are shared interest for all who share the Western Hemisphere. To view the matter through a military analogy, Latin America is the unoccupied high-ground overseeing the U.S. position. A responsible commander would recognize that the occupation of that high ground by an adversary poses an unacceptable threat to his force, and thus would dedicate resources to block the adversary from doing so. By this analogy, it would be a grave error for the United States to conclude that, in the absence of serious threats to the United States from Latin America, it is okay to merely watch as potential future adversaries such as Russia and China expand their positions in the region. While such neglect, in the short term, may "free up resources" to continue other engagements abroad, over the long term, the willing cessation of its own neighborhood by the U.S. is the single factor most likely to force the United States **into a chaotic retreat from its external engagements**. **Latin America is strategically fundamental to the security and prosperity of the United States.** This was a concept integral to the launching of the process of defense ministerial summits with the 1995 Williamsburg summit. It is better that we rediscover that lesson today, rather than learn it at great cost in the future.

Gun Control – Terror

Gun control prevents conventional terror attacks in the U.S.

Harris-Hogan 13 – Shandon, staffwriter, "Gun control could help the fight against homegrown terrorism" http://theconversation.com/gun-control-could-help-the-fight-against-homegrown-terrorism-11611

But we should not fool ourselves. Introducing measures such as closing the "gun-show loophole", requiring background checks, tracking the movement and sale of weapons and banning assault weapons and high capacity magazines will not eradicate the potential for mass casualty attacks. Rather, these actions **are designed to prevent the frequency and extent of such incidents.** Following the 1996 massacre in Port Arthur, Tasmania, which killed 35 people, strict gun control measures were brought in across Australia. As a result, more than 650,000 automatic and semi-automatic rifles were handed in and destroyed. Research published in the American Law and Economics Review noted the benefits. It found that firearm homicides dropped 59% in Australia between 1995 and 2006. In 2011, Harvard University researchers revealed that in the 18 years prior to 1996 there were 13 mass casualty attacks involving guns in Australia (mass casualty attacks being defined as those with four or more fatalities). Since the introduction of gun control laws there have been none. Historical and cultural differences between Australians and Americans in their attitudes towards gun ownership mean that the scale of the issue in the United States is far greater than that faced by Australia. There are as many as 300 million guns throughout the United States and organisations such as the National Rifle Association wield enormous power and influence. There is also an ingrained scepticism throughout American society towards any move perceived as the federal government restricting the rights of the individual. These factors help explain to outside observers why reinstating the bans on the sale of assault weapons has not managed to gain widespread support, even after a series of tragic mass shootings. The gun control debate is not just important in the context of school shootings but is also relevant to all forms of **mass casualty attacks**, including those that are religiously or ideologically inspired. In June 2011, al Qaeda's media production arm released a video urging sympathisers to attack targets in the United States with firearms. It noted that "**America is absolutely awash with easily obtainable firearms**" and that the faithful should take advantage of the country's gun stores and gun shows. Inspire magazine has also **repeatedly urged such undertakings**. Since 9/11, there have been around 50 foiled attempts to carry out a mass casualty attack on American soil in the name of jihadist ideology. An additional four attempts have been successful and resulted in fatalities - at Fort

Hood, Little Rock, the Seattle Jewish Federation and Los Angeles Airport. Each successful attack has involved firearms. In August last year, six people were killed when a gunman with ties to the white supremacy movement opened fire at a Sikh temple in Wisconsin. The 69 Norwegians killed by Anders Breivik in July 2011 remind us of the potential damage assault weapons and high capacity magazines can cause in a civilian environment (eight were also killed in an associated bombing). There has also been a significant increase in attempted jihadist plots in Western countries over the past five years. However, many of the perpetrators often have little or no training or expertise and these plots have tended to be less sophisticated than previous efforts more directly connected to international terrorist organisations. Importantly, **there is a strong relationship between recent plots and a desire to use conventional weaponry** (rather than explosives which require the acquisition of a number of materials and are difficult to assemble). In the same way that restricting the sale of certain chemicals may have gone some way to preventing a bombing inspired by jihadist ideology in America post 9/11, **restricting access to assault rifles and high capacity magazines may also help prevent a large scale attack.** The introduction of restrictions on the sale of firearms in Australia has helped prevent such a mass casualty attack. In 2005 and 2009, cells were intercepted in Victoria which planned to conduct mass casualty attacks in the name of jihadist ideology. **Both unsuccessfully attempted to procure guns from the black market.** The 2005 cell used money raised through criminal activity in an attempt to purchase firearms for the group. Three men were also convicted of planning a suicide mission on Holsworthy Army Barracks in 2009 using guns that carried "up to 60 bullets". These men were recorded commenting that with this type of weaponry, "20 minutes would be enough" to inflict mass casualties. Fortunately, both groups had difficulty acquiring such weapons and authorities were able to intercept both cells before an attack could take place. These examples highlight the fact that for those wanting to inflict mass casualties, **automatic weapons with high magazine capacities are the best weapon choice**. Though the extent of the preparation and skill of a shooter is important, it is the equipment used that may ultimately determine the extent of the damage, particularly if a shooter lacks expertise. Protecting citizens from mass casualty attacks must be the first security priority of any nation. Whether an attacker is motivated by distorted religious teaching, mental illness or revenge, governments must find ways to restrict the extent of the damage such individuals can potentially cause. By introducing significant gun control measures President Obama has an opportunity to leave a legacy of helping to secure the safety of the American people.

That triggers nuclear retaliation and miscalculation

Conley, ACC chief of Systems Analysis Branch, 2003 (Harry, "Not with Impunity Assessing US Policy for Retaliating to a Chemical or Biological Attack", 3-5, http://www.airpower.maxwell.af.mil/airchronicles/apj/apj03/spr03/conley.html, ldg)

The number of American casualties suffered due to a WMD attack may well be the most important variable in determining the nature of the US reprisal. A key question here is how many Americans would have to be killed to prompt a massive response by the United States. The bombing of marines in Lebanon, the Oklahoma City bombing, and the downing of Pan Am Flight 103 each resulted in a casualty count of roughly the same magnitude (150–300 deaths). Although these events caused anger and a desire for retaliation among the American public, they prompted no serious call for massive or nuclear retaliation. The body count from a single biological attack could easily be one or two orders of magnitude higher than the casualties caused by these events. **Using the rule of proportionality as a guide, one could justifiably debate whether the United States should use massive force in responding to an event that resulted in only a few thousand deaths**. However, what if the casualty count was around 300,000? Such an unthinkable result from a single CBW incident is not beyond the realm of possibility: "According to the U.S. Congress Office of Technology Assessment, 100 kg of anthrax spores delivered by an efficient aerosol generator on a large urban target would be between two and six times as lethal as a one megaton thermo-nuclear bomb."46 **Would the deaths of 300,000 Americans be enough to trigger a nuclear response? In this case, proportionality does not rule out the use of nuclear weapons. Besides simply the total number of casualties, the types of casualties- predominantly military versus civilian- will also affect the nature and scope of the US reprisal action**. Military combat entails known risks, and the emotions resulting from a significant number of military casualties are not likely to be as forceful as they would be if the attack were against civilians. World War II provides perhaps the best examples for the kind of event or circumstance that would have to take place to trigger a nuclear response. **A** CBW **event that produced a shock and death toll roughly**

equivalent to those arising from the attack on Pearl Harbor might be sufficient to prompt a nuclear retaliation. President Harry Truman's decision to drop atomic bombs on Hiroshima and Nagasaki- based upon a calculation that up to one million casualties might be incurred in an invasion of the Japanese homeland47- is an example of the kind of thought process that would have to occur prior to a nuclear response to a CBW event. Victor Utgoff suggests that "if **nuclear retaliation is seen at the time to offer the best prospects for suppressing further CB attacks and speeding the defeat of the aggressor, and if the original attacks had caused severe damage that had outraged American or allied publics, nuclear retaliation would be more than just a possibility, whatever promises had been made."48**

Stability – 2NC

Strong gun control is critical to prevent instability in Latin America

Sweig 13 – Julia E., Nelson and David Rockefeller Senior Fellow for Latin America Studies and Director for Latin America Studies @ the Council on Foreign Relations, "Arms, the United States, and the Americas" http://www.cfr.org/arms-control-disarmament-and-nonproliferation/arms-united-states-americas/p31179

Not long after a teenage boy massacred 27 children and teachers in Connecticut last year, a Brazilian student asked me if I thought the United States has "a culture of violence." A truism: Americans do like their guns. And some really do live by a frontier maxim of individualism, often tied to zealous passion for the Constitution's second amendment. But the reason we have an under-regulated market in high-powered weaponry and ammunition is more about politics than a mythological culture: **the arms industry simply has too much power.** Latin Americans, especially Mexicans and Central Americans, experience the **spillover effects of our lax gun laws**. In 2010, for example, the gun-related homicide rate in the region **exceeded the global average by 30 percent**. The World Bank estimates that crime and violence cost Central America nearly **8 percent of its GDP**. Brazil, with its own arms industry too, has the highest number of yearly gun homicides in the world, followed by Colombia, Mexico and Venezuela. The highest rates of gun homicide in the world are also in Latin America, led by Honduras. **And it's not just the guns and ammo that are flowing north to south. Its politics too**. In 2005 the National Rifle Administration (NRA) helped defeat a referendum in Brazil that would have banned the sale of guns and ammunition to private citizens. After the massacres in Texas, Arizona, Colorado and Connecticut during their administration, Barack Obama and Joe Biden and a range of gun control advocacy groups, have begun to challenge the tactics of the NRA. Some states, such as California, Connecticut and Maryland, have passed strict gun laws, despite the impasse in the U.S. congress. The American civilian firearms industry continues to supply the region's transnational criminal networks with weaponry. Earlier this year the U.S. Senate rejected measures to expand background checks, reinstate the federal assault weapons ban, and make straw purchasing a federal crime. It will take a while for the domestic politics around guns to change. But in foreign policy, Washington has some options to make its rhetoric about "**shared responsibility**" more of a reality with executive actions to **reduce trafficking in assault weapons and ammunition in the Americas**. You can read about it here at cfr.org in "A Strategy to Reduce Gun Violence in the Americas," published this week.

More evidence – it's killing U.S. influence and credibility vis-à-vis Latin America

Williams 7/31/**13** – Carol J., senior international affairs writer for the Los Angeles Times. A foreign correspondent for 25 years, she has won four Overseas Press Club awards, two Sigma Delta Chi citations and was a 1993 finalist for the Pulitzer Prize in international reporting, "U.S. gun laws blamed for worsening Latin American violence" http://articles.latimes.com/2013/jul/31/world/la-fg-wn-us-gun-laws-violence-latin-america-20130731

Lax U.S. gun regulations are enabling the international trafficking of high-powered weapons and **fueling the spread of gun violence in Latin America and the Caribbean**, the Council on Foreign Relations argues in a report urging President Obama to take action on initiatives that have foundered in Congress. **More than 70%** of the 99,000 weapons recovered by Mexican law enforcement since 2007 were traced to U.S. manufacturers and importers, the council report said, citing data from the eTrace program of the Bureau of Alcohol, Tobacco, Firearms and Explosives. The figure for guns of U.S. origin recovered in the Caribbean is **over 90%,** the study noted. "The flow of high-powered weaponry from the **U**nited **S**tates to Latin America and the Caribbean **exacerbates soaring rates of gun-related violence** in the region and **undermines U.S. influence in the Western Hemisphere**," states the council's policy memo, written by Latin America studies director Julia Sweig. The ATF statistics, as well as those of the United Nations Office on Drugs and Crime, suggest the escalating flow of assault weapons from the **U**nited **S**tates is connected with a **30% higher rate of per capita gun-related homicides in Latin America than the global average**. In Mexico, the U.N. homicide report for 2011 charts a **more than tripling of firearms slayings in less than a decade**.

Environment Impact – 1NC

Weakening the court prevents sustainable development

Stein, New South Wales Court of Appeal former judge, 2005

(Paul Stein, "Why judges are essential to the rule of law and environmental protection", IUCN Environmental Policy and Law Paper No. 60, online, ldg)

The Johannesburg Principles state: "We emphasize that the **fragile state** of the global environment requires the judiciary, as the **guardian of the Rule of Law**, to boldly and fearlessly implement and enforce applicable international and national laws, which in the field of environment and sustainable development will assist in **alleviating poverty** and **sustaining an enduring civilization**, and ensuring that the present generation will enjoy and improve the quality of life of all peoples, while also ensuring that the **inherent rights** and interests of succeeding generations are not compromised." There can be no argument that environmental law, and sustainable development law in particular, are vibrant and dynamic areas, both internationally and domestically. Judge Weeramantry (of the ICJ) has reminded us that we judges, as **custodians of the law**, have a major obligation to contribute to its development. Much of sustainable development law is presently making the journey from soft law into hard law. This is happening internationally but also it is occurring in many national legislatures and courts. Fundamental environmental laws relating to **water, air**, our **soils and energy** are critical to narrowing the widening gap between the rich and poor of the world. Development may be seen as the bridge to narrow that gap but it is one that is riddled with dangers and contradictions. We cannot bridge the gap with materials stolen from future generations. Truly sustainable development can only take place in harmony with the environment. Importantly we must not allow sustainable

development to be duchessed and bastardized. A role for judges? It is in striking the balance between development and the environment that the courts have a role. Of course, this role imposes on judges a significant trust. The balancing of the rights and needs of citizens, present and future, with development, is a delicate one. It is a balance often between powerful interests (private and public) and the voiceless poor. In a way **judges are the meat in the sandwich** but, difficult as it is, we must not shirk our duty. Extinction

Barry, Wisconsin land resources PhD, 2013

(Glen, "ECOLOGY SCIENCE: Terrestrial Ecosystem Loss and Biosphere Collapse", 2-4, http://forests.org/blog/2013/02/ecology-science-terrestrial-ec.asp, ldg)

Blunt, Biocentric Discussion on Avoiding Global Ecosystem Collapse and Achieving Global Ecological Sustainability Science needs to do a better job of considering worst-case scenarios regarding continental- and **global-scale ecological collapse**. The loss of biodiversity, ecosystems, and landscape connectivity reviewed here shows clearly that ecological collapse is occurring at spatially extensive scales. The collapse of the biosphere and complex life, or eventually even all life, is a possibility that needs to be better understood and mitigated against. A tentative case has been presented here that terrestrial **ecosystem loss is at or near a planetary boundary**. It is suggested that a 66% of Earth's land mass must be maintained in terrestrial ecosystems, to maintain critical connectivity necessary for ecosystem services across scales to continue, including the biosphere. Yet various indicators show that around 50% of Earth's terrestrial ecosystems have been lost and their services usurped by humans. Humanity may have already destroyed more terrestrial ecosystems than the biosphere can bear. There exists a major need for further research into how much land must be maintained in a natural and agroecological state to meet landscape and bioregional **sustainable development** goals while maintaining an operable biosphere. It is proposed that a critical element in determining the threshold where terrestrial ecosystem loss becomes problematic is where landscape connectivity of intact terrestrial ecosystems erodes to the point where habitat patches exist only in a human context. Based upon an understanding of how landscapes percolate across scale, it is recommended that 66% of Earth's surface be maintained as ecosystems; 44% as natural intact ecosystems (2/3 of 2/3) and 22% as agroecological buffer zones. Thus nearly half of Earth must remain as large, connected, intact, and naturally evolving ecosystems, including old-growth forests, to provide the context and top-down ecological regulation of both human agroecological, and reduced impact and appropriately scaled industrial activities. Given the stakes, it is proper for political ecologists and other Earth scientists to willingly speak bluntly if we are to have any chance of averting global ecosystem collapse. A case has been presented that Earth is already well beyond carrying capacity in terms of amount of natural ecosystem habitat that can be lost before the continued existence of healthy regional ecosystems and the global biosphere itself may not be possible. Cautious and justifiably conservative science must still be able to rise to the occasion of global ecological emergencies that may threaten our very survival as a species and planet. Those knowledgeable about planetary boundaries—and abrupt climate change and terrestrial ecosystem loss in particular—must be more bold and insistent in conveying the range and possible severity of threats of global ecosystem collapse, while proposing sufficient solutions. It is not possible to do controlled experiments on the Earth system; all we have is observation based upon science and trained intuition to diagnose the state of Earth's biosphere and suggest sufficient ecological science–based remedies. If Gaia is alive, she can die. Given the strength of life-reducing trends across biological systems and scales, there is a need for a rigorous research agenda to understand at what point the biosphere may perish and Earth die, and to learn what configuration of ecosystems and other boundary conditions may prevent her from doing so. We see death of cells, organisms, plant communities, wildlife populations, and whole ecosystems all the time in nature—extreme cases being desertification and ocean dead zones. There is no reason to dismiss out of hand that the **Earth System could die if critical thresholds are crossed**. We need as Earth scientists to better understand how this may occur and bring knowledge to bear to avoid global ecosystem and biosphere collapse or more extreme outcomes such as biological homogenization and the loss of most or even all life. To what extent can a homogenized Earth of dandelions, rats, and extremophiles be said to be alive, can it ever recover, and how long can it last? The risks of global ecosystem collapse and the need for strong response to achieve global ecological sustainability have been **understated for decades**. If indeed there is some possibility that our shared biosphere could be collapsing, there needs to be further investigation of what sorts of sociopolitical responses are valid in such a situation. Dry, unemotional scientific inquiry into such matters is necessary—yet more proactive and evocative political ecological language may be justified as well. We must remember we are speaking of the potential for a **period of great dying** in species, ecosystems, humans, and perhaps all being. It is not clear whether this global ecological emergency is avoidable or recoverable. It may not be. But we must follow and seek truth wherever it leads us. Planetary boundaries have been quite anthropocentric, focusing upon human safety and giving relatively little attention to other species and the biosphere's needs other than serving humans. Planetary boundaries need to be set that, while including human needs, go beyond them to meet the needs of ecosystems and all their constituent species and their aggregation into a living biosphere. Planetary boundary thinking needs to be more biocentric. I concur with Williams (2000) that what is

needed is an Earth System–based conservation ethic—based upon an "Earth narrative" of natural and human history—which seeks as its objective the "complete preservation of the Earth's biotic inheritance." Humans are in no position to be indicating which species and ecosystems can be lost without harm to their own intrinsic right to exist, as well as the needs of the biosphere. For us to survive as a species, logic and reason must prevail (Williams 2000). Those who deny limits to growth are unaware of biological realities (Vitousek 1986). There are strong indications humanity may undergo societal collapse and pull down the biosphere with it. The longer dramatic reductions in fossil fuel emissions and a halt to old-growth logging are put off, the worse the risk of abrupt and irreversible climate change becomes, and the less likely we are to survive and thrive as a species. Human survival—entirely dependent upon the natural world—depends critically upon both keeping carbon emissions below 350 ppm and maintaining at least 66% of the landscape as natural ecological core areas and agroecological transitions and buffers. Much of the world has already fallen below this proportion, and in sum the biosphere's terrestrial ecosystem loss almost certainly has been surpassed, yet it must be the goal for habitat transition in remaining relatively wild lands undergoing development such as the Amazon, and for habitat restoration and protection in severely fragmented natural habitat areas such as the Western Ghats. The human family faces an unprecedented global ecological emergency as reckless growth destroys the ecosystems and the biosphere on which all life depends. Where is the sense of urgency, and what are proper scientific responses if in fact Earth is dying? Not speaking of worst-case scenarios—the collapse of the biosphere and loss of a living Earth, and mass ecosystem collapse and death in places like Kerala—is **intellectually dishonest**. We must consider the real possibility that we are pulling the biosphere down with us, setting back or **eliminating complex life**. The 66% / 44% / 22% threshold of terrestrial ecosystems in total, natural core areas, and agroecological buffers gets at the critical need to maintain large and expansive ecosystems across at least 50% of the land so as to keep nature connected and fully functional. We need an approach to planetary boundaries that is more sensitive to deep ecology to ensure that habitable conditions for all life and natural evolutionary change continue. A terrestrial ecosystem boundary which protects primary forests and seeks to recover old-growth forests elsewhere is critical in this regard. In old forests and all their life lie both the history of Earth's life, and the hope for its future. The end of their industrial destruction is a global ecological imperative. Much-needed dialogue is beginning to focus on how humanity may face systematic social and ecological collapse and what sort of community resilience is possible. There have been ecologically mediated periods of societal collapse from human damage to ecosystems in the past (Kuecker and Hall 2011). What makes it different this time is that the human species may have the scale and prowess to pull down the biosphere with them. It is fitting at this juncture for political ecologists to concern themselves with both legal regulatory measures, as well as revolutionary processes of social change, which may bring about the social norms necessary to maintain the biosphere. Rockström and colleagues (2009b) refer to the need for "novel and adaptive governance" without using the word revolution. Scientists need to take greater latitude in proposing solutions that lie outside the current political paradigms and sovereign powers. Even the Blue Planet Laureates' remarkable analysis (Brundtland et al. 2012), which notes the potential for climate change, ecosystem loss, and inequitable development patterns neither directly states nor investigates in depth the potential for global ecosystem collapse, or discusses revolutionary responses. UNEP (2012) notes abrupt and irreversible ecological change, which they say may impact life-support systems, but are not more explicit regarding the profound human and ecological implications of biosphere collapse, or the full range of sociopolitical responses to such predictions. More scientific investigations are needed regarding alternative governing structures optimal for pursuit and achievement of bioregional, continental, and global sustainability if we are maintain a fully operable biosphere forever. An economic system based upon endless growth that views ecosystems necessary for planetary habitability primarily as resources to be consumed cannot exist for long. Planetary boundaries offer a profoundly difficult challenge for global governance, particularly as increased scientific salience does not appear to be sufficient to trigger international action to sustain ecosystems (Galaz et al. 2012). If indeed the safe operating space for humanity is closing, or the biosphere even collapsing and dying, might not discussion of revolutionary social change be acceptable? Particularly, if there is a lack of consensus by atomized actors, who are unable to legislate the required social change within the current socioeconomic system. By not even speaking of revolutionary action, we dismiss any means outside the dominant growth-based oligarchies. In the author's opinion, it is shockingly irresponsible for Earth System scientists to speak of geoengineering a climate without being willing to academically investigate revolutionary social and economic change as well. It is desirable that the current political and economic systems should reform themselves to be ecologically sustainable, establishing laws and institutions for doing so. Yet there is nothing sacrosanct about current political economy arrangements, particularly if they are collapsing the biosphere. Earth requires all enlightened and knowledgeable voices to consider the full range of possible responses now more than ever. One possible solution to the critical issues of terrestrial ecosystem loss and abrupt climate change is a massive and global, natural ecosystem protection and restoration program—funded by a carbon tax—to further establish protected large and connected core ecological sustainability areas, buffers, and agro-ecological transition zones throughout all of Earth's bioregions. Fossil fuel emission reductions must also be a priority. It is critical that humanity both stop burning fossil fuels and destroying natural ecosystems, as fast as possible, to avoid surpassing nearly all the planetary boundaries. In summation, we are witnessing the collective dismantling of the biosphere and its constituent ecosystems which can be described as ecocidal. The loss of a species is tragic, of an ecosystem widely impactful, yet **with the loss of the biosphere all life may be gone**. Global ecosystems when connected for life's material flows provide the all-encompassing context within which life is possible. The miracle of life is that life begets life, and the tragedy is that across scales when enough life is lost beyond thresholds, living systems die.

Court's public trust doctrine is key to sustainable development. Now is the key time. We are dangerously close to planetary boundaries

Sagarin et al., Arizona Institute of the Environment research scientist, 2012

(Raphael, “The Public Trust Doctrine: Where Ecology Meets Natural Resources Management”, Annual Review of Environment and Resources, ScienceDirect, ldg)

We are failing to preserve ecosystems and their services on which humanity relies. **Forests, freshwater sources, oceans**, and the **atmosphere** itself are all at degraded states and may be **hovering dangerously close to “planetary boundaries**” (1), where they will no longer provide the services of food production, nutrient cycling, and climate regulation as they do currently. These resources are common-pool resources, meaning resources from which it is hard (i.e., costly) to exclude users but simultaneously are subject to degradation from overuse (2). It has proven difficult to devise ways of governing our sustainable use of common-pool resources. A particular legal doctrine called the public trust doctrine (PTD), which appears in several countries but initially evolved in the United States, is appealing to environmental law and policy scholars on both philosophical and practical grounds. In its most basic interpretation, it states that certain natural resources cannot be subject to private ownership and must be held in trust for the people of a State (or US state) by the government. Governments must manage trust resources for the exclusive benefit of their citizens, both current and future, and if they fail to do so, citizens can **seek remedy in the courts**. Philosophically, the PTD is appealing because it provides a framework for structuring the relationship among citizens, both current and future, the governments they elect, and natural resources and the services they provide. Additionally, by protecting the rights of both current and future citizens to functioning ecosystems, the PTD is tied to the important notion in **international environmental governance** of intergenerational equity. Practically, the PTD is appealing because it scales well from backyard creeks to international waters, and from resources with clear monetary value (e.g., fish) to those with more diffuse values (e.g., intact ecosystems). It is widely incorporated in US states’ law and has increasingly been used in other countries by their legislatures to prescribe a more accountable way forward for environmental governance and by their courts to prevent harm to trust resources or demand their restoration. Achieving laws and policies that prevent overuse of natural resources is an imperative in the enduring global effort to achieve **sustainable development** (3). With the current **global negotiations** about sustainable development, climate change, and high seas governance, not to mention ongoing environmental conflicts at every level, now is an **opportune time** to clarify the PTD and its potential opportunities and pitfalls as a tool for more effective and sustainable natural resources management. Depending on one’s perspective, the PTD could be a powerful tool for recognizing ecological advances in law and policy or a dangerously unwieldy cudgel that threatens democracy and property rights. Those who advocate in academic discussions, court cases, legislative debates, or as delegates to international environmental conferences for an expanded PTD need to understand the many facets of the PTD concept. The vast majority of recent PTD discussion has occurred in law review journals, which have both benefits and drawbacks. Law review articles are built on extensive knowledge of legal precedent, but because they are essentially framed as arguments, they tend to rely on judicial opinions and other articles that support the commentator’s viewpoint and relegate opposing views to an unelaborated “but see . . .” citation in the footnotes. US judicial decisions protecting the environment will create a global norm.

Long, Florida Coastal law professor, 2008

(Andrew, “International Consensus and U.S. Climate Change Litigation”, 33 Wm. & Mary Envtl. L. & Pol'y Rev. 177, lexis, ldg)

1. Enhancing U.S. International Leadership In a time of unfavorable global opinion toward the United States, **explicit judicial involvement** with international norms will move the United States closer to the international community by acknowledging the relevance of international environmental norms for our legal system. As in other contexts, explicit judicial internalization of climate change norms would "build[ ] U.S. 'soft power,' [enhance] its **moral authority**, and strengthen[ ] U.S. capacity for **global leadership**"2 °3 on

climate change, and other global issues. More specifically, domestic judicial consideration of the global climate regime would reaffirm that although the United States has rejected Kyoto, we take the obligation to respect the global commons seriously by recognizing that obligation as a facet of the domestic legal system. U.S. courts' overall failure to interact with the international climate regime, as in other issue areas, has "serious consequences for their roles in **international norm creation**."2" As judicial understandings of climate change law converge, the **early and consistent** contributors to the transnational judicial dialogue will likely play the strongest role in **shaping the emerging international normative consensus**.2"' As Justice L'Heureux- Dube of the Canadian Supreme Court noted in an article describing the decline of the U.S. Supreme Court's global influence, "[decisions which look only inward ... have less relevance to those outside that jurisdiction." °6 Thus, if U.S. courts hope to participate in shaping the normative position on climate change adopted by judiciaries throughout the world, explicit recognition of the relationship between domestic and international law is vital. With climate change in particular, norm development through domestic application should be an important aspect of global learning. The problem requires a global solution beyond the scope of any prior multilateral environmental agreements. This provides a situation in which U.S. judicial reasoning in applying aspects of climate regime thinking to concrete problems will **fall into fertile international policy soil**. Accordingly, the recognition of international norms in domestic climate change litigation may play a strengthening role in the perception of U.S. leadership, encourage U.S. development and **exportation** of effective domestic climate strategies, and **promote international agreements** that will enhance consistency with such approaches. In short, explicit judicial discussion of international climate change norms as harmonious with U.S. law can enhance U.S. ability to regain a global leadership position on the issue and, thereby, more significantly **shape the future of the international climate regime.** 2. Promoting the Effectiveness of the International Response Along with promoting U.S. interests and standing in the international community, climate change litigation has a direct role to play in developing the international regime if courts directly engage that regime." 7 Just as the United States as an actor may benefit from acknowledging and applying international norms, the regime in which the actions occur will benefit through application and acceptance. Indeed, a case such as Massachusetts v. EPA that directly engages only domestic law can nonetheless be understood to impact international lawmaking by considering its actors."' More important, however, will be cases in which the domestic judiciary gives life to international agreements through direct engagement-a "role [that] is particularly important as a check on the delegitimization of international legal rules that are not enforced."" 9 Assuming, as we must in the arena of climate change, that international law can only effect significant changes in behavior through penetration of the domestic sphere, domestic litigation that employs international law not only provides an instance in which the international appears effective but, more importantly, molds it into a shape that will enable further use in domestic cases or suggest necessary changes internationally. By engaging the international, domestic cases can also provide articulation for the norms that have emerged. The precise meaning of the UNFCCC obligation that nations take measures must be hammered out on the ground. In the United States, if Congress has not acted, it is appropriate for the courts to begin this process by measuring particular actions against the standard. 3. Encouraging Consistency in Domestic Law and Policy In the absence of national climate change law and policy, explicit discussion of international sources and norms in litigation will provide a well-developed baseline for a uniform judicial approach in the domestic realm. This could occur both within and beyond the United States. Within the United States, bringing international environmental law into the mix of judicial reasoning would provide common grounding that unifies the decisions and begins to construct a more systematic preference for development of an effective legal response to international threats. Specifically, if an international climate change norm is found relevant to interpretation of a domestic statute, reference will be appropriate to that norm when future questions of interpretation of the domestic statute arise.210 Thus, to the extent that climate change cases rely upon consensus concerning the scientific evidence of climate change, future cases should use that consensus as a measuring stick for claims of scientific uncertainty.2n The same can occur with norm development. For example, had the Court in Massachusetts tied its jurisdictional or substantive holding to an identifiable norm, the opinion would have greater clarity and value as a precedent in other contexts within the United States. Outside the United States, this approach would provide value to other, more transnationally oriented domestic courts.212 This would serve a **norm entrepreneurship function** and likely increase agreement among domestic courts on how to approach climate change issues raised under statutes designed for other purposes. 4. Enabling a Check at the Domestic-International Interface Finally, climate change litigation has something to offer for the growth of administrative law at the interface of domestic and international law. At least two points are noteworthy. First, U.S. courts can serve a unique function of providing legal accountability for U.S. failure to honor its UNFCCC commitments.213 Although this might be achieved implicitly, arguably the approach of Massachusetts, doing so explicitly would provide a check of a different magnitude. An explicit check here would serve the purposes identified above, as well as offering the practical benefit of **increasing compliance**. The dualist tradition, and perhaps concerns of domestic political backlash, weigh against grounding a decision solely in the UNFCC. However, looking to it as a major point in a narrative defining the development of a partly **domestic obligation to take national action for the redress of climate change would serve the** same beneficial **purpose.** This approach has the advantage of building a significant bridge over the dualist divide between domestic and international law without ripping the Court's analysis from traditional, dualist moorings. The U.S econ is a glass house now

Taipei times 15 (Taipei times, "Fragile US economy limits Fed moves," http://www.taipeitimes.com/News/biz/archives/2015/06/19/2003621022, June, 19, 2015)
For US Federal Reserve officials, the US economy is a glass house where aggressive moves could break something. While the median forecast of policymakers still calls for two interest-rate increases by the end of the year, more officials say just one would be enough. Still more advocate a go-slow approach to further tightening next year. Projections from the US Federal Open Market Committee published on Wednesday showed that five officials foresee one increase in the federal funds rate this year, up from just a single policymaker who said so in March. While policymakers said the economy has picked up after a first-quarter slump, Fed Chair Janet Yellen said she still wants to see more "decisive" evidence of a lasting turnaround. "There is concern about the fragility of the expansion," former Fed Division of Monetary Affairs economist and Johns Hopkins University professor Jonathan Wright said. "Growth in the first half of the year seems to have been very weak." Growth slumped at a 0.7 percent annual rate in the first quarter amid severe weather, port disruptions and a stronger US dollar that sapped exports. Consumers still have a high propensity to save much of their incomes rather than spend. Manufacturing has slowed, and global risks, including the possibility Greece is set to default on its debt have increased. Fed officials "just don't have confidence yet," JPMorgan Chase & Co chief US economist Michael Feroli said. "Global factors definitely hit forcefully in the first quarter and it doesn't look like the global economy is picking up steam." At her press conference following the Federal Open Market Committee meeting, Yellen cited signs of "cyclical weakness" in the labor market, and noted wage growth remains "subdued." "Although progress clearly has been achieved, room for further improvement remains," Yellen said. "Economic conditions are currently anticipated to evolve in a manner that will warrant only gradual increases in the target federal funds rate." In the first five months of this year, non-farm payrolls have expanded by just over a million workers. Residential construction has also shown signs of life as housing starts in April and last month registered the best back-to-back readings since 2007. Still, Fed policymakers reiterated in their statement that, before raising interest rates, they must be "reasonably confident" that inflation is set to move back to their 2 percent target over the medium term. Inflation minus food and energy decelerated to 1.2 percent for the year ending April. That compares with a rate of 1.4 percent for the year ended April last year. Yellen stressed that the date of the first interest-rate increase is less important than the trajectory of subsequent ones. On that score, officials reduced their median estimate for the federal funds rate at the end of next year to 1.625 percent from 1.875 percent in their March forecast, and to 2.875 percent for the end of 2017, down from 3.125 percent in March. The shallower interest-rate outlook shows that this tightening cycle is set to be very unlike previous ones and might not be a cycle at all. In previous periods, Fed officials were intent on getting ahead of inflationary pressure that usually emerges in recoveries. By contrast, inflation has been below the Fed's 2 percent goal for three years, and there are few signs of a resurgence. Consequently, Fed officials are talking about data dependence, or an interest-rate cycle that would be responsive to what current indicators are saying about the near-term outlook.

The plan increases crime by removing the third party doctrine

Kerr 9 (Orin Kerr, Professor at George Washington University Law School, "The Case for the Third Party Doctrine", http://www.lexisnexis.com.turing.library.northwestern.edu/hottopics/lnacademic/,February 2009)
Introduction Human beings are social animals. We like to share. We like to gossip. We ask for help from others, and we give help in return. Sometimes we share by speaking in person. Sometimes we write a letter or send a message by computer. In all of these cases, the human impulse to share creates an important opportunity for criminal investigators. When wrongdoers share with others, they often expose evidence of their crimes. A corrupt [*563] businessman might disclose records to his accountant. A mob boss might tell his brother about an assault. A drug dealer might reveal his plans to a confidential informant. In all of these cases, someone other than the criminal or the police - some third party - comes to possess evidence of crime. Investigators often want to collect evidence from these third parties, as they are more likely to cooperate and less likely to tip

off the suspect that an investigation is afoot. The "third-party doctrine" is the Fourth Amendment rule that governs collection of evidence from third parties in criminal investigations. [n1] The rule is simple: By disclosing to a third party, the subject gives up all of his Fourth Amendment rights in the information revealed. According to the Supreme Court: The Fourth Amendment does not prohibit the obtaining of information revealed to a third party and conveyed by him to Government authorities, even if the information is revealed on the assumption that it will be used only for a limited purpose and the confidence placed in the third party will not be betrayed.

Small business close due to fear of crime

Skogan 86 (Wesley Skogan, researches crime prevention, faculty member of northwestern university, "Fear of Crime and Neighborhood Change," file:///C:/Users/navorale/Desktop/Fear.of.Crime.and.Neighborhood.Change.1986%20(1).pdf, 1986)

One barometer of trends in urban neighborhoods is commercial activity. Because they are located on major streets and intersections, small retail shops are one of the most visible features of a community, so their appearance and character may help determine those trends as well (McPherson et al. 1983). Research by Aldrich and Reiss (1976) and McPherson (1978) indicates that disorder and crime hurt small retail establishments by affecting their profitability and not by direct victimization, so business factors are critical. When an area enters the cycle of decline, there will be fewer prosperous shoppers, outsiders will not come into the area to shop, and fewer customers of any kind will be out after dark. Existing stores may close because the market they once served no longer exists. Others may change their hours, prices, and served no longer exists. Others may change their hours, prices, and types of goods in order to stay open. Convenience stores stocking fewer goods at somewhat higher prices grow in number.

Small business is key to the economy

Strauss 11(Steve Strauss, USA today small business columnist, " Why only small business can save America," http://usatoday30.usatoday.com/money/smallbusiness/columnist/strauss/2011-08-08-small-business-can-save-america_n.htm, August, 7, 2011)

The bad news is all around us and never seems to end. If it's not Tea Party Republicans who somehow, shockingly seemed willing to allow the country to go into default before they would accept even the most basic of revenue increases, it's a president who seems unable to match his legislative ability to his previous soaring rhetoric, sharp mind and historic promise. And that's for starters. Unemployment remains far too high, hovering near 9%. The deficit is all too real and getting bigger. China is emerging as a global power, and taking the lead in creating green energy solutions - the clear, big playing field of this new century. Here at home, Gen X and Gen Y'ers seem resigned to living in a country that was not as great as the one they were born into, and my generation - Baby Boomers - are only too happy to collect our benefits. What are we to do? Entrepreneurship is the answer. Small business to the rescue. Foster startup fever. In America, small business has always been The Answer. More than 99% of businesses with payrolls in this country are small businesses, according to the Small Business Administration, and those small businesses historically employ more than half of all workers and create 80% of new jobs. Small business is, and always has been, the engine that moves the country forward. So if the stagnant political class really wants to get this country moving again, and help reassert our rightful place as the most innovative, entrepreneurial, industrious place on the globe, they need to start enacting policies and programs that do one thing - help small businesses and entrepreneurs. What we need is a comprehensive 21st Century Entrepreneurship Act. Want to lower the unemployment rate? Cultivate small business startups and you will. Want more tax revenue? Foster entrepreneurial growth and you will get it. Want to see America create the Next Big Thing? Help small business and just watch where it leads us. The last great boom, during the Clinton administration, created more than 20 million jobs, and many of those came from startups that grew. In 1992, hardly anyone had ever heard of the Internet and no one knew what an Amazon.com was. Today that company, started out of Jeff Bezos' garage, employs about 30,000 people. In 1992, Starbucks was a regional business with about 100 stores. Today it is a public company worth more than $27 billion, and it has more than 6,500 stores. Was there ever a better friend to small business, someone who believed in the power of free enterprise, more than Ronald Reagan? As he said in a May, 1988 speech to students at Moscow University: "The explorers of the modern era are the entrepreneurs, men with vision, with the courage to take risks and faith enough to brave the unknown. These entrepreneurs and their small enterprises are responsible for almost all the economic growth in the United States." The great economic growth during the Reagan administration was similarly fueled by a commitment to, and fostering of, entrepreneurship. So what does "promoting small business and entrepreneurship" mean? What does it look like? I am privileged to be a member of the board of the World Entrepreneurship Forum. This global think tank has spent a lot of time considering what governments can and should do to promote entrepreneurship. They include: "Reform Regulations: To promote a truly entrepreneurship-centered business climate, reform tax and regulatory environments so as to make it easier, faster, and less costly for entrepreneurs to set up enterprises. "Create

Entrepreneur-Friendly Institutions: Introduce entrepreneurship-friendly support institutions that provide technological knowledge, market information, business know-how, certification services, access to capital, and other essential business support. "Understand Entrepreneurship: Make it known that entrepreneurs are positive agents of social change, wealth creation, transparency, sustainability, and innovation." A comprehensive 21st Century Entrepreneurship Act would include tax reform, and regulatory ease. It would include, as SBA administrator Karen Mills recently wrote, immigration reform so we can again attract the best and brightest entrepreneurs and engineers to our country. It would increase access to capital. It would help more startups start up. It would foster business incubators and programs like Business Matchmaking. And it would require something that those in Washington have forgotten about, something that cannot be legislated, but cannot be ignored: It would require pulling together for the common good and the promise that is America. I, like many Americans, am disappointed in both the president and Congress. But I still hold out hope, because I know what is possible, what we can do together. So to our leader, I say: Mr. President, tear down these walls!

Econ decline causes nuclear war

Hutchinson 14 (Martin, Business and Economics Editor at United Press International, MBA from Harvard Business School, former international merchant banker, 1-3-14, "The chilling echoes of 1914, a century on" Wall Street Journal) http://online.wsj.com/articles/william-galston-secular-stagnation-may-be-for-real-1409095263,

The years before 1914 saw the formation of trade blocs separated by high tariff barriers. Back then, the world was dominated by several roughly equivalent powers, albeit with different strengths and weaknesses. Today, the world is similarly multi-polar. The United States is in a position of clear leadership, but China is coming up fast. Europe is weaker than it was, but is still a force to be reckoned with. Japan, Russia, Brazil, India are also too powerful to ignore. A hundred years ago, big international infrastructure projects such as the Berlin-Baghdad Railway, and before it the Suez Canal, were built to protect favored trading. Today's equivalent may be the bilateral mining partnerships forged between, for instance, China and mineral-rich African states. Today, the World Trade Organization offers some defence against tariffs. But protectionism could be become entrenched if prolonged economic stagnation leads countries to pursue their own narrow interests. Germany, Austria, Russia and France lost between 20 and 35 percent of national output between 1913 and 1918, according to Angus Maddison's data used in Stephen Broadberry's "The Economics of World War One: A Comparative Analysis". British GDP declined in 1914 and 1915, but grew 15 percent over the four years, as did the U.S. economy. The 37 million military and civilian casualties may tell a more accurate story but if history were to repeat itself, the global conflict could be both more universal and more destructive. Nuclear weapons proliferate. Warped diplomatic anger could lead to the deployment of chemical and biological devices. Electromagnetic pulses could wipe out our fragile electronic networks. Like the assassination of Archduke Ferdinand that sparked World War One, the catalyst for cataclysm might be something quite surprising. A global run on bank and other investment assets or an outbreak of hyperinflation, maybe? These threats get more serious the more policymakers pump up equity, bond, property and banking bubbles. If global wealth evaporates, or is proven to be an illusion, today's largely cordial global entente could be smashed with precipitous speed.

2nc: Fear of crime bad

Fear of crime economically destroys communities

Skogan 86 (Wesley Skogan, researches crime prevention, faculty member of northwestern university, "Fear of Crime and Neighborhood Change," file:///C:/Users/navorale/Desktop/Fear.of.Crime.and.Neighborhood.Change.1986%20(1).pdf, 1986)

Recent research on fear of crime and neighborhood change suggest that neighborhoods change only slowly unless "triggering" events shift them from a position of relative stability into one of demographic and economic flux. Those precipitating events include disinvestment, demolition, and demagoguery plus regional and national economic forces. Once areas begin to decline, "feedback" processes can take command of neighborhood conditions. Problems such as crime, physical deterioration, and social disorder emerge. Resulting increases in fear of crime in turn undermine the capacity of the community to deal with its problems. Fear stimulates withdrawal from the community, weakens informal social control mechanism, contributes to the declining mobilization capacity of neighborhood, speeds changes in local business conditions, and stimulates further delinquency and disorder. These problems feed on themselves spiraling neighborhoods deeper into decline. There is evidence that some areas can break out of this downward spiral, and the examples illustrate the place of crime among the factors that determine a neighborhood's eventual

fate. However, there is little evidence that those hard-won victories are common, and in the aggregate the effect of fear on the fabric of American society has been very consequential.

AT: Small businesses not a target/not key

Small businesses are targets of crime.

Bressler 9 (Martin Bressler, professor, consultant, and author, currently works at Southeastern Oklahoma State University, "The Impact of Crime on business: A model for Prevention, Detection and Remedy," http://www.aabri.com/manuscripts/09202.pdf, July 2009)

Despite fewer employees and smaller revenues, small businesses may be more susceptible to business crime. As most businesses are small businesses, nearly half of the U.S. workforce is employed in small businesses. The Association for Certified Fraud Examiners indicates 39% of reported instances of fraud occur in companies with 99 or fewer employees (Bank Technology News). The U.S. Small Business Administration reports 13% of small businesses become crime victims, yet less than half (48%) instituted any preventive measures (Small Business Research Summary). This could be a major reason why crime is a major factor in up to 30% of small business failures (U.S. Chamber of Commerce). In addition, small business ventures with less than $5 million in annual revenues may be up to thirty-five times more likely to become a crime victim than their larger counterparts (U.S. Chamber of Commerce). Unfortunately, small business owners prosecute less than 30% of fraud cases (Larimer, 2006). Many crimes committed against small business go unreported to police for a variety of reasons. In some cases, crimes committed by employees or local persons known to the business owner go unreported as the business owner might not want to press charges for fear of negative publicity or loss of confidence in the business. In other instances, such as vandalism, small business owners might assume that police would be unable to apprehend and charge the vandals.

Crime causes poverty

Facey 12 (Davie Facey, writer for the Jamaican Gleaner, "Crime is the biggest threat," http://jamaica-gleaner.com/gleaner/20120915/letters/letters4.html, September 15, 2012)

Economic activities influence all spheres of life and human development, and factors which are disincentives to investment and the growth of businesses naturally retard economic development and contribute to the rise in poverty. Crime is the biggest threat to national development. Poverty, it is often said, leads to crime. But the overwhelming majority of poor people are not criminals. It is more the case that crime is causing poverty. The high crime rate, and not migration, has caused our biggest brain drain, because we are killing many of our most creative and productive citizens. There are numerous livelihoods and lives which have been destroyed by criminals. Businesses, creativity and productivity, we are told, will lead to prosperity. But people become very reluctant or even refuse to start businesses, because any suggestion of prosperity makes people a target. This kills the entrepreneurial spirit of many of our brightest, most creative and productive citizens. Employment factors influenced many to migrate. But many entrepreneurs also migrated after suffering heavy losses by criminals, including loss of life, and many bright, young graduates will also migrate because of the crime problem. Crime has also reduced foreign investments and affected tourism, our biggest foreign-exchange earner. All these have summarily meant fewer employment opportunities and a vicious cycle of underdevelopment from the community to the national level. The primary role of government is to ensure the protection of lives and property of its citizenry. One possible means to reduce crime is to place the security forces on constant high alert, similarly to a general election period. Increase patrols in public places and the number of random and spot checks. The security forces' presence would be felt at all times to serve as a deterrent. Many have argued that random checks are an interference to people going about their daily routines. But isn't it better to be

inconvenienced by the police than be attacked or killed by criminals? There is no denying our high crime rate; but many are in denial of its devastating impact, deaths, destruction and widespread poverty.

Poverty kills millions of people a year

Pogge 5(Thomas Pogge, professor of philosophy and international affairs at Yale university, "World Poverty and Human Rights [Full text]," http://www.carnegiecouncil.org/publications/journal/19_1/symposium/5109.html, March 30, 2005)

Despite a high and growing global average income, billions of human beings are still condemned to lifelong severe poverty, with all its attendant evils of low life expectancy, social exclusion, ill health, illiteracy, dependency, and effective enslavement. The annual death toll from poverty-related causes is around 18 million, or one-third of all human deaths, which adds up to approximately 270 million deaths since the end of the Cold War.[1] This problem is hardly unsolvable, in spite of its magnitude. Though constituting 44 percent of the world's population, the 2,735 million people the World Bank counts as living below its more generous $2 per day international poverty line consume only 1.3 percent of the global product, and would need just 1 percent more to escape poverty so defined.[2] The high-income countries, with 955 million citizens, by contrast, have about 81 percent of the global product.[3] With our average per capita income nearly 180 times greater than that of the poor (at market exchange rates), we could eradicate severe poverty worldwide if we chose to try—in fact, we could have eradicated it decades ago. Citizens of the rich countries are, however, conditioned to downplay the severity and persistence of world poverty and to think of it as an occasion for minor charitable assistance. Thanks in part to the rationalizations dispensed by our economists, most of us believe that severe poverty and its persistence are due exclusively to local causes. Few realize that severe poverty is an ongoing harm we inflict upon the global poor. If more of us understood the true magnitude of the problem of poverty and our causal involvement in it, we might do what is necessary to eradicate it. That world poverty is an ongoing harm we inflict seems completely incredible to most citizens of the affluent countries. We call it tragic that the basic human rights of so many remain unfulfilled, and are willing to admit that we should do more to help. But it is unthinkable to us that we are actively responsible for this catastrophe. If we were, then we, civilized and sophisticated denizens of the developed countries, would be guilty of the largest crime against humanity ever committed, the death toll of which exceeds, every week, that of the recent tsunami and, every three years, that of World War II, the concentration camps and gulags included. What could be more preposterous? But think about the unthinkable for a moment. Are there steps the affluent countries could take to reduce severe poverty abroad? It seems very likely that there are, given the enormous inequalities in income and wealth already mentioned. The common assumption, however, is that reducing severe poverty abroad at the expense of our own affluence would be generous on our part, not something we owe, and that our failure to do this is thus at most a lack of generosity that does not make us morally responsible for the continued deprivation of the poor. I deny this popular assumption. I deny that the 955 million citizens of the affluent countries are morally entitled to their 81 percent of the global product in the face of three times as many people mired in severe poverty. Is this denial really so preposterous that one need not consider the arguments in its support? Does not the radical inequality between our wealth and their dire need at least put the burden on us to show why we should be morally entitled to so much while they have so little? In World Poverty and Human Rights,[4] I dispute the popular assumption by showing that the usual ways of justifying our great advantage fail. My argument poses three mutually independent challenges.

2nc poverty causes terror impact

Poverty causes terrorism

Ather 14 (Usamah Ather, Associate at NBP & attended U of Karachi, Sep 16 2014"Poverty breeds Terrorism" http://blogs.arynews.tv/poverty-breeds-terrorism/)

Globally, the debate on terrorism has gained much attention since the beginning of this century. For the last many years terrorism along with its origin, causes, effects, consequences and implications is amongst the hot topics of debate in the discipline of social sciences, many valuable studies in developed and developing nations have been conducted to establish the relationship of terrorism with its root causes and remedies. The terrorist attacks have been patent with the different names as terrorism, extremism, religious fundamentalism, clash of civilizations etc. Internationally the burning issue of terrorism has many folds; it has embraced many countries to rethink their security strategies. From money laundering to cyber-crimes

everything has now been critically examined to find linkages with terrorism. Nations have invested a substantial amount of their budgets for internal and external security. The study of terrorism is multidisciplinary covering a number of grounds including political science, sociology, criminology, Psychology, economics and many others. Researchers in their respective capacities have tried to elaborate the phenomenon, yet it has generally highlighted more queries than provided retorts**.** The studies reveal that most of the authors have linked terrorism with its causes by focusing on psychology of individuals or groups. A meaningful work of Jerrold(2002) is a distinction that outlines psychological thinking of individuals involved in terrorism by focusing on extent of conditions and characteristics that can force individual/group to take a risk to indulge in terrorism. Edward Newman (2006) has described the root causes of terrorism he stated that root causes can be further broken down into permissive structural factors and direct underlying grievances Structural factors create an enabling environment that, alone, is of no explanatory value but when in conjunction with other factors, may have explanatory value. Underlying grievances are more than merely structural: they represent tangible political issues. As far as substantial and worthwhile works are concerned Andrew Silke points outs "a review of recent research work found that only about 20 percent of published articles on terrorism are providing substantially new knowledge on the subject" (2003: xvii).Many scholars have argued the lack of concrete research and a viable theory of terrorism (see Deflem, 2004; Bergesen and Lizardo, 2004). The studies done on the topic of poverty as a main cause to induce terrorism reveals scatter results while there are some studies which exhibit a strong relation and vice versa. However, all theories are united on one point that some type of conflict is at the base of every terrorist movement. Some theories just confine themselves to explaining what generates this conflict, while others explain how this conflict may turn into acts of terrorism. Hence, there is a strong need for developing a theory of terrorism after synthesizing the scattered facts and theories, which could offer "explanation of its causation, the dynamics of its escalation and de-escalation" (Turk, 2004: 285). As defined by Webster's dictionary, terrorism is "the systematic use of terror especially as a means of coercion." We have seen in the past the many nations have been attacked by terrorist, endangering valuable lives of humans and other assets. According to the Global terrorism Index 2012 the countries ranked on highest numbers have majority of features in common. For instance all the first four countries possess high poverty, illiteracy, unemployment combined with poor health and education condition. Republics that belongs to lower or lower-middle income cluster have experienced the worst terrorist activities in the past decade with a tenfold increase occurring since 2002. This is shown in the list above by the point that amongst the 10 nations that have the highest scores in Global terrorism Index, 07 are classified in the category of lower-middle and two are classified in low income category. In recent years, Afghanistan and Somalia (both belong to low income category) have experienced growth in terrorist attacks that is multiple of 04 times since 2002. According to Global Peace index report of 2013 Injuries and fatalities in lower middle income countries took a sharp rise in 2005 mirroring the drastic increase observed in Iraq during this period. This increase began in January 2005 as Iraq held its first democratic election after the Second Gulf War. Upper middle and high income countries have seen a steady decrease in fatalities from 2002. Altogether South Asian region is amongst the least peaceful region as compared to all over the world. Afghanistan, Pakistan and India have experienced relatively higher terrorism from the recent years. It must be noted that the terrorism in all three countries have different origins and shapes. Saroj Kumar Rath (2012) states that however, the task of uncovering terrorism's root causes is complicated because certain types of causes, such as poverty or modernization, produce all kinds of social outcomes, of which terrorism is just one (Bjorgo, 2005: 2). British PM Tony Blair emphasised that 'Terrorism's teeth are planted in the fertile soil of wrongs un-righted, of disputes left to fester for years or even decades, of failed states, of poverty and deprivation (Blair. 2001). Secretary of State Colin Powell said that 'the root cause of terrorism does come from situations where there is poverty, where there is ignorance, where people see no hope in their lives (Powell. 2002).' A US Senate Resolution declared that "The education of children around the world addresses several of the root causes of international terrorism. The distribution of food in schools increases the attendance of children who might otherwise be susceptible to recruitment by groups that offer them food in return for their attendance at extremist schools or participation in terrorist training camps" (Congressional Record, 2004: 11533). Consequentially, the US National Strategy for Combating Terrorism cites winning the 'War on Poverty' as a means to diminish support for terrorist organizations and recruitment (Khan& Afshan, 2008: 65-86). Kim Dae-Jung, the 2000 Nobel Peace Prize recipient and President of South Korea said that, "At the bottom of terrorism is poverty. That is the main cause. Then there are other religious, national, and ideological differences" (Jai, 2001). Particularly in the scenario of South Asia and Countries like Iraq and Somalia it is evident that the elements that provide the breeding space for terrorism are in abundance. The political structure is labeled with poor governance and corruption; the state does not fulfills its responsibility in providing food, shelter, clothing, education and health to the common. Most importantly the countries in which youth makes up a significant proportion of the total population like Pakistan the dramatic rise of youth unemployment is critical and is likely to establish the fundamental engine of political violence and terrorism. Caruso and Schneider (2011) find a positive and significant association between youth unemployment and terrorism in Europe for the period 1994-2007. In particular, they find a significant association between youth unemployment and incidence of terrorism. Caruso and Gavrilova (2012) find a positive association between the growth rate of youth unemployment and the brutality and incidence of violence in Palestine. How these developing countries can invest on youth to make them economically viable; when the cost that has been incurred to strengthen the internal and external security is so much that it does not allow the government regimes to allocate substantial amount for the development programs for youth. According to Transparency International report India is spending 4% on its education sector of its total GDP, where as Nepal 3.4%, Srilanka 2.1%, Bangladesh 2.4% and Pakistan 2.2%. As far as military expenditure and defense budgets are concerned they are far above the education and health spending. The need of the

day is that for a better and prosperous world, all the developing countries should invest generously on their human resource to make them economically viable. The education and health sectors should be given handsome proportions to make this world more peaceful

> This sad fact is not limited to the United States. Globally, 18 million deaths a year are caused by structural violence, compared to 100,000 deaths per year from armed conflict. That is, approximately every five years, as many people die because of relative poverty as would be killed in a nuclear war that caused 232 million deaths, and every single year, two to three times as many people die from poverty throughout the world as were killed by the Nazi genocide of the Jews over a six-year period. This is, in effect, **the equivalent of an ongoing, unending, in fact accelerating, thermonuclear war or genocide, perpetuated on the weak and**

Poverty kills millions.

Gilligan 2000 (James Gilligan, Department of Psychiatry Harvard Medical School, VIOLENCE: REFLECTIONS ON OUR DEADLIEST EPIDEMIC, 2000, p 195-196.)

The 14 to 18 million deaths a year cause by structural violence compare with about 100,000 deaths per year from armed conflict. Comparing this frequency of deaths from structural violence to the frequency of those caused by major military and political violence, such as World War II (an estimated 49 million military and civilian deaths, including those caused by genocide--or about eight million per year, 1935-1945), the Indonesian massacre of 1965-1966 (perhaps 575,000 deaths), the Vietnam war (possibly two million, 1954-1973), and even a hypothetical nuclear exchange between the U.S. and the U.S.S.R (232 million), it was clear that even war cannot begin to compare with structural violence, which continues year after year. In other word, every fifteen years, on the average, as many people die because of relative poverty as would be killed in a nuclear war that caused 232 million deaths; and every single year, two to three times as many people die from poverty throughout the world as were killed by the Nazi genocide of the Jews over a six-year period. This is, in effect, the equivalent of an ongoing, unending, in fact accelerating, thermonuclear war, or genocide, perpetrated on the weak and poor every year of every decade, throughout the world.

II. Substitution Effects and the Functional Role of the Third-Party Doctrine The widespread criticism of the third-party doctrine overlooks two important benefits of the rule. This Part explains the first major benefit of the third-party doctrine: It ensures technological neutrality in Fourth Amendment rules. The use of third parties has a substitution effect. It enables wrongdoers to take public aspects of their crimes and replace them with private transactions. Without a third-party doctrine, suspects can act opportunistically to effectively hide their criminal enterprises from observation. The result upsets the basic balance of Fourth Amendment law, undercutting the deterrent and retributive force of criminal law. The third-party doctrine blocks such efforts, resulting in a rough equivalence in the overall amount of privacy for criminals acting alone and the amount of privacy for those using third parties. To develop this argument, I will start with the basic balance of the Fourth Amendment. I will explain how third parties threaten this balance and how the third-party doctrine retains it. I will then cover a few examples [*574] and conclude by showing how the doctrine is an essential aspect of the technological neutrality of Fourth Amendment rules.

U.S. violent crimes including murders fell 4.4 percent in 2013 to their lowest number since the 1970s, continuing a decades-long downturn, the FBI said on Monday. The law enforcement agency's annual Crime in the United States report showed the country had an estimated 1.16 million violent crimes last year, the lowest number since 1.09 million were recorded in 1978. All types of violent crimes were lower, with murder and non-negligent manslaughter off 4.4 percent to 14,196, the lowest figure since 1968. Rape was down 6.3 percent and robbery fell 2.8 percent, the Federal Bureau of Investigation data showed. James Alan Fox, a criminologist at Northeastern University in Boston, said there was a variety of factors behind the decline in violent crime in recent decades, including the United States having the highest rate of imprisonment in the world. He said an aging population and improved police tactics also played a role, along with the increased use of security cameras and the pervasive use of phones to take videos. "It's hard for criminals to do anything without being caught on video," Fox said. The violent crime rate last year was 367.9 for each 100,000 in population, down 5.1 percent from 2012. The rate has fallen every year since at least 1994, the earliest year for readily accessible FBI data, and the 2013 figure was about half the 1994 rate. Property crimes fell 4.1 percent to an estimated 8.63 million last year, the 11th straight yearly decline. Losses from property crimes excluding arson were calculated at $16.6 billion, the FBI said. In an analysis, the non-profit Pew Charitable Trusts said the drop in crime coincided with a decline in the prison population, with the number of U.S. prisoners down 6 percent in 2013 from its peak in 2008. Thirty-two of the 50 states have seen a drop in crime rates as the rate of imprisonment fell, Pew said. California notched the largest drop in imprisonment rate over the five-year period, at 15 percent, and crime was down 11 percent. The state has been under court order to reduce prison overcrowding, and voters last week approved an initiative that reduced sentences for some crimes.

Repealing the Third Party doctrine would make it functionally impossible to collect information on terrorists

Baker 14 (Stewart Baker, Writer at the Volokh Conspiracy, contributor at the Washington Post, "The third grade and third-party doctrine", January 22nd, 2014, Washington Post, https://www.washingtonpost.com/news/volokh-conspiracy/wp/2014/01/22/the-third-grade-and-third-party-doctrine/, JAS)

Randy's solution to that problem is to overrule a line of Supreme Court cases (Smith v. Maryland) holding that no one has a reasonable expectation of privacy in information they've disclosed to a third party. With Smith v. Maryland set aside, the government would need a search warrant to see the metadata. Overruling Supreme Court precedent is a law professor's prerogative, but the rest of us don't have to go along. And in fact the Smith v. Maryland doctrine makes sense, especially compared to Randy's solution. We all learned no later than the third grade that secrets shared with another are not really secrets. They can be revealed at times and in ways we never expected. It hurts, but it's a fact of life. Randy's solution is a fiction; he wants the courts to deny the facts of life and pretend that we still control information we willingly gave away. And considering how many slippery slopes Randy has to invoke to make metadata collection scary, he hasn't given much thought to the slipperiness of the doctrine he wants to create. Data gets cheaper to collect and to share all the time. Exactly which kinds of data would he leave under our fictional control after we have given it up, and for how long? After the fictionalizing and overruling is done, though, all Randy achieves is to require a warrant before the government can get phone metadata. That rule would break the NSA program, for sure, and it would recreate the gap that existed on September 10. It would also take away an investigative tool that has been used by law enforcement more than a million times a year, and for nearly a century, without as yet producing a totalitarian American state. And what benefits do we get for incurring that high cost? After all, courts too are government agencies staffed by human beings; the ex parte process of obtaining warrants is hardly a certain guarantee against the Dark Night of Fascism. It's just a bigger speedbump – and probably a less effective protection than we now have. The NSA metadata program, unlike a warrant, is reviewed by members of both parties, both houses of Congress, and the judiciary. It includes audits and oversight that search warrants never get.

– Domestic surveillance is actually key to preventing cyberattacks on critical infrastructure

Betts and Sezer 14 (Jennifer Betts, Sakir Sezer, writers for Queen's University Belfast, http://www.researchgate.net/profile/Jennifer_Betts/publication/263013766_Ethics_and_Privacy_in_National_Security_and_Critical_Infrastructure_Protection/links/02e7e539963e847cdb000000.pdf, Ethics and Privacy in National Security and Critical Infrastructure Protection, May 2014)

The legislation is clear that national security measures have precedence over data protection. Dependency on critical infrastructures in modern societies makes them a target for cyber warfare, organised crime and terrorism. Critical infrastructures include power and water supplies, traffic management systems, financial services and communication networks. Attacks on any of these

can damage economies, cause natural disasters and lead to loss of life. Therefore their protection is vital to national security and public safety. Despite this, critical infrastructure providers are bound by data protection regulation in Europe as their administration networks store personally identifiable and financial information. Data protection for their service users and employees has a central role in designing security systems for critical infrastructure network protection. A growing awareness of the vulnerability of industrial control systems means that their protection has become a global priority. An analysis of critical information infrastructure systems revealed how different priorities in critical infrastructure protection dictate different approaches. When economic outcomes are the priority the main actors come from the private sector, with business continuity being the key consideration. In law and order, the main actors come from the law enforcement establishment to address issues ranging from technology enabled crime to crimes against individual computer users. Notably, where the issue is one of 'national security', the perception is that the whole of society and its core values are in danger due to their dependence on communication technology. In this case the main actors are from the security establishment with action taken at technical, legislative, organisational or international levels [10

To make matters worse **a cyber attack** that can take out a civilian power grid, for example could also **~~cripple~~ (destroy) the U.S. military**.¶ The senator notes that is that the same power grids that supply cities and towns, stores and gas stations, cell towers and heart monitors also power "**every military base** in our country."¶ "Although bases would be prepared to weather a short power outage with backup diesel generators, within hours, not days, fuel supplies would run out", he said.¶ Which means **military c**ommand **and c**ontrol centers could **go dark**.¶ Radar systems that detect air threats to our country would shut Down completely.¶ "Communication between commanders and their troops would also go silent. And many weapons systems would be left without either fuel or electric power", said Senator Grassley.¶ "So **in a few short hours** or days, the mightiest military in the world would be left scrambling to maintain base functions", he said.¶ We contacted the Pentagon and officials confirmed the threat of a cyber attack is something **very real**.¶ Top national security officials—including the Chairman of the Joint Chiefs, the Director of the National Security Agency, the Secretary of Defense, and the CIA Director— have said, "preventing a cyber attack and improving the nation's electric grids is among the most urgent priorities of our country" (source: Congressional Record).¶ So how serious is the Pentagon taking all this?¶ Enough to start, or end a war over it, for sure.¶ A cyber attack today against the US could very well be **seen as an "Act of War"** and could be met with a "full scale" US military response.¶ That could include the use of **"nuclear weapons",** if authorized by the President.

"These programs, especially the FAA 702 [Prism], are the biggest producers of intelligence on terrorism [and] counterintelligence efforts," Alexander says. "And so we have to ensure that we don't hurt these programs as we go forward." He is especially eager to explain the "215" program that involves the mass collection of phone call metadata. "That program, by itself, is the hornet's nest," Alexander says. "It is the hornet's nest that [enables] the NSA to see threats from Pakistan and Afghanistan and around the world, share those insights with the FBI—who can look inside the United States, based on their authorities—and find out, is there something bad going to happen here?" Alexander cites the case of **Najibullah Zazi, the radical Islamist who planned to bomb the New York City subways in 2009,** implying that information collected under the program led to his capture. "My concern is that, without knowing the facts, people will say, 'Let's put that hornet's nest away.' We sure would like to get rid of that hornet's nest. We would like to give it to somebody else, anybody else. But we recognize that if we do that, our nation now is at greater risk for a terrorist attack. So we're going to do the right thing; we're going to hold on to it, let people look at the options. If there is a better option, put it on the table." 1 Oddly, at heart, the NSA's complaints sound remarkably similar to those of the tech companies: People don't understand us. "No one knows how the NSA works," Ledgett says. "It's always been a black box, Enemy of the State movies, stuff like that. People don't understand the NSA's checks and balances."

Domestic surveillance key to preventing critical infrastructure destruction –

Betts and Sezer 14 (Jennifer Betts, Sakir Sezer, writers for Queen's University Belfast, http://www.researchgate.net/profile/Jennifer_Betts/publication/263013766_Ethics_and_Privacy_in_National_Security_and_Critical_Infrastructure_Protection/links/02e7e539963e847cdb000000.pdf, Ethics and Privacy in National Security and Critical Infrastructure Protection, May 2014)

Achieving a balance between individual privacy and national security is increasingly controversial and technically challenging; "…the multiplication of databases and growth of new technologies raise new challenges to the protection of European's fundamental rights to personal data and privacy" [12]. We would also argue that, prior to Snowden, the impact of data surveillance techniques were viewed as something affecting a minority of the population, and costs to privacy were regarded as reasonable when weighed against implications for public safety. Given the secrecy surrounding surveillance, it is not surprising that public opinion was neither particularly informed nor evident. Referring to how society's beliefs are shaped in relation to critical infrastructure protection in particular, Burgess [13] conceptualises critical infrastructures and their protection in terms of 'social values'. In doing so, he shifts the emphasis from the actual critical infrastructure to the effect its destruction has on the psyche of citizens, both in the areas affected and globally. His main argument is that a terrorist attack on a critical infrastructure has less to do with the disruption and even loss of life this may cause, but rather the loss of confidence of people in their critical infrastructures. The reality of future attack makes it easy to engender fear and uncertainty and the value for the terrorist is in the fear they create rather than the material value of the critical infrastructure [13]. Further explanations for the acceptance of surveillance techniques cite perceptions of risk that overestimate the risk of terrorism, while underestimating harms that might come from a reduction in privacy [14]. It is also argued that the way in which threats are presented to the public informs what security reactions are seen as acceptable [15]. For example, an internet virus corrupting thousands of computer systems, if

viewed as a criminal attack prompts users to take measures to protect their individual online security. However, if the same attack is construed as an attack on the information network system of the nation it will be viewed as grounds for greater government surveillance. Different rationale leads to different technical design and, crucially, different levels of tolerance in a reduction of privacy protection. Motivated by how values influence the design and regulation of technologies, Nissenbaum argues for ethics and political values to be added to considerations and constraints in the design and regulation of systems [15].

Cyber Criminals DA

The third party doctrine is critical to defend against cyber criminals

Kerr 09 ** We don't endorse gendered language

(Orin Kerr, professor of law at the George Washington University Law School, "THE CASE FOR THE THIRD-PARTY DOCTRINE", 2009, Michigan Law Review, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1138128, JAS)

Third parties pose a major threat to the Fourth Amendment's basic division between unregulated and regulated steps. The reason is that third parties act as remote agents that permit wrongdoers to commit crimes entirely in private. Those committing crimes naturally try to hide them from the police; no criminal wants to get caught. If a wrongdoer can use third parties as remote agents, he can reduce his exposure to public surveillance. Instead of going out into the world and subjecting himself to exposure, a wrongdoer can bring third-party agents inside and share plans or delegate tasks to them. He can use the third-party services to commit his crimes without exposing himself to spaces open to government surveillance. Put another way, the use of third parties often has a substitution effect. 85 Without the third party, the wrongdoer would have needed to go out into public spaces where the Fourth Amendment does not regulate surveillance. But use of a third party substitutes a hidden transaction for the previously open event. What would have been public now becomes hidden. The wrongdoer no longer needs to leave his home, as the third-party agents enable him to commit the crime remotely. The crime now comes to the criminal rather than the criminal going to the crime.86 Consider how a person might use third parties to commit crimes from the protection of his own home. A mob boss might summon his underlings to his house to give them orders. A stalker might call his victim on his home phone rather than lying in wait outside her door. A computer hacker might hack into computers thousands of miles away without leaving his bedroom. In all of these cases, individuals use third parties to carry on their crimes without exposing themselves to spaces unprotected by the Fourth Amendment. The third-party agents—the employee, the telephone, and the Internet—do the work remotely on the principal's behalf. Now we can see the importance of the third-party doctrine. Without the doctrine, criminals could use third-party agents to fully enshroud their criminal enterprises in Fourth Amendment protection. A criminal could plot and execute his entire crime from home knowing that the police could not send in undercover agents, record the fact of his phone calls, or watch any aspect of his Internet usage without first obtaining a warrant. He could use third parties to create a bubble of Fourth Amendment protection around the entirety of his criminal activity. The result would be a notable shift in the balance between privacy and security. If any observation of any part of the target's conduct violates his reasonable expectation of privacy, then the police would need a warrant to observe any aspect of his behavior. That is, they would need probable cause to believe that the evidence to be collected constitute evidence of the crime. But if the entire crime were protected by a reasonable expectation of privacy, they couldn't observe any aspect of the crime to develop that probable cause. The effect would be a Catch-22: The **police would need probable cause to observe evidence of the crime, but they would need to observe evidence of the crime first to get to probable cause**. In many cases, this would eliminate the use of third-party evidence in investigations altogether. By the time the police would have probable cause to believe that someone's thirdparty records are evidence of crime, they usually would already have probable cause to arrest and charge him with the crime.87 The third-party doctrine responds with a rule that ensures roughly the same degree of privacy protection regardless of whether a criminal commits crimes on his own or uses third parties. The part of the crime that previously was open to observation—the transaction itself—remains open to observation. The part of the crime that previously was hidden—what the suspect did without third parties in his home—remains hidden. The result leaves the Fourth Amendment rule neutral as to the means of committing the crime: Using a third party does not change the overall level of Fourth Amendment protection over the crime. If a person commits a crime on his own, the open part of the crime may be

observed by the police without a warrant. If he harnesses a third party, the third party's involvement is treated as open, resulting in roughly the same amount of open conduct as the self-executed crime.

Technology has made our world increasingly open, and for the most part that has huge benefits for society. Nevertheless, all of this openness may have unintended consequences. Take, for example, the 2008 terrorist assault on Mumbai, India. The perpetrators were armed with AK-47s, explosives and hand grenades. But heavy artillery is nothing new in terrorist operations. The lethal innovation was the way that the terrorists used modern information communications technologies, including smartphones, satellite imagery and night-vision goggles to locate additional victims and slaughter them. A vision of crimes in the future A vision of crimes in the future 19:25 PLAY VIDEO Moreover, the terrorists created their own operations center across the border in Pakistan, where they monitored global news broadcasts, online reporting and social media in real time, leveraging the public's photos, videos and social network updates to kill more people. TED.com: All your devices can be hacked The terrorists in the Mumbai incident even used search engines during their attack to identify individual hostages and to determine, based upon their backgrounds, who should live or and who should die. These innovations gave terrorists unprecedented situational awareness and tactical advantage over the police and the government. Newer forms of technology are also subject to criminal misuse. Robots are becoming more commonplace, and international organized crime groups and terrorists have lost no time in deploying these technologies as part of their field operations. For example, drug traffickers in Latin America are using robotic submarines to deliver thousands of tons of cocaine annually to the United States. Last year, the FBI arrested a man in Boston who planned to use remote-controlled robotic aircraft packed with explosives to attack both the U.S. Pentagon and Capitol building. In the future, as robots become more widely deployed, so too could their criminal use and exploitation. TED.com: How cyberattacks threaten real-world peace Advances in the life sciences means it is now possible to design DNA on a computer screen and send the DNA code to a "bio printer" for assembly. Our ability to reprogram DNA itself will undoubtedly lead to great advances in medicine, but the danger is that these same techniques can be used to modify viruses, like H5N1 influenza, to **become more and more lethal, potentially affecting millions around the globe**. To hackers, DNA is just another operating system waiting to be hacked. We are at the dawn of an exponentially advancing technological arms race between people who are using technology for good and those who are using it for ill. Though such battles have gone on since the beginning of time, what has changed is the pace of innovation. New technologies and capabilities are emerging so quickly, it becomes increasingly likely they will outpace the capabilities of public safety officials to respond. The **threat is serious, and the time to prepare for it is now**. I can assure you that the terrorists and criminals are.

Bio-printers can create toxins and diseases that can kill billions

Last October, scientists in California sequenced the DNA for the "type H" botulinum toxin. One gram of this toxin would be sufficient to kill half a billion people, making it the deadliest substance yet discovered – with no antidote. The DNA sequence was not placed on public databases, marking the first time genetic code has been withheld from the public over security concerns. As biological discoveries accelerate, we may need to censor even more genetic data. The line between digital data and our physical world is not as clear cut as it once was, with the advent of 3D printing technologies and DNA synthesisers. Many people are familiar with the first printed gun, cited heavily by the media as a dangerous development. But many would probably be surprised to learn that analogous technology is used to print pathogens. For example, the polio virus was successfully recreated in 2002, and the 1918 flu virus was resurrected by a DNA synthesiser in 2005. Pandora's box 2.0 The machines that make this resurrection possible serve many legitimate research purposes. Instead of painstakingly manipulating DNA in a local lab, scientists can get made-to-order sequences from a variety of DNA synthesis companies from around the world. Alternatively, if they have some extra cash and desk space, they could get one of the machines right here on Ebay. Access to such a machine gives scientists a critical edge in many areas of genomics research. But the increasing accessibility to this technology raises concerns about the "dual-use" nature of it as an unprecedented weapon. President Obama was worried enough to commission a report on the safety of synthetic biology, while volunteers have created software to detect malicious DNA sequences before an unsuspecting company prints them out. Is ignorance bliss? These are important first steps to more security, but they don't take us far enough. Part of the reason is due to something we call an "information hazard." For the first time in human history, knowledge that is discovered has a reasonable chance of never being forgotten. And while this would normally be a great thing, it also creates a ratchet effect with dangerous information – once a bit of malicious code is online, the whole world can dissect and modify it. We saw this with the infamous Stuxnet virus which appeared in 2010 – an elegantly created computer virus designed to hack Iranian nuclear labs and manipulate centrifuges to the point of breaking them. While this may have been a strategic boon for Israel and the United States, we now must contend with the availability of Stuxnet's source code, which was later posted to Github. The genius mechanisms the virus used to bypass security systems are now available to the world for delivery of alternative cyber payloads. If a similar dynamic emerged with biological code rather than computer code, the results could be catastrophic. About a century ago, 50m people died due to a particularly lethal strain of flu, the genome of which is available online. And it is estimated that if the same virus were to be released today, the initial death toll could top 80m. Any knowledge or technology that has the capability for such destruction ought to be handled with the same caution we give to nuclear secrets, even if it means slowing the advances in medical biotechnology.

This demonstrates that DTOs are advancing in overseas trafficking, setting up labs with possible construction of SPSSs; WMDs will soon follow. It is also common knowledge that once a relatively wealthy country such as South Africa becomes a major transit route, it is not long before it becomes a major drug consuming country‖ 143 An opportunity will always remain for DTOs to conspire with terrorists and use SPSSs for WMDs. It can be chemical or nuclear in nature, causing an international disaster in the Western Hemisphere. The USG and GOC have to take into account the worst-case scenario when dealing with such innovative technology of DTOs. For example, President Barrack Obama believes The **greatest threat to U.S. and global security is no longer a nuclear exchange between nations, but nuclear terrorism by violent extremists and nuclear proliferation to an increasing number of states**.144 This same idea applies to DTOs that may be coercing with terrorists, planning a WMD destruction attack using nuclear or biological weapons via SPSS. According to James Carafano of the Heritage Foundation, The threat is pretty much global, Sri Lanka saw a lot of this and we have seen some from Hamas as well, so we know groups are borrowing tactics from one another.145 It is not a far-fetched situation. DTOs are motivated by profits, and if these extremists were to offer a huge amount of money for the technology and development of SPSSs, a coastal or harbor attack can easily be carried out within a few years in the U.S. The creativity and expansion of these vessels will ignite drug cartels to improve the technology of another transiting tool for cocaine—underground tunnels. In 2007, congress passed legislation providing a 20-year maximum sentence for the developing or financing of subterranean passages between the U.S. and another country.146 The threat of tunnels being used to transports human cargo and drugs concerned congress, because ―these passages were directly on U.S. soil and could be used by terrorists‘ organizations to smuggle in dangerous weapons.‖ 147 The proceeding in passing laws against SPSSs, were based on the same philosophy and guidelines. Drug smugglers operating and transiting SPSSs would be given a ―maximum 15-20 years sentence, since, theoretically, it can carry more dangerous cargo and present a threat to the security of the United States.‖ 148

2NC Ext: Key to Cyber Crime

The third party doctrine is critical to being able to having a reasonable standard for investigating internet crimes

Kerr no date

(Orin Kerr, professor of law at the George Washington University Law School, "The Case for the Third Party Doctrine", after 2010, American Bar Association, http://www.americanbar.org/groups/public_services/law_national_security/patriot_debates2/the_book_online/ch4/ch4_ess2.html, JAS)

My argument rests on the need to maintain the technological neutrality of Fourth Amendment protections. The use of third parties is akin to new technology, and that technology threatens to alter the balance of power struck by the Fourth Amendment. The third-party doctrine offers a way to maintain the balance of police power: It ensures that the same basic level of constitutional protection applies regardless of technology. Or so I will argue, drawing from two recent articles of mine: The Case for the Third-Party Doctrine, 107 Mich. L. Rev. 561 (2009), and Applying the Fourth Amendment to the Internet: A General Approach, 62 Stan. L. Rev. 1005 (2010). My argument begins with a thought experiment. Let's start by imagining a world without third parties. If you want to send a package to a friend, you need to leave your home and carry it to your friend's house. If you want to go to the doctor's office, you need to visit it in person. In a world without third parties, you would need to venture out into the world on a regular basis to accomplish anything. Next, ask yourself how the Fourth Amendment would apply to police investigations in this world with no third parties. The rules would be simple. The police would need a warrant to enter your home, but they would be permitted to watch you in public. They could watch you leave your home, travel to the home of your friend, and disappear inside when you delivered your package. They could watch you leave your home, go to the doctor's office, and disappear inside. All these steps would occur in public, where the Fourth Amendment offers no protection from the watchful eye of the police. Now let's introduce third parties. Third parties allow individuals to do remotely what they would otherwise have to do in person. Instead of traveling to your friend to deliver the package, you can send the package through the postal mail. The postal network substitutes for your trip to your friend; instead of bringing your package to your friend, the mailman will do it. And instead of visiting the doctor in person, you could call the doctor on the phone. To borrow from the old advertising campaign for the Yellow Pages, you can "let your fingers do the walking." In each case, the third-party service means you no longer have to leave your home. The critical point from the standpoint of Fourth Amendment law is that use of third parties introduces a substitution effect. In a world with no third parties, individuals often have to travel in public. The police can see when individuals leave their homes, where they travel, and when they arrive. Using third parties allows individuals to substitute a private transaction for that public transaction. Facts that used to be known from public surveillance are no longer so visible. By allowing individuals to use remote services, the use of third parties has brought outdoor activity indoors. The question for Fourth Amendment law is how to respond to this technological shift. In my view, the goal should be to apply the Fourth Amendment in a technologically neutral way. In a world with no third parties, the Fourth Amendment strikes a balance of police power: It gives the government the power to investigate crimes in some ways, but also limits the government's investigations in important ways. I think that's a sensible balance, as it tries to balance our shared interests in deterring crime and punishing wrongdoing (which can only occur if the police successfully gather evidence to prove cases) with our commitments to privacy and avoiding government abuses of power. If I'm right that

this balance is proper, then it follows we should maintain it. We should try to apply the Fourth Amendment so that it offers the same basic protections and strikes the same balance in a world of third parties than it did in a hypothetical world without them. The third-party doctrine achieves that, in my view. The doctrine ensures that the Fourth Amendment applies to conduct that harnesses third parties in the same way it applies to events that occur without third-party help. It does so by matching the Fourth Amendment protection in the use of the third party with the Fourth Amendment protection that existed before. Smith v. Maryland is a good example. In Smith, a robbery victim was receiving harassing phone calls. The police suspected Smith, and they asked the phone company to install a pen register on his home phone line. Whenever a call was placed from Smith's home phone, the phone company would record the numbers dialed and keep a record for the police. The record showed that the calls did indeed originate from Smith's home, and the police used that evidence to get a warrant to search the home and prove Smith's guilt. The question in the case was whether the numbers dialed were protected by the Fourth Amendment. Before we get to the Court's reasoning in Smith, let's imagine what constitutional protection would apply if Smith could not use third parties but wanted to harass the victim anyway. Smith would have been forced to harass the victim in person: He would have left his house, walked to his car, and driven to her home. If the police suspected that Smith was the harasser, they could have watched him the entire way: All of Smith's conduct would have been exposed to public view without Fourth Amendment protection. The Court in Smith ruled that Smith had no reasonable expectation of privacy in his numbers dialed. That rule maintained the level of Fourth Amendment protection regardless of whether Smith used a third party to harass his victim. By holding that the use of the pen register did not constitute a search, the Court ensured that the police would have the same information either way. The time of the call, the originating number of the call, and the destination of the call are the informational equivalents of what the police would have learned by watching Smith in public if he had not used a third party. In other words, Smith could not change the balance of Fourth Amendment protection by using a third party; the Fourth Amendment offered the same level of protection either way. Importantly, my defense of the third-party doctrine implies an important limit: The doctrine should apply when the third party is a recipient of information, but it should not apply when the third party is merely a conduit for information intended for someone else. Put another way, the third-party doctrine should apply to the collection of non-content information in a network but not the contents of communications. The reason is that when the third party is merely a conduit for information, the information that is sent through the third party is not information that would have been revealed if no third parties had been used. In a world with no third parties, the message would remain private: If I bring you a sealed package in person, the government can't open up the package without a warrant. That same rule should and does apply if the delivered communication takes the form of a sealed letter in the postal mail, the contents of a phone call, or the contents of an e-mail. Greg Nojeim makes several rejoinders to my approach. First, he argues that use of third parties is unavoidable in our modern world. That may be right, but the same was true about going out in public in the world without third parties. It would be unpersuasive to argue that the Fourth Amendment must protect what occurs in the public square because venturing out into the public square is unavoidable in our modern life. In my view, it is equally unpersuasive to claim that the Fourth Amendment must protect third-party substitutes because modern life requires their use.

2NC Ext: Bio-printed Terror

Cyber Criminals can bio-print disease, causing mass pandemics and bioterror

(Marc Goodman and Andrew Hessel, chair for policy, law and ethics at the Singularity University and distinguished researcher at Autodesk Inc in the Bio/Nano Programmable Matter group, "The bio-crime prophecy: DNA hacking the biggest opportunity since cyber attacks", May 28th, 2013, Wired.com, http://www.wired.co.uk/magazine/archive/2013/06/feature-bio-crime/the-bio-crime-prophecy, JAS)

A living cell is analogous to a computer, albeit a very sophisticated one, made of carbon rather than silicon. At its heart is an operating system. It's written in DNA nucleotides -- chemical bits denoted in the less familiar As, Ts, Cs and Gs of DNA code -- but, fundamentally, not so different from the zeroes and ones of electronic software. Seen this way, cells are self-assembling, non-toxic, self-repairing, low-energy, infinitely scalable and adaptive computing devices. Moreover, even though life has evolved over billions of

years and digital computers have been engineered for just a few decades, their fundamental architectures aren't all that different. Cells are hardware and DNA is software. The result? Biology, like other forms of computing, can be hacked. And it is being hacked, every day. Marc Goodman Marc GoodmanArt Streiber Mapped on to computing's timeline, biological hacking is still in its early stages: roughly, we're in 1979. DNA hackers are still innocent, even playful. But this innocence is unlikely to last long: computing advances at the pace of Moore's law, in which processing power doubles or its price halves every two years, whereas genomics is charging ahead at least five times faster. The first human genome, which was completed in 2000, cost about £2 billion; now sequencing costs less than £2,500. And this is just the beginning -- a human genome could, in theory, cost less than a pound by the end of the decade. No other technology has fallen in price so quickly. Over the last 20 years, tens of billions of pounds have flooded into molecular biology and genetics industries. This has led to new technologies for reading DNA. Every day, new genomes are uploaded into health-science databases, and the pace is rapidly increasing. All this data has produced an army of bioinformatics scientists, whose job is to organise all this code and figure out what it does. But reading DNA is only the beginning: science has evolved to the point where human beings can write DNA code as well. As a result, thousands of scientists, known as genetic engineers, are programming living things directly. Genetic engineering used to be very hard and very expensive. Not any more. In fact, advanced genetic engineering can now be done with a just a few weeks of training, a laptop and a credit card. This means that we're on the cusp of a revolution in biotechnology: faster, cheaper and more powerful biotechnologies. On the positive side, this opens the door to scientific breakthroughs in biological understanding, diagnostics and new treatments. As we learn to code in biology, radical new possibilities arise, including abundant biofuels, better medicines and life extension. It also means that we could be approaching a new era of biological hacking, biological attack and even biological warfare. And the best place to look for how these scenarios -- some of them terrifying -- will play out is our experience of cyberspace. Bad bio There have been only a handful of non-government-sponsored biological attacks. The best known example was the mailing of anthrax spores to media outlets and two US senators in September 2001. Five people died. A deranged biotechnologist could create the stuff of nightmares Security agencies consider bioterrorism a growing risk for two reasons: the first is that advances -- such as DNA synthesis and biological design software -- allow the creation of biological agents in ways that were historically impossible. For instance, the Japanese terrorist organisation Aum Shinrikyo, the group behind the sarin gas attack on the Tokyo subway in 1995, had a full-scale bioweapons programme. Despite investing more than $10 million (£6.6 million) in the programme, the group abandoned it due to its complexity. Today such an attack is comparatively easy to carry out. Governments store any harmful agents ("select agents") they may have stockpiled in secure sites, but the DNA code of many of them exists in public databases. Synthetic biology, which allows the building of synthetic organisms, sidesteps these safeguards and potentially allows the design of novel bioweapons. The other reason is statistical: biological engineering could become as common as software engineering, bringing millions of new developers into the field. Lunatics must be expected. A deranged biotechnologist could create the stuff of nightmares: even a small attack could produce economic fallout disproportionate to any actual illness or death caused. And there's little need to even have a genuine agent in the first place; all that's required is some white powder. A few pennies' worth of baking soda and a stamp can result in disruptive evacuations and hundreds of wasted hours of investigator and police time, costing millions. This is a great return for the terrorist pound. Targeting publicly traded companies could provide terrorists the opportunity to profit from short selling. Officials lack tools to analyse biological agents quickly and, indeed, often know little about microbes. Moreover, a 2008 US government report warned that civilian labs with dangerous pathogens could easily be compromised.

2NC Epistemological Defense: Disease Reps

We need apocalyptic discourse about disease to prevent actual pandemics

I wonder if part of the reason Rees has been wrong is because of the overblown rhetoric regarding the so far non-existent bug that will kill all of humanity. It's an excellent premise for a show or a movie (or hey, a column), and these stories make for great (read: clickable) headlines in newspapers. "Witness: The Age of Pandemics" (WSJ); "A Deadly Disease Could Travel at Jet Speed Around the World. How Do We Stop It in Time?" (the Guardian); "Terror or Error: Is Humanity on the Eve of Destruction?" (the Guardian again, also my favorite of the bunch); "Anticipating the Next Pandemic" (The New York Times). Would you click on those? I mean, probably. Right? (I did.) If you did and stayed long enough to read the pieces, you would find something interesting. Despite the headlines, most offer smart takes on an important topic. The New York Times piece, specifically, is a rational, well-argued take on the threats—both real and imagined—and a person's possible responses to them. "The concrete measures are limited by time, place and circumstance," writes David Quammen, author of Spillover: Animal Infections and the Next Human Pandemic. "The broader response is more basic: learn, absorb, understand. Don't start trying to apply your knowledge until you have some." We can't do much to prevent some sort of super bug emerging from the depths of the jungles. We can, however, take simple steps to help minimize the spread of disease. Over the past decade, we've seen a concentrated effort on the part of governments and health organizations around the world to put in place plans to do so on a massive scale, but also an increase in the efforts to educate the general population. We still aren't there, not close, but a ridiculously clickable headline in the Guardian could be beneficial. Hype, in small doses, might not be the most dangerous thing in the world. On the disease front, there is plenty to worry about aside from a super bug virus. Tuberculosis is back. Polio is out there. Antibiotic-resistant bacteria has been found in 46 states. If you really want to be horrified, read this piece on how "bacteria are generous with their genes, sharing them even with members of other bacterial species" and then this on the future where antibiotics no longer work. That's scary. Scary might be good. The underdogs were the story of this NCAA tournament. Humanity is still the favorite versus the super bug. The key for the near future is making sure it's more a 1-16 match-up than a 5-12.

Kerr 09 (Orin Kerr, professor of law at the George Washington University Law School, "THE CASE FOR THE THIRD-PARTY DOCTRINE", February 2009, Michigan Law Review, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1138128, JAS)

The second major criticism of the third-party doctrine is that it gives the police too much power.140 The doctrine permits government officials to send in spies, use informants, get bank records, record numbers dialed, and obtain billing records of entirely innocent people without any cause or courtorder requirement. According to critics, giving the government this much power is inconsistent with a free and open society; the risk of misuse and harassment is too great.141 The problem with this argument is that it assumes the Fourth Amendment is the only game in town. In truth, a wide range of tools exists for addressing police harassment of third-party information outside the Fourth Amendment. These tools substitute for Fourth Amendment protection, prohibiting or limiting access to third-party evidence in specific settings that may be subject to abuse. In the case of secret agents, the legal system uses entrapment law, the Massiah doctrine, the First Amendment, and internal regulations to limit the government's use of secret agents. To be clear, there is considerable room for debate on the sufficiency of these substitutes for Fourth Amendment protection. The warrant requirement is strong medicine, and some of the nonconstitutional substitutes are modest by comparison. Most are designed to deter bad faith investigations rather than to keep the government from accessing information altogether, and observers may disagree on which doctrines succeed or fail. But this should not obscure the deeper point: Fourth Amendment protection is only one tool among several for addressing police harassment. The absence of Fourth Amendment protection does not mean police practices go unregulated. Rather, it means a shift from regulation through a probable cause warrant requirement to regulation through privileges, entrapment doctrine, the Sixth Amendment, the First Amendment, statutes, and other forms of third-party protection. In short, critics suffer from constitutional myopia. While they focus on the failure of the Fourth Amendment to stop government harassment and limit the power of the state, they tend to overlook the substitutes that already address the same concerns through other means. Properly conceived, the choice is not between Fourth Amendment protection and none, but rather between regulation by a diverse set of doctrines or that diverse set of doctrines plus the added protection of the Fourth Amendment. As a result, critics overstate the degree of government power that the third-party doctrine authorizes. We can begin by considering how the law outside the Fourth Amendment tries to regulate secret agents. Although the Fourth Amendment does not regulate the use of secret agents,142 four other bodies of law help fill in the gap: entrapment law; the Massiah doctrine; the First Amendment; and internal agency regulations. All four bodies of law deter abuses of secret agents. They prohibit the use of secret agents in some cases and ensure that they are used only in relatively limited ways in others.

The affirmative does absolutely nothing: forcing the government to get a warrant will stop "the dark night of fascism" for two hours

Baker 14 (Stewart Baker, Writer at the Volokh Conspiracy, contributor at the Washington Post, "The third grade and third-party doctrine", January 22nd, 2014, Washington Post, https://www.washingtonpost.com/news/volokh-conspiracy/wp/2014/01/22/the-third-grade-and-third-party-doctrine/, JAS)

Randy Barnett argues that NSA's metadata program is bad because the government will use the information to target people for their political views and to embrace mission creep. His solution is to leave the metadata in the hands of the phone company. But really, what good would that do? Suppose that, as Randy fears, Congress wakes up one day and decides to use phone metadata to suppress dissent and gun ownership across America. The fact that the data is stored in four or five phone companies' databases rather than NSA's will forestall the Dark Night of Fascism for, oh, about 90 minutes. For the sake of that speedbump, we should give up our ability to identify cross-border terror plots? Randy's solution to that problem is to overrule a line of Supreme Court cases (Smith v. Maryland) holding that no one has a reasonable expectation of privacy in information they've disclosed to a third party. With Smith v. Maryland set aside, the government would need a search warrant to see the metadata. Overruling Supreme Court precedent is a law professor's prerogative, but the rest of us don't have to go along. And in fact the Smith v. Maryland doctrine makes sense, especially compared to Randy's solution. We all learned no later than the third grade that secrets shared with another are not really secrets. They can be revealed at times and in ways we never expected. It hurts, but it's a fact of life.

That's one of the key points these officials want to make: While the NSA might collect a lot of data, rules and oversight limit the extent to which privacy is compromised. In an earlier speech, Alexander said, "You need the haystack to find the needle." Simply gathering the haystack is benign, the officials claim, because ample protections exist to constrain any searches of that information. He refers to the comprehensive collection of voice call metadata as "one of the most highly regulated programs in the entire federal government." He describes in detail the multiple times it has been reauthorized in Congress and the courts, the limited number of people who have access to it, and the oversight employed to make sure that they use it as directed. (In December, two federal judges weighed in on the constitutionality of the government's collection of phone metadata. US District Court judge Richard Leon ruled that the program likely violates the Fourth Amendment but stayed his order pending appeal. In a separate case 11 days later, however, Judge William H. Pauley III declared the dragnet lawful, writing that "the question of whether that program should be conducted is for the other two … branches of government to decide.")

Squo solves—NSA doesn't abuse its surveillance—its workers are dedicated to laws and end tracking as soon as there's no more reason

Levy 14 (Steven, journalist who has written several books on computers, technology, cryptography, the Internet, cybersecurity, and privacy, "How the US almost Killed the Internet," Wired.com, 01.07.14, http://www.wired.com/2014/01/how-the-us-almost-killed-the-internet/

The officials paint a picture, though, of a system that fundamentally works. They describe a rigorous training process. They tell me that respect for boundaries is drilled into the psyche of NSA employees from the day they are hired. (As for one embarrassing incident, in which employees tracked their romantic partners, the officials emphasize its rarity—and point out that the abuses were caught by the NSA's own system of frequent polygraph tests.) Ledgett provides an example of what happens when someone's information is mistakenly analyzed. The agency, he says, had tracked a high-value target in South Asia for over a decade before learn-ing that he had once applied for a green card—making him, under NSA rules, a "US person." "As soon we discovered that," Ledgett says, "we dropped collection on him under our Executive Order 12333 authority and canceled 14 years of reports."

Alt causes to innovat

Alt causes to innovation—higher education entrenches the idea that students should look for jobs, not take creative risks

Doss 15 Henry Doss, former banker turned venture capitalist, "Our Universities are not Teaching Innovation," Forbes, 2/25/15, http://www.forbes.com/sites/henrydoss/2015/02/25/our-universities-are-not-teaching-innovation/

Our system of higher education is out of whack with the future, and with innovation; and it is at direct odds with what we say we believe. Not only are our universities not teaching innovation or delivering an innovation experience, they seem to be doing their best to destroy innovative thinking in young people. This is not intentional, but it may be all the more insidious for being unplanned, unnoticed and unseen. Business leaders, politicians and economists all say more or less the same thing: The future depends on innovation and without it we are doomed as a country and a society to second-class status. So innovation, and those who can lead and cause innovation, are at a premium. You would think we would respond to this in our system of higher education; but, in fact, we are doing the exact opposite. Innovation requires flexibility; it demands experience and knowledge that is both broad and deep. Both. Innovators must be comfortable with pivoting, adapting and changing, often and without hesitation. Innovators must be willing and eager to learn anew, all the time, and to learn quickly. But what kind of learning experience do we present to university and college students? From the day they set foot on a campus, most students are greeted with a homogenized, pre-packaged, profoundly compartmentalized, deeply siloed, interest-entrenched world. The experience of the modern university system is the antithesis of innovative leadership traits. Students are being taught to produce rather than create, to follow rather than lead, and to fear failure greater than death itself. It is as if we said we want to create an entire class of risk-averse followers, ready and able to follow commands. It is as if we decided to teach everything in ways that are the exact opposite of how innovation works. Innovation requires independent thinking and a strong ability to work outside of the comfort of structure and predictability and security. But from the moment students enter into the higher education world, they are greeted with an insistent, unyielding message: "Prepare for a job!" This message is loud, and inescapable. Nothing takes precedence over "job!" and in very short order every student learns that they are in college for one reason and one reason only: To get a job. Students are encouraged to study only those things that will lead to a job; to avoid spending too much time on "unnecessary" studies that won't help with getting a job; to be sure to pick an "employable major," lest they be left behind for a job. They are pointed to internships, to career counseling and to every possible experience that will create a focus on getting a job, all well-intentioned efforts, perhaps; but all strongly reinforcing the jobs message. The system holds their hand, points them to the future, funnels their time, energy and work into a job-related program of study . . . and then we are all somehow surprised when this highly structured process of preparing someone for a job leads to graduates who expect structure and a job, rather than risk, disruption and opportunity. We do all of this, even though we know that virtually any job we are encouraging students to prepare for will likely disappear in a few more years; that the job they are likely to have in ten years doesn't even exist today. We do this even though we know that the vast majority of students will have several careers and that many of those will by necessity be self-created. We do this even when we know that the "skills" (the most over-rated, over-promoted and non-innovative word in the English language) of innovators are the exact opposite of what is being taught in service to getting a job. We hang the boogeyman of "job!" over their heads; we turn them away from things that are fun, exciting, challenging, and off-the-beaten path; and we drill a misguided pragmatism into their heads every minute of every day they're in school. Then we are surprised when, after years of indoctrination about focusing on jobs, students graduate looking for jobs, rather than doing things that will create jobs There's more. As part of our job focus and purported pragmatism, we dismiss as frivolous the Humanities and the arts, and anything else that is not explicity career- or vocation-focused. This is not always overt. There is the occasional discussion around students being well-rounded, and talk about filling out an education with a bit of literature or philosophy or history. But this is usually insincere tokenism, and we can verify this insincerity with a single glance at budget allocations. Follow the money in higher education and you'll find the real priority. It's jobs, not innovation.

Surveillance has not decreased freedom of speech—in fact, it triggered public protest and forcing Congress to reform surveillance

Bowman 14, Bridget Bowman, journalist covering Capitol Hill, "Internet protest to 'fight back' against surveillance," PBS, Feb 10, 2014, http://www.pbs.org/newshour/rundown/internet-protest-fight-back-surveillance/

Activist groups, companies, and websites will encourage internet users to take a stand against government surveillance on Tuesday in a protest called "The Day We Fight Back." On Feb. 11, 5,700-plus websites plan to post a banner on their pages encouraging users to use their social media accounts to protest surveillance by the National Security Administration and to phone or email their representatives in Congress about reforming internet surveillance. The protest is organized by the some of the same groups that orchestrated the movement against the Stop Online Piracy Act (SOPA) and the Protect Intellectual Property Act (PIPA) in 2012. In response, "Congress, overwhelmed by the popular opposition, quickly backpedaled, leaving the legislation to die," 'The New York Times' wrote in July, 2012. Demand Progress executive director David Segal said they are not expecting a response similar to the magnitude of the SOPA and PIPA backlashes. However, he told PBS NewsHour they expect "something quite sizeable." The statement announcing the event speculated that "potentially millions of Internet users" would participate in the protest. The websites will urge internet users to contact their lawmakers and voice their support for the USA FREEDOM Act and encourage Congress to reject the FISA Improvements Act. The USA FREEDOM Act would implement a number of surveillance reforms, including the creation of the Office of the Special Advocate to participate in the Foreign Intelligence Surveillance Court, or the FISA Court. The bill is currently in committee in both chambers of Congress. Segal said the "goal is to start driving that forward" and that he is confident the legislation has enough votes to move out of the House Judiciary Committee and to pass the House floor. Rep. James Sensenbrenner, R.-Wisc, one of the bill's co-sponsors, also said it has broad support in the House. "If brought to the floor, I believe it will pass," he said in a statement to the NewsHour. He also said he would "support any responsible efforts that give it momentum."

Surveillance doesn't kill free speech—in fact, it's increased it—people are using the internet to voice their displeasure at Congress

Tsoumbakos 15, Rachel Tsoumbakos, author, "Nearly 15,000 Sites Block Congress As A Protest Against The NSA Surveillance Laws," Inquisitir, May 31, 2015, http://www.inquisitr.com/2132440/nearly-15000-sites-block-congress-as-a-protest-against-the-nsa-surveillance-laws/

So far, nearly 15,000 websites have blocked Congress IPs from accessing them in an effort to voice their displeasure against the current NSA surveillance laws. As the sites block Congress, others are posting their photos with the hashtag #IFeelNaked to back up the protest. On Friday, the protest began as sites began to block Congress. The Fight for the Future group has provided code so sites can block Congress ahead of the possible re-authorization of NSA surveillance laws under the current Patriot Act, which allows the NSA and FBI to collect data in an effort to curb terror attacks. While this is a very noble cause, citizens are concerned at just how much information is being collected, who can view this information, and, subsequently, what it could potentially be used for. Sites have put a block against congress IP addresses from accessing their sites, which then redirects these Congress addresses to the Blackout Congress website, a site that explains exactly why the blackout is

occurring as well as posting images with the hashtag #IFeelNaked — some of these images being explicit in nature. "You have conducted mass surveillance of everyone illegally and are now on record for trying to enact those programs into law. You have presented Americans with the false dichotomy of reauthorizing the PATRIOT Act or passing the USA Freedom Act. The real answer is to end all authorities used to conduct mass surveillance. Until you do, thousands of web sites have blocked your access, and more are joining every day."

Alt causes to protest

Too many alt causes determines whether protests succeed or not—stability of regime, martyrs, and gov't goals—that means free speech alone doesn't solve

Chesterton 13, Matthew Lawrence Chesteron, writer and editor, "Why are protests so ineffective for achieving political change?," Quora, Dec 11, 2013, http://www.quora.com/Why-are-protests-so-ineffective-for-achieving-political-change

Some back-of-an-envelope thoughts on the third part of the question – Under what conditions do protests succeed at achieving political change? When a regime/system is teetering on the edge and just needs a push to send it over. The Hungarians of 1956 and the Czechs of 1968 were protesting against a system that feared them no more than a man fears a fly on his nose. The Czechs of 1989, on the other hand, were protesting against a system that had, in effect, abolished itself. When a protest movement throws up martyrs. Choose your massacre – "Peterloo" (1819), Amritsar (1919), 16th Street Baptist Church (1963), Bloody Sunday (1972), etc. One of the reasons this is effective is that every dead protestor leaves behind a mother and mothers of dead protestors will invariably spend the rest of their lives finding out what happened to their kids and why. In my adopted country, Argentina, the Mothers of the Plaza de Mayo spent 30 years protesting the "disappearance" (extra-judicial murder) of their sons and daughters at the hands of the military dictatorship which ran the country in the late 1970s. Plenty of people supported them, of course, but the attention of these supporters tended to waver. A grieving mother's attention doesn't waver. ("Living martyrs" work too, so long as they're banged up in prison, preferably somewhere crappy, preferably on an island. See: Captain Dreyfus on Devil's Island [1], Nelson Mandela on Robben Island.) when those in power are smart enough to realise that they can shore up their own position by acceding to the protestors' demands. This only works when the protest movement has a clearly defined and limited goal; the socialist agitation for the eight-hour day of the early 1900s is a good example. As is the male suffrage movement in Britain of the late 19th century which the ruling, but not blindly reactionary, Conservative party astutely turned to its advantage through the Tory Democracy movement. Anarchists whose stated ambition is to tear down the system not only fail, but need to fail. If protesting is what makes you happy, and what gives your life meaning, what could be worse than success?

Freedom of speech strong in the US—supreme Court repeated affirmed that unpopular speech enjoys 1st amendment protection—even blasphemy

Beattie-Moss 15, Melissa Beattie-Moss, Manager of Research Communications at Penn State, "Probing Question: Are there limits to freedom of speech?," Pennstate, January 27, 2015, http://news.psu.edu/story/341896/2015/01/27/research/probing-question-are-there-limits-freedom-speech,

"The U.S. Supreme Court has recognized very few exceptions to the First Amendment," says Robert Richards, founding director of the Pennsylvania Center for the First Amendment at Penn State, which was established in 1992 to promote awareness and understanding of the principles of free expression to the scholarly community, the media and the general

public. "The categories of speech that fall outside of its protection are obscenity, child pornography, defamation, incitement to violence and true threats of violence," he explains. "Even in those categories, there are tests that have to be met in order for the speech to be illegal. Beyond that, we are free to speak." In the United States, several states have had laws against blasphemy even though such laws violate the U.S. Constitution. Charlie Hebdo is considered by many to be an inflammatory and offensive publication, particularly for its graphic cartoons lampooning religious figures such as the Prophet Muhammad. Does that change how we should view the publication's free speech rights as seen through the lens of American laws and values? "Many people are mistaken in their belief that offensive speech or hate speech is not protected," says Richards. "The Supreme Court has repeatedly affirmed the notion that unpopular speech enjoys full First Amendment protection. As the late Justice William Brennan put it, in a case involving flag burning, 'If there is a bedrock principle underlying the First Amendment, it is that government may not prohibit the expression of an idea simply because society finds the idea itself offensive or disagreeable.'" Some would argue that much of the content in Charlie Hebdo is blasphemous. Yet the very notion of blasphemy -- defined as insulting God or any religious or holy person or thing -- varies greatly around the world. In some countries, blasphemy is not only illegal but is punishable by death. In the United States, several states have had laws against blasphemy even though such laws violate the U.S. Constitution. Pennsylvania enacted a blasphemy law in 1977, which was struck down by the U.S. District Court in 2007. The last conviction for blasphemy in the U.S. took place in Arkansas in 1928.

Protests fail—don't influence public opinion enough, and there's not enough force to sway politicians—counter-examples of successful protests are special cases that have other factors

MGK 10, "Why protests don't work, part two," Mightygodking, Jul 27, 2010, mightygodking.com/2010/07/27/why-protests-dont-work-part-two/

The problem is that your standard protest model is, nowadays, bad at doing both of these things. Even in those situations where protests don't dissolve into a cacophony of various messages of dissent only tenuously connected to one another, the standard protest model suffers from a problematic catch-22: in order to significantly impact the news cycle, a protest must be really big, but the larger a protest becomes, the more likely it is to be ineffective due to lessened public support due to the inconvenience of the protest and the perception that it's a one-off stunt. And even when a protest significantly impacts the news cycle, it's still a one-off event in a modern culture which has trouble remembering what happened in the news three months ago. "Aha," you say, "but what about the Tea Party? What about European labour protests?" And these are interesting discussions. The Tea Party isn't really a good counterexample. Although they have had a number of protests and have had some impact on public debate in the United States, they also aren't following the traditional protest model, which is "have a really big protest and then that's it for a while in terms of public visibility." Granted, liberal protesters might argue that they don't get any public visibility outside of protests due to media complacency, and they have a point there. But that right there is why the Tea Party has had more impact on the media: they're essentially sponsored by a cable news network, which has allowed them to outlive the news cycle and become a constant presence.1 Since most protests will not get that advantage, pointing to the Tea Party as a measure of protest success is erroneous. On top of that, for all the visibility the Tea Party has enjoyed, they haven't really had that much success at shifting public opinion; there has been no groundswell of support for their pet issues and the movement has remained mostly confined to conservative Republicans despite halfhearted attempts to reach out to libertarians. Really, the Tea Party is more reflective of the current state of the Republican party base than anything else. As for European labour protests, sure, they work – but they work because when European labour movements go out and protest, that's not a protest fringe

doing it; that's a hefty chunk of the country. People talk about how the G20 protest was big, but it was a drop in the bucket compared to, say, the antiwar protests conducted five or six years ago – and those in turn are equivalent to a smaller European labour protest, except that the American antiwar protests were mostly one-day or very occasionally two-day affairs, whereas European labour protests can go for weeks if need be (and have). European labour protests aren't analagous to the modern North American protest movement expressly because they aren't interested in shifting public opinion[2], but rather in representing a large portion of the public. This makes the "swaying public opinion" part of the protest model null; all these protests are designed to do is sway elite decisions. So, if traditional protest is no longer good for swaying both the public and the elites, what can do it? This is where I come up empty; none of the existing options seem to work. In the US, phone-in campaigns to Congressional offices have had some success at pushing representatives on important votes, but quite apart from the fact that phone campaigns don't sway public opinion at all? Even if we accept that the phone system is a solid answer – and I don't think it's nearly as effective as some claim – simple numbers seem to make it essentially non-duplicable outside of the United States. There are about 700,000 Americans for every representative in Congress. Most other nations have a much lower citizens-to-representative ratio, generally ranging from 100000:1 (the United Kingdom) to 150000:1 (Australia). If you want to flood their phonebanks, phone campaigns need a participation rate essentially six times as high as happens in the United States. This seems unlikely. Facebook/Twitter/other internet petitions and polls are flawed from a different end. Phone calls and letter-writing are the traditional weapons of choice for people attempting to make their voices heard to their representatives, but both of these methods require a person to really, really care about an issue.[3] This is why politicians have traditionally multiple-counted people doing these things: the assumption is that since one person was angry enough about the issue to contact their representative, therefore there are X more people who feel the same way and will be less inclined to vote for the representative (at a minimum). But internet petitions have almost no disincentives attached to them: there's a degree of anonymity involved[4] and there's next to no effort required, which means that representatives/politicians not only don't multiple-count the people involved, they sometimes even discount them (in the "this person will never change their vote based on issue X" sense). Even when they don't discount, the numbers taken at face value are almost never big enough to influence decisionmakers. Fair Copyright For Canada's 87,543 members means an average of 284 members per riding, which isn't enough to swing anything other than the absolute swingiest of swing ridings.

Protests fail because there's less public space to hold a protest—proven by Bush administration protests that it has a large impact

Effectivism 10, "why are U.S. protest marches less effective than they used to be?," feb 2010, http://www.effectivism.net/2010/02/why-are-u-s-protest-marches-less-effective-than-they-used-to-be/

One interesting fact that I dug up while researching this post regards the size of the "public forum". McPhail, McCarthy, & Andrew (2004) observe that the number of places where protests can freely be staged has shrunken significantly since the 1960's. Many sidewalks and parks have changed from public to private property. Additionally, there is far less freedom concerning where a protest can take place than there was then. "During the peak of the cycle of protests in the late 1960s most protest events did not take place in the public forum, but in areas controlled by governmental authorities. During recent protests against the 2000 Presidential election results gatherings occurred almost exclusively in public forums." It's not clear from this conference paper how much the effectiveness of protests is altered by the increasingly restricted access to spaces in which to hold protests. But I suspect that, as well as making the organization of protests more difficult, it reduces the potential size and media coverage of many protests. It sure seemed like the latter was a problem for anti-Bush protesters during the former administration; they were cordoned off into areas that were not easily seen.

The hard-earned trust that the tech giants had spent years building was in danger of evaporating—and they seemed powerless to do anything about it. Legally gagged, they weren't free to provide the full context of their cooperation or resistance. Even the most emphatic denial—a blog post by Google CEO Larry Page and chief legal officer David Drummond headlined, "What the …"—did not quell suspicions. How could it, when an NSA slide indicated that anyone's personal information was just one click away? When Drummond took questions on the Guardian website later in the month, his interlocutors were hostile: "Isn't this whole show not just a face-saving exercise … after you have been found to be in cahoots with the NSA?" "How can we tell if Google is lying to us?" "We lost a decade-long trust in you, Google." "I will cease using Google mail." The others under siege took note. "Every time we spoke it seemed to make matters worse," an executive at one company says. "We just were not believed." "The fact is, the government can't put the genie back in the bottle," says Face-book's global communications head, Michael Buckley. US-China war unlikely—economic inter-dependency checks

Xi Jinping is a nationalist. And China, both the U.S. and China's neighbors have concluded, is displaying newfound assertiveness in pursuing its hard security interests in the region. But there is, nonetheless, a very low risk of any form of direct conflict involving the armed forces of China and the U.S. over the next decade. It is not in the national interests of either country for any such conflict to occur; and it would be disastrous for both, not to mention for the rest of the world. Despite the deep difficulties in the relationship, no Cold War standoff between them yet exists, only a strategic chill. In fact, there is a high level of economic inter-dependency in the relationship, which some international relations scholars think puts a fundamental brake on the possibility of any open hostilities. Although it should be noted the U.S. is no longer as important to the Chinese economy as it once was.

No US-Sino armed conflict—against China's own benefits, so that means deterrence will prevail

Rudd 15 (Kevin Rudd, Senior Fellow, Belfer Center for Science and International Affairs, "U.S.-China 21 The Future of U.S.-China Relations Under Xi Jinping," Harvard Kennedy School, April 2015, http://asiasociety.org/files/USChina21_English.pdf

Of course, Xi Jinping has no interest in triggering armed conflict with the U.S., a nightmare scenario that would fundamentally undermine China's economic rise. Furthermore, there are few, if any, credible military scenarios in the immediate period ahead in which China could militarily prevail in a direct conflict with the U.S. This explains Xi's determination to oversee the professionalization and modernization of the People's Liberation Army (PLA) into a credible, war-fighting and war-winning machine. Xi Jinping is an intelligent consumer of strategic literature and would have concluded that risking any premature military engagement with the U.S. would be foolish. Traditional Chinese strategic thinking is unequivocal in its advice not to engage an enemy unless you are in a position of overwhelming strength. Under Xi, the ultimate purpose of China's military expansion and modernization is not to inflict defeat on the U.S., but to deter the U.S. Navy from intervening in China's immediate periphery by creating sufficient doubt in the minds of American strategists as to their ability to prevail.

China's economy is slowing down due to credit binge—that means it won't ever out-compete the US

The economist 15, "Why China's economy is slowing," March 11, 2015, http://www.economist.com/blogs/economist-explains/2015/03/economist-explains-8

More recent trends also explain China's sharper-than-expected slowdown. The single most important development has been its credit binge. Total debt (including government, household and corporate) has climbed to about 250% of GDP, up 100 percentage points since 2008. This debt allowed China to power its economy through the global financial crisis but also saddled it with a heavy repayment burden. Most worrying, much of the credit flowed to property developers. China's inventory of unsold homes sits at a record high. The real-estate sector, which previously accounted for some 15% of economic growth, could face outright contraction. New property starts fell by nearly a fifth in the first two months of 2015, compared with the same period a year earlier. From this vantage point, the abruptness of China's current slowdown looks more cyclical than structural. A period of overheated economic growth tends to be followed by a correction. Not all cycles are created equal, however. Working off a credit overhang can take years. Given that China's financial system is mostly closed, it has little risk of an acute crisis, but the other side of the coin is that it might need even longer to clean up its bad debts. Read more: China's government preaches the need to tolerate slower growth Whereas previous leaders propped up growth whenever it slowed, Xi Jinping, China's president since 2013, has instead spread the gospel of the "new normal", by which he means less emphasis on growth and faster structural reform. The central bank has been hesitant to ease monetary policy. Changes to fiscal rules have made it harder for local governments to spend money. With consumer-price inflation running at a five-year low of 1.1% and producer prices deep in deflation, there is a case to be made that China's economy, restrained by the government, is performing below its potential. The good news is that neither the cyclical nor the policy explanations for China's slowdown are permanent. As the cycle turns and policy changes, the outlook should improve. But the structural shifts in the Chinese economy are a different story. They will cap any rebounds. Double-digit growth is most certainly a relic of China's past.

Squo solves—NSA surveillance is restricted and is legal in the squo—it's been reauthorized in Congress and courts

That's one of the key points these officials want to make: While the NSA might collect a lot of data, rules and oversight limit the extent to which privacy is compromised. In an earlier speech, Alexander said, "You need the haystack to find the needle." Simply gathering the haystack is benign, the officials claim, because ample protections exist to constrain any searches of that information. He refers to the comprehensive collection of voice call metadata as "one of the most highly regulated programs in the entire federal government." He describes in detail the multiple times it has been reauthorized in Congress and the courts, the limited number of people who have access to it, and the oversight employed to make sure that they use it as directed. (In December, two federal judges weighed in on the constitutionality of the government's collection of phone metadata. US District Court judge Richard Leon ruled that the program likely violates the Fourth Amendment but stayed his order pending appeal. In a separate case 11 days later, however, Judge William H. Pauley III declared the dragnet lawful, writing that "the question of whether that program should be conducted is for the other two … branches of government to decide.")

Turn—unipolarity is the most conflict prone system—stats prove

Montiero 12 [Nuno P. Monteiro is Assistant Professor of Political Science at Yale University, "Unrest Assured: Why Unipolarity is Not Peaceful", International Security, Vol. 36, No. 3 (Winter 2011/12), pp. 9–40]

Unipolarity is the most conflict prone of all the systems, according to at least two important criteria: the percentage of years that great powers spend at war and the incidence of war involving great powers. In multipolarity, 18 percent of great power years were spent at war. In bipolarity, the ratio

is 16 percent. In unipolarity, however, a remarkable 59 percent of great power years until now were spent at war. This is by far the highest percentage in all three systems. Furthermore, during periods of multipolarity and bipolarity, the probability that war involving a great power would break out in any given year was, respectively, 4.2 percent and 3.4 percent. Under unipolarity, it is 18.2 percent—or more than four times higher. 47 These figures provide no evidence that unipolarity is peaceful. 48 In sum, the argument that unipolarity makes for peace is heavily weighted toward interactions among the most powerful states in the system. This should come as no surprise given that Wohlforth makes a structural argument: peace flows from the unipolar structure of international politics, not from any particular characteristic of the unipole. 49 Structural analyses of the international system are usually centered on interactions between great powers. 50 As Waltz writes, "The theory, like the story, of international politics is written in terms of the great powers of an era." 51 In the sections that follow, however, I show that in the case of unipolarity, an investigation of its peacefulness must consider potential causes of conflict beyond interactions between the most important states in the system.

Privacy should not be a legal right

Any crime can also be seen as an invasion of privacy which blurs lines – pre-existing laws ensure specific instances of invasions of privacy better

What should be said, for example, of the following?

(a) The neighbors make a terrible racket every night. Or they cook foul-smelling stews. Do they violate my right to privacy? Some think yes, I think not. But even if they do violate my right to privacy, perhaps all would be well for the simplifying hypothesis since their doing this is presumably a violation of another right of mine, roughly, the right to be free of annoyance in my house.
(b) The city, after a city-wide referendum favoring it, installs loud- speakers to play music in all the buses and subways. Do they violate my right to privacy? Some think yes, I think not. But again perhaps all is well: it is if those of us in the minority have a right to be free of what we (though not the majority) regard as an annoyance in public places.
(c) You are famous, and photographers follow you around, every- where you go, taking pictures of you. Crowds collect and stare at you. Do they violate your right to privacy? Some think yes, I think not: it seems to me that if you do go out in public, you waive your right to not be photographed and looked at. But of course you, like the rest of us, have a right to be free of (what anyone would grant was) annoyance in public places; so in particular, you have a right that the photographers and crowds not press in too closely.
(d) A stranger stops you on the street and asks, "How much do you weigh?" Or an acquaintance, who has heard of the tragedy, says, "How terrible you must have felt when your child was run over by that delivery truck!"3 Or a cab driver turns around and announces, "My wife is having an affair with my psychoanalyst." Some think that your right to privacy is violated here; I think not. There is an element of coercion in such cases: the speaker is trying to force you into a re- lationship you do not want, the threat being your own embarrassment at having been impolite if you refuse. But I find it hard to see how we can be thought to have a right against such attempts. Of course the attempt may be an annoyance. Or a sustained series of such at- tempts may become

an annoyance. (Consider, for example, an ac- quaintance who takes to stopping at your office every morning to ask if you slept well.) If so, I suppose a right is violated, namely, the right against annoyances.
(e) Some acquaintances of yours indulge in some very personal gossip about you.' Let us imagine that all of the information they share was arrived at without violation of any right of yours, and that none of the participants violates a confidence in telling what he tells. Do they violate a right of yours in sharing the information? If they do, there is trouble for the simplifying hypothesis, for it seems to me there is no right not identical with, or included in, the right to privacy cluster which they could be thought to violate. On the other hand, it seems to me they don't violate any right of yours. It seems to me we simply do not have rights against others that they shall not gossip about us.
(f) A state legislature makes it illegal to use contraceptives. Do they violate the right to privacy of the citizens of that state? No doubt certain techniques for enforcing the statute (e.g., peering into bed- room windows) would be obvious violations of the right to privacy; but is there a violation of the right to privacy in the mere enacting of the statute-in addition to the violations which may be involved in enforcing it? I think not. But it doesn't matter for the simplifying hypothesis if it is: making a kind of conduct illegal is infringing on a liberty, and we all of us have a right that our liberties not be infringed in the absence of compelling need to do so.

ICCPR CP Protocol

The US should sign a new ICCPR protocol – sets an international standard

Paust 15 (Jordan J. "Can You Hear Me Now?: Private Communication, National Security, and the Human Rights Disconnect," Chicago Journal of International Law: Vol. 15: No. 2, Article 7 Pages 648-651 http://chicagounbound.uchicago.edu/cjil/vol15/iss2/7)

Despite widespread awareness of the NSA program and increasing awareness of other states' programs for extraterritorial data collection and mining, there seem to remain generally shared expectations that privacy with respect to internet and international telecommunications should still exist in some form. In light of this, I recommend creation of a Protocol to the ICCPR to reflect the more nuanced and restrictive form of limitation found in the European Convention: "necessary in a democratic society in the interests of national security."122 If so, the present "arbitrary" or unreasonable standard would shift to one that will require any interference with privacy and private communication to be reasonably necessary under the circumstances. 123 This will not guarantee freedom from interference: no human rights standard presently does. Although a reasonably necessary standard might still allow use of a program for the widespread and systematic extraterritorial monitoring, data collection, and data mining that President Obama has stated is necessary,'24 it would better accommodate interests in privacy, personal security, and national security than would a less stringent standard tied to the word "arbitrary."

One significant limitation regarding extraterritorial surveillance under programs like the NSA's would remain: the need for a claimant to be within the actual power or effective control of the United States. I doubt that the United States and other countries engaged in extraterritorial surveillancel25 will agree to change the actual power or effective control test that is applicable under the ICCPR, and I do not recommend that such a change appear in a new Protocol.

This Article has demonstrated that at least four questions can arise under human rights law with respect to extraterritorial surveillance, collection of data, and data mining by a state: (1) is the claimant within the actual power or effective control of the state using such measures; (2) does the claimant have a protectable interest in privacy or private communication; (3) does use of the measures interfere with a protectable privacy interest of the claimant; and (4) is the interference permissible under the "arbitrary" and "unlawful" substantive legal standards and limitations, or in view of other types of limitation that are set forth in an applicable human rights instrument? With respect to extraterritorial surveillance and data collection, most claimants will not be within the actual power or effective control of the state using extraterritorial measures and, therefore, under the ICCPR and most human rights instruments, their human rights to privacy and private communication will not obtain.126 However, if the rights to privacy and private communication or a particular aspect thereof are part of customary human rights law, the customary rights will be protected universally under the UN Charter without an exclusion of persons who are not within the jurisdiction, actual power, or effective control of a state,127 and the inquiry will shift to the remaining three questions.

The requirement that an interference not be "arbitrary" actually grants wide latitude to monitoring states, because systematic surveillance and data collection is not prima facie irrational, unreasonable, and arbitrary. One must make choices with respect to various features of factual context, rights, and policies at stake when deciding whether a particular interference is arbitrary or unreasonable, and the permissibility of particular forms of surveillance under international law can inform any such policy-serving choice. A nuanced and considered choice would avoid focusing merely on the rights of privacy claimants and instead involve adequate attention to the rights of others, including human rights to dignity and personal security as well as the concomitant duties of states to seek to achieve personal security for all who are within their jurisdiction. If the international community prefers to achieve greater protection for privacy interests under global human rights law, a Protocol to the International Covenant on Civil and Political Rights could limit extraterritorial surveillance to those interventions "necessary in a democratic society."

ACLU 13 "United States' Compliance with the International Covenant on Civil and Political Rights " American Civil Liberties Union Shadow Report to the Fourth Periodic Report of the United States 109th Session of the Human Rights Committee, Geneva 14 October-1 November 2013

Over the last two months, it has become clear that the National Security Agency (NSA) is engaged in far-reaching, intrusive, and unlawful surveillance of telephone calls and electronic communications both within and outside the United States. Through media reports as well as U.S. government declassifications, we have recently learned about two such forms of NSA surveillance.1 Through one, the NSA is collecting the "telephone metadata" of every single phone call into, out of, and within the United States. Through another, which includes programs called "PRISM" and "UPSTREAM," the NSA is engaged in the large-scale collection, storage, and monitoring of the content of electronic communications all around the world. These mass surveillance programs violate the U.S. Constitution and are the product of defects both in the laws

that authorize them and in the current oversight system. Both of the programs also raise serious concerns about whether they violate the U.S. government's obligations under international human rights law to protect the right to privacy and the right to free expression.2 ¶¶ The Foreign Intelligence Surveillance Act (FISA) affords the government sweeping power to monitor the communications of innocent people, and the law's imposition of excessive secrecy over the existence, operation, and oversight of the programs it authorizes has made legislative oversight difficult and public oversight impossible. Intelligence officials have repeatedly misled the public, the U.S. Congress, and domestic courts about the nature and scope of the government's surveillance activities. Moreover, structural features of the Foreign Intelligence Surveillance Court (FISC) have changed dramatically since the court was first established more than thirty years ago, and it is clear from recent disclosures that those changes prevent that court from serving as an effective guardian of individual rights and overseer of executive power. Finally, challenges to the U.S. government's surveillance practices in regular U.S. courts have been thwarted by procedural doctrines that foreclose meaningful and substantive judicial review of U.S. government surveillance programs, enabling the executive branch to act, improperly and inadequately, as its own "check." ¶¶ The U.S. government's extensive collection of electronic-communications content under the PRISM and UPSTREAM programs is profoundly disturbing, and it raises serious concerns that the Committee should require the U.S. to address during its upcoming review. The U.S. government has acknowledged that, through PRISM, it may, and does, acquire the contents of the entire digital lives of many people across the globe. In particular, the United States regularly demands emails, audio and video chats, photographs, and other internet traffic from nine major service providers—Microsoft, Yahoo!, Google, Facebook, PalTalk, AOL, Skype, YouTube, and Apple—located within the United States. The companies are not even allowed to publicly discuss that they received these orders, let alone notify affected individuals whose data has been seized by the U.S. government. Additionally, the media has reported that, under UPSTREAM, the government scans the content of nearly all emails and other text-based communications that enter or leave the United States for particular keywords "about" its foreign-intelligence targets. ¶¶ The PRISM and UPSTREAM programs are authorized by section 702 of the FISA. That statute authorizes the "targeting" of non-U.S. persons reasonably believed to be located outside the United States for foreign-intelligence purposes. ¶¶ Even though the law requires judicial approval before the government can engage in this kind of surveillance, in practice, there is little judicial involvement in the program. By making an application to the FISC, the U.S. government may obtain a mass-acquisition order that authorizes, for an entire year, whatever surveillance the government may choose to engage in, within broadly drawn parameters.3 Additionally, the government's definition of "foreign intelligence" sweeps so broadly that it potentially encompasses almost any foreign person at all—not just individuals who are foreign agents, engaged in criminal activity, or connected even remotely with terrorist activities. Finally, the U.S. government's targeting procedures allow the NSA to sweep up the communications of not only any foreigner who is a target, but any foreigner who may be communicating about the target as well. ¶¶ The effect of this expansive scheme is to bring virtually every international communication within the reach of the NSA's surveillance. What's more, the government retains most of the information it collects under section 702 indefinitely, and it may disseminate and analyze collected information with only limited restrictions. Moreover, it may do so without subjecting itself to the scrutinizing glare of the courts. II. Relevant Question in the Human Rights Committee's List of Issues 22) Please provide information on steps taken to ensure judicial oversight over National Security Agency surveillance of phone, email and fax communications both within and outside the State party.

Please also specify what circumstances, as mentioned in section 206 of the USA Patriot Act, justify "roving" wiretaps. III. U.S. Government Response The U.S. government's responses to the Committee state that amendments to the FISA have "enhance[d] judicial and Congressional oversight" by giving the FISC a "continuing and active role in overseeing certain NSA collection activities."4 But those answers belie the weakness of the current surveillance-oversight scheme. Until Congress enacted section 702 as part of the FISA Amendments Act (FAA), in 2008, the FISA generally prohibited the government from conducting electronic surveillance without first obtaining an individualized and particularized order from the FISC.5 In order to obtain a court order, the government was required to show that there was probable cause to believe that its surveillance target was an agent of a foreign power, such as a foreign government or terrorist group. It was also generally required to identify the facilities to be monitored. Section 702, in contrast, has as its defining feature the lack of ongoing judicial oversight. The FISC does not review individualized surveillance applications. Nor does it have the right to ask the government why it is initiating any particular surveillance program. Instead, the FISC's role is limited to reviewing the government's targeting and minimization procedures. And even with respect to those procedures, the FISC's role is to review the procedures at the outset of any new surveillance program; it does not have the authority to supervise the implementation of those procedures over time. Section 702 allows the U.S. government to conduct electronic surveillance without indicating to the FISC whom it intends to target or which facilities, telephone lines, email addresses, places, premises, or property at which its surveillance will be directed. Further, the law does not require the government to make any showing to the court—or even make an internal executive determination—that the target is a foreign agent or engaged in terrorism.6 The target could be a human rights activist, a media organization, a geographic region, or even an entire country. And because section 702 does not require the government to identify the specific targets and facilities to be surveilled, it permits the acquisition of these communications en masse. A single acquisition order may be used to justify the surveillance of communications implicating thousands or even millions of people, for a year at a time. The U.S. government must clearly explain to the Committee how the wide-ranging, judicially unsupervised surveillance it is conducting across the globe on millions of people comports with its duties to protect the rights to privacy and freedom of expression. Because the Committee's questions to the U.S. government came before the momentous recent disclosures and acknowledgments, the Committee did not have the opportunity to direct its questions about surveillance and privacy to the issues and concerns that are now most pressing. The U.S. government's responses to the Committee are insufficient and incomplete, given the new public record. The Committee should embrace the U.S. government's upcoming review as an occasion to demand an accounting to the world community that has long been missing in its alarming surveillance practices, which implicate not just Americans, but the entire world. ¶ IV. Recommended Questions 1. Does the U.S. government believe that its collection of international communications for foreign intelligence purposes comport with its obligations under Article 17 (right to privacy) and 19 of the ICCPR? In this context, "collection" means the interception, copying, filtering or processing of communication content or metadata. 2. Although this communications surveillance may be prescribed by U.S. law, please explain the justifications for the restrictions on the rights to privacy and free expression imposed by these laws and how they are both (1) necessary to achieve legitimate government objectives; and (2) proportionate to those aims, as required by the ICCPR? 3. Does the government consider that the rights encompassed by Articles 17 and 19 extend to foreign nationals residing outside the United States? If not, why not? If the government considers rights to extend extraterritorially, what measures does the government employ to ensure that its

surveillance of such persons does not violate U.S. obligations under these articles, and in particular that they are prescribed and governed by law, and both necessary and proportionate to legitimate government objectives? 4. In conducting communications surveillance, what restrictions—if any—does the government impose on (a) information that can be collected on foreign nationals; and (b) what can be done with such information once collected? 5. Please explain the type and amount of international and foreign communications the U.S. government is collecting. Does the government target specific individuals, organizations, countries, or regions for such collection? Does the government consider that international instruments constrain in any way its authority to collect foreigners' communications metadata or content in bulk? V. Suggested Recommendations 1. The U.S. government should release all FISA Court or FISA Court of Review opinions and orders interpreting the meaning, scope, and constitutionality of its surveillance laws, as well establish a presumption that future rulings of this kind will be publicly available. 2. The U.S. government should refrain from broad invocations of jurisdictional, secrecy, and immunity doctrines that prevent judicial review of the merits of government surveillance programs in domestic courts. 3. **The U.S. government should make public its interpretation of its international treaty and other international legal obligations concerning state surveillance of foreign nationals outside the United States, including by clarifying how its current surveillance activities comport with the ICCPR's "proportionality" requirement.** 4. The U.S. government should explain the steps it has taken to supervise its surveillancegathering agencies' collection of international communications to ensure that those agencies comply with the government's international legal obligations. ¶

US did not fully adapt to the ICCPR so they edited it to get away with things

OHCHR 05 (UN Office of the High Commissioner for Human Rights (OHCHR), Fact Sheet No. 15 (Rev.1), Civil and Political Rights: The Human Rights Committee, May 2005, No. 15 (Rev.1), available at: http://www.refworld.org/docid/4794773c0.html [accessed 3 July 2015])

The United States has adopted a categorical position against the extraterritorial application of the ICCPR, arguing that the Covenant's text precludes any kind of extraterritorial application, i.e. that an individual who is not located in a territory over which the state has sovereign title can never have rights under the treaty vis-à-vis that state. But the US views on the extraterritorial application of the ICCPR have in fact not been as clear, long-standing or principled as is sometimes said. It is true that during the drafting of the Covenant it was the United States who proposed to modify the original language of what was to become Article 2(1) – 'within its jurisdiction,' the formula that was taken up by the drafters of the ECHR – so that it became 'within its territory and subject to its jurisdiction.' Much was later made of this drafting change by the George W. Bush administration in the context of the 'war on terror', as well as by Michael Dennis writing in the AJIL.72 Yet not only are the travaux much more ambiguous than the US government has claimed, but it is simply factually wrong to insist on a supposed half-century in the continuity of the US position or indeed in any kind of awareness of the extraterritorial application issue. Indeed, the story of the ICCPR's drafting and adoption is riddled with interruptions and delays. The principal drafting of the text was mostly done from 1947 to 1954; the United States actively took part. But the ideological divisions brought about by the Cold War made it impossible for states to agree to what was then a single human rights Covenant. After much wrangling a political decision was made to split the Covenant into two, followed by further

deliberations and the adoption of the texts and the opening for signature of the ICCPR and the ICESCR in 1966. The two Covenants entered into force ten years later, in 1976. The United States did not even sign the two Covenants until 5 October 1977, under the Carter administration.74 It ultimately ratified the ICCPR only in 1992, under the George H.W. Bush administration, and never ratified the ICESCR.75 ¶ Rather than having a constant and consistent position against the extraterritorial application of the ICCPR, it is fair to say that during most of this extended period neither the United States nor other states expressed any kind of clear view, let alone agreement, on the Covenant's territorial scope. A deeper look at the travaux in the main drafting stages in particular shows the lack of any conceptual coherence among the drafters. Territorial scope was but one of many issues they were considering, and while some states were concerned about the application of the Covenant to specific problems (notably that the Covenant should not require them to protect their nationals abroad against third states, or legislate for the people of occupied Germany), the preparatory work is remarkably unhelpful when it comes to any first principles regarding the interpretation of Article 2(1).76 The travaux certainly do not express a clear sentiment by the drafters that the Covenant should never apply extraterritorially. This was indeed the ICJ's conclusion upon looking at the travaux in the ¶ After the adoption of the text of the ICCPR came several decades of silence during which the issue of the ICCPR's extraterritorial application was simply not on the radar. When the first Bush administration re-initiated the ratification process in the US Senate, no mention was made of the question of the ICCPR's extraterritorial application. The Senate certainly made no declarations or understandings in that regard.79 Nor was the issue raised in the US initial report to the Human Rights Committee,80 even though the Committee's first cases deciding that the Covenant can apply extraterritorially predated both the report and the US ratification.81 ¶ The first time the US government clearly articulated the position that the ICCPR cannot apply extraterritorially tout court was when its initial report was discussed before the Committee in March 1995, and it did so in response to a question by a member of the Committee: Mr. Klein had asked whether the United States took the view that the Covenant did not apply to government actions outside the United States. The Covenant was not regarded as having extraterritorial application. In general, where the scope of application of a treaty was not specified, it was presumed to apply only within a party's territory. Article 2 of the Covenant expressly stated that each State party undertook to respect and ensure the rights recognized "to all individuals within its territory and subject to its jurisdiction". That dual requirement restricted the scope of the Covenant to persons under United States jurisdiction and within United States territory. During the negotiating history, the words "within its territory" had been debated and were added by vote, with the clear understanding that such wording would limit the obligations to within a Party's territory.82 ¶ Note how the US representative made three arguments against the extraterritorial application of the ICCPR: (1) the existence of a default presumption against extraterritorial application; ¶ (2) the ordinary meaning of 'within its territory' coupled with a conjunctive 'and'; (3) the 'clear understanding' to that effect from the preparatory work. Of these three arguments only (2) has real merit, and I will come to it in a moment. As I have already explained with regard to (3), there most certainly was no clear understanding among the drafters regarding the ¶ ICCPR's extraterritorial application – indeed there was very little understanding of any kind. As for (1), it at least is manifestly wrong. Presumptions against the extraterritorial applications of statutes are creatures of domestic law; in the law of treaties the default rule in Article 29 VCLT is that a treaty applies to the state's entire territory, rather than merely parts thereof, but that default rule has absolutely nothing to say on extraterritorial application. ¶ In short, the 1995 US statement before the Human Rights Committee was not the reiteration of some long-standing, consistently held position, but was made there and

then, within the contemporary political context, particularly the 1994-1995 intervention in Haiti. Indeed, it was precisely with regard to Haiti that Theodor Meron wrote an influential 1995 piece in the AJIL on the extraterritoriality of human rights treaties, one of the earliest academic treatments of the topic. The Clinton administration's position was inevitably informed by the possible practical difficulties the ICCPR would pose in its present and future foreign interventions, as was its similar position against the extraterritorial application of the Refugee Convention in the 1993 Sale case before the US Supreme Court,85 again with regard to the crisis in Haiti. ¶ Faced with the 'global war on terror,' the George W. Bush administration was happy to follow the Clinton administration's lead. Its consolidated second and third periodic report to the Human Rights Committee contained a somewhat more extended argument against the extraterritorial application of the Covenant. While dropping argument (1) above, the report again argued that the conjunctive language of Article 2(1) was clear and that the impossibility of the ICCPR's extraterritorial application was supported by the drafting history. ¶ This rigid position was rejected by the Human Rights Committee in its case law and in General Comment No. 31, as well as by the ICJ and most academic commentary. But the Bush administration did not budge. The Obama administration, on the other hand, seemed to be somewhat more flexible. In its fourth periodic report to the Committee, the United ¶ States did not reaffirm its previous position, but merely noted it and its rejection by the Committee and the ICJ: ¶ The United States in its prior appearances before the Committee has articulated the position that article 2(1) would apply only to individuals who were both within the territory of a State Party and within that State Party's jurisdiction. The United States is mindful that in General Comment 31 (2004) the Committee presented the view that "States Parties are required by article 2, paragraph 1, to respect and to ensure the Covenant rights to all persons who may be within their territory and to all persons subject to their jurisdiction. This means that a State party must respect and ensure the rights laid down in the Covenant to anyone within the power or effective control of that State Party, even if not situated within the territory of the State Party." The United States is also aware of the jurisprudence of the International Court of Justice ("ICJ"), which has found the ICCPR "applicable in respect of acts done by a State in the exercise of its jurisdiction outside its own territory," as well as positions taken by other States Parties. ¶¶ The administration thus left the door open to the possibility of changing the previous categorical position. Anxious to accelerate this process the Committee tried to press the administration further in its list of issues, but the administration remained coy in its response, merely referring the Committee back to the US fourth report. ¶ We now know that the administration's coyness was due to internal disputes as to whether abandoning the categorical position would be appropriate. A week before the US delegation was to present its fourth report to the Committee in March 2014, two internal memoranda written by Harold Koh, then the legal adviser to the State Department, were leaked to and published by the New York Times. The first memo is on the extraterritorial application of the ICCPR and is dated 19 October 2010, while the second is on the geographic scope of application of the Convention against Torture, and dated 21 January 2013. ¶ The first opinion, which is of most interest to us here, forcefully argues that the US categorical opposition to the extraterritorial application of the ICCPR is fundamentally flawed and should be abandoned. In particular, Koh agrees with the critics of the US position that the language of the ICCPR is not clear and is open to several possible interpretations, and that reading that language to categorically disallow extraterritorial application would be contrary to the treaty's object and purpose. Similarly, after conducting a thorough and extensive review of US governmental materials, Koh's opinion confirms that the United States adopted the categorical position only in 1995 in the hearings before the Committee, where it was 'first asserted in a conclusory fashion.' ¶ However, despite the

many strengths of his opinion, Koh was unable to persuade the other relevant stakeholders within the administration that the position should be changed, since there were concerns that doing so might require significant changes in existing US policies. Whoever leaked the two memos to the New York Times did so precisely in order to undermine the credibility of the US position as it was about to be reasserted in the hearings before the Committee. And when the position was in fact reasserted, this was understandably met with considerable scepticism on the part of the Committee members.100 In its concluding observations the Committee thus expressed regret that the US maintained its previous position and recommended that it should be reconsidered. ¶To conclude, as we have seen the supposed consistency of the US position on the ICCPR's extraterritorial application should not be overstated. Nor should we for that matter portray the US position, which is today definitely in the minority, as some kind of longstanding historical understanding of the Covenant which is today unjustifiably under threat from human rights and judicial activists, who are (yet again) trying to impose obligations on states without their consent. The US position was contested from the moment that it was actually articulated in 1995. What is true, as much as for the ECHR as for the ICCPR, is that until the 1990s very few people paid any serious thought to the possibility of the extraterritorial application of human rights. This is not, I submit, because the states parties shared an agreement that the treaties do not apply outside their territories, but largely because culturally the rights of others were to a significant extent beyond contemplation, especially during the Cold War, and the process of human rights acculturation took its time. But while the extraterritorial application of human rights treaties, especially during armed conflict, may have been literally unthinkable for most of the treaties' lifetime, that is no longer the case today.

Impact is Inevitable – Other US violations of international commitments

Newman 14 (2014, Alex, writing for The New American, "UN Torture Committee Slams U.S. Police and Military.", Dec 13 www.thenewamerican.com/usnews/constitution/item/19645-un-torture-committee-slams-u-s-police-and-military)

After a spectacle featuring senior Obama administration officials prostrating themselves before the United Nations "Committee Against Torture," the controversial UN body released a scathing report last week accusing U.S. authorities of widespread violations of what it calls "**international law.**" Among other concerns, the global panel cited everything from "police brutality" by state and local officials domestically to the actions of the U.S. military and intelligence agencies abroad. Other criticism directed at the United States focused on **immigration** policies, **deportations**, **prison conditions**, **Guantanamo Bay**, **the terror war**, and more. In response to the UN committee's findings, the panel called on federal officials to alter U.S. laws to comply with its demands — including abolishing the death penalty, reforming deportation procedures, and more. The report also called on the U.S. government to pass new federal laws defining torture in accordance with the UN Convention. In the same section, it lashed out at the U.S. government's "interpretation" of the global "torture" regime, saying that "under international law, reservations that are contrary to the object and purpose of a treaty are impermissible." In other words, the dictator-dominated UN, rather than the U.S. Constitution, purports to be the arbiter of what is or is not "permissible." advertisement The UN bureaucrats on the committee — one comes from Morocco, another from Communist China, and one more from Communist Nepal — also called on U.S. authorities to amend "laws and regulations" to be in compliance with the global agreement. In addition, the UN committee said it "encourages" the U.S. government to ratify other global agreements purporting to bind the American people and their elected officials to globalist demands rather than the U.S. Constitution. Finally, the document is packed with calls for the federal government to go beyond its constitutional limitations in commandeering state and local governments. All across the report, the UN also offered instructions to the Obama administration on everything from indefinite detention without charges or trial to releasing information on post-9/11 atrocities allegedly perpetrated by various agencies within the U.S. government. Among other demands, the UN experts called on the Obama administration to "cease the use of indefinite detention without charge or trial" — something that constitutes a serious crime against the U.S. Constitution, regardless of what the UN and its

oftentimes brutal member governments claim regarding their planetary torture regime. Moreover, the White House should release information on numerous instances of CIA "human rights violations, including torture, ill-treatment and enforced disappearance of persons suspected of involvement in terrorism-related crimes." In addition to the CIA, the U.S. military and its policies — ranging from the treatment of detainees to its policy manuals — came under severe criticism in the document. Of course, virtually all of the UN's complaints should be considered moot, because the U.S. Constitution, which established the federal government in the first place and granted it a few limited powers, already prohibits such schemes. Separately, in an open letter to Obama, a UN group of self-styled "human rights experts" with bombastic titles also called on the administration to release a U.S. Senate report on CIA "interrogation" practices. "As a nation that has publicly affirmed its belief that respect for truth advances respect for the rule of law, and as a nation that frequently calls for transparency and accountability in other countries, the United States must rise to meet the standards it has set both for itself and for others," the UN "experts" declared. According to the UN "human-rights" operatives, victims of torture and human-rights defenders around the world would be "emboldened" if the Obama administration — widely described as the most secrecy-obsessed, least transparent in U.S. history — would support transparency. "On the contrary, if you yield to the CIA's demands for continued secrecy on this issue, those resisting accountability will surely misuse this decision to bolster their own agenda in their countries," the open letter continued. As The New American has reported on multiple occasions, in addition to the draconian secrecy, the Obama administration has also improperly worked to protect George W. Bush administration officials from prosecution for the myriad alleged crimes they perpetrated under color of law. "The Committee expresses concern over the ongoing failure to fully investigate allegations of torture and ill-treatment of suspects held in U.S. custody abroad, evidenced by the limited number of criminal prosecutions and convictions," the UN torture committee said in its report about the United States, the first such "periodic review" since 2006. In light of the overseas torture (such as water boarding) carried out by U.S. officials, the UN called for "prompt, impartial and effective investigations" to "ensure that alleged perpetrators and accomplices are duly prosecuted, including persons in positions of command and those who provided legal cover to torture." If found guilty of the charges, the criminals in government should be punished with serious penalties "commensurate with the grave nature of their acts," the UN said. Victims of U.S. government torture should also be compensated and rehabilitated, the panel said. On law enforcement, which is a power generally reserved for state and local government by the U.S. Constitution, the UN also expressed a wide array of concerns. "The Committee is concerned about numerous reports of police brutality and excessive use of force by law enforcement officials, in particular against persons belonging to certain racial and ethnic groups, immigrants and LGBTI individuals, racial profiling by police and immigration offices and growing militarization of policing activities," the report said, citing Chicago's police department as particularly alarming.

Use of force norms have no effect on conflict---confounding variables doom their data's causality

Posner 3/5/14—Eric, Professor of Law at the University of Chicago Law School, "Have the Use of Force Rules Reduced the Frequency of War?" http://ericposner.com/have-the-use-of-force-rules-reduced-the-frequency-of-war/

As I explained earlier, I have never claimed that international law is inconsequential. For example, trade law seems to matter. But it is always an empirical question whether a specific rule affects state behavior or not, and in a meaningful rather than trivial way. Anecdotal evidence gets one only so far. To address this problem, scholars use statistical methods–basically, event study methodology, to test whether state behavior changes in the predicted fashion after the state ratifies a treaty. This approach has been productively used in the area of trade (yes) and human rights (generally, no). It helps in these areas that different states ratify the treaties at different times. Unfortunately, the use of force rules came into effect all at once for everyone in 1945, so there is not enough variation to do a real test. (Many countries joined the UN system later, but usually when they came into existence, or for other unusual reasons that cannot be controlled for.) Still, I thought it would be interesting to take a look at the incidence of interstate war, and I found the graph I reproduce above in Kristian Skrede Gleditsch & Steve Pickering, Wars Are Becoming Less Frequent (2013), which seems like a carefully written paper. The bars show the number of interstate wars (excluding civil wars) with at least 1,000 battle deaths in a given year. Note that the 2011 Libya war is excluded because the data set ends in 2010, and the 2008 Russo-Georgian war is excluded, presumably because of insufficient battle deaths. One can certainly detect a decline in the frequency of interstate wars (as shown by the various trendlines). But it would be

very hard to attribute any causal influence to the 1945 UN charter. If you trust the linear time trend, 1945 just falls in the middle of a long-term decline. If you take one of the nonlinear time trends, it falls before an increase in the number of wars. If one is looking for causes, the end of the cold war with the onset of U.S. hegemony seems like the most plausible–the infrequent warfare over the last 20 years pulls down all the time trends. However, all in all it is hard to find any causal pattern at all. If you want to, you can find reasons for giving causal effect to the 1945 law. You can say that it took a while for the a new norm to work itself through the system, or that the cold war or decolonization was an anomaly that interrupted what would otherwise have been a smooth pattern of causal influence. Maybe. But it seems to me that if one makes such claims, **one needs to acknowledge a low level of confidence.**

Ukraine is a huge alt cause and disproves their impact

Ku 3/2—Julian, Professor of Law and Faculty Director of International Programs. B.A., Yale University J.D., Yale Law School, "Russia Reminds the World (and International Lawyers) of the Limits of International Law" http://opiniojuris.org/2014/03/02/ukraine-russia-international-law-governing-use-force/

Which brings me to the Ukraine crisis. I agree with Erik Voeten that international law and institutions will be helpful in other ways. And I think Chris provides very helpful analysis of how international law can shape official state rhetoric. But the fact remains that the international law restraining the use of armed force has utterly and completely failed to constrain Russia's actions in Ukraine. This is more than simply adhering to the legislative veto. This is a **body blow** to a foundational piece of the international legal system.

In academic terms, the failure of the Charter is evidence for both realists (who think international law never matters), but also for rational choice theorists like Posner, as to how international law really works. Rational choice folks think that international law works best (in fact, works at all only) when states have a rational self-interest to cooperate around certain legal norms and institutions. But where states no longer have such a rational self interest, states will depart from those legal norms. Compliance with international law for the sake of complying with international law is naive and unrealistic.

The Russia-Ukraine crisis also impacts real-world policymaking. If international law, or at least **the Charter's rule on the use of force, is very weak or non-existent as a tool for restraining state action,** then policymakers should not rely on the Charter rule as meaningful protection against aggression.

A strong military or a network of alliances would probably have been a better idea. States must not overestimate the impact or force of this species of international law (as Ukraine's new government seemed to do) when making decisions. And states like the United States should be careful incorporating this rule into its domestic legal processes, or over-privileging its role in its own domestic public debate.

I may be biased as an American, but the U.S. has about the right balance on this. It does not ignore the Charter, but it does not treat the Charter as having too much independent significance except to the extent it affects the actions of other states (especially its allies). The key thing to focus on in this crisis are the interests of the different states (and leading groups within states).

State interests are driving actions here, and the Charter violation seems to be doing almost now work.

The fact that the Charter is plainly being violated **will not necessarily** mean that Charter proponents like France and Germany will get tough with Russia (in fact, both are going the other way by opposing sanctions or any NATO consultations). The fact that the Charter is plainly being violated **will not mean** China (another big Charter proponent) will do anything other than closely watch developments and urging "all sides to comply with international law" without naming any country.

International law can be, and often is, a very important tool for facilitating international and transnational cooperation. But it is **not doing much** to resolve to Ukraine crisis, and international lawyers need to admit that.

And, there is no correlation between treaties and multilateral coop – AND coop empirically fails

Goldsmith and Posner '6 Jack, is a Professor of law @ Harvard, and Eric is a Professor of law at University of Chicago, "The New International Law Scholarship," http://www.law.uchicago.edu/files/files/126.pdf

Ultimately, the role played by reputation is, as we noted in Limits, an empirical question.20 Raustiala, relying in part on credibility (i.e., reputation) arguments, maintains that states engage in "extensive" and deep multilateral cooperation.21 If Raustiala is right—if we see multilateral treaties and international organizations solving genuine multilateral prisoner's dilemmas among several dozen or more states—then it would be fair to conclude that reputational concerns of either the first or second sort outlined above would be doing more work than we suggest in Limits. But do we really see **extensive** and **deep** multilateral **coop**eration**?**

Raustiala notes that there have been over 50,000 treaties since 1945. **This** number **is much less impressive than it seems**. If each of 190 states entered just two treaties—say, an extradition treaty and a treaty of amity—with every other state, this would amount to about 36,000 treaties. All of these bilateral treaties might (at best) reflect genuine bilateral cooperation, but would say **nothing** about multilateral cooperation. And of course most nations have many more than two bilateral treaties. So the 50,000 figure is misleading, since the vast majority of the 50,000 treaties are merely bilateral treaties that do not purport to reflect multilateral cooperation. **More relevant is the multilateral treaty**, of which, according to the U.N., **there are** perhaps **500** or 600.22 In our book, we address only a half dozen or so of these treaties, and **provide evidence** that they do not reflect genuine **multilateral coop**eration. **Do the** remaining **treaties** actually **solve n-player collective action problems?** Or do they do other things, like provide coordination for pairwise cooperation (our conjecture), express symbolic commitments, or simply fail because they were too ambitious?

These are important questions, and we lack space and time to analyze and address the literatures cited by Raustiala. But we do have simple answers to Raustiala's questions: "Why [do] NATO, the WTO, the U.N., and the many other international organizations that populate New York, Geneva and elsewhere [exist]," and "why, if international law is so limited, do states keep creating and elaborating it?"23 Raustiala and we agree that nations entered into these treaties

because they perceived that they gained more than they lost from them. **But what they gained** from these three treaties in particular **was not**, we think, **the solution to a multilateral prisoner's dilemma**. Article 5 of the NATO treaty imposes an important obligation of mutual self-defense that **was never tested**.24 The rest of the treaty imposes empty obligations (such as settling disputes by peaceful means and strengthening free institutions) and performs the coordinating function of providing a forum and basic procedural rules whereby different constituencies can come together to solve particular problems at the retail level, often in small groups.25 This coordinating function is also the primary accomplishment of the U.N. Charter. The Charter does, to be sure, impose strict obligations about the use of force, but these obligations have been honored in the breach.26 As for the WTO, we argued in Limits that it is an example of an institution that is best understood as resolving bilateral disputes between states.27

These answers are necessarily compressed, and there is much more to say about what multilateral institutions accomplish. But even these observations do lead us to flip Raustiala's question above and ask, "Why, if international law is not so limited, **do states keep failing to create effective international law?"** There are pressing international problems—**war**, refugee crises, global **warming**, the **prolif**eration of nuclear weapons, international **terrorism**, the depletion of **fisheries**, intrastate conflict, lingering **protectionism**—**that states are unable to solve. A good theory would explain both why i**nternational **law** exists and why it **remains** highly **imperfect**. Limits tries to do this. Other theories—at least other theories in the legal academy—do not.

Anonymity is bad

Anonymity decreases security and leads to crime, social unrest, protests, cyberattacks, loss of morality, and even revolution

Davenport 2 (http://www.csl.mtu.edu/cs6461/www/Reading/Davenport02.pdf, Anonymity on the Internet: Why the Price May Be Too High, David Davenport, policy writer for many different websites, including Forbes)

Individuals living in a free society reap benefits in terms of sustenance, shelter, and protection. In return, they are expected to contribute to the community. Problems occur due to imbalances in this relationship. If individuals or groups acquire excessive wealth or power, or, conversely, do not receive just rewards, tension is inevitable. Small groups, such as villages or family units, where people know and depend more directly on each other, tend to be reasonably stable despite significant imbalances. However, in larger communities, such as cities or countries, such differences can quickly lead to crime, social unrest, protests, and even revolution. In circumstances where people can be largely anonymous, and the threat of punishment is thus minimal, they find it easier to justify to themselves actions against those they perceive as outsiders or enemies. Large social groupings necessitate some sort of decision-making mechanism (monarch and government, to name two) to guide them, and a system of controls (police and judiciary) to ensure fairness and compliance. In a democratic society, citizens "consent" to such bodies resolving any problems or conflicts that may arise, rather than taking action themselves. By punishing misconduct, society aims to deter repetition of such offenses and

send a clear warning to those who may be similarly tempted to violate the rights of others. The democratic system also incorporates controls (elections and laws) that ensure that governing bodies cannot abuse their position. Obviously, resolving any unfairness, whether involving individuals, groups, or the state, requires that those responsible for the problems can be held accountable. In a free and fair society, justice must exist, and be seen to exist. Experience suggests a society relying solely on the good will and conscience of its citizens would be unlikely to succeed in ensuring justice. Similarly, attempting to guarantee justice by adopting measures preventing the very possibility of wrongdoing is unfeasible since there is little hope of covering all and take precautions in an attempt to make misbehavior impossible, but we would surely be foolish not to retain the safety net of accountability. Accountability requires those responsible for any misconduct be identified and brought to justice. However, if people remain anonymous, by definition, they cannot be identified, making it impossible to hold them accountable. Proponents of anonymous communications on the Internet thus open the door to many forms of criminal and antisocial behavior, while leaving victims and society helpless. Internet-based crimes, such as hacking, virus writing, denial-of-service attacks, credit card fraud, harassment, and identity theft are increasing. Already, damage estimates are measured in billions of dollars per year, but the human cost, in terms of ruined reputations, loss of trust, and a general deterioration in morals, is immeasurable. While all this is dangerous enough, there is a much more ominous aspect to anonymity. Were anonymous communication to become the default, then it would be available, not just to the private citizen, but to the state and to those individuals comprising it. Highly sensitive material could be leaked, paybacks could be made to secure lucrative deals, pressure could be placed on officials, elections could be rigged, and arrangements could be made for political opponents to be attacked or even eliminated, all with impunity. Distrusting a government accountable to the people is one thing, facilitating a government completely unaccountable is quite another. Some may argue that governments already employ anonymity to cloak clandestine operations, so it would make no difference. However, where governments do currently use it, they do so illegally. Those involved know it is wrong and know the penalties if they are caught, thus deterring all but the most desperate or naive.

Alt Causes to Totalitarianism

Alt causes to totalitarianism

Lefever 12 (http://lefeverblog.dailymail.co.uk/2012/10/the-progression-from-welfare-state-to-totalitarian-state-is-inevitable.html, The progression from welfare state to totalitarian state is inevitable, October 9, 2012, Daily Mail, Dr. Robert Lefever, blogger and writer for Daily Mail)

Marxism is a shallow belief system but deep dangers go with it. The basic tenet, 'from each according to his ability; to each according to his need', is a blueprint for a totalitarian state, not a compassionate society. It imprisons givers and sanctifies takers. In this respect, David Cameron and Nick Clegg are closet Marxists. Ed Milliband is simply more open about acknowledging the roots of his political philosophy. Nick Clegg has been pilloried by his own party for reneging on a promise that he made but couldn't keep. Instead of heading a minority administration, David Cameron tries to detoxify the Conservative brand by making it progressively more socialist. He formed a coalition with people who make unnatural bedfellows. The Communist Manifesto attracts those who want to take. Either they want something for themselves, at someone else's

expense, or they want the credit for giving it to other people. They profess that they seek power not for themselves but for the benefit of others. But, in practice, they themselves revel in the exercise and trappings of state power. Politicians are elected on their promises to confiscate and donate. 'Pre-distribution' is just yet another euphemism for legalised theft. Votes are given on the estimate of whether an individual reckons that he or she is likely to gain or lose in a reapportioning process. Political tracts are fashioned in the guise of altruism but self-interest is the underlying principle. 'To each according to his need' is universal in its appeal. We can all point to our needs, relative to the privilege of some other people. Wants very quickly become needs and then entitlements. 'From each according to his ability' is equally popular when we are looking up the ladder to those whose talents we believe should be channelled towards our betterment. However, we may fail to note those below us who want - and even demand - that we should give to them. In this way, any achievement or possession becomes a liability. This is where the politics of envy, spite and malice has its roots. In a democracy, the politicians control the military and, to a large extent, the constitutional monarchy. The judiciary remain independent. In a dictatorship, leadership is taken by force and imposed. In a theocracy, religious leaders claim civic as well as spiritual power. That all looks clear cut. But it isn't. The body politic is fluid, not static. Once in power, politicians develop a conceit that in time makes the progression from welfare state to totalitarian state inevitable. The electorate colludes with this when it demands repeatedly that the government ought to do something over this or that or everything. Ultimately we get the government and the political system that we deserve. If we want a government to do something, it will. Then, when we wonder where our freedom went, we should recognise that we have only ourselves to blame for throwing it away. We should challenge the ideas and principles upon which politicians base their manifestos. If we unthinkingly surrender moral right to the likes of The Communist Manifesto, it is only a matter of time before the tanks roll into our streets or until we are expected to spy on each other. The only protection against this fearful scenario is that we should demand less government locally, nationally and supra-nationally. We need the protection of a minimum state to guarantee the upholding of contract law, the provision of a police force so that we do not have to take the law into our own hands, and defence forces to protect us from foreign invasion. Beyond that, for our own safety, we should care for ourselves and each other without recourse to government. Otherwise the Marxists and Fascists, the two feet of totalitarianism, will walk through an open door.

Precedent

Status Quo Solves – 1NC

No precedent – Riley court decision already is a precedent in surveillance cases

Oldham and Oldham 14 (Matt and Robert, Georgia Political Review, "THE POLICING PARADOX: THE RISING SECURITY STATE AND HOW THE ROBERTS COURT CAN COUNTER IT", http://georgiapoliticalreview.com/the-policing-paradox-the-rising-security-state-and-how-the-roberts-court-can-counter-it/)//BW

Up until the 2013 term, the Roberts court tended to empower the state by ruling on the side of the police when considering the limits of police activities. A 2006 ruling in Hudson v. Michigan allowed police to admit evidence even when "knock and announce" rules were violated. Earlier this year, Navarette v. California ensured that the police could utilize anonymous tips to make arrests even when there was no probable cause from their observations. This was not surprising as

four current justices, including Chief Justice John Roberts himself, are official members of the Federalist Society. The Federalist Society is part of a conservative legal movement that generally supports the extension of state power, especially when it comes to security concerns. But this did not come into play in the 2014 term. Given the Roberts Court's record, supporters of restrained state power were both pleased and surprised by the landmark ruling in Riley v. California. Roberts wrote the opinion for a 9-0 court decision that generally prohibited police from searching digital data on a cell phone without first obtaining a warrant. This case is particularly important because it concerns both individual rights from burdensome police procedures and the role of the state in the digital age. The Riley ruling protects individuals from invasive police procedures that have been upheld in other circumstances. The state is typically allowed to seize physical records that it uncovers in raids of suspected criminal homes without a warrant. However, because of the massive upswing in the use of smart phones and cloud storage, the Roberts Court has declared that data is different and will be subject to special rules. Because "millions of pages of texts, thousands of pictures, [and] hundreds of videos" can now be stored in a handheld device, there should be a greater expectation of privacy and the state will have to show in a warrant that there is a reasonable expectation that the data will provide further evidence. The ruling is also relevant to the future of NSA spying programs because it rejects the government claim that metadata should not be subject to search and seizure protections. The qualitative characteristics of the data stored in the digital age can be highly personal in nature (e.g. internet history and location tracking services) and the court ruled that this should be protected jealously. Two cases, Klayman v. Obama and ACLU v. Clapper, are both coming up through U.S. Circuit Courts and ask whether or not the NSA collection programs are constitutional. In light of the Riley precedent it is likely that the Supreme Court may also decide these cases in favor of personal liberties. It is possible that the court's unanimity in the case was not due to a wide agreement over rolling back the state's policing power. The case was decided in late April before opinions were to be issued and it may be that the justices simply did not have enough time to draw out more nuanced answers to the question of digital privacy. But the importance of the decision should not be overlooked. It had the dual distinction of protecting individual privacy from physical police seizures and ensuring digital security.

No New Cases – 1NC

No interest in privacy cases now – Roberts Court not intrigued

Pritchard, 11 (Adam C., University of Michigan Law School, "Securities Law in the Roberts Court: Agenda or Indifference?", University of Michigan Law School, University of Michigan Law School Scholarship Repository, http://repository.law.umich.edu/cgi/viewcontent.cgi?article=1504&context=articles)//BW

The Roberts Court's work in the field of securities law demonstrates what happens when a court of general jurisdiction is charged with making decisions in an area with which it is unfamiliar. Analysis of the Court's decisions yields few, if any, common threads tying them together as a body of work. Whatever direction the securities laws take in the Supreme Court, do not expect opinions to grapple more seriously with the interplay between securities law and the securities markets anytime soon. The randomness of the Roberts Court's securities jurisprudence results in part from the stream of cases that make their way on to the Court's docket. It is also a product,

however, of the absence of any individual Justice having an interest in the field. A comparison with Lewis Powell's tenure on the Court illustrates the point. Powell drew on his background as a corporate lawyer to push the Court in a particular direction during his time on the Court, reining in securities class actions and imposing a common law framework on the SEC's vendetta against insider trading. 272 The Roberts Court does not have a figure like Powell in the field of securities law. To be sure, the increased number of securities cases heard by the Roberts Court relative to the Rehnquist Court suggests that the Court recognizes the significance of the securities laws. But it agrees to hear securities cases because there is a circuit split, not because it is anxious to impose its mark on the field of securities law. The debates that engage the Justices in these cases do not come from the field of securities laws, but rather, are more general: statutory interpretation, the use of legislative history, the presumption against the extraterritorial application of legislation, etc. What does this lack of agenda mean for securities law? First, it means that the path of law is somewhat unpredictable. It is hard to know when a Justice will be so galvanized by a particular issue that he takes ownership of it, such as Justice Kennedy with aiding and abetting. Second, absent a galvanizing issue, there is likely to be a presumption in favor of the position taken by the government. This attitude of occasional deference means that the relationship between the SEC and the Solicitor General takes on critical importance. If the SEC can persuade the Solicitor General, its position is likely to prevail in the Roberts Court. With a Democrat currently in the White House, the SEC and the Solicitor General are likely to see eye-to-eye in the near term. If Republicans regain control of the White House, that could change. For now though, the government is likely to take positions that maximize the SEC's reach, as it did in Morrison (albeit unsuccessfully). No Justice is likely to push securities law in a more aggressive direction than the SEC. The retirement of Justice Stevens means that there is no one left on the Court with any pretensions of being an activist in the field, particularly in the area of the private right of action. Justice Ginsberg, writing for the Tellabs majority, made it clear that the Court intends to defer to Congress in this area: "It is the federal lawmaker's prerogative . . . to allow, disallow, or shape the contours of-including the pleading and proof requirements for-§ 10(b) private actions." 2 73 This language suggests we should not expect the Court to be anything more than a passive observer here; major changes, if any, will come from Congress. The Roberts Court's cautious attitude is a departure for the Supreme Court. The Court's treatment of the basic question regarding the existence of the implied private right of action in Stoneridge sends a clear signal that the Court's expansionist days are over in the field of securities law. Kennedy made it clear that the initial implication of a private cause of action had been a mistake; under current doctrine, private causes of action are based only on explicit instruction from Congress. 274 Having recognized the mistake, the Court was not going to compound the error: "Concerns with the judicial creation of a private cause of action caution against its expansion. The decision to extend the cause of action is for Congress, not for us. **Though it remains the law, the § 10(b) private right should not be extended beyond its present boundaries**." 275 Thus, Stoneridge stands for the proposition that the Rule lob-5 cause of action is now frozen, at least when it comes to the expansion of liability by the Court. 276 **Expansion of the cause of action will have to come from Congress, if it is to come at all**. This attitude of deference is a far cry from the heady days of the Warren Court, or even Justice Blackmon's expansionist push in Basic Inc. v. Levinson. Securities law in the Roberts Court is likely to be focused on maintaining the status quo.

Court precedent and previous congressional inaction prove – Third party doctrine is here to stay

Hall 1/8 [John Wesley Hall, criminal defense lawyer who has held all positions in the NACDL and author of several books on the Fourth Amendment; "E.D.N.C.: Third-party doctrine well entrenched and SCA shows Congress isn't changing it, yet"; The Fourth Ammendment, supported by Lexis; 01/08/2015; accessed 07/09/2015; <http://fourthamendment.com/?p=15359>.]

All things considered, the third party doctrine is well established in SCOTUS precedent, and the court declines to depart from it. In addition, the Stored Communications Act, remaining unchanged, is evidence that Congress intends it to remain that way. Cell site location information and a Facebook production order are sustained. In addition, the Google search warrant was overbroad but saved by the good faith exception. United States v. Shah, 2015 U.S. Dist. LEXIS 826 (E.D. N.C. January 6, 2015) [This is a lengthy and demoralizing opinion for those expecting any change in the third party doctrine, but it is correct. A USDJ is stuck with precedent and can't go out on a limb except to ask for change.]. As to overbreadth: The provision [of the warrant] describing the documents "seized" makes a general reference to "[a]ll information described above in Section I that constitutes fruits, evidence, and instrumentalities of Title 18, United States Code, Sections 1030 (Fraud and Related Activity in Connection with Computers)." (Google Warrant, 6). This statute, also known as the federal Computer Fraud and Abuse Act ("CFAA"), prohibits a wide array of activities, including the use of computers to transmit information restricted by the United States without authorization, intentionally accessing a computer without authorization or exceeding authorized access to obtain financial records, accessing nonpublic computers of the United States in a way which affects the government's use, accessing protected computers without authorization in order to commit fraud, threatening to cause damage or obtain information from a protected computer, conspiracy to commit these offenses, and other activities. See 18 U.S.C. § 1030(a). A violation of the CFAA would not necessarily generate such "distinctive evidence" as bank robbery or narcotics. Dickerson, 166 F.3d at 694. Nor would evidence necessarily be as distinctive as that of child pornography, a type of crime more commonly targeted by warrants for electronic information. E.g. United States v. Schesso, 730 F.3d 1040, 1044 (9th Cir.2013); United States v. Deppish, 994 F.Supp.2d 1211, 1214 (D. Kansas 2014). Rather, a warrant authorizing collection of evidence of a CFAA violation comes closer to warrants seeking to collect evidence regarding violations of broad federal statutes prohibiting fraud or conspiracy. In these cases, limitation by reference to the broad statute fails to impose any real limitation. See United States v. Maxwell, 920 F.2d 1028, 1033 (D.C.Cir.1990) ("Although a warrant's reference to a particular statute may in certain circumstances limit the scope of the warrant sufficiently to satisfy the particularity requirement … it will not do so where, as here, the warrant authorizes seizure of all records and where, as here, the reference is to a broad federal statute, such as the federal wire fraud statute."); Rickert v. Sweeney, 813 F.2d 907, 909 (8th Cir.1987) (general search limited only by broad tax evasion statute held overly broad, where probable cause existed only to search for evidence of tax evasion in connection with one particular project); United States v. Roche, 614 F.2d 6, 7–8 (1st Cir.1980) (warrant's limitation of search to "fruits and instrumentalities of the violation" of federal mail fraud statute was inadequate because "limitation by so broad a statute is no limitation at all."). The Google Warrant provides no other details to clarify the particular crime at issue. Section II(a) makes reference to "unauthorized network activity," yet gives no indication as to the meaning of this phrase, which would seem to be implicated in almost all of the activities prohibited by the CFAA. The warrant offers nothing about the time frame of the offense. See United States v. Hanna, 661 F.3d 271, 287 (6th Cir.2011) (noting, in upholding search warrant for electronic information, that the warrant was limited to "the time period that the evidence suggested the activity occurred.") Rather, it provides for the seizure of all evidence of violations of the CFAA "since account inception." (Google Warrant, 6). Although the test for particularity "is a pragmatic one," and must consider "the circumstances and type of items involved," Torch, 609 F.2d at 1090, the record does not indicate that circumstances of the investigation precluded a more particularized description of the crime. Special Agent Ahearn's supporting affidavit provides copious details as to the time and nature of the alleged offenses. Had the Google Warrant properly attached or incorporated this affidavit, it could have provided the necessary context for the search. Hurwitz, 459 F.3d at 471 ("[A]n affidavit may provide the necessary particularity for a warrant if it is either incorporated into or attached to the warrant.") (quoting United States v. Washington, 852 F.2d 803, 805 (4th Cir.1988)). Yet the Google Warrant makes no incorporation, and it does not appear from the record that the affidavit was attached. Without the Google Warrant somehow including the additional details provided by Special Agent Ahearn's affidavit, the affidavit itself cannot satisfy concerns for particularity or overbreadth. See Groh v. Ramirez, 540 U.S. 551, 557 (2004) ("The Fourth Amendment by its terms requires particularity in the warrant, not in the supporting documents."). "[T]here are grave dangers inherent in executing a warrant authorizing a search and seizure of a person's papers that are not necessarily present in executing a warrant or search for physical objects whose relevance is more easily ascertainable." Williams, 592 F.3d at 523–24 (quoting Andresen v. Maryland, 427 U.S. 463, 482 n. 11). "Because electronic devices could contain vast quantities of intermingled information, raising the risks inherent in over-seizing data … law enforcement and judicial officers must be especially cognizant of privacy risks when drafting and executing search warrants for electronic evidence." Schesso, 730 F.3d at 1042; see also In the Matter of the Search of Info. Associated with [redacted]@mac.com that is Stored at Premises Controlled by Apple, Inc., 13 F.Supp.3d 157, 166–67 (D.D.C.2014) ("D.D.C.

Mac.com Order "). Especially in light of the nature of the search and seizure here, the Google Warrant is not drafted with sufficient particularity. In the absence of additional details, the warrant fails to identify the "particular crime" for which officers were to seek evidence. Therefore, the warrant lacks the particularity required by the Fourth Amendment.

No Spillover – 1NC

No precedent – Court decisions are based off political motivations tied to congress

Gely and Spiller 92 (Rafael and Pablo T., Texas A&M University, University of Illinois at Urbana-Champaign, "The POLITICAL ECONOMY OF SUPREME COURT CONSTITUTIONAL DECISIONS: THE CASE OF ROOSEVELT'S COURT-PACKING PLAN", International Review of Law and Economics (1992), 12c45-67) http://ac.els-cdn.com/014481889290005C/1-s2.0-014481889290005C-main.pdf?_tid=a5412502-24dc-11e5-8cd4-00000aacb35e&acdnat=1436296758_584f2260221600a5ca6b09710457fd64)//BW

In Gely and Spiller (1990), on the other hand, the Supreme Court is modeled as a politically motivated actor. The Court is seen undertaking its decisions based not on the traditional rules of legal precedent, but rather on a self-interested political calculus, constrained only by the political interests and structures of the other institutions of government, namely Congress and the president. While this framework abstracts from many important institutional features of the Supreme Court, its predictions seem to conform to much of the conventional wisdom about the workings of the Supreme Court and about the relative power of the different political institutions. For example, Gely and Spiller show that, holding its composition constant, the Supreme Court usually follows the electorate in delivering statutory decisions, even though the Court is not subject to interest groups or direct political pressure. In this paper we find that our theory of constitutional decisions is consistent with much of the intuition concerning the degree of discretion the Supreme Court has when undertaking constitutional decisions. Our theory predicts, however, that the Supreme Court, independently of its own ideological composition, also follows the electorate in its constitutional decisions. The extent and speed by which the Court follows the electorate depends on how unified both houses of Congress and the state legislatures are concerning the issue at hand as well as on the ideological composition of the Court. After developing the theory, we analyze a major change in the Supreme Court interpretation of the Constitution, namely, the reversal in 1937 of its previous constitutional opposition to New Deal legislation. Until 1937 the Court used various interpretations of the commerce, the separation of powers, and the substantive due process clauses to base its decisions on the unconstitutionality of most New Deal regulatory measures. While most previous explanations offered for this change in the position of the Supreme Court point toward President Franklin D. Roosevelt's "court packing," they are unsatisfactory in that they do not take into account that the Court reversed itself before the court-packing plan was announced and that this reversal, as predicted by our model, was closely linked to the 1936 election results that provided for the first time a realistic threat of a constitutional amendment being enacted at the state level.

The courts prevent precedents by making decisions based on congress and the president – Our ev. Is future predictive, theirs is just a snapshot

The nature and process of the main regulatory changes of the last decade represent a challenge for political economists. Not only were major deregulatory processes undertaken without the active support of the regulated industries, but the process itself by which deregulation and regulation developed through the 1970s and 1980s is puzzling. While Congress legislated regulatory and deregulatory changes in some areas (e.g., airlines, trucking, cable, oil), in many other areas regulation and deregulation were promoted and carried out by agencies and the courts, without much active legislative change (e.g., telecommunications, pollution control). The seeming inaction of Congress in the face of rapid regulatory changes, introduced by regulatory agencies and the courts, has been tile subject of much recent research (see, e.g., McCubbins, Noll, and Weingast, 1987, 1989; Weingast, 1981, 1984; Weingast and Moran; Ferejoln and Shipan; McCubbins and Schwartz). This research bias emphasized the agency relationship among the regulatory or administrative agencies, Congress, and the President. The role of the courts, however, has been mostly unexplored in this literature, except for the work of McCubbins, Noll, and Weingast (1987, 1989) and Marks. **The former develop a framework where the courts are seen as indirect agents of Congress, in charge of supporting the interests of the coalition that enacted the original legislation**. Marks, on the other hand, models the impact of judicial decisions on regulatory legislation. His main insight, which we borrow heavily from, is that the bicameral nature of Congress increases the set of Court decisions that are invulnerable to legislative action. In his framework, however, the Court is unconcerned with the impact of its decisions on the legislative process. Neither Marks nor McCubbins, Noll, and Weingast (1987, 1989) consider, and explore the implications of, the conditions for the justices to behave in the way the models stipulate. The role of the Supreme Court in the design of public policy has, on the other hand, attracted much academic attention. The emphasis, however, has been basically normative. Particular attention has been given to the normative properties of different institutional arrangements-for example, whether the Supreme Court should follow a restrained or activist policy.1 Whether any of those institutional arrangements would actually be carried out by self-interested agents, again, has not been analyzed. In this article we follow the recent developments of the modern theory of administrative agencies, by developing a rational choice theory of the Supreme Court. Our framework combines two of the main characteristics of this literature: namely, the rational choice modeling strategy with the notion that institutions matter in the design of public policy. We differ basically by modeling the Supreme Court as a self-interested, ideologically motivated institution, making its decisions subject not to the traditional legal rules of precedent, but to the constraints arising from the political interests of other institutions of government-namely, Congress and the President.

Court decisions are made based on politics, not precedents

Gely and Spiller 90 (Rafael and Pablo T., Texas A&M University, University of Illinois at Urbana-Champaign, "A Rational Choice Theory of Supreme Court Statutory Decisions with Applications to the State Farm and Grove City Cases", Journal of Law, Economics, & Organization, Vol. 6, No. 2 (Autumn, 1990), pp. 263-300, http://www.jstor.org/stable/pdf/764779.pdf)//BW

We apply this approach to the analysis of two recent Supreme Court statutory decisions, the State Farm and Grove City decisions. **We show that both Supreme Court decisions can be understood as the Court reacting strategically to changes in the relevant political constraints reflecting changes in both Congress and the Presidency, and not necessarily to legal precedent or to Congressional intent**. Also, even though these two decisions can be seen as favoring different political tendencies, they are both consistent with a self-interested but politically moderate Supreme Court. While our analysis of these two Supreme Court decisions does not constitute an empirical test of our theory, it shows its potential usefulness to explain and forecast Supreme Court decisions. While we argue in this article that the behavior of the Court can be understood as that of a self-interested, politically motivated actor, the justices' calculus differs from that of members of Congress. Unlike members of Congress, the Court does not necessarily have a relevant constituency whose interests it needs to consider in rendering its opinions.3 On the other hand, the Supreme Court decisions are not taken in a political vacuum. The ability of other political actors to take actions to reverse the Supreme Court decisions is what constrains the scope and power of the Court. While constitutional limits are important,4 we focus here on the constraints on the Court's interpretation of statutes that result from the institutional structure of government (e.g., Congressional jurisdictional rules, the committee system, bicameralism, the President's veto power).5 While simple, our framework has several implications that could, in principle, be subject to empirical testing.6 First, in our framework the Supreme Court "reads election results," as, even without changes in its composition, the Court is responsive to changes in the electorate.7 The impact of the electorate or of interest groups, however, is indirect, and it is effected through changes in the constraints faced by the Court, following changes in the composition of Congress and in the Executive. Second, our model provides an explanation for the conventional wisdom that to a large extent the most important domestic role of the President is to appoint justices to the Court. In our framework, in the absence of veto power, the Supreme Court eliminates most of the President's discretionary power. With veto power, however, the President's views carry substantially more weight in determining the equilibrium. Third, the Supreme Court, in our framework, may increase or decrease the extent of policy stability. By reducing the power of the President, the Court may increase policy stability. On the other hand, the Court may also promote policy changes, as changes in the composition of Congress open the possibility for the Supreme Court to modify the status quo.8'9 Tle Court, however, will follow a more "restrained" path in periods of Congressional stability. Thus, this model of the Supreme Court, which in principle resembles an activist Court, predicts that the Court will play different roles depending on the composition of (and changes in) Congress. The Supreme Court, however, whether "restrained" or "activist," will usually follow electoral changes. Yet an "activist" Court is nothing more than a Court siding with one of the houses of Congress, or

with the President. Finally, the model predicts that Congressional inaction will follow Supreme Court decisions, as these have already taken the composition of Congress into account.

The Supreme Court acts solely in their own self-interest – Presidents don't matter

Gely and Spiller 90 (Rafael and Pablo T., Texas A&M University, University of Illinois at Urbana-Champaign, "A Rational Choice Theory of Supreme Court Statutory Decisions with Applications to the State Farm and Grove City Cases", Journal of Law, Economics, & Organization, Vol. 6, No. 2 (Autumn, 1990), pp. 263-300, http://www.jstor.org/stable/pdf/764779.pdf)//BW

In both cases the Supreme Court follows the electoral results by adjusting to the changes in the composition of Congress and the Presidency. On the one hand, in State Farm, the supreme Court acted to reverse an administrative policy that was implemented following changes in both Congress and the Presidency, which, in the absence of the Supreme Court, would have implied a drastic shift in regulatory policy. In Grove City, however, the Supreme Court moved to make a new policy following a change in the composition of the Senate. Such a new policy would have not, in the absence of the Supreme Court move, come out of Congress, since it would have been blocked by the House of Representatives. In both cases the Supreme Court decisions were supported by one of the houses of Congress and, thus, they could not be reversed by the then current Congress. While one is a pro-conservative and the other is a pro-liberal decision, both are consistent with a Court pursuing its own self-interest, as long as its preferences are not at either extreme of the political spectrum. To summarize, we see in this article the dual role that the Supreme Court can play. On the one hand, it can be seen as supporting the status quo, and restraining both the President and Congress from undertaking drastic regulatory changes. On the other hand, the Supreme Court also plays an activist role, by introducing policies that change the status quo, even though Congress could not, by itself, legislate such policy changes. Thus, whether the Supreme Court is activist or restrained depends on the political circumstances. Following changes in Congress that create legislative stalemate, we would expect the Supreme Court to be activist. On the other hand, following a major change in the Presidency, we would expect the Supreme Court to follow a restrained path.

US-China war won't escalate

Dobbins, 2012 (James Dobbins, directs the International Security and Defense Policy Center at the RAND Corporation, previously served as American Ambassador to the European Community and Assistant Secretary of State, August/September 2012, "War with China," Survival, Vol. 54, No. 4, p. 7-24)

It is important to begin any such analysis by recognising that China is seeking neither territorial aggrandizement nor ideological sway over its neighbours. It shows no interest in matching US military expenditures, achieving a comparable global reach, orassuming defence commitments beyond its immediate periphery. Such intentions might change, but if so, the United States

would probably receive considerable warning, given the lead times needed to develop such capabilities. Despite cautious and pragmatic Chinese policies, the risk of conflict with the United States remains, and this risk will grow in consequence and perhaps in probability as China's strength increases. Among the sources of conflict most likely to occasion a China–US military clash over the next 30 years, listed in descending order of probability, are changes in the status of North Korea and Taiwan, Sino-American confrontation in cyberspace, and disputes arising from China's uneasy relationships with Japan and India. All these sources are on China's immediate periphery, where Chinese security interests and capabilities seem likely to remain focused. **It is important to stress that a China–US military conflict is not probable** in any of these cases, but that judgement is based on the view that the United States will retain the capacity to deter behaviour that could lead to such a clash throughout this period.

Recent Summit solved military relations

High quality global journalism requires investment. Please share this article with others using the link below, do not cut & paste the article. See our Ts&Cs and Copyright Policy for more detail. ¶ In Beijing analysts still struggle to define the precise state of the China-US relationship. As one said to me recently: "Bu shi rezhan, bu shi lengzhan; er shi liangzhan." Or, in the Queen's English: "It's not a hot war, it's not a cold war; it's more like a chilly war."¶ The problem for leaders, diplomats and analysts is that the relationship defies simple definition. Variants range from "strategic engagement", "strategic co-operation" and "strategic competition" to "China as a responsible global stakeholder".¶ The problem with these ideas is that they mean very little to the Chinese. The phrase that hits home in both capitals these days is "strategic trust deficit" – a gap between China and the US which, if left unchecked, could destabilise the entire Asia-Pacific region.¶ Such a deficit is potentially disastrous for both parties. We see it in the world of cyber espionage and cyber warfare; in escalating tensions in the East and South China Seas, where hundreds of naval and air assets are deployed; in escalating tensions on the Korean peninsula; and in the UN Security Council stalemate over Syria.¶ That is why the working summit between presidents Barack Obama of the US and Xi Jinping of China at the weekend **was so important**. There had been no high-level political mechanism for the two sides to manage these and other apparently intractable challenges facing the regional and global order.¶ With this summit, with more to follow, we at last have the capacity to build such a mechanism. The fact is, unless the Chinese president himself (simultaneously chairman of the Central Military Commission and general secretary of the Communist party) engages personally in negotiations with his US counterpart, China's political system is geared to the defence of the status quo. In the US, the secretaries both of state and defence are able to make some strategic calls in negotiations. But their Chinese counterparts are not even among the 250 most senior officials in the party hierarchy. Only the president, in consultation with the other six members of the Politburo Standing Committee, can make the genuinely big calls.¶ Despite opposition in both capitals, both presidents decided to depart from the diplomatic conventions that have governed relations for the past 40 years and convened a working summit, free of the pomp normally associated with state visits. This is a success in its own right. More importantly, both camps are privately delighted by the tone, depth and content of this first engagement, with neither expecting a laundry list of deliverables. Nobody present saw this as the "cyber summit" described in the US media.¶ So, what are the outcomes? First, the agreement to establish a **regular military-to-military dialogue is critical**. It could contribute to rules of the road on cyber security; crisis management for the Korean peninsula; the management of incidents at sea and in the air as well as creating a mechanism to develop basic confidence and security-building measures for the region.¶ Second, the summit represented the first systematic engagement and calibration between the two nations on the future of North Korea, including their reported public commitment to prevent Pyongyang acquiring nuclear weapons. Third, there was agreement on climate change, perhaps reflecting the start of a commitment to make the global rules-based order more effective.¶ No one should expect Chinese policy to change quickly. Much could go wrong. But, without a programme of working bilateral summitry, there is little prospect of getting much of strategic importance right. After 20 years of drift in the relationship – following the elimination of the Soviet threat, which for the previous 20 years provided the underlying rationale for co-operation – this meeting could mark the start of a new period of detente. We were headed towards strategic competition – or worse. We may now have the capacity to build sufficient trust in the relationship, creating a framework to manage the growing complexity of bilateral, regional and global challenges the

nations face.¶ It could even lead to what Mr Xi himself described as "a new model of great power relations" for the future, one that does not mindlessly replicate the bloody history of the rise and fall of great powers in centuries past.

US/ China war wont happen- Nukes and Geography

Keck, Associate Editor of The Diplomat, 13

[Zachary, 7/12/2013, The Diplomat, "Why China and the US (Probably) Won't Go to War", http://thediplomat.com/2013/07/why-china-and-the-us-probably-wont-go-to-war/, accessed 7/8/2014

As I noted earlier in the week, the diplomatic summits between China and the U.S. over the past month has renewed conversation on whether Beijing and Washington, as rising and established power, can defy history by not going to war. Xinhua was the latest to weigh in on this question ahead of the Strategic and Economic Dialogue this week, in an article titled, "China, U.S. Can Avoid 'Thucydides Trap.'" Like many others, Xinhua's argument that a U.S.-China war can be avoided is based largely on their strong economic relationship. This logic is deeply flawed both historically and logically. Strong economic partners have gone to war in the past, most notably in WWI, when Britain and Germany fought on opposite sides despite being each other's largest trading partners. More generally, the notion of a "capitalist peace" is problematic at best. Close trading ties can raise the cost of war for each side, but any great power conflict is so costly already that the addition of a temporarily loss of trade with one's leading partner is a small consideration at best. And while trade can create powerful stakeholders in each society who oppose war, just as often trading ties can be an important source of friction. Indeed, the fact that Japan relied on the U.S. and British colonies for its oil supplies was actually the reason it opted for war against them. Even today, China's allegedly unfair trade policies have created resentment among large political constituencies in the United States. But while trade cannot be relied upon to keep the peace, a U.S.-China war is virtually unthinkable because of two other factors: nuclear weapons and geography. The fact that both the U.S. and China have nuclear weapons is the most obvious reasons why they won't clash, even if they remain fiercely competitive. This is because war is the continuation of politics by other means, and nuclear weapons make war extremely bad politics. Put differently, war is fought in pursuit of policy ends, which cannot be achieved through a total war between nuclear-armed states. This is not only because of nuclear weapons destructive power. As Thomas Schelling outlined brilliantly, nuclear weapons have not actually increased humans destructive capabilities. In fact, there is evidence to suggest that wars between nomads usually ended with the victors slaughtering all of the individuals on the losing side, because of the economics of holding slaves in nomadic "societies." What makes nuclear weapons different, then, is not just their destructive power but also the certainty and immediacy of it. While extremely ambitious or desperate leaders can delude themselves into believing they can prevail in a conventional conflict with a stronger adversary because of any number of factors—superior will, superior doctrine, the weather etc.— none of this matters in nuclear war. With nuclear weapons, countries don't have to prevail on the battlefield or defeat an opposing army to destroy an entire country, and since there are no adequate defenses for a large-scale nuclear attack, every leader can be absolute certain that most of their country can be destroyed in short-order in the event of a total conflict. Since no policy goal is worth this level of sacrifice, the only possible way for an all-out conflict to ensue is for a miscalculation of some sort to occur. Most of these can and should be dealt by Chinese and the U.S. leaders holding regularly senior level dialogues like the ones of

the past month, in which frank and direct talk about redlines are discussed. These can and should be supplemented with clear and open communication channels, which can be especially useful when unexpected crises arise, like an exchange of fire between low-level naval officers in the increasingly crowded waters in the region. While this possibility is real and frightening, it's hard to imagine a plausible scenario where it leads to a nuclear exchange between China and the United States. After all, at each stage of the crisis leaders know that if it is not properly contained, a nuclear war could ensue, and the complete destruction of a leader's country is a more frightening possibility than losing credibility among hawkish elements of society. In any case, measured means of retaliation would be available to the party wronged, and behind-the-scenes diplomacy could help facilitate the process of finding mutually acceptable retaliatory measures. Geography is the less appreciated factor that will mitigate the chances of a U.S.-China war, but it could be nearly as important as nuclear weapons. Indeed, geography has a history of allowing countries to avoid the Thucydides Trap, and works against a U.S.-China war in a couple of ways. First, both the United States and China are immensely large countries—according to the Central Intelligence Agency, the U.S. and China are the third and fourth largest countries in the world by area, at 9,826,675 and 9,596,961 square km respectively. They also have difficult topographical features and complex populations. As such, they are virtually unconquerable by another power. This is an important point and differentiates the current strategic environment from historical cases where power transitions led to war. For example, in Europe where many of the historical cases derive from, each state genuinely had to worry that the other side could increase their power capabilities to such a degree that they could credibly threaten the other side's national survival. Neither China nor the U.S. has to realistically entertain such fears, and this will lessen their insecurity and therefore the security dilemma they operate within. Besides being immensely large countries, China and the U.S. are also separated by the Pacific Ocean, which will also weaken their sense of insecurity and threat perception towards one another. In many of the violent power transitions of the past, starting with Sparta and Athens but also including the European ones, the rival states were located in close proximity to one another. By contrast, when great power conflict has been avoided, the states have often had considerable distance between them, as was the case for the U.S. and British power transition and the peaceful end to the Cold War. The reason is simple and similar to the one above: the difficulty of projecting power across large distances—particularly bodies of waters— reduces each side's concern that the other will threaten its national survival and most important strategic interests. True, the U.S. operates extensively in China's backyard, and maintains numerous alliances and partnerships with Beijing's neighbors. This undeniably heightens the risk of conflict. At the same time, the British were active throughout the Western Hemisphere, most notably in Canada, and the Americans maintained a robust alliance system in Western Europe throughout the Cold War. Even with the U.S. presence in Asia, then, the fact that the Chinese and American homelands are separated by the largest body of water in the world is enormously important in reducing their conflict potential, if history is any guide at least. Thus, while every effort should be made to avoid a U.S.-China war, it is nearly unthinkable one will occur.

President Barack Obama's budget proposal for the 2016 fiscal year seeks $14 billion (9 billion pounds) for cybersecurity efforts across the U.S. government to better protect federal and private networks from hacking threats. Federal cybersecurity funding has steadily increased in recent years, reflecting the intensity of threats U.S. companies and government agencies are facing from cyber intruders, both domestic and foreign.

The head of al Qaeda's branch in Yemen, which U.S. officials say poses the greatest terrorist threat to America, has been killed in a U.S. drone strike, according to Yemeni media reports and statements from the terrorist organization's members.¶ If Nasir al-Wuhayshi was killed—a claim that U.S. officials are so far not disputing—his death would be a significant blow to the already-fragile al Qaeda terrorist organization. And it would be the second major hit in a matter of days on a key al Qaeda leader, following a series of U.S. airstrikes over the weekend in Libya that killed another notorious jihadi, Mokhtar Belmokhtar.¶ Wuhayshi is arguably the bigger prize, having been promoted two years ago to run **all of al Qaeda's global terror attacks**. U.S. intelligence officials have said that his division, al Qaeda in the Arabian Peninsula, or AQAP, has been perfecting methods for sneaking explosives onto airplanes, hidden inside devices that don't alert security screening systems.¶ In other words, as far as the U.S. intelligence community is concerned, Wuhayshi is al Qaeda's No. 1 threat. If he is gone, it would be seen as a **major win for American counterterror operations**.¶ Reports emerged Monday on Twitter from purported AQAP members mourning Wuhayshi's death and praising his already named successor, Qassem al Rimi. The rapid appointment of a new leader speaks to how critical Wuhayshi's position was within the organization. But it also suggests that the group's overall structure remains strong because he was so quickly replaced.¶ "Decapitation strikes have yet to defeat an [al Qaeda] franchise. **It won't defeat AQAP**," Bruce Riedel, a former CIA officer and al Qaeda expert now at the Brookings Institution, told The Daily Beast. "**But it's a welcome development** if true."

according to Professor Jon R. Lindsay's new policy brief, published by Harvard University's Belfer Center. Public record on U.S. and Chinese cyber capabilities remains scant, but Lindsay suggests that the U.S. is gaining an "increasing advantage," evidenced by a new DARPA program launched in 2012, and the use of the Stuxnet worm to damage computer systems at an Iranian nuclear enrichment facility in 2010. In America's private cyber industry, the name of the game

has shifted from defense to offense.∂ But China's interest in developing cyber capabilities is political, not military, Lindsay argues, prompting incursions into foreign digitized space to suppress dissent, in the case of GitHub, or to steal secrets from adversaries. Even so, "lax law enforcement, and poor cyber defenses leave the country vulnerable to both cybercriminals and foreign spies," Lindsay notes, suggesting that China struggles to use the information it comes away with for political gain. China's successful campaigns target NGOs and private sector companies, and "do nothing to defend China from the considerable intelligence and military advantages of the United States."∂

No threat to China Cyber Attacks

Detsch 15 (May 20, 2015, http://thediplomat.com/2015/05/are-we-exaggerating-chinas-cyber-threat/, Are We Exaggerating China's Cyber Threat?, The Diplomat, Jack Detsch, staff writer for the Diplomat)

On May 8, U.S. State Department spokesman Jeff Rathke complained that China had used an offensive cyber capability "to interfere with the ability of worldwide internet users to access content hosted outside of China." Experts feared China had hijacked traffic intended for domestic servers and re-routed to conduct a malicious attack on American sites. In March, the American coding repository, GitHub, reported intermittent outages amid a multiday cyber-attack, which redirected traffic from the popular Chinese search engine Baidu to pages linked to The New York Times Mandarin-language site and GreatFire.org — a tool utilized by Chinese netizens to steer around the Great Firewall. Both sites are banned in the mainland. Researchers say an offensive Chinese cyber attack system called the "Great Cannon," which captures traffic in China and fires it out at offending sites, perpetrated the attack. So how much should we worry about China's cyber capabilities? Not much, according to Professor Jon R. Lindsay's new policy brief, published by Harvard University's Belfer Center. Public record on U.S. and Chinese cyber capabilities remains scant, but Lindsay suggests that the U.S. is gaining an "increasing advantage," evidenced by a new DARPA program launched in 2012, and the use of the Stuxnet worm to damage computer systems at an Iranian nuclear enrichment facility in 2010. In America's private cyber industry, the name of the game has shifted from defense to offense. But China's interest in developing cyber capabilities is political, not military, Lindsay argues, prompting incursions into foreign digitized space to suppress dissent, in the case of GitHub, or to steal secrets from adversaries. Even so, "lax law enforcement, and poor cyber defenses leave the country vulnerable to both cybercriminals and foreign spies," Lindsay notes, suggesting that China struggles to use the information it comes away with for political gain. China's successful campaigns target NGOs and private sector companies, and "do nothing to defend China from the considerable intelligence and military advantages of the United States." That doesn't mean that the PLA isn't busy playing catch-up. In a recent issue of The Science of Military Strategy, put out by the military's chief research institution, analysts concede that the PLA indeed possesses network attack forces inside of intelligence and civilian wings of government, including the Ministry of State Security and the Ministry of Public Security. It suggests that the military will deal with critical infrastructure targets, like electrical grids and gas pipelines, while smaller, nimbler hacking units like Axiom, which has been suspected in intrusions against Fortune 500 companies and pro-democracy groups, will focus on industrial targets. But making that leap will be challenging, and would force China to walk back its global positions on cybersecurity. Beijing hopes to become a leader on that front and has been heavily promoting its concept of "internet sovereignty" as the basis for international standards of

behavior in cyber space. China wants to defend “internet sovereignty” at all costs. Any future cyber attack would probably be justified on those grounds. That’s also a self-limiting belief. While it has allowed home-grown giants like Weibo, Alibaba, and Baidu to flourish, China’s exclusion of American companies and know-how put it at a serious disadvantage in building robust cyber capabilities. China’s own approach to these issues could prevent Beijing from reaching its cyber potential.

Courts Bad/Legislation Good (for Congress CP)

Congress is better-flexibility and can account for new technologies more effectively

Kerr 4-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("THE FOURTH AMENDMENT AND NEW TECHNOLOGIES: CONSTITUTIONAL MYTHS AND THE CASE FOR CAUTION", Michigan Law Review, vol. 122 no. 801 http://papers.ssrn.com/sol3/papers.cfm?abstract_id=421560) HC

In this part, I will argue that such enthusiasm for judicial solutions overlooks significant institutional limitations of judicial rulemaking. Courts tend to be poorly suited to generate effective rules regulating criminal investigations involving new technologies. In contrast, legislatures possess a significant institutional advantage in this area over courts. While courts have successfully created rules that establish important privacy rights in many areas, it is difficult for judges to fashion lasting guidance when technologies are new and rapidly changing. The context of judicial decisionmaking often leaves the law surprisingly unclear. Courts lack the institutional capacity to easily grasp the privacy implications of new technologies they encounter. **Judges cannot** readily understand how the technologies may develop, cannot easily appreciate context, and often cannot **even recognize whether the facts of the case before them raise privacy implications that happen to be typical or atypical**. Judicially created rules also lack necessary flexibility; they cannot change quickly and cannot test various regulatory approaches. As a result, judicially created rules regulating government investigations tend to become quickly outdated or uncertain as technology changes. The context of legislative rule-creation offers significantly better prospects for the generation of balanced, nuanced, and effective investigative rules involving new technologies. In light of these institutional realities, courts should place a thumb on the scale in favor of judicial deference to legislative privacy protections.

Congress is ahead of the game-court precedents are outdated and ineffective

Kerr 4-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("THE FOURTH AMENDMENT AND NEW TECHNOLOGIES: CONSTITUTIONAL MYTHS AND THE CASE FOR CAUTION", Michigan Law Review, vol. 122 no. 801 http://papers.ssrn.com/sol3/papers.cfm?abstract_id=421560) HC

This delay carries important consequences for the clarity of judicial rulemaking. Years may pass before a court considers how the Fourth Amendment regulates use of a new technology; many more years may pass before the issue is resolved definitively. By the time the courts decide how a technology should be regulated, however, the factual record of the case may be outdated, reflecting older technology rather than more recent developments.417 Further, once the law appears to be settled, the rapid pace of technological change may make it difficult to know how future courts might resolve the same problem. Existing precedents may have little force: an appellate decision based on a factual record created a few years before may no longer apply just a few years later. As Stuart Benjamin has noted, "[r]apidly changing facts weaken the force of stare decisis by undermining the stability of precedents. Appellate opinions are only as robust as the facts on which they are based. When those facts evaporate, the opinion on which they rest is weakened as

well."418 Consider the lower court's findings about the Internet in the litigation that led to the Supreme Court's decision in Reno v. ACLU.419 The facts were accurate for 1996, but are not necessarily accurate today.420 Because constitutional rules may be based on changing technological facts, it may be difficult know whether a Fourth Amendment rule that is valid one day is valid the next. Legislative rules are different. Legislatures can act at any time, even when a technology is new. As a practical matter, legislatures often will wait for public concern to surface before regulating a new technology. But recent history suggests that legislatures usually act at a surprisingly early stage, and certainly long before the courts act. For example, while the courts have not yet decided how the Fourth Amendment protects stored e-mails, Congress enacted a comprehensive regime to protect the privacy of e-mails in 1986 in the form of the Electronic Communications Privacy Act.421 Congress regulated the privacy of e-mail before most Americans had even heard of e-mail. Similarly, Congress enacted laws to regulate the "Carnivore" Internet surveillance system in 2001 Congress has even acted before a technology was invented. For example, Congress recently passed a law blocking the Pentagon's proposed "Total Information Awareness" (TIA) program, which would have funded research into the development of computer data-mining technology.423 Unburdened by the procedural barriers that limit and delay judicial power, legislatures can enact comprehensive rules far ahead of current practice rather than decades behind it.

Judicial rule changing is uncertain and lengthy

Kerr 4-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("THE FOURTH AMENDMENT AND NEW TECHNOLOGIES: CONSTITUTIONAL MYTHS AND THE CASE FOR CAUTION", Michigan Law Review, vol. 122 no. 801 http://papers.ssrn.com/sol3/papers.cfm?abstract_id=421560) HC

It is far harder for the courts to adopt such flexible rules under the Fourth Amendment. Putting aside the merits of such an approach from the standpoint of normative constitutional theory, the task would create enormous practical headaches. To allow the governing rules to change as needed over time, courts would be forced either to expressly change the governing rules at regular intervals or else articulate the governing rule using a standard that keeps the result unclear to incorporate changed circumstances. Stare decisis norms make the first option unrealistic; it's hard to imagine the courts creating new rules every few years to keep the law up to date. But the latter option leads to intolerable uncertainty. The result is constitutional law's version of the Heisenberg uncertainty principle in quantum physics;442 you can know the law at one time or you can know its general direction, but you can't know both at the same time.

Mich LR-3rd Party should change with tech

Issues concerning the third party doctrine have to change with technology

Kerr 8-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("The Case for the Third Party Doctrine", Michigan Law Review, vol. 107 no. 561 http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1138128**) HC**

Use of a third party does not always have a substitution effect, but it enables the effect at the suspect's option. And any smart criminal will exercise the option. Those who have the most to hide have the most incentive to

take advantage of how third-party services can hide their activity. Even without Fourth Amendment rules, third-party services will tend to hide otherwise public transactions. A rational actor bent on criminal conduct will use as many third-party services as he can to avoid detection. Viewed from this perspective, the third-party doctrine is not some sort of mysterious hole in Fourth Amendment protection. To the contrary, it is a natural analog to the Supreme Court's decision in Katz v. United States.96 Katz effectively required technological neutrality: Although its precise reasoning is opaque, it is often understood as concluding that telephone calls are protected because of the function they serve rather than the accident of the technology they use.97 Indeed, this was the basic rationale of Justice Brandeis's dissent in Olmstead v. United States.98 Brandeis feared that technological change could narrow Fourth Amendment protection: "Ways may some day be developed by which the Government, without removing papers from secret drawers, can reproduce them in court, and by which it will be enabled to expose to a jury the most intimate occurrences of the home."99 Brandeis proposed that the Fourth Amendment should keep up as technology changed so that new technologies would not gut privacy. But if we embrace this understanding of the Fourth Amendment, then surely it must be a two-way street. Just as the new technologies can bring "intimate occurrences of the home" out in the open, so can technological change and the use of third parties take transactions that were out in the open and bring them inside. If we accept that the Fourth Amendment should stay technology neutral, then we should accept that rule both when new technological practices threaten to expand Fourth Amendment protection as when they threaten to constrict it. Just as the Fourth Amendment should protect that which technology exposes, so should the Fourth Amendment permit access to that which technology hides. From this perspective, the third-party doctrine is needed to ensure the technology neutrality of the Fourth Amendment. It ensures that we have the same rough degree of Fourth Amendment protection independently of whether wrongdoers use third party agents to facilitate their crimes.

Lower Courts

Lower courts can model-will follow analogous reasoning

Kerr 7-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("Four Models of Fourth Amendment Protection", Stanford Law Review, vol. 60 no. 503, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=976296**) HC**

Using multiple models lets the Justices explain decisions using the models that best draw the line in that particular setting. Further, certainty among lower courts can result because lower courts naturally adopt the Supreme Court choice of model when reasoning by analogy. Common techniques of analogical reasoning lead lower courts to reflect the Supreme Court's choices of models in analogous cases, leading both to the adoption of similar rules across decentralized courts and localized guidance that helps accurately distinguish per se from contextually reasonable law enforcement practices.

Lower courts are just as effective-no reason why SCOTUS key because they'll just follow their doctrine

Kerr 7-Orin, professor of computer crime law at George Washington University Law School, JD Harvard ("Four Models of Fourth Amendment Protection", Stanford Law Review, vol. 60 no. 503, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=976296**) HC**

The fact that the Supreme Court can pick whatever model works best in context is not by itself a particular strength of the multiple models approach. However, it does become a particular strength when paired with lower court applications of the reasonable expectation of privacy test. Recall that the Supreme Court decides very few application of the reasonable expectation of privacy test; for the most part, rules evolve in the lower courts. The use of multiple models in Supreme Court opinions provide a way that the law can develop consistent and accurately in the lower courts. When novel issues arise in the lower courts, lower courts will naturally reason by analogy to the Supreme Court's decided cases. Analogical reasoning will focus lower-court judges on the reasoning of the Supreme Court's analogous decisions, which will in turn push the lower courts to apply the same models that the Supreme Court chose in that context. The models will propagate to analogous sets of facts. When this process is repeated over time, the Fourth Amendment tapestry evolves into a system of regional dominance – regional in the sense of categories of cases, not geography – of different models of when an expectation of privacy is reasonable. Different models will apply in different contexts based on the models that the Supreme Court picked in analogous cases. **This leads to both increased accuracy and increased consistency in the evolution of the reasonable expectation of privacy test.** Lower court cases will often draw the same analogies and then pick the same models, leading to greater consistency and predictability in the lower courts. Importantly, this process can occur without conscious recognition of the models. When a Fourth Amendment challenge involves a new police practice unsettled by existing doctrine, litigants and courts will naturally turn to the facts -- and then to the reasoning -- of the most analogous Supreme Court decisions. If the Supreme Court applied the private facts model in the analogous case, the lower court will look to that opinion and mirror the reasoning of the private facts model. If the Supreme Court relied on a particular model, the lower court will do the same. Through the process of analogical reasoning, the Supreme Court's choice of model will guide lower court judges by providing different styles of reasoning that should apply in different types of cases. If the Supreme Court's chosen model accurately identifies police practices in need of regulation, lower court applications of the same model in similar cases should also draw the line accurately in the lower courts. Further, the Supreme Court's selection of model will ensure that lower courts all draw the same or similar lines. Although the selection of the model does not guarantee a result, it narrows the range of discretion and greatly increases the likelihood that different jurisdictions will reach the same outcome. The Supreme Court's certiorari practice completes the feedback loop. **If the lower courts all apply the models in the same way to new facts, then the Supreme Court is unlikely to intervene.** When lower courts disagree on which model applies or how it applies, leading to different rules, the Supreme Court will usually take the case. The Court will address the circuit split, and resolve how the four models apply to that case. The Supreme Court's certiorari practices naturally police lower court applications of the four models, and uncertainty as to a model or its application tends to trigger Supreme Court review.

AT Kerr's Wrong-Schwartz

Kerr's reading of the 2nd Circuit ruling agrees that Congress is best

Schwartz 15 (Yishai Schwartz, associate editor, ""Reasonable Search" or "Reasonable Expectation of Privacy:" A Brief Reply to Orin Kerr on the 2nd Circuit's Decision," Lawfare, May 10, 2015, http://www.lawfareblog.com/reasonable-search-or-reasonable-expectation-privacy-brief-reply-orin-kerr-2nd-circuits-decision

The 2nd Circuit frames the central 4th Amdendment question as whether appellants have "privacy rights in their records." On the one hand, Katz seems to guarantee expansive rights in any areas where there is an "actual (subjective) expectation of privacy…that society is prepared to recognize as 'reasonable'"---a standard that very well may apply to 215 data. But on the other hand, we have the standard emerging from Smith v Maryland, which declares any expectation of privacy in items disclosed to a third party to be "unreasonable" and "illegitimate." In other words, the question of whether the collection of 215 data constitutes a search turns (at least partially) on whether a person's expectation of privacy in that

data is deemed to be reasonable. And on the 2nd Circuit's account, **Congress has a strong voice in that determination.** On this reading **(Kerr pointed out to me) the 2nd Circuit echoes Justice Alito's concurrence in Riley v. California,** where he wrote of cellphones: [B]ecause of the role that these devices have come to play in contemporary life, searching their contents implicates very sensitive privacy interests that this Court is poorly positioned to understand and evaluate. Many forms of modern technology are making it easier and easier for both government and private entities to amass a wealth of information about the lives of ordinary Americans, and at the same time, many ordinary Americans are choosing to make public much information that was seldom revealed to outsiders just a few decades ago. In light of these developments, it would be very unfortunate if privacy protection in the 21st century were left primarily to the federal courts using the blunt instrument of the Fourth Amendment. Legislatures, elected by the people, are in a better position than we are to assess and respond to the changes that have already occurred and those that almost certainly will take place in the future. Determinations of what constitutes a "reasonable expectation of privacy" (and thus what constitutes a "search") are necessarily dependent on swiftly changing technology and social norms. According to Alito, **Congress, not the courts, is best suited to keeping up with those changes**, and its actions are probably be a better indicator of these norms than a judge's intuition. The 2nd Circuit's constitutional ruminations follow a similar logic, and they are therefore precisely directed toward the central question of the NSA challenges. A constitutional inquiry about whether 215 collection represents a search would, under Katz and Smith, need to assess whether a person maintains a reasonable expectation of privacy in that data. And to determine that, we would need to assess how "the availability of information to telephone companies, banks, internet service providers, and the like, and the ability of the government to collect and process volumes of such data" affects society's standard for a reasonable expectation of privacy. **And according to the 2nd Circuit, what Congress thinks and does represents a useful data point in making this assessment.** After all, explicit Congressional authorization of the 215 program both diminishes a person's expectation of privacy and reflects a societal non-expectation of privacy in the first place. When understood like this, the 2nd Circuit's constitutional ruminations aren't so odd after all.

Text: The United States Congress should pass the Electronic Communications Privacy Amendments Act of 2015.

The CP solves and doesn't link to politics

Thomson 2/13 (Iain Thomson, an American philosopher and Professor of Philosophy at the University of New Mexico, undergraduate at the University of California, Berkeley, Ph.D. in philosophy at the University of California, San Diego, "Proposed US law could deal knockout blow to FBI in overseas cloud privacy ding-dongs", http://www.theregister.co.uk/2015/02/13/congress_gets_serious_data_protection_with_new_bills_to_overhaul_ecpa/, 2/13/15, 7/24/15, MEM)

The first piece of proposed legislation [PDF] is the Electronic Communications Privacy Amendments Act of 2015, submitted in the Senate by Senators Mike Lee (R-UT) and Patrick Leahy (D-VT) and in the House by Representatives Kevin Yoder (R-KS) and Jared Polis (D-CO). The bill would require cops and the Feds to show probable cause when seeking a search warrant to rifle through people's emails and other data. (California is mulling over a similar requirement.) Under today's rules, set back when Ronald Reagan was in the White House, deem that any email can be searched, with probable cause or not, provided at least 180 days have passed since the message was sent and received. "For too long now Americans' electronic communications have been subject to invasive and unwarranted searches based on laws written for the Apple 2, not the iPhone 6," said Rep. Jared Polis. "Today, a majority of the House of Representatives is standing up to say that the government has no more business reading your personal email than it does reading your physical mail. I look forward to working with my colleagues on both sides of the aisle to pass this bipartisan bill and make a reasonable expectation of privacy the law for all forms of communication." **The bill has strong support, with six Senate cosponsors and 228 members of the House of Representative – over half of the voting body**. If it passes, **President Obama would be unlikely to veto the legislation**, since the sponsors include some of his closest partners in Congress. "The bill we are introducing today protects Americans' digital privacy – in their emails, and all the other files and photographs they store in the cloud. It builds consumer trust, and it provides law enforcement agencies with the tools they need to ensure public safety," Sen. Leahy said. "**This is a bipartisan issue**, and now is the time to act swiftly to bring our privacy protections into the digital age."

2NC- CP = better precedent

Even with the passage of the USA Freedom Act, ECPA is key to reestablishing 4th amendment protection *(as well as bipartisan, coalitions, public, and business support)*

Calabrese 7/5 (Chris Calabrese, a graduate of Harvard University and holds a J.D. from the Georgetown University Law Center, vice president of policy at the Center for Democracy & Technology, served as legislative counsel at the American Civil Liberties Union's (ACLU) Washington Legislative Office, "Post USA Freedom Act: There's more to be done", http://www.ourmidland.com/opinion/editorials/post-usa-freedom-act-there-s-more-to-be-done/article_6676dd8c-7565-5ba4-8387-0158caae0784.html, 7/5/15, 7/24/15, MEM)

The Fourth Amendment protects us from "unreasonable searches and seizures" of our "persons, houses, papers and personal effects." The government can't inspect our mail or tap our phones our search our homes and offices without obtaining a warrant from a judge after showing probable cause to believe a crime is being committed. But unless ECPA is reformed to reflect modern realities, government agents will continue to assert the authority to search our communications and our private possessions without a warrant and without showing any evidence whatsoever that a crime has been committed. That's an

intolerable and completely unwarranted invasion of our privacy. It isn't what the law's authors intended, of course. But government agencies are taking advantage of ECPA's unintended consequences to evade constitutional checks on their powers. And as long as ECPA remains on the books as written, it no longer represents an unexpected assault on our liberty. It is an intentional one. Fortunately, members in both houses of Congress, led by Senators Mike Lee and Pat Leahy, and Representatives Kevin Yoder and Jared Polis, have introduced legislation to reform ECPA, and restore Fourth Amendment protections to our online communications. **The ECPA Amendments Act** and Email Privacy Act, respectively**, would restore the law's original purpose to protect privacy in the ways we communicate, transact businesses, learn and recreate today by protecting emails and other communications** stored with third party service providers for any amount of time. Their legislation has broad, bipartisan support. It is backed by hundreds of members in Congress, including more than 270 House members. Outside the halls of Congress, conservatives, moderates and liberals, small and large businesses, labor unions, civil libertarians and former prosecutors all advocate reforms to an obsolete law that threatens the liberty and prosperity of the American people. Congress has regularly had to pass reforms to legislation that technology has rendered obsolete and vulnerable to exploitation by the executive branch. We're calling on ECPA to be next. Since our founding as a nation, Americans have insisted that we be secure in our persons and secure in our liberties. We made progress toward that end with the passage of the USA Freedom Act. **The next step is the reform of ECPA,** and re-establishing that neither changes in technology nor laws that have outlived their purpose can be allowed to infringe on Americans' privacy protections.

2NC- CP solves the aff

The Third Party Doctrine presents an arbitrary bright line- CP solves this ambiguity

Henderson 11 (Stephen E. Henderson, Associate Professor, Widener University School of Law. J.D., Yale Law School, 1999; B.S., University of California at Davis, 1995, "The Timely Demise of the Fourth Amendment Third Party Doctrine", page 44, 2011, 7/24/15, MEM)

This is not to say, however, that the Third Party Doctrine is without its champions, or at least without its champion. Professor Orin Kerr has defended the Doctrine for its ex ante clarity and for maintaining technological neutrality.39 "I do not think any of the many critics of the Doctrine fail to recognize that it is a wonderfully bright-line rule. But then it is always easy to craft an arbitrary bright line: Police can stop a person with black hair without suspicion, but require a warrant to stop anyone else. Of course there would still be some quibbles—what to do if the person is bald, or has on a hat that completely covers the hair—but for the most part the rule would be as wonderfully clear as it would be unjust. An even clearer rule would be akin to the Third Party Doctrine: Police can stop every person without suspicion. If two rules are equally wise, prudence dictates that we select the rule that is more clear. But when it is a rule's very arbitrary nature that allows avoidance of all hard questions, which is the case with the Third Party Doctrine, that clarity does little to commend it. Nor would it be less clear to have the opposite default: Police cannot access any record information without probable cause. Such a rule would be devastating to the legitimate needs of law enforcement, but it would be plenty clear. So, the options are (1) having a clear rule that devastates privacy, (2) having a clear rule dial devastates law enforcement, or (3) working out a rule that respects both.

2NC- Court fail/Congress solves (Thompson indicts, their solvency ev.)

Thompson flows neg- Supreme Court is the incorrect agent for institutional change- Congress and legislatures are key

Thompson 14 (Richard M. Thompson II, Legislative Attorney, "The Fourth Amendment Third-Party Doctrine," Congressional Research Service, June 5, 2014, https://www.fas.org/sgp/crs/misc/R43586.pdf, MEM)

From an institutional perspective, one might argue that **the courts are not the proper branch of the federal government to resolve privacy disputes related to information handed over to third-parties.** Once the Supreme Court outlaws, or significantly limits, a certain police practice, it "constitutionalizes" it, and only the Court or a constitutional amendment could overturn this decision. Instead, some argue that when creating rules that pertain to new technologies, **Congress and legislatures** generally, might **be best fitted to find the appropriate**

balance between privacy and security, while providing the necessary flexibility to change this rule as technology.

Congress legislation is key to reforming third party doctrine- overcomes judiciary jurisdiction

Thompson 14 (Richard M. Thompson II, Legislative Attorney, "The Fourth Amendment Third-Party Doctrine," Congressional Research Service, June 5, 2014, https://www.fas.org/sgp/crs/misc/R43586.pdf, MEM)

More recently, **various Members of Congress have sought to temper the reach of the third-party doctrine** with respect to transactional data. Several days after the Edward Snowden leaks became public. Senator Paul filed the "Fourth Amendment Restoration Act of 2013" (S. 1121) in an effort to "stop the National Security Agency from spying on citizens of the United States[.]"This bill would require that "[t|he Fourth Amendment to the Constitution shall not be construed to allow any agency of the United States Government to search the phone records of Americans without a warrant based upon probable cause."1'1" While dictating to the judiciary what the Fourth Amendment should and should not protect may be beyond Congress's constitutional power, 190 **Congress clearly can play a role in setting substantive and procedural limitations on government surveillance authorities**. For instance. Senator Paul has introduced a similar bill, the "Fourth Amendment Preservation and Protection Act of2013" (S. 1037), which would prohibit federal, state, and local government officials from accessing information relating to an individual held by a third party in a "system of records." **Other congressional measures would alter the third-party doctrine in a more targeted way.** Several location monitoring bills would**, for instance, prohibit companies from sharing their customers' location information unless the government obtained a warrant or one of several limited exceptions applied**.'^2

Eliminating the third party doctrine is unlikely but Courts concede Congress can engage and enact policy to solve better

Thompson 14 (Richard M. Thompson II, Legislative Attorney, "The Fourth Amendment Third-Party Doctrine," Congressional Research Service, June 5, 2014, https://www.fas.org/sgp/crs/misc/R43586.pdf, MEM)

Another possibility is for Congress to act. Justice Alito observed in *Jones* that "in circumstances **involving dramatic technological change, the best solution to privacy concerns may be legislative**" as "a legislative body is well situated to gauge changing public attitudes, to draw detailed lines, and to balance privacy and public safety in a comprehensive way."1 This argument that **Congress is best suited to address the nuanced policy questions that privacy and security entails** has been expressed by commentators as well. Like the courts, it appears unlikely that Congress would be willing to completely eliminate the third-party doctrine. On the other hand. Congress may be more inclined to engage in a subject-by-subject approach, in which Congress **limits the third-party doctrine in certain areas.** Congress provided statutory protection for telephone toll records in the pen register/trap and trace statute; for Internet metadata in the Stored Communications Act; and for video customer records in the Video Privacy Protection Act. **It could enact similar protection for other subject areas where non-content information is shared with companies as a necessary part of doing business.**

Thompson supports 2015 Amendment Act to the ECPA and solves lower court flaws- prefer recent evidence

Thompson 6/10 (Richard M. Thompson II, Legislative Attorney, "Stored Communications Act: Reform of the Electronic Communications Privacy Act (ECPA) – R44036," Congressional Research Service, http://biblio.pennyhill.com/stored-communications-act-reform-of-the-electronic-communications-privacy-act-ecpa-r44036/, 6/10/15, MEM)

In recent years, ECPA has faced increased criticism from both the technology and privacy communities that it has outlived its usefulness in the digital era and does not provide adequate privacy safeguards for individuals' electronic communications. In light of these concerns, various reform bills have been introduced in the past several Congresses, with three **major reform bills pending** in the 114th Congress. **The Electronic Communications Privacy Act Amendments Act of 2015** (S. 356, H.R. 283) and the Email Privacy Act (H.R. 699), almost identical in text, would, among other things, place both ECS and RCS providers under the same legal requirement; eliminate the current 180-day rule found in the SCA and require a warrant for emails no matter how long they have been stored or whether they have been opened; and remove the reliance on the definition of "electronic storage," which has confused the lower courts. Additionally, the Online Communications and Geolocation Privacy Act (H.R. 656) would make similar changes to the SCA. Some federal agencies, most prominently the Securities and Exchange Commission (SEC), which currently rely on their subpoena authority to access electronic communications, have argued that these bills would stymie their ability to conduct investigations as they have no legal authority to obtain a warrant. In response to this concern, both the Email Privacy Act and the ECPA Amendments Act include a rule of construction providing that nothing in these bills should be read to preclude the SEC or any other federal agency from seeking these records directly from a party to the communication, rather than the target's service provider.

Courts cannot be trusted Congress has the incentive to create laws to fix Smith v. Maryland

Baker 14 (Stewart Baker, the first Assistant Secretary for Policy at the United States Department of Homeland Security, "Smith v. Maryland as a good first-order estimate of reasonable privacy expectations", https://www.washingtonpost.com/news/volokh-conspiracy/wp/2014/05/04/smith-v-maryland-as-a-good-first-order-estimate-of-reasonable-privacy-expectations/, 5/4/14, 7/24/15, MEM)

Or take the most famous collection of third party data, the one that got this debate rolling – NSA's collection of the metadata for all calls touching the United States. Even there, actual intrusions into privacy were strictly limited. The government held a lot of data, but it conducted searches on fewer than 500 identifiers a year. All three branches of government imposed limits on NSA's actual access to the data. And Congressional reforms of the program are already being debated, with some changes nearly certain. None of this suggests a failure of democracy that requires the Supreme Court to step in and impose its own Procrustean definition of "creepy" on the country. It turns out that Smith v. Maryland provides a good first-order estimate of Americans' evolving expectations of privacy. And where it's wrong about those expectations, **it provides a powerful incentive for Congress** and the Executive **to bring the law into accord with Americans' expectations**.

Congress has the legitimacy to make effective reform- Courts presumption destroys this reform

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1286, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)

As for policy, **Congress has the constitutional authority**, democratic legitimacy, and institutional capacity to make fact-intensive and value-laden judgments of how best to weigh the desire to afford private relief against the disruption to the smooth administration of public programs that such relief may entail. **Courts do not**. When the courts invoke the presumption to contort statutes that appear to preclude review to nonetheless permit it, they dishonor Congress's choices and limit its ability to tailor administrative and regulatory schemes to their particular contexts. The courts should end this practice. Where the best construction of a statute indicates that Congress meant to preclude judicial review, the courts should no longer insist that their participation is indispensable.

2NC- AT: CP links to politics

CP is popular-bicameral and bipartisan legislation

Rottman and McAuliffe 5/1 (Gabe Rottman is legislative counsel and policy director for the ACLU in Washington, D.C. Katie McAuliffe is federal affairs manager and executive director of digital liberty at Americans for Tax Reform, The State-Journal Register, "Gabe Rottman and Katie McAuliffe: Update to online privacy laws long overdue", http://www.sj-r.com/article/20150501/OPINION/150509966/?Start=1, 5/1/15, 7/28/15, MEM)

A bipartisan group of senators introduced the ECPA Amendments Act of 2015 earlier this year, which would solidify Fourth Amendment protections on the web for all Americans and their communications. The bill no longer would afford government officials the power to snoop through citizens' personal correspondence and documents stored on the Internet without a warrant. Companion legislation in the U.S. House also seeks to strengthen constitutional privacy rights online. The Email Privacy Act already has garnered significant support in the House, including more than two-thirds of Republicans and some Democrats. This bill, along with the ECPA Amendments Act of 2015, would grant documents in the cloud the same protections given to those stored in a file cabinet or desk drawer. The ECPA was enacted to protect Americans and their personal emails. Though the law was unable to keep pace with technological innovation, its intent to safeguard Americans' privacy in the digital space was right. For that reason, Congress must update the law to meet the needs of an ever-changing technological age. Democratic U.S. Sen. Dick Durbin understands the importance of extending privacy rights online, and we appreciate his support in this effort. We urge Republican U.S. Sen. Mark Kirk to follow his lead and support these important reforms by cosponsoring the ECPA Amendments Act. Updating this antiquated law is within reach this Congress. With the support of advocates, small businesses, startups, major corporations and lawmakers in Congress, updating the ECPA is an action every American can support. In a time when most people keep their important information a few finger taps away, the last thing that should be of concern is whether the government is able to pry into our privacy online. **Congress must pass bipartisan ECPA reform legislation and finally provide Americans the privacy protections established by the Constitution** — online and offline.

CP has momentum now, bicameral bipartisan support, and Obama isn't the key actor- the bill is sends a strong signal to voter and other countries

Gross 3/11 (Grant Gross, Washington, D.C., correspondent for IDG News Service, "Tech groups renew push for cloud, email privacy protections", http://www.pcworld.com/article/2895592/tech-groups-renew-push-for-cloud-email-privacy-protections.html, 3/11/15, 7/28/15, MEM)

While bills introduced in Congress during the last five years failed to pass, **members of the ECPA reform coalition said they're optimistic about legislation passing soon. Momentum for changing ECPA has been building in Congress**, Chris Calabrese, senior director for policy at the Center for Democracy and Technology, said during a briefing for the media and for congressional staff. A Senate bill, the Electronic Communications Privacy Act Amendments Act, has 17 co-sponsors since it was introduced in early February, and a House of Representatives bill introduced at the same time, the Email Privacy Act, has 249 co-sponsors. With more than half of the House co-sponsoring the bill that "sounds like an easy path to me" McAuliffe said. ECPA reform bills in past sessions of Congress have run into some opposition from the U.S. Securities and Exchange Commission, which conducts investigations using subpoenas but has no warrant-seeking authority. The SEC's concerns are minor, given that the agency generally seeks documents direct from the subjects of its investigations, countered David Lieber, senior privacy policy counsel for Google. Other U.S. agencies, including the Department of Justice and FBI, have voiced support for the proposed changes to ECPA in recent years, and the proposed changes have broad support in the tech industry and across political lines, coalition members said. After a year and a half of revelations about surveillance programs at the U.S. National Security Agency, ECPA reform is a step Congress could take to show voters, and other countries, that it is concerned about electronic privacy, Lieber added.

CP has been approved by the Judiciary Committee and is gaining more support

The government cannot tap our phones, read our mail or search our homes or offices without a warrant supported by probable cause to believe a crime is being committed. But government agents can access anything we store with service providers or in the

cloud for more than 180 days without a warrant. Senators Patrick Leahy (D-Vermont) and Mike Lee (R-Utah) have created bipartisan legislation to stop it. Their reforms constitute a long overdue correction to law that will ensure our privacy remains intact as technology continues to advance. The bill would require government agencies to go before a judge and obtain a search warrant before gaining access to private communications and records, just as they would were those records stored in an office file cabinet. **The Leahy-Lee bill has strong bipartisan support in Congress.** It was approved by the Senate Judiciary Committee early in the last Congress. It is supported by a broad coalition. Almost everyone familiar with the issue is confident we can restore Americans' right to privacy without compromising government's ability to enforce laws, regulations, and investigate criminal activity. The Senate should call up and vote on the Leahy-Lee legislation early in the new Congress. As chairman of the Senate Judiciary Committee, Iowa's Senator Chuck Grassley can be important to ensuring that Iowans are secure in our constitutional rights. By doing so, Iowa startup and existing businesses can innovate and grow without fearing government intrusions into their private lives or those of their customers.

Obama isn't the one pushing the bill- Leahy and Lee have rallied a critical majority of Reps and persuading Senators

Lee 2/4 (Mike Lee, US senator for Utah, "Speeches Protecting Email Privacy", http://www.lee.senate.gov/public/index.cfm/2015/2/protecting-email-privacy, 2/4/15, 7/24/15, MEM)

The Lee-Leahy ECPA Amendments Act of 2015 prohibits an electronic communications or remote computing service provider—like Gmail or Facebook or Twitter—from voluntarily disclosing the contents of customer emails or other communications. It eliminates the ambiguous and outdated "180 day rule" that some government agencies believe grants them warrantless access to the content of older emails. Instead, **all requests for the content of electronic communications would require a search warrant based on probable cause.** And law enforcement agencies would be required to notify, within 10 days, any persons whose email accounts are searched, subject to some logical exceptions. This legislation is also carefully crafted so that it does not impede the ability of law enforcement agencies to conduct investigations. Routing information, customer names, session time records, and other non-content information will still be available through subpoenas. The bill also contains a rule of construction allowing government access to internal corporate email when the communications are *to* or *from* an officer, agent, or employee of a company that is acting as the electronic communications service provider for its own internal email system. I am pleased to say that our bill enjoys broad support from the technology industry, privacy advocates, constitutional scholars, and policy groups on both ends of the ideological spectrum. The Leahy-Lee ECPA Amendments Act of 2015 is truly bipartisan in nature. The Senate bill has 6 additional cosponsors: Republican Senators Cornyn, Moran, and Gardner; and Democratic Senators Shaheen, Merkley, and Blumenthal. The House version of ECPA has 228 additional cosponsors – a critical majority. By working together, as a Democrat from Vermont and a Republican from Utah, we hope that all senators will join us to pass this meaningful and bipartisan legislation that benefits all Americans. **Congress should pass ECPA reform this year**, and President Obama should sign these important privacy reforms into law.

CP is popular- Dems and Reps from both houses are on board

Robinson 2/5 (Teri Robinson, Associated Editor, "Bicameral, bipartisan seeks to modernize electronic privacy law", http://www.scmagazine.com/amendments-to-1986-ecpa-would-require-warrants-court-order/article/396493/, 2/5/15, 7/28/15, MEM)

"In the nearly three decades since ECPA became law, technology has advanced rapidly and beyond the imagination of anyone living in 1986," Lee said. "The prevalence of email and the low cost of electronic data storage have made what were once robust protections insufficient to ensure that citizens' Fourth Amendment rights are adequately protected." David LeDuc, senior director of public policy at the Software & Information Industry Association (SIIA), noted in a blog post that current law "is failing to provide a legal framework for the 21st Century." The privacy protection standards differ for digital communications stored at a target's house versus in a provider's servers. "If government entities want to access your email and communications on your computer in your house, they need to get a warrant," he wrote, "but if they want to access the same information stored remotely "in the cloud," by a company like Google, Facebook or

others, the standard is much lower." **The amended act, "would level the playing field for cloud computing by establishing a warrant requirement" for law enforcement to obtain content from service providers** that hold "private electronic messages, photos and other personal records, like Gmail or Facebook," LeDuc said. If passed into law, the legislation would indeed protect the confidentiality of electronic communications described by section 2703(a) of the act and prohibit government from seeking or forcing disclosure of digital communication content without a warrant issued by "a court of competent jurisdiction directing the disclosure." In other words, law enforcement and government would have to "show the court there is probable cause to believe that the sought-after records may reveal evidence of wronging," wrote LeDuc. The amended bill also clarifies the terms under which a carrier is to disclose information regarding customer communications as well as specifies when law enforcement can delay notification of a search warrant beyond the 90-day or 180-day period (notification requirements vary depending on the law enforcement agency or government entity involved). The amended ECPA bill comes on the heels of a bipartisan effort in the House sponsored by Rep. Zoe Lofgren, D-Calif., Rep. Suzan DelBene, D-Wash., and Rep. Ted Poe, R-Texas, that resurrected **a bill that would require government agencies to obtain a search warrant — after showing probable cause — before intercepting electronic communications such as email and geolocation information or compelling disclosure of that data**.

EFF, along with more than sixty civil liberties organizations, public interest groups, and companies sent two letters to the House and Senate leadership today. One supported the upcoming bipartisan Email Privacy Act by Reps. Kevin Yoder and Jared Polis, and the other supported the upcoming Electronic Communications Privacy Act Amendments Act by Sens. Mike Lee and Patrick Leahy. The bills aim to update the Electronic Communications Privacy Act (ECPA), an archaic law that's been used by the government to obtain emails without getting a probable cause warrant. The bills are common sense bipartisan bills that help to codify current judicial decisions regarding the privacy of your personal online communications. The letters are part of a larger push from the Digital Due Process Coalition to pass the two bills. Last year, the Email Privacy Act in the House has over 270 cosponsors, while the Senate bill successfully made it past the Senate Judiciary Committee. Both bills will codify the precedent set by the Sixth Circuit, which ruled in *US v. Warshak* that users have a reasonable expectation of privacy in their email. The bills ensure the government must obtain a warrant in all contexts before it looks at your private online messages. The coalition letters urge congressional leaders to quickly move on both bills. The letters also encourage passing the bills since... [S]uccessful passage of ECPA reform sends a powerful message–Congress can act swiftly on crucial, widely supported, bipartisan legislation. **Failure to enact reform sends an equally powerful message**–that privacy protections are lacking in law enforcement access to user information and that constitutional values are imperiled in a digital world. Judicial review and presumption destroys agency and agenda of Congress

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1287, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)

As for policy considerations, judicial review might improve the fairness, quality, and legality of agency decision-making. But it also introduces delay, diverts agency resources, upsets agency priorities, and **shifts authority within agencies toward lawyers and away from policymakers**. Congress has the constitutional authority, democratic legitimacy, and institutional capacity to understand and to trade off these competing values. **Courts do not**. **Nor is there reason to think that the presumption allows courts to better capture Congress's intent**. The presumption is sometimes thought to provide a stable backdrop against which to legislate: Congress knows that it must state its intent to preclude review in clear terms and drafts accordingly. The available evidence, however, lends no support for the assumption that Congress is aware of the presumption or keeps it in mind when writing statutes. In fact, the evidence suggests the contrary.

Court presumption fucks with Congress's ability to pass legislation- Disabled veterans prove

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1288, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)

The absence of support for the presumption of reviewability is not just an academic concern. As Justice Frankfurter put it seventy years ago, "engrafting upon remedies which Congress saw fit to particularize . . . impliedly denies to Congress the constitutional right of choice in the selection of remedies."11 Dishonoring Congress's choices limits its ability to tailor its administrative and regulatory schemes to their particular contexts. For one example, consider the Department of Veterans Affairs (VA), which is charged with dispensing disability benefits to wounded veterans.12 Congress had for many years barred veterans who were denied disability benefits from seeking judicial review. The absence of review was thought to be an essential feature of an efficient, easy-to-navigate, and nonadversarial process for resolving disability claims. Although the system appeared to work well, the federal courts repeatedly invoked the presumption of reviewability to avoid the statutory bar — even after Congress tightened the language to confirm its desire to foreclose judicial review. Finally, in 1988, a frustrated Congress relented to the courts' insistence and subjected disability claims to court review. Twenty-five years later, the process for reviewing disability claims is in shambles. Because of the demands of judicial review, disability decisions have swelled in length and intricacy. Far from simple and nonadversarial, the process has become "complex, legalistic, and protracted."13 That has in turn frustrated the VA's efforts to quickly process new claims — an especially troubling development given the surge in disability claims arising from the wars in Iraq and Afghanistan. A backlog of about 600,000 unresolved disability claims has provoked widespread public condemnation.14 The presumption's continuing vitality is especially startling when **viewed alongside the Supreme Court's marked tendency across an array of doctrinal contexts** to narrow the range of disputes that it is willing to hear.'5 Among other things, **the Court has resisted the implication of private rights of action**,16 ratcheted up civil pleading standards," limited habeas suits,'8 restricted standing,'9 and curbed class actions.20 Yet the presumption of reviewability is alive and well, as the Supreme Court vividly demonstrated in the recent case involving EPA.

2NC- AT: Perm do the CP

1. Severs out of the agent of the plan (judiciary branch)

2. Severs out of "presume"

Oxford Dictionaries 7/5 (Oxford Dictionary, dictionary, definition of presume, 7/5/15, 7/25/15, MEM)
Presume: Unjustifiably regard (something) as entitling one to privileges

Should means an obligation or duty

Oxford Dictionaries 7/5 (Oxford Dictionary, dictionary, definition of presume, 7/5/15, 7/25/15, MEM)
Should—1. Used to indicate obligation, duty, or correctness, *I think we should trust our people more.*

3. Severance is a voter

a. Moving Target: Aff becomes a moving target for the Neg, as they can always sever parts of their plan that linked to our DAs

b. Destroys distribution of resources: there are no arguments that the Neg can read that the Aff cannot sever out of which makes it impossible to debate as Neg

c. Kills clash: destroying the dialectic of proof and rejoinder---that's key to other-oriented persuasion, because only through clash can we garner the critical thinking skills necessary for persuasion

d. Advocacy skills: The Aff is constantly changing its plan which means it is going against the inherent properties of debate- the aff has to stick with one plan and go with it. Severance erodes the stability of their advocacy. The impact is advocacy skills and their ability to defend controversial ideas.

e. functionality competition : the perm cannot function. Functionality is bad because it allows for unpredictable limits. Being allowed to change anything in the plan and how it gets implemented gives the neg way too much ground and it allows for an uneducational and unfair debate which, limits clash and ruins policy debate.

f. Textual competition: is good because it allows for the best policy to be implemented. Changing the wording of the plan for the best policy creates a more educational debate which allows for more clash and a more fair debate.

4. Congress is the key to effective change over the third party doctrine- courts can't resolve privacy disputes related to third-parties

Thompson 14 (Richard M. Thompson II, Legislative Attorney, "The Fourth Amendment Third-Party Doctrine," Congressional Research Service, June 5, 2014, https://www.fas.org/sgp/crs/misc/R43586.pdf)
From an institutional perspective, one might argue that **the courts are not the proper branch of the federal government to resolve privacy disputes related to information handed over to third-parties.** Once the Supreme Court outlaws, or significantly limits, a certain police practice, it "constitutionalizes" it, and only the Court or a constitutional amendment could overturn this decision. Instead, some argue that when creating rules that pertain to new technologies, **Congress and legislatures** generally, might **be best fitted to find the appropriate balance between privacy and security, while providing the necessary flexibility to change this rule as technology**.

2NC- AT: Perm do both

This perm is incoherent in what a world would look like with the CP and Plan

1. Only Congress legislation can produce effective reform the 3rd party doctrine by protecting privacy in communications, transact businesses, and data collection- Calabrese evidence

2. Judicial presumption would distort agency and flexibility of Congress to pass legislation and promote false faith in judicial power

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1330, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)
When courts invoke the presumption of reviewability to twist a statute that would otherwise have been read to preclude review, the additional review will distort the system of remedies that Congress meant to establish. Unwarranted review may introduce delay, divert agency resources, and limit agency flexibility.254 It may increase the relative influence of lawyers in agency decisionmaking.251* It may encourage agencies to rely more heavily on guidance documents, which are relatively difficult to challenge in court.260 And it may foster a faith in what Merrill has called "a major trope of modern administrative law: Judicial review cures all."261

Court = key

Supreme Court is key to dismantle the third party doctrine

Lamparello 3/3 (Adam Lamparello, Assistant Professor of Law, Indiana Tech Law School, "ONLINE DATA BREACHES, STANDING, AND THE THIRD-PARTY DOCTRINE", Page 123-124, 3/3/15, 7/24/15, MEM)
Recently, however, the Court has called into question the continuing viability of the third-party doctrine. In United States v. Jones,23 the Court held that the government's use of a GPS tracking device to monitor a suspect's whereabouts on public roads for twenty eight days constituted a search under the Fourth Amendment.24 Although the Court was divided over whether the search was an unlawful trespass or an infringement of privacy, five Justices suggested that the length of the surveillance violated a societal expectation of privacy, notwithstanding the fact that the suspect's vehicle was traveling on public roads and readily observable.25 Furthermore, in her concurrence, **Justice Sotomayor directly questioned the validity of the third-party doctrine, including "the premise that an individual has no reasonable expectation of privacy in information voluntarily disclosed to third parties**."26 Likewise, in Riley v. California?1 the Court held that, in the absence of exigent circumstances, law enforcement may not search the contents of a suspect's cell phone without a warrant and probable cause."8 The Court relied on the fact that, unlike finite objects such as plastic containers or crumpled cigarette packs, cell phones store volumes of private information, such as photographs, financial documents, and emails.29 In both cases, the Court could have applied the third-party doctrine and held that citizens have no expectation of privacy in their public movements or outgoing calls. By doing the opposite and focusing on a societal—rather than subjective expectation of privacy, **the Court suggested that the third-party doctrine may be on its last legs**.

Judicial presumption is key to setting protecting property and liberty interests

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1317, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)
Second, the presumption of reviewability comes into play even where no protected property or liberty interests are at stake. A recent decision from the D.C. Circuit, Council for Urological Interests v.

Sebelius.1*4 is illustrative. A group of urologists had challenged a Medicare regulation that limited the circumstances under which hospitals could secure payment for radiological services.185 Because urologists routinely contract to receive a portion of hospitals' Medicare payments, the urologists feared that they would lose money. But the urologists could not raise their complaint about hospital reimbursement through administrative avenues that were open only to hospitals. Although the Medicare statute clearly provides that administrative exhaustion is a jurisdictional prerequisite to securing judicial review, 186 the D.C. Circuit invoked the presumption of reviewability and blessed the urologists' effort to go straight to court.187

Supreme Court key to build adaptable legal framework

Price 15 (Michael, Serves as counsel for the Brennan Center's Liberty and National Security Program, previously the National Security Coordinator for the National Association of Criminal Defense Lawyers, former student research director for NYU's Center on Law and Security, an intern with the Department of Justice Civil Rights Division, a symposium editor for the Journal of International Law and Politics, and a student advocate in NYU's International Human Rights Clinic, J.D. from NYU School of Law and a B.A. from Columbia University in Political Science and Middle East & Asian Languages and Cultures, "Rethinking Privacy: Fourth Amendment 'Papers' and the Third-Party Doctrine", 8 Journal of National Security Law and Policy, http://jnslp.com/wp-content/uploads/2015/06/Rethinking-Privacy.pdf, 2015, 7/25/15, MEM)

Given this context, **it is imperative that the Supreme Court establish new rules for government access to third-party records**.164 Property law and the antiquated trespass doctrine are not promising springboards. The "reasonable expectations" framework is likewise prone to error whenever new technology is involved. Although both approaches continue to provide some measure of protection against traditional methods of search and seizure, they have also struggled to respond to the realities of the digital age. Instead, the Court might want to consider a new paradigm for the information age, another OlmsteadKatz moment.165 This is call not a to abandon the property-oriented and reasonable expectation tests. It makes sense to talk about home searches in terms of property rights, for example. At the same time, situations that do not involve physical trespass into the home may remain subject to the Katz analysis.166 When it comes to data privacy, however, the Court may want to consider a third way that will co-exist with and complement existing approaches.167

The Supreme Court is the best branch to protect individual rights

Friedman 12 (Leon Friedman, Law Professor, Hofstra Law School, "The Supreme Court vs. Congress", http://www.huffingtonpost.com/leon-friedman/the-supreme-court-vs-cong_b_1561123.html, 10/4/12, 7/25/15, MEM)

The power of the Supreme Court to protect individual rights from Congressional encroachment seems unquestioned. That surely is its prime function, to ensure that the other branches of government do not violate the Bill of Rights protecting the people. A second category of cases involves the Court's function as arbitrator among the branches of government. One of the key protections of freedom in the Constitution is the structural separation of powers among the three branches. Congress must pass laws, the president must execute them, and the courts must interpret those laws. If one branch encroaches on the authority of others, there is a danger that such encroachment will upset the balance of power between them and increase the possibility of one branch dominating the others. Thus the Court acts as the umpire, not calling balls and strikes, as Chief Justice Roberts stated during his nomination hearings, but insuring that each branch stays on its own turf, as Sen. Sam Ervin once said in an argument before the Court. Thus last year, the Court invalidated a provision of the Sarbanes-Oxley law that restricted the president's power to remove members of an investigatory board created under that law. The third area involves the most questionable use of Supreme Court power. The Court assumes the power to say to Congress, not that it violated anyone's rights or that it passed a law that crossed the line that separated one branch of government from another, but simply that Congress lacked the power to act. States have the power to pass any law they choose (subject to both state and federal constitutional restraints). But when Congress passes a law, it must rely on specific grants of power contained in Article I, Section 8 of the Constitution.

Federal lawmen whine that law enforcement might be *hard* with scrupulous attention to the Fourth Amendment: In hearings on Capitol Hill and in letters to members of Congress, government officials have warned that the bill would hamper civil and criminal investigations, especially for certain agencies such as the Securities and Exchange Commission, which does not have warrant authority, only subpoena authority. Mary Jo White, chairwoman of the SEC, gave an example of an investigation in which authorities were able to obtain a critical piece of evidence by subpoenaing the personal emails of an employee even though he lived in Canada, where the emails would otherwise have been unattainable under Canadian law.... The White House did not respond to a request for comment on the legislation. That the executive branch doesn't understand the implications and language of the Fourth Amendment well enough to short circuit this long, long debate is disgraceful. **Back in 2013, the Obama administration at least rhetorically indicated they'd be open to some email privacy sanity, but have been reluctant to act unforced by Congress apparently. A long record of Reason keeping an unhappy eye on ECPA and email privacy issues.**

Congress favors judicial review presumption- better quality of agency decision-making

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1319, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)

The point could also be framed in functional, nonconstitutional terms. By increasing the likelihood of judicial review, the presumption may enhance agency accountability, improve the quality of agency decision-making, and legitimize governmental action. Because judicial review is such a good thing — something any reasonable Congress would usually want — it's appropriate to construe federal statutes to permit such review.197 As such, the presumption would reflect a convention in our legal and political culture favoring judicial review of administrative action.198 In Professor Louis Jaffe's words, u[t]he availability of judicial review is the necessary condition, psychologically if not logically, of a system of administrative power which purports to be legitimate, or legally valid."199

SCOTUS shields the link

Owens et al 2013 (Assistant Professor in the Department of Political Science, University of Wisconsin, Madison, "How the Supreme Court Alters Opinion Language to Evade Congressional Review." Journal of Law and Courts 1.1 (2013): 35-59. http://www.uky.edu/~jpwede2/JLC.pdf)

Taking our cue from these studies, we suggest that justices use opinion language as an instrument to protect their decisions from hostile legislative actors. Justices are policyseeking actors who want their opinions to reflect their personal policy preferences. They therefore must predict and anticipate how the political branches will react to their rulings, and attempt to protect those rulings from legislative rebuke. Obfuscation in Court opinions can depress the probability of legislative rebuke by deterring Congress from pursuing (costly) review and, thereby, **shield the Court's decisions**. Obfuscating the Court's opinions by making them less readable may expose some of Congress's weakness, such as members' scarcity of time and resources and their collective action problems. Congress has finite resources and time. Members, therefore, must make tradeoffs in the legislative process—tradeoffs that generally lead them to pursue simple measures that produce immediate electoral payoffs. Members of Congress are elected with broad political platforms and general policy goals. But once they arrive in Washington, they find themselves seeking answers to complex questions. Even the simplest problems require information and resources that members may not have. Hall and Deardorff (2006), for example, show that interest groups are necessary for Congress to operate. They provide policy information to otherwise information-starved members, helping to fill the void for a Congress that has neither the policy information to do its job effectively nor the time to collect such information. Likewise, Cox and McCubbins (1993) explain how members must use parties to overcome

their collective constraints. And, while interest groups and party leaders can help members overcome some constraints, they do not always lead them to obtain their goals. Put plainly, Congress has scarce time and resources to accomplish what all 535 members desire. The significant costs imposed on members to pass legislation **often lead them to avoid difficult issues**. For example, action in the Senate is often stymied by opportunity costs. Reflecting on these costs, Senate Majority Leader Harry Reid (D-NM) once stated: "there isn't enough time in the world – the Senate world, at least – to move cloture on every one of these [filibustered issues]" (Wilson and Murray 2010). Similarly, scholars emphasizing the role of party organization in the House have argued that scarce time for floor debate and the need to overcome collective action problems is a persistent problem (Cox and McCubbins 2005). Combined with the ubiquitous need to generate benefits for constituents and to claim legislative successes, there is a premium on the time and resources of House members. Furthermore, across both chambers, the shrinking numbers of committee staffers makes it harder for Congress to gain substantive knowledge over matters that require expertise, thus further degrading Congress's ability and desire to understand effectively and legislate on complex issues. As Lee (2010) explains, "over the last two decades there has been a decline of committee staffing levels. . . A significant share of the new leadership office staff has been dedicated to 'war room,' political, and 'message' activities rather than to substantive policy expertise" (228). This reduction in staff, coupled with other changes, has made Congress "less serious and substantive as a policymaking institution" (228).4 The combination of scarce resources and time, the need to obtain immediate benefits, and collective action problems leaves members little choice but to focus predominately on the simplest legislative issues. Obfuscated Court opinions can generate heightened review costs and thereby deter congressional responses. To understand complex and obscure Court decisions, Congress must expend additional—and scarce—resources. A member who wishes to alter the Court's policies or otherwise punish the Court must examine the central logic and tenets of the Court's opinions and may even need to examine how the opinion compares to others written in the past by the Court. In some cases, the Court's opinion may be clear. In those cases, members may easily internalize the degree to which they favor the political content of the majority opinion. Yet, the Court also has the ability to obfuscate opinions by making them less readable. In those instances, the heightened legislative costs required to address the opinion may increase. By writing a less readable opinion, justices might craft a desired judicial policy while simultaneously deterring a legislative response by making it more difficult for Congress to address it. To be clear, we are not arguing that Congress can never override obfuscated Supreme Court decisions. There are certainly examples in which Congress reversed such Court decisions (Eskridge 1991). Rather, we argue that opinion obfuscation affects the costs necessary for Congress to take up the issue and undo the Court's decisions. By writing such opinions, the Court may dull the edges of their decisions, making the public presentation of the outcome less transparent and, therefore, more difficult for members to understand, frame, and attack. And, while Congress can rely on outside groups to learn about the Court's decisions, those groups must first obtain access to members, no easy task in itself. They also must overcome similar information constraints and then convince a majority of members in each chamber. Simply put, even when interest groups participate, hurdles still arise.

Lobbying groups favor judicial review presumption and Congress uses court rulings

Hall 14 (Kermit L. Hall, Dean of the College of Humanities and Executive Dean of the Colleges of the Arts and Sciences, Professor of History and Law at The Ohio State University, he was the Editor-in-Chief of The Oxford Companion to the

To reject this view of group choice for a "strong" Chevron, it is not necessary to reject altogether the view that groups are intended to be the beneficiaries of statutes that create agencies. Groups may be successful in getting a law passed **but yet want the court to play an active role in deciding ambiguous cases.** Even where the original deal gives the group a benefit, there is no guarantee that the agency will interpret the ambiguous cases in its favor. State banks were quite successful in getting Congress to enact a statute limiting the branching opportunities of national banks. But the responsibility for interpreting the branching statutes was review not to enforce the original deal, or simply to get the benefits of a regulatory enactment, but to resist all implementation efforts by the agency.136 Indeed, it is difficult to detect group legislative efforts to cut back generally on judicial review. Perhaps where the group is totally controlling the regulatory scheme that might be an option.137 Yet **Congress has rarely reversed a Supreme Court ruling that generally expands the scope or**

availability of judicial review of agency action on questions of law.[138] **Group lobbying in Congress suggests some support for aggressive judicial review.**[139]

Perm do both

Perm do both solves- Judicial presumption increases Congress's accuracy of decisions- Its Congress's job to strike the balance between the unequal values

Bagley 14 (Nicholas Bagley, Assistant Professor of Law, University of Michigan Law School, Harvard Law Review, Volume 127, Number 5, page 1330, "THE PUZZLING PRESUMPTION OF REVIEWABILITY", March 2014, 7/26/15, MEM)

To be sure, application of the presumption may sometimes yield benefits: among other things, it could foster adherence to law, improve agency deliberation, and increase the accuracy of agency decisions. But when courts sidestep constraints on their reviewing authority, they upset the balance that Congress has struck between a host of incommensurate values. **It is Congress's role, not the courts', to strike that balance.** Whatever the countervailing benefits might be, Congress judged that the costs outweighed them. The courts have no constitutional authority to revise that judgment and no epistemic basis for thinking they can make a better one.264

Congress can decide, whether opening the courts to those aggrieved by agency action strikes the appropriate balance between competing concerns of fairness--no reason the courts would disrupt Congress's power

On the other hand, Judge Pauley from the Southern District of New York delivered an opposite ruling in *ACLU v. Clapper*, nearly ten days after Judge Leon ruled in*Klayman*. [n64] Judge Pauley reasoned that the NSA could not achieve its objective of combating future terrorist attacks if it could not conduct a sweeping collection of every telephone record. [n65] Like Judge Leon, Judge Pauley described the querying system the NSA uses on surveillance targets. [n66] However, unlike Judge Leon, Judge Pauley discerned a greater purpose behind the queries and held that the system was constitutional and kept with the *Smith* precedent. [n67] Judge Pauley applied *Smith* to find that the communication records were already handed over to private companies by citizens who could not expect that the information could still be considered private to the individual.[n68] Judge Pauley took his analysis a step further and bolstered a need to keep FISC matters secret by citing historical deference to the executive when it comes to matters of national security. [n69] Judge Pauley dismissed the ACLU's claim and held that the program was meant to remain classified and unchallenged and that telephony metadata collection is constitutional. [n70]

Courts had been out of counterterrorism measures for too long--- can no longer interfere.

Numerous American commentators have pointed out that courts tend to defer to the Executive during times of perceived emergencies, and most of the commentators carry at least the hope, if not the promise, that civil liberties will be restored when the crisis has passed. [n50] Specifically, long before 9/11, Justice [*315] William Brennan had acknowledged that the "Ship of State" may right itself as the crisis eases, but asserted that the ship would tend to founder again in the next crisis. [n51] Looking at the picture from the perspective of courts other than the United States, Professor Shimon Shetreet subscribes explicitly to the "ship of state righting itself" view: International Jurisprudence has shown in the beginning of this century, after the 9/11 attacks, complete acceptance of executive and legislative emergency measures against terror. However, in later years courts showed a very strict approach toward executive and legislative counterterrorism measures. The general pattern in most jurisdictions has been to broaden the scope of judicial review of executive decisions in matters of national security. [n52] Professor Shetreet rightly points to Canadian and U.K. court decisions striking down extrajudicial detention measures. [n53] Chief [*316] Justice Barak authored opinions for the Israeli High Court in cases involving torture [n54] and targeted killings. [n55] On the general issue of judicial **deference** in the face of terror threats, Barak commented: The security oriented character of administrative discretion restricted judicial review in the past. Judges are not members of the security establishment and they should refrain from interfering in security considerations. Over the years it has been held that security considerations are not unique insofar as judicial review is concerned. Judges are not administrators, yet the principle of separation of powers requires that they review the lawfulness of administrative decisions. In this regard, security considerations do not enjoy a different status. [n56] Optimism is welcome. And predictions of judicial recovery may well come to pass. But unfortunately, in the past decade, the U.S. Ship of State has been severely damaged and will require extensive repairs before it will set sail confidently again. As Justice Brennan said, the ship will founder again, but the question of the moment is whether it can even be righted in the short term.

Some lower courts have held that an alternate line of an investigation, such as the parallel investigation that was proceeding in Williams, is a prerequisite to the applicability of the inevitable discovery doctrine. n109 In other jurisdictions, however, courts have held that "the inevitable discovery exception may be invoked in the absence of an ongoing, independent investigation." n110 In those circuits [*178] that have declined to require an alternate line of investigation, the inevitable discovery exception has the potential to overtake the rule itself. It can be used to justify an exception to the exclusionary rule wherever there is a conceivable manner in which law enforcement officers could lawfully observe the information.¶Moreover, some courts have liberally interpreted the Court's requirement that only "lawful" alternative means of discovering evidence provide a basis from which the prosecution can invoke the inevitable discovery exception. n111 The First Circuit has gone the furthest in this direction. n112 In United States v. Scott, a search of the defendant's vehicle lacked probable cause, and was thus held unconstitutional. n113 On the basis of the inevitable discovery doctrine, however, the First Circuit declined to exclude fruits discovered during the unconstitutional search. The court held that the police would have had probable cause to search had they been aware of statements that the defendant's confederate made simultaneously to fellow police officers. The confederate's statements were not admissible against the confederate himself since the police had failed to give the confederate required Miranda warnings, but the First Circuit held that the statements provided a sufficient basis to establish that the police would have inevitably discovered the contraband in the defendant's vehicle. The First Circuit reasoned that the defendant lacked standing to contest the constitutionality of his confederate's statements, n114 interpreting the requirement of inevitable discovery by legal means to exclude only those discoveries "unlawful as to a defendant." n115 The court held that "inevitable discovery may rely on an illegal action that did not violate the relevant defendant's personal rights." n116 While there is no consensus on the First Circuit's approach, this extension of the inevitable discovery doctrine has the potential to further erode the general applicability [*179] of the exclusionary rule and create avenues for police exploitation that substantially reduce Fourth Amendment barriers to prosecution.

The Fourth Amendment's goal of protecting citizen privacy "against unreasonable searches and seizures" n2 has been the major driving force behind much of the Supreme Court's Fourth Amendment jurisprudence. n3 As such, ever since the Court's seminal ruling in Katz v. United States, the Court has held that warrantless searches that encroach upon a citizen's reasonable expectation of privacy are unconstitutional. n4 Holding otherwise would "erode the privacy guaranteed by the Fourth Amendment." n5 [*189] ¶But despite the Court's long-established practice of protecting citizens' reasonable expectations of privacy, many commentators have expressed concern as to whether the reasonable expectation of privacy test developed in Katz will continue to adequately protect citizens' Fourth Amendment rights in this age of ever-advancing technology. One commentator argues that the reasonable expectation of privacy test "has proven more a revolution on paper than in practice and . . . as a result, courts . . . have rejected broad claims to privacy in developing technologies with surprising consistency." n6 Another argues that

"Katz was a ruling without substance" and that it has done "little to protect Fourth Amendment liberties." n7 Still other commentators argue that, in light of the privacy concerns raised by modern technology, the reasonable expectation of privacy test should be abandoned altogether. n8 Based on the tone of such commentary and the undeniably rapid advance of modern technologies, one might conclude that the death knell has already sounded for the reasonable expectation of privacy test. But contrary to such analysis, the state of the Court's Fourth Amendment jurisprudence is not as dire as some commentators make it out to be.¶This Note seeks to defend the reasonable expectation of privacy test and demonstrate that it more than adequately protects citizens' [*190] Fourth Amendment rights, even in the face of rapidly advancing modern technology. Despite heavy academic criticism of the reasonable expectation of privacy test, both Supreme Court and lower federal court cases provide little reason to worry that the test is ill suited for protecting citizens' Fourth Amendment rights. Indeed, just this past term the Court held that an unwarranted search using GPS tracking technology violated the Fourth Amendment. n9 Though Justice Scalia's majority opinion reached this conclusion by relying on fundamental concepts of trespass, n10 the concurrences of Justices Sotomayor n11 and Alito n12 strongly suggest that five justices are prepared to recognize that extensive, unwarranted GPS surveillance of a citizen violates reasonable expectations of privacy. n13 Most importantly, all nine justices ruled in favor of protecting the defendant's Fourth Amendment rights from an advanced technology. This holding, combined with the language of many of the Court's earlier Fourth Amendment decisions, demonstrates that the reasonable expectation of privacy test is more than capable of protecting citizens' Fourth Amendment rights from such technologies.¶Since the development of the reasonable expectation of privacy test in 1967, the Court has taken surprisingly few opportunities to rule on Fourth Amendment cases dealing with advanced technology. Before Jones in 2012 and Kyllo v. United States n14 in 2001, which dealt with infrared imaging, the most advanced technology the Court had dealt with in the Fourth Amendment context was aerial photography from airplanes in 1986 n15 and from helicopters in 1989. n16 This absence of Supreme Court precedent dealing with truly modern technology indicates that calls for Katz's demise are, at the very least, premature. It is no secret that the Court often takes its time before ruling on [*191] important issues, giving the issues time to percolate in the lower courts, and the Court seems to be adopting this approach here. n17¶Further, in the only two Fourth Amendment and technology cases the Court has heard during this century, Kyllo and Jones, the Court ruled in favor of the defendant and thus actually served to protect citizens' privacy--not erode it. This is more evidence of the Court's steadfast adherence to the importance of protecting the privacy of citizens and indicates that the Court will continue to apply the reasonable expectation of privacy test in a manner that protects citizens' Fourth Amendment interests from modern technology.

JUDICIAL ACTIVISM ON THE REHNQUIST COURT: AN EMPIRICAL ASSESSMENT; St. John's Journal of Legal Commentary; lexis) jskullz

[*38] Because the phrase "judicial activism" means nothing, it cannot be coherently described, and because it cannot be coherently described, it cannot be measured empirically. Consequently, this Article does not attempt to measure it. Nor, for that matter, have other recent articles that have addressed judicial behavior truly attempted to measure judicial activism, even as they employ this phrase. n9 Therefore, what is actually studied in this and other scholarly articles is judicial deference, not judicial activism. n10 Deference refers to the tendency of judges to defer to the political branches (i.e., the legislative and the executive). Here, deference is measured simply by counting how often courts strike down acts of the legislature. A judge that upholds the action of a political branch against a constitutional challenge brought by an individual (or group of individuals) is being deferential; a judge who strikes down the action of the political branch is being non-deferential.¶ Of course, even though the term "judicial activism" is generally devoid of meaning, there is an obvious connection between what is referred to as judicial deference and what people ostensibly mean when they use the phrases "judicial activist" or "judicial activism." The connection has to do with judicial legitimacy. When a critic says that a judge is an activist or that a decision exhibits judicial activism, what the critic ordinarily means is that the judicial action is illegitimate - that the judge did something he or she ought not to have done. n11 In the context of constitutional adjudication, where a court is declaring an act of the executive or the legislature (federal, state, or other) unconstitutional, "illegitimate" ordinarily means that the court has wrongly thwarted [*39] the will of the majority n12 - that the court has substituted its will or judgment for the action of the legislature, the immediate representatives of the people. To take perhaps the most famous example in constitutional history, when critics argue that the decisions in Roe v. Wade n13 and its progeny exemplify judicial activism, the essence of the criticism is that the Roe line of cases illegitimately defies the political majority's efforts to place some restrictions on the right to choose an abortion. Legitimacy is therefore closely related to the so-called counter-majoritarian difficulty. n14 "Judicial activists" render decisions that are illegitimate because they wrongfully thwart the will of the majority by imposing their own beliefs on the populace. n15 Once the connection between the phrase "judicial activism" (or "activist") and decisions that thwart the will of the majority is acknowledged, the concept can then be measured empirically. Even though "judicial activism" does not describe a discrete methodology, the capacity exists to tally up the instances where judges overturn acts of the political majority, and the results of that calculation produce a body of data. n16

Dalal 14 (Anjali S. Dalal; 2014; J.D., Yale Law School; ARTICLE: SHADOW ADMINISTRATIVE CONSTITUTIONALISM AND THE CREATION OF SURVEILLANCE CULTURE; Michigan State Law Review; lexis) jskullz

Why is it that the evolution of the Attorney General Guidelines systematically promoted norms that prioritized national security over civil liberties and expanded the FBI's authority? In this Part, I argue that this phenomenon is the result of the agency's natural impulse towards mission creep. This instinct is a function of two separate conditions both operating in the

national security arena: a powerful and loosely defined mandate--preserving our national security--and the medieval structure of bureaucracy. These factors encouraged the creation of policies that rejiggered the balance between civil rights and national security needs in favor of national security.¶ A. Powerful, Loosely Defined Mandate¶ The mission of national security is at once so powerful and so vague that mission creep towards complete surveillance is only [*100] natural. After all, it is a Hobbesian reminder of the primary purpose of the state. The state exists to keep us safe from each other and from outsiders. If the citizenry cannot rest assured that their possessions, livelihoods, and lives are stable and secure, then the state has failed in its most fundamental duty. At the highest level, this mandate contains no limiting principles, and the determination of when our national security is threatened is solely in the hands of the executive charged with delivering on the mandate. Thus, while we may negotiate peacetime limitations on the authorities of law enforcement and intelligence gathering, when the security of the nation is called into question, those limitations are easily shrugged off and the mission expanded.¶ As existential threats to our national security increasingly become a way of life, the FBI is instinctively responding by expanding its mission and pursuing its mission more comprehensively. As Professor Peter Swire explains:¶ [A] more general reason why surveillance powers expand over time [is that] intelligence agencies get part of a picture but are unable to understand the entire picture and thus seek and receive additional powers, with the hopes that the additional surveillance capabilities will be more effective at meeting the goal of preventing harm before it occurs. n183¶ Thus it is in part the noble pursuit of a powerful but amorphous mandate that motivates mission creep.¶ The powerful and loosely defined mission also encourages mission creep in an attempt to avoid the public inquiry and blame game that often occur in the wake of an attack. Consider the response to the Boston Marathon bombing in 2013. The FBI was widely blamed for not keeping better tabs on one of the accused bombers, Tamerlan Tsarnaev, a legal, permanent resident of the United States. In early 2011, the FBI received a tip from the Russian government that Tsarnaev was growing increasingly radicalized in his practice of Islam. n184 In response, the FBI "checked U.S. government databases and other information to look for such things as derogatory telephone communications, possible use of online sites associated with the promotion of radical activity, associations with other persons of [*101] interest, travel history and plans, and education history," in addition to interviewing Tsarnaev's family members. n185 The investigation produced little actionable evidence. The FBI shared the information with Russian authorities and asked for additional information on Tsarnaev that might justify further investigation, but did not receive any information. n186¶ Despite the fact that the FBI followed protocol, the public and the press fixated on the fact that the FBI was aware of Tsarnaev's radicalization and yet did not prevent the attack in Boston. n187 The public's fear that the attacks represented a failure of the FBI was not allayed by the President's assurances that the FBI managed the situation with the utmost competence, both pre- and post-attack. n188 In a moment of fear, the public demanded 100% prevention, ignoring the fact that perfect prevention is difficult in a society that also protects civil liberties. n189¶ This post-attack blame game forces the Justice Department and the FBI to make a difficult decision: Do they aggressively and potentially unconstitutionally expand their vague mandate to include the prevention of all instances of terrorism-related violence, or do they maintain a conservative interpretation of their authority and risk exposing the agency to intense public scrutiny and potentially having the agency brass raked over the coals, regardless of whether or not the FBI or any other element of DOJ was at fault? A reasonable agency head would choose to expand the mandate. After all, as I discuss more fully in Parts IV and V, given the secrecy in which national security policy is made and the sparse oversight to which it is subject, the minimal chance of any exposure of inappropriate or illegal practices is outweighed by the benefits of expanding the mandate.¶ [*102] Given the powerful and loosely defined national security mandate, it is only natural that the FBI's mission creeps from investigating crimes to preventing crime. This expansive interpretation of the mandate encourages aggressive surveillance norms. In this way, the FBI's instinctive promotion of surveillance norms is inevitable.¶ B. Medieval Structure of Bureaucracy¶ The proclivity toward mission creep is compounded by a general bureaucratic inclination towards mission creep. Bureaucracies tend to operate as fiefdoms--collecting and holding onto as much power as possible, limiting external oversight of their work, and allowing it only ex post. n190 Some scholars, including Daryl Levinson, have questioned this theory, arguing that the "bureaucrats' commitment to a particular mission, or to a particular vision of how that mission ought to be accomplished, might cause them to resist any expansion of agency activity outside of these boundaries." n191 Levinson further argues that agency heads are "high-level political appointees who will be much less invested in the agency's mission and much more interested in pleasing their political overseers"--individuals who likely have no reason to prioritize the expansion of bureaucracy. n192 Such arguments underestimate the natural instincts of individuals to believe that what they are doing is good and useful and therefore that doing more

of it is likely better. Furthermore, such arguments assume that agency officials are so politically tied to their "overseers" that they will abandon any desire to create a separate professional legacy of their own.¶ Together, the nature of bureaucracy and the powerful and loosely defined national security mandate provide one rationale for the evolution of the norms embedded within the Attorney General Guidelines. The next Part of this Article attempts to unpack the conditions that support the entrenchment of those norms into our culture.

Plan

The United States federal government should substantially curtail its domestic surveillance by ceasing Border Patrol activities on the Tohono O'odham Nation.

Contention 1 is the Occupation

The Tohono O'odham Nation lies on the border between the United States and Mexico. The nation has become the frontline in America's battle for border surveillance.

Todd **Miller**, 11-1-20**12**, *Todd Miller has researched and written about U.S.-Mexican border issues for more than 10 years. He has worked on both sides of the border for BorderLinks in Tucson, Arizona, and Witness for Peace in Oaxaca, Mexico. He now writes on border and immigration issues for* NACL, "Ground Zero: The Tohono O'odham Nation," https://nacla.org/blog/2012/11/2/ground-zero-tohono-oodham-nation TB

According to Margo Cowan, former general council to the Tohono O'odham Nation, there was no Border Patrol presence on the Nation until 1993. Now, the Department of Homeland Security green-striped SUVs, trucks, cars, and vans are everywhere, at every turn. There are also ATVs, horse patrols, and Predator drones and Blackhawks and other "air assets" flying overhead. There are surveillance towers and scope trucks and a|||n||| Forward Operating Base, which—as with U.S. military operations in Iraq and Afghanistan—are small, make-shift bases to facilitate "tactical operations" in remote regions. A Joint Task Force Substation that they have on the reservation is supposedly a collaboration between Customs and Border Protection (CBP—Border Patrol's parent agency) and the Tohono O'odham Nation Police Department, but looks more like a mini-Border Patrol station packed with a fleet of CBP vehicles and mobile surveillance trucks. Behind the substation is a chain-linked caged-in area where people are held before agents hand them off to the non-labeled, white Wackenhut bus, as everyone calls them (though Wackenhut has now changed its name to G4S), which will transport the captured migrants to Tucson for further processing and maybe prison time. Mike Wilson, a Tohono O'odham man who puts out water in stations on the reservation in**defiance** of the Nation's legislative council, says that the Border Patrol on the Nation has become an "occupying army."[i] An Amnesty International report entitled I***n Hostile Terrain***, not only underscores the constant violations to undocumented people traveling through this area, particularly death, but also how the border surveillance apparatus has impacted the O'odham people whose aboriginal land extends well into Mexico and has been bisected by an international boundary they never wanted. Amnesty International documents a constant pattern of harrassment against the O'odham, including a pattern of physical and verbal abuse, who now have more federal officers on their "sovereign" nation than any other time in their long, painful history of colonization and forced-assimilation. The presence of Border Patrol on the Nation is buzzing, entrenched, and now apparently expanding. Now besides the flow of agents from Casa Grande and Tucson stations, the Border Patrol has undertaken a massive expansion of the Ajo station, a 52,900 square-foot state-of-the-art **facility**. This greatly contrasts with the many aging buildings in the economically-depressed area which previously relied on now barely-functioning mines, another economic model that marginalized and exploited the Tohono O'odham, who were the lowest rung of a racially-segregated wage hierarchy (whites were at the top). You

can almost see the tailings of the former copper mine in Ajo (closed in 1985) from the Border Patrol station in Why, an uneasy symbol of one economy replacing another.

Under the guise of border surveillance, the USFG has invaded the nation, assaulted the people, ransacked their homes, and spied on innocents. *The USFG's militarized surveillance confines the Tohono to violence and subjugation.*

Miller 14 (*Todd Miller has researched and written about U.S.-Mexican border issues for more than 10 years. He has worked on both sides of the border for BorderLinks in Tucson, Arizona, and Witness for Peace in Oaxaca, Mexico. He now writes on border and immigration issues for* NACL, Todd Miller, 4-22-2014, "Tomgram: Todd Miller, The Creation of a Border Security State," Tomdispatch, http://www.tomdispatch.com/blog/175834/tomgram%3A_todd_miller,_the_creation_of_a_border_security_state/) GW

Before 9/11, there was little federal presence on the Tohono O'odham reservation. Since then, the expansion of the Border Patrol into Native American territory has been relentless. Now, Homeland Security stations, filled with hundreds of agents (many hired in a 2007-2009 hiring binge), circle the reservation. But unlike bouncers at a club, they check people going out, not heading in. On every paved road leaving the reservation, their checkpoints form a second border. There, armed agents -- ever more of whom are veterans of America's distant wars -- interrogate anyone who leaves. In addition, there are two "forward operating bases" on the reservation, which are meant to play the role -- facilitating tactical operations in remote regions -- that similar camps did in Afghanistan and Iraq. Now, thanks to the Elbit Systems contract, a new kind of border will continue to be added to this layering. Imagine part of the futuristic Phoenix exhibition hall leaving Border Expo with the goal of incorporating itself into the lands of a people who were living here before there was a "New World," no less a United States or a Border Patrol. Though this is increasingly the reality from Brownsville, Texas, to San Diego, California, on Tohono O'odham land a post-9/11 war posture shades uncomfortably into the leftovers from a nineteenth century Indian war. Think of it as the place where the homeland security state meets its older compatriot, Manifest Destiny. On the gate at the entrance to her house, Tohono O'odham member Ofelia Rivas has put up a sign stating that the Border Patrol can't enter without a warrant. It may be a fine sentiment, reflecting a right embodied in the U.S. Constitution, but in the eyes of the "law," it's ancient history. Only a mile from the international boundary, her house is well within the 25-mile zone in which the Border Patrol can enter anyone's property without a warrant. These powers make the CBP a super-force in comparison to the local law enforcement outfits it collaborates with. Although CBP can enter property warrantlessly, it still needs a warrant to enter somebody's dwelling. In the small community where Rivas lives, known as Ali Jegk, the agents have overstepped even its extra-constitutional bounds with "home invasions" (as people call them). Throughout the Tohono O'odham Nation, people complain about Homeland Security vehicles driving at high speeds and tailgating on the roads. They complain about blinding spotlights, vehicle pull-overs, and unexpected interrogations. The Border Patrol has pulled O'odham tribal members out of cars, pepper-sprayed them, and beaten them with batons. As local resident Joseph Flores told a Tucson television station, "It feels like we're being watched all the time." Another man commented, "I feel like I have no civil rights." On the reservation, people speak not only about this new world of intense surveillance, but also about its raw impact on the Tohono O'odham people: violence and subjugation. Although the tribal legislative council has collaborated extensively with Border Patrol operations, Priscilla Lewis seemed to sum up the sentiments of many O'odham at an open hearing in 2011: "Too much harassment, following the wrong people, always stopping us, including and especially those who look like Mexicans when driving or walking in the desert... They have too much domination over us." At her house, Ofelia Rivas tells me a story. One day, she was driving with Tohono O'odham elders towards the U.S.-Mexican border when a low-flying Blackhawk helicopter seemingly picked them up and began following them. Hanging out of the open helicopter doors were CBP gunmen, she said. When they crossed the border into Mexico, the helicopter tracked them through a forest of beautiful saguaro cacti while they headed for a ceremonial site, 25 miles south of the border. They were, of course, crossing what was a non-border to the O'odham, doing something they had done for thousands of years. Hearing, even feeling the vibration of the propellers, one of the elders said, "I guess we are going to die." They laughed, Rivas added,

as there was nothing else to do. They laughed real hard. Then, a mile or so into Mexico, the helicopter turned back. Americans may increasingly wonder whether NSA agents are scouring their meta-data, reading their personal emails, and the like. In the borderlands no imagination is necessary. The surveillance apparatus is in your face. The high-powered cameras are pointed at you; the drones are above you; you're stopped regularly at checkpoints and interrogated. Too bad if you're late for school, a meeting, or an appointment. And even worse, if your skin complexion, or the way you're dressed, or anything about you sets off alarm bells, or there's something that doesn't smell quite right to the CBP's dogs -- and such dogs are a commonplace in the region -- being a little late will be the least of your problems. As Rivas told me, a typical exchange on the reservation might involve an agent at a checkpoint asking an O'odham woman whether, as she claimed, she was really going to the grocery store -- and then demanding that she show him her grocery list. People on the reservation now often refer to what is happening as an armed "occupation." Mike Wilson, an O'odham member who has tried to put gallon jugs of water along routes Mexican migrants might take through the reservation, speaks of the Border Patrol as an "occupying army." It's hardly surprising. Never before in the Nation's history under Spain, Mexico, or the United States have so many armed agents been present on their land.

We'll isolate X impact scenarios:

One is pseudo-speciation

Border Patrol agents separate the Tohono from their human identity in order to commit atrocities against them.

Miller 14 (*Todd Miller has researched and written about U.S.-Mexican border issues for more than 10 years. He has worked on both sides of the border for BorderLinks in Tucson, Arizona, and Witness for Peace in Oaxaca, Mexico. He now writes on border and immigration issues for* NACL, Todd Miller, 4-22-2014, "Tomgram: Todd Miller, The Creation of a Border Security State," Tomdispatch, http://www.tomdispatch.com/blog/175834/tomgram%3A_todd_miller,_the_creation_of_a_border_security_state/)TB

Between the unbridled enthusiasm of the vendors with their techno-optimistic "solutions" and the reality of border life in the Tohono O'odham Nation -- or for that matter just about anywhere along the 2,000-mile divide -- the chasm couldn't be wider. On the reservation back in 2012, Longoria called in the GPS coordinates of the unknown dead woman, as so many agents have done in the past and will undoubtedly do in the years to come. Headquarters in Tucson contacted the Tohono O'odham tribal police. The agents waited in the baking heat by the motionless body. When the tribal police pulled up, they took her picture, as they have done with other corpses so many times before. They rolled her over and took another picture. Her body was, by now, deep purple on one side. The tribal police explained to Longoria that it was because the blood settles there. They brought out a plastic body bag. "Pseudo-speciation," Longoria told me. That, he said, is how they deal with it. He talked about an interview he'd heard with a Vietnam vet on National Public Radio, who said that to deal with the dead in war, "you have to take a person and change his genus. Give him a whole different category. You couldn't stand looking at these bodies, so you detach yourself. You give them a different name that detracts from their humanness." The tribal police worked with stoic faces. They lifted the body of this woman, whose past life, whose story, whose loved ones were now on another planet, onto a cart attached to an all-terrain vehicle and headed off down a bumpy dirt road with the body bouncing up and down.

This causes domination, slavery, and every form of evil.

It is undeniable that throughout human history dominant and oppressive groups have committed unspeakable wrongs against those viewed as inferior. Once a person (or a people) has been characterized as sub-human, there appears to have been no limit to the cruelty that was or will be visited upon|||them||| him. ***For example,*** *in almost all wars, hatred towards the enemy was inspired to justify the killing and wounding by separating the enemy from the human race, by casting them as unworthy of human status. This same rationalization has supported: genocide, chattel slavery, racial segregation, economic exploitation, caste and class systems, coerced sterilization of social misfits and undesirables, unprincipled medical experimentation, the subjugation of women, and the social Darwinists' theory justifying indifference to the poverty and misery of others.*

Two is physical violence

For over 10 years, Border Patrol agents have regularly committed acts of physical violence against Tohono people with impunity.

Publisher of Censored News, news reporter of Native American news for 32 years, lived on Navajoland for 18 years.

SAN MIGUEL, TOHONO O'ODHAM NATION — Mike Wilson, Tohono O'odham, said the US Border Patrol shot two Tohono O'odham at the border, one in the face. The Border Patrol claims O'odham side-swiped its vehicle in San Miguel, "The Gate," on Tohono O'odham land at the US Mexico border. However, Wilson points out in the video below that the Tohono O'odham government, Tohono O'odham police, and US Border Patrol can not be trusted. Wilson said that neither the Tohono O'odham government nor police have taken steps to ensure the safety of O'odham when faced with the US Border Patrol. He said these human rights violations by the US Border Patrol inflicted on O'odham have been going on for more than 10 years and the Tohono O'odham Nation has done nothing to halt this. Further, Wilson expresses his concern over the Tohono O'odham Nation government's efforts to disable the new district of Hia-Ced on the western portion of the Tohono O'odham Nation near Ajo, Arizona. He said even though the Tohono O'odham Nation initially approved of the new district, it is now doing everything in its power to ensure that the new district fails. Wilson has put out water for years for migrants, over the objections of the Tohono O'odham government, and his life-saving water containers were vandalized. Wilson's water stations have been in the area of the Tohono O'odham Nation with one of the highest rates of death. Wilson has also aided humanitarian groups searching for the bodies of missing migrants on the Tohono O'odham Nation. Meanwhile, the Tohono O'odham Nation has been able to control and silence much of the mainstream media. The Tohono O'odham police have threatened and stalked O'odham human rights activists to silence them. Now, the US Homeland Security has given the US southern border contract to an Israeli company, Elbit Systems, which is also responsible for Apartheid security surrounding Palestine. Elbit Systems now has the contract to construct US spy towers on Tohono O'odham land. The Tohono O'odham Legislative Council approved the construction of the 15th spy tower on sovereign O'odham land, according to the May 7, 2013 resolution, despite O'odham protests over the militarization of their lands.

Contention 2 is the Border

The unfettered right to move freely across the US-Mexico border is a critical Tohono cultural practice.

Singleton 9(Sara, January 2009, PHD in political science, and associate professor at Western Washington U, Not our borders: Indigenous people and the struggle to maintain shared lives and cultures in post-9/11 North America, Border Policy Research Institute, http://www.wwu.edu/bpri/files/2009_Jan_WP_No_4.pdf, Accessed 7/13/15) CH

In 1848, the Treaty of Guadalupe Hidalgo established the boundary line between the U.S. and Mexico at the Gila River, which meant that the territories of the people known as the Tohono O'odham became part of Mexico. Five years later, the Gadsden Purchase established the southern boundary of the United States at its present location, and in so doing, bisected the territory of the Tohono O'odham. Today, the reservation is comprised of 2.8 million acres (about the size of Connecticut), abutting 75 miles of the Mexican border, and reaches across the border into northern Sonora, Mexico. The Tohono O'odham Nation has about 27,000 members, more than a thousand of whom live across the border in Mexico. About half of the 3 Between Texas and California, there are eight tribes with communities on both sides of the border: Kumeyaay, Cocopah, Tohono O'odham, Yaqui, Gila River Pima, Yavapai, Ysleta del Sur (Tira) and Kickapoo. Not our borders: Indigenous people and the struggle to maintain shared lives and cultures in post- 9/11 North America remaining tribal members live on the reservation. For the Tohono O'odham, the Yaqui and other native people of the region, the freedom to travel the many paths criss-crossing the border has always been essential—to gather medicinal plants, to collect a type of clay used at childbirth, or to practice the annual round of ceremonies that sustain the traditional religion and culture. While at the time of treaties the Tohono O'odham were not granted dual citizenship nor given explicit permission to move freely across the border, cross-border travel for work, for socializing and for participation in religious ceremonies was an established and accepted practice for more than a century. In the mid-1980s that began to change, and by the mid-1990s, it began to change dramatically. Today, parts of the formerly quiet, isolated reservation have been transformed into an area bristling with weapons, new roads, spotlights and military surveillance vehicles. Beginning in the 1990s, a series of strategic decisions were made by federal agencies to clamp down on illegal entry at popular border crossing points— beginning in San Diego, California, with "Operation Gatekeeper" (1994), later spreading eastward with "Operation Safeguard" (1995) in central Arizona, and then "Operation Rio Grande" in the southernmost tip of Texas in 1998. Various reasons have been suggested for these successive waves of intense border security—to displace drug and human-trafficking from densely populated areas to less visible locations and to change behavior of would be crossers by re-channeling activity to areas with highly inhospitable conditions. The resulting "funnel effect" relocated vast amounts of illegal border-crossing activity to the Tohono O'odham nation where summer temperatures have been known to reach 130 degrees, water is scarce and the terrain difficult. The costs to the Tohono O'odham have been significant.

Two internal links to the impact:

First, the CBP Restricting border access is directly hurting culture.

Austin 91(Megan, Fall 1991, A CULTURE DIVIDED BY THE UNITED STATES-MEXICO BORDER: THE TOHONO O'ODHAM CLAIM FOR BORDER CROSSING RIGHTS, Arizona Journal of International and Comparative Law [Vol. 8, No. 2], Accessed 7/14/15) CH

Although much of the O'odham traditional lands have been taken away, the Tohono O'odham people still have firm spiritual and familial roots in these lands. The border constructs an artificial barrier to the freedom of the Tohono O'odham people to traverse their lands, impairing their ability to collect foods and materials

needed to sustain their culture and to visit family members and traditional sacred sites. Specifically, immigration laws prevent many O'odham people from entering the United States from Mexico. Pursuant to these laws, United States immigrations officers can exclude immigrants and non-immigrants for not possessing certain types of documentation such as passports and border identification cards. Immigrations officers can deport "aliens" who do not carry those forms of identification. 18 Using these laws, the United States can detain and deport the Tohono O'odham people who are simply travelling through their own lands, practicing migratory traditions essential to their religion, economy and culture. Customs regulations have a similar effect. United States Customs officials may prevent the Tohono O'odham people from bringing from one part of their land to another raw materials and goods essential for their spirituality, economy and traditional culture. 2

Second, The way the border patrol confirms identity at the border projects western customs and beliefs onto the Tohono people, ignoring their culture.

Vanderpool, 3 (Tim Vanderpool, Special Contributer to the Christian Science Monitor, writer for Tuscon Weekly,4-30-2003, "A tribe's tale of three identities," Christian Science Monitor, http://www.csmonitor.com/2003/0430/p02s02-usgn.html)

Born in Mexico, Antone is among 8,400 tribal members who grew up in remote, rustic villages along this international frontier without birth certificates or other documents. After serving with the US Marines and attending college, she returned to the reservation north of the border. Now she works as a counselor here in Sells, a dusty desert town that's home to the tribal government. But she still doesn't have US citizenship. Antone lives in a world that includes three nationalities: Mexican, American, and Tohono O'odham. "It gets confusing" she says. "But as O'odham, we're all one people, and we have one land." Now, freshmen Rep. Raul Grijalva (D) of Arizona wants to turn that concept into law. In a controversial move, he has introduced legislation that would grant US citizenship to all enrolled members of the tribe - including those living in Mexico. Supporters see the measure as a way to correct an "oversight" that was made more than 150 years ago. But critics see it as giving the O'odham a special privilege - and setting a dangerous precedent for immigration laws. The dilemma dates back to 1854, when the O'odham's ancestral homeland was halved by the Gadsden Purchase. Today, some 1,000 tribal members remain scattered among small villages in northern Mexico, while in the United States their reservation spans 4,500 square miles, including 60 miles of the US-Mexico border. No ID, no birth certificates Henry Ramon, vice chairman of the 25,000-member Tohono O'odham Nation, hopes Representative Grijalva's bill will correct a lingering injustice. "With our way of life here on the reservation, we don't always have documents," says Mr. Ramon. "We were born in our homes, and don't have [birth certificates]." Recent illegal immigration and security crackdowns on the border have increased the need for such documents: Not long ago, a group of O'odham traveling north from their Mexican homes for medical help on the reservation - services accorded them as registered tribal members - were summarily stopped at the border and detained for hours. Federal officials turned some back. Many reservation residents in the United States also lack the papers needed to travel back and forth, or even to prove they were born in this country. "My people have lived here since time immemorial," says Ramon. "But many O'odham right here on the reservation are considered illegal [Undocumented] aliens" because they lack documents. Records of birth and death, he says, "were just passed down by word-of-mouth, from generation to generation."

Self-determination of cultural values is key to maintain cultural integrity.

Wiessner, Law Professor at St Thomas University, 2007 (Siegfried, "Indigenous Sovereignty: A Reassessment in Light of the UN Declaration on the Rights of Indigenous Peoples", Vanderbilt Journal of Transnational Law, Volume 41, http://www.vanderbilt.edu/jotl/manage/wp-content/uploads/Wiessner_final_7.pdf, accessed July 13, 2015, TB)

As law, in essence, ought to serve human beings, any effort to design a better law should be conceived as a response to human needs and aspirations. These vary from culture to culture, and they change over time. As Michael Reisman has explained, humans have a distinct need to create and ascribe meaning and value to immutable experiences of human existence: the trauma of birth, the discovery of the self as separate from others, the formation of gender or sexual identity, procreation, the death of loved ones, one's own death, indeed, the mystery of it all. Each culture . . . records these experiences in ways that provide meaning, guidance and codes of rectitude that serve as compasses for the individual as he or she navigates the vicissitudes oflife.**185** Thus, from the need to make sense of one's individual and cultural experiences arise inner worlds, or each person's inner reality. The international human rights system, as Reisman sees it, is concerned with protecting, for those who wish to maintain them, the integrity of the unique visions of these inner worlds, from appraisal and policing in terms of the cultural values of others. This must be, for these inner world cosmovisions, or introcosms, are the central, vital part of the individuality of each of us. This is, to borrow Holmes' wonderful phrase, "where we live." Respect for the other requires, above all, respect for the other's inner world.**186** The cultures of indigenous peoples have been under attack and are seriously endangered. One final step is the death of their language. As George Steiner wrote in 1975: Today entire families of language survive only in the halting remembrances of aged, individual informants . . . or in the limbo of tape recordings. Almost at every moment in time, notably in the sphere of

American Indian speech, some ancient and rich expression of articulate being is lapsing into irretrievable silence.**187**

Reisman concluded that political and economic self-determination in this context are important, "but it is the integrity of the inner worlds of peoples—their rectitude systems or their sense of spirituality—that is their distinctive humanity. Without an opportunity to determine, sustain, and develop that integrity, their humanity—and ours— is denied."**188** Similarly, the late Vine Deloria, Jr., revered leader of the U.S. indigenous revival, stated that indigenous sovereignty "consist[s] more of a continued cultural integrity than of political powers and to the degree that a nation loses its sense of cultural identity, to that degree it suffers a loss of sovereignty."**189** "Sovereignty," explains another great Native American leader, Kirke Kickingbird, "cannot be separated from people or their culture."**190** In this vein, Taiaiake Alfred appeals for a process of "de-thinking" sovereignty. He states: Sovereignty . . . is a social creation. It is not an objective or natural phenomenon, but the result of choices made by men and women, indicative of a mindset located in, rather than a natural force creative of, a social and political order. The reification of sovereignty in politics today is the result of a triumph of a particular set of ideas over others—no more natural to the world than any other man-made object.

The Border Patrols denying the Tohono of their culture leads to social death and genocide.

Short 10(Damien, PHD and director of human rights at London University, November 2010, THE INTERNATIONAL JOURNAL OF HUMAN RIGHTS, Cultural genocide and indigenous peoples: a sociological approach, accessed 7/14/15) CH

For those indigenous peoples fighting to retain or regain their lands they are fighting for their life as distinct peoples since, for them, their spirituality and cultural vitality is based in and on and with their lands. If we take this point seriously when this relationship is forcibly interrupted and breaks down we can only conclude that genocide is occurring. Indeed, when indigenous peoples, who have a physical, cultural and

spiritual connection to their land, are forcibly dispossessed and estranged from their lands they invariably experience 'social death' and thus genocide. Furthermore, when indigenous lands are used by extractive industries the inherent corporate preference for externalising environmental costs can lead to physical, as well as cultural destruction. The tar sands project is a prime example of this.

The degradation of even a single culture outweighs all impacts.

Short 10(Damien, PHD and director of human rights at London University, November 2010, THE INTERNATIONAL JOURNAL OF HUMAN RIGHTS, Cultural genocide and indigenous peoples: a sociological approach, accessed 7/14/15) CH

The second element of Lemkin's prior formulation, vandalism — the destruction of culture — was now a technique of group destruction.42 Lemkin's central ontological assertion here was that culture integrates human societies and consequently is a necessary pre-condition for the realisation of individual material needs. For Lemkin, culture is as vital to group life as individual physical well-being: So-called derived needs, are just as necessary to their existence as the basic physiological needs....These needs find expression in social institutions or, to use an anthropological term, the culture ethos. If the culture of a group is violently undermined, the group itself disintegrates and its members must either become absorbed in other cultures which is a wasteful and painful process or succumb to personal disorganization and, perhaps, physical destruction....(Thus) the destruction of cultural symbols is genocide...(It) 'menaces the existence of the social group which exists by virtue of its common culture'.43 'This quotation gives us clues to Lemkin's conception of genocide. He was more concerned with the loss of culture than the loss of life,'44 as culture is the social fabric of a genus. Indeed, in Lemkin's formulation, culture is the unit of collective memory, whereby the legacies of the dead can be kept alive and each cultural group has its own unique distinctive genius deserving of protection.45 National culture for Lemkin is an essential element of world culture and nations have a life of their own comparable to the life of an individual. On this point Lemkin wrote: The world represents only so much culture and intellectual vigour as are created by its component national groups. The destruction of a nation, therefore, results in the loss of its future contributions to the world. Moreover, such a destruction offends our feelings of morality and justice in much the same way as does the criminal killing of a human being: the crime in the one case as in the other is murder, though on a vastly greater scale.

Contention 3 is Solvency

Easing border crossing restrictions by eliminating Border Patrol surveillance solves culture.

Austin 91(Megan, Fall 1991, A CULTURE DIVIDED BY THE UNITED STATES-MEXICO BORDER: THE TOHONO O'ODHAM CLAIM FOR BORDER CROSSING RIGHTS, Arizona Journal of International and Comparative Law [Vol. 8, No. 2], Accessed 7/14/15) CH

The Tohono O'odham Tribe suffers fundamental human rights violations under current policies governing the international border between the United States and Mexico. The survival of this indigenous culture depends upon its ability to pass through traditional lands freely, to collect raw materials for traditional foods and crafts and to visit religious sites and family members. Current policies and laws of the United States deny the Tohono O'odham these rights. Border crossing legislation will help to eliminate these abuses. However, in order to be effective, the legislation must allow the Tohono O'odham people to participate in decisions regarding regulation of the border. The goal of the Tohono O'odham Tribe is to protect its culture and assure its continued existence. Approaching the Tohono O'odham claim for border crossing rights as a claim for basic human rights places indigenous

groups within the scope of international principles. The new movements of intemational law focus on the unique claims of indigenous groups, which amount not to secession, but to a level of autonomy which permits the survival of their cultures. Guided by these fundamental international principles, the United States and neighboring nations must recognize the right of the Tohono O'odham to keep their culture alive.

Without absolute side constraints against violating human dignity such as the affirmative, utilitarianism becomes a justification for slavery, torture, and murder.

Clifford, 11 (**Professor of Philosophy @ Mississippi State University,** Michael, Spring, "MORAL LITERACY", Volume 11, Issue 2, https://webprod1.uvu.edu/ethics/seac/Clifford_Moral_Literacy.pdf, Accessed 7-6-13, TB)

As for fairness of application, here the waters are muddy. On the one hand, utilitarianism prides itself on fairness, since everyone's happiness (i.e. pleasure/pain) must be taken into account when determining what will produce the gr eatest happiness. Fairness is part of the very justification of utilitarianism in that it assumes, correctly I think, that everyone wants to be happy; thus it is incumbent upon any ethics to promote this, as far as is possible. In fact, it was this "democratic" aspect of utilitarianism which prompted James Mill to champion it as a model for political and social reform. On the other hand, one of the most enduring criticisms of utilitarianism , especially the sort advocated by Bentham, is that it may require us to trample upon individual rights if it will increase the pleasure of the majority. An example I like to use in my courses to illustrate this is black slavery in Mississippi. There was a time when Mississippi had more millionaires per capita than any other state in the union. Of course, it achieved th at distinction through the institution of slavery, the evidence of which can still be seen in Rhode Island, where the estates of former cotton barons line the shores of Newport. Now Mississippi is among the poorest state in the nation. Suppose some savvy economic consultant suggested that we could bring prosperity back to the South by reinstating the institution of slavery. The population of African-Americans being only about th irty percent, the majority would certainly have their happiness increased. Of course, we would immediately object that such happiness would be achieved by the most atrocious violation of individual rights. What can the utilitarian say to this? Even Ja mes Mill's son, John Stuart, was very concerned about this troublesome possibility. He advocated a form of utilitarianism in which we are obligated to promote the "higher pleasures" of justice and equality. However, Mill would not allow an appeal to individual rights, because he did not believe that such rights exist. His defense of individual freedoms in On Liberty is not based on the idea that human beings have rights, but because of the good consequences for society that comes from such a recognition. "I regard utility as the ultimate appeal on all ethical questions," says Mill. 14 If this is the case, then a utilitarian, even one as enlightened as Mill, must entertain the possibility that the greatest happiness could only be bought at the expense of individual freedoms. 15 Whether or not you believe in individual rights, whether or not you are convinced by arguments one way or another about the metaphysical grounds of rights, we can all appreciate the idea that any ethics should recognize the fundamental dignity of human|||s||| beings. This is precisely what worries critics of utilitarianism, that it may require us to violate that dignity, for some at least, if doin g so will promote the greatest happiness. But to violate human dignity is to ignore or to misunderstand the very point of ethics. For the deontologist, such as Kant, we have a duty not to violate human dignity, even if it causes us pain, even if the consequences fail to maximize the overall happiness. The inviolate character of human dignity is expressed most practically by the idea that we have certain basic rights (whatever the source of rights are, whether natural or by convention). John Locke defined rights as "prima facie entitlements," which means that anyone who would restrict my rights bears the burden of proving that there are good reasons for doing so. For example, the right to private property is sometimes trumped by the principle of eminent domain, provided that I too sta nd to gain by seizure of my land. My right to free speech is limited by the harm it might cause by, say, shouting "fire!" in a crowded theatre. There are times when we feel

justified in limiting or abrogating certain positive rights for the common good, but even here no social outcome justifies torture, slavery, murder, or any action which violates my fundamental human dignity. Deontological ethics assumes there to be a line that cannot be crossed, regardless of the consequences. Thus, Kant's type of ethics would seem to fair best with respect to the fairness of application criterion beca use it requires, as intrinsic to the Categorical Imperative itself, that we treat all persons, at all times, as ends and not merely as means to an end. This is not due to any good benefits that may stem from doing so; in fact, respecting the dignity of others may actually diminish overall pleasure. But we have a duty to do so, regardless, because reason demands it. It demands it because to do otherwise is irrational given the requirements of the Categorical Imperative, which are (arguably) three:

Off-Case

T – Domestic

1NC

A. Domestic surveillance is surveillance of US persons

Small 8 MATTHEW L. SMALL. United States Air Force Academy 2008 Center for the Study of the Presidency and Congress, Presidential Fellows Program paper "His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power during Times of National Crisis" http://cspc.nonprofitsoapbox.com/storage/documents/Fellows2008/Small.pdf

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to narrow the scope of the term "domestic surveillance." Domestic surveillance is a subset of intelligence gathering. Intelligence, as it is to be understood in this context, is "information that meets the stated or understood needs of policy makers and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, domestic surveillance is a means to an end; the end being intelligence. The intelligence community best understands domestic surveillance as the acquisition of nonpublic information concerning United States persons (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept. This paper's analysis, in terms of President Bush's policies, focuses on electronic surveillance; specifically, wiretapping phone lines and obtaining caller information from phone companies. Section f of the USA Patriot Act of 2001 defines electronic surveillance as:

B. Border Patrol surveillance occurs on non-US Persons

(CBP 15, CBP, US Border Patrol Official Website, "Border Patrol Overview," USCBP, acc. 7/24/15 http://www.cbp.gov/border-security/along-us-borders/overview)

While the Border Patrol has changed dramatically since its inception in 1924, its primary mission remains unchanged: to detect and prevent the illegal entry of aliens into the United States. Together with other law enforcement officers, the Border Patrol helps maintain borders that work - facilitating the flow of legal immigration and goods while preventing the illegal trafficking of people and contraband.

Undocumented persons are not US persons

(Jackson et al 9 Brian A. Jackson, Darcy Noricks, and Benjamin W. Goldsmith, RAND Corporation The Challenge of Domestic Intelligence in a Free Society RAND 2009 BRIAN A. JACKSON, EDITOR
http://www.rand.org/content/dam/rand/pubs/monographs/2009/RAND_MG804.pdf

3 Federal law and executive order define a U.S. person as "a citizen of the United States, an alien lawfully admitted for permanent residence, an unincorporated association with a substantial number of members who are citizens of the U.S. or are aliens lawfully admitted for

permanent residence, or a corporation that is incorporated in the U.S." (NSA, undated). Although this definition would therefore allow information to be gathered on U.S. persons located abroad, our objective was to examine the creation of a domestic intelligence organization that would focus on—and whose activities would center around—individuals and organizations located inside the United States . Though such an agency might receive information about U.S. persons that was collected abroad by other intelligence agencies, it would not collect that information itself.

C. The Aff interpretation is bad for debate – limits are necessary for negative preparation and clash, and their interpretation makes the topic too big. Immigration is a huge area, big enough to be a topic itself, and all the issues are completely different.

D. T is a voter – the opportunity to prepare promotes better debating

Text: The United States Federal Government should cross-deputize the Tohono O'odham Tribal Police Department with Arizona State Police Forces, increase cooperation with United States Border Patrol, border crossing rights to all members of the Tohono O'odham tribe, give exclusive jurisdiction of border crossings to the cross-deputized tribal law officers, increase funding for tribal law enforcement and increased crossing zones.

The Counterplan solves the entirety of the affirmative and net-benefit plus solves disputes, violence, drug and human trafficking, culture, and terrorism

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

The onerous history of relations between tribal, federal, and state governments and the coinciding development and enforcement of laws surrounding tribal entities have yielded the current complex and highly antagonistic environment that exists today. Until greater attention is given to these issues and shifts in governmental policies occur, the negative circumstances faced by the Tohono O'odham and Saint Regis Mohawk Nations, as well as several other American Indian tribes in the United States, will continue to escalate.¶ Currently, limitations on tribal sovereignty serve as one of the most substantial barriers in tribal law enforcement's ability to carry out its duties to protect tribal members and resources. An examination of the results of increased tribal sovereignty in the past forty years provides reason to believe that further increases in sovereignty would improve the [End Page 311]

current conditions faced by these communities. Since the mid-1970s, shifts in federal policy toward increased tribal self-determination have progressively manifested as improvements in tribal judicial, economic, and social systems. These improvements may be attributed to the allocation of responsibilities to tribal providers who are more knowledgeable about tribal needs and more accountable to tribal communities than their federal counterparts. Grant programs like STOP VAIW, which encourages tribally developed strategies to reduce crimes against Indian women, have also shown substantial success, including increasing arrest rates and empowering tribal officials and women.100 Additionally, because the federal government still possesses plenary power over Indian nations, there is significant incentive for tribal nations to support activity that is fair to all Native and non-Native people.101 One specific example of how an increase in tribal sovereignty could address these challenges includes the expansion of tribal law enforcement jurisdictional authority through the continued use of policies such as cross-deputization agreements. Expanding the authority of tribal law enforcement will work to reduce and possibly prevent non-Indian criminal activity on reservations. This type of system is also typically less expensive than other options, such as security contracts in which tribal governments contract with public or private entities to provide additional security on tribal land. In cross-deputization agreements, all participants may undergo training that provides a comprehensive overview of federal, state, and tribal laws. Additionally, these agreements enable tribal, state, and county officials to utilize emergency equipment, such as firearms and vehicles, on and off reservation land.102¶ Furthermore, because the responsibility of protecting our nation's borders falls on the shoulders of the US government and should not fall exclusively on two small Indian nations, it is also important for the federal government to maintain a presence along the border. According to the federal Indian trust responsibility, the United States "has charged itself with moral obligations of the highest responsibility and trust" toward Indian tribes (Seminole Nation v. United States, 1942). This doctrine is also a "legally enforceable fiduciary obligation on the part of the United States to protect tribal treaty rights, lands, assets, and resources, as well as a duty to carry out the mandates of federal law with respect to American Indian and Alaska Native tribes and villages."103¶ Given the federal government's responsibility to protect our nation's [End Page 312] borders and tribal lands and resources, it is crucial that the federal government should maintain a presence along the international borders within tribal land. This presence, however, should be limited to a specified radius where the most violent crimes tend to occur.104 This would serve as a mechanism to reduce the current animosity between the tribal communities and federal agents, enhance the safety of tribal members on the Tohono O'odham and Saint Regis Mohawk reservations, and reduce the impact of trafficking on vital resources.¶ Given that it is extremely important for tribal, local, state, and federal governments to work together to improve the situation along the border, communication and cooperation are vital to the successful achievement of goals. By increasing formal collaborations with tribal members concerning issues related to the border, solutions can be developed that benefit all stakeholders. In this particular situation, increased utilization of tribal knowledge and experience will enhance the effectiveness of law enforcement efforts. Not only do tribal members know the land better than anyone, they also know the individuals involved and methods utilized in carrying out this intricate system of trafficking. Maintaining an environment of respect is crucial for the positive advancement of these interactions and may be achieved by implementing a compulsory training on cultural sensitivity issues for federal and state law enforcement agencies.¶ At the macrolevel, congressional involvement is also fundamental to inducing change. Legislative initiatives may involve increasing funding for education and employment opportunities on reservations, increasing sentences for drug traffickers who utilize Indian land (although this may disproportionately affect Native people), and reallocating enforcement resources to treat the demand for drugs as a public health problem.105 It is also important to develop a fair and easily accessible method for tribal members in the United States, Mexico, and Canada to gain access to identification that is consistently accepted by all border enforcement agencies. One method of achieving this would be to provide US citizenship to all Tohono O'odham and Saint Regis Mohawk members regardless of what country they reside in and provide them with a realistic means for obtaining US passports or identification cards. Furthermore, it is crucial that policymakers eliminate the inequities in resource allocation between tribal, local, and state governments to

increase the effectiveness of the enforcement of borders. [End Page 313]¶ The crisis of drug and human trafficking within the Saint Regis Mohawk and Tohono O'odham Nations is not a matter to be taken lightly. Not only is it a threat to the security and culture of two unique populations, but it also poses a threat to the United States' homeland security. Each year tons of drugs and weapons are transported through these locations and distributed throughout the United States. These sites also represent an easily accessible entry point for terrorist groups. Allowing for the changes referenced above, tribal groups like the Tohono O'odham and Saint Regis Mohawk Nations can begin to build innovative and effective systems that incorporate their traditional beliefs and may even serve as a model for the rest of the nation. Achieving a balance between federal presence on the reservation, increased tribal authority over their land and activities, and equitable distribution of resources is fundamental to resolving unrest along the border.

Pseudo-Speciation

Cooperation solves national security and resolves disputes

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

All members of a society confronted by a terrorist threat have an equal interest in preserving their security. With this common motivation, it is logical to expect that every member of society has some role in ensuring the desired security. A common goal suggests common means, or more specifically, a coordinated effort. The nature of the terrorist threat mandates a proactive response to minimize access to the nation by those seeking to carry out acts of terrorism. Meeting this goal necessitates taking a close look at the past and current relationship between the federal government and Native American tribes. Logically, the best solution is one in which hostilities between these partners is eliminated, not compounded, as both parties share in the hopes of internal security. To that effect, the federal government must recognize the important role that Native American tribes have in protecting international borders, and take appropriate steps to make Native American tribes a full and equal partner in combating this common threat.

Coming together to meet this mutual homeland security goal may, in the end, bring Native Americans and the federal government closer together, mending more longstanding disputes. Native Americans may come to enjoy the type of sovereignty they possessed prior to European discovery, the limiting statements of Chief Justice Marshall, and later actions by the federal government.

Alt cause to pseudo-speciation is lack of Tohono O'odham authority and cross-deputizing with local law enforcement solves

The Tohono O'odham and Saint Regis Mohawk Nations (as well as many other federally recognized tribes) find themselves in a uniquely complex political milieu that is perhaps found nowhere else in the world. Consequently, this environment contributes to each tribal nation's inability to effectively enforce its own laws and regulations.¶ The origins of the current political system stem from the fact that tribal nations preexisted the United States and are therefore inherently sovereign entities.

Tribal sovereignty is defined as self-rule and ensures that any decision made with regard to tribal citizens and property cannot be made without their participation and consent. Today this sovereignty has been greatly eroded through the signing of treaties, acts of Congress, executive orders, and court decisions limiting tribal communities' ability to express their identity and values when defining issues of legality.47 Sovereignty does, however, still exist in a limited capacity and shapes the decisions and actions not only of tribal nations but also of their local, state, and federal counterparts.48¶ The relationship between the federal government and tribal nations [End Page 298] can be broadly described as a "mixture of legal duties, moral obligations, understandings and expectancies that have arisen from the entire course of dealing between the [two nations]." At a very narrow level, the relationship can be defined as that of a trustee (the United States) and a beneficiary. The US Constitution does not explicitly delineate a relationship between the tribal nations and the federal government, but it does grant powers to the US government that have been used to sanction its role as a trustee. Of these powers, the most critical have been identified as the congressional ability to regulate commerce (US Const. art. I, § 8, cl. 3) and the presidential power to make treaties (art. II, § 2, cl. 2) with Indian tribes.49¶ Tribal nations also maintain relationships with the states in which they reside. Because the Constitution allocated plenary powers of Indian affairs to the US legislative branch, states have no authority over tribal governments unless expressly authorized by Congress. As a result, a government-to-government relationship has arisen between states and the tribal nations within their boundaries. Because of this system, tribal governments may draft their own constitutions and possess the authority to regulate activities occurring on their land; tribal governments may enact stricter or more lenient laws than those of the surrounding state(s) in which they reside. Tribes, however, often collaborate with states on issues that mutually impact both entities; one example of this collaboration includes law enforcement.50¶ When examining jurisdictional challenges from the perspective of law enforcement, this political system becomes even more complex. Tribal nations across the United States utilize multiple systems for enforcing law on their land. Some tribal governments rely solely on the BIA to manage law enforcement activities on the reservation through the Office of Justice Services. Following the passage of Public Law 83–280, the federal government ceded law enforcement authority for many tribal nations to certain states (18 usc § 1162). Other tribal nations, like the Tohono O'odham and Saint Regis Mohawk, utilize their sovereignty status to develop and employ their own law enforcement systems. Through Public Law 93-638, or the Self-Determination and Education Assistance Act of 1975, these tribal governments obtain funds from and contract with the BIA to develop their own law enforcement programs.¶ Within the context of the criminal justice system, tribal governments have jurisdiction over Indian-on-Indian and Indian-on-nonmember-Indian-minor [End Page 299] crimes within the limits of the reservation.51 Additionally, the Major Crimes Act, passed in 1885, gives concurrent jurisdiction to the federal government for certain major felonies committed by Indians on tribal land, such as murder, rape, assault, and burglary.52 The tribal government's ability to sentence its members is also limited. Any tribal member jailed for more than a year has the right to invoke a habeas corpus remedy in federal courts.¶ Tribal governments have even less criminal authority over non-Indians.53 Non-Indians on reservation lands suspected of criminal activity may be detained but not arrested. These individuals must be turned over to local or state authorities within a specified time frame. If these authorities do not arrive within the allotted time, tribal officials are forced to release suspects or face a possible suit for false imprisonment. The authority of tribal officers over non-Indians on reservation land has been equated to that of a citizen's arrest power.¶ When tribal authorities leave reservation boundaries, their authority is also limited. They are forced to comply with all traffic regulations and restrictions on vehicle markings. Consequently, tribal officers cannot pursue non-Indians off reservation lands. Also, because many reservations (including the Tohono O'odham Nation) have noncontiguous parcels of land, officers are often forced to utilize nonreservation roads to access other parts of the reservation. In emergency situations, a tribal officer's lack of authority outside of reservation lands may inhibit that officer's ability to respond in a timely manner. In some cases, however, tribal police have been able to develop relationships with surrounding law enforcement officials, enabling them to circumvent these challenges while simultaneously expanding their jurisdictional authority. The Hoopa Valley Tribe of California, for example, entered into a cross-deputization agreement with the Humboldt County Sheriff's Department; this agreement allows tribal officers to enforce state law and local law enforcement officials to enforce tribal law under certain conditions.54¶ The restrictions placed on tribal law enforcement authority hinder the ability of tribal officials on both the Tohono O'odham and Saint Regis Mohawk reservations to effectively reduce drug trafficking and protect international boundaries. In 2010, a police officer of the Saint Regis Mohawk Tribe working in conjunction with the Akwesasne Mohawk Police Service (the tribe's Canadian counterpart) observed an individual [End Page 300] enter and exit an unmarked, unguarded border crossing on the reservation into Canada. After reentering the United States, the individual was followed and eventually stopped by tribal police officers in an area not considered a part of the Saint Regis Mohawk territory. After conducting what was then thought to be a legal search, officers uncovered over one hundred pounds of marijuana in the trunk of the defendant's car. In a district court hearing, however, the officers who stopped the vehicle were found to be outside of their jurisdictional authority. This was due to multiple factors, including the fact that the stop occurred outside of the reservation boundaries. As a result, the case was eventually dismissed due to a suppression of evidence.55¶ As is evident, the complexities of jurisdictional circumstances make tribal law officers' efforts to reduce drug trafficking extremely inhibited. Unfortunately, incidents like the one described above occur frequently. An overall lack of communication and trust, compounded by competition for resources between local, state, and tribal agencies, amplifies the

problem. Until resolutions are developed and positive interactions between these distinct agencies increase, drug traffickers will continue to identify and take advantage of weaknesses in the system.

Solves – Migrant Deaths

Border Patrol can solve – already implementing a laundry list of life-saving measures

(Gurrete '07, GUERETTE, Rob. T. (2007), IMMIGRATION POLICY, BORDER SECURITY, AND MIGRANT DEATHS: AN IMPACT EVALUATION OF LIFE-SAVING EFFORTS UNDER THE BORDER SAFETY INITIATIVE. Criminology & Public Policy, 6: 245–266. doi: 10.1111/j.1745-9133.2007.00433.) //LS

Under this initiative, the Border Patrol has implemented several safety measures along the 2,013 miles of U.S.–Mexico border as part of the ongo- ing BSI strategy. These measures are as follows:¶ • Implementation of public message campaigns and posting signs identifying the dangers of remote terrain crossings.¶ • Search and rescue operations performed by selected and highly trained agents that comprise the BORSTAR teams.¶ • Training of line agents in initial life-saving and rescue techniques.¶ • Creation of a data tracking system that records all rescues and deaths along the U.S. side of the southwest border. The data are¶ intended to inform ongoing life-saving measures.¶ In addition to ongoing operations implemented under BSI, the Border Patrol conducted a repatriation effort in September 2003 in an attempt to reduce migrant deaths. Facing record numbers of deaths that year in the West Desert of Arizona (located in the Border Patrol's Tucson sector), the Lateral Repatriation Program (LRP) returned migrants apprehended in this area to other less hazardous places along the border. Originally the plan was to return the migrants to the interior of Mexico, but the Mexican government did not agree so migrants were returned to the southern por- tion of the Texas–Mexican border. It was believed that if migrants were returned directly across the Arizona border, as is standard practice, the migrants would simply reattempt entry, thereby once again risking their lives during the hottest summer months.4 The LRP lasted 23 days and processed over 6,200 migrants at a cost of $1,352,080.

US Border Patrol can solve migrant deaths – it's try or die

(Gurrete '07, GUERETTE, Rob. T. (2007), IMMIGRATION POLICY, BORDER SECURITY, AND MIGRANT DEATHS: AN IMPACT EVALUATION OF LIFE-SAVING EFFORTS UNDER THE BORDER SAFETY INITIATIVE. Criminology & Public Policy, 6: 245–266. doi: 10.1111/j.1745-9133.2007.00433.) //LS

This finding raises another point. In the past, the Border Patrol has been oppositional to those groups providing humanitarian assistance to migrants in distress. Some have even been prosecuted for federal immigra- tion crimes.17 Yet, it would better serve the Border Patrol to form alli- ances with such groups and work in concert with them rather than criminalizing their actions. Doing so would provide the benefit of acting as 17. In July 2005, two volunteers for No More Deaths were arrested by the U.S. Border Patrol and prosecuted for medically evacuating 3 illegal migrants in critical con- dition from the Arizona desert where temperatures were 105 degrees. The volunteers were said to follow established protocols of the organization by consulting medical pro- fessionals who advised them to evacuate the critically ill men to a

medical facility and a force multiplier for the government's life-saving campaign and would assist in fostering better community acceptance of the Border Patrol, at least among those sympathetic to the illegal migrant. Despite the above constraints, this study does provide evidence that some of the life-saving efforts undertaken by the U.S. Border Patrol have been worthwhile. Continued refinement of life-saving practice may not eliminate all deaths, but it is better than no action at all and the obligation to improve life-saving practice falls with government (Guerette, 2006). Many have claimed that the only way to reduce migrant deaths along the border is through abandonment of current immigration policy and border enforcement. However, until the threat of international terrorism recedes, it is unlikely that any relaxing of border security will take place. Nor is it clear that revamping anti-immigration efforts that began in the 1990s will solve the death problem, considering that deaths frequently occurred prior to this period (Eschbach et al., 1999). Little doubt exists that federal policy makers need to address the multitude of issues that surround illegal immi- gration, but the strong polarity of opinions on these matters is sure to result in incremental changes at best. In the mean time, migrants will con- tinue to die. Given this, continued refinement and application of proactive life-saving measures may be the only immediate hope.¶

Problem is not USFG Border Patrol – rather a lack of authority and staffing from reservation law enforcement that causes them to have to rely on federal authority

If the problem is so widely acknowledged within the community, why is it slow to improve? Revels and Cummings outline a number of reasons, revealing that part of the answer lies in the complicated history between American ~~Indian~~ Native tribes and the U.S. federal government. Like most tribes in the U.S., the Tohono O'odham technically have complete sovereignty over their reservation. As part of this sovereignty, the reservation has its own law enforcement system which is not tied to state-level government and can determine its own punishments for minor crimes. Yet, reservation law enforcement officers are severely restricted compared to their to state and county brethren: They are not allowed to arrest non-~~Indians~~ Natives, they lose all enforcement powers when not on reservation property, and those who are detained must be quickly handed over to U.S. authorities. This makes things particularly difficult for Tohono O'odham officials, since the reservation is made up of several unattached land areas. It also leaves them reliant on federal and state authorities, who have far more access to the funding and technology necessary for capturing and deterring trafficking. Even within the reservation, there is only so much ground tribal law enforcement agencies can cover with limited resources. **Staffing** of officers on reservations **is only 20 to 25 percent of the levels attained in comparable US high-crime-rate areas**.

Extend – Tohono Police Fail Now

Tohono police lack funding - diversion of existing funds causes a complete shift away from the safety of Tohono O'odham people

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

Another major challenge impeding the Tohono O'odham and Saint Regis Mohawk Tribal Police Departments from ably ensuring the safety of their members is the general lack of funding, personnel, access to technology, and a variety of other resources. As a result, tribal officials in both nations are increasingly overwhelmed by border enforcement responsibilities.¶ The BIA , the US Department of Justice, private and public grant programs, and tribes themselves primarily contribute resources to the operation of tribal police departments. On the Saint Regis Mohawk reservation, roughly 75 percent of the tribal police department's 3.4-million-dollar budget in 2010 came directly from private tribal enterprises such as casinos. Of the other 25 percent, approximately $800,000 came from the BIA , while contracts and grants with various other federal agencies made up the remaining few thousand dollars.56¶ Despite increasing cost associated with drug trafficking and border enforcement, a reduction in funding sources from outside the tribe [End Page 301] has historically occurred. The US Department of Justice's spending on Native American criminal justice programs declined approximately 15 percent between 2003 and 2004. Office of Justice Programs for police department spending on reservations is also estimated to be only 80 percent of spending in comparable rural areas.57 Additionally, in April 2012,

the US House and Senate Appropriations Committees approved fiscal year 2013 bills that governed funding levels for assistance grants for state, local, and tribal law enforcement. Although the actions are still in the early stages of the appropriations process, the approved amounts represent substantial reductions in grants used to fund activities by tribal law enforcement agencies.58¶ Tribal police department resources are also increasingly being diverted away from the protection of tribal members and toward ensuring the security of our nation's borders. The Tohono O'odham Tribal Police Department estimates that an average of $3 million is spent annually on immigrant and drug-smuggling incidents. This figure represents more than half of the department's annual budget.59 Although the exact figure was unknown, Police Chief Thomas of the Saint Regis Mohawk Tribe estimates that a significant portion of their funds are also allocated toward border enforcement.60¶ Staffing of officers on reservations is only at about 75–80 percent of the levels in comparable US rural areas and 20–25 percent of the levels attained in comparable US high-crime-rate areas.61 The Tohono O'odham Tribal Police Department currently maintains ninety officers who are responsible for nearly forty-five hundred square miles of land and approximately twenty-eight thousand members.62 On the Tohono O'odham reservation, it can take an officer up to two hours to respond to a call for assistance.63 Any incidents along the border related to drug and human trafficking also divert officer time and resources and prevent "the police department from completing its mission to provide community policing for the Tohono O'odham communities."64 The Saint Regis Mohawk Tribal Police Department currently employs twenty-six law enforcement officials who are responsible for ensuring the safety of approximately twenty-three square miles of land and over nine thousand tribal members.65 Saint Regis Mohawk law enforcement officers also dedicate a significant portion of their time to border security issues. According to Andrew Thomas, the current police chief, three of the five [End Page 302] investigators currently on staff work full time on cases solely related to the trafficking of illegal narcotics.66¶ Irrespective of funding constraints, recruitment of additional law enforcement officials is extremely difficult. Ideally, tribal police officers would be members of the tribe that they serve. These individuals are desired most because they are familiar with and understand the cultures and customs of the people with whom they work daily. However, it can be difficult to find interested candidates who meet the educational criteria and skill level necessary to qualify for these positions. Additionally, many tribal members have a criminal record that can prevent them from becoming officers. Recruitment and retention of personnel outside of the tribe also proves to be a challenge. Both of the reservations (especially the Tohono O'odham) are located in remote regions of the country. Moreover, an overwhelming sense of poverty and a general lack of quality housing deter qualified candidates from seeking employment in these areas.¶ Because so much of tribal law enforcement funds is diverted toward securing the nation's borders, this places enormous constraints on other aspects of the budget. Often, tribal police departments lack the same equipment and technology used by their state and federal counterparts, such as background check databases. Additionally, training of law enforcement officers is frequently overlooked when funds are progressively allocated to border security. Furthermore, areas like education, health care, and the building of other necessary infrastructure that supports violence and injury prevention efforts for tribal members are also increasingly neglected as more and more tribal funds are distributed to law enforcement activities.

1. Drug trafficking from Mexico to the US through the Tohono O'odham nation is high now – native population involved and the aff can't solve

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement

Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

The distribution and use of illegal narcotics has historically been a prevailing concern among the US general public, with local laws related to the issue enacted as early as the 1840s. It was not until the initiation of the "War on Drugs" by President Richard Nixon in 1971, however, that this topic became a central theme in political arenas. Since this era, numerous laws have been enacted in an attempt to combat this problem. In spite of the implementation of more stringent laws and regulations geared toward reducing the pervasiveness of drugs since the 1970s, the distribution and use of illegal narcotics continues to be widespread throughout the United States and, in some cases, has shown significant increases.¶ This escalation is particularly evident on reservations such as those of the Tohono O'odham and Saint Regis Mohawk Nations. According to a report released by the US Department of Justice, both Mexican and Asian drug-trafficking organizations (dtos) frequently exploit reservations along the US-Mexico and US-Canada borders as arrival and/or transit zones for illegal drugs destined for markets throughout the United States.1 Drugs are brought in via a variety of means, and Native American criminal groups are often recruited to retrieve and transport the goods on the US side of the reservations.¶ In 2010, the Tohono O'odham Nation was designated as a part of the Arizona High Intensity Drug Trafficking Area (hidta) by the US Department of Justice. This region encompasses the western and southern [End Page 289] counties of Cochise, La Paz, Maricopa, Mohave, Pima, Pinal, Santa Cruz, and Yuma, including the entire US-Mexico border in Arizona. The area is considered to be a major arrival zone for large quantities of marijuana, methamphetamine, cocaine, and heroin entering the United States from Mexico. In 2009, 42 percent of all marijuana seizures occurring along the US-Mexico border took place in this region, with the Tohono O'odham reservation serving as the primary entry point.2 Another report estimated that 5–10 percent of all marijuana produced in Mexico is transported through this reservation, which accounts for less than 4 percent of the entire US-Mexico border.3¶ Increased border enforcement efforts along many parts of the US-Mexico border that began in the 1990s and intensified after the September 11 terrorist attacks have forced drug and human smugglers to use more remote areas like the Tohono O'odham reservation.4 Five informal border crossings have existed for decades along the Tohono O'odham Nation's seventy-five-mile international border. Officially, only tribal members are permitted to pass through these entry points, and the biggest obstacle to crossing these locations used to be steel cattle guards and barbed-wire fencing. Due to a lack of enforcement and extensive desert terrain along these areas, however, smugglers began using these points to gain easy access into the United States via stolen vehicles. As a result, tribal officers were forced to close some of the entry points.5 Additionally, the border has been enhanced with metal post and Normandy-style barriers (surface mountings constructed with high-strength tubular and structural steel components) in an attempt to stop trucks carrying illegal drugs headed for urban areas.6 Other means of transporting drugs across the border include backpackers, couriers on horseback, and airplanes.7¶ Because of the reservation's proximity to the border, wholesale quantities of drugs are often seized throughout the land of the Tohono O'odham Nation, and these quantities have increased dramatically in the past decade. During fiscal year 2001, the Tohono O'odham Police Department seized 45,000 pounds of illegal narcotics; this number increased to 65,000 pounds in 2002.8 This pattern of escalation has shown no signs of deterioration. In 2008, a total of 201,000 pounds of marijuana alone were seized on the reservation by law enforcement; in 2009, this amount increased further to 319,000 pounds of marijuana.9¶ Even more alarming than the increase in the quantity of drugs seized [End Page 290] is the increase in tribal member involvement with the smuggling process. According to a statement made by Sgt. David Cray, a nineteen-year veteran of the Tohono O'odham Police Department's antidrug unit, the percentage of drug smugglers arrested on the reservation who are tribal members has substantially increased in the last two decades. In the first half of 2009, twenty-nine of the forty-five arrests related to drug smuggling made by tribal officers were of tribal members.10 One of the primary reasons tribal members are recruited to assist with trafficking is because law enforcement officials must have a reasonable suspicion to stop tribal members, whereas nontribal persons driving on the reservation's restricted areas are not held to this standard.¶ The Saint Regis Mohawk Nation of New York is experiencing a similar predicament. According to reports, Asian dtos exploit the reservation and its tribal members by smuggling marijuana, mdma, and cocaine across the Canadian border daily. The National Drug Threat Assessment 2010 estimates that as much as 20 percent of all high-potency marijuana grown in Canada each year is smuggled through the reservation. Each week, multiple tons of illegal narcotics pass through the reservation, an area that accounts for less than 1 percent of the US-Canada border.11 According to Saint Regis Mohawk Tribal Police Chief Andrew Thomas, incidents related to border security occur daily, and a high percentage of these violations relate to illegal narcotics.12¶ Unless significant strides are made in the realm of policy, it is unlikely that the circumstances on the Tohono O'odham or Saint Regis Mohawk reservations will improve. Until

these changes occur, drug trafficking will continue to place a significant financial and public health burden on tribal entities and threaten the security of the United States.

2. Only expansion of current federal presence can solve - removing Border Patrol destroys the only hope the Tohono have to combat drug trafficking

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly, http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

Yet there are reasons to hope. Tribal revenues are up, which may allow for increased investment in education (which could help to combat poverty and reduce the attractiveness of drug trafficking). State, local, and federal officials are aiming to improve coordination with reservation law enforcement, **the Border Patrol has introduced cultural sensitivity training for its officers**, and new counter-trafficking measures grant O'odham officers access to advanced technological tools. Revels and Cummings are optimistic about this upward trajectory, advocating further expansion of the legal capabilities of Tohono O'odham law enforcement, and a continued strong, but perhaps more respectful **federal presence to reduce cross-border trafficking and protect vulnerable O'odham.**

3. Border Patrol loss increases crime – making a bad situation even worse

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

The federal government can grant border tribes complete sovereignty, treating them like foreign states as argued in Cherokee Nation. Such a change would give the border tribes sole authority to patrol international borders. United States Border Patrol would then shift its operations to controlling the borders between the Native American lands and the United States. The federal and state governments would then have mutual responsibility for patrolling and prosecuting illegal activity crossing into the United States from the Native American lands without having to expend resources in monitoring the soft spots along Native American international borders. Decades of federal assistance have created a strong reliance on the federal government in tribal affairs. Because of federal oversight, Native American tribes have never been completely self-sufficient. Abruptly cutting off this federal assistance would likely leave the tribal lands in greater security disarray than at present. Native American tribes currently lack the ability to combat crime in their territory. Therefore, without federal assistance, their crime problems could significantly worsen. Native American violent crime rates far exceed those of any other group.10 7

4. Devastates the Tohono people and turns their culture claims – drug abuse, sexual violence, killings by rival drug cartels from smugglers and affiliates

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly, http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

The increase in drug trafficking has spilled over into almost every other aspect of reservation life. Where other racioethnic groups have seen a decrease in violent crime over the past several decades, American Indian communities have suffered from rising incidences of violence over the past 30 years. According to Revels and Cummings, "tribal law enforcement officials across the [United States] consistently report that most violent, personal, and property crimes on reservations relate to drug trafficking, drug abuse, and gang activity," which "often lead to other indirect consequences such as **accidental death, injuries, suicide, domestic violence, and sexual abuse."** The increasingly militarized nature of border reservations like that of the Tohono O'odham has fundamentally changed life in those communities: They are no longer peaceful or safe places to live, and not a single resident is unaffected by the realities and spillover effects of the drug trade. Homes are regularly broken into by smugglers and their affiliates. Residents are routinely searched by law enforcement, their movements restricted on their own land. Those who assist independent drug smugglers who are not attached to major cartels are at risk of being attacked by members of dominant drug cartels who want to eliminate competition and retain their near monopoly on the business. "The psychological burden this type of environment places upon individuals," write Revels and Cummings, "coupled with the constant sense of fear, is immeasurable."

Extend – Tonoho Death

Involvement in drug trafficking activities results in violent outbreaks in the Tohono O'odham nation – plan causes net-harm

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

Injury can be defined as damage or harm to the body resulting in impairment or destruction of health and may be unintentional or intentional (violence) in nature.13 In the United States, the leading cause of death among persons age one to forty-four is injury.14 Despite evidence depicting injury and violence as predictable and largely preventable, the topic is often neglected as a public health concern in the United States and across the globe.15 [End Page 291]¶ Not surprisingly, American Indians are also heavily impacted by this issue. Reservations throughout the United States are plagued by a "public safety crisis," experiencing staggering rates of homicide, juvenile crime, gang activity, child abuse, and substance abuse.16 Compared to other racial/ethnic groups, American Indians experience higher rates of violent crime.17 For example, between 1992 and 2002, American Indians experienced approximately 100 violent crimes for every 1,000 persons age twelve and over, compared to 41 per 1,000 persons among whites and 50 per 1,000 persons among blacks.¶ Although the trend for the overall US population has shown a general decrease in violent crime rates between 1981 (758.2 per 100,000) and 2010 (403.6 per 100,000), some tribes have seen increases.18 Between 1997 and 2000, the number of charges filed against American Indians for violent crimes increased by 27 percent. It is also noteworthy that in 2000, 75 percent of the investigations by the US Attorney's Office involved violent crimes in Indian Country.19 Furthermore, these figures are most likely underestimated. The Executive Committee on

Indian Country Law Enforcement Improvements acknowledged concerns that "available statistics [related to violent crime] understate the magnitude of the problem in many areas of Indian Country."20¶ In Arizona, the rates of violence and injury for American Indians surpass those of other racial/ethnic groups. According to the Arizona Injury Prevention Plan, American Indians maintained the highest mortality rates as a result of injuries in 2004 and the highest age-adjusted suicide rate (17 per 100,000). American Indians also experience the second highest age-adjusted homicide rate relative to other racial/ethnic groups.21 The rate of deaths attributable to a violently sustained injury is also higher for American Indians (33.08 per 100,000) than for all other races (9.65 per 100,000 among Asian/Pacific Islanders to 24.16 per 100,000 for whites) in Arizona (table 1). In fact, of the top five leading causes of death for American Indians in Arizona, three are contributable to various forms of homicide (table 2).22 Lastly, research has shown that American Indian/Alaska Native women are 34 percent more likely to report being raped than any other ethnic and racial group.23 [End Page 292]¶ Deaths per 100,000 resulting from an injury sustained due to violence in Arizona (1999–2007) Source: Statistics in this table were collected from the Center for Disease Control's "Web-Based Injury Statistics Query and Reporting System (wisqars)."¶ Click for larger view¶ Table 1. ¶ Deaths per 100,000 resulting from an injury sustained due to violence in Arizona (1999–2007)¶ Source: Statistics in this table were collected from the Center for Disease Control's "Web-Based Injury Statistics Query and Reporting System (wisqars)."¶ Top five violent causes of death for all ages by race in Arizona (1999–2007) Source: Statistics in this table were collected from the Center for Disease Control's "Web-Based Injury Statistics Query and Reporting System (wisqars)."¶ Click for larger view¶ Table 2. ¶ Top five violent causes of death for all ages by race in Arizona (1999–2007)¶ Source: Statistics in this table were collected from the Center for Disease Control's "Web-Based Injury Statistics Query and Reporting System (wisqars)."¶ Although statistics are not available, it is highly likely that the Tohono O'odham Nation's proximity to the Mexican border and its involvement in drug trafficking contribute to the high rates of violent deaths and injuries sustained by Native Americans in Arizona. According to the Indian Country Drug Threat Assessment, tribal law enforcement officials across the nation consistently report that most violent, personal (i.e., threats and intimidations), and property crimes on reservations relate to drug trafficking, drug abuse, and gang activity. Moreover, these risky behaviors often lead to other indirect consequences such as accidental deaths, injuries, suicide, domestic violence and sexual abuse. Tribal law enforcement officials have also seen a rise in the use of weapons by gang members and drug traffickers for personal protection and the commission [End Page 293] of crimes. A wide variety of weapons has been seized from drug traffickers, gang members, and tribal members involved in criminal activity on reservations, including handguns, ak-47s , rifles, sawed-off shotguns, impact weapons (bats, beer bottles, handmade clubs, pipes, and razors), and knives.24¶ Also in Arizona, criminal groups called "border bandits" utilize violence to carry out armed assaults on drug smugglers. An increase in this type of activity has been found on the Tohono O'odham reservation. These "rip-off crews" often dress in dark clothing and police-style raid gear to appear to others as law enforcement agents.25 These criminal groups have existed for decades and also frequently target vulnerable men, women, and children crossing the border illegally. In recent years, however, the groups have become more violent because Mexican drug-trafficking organizations use these bajadores to patrol their routes and ensure that competitors do not utilize their corridors.26¶ Along the entire Arizona-Mexico border, violence directed at law enforcement has also been on the rise. Border personnel have experienced vehicular and physical assaults and gunfire. This increase is attributed to heightened counterdrug operations and is an attempt to deter or divert agents from seizing illicit drugs.27 The violence directed at law enforcement also includes incursions by Mexican military personnel in support of drug smugglers.

Narcotics trade is a major source of revenue for terrorists

Thomas **Sanderson**, Center for Strategic and International Studies, **2004**, SAIS Review, vol XXIV, No. 1, Winter-Spring, http://muse.jhu.edu/journals/sais_review/v024/24.1sanderson.pdf p. 52 //rf

The narcotics industry remains the most common and lucrative source of revenue to terrorists groups, leading many to legitimize this criminal activity by emphasizing the financial needs of the organization and the role of narcotics in undermining Western society. As has been well documented, Hezbollah operatives and their supporters are deeply engaged in the businesses of illegal methamphetamine production and distribution. The Drug Enforcement Administration has made a number of arrests through its Operation Mountain Express, which uncovered Hezbollah-operated methamphetamine labs in the rural western United States. The dramatic spike in opium cultivation in Afghanistan over the past two years provides yet more evidence of the terrorism-narcotics nexus.¶ The United Nations' International Drug Control

Programme (UNDCP) and International Narcotics Control Board (INCB) said that after zero opium production in the last year of Taliban rule in 2001, Afghanistan met about 76 per cent of the global demand of heroin and opium by harvesting poppy on 225,000 acres that yielded a record produce of 3,500 metric tons of opium. In 2003, the harvest is expected to yield 5,000 tons of opium.4 Narcotics remains the most common and most lucrative form of organized crime used by terrorists groups such as the Kosovo Liberation Army (KLA), the Islamic Movement of Uzbekistan (IMU), al Qaeda, and Hezbollah.

Drug trafficking is usually connected with narco-terrorist associations

Shuchi **Wadhwa &** Michael **Sheets**, Political Science Professors, Marquette University, **2004,** Divergent Paths to Justice: A Study of the US War on Terrorism and Drug Policies, http://www.marquette.edu/polisci/ITJWeb/JusticeConfPapers/Wadhwa%20Sheets.pdf, p. 7 //rf

Any region, in which illegal drugs are cultivated, transported, distributed, or consumed, is susceptible to narco-terrorism. Throughout the world, insurgent groups, revolutionary groups, and ideological or spiritual groups, who use violence to promote their political mission may use drug proceeds to fund acts of terror in furtherance of their ideology. Leadership, cultural, political, and economic change may affect the ideology or mission of a group. Internal divisions and splinter groups may result, each seeking to pursue their goals via different avenues, be they legitimate political activity, perpetuation of violence, or criminal activity, such as drug trafficking.

Extend – Uniqueness

The Plan causes weak border patrol and an open avenue into the US that spills into US Cities, causing an internal war

(Turbiville '10, Firefights, raids, and assassinations: tactical forms of cartel violence and their underpinnings, Graham H. Turbiville, Jr., Courage Services, Inc., McLean, VA, USA, Department of Defense Consultant, and Associate Fellow, Joint Special Operations University, MacDill Air Force Base, FL, USA, Publisher: Routledge, http://www.tandfonline.com/loi/fswi20, Small Wars & Insurgencies, Published online: 12 Mar 2010) //LS

The firefights, raids, and assassinations that characterize so much of Mexican drug trafficking violence are actions that require a measure of organization, planning, and equipping to be successful. Wartime and contingency force experience is replete with examples of regular military units around the world which have failed to complete tactical actions that Mexican drug paramilitaries sometimes execute with notable effectiveness. Drug paramilitaries clearly owe much of their real and perceived lethality to cadres recruited from among Mexico's special operations forces, regular military, police, and other security personnel. The changes that began in drug paramilitaries at the turn of the twenty-first century accord with the arrival of the first major military recruiting of exceptionally well-trained uniformed soldiers and officers. In the years since, drug paramilitaries have often evidenced the tactical competence, weapons skills, communications, transportation, and surveillance capability, and intelligence gathering and counter-intelligence capability that smaller regular armies may not themselves possess. While acting on behalf of a major world evil, they have evidenced a rough, robust confidence and willingness to engage in daring operations that too often have confounded security forces intended to stop or punish them. As notable as paramilitary capabilities may appear, much of that effectiveness is owed to the 'force multiplier' of endemic corruption. Ubiquitous bribery and coercion of major and minor officials in security and other institutions by drug trafficking organizations opens police road blocks; unlocks prison doors; renders police and security forces blind, deaf, and speechless; reveals military and police plans for pending actions; and purchases not-guilty judgments or dismissals in the Mexican judicial system. It buys lists of informants and facilitates the dissemination of disinformation. Applied brutality and reward also gains a measure of silence and cooperation from citizens. Drug paramilitary employment of informants and the use of squads of street-level observers generate continued information of value. Collectively, this constitutes a penetration of Mexican society that presents a daunting challenge. While the infrastructure and practice of paramilitary violence is established in Mexico in seemingly unprecedented ways, the concern north of the border is its potential transportability. Many law enforcement personnel have compared 1980s' Miami – with its running drug firefights, revenge raids, and bloody assassinations by Colombian cocaine traffickers – to Mexican drug violence. There are enough precursors north of the Rio Grande now to make the potential for something analogous more than empty speculation. Incidents of cross-border

violence; a Mexican narco-trafficking presence in nearly 200 US cities raising local crime rates; limited but increasing corruption among US border law enforcement; and the successful recruitment of US residents to commit capital murder, suggest **cross-border criminality could expand** apace without stronger countermeasures. **In that environment, outbreaks of narco-violence** analogous to 1980s' Miami – **or** the **more widespread firefights, raids and assassinations** of Mexican cities – **seem more than possible.**

Increase of border security on other areas and a decrease in resources on the Tohono border has forced a huge amount of drug trade into the Tohono O'odham Nation

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly, http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

Areas where American ~~Indian~~ Native reservations meet the Mexican and Canadian borders have seen some of the country's highest increases in both drug trafficking and abuse. In a recent article in American Indian Quarterly, Asa Revels and Janet Cummings explore how this situation developed and what it means for members of the the Tohono O'odham Nation, whose Arizona-based reservation abuts the Mexican border for some 75 miles. The Tohono O'odham reservation consists largely of mountains and desert — inhospitable terrain that is difficult to patrol, **much to the delight of drug smugglers**. Though the reservation's size accounts for less than four percent of the total length of U.S.-Mexico border, **between five and 10 percent of all marijuana produced in Mexico is transported through Tohono** O'odham territory, according to Revels & Cummings. The U.S. government has designated the reservation as a "High Intensity Drug Trafficking Area," with the amount of narcotics seized on the territory drastically increasing over the last 15 years. In 2008, roughly 201,000 pounds of marijuana was seized on the res; in 2009, marijuana seizures rose to 319,000 pounds. Why the sudden increase? Perhaps counterintuitively, Cummings and Revels argue that one factor is the increased border security along the U.S.-Mexico border. Prior to the 9/11 attacks, there were several transborder entry points open only to Tohono O'odham people, an accommodation made in recognition of the native Arizonan population's strong familial and social ties with O'odham living just across the border; **after 9/11, these checkpoints saw their security resources retired to high-traffic areas**, and smugglers saw the reservation crossings as opportunities for easier entry into the United States. Though security has since been enhanced at those reservation checkpoints that remain, O'odham who know the land are courted by drug smugglers to help them make it across the border.

Desperate Tohono have no choice but to resort to drug trafficking

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly, http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

High levels of extreme poverty on the reservation — four times higher than the rest of Arizona — drive desperate residents to participate in drug trafficking to make money or spiral into substance abuse to numb the pain. "Smuggling can garner a destitute O'odham a quick $3,000 to $5,000 for hustling drugs just one time," write Revels and Cummings, "and is often the best job opportunity available." It's a paradox. The tribe's resources are limited. They spend money to reduce drug trafficking, but don't have enough to make a substantial improvement. With funds going to direct action along the border, little is left for the creation and improvement of social programs that may

help the average resident. Some residents see drug smuggling as a quick way to help pay the bills, and so participate in the trade even as the tribe spends money to combat it.

Status Quo Solves the Aff – Cultural Sensitivity Training

Extend the cultural sensitivity training from the 1NC - solves border patrol abuses and allows groups to find work together to achieve DHS goals

(Brown '14, Cecelia Wright Brown; Kevin A Peters; Kofi Adofo Nyarko, "Cases on Research and Knowledge Discovery : Homeland Security Centers of Excellence (eBook, 2014), Hershey, PA : Information Science Reference, [2014], http://www.worldcat.org/title/cases-on-research-and-knowledge-discovery-homeland-security-centers-of-excellence/oclc/880631356) //LS

Build Consensus: Achieving effective cooperative relationships requires con-sideration of the different concerns and interests amongst the stakeholders in order to reach a broad consensus about what is in the best interest of the group. Before consensus can be achieved, trust must be achieved so that each stake-holder is comfortable with expressing their beliefs and viewpoints. Building trust is a process and it must be approached with patience and perseverance. They have to develop trust for each other and trust that their government coun-terparts are apt to handle complex, overarching policy issues as well. There needs to be more communication that is focused on sharing information about the differing governing styles of each party as well as their decision making processes and available resources; all of which could vary from tribe to tribe, and state to state as well. **Cultural sensitivity training is going to be a neces-sary investment for the representatives from the two government structures**. As was discussed in the qualitative data, it is clear that a great majority of the conflict is stemming from a lack of familiarity with the cultural differences between the groups. Once they have been able to share, the group can work to find common ground amongst their perspectives so that agreements can be made where consensus exists, compromises can be discussed, and unrelenting disagreements between members can be further explored as a group. In this particular context, all parties must agree that the area of homeland security and emergency management is an area of shared concern and must seek joint ventures to help in the achievement of a unified system of homeland security. The interactions between these governments should be guided by efforts to achieve the mission of the Department of Homeland Security. A method of ensuring that this focus remains at the forefront of the Tribal-U.S. partnerships is to seek out joint funding opportunities such as the Urban Areas Security Initiative (UASI) or Operation Stonegarden (OPSG). This process will in-crease opportunities for collaboration, help to protect the nation in a unified and inclusive manner, and strengthen intergovernmental partnerships within the area of homeland security and emergency management.

Terror DA

1. Terror risk is high- maintaining current surveillance is key

Inserra, 6-8-2015

David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation, 6-8-2015, "69th Islamist Terrorist Plot: Ongoing Spike in Terrorism Should Force Congress to Finally Confront the Terrorist Threat," Heritage Foundation, http://www.heritage.org/research/reports/2015/06/69th-islamist-terrorist-plot-ongoing-spike-in-terrorism-should-force-congress-to-finally-confront-the-terrorist-threat

On June 2 in Boston, Usaamah Abdullah Rahim drew a knife and attacked police officers and FBI agents, who then shot and killed him. Rahim was being watched by Boston's Joint Terrorism Task Force as he had been plotting to behead police officers as part of violent jihad. A conspirator, David Wright or Dawud Sharif Abdul Khaliq, was arrested shortly thereafter for helping Rahim to plan this attack. This plot marks the 69th publicly known Islamist terrorist plot or attack against the U.S. homeland since 9/11, and is part of a recent spike in terrorist activity. The U.S. must redouble its efforts to stop terrorists before they strike, through the use of properly applied intelligence tools. The Plot According to the criminal complaint filed against Wright, Rahim had originally planned to behead an individual outside the state of Massachusetts,[1] which, according to news reports citing anonymous government officials, was Pamela Geller, the organizer of the "draw Mohammed" cartoon contest in Garland, Texas.[2] To this end, Rahim had purchased multiple knives, each over 1 foot long, from Amazon.com. The FBI was listening in on the calls between Rahim and Wright and recorded multiple conversations regarding how these weapons would be used to behead someone. Rahim then changed his plan early on the morning of June 2. He planned to go "on vacation right here in Massachusetts…. I'm just going to, ah, go after them, those boys in blue. Cause, ah, it's the easiest target."[3] Rahim and Wright had used the phrase "going on vacation" repeatedly in their conversations as a euphemism for violent jihad. During this conversation, Rahim told Wright that he planned to attack a police officer on June 2 or June 3. Wright then offered advice on preparing a will and destroying any incriminating evidence. Based on this threat, Boston police officers and FBI agents approached Rahim to question him, which prompted him to pull out one of his knives. After being told to drop his weapon, Rahim responded with "you drop yours" and moved toward the officers, who then shot and killed him. While Rahim's brother, Ibrahim, initially claimed that Rahim was shot in the back, video surveillance was shown to community leaders and civil rights groups, who have confirmed that Rahim was not shot in the back.[4] Terrorism Not Going Away This 69th Islamist plot is also the seventh in this calendar year. Details on how exactly Rahim was radicalized are still forthcoming, but according to anonymous officials, online propaganda from ISIS and other radical Islamist groups are the source.[5] That would make this attack the 58th homegrown terrorist plot and continue the recent trend of ISIS playing an important role in radicalizing individuals in the United States. It is also the sixth plot or attack targeting law enforcement in the U.S., with a recent uptick in plots aimed at police. While the debate over the PATRIOT Act and the USA FREEDOM Act is taking a break, the terrorists are not. The result of the debate has been the reduction of U.S. intelligence and counterterrorism capabilities, meaning that the U.S. has to do even more with less when it comes to connecting the dots on terrorist plots.[6] Other legitimate intelligence tools and capabilities must be leaned on now even more. Protecting the Homeland To keep the U.S. safe, Congress must take a hard look at the U.S. counterterrorism enterprise and determine other measures that are needed to improve it. Congress should: Emphasize community outreach. Federal grant funds should be used to create robust community-outreach capabilities in higher-risk urban areas. These funds must not be used for political pork, or so broadly that they no longer target those communities at greatest risk. Such capabilities are key to building trust within these communities, and if the United States is to thwart lone-wolf terrorist attacks, it must place effective community outreach operations at the tip of the spear. Prioritize local cyber capabilities. Building cyber-investigation capabilities in the higher-risk urban areas must

become a primary focus of Department of Homeland Security grants. With so much terrorism-related activity occurring on the Internet, local law enforcement must have the constitutional ability to monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working on integrating intelligence and law enforcement activities. Full integration will require overcoming inter-agency cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Maintain essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Clear-Eyed Vigilance The recent spike in terrorist plots and attacks should finally awaken policymakers—all Americans, for that matter—to the seriousness of the terrorist threat. Neither fearmongering nor willful blindness serves the United States. Congress must recognize and acknowledge the nature and the scope of the Islamist terrorist threat, and take the appropriate action to confront it.

2. Plan forces border patrol to monitor the entire perimeter of the Tohono O'Odham border, killing already scarce funding and creating an open highway into the US for terrorists

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

Additionally, such a plan would result in increasing the territory under the jurisdiction of the Border Patrol. For example, instead of just worrying about the Tohono O'odham border with Mexico, the Border Patrol would have to monitor the entire perimeter of the tribe's border in Arizona. This increased area would require additional personnel and funds, both of which are scarce.¶ As a final point, such a strategy would create the same disparate treatment noted previously. Border tribes would receive true sovereignty, while landlocked tribes, which do not present the same homeland security problems, would likely maintain the status quo. It is highly unlikely that the federal government would be willing to carve up small sovereign states in its midsection and elsewhere. Undoubtedly, this would lead to considerable litigation and further complicate an already difficult relationship between Native Americans and the federal government. More dangerously, Native Americans may be pushed too far in this relationship and respond with open hostility. ¶ As a goal for society, granting Native Americans greater control over their territories and destinies is an admirable and noble goal. As a means to combat current deficiencies in homeland security, this plan fails. It would likely result in a further stretching of scarce resources and ultimately create more gaps in security.

3. Terrorists will use bioweapons- guarantees extinction

Cooper 13

(Joshua, 1/23/13, University of South Carolina, "Bioterrorism and the Fermi Paradox," http://people.math.sc.edu/cooper/fermi.pdf, 7/15/15, SM)

We may conclude that, when a civilization reaches its space-faring age, it will more or less at the same moment (1) contain many individuals who seek to cause large-scale destruction, and (2) acquire the capacity to tinker

with its own genetic chemistry. This is a perfect recipe for bioterrorism, and, given the many very natural pathways for its development and the overwhelming∂ evidence that precisely this course has been taken by humanity, it is hard to∂ see how bioterrorism does not provide a neat, if profoundly unsettling, solution∂ to Fermi's paradox. One might object that, if omnicidal **individuals** are∂ successful in releasing **highly virulent** and **deadly genetic malware** into the∂ wild, they are still unlikely to succeed in killing everyone. However, even if∂ every such mass death event results only in a high (i.e., not total) kill rate and∂ there is a large gap between each such event (so that individuals can build up∂ the requisite scientific infrastructure again**), extinction would be inevitable**∂ regardless. Some of the engineered bioweapons will be more successful than∂ others; the inter-apocalyptic eras will vary in length; and post-apocalyptic∂ environments may be so **war-torn, disease-stricken, and impoverished of genetic variation that they may culminate in true extinction events even if the initial cataclysm 'only' results in 90% death rates**, since they may cause the∂ effective population size to dip below the so-called "minimum viable population."∂ This author ran a Monte Carlo simulation using as (admittedly very∂ crude and poorly informed, though arguably conservative) estimates the following∂ Earth-like parameters: bioterrorism event mean death rate 50% and∂ standard deviation 25% (beta distribution), initial population 1010, minimum∂ viable population 4000, individual omnicidal act probability 10−7 per annum,∂ and population growth rate 2% per annum. One thousand trials yielded an∂ average post-space-age time until extinction of less than 8000 years. This is∂ essentially instantaneous on a cosmological scale, and varying the parameters∂ by quite a bit does nothing to make the survival period comparable with the∂ age of the universe.

Federal supervision key to avoid corruption – difficult shift causes decrease in homeland security and increased terrorist entry points, enables a terrorist attack

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

Additionally, corruption is rampant within tribal governments, a situation that would only worsen without federal supervision. 108 This would require the expenditure of additional resources designated to the transition of Native American lands from domestic dependent nations to true sovereigns. As resources such as these are always scarce, such a plan would likely divert funds from other areas, perhaps from other homeland security operations.

As a result of the present internal deficiencies in Native American lands, the border areas would likely become a more attractive point of entry for terrorists, who would recognize that the Native American police forces do not have the capacity to properly secure their borders. This presents additional problems because of the extent of United States infrastructure contained in border tribal areas. While tribal sovereignty could be granted, power plants cannot be easily moved into other areas of the United States, nor can these plants be immediately shut down, as significant portions of the nation rely upon them for electricity. Thus, if a terrorist could infiltrate a Native American border, which would likely become an easier task, that terrorist could potentially inflict significant damage on United States infrastructure without ever stepping foot on United States soil. It is unlikely that the federal government would be prepared to completely turn over security for this infrastructure to Native American police forces. Native Americans would be in the same situation they are now: called sovereign, but without complete control of their territory.

Any gap in security on the border allows international terror groups to come into the United States

Wilson 15 [Reid Wilson, 2/26/15, covers national politics for the Washington Post, "Texas officials warn of immigrants with terrorist ties crossing southern border," Washington Post, http://www.washingtonpost.com/blogs/govbeat/wp/2015/02/26/texas-officials-warn-of-immigrants-with-terrorist-ties-crossing-southern-border/ jf]

A top Texas law enforcement agency says **border security organizations have apprehended several members of known Islamist terrorist organizations crossing the southern border** in recent years, and while a surge of officers to the border has slowed the flow of drugs and undocumented immigrants, it's costing the state tens of millions of dollars. In a report to Texas elected officials, the state Department of Public Safety says bo**rder security agencies have arrested several Somali immigrants crossing the southern border who are known members of al-Shabab**, the terrorist group that launched a deadly attack on the Westgate shopping mall in Nairobi, Kenya, and Al-Itihaad al-Islamiya, another Somalia-based group once funded by Osama bin Laden. **Another undocumented immigrant arrested crossing the border was on multiple U.S. terrorism watch lists**, the report says. According to the report, **one member of al-Shabab, apprehended in** June **2014**, told authorities he **had been trained for an April 2014 suicide attack in Mogadishu.** He said he escaped and reported the planned attack to African Union troops, who were able to stop the attack. The FBI believed another undocumented immigrant was an al-Shabab member who helped smuggle several potentially dangerous terrorists into the U.S. Authorities also apprehended immigrants who said they were members of terrorist organizations in Sri Lanka and Bangladesh. The Department of Public Safety said the report, first published by the Houston Chronicle, was not meant for public distribution. "[T]hat report was inappropriately obtained and [the Chronicle was] not authorized to possess or post the law enforcement sensitive document," department press secretary Tom Vinger said in an e-mail. U.S. Customs and Border Protection did not respond to requests for comment. **The department said it had come into contact in recent years with "special interest aliens," who come from countries with known ties to terrorists or where terrorist groups thrive.** Those arrested include Afghans, Iranians, Iraqis, Syrians, Libyans and Pakistanis. In all, immigrants from 35 countries in Asia and the Middle East have been arrested over the past few years in the Rio Grande Valley. The department says there is no known intelligence that specifically links undocumented immigrants to terrorism plots, but the authors warn it's almost certain that foreign terrorist organizations know of the porous border between the U.S. and Mexico. **"It is important to note that an unsecure border is a vulnerability that can be exploited by criminals of all kinds," Vinger said. "And it would be naive to rule out the possibility that any criminal organizations around the world, including terrorists, would not look for opportunities to take advantage of security gaps along our country's international border."**

Coloniality K ("Notion of culture" argument is not done yet, do not read)

The concept of "valuing culture" is inherently Eurocentric—they privilege certain performances of others according to Western artistic standards

Ramos 11, (Juan, Ph. D. Student in Philosophy at UMass Amherst, LATIN AMERICAN DECOLONIAL AESTHETICS: ANTIPOETRY, NUEVA¶CANCIÓN, AND THIRD CINEMA

AS COUNTERCULTURE (1960-1975), Dissertation submitted to the Graduate School of the¶ University of Massachusetts Amherst, 2011)//rf

The very idea of the 'cultured person' would seem to privilege specific types of¶ information, cultural production, and knowledge (as processes of cultivation) that can be derived from select cultural artifacts (the means of cultivation). In this way, **the¶ cultured person participates in an ongoing process of selective evaluation of what¶ constitutes worthy** components of culture. Put differently, only some cultural artifacts¶ can lead to the road of cultivation. This is to say that some artworks will derive the¶ most amount of information, which, in turn, leads to the cultivation of the mind.¶ Simply put, **the goal of the cultured individual is to accrue the most culture through¶ means of education**, whether formal or informal, whether at school or by going to a¶ museum or the opera. In these specific locations, **the highest forms of culture are¶ traditionally studied or housed and thus the cultured individual seeks to attain that¶ which has been identified as valuable or indispensable to become cultured** or to¶ achieve a developed state of mind. As such, for Williams all three spheres (i.e. developed state of mind, the¶ processes of development and the means of such processes) are linked to one another¶ and point toward a relational interest in the investigation of all aspects of cultural¶ production and how it shapes, informs, and determines a specific group's way of life¶ or quotidian cultural practices. Put differently, **Williams' interest in culture is to arrive¶ at a complete or holistic way of looking at culture from a sociological standpoint and¶ how competing meanings of culture** (anthropological/sociological vs. humanistic)¶ **converge and are dependent upon each other.¶ Part of the problem with** Williams' **conceptualization of culture in terms of¶ cultivation** and development is that it retains and echoes the same logic and wording¶ that stratified the world into three tiers, which coincided with perceived economic¶ development and its concomitant relationship to democratic values under Cold War politics.1 **Nonetheless,** in Williams it **is possible to observe traces of not only Marxist¶ understanding of culture, but also of dependency theory and its the distinction among¶ developed and underdeveloped parts of the world with rhetorical geopolitical¶ coordinates** (e.g. center vs. periphery) still prevalent today in postcolonial studies and¶ other theoretical approaches. Despite these objections to Williams' approach, when applied to specific¶ examples of cultural production, his concepts render particularly pressing¶ observations**. If one were to apply his categories of analysis to musical genres, one is¶ able to discern precisely how the means, process, and development of the mind come¶ to have different** implications according to the type of cultural artifact with which one¶ is

dealing. **If we turn our attention to** Giacomo Puccini's **La bohème, given opera's¶ status as a high form of culture and even though the opera deals with popular topics**,¶ this particular opera continues to be deemed as one of the renowned, admired, and¶ most widely staged operatic productions. In terms of Williams' categories, **La bohème¶ would be associated with the means of cultural development. The process of¶ development would be associated with the amount of aesthetic pleasure**, information,¶ and knowledge the viewers can derive from the opera. **Since it is assumed that an¶ artifact of high culture would contain plenty of aesthetic qualities, as well as useful¶ information**, upon being exposed to this opera, **one would add more culture to one's¶ development or cultivation of the mind**. If we compare this example to a different¶ musical genre, for instance, vallenato, the conclusions would be different. **Vallenato,¶ as a means of cultural development, does not have the stature or recognition as opera.** Thus, the implication is that it has little aesthetic value or useful information to offer to listeners. Moreover, **since it lacks aesthetic value and because it is not a recognized¶ means of cultural development, vallenato would not lead to the development or¶ cultivation of the mind**. If further proof were needed today that such distinctions have¶ not lost their currency, among academic departments of music, classical music¶ continues to be most sought after genre, whereas a genre like vallenato is relegated to¶ ethnomusicology.

Coloniality naturalizes a non-ethic of death and generalizes the condition of damnation—ongoing genocide, enslavement, rape, ecological destruction and unending war is produced by and reproduces colonial epistemologies.

Maldonado-Torres 2008 [Nelson. "Against War : Views from the Underside of Modernity"¶ Durham, NC, USA: Duke University Press, 2008. p 215-217¶ http://site.ebrary.com/lib/utexas/Doc?id=10217191&ppg=52]

Dussel, Quijano, and Wynter lead us to the understanding that what happened in the Americas was a transformation and naturalization of the non-ethics of war— which represented a sort of exception to the ethics that regulate normal conduct in Christian countries— into a more stable and long-standing reality of damnation, and that this epistemic and material shift occurred in the colony. Damnation, life in hell, is colonialism: a reality characterized by the naturalization of war by means of the naturalization of slavery, now justified in relation to the very constitution of people and no longer solely or principally to their faith or belief. That human beings become slaves when they are vanquished in a war translates in the Americas into the suspicion that the conquered people, and then non-European peoples in general, are constitutively inferior and that therefore they should assume a position of slavery and serfdom. Later on,

this idea would be solidified with respect to the slavery of African peoples, achieving stability up to the present with the tragic reality of different forms of racism. Through this process, what looked like a "state of exception" in the colonies became the rule in the modern world. However, deviating from Giorgio Agamben's diagnosis, one must say that the colony— long before the concentration camp and the Nazi politics of extermination— served as the testing ground for the limits and possibilities of modernity, thereby revealing its darkest secrets.61 It is race, the coloniality of power, and its concomitant Eurocentrism (and¶ not only national socialisms or expressed forms of fascism) that allow the "state of exception" to continue to define ordinary relations in this, our so-called postmodern world. Race emerges within a permanent state of exception where forms of behavior that are legitimate in war become a natural part of the ordinary way of life. In that world, an otherwise extraordinary affair becomes the norm and living in it requires extraordinary effort.62 **In the racial/ colonial world, the "hell" of war becomes a condition that defines the reality of racialized selves**, which Fanon referred to as the damnés de la terre (condemned of the earth). The damné (condemned) is a subject who exists in a permanent "hell," and as such, this figure serves as the main referent or liminal other that guarantees the continued affirmation of modernity as a paradigm of war. The hell of the condemned is not defined by the alienation of colonized productive forces, but rather signals the dispensability of racialized subjects, that is, the idea that the world would be fundamentally better without them. The racialized subject is ultimately a dispensable source of value, and exploitation is conceived in this context as due torture, and not solely as the extraction of surplus value. Moreover, it is this very same conception that gives rise to the particular erotic dynamics that characterize the relation between the master and its slaves or racialized workers. The condemned, in short, inhabit a context in which the confrontation with death and murder is ordinary. Their "hell" is not simply "other people," as Sartre would have put it— at least at one point— but rather racist perceptions that are responsible for the suspension of ethical behavior toward peoples at the bottom of the color line. **Through racial conceptions that became central to the modern self, modernity and coloniality produced a permanent state of war that racialized and colonized subjects cannot evade or escape**. The modern function of race and the coloniality of power, I am suggesting here, can be understood as a radicalization and naturalization of the non-ethics of war in colonialism.63 This non-ethics included the practices of eliminating and enslaving certain subjects— for example, indigenous and black— as part of the enterprise of colonization. From here one could as well refer to them as the death ethics of war. War, however, is not only about killing or enslaving; it also includes a particular treatment of sexuality and femininity: rape. Coloniality is an order of things that places people of color within the murderous and rapist view of a vigilant ego, and the primary targets of this rape are women. But men of color are also seen through these lenses and feminized, to become fundamentally penetrable subjects for the ego conquiro. Racialization functions through gender and sex, and the ego conquiro is thereby constitutively a phallic ego as well.64 Dussel, who presents this thesis of the phallic character of the ego cogito, also makes links, albeit indirectly, with the reality of war. And thus, in the beginning of modernity, before Descartes discovered . . . a terrifying anthropological dualism in Europe, the Spanish conquistadors arrived in America. The phallic conception of the European-medieval world is now added to the forms of submission of the vanquished Indians. "Males," Bartolomé de las Casas writes, are reduced through "the hardest, most horrible, and harshest serfdom"; but this only occurs with those who have remained alive, because many of them have died; however, "in war typically they only leave alive young men (mozos) and women."65 The indigenous people who survive the massacre or are left alive have to contend with a world that considers them to be dispensable. And since their bodies have been conceived of as inherently inferior or violent, they must be constantly subdued or civilized, which requires renewed acts of conquest and colonization. The survivors continue to live in a world defined by war, and this situation is peculiar in the case of women. As T. Denean Sharpley-Whiting and Renée T. White put it in the preface to their anthology Spoils of War: Women of Color, Cultures, and Revolutions: A sexist and/or racist patriarchal culture and order posts and attempts to maintain, through violent acts of force if necessary, the subjugation and inferiority of women of color. As Joy James notes, "its explicit, general premise constructs a conceptual framework of male [and/or white] as normative in order to enforce a political [racial, economic, cultural, sexual] and intellectual mandate of male [and/or white] as superior." The warfront has always been a "feminized" and "colored" space for women of color. Their experiences and perceptions of war, conflict, resistance,

and struggle emerge from their specific racial-ethnic and gendered locations. "Inter arma silent leges: in time of war the law is silent," Walzer notes. Thus, this volume operates from the premise that war has been and is presently in our midst.66 The links between war, conquest, and the exploitation of women's bodies are hardly accidental. In his study of war and gender, Joshua Goldstein argues that conquest usually proceeds through an extension of the rape and exploitation of women in wartime.67 He argues that to understand conquest, one needs to examine: 1) male sexuality as a cause of aggression; 2) the feminization of enemies as symbolic domination; and 3) dependence on the exploitation of women's labor— including reproduction.68 My argument is, first, that these three elements came together in a powerful way in the idea of race that began to emerge in the conquest and colonization of the Americas. My second point is that through the idea of race, these elements exceed the activity of conquest and come to define what from that point on passes as the idea of a "normal" world. As a result, the phenomenology of a racial context resembles, if it is not fundamentally identical to, the phenomenology of war and conquest. Racism posits its targets as racialized and sexualized subjects that, once vanquished, are said to be inherently servile and whose bodies come to form part of an economy of sexual abuse, exploitation, and control. The coloniality of power cannot be fully understood without reference to the transformation and naturalization of war and conquest in modern times. Hellish existence in the colonial world carries with it both the racial and the gendered aspects of the naturalization of the non-ethics of war. "Killability" and "rapeability" are inscribed into the images of colonial bodies and deeply mark their ordinary existence. Lacking real authority, colonized men are permanently feminized and simultaneously represent a constant threat for whom any amount of authority, any visible trace of the phallus is multiplied in a symbolic hysteria that knows no limits.69 Mythical depiction of the black man's penis is a case in point: the black man is depicted as an aggressive sexual beast who desires to rape women, particularly white women. The black woman, in turn, is seen as always already sexually available to the rapist gaze of the white, and as fundamentally promiscuous. In short, the black woman is seen as a highly erotic being whose primary function is fulfilling sexual desire and reproduction. To be sure, any amount of "penis" in either one represents a threat, but in his most familiar and typical forms the black man represents the act of rape—"raping"—while the black woman is seen as the most legitimate victim of rape—"being raped." In an antiblack world black women appear as subjects who deserve to be raped and to suffer the consequences— in terms of a lack of protection from the legal system, sexual abuse, and lack of financial assistance to sustain themselves and their families— just as black men deserve to be penalized for raping, even without having committed the act. Both "raping" and "being raped" are attached to blackness as if they form part of the essence of black folk, who are seen as a dispensable population. Black bodies are seen as excessively violent and erotic, as well as being the legitimate recipients of excessive violence, erotic and otherwise.70 "Killability" and "rapeability" are part of their essence, understood in a phenomenological way. The "essence" of blackness in a colonial anti-black world is part of a larger context of meaning in which the death ethics of war gradually becomes a constitutive part of an allegedly normal world. In its modern racial and colonial connotations and uses, blackness is the invention and the projection of a social body oriented by the death ethics of war.71 This murderous and raping social body projects the features that define it onto sub-Others in order to be able to legitimate the same behavior that is allegedly descriptive of them. The same ideas that inspire perverted acts in war— particularly slavery, murder, and rape— are legitimized in modernity through the idea of race and gradually come to be seen as more or less normal thanks to the alleged obviousness and non-problematic character of black slavery and anti-black racism. To be sure, those who suffer the consequences of such a system are primarily blacks and indigenous peoples, but it also deeply affects all of those who appear as colored or close to darkness. In short, this system of symbolic representations, the material conditions that in part produce and continue to legitimate it, and the existential dynamics that occur therein (which are also at the same time derivative and constitutive of such a context) are part of a process that naturalizes the non-ethics or death ethics of war. Sub-ontological difference is the result of such naturalization and is legitimized through the idea of race. In such a world, ontology collapses into a Manicheanism, as Fanon suggested.72

The alternative is the definitive rejection of epistemic privilege and total decolonization. The starting point for the decolonial option is the repudiation of death ethics in the name of life. Dewesternization alone or continuing faith in the project of modernity fails to undermine the overrepresentation of man.

Mignolo 09 (Walter, Professor of literature-Duke University, Ph.D. from the Ecole des Hautes Etudes, academic director of Duke in the Andes, an interdisciplinary program in Latin American and Andean Studies in Quito, Ecuador at Pontificia Universidad Católica del Ecuador and the Universidad Politécnica Salesiana, "Epistemic Disobedience,¶ Independent Thought and¶ De-Colonial Freedom" ,Theory, Culture & Society 2009)

ONCE UPON a¶ time scholars assumed that the knowing subject in¶ the disciplines is transparent, disincorporated from the known and¶ untouched by the geo-political configuration of the world in which¶ people are racially ranked and regions are racially configured. From a¶ **detached and neutral point of observation** (that Colombian philosopher¶ Santiago Castro-Gómez (2007) describes as the **hubris of the zero point**), the¶ **knowing subject maps the world and its problems, classifies people and¶ projects into what is good for them**. Today that assumption is no longer¶ tenable, although there are still many believers. At stake is indeed the¶ question of racism and epistemology (Chukwudi Eze, 1997; Mignolo, forthcoming).¶ And once upon a time scholars assumed that if you 'come' from¶ Latin America you have to 'talk about' Latin America; that in such a case¶ you have to be a token of your culture. Such expectation will not arise if the¶ author 'comes' from Germany, France, England or the US. In such cases it¶ is not assumed that you have to be talking about your culture but can¶ function as a theoretically minded person. As we know: the first world has¶ knowledge, the third world has culture; Native Americans have wisdom,¶ Anglo Americans have science. The need for **political and epistemic delinking**¶ here comes to the fore, as well as decolonializing and de-colonial¶ knowledges, necessary steps for imagining and building democratic, just,¶ and non-imperial/colonial societies.¶ Geo-politics of knowledge goes hand in hand with geo-politics of¶ knowing. Who and when, why and where is knowledge generated (rather¶ than produced, like cars or cell phones)? Asking these questions means to¶ shift the attention from the enunciated to the enunciation. And by so doing,¶ turning Descartes's dictum inside out: rather than assuming that thinking¶ comes before being, one assumes instead that it is a racially marked body¶ in a geo-historical marked space that feels the urge or get the call to speak,¶ to articulate, in whatever semiotic system, the urge that makes of living¶ organisms 'human' beings.¶ By setting the scenario in terms of geo- and body-politics I am starting¶ and departing from already familiar notions of 'situated knowledges'. Sure,¶ all knowledges are situated and every knowledge is constructed. But that is¶ just the beginning. The question is: who, when, why is constructing¶ knowledges (Mignolo, 1999, 2005 [1995])? Why eurocentered epistemology¶ carefully hidden (in the social sciences, in the humanities, in the natural¶ sciences and professional schools, in think tanks of the financial sector and¶ the G8 or G20), its own geo-historical and bio-graphical locations Occidentales), that created the conditions for Orientalism; distinguished the¶ South of Europe from its center (Hegel) and, on that long history, remapped¶ the world as first, second and third during the Cold War. **Places of nonthought**¶ (of myth, non-western religions, folklore, underdevelopment involving¶ regions and people) **today have been waking up from the long process¶ of westernization.** The anthropos inhabiting non-European places discovered¶ that s/he had been invented, as anthropos, by a locus of enunciations¶ self-defined as humanitas.¶ Now, there are currently two kinds or directions advanced by the former¶ anthropos who are no longer claiming recognition by or inclusion in, the¶ humanitas, but engaging in epistemic

disobedience and de-linking from the¶ magic of the Western idea of modernity, ideals of humanity and promises of¶ economic growth and financial prosperity (Wall Street dixit). One direction¶ unfolds within the globalization of a type of economy that in both liberal¶ and Marxist vocabulary is defined as 'capitalism.' One of the strongest advocates¶ of this is the Singaporean scholar, intellectual and politician Kishore¶ Mahbubani, to which I will return later. One of his earlier book titles carries¶ the unmistakable and irreverent message: Can Asians Think?: Understanding¶ the Divide between East and West (2001). Following Mahbubani's own¶ terminology, this direction could be identified as de-westernization. Dewesternization¶ means, within a capitalist economy, that the rules of the game¶ and the shots are no longer called by Western players and institutions. The¶ seventh Doha round is a signal example of de-westernizing options.¶ The second direction is being advanced by what I describe as the decolonial¶ option. The de-colonial option is the singular connector of a¶ diversity of de-colonials. The de-colonial path has one thing in common: the¶ colonial wound, the fact that regions and people around the world have been¶ classified as underdeveloped economically and mentally. Racism not only¶ affects people but also regions or, better yet, the conjunction of natural¶ resources needed by humanitas in places inhabited by anthropos. Decolonial¶ options have one aspect in common with de-westernizing arguments:¶ the **definitive rejection of 'being told' from the epistemic privileges¶ of the zero point what 'we' are, what our ranking is in relation to the ideal¶ of humanitas and what we have to do to be recognized as such.** However,¶ de-colonial and de-westernizing options diverge in one crucial and in -¶ disputable point: while the latter do not question the '**civilization of death'**¶ hidden under the rhetoric of modernization and prosperity, of the improvement¶ of modern institutions (e.g. liberal democracy and an economy¶ propelled by the principle of growth and prosperity), **de-colonial options¶ start from the principle that the regeneration of life shall prevail over¶ primacy of the production and reproduction of goods at the cost of life** (life¶ in general and of humanitas and anthropos alike!). I illustrate this direction,¶ below, commenting on Partha Chatterjee's re-orienting 'eurocentered¶ modernity' toward the future in which 'our modernity' (in India, in Central¶ Asia and the Caucasus, in South America, briefly, in all regions of the world¶ upon which eurocentered modernity was either imposed or 'adopted' by local¶ Mignolo – Epistemic Disobedience, Independent Thought and . . . 3¶ actors assimilating to local histories inventing and enacting global designs)¶ becomes the statement of interconnected dispersal in which de-colonial¶ futures are being played out.¶ Last but not least, my argument doesn't claim originality ('originality'¶ is one of the basic expectations of modern control of subjectivity) but aims¶ to make a contribution to growing processes of de-coloniality around the¶ world. My humble claim is that **geo- and body-politics of knowledge has¶ been hidden from the self-serving interests of Western epistemology and that¶ a task of de-colonial thinking is the unveiling of epistemic silences of¶ Western epistemology and affirming the epistemic rights of the racially¶ devalued, and de-colonial options to allow the silences to build arguments**¶ to confront those who take 'originality' as the ultimate criterion for the final¶ judgment.

And we must decolonize debate practice itself—Education based on Western epistemologies continue forms ofcolonial schooling designed to reproduce coloniality-from the "moral project" of educating and civilizing the Indians to teaching of social Darwinism in the Congo. Decolonizing education requires not only an analysis of the knowledge, power, Eurocentrism, colonial history, and political economy inherent in educational activities like debate but also foregrounding the possibility of epistemic resistance.

Revisiting histories of colonial educational policy in schooling helps us contextualize¶ and demonstrate how evidence-based education, tied to high-stakes testing and¶ neoliberalism, reproduces past colonial ideologies with respect to developing colonized¶ labor. Throughout European colonialism, schooling was not only used to colonize¶ the minds to force cultural assimilation or acceptance of colonial rule, but also to¶ produce a reservoir of subservient labor that would harvest and mine commodities for¶ the imperial economy. For instance, in North America, colonial schooling 'introduced¶ the concept of forced labor as part of Indian education, transforming the ostensibly¶ "moral project" of civilizing Indians into a for-profit enterprise' (Grande 2004, 13). In¶ boarding schools, part of the most important feature of the colonialist curriculum 'was¶ the inculcation of the industrial or "Protestant" work ethic' (13). In the Belgian¶ Congo, Darwin's scientific racism was the dominant discourse among Belgian colonizers,¶ and it influenced their colonial educational policy. For the Belgian government¶ and leaders of industry, the Congolese was to learn in school a work ethos that clearly¶ catered to the economic endeavor, and to mold the Congolese playfulness and laziness¶ into a life of 'progress,' order and discipline (Seghers 2004, 465). In Hawaii, colonial¶ schools 'became less a means of religious conversion and more a site for socializing¶ Hawaiian and immigrant children for work on the plantation' (Kaomea 2000, 322). In¶ Africa in general, Urch notes: The demand for skilled native labor by the white settlers and commercial leaders caused¶ the colonial administrators to reevaluate the educational program of the missions.¶ Education solely for proselytization was not considered sufficient to enable the colonies'¶ economy to expand. Government officials saw the need for an educational process that¶ would help to break down tribal solidarity and force the African into a money economy.¶ (1971, 252)¶ In short, **colonial schooling played a significant role in disciplining the minds and¶ bodies of the colonized for imperial profit**.¶ Interestingly, when it came to 'pillars of the curriculum,' what was common¶ among many colonial environments, 'were religion and the legendary "3Rs"¶ [Reading, (W)riting and "Rithmetic"]' (Sjöström 2001, 79). These pillars of the¶ curriculum very much parallel, with a slight change, the curriculum that is tested via¶ PISA and TIMSS which concentrates on reading, math, and science. In the contemporary¶ context, science has replaced the pillar of religion in the curriculum. Also, in the¶ present context, the neoliberal economy has replaced the old imperial economy, **but¶ the objective for schooling still stays the same, which is to produce a labor force for¶ the global economy.** As Lipman points out, these accountability reforms 'certify that¶ students that graduate from' schooling 'will have [the] basic literacies and disciplined¶ dispositions' needed for a global workforce (2003, 340). International organizations¶ such as the OECD and the World Bank, have replaced the old adage 'protestant work¶ ethic' of colonial schooling, with the knowledge and skills to function in the knowledge¶ economy, such as literacy to manipulate information, problem solving, math, and¶ science (Spring 2009). In other words, like colonial schooling, education via neoliberal¶ reform is working towards reproducing a labor force and objectification of the¶ colonized. Ceasire's argument of 'thingification' fits very well with the colonizing of¶ bodies in neoliberal educational reform. Teachers, students, and education in general¶ are all objectified and reduced to commodities to serve the global economy. To this¶ end, Lipman states: Students are reduced to test scores, future slots in the labor market, prison numbers, and¶ possible cannon fodder in military conquests. Teachers are reduced to technicians and¶ supervisors in the education assembly line – 'objects' rather than 'subjects' of history.¶ **This system is fundamentally about the negation of human agency**, despite the good¶ intentions of individuals at all levels. (2004, 179)¶ Global colonialism continues with the evidence-based education movement, as education¶ is increasingly reduced into standardized packages that can be sold in the global¶ marketplace, while at the same time promoting a system of education that is focused¶ on training a skilled workforce that will operate in the global labor market (Lipman¶ 2004; Berry 2008; Spring 2009; Rizvi and Lingard 2010). To this end, Fanon states:¶ I came into the world imbued with the will to find a meaning in things, my spirit filled¶ with the desire to attain to the source of the world, and then I found that I was an object¶ in the midst of other objects. (1967, 109).¶ The desires and agencies of many teachers, students, and educational leaders are being¶ stripped away, while at the same time they are turned into 'an object in the midst of¶ other objects' through the neoliberal logic of evidence-based education. In summary,¶ **the neoliberal agenda, currently dominant in education systems around the world, reproduces¶ colonial educational policies**. Within the evidence-based education movement, the epistemic and material are not separate but are intertwined

in colonial discourse¶ and history. As this section demonstrates, evidence-based education not only colonizes¶ education epistemologically, but also perpetuates materialist power relations and¶ disciplines bodies of the colonized to serve the global economy.¶ Concluding remarks and implications¶ [U]nless educational reform happens concurrently with analysis of the forces of colonialism,¶ it can only serve as a insufficient Band-aid over the incessant wound of imperialism.¶ (Grande 2004, 19)¶ Grande eloquently summarizes the intention behind this article, which is to offer a¶ conceptual map linking events of the colonial past with a present movement tha¶ continues to perpetuate colonial discourses and practices within educational policy.¶ My hope is that the analysis presented in this paper provides an alteration in terms on¶ what is unsaid or left out in educational policy and bolsters a critical analysis of power¶ in educational policy. I argue in this paper that the evidence-based education movement¶ is very much tied to multiple colonial discourses, which can be traced back to a¶ colonial history that has simply been ignored in the literature. In other words, this article¶ challenges us to move beyond the confines of Eurocentrism and historical amnesia¶ to critically examine evidence-based education and to contextualize this movement¶ within colonial discourses and histories. It is my hope that this article demonstrates the usefulness of the anticolonial lens¶ in examining educational policy. This framework foregrounds the intersections¶ between knowledge, power, Eurocentrism, colonial history, and political economy, in¶ educational policy.

The epistemic, cultural, and material perspectives in anticolonial¶ thought are applicable to policy analysis. This is evident in the way that 'educational¶ research,' 'evidence,' 'curriculum,' and 'learning outcomes' are being defined and¶ re-imagined in evidence-based education, as these are ultimately shaped by material¶ relations of power that are colonizing. For instance, common to any colonial¶ discourse is the rationale for purifying administration in the name of efficiency, and a¶ binaristic civilizing narrative is used in this regard. By naming and representing¶ education as a field in chaos, evidence-based education proponents, with good intentions,¶ are justifying actions and measures to make education systems more evidencebased¶ and in turn standardize and rationalize complex educational processes. As this¶ paper demonstrates, many proponents of evidence-based education profess an¶ educational policy with the intention of improving learning for all students (which¶ may be their full intent), **but their discourse continues to perpetuate colonized power¶ relationships**. In other words, they are unknowingly striving to control and 'tame'¶ education through evidence-based education. An anticolonial lens also reminds us how social hierarchies and knowledge¶ systems were used to justify colonial interventions with the objective of reshaping¶ society in order to exploit the labor and material resources of the colonized, and allow¶ for certain power relations to be legitimized. **In the evidence-based education movement,¶ we see the mobilization of colonial discourse with regard to the way 'evidence'¶ and 'learning' is being constructed and used to purify the production of knowledge to¶ meet neoliberal ends of education**. Furthermore, the anticolonial lens reveals the¶ commodification, objectification, and dehumanization of bodies and knowledge¶ systems in colonial processes. This article demonstrates how this 'thingification' occurs in evidence-based education for teachers, students, and educational leaders. An¶ anticolonial lens cannot separate the political economy from the epistemic issues. To¶ this end, this paper demonstrates how **evidence-based education is part of a neoliberal¶ agenda which is also tied to global colonialism and the production of colonized labor**.¶ In short, an anticolonial lens helps to bring forward the social–historical–political¶ processes that stem from colonial relations of power and informs contemporary¶ knowledge production, validation, and dissemination in educational policy. An anticolonial lens also stresses that colonial discourses and material relations of¶ power are not absolute, and that the colonized also have discursive and material¶ agency. To this end, one of the limitations of my analysis is that it overlooks the¶ agency among the colonized, and has presented evidence-based education as a monolithic¶ discourse with homogenizing effects, rather than a partial discourse that is¶ contested and lived differently from its intentions. Historically, and in present¶ contexts, imperialism and colonialism were never monolithic or unidirectional, and¶ the boundaries between colonizers and colonized were not clearly demarcated (see¶ Cooper and Stoler 1997; Young 2001; Bush 2006). Similarly, evidence-based education¶ is not an absolute, unidirectional discourse. From an anticolonial lens, we need to¶ look for those sites of resistance and discrepancies to highlight the limitations/¶ inequities of evidence-based education and **bring those struggles to the foreground**. To¶ this end, I will now discuss some examples of the 'tensions' and resistances to¶ evidence-based education. For instance, in Canada, the British Columbia Teacher's¶ Federation has led a campaign to resist the Foundations Skills Assessment instituted¶ by the provincial government (http://www.bctf.ca/fsa.aspx). In Ontario, African-¶ Canadian parents are frustrated with the Toronto public schooling system failing to¶ respond to the needs of Black youth and are demanding Africentric schools from the¶ Toronto District School Board (Adjei and Agyepong 2009). In the USA, Fine et al.¶ (2007) describe, how schools, communities, parents, and grandparents are

engaged in¶ active resistance to such accountability measures and schooling. Chicago residents of¶ Little Village have launched an organizing campaign for a local high school dedicated¶ to culture, community, and activism, which culminated in a 19-day hunger strike by¶ Latino high school students, educators, community organizers, residents, and even¶ grandmothers. Similarly, in a California community, largely populated by migrant¶ families, the school district, joined by nine other districts and civil rights organizations,¶ sued the state over the improper use of English-language assessments to test¶ English Language Learners and the sanctions they face under NCLB (Fine et al.¶ 2007). Teachers also have the agency to interpret, disseminate, and act on the information¶ based on such accountability policies (Lipman 2002; Ball 2003; Sloan 2007). Some¶ teachers have left the profession as an act of resistance because these accountability¶ trends no longer reflect their critical educational philosophy (McNeil 2000; Lipman¶ 2002; Ball 2003). Other teachers enact resistance by subverting the official test-based¶ curriculum. For instance, as one Chicago school teacher put it:¶ I think that we are having a rough time, that sometimes we may lean a little bit more¶ towards CPS policies and other times we lean a little bit more to 'screw CPS' and focus¶ on critical thinking skills. (Lipman 2002, 392)¶ Some still display ambivalence towards teaching for the test for the purpose of¶ surveillance: I have mixed feelings about it … I think it's how we interpret the results. If we use it to¶ say our school is better than yours, then I don't want to do it. If we use it so that we can¶ help the teachers program better for the kids, then that is more useful as a tool. (Canadian¶ Grade 3 teacher, cited in Childs and Fung 2009, 9)¶ In short, teachers, students, parents, families, and community activists have demonstrated¶ the agency to negotiate and contest these colonial discourses in every day¶ practice. Accountability reforms, tied with evidence-based education, depending on¶ context, have also had multiple effects on schools and curricula, and also have critics¶ from within. Scholars have noted how the colonizing effects of accountability reform¶ on schooling and resistance to these reforms depend on the context and the questions¶ of race, class, language, and localized policies (Lipman 2002, 2003; Earl and Fullan¶ 2003; Maxcy 2006). For instance, in her study on the impact of accountability reform¶ for four Chicago schools, Lipman notes how these 'schools' responses to accountability¶ are closely linked to past and present race and class advantages, the relative political¶ power of their communities, and new forms of racialization' (2003, 338).¶ Moreover, in a significant minority of cases, high-stakes testing has led to curricular¶ content expansion, the integration of knowledge, and more student-centered, cooperative¶ pedagogies, such as in secondary social studies and language arts (Au 2007).¶ Hence, the nature of high-stakes-test-induced curricular control is highly dependent¶ on the structures of the tests themselves (Au 2007). In summary, high-stakes testing¶ does not produce a monolithic effect, but has heterogeneous results depending on¶ questions of social difference and context. Furthermore, proponents of evidence-based¶ education 'are not monolithic and that at least some of them are open to dialog on the¶ issues on which we disagree' (Maxwell 2004, 39). In short, an acknowledgment of the¶ colonial historical legacy of the evidence-based education movement may help us¶ move beyond a discourse of sameness in colonial discourse, and start thinking about¶ the possibilities, interruptions, contestations, and resistances to the colonizing effects¶ of evidence-based education. Recently, there has been growing ethnographic studies¶ that examine such sites of resistance and contradictions at the ground level. These¶ spaces are where future studies and dialog could focus their attention. **In terms of policy and educational practice, an anticolonial lens motivates us to ask¶ a different set of questions and re-imagine educational research, practice, and policy.**¶ For instance, what is being left out in the discussion of evidence-based education¶ movement is the glaring systemic inequities that are privileging some bodies¶ (students, teachers, and administrators) and knowledge systems (language, curricula,¶ and culture) over others (see McNeil 2000; Lipman 2004; Valuenzela 2005; Maxcy¶ 2006), that are tied to the global economy (Stewart-Harawira 2005). Rather than blaming¶ students, teachers, and administrators for progress in public tests, and working¶ from a deficit model, we need to shift our attention towards deploying significant¶ material and intellectual resources to serve diverse needs and minoritized bodies¶ (Lipman 2002, 2003), and challenge global economic systems. Furthermore, instead¶ of looking for the pitfalls of educational practice, we could ask and explore the following¶ questions (see Asa Hilliard cited in Lemons-Smith 2008; Hood and Hopson 2008):¶ How does academic excellence flourish in schools attended mostly by minoritized¶ students? How do teachers who reject the status quo and define excellence as responding¶ to community needs, find ways to promote excellence for all students regardless¶ of their circumstances? 'Student achievement at what cost' [Michael Dantley, personal communication]? What ideological paradigms underlie teacher education?¶ What is the role of teacher preparation programs in perpetuating and promoting these¶ values of equity and social justice?¶ Finally, in terms of educational policy, we may ask: whose cultural assumptions¶ and histories inform such accountability systems, 'evidence,' 'data,' and

'learning¶ outcomes?' 'Whose notions of evidence matter most? And to whom does evidence¶ matter most?' (Hood and Hopson 2008, 418). According to Stanfield (1999) and¶ Gillborn (2005), **educational policy and research continue to impose the standards and¶ products of White supremacy on the racially minoritized**. As Stanfield states:¶ Implicit White supremacy norms and values contribute … to Eurocentric concepts and¶ measurement epistemologies, techniques, and interpretations … Concretely, in the¶ United States and elsewhere in the West, … it has been considered normative to consider¶ Eurocentric notions and experiences as the baseline, as the yardstick to compare and¶ contrast the notions and experiences of people of color. This is … most apparent in¶ designing, implementing, and interpreting standardized tests and survey instruments.¶ (1999, 421)¶ I would argue that we need to 'reappropriate' evidence-based education to include a¶ broader array of evidence, experiences, and cultural knowledges (Luke 2003, 98; see¶ also Stanfield 1999; Valuenzela, Prieto, and Hamilton 2007). Finally, borrowing the¶ words of Asa Hilliard III, we need to ask, 'do we have the will to educate all children'¶ (cited in Lemons-Smith 2008, 908), to respond to the needs, survival, self-determination,¶ and sovereignty of their respective communities and the planet? (see also Dei 2000;¶ Grande 2004). In an era of transnational capital, where '[g]lobalized discourses and agendasetting¶ and policy pressures now emerge from beyond the nation'(Rizvi and Lingard¶ 2010, 14–15), we need to have transnational dialogs (Mohanty 2003) on the impact of¶ evidence-based education and neoliberal reform across borders and social institutions.¶ This is because such transnational alliances and solidarity are needed to contest global¶ forces informed by transnational corporations as well as international organizations¶ such as the World Bank and OECD. What is noteworthy and rarely discussed, are the¶ similarities and differences in the discourses and effects of evidence-based education¶ movement across the three nation-states analyzed in this paper. Future research could¶ speculate and study how these ideas of evidence-based education circulate and move¶ across borders (see Rizvi and Lingard 2010).¶ Finally, as someone who has had the privilege to teach research methodology to¶ graduate students (including teachers, teacher educators, principals, and superintendents),¶ I am alarmed by how many of my students grumble about standardized testing,¶ and some even focus their research on such topics. What is also disconcerting is how¶ many of my students have a hard time imagining research and evidence that go¶ beyond numbers because of the 'numbers game' they must play in their daily working¶ lives. These trends are not a reflection of my students' inabilities to see beyond¶ numbers, but a testament to the hegemony of the structural environment that reminds¶ them of what constitutes valid knowledge every day. Also of great concern is the¶ speed at which educational leaders, students, and teachers are being rushed through¶ standardized processes that leave little time for reflection, authenticity, and healing.¶ Many of my students have shared these accounts in my classroom, with me in person,¶ and in their reflection papers. For instance, one student who is currently a high school¶ teacher commented in a recent email: 'The standards and objectives themselves work to eliminate any third space or anticolonial space. We read, write, process for the sole¶ purpose of testing and not for liberation.'¶ In this regard, I propose that we need to 'slow down' in educational practice and¶ policy. To this end, I am reminded of the words of Malidoma Some, an African Shaman¶ healer, who stated 'while that the indigenous world looks, the industrial world over¶ looks' (emphasis added). Educators, teachers, students, and policy-makers need time,¶ not to be given more information for decision-making or learning, but more importantly¶ to assess what we are overlooking in educating future generations. For instance, we¶ need more time to come together, dialog, heal, build reciprocity, understand difference,¶ and re-imagine educational policy and practice for the benefit of future generations. It¶ is only by slowing down that we will realize that our students, educational researchers,¶ teachers, and administrators are not 'uncultivated soil,' in the words of La Casas, but¶ rather seeds with the power within to germinate on their own if they are provided the¶ freedom, resources, and time. Slowing down is what I believe decolonizing education¶ means in this era of neoliberal policies and transnational capital!

Impact – Turns Culture

Eurocentric conceptions of modernity justify continued economic oppression and epistemological disqualification for indigenous peoples: the banners of science and reason allow the destruction of culture and abdication of responsibility for the West

Orozco-Mendoza 8 (Elva, doctoral student currently concentrating in political theory at UMass, Borderlands Theory: Producing Border Epistemologies with Gloria¶ Anzaldúa, Thesis submitted to the Faculty of¶ Virginia Polytechnic Institute, 4/24/2008)

One of the goals of modernity8 was to change the obscurantism of the world into reason.¶ During this period, the **European civilization expanded** all over the world **due to the fact that they**¶ **managed to carry on the social production of frontiers**; a concept that according to Walter D.¶ Mignolo and Madina V. Tlostanova was described as "[a] line indicating the last point in the¶ relentless march of civilization. On the one side of the frontiers was civilization; on the other;¶ nothing, just barbarism or emptiness" (Mignolo and Tlostanova, 2006: 205).9 **According to this**¶ classification, **civilization was meant to be a synonym of Western Europe while barbarism was to**¶ **be understood as the remainder**, i.e. Africa, Asia, and America. From this context, then, frontiers¶ became the spaces of influence that Europeans accommodated to exercise control over its¶ periphery on the basis of racist values that led to the establishment of opposing categories such¶ as us and them, or, we and others. **With this** classification, **Europe "attempted to appoint itself the**¶ **center of the world and tried to divide up the earth to organize the world's exploitation and to export the 'border form' to the periphery**" (Balibar, 2004: 7). Thus, exporting the border form to¶ the periphery not only implied organizing the world in units called nation-states, but it also¶ meant developing a cultural or spiritual nationalism that required citizens to associate "the¶ **democratic universality of human rights with particular national belonging… leading inevitably**¶ **to systems of exclusion**: the **divide between …populations considered native and those**¶ **considered foreign, heterogeneous, who are racially or culturally stigmatized**" (Balibar, 2004: 8).¶ This **mechanism was crucial to sustain colonization since colonized people were**, obviously,¶ **not considered citizens of the imperial government; thereby they should not have access to rights since they were not considered citizens in the first place.** Castro-Gomez gives us a similar¶ argument that is worth transcribing at length:¶ **Citizenship was not only restricted to men who were married, literate, heterosexual, and proprietors,**¶ **but also, and especially, to men who were white**. In turn, the individuals that fell outside the space of¶ citizenship were not only the homosexuals, prisoners, mental patients and political dissidents¶ Foucault had in mind, but also blacks Indians, mestizos, gypsies, Jews, and now, in terms of¶ globalization, "ethnic minorities," immigrants and Auslandern (foreigners) (Castro-Gomez and¶ Johnson, 2000: 513).¶ To be sure, **Europeans not only denied colonized people a citizen status but they also classified**¶ **native people as inhuman, devilish, or even animals**, as inscribed in the philosophies predicated¶ by Kant (1764), Hegel (1822), **and others who considered that underdevelopment was a**¶ **characteristic proper of non-Europeans** (Natter, 2008). Thus, since colonized people could not be¶ treated as "equals," it was quite acceptable to use their labor and land to benefit the colonizers, a¶ belief that has been extended to the present-day, as Mignolo and Tlostanova explain: [T]**he rhetoric of modernity** (and globalization) of salvation continues to be implemented on the¶ assumption of the inferiority or devilish intentions of the other and, therefore, **continues to justify**¶ **oppression and exploitation as well as the eradication of the difference** (Mignolo and Tlostanova,¶ 2006: 206).¶ **Change**, in the European view, **consisted of turning "savages" into "gentlemen" and of bringing**¶ **them into civilization**. However, **until the moment when that change actually happened**¶ **Europeans did not need to take into account the voice, contributions, and knowledge of the**¶ **colonized.** In that way, **the epistemologies of indigenous** peoples **were shadowed in**¶ **obscurantism, and reason was considered a characteristic exclusively associated with whiteness**,¶ where epistemologies of colored people were denied as such. Accounts of this have been¶ recorded by researchers such as Dwight Conquergood who explains, "[s]ince the enlightenment¶ project of modernity, the first way of knowing has been preeminent. **Marching under the banner**¶ **of science and reason, it has disqualified and repressed other ways of knowing** that are rooted in embodied experience, orality and local contingencies" (Conquergood, 2002: 146). On similar¶ lines, we find Mignolo and Tlostanova (2006), who complain that the epistemologies of the¶ colonized were erased from world history, since they held no value in the eyes of Europeans.¶ **Thus, the following step in colonization consisted of imposing assimilation into European settler**¶ **cultures**; **that is how the Nahuatl and Maya languages were changed into Spanish, the Congolese,**¶ **Kituba, or Lingala into French, or the Dahomeyan into English.** This was also the reason why¶ millions of people were forced to abandon their religion in order to be converted into¶ Christianity. In sum, the culture,

traditions, and religion of colonized people were used against¶ them to justify oppression. For instance, **the art and writing of the Maya civilization was¶ destroyed under the justification that Maya texts were considered pagan.** Similarly, **the religious¶ rites and human sacrifices of the Aztec culture were used as a justification for the destruction and¶ subjugation of the Aztec people**.¶ Although these events are highly problematic in themselves, there exist additional¶ implications that are more disturbing; namely, the fact that the world inherited from modernity¶ an international system that associates certain identities with specific geographical places, thereby implying the problematic assumption that "to say we have an identity is just to say that¶ we have a location in social space, a hermeneutic horizon that is both grounded in a location and¶ an opening or site from which we attempt to know the world" (Saldívar, 2007: 344). Saldívar¶ criticizes this argument, since accepting it will be constitutive of geographical determinism,10¶ which attempts to establish a direct association between the degree of development in a nation,¶ culture, or individual and his geographical location in the globe. **So, for instance, it is believed¶ that the reason why there is poverty in Colombia, Venezuela, or the Caribbean is because these¶ countries are located in the south; a region where nature produces food easier than in the north,¶ thus making people in the south lazier and more reluctant to work**, create, and innovate. Of¶ course, **this** version **does not take any account of colonial history when attempting to explain the¶ reasons why certain nations are economically more developed** than others. In conclusion,¶ **modernity implies that "certain areas of the planet were [are] designated as the location of the¶ barbarians** and of the primitives" (Mignolo and Tlostanova, 2006: 205).

Eurocentric framing ignores the non-Western history and privileges Western knowledge production

Sabaratnam 13 (Meera, Department of Politics and International Studies, University of Cambridge, "Avatars of Eurocentrism in the critique of the liberal peace" http://sdi.sagepub.com/content/44/3/259.full)

Although Eurocentrism has multiple incarnations, overall it can be described as the sensibility that Europe is historically, economically, culturally and politically distinctive in ways that significantly determine the overall character of world politics. As a starting point, we might regard it as a conceptual and philosophical framework that informs the construction of knowledge about the social world – a foundational epistemology of Western distinctiveness. In this sensibility, 'Europe' is a cultural-geographic sphere (Bhambra, 2010: 5), which can be understood as the genealogical foundation of 'the West'. In his piece 'Eurocentrism and Its Avatars', Immanuel Wallerstein (1997) argues that many critical literatures in world history nonetheless reproduce tropes of Eurocentrism in their analyses. In this article I argue similarly, focusing on the critiques of the liberal peace in IR and IPE3. Here I suggest these avatars can be grouped under three broad headings: culturalist, historical and epistemic. Some of Eurocentrism's culturalist avatars, as identified by Wallerstein (1997), are now relatively well recognized by scholars across various disciplines. The most famous is probably Orientalism, which is a framing of the East through negative and/or feminized stereotypes of its culture, political character, social norms and economic agency. This framing casts it as a space of tradition and opportunity to be governed and explored, or alternatively feared, by the rational and enlightened West (Said, [1973] 2003). This is closely allied to the avatar of civilizational thinking that assigns to the West as a whole a package of secular-rational, Judeo-Christian, liberal democratic tolerant social values, in contrast to other civilizations such as the 'Indic' (Wallerstein, 1997: 97–98). However, this culturalist avatar seems to have taken new forms since the apparent decline of public Orientalism. As Balibar (1991) has suggested, there are important functional continuities between old and new frameworks based on 'civilization', 'race' and 'cultural difference' in reproducing an idea of Western distinctiveness. Although now rarely supremacist, this culturalist form of Eurocentrism is generative: it posits the core ontological difference between the West and its others as deriving from their distinctive cultures or civilizations, with major political issues emerging from the question of cultural difference and how to manage this. Eurocentrism is also manifested through historical avatars. The first of these is the assumption that Europe is the principal subject of world history, as discussed by the Subaltern Studies research group, and especially Chakrabarty (2000). This is the tendency of historians (Hobsbawm is offered as the exemplar) to see the emergence of capitalism and industrialization in the West as the real driver of history, and non-Western societies as either 'outside history' or as lagging behind Western historical development. A closely related historical avatar includes the notion of historical progress (Wallerstein, 1997: 96), as elaborated in

much post-Hegelian theory, which understands human history not just as linear but as self-consciously improving the human condition through the trying out of different political ideas. Again, these particular forms are understood as somewhat outmoded in scholarship, although they seem to reappear in new guises. More recent critiques, for example, point to the attribution to the West of historical 'hyper-agency' in terms of world-historical development (Hobson, 2004, 2007, 2012), even if few scholars maintain a strictly Hegelian story of historical progress. For Bhambra (2010), the emphasis is on the assumption of 'endogeneity' in the story of the rise of Europe – the idea that European development was self-generating, driven by war, competition, the Enlightenment and technological advances, and then diffused out to the rest of the world via imperial expansion. This thus reinstates Europe as the implicit subject of world history and historical sociology, and occludes the contemporaneous and necessary involvement of the wider world in this rise (see also Barkawi and Laffey, 2006). Both old and new historical versions of Eurocentrism understand different parts of the world as more and less 'developed', or more and less 'modern', indicating a strong connection between geographic-cultural space and temporal/scalar positioning (see also Hindess, 2007; Hutchings, 2008b). Finally, we can identify Eurocentrism's epistemic avatar, which is the purported atemporal universalism of modern social scientific knowledge (Wallerstein, 1997: 100). In this tendency, social scientific modes of knowledge that emerged in Europe from the 19th century onwards are represented as supremely privileged in their understanding of social phenomena above other modes of knowing, as demonstrated through their powers of abstraction, reasoning and objectivity. This also establishes a hierarchy of knowers with the authority to speak about the world, which tracks their positions in relation to the Western academy.

Colonialism establishes the framework for Eurocentrism—obscures historical identity to justify capitalistic relations of domination

Quijano 2K (Aníbal, professor of the Department of Sociology at Binghamton University, New York, "Coloniality of Power, Eurocentrism, and Latin America")

As the center of global capitalism, Europe not only had control of the world market, but it was also able to impose its colonial dominance over all the regions and populations of the planet, incorporating them into its world-system and its specific model of power. For such regions and populations, this model of power involved a process of historical reidentification; from Europe such regions and populations were attributed new geocultural identities. In that way, after America and Europe were established, Africa, Asia, and eventually Oceania followed suit. In the production of these new identities, the coloniality of the new model of power was, without a doubt, one of the most active determinations. But the forms and levels of political and cultural development, and more specifically intellectual development, played a role of utmost importance in each case. Without these factors, the category "Orient" would not have been elaborated as the only one with sufficient dignity to be the other to the "Occident," although by definition inferior, without some equivalent to "Indians" or "blacks" being coined.10 But this omission itself puts in the open the fact that those other factors also acted within the racist model of universal social classification of the world population. The incorporation of such diverse and heterogeneous cultural histories into a single world dominated by Europe signified a cultural and intellectual intersubjective configuration equivalent to the articulation of all forms of labor control around capital, a configuration that established world capitalism. In effect, all of the experiences, histories, resources, and cultural products ended up in one global cultural order revolving around European or Western hegemony. Europe's hegemony over the new model of global power concentrated all forms of the control of subjectivity, culture, and especially knowledge and the production of knowledge under its hegemony. During that process, the colonizers exercised diverse operations that brought about the configuration of a new universe of intersubjective relations of domination between Europe and the Europeans and the rest of the regions and peoples of the world, to whom new geocultural identities were being attributed in that process. In the first place, they expropriated the cultural discoveries of the colonized peoples most apt for the development of capitalism to the profit of the European center. Second, they repressed as much as possible the colonized forms of knowledge production, the models of the production of meaning, their symbolic universe, the model of expression and of objectification and subjectivity. As is well known, repression in this field was most violent, profound, and long lasting among the Indians of Ibero-America, who were condemned to be an illiterate peasant subculture stripped of their objectified intellectual legacy. Something equivalent happened in Africa. Doubtless, the repression was much less intense in Asia, where an important part of the history of the intellectual written

legacy has been preserved. And it was precisely such epistemic suppression that gave origin to the category "Orient." Third, indifferent ways in each case, they forced the colonized to learn the dominant culture in any way that would be useful to the reproduction of domination, whether in the field of technology and material activity or subjectivity, especially Judeo-Christian religiosity. All of those turbulent processes involved a long period of the colonization of cognitive perspectives, modes of producing and giving meaning, the results of material existence, the imaginary, the universe of intersubjective relations with the world: in short, the culture.11 The success of Western Europe in becoming the center of the modern world-system, according to Wallerstein's suitable formulation, developed within the Europeans a trait common to all colonial dominators and imperialists, ethnocentrism. But in the case of Western Europe, that trait had a peculiar formulation and justification: the racial classification of the world population after the colonization of America. **The association of colonial ethnocentrism and universal racial classification helps to explain why Europeans came to feel** not only superior to all the other peoples of the world, but, in particular, **naturally superior**. This historical instance is expressed through a mental operation of fundamental importance for the entire model of global power, but above all with respect to the intersubjective relations that were hegemonic, and especially for its perspective on knowledge: the Europeans generated a new temporal perspective of history and relocated the colonized population, along with their respective histories and cultures, in the past of a historical trajectory whose culmination was Europe (Mignolo 1995; Blaut 1993; Lander 1997). Notably, however, they were not in the same line of continuity as the Europeans, but in another, naturally different category. The colonized peoples were inferior races and in that manner were the past vis-à-vis the Europeans. That perspective imagined modernity and rationality as exclusively European product s and experiences. From this point of view, intersubjective and cultural relations between Western Europe and the rest of the world were codified in a strong play of new categories: East-West, primitive- civilized, magic/mythic-scientific, irrational-rational, traditional-modern —Europe and not Europe. Even so, the only category with the honor of being recognized as the other of Europe and the West was "Orient"—not the Indians of America and not the blacks of Africa, who were simply "primitive." For underneath that codification of relations between Europeans and non-Europeans, race is, without doubt, the basic category.12 This binary, dualist perspective on knowledge, particular to Eurocentrism, was imposed as globally hegemonic in the same course as the expansion of European colonial dominance over the world.

Impact – Violence

Colonialism promotes structural inequality and oppression towards natives—the ballot is key to endorse participatory politics

Ibarra-Colado 7 (Eduardo, Professor of Management Studies at the Department of Economic Production, Metropolitan Autonomous University, "Organization Studies and Epistemic Coloniality in Latin America: Thinking Otherness from the Margins")

The Economic and Wage Commission reported brutality to native laborers by white managers in the form of severe floggings in South Africa.59There have been discriminatory practices against natives in many instances. For example, natives cannot bear or secure arms in South Africa without¶ a special license, whereas the whites could do so, according to the Defense Act of 1912. In West Africa, inhabitants of the British, French and Portuguese colonies are not allowed to bear arms or to be found with any in their possession. It is a felonious crime over there, but the white man could possess as many pistols or rifles as his pocket will allow. Hertzog followed his policy of Repressionism by passing the historic Color Bar Legislation and the Pass Laws, which make it obligatory for natives to carry identification cards.60 In the French colonies, a special body of rules applicable to natives alone, exist, and it is called the indigenat. In Korea, Japanese colonists employed drastic flogging against Koreans and made the penal code especially severe toward these natives.6' In Nigeria, the British adopted a policy of segregation by not allowing natives to live within a specified radius in the Ikoyi and Apapa reservations where the white officials lived.62In South Africa, the native finds that after receiving an industrial education, his skill is worthless for he is prohibited by law from skilled labor and agriculture.63¶ These problems are yet to be solved. Force will not settle these issues. Sympathetic attitude alone will not alleviate these deplorable conditions. There is only one solution, and it is not a palliative at that, and that is the, realistic interpretation and the practice of the policy of trusteeship. Unless the natives are allowed to participate in the government of their

own lands, on a sound basis of democracy, that is the application of the doctrine of natural, civil, political, social and economic rights and equalities, in the administration of their country, **by a system which will** not only **educate them to use the ballot**, but also make it possible for them to participate in the higher political offices which are now restricted to foreigners, the future forecasts an inter-racial war, which might be worse than Armaggedon."

Alt Solvency – Aesthetics

Decolonial aesthetics utilizes art and ecpression to dismantle modernity, epistemic coloniality, and state multiculturalism

Maldonado-Torres et al 11 (Nelson, Professor Comparative Literature at Rutgers, "THE ARGUMENT (AS MANIFESTO FOR DECOLONIAL AESTHETICS", https://globalstudies.trinity.duke.edu/the-argument-as-manifesto-for-decolonial-aesthetics)OG

Decolonial aesthetics, in particular, and decoloniality in general have joined the liberation of sensing and sensibilities trapped by modernity and its darker side: coloniality. Decoloniality endorses interculturality, (which has been conceptualized by organized communities) and **delinks from multiculturalism** (which has been conceptualized and implemented by the State). Muticulturalism promotes identity politics, while interculturality promotes transnational identities-in-politics. Multiculturalism is managed by the State and some affiliated NGO's, whereas interculturality is enacted by the communities in the process of delinking from the imaginary of the State and of multiculturalism. Interculturality promotes the re-creation of identities that were either denied or acknowledged first but in the end were silenced by the discourse of modernity, postmodernity and now altermodernity. Interculturality is the celebration by border dwellers of being together in and beyond the border. Decolonial transmodern aesthetics is intercultural, inter-epistemic, inter-political, inter-aesthetical and inter-spiritual but always from perspectives of the global south and the former-Eastern Europe.¶ Massive migration from the former Eastern Europe and the global south to former-Western Europe (today European Union) and to the United States have transformed the subjects of coloniality into active agents of decolonial delinking. "We are here because you were there" is the reversal of the rhetoric of modernity; transnational identities-in-politics are a consequence of this reversal, it challenges the self-proclaimed imperial right to name and create (constructed and artificial) identities by means either of silencing or trivialization.¶ The embodied daily life experience in decolonial processes within the matrix of modernity defeats the solitude and the search for order that permeates the fears of postmodern and altermodern industrial societies. Decoloniality and decolonial aesthetics are instrumental in confronting a world overflowed with commodities and 'information' that invade the living space of 'consumers' and confine their creative and imaginative potential.¶ Within different genealogies of re-existence 'artists' have been questioning the role and the name that have been assigned to them. They are aware of the confinement that Euro-centered concepts of arts and aesthetics have imposed on them. They have engaged in transnational identities-in-politics, revamping identities that have been discredited in modern systems of classification and their invention of racial, sexual, national, linguistic, religious and economic hierarchies. They have removed the veil from the hidden histories of colonialism and have rearticulated these narratives in some spaces of modernity such as the white cube and its affiliated branches. They are dwelling in the borders, sensing in the borders, doing in the borders, they have been the propellers of decolonial transmodern thinking and aesthetics. Decolonial transmodernities and aesthetics have been delinking from all talks and beliefs of universalism, new or old, and in doing so have been promoting a pluriversalism that rejects all claims to a truth without quotation marks. In this regard, decolonial transmodernity has endorsed identities-in-politics and challenged identity politics and the self-proclaimed universality of altermodernity.¶ Creative practitioners, activist and thinkers continue to nourish the global flow of decoloniality towards a transmodern and pluriversal world. They confront and traverse the divide of the colonial and imperial difference invented and controlled by modernity, dismantling it, and working towards "living in harmony and in plenitude" in a variety of languages and decolonial histories. The worlds emerging with decolonial and transmodern political societies have art and aesthetics as a fundamental source.

Alt Solvency – Borders

We must engage in a process of delinking ourselves from Eurocentric epistemology through a combination of critical border thinking and challenging the epistemology of the West through denaturalizing the concepts and fields of knowledge grounded in and surrounding the epistemology of coloniality

Panotto 11 , Nicolas Panotto, theologian and currently serves as Group Managing Director for Multidisciplinary Studies on Religion and Public Advocac, "Walter Mignolo: Epistemic disobedience. Rhetoric of modernity, logic of coloniality and decolonial grammar (Buenos Aires 2010), July 27, 2011 [http://postcolonialnetworks.com/2011/07/27/walter-mignolo-epistemic-disobedience-rhetoric-of-modernity-logic-of-coloniality-and-decolonial-grammar/]

This book summarizes the main aspects of the "Research Project on Modernity/ Coloniality" and the central theorical proposals of the famous Argentine decolonization theorist, Walter Mignolo. The main thrust of this work is explained thus: "if knowledge is an instrument of imperial colonization, one of the urgent tasks ahead is the decolonization of knowledge."¶ First, the book attempts to broaden the definition of colonialism. This concept refers to a complex matrix in which various spheres intertwine (economy, authority, nature, gender and sexuality, subjectivity and knowledge) and is based on three main foundations: knowledge (epistemology), understanding or comprehention (hermeneutics) and the ability to feel (aesthesis). On the other hand, there also exists a relationship between colonialism and modern rationality, where the latter is undestood as a construction of a Totality that overrides any difference or possibility of constructing other totalities. Although there is a critique of these notions from postmodern writers (postcolonialism being the wellspring in this field of study), it is circumscribed to European history and the history of European ideas. Thus, this critique is incapable of reaching deep into the colonial paradigm and imagination. This is why a decolonial project is ultimately necessary in order to make possible a programmatic analysis of delinking categories (Aníbal Quijano) of colonial knowledge.¶ The book also takes some of the contributions from the philosopher Erique Dussel as a proposal of decolonization of knowledge, as exemplified by the differentiation he makes between emancipation (as liberal framework that serves to the pretensions of the bourgeoisie) and liberation (as a broader category that seeks ways of leaving the european emancipatory project). But decolonization, for Mignolo, goes further than liberation: it involves both the colonizers and the colonized (using the ideas of Franz Fanon), by including emancipation/liberation on a same level within its framework. But because emancipation is a modern project linked to European liberal bourgeoisie, it is better to think in terms of liberation/decolonization, which includes in itself the rational concept of emancipation.¶ Mignolo proposes a delinking strategy, which involves denaturalizing the concepts and fields of knowledge within coloniality. This does not mean "ignoring or denying what cannot be denied", but rather using imperial strategies for decolonial purposes. Delinking also implies disbelieving that imperial reasoning can itself create a liberating reason (i.e. proposals of decolonization from a marxist enterprise, which do not involve a radical delinking but rather a radical emancipation; the reason being marxism offers a different "content" but not a different "logic"). Postmodern thought attempts to be a liberating discourse, but still maintains a European framework that is far from creating a delinked colonial logic. In this sense, Mignolo argues that while modernity is not strictly a European phenomenon, its

rhetoric -as Dussel argues- is formed by European philosophers, academics and politicians. Hence, modernity involves colonization of time and space, defining a border in realtion to a self-determining Other and it's own European identity.¶ The project of decolonization proposes a displacement of the theo- and ego- hegemonic logic of empire into a geo-political and a body-logic of knowledge. This project arises from a de-clasification and de-identification of imperially denied subjects, as a de-colonial policy and epistemology that affects both the political and economic control of neoliberalism and capitalism, each frameworks of the imperialist project. The decolonization process begins when these same agents or subjects, who inhabit the denied languages and identities of the Empire, become aware of the effects of coloniality on being, body and knowledge. This process does not imply a call to an external element/actor/project but a movement towards an exteriority which make visible the difference in the space of experience and the horizon of expectations registered in the colonial space. Is this a proposal of cultural relativism? No. What Mignolo suggests is a questioning of the posture taken from divisive borders. In other words, the borders that both unite and separate modernity/coloniality.¶ Henceis the main proposal of the book: border thinking. This epistemology evokes the pluri-versity and di-versity of the dynamics between the spaces of experience and horizons of expectations found within the larger arena of coloniality/modernity. Border thinking implies that decolonization will not come from the conflicts over the imperial difference but from the spaces of experience and horizons of expectations generated by the colonial difference. Decolonial critical thinking connects the pluri-versity of experiences enclosed within the colonial framework with the delinking uni-versal project that is in constant tension within imperial horizons. It builds a proposal that goes beyond the implementation of a model constructed within modern categories (right, center, left) and onto reflecting on the subversive spaces inscribed among the actions of colonized agents through the fissures and cracks of the imperial system.¶ The concept of decolonization offered in Mignolo's work is a major contribution towards creating a theoretical framework outside the standards of modern Western philosophy. What must also be recognized, however, is that this theoretical proposal and its development is still influenced by those same theories and epistemologies that it intends to criticize. It could be said that the book itself is a decolonization proposal in how it subversively re-orients traditional theoretical frameworks into a deep questioning of themselves.

Serial Policy Failure

The ethic of coloniality makes serial policy failure and error replication inevitable –it biases research and skews claims of development

Ibarra-Colado 7 (Eduardo, Professor of Management Studies at the Department of Economic Production, Metropolitan Autonomous University, "Organization Studies and Epistemic Coloniality in Latin America: Thinking Otherness from the Margins")

Since the abolition of slavery, this principle of colonial humanitarianism has been making an advance, but the imperial powers must now realize that Europeans (and American imperialists for that matter) are not the racial superiors of any other race, and unless this bugaboo of race superiority is renounced, there can be no sincere progress or inter-racial and international peace and good will.28 Dr. George Dorsey of the University of Chicago, recently criticized this idea of race superiority and inferiority, when in his famous treatise he said that too many abstract formulae about humanity and too little common sense for solving concrete social problems make human association and fellowship increasingly tense; "But," he states, "the 'racial purity' and 'racial inferiority' behind such books as McDougall's Is America Safe for Democracy? Chamberlain's Foundations of Nineteenth Century Civilization; Grant's The Passing of the Great Race; Wiggam's The New Decalogue of Science; Gould's America a Family Matter; and East's Mankind at the Crossroads, are pure bunk and simple. If the United States wish to restrict immigration to 'Nordics' or to this or that political group why not say so and be done with it? To bolster up racial prejudice or a Nordic or a Puritan complex by false and misleading inferences drawn from

'intelligence tests' or from pseudo-biology and ethnology is to throw away science and fall back on the mentality of primitive savagery. Evolution produced a human brain, our only remarkable inheritance. Nothing else counts. Body is simply brain's servant. Treat the body right, of course; no brain can function well without good service. But why worry more about the looks, color, and clothes of the servant than the service it performs? "2 Weyl holds that the social goal of democracy is advancement of the people through a democratization of advantages and opportunities of life.30 Even Edmund Burke, the fore-sighted statesman of England, warned the British regarding its policy under the complex of race superiority in the colonies thus: "Let the colonies always keep the idea of their civil rights associated with your government; they will cling and grapple to you; and no force under heaven will be of power to tear them from their allegiance. But let it be once understood, that your government may be one thing, and your privileges another; that these two things may exist without any mutual relation; the cement is gone; the cohesion is loosened, and everything hastens to decay and dissolution ...." Deny them this participation of freedom, and you break that sole bond which originally made, and must still preserve the unity of the Empire."" Thus the dual mandate principle entails more than trusteeship, it entails social progress and social progress entails a liberality of attitude and equal opportunities so that these adolescents will reap the benefit of a realistic and not a fictitious mandates principle. This is a challenge to international morality and particularly the League of Nations.

Regard the affirmative's claims of growth and development with skepticism—the act of benign foreign intervention has been empirically denied

Ibarra-Colado 7 (Eduardo, Professor of Management Studies at the Department of Economic Production, Metropolitan Autonomous University, "Organization Studies and Epistemic Coloniality in Latin America: Thinking Otherness from the Margins")

There is an important question which students of colonial diplomacy have always evaded. The nature of the question is rather problematic. It is narrowed down to the fact that when once a principle is put into practice it becomes almost suicidal to follow a course that would be for the greatest good of the greatest number, without regard to selfish interests. If tutelage of these adolescents implies education till they are fledged and mature to take over the reins of government, then by all principles of justice and equity, there should be no unnecessary argument as to the right of a ward to claim his hard-earned fruits of victory. However, Lord Bryce views this question with avid pessimism when he concluded that the diffusion of education among backward races, such as the Filipinos or the African tribes will not necessarily qualify them for self-government.32 According to Foerster in Mes Combates, cited by Oldham, "It is just in hours of crisis, that strength of character, the sense of honor and the sincerity of our belief in moral forces have the opportunity of proving themselves."33 And when colonial powers are faced with such problems as independence, or a radical change in political status, force is resorted to, as the supreme ideal. This use of force, says Lord Bryce, makes a colonial power to reel like a drunkard; his authority intoxicates him insomuch that "the dazzling splendor of his aim blinds him in the wrongfulness of the means I whereby he flagrantly desecrates the sacred trust of civilization.34 In the preface to a publication on Africa, Lord Olivier charged that European governments of African dependencies were inherently "full of cruelty" because the white man will always draw a color line which causes resentment and ultimate inter-racial conflict.35¶ Sir G. C. Lewis in his book, suggests that every dominant power should not attempt by coercive means to repress political determinism the dependencies, but rather should grant them independence as soon as self-determination has been made.36The fallacy of this argument is the fact that "self-determination" has been loosely interpreted as to mean a vague ideal, so far as native races are concerned. The struggle for independence successively waged by Ireland, Egypt, India, the Philippine Islands, China, Korea, and Haiti, demonstrates that once a colony docilely accepts foreign domination, that becomes its eternal heritage, until it is able to muster arms and employ force to overthrow the dominating power. **This is the only verdict of history**.37In 1792, Premier William Pitt visualized the day when native Africans would become fledged to rule themselves.38But the noble lord fails to realize that responsibility of trusteeship is not fully discharged in securing justice to the natives; if the natives will eventually become a dominant factor in the administration of their own native-land, and if their colonial rulers are really honest

and sincere, their material and moral advancement must be fostered by positive measures, constructive educational policies, promotion of health, and political tutelage, by actual appointment to the higher divisions of the various bureaus of the civil service of these colonies. So far, the little government of Gold Coast in West Africa has taken the initiative to establish a million dollar college for the training of natives and also the appointment of qualified Africans to the higher positions of the Gold Coast Civil Service. Nigeria, Gambia and other British colonies still believe that unless you restrict the education of the native, the white man will have to face another "Black Peril" in Africa.39According to John H. Harris, "trusteeship means that the government is to be in the interests of the governed; it means that when the ward has attained to manhood the trusteeship will be surrendered; it means that it is the prime duty of the trustee so to foster the growth of the ward that upon reaching the state of manhood the capacity to manage his own affairs will not be denied or questioned."40 Lord Durham followed the great orator Charles Fox, by adding that "the only method of retaining distant colonies with advantage was to enable them to govern themselves.4'41 Buell, realizing the almost unsolvable difficulties of colonial administration has said that the habit of one¶ nation colonizing another nation that is weaker eventually forms a curse to the mother country.42

AT: Perm

Perm fails – non-Western knowledge will be appropriated to strengthen colonial hegemony

Breidlid 13 (Anders, Professor, Master programme in Multicultural and International Education, Oslo University College, "Education, Indigenous Knowledge, and Development in the Global South", p. 52-53)OG

In a sense, Freire's (1970) theorizing of the dialogic nature of knowledge¶ production is important here, but it requires that both parties in the dialogue acknowledge that there is wisdom and important knowledges to be¶ gathered from the other dialogue partner. There is a need to acknowledge the significance of contextual, localized, and spiritual knowledges, in educational institutions, in the world of aid, and in societies in the South at large simply because the current epistemic hegemony is not able, as has¶ been repeatedly noted, to address these issues in a sustainable way alone. It is with this perspective that White suggests the importance of an alterna-¶ tive Western knowledge system derived from the teachings of St. Francis,¶ which I propose to call the Francisization of Western knowledge produc-¶ tion.7 There is a sense that the negotiation of a third space in relation to¶ CHAT, which encompasses different knowledge systems may be facilitated¶ with the inclusion of, or the **appropriation** of, aspects of this alternative¶ Western knowledge into the **hegemonic** one. There are, however, difficul-¶ ties with such an appropriation /inclusion due to the hegemonic power/¶ knowledge syndrome and also because of a heavy historical legacy.

No perm: any residual modernity mitigates any solvency – a complete break is necessary (also post-mod. doesn't solve)

Without contradicting this perspective, although implying a completely¶ different intellectual commitment, the concept of "post"-modernity¶ (the A moment I will show in figure 2) indicates that there is a process that¶ emerges "from within" modernity and reveals a state of crisis within globalization.¶ "Trans"-modernity, in contrast, demands a whole new interpretation¶ of

modernity in order to include moments that were never incorporated¶ into the European version. Subsuming the best of globalized European and¶ North American modernity, **"trans"-modernity affirms "from without"** the¶ essential components of modernity's own excluded cultures in order to develop¶ **a new civilization** for the twenty-first century. Accepting this massive¶ exteriority to European modernity allows one to comprehend that there¶ are cultural moments situated "outside" of modernity. **To achieve this, an¶ interpretation that supposes a "second" and very subtle Eurocentrism must¶ be overcome**.6 One can then shift to a non-Eurocentric interpretation of¶

the history of the world-system, a system only hegemonized by Europe¶ for the last two hundred years (not five hundred). The emergence of other¶ cultures, until now depreciated and unvalued, from beyond the horizon of¶ European modernity is thus not a miracle arising from nothingness, but¶ rather a return by these cultures to their status as actors in the history of¶ the world-system. Although Western culture is globalizing—on a certain¶ technical, economic, political, and military level—this does not efface other¶ moments of enormous creativity on these same levels, moments that affirm¶ from their "exteriority" other cultures that are alive, resistant, and growing.

Borders K (Do not read yet, missing "good" link)

1NC

Focus on borders and separations between nations are a part of a desire for a unified national identity. This desire cannot be fulfilled because every social body is a realization of multiple ideals and perspectives. A focus on territories masks the violence that created the state. An inability for the US to become a unified identity is translated to labeling others threats and dangers that challenge the non-existent unified identity (a link to the sovereign idea of treaties and border focus)

The complicity of social sciences, psychology, and psychiatry in the idea that there is a normal and cohesive American character type served ultimately to help depoliticize issues of racism, sexism, class, repression, and other forms of antagonism with a discourse on deviance and irrationality. The repression of difference at the level of institutional politics was therefore reinforced with a conceptual repression. ¶ Nevertheless, the forces of fragmentation persist, and those that are particularly threatening to representational practices of selfhood and nationhood as coherent and undivided are, among other things, "peripheral sexualities" (hence the recent furor over gays in the military, a conflict at the level of models of individuality) and various social antagonisms (hence the recent struggle over entitlements). Adding a dimension to Herman Melville's insights about the masks of history, Slavoj Zizek has argued, with a Lacanian frame, that the drive for coherent identity at either individual or collective levels is necessarily always blocked. As this drive to overcome incompleteness is played out at the collective level, the imposed story of coherence is a mask that covers a void. The fact of social antagonism is displaced by a myth of undividedness. And rather than facing the disjuncture between fact and

aspiration, the dissatisfaction is turned outward, becoming an "enjoyment" in the form of a disparaging model of enemy-others, dangerous character types, and outlaw nations. ¶ As Zizek notes,

Shapiro 1997 (Shapiro, Professor of Political Science at Hawaii, "Violent Cartographies," p. 7)//rf

it is not an external enemy that prevents one from achieving an identity with oneself; that coherence is always already impossible. But the nonacceptance of that impossibility produces fantasy in the form of "an imaginary scenario the function of which is to provide support filling out the subject's constitutive void." When this kind of fantasy is elaborated at the level of the social, it serves as a counterpart to antagonism. It is an imagination of a unified and coherent society that supposedly came into being by leaving a disordered condition of struggle behind. ¶ This mythologizing of origin, which constructs the society as a naturally bounded and consensual community, is a political story that those seeking legitimacy for a national order seek to perpetuate. But the disorder continues to haunt the order. The mythic disorder of the state of nature, supposedly supplanted by the consensual association as society comes into being, continues to haunt the polity. It is displaced outside the frontiers and attributed to the Other. ¶ In short, the anarchic state of nature is attributed to relations between states. This displacement amounts to an active amnesia, a forgetting of the violence that both founds and maintains the domestic order; it amounts to a denial of the disorder within the order. This tendency to deny domestic disorder in general and to overcome more specifically the disorder and antagonisms in post-Vietnam War America – stresses between

generations, between military and civilian order, between the telling of imperialist tales and the telling of post-colonial ones – has been reflected in the media of post- Gulf War America. The triumphalists after the Gulf War have been attempting to write out of the U.S. history the post-Vietnam agonism in which tensions within the order were acknowledged. They seek to banish a politics of interpretation and self-appraisal that was part of both the official and popular culture during the post-Vietnam period. This was especially evident in the orchestration of Norman Schwarzkopf's career as a media personality.

The collectivization of people under the territory of the nation-state justifies the ability to create solidified identities that result in antagonism and violence toward Others

In this investigation I also turn to geography, but not to provide an explanation of state-level decision making. As I noted, I want less to understand war, in the traditional empirical/explanatory sense, than to effect a political and ethical resistance to the enmities upon which it feeds. To do this I emphasize an approach to maps that provides distance from the geopolitical frames of strategic thinkers and security analysts. Geography is inextricably linked to the architecture of enmity But rather than an exogenous "explanatory variable' it is a primary part of the ontology of a collective. Along with various ethnographic imaginaries—the ethnoscapes that are a part of geographic imaginations—it constitutes a fantasy structure implicated in how territorially elaborated collectivities locate themselves in the world and thus how they practice the meanings of self and Other that provide the conditions of possibility for regarding others as threats or antagonists. Grammatically, then, it is appropriate for me to recognize cartographic violence instead of speak ing of the geographic causes of violence.

The division of peoples based upon nation-states justifies violence and genocide

The attitude of the English commanders to the results of the destruc tion of the Pequots went beyond complacency; they saw their actions as morally vindicated. In addition to invoking the code of military professionalism to justify their genocidal approach to their hostilities with the

Pequots, they found legitimation in their reading of Scripture. For example, allowing that the scene of the burning and killing at the fort produced a "most doleful cry;" Captain Underhill, in response to queries about slaughtering women and children, responded: "We had sufficient light

Shapiro 1997 (Shapiro, Professor of Political Science at Hawaii, "Violent Cartographies," p. 173-180.)//rf

from the word of God for our proceedings?" And this view only strengthened during the colonial period. The prominent Puritan preacher Increase Mather, writing an account of the war forty years later, emphasized the power of prayer, which, he argued, delivered his people from "the rage of the heathen." Mather ascribed the burning of the fort to the action of "the Lord": "The Lord burnt them up in the fire of his wrath, & dunged the ground with their flesh, it was the Lord's doing, and it is marvelous to our eyes?' ¶ [continued] ¶ The Pequot War has virtually no place in the Euro-American telling of the history of warfare or in the story of gradual proprietary control over the North American continent. To give it a place of importance, it is necessary to analyze the forces at work that allowed the Pequots and their practices to be so devalued as to become targets of an attempt at total extermination. Moreover, such an analysis serves as a prelude to what I shall be calling an ethnographically oriented approach to warfare, one that is aimed both at disclosing the interpretations through which war ring groups impose meaning and value on each other and at providing a critique of approaches to warfare favored by many contemporary historians and political scientists. The dominant, strategically oriented treatment of war, historical or contemporary, provides a rationale for violence rather than for respectful encounters. More specifically, a geographic imaginary, a nation-state-oriented geopolitical map, which provides the ground plan for what are known as "security studies," tends to frame conduct and events within a state-oriented cartography and thereby reproduces the structures of nonrecognition operating in the seventeenth century, when Pequots turned out to be easy prey for merchants, militias, and moral consciences.

The alt is reject the collective identity the aff constructs by focusing on geopolitical boundries and embrace our vulnerability to alterity. This cultivates an ethical relationship to otherness.

To claim membership in a particular tribe, ethnicity, or nation—that is, to belong to a "people"—one must claim location in a particular genealogical and spatial story. Such stories precede any particular action aimed at a future result and provoke much of the contestation over claims to territory and entitlement to collective recognition. To the extent that they are part of the reigning structure of intelligibility, identity stories tend to escape contentiousness within ongoing political and ethical discourses. To produce an ethics responsive to contestations over identity claims and their related spatial stories, it is necessary to intervene in the dominant practices of intelligibility. Michel Foucault was calling for such intervention when he noted that the purpose of critical analysis is to question, not deepen, existing structures of intelligibility. Intelligibility results from aggressive, institutionalized practices that, in producing a given intelligible world, exclude alternative worlds. "We must," Foucault said, "make the intelligible appear against a background of emptiness, and deny its necessity. We must think that what exists is far from filling all possible spaces?' ¶ Like Foucault, Derrida claimed that a recognition of practices of exclusion is a necessary condition for evoking an ethical sensibility. His in sights into the instability and contentiousness of the context of an utterance, in his critique of Austin, provides access to what is effectively the protoethics of ethical discourse, the various contextual commitments that determine the normative implications of statements. To heed this observation, it is necessary to analyze two particular kinds of contextual commitments that have been silent and often unreflective predicates of ethical discourses. And it is important to do so in situations in which contending parties have something at stake—that is, by focusing on the ethics of encounter. Accordingly, in what follows, my approach to "the ethical" locates ethics in a respect for an-Other's identity performances with special attention to both the temporal or narrative dimension ¶ and the spatial dimension of those performances. Moreover, to produce a critical political approach to the ethics of the present, it is necessary to oppose the dominant stories of modernity and the institutionalized, geopolitical versions of space, which support existing forms of global proprietary control,

for both participate unreflectively in a violence of representation. The ethical sensibility offered in the thought of Emmanuel Levinas provides an important contribution to the ethics-as-nonviolent encounter thematized in my analysis. Levinas regarded war, the ultimate form of violence, as the suspension of morality; "it renders morality de risory," he said. Moreover, Levinas's thought fits fh general ¶ anti Clausewitzian/antirationalist approach to war th in prior chapters, for Levinas regarded a strategically oriented politics—"the art of foreseeing war and of winning it by every means' which is "enjoined as the very essence of reason"—as "opposed to morality." In order to oppose war and promote peace, Levinas enacted a linguistic war on the governing assumptions of Western philosophy. He argued that philosophy from Plato through Heidegger constructed persons and peoples within totalizing conceptions of humanity. The ethical regard, he insisted, is one that resists encompassing the Other as part of the same, that resists recognizing the Other solely within the already spoken codes of a universalizing vision of humankind. However problematic Levinas's notion of infinite respect for an alterity that always evades complete comprehension may be (an issue I discuss later), it nevertheless makes possible a concern with the violence of representation, with discursive control over narratives of space and identity, which is central - to my analysis. Edward Said emphasized the ethicopolitical significance of systems of discursive control, locating the violence of imperialism in the control over stories: "The power to narrate, or to block other narratives from forming and emerging, is very important to culture and imperialism, and constitutes one of the main connections between them." Indeed, contemporary neoimperialism resides in part in the ¶ dominance of a spatial story that inhibits the recognition of alternatives. A geopolitical imaginary, the map of nation-states, dominates ethical discourse at a global level. Despite an increasing instability in the geo political map of states, the more general discourses of "international affairs" and "international relations" continue to dominate both ethical and ¶ political problematics. Accordingly, analyses of global violence are most often constructed within a statecentric, geostrategic cartography, which organizes the interpretation of enmities on the basis of an individual and collective national subject and on cross-boundary antagonisms. And ethical theories aimed at a normative inhibition of these antagonisms continue to presume this same geopolitical cartography.'° To resist this discursive/representational monopoly, we must challenge the geopolitical map. Although the interpretation of maps is usually subsumed within a ¶ scientific imagination, it is nevertheless the case that "the cartographer's categories's J. B. Harley has put it, "art the basis of the morality of the 11 " here emerges most icantly from the boundary and naming practices that construct the map. The nominations and territorialities that maps endorse constitute, among other things, a "topographical amnesia." Effacements of older maps in contemporary namings and configurations amount to a non- recognition of older, often violently displaced practices of identity and space. Among the consequences of this neglected dimension of cartography, which include a morality-delegating spatial unconscious and a historical amnesia with respect to alternatives, has been a radical circumspection of the kinds of persons and groups recognized as worthy subjects of moral¶ solicitude. State citizenship has tended to remain the primary basis for the identities recognized in discourses such as the "ethics of international affairs." The dominance and persistence of this discursive genre, an "ethics" predicated on absolute state sovereignty, is evident in a recent analysis that has attempted to be both critical of the ethical limitations of the sovereignty system and aware that "conflict has increasingly moved away from interstate territorial disputes." Despite these acknowledged sensitivities, the analysis proceeds within a discourse that reinstalls the dominance of geopolitical thinking, for it remains within its cartography and conceptual legacy Arguing for a humanitarianism that avoids interstate partisanship, the writers go on to reproduce the geopolitical discourse on war, which ¶ grants recognition only to state subjects. Even as they criticize the language of "intervention" as a reaffirmation of a sovereignty discourse, they refer to the "Persian Gulf War" on the one hand and "insurgencies" on the other. As I noted in chapter i, Bernard Nietschmann has shown that the map of global warfare changes dramatically when one departs from the language of sovereignty. Challenging the state-oriented language of war and unmapping the ¶ geostrategic cartography of "international relations;' Nietschmann refers to the "Third World War," which is "hidden from view because the fighting is against peoples and countries that are often not even on the map"—a war in which "only one side of the fighting has a name." Focusing on struggles involving indigenous peoples, Nietschmann proceeds to map 120 armed struggles as part of the "war' In his mapping, only 4 of the struggles involved confrontations between states, while 7 involve states against nations. ¶ In order to think beyond the confines of the states orientation, it is therefore necessary to turn to ethical orientations that challenge the spatial predicates of traditional moral thinking and thereby grant recognition outside of modernity's dominant political identities. -This must necessarily also take us outside the primary approach that contemporary philosophy has lent to (Anglo-American) ethical theory. As applied at any level of human interaction, the familiar neo-Kantian ethical injunction is to seek transcendent values. Applied to the inter state or sovereignty model of global space more specifically, this approach seeks to achieve a set of universal moral imperatives based on shared values and regulative norms. This dominant tradition has not yielded guidance for

specific global encounters because it fails to acknowledge the historical depth of the identity claims involved in confrontations or collisions of difference— difference that includes incommensurate practices of space and conflicting narratives of identity. The tradition depends instead on two highly abstract assumptions. The first is that morality springs from what humanity ¶ holds in common, which is thought to yield the possibility of a shared intuition of what is good. The second is that the values to be apprehended are instantiated in the world and are capable of being grasped by human consciousness, wherever it exists. As Hegel pointed out in one of his earliest remarks on Kantian moral reasoning, Kant's system involves "a conversion of the absoluteness of pure identity. . . into the absoluteness of content." Because, for Kant, the form of a concept is what determines its rightness, there remains in his perspective no way to treat "conflicts among specific matters."17 A brief account of an encounter between alternative spatial imaginar ies helps to situate the alternative ethical frame to be elaborated later. It is provided by the reflections of the writer Carlos Fuentes after an un anticipated encounter with a Mexican peasant. Lost driving with friends in the state of Morelos, Mexico, Fuentes stopped in a village and asked an old peasant the name of the village. "Well, that depends;' an approach that assails such totalizations with the aim of providing an ethics of encounter. Levinas and the Ethics of the Face to Face Fuentes's experience and the conclusions he draws from are elaborately prescripted in the ethical writings of Levinas, for whom the ¶ face-to-face encounter and the experience of the Other as a historical trace are crucial dimensions of an ethical responsibility. To confront Levinas is to be faced with an ethical tradition quite different from those traditionally applied to issues of global encounter. In Levinas's ethical thinking and writing, morality is not an experience of value, as it is for both the Kantian tradition and Alasdair Maclntyre's post-Kantian concern with an anthropology of ethics, but a recognition of and vulnerability to alterity. This conception of vulnerability to alterity is not a moral psychology, as is the case with, for example, Adam Smith's notion of interpersonal sympathy. It is a fundamentally ethical condition attached to human subjectivity; it is an acceptance of the Other's absolute exteriority, a recognition that "the other is in no way another myself, participating with me in a common existence." According to Levinas, we are responsible to alterity as absolute alterity, as a difference that cannot be subsumed into the same, into a totalizing conceptual system that comprehends self and Other. For relations with Others to be ethical they must therefore be nontotalizing. Rejecting ontologies that homogenize humanity, so that self-recognition is sufficient to constitute the significance of Others, Levinas locates the ethical regard as a recognition of Others as enigmatically and irreducibly other, as prior to any ontological aim of locating oneself at home in the world: "The relations with the other... [not arise within a totality nor does it establish a totality, integrating me and the other. Ontologies of integration are egoistically aimed at domesticating alterity to a frame of understanding that allows for the violent appropriation of the space of the Other: ¶ My being in the world or my 'place in the sun,' my being at home, have not also been the usurpation of spaces belonging to the other man whom I have already oppressed or starved, or driven out into a third-world; are they not acts of repulsing, excluding, exiling, stripping, killing? 23 To be regarded ethically, the Other must remain a stranger "who disturbs the being at home with oneself." The ethical for Levinas is, in sum, "a non-violent relationship to the as infinitely other." we recall the problematic presented in chapter 5, it should be evident within a Levinasian ethical perspective, one would, for example, accept Ward Just's perpetually enigmatic Vietnam rather than endorse Norman Schwarzkopf's domesticated version.

Politics DA – Iran Deal

1. Obama can hold off a veto now – but his political capital is key

Walsh and Barrett 7/16 (Deirdre, Senior Congressional Producer for CNN, Ted, senior congressional producer for CNN Politics, "WH dispatches Joe Biden to lock down Iran deal on Capitol Hill," CNN, 7/16/2015, http://www.cnn.com/2015/07/15/politics/iran-deal-white-house-democrats-congress/)//duncan

Two days after the Iran deal was unveiled, **the** Obama **administration's sales job is in full swing.¶** Vice President Joe Biden traveled to Capitol Hill on Wednesday to convince House Democrats to support the deal, while a small group of senators were invited to the White House to get their questions answered directly from officials who sat across from the Iranians at the negotiating table. Biden meets with Senate Democrats of the Foreign Relations

Committee on Thursday.¶ House lawmakers said Biden was candid about the strengths and weaknesses of the compromise deal. One described his behind closed doors pitch.¶ "I'm going to put aside my notes and talk to you from my heart because I've been in this business for 45 years," Biden said in his opening comments, according to Rep. Bill Pascrell, D-New Jersey, who attended the session.¶ "I'm not going to BS you. I'm going to tell you exactly what I think," the vice president reportedly said.¶ Obama got a boost from the leader of his party in the chamber when Minority Leader Nancy Pelosi formally announced Thursday that she was backing the deal.¶ SInce Republicans in the House and Senate are firmly against the Iran nuclear deal -- announced by President Barack Obama on Tuesday -- **the administration is cranking up its campaign to sway concerned Democrats to back the agreement.¶** Under legislation that allows Congress to review the agreement, the White House needs to secure enough votes from members of his own party to sustain the President's promised veto on an resolution of disapproval -- 145 in the House and 34 in the Senate.¶ After the session with Biden, several House Democrats stressed that while the process is just beginning, right now **the administration likely has the votes to sustain the President's veto on a resolution to block the deal.¶** "I'm confident they will like it when they understand it all," the vice president told reporters on his way into the session, beginning what will be a two month campaign culminating in a vote, expected in September.¶ Democrats, both for and against the deal, praised Biden's presentation.¶ "Joe Biden was as good as I've seen him," Rep. John Larson, D-Connecticut, told CNN. "I thought he did an excellent job."¶ Texas Democratic Rep. Henry Cuellar said Biden is a "master of detail" and helped clarify some concerns he had about the verification provisions in the deal, but he still planned to carefully study it and said he was undecided.¶ Pascrell also cited the verification issue as a potential sticking point but said he is leaning 'yes' on the agreement.¶ "On our side of the aisle **there is concern and skepticism shared by a number of members but an openness to be persuaded** if the facts take them that way," Rep. Gerry Connolly of Virginia said. "I think (Biden) made some real progress on behalf of the administration today."¶ But Democratic Rep. Steve Israel of New York, a former member of Democratic leadership, told reporters he wasn't sold yet.¶ "For me, I still have some very significant questions with respect to lifting of the embargo on conventional arms. And missiles. The (International Atomic Energy Agency) verification process for me is not any time anywhere, I think there are some very significant delays built into that," Israel said.¶ Larson noted that both Biden's presentation, along with Hillary Clinton's a day earlier, who he said spoke favorably about the deal, helped lay the groundwork for most Democrats to back the White House.¶ At the same time on Wednesday that the President held a news conference trying to persuade the public he had brokered an strong and effective deal with Iran, Sen. Joe Manchin, a Democrat from West Virginia, and a handful of other senators, were in a separate part of the White House meeting with some of the President's top negotiators, who had just returned from Vienna.¶ "I was very satisfied with an awful lot of the answers we received," Manchin told CNN.¶ **The intimate meeting for senators was another example of the White House's effort to shore up support in the Senate where leaders believe as many as 15 Democrats could oppose the deal.** If they did, it could provide Senate Republicans the votes needed to override a veto of the disapproval resolution and scuttle the deal.¶ But Manchin, a centrist who has close relations with senators on both sides of the aisle, said at this point he has not detected major blowback from Senate Democrats to the deal.¶ "At caucus yesterday I didn't get a reading there is hard, hard opposition. I did not," he said.¶ In fact, Manchin said he thought Republicans actually might struggle getting the 60 votes they will need to pass the disapproval resolution, much less the dozen or so votes that might be needed to sustain a veto.¶ One key senator whose position will be closely monitored by the White House and his colleagues from both parties on the Hill, is Sen. Chuck Schumer of New York, the third-ranking Democrats who is poised to become the Democratic leader in the next Congress. Schumer has many Jewish voters in his state who are wary of the impact of the Iran agreement on the security of Israel. Schumer said he is skeptical of the deal and won't decide whether to support it before doing his homework.¶ "I will sit down, I will read the agreement thoroughly and then I'm gonna speak with officials -- administration officials, people all over on all different sides," he said when asked about his decision-making process. "Look, this is a decision that shouldn't be made lightly and I am gonna just study this agreement and talk to people before I do anything else."¶ Sen. John McCain, R-Arizona, a leading critic of the agreement with Iran, said "**the pressure will be enormous from the administration," as it tries to keep Democrats from defecting**. As chairman of the Armed Services Committee, McCain said he intends to hold hearings to demonstrate what he calls the "fatal flaws" in the deal.¶ House **conservatives** speaking at a forum sponsored by the Heritage Foundation, a conservative think tank, one after another ripped the Iran deal. But they **conceded that ultimately they may not be able to block it.¶** "The game is rigged in favor of getting this done" Ohio Rep. Jim Jordan said.

2. Schumer is border security hawk – the plan pisses him off

3. Schumer would create a dem majority to override the deal

Associated Press, **7/16**/2015, "Schumer squeezed on Iran Nuclear deal," http://nypost.com/2015/07/16/schumer-squeezed-on-obamas-iran-nuclear-deal/)//

Indeed, with the leaders of Israel and their supporters in the US strongly opposed to the accord, observers on and off Capitol Hill say that the only chance congressional opponents have is if they get Schumer in their corner. Sometime in the fall, Congress will vote on whether to approve or disapprove the Iran deal. If enough hawkish Democrats join Republicans and the disapprove side prevails, Obama would veto the legislation. At that point, the focus would turn to whether Congress could override Obama's veto, which takes a two-thirds vote in both the House and Senate. Chances of that are slim, but with Schumer on their side, opponents might stand a chance. "There is no way a veto would be overridden without Sen. Schumer," said Aaron Keyak, a consultant to several Jewish groups and a former Democratic congressional aide. "Finding 67 votes to override a presidential veto is a very high threshold and there is no way to get to that number without Sen. Schumer." That helps explain the intense pressures on Schumer and a handful of other key senators in a debate that pro-Israel groups have made clear will be their top focus, bar none, in the months to come. With the deal just a few days old, Schumer is already being targeted in advertising, news releases and social media from both sides. The Emergency Committee for Israel announced an ad campaign on New York City cable television encouraging New Yorkers to "Call Sen. Schumer and tell him he must stand firm" on his insistence that the deal allow nuclear inspections anytime and anywhere, which opponents contend it does not. Another group, Secure America Now, has been urging supporters over Twitter to call Schumer and tell him to oppose the deal. On the opposite side, the progressive group Credo issued a statement warning that "Democrats who sabotage the Iran deal will face consequences," and listed Schumer, who likely will win re-election next year, as a top target. Adding to the pressure, the Democrats' likely presidential nominee, Hillary Rodham Clinton, has cautiously embraced the deal. At the middle of the storm, the famously media-friendly Schumer has gone uncharacteristically quiet. Questioned at an unrelated news conference this week, he repeated his initial written statement nearly word for word. "I will sit down, I will read the agreement thoroughly, and then I'm going to speak with officials, administration officials, people all over, on all different sides," Schumer said. "This is a decision that shouldn't be made lightly, and I am going to just study this agreement and talk to people before I do anything else." Congressional allies say Schumer seems genuinely torn. "He's obviously got pressures and I assume he's going to do the right thing," said Rep. Jerrold Nadler (D-NY), who is undecided and facing similar pressures. "There are very severe upsides and very severe downsides." Obama argues the deal closes off Iran's pathway to a nuclear bomb for the next decade, and has challenged opponents to come up with an alternative. The liberal Jewish group J Street is backing the deal, and the group's vice president of government affairs, Dylan Williams, said Schumer risks angering progressive voters if he breaks with the White House. "This deal is and will continue to be supported by an overwhelming majority of Sen.

Schumer's Democratic base and if there is a political consideration here, that would be the overriding one," Williams said. But the powerful pro-Israel lobby American Israel Public Affairs Committee is vehemently opposed to the deal, which Israeli Prime Minister Benjamin Netanyahu is denouncing all over American media as undermining the security of Israel and the region. Steven J. Rosen, a former longtime senior official with the group, said that backing the deal could hurt Schumer with the pro-Israel community — and with donors in New York. "I think he wants to be seen as one of Israel's most important friends in the United States. A bad vote here could have lasting damage on his standing in that regard," Rosen said. "The White House has put him in a very, very tough position here."

4. Failure will spur prolif and war with Iran – the plan tanks Obama's ability to hold off Congress

Beauchamp 14 (Zack – B.A.s in Philosophy and Political Science from Brown University and an M.Sc in International Relations from the London School of Economics, former editor of TP Ideas and a reporter for ThinkProgress.org. He previously contributed to Andrew Sullivan's The Dish at Newsweek/Daily Beast, and has also written for Foreign Policy and Tablet magazines, now writes for Vox , "How the new GOP majority could destroy Obama's nuclear deal with Iran," http://www.vox.com/2014/11/6/7164283/iran-nuclear-deal-congress,)

There is one foreign policy issue on which the GOP's takeover of the Senate could have huge ramifications, and beyond just the US: Republicans are likely to try to torpedo President Obama's ongoing efforts to reach a nuclear deal with Iran. And they just might pull it off. November 24 is the latest deadline for a final agreement between the United States and Iran over the latter's nuclear program. That'll likely be extended, but it's a reminder that the negotiations could soon come to a head. Throughout his presidency, **Obama has prioritized these negotiations**; he likely doesn't want to leave office without having made a deal. But if Congress doesn't like the deal, or just wants to see Obama lose, it has the power to torpedo it by imposing new sanctions on Iran. Previously, Senate Majority Leader Harry Reid used procedural powers to stop this from happening and save the nuclear talks. But Senate Majority Leader Mitch McConnell may not be so kind, and he may have the votes to destroy an Iran deal. If he tries, we could see one of **the most important legislative fights of Obama's presidency.** Why Congress can bully Obama on Iran sanctions At their most basic level, the international negotiations over Iran's nuclear program (they include several other nations, but the US is the biggest player) are a tit-for-tat deal. If Iran agrees to place a series of verifiable limits on its nuclear development, then the United States and the world will relax their painful economic and diplomatic sanctions on Tehran. "The regime of economic sanctions against Iran is arguably the most complex the United States and the international community have ever imposed on a rogue state," the Congressional Research Service's Dianne Rennack writes. To underscore the point, Rennack's four-page report is accompanied by a list of every US sanction on Iran that goes on for 23 full pages. The US's sanctions are a joint Congressional-executive production. Congress puts strict limits on Iran's ability to export oil and do business with American companies, but it gives the president the power to waive sanctions if he thinks it's in the American national interest. "In the collection of laws that are the statutory basis for the U.S. economic sanctions regime on Iran," Rennack writes, "the President retains, in varying degrees, the authority to tighten and relax restrictions." The key point here is that Congress gave Obama that power — which means they can take it back. "You could see a bill in place that makes it harder for the administration to suspend sanctions," Ken Sofer, the Associate Director for National Security and International Policy at the Center for American Progress (where I worked for a little under two years, though not with Sofer directly), says. "You could also see a bill that says the president can't agree to a deal unless it includes the following things or [a bill] forcing a congressional vote on any deal." Imposing new sanctions on Iran wouldn't just stifle Obama's ability to remove existing sanctions, it would undermine Obama's authority to negotiate with Iran at all, sending the message to Tehran that Obama is not worth dealing with because he can't control his own foreign policy. So **if Obama wants to make a deal with Iran, he needs Congress to play ball**. But it's not clear that Mitch McConnell's Senate wants to. Congress could easily use its authority to kill an Iran deal To understand why the new Senate is such a big deal for congressional action on sanctions, we have to jump back a year. In November 2013, the Obama administration struck an interim deal with Iran called the Joint Plan of Action (JPOA). As part of the JPOA, the US agreed to limited, temporary sanctions relief in exchange for Iran limiting nuclear program components like uranium production. Congressional Republicans, by and large, hate the JPOA deal. Arguing that the deal didn't place sufficiently serious limits on Iran's nuclear growth, the House passed new sanctions on Iran in December. (There is also a line of argument, though often less explicit, that the Iranian government cannot be trusted with any deal at all, and that US policy should

focus on coercing Iran into submission or unseating the Iranian government entirely.) Senate Republicans, joined by more hawkish Democrats, had the votes to pass a similar bill. But in February, Senate Majority leader Harry Reid killed new Iran sanctions, using the Majority Leader's power to block consideration of the sanctions legislation to prevent a vote. McConnell blasted Reid's move. "There is no excuse for muzzling the Congress on an issue of this importance to our own national security," he said. So now that McConnell holds the majority leader's gavel, it will remove that procedural roadblock that stood between Obama and new Iran sanctions. To be clear, it's far from guaranteed that Obama will be able to reach a deal with Iran at all; negotiations could fall apart long before they reach the point of congressional involvement. But if he does reach a deal, and Congress doesn't like the terms, then they'll be able to kill it by passing new sanctions legislation, or preventing Obama from temporarily waiving the ones on the books. And make no mistake — imposing new sanctions or limiting Obama's authority to waive the current ones would kill any deal. If Iran can't expect Obama to follow through on his promises to relax sanctions, it **has zero incentive to limit its nuclear program**. "If Congress adopts sanctions," Iranian Foreign Minister Javad Zarif told Time last December, "the entire deal is dead." Moreover, it could fracture the international movement to sanction Iran. The **U**nited **S**tates is far from Iran's biggest trading partner, so it depends on international cooperation in order to ensure the sanctions bite. If it looks like the US won't abide by the terms of a deal, **the broad-based international sanctions regime could collapse**. Europe, particularly, might decide that going along with the sanctions is no longer worthwhile. "Our ability to coerce Iran is largely based on whether or not the international community thinks that we are the ones that are being constructive and [Iranians] are the ones that being obstructive," Sofer says. "If they don't believe that, then the international sanctions regime falls apart." This could be one of the biggest fights of Obama's last term It's true that Obama could veto any Congressional efforts to blow up an Iran deal with sanctions. But a two-thirds vote could override any veto — and, according to Sofer, an override is entirely within the realm of possibility. "There are plenty of Democrats that will probably side with Republicans if they try to push a harder line on Iran," Sofer says. For a variety of reasons, including deep skepticism of Iran's intentions and strong Democratic support for Israel, whose government opposes the negotiations, Congressional Democrats are not as open to making a deal with Iran as Obama is. Many will likely defect to the GOP side out of principle. The real fight, Sofer says, will be among the Democrats — those who are willing to take the administration's side in theory, but don't necessarily think a deal with Iran is legislative priority number one, and maybe don't want to open themselves up to the political risk. These Democrats "can make it harder: you can filibuster, if you're Obama you can veto — you can make it impossible for a full bill to be passed out of Congress on Iran," Sofer says. **But it'd be a really tough battle, one that would consume a lot of energy and lobbying effort that Democrats might prefer to spend pushing on other issues.** "I'm not really sure they're going to be willing to take on a fight about an Iran sanctions bill," Sofer concludes. "I'm not really sure that the Democrats who support [a deal] are really fully behind it enough that they'll be willing to give up leverage on, you know, unemployment insurance or immigration status — these bigger issues for most Democrats." So if the new Republican Senate prioritizes destroying an Iran deal, **Obama will have to fight very hard to keep it** — without necessarily being able to count on his own party for support. And the stakes are enormous: **if Iran's nuclear program isn't stopped peacefully, then the most likely outcomes are either Iran going nuclear, or war with Iran**. The administration believes a deal with Iran is their only way to avoid this horrible choice. That's why it's been **one of the administration's top priorities** since day one. It's also why this could become one of the biggest legislative fights of Obama's last two years.

5. Nuke war

Stevens 13 (Philip Stevens, associate editor and chief political commentator for the Financial Times, Nov 14 2013, "The four big truths that are shaping the Iran talks," http://www.ft.com/cms/s/0/af170df6-4d1c-11e3-bf32-00144feabdc0.html)

The who-said-what game about last weekend's talks in Geneva has become a distraction. The six-power negotiations with Tehran to curb Iran's nuclear programme may yet succeed or fail. But wrangling between the US and France on the terms of an acceptable deal should not

allow the trees to obscure the forest. The organising facts shaping the negotiations have not changed.¶ The first of these is that Tehran's acquisition of a bomb would be more than dangerous for the Middle East and for wider international security. It would most likely set off a **nuclear arms race** that would see **Saudi Arabia, Turkey and Egypt** signing up to the **nuclear club**. The nuclear **n**on-**p**roliferation **t**reaty would be shattered. A future regional conflict could **draw Israel into launching a pre-emptive nuclear strike.** This is not a region obviously susceptible to **cold war disciplines of deterrence**.¶ The second **ineluctable reality** is that Iran has mastered the nuclear cycle. How far it is from building a bomb remains a subject of debate. Different intelligence agencies give different answers. These depend in part on what the spooks actually know and in part on what their political masters want others to hear. The progress of an Iranian warhead programme is one of the known unknowns that have often wreaked havoc in this part of the world.¶ Israel points to an imminent threat. European agencies are more relaxed, suggesting Tehran is still two years or so away from a weapon. Western diplomats broadly agree that Ayatollah Ali Khamenei has not taken a definitive decision to step over the line. What Iran has been seeking is what diplomats call a breakout capability – the capacity to dash to a bomb before the international community could effectively mobilise against it.¶ The third fact – and this one is hard for many to swallow – is that neither a negotiated settlement nor the air strikes long favoured by Benjamin Netanyahu, Israel's prime minister, can offer the rest of the world a watertight insurance policy.¶ It should be possible to construct a deal that acts as a plausible restraint – and extends the timeframe for any breakout – but no amount of restrictions or intrusive monitoring can offer a certain guarantee against Tehran's future intentions.¶ By the same token, bombing Iran's nuclear sites could certainly delay the programme, perhaps for a couple of years. But, assuming that even the hawkish Mr Netanyahu is not proposing permanent war against Iran, **air strikes would not end it.**¶ You cannot bomb knowledge and technical expertise. To try would be to empower those in Tehran who say the regime will be safe only when, like North Korea, it has a weapon. So when Barack Obama says the US will never allow Iran to get the bomb he is indulging in, albeit understandable, wishful thinking.¶ The **best the** international **community can hope** for is that, in return for a relaxation of sanctions, Iran will make a judgment that it is better off sticking with a threshold capability. To put this another way, if Tehran does step back from the nuclear brink it will be because of **its own calculation of the balance of advantage**.¶ The fourth element in this dynamic is that Iran now has a leadership that, faced with the severe and growing pain inflicted by sanctions, is **prepared to talk**. There is nothing to say that Hassan Rouhani, the president, is any less hard-headed than previous Iranian leaders, but he does seem ready to weigh the options.

1. Clinton is likely to win 2016, but its close – recent poll proves – surveillance will be a key factor

Glenza 6/23 [Jessica Glenza, Breaking News Reporter at Guardian News & Media, "Hillary Clinton on course to win presidential election, poll says", http://www.theguardian.com/us-news/2015/jun/23/hillary-clinton-presidential-election-poll, June 23rd, 2015//Rahul]

Hillary Clinton is on course to win the Democratic primary and would go on to trounce her Republican opponents, according to a new poll. The NBC News/Wall Street Journal poll found that the former secretary of state was the first choice for nominee of 75% of her party, with Vermont socialist Bernie Sanders far behind on 15%. Analysis Clinton v Bush: America is getting the dynastic matchup it said it didn't want Despite rivals' protestations, Hillary Clinton and Jeb Bush enjoy the support of their own party's voters. But the other party's dynasty candidate? Not a chance Martin O'Malley, the former Maryland governor, was on 2%, while Lincoln Chafee, the former governor of Rhode Island, polled less than 1%. Former Virginia senator Jim Webb, who has not yet formally declared he is running, was on 4%. According to the poll, 92% of likely Democratic voters said they could see themselves supporting Clinton. The poll asked 1,000 likely voters about their opinions on potential presidential candidates, both Republican and Democrat. It showed Clinton polling at 48% to 40% against her closest Republican contender, former Florida governor Jeb Bush, the brother of former president George W Bush and son of former president George HW Bush. Against the Florida senator Marco Rubio, Clinton polled 50% against 40%. And against Wisconsin governor Scott Walker she polled 51% to 37%. Among Republican primary voters, the poll showed Bush ahead with 22% of the vote. Walker was next with 17% and Rubio third

with 14%. Retired neurosurgeon Ben Carson had 11%, while former Arkansas governor Mike Huckabee (9%), libertarian senator Rand Paul (7%), former Texas governor Rick Perry (5%), New Jersey governor Chris Christie (4%) and Texas senator Ted Cruz (4%) were all in single figures. The poll is likely to encourage the Clinton camp, whose campaign got off to a rough start when questions arose about Clinton's use of personal email as secretary of state, this spring. But it is possible that early polls may not reflect the true strength of Clinton's challengers. On Tuesday, Clinton urged businesses to stop selling images with the Conferdate flag on them, in the wake of the attack on a black church in Charleston Republican pollster Bill McInturff told the Wall Street Journal that Clinton had "the strongest and most advantageous" standing among Democrats he had seen in 35 years of campaign polling. "She starts with advantages among very important groups," he said. McInturff conducted the poll with Democrat Fred Yang. Clinton's high rankings could be buoyed by increasingly positive support numbers for her 2008 rival Barack Obama, whose approval rating is up by 8 percentage points to 48% since September 2014, when it hit an all-time low of 40% according to the same polls. Among Republican candidates, Bush and Rubio remain neck and neck, with 75% and 74% of respondents saying they could see themselves supporting the candidates in a Republican primary. Bush pulls away slightly in favorability rankings, pulling 5% ahead of Walker with 22%, and 8% ahead of Rubio. Most see Clinton as a moderate candidate (58%) who is trustworthy because of her "experience and background" (59%). Respondents were fairly split over which party the next president should be from, with Republicans scoring 36% and Democrats 39%. Ongoing concerns going into the election could set the mood for the campaign. A "decline in traditional moral values" was rated as the most alarming trend in America of all respondents (25%), seconded by possible terrorist attacks on the US (18%), while corporate and wealthy individuals' influence over elections was rated as the most disconcerting facet of the upcoming campaign (33%).

2. Dems are working on the evangelical vote now - loosening border control isolates their base and forfeits the election to the GOP

Jack **Jenkins, 6-16**-2015, "The Explosive Growth Of Evangelical Belief In Latinos Has Big Political Implications," ThinkProgress, http://thinkprogress.org/election/2015/06/16/3668780/hispanic-evangelicals-battle-political-soul-americas-curious-new-swing-vote/)//GV

Much has been written over the past year or so about the ecstatic faith and explosive growth of this new brand of Latino faithful, who unsettle traditional understandings of American Hispanics as a predominantly Catholic demographic. But as the United States gears up for the 2016 presidential election, **Hispanic evangelicals appear to be making that classic American shift from curious cultural newcomer to powerful political force.** If attendees at the conference in Houston were to be believed, Hispanic evangelicals are eager to vote, and in substantial numbers. Yet unlike Hispanic Catholics, who overwhelmingly reflect the Democratic party platform on several key issues, **Latino evangelicals share political sensibilities with both parties.** This has made their voting habits increasingly uncertain, **meaning the group could become that much-prized unicorn of American politics: the swing vote.** The 2016 election may be the "coming out" year for the Latino evangelicals, but as candidates and parties — and particularly the GOP — begin jockeying for this unusual electorate, one question is lingering in the minds of political strategists on both sides of the aisle: **Who will win the "evangélicos vote"?** Hispanic evangelicals share more than worship styles with their white theological brethren. Following in the tradition of Billy Graham and Rick Warren, evangélicos are primarily represented outside their community by a small group of dynamic pastors, most of whom enjoy robust followings and the political power that comes with it. Election buzzwords such as "left" and "right" are always poor descriptors for theological camps, but a casual observer could potentially label the movement's more progressive leaders as Rev. Gabriel Salguero, a pastor and president of the National Latino Evangelical Coalition (NaLEC), and Rev. Luis Cortés Jr., the head of Esperanza, a faith-based Hispanic evangelical network of more than 13,000 congregations. Both men enjoy theological and political clout among Democrats, and the most tangible example of their influence — like many faith leaders — lies in where they pray: Salguero delivered an invocation at the Democratic National Convention in 2012, and Cortés offered the opening prayer at President Obama's inauguration luncheon in 2013. Rev. Gabriel Salguero addresses the Democratic National Convention in 2012.Rev. Gabriel Salguero addresses the Democratic National Convention in 2012.CREDIT: AP Meanwhile, the largest — and arguably most conservative — group of Latino evangelicals is the NHCLC, led by Rev. Samuel Rodriguez. An energetic and media-savvy pastor born in Puerto Rico, Rodriguez is often associated with the Republican party: The NHCLC conference, for instance, included speeches from two GOP presidential hopefuls — former Arkansas Gov. Mike Huckabee and Gov. Jeb Bush of Florida — which makes sense when one realizes

that Rodriguez delivered the benediction at the 2012 Republican National Convention, where he was introduced by none other than RNC chairman Reince Priebus. His organization has grown steadily over the past few years, now boasting over 40,000 affiliated congregations in the U.S., an eye-catching number that has spurred Rodriguez to begin throwing his political weight around among conservatives. In January, he published an op-ed boldly entitled "Hispanic Evangelicals could determine GOP nominee" aimed at attracting the attention of Republican presidential hopefuls. "Based on the performance on display in Iowa last weekend by several of the Republican presidential hopefuls, none of them seem to be paying attention to what could deliver the keys to the front door of the White House: Latino voters," Rodriguez wrote, pointing to immigration and education as crucial issues for his member congregations. "The Hispanic faith community will be listening closely to where candidates stand on reforms that align with the word of God and respect the dignity of all his people." Despite Rodriguez's eagerness to influence the GOP primary, however, it would be a mistake to pigeonhole him as singularly dedicated to either party: He has served on White House committees under President Barack Obama. His fellow faith leaders have similarly mixed political histories. Cortés has identified as a Republican in the past, and his organization's annual National Hispanic Prayer Breakfast regularly features speakers from both parties — including President George W. Bush, who keynoted the event on six occasions. Salguero, meanwhile, can eagerly recount instances when presidential contenders from both parties have courted his favor. "I have met with Chris Christie, Jeb Bush … former Secretary Clinton's people," Salguero told ThinkProgress. "We are the quintessential swing voter in many ways." **But even as Hispanic evangelicals begin to flex their political muscles, assessing their true electoral power is tricky**, in part because exact estimates of their budding population are hard to come by. The U.S. census does not include questions about religion, so the best guess for their population size comes from a 2014 Pew study that listed them as roughly 16 percent of the nation's 35.4 million Latino adults. That amounts to an estimated 5 to 6 million voting-aged worshippers, and the real number could be even higher: Rodriguez has claimed that there are 16 million Hispanic evangelicals in the U.S., and the NHCLC says that evangélicos make up about 20 percent of Latinos overall. Rev. Samuel Rodriguez speaks during a press conference at the NHCLC in AprilRev. Samuel Rodriguez speaks during a press conference at the NHCLC in AprilCREDIT: JACK JENKINS/THINKPROGRESS That's a sizable body politic by any measure. And it's one that only continues to grow, as more and more Latinos abandon Catholic cathedrals in droves for rock-music-filled worship halls — or, in some cases, immigrate to the United States from existing evangelical communities in Central and South America. Assuming high voter turnout and a healthy registration rate (two things that are admittedly difficult to quantify at this early stage), **there could be roughly enough evangélicos to tip the scales by as much as a percentage point in a national election, if they voted as a bloc.** One percent may not sound like much, but that portion of the electorate can have a big effect. Barack Obama, George W. Bush, Jimmy Carter, and Ronald Reagan all won (or lost) the popular vote in presidential elections by two points or less. And more importantly for election strategists, according to Salguero, is the fact that evangélicos are clustered in states critical to the 2016 Electoral College tally. "We are big in key swing states: Colorado, Florida, North Carolina, Ohio, Cleveland, Cincinnati…North Carolina — we have a radio station there," Salguero said. "We're also big in Texas, Arizona — we're big in the 'purple' states." Unlike their Catholic compatriots, Hispanic evangelicals tend to skew to the right on several issues that line up squarely with the Republican base, according to data provided to ThinkProgress from the Public Religion Research Institute (PRRI). Evangélicos roughly mirror Hispanic Catholics in terms of age and education, but PRRI's polling showed Latino evangelicals far more likely than the general Latino population to "oppose" or "strongly oppose" legalizing same-sex marriage (66 percent vs. 36 percent) and to say that abortion should be illegal in all instances (42 percent vs. 27 percent). The Pew Research survey found almost identical results. Most significantly for Republicans, polls show that a solid slice of evangélicos are also uncharacteristically conservative on the most important question in American politics: Party identification. The PRRI survey reported that 21 percent of Hispanic evangelicals say they're Republicans, a full 10 percent more than the total Hispanic population. (For context, most evangélicos — 41 percent — identify as independents, while 28 affiliate with the Democratic Party.) Pew found an even bolder conservative streak: A full 30 percent of Hispanic evangelical Protestant respondents said they "identify or lean Republican," compared to 20 percent of Latino Catholics. These numbers have not gone unnoticed by the Republican Party. At the NHCLC conference, where there was only one Democratic congressman — Rep. Luis Gutierrez of Illinois — and not a single Democratic candidate for president, it was clear the GOP has stepped up its outreach to the Hispanic evangelicals who appear to be primed to support them. Most mentions of the Obama were negative, with speakers repeatedly arraigning him for failing to do enough to protect "religious liberty." But Republican political strategists are aware that there's one roadblock standing in the way. After then-GOP presidential candidate Mitt Romney only won 27 percent of the Hispanic vote during his failed attempt to win the 2012 election — whereas George W. Bush accrued a solid 44 percent of the same group in 2004 — the RNC conducted an internal review of their party to determine a new strategy. When the group published the results in 2013, **researchers concluded that, when it comes to Hispanics, the answer is clear: Republicans need to steer clear of concepts such as "self-deportation" and rethink their stance on immigration reform.** "If Hispanic Americans perceive that a GOP nominee or candidate does not want them in the United States (i.e. self-deportation), they will not pay attention to our next

sentence," the report read. "It does not matter what we say about education, jobs or the economy; if Hispanics think we do not want them here, they will close their ears to our policies. … among the steps Republicans take in the Hispanic community and beyond, we must embrace and champion comprehensive immigration reform. If we do not, our Party's appeal will continue to shrink to its core constituencies only." Indeed, Hispanics overall consistently rank immigration as a top concern during elections, a tendency that is also generally true of Latino evangelicals: According to PRRI's data, 64 percent of evangélicos support an immigration reform policy that would provide undocumented people a pathway to citizenship provided they meet certain requirements, compared to 66 percent of Latinos overall. Salguero and Cortés have both made passionate pleas to lawmakers about the importance of immigration reform, and even as Rodriguez actively courted the favor of GOP candidates in Houston, he was unequivocal on the issue of immigration. He announced midway through the gathering a plan to ask all presidential hopefuls — Democrats and Republicans — to sign a pledge endorsing comprehensive immigration reform, invoking biblical language to drive his point home. Republicans must cross the Jordan of immigration reform to step into the Promised Land of the Hispanic faith electorate. "Republicans must cross the Jordan of immigration reform to step into the Promised Land of the Hispanic faith electorate," Rodriguez said in response to a question from ThinkProgress at a press conference. He tapped the table with his hand for emphasis as he spoke, adding, "There's a period there, not a comma. They must." Beatriz Mesquias, the president of Convención Bautista Hispana de Texas, or the Hispanic Baptist Convention, who attended the conference, echoed this view. "I live on the border, in Harlingen, Texas, and I want to see more protection, but I also wish there were more immigrants who could become residents of the United States," Mesquias said in Spanish. "I want a President who supports immigration reform, not because he or she is a Republican or Democrat, but because it's the right thing for the nation." Clearly, the RNC's advice hasn't reversed every Republican's resistance to immigration reform — but for Latino evangelicals, just one candidate might be enough. At the gathering in Houston, Huckabee and Bush both offered rival addresses to the assembly, competing for the (very bright) spotlight among an eager clientele. Huckabee, like many Republican candidates, mostly ignored issues impacting undocumented people. But Bush, who is Catholic but whose wife is Hispanic, impressed by delivering a speech that appeared to be directly inspired by Rodriguez's op-ed. Speaking partly in Spanish, he pushed for a better education system and outlined something that sounded suspiciously like a version of immigration reform. Jeb Bush addresses the crowd in Houston.Jeb Bush addresses the crowd in Houston.CREDIT: JACK JENKINS/THINKPROGRESS "We have to fix a broken immigration system, and do it in short order," he said, outlining a pathway to "earned legal status." "This country does not so well when people lurk in the shadows. This country does spectacularly well when everybody can pursue their God-given abilities," he added. Bush repeated and arguably expanded this idea while announcing his official campaign for the presidency on June 15. When a group of demonstrators interrupted his speech with a protest encouraging full citizenship for undocumented people instead of legal status, Bush departed from his prepared remarks, distancing himself from the president's executive actions on the issue while simultaneously endorsing a version of immigration reform. "The next president of the United States will pass meaningful immigration reform so that [problem] will be solved, not by executive order," he said. Rodriguez, for his part, returned the favor for Bush. In the lead-up to the conference, he all but endorsed a Bush candidacy in an interview with Bloomberg. "I see hope in the candidacy of Governor Jeb Bush," Rodriguez said. "I think Governor Bush gets it. He's not pro-amnesty, but he knows we have to find a solution to the immigration issue in America. I have a great respect, an admiration toward Governor Bush for his exemplary leadership in Florida." I see hope in the candidacy of Governor Jeb Bush. However — despite all of Bush's policy-talk, linguistic prowess, and degree in Latin-American studies — it was Huckabee, the former Baptist minister and dyed-in-the-wool evangelical conservative, who stole the show in Houston. Huckabee's warm reception was initially confusing, given that the onetime governor has a long history of opposing immigration reform. True to form, when ThinkProgress asked Huckabee in Houston whether he would sign NHCLC's immigration pledge, he refused to answer, saying he hadn't read it. What happened next, however, offered a telling glimpse into the uncomfortable position occupied by right-leaning Hispanic evangelical leaders, who appear caught between a need to advocate for their community's issues and a desire to win favor with the conservative elite. Rodriguez, sitting just inches from Huckabee when the question was asked, did not push for clarification regarding Huckabee's immigration stance or pressure him to sign the pledge. Instead, the otherwise spirited pastor — who spoke so passionately about immigration reform earlier that morning — simply stared at the table as Huckabee spoke. When the governor finished, Rodriguez abruptly exited the press conference, only returning several minutes later to help close the meeting. Rodriguez prays over former Gov. Mike Huckabee at the NHCLC conference.Rodriguez prays over former Gov. Mike Huckabee at the NHCLC conference.CREDIT: JACK JENKINS/THINKPROGRESS Even if the winner of the GOP primary doesn't shift on immigration reform, the party could cleave off a few Hispanic evangelical votes through old-fashioned faith outreach. Immigration was clearly a charged topic at the NHCLC gathering, but attendees were equally energized by Bush's frank discussion of his own spiritual journey. When ThinkProgress asked Lisa, a young Hispanic evangelical who attended the conference, what she was looking for in a presidential candidate, she responded with an answer that was virtually indistinguishable from a rank-and-file white evangelical. "Number one, their faith," said Lisa, her two friends nodding in agreement beside her. "That they stand for the family, the husband and the wife … and that they continue to just hold the truth that the United States was founded on from the very beginning, and not to change or sway because other people's beliefs are different." This is typical of Hispanic evangelicals. A May 2014 Pew survey showed a strong majority of evangelical Latinos (62 percent) believed firmly that the church should speak out on social issues, compared to 47 percent of Hispanics overall. This certainly seemed true for Daisy Gonzalez, another young Hispanic evangelical at the conference from Del Rio, Texas, who gave Bush high marks for discussing education in his speech, but maintained that faith was paramount. "I don't really look at the elephant or the donkey [when picking a candidate]," Gonzalez said, referencing the mascots of America's two dominant political parties. "At first, I look at their foundation — their biblical foundation and their family foundation. The fact that [Bush] comes from a Christian family … is very important." If that quip about political symbols sounds smooth enough to be a catch-phrase, that's because it is. It's an oft-quoted line from Rodriguez, whose 2013 book The Lamb's Agenda claims to posit a faith-led "third way" that bucks the rigid

dichotomy of American politics. I don't really look at the elephant or the donkey [when picking a candidate]. In practice, however, Rodriguez's understanding of the "lamb's agenda" tracks closely with America's political right-wing. One of the book's forwards is written by Jim Daly, head of the conservative think tank Focus on the Family, and the chapter entitled "Not the Donkey, Not the Elephant, but the Lamb!" focuses largely on the moral shortcomings of the Democratic party: Rodriguez bemoans the progressive embrace of marriage equality and abortion rights, and while he celebrates Obama's willingness to discuss his faith, he chastises the president for changing his position on same-sex marriage. "Unless the Donkey reconciles with the Lamb, the Donkey may finish this century in the pony show of the politically obscure," Rodriguez writes. By contrast, his vision for the future of the Republican party was practically glowing: "The Elephant will make significant advances if it intentionally goes forward with the justice mission of Lincoln and the moral optimism of Ronald Reagan." The Hispanic evangelical embrace of the GOP may well become a reality, but not without a lot of help. Salguero, the de-facto representative of the demographic's left-wing, hinted that this ideological creep rightward has been bolstered by robust outreach efforts from conservatives. "I know there is a lot of money going into recruiting Hispanic evangelicals into a certain ideological camp. We should resist that," he said. "One camp is ahead of the other in terms of outreach … I'm concerned that [we will be coopted] instead of developing the voting bloc for the 21st century, a fiercely independent voice that holds candidates accountable." **Still, there is hope for Democrats. Hispanic evangelicals interviewed by ThinkProgress pushed back on the idea that either party has successfully "won" their vote. Salguero insisted Republicans still have to cross the "rubicon" of immigration** — as well as education and criminal justice — noting, "it would be a political miscalculation to assume that Latino evangelicals don't remember voting records — after you leave the room, we visit your website." He drew connections between Hispanic evangelicals and African Americans, pointing out that evangélicos organizations were among the first to come out against death penalty, adding, "We marched with African American communities on criminal justice reform, community policing." And Salguero also noted that, although political leaders on the Left have a lot of ground to make up if they expect to hold onto evangélicos votes in the event of a pro-immigration Republican candidate, they can start with a renewed effort to engage with religion. He emphasized that progressives need to take seriously the conservative concerns of religious liberty, a sentiment shared by Rodriguez and Cortés.

3. Hillary is key to comprehensive immigration reform

Nowicki 7/19 – Dan, The Arizona Republic's national political reporter. ("Clinton stands apart from GOP on immigration," 7/19/15, http://www.usatoday.com/story/news/politics/elections/2016/2015/06/19/clinton-stands-apart-from-gop-on-immigration/28968585/)

As the 2016 Republican presidential field toughens its tone on border security and enforcement, Democratic front-runner Hillary Clinton has drawn a sharp distinction on immigration by embracing comprehensive reforms such as a pathway to citizenship for undocumented workers already in the United States.¶ Speaking Thursday before the National Association of Latino Elected and Appointed Officials, Clinton, a former secretary of State, reiterated promises she made during a May 5 roundtable in North Las Vegas.¶ That she would fight for comprehensive immigration reform that includes "a real path to citizenship" for the more than 11 million undocumented immigrants who have settled in the United States.¶ That she would oppose any move to deport the young immigrants known as "Dreamers" or to undo President Obama's executive actions that are shielding millions of immigrants from enforcement action.¶ And that if Congress continues to balk at acting on immigration reform, "as president I will do everything possible under the law to go even further than what President Obama has attempted to achieve," she said.¶ "There are so many people with deep ties and contributions to our communities, like many parents of dreamers, who deserve a chance to stay, and I will fight for them, too," Clinton said to applause from a standing-room-only crowd inside the Aria Resort & Casino. "But I don't have to wait to become president to take a stand, right here and right now, against divisive rhetoric that demonizes immigrants and their families. It's wrong and no one should stand for it."¶ The contrast between Clinton and the Republican White House prospects grew sharper this week with the entry into the race of celebrity real-estate developer Donald Trump, who announced his candidacy with a speech bashing Mexican immigrants as "rapists" and vowing to build a border wall at Mexico's expense.¶ "They're bringing drugs. They're bringing crime. They're rapists. And some, I assume, are good people," Trump said of immigrants from Mexico.¶ While Trump is viewed by many political handicappers as a novelty candidate, others said his anti-immigrant rant could tarnish the Republican brand with Latino voters, a fast-growing demographic that is increasingly influential in key swing states such as Nevada, Colorado, Florida, New Mexico and Virginia.¶ Despite warnings from national GOP leaders after the loss of 2012 nominee Mitt Romney to Obama, in which Romney was shellacked among Latino voters, most of the Republican

presidential contenders continue to stake out hard-line positions on immigration and border security.

4. Comprehensive reform is key to prevent food insecurity

Gaskill '10 (Ron Gaskill is director of congressional relations for the American Farm Bureau Federation. Worker shortage urges immigration reform efforts April 9, 2010 Season Right for Meaningful Immigration Reform By Ron Gaskill)

Even in these times of higher-than-usual unemployment, most farmers and ranchers still struggle to find all the workers they need for a successful season. Serious concerns that not enough domestic workers will choose to work in agriculture has become a harsh reality *across the countryside*. About 15 million people in the United States choose non-farm jobs at wages that are actually lower than what they could earn by working alongside farmers and ranchers. The on-farm jobs and opportunities are there, but many workers choose not to take advantage of them. The issue is rapidly moving from one centered on a lack of resources, to one with food insecurity at its heart. Farmers and ranchers are the ones being squeezed; caught between a domestic labor force that doesn't want agricultural work, government policy that fails to recognize the seriousness of the problem and an administration that consistently makes it harder to hire workers. U.S. consumers will continue to eat fresh fruits and vegetables regardless of how the labor scenario ultimately plays out. But, whether or not those fruits and vegetables are grown in the U.S. or imported from other countries where labor is more plentiful greatly concerns Farm Bureau. It's past time for our nation's policymakers to translate grassroots concern into meaningful action. As much as we believe in a farmer's right to farm, Farm Bureau fully respects the right of U.S. workers to choose other lines of work. But, on the flip side, as employers, we must be able to legally employ those who do want to work, even if they're from other countries. Comprehensive immigration reform is needed, so that America's farmers and ranchers can continue to produce an abundant supply of safe, healthy food, as well as renewable fuels and fiber for our nation.

5. Food insecurity causes extinction

Brown 9 – is a US environmental analyst, founder of the Worldwatch Institute, and founder and president of the Earth Policy Institute, a nonprofit research organization based in Washington, (Lester R, "Can Food Shortages Bring Down Civilization?" Scientific American, May - http://www.scientificamerican.com/article/civilization-food-shortages/)//GV

The biggest threat to global stability is the potential for food crises in poor countries to cause government collapse. Those crises are brought on by ever worsening environmental degradation One of the toughest things for people to do is to anticipate sudden change. Typically we project the future by extrapolating from trends in the past. Much of the time this approach works well. But sometimes it fails spectacularly, and people are simply blindsided by events such as today's economic crisis. For most of us, the idea that civilization itself could disintegrate probably seems preposterous. Who would not find it hard to think seriously about such a complete departure from what we expect of ordinary life? What evidence could make us heed a warning so dire--and how would we go about responding to it? We are so inured to a long list of highly unlikely catastrophes that we are virtually programmed to dismiss them all with a wave of the hand: Sure, our civilization might devolve into chaos--and Earth might collide with an asteroid, too! For many years I have studied global agricultural, population, environmental and economic trends and their interactions. The combined effects of those trends and the political tensions they generate point to the breakdown of governments and societies. Yet I, too, have resisted the idea that food shortages could bring down not only individual governments but also our global civilization. I can no longer ignore that risk. Our continuing failure to deal with the environmental declines that are undermining the world food economy--most important, falling water tables, eroding soils and rising temperatures--forces me to conclude that such a collapse is possible. The Problem of Failed States Even a cursory look at the vital signs of our current world order lends unwelcome support to my conclusion. And those of us in the environmental field are well

into our third decade of charting trends of environmental decline without seeing any significant effort to reverse a single one. In six of the past nine years world grain production has fallen short of consumption, forcing a steady drawdown in stocks. When the 2008 harvest began, world carryover stocks of grain (the amount in the bin when the new harvest begins) were at 62 days of consumption, a near record low. In response, world grain prices in the spring and summer of last year climbed to the highest level ever. As demand for food rises faster than supplies are growing, the resulting food-price inflation puts **severe stress** on the governments of countries already **teetering on the edge of chaos**. Unable to buy grain or grow their own, hungry people take to the streets. Indeed, even before the steep climb in grain prices in 2008, the number of failing states was expanding [see sidebar at left]. Many of their problem's stem from a failure to slow the growth of their populations. But if the food situation continues to deteriorate, entire nations will break down at an ever increasing rate. We have entered a new era in geopolitics. In the 20th century the main threat to international security was superpower conflict; today it is failing states. It is not the concentration of power but its absence that puts us at risk. States fail when national governments can no longer provide personal security, food security and basic social services such as education and health care. They often lose control of part or all of their territory. When governments lose their monopoly on power, law and order begin to disintegrate. After a point, countries can become so dangerous that food relief workers are no longer safe and their programs are halted; in Somalia and Afghanistan, deteriorating conditions have already put such programs in jeopardy. Failing states are of international concern because they are a source of terrorists, drugs, weapons and refugees, threatening political stability everywhere. Somalia, number one on the 2008 list of failing states, has become a base for piracy. Iraq, number five, is a hotbed for terrorist training. Afghanistan, number seven, is the world's leading supplier of heroin. Following the massive genocide of 1994 in Rwanda, refugees from that troubled state, thousands of armed soldiers among them, helped to destabilize neighboring Democratic Republic of the Congo (number six). Our global civilization depends on a functioning network of politically healthy nation-states to control the spread of infectious disease, to manage the international monetary system, to control international terrorism and to reach scores of other common goals. If the system for controlling infectious diseases--such as polio, SARS or avian flu--breaks down, humanity will be in trouble. Once states fail, no one assumes responsibility for their debt to outside lenders. If enough states disintegrate, their fall will threaten the stability of global civilization itself.

Case

Culture

Baudrillard: Do not read unless you will go for it

1. Culture Crash Turn: Culture is like the economic system. The aff causes overproduction of culture through infinite preservation and goes beyond people's ability to consume it, leading a complete crash in all cultural signs and a destruction of the very things they try to protect.

(Baudrillard '96 Jean, March 16, "The Global and the Universal") //LS

Culture is a form of glory - it implies notion of sovereignty. Identity is a poor value: there is always something vain and useless about demanding identity. It is an aftereffect of the colonisation of mental space and the failure of its decolonisation. Culture is a symbolic pact. Once it solidifies as a heritage, as power, as appropriation, as identity, once it be-comes signature, that is, a material image of this power, it is all over. Finished. We could repeat what Hannah Arendt said of power: "What saps and ends up killing political com-munities", she said, "is the loss of power and ultimate powerlessness. But power (and culture) cannot be stockpiled and kept for emergencies, like instruments of violence: it exists only as act. Power which does not become action disappears and history demonstrates with a host of examples that the greatest material riches cannot not make up for such a loss." That is what culture is, in its highly singular and original form. Let us now look at what it has become at the global level. Culture (understood as cultural production and consumption) is a mirror of material production. And material production, since the 1929 Crash, has been in a state of overproduction, or in a state of threatening overproduction. Already in 1929, growth was giving way to excessive or "over-growth". And ever since, this "overgrowth" (and not growth) has kept our societies in a state of increasingly acute economic crisis - interrupted, on by wars and the economic recovery that destruction carries within it, all of this being only cure for excess growth. We can say then that the fundamental catastrophe remains the excessive growth that globalisation continues to intensify. The other antidote to exponential growth, besides wars, is the Stock Market Crash (but the latter would appear to be less and less effective, since it is now only virtual and involves only speculative capital. The same diagnosis could be made of culture, and the other Crash threatening us is that of cultural overproduction. The powers that be would have us believe that in the cultural market place, unlike in the commodity marketplace, demand still exceeds supply and will continue to do so for a good while yet. The people supposedly have an insatiable hunger for cultural goods. And so we get a guaranteed boom in all cultural "values or securities". In fact, this is not at all the case. In the cultural economy of the average citizen (if such a thing exists), there is a noticeable surplus of supply over demand. It is like/just the same as at the supermarket. The illimited promotion of cultural products already far exceeds human capacity to absorb them. The average person no longer even has the time to consume his own cultural products, let alone those of others. The public does its best: people run round from one exhibition to another, from one film festival to another but their capacity or cultural labour is stretched to the limit. What results from this is an original form of cultural alienation, not due to lack or deprivation, but to surplus and saturation. In this new context, the degree of cultural alienation, that is of being held hostage by culture (by its ads., its media, its institutions) comes close to the degree of voluntary submission in politics. The public supposedly wants even more of this culture; one can never have too much

of it. Well that is a colossal illusion and error of perspective. The same is said about information too: one can never have too much of it. Always more information. Always more transparency. And we can see the effects that are as murderous as they are contradictory. But in the case of culture, the situation is even more serious. For, either culture is a singular language, the idiom of a particular group or society and in that case it has its own finality, and is not at all infinitely expandable (its promotion and its proliferation on the contrary signify its death); it is like natural languages, both open to an infinite internal complexity and strictly limited in their structure and constitutive elements - if this were not so, they would not be languages. Well, either culture is a singularity of this kind, or else it is what it has become: a market with all the effects of artificial shortage, spiraling values and speculation. And, as soon as one tends to confuse these exponential market factors with irresistible cultural progress, what looms on the horizon is the same reversal as occurred in the 1929 crisis in material production: overproduction, priority of supply over demand, the end of `natural' assumptions about an economy that had become speculative, virtual and completely cut off from real wealth and real economic requirements. This is exactly what lies in wait for culture and a cultural market turned speculative. And there could very easily be like Black Thursday on Wall Street in 1929, a Black Sunday of culture. The expansion of cultural production far surpasses the expansion of material production, and the result is cultural bottlenecks that are even more monstrous than blockages in the economy or our constantly paralysed traffic systems. For, in the open field of communication, anyone can produce gestures, texts, colours, signs and meanings, spontaneously and indefinitely in a kind of uninterrupted interchange. Anyone can stage his or her own performance, unfortunately in total indifference to the other, or with only a token superficial consent and in a certain sense this is unavoidable for how can these countless productions be adequately provided for? And if, to a certain extent, we have managed to ward off economic crisis by opening cultural markets (particularly in France, where it is actually obvious that culture is a political instrument) who will save us from cultural over-production when this market, in its turn, is saturated? Perhaps we will have to undertake a massive destruction of cultural values to save the stock market value of the sign, the stock market value of the cultural artifact, just as they once burned coffee in the furnaces of steam engine locomotives so as to save the world price of coffee. Already most non-material goods are meeting the same fate as material goods: forced production, forced advertising, accelerated recycling, built-in obsolescence. Art becomes ephemeral, not so as to express the ephemeral nature of life, but to adapt to the transience of the market. Rather than decadent, art is now degradable in line with the biodegradability of the physical world. **Such is the fate of our cultural signs,** be the disinvested or of transvestite nature, they are part of the pure and simple discount of degradable products.

Solvency

Disparate Treatment **Do not run with Co-Op CP**

Turn: Giving more sovereignty to border tribes creates disparate treatment – leads to litigation and hostility

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

As a final point, such a strategy would create the same disparate treatment noted previously. Border tribes would receive true sovereignty, while landlocked tribes, which do not present the same homeland security problems, would likely maintain the status quo. It is highly unlikely that the federal government would be willing to carve up small sovereign states in its midsection and elsewhere. Undoubtedly, this would lead to considerable litigation and further complicate an already difficult relationship between Native Americans and the federal government. More dangerously, Native Americans may be pushed too far in this relationship and respond with open hostility.

Circumvention

Plan gets circumvented – Guadalupe proves the USFG just does whatever it wants when it comes to border-crossing rights when convenient

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

The Treaty of Guadalupe Hidalgo, signed between the United States¶ and Mexico at the conclusion of the Mexican-American War, brought several border tribes under the protection of the federal government.47¶ While this treaty made no mention of border crossing akin to the Jay Treaty, the Native American tribes routinely enjoyed free passage between¶ the United States and Mexico for a significant period of time.48 This freedom continued, largely unchanged, until the 1980s, when the problem of illegal Mexican immigration forced the United States government to restrict all passage between the United States and Mexico border.4 9¶ While federal actions after this treaty did not renege on promises guaranteed to Native Americans, the actions reiterate the underlying nature of the federal government-Native American relationship portrayed by the Marshall trilogy and the discussed treaties. Whatever rights may exist for Native Americans cannot be considered fundamental in any way. They exist at the pleasure of the federal government, to be granted or withheld at¶ the convenience of the government.¶ The United Nations Draft Declaration, though not yet adopted by the United Nations or its members, reflects generally recognized international norms with respect to the treatment of indigenous populations, such as Native Americans. 50 In short, it would recognize the importance of Native Americans' right to occupy and use traditional lands while requiring¶ 51¶ The International Labor Organization Convention reflects the sovereign hopes of Native American tribes by recognizing the "aspirations of indigenous peoples to exercise control over their own institutions, ways of life and economic development and to maintain and develop their identities, languages and religions, within the framework of States in which they live." 52 The Convention requires that its signers take affirmative steps¶ to assist Native American tribes in preserving their culture and protecting in case law and treaties. The historical record shows that the relationship between the federal government and Native Americans is dictated not by words, but by actions. In that vein, Native Americans should take little consolation from the statements and efforts of the international

community, as it is unlikely that the federal government will be swayed more by the words of the international community than it has been by its own words. The historical record reflects the tenuous nature of the relationship between the federal government and Native Americans. Often depicted as less than human, Native Americans have never enjoyed equal status. Moreover, the federal government has routinely failed to abide by its agreements with Native Americans.

Arizona, where the Tohono live, won't follow new border laws

Elizabeth **Erwin 4/11** ("Arizona lawmakers want to ignore President Obama's executive orders", Mar 11, 2015 6:27 PM, http://www.abc15.com/news/state/arizona-lawmakers-want-to-ignore-president-obamas-executive-orders, Accessed 7/16/15,)

President Barack Obama has signed some big executive orders lately. **They've impacted** guns and immigration, two **issues Arizonans clearly care about.** But the approach some lawmakers are taking to keep us from enforcing those rules has some questioning if the plan is even legal! "**The legislature wants to prevent enforcement of executive orders and prevent enforcement of federal agency policy directives**," said attorney David Abner with Knapp & Roberts Law Firm. **House Bill 2368 says unless those orders have been voted on by Congress and signed into law, Arizona wouldn't have to follow them. "It's political grandstanding. There's nothing of substance to this. It's silly**," Abner said. "Well, unfortunately, it's a waste of time, somewhat ridiculous. In fact very ridiculous," said House Minority Leader Bruce Wheeler. Wheeler voted against the bill. He said the priorities of what gets floor time doesn't match up with what Arizonans really need. "**We ought to be addressing education and jobs. Instead we're addressing these extremist bills**," Wheeler said. **Abner said even if this bill is signed into law there's no way it would stand up in court**. "If our state officials ignore federal law they run the risk of prosecution by federal authorities," Abner said. ABC15 reached out to the bill's sponsors today for comment. We have not heard back yet.

Immigration Turn

1. Border Patrol is stopping immigration but plan pullout reverses current trends - crossings in this area cause negative environmental impacts, break-ins, means Tohono O'odham can't do cultural activities

(Filzen '13, Andrea Filzen, 2-22-2013, "Clash on the Border of the Tohomo O'odham Nation," Pulitzer Center, http://pulitzercenter.org/reporting/clash-border-tohomo-o%E2%80%99odham-nation-migration-Mexico-Arizona-Native-Americans) //LS

Some migrants are poor parents who want to financially support their families by working in the United States. They are not aggressive and they are not drug dealers. Some well- intentioned migrants, out of desperation, steal food, water, and trucks, leave their trash on the land, and use medical resources when passing through the O'odham nation. Employees like Gary Olson, manager of waste maintenance for the O'odham government, reduce the negative effects of migration by cleaning up litter. "Some of my employees have had their homes broken into. Migrants raid their fridges because they're starving after a long journey. Trashing homes and leaving dirty clothes behind negatively impacts the environment," Olson expresses. Yet according

to Olson, the amount of litter on the reservation decreased due to reduction in border-crossing and help from larger environmental safety bodies such as the Environmental Protection Agency (EPA). "**Immigration has significantly decreased because Border Patrol has buckled down**. It's a cat and mouse game, and now there are more cats then mice. Another factor is just the little job opportunities in the States now. With unemployment gone up there is less of an appeal to come to the United States," Olson explains. Views vary. Zepeda believes that migration is on the rise. "A lot of times the migrants will want, especially in the summer time, water or food. In the past it wasn't a problem but let's say in the last ten to fifteen years it has gotten pretty dangerous, where there are more people crossing and they want more than water and food—for example your truck or things on your lawn—and to that extent, Tohono O'odham people are not open to helping because they don't know who they're helping and that might cause further problems. Because of the influx of more movement across the O'odham nation Border Patrol is very visible out there so there's that conflict as well for jurisdiction and so on."

2. Plan funnels illegal immigration into the most dangerous areas of the desert – increases violence, drug trade, migrant deaths

(Filzen '13, Andrea Filzen, 2-22-2013, "Clash on the Border of the Tohomo O'odham Nation," Pulitzer Center, http://pulitzercenter.org/reporting/clash-border-tohomo-o%E2%80%99odham-nation-migration-Mexico-Arizona-Native-Americans) //LS

"A woman was driving her truck –and a lot of roads that come off of the main highway towards the reservation, like dirt roads, was one that she was on –and she had to stop because she saw a large tree laid across the road, which was unusual… so she couldn't cross. So she stopped and these people came out of the desert and they were all illegal immigrants and they didn't hijack her but they took her truck… and that was one way of making sure she stopped by putting the tree there. So that made it in the local tribal paper and people are warned of things that are unusual to come across. Trees in the road."

Ofelia Zepeda, professor of linguistics at the University of Arizona, refers to an incident in which migrants crossing into the United States from the border of Mexico disturb the lives of a Native American group, the Tohono O'odham, who reside on the border. **Currently migrants who attempt to cross the United States border from Mexico and avoid Border Patrol are channeled into a strip of the Tohono O'odham Nation's hazardous desert land**. Stricter national security increasingly causes migrants to cross through the reservation, which attracts various actors onto the nation's land, consequentially altering O'odham way of life as well as O'odham attitudes towards undocumented migrants. Eddie Brown, a professor of Arizona State University and a member of the Tohono O'odham tribe, discusses some of the issues that Tohono O'odham tribal members face because they live on the border of Mexico and Arizona. "You have O'odham living in villages close to the border and many times their houses are robbed, their cars stolen, their homes broken into. So many times you have O'odham that are afraid sometimes to go into town to buy food, to leave their houses alone never knowing what is going to happen. And then of course you have the drug trade and this is where it gets even more complicated: Illegals coming across have dollars that pay people so you have O'odham that do not have jobs and are looking for some way to earn a living; that becomes a very easy way as well."

Culture Crash Overview 1

Extend Baudrillard 96. Here's the argument.

1. The collection of world cultures is like a giant economy, and it operates on the same principles. People can only deal with so much culture; limited amounts of it can be consumed. Culture is already being overproduced, and everyone is already being overwhelmed with cultural artifacts and practices.

2. Their effort to preserve a particular culture aids in this market saturation of culture. Like any other market, when something is in too great of supply, its value drops, so the more culture there is, the less people value it, and it stops having any real-life application – in practical terms, people stop having time to deal with all the different practices of culture out there, so they stop caring about any of them, which turns their impacts.

3. Also, this overproduction will result in a complete crash of all culture, like the Great Depression of the 30s. This means the destruction of everything they try to protect, because it lacks any value and people abandon culture entirely, so not only the culture they protect is lost but all other ones too, as cultures become another minimum value commodity to be used and cast away.

Culture Crash Overview 2

They drop some key analysis on this argument, so extend the Baudrillard 96 evidence and these points from the overview:

1. Culture is like an economic product, and it's already overproduced. They protect culture, so there's more of it and the value of it drops, so all the good stuff they claim to save by protecting culture is no longer there, because culture is no longer valued by people.

2. This leads to the destruction of all culture, a worldwide rejection of all cultural products as useless. That's bigger than anything they can claim to solve for, and is a terminal impact that outweighs anything they can claim.

3. It's crucial to allow some culture to be destroyed in order to save the whole – only by letting the supply drop so the value of it can increase will culture retain any meaning. Allow their impacts to happen to avoid the crash of culture.

T – Domestic

A. Domestic surveillance is surveillance of US persons

Small 8 MATTHEW L. SMALL. United States Air Force Academy 2008 Center for the Study of the Presidency and Congress, Presidential Fellows Program paper "His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power during Times of National Crisis" http://cspc.nonprofitsoapbox.com/storage/documents/Fellows2008/Small.pdf

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to narrow the scope of the term "domestic surveillance." Domestic surveillance is a subset of intelligence gathering. Intelligence, as it is to be understood in this context, is "information that meets the stated or understood needs of policy makers and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, domestic surveillance is a means to an end; the end being intelligence. The intelligence community best understands domestic surveillance as the acquisition of nonpublic information concerning United States persons (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept. This paper's analysis, in terms of President Bush's policies, focuses on electronic surveillance; specifically, wiretapping phone lines and obtaining caller information from phone companies. Section f of the USA Patriot Act of 2001 defines electronic surveillance as:

B. Border Patrol surveillance occurs on non-US Persons

(CBP 15, CBP, US Border Patrol Official Website, "Border Patrol Overview," USCBP, acc. 7/24/15 http://www.cbp.gov/border-security/along-us-borders/overview)

While the Border Patrol has changed dramatically since its inception in 1924, its primary mission remains unchanged: to detect and prevent the illegal entry of aliens into the United States. Together with other law enforcement officers, the Border Patrol helps maintain borders that work - facilitating the flow of legal immigration and goods while preventing the illegal trafficking of people and contraband.

Undocumented persons are not US persons

(Jackson et al 9 Brian A. Jackson, Darcy Noricks, and Benjamin W. Goldsmith, RAND Corporation The Challenge of Domestic Intelligence in a Free Society RAND 2009 BRIAN A. JACKSON, EDITOR

3 Federal law and executive order define a U.S. person as "a citizen of the United States, an alien lawfully admitted for permanent residence, an unincorporated association with a substantial number of members who are citizens of the U.S. or are aliens lawfully admitted for permanent residence, or a corporation that is incorporated in the U.S." (NSA, undated). Although this definition would therefore allow information to be gathered on U.S. persons located abroad, our objective was to examine the creation of a domestic intelligence organization that would focus on—and whose activities would center around—individuals and organizations located

inside the United States . Though such an agency might receive information about U.S. persons that was collected abroad by other intelligence agencies, it would not collect that information itself.

C. The Aff interpretation is bad for debate – limits are necessary for negative preparation and clash, and their interpretation makes the topic too big. Immigration is a huge area, big enough to be a topic itself, and all the issues are completely different.

Text: The United States Federal Government should do the following: 1. Cross-deputize the Tohono O'odham Tribal Police Department with Arizona State Police Forces, 2. Mandate cultural sensitivity training, 3. Substantially increase shared responsibilities with United States Border Patrol, 4. It should grant citizenship and border crossing rights to all members of the Tohono O'odham tribe, 5. Give exclusive jurisdiction of border crossings to the cross-deputized tribal law officers, 6. Increase funding for tribal law enforcement and 7. Substantially increase border-crossing zones.

The Counterplan solves the entirety of the affirmative and net-benefit plus solves disputes, violence, drug and human trafficking, culture, and terrorism

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

The onerous history of relations between tribal, federal, and state governments and the coinciding development and enforcement of laws surrounding tribal entities have yielded the current complex and highly antagonistic environment that exists today. Until greater attention is given to these issues and shifts in governmental policies occur, the negative circumstances faced by the Tohono O'odham and Saint Regis Mohawk Nations, as well as several other American Indian tribes in the United States, will continue to escalate.¶ Currently, limitations on tribal sovereignty serve as one of the most substantial barriers in tribal law enforcement's ability to carry out its duties to protect tribal members and resources. An examination of the results of increased tribal sovereignty in the past forty years provides reason to believe that further increases in sovereignty would improve the [End Page 311] current conditions faced by these communities. Since the mid-1970s, shifts in federal policy toward increased tribal self-determination have progressively manifested as improvements in tribal judicial, economic, and social systems. These improvements may be attributed to the allocation of responsibilities to tribal providers who are more knowledgeable about tribal needs and more accountable to tribal communities than their federal counterparts. Grant programs like STOP VAIW, which encourages tribally developed strategies to reduce crimes

against Indian women, have also shown substantial success, including increasing arrest rates and empowering tribal officials and women.100 Additionally, because the federal government still possesses plenary power over Indian nations, there is significant incentive for tribal nations to support activity that is fair to all Native and non-Native people.101 One specific example of how an increase in tribal sovereignty could address these challenges includes the expansion of tribal law enforcement jurisdictional authority through the continued use of policies such as cross-deputization agreements. Expanding the authority of tribal law enforcement will work to reduce and possibly prevent non-Indian criminal activity on reservations. This type of system is also typically less expensive than other options, such as security contracts in which tribal governments contract with public or private entities to provide additional security on tribal land. In cross-deputization agreements, all participants may undergo training that provides a comprehensive overview of federal, state, and tribal laws. Additionally, these agreements enable tribal, state, and county officials to utilize emergency equipment, such as firearms and vehicles, on and off reservation land.102¶ Furthermore, because the responsibility of protecting our nation's borders falls on the shoulders of the US government and should not fall exclusively on two small Indian nations, it is also important for the federal government to maintain a presence along the border. According to the federal Indian trust responsibility, the United States "has charged itself with moral obligations of the highest responsibility and trust" toward Indian tribes (Seminole Nation v. United States, 1942). This doctrine is also a "legally enforceable fiduciary obligation on the part of the United States to protect tribal treaty rights, lands, assets, and resources, as well as a duty to carry out the mandates of federal law with respect to American Indian and Alaska Native tribes and villages."103¶ Given the federal government's responsibility to protect our nation's [End Page 312] borders and tribal lands and resources, it is crucial that the federal government should maintain a presence along the international borders within tribal land. This presence, however, should be limited to a specified radius where the most violent crimes tend to occur.104 This would serve as a mechanism to reduce the current animosity between the tribal communities and federal agents, enhance the safety of tribal members on the Tohono O'odham and Saint Regis Mohawk reservations, and reduce the impact of trafficking on vital resources.¶ Given that it is extremely important for tribal, local, state, and federal governments to work together to improve the situation along the border, communication and cooperation are vital to the successful achievement of goals. By increasing formal collaborations with tribal members concerning issues related to the border, solutions can be developed that benefit all stakeholders. In this particular situation, increased utilization of tribal knowledge and experience will enhance the effectiveness of law enforcement efforts. Not only do tribal members know the land better than anyone, they also know the individuals involved and methods utilized in carrying out this intricate system of trafficking. Maintaining an environment of respect is crucial for the positive advancement of these interactions and may be achieved by implementing a compulsory training on cultural sensitivity issues for federal and state law enforcement agencies.¶ At the macrolevel, congressional involvement is also fundamental to inducing change. Legislative initiatives may involve increasing funding for education and employment opportunities on reservations, increasing sentences for drug traffickers who utilize Indian land (although this may disproportionately affect Native people), and reallocating enforcement resources to treat the demand for drugs as a public health problem.105 It is also important to develop a fair and easily accessible method for tribal members in the United States, Mexico, and Canada to gain access to identification that is consistently accepted by all border enforcement agencies. One method of achieving this would be to provide US citizenship to all Tohono O'odham and Saint Regis Mohawk members regardless of what country they reside in and provide them with a realistic means for obtaining US passports or identification cards. Furthermore, it is crucial that policymakers eliminate the inequities in resource allocation between tribal, local, and state governments to increase the effectiveness of the enforcement of borders. [End Page 313]¶ The crisis of drug and human trafficking within the Saint Regis Mohawk and Tohono O'odham Nations is not a matter to be taken lightly. Not only is it a threat to the security and culture of two unique populations, but it also poses a threat to the United States' homeland security. Each year tons of drugs and weapons are transported through these locations and distributed throughout the United States. These sites also represent an easily accessible entry point for terrorist groups.

Allowing for the changes referenced above, tribal groups like the Tohono O'odham and Saint Regis Mohawk Nations can begin to build innovative and effective systems that incorporate their traditional beliefs and may even serve as a model for the rest of the nation. Achieving a balance between federal presence on the reservation, increased tribal authority over their land and activities, and equitable distribution of resources is fundamental to resolving unrest along the border.

Cooperation solves national security and resolves disputes

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

All members of a society confronted by a terrorist threat have an equal interest in preserving their security. With this common motivation, it is logical to expect that every member of society has some role in ensuring the desired security. A common goal suggests common means, or more specifically, a coordinated effort. The nature of the terrorist threat mandates a proactive response to minimize access to the nation by those seeking to carry out acts of terrorism. Meeting this goal necessitates taking a close look at the past and current relationship between the federal government and Native American tribes. Logically, the best solution is one in which hostilities between these partners is eliminated, not compounded, as both parties share in the hopes of internal security. To that effect, the federal government must recognize the important role that Native American tribes have in protecting international borders, and take appropriate steps to make Native American tribes a full and equal partner in combating this common threat.

Coming together to meet this mutual homeland security goal may, in the end, bring Native Americans and the federal government closer together, mending more longstanding disputes. Native Americans may come to enjoy the type of sovereignty they possessed prior to European discovery, the limiting statements of Chief Justice Marshall, and later actions by the federal government.

1. Drug trafficking from Mexico to the US through the Tohono O'odham nation is high now – native population involved and the aff can't solve

Cummings and Revel 14 (Janet, Emory University, Department of Health Policy and Management, and Asa, Executive Assistant, National Native American Law Enforcement Association, The American Indian Quarterly, Volume 38, Number 3, Summer 2014, Project Muse)//rf

The distribution and use of illegal narcotics has historically been a prevailing concern among the US general public, with local laws related to the issue enacted as early as the 1840s. It was not until the initiation of the "War on Drugs" by President Richard Nixon in 1971, however, that this topic became a central theme in political arenas. Since this era, numerous laws have been enacted in an attempt to combat this problem. In spite of the implementation of more stringent laws and regulations geared toward reducing the pervasiveness of drugs since the 1970s, the distribution and use of illegal

narcotics continues to be widespread throughout the United States and, in some cases, has shown significant increases.¶ This escalation is particularly evident on reservations such as those of the Tohono O'odham and Saint Regis Mohawk Nations. According to a report released by the US Department of Justice, both Mexican and Asian drug-trafficking organizations (dtos) frequently exploit reservations along the US-Mexico and US-Canada borders as arrival and/or transit zones for illegal drugs destined for markets throughout the United States.1 Drugs are brought in via a variety of means, and Native American criminal groups are often recruited to retrieve and transport the goods on the US side of the reservations.¶ In 2010, the Tohono O'odham Nation was designated as a part of the Arizona High Intensity Drug Trafficking Area (hidta) by the US Department of Justice. This region encompasses the western and southern [End Page 289] counties of Cochise, La Paz, Maricopa, Mohave, Pima, Pinal, Santa Cruz, and Yuma, including the entire US-Mexico border in Arizona. The area is considered to be a major arrival zone for large quantities of marijuana, methamphetamine, cocaine, and heroin entering the United States from Mexico. In 2009, 42 percent of all marijuana seizures occurring along the US-Mexico border took place in this region, with the Tohono O'odham reservation serving as the primary entry point.2 Another report estimated that 5–10 percent of all marijuana produced in Mexico is transported through this reservation, which accounts for less than 4 percent of the entire US-Mexico border.3¶ Increased border enforcement efforts along many parts of the US-Mexico border that began in the 1990s and intensified after the September 11 terrorist attacks have forced drug and human smugglers to use more remote areas like the Tohono O'odham reservation.4 Five informal border crossings have existed for decades along the Tohono O'odham Nation's seventy-five-mile international border. Officially, only tribal members are permitted to pass through these entry points, and the biggest obstacle to crossing these locations used to be steel cattle guards and barbed-wire fencing. Due to a lack of enforcement and extensive desert terrain along these areas, however, smugglers began using these points to gain easy access into the United States via stolen vehicles. As a result, tribal officers were forced to close some of the entry points.5 Additionally, the border has been enhanced with metal post and Normandy-style barriers (surface mountings constructed with high-strength tubular and structural steel components) in an attempt to stop trucks carrying illegal drugs headed for urban areas.6 Other means of transporting drugs across the border include backpackers, couriers on horseback, and airplanes.7¶ Because of the reservation's proximity to the border, wholesale quantities of drugs are often seized throughout the land of the Tohono O'odham Nation, and these quantities have increased dramatically in the past decade. During fiscal year 2001, the Tohono O'odham Police Department seized 45,000 pounds of illegal narcotics; this number increased to 65,000 pounds in 2002.8 This pattern of escalation has shown no signs of deterioration. In 2008, a total of 201,000 pounds of marijuana alone were seized on the reservation by law enforcement; in 2009, this amount increased further to 319,000 pounds of marijuana.9¶ Even more alarming than the increase in the quantity of drugs seized [End Page 290] is the increase in tribal member involvement with the smuggling process. According to a statement made by Sgt. David Cray, a nineteen-year veteran of the Tohono O'odham Police Department's antidrug unit, the percentage of drug smugglers arrested on the reservation who are tribal members has substantially increased in the last two decades. In the first half of 2009, twenty-nine of the forty-five arrests related to drug smuggling made by tribal officers were of tribal members.10 One of the primary reasons tribal members are recruited to assist with trafficking is because law enforcement officials must have a reasonable suspicion to stop tribal members, whereas nontribal persons driving on the reservation's restricted areas are not held to this standard.¶ The Saint Regis Mohawk Nation of New York is experiencing a similar predicament. According to reports, Asian dtos exploit the reservation and its tribal members by smuggling marijuana, mdma, and cocaine across the Canadian border daily. The National Drug Threat Assessment 2010 estimates that as much as 20 percent of all high-potency marijuana grown in Canada each year is smuggled through the reservation. Each week, multiple tons of illegal narcotics pass through the reservation, an area that accounts for less than 1 percent of the US-Canada border.11 According to Saint Regis Mohawk Tribal Police Chief Andrew Thomas, incidents related to border security occur daily, and a high percentage of these violations relate to illegal narcotics.12¶ Unless significant strides are made in the realm of policy, it is unlikely that the circumstances on the Tohono O'odham or Saint Regis Mohawk reservations will improve. Until these changes occur, drug trafficking will continue to place a significant financial and public health burden on tribal entities and threaten the security of the United States.

2. Only expansion of current federal presence can solve - removing Border Patrol destroys the only hope the Tohono have to combat drug trafficking

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly,

http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

Yet there are reasons to hope. Tribal revenues are up, which may allow for increased investment in education (which could help to combat poverty and reduce the attractiveness of drug trafficking). State, local, and federal officials are aiming to improve coordination with reservation law enforcement, **the Border Patrol has introduced cultural sensitivity training for its officers**, and new counter-trafficking measures grant O'odham officers access to advanced technological tools. Revels and Cummings are optimistic about this upward trajectory, advocating further expansion of the legal capabilities of Tohono O'odham law enforcement, and a continued strong, but perhaps more respectful **federal presence to reduce cross-border trafficking and protect vulnerable O'odham.**

3. Border Patrol loss increases crime – making a bad situation even worse

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

The federal government can grant border tribes complete sovereignty, treating them like foreign states as argued in Cherokee Nation. Such a change would give the border tribes sole authority to patrol international borders. United States Border Patrol would then shift its operations to controlling the borders between the Native American lands and the United States. The federal and state governments would then have mutual responsibility for patrolling and prosecuting illegal activity crossing into the United States from the Native American lands without having to expend resources in monitoring the soft spots along Native American international borders. Decades of federal assistance have created a strong reliance on the federal government in tribal affairs. Because of federal oversight, Native American tribes have never been completely self-sufficient. Abruptly cutting off this federal assistance would likely leave the tribal lands in greater security disarray than at present. Native American tribes currently lack the ability to combat crime in their territory. Therefore, without federal assistance, their crime problems could significantly worsen. Native American violent crime rates far exceed those of any other group.10 7

4. Devastates the Tohono people and turns their culture claims – drug abuse, sexual violence, killings by rival drug cartels from smugglers and affiliates

(Mizzi '14, Shannon Mizzi, Friday, SEP 26, 2014, "A Forgotten Front in the Drug & Border Fights: Tribal Reservations by Shannon Mizzi," The Wilson Quarterly, http://wilsonquarterly.com/stories/forgotten-front-in-drug-border-fights-tribal-reservations/, language edited) //LS

The increase in drug trafficking has spilled over into almost every other aspect of reservation life. Where other racioethnic groups have seen a decrease in violent crime over the past several decades, American Indian communities have suffered from rising incidences of violence over the past 30 years. According to Revels and Cummings, "tribal law enforcement officials across the [United States] consistently report that most violent, personal, and property crimes on reservations relate to drug trafficking, drug abuse, and gang activity," which "often lead to other indirect consequences such as **accidental death, injuries, suicide, domestic violence, and sexual abuse."** The increasingly militarized nature of border reservations like that of the Tohono

O'odham has fundamentally changed life in those communities: They are no longer peaceful or safe places to live, and not a single resident is unaffected by the realities and spillover effects of the drug trade. Homes are regularly broken into by smugglers and their affiliates. Residents are routinely searched by law enforcement, their movements restricted on their own land. Those who assist independent drug smugglers who are not attached to major cartels are at risk of being attacked by members of dominant drug cartels who want to eliminate competition and retain their near monopoly on the business. "The psychological burden this type of environment places upon individuals," write Revels and Cummings, "coupled with the constant sense of fear, is immeasurable."'

Terror DA

1. Terror risk is high- maintaining current surveillance is key

Inserra, 6-8-2015

David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation, 6-8-2015, "69th Islamist Terrorist Plot: Ongoing Spike in Terrorism Should Force Congress to Finally Confront the Terrorist Threat," Heritage Foundation, http://www.heritage.org/research/reports/2015/06/69th-islamist-terrorist-plot-ongoing-spike-in-terrorism-should-force-congress-to-finally-confront-the-terrorist-threat

On June 2 in Boston, Usaamah Abdullah Rahim drew a knife and attacked police officers and FBI agents, who then shot and killed him. Rahim was being watched by Boston's Joint Terrorism Task Force as he had been plotting to behead police officers as part of violent jihad. A conspirator, David Wright or Dawud Sharif Abdul Khaliq, was arrested shortly thereafter for helping Rahim to plan this attack. This plot marks the 69th publicly known Islamist terrorist plot or attack against the U.S. homeland since 9/11, and is part of a recent spike in terrorist activity. The U.S. must redouble its efforts to stop terrorists before they strike, through the use of properly applied intelligence tools. The Plot According to the criminal complaint filed against Wright, Rahim had originally planned to behead an individual outside the state of Massachusetts,[1] which, according to news reports citing anonymous government officials, was Pamela Geller, the organizer of the "draw Mohammed" cartoon contest in Garland, Texas.[2] To this end, Rahim had purchased multiple knives, each over 1 foot long, from Amazon.com. The FBI was listening in on the calls between Rahim and Wright and recorded multiple conversations regarding how these weapons would be used to behead someone. Rahim then changed his plan early on the morning of June 2. He planned to go "on vacation right here in Massachusetts…. I'm just going to, ah, go after them, those boys in blue. Cause, ah, it's the easiest target."[3] Rahim and Wright had used the phrase "going on vacation" repeatedly in their conversations as a euphemism for violent jihad. During this conversation, Rahim told Wright that he planned to attack a police officer on June 2 or June 3. Wright then offered advice on preparing a will and destroying any incriminating evidence. Based on this threat, Boston police officers and FBI agents approached Rahim to question him, which prompted him to pull out one of his knives. After being told to drop his weapon, Rahim responded with "you drop yours" and moved toward the officers, who then shot and killed him. While Rahim's brother, Ibrahim, initially claimed that Rahim was shot in the back, video surveillance was shown to community leaders and civil rights groups, who have confirmed that Rahim was not shot in the back.[4] Terrorism Not Going Away This 69th Islamist plot is also the seventh in this calendar year. Details on how exactly Rahim was radicalized are still forthcoming, but according to anonymous officials, online propaganda from ISIS and other radical Islamist groups are the source.[5] That would make this attack the 58th homegrown terrorist plot and continue the recent trend of ISIS playing an important role in radicalizing individuals in the United States. It is also the sixth plot or attack targeting law

enforcement in the U.S., with a recent uptick in plots aimed at police. While the debate over the PATRIOT Act and the USA FREEDOM Act is taking a break, the terrorists are not. The result of the debate has been the reduction of U.S. intelligence and counterterrorism capabilities, meaning that the U.S. has to do even more with less when it comes to connecting the dots on terrorist plots.[6] Other legitimate intelligence tools and capabilities must be leaned on now even more. Protecting the Homeland To keep the U.S. safe, Congress must take a hard look at the U.S. counterterrorism enterprise and determine other measures that are needed to improve it. Congress should: Emphasize community outreach. Federal grant funds should be used to create robust community-outreach capabilities in higher-risk urban areas. These funds must not be used for political pork, or so broadly that they no longer target those communities at greatest risk. Such capabilities are key to building trust within these communities, and if the United States is to thwart lone-wolf terrorist attacks, it must place effective community outreach operations at the tip of the spear. Prioritize local cyber capabilities. Building cyber-investigation capabilities in the higher-risk urban areas must become a primary focus of Department of Homeland Security grants. With so much terrorism-related activity occurring on the Internet, local law enforcement must have the constitutional ability to monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working on integrating intelligence and law enforcement activities. Full integration will require overcoming inter-agency cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Maintain essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Clear-Eyed Vigilance The recent spike in terrorist plots and attacks should finally awaken policymakers—all Americans, for that matter—to the seriousness of the terrorist threat. Neither fearmongering nor willful blindness serves the United States. Congress must recognize and acknowledge the nature and the scope of the Islamist terrorist threat, and take the appropriate action to confront it.

2. Plan forces border patrol to monitor the entire perimeter of the Tohono O'Odham border, killing already scarce funding and creating an open highway into the US for terrorists

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

Additionally, such a plan would result in increasing the territory under the jurisdiction of the Border Patrol. For example, instead of just worrying about the Tohono O'odham border with Mexico, the Border Patrol would have to monitor the entire perimeter of the tribe's border in Arizona. This increased area would require additional personnel and funds, both of which are scarce.¶ As a final point, such a strategy would create the same disparate treatment noted previously. Border tribes would receive true sovereignty, while landlocked tribes, which do not present the same homeland security problems, would likely maintain the status quo. It is highly unlikely that the federal government would be willing to carve up small sovereign states in its midsection and elsewhere. Undoubtedly, this would lead to considerable litigation and further complicate an already difficult relationship between Native Americans and the federal government. More dangerously, Native Americans may be pushed too far in this relationship and respond with open hostility. ¶ As a goal for society, granting Native Americans greater control over their territories and destinies is an admirable and noble goal. As a means to combat current deficiencies in homeland security, this plan fails. It would likely result in a further stretching of scarce resources and ultimately create more gaps in security.

3. Terrorists will use bioweapons- guarantees extinction

Cooper 13

(Joshua, 1/23/13, University of South Carolina, "Bioterrorism and the Fermi Paradox," http://people.math.sc.edu/cooper/fermi.pdf, 7/15/15, SM)

We may conclude that, when a civilization reaches its space-faring age, it will more or less at the same moment (1) contain many individuals who seek to cause large-scale destruction, and (2) acquire the capacity to tinker with its own genetic chemistry. This is a perfect recipe for bioterrorism, and, given the many very natural pathways for its development and the overwhelming evidence that precisely this course has been taken by humanity, it is hard to see how bioterrorism does not provide a neat, if profoundly unsettling, solution to Fermi's paradox. One might object that, if omnicidal **individuals** are successful in releasing **highly virulent** and **deadly genetic malware** into the wild, they are still unlikely to succeed in killing everyone. However, even if every such mass death event results only in a high (i.e., not total) kill rate and there is a large gap between each such event (so that individuals can build up the requisite scientific infrastructure again**), extinction would be inevitable** regardless. Some of the engineered bioweapons will be more successful than others; the inter-apocalyptic eras will vary in length; and post-apocalyptic environments may be so **war-torn, disease-stricken, and impoverished of genetic variation that they may culminate in true extinction events even if the initial cataclysm 'only' results in 90% death rates**, since they may cause the effective population size to dip below the so-called "minimum viable population." This author ran a Monte Carlo simulation using as (admittedly very crude and poorly informed, though arguably conservative) estimates the following Earth-like parameters: bioterrorism event mean death rate 50% and standard deviation 25% (beta distribution), initial population 1010, minimum viable population 4000, individual omnicidal act probability 10^{-7} per annum, and population growth rate 2% per annum. One thousand trials yielded an average post-space-age time until extinction of less than 8000 years. This is essentially instantaneous on a cosmological scale, and varying the parameters by quite a bit does nothing to make the survival period comparable with the age of the universe.

Case

Culture

1. Border Patrol is stopping immigration but plan pullout reverses current trends - crossings in this area cause negative environmental impacts, break-ins, means Tohono O'odham can't do cultural activities

(Filzen '13, Andrea Filzen, 2-22-2013, "Clash on the Border of the Tohomo O'odham Nation," Pulitzer Center, http://pulitzercenter.org/reporting/clash-border-tohomo-o%E2%80%99odham-nation-migration-Mexico-Arizona-Native-Americans) //LS

Some migrants are poor parents who want to financially support their families by working in the United States. They are not aggressive and they are not drug dealers. Some well- intentioned migrants, out of desperation, steal food, water, and trucks, leave their trash on the land, and use medical resources when passing through the O'odham nation. Employees like Gary Olson, manager of waste maintenance for the O'odham government, reduce the negative effects of migration by cleaning up litter. "Some of my employees have had their homes broken into. Migrants raid their fridges because they're starving after a long journey. Trashing homes and leaving dirty clothes behind negatively impacts the environment," Olson expresses. Yet according to Olson, the amount of litter on the reservation decreased due to reduction in border-crossing and

help from larger environmental safety bodies such as the Environmental Protection Agency (EPA). "**Immigration has significantly decreased because Border Patrol has buckled down**. It's a cat and mouse game, and now there are more cats then mice. Another factor is just the little job opportunities in the States now. With unemployment gone up there is less of an appeal to come to the United States," Olson explains. Views vary. Zepeda believes that migration is on the rise. "A lot of times the migrants will want, especially in the summer time, water or food. In the past it wasn't a problem but let's say in the last ten to fifteen years it has gotten pretty dangerous, where there are more people crossing and they want more than water and food—for example your truck or things on your lawn—and to that extent, Tohono O'odham people are not open to helping because they don't know who they're helping and that might cause further problems. Because of the influx of more movement across the O'odham nation Border Patrol is very visible out there so there's that conflict as well for jurisdiction and so on."

2. Plan funnels illegal immigration into the most dangerous areas of the desert – increases violence, drug trade, migrant deaths

(Filzen '13, Andrea Filzen, 2-22-2013, "Clash on the Border of the Tohomo O'odham Nation," Pulitzer Center, http://pulitzercenter.org/reporting/clash-border-tohomo-o%E2%80%99odham-nation-migration-Mexico-Arizona-Native-Americans) //LS

"A woman was driving her truck –and a lot of roads that come off of the main highway towards the reservation, like dirt roads, was one that she was on –and she had to stop because she saw a large tree laid across the road, which was unusual… so she couldn't cross. So she stopped and these people came out of the desert and they were all illegal immigrants and they didn't hijack her but they took her truck… and that was one way of making sure she stopped by putting the tree there. So that made it in the local tribal paper and people are warned of things that are unusual to come across. Trees in the road."

Ofelia Zepeda, professor of linguistics at the University of Arizona, refers to an incident in which migrants crossing into the United States from the border of Mexico disturb the lives of a Native American group, the Tohono O'odham, who reside on the border. **Currently migrants who attempt to cross the United States border from Mexico and avoid Border Patrol are channeled into a strip of the Tohono O'odham Nation's hazardous desert land**. Stricter national security increasingly causes migrants to cross through the reservation, which attracts various actors onto the nation's land, consequentially altering O'odham way of life as well as O'odham attitudes towards undocumented migrants. Eddie Brown, a professor of Arizona State University and a member of the Tohono O'odham tribe, discusses some of the issues that Tohono O'odham tribal members face because they live on the border of Mexico and Arizona. "You have O'odham living in villages close to the border and many times their houses are robbed, their cars stolen, their homes broken into. So many times you have O'odham that are afraid sometimes to go into town to buy food, to leave their houses alone never knowing what is going to happen. And then of course you have the drug trade and this is where it gets even more complicated: Illegals coming across have dollars that pay people so you have O'odham that do not have jobs and are looking for some way to earn a living; that becomes a very easy way as well."

Solvency

Plan gets circumvented – Guadalupe proves the USFG just does whatever it wants when it comes to border-crossing rights when convenient

(Di Iorio '07, "Mending Fences: The Fractured Relationship between Native American Tribes and the Federal Government and Its Negative Impact on Border Security", Syracuse Law Review, Vol. 57, Issue 2 (2007), pp. 407-428, Di Iorio, William R.) //LS

The Treaty of Guadalupe Hidalgo, signed between the United States¶ and Mexico at the conclusion of the Mexican-American War, brought several border tribes under the protection of the federal government.47¶ While this treaty made no mention of border crossing akin to the Jay Treaty, the Native American tribes routinely enjoyed free passage between¶ the United States and Mexico for a significant period of time.48 This freedom continued, largely unchanged, until the 1980s, when the problem of illegal Mexican immigration forced the United States government to restrict all passage between the United States and Mexico border.4 9¶ While federal actions after this treaty did not renege on promises guaranteed to Native Americans, the actions reiterate the underlying nature of the federal government-Native American relationship portrayed by the Marshall trilogy and the discussed treaties. Whatever rights may exist for Native Americans cannot be considered fundamental in any way. They exist at the pleasure of the federal government, to be granted or withheld at¶ the convenience of the government.¶ The United Nations Draft Declaration, though not yet adopted by the United Nations or its members, reflects generally recognized international norms with respect to the treatment of indigenous populations, such as Native Americans. 50 In short, it would recognize the importance of Native Americans' right to occupy and use traditional lands while requiring¶ 51¶ The International Labor Organization Convention reflects the sovereign hopes of Native American tribes by recognizing the "aspirations of indigenous peoples to exercise control over their own institutions, ways of life and economic development and to maintain and develop their identities, languages and religions, within the framework of States in which they live." 52 The Convention requires that its signers take affirmative steps¶ to assist Native American tribes in preserving their culture and protecting in case law and treaties. The historical record shows that the relationship between the federal government and Native Americans is dictated not by words, but by actions. In that vein, Native Americans should take little consolation from the statements and efforts of the international community, as it is unlikely that the federal government will be swayed more by the words of the international community than it has been by its own words. The historical record reflects the tenuous nature of the relationship between the federal government and Native Americans. Often depicted as less than human, Native Americans have never enjoyed equal status. Moreover, the federal government has routinely failed to abide by its agreements with Native Americans.

Arizona, where the Tohono live, won't follow new border laws

Elizabeth **Erwin 4/11** ("Arizona lawmakers want to ignore President Obama's executive orders", Mar 11, 2015 6:27 PM, http://www.abc15.com/news/state/arizona-lawmakers-want-to-ignore-president-obamas-executive-orders, Accessed 7/16/15,)

President Barack Obama has signed some big executive orders lately. **They've impacted** guns and immigration, two **issues Arizonans clearly care about.** But the approach some lawmakers are taking to keep us from enforcing those rules has some questioning if the plan is even legal! "**The legislature wants to prevent enforcement of executive orders and prevent enforcement of federal agency policy directives**," said attorney David Abner with Knapp & Roberts Law Firm. **House Bill 2368 says unless those orders have been voted on by Congress and signed into law, Arizona wouldn't have to follow them. "It's political grandstanding. There's nothing of substance to this. It's silly**," Abner said. "Well, unfortunately, it's a waste of time, somewhat ridiculous. In fact very ridiculous," said House Minority Leader Bruce Wheeler. Wheeler voted against the bill. He said the priorities of what gets floor time doesn't match up with what Arizonans really need. "**We ought to be addressing education and jobs. Instead we're addressing these extremist bills**," Wheeler said. **Abner said even if this bill is signed into law there's no way it would stand up in court**. "If our state officials ignore federal law they run the risk of prosecution by federal authorities," Abner said. ABC15 reached out to the bill's sponsors today for comment. We have not heard back yet.

T-Surveillance

Interpretation:

Surveillance is systematic collection of information

Kalhan 14 Anil Kalhan, Associate Professor of Law, Drexel University. Maryland Law Review 2014 74 Md. L. Rev. 1 Article: IMMIGRATION SURVEILLANCE lexis
A. The Functions and Practices of Immigration Surveillance
As conceptualized by John **Gilliom and** Torin **Monahan, surveillance involves "the systematic monitoring, gathering, and analysis of information in order to make decisions, minimize risk, sort populations, and exercise power."** n112 In this Section, I identify and analyze a series of specific surveillance practices and technologies that have become increasingly important components of immigration enforcement strategies. The processes and technologies that comprise the information infrastructure of immigration enforcement enable new approaches to four distinct sets of surveillance activities: identification, screening and authorization, mobility tracking and control, and information sharing.

Violation:

While the aff does curtail a lot of surveillance that falls under our interpretation, they also affect non-surveillance related border operations

Miller 14 (*Todd Miller has researched and written about U.S.-Mexican border issues for more than 10 years. He has worked on both sides of the border for BorderLinks in Tucson, Arizona, and Witness for Peace in Oaxaca, Mexico. He now writes on border and immigration issues for* NACL, Todd Miller, 4-22-2014, "Tomgram: Todd Miller, The Creation of a Border Security State," Tomdispatch, http://www.tomdispatch.com/blog/175834/tomgram%3A_todd_miller,_the_creation_of_a_border_security_state/) GW

Before 9/11, there was little federal presence on the Tohono O'odham reservation. Since then, the expansion of the Border Patrol into Native American territory has been relentless. Now**, Homeland Security stations, filled with hundreds of agents** (many hired in a 2007-2009 hiring binge**), circle the reservation**. But unlike bouncers at a club, **they check people going out, not heading in**. On every paved road leaving the reservation, **their checkpoints form a second border**. There, **armed agents** -- ever more of whom are veterans of America's distant wars **-- interrogate anyone who leaves. In addition, there are two "forward operating bases" on the reservation, which are meant to play the role -- facilitating tactical operations in remote regions** -- that similar camps did in Afghanistan and Iraq. Now, thanks to the Elbit Systems contract, a new kind of border will continue to be added to this layering. Imagine part of the futuristic Phoenix exhibition hall leaving Border Expo with the goal of incorporating itself into the lands of a people who were living here before there was a "New World," no less a United States or a Border Patrol. Though **this is** increasingly the reality from Brownsville, Texas, to San Diego, California, on Tohono O'odham land a post-9/11 war posture shades uncomfortably into the leftovers from a nineteenth century Indian war. Think of it as the place **where** the **homeland security** state **meets** its older compatriot, **Manifest Destiny**. On the gate at the entrance to her house**, Tohono O'odham member Ofelia Rivas has put up a sign stating that the Border Patrol can't enter**

without a warrant. It may be a fine sentiment, reflecting a right embodied in the U.S. Constitution, but in the eyes of the "law," it's ancient history. Only a mile from the international boundary, her house is well within the 25-mile zone in which the Border Patrol can enter anyone's property without a warrant. These powers make the CBP a super-force in comparison to the local law enforcement outfits it collaborates with. Although **CBP can enter property warrantlessly**, it still needs a warrant to enter somebody's dwelling. In the small community where Rivas lives, known as Ali Jegk, the agents have overstepped even its extra-constitutional bounds with "home invasions" (as people call them). Throughout the Tohono O'odham Nation, people complain about Homeland Security vehicles driving at high speeds and tailgating on the roads. They complain about blinding spotlights, vehicle pull-overs, and unexpected interrogations. **The Border Patrol has pulled O'odham tribal members out of cars, pepper-sprayed them, and beaten them with batons**. As local resident Joseph Flores told a Tucson television station, "It feels like we're being watched all the time." **Another man commented, "I feel like I have no civil rights**." On the reservation, **people speak not only about this new world of intense surveillance, but also about its raw impact on the Tohono O'odham people: violence and subjugation.** Although the tribal legislative council has collaborated extensively with Border Patrol operations, Priscilla Lewis seemed to sum up the sentiments of many O'odham at an open hearing in 2011: "**Too much harassment, following the wrong people, always stopping us, including and especially those who look like Mexicans when driving or walking in the desert... They have too much domination over us**." At her house, Ofelia Rivas tells me a story. One day, she was driving with Tohono O'odham elders towards the U.S.-Mexican border when a low-flying Blackhawk helicopter seemingly picked them up and began following them. Hanging out of the open helicopter doors were CBP gunmen, she said. When they crossed the border into Mexico, the helicopter tracked them through a forest of beautiful saguaro cacti while they headed for a ceremonial site, 25 miles south of the border. They were, of course, crossing what was a non-border to the O'odham, doing something they had done for thousands of years. Hearing, even feeling the vibration of the propellers, one of the elders said, "I guess we are going to die." They laughed, Rivas added, as there was nothing else to do. They laughed real hard. Then, a mile or so into Mexico, the helicopter turned back. **Americans may increasingly wonder whether NSA agents are scouring their meta-data, reading their personal emails, and the like. In the borderlands no imagination is necessary. The surveillance apparatus is in your face. The high-powered cameras are pointed at you; the drones are above you; you're stopped regularly at checkpoints and interrogated.** Too bad if you're late for school, a meeting, or an appointment. And even worse, if your skin complexion, or the way you're dressed, or anything about you sets off alarm bells, or there's something that doesn't smell quite right to the CBP's dogs -- and such dogs are a commonplace in the region -- being a little late will be the least of your problems. As Rivas told me, a typical exchange on the reservation might involve an agent at a checkpoint asking an O'odham woman whether, as she claimed, she was really going to the grocery store -- and then demanding that she show him her grocery list**. People on the reservation now often refer to what is happening as an armed "occupation."** Mike Wilson, an O'odham member who has tried to put gallon jugs of water along routes Mexican migrants might take through the reservation, speaks of the Border Patrol as an "occupying army." It's hardly surprising. Never before in the Nation's history under Spain, Mexico, or the United States have so many armed agents been present on their land.

The aff is extra-topical which is a voter for limits.

It allows affirmative teams to gain advantage ground off of planks of plans that do not fall under the resolution and that the neg could never have prepared for.

They are literally gaining advantages off of the removal of checkpoints.

This justifies affs like (insert ideas here).

Cartel DA

Organized crime along the border is in decline

Cawley 13 (Marguerite Cawley, journalist on organized crime, "Violent Crime on the US Southwest Border Decreased from 2004-2011: Study", 2/27/2013, Insight Crime, http://www.insightcrime.org/news-briefs/violent-crime-on-the-us-southwest-border-decreased-from-2004-2011-study, DJE)

A US government study points to an overall decrease in US border crime between 2004 to 2011, further indicating that fears of a "spillover" effect from Mexico's war against organized crime may be unfounded. **The report**, released by the United States Government Accountability Office (GAO) earlier this month, **found that the average rate for both violent and property crimes had dropped in the US Southwest border states. Arizona saw the most significant decline, of 33 percent over the seven-year time period.** Other decreases were seen in Texas (30 percent), California (26 percent), and New Mexico (eight percent from 2005 onward). Significantly, violent crime was found to be lower in border counties than in non-border counties for all the years examined in three out of the four states -- California, New Mexico and Texas -- with Arizona the only exception. The GAO also reported that **assaults against Border Patrol agents decreased** between 2008 to 2012, to levels 25 percent lower than in 2006. Officials from 31 of the 37 state and local law enforcement agencies interviewed by the GAO stated that they had not observed violent crime from Mexico regularly spilling over into the US, **although many said they were still concerned about safety levels in the region. Local law enforcement officials told the GAO that increased law enforcement personnel and new infrastructure may have contributed to the declining crime rates. Recent US federal efforts -- including technical assistance to Mexico under the 2008 Merida Initiative and $600 million put towards border security in 2010 -- have also aimed to curb violence in the region.** InSight Crime Analysis **Concerns have long existed about the extent to which Mexico's conflict may affect security dynamics in the US border states. Several incidents, involving Mexican nationals carrying out violent attacks in relation to the drug trade on US soil, have only served to feed such fears.** However, available data has generally failed to support these concerns. Figures from the Federal Bureau of Investigations (FBI), for example, show that violent crime in Arizona declined from 532 incidents per 100,000 inhabitants in 2000, to 408 in 2010. An analysis by Austin-based newspaper the Statesman found that, despite the release of a government-sponsored report warning of escalating violence in Texas, the combined number of murders in the state's 14 border counties fell by 33 percent between 2006 and 2010. The GAO's most recent study further supports the interpretation that claims of rampant "spillover violence" in the US border region have been mostly exaggerated.

Eliminating border patrol in the Tohono O'odham nation will collapse the best prevention methods against cartel crime.

Pitts 13 (Byron Pitts, ABC News Anchor & Chief National Correspondent, "In Efforts to Secure US-Mexico Border, Ariz. Native Americans Feel Caught in the Middle", 7/27/2013, ABC News, http://abcnews.go.com/US/efforts-secure-us-mexico-border-ariz-native-americans/story?id=19496394, DJE)

In Southwest Arizona, where the U.S. and Mexico borders meet, **the U.S. Border Patrol has made huge strides in capturing border crossers and seizing drugs from Mexican cartels**, but there is one stretch of land along the border that has made life a daily hell for a tribe of Native

Americans. **The Tohono O'odham Nation**, a Native American reservation about the size of Connecticut, is located in the Sonoran Desert, about 60 miles south of Tucson, Ariz., right on the U.S. border with Mexico. Here, there is no barbed-wire high fence, but open desert, with only a vehicle barrier meant to stop cars but not people. It **is an area where the U.S. government has the fewest resources and the widest open space to patrol, making it a hot spot for Mexican drug cartels and human smuggling operations.** "Nightline" spent 48 hours with U.S. Border Patrol agents and the Tohono O'odham reservation police force to get a firsthand look at the battle on the border. **"The Tohono O'odham Nation is one of our most problematic areas," Arizona Commander Jeffrey Self of the U.S. Border Patrol told "Nightline". "The narcotics smugglers have moved up into the mountainous area. There is not a lot of access." While border-crossing apprehensions in Arizona are down 43 percent from two years ago, it is a different, more complicated story on the Tohono O'odham Nation. Drug seizures on the reservation are steadily climbing -- nearly 500,000 pounds of marijuana was seized last year, a number that has nearly doubled since 2010. Recently, Tohono O'odham police seized $1 million worth of marijuana in just one week.** But **the Tohono O'odham tribal members are caught in the middle of a war between the Mexican drug cartels coming through their community and the U.S. Border Patrol officers who tribal members say have become more aggressive to stop them.**

If cartels gain ground they will launch bioterror attacks

Lentzos '14, Senior Research Fellow in the Department of Social Science, Health and Medicine at King's College London (1/27/14, Filippa Lentzos, BioSocieties, "The risk of bioweapons use: Considering the evidence base")

I can see a situation in **which a group of individuals will set up a cell and do these things in a state that doesn't have effective laws in place**, probably no laws in place at all. And **they could quite easily build up a small laboratory complex in a safe haven state**: **develop a device**, even test it in a sort of rudimentary way within the safe haven state, and then from that, build up a device which they could take and use somewhere else. And I don't think that has happened yet with any group trying to develop biological weapons, but **it's certainly happened with illicit drug type production, where there's been a bunch of individuals who are making illicit drug**s, and as the laws tighten up in one particular country, they'll relocate to a second country. And as things tighten there, they'll go to a third country. So **that's happened** certainly in the Asia Pacific, **with illicit drug cartels**, and I can see a scenario where that could happen with bioweapons too. And that really the motivation behind my interests in helping smaller countries develop legislation, develop government structures, including law enforcement, to make it more difficult for these rogues to do these things within these states.And **just because the Aum Shinrikyo attempts weren't successful, it doesn't mean to say that it's okay, that it's more difficult than everybody thought, it won't happen. I think there may well be a certain level of complacency starting to develop**, and that **we may well be caught out later on**. It mightn't be very sophisticated, but it could be a very disruptive event. Former bioweapons inspector and microbiologist: I agree, **even if biological weapons haven't been used that doesn't mean they won't be**. Maybe it's still easier to cause terror through other means. But we could not have anticipated 9/11; we could not foresee that airplanes would be used for that sort of attack. So we can't foresee all scenarios, we don't know what is next, so I wouldn't exclude anything. And the

biothreat is more relevant than a nuclear threat; I mean, you can't easily acquire a nuclear or even dirty bomb. But **you can easily acquire biological agents**. You don't even have to break into a lab, **you can get it in nature, you can get if off a sick person.** And, you don't even necessarily have to weaponize it. I mean how many casualties do you need to cause terror? You don't need mass casualties, it's not war. We're talking about infectious disease agents being spread deliberately, and that doesn't necessarily require weaponization.

Bioterrorism is an existential threat that risks mass deaths and social disorder

Saunders-Hastings 14 (Patrick Saunders-Hastings, doctoral student in the Population Health program at the University of Ottawa, "Securitization Theory and Biological Weapons", 1/8/2014, http://www.e-ir.info/2014/01/08/securitization-theory-and-biological-weapons/, DJE)

A government's decision to securitize an issue is a strategy to make extreme responses seem justified, and it **centers on the perceived existential risk a threat poses to the population**. Beginning with a brief history of biological weapons use, this section will aim to defend the framing of biological weapons use as an existential threat by examining their ability to cause mortality or to generate negative social and economic fallout. A brief discussion of the potential catastrophic consequences of a smallpox attack will illustrate the argument. **The use of biological weapons dates back centuries**. Examples include the Tatars catapulting plague-infected corpses over city walls at the siege of Kaffa in the 14th century, the deliberate triggering of a smallpox epidemic among Native Americans via contaminated blankets in the 18th century during the French and Indian War, and the contamination of salad bars with salmonella at a restaurant in Oregon in the 20th century2. However, **with the development of the germ theory during the 19th and into the 20th century, there was an increase in scientific knowledge about biological weapons. States became increasingly interested in such weapons, with Japan establishing a bioweapons program between 1932-1945, the United States in 1942, and the Soviet Union in 197313.** In 1972, in response to increasing concern about the threat of biological weapons, **the United Nations** proposed the Convention on the Prohibition of the Development, Production and Stockpiling of Bacteriological (Biological) and Toxin Weapons and on their Destruction, more commonly known as the **Biological Weapons Convention** (or BWC)14. The treaty came into effect in 1975, and banned the development, acquisition, and stockpiling of biological weapons1. However, it **failed to halt the research and development of biological weapons, which have continued into the 21st century. Those who argue that government response to the biological weapons threat has been overstated point to very low mortality in previous attacks**11. The anthrax attacks of 2001 in the United States, for example, resulted in only 5 deaths15. This argument could be used to urge governments to instead invest resources in areas that consistently cause higher mortality, such as infectious diseases like AIDS or even the seasonal flu. **However, in carrying out a threat assessment, it is also important to look at the potential for mortality. Here it has been suggested future attacks may not be on the same relatively small scale as those in the past**15. It is difficult to produce reliable estimates of fatalities that might result from an attack; there is huge variation in estimates and, often, little statistical evidence to support the predictions11. That said, **it is agreed that, in theory, even small amounts of a dangerous biological agent could cause significant mortality if prepared**

and disseminated effectively16. For instance, the WHO estimates that 50kg of B. anthracis distributed upwind of a population of 500 000 would leave 95 000 people dead and 125 000 more incapacitated17. Other sources suggest that **100kg of B. anthracis, disseminated via a crop-sprayer, could kill as many as three million people**, and comparable values have been projected for other agents2,18. Another concern is that **a contagious biological agent will result in person-to-person transmission, creating a self-sustaining effect not present in any other weapons class**10. While mass casualties are possible, it is also important to note that, even in situations with few casualties, **biological weapons attacks may have profound social and economic ramifications**3. **Such attacks could lead to widespread social panic and disorder, resulting in self-destructive behaviour and creating what is called a "societal autoimmune effect" involving increases in crime and looting19**. While there is little evidence to predict this would occur based on previous disaster situations (such as the terrorist attacks on the World Trade Center in 1993 and 2001, where the public reaction is described as effective and adaptive, rather than panicked and disruptive), it must remain a consideration20. The effects of a largescale attack involving biological weapons are unknown, and epidemics of highly fatal diseases may cause serious social disruption20. The economic consequences of biological weapons attacks are severe and suggest that investing in defense makes good economic sense. While there were only five deaths in the 2001 anthrax attacks, those attacks resulted in tens of billions of dollars in government spending21. Also, the financial sector may be negatively impacted if investor confidence plummets3. Similarly, an attack on the agricultural sector, which accounts for 15% of the United States GDP, could have severe economic ramifications3. If the biological agent being used is contagious, there could also be implications for trade and travel restrictions3. The SARS epidemic of 2003 showed the economic consequences of a highly infectious disease, essentially "crippling" some of the most dynamic cities in the world4. The Center for Biosecurity has estimated the economic cost of a biological weapons attack in the U.S. could exceed one trillion USD15. In short, **there are social and economic consequences that, considered in conjunction with the potential for catastrophically high mortality, justify the framing of biological weapons as a significant existential threat to the United States.** This is illustrated by considering the specific case of smallpox.

Border enforcement is supported universally. The plan would pit Obama against everyone.

Conservatives generally find themselves deeply split on the issue of¶ immigration. Some staunch members of the Republican Party, including¶ President George W. Bush, generally favor liberal admission policies, or¶ at least more liberal policies than the ones currently in place. Economic¶

conservatives see gains from immigration and inexpensive labor. In stark¶ contrast, another wing of the Republican Party is deeply concerned with¶ the alleged cultural impacts of immigration. This faction aggressively¶ plays on populist fear about cultural changes blamed on immigrants and¶ demands restrictionist policies and tougher border enforcement. Today,¶ this arm of the Republican Party, represented most prominently by Congressman¶ Tom Tancredo and the conservative icon Pat Buchanan, often¶ exercises great influence over the direction of immigration law and policy¶ by tapping into broad-based fears of economically and otherwise insecure¶ U.S. citizens. Poor, working, and middle-income people worry¶ about the changes wrought by immigration and are not likely to sympathize¶ with the desire of big business for cheap labor.¶ On the other hand, Democrats also find themselves divided on immigration.¶ Economically, they are concerned with immigration's downward¶ pressure on the wage scale and its impact on a long-time base of¶ Democratic support, labor unions. Although change has come in recent¶ years, organized labor, often supportive of the basic Democratic agenda,¶ has historically supported restrictionist immigration laws and policies.¶ Many liberals, however, desire the humane treatment of immigrants and¶ often push for pro-immigration and pro-immigrant laws and policies.¶ There, however, is some common ground. Many Democrats and Republicans¶ often agree that increased border enforcement is necessary.¶ Like tough-on-crime stances, this has proved time and time again to be a¶ politically popular position. This is even true for those sympathetic to¶ 138 | *The Economic Benefits of Liberal Migration of Labor Across Borders*¶ the plight of immigrants. In addition, influenced by public fears of being¶ overrun by floods of immigrants, politicians of both parties often support¶ limits on legal immigration and heavy border enforcement.

Marxism K

The aff's analysis renders invisible the set of historical capitalist relations that informed genocide against the Native body and made oppression possible

Libretti, 1 (Tim, Associate Professor of English and Women's Studies at Northeastern Illinois University. He has published articles on proletarian literature, U.S. Third World and multi-ethnic literatures, Marxism, and cultural studies in such journals as MELUS, Women's Studies Quarterly, and Mediations.2001, Modern Fiction Studies, Vol 47, No. 1, "The Other Proletarians: Native American Literature and Class Struggle," AS)

This rich passage raises many points for discussion in terms of how Ortiz constructs class consciousness and how this text and his writing as a whole relate to and redefine the contours and politics of the proletarian [End Page 180] literary genre. Ortiz here is asserting the privileged historical, economic, and social position, as well as the privileged perspective of the Native American in the historical development and contemporary society of U.S. capitalism. Just as Lukacs in History and Class Consciousness argues that "the superiority of the proletariat must lie exclusively in its ability to see society from the center, as a coherent whole" (69), Ortiz effectively suggests that Native Americans occupy a "more central" position in society from which to comprehend it as a coherent whole. However, while Lukacs argues that "the self-understanding of the proletariat is [. . .] simultaneously the objective understanding of the nature of society" and that "when the proletariat furthers its own class-aims it simultaneously achieves the conscious realization of the--objective--aims of society, aims which would inevitably remain abstract possibilities and objective frontiers but for this conscious intervention" (149), **Ortiz represents Native Americans' self-understanding as yielding a more accurate and insightful vision of the trajectory of social history because they are most immediately threatened and affected by the historical development of capitalism**. First in line for genocide, they are first to understand through experience the operations and aims of our current course of historical development. Thus they occupy the most advantageous position from which both to achieve a full consciousness of U.S. capitalism and to intervene consciously in redirecting historical development. Consequently, Ortiz means to bring the exigency of survival to the forefront of political and class consciousness, **suggesting that while Native Americans are most**

urgently conscious of the task of survival, it needs to be a larger working-class issue; it needs to be the premise of the class struggle itself to prioritize survival by making lands "productive to serve humanity." However, **Ortiz** warns that such a goal "will take real decisions and actions and concrete understanding by the poor and workers of this nation" (360).¶ The above passage also **highlights the importance of understanding Native Americans as a dynamic part of the U.S. proletariat and of U.S. labor history**. In the text as a whole, Ortiz worries about the "preservation" of Native American culture in museums and state parks that tend to hypostatize Native Americans as relics of history rather than as historical and contemporary participants in U.S. society and economy. The worry is that Native Americans will be isolated in "natural wilderness or [End Page 181] cultural parks" (360) and thus relegated to the margins instead of recognized as the center of social change and class consciousness that Ortiz believes they need to be. **The other sectors of the working class need to understand the genocide and exploitation of Native Americans if they are going to understand comprehensively the operations of U.S. capitalism**, the path of their genuine self-interest within that system, and the fate that awaits them if they do no act to redirect the course of history by learning from and following the lead of Native Americans. It is here that Ortiz makes his most passionate plea, one worth quoting at length:¶ They will have to see that the present exploitation of coal at Black Mesa Mine in Arizona does not serve the Hopi and Navajo whose homeland it is. They will have to understand that the political and economic forces which have caused Hopi and Navajo people to be in conflict with each other and within their own nations are the same forces which steal the human fabric of their own communities and lives. They will have to be willing to identify capitalism for what it is, that it is destructive and uncompassionate and deceptive. They will have to be willing to do so or they will never understand why the Four Corners power plants in northwestern New Mexico continue to spew poisons into the air, destroying plant, animal, and human life in the area. They will have to be willing to face and challenge the corporations at their armed bank buildings, their stock brokers, and their drilling, mining, milling, refining and processing operations. If they don't do that, they will not understand what Aacqu and her sister Pueblos in the Southwest are fighting for when they seek time and time again to bring attention to their struggle for land, water, and human rights. The American poor and workers and white middle class, who are probably the most ignorant of all U.S. citizens, must understand how they, like Indian people, are forced to serve a national interest, controlled by capitalist vested interests in collusion with U.S. policy makers, which does not serve them. Only when this understanding is attained and decisions are reached and actions taken to overcome economic and political oppression imposed on us all will there be no longer a national sacrifice area in the Southwest. Only then will there [End Page 182] be no more unnecessary sacrifices of our people and land. (360-61)¶ In this catalog of what the American poor and working class need to see, understand, and do--much of which entails facing and comprehending the particular exploitation and colonized status of Native Americans--Ortiz is suggesting that Native American class consciousness and political self-interests are not only identical to those of the non-Native American working class and poor but that, even more so, they are definitive of class consciousness and working-class political interests. If they do not understand the Native American situation, they will not understand "the same forces which steal the human fabric of their own American communities and lives." This same recognition is equally crucial in the literary critical sphere when we attempt to map the coordinates of a genre of proletarian literature as such a genre becomes the cultural representation and mouthpiece of the U.S. working class and its interests. **To marginalize Native American literature or categorize it wholly apart from and exclusive of proletarian literature re-enacts the same gesture of making invisible the Native American working class, of isolating it from the scene of wage labor.¶** Moreover, **what is also rendered invisible by obscuring the historical experience of Native Americans, their working-class experience, and their narrative of survival and class struggle, is the historical memory of an unalienated relationship with the land.** We have already seen Ortiz represent precolonial moments in which the Aacqu's lives were described as ones of material well being and spiritual integrity. While his narrative of colonization represents their growing dependence on wage labor and their general dependence under capitalism because of the diminution of their access to natural resources caused in part by their dispossession and in part by industrial capitalism's destruction of those resources, Ortiz also highlights that what remains through oral history is a memory of an actual culture or way of life characterized not by alienation but by integrity with nature, oneself, and others. Ortiz writes,¶ I don't know when it was that the grass was as high as a man's waist. I never knew that. All my life, the grass had been sparse and brittle. All my life, the winters have been cold and windy [End Page 183] and the summers hot and mostly rainless. But the people talk about those good years when they could cope with life on their own terms. The winters were always cold and the summers hot, but they could cope with them because there was a system of life which spelled out exactly how to deal with the realities they knew. The people had developed a system of knowledge which made it possible for them to work at solutions. And they had the capabilities of developing further knowledge to deal with new realities. There was probably not anything they could not deal properly and adequately with until the Mericano came. (349)¶ **The phenomenon Ortiz describes here is the general** deskilling of the human, of the **alienation that capitalism inflicts in its will to dominate.** Here Ortiz depicts again, it is worth reiterating, the way capitalism curtails rather than enhances productive efficiency as he represents how the colonizing process hobbled the people, made them dependent rather than self-sufficient, and robbed them of their creative abilities and skills.¶ But what is perhaps most striking about the narrative is that Ortiz represents an actual useable past that is not simply a utopian invention but rather a viable historical model. The importance of Ortiz's identification of this historical actuality is that it challenges those critics who see Marxism's ideal of a culture of disalienation, in which each person realizes her species being, as not only unattainable but also as never having been attained, as historically fantastic. Take, for example, Stephen Greenblatt's criticism of a passage from The Political Unconscious in which Fredric Jameson speaks to the process whereby capitalism diminishes the unalienated individual subject in its

production of the fragmented bourgeois individual. Greenblatt writes,¶ The whole passage has the resonance of an allegory of the fall of man: once we were whole, agile, integrated; we were individual subjects but not individuals, we had no psychology distinct from the shared life of the society; politic and poetry were one. Then capitalism arose and shattered this luminous, benign totality. The myth echoes throughout Jameson's book, though by the close it has been eschatologically reoriented so that the totality lies not in a past revealed to have always [End Page 184] already fallen but in the classless future. A philosophical claim that appeals to an absent empirical event. (3)¶ While Greenblatt no doubt has a point--it is certainly difficult to attribute alienation solely to the onset of capitalism, as though somehow feudal and slave economies featured whole and happy individual subjects--his own sense of the past is equally distorted, at least in light of Ortiz's narrative. Nonetheless, Greenblatt's criticism is one commonly hauled out to attempt to undermine the legitimacy of Marxist theories of human nature and liberation. Thus, Ortiz's identification of this historical moment of integration, as opposed to alienation, serves not only to challenge the cynical bourgeois critics of Marxism but, perhaps even more importantly, to give the Marxist tradition a model of possibility on which to build and imagine a postcapitalist culture. **To distance or isolate Native Americans from the U.S. working class** and their literature from the larger proletarian tradition **is to impoverish and, really, to disempower the U.S. working class** by cutting it off from this model of possibility that ought to inform class struggle.¶ Indeed, as Ortiz strenuously argues throughout the piece, **it is the condition of alienation** from ourselves, nature, and other people that most seriously **needs to be addressed, as alienation is the premise of exploitation and the destructive features of capitalism; Native Americans possess most vividly the collective memory of unalienated life**, as opposed to most elements of the U.S. working class whose memory is confined to a capitalist world and an experience of wage labor, which might explain why so much energy in labor struggles focuses on wages rather than focusing more concertedly on alienation and on the use of resources.¶ Native Americans are best positioned to assess the experience of alienation under capitalism, Ortiz suggests, because they have not just an imagination but also an historical knowledge of a different mode of production, culture, and way of life, as we see in the following passage in which Ortiz discusses the experiences of Laguna and Navajo miners working for the Kerr-McGee mines in New Mexico:¶ The Navajo men who went into the underground mines did not have much choice except to work there, just like the Laguna miners who find themselves as surface labor and semi-skilled [End Page 185] workers. The Kerr-McGee miners who had stayed for any length of time underground breathing the dust laden with radon gas would find themselves cancerous. The Laguna miners would find themselves questioning how much real value the mining operation had when their land was overturned into a gray pit miles and miles in breadth. They would ask if the wages they earned, causing wage income dependency, and the royalties received by the Kawaikah people were worth it when Mericano values beset their children and would threaten the heritage they had struggled to keep for so long. (356)¶ The Laguna miners are able to measure their value system and the social relationships it entails against that of capitalism and its destructive, even murderous, effects on the land and the people. Once again, Ortiz counterpoints two modes of conceptualizing value, embodied in one culture that prioritizes quality of life and in another quantitatively oriented culture committed to accumulating monetary wealth at the expense of life. The importance here, though, is that the Native American working class already possesses the value system for as well as the memory and imagination of a postcapitalist culture that the non-Native American U.S. working class needs to recognize as a valuable and crucial attribute of its tradition of resistance to capital and its aspirations of social transformation. Similarly, Ortiz also speaks of the memory of the Peublo Revolt of 1680 in which enslaved Africans, native Americans, and descendants of the Chicano people fought back against Spanish colonialism. This example of multiracial organizing and resistance is highlighted as a central element of the collective memory of empowerment and change. It is just such models of revolt that the U.S. working class needs as part of its historical and class consciousness, which it needs to be attached to and not dissociated from.¶ But yet when critics narrowly periodize and restrictively define the category of proletarian literature, it is just such dissociation and erasure that takes place. In developing a Marxist cultural tradition on the Left that is capable of directing and imagining full liberation, we must construct a proper proletarian literature genre which maps comprehensively the body of texts that are expressions of class struggle and which mediates the sociological and the cultural in a way that allows us to draw on the whole rich collective tradition of working class struggle [End Page 186] against racial patriarchal capitalism. **Understanding Native American literature as proletarian begins this process of political** and literary **reorganization**. Both Silko and Ortiz offer rethinkings of Marxism and class struggle that position Native Americans as pivotal actants and Native American culture and history as a rich reservoir of models for imagining change as well as postcapitalist culture and economy. Both culturally and politically, the Left needs to revivify its cultural imaginary and not dissociate by virtue of its exclusive cultural and political categories from political and cultural traditions that offer meaningful cross-fertilization. Indeed, just as Marx said the educators must be educated, so the Left must be educated by other left Marxist traditions it might not have even recognized as such. As Ward Churchill admonishes, when you think about Native American political concerns over such issues as land and water rights,¶ The great mass of non-Indians in North America really have much to gain, and almost nothing to lose, from the success of native people in struggles to reclaim the land which is rightfully ours. The tangible diminishment of U.S. material power which is integral to our victories in this sphere stands to pave the way for realization of most other agendas--from anti-imperialism to environmentalism, from African-American liberation to feminism, from gay rights to the ending of class privilege--pursued by progressives on this continent. Conversely, succeeding with any or even all these other agendas would still represent an inherently oppressive situation if their realization is contingent upon an ongoing occupation of Native North America without the consent of Indian people. Any North American revolution which failed to free indigenous territory from non-Indian domination would simply be a continuation of colonialism in another form. (88)¶ Indeed, just as Marx theorizes that **the working class is the lynchpin of liberation because in order to liberate itself it must do away with class altogether**, we can take Churchill here, as well as Silko and Ortiz, to be in some sense saying that for the non-Indian U.S. working class to liberate itself, Native Americans must be liberated. Put another way, the working class cannot liberate only part of itself, so it must identify and

understand [End Page 187] itself fully in order to liberate itself fully. Mapping this understanding via the space of a proletarian literary genre is a place to begin.

Utilitarianism is good for policy makers – leads to the most benefits over harms

Manuel **Velasquez**,, 8-1-**2014**, "Calculating Consequences: The Utilitarian Approach to Ethics," Markkula Center For Applied Ethic, http://www.scu.edu/ethics/practicing/decision/calculating.html

Calculating Consequences: The Utilitarian Approach to Ethics Developed by Manuel Velasquez, Claire Andre, Thomas Shanks, S.J., and Michael J. Meyer Imagine that the U.S. Central Intelligence Agency gets wind of a plot to set off a dirty bomb in a major American city. Agents capture a suspect who, they believe, has information about where the bomb is planted. Is it permissible for them to torture the suspect into revealing the bomb's whereabouts? Can the dignity of one individual be violated in order to save many others? Greatest Balance of Goods Over Harms If you answered yes, you were probably using a form of moral reasoning called "utilitarianism." Stripped down to its essentials, **utilitarianism is a moral principle that holds that the morally right course of action in any situation is the one that produces the greatest balance of benefits over harms for everyone affected.** So long as a course of action produces maximum benefits for everyone, utilitarianism does not care whether the benefits are produced by lies, manipulation, or coercion. Many of us use this type of moral reasoning frequently in our daily decisions. When asked to explain why we feel we have a moral duty to perform some action, we often point to the good that will come from the action or the harm it will prevent. **Business analysts, legislators, and scientists weigh daily the resulting benefits and harms of policies when deciding**, for example, whether to invest resources in a certain public project, whether to approve a new drug, or whether to ban a certain pesticide. Utilitarianism offers **a relatively straightforward method for deciding the morally right course of action for any particular situation** we may find ourselves in. To discover what we ought to do in any situation, we first identify the various courses of action that we could perform. Second, we determine all of the foreseeable benefits and harms that would result from each course of action for everyone affected by the action. And third, we choose the course of action that provides the greatest benefits after the costs have been taken into account. The principle of utilitarianism can be traced to the writings of Jeremy Bentham, who lived in England during the eighteenth and nineteenth centuries. Bentham, a legal reformer, sought an objective basis that would provide a publicly acceptable norm for determining what kinds of laws England should enact. He believed that the most promising way of reaching such an agreement was to choose that policy that would bring about the greatest net benefits to society once the harms had been taken into account. His motto, a familiar one now, was "the greatest good for the greatest number." Over the years, the principle of utilitarianism has been expanded and refined so that today there are many variations of the principle. For example, Bentham defined benefits and harms in terms of pleasure and pain. John Stuart Mill, a great 19th century utilitarian figure, spoke of benefits and harms not in terms of pleasure and pain alone but in terms of the quality or intensity of such pleasure and pain. Today utilitarians often describe benefits and harms in terms of the satisfaction of personal preferences or in purely economic terms of monetary benefits over monetary costs. Utilitarians also differ in their views about the kind of question we ought to ask ourselves when making an ethical decision. Some utilitarians maintain that in making an ethical decision, we must ask ourselves: "What effect will my doing this act in this situation have on the general balance of good over evil?" If lying would produce the best consequences in a particular situation, we ought to lie. Others, known as rule utilitarians, claim that we must choose that act that conforms to the general rule that would have the best consequences. In other words, we must ask ourselves: "What effect would everyone's doing this kind of action have on the general balance of good over evil?" So, for example, the rule "to always tell the truth" in general promotes the good of everyone and therefore should always be followed, even if in a certain situation lying would produce the best consequences. Despite such differences among utilitarians, however, most hold to the general principle that **morality must depend on balancing the beneficial and harmful consequences of our conduct.** - See more at: http://www.scu.edu/ethics/practicing/decision/calculating.html#sthash.7QghnbgB.dpuf
