Transition Inevitable

China rise means transition is inevitable – no hard power

THE RELATIVE ECONOMIC DECLINE OF THE UNITED STATES IS A FACT. For the first time in 200 years, most growth is occurring in the developing world, and the speed with which that shift -- a function of globalization -- has occurred is hard to fathom. Whereas in 1990 just 14 percent of cross-border flows of goods, services, and finances originated in emerging economies, today nearly 40 percent do. As recently as 2000, the GDP of China was one-tenth that of the United States; just 14 years later, the two economies are equal (at least in terms of purchasing power parity). This shift reorders what was, in some sense, a historical anomaly: the transatlantic dominance of the past 150 years. As illustrated by the map below, it wasn't until the Industrial Revolution took hold in the 19th century that the world's "economic center of gravity" decisively moved toward Europe and the United States, which have since been the primary engines of growth. Today, however, the economic center of gravity is headed back toward Asia, and it is doing so with unique historical speed. This trend will persist even though emerging economies are hitting roadblocks to growth, such as pervasive corruption in India and demographic challenges and serious distortions in the banking system in China. For instance, according to the asset-management firm BlackRock and the Organization for Economic Cooperation and Development (OECD), consumption in emerging markets has already eclipsed that in the United States, and spending by the middle classes in Asia-Pacific nations is on track to exceed middle-class spending in North America by a factor of nearly six by 2030. U.S. wealth is not shrinking in absolute terms -- and it continues to benefit from economic globalization -- but the United States and its allies are losing might compared with potential rivals. Although Europe and Japan have been responsible for much of the developed world's lost relative economic power, the U.S. economy has also slowed from its traditional rates of expansion over the past several decades. Worsening productivity growth has played a particularly large role in the U.S. slowdown, dropping to around 0.5 percent annually, which the Financial Times has referred to as a "productivity crisis." A range of factors are responsible, including a decline in the skill level of the American workforce and a drop in resources allocated to **r**esearch **and d**evelopment. Overall, the U.S. economy has become less competitive. The McKinsey Global Institute, for instance, has measured the relative attractiveness of the United States across a range of metrics, such as national spending on research and development and foreign direct investment as a percentage of GDP. It found that U.S. business attractiveness relative to that of competitors fell across 14 of 20 key metrics from 2000 to 2010 -- and improved in none. And according to the Harvard Business Review, U.S. exports' global market share dropped across the board from 1999 to 2009 and suffered particularly sharp falls in cutting-edge fields such as aerospace. This shift in economic growth toward the developing world is going to have strategic consequences. Military power ultimately derives from wealth. It is often noted that the United States spends more on defense than the next 10 countries combined. But growth in military spending correlates with GDP growth, so as other economies grow, those countries will likely spend more on defense, reducing the relative military power of the United States. Already, trends in global

defense spending show a rapid and marked shift from the United States and its allies toward emerging economies, especially China. In 2011, the United States and its partners accounted for approximately 80 percent of the military spending by the 15 countries with the largest defense budgets. But, according to a McKinsey study, that share could fall significantly over the next eight years -- perhaps to as low as 55 percent. The resulting deterioration in American military superiority has already begun, as the countries benefiting most rapidly from globalization are using their newfound wealth to build military capacity, especially in high-tech weaponry. As Robert Work and Shawn Brimley of the Center for a New American Security wrote this year: "[T]he dominance enjoyed by the United States in the late 1990s/early 2000s in the areas of high-end sensors, guided weaponry, battle networking, space and cyberspace systems, and stealth technology has started to erode. Moreover, this erosion is now occurring at an accelerated rate." (Work has since been confirmed as deputy secretary of defense.) China, in particular, is acquiring higher-end capabilities and working to establish "no-go zones" in its near abroad in the hopes of denying U.S. forces the ability to operate in the Western Pacific. China's declared defense budget grew 12 percent this year -- and has grown at least ninefold since 2000 -- and most experts think its real defense spending is considerably larger. The International Institute for Strategic Studies has judged that Beijing will spend as much on defense as Washington does by the late 2020s or early 2030s. Meanwhile, regional powers like Iran -- and even nonstate actors like Hezbollah -- are becoming more militarily formidable as it becomes easier to obtain precision-guided munitions and thus threaten U.S. power-projection capabilities.

Alt Causes

Deficit and a litany of fiscal constraints that the aff can’t resolve

Simultaneously, the United States is slashing its defense spending while allocating its remaining funds less strategically. Not only has the Defense Department estimated that it has already cut almost $600 billion from its budget plans for the next decade, but if current trends continue, by 2021 nearly half of the Pentagon's budget will go to personnel-related costs, rather than procurement, training, research and development, or operations. The U.S. National Intelligence Council recently projected the future distribution of global power using two distinct methodologies that incorporated a range of "hard" and "soft" factors. By both estimates, the U.S. share of global power will fall dramatically, from around 25 percent in 2010 to around 15 percent in 2050. The National Intelligence Council predicted that over the same period, the relative power of the European Union and Japan will fall significantly as well. The United States is worsening this problem by refusing to confront its federal debt and deficits. Unsustainable fiscal policy will limit U.S. competitiveness and freedom of action in the world with a severity and alacrity not remotely appreciated in today's U.S. foreign-policy debates. The total federal debt currently held by the public, which includes foreign creditors, is approximately $13 trillion. That is almost three-quarters of U.S. GDP, the highest it has ever been except for a brief period during and after World War II. Moreover, the drivers of the debt are entitlement programs that will impose enormous costs indefinitely. Today, well over 60 percent of federal revenue is consumed by spending on Social Security, the major

health-care programs (including Medicare, Medicaid, and subsidies under the Affordable Care Act), and interest payments on the federal debt. By 2043, spending on entitlements and net interest payments will consume all federal revenue, according to the Congressional Budget Office. Every dollar the U.S. government spends on anything else -- defense, intelligence, foreign affairs, the federal justice system, infrastructure, science and technology, education, the space program -- will be borrowed. And by that time, the total federal debt held by the public will far exceed U.S. GDP. Recent attempts to address the problem have only resulted in fiasco. The "sequester" imposed automatic, arbitrary, across-the-board cuts to discretionary spending -- precisely the spending that is not causing the fiscal problem -- with the heaviest burden falling on defense. Most spending for entitlements was untouched. One could hardly imagine an outcome more likely to reduce American power, and quickly. The unwillingness to choose a sustainable fiscal path is forcing the United States to forgo the investments necessary to sustain the domestic sources of its power, and it is already eroding its strength abroad. Among allies, adversaries, and swing states alike, U.S. fiscal policy is increasingly calling into question America's ability to lead globally.

Growth now – housing boom

Bartash, 7/19

(Jeffry Bartash is a reporter for MarketWatch in Washington, "Housing boomlet furnishes U.S. economy with fresh source of growth", http://www.marketwatch.com/story/housing-boomlet-furnishes-us-economy-with-fresh-source-of-growth-2015-07-19, July 19, 2015, ak.)

The U.S. economy has reached halftime in 2015 and it's been a low-scoring affair. But the second half of the year could show more razzle-dazzle. After contracting 0.2% in the first three months of 2015, the economy is on track to grow a solid 2.5% or a bit higher in the second quarter stretching from April to June. And economists polled by MarketWatch predict comfortable 3% growth in the remaining two quarters of the year. If that's going to happen, the U.S. housing market probably has to keep setting postrecession highs. Construction of new homes in June was almost 27% higher compared with a year earlier and permits to build additional properties hit an eight-year peak. "The housing market rebound is showing no signs of slowing down," said Scott Anderson, chief economist of Bank of the West. "Home builders are in the catbird seat right now." Fresh sales figures this week on new and previously owned homes in June will shed more light on the health of the housing industry. The market continues to recover from its worse bust in modern times, with sales still far below their prerecession high. The current mini-boomlet, if you can call it that, has been driven by a combination of rising urban demand for rental units such as townhouses and apartments and as well as a drop in national vacancy rates to a two-decade low. Younger millennials have gravitated toward cities and many prefer to rent instead of owning their own homes, a trend hastened in part by tighter mortgage-lending standards. They are also forming more families to create additional demand for housing. At the same time, strong job creation over the past few years that has shrunk the unemployment rate has allowed more people to set out on their own. Many young people, for example, were forced by financial circumstances to move back in with their parents after the Great Recession. Only recently has the so-called boomerang trend started to reverse. The benefits of a robust housing market are widespread. Home buyers and renters have to furnish their new living spaces with couches, TVs, beds and the like. Suppliers of building materials such as brick, wood and tiles see an uptick in demand. And home builders, lured by the prospect of higher profits, have to hire more workers. It's a virtuous cycle. "Residential construction will provide a big boost to GDP growth in the second quarter, and through the rest of 2015," said Stuart Hoffman, chief economist at PNC Financial Services.

Alt cause – income inequality

Cynamon and Fazzari, 15

(*Barry Z. Cynamon is a visiting scholar at the Center for Household Financial Stability at the Federal Reserve Bank of St. Louis. His research focuses on the intersection between household finance, including balance sheet health and the distribution of income, and economic growth. Recent efforts supported by the Institute for New Economic Thinking have included contributions

to the measurement of consumption across the U.S. income distribution and alignment of the U.S. national accounts to match household survey data, **Steven Fazzari is a professor of economics at Washington University in St. Louis. His research explores two main areas: the link between macroeconomic activity and finance, particularly the financial determinants of investment spending, and the foundations of Keynesian macroeconomics. His perspectives on the causes and consequences of the Great Recession, the macroeconomic effects of rising income inequality, financial instability, deficit reduction and capital gains taxation have been highlighted in the national and international press, "**Rising Inequality Is Holding Back the U.S. Economy**", London School of Economics, http://www.newsweek.com/rising-inequality-holding-back-us-economy-354777, July 17, 2015, ak.)

Why has the U.S. economy been so sluggish to return to growth in the aftermath of the Great Recession of the late 2000s? In new research, Barry Z. Cynamon and Steven M. Fazzari find that the current level of household demand is more than 17 percent lower than its pre-recession trend, preventing a stronger recovery. They argue that in the lead-up to the Great Recession, households compensated for rising inequality and stagnant wages by borrowing more, something that became unsustainable when the financial crisis hit. For the U.S. to achieve robust growth rates once again, the gap in demand that opened with the collapse of household spending in the Great Recession will have to be closed, preferably through wage growth across the board. In announcing his run for the presidency last month, Jeb Bush has set an ambitious goal of 4 percent real growth in gross domestic product. This goal has been greeted with substantial skepticism from parts of the economics establishment, while some economists have praised it as a "worthy and viable aspiration" that could be achieved with growth-oriented policies (see the op-ed by Glenn Hubbard and Kevin Warsh, for example). Our recent research implies that a 4 percent growth goal for first term of the next president is not only possible but is what we should strive to achieve. Like Hubbard and Warsh, we agree that the U.S. needs policies that raise labor force participation, accelerate productivity growth and improve expectations. **Where we part ways is the tactics**. Their recommendations focus on supply-side policies, such as tax reform, **regulatory reform**, reduced trade friction and education and training. Our research implies that a weak demand side explains the sluggish recovery from the Great Recession, with the rise of income inequality as a central factor. Consequently, our policy prescriptions revolve around increasing the take-home pay of the majority of American households. The Great Recession, which began in December 2007, was the most severe American economic downturn in three-quarters of a century. Most economists did not anticipate ahead of time that this kind of thing could happen, although we warned that "it could get ugly out there" in October 2007. But as the severity of the recession became apparent in the dark days of late 2008 and early 2009, many economists predicted a swift bounce-back, reasoning from historical evidence that deep downturns are followed by rapid recoveries. Sadly, that prediction was also incorrect. The growth path following the Great Recession has been historically sluggish. Our recent research, supported by the Institute for New Economic Thinking, helps explain why: **The economic drag from decades of rising income inequality has held back consumer spending**. Our work studies the link between rising income inequality and U.S. household demand over the past several decades. From the middle 1980s until the middle 2000s, American consumers spent liberally despite the fact that income growth stagnated for most of the population. We show that the annual growth rate of household income slowed markedly in 1980 for the bottom 95 percent of the income distribution, while income growth for the top 5 percent accelerated at the same time. The result was the widely discussed rise of income inequality. It is also well known that household debt grew rapidly during this period. Our work points out that the buildup of debt relative to income was concentrated in the bottom 95 percent of the income distribution. Debt to income for the top 5 percent bounced around with little clear trend: When the financial crisis hit, our work shows that the bottom 95 percent of Americans could no longer get the rising debt they needed to continue to spend along the trend they established in the years leading up to the crisis. The result was a sharp cutback in household demand relative to income that caused the collapse of the Great Recession, shown by the arrow in Figure 2: What about the recovery? Figure 3 shows the path of our measure of real household demand and compares it to the trend it followed from the peak of the business cycle that ended in 2000 to its peak in 2006 prior to the Great Recession: Household demand in 2013 (the most recent observation we have because our computations incorporate data that are released with a lag and are available at an annual frequency only) was a stunning 17.5 percent below its pre-recession trend, with no sign of recovering back toward the trend. What happened? Our research implies that the cutoff of credit for the group of households falling behind as income inequality rose prevented their spending from recovering to its pre-recession path. While there is no reason to

necessarily expect that consumer spending will follow a constant trend over long periods of time, the practical reality is that the U.S. economy needed the pre-recession trend of demand to maintain adequate growth and at least a rough approximation of full employment prior to 2007. In the middle 2000s, there was no sign of excess demand in the U.S. economy. Inflation was tame and interest rates low. Wage growth was stagnant. Although some gradual slowing in long-term U.S. growth might have been predicted as the large baby-boom generation ages, the overall labor force participation rate was actually rising prior to the recession, so there was no reason to expect any significant decline in labor resources in the years immediately following 2007. Yes, the way many Americans were financing their demand was unsustainable, but there is no indication that businesses could not sustainably continue to produce along the pre-recession trend if they had been able to sell the output. Our interpretation of the evidence is that the demand drag that could be expected as the result of rising inequality is, after a delay of a quarter-century, finally constraining the U.S. economy. Intuition, theory and evidence predict that high-income people spend, on average, a smaller share of their income than everyone else does. So as a higher share of income goes into the pockets of the well-to-do, the household sector as a whole is likely to recycle less of its income back into spending, which slows the path of demand growth. A possible problem with this prediction for the U.S. in recent years is that income inequality began to rise in the early 1980s, but household demand remained strong through 2006. Our argument is that the demand drag from rising inequality was postponed by the buildup of debt: The bottom 95 percent borrowed rather than cut back their spending when their income growth slowed. But as the crisis hit, lending to households collapsed, and the trend of rising debt could not continue. The effect of rising inequality has come home to roost, hitting the economy hard. As a result, today's economy is underperforming. No one can know precisely how much of the stagnation in household demand is due to the rise of inequality, but our estimates imply that the current path of total demand in the economy is at least 10 percent below where it would have been with the income distribution of the early 1980s. **Where demand goes, so follows output and employment**. This analysis links to the call for 4 percent growth. Considering conventional estimates of the long-term trend growth of the economy, a 4 percent growth rate through the next U.S. president's first term would go a long way toward closing the gap in output that opened with the collapse of household spending in the Great Recession and has yet to be filled. How can we move toward this goal? Our research strongly implies that the main problem is on the demand side, not the supply side. The U.S. needs to find a way to boost demand growth by arresting, and hopefully reversing, the dramatic rise of inequality. The basic argument is exceedingly simple: The economy continues to be held back by insufficient household spending, and if the income share of Americans outside of the top sliver rises, household spending will increase. Policies that raise the minimum wage and reduce the tax burden of low- and middle income-households would help. In our view, however, the best method to achieve this objective would be to restore wage growth across the income distribution as occurred in the decades after World War II. Meeting this objective is challenging for a variety of reasons, including the fact that there remains no clear consensus about what has caused the rise of American economic inequality. But the need to address inequality is not just a matter of social justice; it also is important to get the economy back on the right track after more than seven years of stagnation. We can do better.

FDI Not Key

No impact – investment bounces back and foreign investors aren't key

Jackson 9 (James, specialist in International Trade and Finance for the Congressional Research Service, "Foreign Investment In US Securities: CRS Report for Congress", research.policyarchive.org/2110_Previous_Version_2009-11-18.pdf)

Over the long run, the economic and financial effects of a foreign withdrawal from U.S. financial markets **would be limited** because those factors which allowed foreigners to withdraw **would attract other foreign investors** to the U.S. markets. As U.S. interest rates rose in response to the selling of securities, other investors likely would **be attracted** to the higher returns of the assets, which would curb the decline in the prices in the securities. Also, the rise in U.S. interest rates would attract foreign capital, which would limit the rise in interest rates. A decline in the value of the dollar against other currencies would also improve the international price competitiveness of U.S. goods. As a result, U.S. exports would increase, likely narrowing the gap between the earnings on U.S. exports and the amount Americans spend on imports, thereby reducing the amount of foreign capital the U.S. economy would need. Furthermore, those foreign investors who are successful in withdrawing their funds from the U.S. markets **would have to find suitable alternatives**. Even if they did not reinvest their finds in the United States, the infusion of capital **back into foreign capital markets** likely would have **spillover effects** on the United States and on U.S. securities.

FDI does not have a significant impact on economic growth

Alfaro 03 (Laura, the Warren Alpert Professor of Business Administration at Harvard, She is also a Faculty Research Associate in the National Bureau of Economic Research's International Macroeconomics and Finance Program, Member of the Latin-American Financial Regulatory Committee (CLAAF), Faculty Associate at Harvard's Weatherhead Center for International Affairs, and member of the David Rockefeller Center for Latin American Studies' (DRCLAS) policy committee, "Foreign Direct Investment and Growth: Does the Sector Matter?," Harvard Business School, April 2003, http://www.people.hbs.edu/lalfaro/fdisectorial.pdf)//kjz

Attitudes and government policies towards FDI as well its characteristics have varied considerably over time.18 From 1880 and until the first decades of the twentieth century, for example, FDI grew exponentially and became heavily concentrated in the exploitation of natural resources. World War I and the nationalization of foreign property in Russia in 1917 dealt heavy blows to FDI, but it was the onset of the Great Depression in 1929 that marked the end of its golden era. Between the 1930s and the 1970s, there was a worldwide growth in restrictions because governments became more concerned about the impact FDI had on their economies. After decades of skepticism, in the 1980s international events reshaped the attitude towards FDI as the debt crisis severed developing countries' access to credit and portfolio investment. In addition, there was a shift in the industries in which foreign firms were active compared to the post war period, which involved mostly the exploitation of oil and natural resources, towards manufacturing, services, and high technology. Governments began to ease restrictions on FDI and increasingly offer incentives in an effort to attract investment. During the 1990s, FDI soared, growing more than 20% per year. This recent surge of FDI had its own distinctive characteristics: more than 50% of new investments were in the service sector. This paper finds that FDI flows into the different sectors of the economy (namely primary, manufacturing, and services) exert different effects on economic growth. FDI inflows into the primary sector tend to have a negative effect on growth, whereas FDI inflows in the manufacturing sector a positive one. Evidence from the foreign investments in the service sector is ambiguous. Despite the limitations of the data used, the results are robust to the inclusion of other growth determinants, such as income, human capita measures, domestic financial development, institutional quality, different samples, and the use of lagged values of FDI. One can conjecture that these investments, given their nature — agriculture and mining — have little spillover potential for the host economy. FDI flows to manufacturing seem to have a positive 13 effect on growth. Indeed, most of the theoretical work on the benefits associated with FDI tends to be related to the manufacturing-industry sector. Foreign investment in the service sector has an ambiguous effect. The macroeconomic literature had focused on total FDI inflows or stocks, in part due to data limitations. This work suggests that not all forms of foreign investment seem to be beneficial to host economies. A priori, this might suggest differentiated efforts towards attracting different forms of FDI flows and even negative incentives to certain types, in particular investment in natural re sources. In effect, countries have recently begun to pursue targeted policies towards attracting foreign direct investment. Evidence that countries might want to target certain sectors needs to be weighed against bureaucratic costs and increased potential for the corruption of differentiated schemes. The economic nature of the host country is also an important determinant. More work in this area is warranted, in particular, in terms of better data sets that will support exploiting the time variation in the data.

FDI High

Foreign investment is high now – even with regulatory uncertainty, the US is still perceived as safe

Shah 13 (Neil, covers the U.S. economy and demographics for the WSJ, "For U.S., Big Foreign Investment Is a Mixed Blessing", http://www.wsj.com/articles/SB10001424127887323466204578384704161999108)

Foreign investment in the U.S. dwarfed American investment abroad by the **biggest margin on record** for much of last year, leaving the U.S. economy more vulnerable to external shocks but also suggesting the nation **remains a magnet** for foreign funds after the financial crisis. America's "international investment position" in 2012—how much the value of foreign investments in the U.S. exceeded U.S. investments abroad—**jumped to $4.7 trillion** in the second and third quarters of last year before falling to $4.4 trillion by year's end, up from $4.0 trillion at the end of 2011, the Commerce Department said in a report Tuesday that provided quarterly data for the first time. The $4.7 trillion gap in the second and third quarters was the biggest since the government began tracking the figures in 1976, according to the report. The report suggests foreign investors and companies are playing a much **bigger role in U.S. financial markets** and the economy. That worries some observers, since it makes the U.S. economy more

vulnerable to sharp turns in the global environment. Yet it also **suggests America remains a beacon for foreign investment**. "The U.S. is still the largest market in the world and **despite some of our dysfunction**, by comparison, we look like a **pretty good investment**," said Nancy McLernon, chief executive of the Organization for International Investment, a Washington, D.C., group representing major foreign investors in the U.S.

Foreign investment is high and rising now

Cox 13 (Jeff, finance editor with CNBC, "Foreign Holdings of US Securities Have Exploded", http://www.cnbc.com/id/100695176)

Foreigners now hold more than $13 trillion in American securities, **a record set** as the U.S. seeks to assert itself as the safest port in troubled global waters. China and Japan combined owned more than $3.4 trillion, including $2.4 trillion in debt, a number that has grown since the data set was compiled. The total value of U.S. stocks and bonds under foreign ownership **rose 6.5 percent** in 2012, with stocks actually rising more on a percentage basis, according to the most recent data from the U.S. Treasury. **Foreign holdings have more than doubled since 2005** and are getting close to the $15 trillion total size of the U.S. economy.

Foreign direct investment (FDI) is a key source of capital, job creation, innovation, and U.S. exports. Firms invest in the United States to balance business growth and sustainability with global economic pressures to raise productivity and lower operating costs. Their investments contribute to the overall economic strength and competitiveness of the United States. Businesses worldwide recognize the longstanding, unequivocal U.S. policy of openness to foreign direct investment (FDI). They invest in the United States to access the world's largest, most innovative single-country economy with an annual GDP (gross domestic product) of approximately $14 trillion and a population of about 310 million, representing 42 percent of the global consumer goods market. The United States is the world's largest recipient of FDI, and these investments are a sign of U.S. economic strength. Companies invest in the United States because our economy is stable, our workforce is reliable, and our climate of innovation and access to global markets can help achieve unparalleled success. Even through the global economic volatility in recent years, FDI in the United States has remained steady. Preliminary data from the U.S. Bureau of Economic Analysis (BEA) shows that approximately $190 billion in FDI flowed into the United States in 2010, almost a 30 percent increase from 2009. Overall, the $2.3 trillion stock of FDI in the United States is nearly 16 percent of our total GDP. In numerous confidence indices, the U.S. is consistently ranked among the top. A.T. Kearney ranks the U.S. as second in FDI confidence, and the World Economic Forum has ranked the U.S. fourth in global manufacturing competitiveness. Meanwhile, the World Bank names the United States fifth in its "ease of doing business" index. Given the sheer size and industrial diversity of the U.S. economy, it is impressive to secure uniformly high rankings in business benchmarks. In addition to new capital, foreign direct investment contributes to the U.S. economy through employment of U.S. workers. In 2009, sSubsidiaries of foreign-owned firms directly employ over 5.2 million U.S. workers, paying almost $408 billion in annual salaries and wages in 2009. Multinational firms value the quality of U.S. education and training. Their U.S. operations are often in specialized functions, leading to job creation in highly skilled sectors. They want the best workers in the world and are willing to pay a premium for U.S. talent. Recent statistics show that nearly 40 percent of U.S. jobs created through FDI are in

manufacturing. On average, U.S. employees of foreign-owned firms earn 25 percent higher wages than the U.S. private sector average wage.

Another significant impact of FDI on the U.S. economy is the continued growth of its assets in research and development (R&D) and innovation. Already a world leader in R&D, the U.S. is further enhanced by FDI occurring in this sector. In 2008, over $40 billion was spent on R&D by U.S. subsidiaries of foreign firms. Recently, the National Science Foundation (NSF) collected business data gathered by the NSF, the U.S. Census Bureau, and the U.S. Bureau of Economic Analysis to find that U.S. affiliates of foreign firms have a growing share of R&D investments in the United States. Firms recognize the hospitable climate the U.S. provides for product research and development, intellectual property rights protection, and commercialization. Not only does the United States excel in R&D, but we also safeguard new inventions and innovations through a robust intellectual property protection rights (IPR) system. Last year, 34 percent of all R&D in the world took place in the United States with almost half of the developed world's researchers working here. This research yields to impressive results, including the research of 45 percent of all Nobel Prize winners in the fields of chemistry, medicine and physics being completed in the United States. Further contributing to our competitiveness, the U.S. has a clear global advantage in the ability of firms to commercialize their technologies while relying on IPR protection. As the Global Manufacturing Index published by Deloitte and the U.S. Council on Competitiveness notes, "Strong intellectual (property) protection not only encourages innovation, it provides a level of confidence in an economy needed to attract FDI and spur technology transfer." Multinational companies have choices, and they choose to invest in the United States for its supportive environment for their research, development, and commercialization. FDI's impact on the U.S. economy transcends its borders. In addition to introduction of new capital, creation of new jobs and strengthening U.S. competitiveness in R&D, U.S. affiliates of foreign-owned firms account for almost 19 percent of total U.S. exports. In recent years, the steady rise in the proportion of U.S. exports originating from these firms is evidence that multinational companies establish themselves not only to service the U.S. market but to utilize our business climate as an export platform, as well. After all, the United States nearly doubles its market access through strategic trade agreements representing 610 million consumers worldwide. Growing this trend is integral to the success of the President's National Export Initiative to double U.S. exports over a five-year period.

The trade-off is non-unique—the FBI is already understaffed

CAIR, '12, ("FBI Counterterrorism Division 'Inexcusably Understaffed'" July 16, 2012, Council on American Islamic Relations, http://www.cair.com/press-center/cair-in-the-news/10850-fbi-counterterrorism-division-inexcusably-understaffed.html)//erg
The Federal Bureau of Investigation (FBI) is battling a real “good news — bad news” situation within their ranks. Bad news first: The FBI’s highest-ranking Arab-American agent told a congressional panel this week that he is not being allowed to work on important counterterrorism assignments, despite a shortage of agents who speak Arabic. The good news — for the FBI, not the nation — is that senior Bush Administration officials apparently ignored warnings from the FBI over interrogation techniques used at Guantanamo Bay and in Iraq and Afghanistan, according to a new US government report. Bassem Youssef, chief of the communications analysis unit of the FBI’s counterterrorism division, said the bureau’s International Terrorism Operations Sections (ITOS) — which include those that track Al-Qaeda terrorists — are “**; inexcusably understaffed**.” Egyptian-born Youssef, who has been an agent with the FBI since 1988, said only 62 percent of posts were filled in the counterterrorism unit. In other words, more than one out of every three positions in an elite FBI division that tracks Al-Qaeda terrorists is vacant. This was confirmed this week by another source, when an internal FBI document was leaked to the press. The FBI’s counterterrorism section is too badly organized and too understaffed to be able to protect the United States effectively against attack, Youssef told lawmakers. This chronic staff shortage forced the FBI to recruit staff with no relevant experience, specifically with Middle Eastern counterterrorism, possibly lacking pertinent language skills and cultural understanding.

No investigation trade-off—that was Bush

Kiel, '08, (Paul, consumer finance expert, "The End of FBI's Terror Trade-Off?" ProPublica, Oct. 20, 2008, http://www.propublica.org/article/the-end-of-fbis-terror-trade-off-1020)//erg
The Bush administration made a choice in the wake of 9/11. The FBI needed to dramatically increase its counterterrorism capabilities. To do that, it needed agents. Most of those agents came from FBI priorities now deemed less important – like white-collar crime. The ramifications, as the Seattle Post –Intelligencer documented in a multi-part series last year, "The Terrorism Trade-Off," were plenty and apparent. Among them was a dramatic drop in financial crime investigations like fraud and embezzlement cases. But now that the nation is in the midst of a market crisis, the FBI is scrambling to regain lost ground, the New York Times reported this weekend. Since 2001, the FBI reassigned about one third of the 1,700 agents who had been working white-collar crime cases. Now the FBI, "struggling" to find the resources to respond to the financial crisis, is "planning to double the number of agents working financial crimes by reassigning several hundred agents amid a mood of national alarm." Even a few months ago, the White House had reiterated the wisdom of shifting agents from the white-collar crime. When the administration's 2009 budget again contained no new funding to boost the number of agents in the FBI's crime-fighting squads, a White House official responded to criticism by saying "The assumption that how it was pre-9/11 is how it ought to be for all time is not the correct premise." The Times points to another possible reason for the FBI's diminished performance in combating white-collar crime: concern from the administration that the recent high-profile investigations of Enron, WorldCom and others had gone too far. Several "former law enforcement officials" told the paper that "senior administration officials, particularly at the White House and the Treasury Department, had made clear to them that they were concerned the Justice Department and the F.B.I. were taking an anti-business attitude that could chill corporate risk taking." With the credit market nearly frozen, chilling corporate risk-taking is unlikely still a problem, and politically, **the terrorism trade-off appears to no longer be acceptable**. On an almost daily basis, news has leaked that the FBI is investigating one of the major financial institutions at the center of the crisis: Fannie Mae and Freddie Mac, AIG, Lehman Brothers, Washington Mutual, Countrywide. At last count, the FBI says it's investigating 26 national corporations related to the crisis. It seems the philosophy has been to jump first and scramble for resources later. When the U.S. Attorney for Seattle announced that his office was investigating WaMu, he was candid about the reasons: "intense public interest" in the largest bank collapse in U.S. history.

Counterterror resources are inadequate now

The Obama administration's approach to combating terrorist radicalization inside the U.S. has been "**inadequate**" while ISIS has found extraordinary success at inspiring many to commit violence, current and former officials said at a congressional hearing today. So far this year, the FBI has arrested 48 suspects in the U.S. accused of attempting to support ISIS or act violently in the name of the Islamist extremist group – and yet in all of the U.S. government, only half that number of U.S. officials are devoted to Countering Violent Extremism (CVE) programs, according to Rep. Michael McCaul, Chairman of the House Homeland Security Committee. "In the high-threat environment we are in today, **this is unacceptable**," McCaul said. But current and former officials have told ABC News the numbers are even worse and that many of those officials counted in the number the administration provided to McCaul split their time between CVE and other duties. Those inside the government solely focused on CVE at the Department of Homeland Security, Department of Justice and National Counterterrorism Center number approximately eight, these officials said. "**Resources devoted to CVE have been highly inadequate**, and CVE units within each relevant agency **remain understaffed**," Seamus Hughes, who recently left the National Counterterrorism Center, told the House Committee on Homeland Security. Before leaving NCTC, Hughes was one of the officials responsible for such CVE efforts over the past three years.

Brooks 15 - Rosa Brooks is a law professor at Georgetown University and a Schwartz senior fellow at the New America Foundation. She served as a counselor to the U.S. defense undersecretary for policy from 2009 to 2011 and previously served as a senior advisor at the U.S. State Department. ("U.S. Counterterrorism Strategy Is the Definition of Insanity," http://foreignpolicy.com/2015/06/24/u-s-counterterrorism-strategy-is-the-definition-of-insanity/ 6/24/2015) STRYKER

Show me someone who publicly insists that the United States has an effective counterterrorism strategy, and **I'll show you someone who draws a paycheck from the U.S. government**. "This week we have seen success across a broad spectrum," Pentagon spokesman Col. Steve Warren told reporters on June 16, commenting on the death of Yemeni al Qaeda leader Nasir al-Wuhayshi, reportedly killed as a result of a U.S. drone strike. "Any time a terrorist is removed from the battlefield, is killed or captured, I think the net gain outweighs any potential loss." Loyalty to your employer is a fine thing, especially in a press spokesman, but outside the ranks of officials in President Barack Obama's administration, experts are far more dubious about the heavy U.S. reliance on air power and targeted strikes. "The tactical, whack-a-mole approach is **not having the desired effect**," my Foreign Policy colleague Micah Zenko told the New York Times. "Not having the desired effect" was a polite circumlocution: As Zenko recently noted for FP, State Department figures show a substantial recent uptick in global terrorism. In 2014, terrorist attacks increased 39 percent over the previous year, while the number of fatalities caused by terrorist attacks went up 83 percent. In Yemen, which the administration inexplicably continues to tout as a counterterrorism "success," **U.S. policy in in shambles**. "If you're looking for logic here, you're not going to find much," Stephen Seche, a former U.S. ambassador to Yemen, told the New York Times. In mid-June, the Washington Post reported that "[al]-Qaeda affiliates are significantly expanding their footholds" in both Yemen and Syria. And the Islamic State also continues to gain ground in both countries. Meanwhile, in Libya, it's "utter chaos," former U.N. advisor Dirk

Vandewalle told the Times: The Islamic State and al Qaeda-linked groups are vying for power, and a recent U.S. drone strike against al Qaeda operative Mokhtar Belmokhtar "shows that we're still relying on ad hoc measures." In Iraq, Somalia, and Afghanistan, it's the same story. The United States continues to rely heavily on airstrikes and targeted killings, while terrorist groups continue to cause mayhem and gain adherents. Even some of those who do get paid by Uncle Sam have grown more openly skeptical of U.S. counterterrorism policy. Capt. Robert Newson, a Navy SEAL who served as director of the Joint Interagency Task Force-Counter Terrorism, told an interviewer at West Point's Combating Terrorism Center that "drone strikes, manned airstrikes, and special operations raids ... buy space and time. But by themselves they are only a delaying action, and everywhere I have been, in Iraq, Afghanistan, Yemen, every military person up and down the chain of command acknowledges this. This 'CT concept' — the solution that some people champion where the main or whole effort is drone strikes and special operations raids — is a fantasy." Like Newson, I haven't encountered many defenders of U.S. counterterrorism strikes. Last year, I co-chaired a Stimson Center commission on U.S. drone policy with retired Gen. John Abizaid. The commission, which included former senior military and intelligence officials from both Obama's and George W. Bush's administrations, concluded in June 2014 that "the Obama administration's heavy reliance on targeted killings as a pillar of **US counterterrorism strategy** rests on questionable assumptions, and **risks increasing instability and escalating conflicts**. While tactical strikes may have helped keep the homeland free of major terrorist attacks, existing evidence indicates that both Sunni and Shia Islamic extremist groups have grown in scope, lethality and influence in the broader area of operations in the Middle East, Africa and South Asia." In dozens of interviews and conversations with national security experts since June 2014, I have yet to find anyone who won't admit, off the record, that U.S. counterterrorism policy is flailing badly. So here's the question: If no one except administration press flacks thinks the whack-a-mole approach to counterterrorism is working, why are we still using it? To me, that's one of the unsolved mysteries of the universe, right up there with "what is dark matter?" and "why do we yawn?" Why do smart people like Obama and his top advisors continue to rely on counterterrorism policies that aren't working? I can think of a few possibilities. 1. They know something we don't. This is the most generous hypothesis I can come up with. Maybe there's secret intelligence information showing that, contrary to all appearances, al Qaeda, the Islamic State, al-Shabab, Boko Haram, and other major terrorist groups have all been fatally weakened and peace on Earth is right around the corner. Maybe. But not very likely. 2. We know something they don't. Back in 2003, many of us were skeptical of the Bush administration's claims about Iraqi weapons of mass destruction, but told ourselves that senior officials probably knew something we didn't. Not so, as it turned out. Internal and external critics were ignored or silenced, and everyone from Defense Secretary Donald Rumsfeld to Secretary of State Colin Powell convinced themselves that dubious intelligence was the gospel truth. Had they paid more attention to critics, the United States might never have launched its misguided war in Iraq — the same war that became an inspiration and training ground for many of the terrorist leaders who continue to plague the region today. The critics were right. There's no particular reason to think that today's senior U.S. officials are any less prone to self-delusional groupthink. Maybe they're trapped in their own little bubble; maybe they've started to believe their own hype. 3. They don't know what they don't know. Or maybe they don't — and can't — know that they don't know what the rest of us know. Maybe no one draws their attention to critical reports. Maybe the internal critics — of whom there are clearly many — censor themselves when they're around the president and his inner circle. I sometimes think that the U.S. government is a giant machine designed to prevent senior decision-makers from every getting any useful information. For one thing, it's a vast and sprawling bureaucracy, and the right hand is frequently oblivious to the machinations of the left hand. In a sense, there's just no "there" there: The State Department doesn't always share important information with the Defense Department, the Defense Department doesn't always share important information with Department of Homeland Security, and the intelligence community generally doesn't share important information with anyone. Within agencies, it's no different. Central Command doesn't necessarily know what Special Operations Command knows, and Africa Command may not know what either knows. Military intelligence and surveillance assets are concentrated in the Central Command area or responsibility, leaving commanders elsewhere with less ability to monitor and understand what's going on. Meanwhile, the CIA's shift toward paramilitary operations has left it less able to gain vital human intelligence. Put all this together, and you get a situation in which U.S. officials can see millions of trees, but almost no one can spot any forests. Add to this the natural desire to bring good news rather than bad news to the boss — and combine it with a bureaucratic culture that insists that everything be boiled down to a few slides or a page of bullet points before it goes to senior officials. Maybe, at the end of the day, Obama can't be expected to know whether his approach to counterterrorism is succeeding or failing, because the structure and incentives of the players in his own government make it impossible for him to know. 4. They don't want to know. Maybe that's too generous. Bush used to boast that he never read the newspaper. Maybe Obama has stopped reading the news too. Or maybe he skips articles that look critical or negative and goes straight to the sports section. It will be many years before current intelligence assessments are declassified, but so far, journalistic reports of leaked documents and comments by former officials suggest that there's **no shortage of internal evidence that U.S. counterterrorism policy is failing**. According to the BBC, leaked CIA reports concluded that targeting killings of Taliban leaders were ineffective, for instance. Other internal documents reportedly acknowledge that U.S. officials are often uncertain whom they're killing in the first place. But maybe senior officials find reasons to avoid reading such reports. Taking such information fully on board — or

grappling with the full implications of the recent rise in global terrorism — would require senior officials to admit (to themselves, even if not to the general public) that a counterterrorism strategy centered on air power and targeted killings isn't working. Not fun. 5. They know, but don't care. Perhaps I'm still being too generous. Maybe senior administration officials know perfectly well that their approach to counterterrorism is failing, but simply have **no incentive to change it**. Why bother? In less than two years, this administration will be gone, and the next crew will have to clean up the mess — which won't be easy, since no one has any magic solutions. In the meantime, politics trumps policy. The experts, analysts, and pundits can yap all they want, but airstrikes and targeted killings scratch the itch to "do something" and look tough while doing it. The long-term efficacy of this approach is immaterial. 6. They're just really conflicted and confused. It's definitely possible. In May 2013, Obama told an audience at the National Defense University that counterterrorist drone strikes raise "profound questions" and that "the use of force must be seen as part of a larger discussion we need to have about a comprehensive counterterrorism strategy." In May 2014, he repeated his commitment to having that discussion and added, "I also believe we must be more transparent about both the basis of our counterterrorism actions and the manner in which they are carried out.... When we cannot explain our efforts clearly and publicly, we face terrorist propaganda and international suspicion." In September 2014, he admitted, "We don't have a strategy yet" for dealing with the rise of the Islamic State." A few weeks ago, he amended this to "we don't yet have a complete strategy." **It shows**.

Counterterrorism is ineffective and inefficient—the DHS is an alt cause

Imperfect Intelligence Sharing In the aftermath of 9/11, DHS was created to ensure that silos of information are broken down, and that counterterrorism agents are able to use the best intelligence proactively. While great strides have been made in this direction, DHS's role in the intelligence and information-sharing arenas remain limited. In 2012, the Senate Homeland Security and Government Affairs Committee found that fusion centers "often produced irrelevant, useless or inappropriate intelligence reporting to DHS and many produced no intelligence reporting whatsoever." It also provided multiple assessments and examples that show fusion centers were not meaningfully contributing to counterterrorism measures and **may have even been harming efforts**.[1] More recent reports also show fusion centers to have mixed results.[2] Meant to serve as hubs of sharing between federal, state, and local officials, the 78 fusion centers often serve cities or regions already covered by 104 FBI Joint Terrorism Task Forces (JTTFs) and 56 Field Intelligence Groups (FIGs), which play a similar role to that of fusion centers.[3] This broad duplication of efforts results in an inefficient and counterproductive use of counterterrorism funds. In 2013, the DHS Inspector General (IG) reported that DHS's Homeland Security Information Network (HSIN)—designed to share sensitive but not classified information with federal, state, local government, and private-sector partners—was only being used by a small percentage of all potential partners. State and local officials stated that one reason for not using HSIN was that "**the system content was not useful**."[4] Since the IG report came out, however, HSIN has successfully migrated to an updated system and is seeking to add desired content from DHS components.[5] At around 40,000 active users at the end of 2013, HSIN is far short of its 2015 objective of 130,000.[6] Furthermore, a RAND report sponsored by DHS found that HSIN was only a somewhat useful source of information.[7] Other DHS intelligence products and efforts also had mixed results. In 2013, the Senate Select Committee on Intelligence found that DHS's Office of Intelligence and Analysis (I&A) had more analysts than reports.[8] In 2014, Government Accountability Office (GAO) surveys found that private-sector, intelligence-community, and DHS-component customers of DHS's intelligence products generally found them not useful, although the primary customers, DHS headquarters and state and local law enforcement partners, found them helpful.[9] Combined with low morale—I&A was rated the third-worst office to work for in the federal government in 2014—DHS's intelligence operations are far from where they should be.[10] Of course, **DHS is not alone in its shortfalls** in the intelligence and counterterrorism sphere. While the FBI has made progress in its intelligence activities and sharing information with state and local law enforcement or private-sector partners, the recent report by the FBI's 9/11 Review Commission found that there is "still room for improvement"[11] as partners often view the FBI as "a one way street."[12] The report also found **substantial problems in the FBI's larger intelligence endeavor**, finding "a significant gap between the articulated principles of the Bureau's

intelligence programs and their effectiveness in practice."[13] While the National Security Branch and newly established Intelligence Branch, together with other substantial endeavors to build intelligence structures and programs, are steps in the right direction, intelligence analysts need more resources and opportunities to train, develop, and advance professionally, and the uneven integration of intelligence with law enforcement activities must be fixed by further elevating the role of intelligence in the FBI.[14] As a result, both DHS and the FBI remain works in progress in the analysis, sharing, and use of intelligence. Proactively Defending the U.S. Homeland DHS and the FBI stand at the center of many of the U.S.'s efforts to combat terrorism. Despite the importance of its positions, its efforts are often **plagued by inefficiencies and ineffectiveness**. To better protect the U.S. from terrorism, Congress should:

Counter-terror is already ineffective

SCHMITT and SHANKER, '10, (ERIC, Pulitzer Prize–winning American journalist who writes for the New York Times and THOM, "Hurdles Hinder Counterterrorism Center," New York Times, February 22, 2010, http://www.nytimes.com/2010/02/23/us/politics/23center.html?_r=0)//erg

WASHINGTON — The nation's main counterterrorism center, created in response to the intelligence failures in the years before Sept. 11, is struggling because of flawed staffing and internal cultural clashes, according to a new study financed by Congress. Related Documents Document: Project on National Security Reform Study (pdf) The result, the study concludes, is a lack of coordination and communication among the agencies that are supposed to take the lead in planning the fight against terrorism, including the C.I.A. and the State Department. The findings come just weeks after the National Counterterrorism Center was criticized for missing clear warning signs that a 23-year-old Nigerian man was said to be plotting to blow up a Detroit-bound commercial airliner on Dec. 25. The counterterrorism center's mission is to gather information from across the government, pull it all together and assess terrorist threats facing the United States, then develop a plan for the government to combat them. But the new report found that the center's planning arm did not have enough authority to do its main job of coordinating the White House's counterterrorism priorities. The center's planning operation is supposed to be staffed by representatives of various agencies, but not all of them send their best and brightest, the report said. It also cited examples in which the C.I.A. and the State Department did not even participate in some plans developed by the center that were later criticized for lacking important insights those agencies could offer. As a result, the center's planning arm "has been forced to develop national plans without the expertise of some of the most important players," the report determined. The counterterrorism center was part of the overhaul of the government after Sept. 11, including the creation of the director of national intelligence. Now, years after the attacks, the entire reorganization is coming under scrutiny, raising fundamental questions about who is in charge of the nation's counterterrorism policy and its execution. "The fluid nature of modern terrorism necessitates an agile and integrated response," the report concluded. "Yet our national security system is organized along functional lines (diplomatic, military, intelligence, law enforcement, etc.) with weak and cumbersome integrating mechanisms across these functions." The 196-page report is the result of an eight-month study by the Project on National Security Reform, a nonpartisan research and policy organization in Washington. It was financed by Congress and draws on more than 60 interviews with current and former government and Congressional officials, including nearly a dozen officials at the counterterrorism center. The study is scheduled to be made public this week. The authors provided a copy to The New York Times.

1NC—Money Laundering Frontline

Anti-money laundering fails—it is an ineffective approach

Rahn, 2014 (Richard W. Rahn, senior fellow at the Cato Institute and chairman of the Institute for Global Economic Growth. "Anti-Money Laundering Surveillance Hurts Banking Services" http://www.cato.org/publications/commentary/anti-money-laundering-surveillance-hurts-banking-services) // IL

For the last several decades, global liberty-haters have dreamt that all financial privacy would be eliminated. They have sought out a variety of excuses to act as Peeping Toms peering into your bank accounts. In the 1980s, their big push was to enact "anti-money laundering" legislation, with the claim that it would make catching drug dealers and other assorted criminals easier. The United States passed its first anti-money laundering law in 1986 — despite the fact that no one could objectively define money laundering, because it is not an action but an "intent" to act unlawfully. The whole global anti-money laundering regime makes no economic sense, is unworkable, and is morally repugnant." In 1989, at the G-7 summit in Paris (before Russia joined and made it the G-8), it was decided to create an

international organization dedicated to combating money laundering — duplicating the efforts of the International Monetary Fund (IMF) and the Organization for Economic Cooperation and Development (OECD) which already had the responsibility. The new organization was called the Financial Action Task Force on Money Laundering (FATF). Over time, the task force expanded its membership to include some corrupt governments such as Russia (which is alleged to engage in money laundering). By the way, a Russian government official, Vladimir Nechaev, is now president of the task force. As a result of all the global anti-money laundering regulations, total compliance costs for financial institutions are now in the hundreds of billions of dollars. Basic banking and other financial services have been reduced and even eliminated for tens of millions of people around the world. Have all of these regulatory costs done any good? In an effort to answer that basic question, the Center for Law and Globalization (a partnership of the University of Illinois College of Law and the American Bar Association) published a report in January, "Global Surveillance of Dirty Money." The authors had the full cooperation of the IMF and FATF, yet the conclusions were damning. One of the authors of the report, Terence Halliday, stated: "We find that the current system is pervasive and highly intrusive but without any evidence of tangible effect." The authors were quoted in The Wall Street Journal as saying the IMF and FATF have built a "Potemkin village" and a "paper reality" based on "a plausible folk theory," rather than data and evidence of what works.

I've complained many times about the pointless nature of anti-money laundering laws. They impose very high costs and force banks to spy on their customers, but they are utterly ineffective as a weapon against criminal activity. Yet politicians and bureaucrats keep making a bad system worse, and the latest development is a silly scheme to ban $100 bills! It also seems that poor people are the main victims of these expensive and intrusive laws. According to a new World Bank study, half of all adults do not have a bank account, with 18 percent of those people (click on nearby chart for more info) citing documentation requirements – generally imposed as part of anti-money laundering rules – as a reason for being unable to participate in the financial system. But this understates the impact on the poor. Of those without bank accounts, 25 percent said cost was a factor, as seen in the chart below. But one of the reasons that costs are high is that banks incur regulatory expenses for every customer, in large part because of anti-money laundering requirements, and then pass those on to consumers. Here are some of the key points in the World Bank report. "The data show that 50 percent of adults worldwide have an account at a formal financial institution… Although half of adults around the world remain unbanked, at least 35 percent of them report barriers to account use that might be addressed by public policy. …The Global Findex survey, by asking more than 70,000 adults without a formal account why they do not have one, provides insights into where policy makers might begin to make inroads in improving financial inclusion. …Documentation requirements for opening an account may exclude workers in the rural or informal sector, who are less likely to have wage slips or formal proof of domicile. …Analysis shows a significant relationship between subjective and objective measures of documentation requirements as a barrier to account use, even after accounting for GDP per capita (figure 1.14). Indeed, the Financial Action Task Force, recognizing that overly cautious Anti-Money Laundering and Terrorist Financing (AML/CFT) safeguards can have the unintended consequence of excluding legitimate businesses and consumers from the financial system, has emphasized the need to ensure that such safeguards also support financial inclusion."

AML fails—the US catches 0.2% of money laundered

Pymnts 15 - Pymnts is an online media channel reporting on the payments and commerce sectors. ("THE GLOBAL COST OF ANTI-MONEY-LAUNDERING EFFORTS," http://www.pymnts.com/news/2015/the-global-cost-of-anti-money-laundering-efforts/#.Va6UchNVjxc 2/24/2015) STRYKER

Global efforts to prevent money laundering are both **ineffective and incredibly expensive** to maintain — and poor countries are the ones hit hardest by that cost, according to a commentary for Bloomberg. At best, the global anti-money-laundering (AML) system "snares just a fraction of 1 percent of criminal income flows," wrote Charles Kenny, a senior fellow at the Center for Global Development. Citing numbers from a 2006 study,

Kenny said global money-laundering transactions are at least 2 percent of global GDP, or roughly $1.5 trillion. Actual money laundering convictions worldwide involve at most hundreds of millions of dollars, and in the U.S., the amounts seized in AML efforts is **less than 0.2 percent** of all laundered money. "A system that misses all but a fraction of a percent of criminal financial flows is almost guaranteed to miss terrorism finance in particular, which involves very small sums," Kenny wrote, noting that no known AML prosecutions have involved terror financing. But AML efforts still cost money: an estimated $7 billion annually in the U.S. alone for implementing AML regulations from the international Financial Action Task Force (FATF). The cost is disproportionately more in smaller countries such as Mauritius, which has 1.3 million people and 25 government officials working on AML implementation — more AML bureaucrats than the country has opticians — and that's not counting bank staff who carry out customer investigations.

IMF 15 - International Monetary Fund ("The IMF and the Fight Against Money Laundering and the Financing of Terrorism," https://www.imf.org/external/np/exr/facts/aml.htm 3/27/2015) STRYKER
The international community has made the fight against money laundering and terrorist financing a priority. The IMF is especially concerned about the possible consequences money laundering, terrorist financing, and related crimes have on the integrity and stability of the financial sector and the broader economy. These activities can undermine the integrity and stability of financial institutions and systems, discourage foreign investment, and distort international capital flows. They may have negative consequences for a country's financial stability and macroeconomic performance, resulting in welfare losses, draining resources from more productive economic activities, and even have destabilizing spillover effects on the economies of other countries. In an increasingly interconnected world, the negative effects of these activities are global, and their impact on the financial integrity and stability of countries is widely recognized.
Money launderers and terrorist financiers **exploit** both the complexity inherent in the global financial system as well as differences between national AML/CFT laws and systems, and they are especially attracted to jurisdictions with **weak or ineffective** controls where they can more easily move their funds without detection. Moreover, problems in one country can quickly spread to other countries in the region or in other parts of the world.

AML surveillance is wasteful

As the financial crisis levels off, regulators are now refocusing their efforts on anti- money laundering (AML) and terrorist financing enforcement. This increase in regulatory scrutiny is compelling many financial institutions to take a closer look at their AML operations as they seek innovative ways to meet regulator expectations and reduce costs in an uncooperative economic environment. Considering the regulatory complexity and high costs associated with AML transaction monitoring, institutions often start with improving the effectiveness and efficiency of their automated AML transaction monitoring alert engines. When properly configured, these systems can help institutions detect patterns of activity that may indicate money- laundering or terrorist-financing activities. Poorly defined alert engine parameters and thresholds, however, may raise flags unnecessarily or even miss significant money laundering activity. PricewaterhouseCoopers (PwC) analysis indicates that 90 percent to 95 percent of all alerts generated by AML alert engines are false positives. These high false-positive rates lead to significant monitoring costs but more disconcerting are the false negatives, or the cases of money laundering that are not detected. Unlike false positives, these are hidden, are harder to quantify, and can have significant negative impact. Both of these issues can be addressed if institutions refine their rule set thresholds. But tuning without first tackling AML data quality can lead to skewed and misrepresented thresholds. By the time the data is discovered to be inaccurate or incomplete, a threshold change may have already been implemented, leading to costly rework and the potential for a regulator- mandated transaction lookback. Many institutions are caught in a cycle of tuning, rework, lookback, tuning, rework, lookback, etc., because data quality issues are addressed haphazardly instead of systematically. The quality of data clearly affects the quality of the alerts generated by a transaction monitoring system. Active management of monitoring data is paramount to improving data quality. When AML transaction monitoring systems were initially implemented, the accuracy of the transaction code data and rules that determined what qualified as an exception may have been established and vetted. Since the original implementation, however, many institutions have not reassessed and verified whether the transaction codes and data that feed their AML monitoring systems remain at initial quality levels. Despite this, many institutions have still spent time and money tuning monitoring rules using outdated, inaccurate, and incomplete transaction reference data. This reliance on a one-

time assessment of data ignores an institution's dynamic fiscal landscape as it introduces new products, consolidates financial entities, and its IT infrastructure evolves.

Small Biotech Startups are doing fine now and larger companies solve—squo solves

Thomas 12 [David, currently Senior Director of Industry Research and Analysis at BIO in Washington, DC. In this role, he is responsible for financial statistics and analysis of the biotechnology sector and contributes to BIO's policy activities as well as programming for BIO's investor conferences, "Small Companies, Big Returns", 12/07/2012, http://www.biotech-now.org/business-and-investments/inside-bio-ia/2012/12/small-companies-big-returns] alla

The **broader biotech indices are up more than 30 percent this year and have reached levels not seen since the peak of March 2000**. Larger biotechs account for much of the index returns, as we have described previously, and have helped the sector outperform the S&P 500 by two fold. But how have smaller biotech companies been performing? As of Nov 30, 27 companies that started the year under $1 billion in market capitalization have jumped 100 percent or more. That is a little more than the top decile for the category. When compared to the small cap returns across other industries, only 72 of 1730 (4.2 percent) had 2x returns. Consider the returns this year for the top 20 performing companies under $1B: (source: Factset) Finding positive outliers, with 2x, 3x, or even 5x returns can have a big effect on a concentrated portfolio. A small 1 percent position with a 5x return can move an entire portfolio 4 percent. Of course, in biotech, picking these winners requires more than a glance at burn rates and cash on hand. It takes a detailed understanding of the company's leading pipeline assets – a drug's market potential, its competition (on the market and in the pipeline), likelihood of clinical success (which in turn depends on safety profile, modality and novelty of mechanism of action), the potential regulatory scrutiny, and the drug's probability of achieving reimbursement – just to name a few items. But the hard work can pay off. Small cap biotech is one segment of the overall market where skilled investors with deep industry knowledge can outperform equal weight and market cap weighted baskets of securities. Specialist hedge fund managers have been able to spot small cap winners and beat the average returns listed above. One fund manager that has been able to do to just that is Peter Kolchinsky whose fund RA Capital has been able to beat the average returns by a wide margin over the last ten years. In his words: "Smaller, development-stage companies cannot be understood through their financial statements the way larger profitable companies can be. You have to differentiate between good and bad science, data, trial design, and target markets, all on borrowed time as cash burns down. We have a great team dedicated to dissecting the fundamental basis for everything these companies do and we try to anticipate the chess game that companies play in competitive fields. That's helped us make some good investments. But we always appreciate a little luck." Kolchinsky is one of hundreds of biotech investors that will be attending BIO's next investor event, the BIO CEO Conference in February. As the world's only independent conference focused on publically traded biotechs, it is the essential event for scouting next year's winners at therapeutic panels, business roundtables, and company presentations.

Hanna 14 [Julia, an associate editor of the HBS Alumni Bulletin, "The Costs And Benefits Of Sarbanes-Oxley", Forbes, 3/10/2014, http://www.forbes.com/sites/hbsworkingknowledge/2014/03/10/the-costs-and-benefits-of-sarbanes-oxley/] alla

Widely deemed the most important piece of security legislation since formation of the Securities and Exchange Commission in 1934, the landmark Sarbanes-Oxley Act of 2002 was born into a climate still reeling from the burst of the high-tech bubble and fraud scandals at Enron and WorldCom. Its intent was to improve corporate governance and restore the faith of investors, but many in the business world spoke out against SOX, viewing it as a politically motivated over-correction that would lead to a loss of risk-taking and competitiveness. HBS Associate Professor Suraj Srinivasan and Harvard Law School Professor John C. Coates leverage the benefit of hindsight to assess research findings from over

120 papers in accounting, finance, and law to evaluate the act's impact and establish takeaways to guide the creation of future legislation. While current measurement systems are insufficient to make an unambiguous, overarching judgment of the act's net benefits, Srinivasan and Coates isolate a few clear findings and make a case for flexibility and experimentation to guide future laws and reforms in the financial arena. One thing is clear: Despite severe criticism, the act and the institutions it created have survived almost intact since enactment. But so have condemnations. It's a puzzle, say the authors, that "on the one hand, the law continues to be fiercely and relentlessly attacked in the US" while those most affected by the act as implemented express "acquiescence or even mild praise." The paper, SOX after Ten Years: A Multidisciplinary Review, is scheduled to be published later this year in Accounting Horizons. "We took a cost/benefit approach when considering SOX," explains Srinivasan. The most worrisome part of the act on the business side was the mandate that required public companies to obtain an independent audit of their internal control practices. The cost of this requirement, he says, was felt most acutely by smaller companies, although it was ultimately deferred for companies with market caps of less than $75 million and made permanent in the Dodd-Frank Act. **Audit standards also were modified in 2007, a change that reportedly reduced costs for many firms by 25 percent or more per year**. "**That aspect of flexibility—being able to exempt some smaller companies from the mandate and make it easier for others to implement—is an important quality to keep in mind when we discuss future regulation,**" says Srinivasan, who also cites the important role of the Public Company Accounting Oversight Board (PCAOB), a nonprofit private corporation created by SOX that oversees auditors of SEC-registered companies. MARKETS HAVE BENEFITTED **Despite high initial costs of the internal control mandate, evidence shows that it has proved beneficial**. "Markets have been able to use the information to assess companies more effectively, managers have improved internal processes, and the internal control testing has become more cost-effective over time," according to Srinivasan. The research does not support the fear that SOX would reduce levels of risk-taking and investment in research and growth. Another concern that the act would shrink the number of IPOs has not been borne out either; in fact, the pricing of IPOs post-SOX became less uncertain. The cost of being a publicly traded company did cause some firms to go private, but research shows these were primarily organizations that were smaller, less liquid, and more fraud-prone. **"Yes, SOX may have cut off public market financing to these companies, but the question is whether it was appropriate for them to be in public markets in the first place," Srinivasan says. "That is a value judgment, to be sure. But it may not be a bad thing if certain companies are restricted in their access to financing, simply because loss of trust in public capital markets has big consequences for the entire economy**." A 2005 survey by the Financial Executives Research Foundation found that 83 percent of large company CFOs agreed that SOX had increased investor confidence, with 33 percent agreeing that it had reduced fraud. And yet—the financial crisis of 2008 still happened. "The big, unanswered question is whether SOX-related changes had any impact in the lead-up to the financial crisis. Did it make things better or worse?" says Srinivasan. "We don't know the answer to that. We only know that there were benefits in terms of financial reporting and corporate governance; that costs of implementation were higher for smaller companies; and that concerns about risk-taking and investment haven't come to bear. One of the big takeaways from this paper is how difficult it is to measure costs and benefits of regulation in a systematic way." COSTS AND BENEFITS Building flexibility into new policymaking that allows for more experimentation and measurement is helpful, he notes, as is **avoiding a one-size-fits-all approach**. "The costs of regulation are more direct and easier to comprehend than the benefits, which are mostly indirect. So there will always be upfront concerns about regulation, which leads back to the importance of building in opportunities to measure the costs and benefits.

No Impact—too many alt causes—and GM Ag cannot be perfect

But is it the only way?, Last Modified: 19 December 2000, http://www.theguardian.com/science/2000/mar/31/gm.food] alla

Dr Sue Mayer: GM "super rice" could play a major role in tackling world hunger, we are told. Genetically modified for improved photosynthetic ability, its yields could be increased by a massive 35%. Surely this is the end to starvation and we should hang out the banners. However, some awkward questions remain. First, what are the major causes of hunger? And can a new rice variety solve them? There seems to be agreement that poverty and inequality, war and economic instability are the major causes of malnutrition. **There are enough calories to go round but they are not distributed properly. Education and sanitation are often inadequate, and tackling them can make dramatic differences**. Thailand has seen falls of 90% in maternal death rates and a reduction in the proportion of underweight children from 50% in 1982 to 10% in 1996 through political and social commitments to ending undernutrition, largely through community-based initiatives. Some of the improvements are threatened by the financial insecurity of south-east Asia, and that will not be cured by super rice. Second, could there be any problems with the rice itself? If a GM crop is intended for mass consumption, most people would agree it will have to face some serious safety assessments. At the recent OECD conference in Edinburgh, debate focused on the need to find adequate safety testing mechanisms for unintentional changes, and the need to develop such systems is urgent. There are also environmental and agricultural issues that need to be addressed. If the genes for increased photosynthetic ability are passed to weedy rice varieties (which exist in close proximity to paddy fields and can cross freely with rice) and they get a 35% boost in growth, super weeds will be a reality and any benefits may be short-lived And because this is obviously a major change to the way in which the rice behaves, it could make the rice crop itself more weedy. Excitement must therefore be tempered with caution. This raises a question about how this new rice variety will be marketed? Even though it was developed in the public sector, the biotechnology industry in the developed world is desperate to get some good PR, and super rice will now be promoted around the world. Having nothing beneficial to offer consumers in the north, the industry has been forced to use poverty and malnutrition as a justification for its continued existence. All the major multinationals are investigating systems of controlling - and gaining maximum profit from - their patented crops, through the linked use of a chemical supplied by the same company. They are prospecting for useful genes in the south to patent and use in the north. There is active development of GM crops in the north to create substitutes for crops such as palm oil and cocoa, which are traditionally grown in the developing world. This has the potential to threaten the export markets of these countries and cause serious economic hardship. While we are told about the advantages that super rice may bring, little mention is made of other GM crop developments which may increase inequalities and threaten food security, not improve it. Genetic modification is not the only way to increase yields in rice. Other recent reports showed how crossing a cultivated rice with a weedy rice caused similar dramatic increases in yields. Changes in cultivation practice can also make a big difference. GM super rice **is clearly not the only solution available**. So super rice is unlikely to save the world. Its role, if any, is likely to be minor, as underlying inequalities can only be addressed by a shift in political and social attitudes. Finding solutions at a local level, consulting with communities and letting them determine the best way to a balanced diet is crucial. Let's not use the horrors of malnutrition to justify a whole technology.

Topicality

1NC—Topicality (Intelligence Gathering)

"Domestic surveillance" is a form of intelligence gathering

Small 8 — Matthew L. Small, Presidential Fellow at the Center for the Study of the Presidency, Student at the United States Air Force Academy, now serves as an Operational Analyst at the United States Air Force, 2008 ("His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power During Times of National Crisis," Paper Published by the Center for the Study of the Presidency, Available Online at http://cspc.nonprofitsoapbox.com/storage/documents/Fellows2008/Small.pdf, Accessed 07-11-2015, p. 2-3)

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to **narrow the scope of the term** "domestic surveillance." Domestic surveillance is **a subset of intelligence gathering**. Intelligence, as it is to be understood in this context, is "information that meets the stated or understood needs of policy makers and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, domestic surveillance is **a means to an end**; the end being **intelligence**. The intelligence community best understands domestic surveillance as the acquisition of nonpublic information concerning United States persons (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept.

This paper's analysis, in terms of President Bush's policies, focuses on electronic surveillance; specifically, wiretapping phone lines and obtaining caller information from phone companies. Section f of the USA Patriot Act of 2001 defines electronic surveillance as:

> [T]he acquisition by an electronic, mechanical, or other surveillance device of the contents of any wire or radio communication sent by or intended to be received by a particular, known United States person who is in the United States, if the contents are acquired by intentionally targeting that United States person, under circumstances in which a person has a reasonable expectation of privacy and a warrant would be required for law enforcement purposes;

Adhering to the above definition allows for a **focused analysis** of one part of President Bush's domestic surveillance policy as its implementation relates to the executive's ability to abridge certain civil liberties. However, since electronic surveillance did not become an issue of public concern until the 1920s, there would seem to be a problem with the proposed analysis.

Considering an American citizen's claim to a right to privacy, the proposed analysis is not limited to electronic surveillance alone but rather includes those actions that would seek, or at least appear, to abridge a civil liberty. The previously [end page 2] presented definition of electronic surveillance itself implies an infringement into a person's expected right, in this case the right is to privacy. Acknowledging the intrusion **inherent in the definition**, the question of how far the president can push this intrusion becomes even more poignant. As such, President Bush's policies are not the sole subject of scrutiny, but rather his supposed power to abridge civil liberties in the interest of national security. The first part of the analysis, then, turns to a time where the national security of the United States was most at jeopardy, during its fight for independence.

The plan is not intelligence gathering because its purpose is not identifying and disrupting a future security threat. That is distinct from traditional law enforcement like the SEC

Defining Domestic Intelligence

What do we mean by the term domestic intelligence? The term intelligence sparks a range of associations, many of which stem from intelligence's connection with the secret activities of governments seeking to advance their interests in international affairs. In recent years, the term intelligence has been integrated into domestic law enforcement and public safety agencies as part of the phrase intelligence-led policing. Definitions of intelligence-led policing vary, but common elements include the use of information-gathering capabilities and the analysis and application of resulting information in crime prevention and response activities in addition to their more traditional use in the prosecution of past [end page 34] criminal acts (see, e.g., Weisburd and Braga, 2006; Milligan, Clemente, and Schader, 2006; Ratcliffe, 2002; Peterson, 2005). Use of the term intelligence has also spread beyond government organizations into private-sector organizations and elsewhere.1 To some, the term is most closely associated with the collection of information; others see intelligence as a more general category that includes a much broader range of activities. Such variety in the use and understanding of these terms **complicates policy debate**, and the lack of standard definitions for intelligence activities focused on homeland security and domestic counterterrorism (CT) efforts has been cited as a **significant impediment** to designing and assessing policy in this area (Masse, 2003, 2006).

To guide the work reported in this volume, we define domestic intelligence as efforts by government organizations to **gather**, **assess**, and **act on** information about individuals or organizations in the United States or U.S. persons elsewhere2 that are **not related** to the investigation of a known past criminal act or specific planned criminal activity.3

It is often the case that an individual or organization that carries out a terrorist attack—or has specific plans to do so (e.g., the attacker has conspired [end page 35] to acquire weapons for a future attack)—has committed one or more specific crimes. In these cases, traditional law enforcement approaches for investigating and prosecuting these crimes apply. The major difference between intelligence approaches and those used during traditional law enforcement stems from the former's emphasis on **preventing future events**—i.e., on acting when the individuals or organizations planning an attack may **not yet have committed** any prosecutable criminal offenses. Intelligence activities can be **investigative** in nature and may resemble law enforcement activities. However, they do not have to satisfy the same legal requirements that constrain the initiation of a law enforcement investigation. An example of such an intelligence activity is investigating a tip about the suspected terrorist behavior of an unknown group to

determine whether the tip is credible and, if it is, acting to prevent the attack. However, given substantial concern about the ability of even a single individual working alone to plan and execute acts of terrorist violence, investigative follow-up may not be enough to address the threat of terrorism. As a result, another type of intelligence effort can be more **explorative** in character, seeking proactively to (1) identify individuals or groups that might be [end page 36] planning violent actions and (2) gather information that might indicate changes in the nature of the threat to the country more broadly (see, e.g., DeRosa, 2004). Such explorative activity inherently involves gathering a broader spectrum of data about a greater number of individuals and organizations who are unlikely to pose any threat of terrorist activity.

Our definition of domestic intelligence parallels those that appear in the academic literature that has examined U.S. policy in this area over the past several decades (see, e.g., Morgan, 1980). However, it is **narrower than more-general definitions** that seek to capture the full breadth of intelligence requirements associated with homeland security or homeland defense.4 Our focus on the collection and use of information about individuals and organizations means that we have focused on the **tactical threat-identification** and **threat-disruption** parts of homeland security intelligence. Thus, we do not consider activities such as analyses designed to identify societal vulnerabilities or map the threat to those identified vulnerabilities to guide broader homeland security policies.5 Others have noted that the boundary between intelligence and law enforcement activities has blurred over time, particularly [end page 37] in response to transnational threats such as drug trafficking and terrorism. This blurring of the boundary between the two complicates an examination focused largely on the CT mission.6

Vote negative to endorse a limited topic.

First, the link: intelligence gathering is sufficiently broad to allow affirmative flexibility but narrow enough to ensure predictable, in-depth debates. The aff justifies an unmanageably large number of plans that curtail monitoring in sectors like *agriculture*, *banking*, *education*, *environment*, *finance*, *health care*, *housing*, *transportation*, and *welfare*.

Second, the impact: this prevents rigorous preparation and focused analysis because it shifts debates away from the core controversy about balancing security and civil liberties. This won't get stale thanks to the Snowden revelations, but no one will debate it if affs are given less controversial options that skirt the controversy. Broad interpretations sabotage clash and subvert topic education.

2NC—Interpretation

"Domestic surveillance" is focused on the prevention of future attacks, not the prosecution of ordinary crimes. This is from an authoritative Supreme Court decision.

Powell 72 — Lewis Franklin Powell, Jr., Associate Justice of the United States Supreme Court (succeeded by Anthony Kennedy), 1972 (United States Supreme Court Majority Decision in United States v. United States District Court, Number 70-153, June 19th, Available Online at http://caselaw.findlaw.com/us-supreme-court/407/297.html, Accessed 07-05-2015)

We emphasize, before concluding this opinion, the scope of our decision. As stated at the outset, this case involves only the domestic aspects of national security. We have not addressed, and express no opinion [407 U.S. 297, 322] as to, the issues which may be involved with respect to activities of foreign powers or their agents. 20 Nor does our decision rest on the language of 2511 (3) or any other section of Title III of the Omnibus Crime Control and Safe Streets Act of 1968. That Act does not attempt to define or delineate the powers of the President to meet domestic threats to the national security.

Moreover, we do not hold that the same type of standards and procedures prescribed by Title III are necessarily applicable to this case. We recognize that domestic security surveillance may involve **different policy and practical considerations** from the surveillance of "ordinary crime." The gathering of security intelligence is often **long range** and involves the interrelation of various sources and types of information. The exact targets of such surveillance may be more difficult to identify than in surveillance operations against many types of crime specified in Title III. Often, too, the emphasis of domestic intelligence gathering is on **the prevention of unlawful activity** or the enhancement of the Government's **preparedness for some possible future crisis or emergency**. Thus, the focus of domestic surveillance may be **less precise** than that directed against more conventional types of crime.

1NC—Reform Counterplan

The United States federal government should

-require reauthorization of the Public Company Accounting Oversight Board

-include the PCAOB in SEC accountability reviews

-create an expedited appeal process for PCAOB audit decisions

-eliminate PCAOB exemptions from public right-to-know laws

The counterplan solves – creates effective oversight of the SEC and incorporates small businesses into legislative processes – here's the solvency advocate

Coates 7 (John, Professor of Law and Economics at Harvard Law School, "The Goals and Promise of the Sarbanes-Oxley Act", The Journal of Economic Perspectives, Vol. 21, No. 1 (Winter, 2007), http://faculty.wwu.edu/dunnc3/rprnts.GoalsPromiseSOX.pdf)

If or when Congress revisits the Sarbanes-Oxley legislation, it could improve upon the design of the **P**ublic **C**ompany **A**ccounting **O**versight **B**oard in several ways. First, Congress should require that PCAOB be reauthorized after some number of years of operation (Clark, forthcoming). Such reauthorization would force an evaluation of PCAOB's performance and effectiveness, and would provide an opportunity for Congress to alter the institution if (for example) it has been captured by the auditing industry or has shown signs of bureaucratic empirebuilding. While a near-term reauthorization would face a political risk that the law might not be approved absent headline-grabbing scandals, a reauthorization after, say, a decade would give PCAOB sufficient time to build political relationships so that reauthorization would be likely, absent a strong showing by PCAOB critics that the agency had been ineffective or unresponsive to legitimate concerns. Second, rather than giving **the SEC alone** the task of ensuring ongoing accountability at PCAOB, it might be better to involve PCAOB's constituencies in its governance. For example, the PCAOB could be required to **obtain and respond to evaluations** by specified advisory groups-including investors, auditing firms, finance executives, and **representatives of small business**-giving those groups **a permanent and substantive role** in its deliberations. A process similar to this operates at the Financial Accounting Standards Board, which consults with a 34-member Financial Accounting Standards Advisory Committee made up of top corporate executives, audit firm partners, accounting academics, officers of selfregulatory organizations (such as the New York Stock Exchange), and financial analysts. Third, audit **clients that are unhappy** about audit firm's judgments-particularly regarding control system weaknesses-should have a prompt and effective way to appeal the judgment to PCAOB staff. The SEC should monitor such appeals to verify that PCAOB is restraining the audit firms from imposing costs on public companies. Fourth, while PCAOB's reports disclose problems found with past audits, Sarbanes-Oxley prohibits PCAOB from releasing portions of inspection reports that criticize an audit firm's control systems unless the audit firm fails to address the criticisms within 12 months of the report. As a result, the market and client firms will not know about and will not be able to react to those criticisms. Increased disclosure by PCAOB would be appropriate. Fifth, PCAOB's exemptions from public-right-to-know laws, while defensible in its start-up phase, should be revisited as its power and influence grows.

1NC—Politics Net Benefit

the CP's popular – avoids politics

Hamilton 13 (James, Principal Analyst at Wolters Kluwer Law & Business, a leading provider of corporate and securities information. Hamilton has been tracking, analyzing and explaining securities law and regulation for over 30 years as an analyst for Wolters Kluwer Law & Business. He has written and spoken extensively on federal securities law and is cited as an authority in the Senate Banking Committee Report (S. 111-176) of the Dodd-Frank Act. "Prospects for Securities and Financial Legislation in the 113th Congress", a white paper published by Wolters Kluwer, http://www.wklawbusiness.com/media/wk/lnb/pdf/securities/whitepapers/briefing_prospects-for-securities-and-financial-legislation%20_01-13_draft3.pdf)

Another piece of legislation that appears to have **strong bipartisan support** would reform PCAOB procedures. The PCAOB has asked Congress for legislation **amending the Sarbanes-Oxley Act** so that Board disciplinary hearings against individual auditors and accounting firms will be public. From the initiation of the PCAOB disciplinary proceeding through the SEC decision to let the sanctions commence, the entire proceeding currently take place behind closed doors, which is in sharp contrast to similar SEC proceedings against auditors. In the 112th Congress, Senators Jack Reed (D-RI) and Charles Grassley (R-Iowa) introduced legislation making PCAOB disciplinary proceedings public to bring auditing deficiencies at the audit firms or the companies they audit to light in a timely manner and help deter violations. The PCAOB Enforcement Transparency Act, S. 1907, would make hearings by the PCAOB, and all related notices, orders, and motions, open and available to the public unless otherwise ordered by the Board. The Board procedure would then be similar to the SEC's Rules of Practice for similar matters, where hearings and related notices, orders, and motions are open and available to the public. The draft legislation would also retain the Board's flexibility to order non-public proceedings in appropriate cases. It is expected that this legislation will be re-introduced in the 113th Congress. Senators Reed and Grassley will have key oversight roles in the 113th Congress and the PCAOB continues to support the legislation. The PCAOB is responsible for setting auditing standards for auditors of public companies, for examining the quality of audits performed by public company auditors and, where necessary, for imposing disciplinary sanctions on registered auditors and auditing firms. The Board's ability to commence proceedings to determine whether there have been violations of its auditing standards or rules of professional practice is an important component of its oversight.

2NC—Solvency

the counterplan solves without outright repeal – this is the best option

-also avoids politics – it's pragmatic and is seen as a compromise on financial legislation

Coates 7 (John, Professor of Law and Economics at Harvard Law School, "The Goals and Promise of the Sarbanes-Oxley Act", The Journal of Economic Perspectives, Vol. 21, No. 1 (Winter, 2007), http://faculty.wwu.edu/dunnc3/rprnts.GoalsPromiseSOX.pdf)

The process by which Sarbanes-Oxley was enacted has been criticized for being rushed and for ignoring relevant research (Butler and Ribstein, 2006; Romano, 2005; Zingales, 2004). Neither criticism is fair. The core ideas behind Sarbanes-Oxley had developed for years. Federal bills to create an auditing oversight body date to 1978, after hearings and reports prompted by auditing failures in the market downturn of the early 1970s. Similar legislation was debated again in 1995. In the run-up to Sarbanes-Oxley, Congress heard scores of witnesses debate in detail how auditing should be regulated. In a number of other controversial areas-executive compensation and stock options, audit firm rotation, general design of accounting rules-Congress showed a willingness to choose further study over either regulation or delegation (Bratton, 2003). Congress acted no differently in passing Sarbanes-Oxley than it does in passing most significant legislation. In fact, perhaps the most important component of Sarbanes-Oxley was precisely to delegate power to PCAOB, so that it could customize rules and respond to feedback much more rapidly than Congress could do on its own. Professional **lobbyists**, of course, may seek the outright repeal of Sarbanes-Oxley as a bargaining tactic while planning to settle on regulatory reform **as a**

compromise, but academics, **policymakers**, and the public would do well to see those tactics for what they are and recognize Sarbanes-Oxley, like many regulatory institutions, **as a work in progress**. Rather than **pushing for repeal** of SarbanesOxley, a more **cost-effective approach** is to push for the SEC and PCAOB to use their authority to **exempt or curtail requirements or prohibitions that are unnecessarily costly.**

FBI Advantage Counterplan

1NC—FBI Counterplan

Text: As outlined in our Inserra evidence, the United States federal government should:

- **streamline United States fusion centers**
- **refocus the Department of Homeland Security's intelligence capabilities**
- **push the Federal Bureau of Investigation toward being more effectively driven by intelligence**
- **and ensure that the Federal Bureau of Investigation more readily and regularly shares information with state and local law enforcement.**

The counterplan is both *necessary* and *sufficient* to effective resource allocation

Inserra 15 - David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy, of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation. ("Time to Reform the U.S. Counterterrorism Enterprise—Now," http://www.heritage.org/research/reports/2015/04/time-to-reform-the-us-counterterrorism-enterprisenow 4/15/2015) STRYKER

Proactively Defending the U.S. Homeland DHS and the FBI stand at the center of many of the U.S.'s efforts to combat terrorism. Despite the importance of its positions, its efforts are often plagued by inefficiencies and ineffectiveness. To better protect the U.S. from terrorism, **Congress should**:

Streamline U.S. fusion centers. Congress should limit fusion centers to the approximately 30 areas with the greatest level of risk as identified by the Urban Area Security Initiative (UASI). Some exceptions might exist, such as certain fusion centers that are leading cybersecurity or other important topical efforts. The remaining centers should then be fully funded and resourced by UASI.

Refocus DHS's intelligence capabilities. Intelligence and information is critical to stopping terrorist attacks before they occur. Instead of allowing DHS to continue to struggle with its role as an intelligence producer, Congress should consider **redirecting DHS efforts toward information sharing and coordinating** proper roles and responsibilities for federal, state, and local counterterrorism.

Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working to integrate intelligence and law enforcement activities. This will require overcoming cultural barriers and **providing FBI intelligence personnel with resources**, opportunities, and the stature they need to become a more effective and integral part of the FBI.

Ensure that the FBI more readily and regularly shares information with state and local law enforcement, treating state and local partners as critical actors in the fight against terrorism. State, local, and private-sector partners must send and receive timely information from the FBI. DHS should play a role in supporting these partners' efforts, by acting as a source or conduit for information to partners and coordinating information sharing between the FBI and its partners.

Focusing on Security With lone wolf and homegrown terrorists an increasing concern, Congress simply has to get serious about reforming the counterterrorism enterprise. This means refocusing DHS on its original mission and improving the coordination between DHS and other agencies, such as the FBI, and with state and local partners. Failure to do so leaves America at risk.

Several months ago, President Obama announced that the Department of Homeland Security (DHS) would provide work authorization and protection from deportation to as many as 5 million unlawful immigrants. While The Heritage Foundation has written extensively on the harm done to the U.S. immigration system and the rule of law, another serious side effect of Obama's executive action on immigration is the harmful redirection of attention and resources away from other pressing homeland security issues, ranging from terrorism to emergency preparedness to institutional reform at DHS. In order to implement the President's sweeping order, Secretary of Homeland Security Jeh Johnson and other leaders at DHS will simply not have the time, money, manpower, or trust of Congress to make important reforms to these other areas of critical importance. **It falls to Congress to correct these misplaced priorities**. Created in the aftermath of 9/11, combatting terrorism is the central mission of DHS. **Major problems with DHS's counterterrorism enterprise**, however, continue more than a decade after the department's creation. Specifically, problems with the production and dissemination of intelligence and information continue to undermine U.S. security.

Eisinger, 12

(Jesse Eisinger is a senior reporter at ProPublica, covering Wall Street and finance, In April 2011, he and Jake Bernstein were awarded the Pulitzer Prize for National Reporting for a series of stories on questionable Wall Street practices that helped make the financial crisis the worst since the Great Depression. He has also twice been a finalist for the Goldsmith Prize for Investigative Reporting, "The SOX Win: How Financial Regulation Can Work", http://www.propublica.org/thetrade/item/the-sox-win-how-financial-regulation-can-work, February 8, 2012, ak.)

As fears mount that Dodd-Frank, the financial overhaul law, is about to be emasculated, it's worth reflecting on the 10-year anniversary of a major regulatory success. I'm speaking of the mocked, patronized and vilified Sarbanes-Oxley, the law that cleaned up American corporate accounting. SOX, as it's known, was a response to an epidemic in corporate accounting fraud that swept American business in the late 1990s and early 2000s. Because the 2008 financial crisis dwarfs that earlier round of scandal, it's easy to forget how rotten things were, said Broc Romanek, editor of TheCorporateCounsel.net, a site devoted to securities law and corporate governance. "Everyone had lost faith in the numbers put out by big public companies," he said. Cast your mind back. The scandals erupted in some of the purportedly best, most recognizable companies in America. Enron and WorldCom were the two biggest names and the two biggest failures. Tyco and Adelphia were in the second tier. But there were appalling accounting disgraces at HealthSouth, Rite Aid and Sunbeam. Waste Management and Xerox barely survived theirs. Today, there are certainly debates about stocks and their valuations — and some questionable accounting — but no company that finds itself under scrutiny now is anywhere near as large, respected or publicized as those were then. Something else characterized those dark days: the frauds often lasted and lasted. Investors known as short-sellers, who make money when stocks collapse, waged battles for years over certain companies. Today, accounting disputes are finished before they start. An accounting scandal at Groupon, the online coupon company, came and went in a matter of weeks back in the fall — resolved by the regulators before the company went public. When SOX was passed, it was attacked — almost exactly like Dodd-Frank is today. Sarbanes-Oxley got "horrible press," said Jack T. Ciesielski, who edits the Analyst's Accounting Observer. People mocked it for requiring companies "to flow chart the keys to the executive washroom," he said. But the result is that **accounting at American companies is much cleaner today**. The main criticisms of the law haven't panned out. Corporate earnings have soared, and no company has ever missed a quarterly estimate because it was spending too much on its accounting and internal controls. Critics railed that it would cost small companies too much, which it may have, though the evidence is debated. They also argued that it would hurt initial public offerings, which it didn't. Yet, there remains vestigial criticism from the right; Newt Gingrich called for its repeal the other day on the campaign trail. Is Sarbanes-Oxley perfect? Of course not. The financial crisis included accounting problems. The books of the American International Group, Lehman Brothers and Merrill Lynch misrepresented the true state of the companies. The auditors have managed to skirt blame — even more so than other gatekeepers, like the ratings agencies, have. But at its heart, the financial crisis wasn't an accounting scandal. It was a bubble, albeit one exacerbated by some book-cooking. But the evidence in SOX's favor is that one big dog didn't bark. Even as the financial panic turned into the Great Recession, **corporate America weathered the worst of the downturn without a series of major accounting frauds**. SOX required that chief executives and chief financial officers personally sign off on their companies' financial statements. That seems minor. No doubt a Madoff wouldn't be deterred by a little dissembling signature. But blackhearts aren't the typical accounting fraudsters. At huge corporations, corruption usually develops slowly, incrementally, starting with a minor crossing of the line. At the

end of a quarter, a sale is booked before it was actually ordered — to make the numbers for Wall Street. Over time, the fraud builds on itself and it's easier to keep the game going than to clean it up. Requiring a step where the top dogs actually have to mark the books as their own territory halts that process. It steels their concentration and improves the culture, **preventing those initial halting steps toward fraud**. The accounting industry has been improved as well. The new SOX-created industry overseer, the Public Company Accounting Oversight Board, has made inroads. Accountants have done a better job, remembering the devastating collapse of the accounting firm Arthur Andersen in the wake of the Enron debacle. SOX wasn't the only factor in this cleanup, of course. **The accounting trials of the early 2000s made a cultural mark**. Kenneth L. Lay and Jeffrey K. Skilling of Enron, the Tyco fraudsters L. Dennis Kozlowski and Mark H. Swartz and Bernard J. Ebbers of WorldCom all had their day in court. All the world, including their executive peers, watched them go from their mansions to the big house. Is there a lesson to draw here for the prospects of Dodd-Frank? The new law is more sweeping, more pilloried and more complicated. It is concentrated on one industry, which allows for a more unified opposition. Importantly, a round of perp walks and prison terms didn't accompany the law. Quite the contrary, the people responsible for the greatest economic collapse since 1929 have all danced away untouched. But for all of the criticisms of Dodd-Frank, there has been **a societal change in our views**. Few can sustain an argument in favor of a gigantic, self-serving and rapacious financial sector. Some kind of financial reform law was — and still is — needed. If lawmakers don't gut Dodd-Frank, then 10 years from now we just might be reflecting on how safe our financial system is.

2NC—Framing

It's been over a decade since SOX was passed – businesses have adapted

Stanton 12 (Sara, Audit Staff at Deloitte, CPA, "SOX TURNS 10: EVALUATING THE RELEVANCY OF THE SARBANES-OXLEY ACT IN 2012", https://digital.library.txstate.edu/bitstream/handle/10877/4179/StantonSara.pdf?sequence=1)

Ten years after Sarbanes-Oxley was enacted, most companies have **come to accept it**. The high initial **costs of compliance have decreased** as businesses set up internal controls (and systems to document them). However, today's economy is markedly different from that of the early 2000s, and the nation's changing needs have led some to question whether or not Sarbanes-Oxley is still relevant in today's financial environment. Even Representative Michael Oxley has recognized that Sarbanes-Oxley may need some changes in order to stay relevant, saying that "we didn't write [the Act] in stone…I think it's highly likely and probably a good thing that you'd have some revisions" (Rosen 2011).

While portions of the legislation - **such as Section 404** - have been criticized, **many of these concerns have been addressed through a series of regulatory and legislative actions**. As a whole, the Ernst & Young report indicates that SOX has afforded substantial benefit to investors and U.S. capital markets: Audit quality has been improved by stronger alignment of independent auditors, independent audit committees, independent audit oversight authorities, and public company shareholders. In a 2008 audit committee survey reported by the Center for Audit quality, **90 percent of audit committee members** surveyed said that "they work more closely with the independent auditor" post-SOX. Audit quality has improved because of PCAOB inspections and standard setting. As of December 31, 2011, over 2,000 audit firms from more than 80 countries were registered with the PCAOB. In 2011, the organization conducted inspections of 213 registered audit firms, and initiated an interim inspection program for broker-dealers. More audit committees have financial experts. In 2003, only a small number of audit committee members were financial experts. Today, **almost half of all audit committee members** are identified through proxy statement disclosure as meeting the definition of a financial expert. Companies that comply with all of the internal control provisions in SOX **are less likely to issue financial restatements**. A November 2009 study published by Audit Analytics found the rate of financial restatements was 46 percent higher for companies that did not comply with all of the SOX internal control provisions. **Corporate governance is stronger.** Prior to SOX, the process for the selection and assessment of the independent auditor typically was controlled by management. Audit committees now play an essential role in corporate governance framework by overseeing the quality and integrity of company financial statements. Ernst & Young believes that achieving and maintaining audit quality requires a process of continuous improvement. Moving forward, the firm reaffirms its commitment to build on the foundation established by SOX by working with the PCAOB, independent audit committees, and shareholders.

Section 404 is great – more studies

Singer and You 11 (Zvi, prof of Accounting at McGill, holds a PhD in accounting from UC Berkeley, and Haifeng, prof of accounting at the Hong Kong University of Science and Technology, "The Effect of Section 404 of the Sarbanes-Oxley Act on Earnings Quality", SAGE Journals, http://jaf.sagepub.com/content/26/3/556.full.pdf+html)

In this article, we study the effect of Section 404 of SOX on earnings quality in terms of reliability and relevance. **We examine all affected firms** instead of only those remediating their internal control weaknesses because we believe that the benefits of the regulations are not limited to those firms. Moreover, evaluation of the changes in earnings quality of all affected firms provides more complete evidence on the effectiveness of the regulation. Using a group of U.S.-listed Canadian firms not required to comply with Section 404 as a control sample, we find that complying firms **improved their earnings** quality in the post- 404 period more than the control firms. Specifically, we show that complying firms exhibited **significantly larger improvement** in earnings reliability as evidenced by a reduction in the absolute value of discretionary accruals. Our results also suggest that the regulation helped to reduce intentional misstatements, as the asymmetry between the use of negative and positive special items declined more for complying firms. We also find a decrease in the asymmetry between reported earnings that slightly beat analysts' forecasts and those that slightly miss the forecasts for both groups. The improvement in earnings reliability, if achieved at the expense of earnings relevance, may actually jeopardize the usefulness of earnings to investors. We therefore also test the impact of the regulation on earnings relevance as measured by the predictive power of earnings over future cash flows and future earnings. Our test results show a **significantly larger improvement** in the predictive power for the complying firms, suggesting that Section 404 not only improved the reliability of earnings **but also improved the relevance or usefulness of earnings in predicting future fundamentals.** As earnings quality of complying firms improved, investors reacted more strongly

to earnings surprises of those firms compared to those of the control firms. Taken together, **we provide evidence that the implementation of Section 404 helped to achieve SOX's main goal of protecting investors by improving the accuracy and reliability of corporate disclosure.**

SOX is good – it created broader transparency, boosted investor confidence, and improved audit quality

Eyden 12 (Terri, contributor to AccountingWeb, Lead Marketing Editor at Western CPE in Colorado – Western CPE is a professional traning program that teaches people about investments and the financial market, "SOX Has Restored Investors' Confidence", http://www.accountingweb.com/practice/practice-excellence/sox-has-restored-investors-confidence)

The passage of the Sarbanes-Oxley Act (SOX) ten years ago **dramatically transformed** U.S. financial reporting by improving audit quality and strengthening corporate governance. Ernst & Young LLP released a report July 11, 2012 - The Sarbanes-Oxley Act at 10 - that considers the legislation, discusses what it was designed to do, and analyzes its impact. SOX ended more than 100 years of self-regulation and established the independent oversight of public company audits by the Public Company Accounting Oversight Board (PCAOB). Designed to enhance the reliability of financial reporting and to improve audit quality, the SOX shifted responsibility for the external auditor relationship away from corporate management to independent audit committees, **which are responsible to shareholders**. "At this anniversary, it is important to acknowledge one of the **greatest successes** of Sarbanes-Oxley: the alignment of the **interests of shareholders**, with **independent audit committees**, audit oversight authorities and auditors," said Steve Howe, the Americas managing partner for the global Ernst & Young organization. "Increased **transparency** is critical to improving audit quality, **maintaining investor confidence**, **and ensuring the strength and competitiveness of U.S. capital markets**."

SOX is awesome – it massively increased market efficiency – all predicted consequences have proven to be flat-out wrong

Hanna 14 (Julie, Associate Publishing Editor at Harvard Business School, contributor to Forbes on financial issues, citing Suraj Srinivasan, HBS Associate Professor and John Coates, Harvard Law prof, "The Costs And Benefits Of Sarbanes-Oxley", http://www.forbes.com/sites/hbsworkingknowledge/2014/03/10/the-costs-and-benefits-of-sarbanes-oxley/)

Despite high initial costs of the internal control mandate, **evidence shows that it has proved beneficial.** "Markets have been able to use the information to **assess companies more effectively**, managers have **improved internal processes**, and the internal control testing has become more cost-effective over time," according to Srinivasan. The research **does not support** the fear that SOX would reduce levels of risk-taking and investment in research and growth. Another concern that the act would shrink the number of IPOs **has not been borne out** either; in fact, the pricing of IPOs post-SOX became less uncertain. The cost of being a publicly traded company did cause some firms to go private, but research shows these were **primarily** organizations that were **smaller**, **less liquid**, and more **fraud-prone**. "Yes, SOX may have cut off public market financing to these companies, but **the question is whether it was appropriate for them to be in public markets in the first place**," Srinivasan says. "That is a value judgment, to be sure. But it may not be a bad thing if certain companies are restricted in their access to financing, simply because loss of trust in public capital markets has big consequences for the entire economy." A 2005 survey

by the Financial Executives Research Foundation **found that 83 percent of large company CFOs agreed that SOX had increased investor confidence**, with 33 percent agreeing that it had reduced fraud.

Even private companies voluntarily consent to be held to SOX – whistleblower protections

Dewey 12 (Charlsie, Grand Rapids Business Journal staff reporter who covers law, manufacturing, travel and tourism, transportation, advertising, marketing and PR and sustainability, "Sarbanes-Oxley Act impacts privately held companies", http://www.grbj.com/articles/74764-sarbanes-oxley-act-impacts-privately-held-companies)

2002's Sarbanes-Oxley Act **doesn't apply to privately held companies**, yet many are starting to take up some of its provisions **voluntarily.** That's because of the best practices resulting from the Act's implementation by publicly held companies, according to Jeff Ott, partner at law firm Warner Norcross & Judd. SOX was adopted by the U.S. Congress in response to a handful of large-scale accounting frauds that occurred at publicly held companies in the late 1990s and early 2000s, including Enron and WorldCom. Its purpose is to protect outside investors in these companies, which is why nearly all the provisions included within the Act apply only to publicly held companies. "Essentially, it was an attempt to impose tighter controls on the financial reporting, **to try and provide more transparency** in financial reporting and to hold people accountable in the financial reporting," Ott explained. SOX does contain one provision that directly applies to privately held companies: its provision on whistle blowers. "They changed the United States criminal code, that basically made it illegal to retaliate against a whistleblower," Ott said. "So, basically, it says it's illegal for anybody to retaliate against someone who provides truthful information to any law enforcement officer relating to the commission or possible commission of a federal offense. "That's why you see a lot of private companies have adopted whistle-blower policies, and, frankly, a lot of nonprofits and other organizations have adopted whistle-blower policies because of that provision in Sarbanes-Oxley." Ott said another provision in the Act could potentially impact privately held companies: the changes to federal sentencing guidelines. "Basically, **it's tied to the code of ethics**," Ott said. "If you have a code of ethics in place, **it can reduce the sentence that a company could receive** under the federal sentencing guidelines if there is some sort of financial wrongdoing that is discovered. From that perspective, you will see private companies that adopt codes of ethics for their financial officers." Now a decade old, SOX has begun to permeate the walls of privately held companies a little more deeply. "What public companies do often will become considered to be best practices," Ott said. "When companies are out there looking at what are best practices for corporate governance, they are going to see all the things that public companies do and, to the extent that these become considered best practices, those will have a trickle-down effect on private companies that are looking to implement best practices." Ott pointed to audit standards and the procedures public companies use in terms of internal controls as an example of how SOX might indirectly impact privately held companies. "The fact of the matter is that private companies will look now and say, 'Well, all these public companies have their CEO and CFO certify the financials; perhaps we should have our CEO and CFO at least certify the financials to the board so that we have this accountability,'" he said. Ott believes that larger, **privately held companies may very well benefit from some of the best practices that have come out of SOX.**

2NC—Investor Confidence

SOX boosts investor confidence – increased accountability

Turley and Howe 13 (James, Former Global Chairman and CEO of Ernst and Young, an international corporate law firm, and Steve, Americas Managing Partner and Managing Partner of the US Firm, "The Sarbanes-Oxley Act at 10 Enhancing the reliability of financial reporting and audit quality", http://www.ey.com/Publication/vwLUAssets/The_Sarbanes-Oxley_Act_at_10_-_Enhancing_the_reliability_of_financial_reporting_and_audit_quality/$FILE/JJ0003.pdf)

One of the core elements of Sarbanes-Oxley was to **clearly define and place responsibility** for a company's financial statements with its cchief executive officer (CEO) and chief financial officer (CFO), SOX mandated that these executives certify the following items (among others) for each annual and quarterly report: • They have reviewed the report • Based on their knowledge, the financial information included in the report is fairly presented • Based on their knowledge, the report does not contain any untrue statement of material fact or omit a material fact that would make the financial statements misleading • They acknowledge their responsibility for establishing and maintaining internal controls over financial reporting and other disclosures • They have evaluated the effectiveness of these controls, presented their conclusion as to effectiveness and disclosed any material changes in the company's controls By making management executives **fully accountable** for their companies' financial statements, Sarbanes-Oxley set a clear tone for corporate responsibility and helped restore investors' confidence in financial statements. To enhance the significance of these certifications, SOX mandated **stiff penalties** for executive officers who certify that financial reports comply with the various regulatory requirements while knowing that they do not. Such penalties include potential SEC enforcement action, forfeiture of bonuses and profits, or criminal penalties such as fines or imprisonment.13 As a further step to **help restore investor confidence** in corporate financial statements, SOX required companies to have an auditor attest to the effectiveness of the company's internal controls over financial reporting. To supplement the financial relief available to victims of securities fraud, SOX also established the "Fair Funds" program at the SEC. This program allows the SEC to add monetary penalties paid by those who commit securities fraud to the funds available for distribution to wronged investors.14

Long term benefits of SOX outweigh short terms costs – overall increase in investor confidence

Lowenbrug, 05 –Ph.D. in Economics and Finance and adjunct faculty member in the School of Professional Studies and Business Education at Johns Hopkins University. Manager in the Network Industries Strategies group of the FTI Economic Consulting practice (Paul, "The Impact Of Sarbanes Oxley On Companies, Investors, & Financial Markets", Sarbanes-Oxley Compliance Journal, 12/6/05, http://www.s-ox.com/dsp_getFeaturesDetails.cfm?CID=1141)//KTC

SHORT & LONG RUN IMPACT OF COSTS The costs of SOX compliance negatively affect companies, markets, investors, and economic growth in the short run. So what can we expect in the long run? If rising costs persuade large numbers of companies to exit the public markets to sidestep SEC regulation, two distinct problems are created. First, the overall economy could suffer because corporations limit investment projects due to the higher-cost sources of capital to fund potentially new operations. Second, financially stressed companies that "go dark" are the very companies shareholders need to monitor and where transparency is most important. Ironically if Enron had gone dark, shareholders would not be funding them by purchasing their stock. Although the U.S. markets and economy are currently suffering, evidence suggests this may only be a temporary glitch. For example, there has been a recent resurgence in the IPO market and foreign countries have started adopting and applying various parts of SOX to companies under their jurisdiction. If costs of compliance fall or stabilize over time, and international markets adopt a similar version of SOX, U.S. markets could potentially create even more wealth and productivity for the U.S. economy and surpass levels of the late 1990s. The primary goal of SOX was to help investor confidence in the public marketplace. Investors had lost faith that their investments in American companies were safe. This lack of faith resulted in the decline of stock values. Investors also believe that most of the scandals could have been prevented if the accounting misconducts could have been better monitored and thus deterred by regulatory agencies. The critics correctly assert that complying with SOX is not sufficient to restore faith in America's financial markets. Indeed, additional steps are necessary because, by itself, SOX simply

cannot address one of the driving causes of the accounting failures' the short-term thinking of corporate managers who want to increase the current stock price without appropriate regard for the long-term cost and ethical issues. However, by embracing the spirit of SOX, managers can improve their internal controls, board performance, and increase disclosure and reduce costs. Yes, costs can likely be reduced over time. A company with good communication, a more involved board of directors, more robust audits by external auditors, enhanced internal audit resources and performance, higher quality financial statements, fewer restatements of financials and improved operational efficiency will clearly be more attractive to investors. Companies that adhere to the minimum necessary for compliance will realize little in the way of benefits of SOX. Not only are they wasting an important opportunity; but investors, lenders, insurance companies may question whether such companies are sincere in establishing a culture of ethics, transparency, and a commitment to reliable financial reporting. As more companies exceed mandatory compliance, competitors will need to conform otherwise they will find themselves at a competitive disadvantage.

Increased transparency makes companies more trustworthy due to compliance with SOX

Lowenbrug, 05 –Ph.D. in Economics and Finance and adjunct faculty member in the School of Professional Studies and Business Education at Johns Hopkins University. Manager in the Network Industries Strategies group of the FTI Economic Consulting practice (Paul, "The Impact Of Sarbanes Oxley On Companies, Investors, & Financial Markets", Sarbanes-Oxley Compliance Journal, 12/6/05, http://www.s-ox.com/dsp_getFeaturesDetails.cfm?CID=1141)//KTC

In the long run, companies that invest in appropriate internal controls are not only more likely to have more reliable financial statements, but also will benefit from better management information structures. Other improvements include the reconciliation and segregation of duties, and enhancement of IT. Companies that have more confidence in their control structure and are evaluating accounting risks should enable investors to have more confidence in the reliability of unaudited data furnished to the securities' market. Thus, better information and internal controls lead to too greater operational efficiency and better long-term performance. Risk management, reduced fraud risk, enhanced governance, and strengthened controls resulting from implementation of SOX will strengthen investor confidence. This in turn reflects positively on the U.S. economy, and the intangible benefits should hopefully outweigh the calculable costs to public corporations of compliance with SOX. Initial spending on compliance will divert funds that could have been used to boost earnings and dividends. In the short-term, valuations may shift downward. However, if SOX helps to restore investor faith in the honesty and transparency of public companies, these downward valuations may become positive valuations in the long run.

2NC—Foreign Investment

Foreign investment has drastically increased post SOX – companies care about accountability

Abdiglua et. al, 15 – Works for Balikesir University in Business Administration, Behavioral Economics and Financial Economics (Nida, Vassiliki Bamiatzib, S.Tamer Cavusgilc, Arif Khurshedd,Konstantinos Stathopoulosd, "Information asymmetry, disclosure and foreign institutional investment: An empirical investigation of the impact of the Sarbanes-Oxley Act", International Business Review, Received 5/11/14 and Last Revised before publishing 1/7/15, http://www.sciencedirect.com/science/article/pii/S096959311500061Xhttp://www.sciencedirect.com/science/article/pii/S096959311500061X)//KTC

Using information on the holdings of institutional investors from 18 foreign countries, we find that the change in the information environment of U.S. firms has indeed positively impacted on foreign institutional investment levels. Consistent with our first hypothesis, we observe that FIO has increased subsequent to the enactment of SOX. We argue that this positive relationship is, ceteris paribus, a result of the enhanced corporate disclosure and the ensuing reduction in information asymmetry. Foreign investors are particularly sensitive to information asymmetries aggravated by governance problems and/or

expropriation by insiders (Leuz et al., 2010). However, the better internal accountability and monitoring control mechanisms induced by SOX in U.S. firms reduce information asymmetries and lessen investors' evaluation (agency) costs, perceived risks and biases. The overall level of trust in U.S. firms is elevated, and the prospect of investing in them becomes more attractive (Forbes, 2010 and Healy et al., 1999). This result affirms the initial expectations from the SOX enactment; the implementation of the act has been successful in achieving one of its objectives – reduction in information asymmetry. It further strongly denotes the critical role of corporate disclosure policies in FII investment.

SOX increases passive foreign investment

Abdiglua et. al, 15 – Works for Balikesir University in Business Administration, Behavioral Economics and Financial Economics (Nida, Vassiliki Bamiatzib, S.Tamer Cavusgilc, Arif Khurshedd,Konstantinos Stathopoulosd, "Information asymmetry, disclosure and foreign institutional investment: An empirical investigation of the impact of the Sarbanes-Oxley Act", International Business Review, Received 5/11/14 and Last Revised before publishing 1/7/15, http://www.sciencedirect.com/science/article/pii/S096959311500061Xhttp://www.sciencedirect.com/science/article/pii/S096959311500061X)//KTC

Interestingly, we not only find an increase in foreign institutional investment, post-SOX, but also changes in FII investment preferences. We document two intriguing results. First, post-SOX, FII exhibit a shift in their investment behavior toward less prudent stocks. Contrary to the 'prudent man' rule according to which we would anticipate institutional investors investing in the most reliable firms – large firms with high turnover, high liquidity and typically global exposure (Badrinath et al., 1989 and Del Guercio, 1996) – we find that post-SOX, FII have increased their investment in smaller firms, firms with lower dividend yields, and firms with higher leverage. We therefore conclude that the investment shortcomings foreign investors typically associate with riskier firms can be subdued with increased information disclosure induced by the enactment of SOX. Second, in line with Hypotheses 3 and 4, we discover that the increase in passive FIO has been larger than that of active FIO, post-SOX. We argue that this is driven by a reduction in the value of private information, post-SOX. Passive investors incur high costs of monitoring their investments; hence they rationally abstain from monitoring (Brickley et al., 1988). As a result they do not collect private information. On the contrary, active investors' competitive advantage lies on their efficiency in collecting private information (Almazan et al., 2005). Better disclosure results in a reduction in the value of private information. Hence SOX provides high gains for passive investors and potentially a loss of competitive advantage for the active ones. Our results strongly support this line of reasoning; we uncover that not only passive foreign investment has increased more than active foreign investment post-SOX, but also that this trend is pronounced in stocks with high levels of private information.

AT: Foreign Indirect Investment

SOX creates more foreign *in*direct investment in overlooked firms- evens the market

Abdiglua et. al, 15 – Works for Balikesir University in Business Administration, Behavioral Economics and Financial Economics (Nida, Vassiliki Bamiatzib, S.Tamer Cavusgilc, Arif Khurshedd,Konstantinos Stathopoulosd, "Information asymmetry, disclosure and foreign institutional investment: An empirical investigation of the impact of the Sarbanes-Oxley Act", International Business Review, Received 5/11/14 and Last Revised before publishing 1/7/15, http://www.sciencedirect.com/science/article/pii/S096959311500061Xhttp://www.sciencedirect.com/science/article/pii/S096959311500061X)//KTC

Overall, our study makes a unique contribution in two distinct ways. First, we provide a theoretical explanation (information symmetry framework) as well as empirical evidence on the SOX consequences so far and their implications. Second, from a policy perspective, we directly respond to the question of whether SOX has been effective and in what extent, and offer judgments in terms of investor benefits and market mechanism. The results particularly highlight a positive effect of the enactment of SOX, namely higher foreign institutional investment in U.S. firms. Further, firms that were traditionally overlooked by foreign institutional investors are now attracting their attention, resulting in a more evenly distribution of investment among small and large firms. Future research should investigate the potential implications of this trend.

Lowenbrug concludes neg – negative effects are due to implementation problems and don't justify repeal

Our Author, Lowenbrug, 05 –Ph.D. in Economics and Finance and adjunct faculty member in the School of Professional Studies and Business Education at Johns Hopkins University. Manager in the Network Industries Strategies group of the FTI Economic Consulting practice (Paul, "The Impact Of Sarbanes Oxley On Companies, Investors, & Financial Markets", Sarbanes-Oxley Compliance Journal, 12/6/05, http://www.s-ox.com/dsp_getFeaturesDetails.cfm?CID=1141)//KTC

CONCLUSION Clearly, SOX has both positive and negative effects. However, the implementation problems of the past three years do not provide sufficient reason to weaken or eliminate SOX requirements or to adopt significant exemptions based on company size. This would be premature and could seriously damage important reforms that are helping to restore confidence in the U.S. capital markets. Three years is not enough time to fully measure SOX's ongoing costs and benefits. This is not to suggest that investors will tolerate unnecessary costs or gouging by audit firms related to internal control certification. Rather that we must exercise patience. In time, corporate America and the U.S. government will be able to produce a more accurate cost/benefit analysis. Then and only then will we know if this "reactionary" Congressional Act has a predominating positive effect of increased investor confidence in the market or a prohibitory cost that results in lowered productivity of public companies and dilution of the dominant U.S. financial services market.

Fraud Link Turn

Uniqueness

SOX is increasing the discovery of fraud now

Bhasin, 13- KIMEP University, Almaty, Republic of Kazakhstan, (Madan Lal, "Corporate Accounting Scandal at Satyam: A Case Study of India's Enron", Research Gate, April 2013, pdf)//KTC

The wave of financial scandals at the turn of the 21st century elevated the awareness of fraud and the auditor's responsibilities for detecting it. The frequency of financial statement fraud has not seemed to decline since the passage of the Sarbanes-Oxley Act in July 2002 (Hogan et al., 2008). For example, The 4th Biennial Global Economic Crime Survey (2007) of more than 3,000 corporate officers in 34 countries conducted by PricewaterhouseCoopers (PwC) reveals that "in the post-Sarbanes-Oxley era, more financial statement frauds have been discovered and reported, as evidenced by a 140% increase in the discovered number of financial misrepresentations (from 10% of companies reporting financial misrepresentation in the 2003 survey to 24% in the 2005 survey). The increase in fraud discoveries may be due to an increase in the amount of fraud being committed and/or also due to more stringent controls and risk management systems being implemented," (PricewaterhouseCoopers 2005). The high incidence of fraud is a serious concern for investors as fraudulent financial reports can have a substantial negative impact on a company's existence as well as market value. For instance, the lost market capitalization of 30 high-profile financial scandals caused by fraud from 1997 to 2004 is more than $900 billion, which represents a loss of 77% of market value for these firms, while recognizing that the initial market values were likely inflated as a result of the financial statement fraud.

SOX regulation has caused fraud to no longer go undetected- continued regulation is necessary

Bhasin, 13- KIMEP University, Almaty, Republic of Kazakhstan, (Madan Lal, "Corporate Accounting Scandal at Satyam: A Case Study of India's Enron", Research Gate, April 2013, pdf)//KTC

No doubt, recent corporate accounting scandals and the resultant outcry for transparency and honesty in reporting have given rise to two disparate yet logical outcomes. First, 'forensic' accounting skills have become crucial in untangling the complicated accounting maneuvers that have obfuscated financial statements. Second, public demand for change and subsequent regulatory action has transformed 'corporate governance' (henceforth, CG) scenario. Therefore, more and more company officers and directors are under ethical and legal scrutiny. In fact, both these trends have "the common goal of addressing the investors' concerns about the transparent financial reporting system." The failure of the corporate communication structure has made the financial community realize that there is a great need for 'skilled' professionals that can identify, expose, and prevent 'structural' weaknesses in three key areas: poor CG, flawed internal controls, and fraudulent financial statements. "Forensic accounting skills are becoming increasingly relied upon within a corporate reporting system that emphasizes its accountability and responsibility to stakeholders" (Bhasin, 2008). Following the legislative and regulatory reforms of corporate America, resulting from the Sarbanes-Oxley Act of 2002, reforms were also initiated worldwide. Largely in response to the Enron and WorldCom scandals, Congress passed the Sarbanes-Oxley Act (SOX) in July 2002. SOX, in part, sought to provide whistle-blowers greater legal protection. As Bowen et al. (2010) states, "Notable anecdotal evidence suggests that whistle-blowers can make a difference. For example, two whistle-blowers, Cynthia Cooper and Sherron Watkins, played significant roles in exposing accounting frauds at WorldCom and Enron, respectively, and were named as the 2002 persons of the year by Time magazine." Given the current state of the economy and recent corporate scandals, fraud is still a top concern for corporate executives. In fact, the sweeping regulations of Sarbanes-Oxley, designed to help prevent and detect corporate fraud, have exposed fraudulent practices that previously may have gone undetected. Additionally, more corporate executives are paying fines and serving prison time than ever before. No industry is immune to fraudulent situations and the negative publicity that swirls

around them. The implications for management are clear: every organization is vulnerable to fraud, and managers must know how to detect it, or at least, when to suspect it.

SOX has decreased the magnitude of fraud incidents

Eisinger 12 (Jesse, an American journalist, currently a financial reporter for ProPublica, won the Pulitzer Prize for National Reporting in 2011, "The SOX Win: How Financial Regulation Can Work," ProPublica, 2/8/12, https://www.propublica.org/thetrade/item/the-sox-win-how-financial-regulation-can-work)//kjz

As fears mount that Dodd-Frank, the financial overhaul law, is about to be emasculated, it's worth reflecting on the 10-year anniversary of a major regulatory success. I'm speaking of the mocked, patronized and vilified Sarbanes-Oxley, the law that cleaned up American corporate accounting. Jesse Eisinger About The Trade In this column, co-published with New York Times' DealBook, I monitor the financial markets to hold companies, executives and government officials accountable for their actions. Tips? Praise? Contact me at jesse@propublica.org SOX, as it's known, was a response to an epidemic in corporate accounting fraud that swept American business in the late 1990s and early 2000s. Because the 2008 financial crisis dwarfs that earlier round of scandal, it's easy to forget how rotten things were, said Broc Romanek, editor of TheCorporateCounsel.net, a site devoted to securities law and corporate governance. "Everyone had lost faith in the numbers put out by big public companies," he said. Cast your mind back. The scandals erupted in some of the purportedly best, most recognizable companies in America. Enron and WorldCom were the two biggest names and the two biggest failures. Tyco and Adelphia were in the second tier. But there were appalling accounting disgraces at HealthSouth, Rite Aid and Sunbeam. Waste Management and Xerox barely survived theirs. Today, there are certainly debates about stocks and their valuations — and some questionable accounting — but no company that finds itself under scrutiny now is anywhere near as large, respected or publicized as those were then. Something else characterized those dark days: the frauds often lasted and lasted. Investors known as short-sellers, who make money when stocks collapse, waged battles for years over certain companies. Today, accounting disputes are finished before they start. An accounting scandal at Groupon, the online coupon company, came and went in a matter of weeks back in the fall — resolved by the regulators before the company went public. When SOX was passed, it was attacked — almost exactly like Dodd-Frank is today. Sarbanes-Oxley got "horrible press," said Jack T. Ciesielski, who edits the Analyst's Accounting Observer. People mocked it for requiring companies "to flow chart the keys to the executive washroom," he said. But the result is that accounting at American companies is much cleaner today. The main criticisms of the law haven't panned out. Corporate earnings have soared, and no company has ever missed a quarterly estimate because it was spending too much on its accounting and internal controls. Critics railed that it would cost small companies too much, which it may have, though the evidence is debated. They also argued that it would hurt initial public offerings, which it didn't. Yet, there remains vestigial criticism from the right; Newt Gingrich called for its repeal the other day on the campaign trail. Is Sarbanes-Oxley perfect? Of course not. The financial crisis included accounting problems. The books of the American International Group, Lehman Brothers and Merrill Lynch misrepresented the true state of the companies. The auditors have managed to skirt blame — even more so than other gatekeepers, like the ratings agencies, have. But at its heart, the financial crisis wasn't an accounting scandal. It was a bubble, albeit one exacerbated by some book-cooking. But the evidence in SOX's favor is that one big dog didn't bark. Even as the financial panic turned into the Great Recession, corporate America weathered the worst of the downturn without a series of major accounting frauds. SOX required that chief executives and chief financial officers personally sign off on their companies' financial statements. That seems minor. No doubt a Madoff wouldn't be deterred by a little dissembling signature. But blackhearts aren't the typical accounting fraudsters. At huge corporations, corruption usually develops slowly, incrementally, starting with a minor crossing of the line. At the end of a quarter, a sale is booked before it was actually ordered — to make the numbers for Wall Street. Over time, the fraud builds on itself and it's easier to keep the game going than to clean it up. Requiring a step where the top dogs actually have to mark the books as their own territory halts that process. It steels their concentration and improves the culture, preventing those initial halting steps toward fraud. The accounting industry has been improved as well. The new SOX-created industry overseer, the Public Company Accounting Oversight Board, has made inroads. Accountants have done a better job, remembering the devastating collapse of the accounting firm Arthur Andersen in the wake of the Enron debacle. SOX wasn't the only factor in this cleanup, of course. The accounting trials of the early 2000s made a cultural mark. Kenneth L. Lay and Jeffrey K. Skilling of Enron, the Tyco fraudsters L. Dennis Kozlowski and Mark H. Swartz and Bernard J. Ebbers of WorldCom all had their day in court. All the world, including their executive peers, watched them go from their mansions to the big house.

SOX solves Fraud

SOX prevents fraud – forces compliant and active corporate management

Thompson is an elected Fellow of the American Board of Criminal Lawyers (Larry D., "The Corporate Scandals, Why They Happened And Why They May Not Happen Again", Speech, Brookings Institute, 7/13/104, http://www.brookings.edu/research/speeches/2004/07/13business-thompson)//KTC

Sarbanes-Oxley has brought about much needed improvements in transparency and accountability in the books and records of public companies. Tough criminal enforcement will send a much needed message of deterrence for anyone contemplating self-dealing and financial fraud. But this will not be enough as we all know. For we all know that crooks will always be amongst us. There are, however, two developments in the area of corporate governance that I believe are significant and may go a long way toward preventing the type of scandals we have just experienced from reoccurring. At the very least, these developments will minimize the likelihood of these scandals happening again. Section 406 of the Sarbanes-Oxley Act and the implementing rules by the SEC call for a code of ethics for the CEOs and chief financial officers of public companies. This concept has been embraced and greatly expanded upon by the revised guidelines for organizations recently published by the influential U. S. Sentencing Commission. Although the guidelines technically apply only when an organization is being sentenced for violating a criminal law, the guidelines have, over the years, greatly influenced the design, implementation and administration of corporate compliance programs. The guidelines are scheduled to go into effect on November 1, 2004. The main theme of the revised guidelines is a greater emphasis on ethics as opposed to mere compliance with the law. The guidelines encourage companies to promote "an organizational culture that encourages ethical conduct and a commitment to compliance with the law." The revised guidelines give specific directions to companies as to how an effective ethical environment can be accomplished. High level corporate officials and boards of directors will be required to take an active leadership role in the operation of ethics and compliance programs. Senior management and the board of directors will now be expected to understand the major risks of unlawful conduct facing their companies and how their companies' ethics and compliance programs are to work to counteract those risks. The Board of Directors and Senior Management can no longer simply delegate the ethics and compliance function to officials lower in the organization. They must understand what is going on and what problems and vulnerabilities their companies may have from a compliance standpoint.Companies will now also be required to evaluate the overall effectiveness of their compliance programs by undertaking periodic risk assessments to determine the scope and nature of risks of violations of law associated with a company's business. These requirements make certain that ethics and compliance programs will be real; they can no longer exist on paper only. What they will require companies to do is actively and seriously investigate allegations of wrong doing. They will require education and training programs of substance and, most importantly, the corporations' problems and vulnerabilities will go directly to the board of directors. When this happens, the board cannot afford to bury its head in the sand. Under legal standard and case law in existence before the revised guidelines, the board could escape liability for corporate wrongdoing by showing simply that it had attempted in good faith to ensure that an adequate corporate information gathering and reporting system was in place. Now, board members will be required to get "their hands dirty" and become knowledgeable about a company's compliance problems and vulnerabilities.

Section 806 whistle blower protections prevent fraud

But the most important development in terms of preventing the reoccurrence of the corporate fraud we have experienced comes from a little known provision of the Sarbanes-Oxley Act. Section 806 of the Act establishes a new federal cause of action to protect whistleblowers who are employees of public companies who provide information to the authorities that they believe constitutes a violation of federal securities laws or involves other types of corporate criminal conduct. The provision is designed to shield these whistleblower employees from retaliation by the corporate employer. An employee claiming retaliation because he or she uncovered corporate fraud can file a complaint with the Department of Labor which will investigate the claim unless the employer can show that it would have taken adverse employment action despite the employee's allegations of corporate fraud. From a purely practical standpoint, this will be a very difficult proposition for an employer. In today's environment there will be a presumption, albeit informal or subjective, in favor of at least investigating the claim. Employees who prevail in whistleblower cases are entitled to relief which may include reinstatement, back pay, interest, litigation costs, and relief that will make any good plaintiff's attorney interested in the case, compensatory damages. The provision does not provide for punitive damages, but the statue does not preempt existing state of federal law. So an employee aggrieved under the whistleblower provision can file multiple claims and let the Department of Labor, with its resources and authority, investigate claims and use the results as a hammer in other cases. Whistleblower provisions have been very effective in defense procurement and healthcare fraud cases. The possibility of whistleblower suits has, I believe, encouraged effective compliance efforts in these industries. I believe the Sarbanes-Oxley whistle blower provisions can have a positive impact on the prevention of corporate fraud.

Title IX of SOX will continue to prevent fraud – personal deterrent

Kennedy, 12 – Writing for Senior Honors Thesis in Accounting (Kristin A., "An Analysis of Fraud: Causes, Prevention, and Notable Cases", University of New Hampshire Scholar's Repository, Fall 2012, pdf)//KTC

Title IX, entitled White-Collar Crime Penalty Enhancements, aims to increase penalties handed down to perpetrators of fraud. Section 902 involves individuals who attempt or conspire to commit mail, wire, or securities fraud. Under this section, these individuals will get the same punishment as others who actually commit these acts. It is intended to defer people from even considering committing fraud, as if it the plan is revealed, they will be punished even if they decided not to proceed with the fraud. Section 903 increases the maximum possible jail sentence for mail and wire fraud from five to 20 years (SOX 61). Section 905 lists amendments to the sentencing guidelines that the United States Sentencing Commission should make. Section 906 goes along with Section 302 and 404 in that it is increasing the accountability of CEOs and CFOs. This section adds the criminal punishments for those who intentionally certify misstated financial filings to the SEC. In circumstances where the individual "knowingly certifies" the misstated financial statements, they may face a fine of up to $1,000,000 and imprisonment of up to 10 years, or both. When the individual "willfully" certifies the misstated financial statements, they may face a fine of up to $5,000,000 and imprisonment of up to 20 years, or both (Prentice 68). Title IX imposes very severe punishments on perpetrators of fraud, which could have been very effective at preventing some of the fraud scandals that happened in the early 2000s. The maximum sentence for mail and wire fraud was increased by four times from five to 20 years. That is a very significant difference. If someone was weighing the risks of getting caught, 33 five years in prison is very different than 20 years in prison, so that would be a very strong deterrent. Also, imprisonment can now be handed down for not only committing fraud, but also conspiring to do so. This could have resulted in less people considering committing fraud and therefore, even less people actually committing it. Furthermore, the fines and maximum imprisonment for executive officers who knowingly certify or willingly certify misstated financial statements have also been increased significantly. This could have prevented many of the top executives during the early 2000s from committing the fraud that they did. Greater personal risk is also a strong deterrent from bad behavior.

Title XIII deters fraud

Kennedy, 12 – Writing for Senior Honors Thesis in Accounting (Kristin A., "An Analysis of Fraud: Causes, Prevention, and Notable Cases", University of New Hampshire Scholar's Repository, Fall 2012, pdf)//KTC

Title XIII has certain elements that could have been effective at preventing fraud. Tampering with evidence can now carry a prison sentence of up to 20 years. Although this may not necessarily have prevented fraud, it could have if accounting firms acted properly knowing that they could not just destroy evidence that showed they had overlooked certain facts. At the very least, it may have prevented public accounting firms such as Arthur Andersen in the Enron scandal from shredding documents. The same also holds true because work papers now must be 32 held for seven years or a ten year imprisonment could be faced. Title XIII also has a whistleblower section to protect those who come forward. This could have prevented such disastrous results from occurring because whistleblowers would have been encouraged to come forward sooner than was actually happening.

Title XI deters fraud

Kennedy, 12 – Writing for Senior Honors Thesis in Accounting (Kristin A., "An Analysis of Fraud: Causes, Prevention, and Notable Cases", University of New Hampshire Scholar's Repository, Fall 2012, pdf)//KTC

In Title XI, specifically Corporate Fraud and Accountability, other criminal provisions are added in order to limit obstruction of justice. Section 1102 involves tampering with records and impending official investigations. Anyone who corruptly "alters, destroys, mutilates, or conceals a record, document, or other object, or attempts to do so, with the intent to impair the object's integrity or availability for us in an official proceeding" or "otherwise obstructs, influences, or impedes any official proceeding, or attempts to do so" will be fined or face up to 20 years in prison, or both (SOX 63). Section 1103 give the SEC the authority to temporarily freeze the funds of a company if it appears that, during an investigation, those funds are likely to be paid as bonuses or other to directors, officers, or other individuals within the company (Prentice 71). Section 1105 authorizes the SEC to permanently or temporarily bad individuals from serving as officers or directors of public companies. Section 1106 increased penalties for individuals intentionally violating sections of the Securities Exchange Act of 1934 from $1 million to $5 million and from a maximum sentence of 10 years to a maximum of 20 years. For 34 corporations in violation, the maximum fines were increased from $2.5 million to $25 million (Prentice 72). Section 1107 makes it unlawful to retaliate, or cause other harmful actions against, a person who provides any truthful information to law enforcement regarding the commission of any Federal offense. The perpetrator of the retaliation may face fines and up to 10 years imprisonment (Prentice 72). Title XI contains some sections similar to others within SOX. Section 1102 involves tampering with records, which being similar to tampering with evidence, carries a maximum prison sentence of 20 years. This could have reduced fraud if accounting firms were prevented from allowing tainted records to exist in the first place. Section 1107 goes along with the increased protection for whistleblowers by making it unlawful to retaliate against such individuals and therefore encouraging them to come forward. This could have prevented such large losses from being incurred if the whistleblowers had come forward sooner

SOX key to fraud prevention and internal controls fail

Clark 12 (Kiersten N., wrote a Senior Thesis submitted in partial fulfillment of the requirements for graduation in the Honors Program, "The Effects of Sarbanes Oxley on Current Financial Reporting Standards," Liberty University, 2012, http://digitalcommons.liberty.edu/cgi/viewcontent.cgi?article=1303&context=honors)//kjz

Section 404. The reporting requirements of SOX section 404 first became applicable to accelerated filers in 2004. This particular section of the Sarbanes-Oxley Act THE EFFECTS OF SOX 15 mandates that company management and their external auditors testify concerning the efficiency of internal controls over financial reporting (Moffett, et al., 2011). Section 404 also requires the firms to file their report on internal controls with the SEC in order to divulge any noteworthy control deficiencies and material control weaknesses (Moffett, et al., 2011). It is necessary to specify that only material weaknesses need be divulged. Those that are not considered material are assumed to have little importance (Thevenot, et al., 2011). Fraud prevention. Because of all the uncertainty Enron's meltdown caused, many employees of companies in the United States were afraid to come forward to reveal fraudulent practices because they feared losing their jobs. In April of 2003, the U.S. Securities and Exchange Commission published an addition to Section 301 of SOX (Rulemaking, 2009). This addition provided protection to employees who would come forward and disclose pertinent information. One of the primary purposes of a company having internal controls in place is to prevent fraud. Without the presence of effective and strong internal controls, companies are extremely susceptible to fraudulent activities (Moffett, et al., 2011). Weaknesses. A major weakness of internal control systems surprisingly comes from the management of the company. Management has the ability to damage or reinforce these systems by the way they interact with the company and the employees (Moffett, et al., 2011). According to an article published in Internal Auditing by Ryan Moffett and Gerry Grant, management override and collusion with the other individuals employed at the firm have proven to be the largest danger (2011). In research conducted by Maya Thevenot and Linda Hall, certain deficiencies in internal controls have been THE EFFECTS OF SOX 16 linked to poor accrual quality, poor board and audit committee quality, firm risk, and the cost of equity capital (2011). Furthermore, many firms with serious control flaws have a tendency to be smaller, less monetarily sound, have more involved operations and smaller amounts of resources (Thevenot, et al., 2011). These firms are unable to invest the proper funding into creating a secure system of internal controls, which causes them to be less confident. There are two types of weaknesses: account-specific and entity-level deficiencies. Those that are considered account-specific are regarded as less severe because they are linked to specific financial statement accounts, such as inventory, receivables, and intangibles (Thevenot, et al.). On the other hand, entity-level weaknesses have a far-reaching impact on the firm. They affect larger areas, such as "recognition and segregation of duties" and tend to be a sign of company-wide weak control environment (Thevenot, et al., para. 14). Corporate Fraud and Accountability Many companies that experience fraud on any level are typically searching for ways to lessen the potential for fraud. Title XI of the Sarbanes-Oxley Act, Corporate Fraud and Accountability, seeks to alleviate the longevity of the search (SOX, 2002). This particular section contains severe consequences for both individuals and companies alike who engage in fraudulent practices. One such consequence applies to any individual who attempts to tamper with documents or official proceeding. These individuals would be subject to a fine or placed in prison for up to twenty years (SOX). Title XI contains six applicable sections with penalties and regulations: tampering with a record or otherwise impeding an official proceeding (1102), temporary freeze authority for the SEC (1103), amendment to the federal sentencing guidelines (1104), authority of the commission to THE EFFECTS OF SOX 17 prohibit persons from serving as officers or directors (1105), increased criminal penalties under Securities Exchange Act of 1934 (1106), and retaliation against informants (1107) (SOX, 2002). Each of these sections was meant to instill a particular emotion so as to decrease the desire to commit such practices. Section 1107 specifically states what actions would be taken against informants: Whoever knowingly, with the intent to retaliate, takes any action harmful to any person, including interference with the lawful employment or livelihood of any person, for providing to a law enforcement officer any truthful information relating to the commission or possible commission of any Federal offense, shall be fined under this title or imprisoned not more than ten years, or both. (SOX, p. 65) Recent research provides evidence of the specific types of individuals who would take the chance to inform the authorities of fraudulent practices. Such individuals have been identified as (a) employees of the company, (b) industry regulators, (c) press journalists, (d) equity holders and their analysts, (e) securities regulators, and (f) auditors (Bolt-Lee, Farber, & Moehrle, 2011). As is evident by the variety of individuals who have been categorized as informants, one need not be an employee of a company to discover fraudulent information.

Perception Link - SOX is increasing investor confidence in fraud prevention

Despite high initial costs of the internal control mandate, evidence shows that it has proved beneficial. "Markets have been able to use the information to assess companies more effectively, managers have improved internal processes, and the internal control testing has become more cost-effective over time," according to Srinivasan. The research does not support the fear that SOX would reduce levels of risk-taking and investment in research and growth. Another concern that the act would shrink the number of IPOs has not been borne out either; in fact, the pricing

of IPOs post-SOX became less uncertain. The cost of being a publicly traded company did cause some firms to go private, but research shows these were primarily organizations that were smaller, less liquid, and more fraud-prone. "Yes, SOX may have cut off public market financing to these companies, but the question is whether it was appropriate for them to be in public markets in the first place," Srinivasan says. "That is a value judgment, to be sure. But it may not be a bad thing if certain companies are restricted in their access to financing, simply because loss of trust in public capital markets has big consequences for the entire economy." **A 2005 survey by the Financial Executives Research Foundation found that 83 percent of large company CFOs agreed that SOX had increased investor confidence, with 33 percent agreeing that it had reduced fraud.**

Dittmar and Wagner 6 (Stephen Wagner is the managing partner of the U.S. Center for Corporate Governance at Deloitte & Touche and Lee Dittmar leads the Enterprise Governance Consulting practice at Deloitte Consulting and serves as coleader of the organization's Sarbanes-Oxley practice. Wagner is based in Boston; Dittmar, in Philadelphia, April 2006, "The Unexpected Benefits of Sarbanes-Oxley" Harvard Business Review, https://hbr.org/2006/04/the-unexpected-benefits-of-sarbanes-oxley) CW

After more than a decade of Sarbanes-Oxley governance, the increased oversight of corporate financial management is paying off when it comes to fraud controls. And, while organizations pay a bit more every year to comply, the costs are manageable, according to the 2013 Sarbanes-Oxley Compliance Survey by the Protiviti consulting firm. Nearly 300 chief audit and financial officers at companies ranging from less than $100 million to more than $20 billion were surveyed. A full 80 percent of respondents said they have seen improvement in internal controls over financial reporting, with 26 percent reporting that internal controls had significantly improved. Of financial executives at larger corporations, 87 said percent they had seen an improvement. Enacted in July 2002, the Sarbanes-Oxley Act was drafted in response to a number of high profile corporate scandals, including Enron. The legislation increased the independence of external auditors, increased the oversight role of boards of directors and required top management to individually certify the accuracy of financial information. In addition, penalties for fraudulent financial activity were made much more severe. More than one-third of financial executives surveyed reported that SOX compliance costs had increased during the previous year, but overall most executives said the costs "remain at a manageable level." Ten percent had a decrease in costs and 52 percent stayed the same. Automating controls is an area of increased focus, with 90 percent of executives saying they have plans to automate IT processes and controls for SOX compliance, up from 83 percent the previous year. The study found that more companies are adjusting their compliance efforts to focus on high-risk processes and walkthroughs. "To continue to improve their SOX compliance efforts, companies need to intensify their scrutiny of high-risk processes such as financial reporting, accrual processes, stock options and equity, and taxes," said Brian Christensen, Protiviti's executive vice president for global internal audit. "The study shows that companies are beginning to adjust in that direction and the shift aligns with guidance from the SEC and PCAOB." The survey also asked about which area within an organization should oversee SOX compliance. The internal auditing department led at 45 percent of companies (up 15 percent from the previous year), with only 10 percent now placing the function in the project management office (down 15 percent from the previous year). The reason given for the shift toward the internal audit department is the willingness of external auditors to rely on the work of internal audit departments rather than other functions.

SOX is being modeled – that solves overall market fraud

Accounting Web 15 (AccountingWeb – leading blog for information affecting accounting, originally posted: 8/19/08 Last update: June 1, 2015, "Before and after Sarbanes-Oxley - learning to live with change" http://www.accountingweb.com/practice/practice-excellence/before-and-after-sarbanes-oxley-learning-to-live-with-change) CW

SOX extended the statute of limitations on securities fraud. Auditors are required under the law to maintain "all audit or review work papers" for five years and employees of issuers and accounting firms are extended "whistleblower protection." Forensic accounting is a growing specialty in the accounting profession. In June, the SEC agreed to provide small businesses with an additional one-year

extension to comply with the Sarbanes-Oxley Section 404(b) auditor attestation requirements. Senator Olympia Snowe, a member of the Senate Committee on Small Business, applauded the decision but asked for further study. "I am also pleased that the SEC will complete a study on the costs and benefits of applying the law to small businesses. The SEC should refrain from implementing any new regulations until such an evaluation is complete." The influence of SOX has extended to private companies and to nonprofits. Private companies adopted Sarbanes-Oxley provisions either primarily as a "best business practice" or because they were hoping to go public or have hopes of being bought by a public company. These companies have to think ahead to get their internal controls in place, which can take two years by some estimates, the Sacramento Business Journal reports. Although it does not apply to nonprofits, SOX is serving as a model for higher education and laws that affect nonprofit governance, University Business reports. In 2004 California's legislature passed SB 1262, the Nonprofit Integrity Act, which requires nonprofits with more than $2 million in revenue, chartered or doing business in the state, to have an annual audit and an independent audit committee on the board. Other nonprofits have adopted governance provisions of Sarbanes as a best practice. A greater emphasis on accountability and transparency followed some of the problems the larger organizations faced after Hurricane Katrina. "We're heavily reliant on donors to entrust us with the good stewardship of their resources," Jeff Amburgey, vice president of finance at Berea College (KY) told University Business. So the staff and board members at Berea College try to stay in front of governance issues.

SOX solves fraud

Cohen 13 (Tracey Coehen – seasoned forensic accountant and fraud investigator, June 2013, "FRAUD PREVENTION", http://www.fraudessentials.com/fraud-prevention/)

The Sarbanes-Oxley Act of 2002 (SOX) generally applies to U.S. public companies and their auditors, but numerous multinational public companies and private companies are complying with the regulations voluntarily. SOX generally requires: Management to assess the effectiveness of the company's internal control structure over financial reporting. Are the controls effective at ensuring that the financial statements will be presented accurately? An auditor's report on management's assessment. Do the auditors believe that management's assessment of the internal controls is accurate? New auditing standards and rules for auditing firms with public clients. Auditors of public companies are limited in the other services that they may provide to their clients, in order to ensure their independence. Other broad requirements of SOX include whistleblower provisions, under which companies must establish a confidential, anonymous reporting mechanism for employees. This is most often accomplished with an anonymous hotline; this can be set up through a vendor, which guarantees anonymity for callers. The company must also disclose whether a Code of Ethics has been established for executives and make it available to the public. SOX defines conflicts of interest and prohibits certain actions, such as personal loans to executive officers or directors. SOX does not specify a particular set of internal controls that must be in place in companies. There are certain elements of internal controls that are required, such as the whistleblower provisions and management's evaluation of the internal controls, but the regulation does not specify a large set of controls that must be put into place. Understanding what SOX does not require of companies may be even more important than knowing what is required. Many individuals and investors do not understand that SOX actually requires very little in the way of substantive improvement to the internal controls of a company. As long as management is willing to admit publicly that its controls are not good, the company is not forced to improve the internal controls.

Self regulation fails

Self-regulation fails, the top will be corrupt without any checks

Kennedy, 12 – Writing for Senior Honors Thesis in Accounting (Kristin A., "An Analysis of Fraud: Causes, Prevention, and Notable Cases", University of New Hampshire Scholar's Repository, Fall 2012, pdf)//KTC

As all of the cases discussed have shown, it is typically the highest individuals in an organization that have the power to commit the most damaging fraud. Internal controls cannot be effective if the executives in

charge have to power to override them. The tone from the top within an organization needs to be positive and even the top employees need to be overseen. It appears true that more accountability and increased responsibility for these top executives of public companies is a successful way of preventing fraud, at least at the highest levels of an organization. Personal risk is typically a great deterrent from bad behavior. With the exception of the Bernie Madoff scandal, accounting fraud seems to be declining since the early 2000s. It appears that recent accounting legislation, namely the Sarbanes-Oxley Act and Dodd Frank Act, is heading in the right direction, but more can be done to prevent fraud. As 45 accounting standards within the United States converge with IFRS, there is the potential that fraud can be reduced even more. With the rules-based accounting laid out in U.S. G.A.A.P., individuals are expected to follow exactly what is laid out. If there is not a specific rule about something, it can be argued that it was not clear what should have been done, even if an action was clearly immoral. Under a principle-based system such as IFRS, more discretion in decision making is placed on the individual. Therefore, moral actions are expected to be chosen, often leading to less fraud. Overall, accounting in the United States seems to be heading in the right direction, even if fraud will never really vanish entirely.

Zero political backing for repealing SOX – it's overwhelmingly popular

Ames 9 (Marius, attorney and political writer for SCW, a blog on Congressional politics and finance, "SARBANES-OXLEY: THE GREAT REPUBLICAN OVERREACH BEGINS", http://acandidworld.com/2009/09/09/sarbanes-oxley-the-great-republican-overreach-begins/)

Every movement reaches a point where, emboldened by temporary success, it oversteps its victories, and finally loses the public — an Icarus moment. For the Republicans, though, hubris kicked in early. Health care is stalled, sure, but it's coming back, and Obama's approval still hovers in the low 50's, with no sign of dipping lower. This, apparently, passes for victory, because Newt Gingrich is moving on. Now's he has designs on repealing the Sarbanes-Oxley Act, the intensely complicated regulatory regime passed in the wake of the Enron/WorldComm scandals, to stop future scandals before they come, by ensuring disinterested boards, and incentivizing whistleblowing, among others. Lest we forget, Soxley, as it's affectionately known, is the very **definition of bipartisan reform** — it passed with a **supermajority in the House**, and an astonishing **99-0 vote** in the Senate, making it **more popular** at its passage **than the PATRIOT Act**. There are academic questions to to whether Soxley is the cheapest way to solve the problems it was drafted towards, but there has **never been a question** about the need for it, or similar reforms. It takes an academic to question Sarbanes-Oxley's effectiveness — but **it takes a fool to wish for its repeal**, with nothing else waiting.

Executive Orders lack the exposure and durability to solve.

Schlanger 15 Margo, Henry M. Butzel Professor of Law, University of Michigan. "Intelligence Legalism and the National Security Agency's Civil Liberties Gap," Harvard National Security Journal. 6:112

Efforts to implement most of the Church Committee's substantive recommendations as statutory law failed; they entered American law instead as part of Executive Order 12,333. As already quoted, the Executive Order does expressly state (in language unchanged from its 1981 promulgation): "Set forth below are certain general principles that, in addition to and consistent with applicable laws, are intended to achieve the proper balance between the acquisition of essential information and protection of individual interests." n301 That is, one of 12,333's purposes is to fill the civil liberties gap left by constitutional and statutory law.

But 12,333 cannot live up to that goal. For one thing, the rules' status as part of an executive order renders them both less visible and more easily weakened. The 2008 amendments to 12,333, for example, for the first time allowed inter-agency sharing of signals intelligence "for purposes of allowing the recipient agency to determine whether the information is [*181] relevant to its responsibilities and can be retained by it," pursuant to potential "procedures established by the Director in coordination with the Secretary of Defense and approved by the Attorney General." n302 This change received no attention by non-governmental commentators. n303

More important, even if Executive Order 12,333 adequately covered civil liberties interests in 1980, it--along with its associated AG Guidelines--has grown out-of-date in subsequent decades. Unsurprisingly, given the generally low visibility of intelligence matters, there was little appetite to update either Executive Order 12,333 or other sources of executive self-regulation to address new challenges to liberty, until the Snowden disclosures. Thus notwithstanding the enormous changes that have taken place in the scope of surveillance since 1980 and the advent of "big data" methods, there have been no substantive liberty-protective changes ever made to the Executive Order. Some procedural protections have been added, n304and notable efforts to weaken the protection of U.S. Person information were fended off. n305 But whatever further substantive protection might be useful in light of technological or other changes, all that has been added since 1980 is new hortatory language swearing fealty to (already binding) other laws: "The United States Government has a solemn obligation, and shall continue in the conduct of intelligence activities under this order, to protect fully the legal rights of all United States persons, including freedoms, civil liberties, and privacy rights guaranteed by Federal law." n306

No cyberterror

empirics, hollow threats, no capabilities, no motive, disincentives, and focus on other strategies

Healey '11 Director of the Cyber Statecraft Initiative at the Atlantic Council of the United States (Jason, "Cyberterror is Aspirational Blather," http://www.acus.org/new_atlanticist/cyberterror-aspirational-blather10/3/11)

The Atlantic Council's Cyber Statecraft Initiative recently hosted a conference call to discuss the terrorist use of the Internet and how it has evolved in the ten years since 9/11. The call featured Matt Devost of FusionX, Neal Pollard of PriceWaterhouseCooper and Rick Howard of VeriSign/iDefense – who have been tracking this and many other online threats for years. While this conversation was off

the record, this blog attempts to capture the spirit. Terms such as "cyber 9/11" and "cyber terrorism" have been used frequently to describe the security threats posed by terrorists online. Cyber technologies, like any other, enable terrorist groups to do their terrorizing more effectively and efficiently. In the past few years it is increasingly common for them to use the Internet for propaganda, fundraising, general support, and convergence. Videos and anonymous discussion forums allow for the dissemination of training information and the call to arms for more individuals to participate and join groups. Importantly, the panelists agreed that these groups have not yet used cyber attack capabilities in any significant way to cause casualties or actually terrorize anyone. While Ibrahim Samudra or Irahabi 007 hacked to raise funds through credit-card fraud, this is a traditional support activity, not "cyber terror". The US government was a relatively early advocate of a strict definition of cyber terrorism, as nearly a decade ago they were calling it as "a criminal act perpetrated through computers resulting in violence, death and/or destruction, and creating terror for the purpose of coercing a government to change its policies." Not defacing a webpage, not flooding a website (even of the South Korean president) and not stealing credit card information. Some terrorists groups may talk about waging an e-Jihad, but such talk remains, for now, aspirational blather. For decades, the rule of thumb for intelligence analysts has been that adversaries with motives for damaging cyber attacks do not have the capabilities, while those with the capabilities do not yet have the motives. A large-scale cyber attacks is more difficult than is generally believed and few adversaries have both the motive and capability. Additionally, terrorist groups have many disincentives for pursing cyber capabilities. For example, their leadership tends to be conservative and they tend to stick with what they know will work – suicide bombers, road-side bombs, and kinetic assaults. These actually kill and terrorize people which, as yet, no cyber attack has accomplished. The Congressional Research Service summed this up as "lower risk, but less drama."

Backdoors good, if we don't do it other countries will

Wittes 6/12 [Benjamin, Senior Fellow in Governance Studies at the Brookings Institution and member of the Hoover Institution's Task Force on National Security and Law. "Thoughts on Encryption and Going Dark: Part I," Lawfare: Hard National Security Choices. http://www.lawfareblog.com/thoughts-encryption-and-going-dark-part-ii-debate-merits#]

Let me start by breaking the encryption debate into two distinct sets of questions: One is the conceptual question of whether a world of end-to-end strong encryption is an attractive idea. The other is whether—assuming it is not an attractive idea and that one wants to ensure that authorities retain the ability to intercept decrypted signal—an extraordinary access scheme is technically possible without eroding other essential security and privacy objectives. These questions often get mashed together, both because tech companies are keen to market themselves as the defenders of their users' privacy interests and because of the libertarian ethos of the tech community more generally. But the questions are not the same, and it's worth considering them separately. Consider the conceptual question first. Would it be a good idea to have a world-wide communications infrastructure that is, as Bruce Schneier has aptly put it, secure from all attackers? That is, if we could snap our fingers and make all device-to-device communications perfectly secure against interception from the Chinese, from hackers, from the FSB but also from the FBI even wielding lawful process, would that be desirable? Or, in the alternative, do we want to create an internet as secure as possible from everyone except government investigators exercising their legal authorities with the understanding that other countries may do the same? Conceptually speaking, I am with Comey on this question—and the matter does not seem to me an especially close call. The belief in principle in creating a giant world-wide network on which surveillance is technically impossible is really an argument for the creation of the world's largest ungoverned space. I understand why techno-anarchists find this idea so appealing. I can't imagine for moment, however, why anyone else would. Consider the comparable argument in physical space: the creation of a city in which authorities are entirely dependent on citizen reporting of bad

conduct but have no direct visibility onto what happens on the streets and no ability to conduct search warrants (even with court orders) or to patrol parks or street corners. Would you want to live in that city? The idea that ungoverned spaces really suck is not controversial when you're talking about Yemen or Somalia. I see nothing more attractive about the creation of a worldwide architecture in which it is technically impossible to intercept and read ISIS communications with followers or to follow child predators into chatrooms where they go after kids.

Other countries will access data regardless of what the U.S. does.

Wittes 6/12 [Benjamin, Senior Fellow in Governance Studies at the Brookings Institution and member of the Hoover Institution's Task Force on National Security and Law. "Thoughts on Encryption and Going Dark: Part I," Lawfare: Hard National Security Choices. http://www.lawfareblog.com/thoughts-encryption-and-going-dark-part-ii-debate-merits#]

I am certain that the computer scientists are correct that foreign governments will move in this direction, but I think they are misreading the consequences of this. China and Britain will do this irrespective of what the United States does, and that fact may well create potential opportunity for the U.S. After all, if China and Britain are going to force U.S. companies to think through the problem of how to provide extraordinary access without compromising general security, perhaps the need to do business in those countries will provide much of the incentive to think through the hard problems of how to do it. Perhaps countries far less solicitous than ours of the plight of technology companies or the privacy interests of their users will force the research that Comey can only hypothesize. Will Apple then take the view that it can offer phones to users in China which can be decrypted for Chinese authorities when they require it but that it's technically impossible to do so in the United States? There's a final, non-legal factor that may push companies to work this problem as energetically as they are now moving toward end-to-end encryption: politics. We are at very particular moment in the cryptography debate, a moment in which law enforcement sees a major problem as having arrived but the tech companies see that problem as part of the solution to the problems the Snowden revelations created for them. That is, we have an end-to-end encryption issue, in significant part, because companies are trying to assure customers worldwide that they have their backs privacy-wise and are not simply tools of NSA. I think those politics are likely to change. If Comey is right and we start seeing law enforcement and intelligence agencies blind in investigating and preventing horrible crimes and significant threats, the pressure on the companies is going to shift. And it may shift fast and hard. Whereas the companies now feel intense pressure to assure customers that their data is safe from NSA, the kidnapped kid with the encrypted iPhone is going to generate a very different sort of political response. In extraordinary circumstances, extraordinary access may well seem reasonable. And people will wonder why it doesn't exist.

2NC Cyber Attacks

The risk of a cyber attack is EXTREMELY over-hyped: by the government to get bills passed, by companies to get funding, and by the media

Thomas **Rid**, a Reader in War Studies at King's college Longon and a non-resident fellow at the Center for Transatlantic Relations in the School for Advanced International Studies Johns Hopkins University and worked at the Woodrow Wilson Center, **3/13**/13, "The Great Cyberscare" http://www.foreignpolicy.com/articles/2013/03/13/the_great_cyberscare

The White House likes a bit of threat. In his State of the Union address, Barack Obama wanted to nudge Congress yet again into passing meaningful legislation. The president emphasized that America's enemies are "seeking the ability to sabotage our power grid, our financial institutions, and our air traffic control systems." After two failed attempts to pass a cybersecurity act in the past two years, he added swiftly: "We cannot look back years from now and wonder why we did nothing in the face of real threats to our security and our economy." Fair enough. A bit of threat to prompt needed action is one thing. Fear-mongering is something else: counterproductive. Yet too many a participant in the cybersecurity debate reckons that puffery pays off.¶ The Pentagon, no doubt, is the master of razzmatazz. Leon Panetta set the tone by warning again and again of an impending "cyber Pearl Harbor." Just before he left the Pentagon, the Defense Science Board delivered a remarkable report, Resilient Military Systems and the Advanced Cyber Threat. The paper seemed obsessed with making yet more drastic historical comparisons: "The cyber threat is serious," the task force wrote, "with potential consequences similar to the nuclear threat of the Cold War." The manifestations of an all-out nuclear war would be different from cyberattack, the Pentagon scientists helpfully acknowledged. But then they added, gravely, that "in the end, the existential impact on the United States is the same."¶ A reminder is in order: The world has yet to witness a single casualty, let alone fatality, as a result of a computer attack. Such statements are a plain insult to survivors of Hiroshima. Some sections of the Pentagon document offer such eye-wateringly shoddy analysis that they would not have passed as an MA dissertation in a self-respecting political science department. But in the current debate it seemed to make sense. After all a bit of fear helps to claim -- or keep -- scarce resources when austerity and cutting seems out-of-control. The report recommended allocating the stout sum of $2.5 billion for its top two priorities alone, protecting nuclear weapons against cyberattacks and determining the mix of weapons necessary to punish all-out cyber-aggressors.¶ Then there are private computer security companies. Such firms, naturally, are keen to pocket some of the government's money earmarked for cybersecurity. And hype is the means to that end. Mandiant's much-noted report linking a coordinated and coherent campaign of espionage attacks dubbed Advanced Persistent Threat 1, or "APT1," to a unit of the Chinese military is a case in point: The firm offered far more details on attributing attacks to the Chinese than the intelligence community has ever done, and the company should be commended for making the report public. But instead of using cocky and over-confident language, Mandiant's analysts should have used Words of Estimative Probability, as professional intelligence analysts would have done.¶ An example is the report's conclusion, which describes APT1's work: "Although they control systems in dozens of countries, their attacks originate from four large networks in Shanghai -- two of which are allocated directly to the Pudong New Area," the report found. Unit 61398 of the People's Liberation Army is also in Pudong. Therefore, Mandiant's computer security specialists concluded, the two were identical: "Given the mission, resourcing, and location of PLA Unit 61398, we conclude that PLA Unit 61398 is APT1." But the report conspicuously does not mention that Pudong is not a small neighborhood ("right outside of Unit 61398's gates") but in fact a vast city landscape twice the size of Chicago. Mandiant's report was useful and many attacks indeed originate in China. But the company should have been more careful in its overall assessment of the available evidence, as the computer security expert Jeffrey Carr and others have pointed out. The firm made it too easy for Beijing to dismiss the report. My class in cybersecurity at King's College London started poking holes into the report after 15 minutes of red-teaming it -- the New York Times didn't.¶ Which leads to the next point: The media want to sell copy through threat inflation. "In Cyberspace, New Cold War," the headline writers at the Times intoned in late February. "The U.S. is not ready for a cyberwar," shrieked the Washington Post earlier this week. Instead of calling out the above-mentioned Pentagon report, the paper actually published two supportive articles on it and pointed out that a major offensive cyber capability now seemed essential "in a world awash in cyber-espionage, theft and disruption." The Post should have reminded its readers that the only military-style cyberattack that has actually created physical damage -- Stuxnet -- was actually executed by the United States government. The Times, likewise, should have asked tough questions and pointed to some of the evidential problems in the Mandiant report; instead, it published what appeared like an elegant press release for the firm. On issues of cybersecurity, the nation's fiercest watchdogs too often look like hand-tame puppies

eager to lap up stories from private firms as well as anonymous sources in the security establishment.

No impact to cyberterror

Green 2 – editor of The Washington Monthly (Joshua, 11/11, The Myth of Cyberterrorism, http://www.washingtonmonthly.com/features/2001/0211.green.html, AG)

There's just one problem: There is no such thing as cyberterrorism--no instance of anyone ever having been killed by a terrorist (or anyone else) using a computer. Nor is there compelling evidence that al Qaeda or any other terrorist organization has resorted to computers for any sort of serious destructive activity. What's more, outside of a Tom Clancy novel, computer security specialists believe it is virtually impossible to use the Internet to inflict death on a large scale, and many scoff at the notion that terrorists would bother trying. "I don't lie awake at night worrying about cyberattacks ruining my life," says Dorothy Denning, a computer science professor at Georgetown University and one of the country's foremost cybersecurity experts. "Not only does [cyberterrorism] not rank alongside chemical, biological, or nuclear weapons, but it is not anywhere near as serious as other potential physical threats like car bombs or suicide bombers." Which is not to say that cybersecurity isn't a serious problem--it's just not one that involves terrorists. Interviews with terrorism and computer security experts, and current and former government and military officials, yielded near unanimous agreement that the real danger is from the criminals and other hackers who did $15 billion in damage to the global economy last year using viruses, worms, and other readily available tools. That figure is sure to balloon if more isn't done to protect vulnerable computer systems, the vast majority of which are in the private sector. Yet when it comes to imposing the tough measures on business necessary to protect against the real cyberthreats, the Bush administration has balked. Crushing BlackBerrys When ordinary people imagine cyberterrorism, they tend to think along Hollywood plot lines, doomsday scenarios in which terrorists hijack nuclear weapons, airliners, or military computers from halfway around the world. Given the colorful history of federal boondoggles--billion-dollar weapons systems that misfire, $600 toilet seats--that's an understandable concern. But, with few exceptions, it's not one that applies to preparedness for a cyberattack. "The government is miles ahead of the private sector when it comes to cybersecurity," says Michael Cheek, director of intelligence for iDefense, a Virginia-based computer security company with government and private-sector clients. "Particularly the most sensitive military systems." Serious effort and plain good fortune have combined to bring this about. Take nuclear weapons. The biggest fallacy about their vulnerability, promoted in action thrillers like WarGames, is that they're designed for remote operation. "[The movie] is premised on the assumption that there's a modem bank hanging on the side of the computer that controls the missiles," says Martin Libicki, a defense analyst at the RAND Corporation. "I assure you, there isn't." Rather, nuclear weapons and other sensitive military systems enjoy the most basic form of Internet security: they're "air-gapped," meaning that they're not physically connected to the Internet and are therefore inaccessible to outside hackers. (Nuclear weapons also contain "permissive action links," mechanisms to prevent weapons from being armed without inputting codes carried by the president.) A retired military official was somewhat indignant at the mere suggestion: "As a general principle, we've been looking at this thing for 20 years. What cave have you been living in if you haven't considered this [threat]?" When it comes to cyberthreats, the Defense Department has been particularly vigilant to protect key systems by isolating them from the Net and even from the Pentagon's internal network. All new software must be submitted to the National Security Agency for security testing. "Terrorists could not gain control of our spacecraft, nuclear weapons, or any other type of high-consequence asset," says Air Force Chief Information Officer John Gilligan. For more than a year, Pentagon CIO John Stenbit has enforced a moratorium on new wireless networks, which are often easy to hack into, as well as common wireless devices such as PDAs, BlackBerrys, and even wireless or infrared copiers and faxes. The September 11 hijackings led to an outcry that airliners are particularly susceptible to cyberterrorism. Earlier this year, for instance, Sen. Charles Schumer (D-N.Y.) described "the absolute havoc and devastation that would result if cyberterrorists suddenly shut down our air traffic control system, with thousands of planes in mid-flight." In fact, cybersecurity experts give some of their highest marks to the FAA, which reasonably separates its administrative and air traffic control systems and strictly air-gaps the latter. And there's a reason the 9/11 hijackers used box-cutters instead of keyboards: It's impossible to hijack a plane remotely, which eliminates the possibility of a high-tech 9/11 scenario in which planes are used as weapons. Another source of concern is terrorist infiltration of our intelligence agencies. But here, too, the risk is slim. The CIA's classified computers are also air-gapped, as is the FBI's entire computer system. "They've been paranoid about this forever," says Libicki, adding that paranoia is a sound governing principle when it comes to cybersecurity. Such concerns are manifesting themselves in broader policy terms as well. One notable characteristic of last year's Quadrennial Defense Review was how strongly it focused on protecting information systems.

Some sections of the Pentagon document offer such eye-wateringly shoddy analysis that they would not have passed as an MA dissertation in a self-respecting political science department. But in the current debate it seemed to make sense. After all a bit of fear helps to claim -- or keep -- scarce resources when austerity and cutting seems out-of-control. The report recommended allocating the stout sum of $2.5 billion for its top two priorities alone, protecting nuclear weapons against cyberattacks and determining the mix of weapons necessary to punish all-out cyber-aggressors.¶ Then there are private computer security companies. Such firms, naturally, are keen to pocket some of the government's money earmarked for cybersecurity. And hype is the means to that end. Mandiant's much-noted report linking a coordinated and coherent campaign of espionage attacks dubbed Advanced Persistent Threat 1, or "APT1," to a unit of the Chinese military is a case in point: The firm offered far more details on attributing attacks to the Chinese than the intelligence community has ever done, and the company should be commended for making the report public. But instead of using cocky and over-confident language, Mandiant's analysts should have used Words of Estimative Probability, as professional intelligence analysts would have done.¶ An example is the report's conclusion, which describes APT1's work: "Although they control systems in dozens of countries, their attacks originate from four large networks in Shanghai -- two of which are allocated directly to the Pudong New Area," the report found. Unit 61398 of the People's Liberation Army is also in Pudong. Therefore, Mandiant's computer security specialists concluded, the two were identical: "Given the mission, resourcing, and location of PLA Unit 61398, we conclude that PLA Unit 61398 is APT1." But the report conspicuously does not mention that Pudong is not a small neighborhood ("right outside of Unit 61398's gates") but in fact a vast city landscape twice the size of Chicago. Mandiant's report was useful and many attacks indeed originate in China. But the company should have been more careful in its overall assessment of the available evidence, as the computer security expert Jeffrey Carr and others have pointed out. The firm made it too easy for Beijing to dismiss the report. My class in cybersecurity at King's College London started poking holes into the report after 15 minutes of red-teaming it -- the New York Times didn't.¶ Which leads to the next point: The media want to sell copy through threat inflation. "In Cyberspace, New Cold War," the headline writers at the Times intoned in late February. "The U.S. is not ready for a cyberwar," shrieked the Washington Post earlier this week. Instead of calling out the above-mentioned Pentagon report, the paper actually published two supportive articles on it and pointed out that a major offensive cyber capability now seemed essential "in a world awash in cyber-espionage, theft and disruption." The Post should have reminded its readers that the only military-style cyberattack that has actually created physical damage -- Stuxnet -- was actually executed by the United States government. The Times, likewise, should have asked tough questions and pointed to some of the evidential problems in the Mandiant report; instead, it published what appeared like an elegant press release for the firm. On issues of cybersecurity, the nation's fiercest watchdogs too often look like hand-tame puppies

eager to lap up stories from private firms as well as anonymous sources in the security establishment.

2NC Backdoors Good

Other countries will access data regardless of what the U.S. does.

Wittes 6/12 [Benjamin, Senior Fellow in Governance Studies at the Brookings Institution and member of the Hoover Institution's Task Force on National Security and Law. "Thoughts on Encryption and Going Dark: Part I," Lawfare: Hard National Security Choices. http://www.lawfareblog.com/thoughts-encryption-and-going-dark-part-ii-debate-merits#]

I am certain that the computer scientists are correct that foreign governments will move in this direction, but I think they are misreading the consequences of this. China and Britain will do this irrespective of what the United States does, and that fact may well create potential opportunity for the U.S. After all, if China and Britain are going to force U.S. companies to think through the problem of how to provide extraordinary access without compromising general security, perhaps the need to do business in those countries will provide much of the incentive to think through the hard problems of how to do it. Perhaps countries far less solicitous than ours of the plight of technology companies or the privacy interests of their users will force the research that Comey can only hypothesize. Will Apple then take the view that it can offer phones to users in China which can be decrypted for Chinese authorities when they require it but that it's technically impossible to do so in the United States? There's a final, non-legal factor that may push companies to work this problem as energetically as they are now moving toward end-to-end encryption: politics. We are at very particular moment in the cryptography debate, a moment in which law enforcement sees a major problem as having arrived but the tech companies see that problem as part of the solution to the problems the Snowden revelations created for them. That is, we have an end-to-end encryption issue, in significant part, because companies are trying to assure customers worldwide that they have their backs privacy-wise and are not simply tools of NSA. I think those politics are likely to change. If Comey is right and we start seeing law enforcement and intelligence agencies blind in investigating and preventing horrible crimes and significant threats, the pressure on the companies is going to shift. And it may shift fast and hard. Whereas the companies now feel intense pressure to assure customers that their data is safe from NSA, the kidnapped kid with the encrypted iPhone is going to generate a very different sort of political response. In extraordinary circumstances, extraordinary access may well seem reasonable. And people will wonder why it doesn't exist.

Security and government access need to be balanced, without access it becomes too difficult to gain information.

Comey 7/6 [James, Director of the FBI. "Encryption, Public Safety and 'Going Dark,'" Lawfare: Hard National Security Choices. http://www.lawfareblog.com/encryption-public-safety-and-going-dark]

2. There are many benefits to this. Universal strong encryption will protect all of us—our innovation, our private thoughts, and so many other things of value—from thieves of all kinds. We will all have lock-boxes in our lives that only we can open and in which we can store all that is valuable to us. There are lots of good things about this. 3. There are many costs to this. Public safety in the United States has relied for a couple centuries on the ability of the government, with predication, to obtain permission from a court to access the "papers and effects" and communications of Americans. The Fourth Amendment reflects a trade-off inherent in ordered liberty: To protect the public, the government sometimes needs to be able to see an individual's stuff, but only under appropriate circumstances and with appropriate oversight. 4. These two things are in tension in many contexts. When the government's ability—with appropriate predication and court oversight—to see an individual's stuff goes away, it will affect public safety. That tension is vividly illustrated by the current ISIL threat, which involves ISIL operators in Syria recruiting and tasking dozens of troubled Americans to kill people, a process that increasingly takes part through mobile messaging apps that are end-to-end encrypted, communications that may not be intercepted, despite judicial orders under the Fourth Amendment. But the tension could as well be illustrated in criminal investigations all over the country. There is simply no doubt that bad people can communicate with impunity in a world of universal strong encryption.

Advantage 2 – Internet Freedom

1NC Innovation

No impact to internet nationalization

Gordon M. **Goldstein**, 6/25/**2014**. Served as a member of the American delegation to the World Conference on International Telecommunications. "The End of the Internet?" The Atlantic, http://m.theatlantic.com/magazine/archive/2014/07/the-end-of-the-internet/372301/.

Some experts anticipate a future with a Brazilian Internet, a European Internet, an Iranian Internet, an Egyptian Internet—all with different content regulations and trade rules, and perhaps with contrasting standards and operational protocols. Eli Noam, a professor of economics and finance at Columbia Business School, believes that such a progressive fracturing of the global Internet is inevitable. "We must get used to the idea that the standardised internet is the past but not the future," he wrote last fall. "And that the future is a federated internet, not a uniform one." Noam thinks that can be managed, in part through the development of new intermediary technologies that would essentially allow the different Internets to talk to each other, and allow users to navigate the different legal and regulatory environments.

Internet isn't key to innovation

Eli M. **Noam**, 8/28/**2002**. Professor and Finance and Economics, Director, Columbia Institute for Tele-Information, Graduate School of Business, Columbia University. "Will the Internet Be Bad for Democracy?" Financial Times Online, http://www.citi.columbia.edu/elinoam/articles/int_bad_dem.htm.

When the media history of the 20th Century will be written, the Internet will be seen as its major contribution. Television, telephone, and computers will be viewed as its early precursors, merging and converging into the new medium just as radio and film did into TV. The Internet's impact on culture, business, and politics will be vast, for sure. Where will it take us? To answer that question is difficult, because the Internet is not simply a set of interconnecting links and protocols connecting packet switched networks, but it is also a construct of imagination, an inkblot test into which everybody projects their desires, fears and fantasies.¶ Some see enlightenment and education. Others see pornography and gambling. Some see sharing and collaboration; others see e-commerce and profits. Controversies abound on most aspects of the Internet. Yet when it comes to its impact on democracy process, the answer seems unanimous.[1] The Internet is good for democracy. It creates digital citizens (Wired 1997) active in the vibrant teledemocracy (Etzioni, 1997) of the Electronic Republic (Grossman 1995) in the ¶Digital Nation (Katz 1992).Is there no other side to this question? Is the answer so positively positive? ¶The reasons why the Internet is supposed to strengthen democracy include the following.¶1.The Internet lowers the entry barriers to political participation.¶2.It strengthens political dialogue.¶3.It creates community.¶4.It cannot be controlled by government.¶5.It increases voting participation.¶6.It permits closer communication with officials.¶7.It spreads democracy world-wide.¶ Each of the propositions in this utopian populist, view, which might be called is questionable. But they are firmly held by the Internet founder generation, by the industry that now operates the medium, by academics from Negroponte (1995) to Dahl (1989), by gushy news media, and by a cross-party set of politicians who wish to claim the future, from Gore to Gingrich, from Bangemann to Blair.¶I will argue, in contrast, that the Internet, far from helping democracy, is a threat to it. And I am taking this view as an enthusiast, not a critic. But precisely because the Internet is powerful and revolutionary, it also affects, and even destroys, all traditional institutions--including--democracy. To deny this potential is to invite a backlash when the ignored problems eventually emerge.[2]¶My perspective is different from the neo-Marxist arguments about big business controlling everything; from neo-Luddite views that low-tech is beautiful; and from reformist fears that a politically disenfranchised digital underclass will emerge. The latter, in particular, has been a frequent perspective. Yet, the good news is that the present income-based gap in Internet usage will decline in developed societies. Processing and

transmission becomes cheap, and will be anywhere, affordably. Transmission will be cheap, and connect us to anywhere, affordably. And basic equipment will almost be given away in return for long-term contracts and advertising exposure.¶ That is why what we now call basic Internet connectivity will not be a problem. Internet connectivity will be near 100% of the households and offices, like electricity, because the Internet will have been liberated from the terror of the PC as its gateway, the most consumer-unfriendly consumer product ever built since the unicycle.¶ Already, more than half of communications traffic is data rather than voice, which means that it involves fast machines rather than slow people.These machines will be everywhere.Cars will be chatting with highways.Suitcases will complain to airlines.Electronic books will download from publishers.Front doors will check in with police departments.Pacemakers will talk to hospitals.Television sets will connect to video servers.¶ For that reason, my skepticism about the Internet as a pro-democracy force is not based on its uneven distribution. It is more systemic. The problem is that most analysts commit a so-called error of composition. That is, they confuse micro behavior with macro results. They think that if something is helpful to an individual, it is also helpful to society at large, when everybody uses it.¶ Suppose we would have asked, a century ago, whether the automobile would reduce pollution. The answer would have been easy and positive: no horses, no waste on the roads, no smell, no use of agricultural land to grow oats. But we now recognize that in the aggregate, mass motorization has been bad for the environment. It created emissions, dispersed the population, and put more demand on land. ¶ The second error is that of inference. Just because the Internet is good for democracy in places like North Korea, Iran, or Sudan does not mean that it is better for Germany, Denmark, or the United States. Just because three TV channels offer more diversity of information than one does not mean that 30,000 are better than 300.¶ So here are several reasons why the Internet will not be good for democracy, corresponding to the pro-democracy arguments described above.¶ §The Internet Will Make Politics More Expensive and Raise Entry Barriers¶ The hope has been that online public space will be an electronic version of a New England or Swiss town meeting, open and ongoing. The Internet would permit easy and cheap political participation and political campaigns. But is that true?¶ Easy entry exists indeed for an Internet based on narrowband transmission, which is largely text-based. But the emerging broadband Internet will permit fancy video and multimedia messages and information resources. Inevitably, audience expectations will rise. When everyone can speak, who will be listened to? If the history of mass media means anything, it will not be everyone. It cannot be everyone. Nor will the wisest or those with the most compelling case or cause be heard, but the best produced, the slickest, and the best promoted. And that is expensive.¶ Secondly, because of the increasing glut and clutter of information, those with messages will have to devise strategies to draw attention. Political attention, just like commercial one, will have to be created. Ideology, self-interest, and public spirit are some factors. But in many cases, attention needs to be bought, by providing entertainment, gifts, games, lotteries, coupons, etc, That, too, is expensive. The basic cost of information is rarely the problem in politics; it's the packaging. It is not difficult or expensive to produce and distribute handbills or to make phone calls, or to speak at public events. But it is costly to communicate to vast audiences in an effective way, because that requires large advertising and PR budgets.¶ Thirdly, effective politics on the Internet will require elaborate and costly data collection. The reason is that Internet media operate differently from traditional mass media. They will not broadcast to all but instead to specifically targeted individuals.Instead of the broad stroke of political TV messages, "netcasted" politics will be customized to be most effective.This requires extensive information about individuals' interests and preferences. Data banks then become a key to political effectiveness. Who would own and operate them? In some cases the political parties. But they could not maintain control over the data banks where a primary exist that is open to many candidates. There is also a privacy problem, when semi-official political parties store information about the views, fears, and habits of millions of individuals. For both of those reasons the ability of parties to collect such data will be limited.¶ Other political data banks will be operated by advocacy and interest groups. They would then donate to candidate's data instead of money. The importance of such data banks would further weaken campaign finance laws and further strengthen interest group pluralism over traditional political parties.¶ But in particular, political data banks will maintained through what is now known as political consultants. They will establish permanent and proprietary permanent data banks and become still bigger players in the political environment and operate increasingly as ideology-free for –profit consultancies.¶ Even if the use of the Internet makes some political activity cheaper, it

does so for everyone, which means that all organization will increase their activities rather than spend less on them.[3] If some aspects of campaigning become cheaper, they would not usually spend less, but instead do more.¶ Thus, any effectiveness of early adopters will soon be matched by their rivals and will simply lead to an accelerated, expensive, and mutually canceling political arms-race of investment in action techniques and new--media marketing technologies.¶ The early users of the Internet experienced a gain in their effectiveness, and now they incorrectly extrapolate this to society at large. While such gain is trumpeted as the empowerment of the individual over Big Government and Big Business, much of it has simply been a relative strengthening of individuals and groups with computer and online skills (who usually have significantly about-average income and education) and a relative weakening of those without such resources. Government did not become more responsive due to online users; it just became more responsive to them.¶ •The Internet will make reasoned and informed political dialog more difficult. ¶ True, the Internet is a more active and interactive medium than TV. But is its use in politics a promise or a reality?¶ Just because the quantity of information increase does not mean that its quality rises. To the contrary. As the Internet leads to more information clutter, it will become necessary for any message to get louder. Political information becomes distorted, shrill, and simplistic.¶ One of the characteristics of the Internet is disintermediation, the Internet is in business as well as in politics. In politics, it leads to the decline of traditional news media and their screening techniques. The acceleration of the news cycle by necessity leads to less careful checking, while competition leads to more sensationalism. Issues get attention if they are visually arresting and easily understood. This leads to media events, to the 15 min of fame, to the sound bite, to infotainment. The Internet also permits anonymity, which leads to the creation of, and to last minute political ambush. The Internet lends itself to dirty politics more than the more accountable TV.¶ While the self-image of the tolerant digital citizen persists, an empirical study of the content of several political usenet groups found much intolerant behavior: domineering by a few; rude "flaming"; and reliance on unsupported assertions. (Davis, 1999) Another investigation finds no evidence that computer-mediated communication is necessarily democratic or participatory (Streck, 1998).¶ •The Internet disconnects as much as it connects¶ Democracy has historically been based on community. Traditionally, such communities were territorial — electoral districts, states, and towns. Community, to communicate — the terms are related: community is shaped by the ability of its members to communicate with each other. If the underlying communications system changes, the communities are affected. As one connects in new ways, one also disconnects the old ways. As the Internet links with new and far-away people, it also reduces relations with neighbors and neighborhoods.¶ The long-term impact of cheap and convenient communications is a further geographic dispersal of the population, and thus greater physical isolation. At the same time, the enormous increase in the number of information channels leads to an individualization of mass media, and to fragmentation. Suddenly, critics of the "lowest common denominator" programming, of TV now get nostalgic for the "electronic hearth" around which society huddled. They discovered the integrative role of mass media.¶ On the other hand, the Internet also creates electronically linked new types of community. But these are different from traditional communities. They have less of the averaging that characterizes physical communities–-throwing together the butcher, the baker, the candlestick maker.Instead, these new communities are more stratified along some common dimension, such as business, politics, or hobbies. These groups will therefore tend to be issue - driven, more narrow, more narrow-minded, and sometimes more extreme, as like-minded people reinforce each other's views.¶ Furthermore, many of these communities will be owned by someone.They are like a shopping mall, a gated community, with private rights to expel, to promote, and to censor.The creation of community has been perhaps the main assets of Internet portals such as AOL.It is unlikely that they will dilute the value of these assets by relinquishing control.¶ If it is easy to join such virtual communities, it also becomes easy to leave, in a civic sense, one's physical community.Community becomes a browning experience.¶ •Information does not necessarily weaken the state.¶ Can Internet reduce totalitarianism? Of course. Tyranny and mind control becomes harder. But Internet romantics tend to underestimate the ability of governments to control the Internet, to restrict it, and to indeed use it as an instrument of surveillance.How quickly we forget.Only a few years ago, the image of information technology was Big Brother and mind control. That was extreme, of course, but the surveillance potential clearly exists. Cookies can monitor

usage.Wireless applications create locational fixes.Identification requirements permit the creation of composites of peoples' public and private activities and interests.Newsgroups can (and are) monitored by those with stakes in an issue.¶ A free access to information is helpful to democracy.But the value of information to democracy tends to get overblown. It may be a necessary condition, but not a sufficient one.¶ Civil war situations are not typically based on a lack of information. Yet there is an undying belief that if people "only knew", eg. by logging online, they would become more tolerant of each other. That is wishful and optimistic hope, but is it based on history? Hitler came to power in a republic where political information and communication were plentiful. ¶ Democracy requires stability, and stability requires a bit of inertia. The most stable democracies are characterized by a certain slowness of change. Examples are Switzerland and England. The US operates on the basis of a 210-year old Constitution. Hence the acceleration of politics made the Internet is a two-edged sword.¶ The Internet and its tools accelerate information flows, no question about it. But same tools are also available to any other group, party, and coalition. Their equilibrium does not change, except temporarily in favor of early adopters. All it may accomplish in the aggregate is a more hectic rather than a more thoughtful process.¶ •Electronic voting does not strengthen democracy¶ The Internet enables electronic voting and hence may increase voter turnout.But it also changes democracy from a representative model to one of direct democracy.¶ Direct democracy puts a premium on resources of mobilization, favoring money and organization.It disintermediates elected representatives.It favors sensationalized issues over "boring" ones.Almost by definition, it limits the ability to make unpopular decisions.It makes harder the building of political coalition (Noam, 1980, 1981).The arguments against direct democracy were made perhaps most eloquently in the classic arguments for the adoption of the US Constitution, by James Madison in the Federalist Papers #10.¶ Electronic voting is not simply the same as traditional voting without the inconvenience of waiting in line.When voting becomes like channel clicking on remote, it is left with little of the civic engagement of voting.When voting becomes indistinguishable from a poll, polling and voting merge.With the greater ease and anonymity of voting, a market for votes is unavoidable.Participation declines if people know the expected result too early, or where the legitimacy of the entire election is in question.¶ §Direct access to public officials will be phony¶ In 1997, Wired magazine and Merrill Lynch commissioned a study of the political attitudes of the"digital connected".The results showed them more participatory, more patriotic, more pro-diversity, and more voting-active.They were religious (56% say they pray daily); pro-death penalty (3/4); pro-Marijuana legalization (71%); pro-market (%) and pro-democracy (57%).But are they outliers or the pioneers of a new model?At the time of the survey (1997) the digitally connected counted for 9% of the population; they were better educated, richer (82% owned securities); whites; younger; and more Republican than the population as a whole.In the Wired/Merrill Lynch survey, none of the demographic variables were corrected for.Other studies do so, and reach far less enthusiastic results.¶ One study of the political engagement of Internet users finds that they are only slightly less likely to vote, and are more likely to contact elected officials.The Internet is thus a substitute for such contacts, not their generator.Furthermore, only weak causality is found.(Bimber 1998)¶ Another survey finds that Internet users access political information roughly in the same proportions as users of other media, about 5% of their overall information usage (Pew, 1998).Another study finds that users of the Internet for political purposes tend to already involved.Thus, the Internet reinforces political activity rather than mobilizes new one (Norris, Pippa, 1999)¶ Yes, anybody can fire off email messages to public officials and perhaps even get a reply, and this provides an illusion of access.But the limited resource will still be scarce: the attention of those officials. By necessity, only a few messages will get through.Replies are canned, like answering machines.If anything, the greater flood of messages will make gatekeepers more important than ever: power brokers that can provide access to the official. As demand increases while the supply is static, the price of access goes up, as does the commission to the middle-man. This does not help the democratic process.¶ Indeed, public opinion can be manufactured.Email campaigns can substitute technology and organization for people.Instead of grass roots one can create what has been described as "Astroturf",. i.e. manufactured expression of public opinion.¶ Ironically, the most effective means of communication (outside of a bank check) becomes the lowest in tech: the handwritten letter (Blau, 1988)¶ If, in the words of a famous cartoon, on the Internet nobody knows that you are a dog, then everyone is likely to be treated as one.¶ •The Internet facilitates the International Manipulation of Domestic Politics.¶ Cross-border interference in national politics becomes easier with the Internet.Why negotiate with the US ambassador if one can target a key Congressional chairman by an e-mail campaign,chat group interventions, and misinformation, and intraceable donations.People have started to worry about computer attacks by terrorists.They should worry more about state-sponsored interferences into other countries' electronic politics.¶ Indeed, it is increasingly difficult to conduct national politics and policies in a globalized world, where distance and borders are less important than in the past, even if one does not share the hyperbole of the "evaporation" of the Nation State (Negroponte 1995).The difficulty of societies to control their own affairs leads, inevitably, to backlash and regulatory intervention.¶ Conclusion:¶ It is easy to romanticize the past of democracy as Athenian debates in front

of an involved citizenry, and to believe that its return by electronic means is neigh. A quick look to in the rear-view mirror, to radio and then TV, is sobering. Here, too, the then new media were heralded as harbingers of a new and improved political dialogue. But the reality of those media has been is one of cacophony, fragmentation, increasing cost, and declining value of "hard" information.¶ The Internet makes it easier to gather and assemble information, to deliberate and to express oneself, and to organize and coordinate action.(Blau, 1998). ¶ It would be simplistic to deny that the Internet can mobilize hard-to-reach groups, and that it has unleashed much energy and creativity. Obviously there will be some shining success stories.¶ But it would be equally naïve to cling to the image of the early Internet - - nonprofit, cooperative, and free - - and ignore that it is becoming a commercial medium, like commercial broadcasting that replaced amateur ham radio. Large segments of society are disenchanted with a political system is that often unresponsive, frequently affected by campaign contributions, and always slow. To remedy such flaws, various solutions have been offered and embraced. To some it is to return to spirituality. For others it is to reduce the role of government and hence the scope of the democratic process. And to others, it is the hope for technical solution like the Internet. Yet, it would only lead to disappointment if the Internet would be sold as the snake oil cure for all kinds of social problems. It simply cannot simply sustain such an expectation. Indeed if anything, the Internet will lead to less stability, more fragmentation, less ability to fashion consensus, more interest group pluralism. High capacity computers connected to high-speed networks are no remedies for flaws in a political system. There is no quick fix. There is no silver bullet. There is no free lunch.

Innovation's tapped out and can't solve existential threats alone

Tainter & Patzek 12 - Joseph A. Tainter, Professor, Department of Environment and Society, Utah State University; and Tadeusz W. Patzek, Professor, Department of Petroleum and Geosystems Engineering, The University of Texas at Austin, Drilling Down: The Gulf Oil Debacle and Our Energy Dilemma, p. 48

We are often assured that innovation in the future will reduce our society's dependence on energy and other resources while providing a lifestyle such as we now enjoy. We discuss this point further in Chaps. 5 and 9. Here we observe that rates of innovation appear to change in a manner similar to the Hubbert cycle of resource production. This finding has important implications for the future productivity and complexity of our society.¶ Energy flows, technology development, population growth, and individual creativity can be combined into an overall "Innovation Index" which is the number of patents granted each year by the U.S. Patent Office per one million inhabitants of the United States of America. This specific patent rate has the units of the number of patents per year per one million people. Figure 3.16 is a decomposition of this patent rate into multiple Hubbert-like cycles between 1790 and 2009.¶ Interestingly, the fundamental Hubbert cycle of the U.S. patent rate peaked in 1914, the year in which World War I broke out. The second major rate peak was in 1971, coinciding with the peak of U.S. oil production. The last and tallest peak of productivity occurred in 2004. Note that without a new cycle of inventions in something, the current cycles will expire by 2050. In other words, the productivity of U.S. innovation will decline dramatically in the next 20–30 years, with some of this decline possibly being forced by a steady decline of support for fundamental research and development. ¶ Energy and Complexity¶ Each new complex addition to the already overwhelmingly complex social and scientific structures in the United States is less and less relevant, while costing additional resources and aggravation. Most of this complexity is apparent to the naked eye: look at the global banking and trading system, the healthcare system, the computer operating systems and

software, military operations, or government structures. The scope of the problem is also obvious in the production pains of Boeing's 787 Dreamliner, and in the drilling of the BP Macondo well.

1NC Economy

Internet not key to economy

Charles **Kenny**, 6/17/**2013**. senior fellow at the Center for Global Development. "Think the Internet Leads to Growth? Think Again," Bloomberg Business Week, http://www.businessweek.com/articles/2013-06-17/think-the-internet-leads-to-growth-think-again.

Remember the year 2000 in the months after the Y2K bug had been crushed, when all appeared smooth sailing in the global economy? When the miracle of finding information online was so novel that The Onion ran an article, "Area Man Consults Internet Whenever Possible?" It was a time of confident predictions of an ongoing economic and political renaissance powered by information technology. Jack Welch—then the lauded chief executive officer of General Electric (GE)—had suggested the Internet was "the single most important event in the U.S. economy since the Industrial Revolution." The Group of Eight highly industrialized nations—at that point still relevant—met in Okinawa in 2000 and declared, "IT is fast becoming a vital engine of growth for the world economy. … Enormous opportunities are there to be seized by us all." In a 2000 report, then-President Bill Clinton's Council of Economic Advisers suggested (PDF), "Many economists now posit that we are entering a new, digital economy that could inaugurate an unprecedented period of sustainable, rapid growth."¶ It hasn't quite worked out that way. Indeed, if the last 10 years have demonstrated anything, it's that for all the impact of a technology like the Internet, thinking that any new innovation will set us on a course of high growth is almost certainly wrong.¶ That's in part because many of the studies purporting to show a relationship between the Internet and economic growth relied on shoddy data and dubious assumptions. In 1999 the Federal Reserve Bank of Cleveland released a study that concluded (PDF), "… the fraction of a country's population that has access to the Internet is, at least, correlated with factors that help to explain average growth performance." It did so by demonstrating a positive relationship between the number of Internet users in a country in 1999 with gross domestic product growth from 1974 to 1992. Usually we expect the thing being caused (growth in the 1980s) to happen after the things causing it (1999 Internet users).¶ In defense of the Fed, researchers at the World Bank recently tried to repeat the same trick. They estimated that a 10 percent increase in broadband penetration in a country was associated with a 1.4 percentage point increase in growth rate. This was based on growth rates and broadband penetration from 1980 to 2006. Given that most deployment of broadband occurred well after the turn of the millennium, the only plausible interpretation of the results is that countries that grew faster from 1980 to 2006 could afford more rapid rollouts of broadband. Yet the study is widely cited by broadband boosters. Many are in denial about the failure of the IT revolution to spark considerable growth.¶ Innovation in information technology has hardly dried up since 2000. YouTube(GOOG) was founded in 2005, and Facebook (FB) is only a year older. Customer-relations manager Salesforce.com (CRM), the first cloud-based solution for business, only just predates the turn of the millennium. And there are now 130 million smartphones in the U.S., each with about the same computing power as a 2005 vintage desktop. Meanwhile, according to the U.S. Department of Commerce (PDF), retail e-commerce as a percentage of total retail sales has continued to climb—e-commerce sales were more than 6 percent of the total by the fourth quarter of 2012, up from less than 2 percent in 2003.¶ Yet despite continuing IT innovation, we've seen few signs that predictions of "an unprecedented period of sustainable, rapid growth" are coming true. U.S. GDP expansion in the 1990s was a little faster than the 1980s—it climbed from an annual average of 3 percent to 3.2 percent. But GDP growth collapsed to 1.7 percent from 2000 to 2009. Northwestern University economist Robert Gordon notes that U.S. labor productivity growth spiked briefly—rising from 1.38 percent from 1972 to 1996 to 2.46 percent from 1996 to 2004—but fell to 1.33 percent from 2004 and 2012.¶ Part of the labor productivity spike around the turn of the century was because of the rapidly increasing

efficiency of IT production (you get a lot more computer for the same cost nowadays). Another part was because of considerable investments in computers and networks across the economy—what economists call "capital deepening." But even during the boom years it was near-impossible to see an economywide impact of IT on "total factor productivity"—or the amount of output we were getting for a given input of capital and labor combined.¶ Within the U.S., investment in the uses of the Internet for business applications had an impact on wage and employment growth in only 6 percent of counties—those that already had high incomes, large populations, high skills, and concentrated IT use before 1995, according to a recent analysis (PDF) by Chris Forman and colleagues in the American Economic Review. Investments in computers and software did yield a return for most companies—but the return wasn't anything special.¶ So what happened to the promised Internet miracle? While the technology has had a dramatic impact on our lives, it hasn't had a huge impact on traditional economic measures. Perhaps that shouldn't come as a surprise.¶ To understand why, think about television in the 1970s. Broadcast to the home for free, and all we had to pay for was the set and the electricity to run it. Despite that small expenditure, we spent hours a day watching TV. Fast-forward four decades: 209 million Americans spent an average 29 hours online in January, according toNielsen; 145 million U.S. Facebook visitors spent an average six hours in January on that site alone. And each month, YouTube users spend 6 billion hours watching videos—or 684,000 times as long as it took to paint the Sistine Chapel. They pay for the PC and Internet connection, but per hour, surfing the Web is a cheap form of entertainment.¶ And all that time online has knock-on effects. Andirana Bellou at the University of Montreal suggests that broadband adoption has led to increasing marriage rates among 21- to 30-year-olds as they meet online in chatrooms and dating sites, but has "significantly reduced the time young people spend on socializing and physically communicating." This may be why the link between Internet usage and measures of contentment are pretty weak. According to the World Database of Happiness, answers to a poll that asked if you were not happy (a score of 1), somewhat happy (2), or very happy (3) averaged 2.28 in the U.S. in 1990. That fell to 2.11 in 2010. Studies of Internet use tend to suggest that people who spend more time online are less happy (PDF) than the rest of us—although it may be that less happy people are surfing more rather than surfing being the cause of their misery. Regardless, the Internet has been behind a massive shift in our use of time during the past two decades, and not necessarily one that has generated a huge amount of positive feelings.¶ Of course, we also use the Internet to sell stuff on e-Bay and look for jobs. While Betsy Stevenson has suggested (PDF) in a National Bureau of Economic Research paper that the widespread use of the Internet in job searches may be one factor behind employed people switching jobs more often, she concludes there's little evidence that the Web helps the unemployed find jobs faster.¶ Perhaps one reason we haven't seen a huge impact on productivity because of access to the Internet is because, once we find a job, we spend quite a lot of time surfing the Web at the office. (Some of that time is used to look for a different job, apparently.) Ninety percent of workers with a PC also say they surf recreational sites at work. Almost the same number say they send personal e-mails, and more than half report they cybershop. The reality may be worse: Tracking software suggests that 70 percent of employees visit retail sites, and more than one-third check out X-rated sites. Perhaps we're using the Internet to do more in less time at work. Yet we're using the extra hours to check out pictures of Kate Upton or cats playing the piano rather than producing more widgets for the boss.

No impact to the economy

Jervis '11 (Robert Jervis 11, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December 2011, "Force in Our Times," Survival, Vol. 25, No. 4, p. 403-425

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine

democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that **even if** the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict **leaders and mass opinion would come to believe that their countries could prosper by impoverishing or** even **attacking others**. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without **anyone** suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, **it will not make war thinkable**.

Tech's not sufficient to make global industrial civilization environmentally sustainable

Dr. Samuel **Alexander 14**, lecturer with the Office for Environmental Programs, University of Melbourne, and research fellow, Melbourne Sustainable Society Institute; and Jonathan Rutherford, Professor of Cultural Studies at the University of Middlesex, 2014, "The Deep Green Alternative: Debating Strategies of Transition," Simplicity Institute, http://simplicityinstitute.org/wp-content/uploads/2011/04/The-Deep-Green-Alternative.pdf

Evidence continues to mount that industrial civilisation, driven by a destructive and insatiable growth imperative, is chronically unsustainable, as well as being grossly unjust. The global economy is in ecological overshoot, currently consuming resources and emitting waste at rates the planet cannot possibly sustain (Global Footprint Network 2013). Peak oil is but the most prominent example of a more general situation of looming resource scarcity (Klare, 2012), with high oil prices having a debilitating effect on the oil-dependent economies which are seemingly dependent on cheap oil to maintain historic rates of growth (Heinberg, 2011). At the same time, great multitudes around the globe live lives of material destitution, representing a vast, marginalised segment of humanity that justifiably seeks to expand its economic capacities in some form (World Bank, 2008). Biodiversity continues to be devastated by deforestation and other forms of habitat destruction (United Nations, 2010), while the global development agenda seems to be aiming to provide an expanding global population with the high-impact material affluence enjoyed by the richest parts of the world (Hamilton, 2003). This is despite evidence crying out that the universalisation of affluence is environmentally unsupportable (Smith and Positano, 2010; Turner, 2012) and not even a reliable path to happiness (Lane, 2001; Alexander, 2012a). Most worrying of all, perhaps, is the increasingly robust body of climate science indicating the magnitude of the global predicament (IPCC, 2013). According to the Climate Tracker Initiative (2013: 4), the world could exceed its 'carbon budget' in around 18 years, essentially locking us into a future that is at least 2 degrees warmer, and threatening us with 4 degrees or more. It is unclear to what extent civilisation as we know it is compatible with runaway climate change. And still, almost without exception, all nations on the planet - including or especially the richest ones - continue to seek GDP growth without limit, as if the cause of these problems could somehow provide the solution. If once it was hoped that technology and science

were going to be able decouple economic activity from ecological impact, such a position is no longer credible (Huesemann and Huesemann, 2011). Technology simply cannot provide any escape from the fact that there are biophysical limits to growth. Despite decades of extraordinary technological advance, which it is was promised would lighten the ecological burden of our economies, global energy and resource consumption continues to grow, exacerbated by a growing population, but which is primarily a function of the growth-orientated values that lie at the heart of global capitalism (Turner, 2012).¶ Against this admittedly gloomy backdrop lies a heterogeneous tradition of critical theorists and activists promoting what could be called a 'deep green' alternative to the growth-orientated, industrial economy. Ranging from the radical simplicity of Henry Thoreau (1983), to the post-growth economics of the Club of Rome (Meadows et al, 1972; 2004), and developing into contemporary expressions of radical reformism (Latouche, 2009; Heinberg, 2011; Jackson, 2009), eco-socialism (Sarkar, 1999; Smith, 2010), and eco-anarchism (Bookchin, 1989; Holmgren, 2002; Trainer; 2010a), this extremely diverse tradition nevertheless agrees that the nature of the existing system is inherently unsustainable. Tinkering with or softening its margins - that is, any attempt to give capitalism a 'human face' - is not going to come close to addressing the problems we, the human species, are confronted with. What is needed, this tradition variously maintains, is a radically alternative way of living on the Earth - something 'wholly other' to the ways of industrialisation, consumerism, and limitless growth. However idealistic or Utopian their arguments might seem, the basic reasoning is that the nature of any solutions to current problems must honestly confront the magnitude of the overlapping crises, for else one risks serving the destructive forces one ostensibly opposes.

Economic decline doesn't cause war

Tir 10 [Jaroslav Tir - Ph.D. in Political Science, University of Illinois at Urbana-Champaign and is an Associate Professor in the Department of International Affairs at the University of Georgia, "Territorial Diversion: Diversionary Theory of War and Territorial Conflict", The Journal of Politics, 2010, Volume 72: 413-425), Ofir]

Empirical support for the economic growth rate is much weaker. The finding that poor economic performance is associated with a higher likelihood of territorial conflict initiation is significant only in Models 3–4.14 The weak results are not altogether surprising given the findings from prior literature. In accordance with the insignificant relationships of Models 1–2 and 5–6, Ostrom and Job (1986), for example, note that the likelihood that a U.S. President will use force is uncertain, as the bad economy might create incentives both to divert the public's attention with a foreign adventure and to focus on solving the economic problem, thus reducing the inclination to act abroad. Similarly, Fordham (1998a, 1998b), DeRouen (1995), and Gowa (1998) find no relation between a poor economy and U.S. use of force. Furthermore, Leeds and Davis (1997) conclude that the conflict-initiating behavior of 18 industrialized democracies is unrelated to economic conditions as do Pickering and Kisangani (2005) and Russett and Oneal (2001) in global studies. In contrast and more in line with my findings of a significant relationship (in Models 3–4), Hess and Orphanides (1995), for example, argue that economic recessions are linked with forceful action by an incumbent U.S. president. Furthermore, Fordham's (2002) revision of Gowa's (1998) analysis shows some effect of a bad economy and DeRouen and Peake (2002) report that U.S. use of force diverts the public's attention from a poor economy. Among cross-national studies, Oneal and Russett (1997) report that slow growth increases the incidence of militarized disputes, as does Russett (1990)—but only for the United States; slow growth does not affect the behavior of other countries. Kisangani and Pickering (2007) report some significant associations, but they are sensitive to model specification, while Tir and Jasinski (2008) find a clearer link between economic underperformance and increased attacks on domestic ethnic minorities. While none of these works has focused on territorial diversions, my own inconsistent findings for economic growth fit well with the mixed results reported in the literature.15 Hypothesis 1 thus receives strong support via the unpopularity variable but only weak support via the economic growth variable. These results suggest that embattled leaders are much more likely to respond with territorial diversions to direct signs of their unpopularity

(e.g., strikes, protests, riots) than to general background conditions such as economic malaise.
Presumably, protesters can be distracted via territorial diversions while fixing the economy would take a more concerted and prolonged policy effort. Bad economic conditions seem to motivate only the most serious, fatal territorial confrontations. This implies that leaders may be reserving the most high-profile and risky diversions for the times when they are the most desperate, that is when their power is threatened both by signs of discontent with their rule and by more systemic problems plaguing the country (i.e., an underperforming economy).

Decoupling means US isn't key to the global economy

Bloomberg 10 ["Wall Street Sees World Economy Decoupling From U.S.", October 4th, 2010, http://www.bloomberg.com/news/2010-10-03/world-economy-decoupling-from-u-s-in-slowdown-returns-as-wall-street-view.html, Chetan]

The main reason for the divergence: "Direct transmission from **a U.S. slowdown** to other economies through exports **is** just **not large enough to spread** a U.S. demand problem **globally**," Goldman Sachs economists Dominic Wilson and Stacy Carlson wrote in a Sept. 22 report entitled "If the U.S. sneezes..." Limited Exposure **Take** the so-called BRIC countries of **Brazil, Russia, India and China**. While **exports account for** almost **20 percent of their g**ross **d**omestic **p**roduct, **sales to the U.S. compose less than 5 percent** of GDP, according to their estimates. That means **even if U.S. growth slowed** 2 percent, **the drag on these** four **countries would be about 0.1** percentage point, the economists reckon. Developed economies including the **U.K., Germany and Japan also have limited exposure**, they said. **Economies outside the U.S. have room to grow that the U.S. doesn't**, partly because of its outsized slump in house prices, Wilson and Carlson said. The drop of almost 35 percent is more than twice as large as the worst declines in the rest of the Group of 10 industrial nations, they found. The risk to the decoupling wager is a repeat of 2008, when the U.S. property bubble burst and then morphed into a global credit and banking shock that ricocheted around the world. For now, Goldman Sachs's index of U.S. financial conditions signals that bond and stock markets aren't stressed by the U.S. outlook. Weaker Dollar The break with the U.S. will be reflected in a weaker dollar, with the Chinese yuan appreciating to 6.49 per dollar in a year from 6.685 on Oct. 1, according to Goldman Sachs forecasts. The bank is also betting that yields on U.S. 10-year debt will be lower by June than equivalent yields for Germany, the U.K., Canada, Australia and Norway. U.S. notes will rise to 2.8 percent from 2.52 percent, Germany's will increase to 3 percent from 2.3 percent and Canada's will grow to 3.8 percent from 2.76 percent on Oct. 1, Goldman Sachs projects. Goldman Sachs isn't alone in making the case for decoupling. Harris at BofA Merrill Lynch said he didn't buy the argument prior to the financial crisis. Now he believes global growth is strong enough to offer a "handkerchief" to the U.S. as it suffers a "growth recession" of weak expansion and rising unemployment, he said. Giving him confidence is his calculation that the **U.S. share of global GDP has shrunk** to about 24 percent from 31 percent in 2000. He also notes that, unlike the U.S., many countries avoided asset bubbles, kept their banking systems sound and improved their trade and budget positions. Economic Locomotives A book published last week by the World Bank backs him up. "The Day After Tomorrow" concludes that **developing nations aren't only decoupling, they** also **are** undergoing a "switchover" that will make them such **locomotives for the world economy**, they can help rescue advanced nations. Among the reasons for the revolution are greater trade between emerging markets, the rise of the middle class and higher commodity prices, the book said. Investors are signaling they agree. **The U.S. has fallen behind Brazil, China and India** as the preferred place to invest, according to a quarterly survey conducted last month of 1,408 investors, analysts and traders who subscribe to Bloomberg. Emerging markets also attracted more money from share offerings than industrialized nations last quarter for the first time in at least a decade, Bloomberg data show. Room to Ease Indonesia, India, China and Poland are the developing economies least vulnerable to a U.S. slowdown, according to a Sept. 14 study based on trade ties by HSBC Holdings Plc economists. **China, Russia and Brazil** also **are among nations with more room** than industrial countries **to ease policies if a U.S. slowdown does weigh on their growth**, according to a policy- flexibility index designed by the economists, who include New York-based Pablo Goldberg. "Emerging economies kept their powder relatively dry, and are, for the most part, in a position where they could act countercyclically if needed," the HSBC group said. Links to developing countries are helping insulate some companies against U.S. weakness. Swiss watch manufacturer Swatch Group AG and tire maker Nokian Renkaat of Finland are among the European businesses that should benefit from trade with nations such as Russia and China where consumer demand is growing, according to BlackRock Inc. portfolio manager Alister Hibbert. "There's a lot of life in the global economy," Hibbert, said at a Sept. 8 presentation to reporters in London.

Economy is resilient -- laundry list

Chandra 13 (Shobhana, Bloomberg reporter and tenured firebrand, "America Resilient Five Years After Great Recession", http://www.bloomberg.com/news/2013-08-27/america-resilient-five-years-after-great-recession.html, hhs-ab)

While Harris's premonition proved true -- Lehman's bankruptcy filing on Sept. 15, 2008, exacerbated the worst financial crisis since the Great Depression -- the economy, with help from the Federal Reserve, has emerged from the ruins "in much better health," he said. **The U.S. is weathering federal budget cuts** and **higher payroll taxes**, **growth is picking up** and some economists predict **the expansion**, now in its fifth year, **may last longer than most**. The ***signs of resilience*** are everywhere: **Households continue to spend**. **Businesses are investing** and hiring. Home **sales are rebounding**, and the **automobile industry is surging**. Banks have healthier balance sheets, and credit is easing. All this coincides

with the economy **shedding the excesses of the past**, such as unmanageable levels of consumer and corporate debt. 'Better Place' "We are in a much better place than we were five years ago," said Mark Zandi, chief economist at Moody's Analytics Inc. in West Chester, Pennsylvania. "Consumers are feeling much, much better; certainly investors are." Confidence is hovering around a **five-year high**, and the Standard & Poor's 500 Index has climbed 80 percent since the 18-month recession ended in June 2009. This month, the share of Americans who say jobs are currently hard to get decreased to 33 percent, the lowest since September 2008, the month of Lehman's collapse, according to a report today from the Conference Board. "Considering the trauma we went through and the panic in the markets, the economy has really done pretty well," and is "strong enough to support higher equity prices," said John Carey, a portfolio manager at Pioneer Investment Management Inc. in Boston, which manages about $200 billion. "Stocks look attractive relative to bonds," and shares of consumer-related and regional banks will benefit the most from growth in spending and demand for credit.

Congress extends bulk data collection despite its effects

Charlie **Savage 15**, Washington correspondent for The New York Times, degree in English and American Literature and Language from Harvard College, master's degree from Yale Law School, 6/30/15, "Surveillance Court Rules That N.S.A. Can Resume Bulk Data Collection," *The New York Times*, http://www.nytimes.com/2015/07/01/us/politics/fisa-surveillance-court-rules-nsa-can-resume-bulk-data-collection.html

The Foreign Intelligence Surveillance Court ruled late Monday that the National Security Agency may temporarily resume its once-secret program that systematically collects records of Americans' domestic phone calls in bulk. But the American Civil Liberties Union said Tuesday that it would ask the United States Court of Appeals for the Second Circuit, which had ruled that the surveillance program was illegal, to issue an injunction to halt the program, setting up a potential conflict between the two courts. The program lapsed on June 1, when a law on which it was based, Section 215 of the USA Patriot Act, expired. Congress revived that provision on June 2 with a bill called the USA Freedom Act, which said the provision could not be used for bulk collection after six months. The six-month period was intended to give intelligence agencies time to move to a new system in which the phone records — which include information like phone numbers and the duration of calls but not the contents of conversations — would stay in the hands of phone companies. Under those rules, the agency would still be able to gain access to the records to analyze links between callers and suspected terrorists. But, complicating matters, in May the Court of Appeals for the Second Circuit, in New York, ruled in a lawsuit brought by the A.C.L.U. that Section 215 of the Patriot Act could not legitimately be interpreted as permitting bulk collection at all. Congress did not include language in the Freedom Act contradicting the Second Circuit ruling or authorizing bulk collection even for the six-month transition. As a result, it was unclear whether the program had a lawful basis to resume in the interim. After President Obama signed the Freedom Act on June 2, his administration applied to restart the program for six months. But a conservative and libertarian advocacy group, FreedomWorks, filed a motion in the surveillance court saying it had no legal authority to permit the program to resume, even for the interim period. In a 26-page opinion made public on Tuesday, Judge Michael W. Mosman of the surveillance court rejected the challenge by FreedomWorks, which was represented by a former Virginia attorney general, Ken Cuccinelli, a Republican. And Judge Mosman said the Second Circuit was wrong, too. "Second Circuit rulings are not binding" on the surveillance court, he wrote, "and this court respectfully disagrees with that court's analysis, especially in view of the intervening enactment of the USA Freedom Act." When the Second Circuit issued its ruling that the program was illegal, it did not issue any injunction ordering the program halted, saying it would be prudent to see what Congress did as Section 215 neared its June 1 expiration. Jameel Jaffer, an A.C.L.U. lawyer, said on Tuesday that the group would now ask for one. "Neither the statute nor the Constitution permits the government to subject millions of innocent people to this kind of intrusive surveillance," Mr. Jaffer said. "We intend to ask the court to prohibit the surveillance and to order the N.S.A. to purge the records it's already collected." The bulk phone records program traces back to October 2001, when the Bush administration secretly authorized the N.S.A. to collect records of Americans' domestic phone calls in bulk as part of a broader set of post-Sept. 11 counterterrorism efforts. The program began on the basis of presidential power alone. In 2006, the Bush administration persuaded the surveillance court to begin blessing it under of Section 215 of the Patriot Act, which says the government may collect records that are "relevant" to a national security investigation. The program was declassified in June 2013 after its existence was disclosed by the former intelligence contractor Edward J. Snowden. It remains unclear whether the Second Circuit still considers the surveillance program to be illegal during this six-month transition period. The basis for its ruling in May was that Congress had never intended for Section 215 to authorize bulk collection. In his ruling, Judge Mosman said that because Congress knew how the surveillance court was interpreting Section 215 when it passed the Freedom Act, lawmakers implicitly authorized bulk collection to resume for the transition period. "Congress could have prohibited bulk data collection" effective immediately, he wrote. "Instead, after lengthy public debate, and with crystal-clear knowledge of the fact of ongoing bulk collection of call detail records," it chose to allow a 180-day transitional period during which such collection could continue, he wrote. The surveillance court is subject to review by its own appeals panel, the Foreign Intelligence Surveillance Court of Review. Both the Second Circuit and the surveillance review court are in turn subject to the Supreme Court, which resolves conflicts between appeals courts. Wyn Hornbuckle, a Justice Department spokesman, said in a written statement that the Obama administration agreed with Judge Mosman. Since the program was made public, plaintiffs have filed several lawsuits before regular courts, which hear arguments from each side before issuing rulings, unlike the surveillance court's usual practice, which is to hear only from the government. Judge Mosman's disagreement with the Second Circuit is the second time that the surveillance court has rejected a contrary ruling about the program by a judge in the regular court system. In a lawsuit challenging the program that was brought by the conservative legal advocate Larry Klayman, Judge Richard J. Leon of Federal District Court in the District of Columbia ruled in December 2013 that the program most likely violated the Fourth Amendment, which prohibits unreasonable searches and seizures. But in March 2014, Judge Rosemary M. Collyer, a Federal District Court judge who also

sits on the secret surveillance court, rejected Judge Leon's reasoning and permitted the program to keep going. The Obama administration has appealed Judge Leon's decision to the Court of Appeals for the District of Columbia. The Freedom Act also contains a provision saying that whenever the surveillance court addresses a novel and significant legal issue, it must either appoint an outside "friend of the court" who can offer arguments contrary to what the government is saying, or explain why appointing one is not appropriate. The first test of that reform came last month when another judge on the court, F. Dennis Saylor IV, addressed a separate issue raised by the passage of the Freedom Act. Judge Saylor acknowledged that it was novel and significant, but declined to appoint an outside advocate, saying the answer to the legal question was "sufficiently clear" to him without hearing from one.

NSA backdoors

Backdoors destroy cybersecurity and have cost the US billions of dollars due to mistrust of USFG

Trevor **Timm 15**, co-founder and the executive director of the Freedom of the Press Foundation, lawyer who writes a column for The Guardian on privacy, free speech, and national security, "Building backdoors into encryption isn't only bad for China, Mr. President," 3/4/15, http://www.theguardian.com/commentisfree/2015/mar/04/backdoors-encryption-china-apple-google-nsa

Want to know why forcing tech companies to build backdoors into encryption is a terrible idea? Look no further than President Obama's stark criticism of China's plan to do exactly that on Tuesday. If only he would tell the FBI and NSA the same thing.¶ In a stunningly short-sighted move, the FBI - and more recently the NSA - have been pushing for a new US law that would force tech companies like Apple and Google to hand over the encryption keys or build backdoors into their products and tools so the government would always have access to our communications. It was only a matter of time before other governments jumped on the bandwagon, and China wasted no time in demanding the same from tech companies a few weeks ago.¶ As President Obama himself described to Reuters, China has proposed an expansive new "anti-terrorism" bill that "would essentially force all foreign companies, including US companies, to turn over to the Chinese government mechanisms where they can snoop and keep track of all the users of those services."¶ Obama continued: "Those kinds of restrictive practices I think would ironically hurt the Chinese economy over the long term because I don't think there is any US or European firm, any international firm, that could credibly get away with that wholesale turning over of data, personal data, over to a government."¶ Bravo! Of course these are the exact arguments for why it would be a disaster for US government to force tech companies to do the same. (Somehow Obama left that part out.)¶ As Yahoo's top security executive Alex Stamos told NSA director Mike Rogers in a public confrontation last week, building backdoors into encryption is like "drilling a hole into a windshield." Even if it's technically possible to produce the flaw - and we, for some reason, trust the US government never to abuse it - other countries will inevitably demand access for themselves. Companies will no longer be in a position to say no, and even if they did, intelligence services would find the backdoor unilaterally - or just steal the keys outright.¶ Advertisement¶ For an example on how this works, look no further than last week's Snowden revelation that the UK's intelligence service and the NSA stole the encryption keys for millions of Sim cards used by many of the world's most popular cell phone providers. It's happened many times before too. Security expert Bruce Schneier has documented with numerous examples, "**Back-door access built for the good guys is routinely used by the bad guys.**"¶ Stamos repeatedly (and commendably) pushed the NSA director for an answer on what happens when China or Russia also demand backdoors from tech companies, but Rogers didn't have an answer prepared at all. He just kept repeating "I think we can work through this". As Stamos insinuated, maybe Rogers should ask his own staff why we actually can't work through

this, because virtually every technologist agrees **backdoors just cannot be secure in practice**.¶ (If you want to further understand the details behind the encryption vs. backdoor debate and how what the NSA director is asking for is quite literally impossible, read this excellent piece by surveillance expert Julian Sanchez.)¶ It's downright bizarre that the US government has been warning of the grave cybersecurity risks the country faces while, at the very same time, arguing that we should pass a law that would **weaken cybersecurity** and put every single citizen at more risk of having their private information stolen by criminals, foreign governments, and our own.¶ Forcing backdoors will also be disastrous for the US economy as it would be for China's. US tech companies - which already have suffered billions of dollars of losses overseas because of consumer distrust over their relationships with the NSA - would lose all credibility with users around the world if the FBI and NSA succeed with their plan.¶

Enraged over Snowden revelations, hackers are gaining access to servers through backdoors – cyber-terrorists have the skills and the political motivation

Dimitri **Tokmetzi 4/17**, data-journalist for The Correspondent, expert in investigative journalism in the relationship between power and data and tech, "How to protect privacy and security in the Crypto Wars," 4/17/15, https://www.gccs2015.com/sites/default/files/documents/How%20to%20protect%20privacy%20and%20security%20in%20the%20crypto%20wars.pdf

We thought that the Crypto Wars of the nineties were over, but renewed fighting has erupted since the Snowden revelations. On one side, law enforcement and intelligence agencies are¶ afraid that broader use of encryption on the Internet will make their work harder or even¶ impossible. On the other, security experts and activists argue that **installing backdoors will make everyone unsafe**. Is it possible to find some middle ground between these two¶ positions?¶ 'This is the story of how a handful of cryptographers **"hacked" the NSA**. It's also a story of encryption backdoors, and why they never quite work out the way you want them to.' So¶ began the blog post on the FREAK attack, one of the most ironic hacks of recent years.¶ Matthew Green, assistant professor at John Hopkins university, and a couple of international colleagues exploited a nasty bug on the servers that host the NSA website. By forcing the servers to use an old, almost forgotten and weak type of encryption which they were able to crack within a few hours, they managed to gain access to the backend of the NSA website, making it possible for them to alter its content.¶ Worse still, the cryptographers found that the same weak encryption was used on a third of the 14 million other websites they scanned. For instance, if they had wanted to, they could have gained access to whitehouse.gov or tips.fbi.gov. Many smartphone apps turned out to¶ be vulnerable as well.¶ The irony is this: this weak encryption was deliberately designed for software products exported from the US in the nineties. The NSA wanted to snoop on foreign governments and¶ companies if necessary and pushed for a weakening of encryption. This weakened¶ encryption somehow found its way back onto the servers of US companies and government¶ agencies. 'Since the NSA was the organization that demanded export-grade crypto, it's only fitting that they should be the first site affected by this vulnerability', Green gleefully wrote.¶ The FREAK attack wasn't only a show of technological prowess, but also **a political statement. Ever since Edward Snowden** released the NSA files in June 2013, a new battle has been raging between computer security experts and civil liberties activists on one side¶ and law enforcement and intelligence agencies on the other.¶ 2¶ There was one set of revelations that particularly enraged the security

community. In¶ September 2013 the New York Times, ProPublica and the Guardian published a story on the¶ thorough and persistent efforts of the NSA and its British counterpart GCHQ to decrypt¶ Internet traffic and databases. In a prolonged, multi-billion operation dubbed 'BULLRUN', the intelligence agencies used supercomputers to crack encryption, asked, persuaded or cajoled¶ telecom and web companies to build backdoors into their equipment and software, used their influence to plant weaknesses in cryptographic standards and simply stole encryption keys from individuals and companies.

NSA backdoors destroy US cybersecurity by stockpiling zero-day vulnerabilities and revelations have made the US lose all credibility on internet governance and norms

Kim **Zetter 14**, an award-winning, senior staff reporter at Wired covering cybercrime, privacy, and security, "Personal Privacy Is Only One of the Costs of NSA Surveillance," 7/29/14, http://www.wired.com/2014/07/the-big-costs-of-nsa-surveillance-that-no-ones-talking-about/

*possible other tag: NSA leaks and backdoors destroy US cybersecurity and consumer trust – the US has lost all credibility on internet governance and norms

THERE IS NO doubt the integrity of our communications and the privacy of our online activities have been the biggest casualty of the NSA's unfettered surveillance of our digital lives. But the ongoing revelations of government eavesdropping have had a profound impact on the economy, the security of the internet and the credibility of the U.S. government's leadership when it comes to online governance.¶ These are among the many serious costs and consequences the NSA and those who sanctioned its activities—including the White House, the Justice Department and lawmakers like Sen. Dianne Feinstein—apparently have not considered, or acknowledged, according to a report by the New America Foundation's Open Technology Institute.¶ "Too often, we have discussed the National Security Agency's surveillance programs through the distorting lens of a simplistic 'security versus privacy' narrative," said Danielle Kehl, policy analyst at the Open Technology Institute and primary author of the report. "But if you look closer, the more accurate story is that in the name of security, we're trading away not only privacy, but also the U.S. tech economy, internet openness, America's foreign policy interests and cybersecurity."¶ Over the last year, documents leaked by NSA whistleblower Edward Snowden, have disclosed numerous NSA spy operations that have gone beyond what many considered acceptable surveillance activity. These included infecting the computers of network administrators working for a Belgian telecom in order to undermine the company's routers and siphon mobile traffic; working with companies to install backdoors in their products or network infrastructure or to devise ways to undermine encryption; intercepting products that U.S. companies send to customers overseas to install spy equipment in them before they reach customers.¶ The Foundation's report, released today, outlines some of the collateral damage of NSA surveillance in several areas, including:¶ Economic losses to US businesses due to lost sales and declining customer trust. The deterioration of internet security as a result of the NSA stockpiling zero-day vulnerabilities, undermining encryption and installing backdoors in software and hardware products. Undermining the government's credibility and leadership on "internet freedom" and governance issues such as censorship.

Backdoors undermine security and allow hackers access – Greece proves

David **Perera 13**, executive editor of the FierceMarkets Government Group, expert on the Federal IT market and cybersecurity since 2004, "NSA backdoor encryption access re-ignites debate over government role in encryption," 10/9/13, http://www.fiercegovernmentit.com/story/nsa-backdoor-encryption-access-re-ignites-debate-over-government-role-encry/2013-09-09

All three new organizations said they were asked by intelligence officials not to publish the new revelations from Snowden documents, but did so "because of the value of a public debate about government actions that weaken the most powerful privacy tools."¶ It's a debate that many thought predicated at least on a understanding that the NSA would not force the private- or public- sectors into undermining the integrity of cryptology techniques in order for the intelligence community to have a guaranteed access to encrypted messages.¶ Security researchers almost uniformly agree that backdoors undermine the efficacy of encryption since they create the possibility that unknown parties might find and utilize them, as well. Famously, hackers used a backdoor mid-last decade in the Vodafone Greece mobile phone network to wiretap the cell phones of top Greek governmental officials, including the prime minister.¶ The administration of President Bill Clinton attempted to have the private IT sector adopt encryption hardware known as the Clipper Chip that would have carried keys the NSA would have had access to through a key escrow. The attempt was a reaction to the rise of Pretty Good Privacy, an encryption program that eluded government cracking. By the mid 1990s, after researchers found vulnerabilities in the NSA algorithm and in response to widespread condemnation, the Clinton administration let the proposal whither.¶ "The NSA's techno-dodges give civil libertarians a choice of two large pitches on which to throw their fits. Should they be more angry about the national security bureaucracy first seeking the public's consent to drink from the national information stream and then, when told 'no,' ignoring the thumb down? Or is the greater outrage the fact that the vast and secret surveillance program was established at all, and not how it was established?" wrote Reuters columnist Jack Shafer shortly after the news articles came out.

Backdoors give path to hackers – cyber-attacks bound to happen

Joe **Stanganelli 13**, US Census Bureau, Nevada Attorney General, Becker & Poliakoff, P.A., teaches seminars on data privacy and cybersecurity, "Data Breaches and NSA Backdoors: A Legal Primer," 12/18/13, http://www.enterprisenetworkingplanet.com/netsecur/data-breaches-and-nsa-backdoors-a-legal-primer.html

Thanks to Edward Snowden, it is now common knowledge that the NSA and the UK's GCHQ managed to get their own backdoors and other workarounds into various systems internationally, from US tech goliaths like Google and Yahoo to overseas telecoms like Belgacom. Consequently, concern rages worldwide over data center and cloud security. It seems that companies' data have been compromised even without being specifically targeted, given reports that the NSA inserted a backdoor in a NIST-endorsed encryption method, Dual_EC_DRBG, an encryption method that has been used by cybersecurity firm RSA Security and others and is included in the libraries of networking vendors like Cisco, Juniper, Riverbed, and Lancope, among many others.¶ And it isn't

just the government that enterprises must worry about. Government-implanted vulnerabilities can **open the door for hackers**, too. (This has happened before, with **serious consequences**.) With an estimated 20 percent of routers having some kind of backdoor, Internet of Things security seriously lagging, and other weaknesses frequently cropping up in other networking equipment and hardware, a data compromise may be just waiting to happen at your organization.¶ There are, of course, technological security steps companies can take to try to stay ahead of hackers and government surveillance. Still, as Murphy's Law says, if **something can go wrong, it will**. Thus, enterprises must consider how to reduce and mitigate legal liability in the event of data compromises.

Solvency - Norms

Effective cybersecurity norms require curtailing surveillance and removal of backdoors and ensuring company trust – that's key to preventing cyber-conflict

Paul **Nicholas 15**, leads Microsoft's Global Security Strategy and Diplomacy Team, expert in advancing infrastructure security and resiliency, spent over eight years in the U.S. Government, focusing on emerging threats to economic and national security, served as White House Director of Cybersecurity and Critical Infrastructure Protection, B.A. from Indiana University, an M.A. from Georgetown University, and is a Certified Information Systems Security Professional, "Six Proposed Norms to Reduce Conflict in Cyberspace," 1/20/15, http://blogs.microsoft.com/cybertrust/2015/01/20/six-proposed-norms/

Last month, my team launched a new white paper, "International Cybersecurity Norms, Reducing conflict in an Internet-dependent world" at the EastWest Institute's 2014 Global Cyberspace Cooperation Summit in Berlin. In the paper we explained the unique cyber risks posed by nation states' offensive activities, and how these risks could escalate – perhaps unintentionally – to catastrophic consequence. Our goal was to outline the risks faced by society, and propose six cybersecurity norms that nation states can consider for reducing risk in cyberspace.¶ The framework we propose for developing norms evaluates various actors in cyberspace, the objectives those actors are seeking to advance, the corresponding actions that could be taken, and, finally, the potential impacts that can result. Governments, often among the most advanced actors in cyberspace, can take a multitude of actions in cyberspace, both offensively and defensively, to support acceptable objectives. These actions and their resulting impacts, both intended and unintended, can precisely support defined objectives but can also advance one generally acceptable objective while simultaneously challenging another. In many cases, societal debate is not about objectives, such as degrading or delaying the spread of nuclear weapons or preventing terrorism, but whether the actions that can be taken—and the impact of those actions—are acceptable. With this framework in mind, when developing cybersecurity norms for governments, we can focus on discussing acceptable and unacceptable objectives, which actions may be taken by governments, in pursuit of those objectives, what the possible impacts are, and whether they

are acceptable for a civilized, connected society.¶ Cybersecurity norms should be designed not only to increase the security of cyberspace but also to preserve the utility of a globally connected society. As such, norms should define acceptable and unacceptable state behaviors, with the aim of reducing risks, fostering greater predictability, and limiting the potential for the most problematic impacts, including (and in particular) impacts which could result from government activity below the threshold of war.¶ **Cybersecurity norms that limit potential conflict in cyberspace can bring** predictability, stability, and **security to the international environment**. With a wide acceptance of these norms, governments investing in offensive cyber capabilities would have a responsibility to act and work within the international system to guide their use, and this would ultimately lead to a reduction in the likelihood of conflict. In many cases the norms are either rooted in principles not dissimilar from those governing the Law of Armed Conflict, or derived from international best practices currently employed globally by the Information Communication and Technology sector.¶ The following norms, and the framework, used to build them, enable states to make choices that appropriately balance their roles as users, protectors, and exploiters of cyberspace. 1. **States should not target** ICT **companies to insert vulnerabilities (backdoors**) or take actions that would otherwise **undermine public trust in products and services**.¶ 2. States should have a clear principle-based policy for handling product and service vulnerabilities that reflects a strong mandate to report them to vendors rather than to stockpile, buy, sell, or exploit them.¶ 3. States should exercise restraint in developing cyber weapons and should ensure that any which are developed are limited, precise, and not reusable.¶ 4. States should commit to nonproliferation activities related to cyber weapons.¶ 5. States should limit their engagement in cyber offensives operations to avoid creating a mass event.¶ 6. States should assist private sector efforts to detect, contain, respond to, and recover from events in cyberspace.

Norms motivate states to keep a better check on cyber-crime – key to cybersecurity

Peter W. **Singer and** Allan **Friedman 14,** P. W. Singer is an American political scientist, an international relations scholar and a preeminent specialist on 21st century warfare, currently is a strategist for the New American Foundation, Allan Friedman is the Director of Cybersecurity Initiatives at National Telecommunications and Information Administration in the US Department of Commerce, "Cybersecurity: What Everyone Needs to Know," 1/3/14, pg. 179-180

The cyber parallel today, again, is that all netizens have shared global expectation of freedom of action on the Internet, particularly online trade, just as it ensured on the open ocean. If you knowingly host or abet maritime pirates or privateers, their actions reflect back on you. The same should be true online. Building those norms will motivate both states and companies to keep a better check on individual hackers and criminals (the pirate equivalent). It will also weaken the value of outsourcing bad action to patriotic hackers (the latter-day privateers). In addition to encouraging new accountability, this approach also offers opportunities for what are known as "**confidence-building measures**," where two states that don't get along can find ways to work together and build trust. After the War of 1812, for example, the British Royal Navy and nascent US Navy constantly prepared for hostilities against each other, which made sense since they had just fought two outright was. But as the network of norms began to spread, they also began to cooperate in anti-piracy and anti-slavery campaigns. That cooperation did more than underscore

global norms: it built familiarity and trust between the two forces and helped mitigate the danger of military conflict during several crises. Similarly, today the United States and China are and will certainly continue to bolster their own cyber military capabilities. But like the Royal Navy and new American Navy back in the 1800s, this should not be a barrier to building cooperation. Both countries, for instance, could go after what the Chinese call “double crimes,” those actions in cyberspace that both nations recognize as illegal. The lesson here is that the world is in a better place with commerce and communication made safe and freewheeling pirates and privateers brought under control. Indeed, the period was never all that good even for the pirates. Jean Fleury made away with all that Aztec gold, but he should have quit while he was ahead. Just five years after the ultimate pirate score, he was caught by the Spanish on another raiding expedition and hanged.

Norms begin with countries restraining security

Molly **Walker 14**, Executive Editor of the Government Publishing Group at FierceMarkets, “Cyberspace needs 'peace-time norms' to achieve stability, says State Department cybersecurity expert,” 11/12/14, http://www.fiercegovernmentit.com/story/cyberspace-needs-peace-time-norms-achieve-stability-says-state-department-c/2014-11-12

The State Department is trying to refocus an international conversation about how traditional military concepts and international law apply in cyberspace to "the next level down" as a way to achieve stability, said a cybersecurity official with the department.¶ While it's important to determine how concepts like distinction and proportionality apply in cyberspace, "you seldom get to that very high threshold of armed conflict," said Christopher Painter, who is coordinator for cyber issues at the State Department. Rather, this **conversation should be held in the context of** "peace-time **norms**."¶ Painter was one of the speakers at a Nov. 5 discussion about NATO's cyber defense mission and capabilities, which was held by the Atlantic Council, a Washington, D.C.-based think tank.¶ He said rallying support for peace-time norms could begin with countries agreeing to do things or refraining from doing things.¶ For example, absent war, they may agree that no country should attack critical IT systems nor computer emergency response teams. They may also agree that it's a nation's duty to cooperate with law enforcement or counter any malicious cyber activity that they detect in their territory.¶ The approach for cyberspace should mirror confidence-building measures in the nuclear arena, said Painter. This means they must adopt measures that lead them to transparency, cooperation and, eventually, stability.¶ Sorin Ducaru, NATO's assistant security general for emerging security challenges, said the alliance has taken significant steps to advance the conversation on cyber norms with the passage of its third cyber policy on Sept. 5. Among the concepts endorsed by alliance members was the agreement that international law applies in cyberspace.¶ "NATO does not want this space ungoverned," he said, adding that the alliance would support a **clearer distinction of norms, barriers and laws**.¶ Painter said this clearly points to the idea that cyberspace is not lawless and has boundaries.¶ "I think there was some doubt before. I think there was some thought that you would have different rules entirely for the cyber world and the physical, which would make no sense – in fact, it could be very destabilizing in the long term," he added.

As societies expand their digital footprint, increasing connectivity among citizens, businesses, and governments, the world has also seen a concomitant increase in cyber incidents. At times, the attackers' motivations are financial, not unlike criminal behavior in the "physical world." The past several years have shown a new trend. Increasingly, states use the Internet to advance tried and true tenets of intelligence or even military operations: espionage, reconnaissance, and even sabotage. The targets of these operations, whether intentional or not, are often civilians. In an effort to encourage the international community to reverse this trend, International Cybersecurity Norms, Reducing conflict in an Internet-dependent world, analyzes the unique attributes that make cybersecurity conflict-prone and proposes a framework and norms for cybersecurity.¶ As the pace of activity in cyberspace increases, so does the likelihood of one state misinterpreting the actions of another. Moreover, the risk of a cyber-arms race cannot be discounted. It would be naïve to hope that states should fully pull back their military operations from the Internet. Nevertheless, just as there are universally accepted norms of behavior in other realms of conflict, it is no less important to establish norms for cybersecurity. These norms should not only strengthen cybersecurity but also preserve the freedoms of a globally connected society.¶ Some will contend that this search for norms is rather futile, as states might simply ignore or pay lip service to them. Smaller countries may be reluctant to disavow a powerful arrow in their quiver that could give them an asymmetric advantage. And would there even be consequences for violators at all? While valid, this kind of skepticism only underscores the need to move forward. Norms cannot guarantee that states will never violate agreed upon principles, but they will put violators on notice within the international community. And from norms that gradually become accepted a stronger framework can eventually emerge.¶ Yes, achieving global acceptance of new international norms in such a critical realm is difficult. In the deliberations leading to the Nuclear Non-Proliferation Treaty, Willy Brandt, then the German Foreign Minister, said, "We shall not be able to discuss security guarantees, disarmament, and the perspectives¶ for the peaceful use of nuclear energy with any prospect of success unless a common will and joint proposals put right the rules of order the community of nations urgently needs." Nuclear power and cyberspace are different in many respects, but Brandt's argument very much applies here.¶ International Cybersecurity Norms contains many sound and thought-provoking ideas and recommendations to that effect and deserves the full attention of citizens, businesses, and governments alike.

Solvency – Trust

FIND CARD THAT SAYS: 2. Trust—The SSRA would rebuild trust between the government and the private sector—that's key to cybersecurity

The SSRA is <u>essential</u> to regaining public trust

Jillian **Kane 15**, Bill of Rights Defense Committee, an organization working to restore the rule of law and constitutional rights, Mount Holyoke College BA, Politics, "What is the SSRA and why is it important?," 3/4/15, http://www.bordc.org/blog/what-ssra-and-why-it-important

Many people do not know about the Surveillance State Repeal Act (SSRA) and how important it really is. Former Senator Russ Feingold (D-WI) first devevloped the act as the JUSTICE

(Judicious Use of Surveillance Tools in Countering Extremism) Act. Recently retired Rep. Rush Holt (D-NJ) was the first to re-introduce it as the SSRA in the wake of the 2013 Snowden revelations. It is set to be re-introduced later this month by Rep. Mark Pocan (D-WI).¶ Rep. Holt says, "This isn't reform. It is repeal." Since it is a repeal this Act would be different from all the other NSA reform proposals.¶ The act would repeal the USA PATRIOT Act and the FISA Amendments Act of 2008. The Bill would restore all provisions that were amended or repealed by the USA PATRIOT ACT or the FISA Amendments Act. This Bill would help to ensure everyone's rights are protected. There are even protections for whistleblowers. TechDirt said:¶ This offers better whistleblower protection, especially in terms of guarding against retaliatory actions. Unfortunately, this won't protect whistleblowers like Snowden, who quit of his own accord (eliminating the chance of retaliatory action) and is now facing espionage charges. Providing several routes for whistleblowers to take helps, but if anyone above these routes objects to the whistleblower (and is outside the "intelligence community" -- like the administration itself), the built-in protections of this legislation are nullified**. This is an important step that our government needs to take in order for the public to trust them again**. While USA PATRIOT ACT was created in a time of realization that there are terrorists out there who want to harm the United States, the government went too far by creating the Act and allowing all sorts of things that should never be done, like sneak and peak searches.

Private sector partnerships key to solving cyber attacks

Michael **Hayden**, Samuel **Visner** and David **Zolet 11,** Hayden was director of the NSA, director of the CIA and principal deputy director of national intelligence, Virmani is the director of the INTERPOL Digital Crime Centre, was a Supervisory Special Agent with the Federal Bureau of Investigation, Virmani has been one of the FBI's leading experts in cyber terrorism and has led multi-agency initiatives against terrorist use of the Internet as a supervisor in the FBI's Counterterrorism and Cyber Divisions, "Cyber threat clearinghouse key to national security," 12/9/11, http://fcw.com/articles/2011/12/12/comment-hayden-visner-zolet.aspx

David Zolet is president of strategy and development for CSC's North American Public Sector.

The government warns Americans about health, pollution, weather and other threats. Why not cyber threats? Washington should begin sharing cyber warnings with those responsible for America's critical infrastructure, from hospitals to water systems to banks. But the private sector should act on its own without waiting for the government.¶ Public/private partnerships are valuable tools for enhancing public safety and security. Through organized neighborhood watches, citizens report suspicious activities and receive better policing. Drug stores report data on the sales of certain pharmaceuticals, helping public health officials issue timely alerts about contagious diseases. Emergency management agencies and private suppliers of food and other consumables share information that helps them aid victims of natural disasters.¶ Cyber threats are growing. Advanced persistent threats already target the public and private sectors, with potentially dire consequences. Infection of a dam's electronic control system, for example, could cause it to unleash cascades of water and destroy homes and lives downstream.¶ The code for the Stuxnet virus, which disrupted the industrial processes that control Iran's uranium enrichment, is now available on the Internet. Adversaries could adapt such tools to harm process-oriented

infrastructure, such as chemical plants and electric power grids. **To protect against attacks, private-sector involvement is crucial.** Private industry owns 85 percent of the country's critical infrastructure and deploys far more cybersecurity experts than the government ever will.¶ The Homeland Security and Justice departments counter cyber threats, but much more should be done.

¶As a first step, critical infrastructure operators and their IT providers should band together and establish a clearinghouse to share information on cyber threats and countermeasures. An umbrella cybersecurity operations center or a streamlined group of federated centers could oversee collaboration without raising antitrust obstacles.¶A cyber partnership between the Defense Department and the private sector is a second way forward. The Defense Industrial Base program represents a growing commitment on the part of government and industry to work together to share information about threats and best practices to protect important unclassified data. Recently, then-Deputy Defense Secretary William Lynn pointed out that DOD shares sensitive data with private participants, who integrate it into their network defenses.¶The pilot project has been a resounding success, and its logic is irrefutable. If a firm provides DOD with weaponry, both have a strong interest in protecting information about it. But companies cannot allow proprietary data to fall into the wrong hands, and DOD must protect sensitive government data and not give an advantage to one supplier over another.¶Lynn said DOD is now working with DHS and the White House to expand the pilot partnership to other sectors of critical infrastructure. It ought to be an urgent priority. New protections and incentives must guide voluntary information sharing. If the risks and consequences of cyberattacks are lowered, partners might qualify for reduced insurance premiums or incur diminished liabilities.¶Finally, more operators of critical infrastructure should establish or gain access to round-the-clock cybersecurity operations centers. They would build on existing coordination efforts and link with a DHS integration center.¶National security restrictions hinder the sharing of government cybersecurity data. After the 2001 terrorist attacks, the national security community began sharing more data so they could better "connect the dots." Similarly, security issues associated with sharing information on cyber threats are likely solvable.¶Wider access to information and new concepts of public/private trust are essential for America to protect its economy and homeland security against tomorrow's cyber threats.

Cyber attacks – power grid

Adversaries have malware to cripple the power grid through backdoors – "cascading failures" make full power grid collapse likely

Amelia **Smith 14**, writer for Newsweek, expert in technology and security, graduate from MIT, cites the head of the NSA, "China Could Shut Down U.S. Power Grid With Cyber Attack, Says NSA Chief," 11/21/14, http://europe.newsweek.com/china-could-shut-down-us-power-grid-cyber-attack-says-nsa-chief-286119

China and "one or two" other countries have the ability to launch a cyber attack that could **shut down** the entire **U.S. power grid** and other critical infrastructure, the head of the National Security Agency (NSA) and U.S. Cyber Command told a congressional panel on Thursday. Admiral Michael Rogers told the hearing that **software had been detected** in China that could significantly damage the nation's economic future by interfering with power company networks and other critical systems. Describing the malware, he told the House Intelligence Committee that: "It enables you to shut down very segmented, very tailored parts of our infrastructure that forestall the ability to provide that service to us as citizens." "**It is only a matter of the when, not the if**, that we are going to see something traumatic," he added. When asked by Republican representative for Michigan Mike Rogers, who chairs the intelligence committee, what other countries have this capability, the NSA director responded "one or two others," but declined to name them for security reasons. "We're watching multiple nation states invest in this capability," he said. According to cyber expert Caroline Baylon of think tank Chatham House, the interconnectedness of power grids means that they are liable to **"cascading failures**". As nearby grids take up the slack for the failed system, **they become overloaded** and they too fail in a chain reaction. Rogers said that such attacks are part of "coming trends" in which so-called zero-day vulnerabilities in U.S. cyber systems are exploited. A zero-day vulnerability refers to a hole in software that is unknown to the vendor, which can be exploited by hackers before the vendor becomes aware and hurries to patch it up. They are becoming an increasingly powerful weapon of cyber espionage as countries become more connected to the internet. As well as espionage, there are also fears of cyber warfare. "Once an attacker finds an open vulnerability, he or she can get into the system," Baylon told Newsweek. "**This allows the adversary to place a 'backdoor' in that system**, as China are doing in the U.S., which they can use to access that system again at a later date." "Whilst at present it is not in any country's interest to attack the power grid of another country, now is the time for countries to look for these vulnerabilities because this is when they are open," she added. "It is a dangerous situation because a number of countries are looking for vulnerabilities in the power grids of other countries." A so-called 'grey-market' - a black market that isn't strictly illegal yet - for zero-day vulnerabilities now exists, with companies like Vupen in France selling them to governments for use in espionage. According to Baylon, the U.K and the U.S. are particularly at risk because they have a huge amount of critical infrastructure connected to the internet. Some countries however, like Russia, have clear government policy about being connected to the internet. "There is a huge asymmetry going on," she said. Russia is also regarded as having an aggressive cyber programme. Rogers's testimony comes shortly after the release of a report from the Pew Internet and American Life Project that says that it is likely that a catastrophic cyber-attack would have occurred by 2025, causing significant losses in life and financial damage. "Intelligence agencies and governments are very concerned about it," says Baylon. She predicts that the most likely scenario would be a coordinated attack."In the event of major attack, we might see a series of simultaneous attacks on a number of areas, for example attacking a power grid and paralyzing communications networks at the same time." This, she says, is something we could see in the next five to 10 years. However she stresses that whilst "it is very hard to find solutions", governments and experts are working very hard on the issue. In his testimony to the intelligence committee, Rogers said: "The Chinese intelligence services that conduct these attacks have little to fear because we have no practical deterrents to that theft. This problem is not going away until that changes." The problem, Baylon says, is that security costs money, and critical infrastructures like power grids are ultimately businesses with a bottom line.

Whilst they want to protect themselves, it is simply not practical or even possible to defend against all things, and moreover patching up vulnerabilities can sometimes inadvertently **trigger a system failure**. "It wouldn't be possible or practical to defend against everything, either financially or otherwise," she said. "We need to be more careful than we are being and make sure that profit is not dictating everything," says Baylon.

A cyber-attack would take out critical infrastructure and power grid

Jonathan **Pollet 14**, founder of Red Tiger Security, an infrastructure security firm, a 17-year veteran of the critical infrastructure industry, consults for some of the world's largest energy companies, as well as electric utilities, chemical plants, water treatment plants, etc. to help them better defend against cyber attacks, consultant of security for the FBI, DHS and Utility Telecom Council, "Here's What Chinese Hackers Can Actually Do To The US Power Grid," 11/23/14, http://www.businessinsider.com/what-hackers-can-do-to-our-power-grid-2014-11

There's been a lot of discussion lately about the risks posed by hackers to America's critical infrastructure systems, with terms like "cyber-Pearl Harbor" and "**cyber-9/11**" being bandied about by government officials and other prominent figures.¶ Invariably, **one of the worst scenarios** often depicted by these cyberwar predictions **is an attack on the US power grid that would cause a widespread blackout**.¶ In his testimony before the House Intelligence Committee on November 20th, NSA Director Adm. Michael Rogers went into some detail on those risks:¶ House Intelligence Committee Chairman Mike Rogers: "It was determined that malware was on those (critical infrastructure) systems. Can you be a little more definitive about what does that mean? If I'm on that system and I want to do some harm, what does that do … ? Do the lights go out? Do we stop pumping water? What does that really mean? And the fact that it was there, does that mean they already have the capability to 'flip the switch' if they wanted to?"¶ Admiral Michael Rogers: "Well let me address the last part first. There shouldn't be any doubt in our minds that there are nation-states and groups out there that **have the capability to** do that. To **enter our systems**, to enter those industrial control systems, and to shut down, forestall our ability to operate, our basic infrastructure. Whether it's generating power across this nation, whether it's moving water and fuel … Once you're into the system and you're able to do that, it enables you to do things like, if I want to tell power turbines to go offline and stop generating power, you can do that. If I wanted to segment the transmission system so that you couldn't distribute the power that was coming out of the power stations, this would enable you to do that. It enables you to shut down very segmented, very tailored parts of our infrastructure"

The power grid is vulnerable to cyberattacks, threatening national security – legislative action is the only way to solve

The threat and capability of attacks to U.S. infrastructure remains dynamic. The number of incidents as reported to the U.S. Computer Emergency Readiness Team from fiscal years 2006 to 2012 has **dramatically increased** (Figure 1).7 Some progress toward protecting America's defense capabilities has been accomplished. However, "[t]he well spring of our strength,"8 America's economy and its critical infrastructure sectors, crucial to the nation's wellbeing and DoD's ability to develop and project power, remain alarmingly vulnerable to debilitating cyberattack. "Cyberwarfare is like maneuver warfare, in that speed and agility matter most."9 Many critical American infrastructural capabilities and corporations are neither adequately defended nor are taking sufficient steps to defend against cyberattack.10 Moreover, beyond the headlines, there is scant interest for cybersecurity cooperation from industry partners with the United States Government in general or, with the Department of Defense in particular. The nation's electrical grid, one of its paramount critical infrastructure sectors, is generally **underprepared against cyber** threat and **attack**, especially multi-pronged infrastructural attack that create **significant grid damage** and loss of power. What is further alarming is to consider that "[m]ore malware was detected on computer networks in 2011 than in all previous years combined, with critical infrastructure being a prime target.11 It is difficult to overstate how dependent America's economy and **defense relies on electrical power** and other forms of energy.12 The economy, domestic households, and defense rely on electrical power like no other commodity: From manufacturing and fuel refining to hospitals and homes, to air defense systems, to just about everything, electricity is critical. The Department of Defense, symptomatic of the nation at large, relies on the electric grid and faces the same vulnerabilities as industry.¶ These vulnerabilities pose substantial risks to U.S. national security. A 2008 report by the Defense Science Board's Task Force on Department of Defense (DOD) Energy Strategy concluded that "critical missions … are almost entirely dependent on the national transmission grid. About 85% of the energy infrastructure upon which DOD depends is commercially owned, and 99% of the electric energy DOD installations consume originates outside the fence. … In most cases, neither the grid nor on-base backup power provides sufficient reliability to ensure continuity of critical national priority functions and oversight of strategic missions in the face of a long term (several months) outage." An October 2009 report by the Government Accountability Office concluded that of DOD's 34 most critical global assets, 31 rely on commercially operated electricity grids for their primary source of electricity. The current state of cyber security information sharing within electrical power grid industry and between it and the USG is lackluster. There are four primary causes for this circumstance: A complacent power industry cultural attitude toward the cyber threat; a lack of effective industry information sharing mechanisms; **congressional legislative inaction; and tardy, insufficient executive branch action.**

Cyber-attacks – military retaliation

Defense strategies define cyber-attacks as acts of war and are met with military retaliation – leads to war

Alex **Spillius 11**, Diplomatic Correspondent for the Daily Telegraph, won the Amnesty International Award for newspaper reporting, University of Bristol, "US could respond to cyber-attack with conventional weapons," 6/1/11, http://www.telegraph.co.uk/news/worldnews/northamerica/usa/8550642/US-could-respond-to-cyber-attack-with-conventional-weapons.html

In an effort to lay down military guidelines for the age of internet warfare, President Barack Obama's administration has been formalising rules on cyberspace amid growing concern about the reach of hackers.¶ Defence company Lockheed Martin, the biggest supplier to the Pentagon, admitted over the weekend that its computer networks had been subjected to a sustained attack, though it said security had not been seriously compromised.¶ The White House's strategy statement on cybersecurity said the United States "will respond to hostile acts in cyberspace as we would to any other threat to our country".¶ "We reserve the right to use all necessary means – diplomatic, informational, military, and economic – as appropriate and consistent with applicable international law, in order to defend our nation, our allies, our partners and our interests," the May 16 document said.¶ Pentagon spokesman Colonel Dave Lapan confirmed that the White House policy did not rule out a **military response to a cyber-attack**."A response to a cyber incident or attack on the US would not necessarily be a cyber-response," he said. "All appropriate options would be on the table if we were attacked, be it cyber."¶ Col Lapan said that the Pentagon was also drawing up an accompanying cyber-defence strategy to respond to attacks on government computer networks, power grids or other utilities.¶ The Wall Street Journal reported that that document would **classify major cyber-attacks as acts of war**, paving the way for possible **military retaliation**.¶ The strategy was intended in part as a warning to foes that may try to sabotage the US electricity grid, subways or pipelines, officials said.¶ "**If you shut down our power grid, maybe we will put a missile down one of your smokestacks**," a military official told the newspaper.¶ The new strategy in the US is likely to mean that Nato would have to devise its own rules or response to cyber-attacks. The alliance would have to examine whether or not its principle of collective defence will apply to online warfare.¶

Backdoors

NSA close to building a backdoor only they can access – squo solves

Dimitri **Tokmetzi 4/17**, data-journalist for The Correspondent, expert in investigative journalism in the relationship between power and data and tech, "How to protect privacy and security in the Crypto Wars," 4/17/15, https://www.gccs2015.com/sites/default/files/documents/How%20to%20protect%20privacy%20and%20security%20in%20the%20crypto%20wars.pdf

Theoretically it might be feasible, as current NSA director Michael Rogers argues, to build a backdoor that only his agency can use. The NSA actually came close to building a very secure backdoor with DUAL_EC_DRBG, the Dual Elliptic Curve Deterministic Random Bit¶Generator. This piece of software is one of the few international standards used to generate encryption keys. The Snowden files showed that in the early 2000s the NSA exploited a weakness in the code, through which only they could guess the outcome of the generator, and with that knowledge were able to break the widely-used encryption keys.

Cybersecurity isn't vulnerable and cyber-terror is highly unlikely

Cato Institute 11, public policy research organization — a think tank – dedicated to the principles of individual liberty, limited government, free markets and peace, its scholars and analysts conduct independent, nonpartisan research on a wide range of policy issues, "The Underwhelming Threat of Cyberterrorism," January 2011, http://www.cato.org/policy-report/januaryfebruary-2011/underwhelming-threat-cyberterrorism

In 1983, Americans watched as Matthew Broderick, armed with only a personal computer, brought the world to its knees. In the popular movie WarGames, Broderick played a young hacker who broke into the military's electronic network and nearly started World War III. In recent years, as fear of terrorism continues to overwhelm rational threat assessment, the WarGames scenario looks a lot like what so-called cybersecurity experts and their federal government allies tout.¶ The problem with "cybersecurity," says Jim Harper, director of information policy studies at the Cato Institute, is that we're convincing ourselves that cyberspace is an endless sea of vulnerabilities that leave us weak and exposed. It's not. Harper has emerged as the voice of reason among breathless news reports of "cyber attacks" and calls for Washington to take over security of the nation's computing infrastructure. In his papers, congressional testimonies, and numerous media appearances, Harper emphasizes the need to better understand the nature of cyberspace, to appreciate the improvements in cybersecurity civil society is constantly generating, and to recognize the near impossibility that terrorists might inflict significant harm using computers.¶"It's helpful to imagine 'cyberspace' as organized like the

physical world," Harper says. "Think of personal computers as people's homes. Their attachments to the network analogize to driveways, which connect to roads and then highways. E-mails, financial files, and pictures are the personal possessions that could be stolen out of houses and private vehicles, leading to privacy loss."¶ Cyberspace will be secured the way real space is. Computer owners, like homeowners and businesses, should be the first line of protection for their own property, Harper says. They should install the latest patches and place their systems behind firewalls. What the government wants — to come up with a national cybersecurity plan and force it upon network, data, and computer owners — is akin to cutting down crime in neighborhoods by stationing police officers in livingrooms and dictating what sorts of door locks and alarm systems must be in all new homes.¶ "The analogy between cyberspace and real space shows that 'cybersecurity' is not a small universe of problems, but thousands of different problems that will be handled in thousands of different ways by millions of people," Harper says. This analogy is particularly important when the topic shifts from broad "cybersecurity" to the narrower threat of "cyberterrorism."¶ The popular view of such attacks, like WarGames, is nonsense, according to Harper. "With communications networks, computing infrastructure, and data stores under regular attack from a variety of quarters — and regularly strengthening to meet them — it is highly unlikely that terrorists can pull off a cybersecurity event disruptive enough to instill widespread fear of further disruption," Harper says. If they could do it at all, taking down websites, interrupting financial networks, or knocking out power systems does not terrorize. In a 2009 speech about cybersecurity, President Obama spoke about "weapons of mass disruption," a poor relation of the instruments that truly threaten violence and chaos.¶ The federal government plays a significant role in protecting Americans from genuine terrorism. And, even though the threat of cyberterrorism is dramatically overblown, the government can improve security in that area, too. But it should not do so through regulation, Harper says. Instead, it can take advantage of its position as a large purchaser of information technology and, through the market, guide technology producers to meet better security standards.¶ The politicians in Washington should realize that the easiest way to protect critical data and infrastructure is not to make it vulnerable in the first place. "Where security is truly at a premium," Harper says, "the lion's share of securing infrastructure against cyberattack can be achieved by the simple policy of fully decoupling it from the Internet."¶ Harper's level-headedness is getting attention. The Obama White House cited a paper he wrote in the executive summary of its Cyberspace Policy Review. In it, Harper argued that updating tort law to allow those harmed by insecure computer products to recover damages from providers and manufacturers is a better path to true security than government regulation of the market. And he was called before the House Subcommittee on Technology and Innovation to testify about how the federal government should respond to cyberterrorist threats and how it should approach securing the nation's information technology infrastructure.¶ Harper is adamantly clear that cybersecurity is important. While arguing that the federal government should not directly regulate computer security, he is careful not to downplay the need to secure our computer networks. But such security, like in the brick and- mortar world outside the Internet, is a matter of personal responsibility, business interest, and common sense.¶ That same common sense should lead us to recognize that cyberterrorism does not exist and that threat of cyberwarfare is minimal. Claims to the contrary result from technological illiteracy and the incentives of government officials and contractors that favor inflating threats. Cyberterrorism is "cyber–snake oil," Harper says.

Hackers exploiting vulnerabilities are rarely serious and terrorists lack motivation and skills to pull off an attack – there are no instances of cyber-terror to assess any impact on

Sam **Berner 03**, B.Ed., Dipl. LIS, Postgraduate Diploma in Information Management, is a principal of the company ECognu, a knowledge management consultant, assisting SMEs to benefit the most from their intellectual assets, ECognus also provides services in the area of tailored software applications and digitization of business processes, "Cyber-terrorism: reality or paranoia?," March 2003, SAJIM Secure Notes – Vol.5(1)

The answer is both yes and no; yes, because vulnerabilities in computing systems can be exploited by terrorist elements, and no, because although the exploitation can directly impact the public, it is **rarely serious or fatal**. However, after having read all the frightful scenarios available so freely on-line (see, for example, Brenner and Overholt 1998), one main thing remains to remember. Computers do not exert control by themselves – there are humans involved in the information chain. Whether or not we chose to consider humans more fallible than the computerized systems they have created is a related issue. After all, cyber-error can be as devastating as cyber-terror. However, as long as humans control and monitor the system, terrorist attacks in cyberspace can be offset. The world does not yet face a compelling threat from terrorists using information warfare techniques to disrupt critical infrastructure. **Terrorists lack the motivation, capabilities and/or skills to pull off a cyber- attack**. Although a physical attack against the infrastructure cannot be ruled out, such a threat is neither new nor matured by the reliance of the developed world on technology (Church 1997:23). Because **systems are complex**, it may be harder to control an attack and achieve a **desired level of damage**. Unless people are injured, there are also less drama and emotional appeal. Further, terrorists may be disinclined to try new methods unless they see their old ones as inadequate.¶ **Given that there are no instances of cyber-terrorism, it is not possible to assess the impact of acts that have taken place**. It is equally difficult to assess potential impact, in part because it is hard to predict how a major computer network attack, with the intent to affect national or international policy, would unfold. So why is cyber-terrorism suddenly basking in the limelight, from government agencies, to 'specialists' to the hubris of the media? There are multiple reasons, and most of these are political rather than informational. One close look at the proposed remedies, especially those put in place after the World Trade Center attacks, will show that fighting cyber-terrorism can become a heaven-sent excuse for governments to place more control on the evasive cyber-space. How this affects such issues as democracy, privacy, freedom of expression and copyright will be discussed in the forthcoming issue.

Status quo solves cybersecurity and vulnerabilities – new XO ensuring cybersecurity

Mike **McConnell and** Sedar **Labarre 15**, McConnell is a Senior Executive Advisor and former Vice Chairman of Booz Allen Hamilton, leading Booz Allen's rapidly expanding cyber business, led the development of the Intelligence business focused on policy, transformation, Labarre ia a leader in the Booz Allen's commercial business, focusing on cybersecurity, "The

Cybersecurity Executive Order," 6/3/15, http://www.boozallen.com/media/file/BA13-051CybersecurityEOVP.pdf

Executive Order (EO) 13636, "Improving Critical Infrastructure Cybersecurity," calls for government to collaborate more closely with critical infrastructure owners and operators to strengthen cybersecurity, particularly by sharing information about cyber threats and jointly developing a framework of cybersecurity standards and best practices. Elements of the framework may later be incorporated into government regulations or voluntarily adopted by industry. Many owners and operators recognize the value of these efforts but worry that the EO will result in burdensome regulation rather than strengthened security. They are cautiously supportive, waiting to see how the EO will differ from previous efforts to improve government industry collaboration. Others question if the EO goes far enough, suggesting cybersecurity legislation is required to make a difference. At Booz Allen Hamilton, we believe the EO offers reason for optimism. While it is true that the general concepts and goals of the EO are similar to earlier initiatives, such as the 1998 Presidential Decision Directive 63 and the 2003 Homeland Security Presidential Directive 7, cyber technologies and practices have evolved in significant ways since those directives were issued. For example, new continuous monitoring capabilities ensure that government and industry collect enormous amounts of data that enhance the value of information sharing. The development of powerful analytics makes that data even more valuable because of the potential insights that can be gleaned by sharing intelligence and data. In addition, cyber **professionals have developed stronger cybersecurity skills** and better understand how to exploit the accumulating threat and network data. And cyber experts have used their experience to identify cybersecurity best practices and create standards and maturity models that can be applied across critical infrastructure sectors. These changes offer government and industry opportunities to strengthen cybersecurity.

Cyber-terrorism: reality or paranoia? The new millennium – if there ever was one in any scientific meaning of the term – has been ushered amid a media circus of a Y2K scare and predictions of total world paralysis. It did not realize, and we were all relieved for a while, short as it was, until something far more dark and sinister in the shape of two airplanes hit the World Trade Centre. The amount of vital data and information lost in that attack has brought home a new threat to haunt those responsible for information security: cyber-terrorism. Increasingly, the world depends on computers. The systems residing on them control power delivery, communications, aviation and financial services. They are used to store vital information, from medical records to business plans to criminal records. These computers are vulnerable to the effects of poor design and insufficient quality control, to accident, and perhaps most alarmingly, to deliberate attack. The modern thief can steal more with a computer than with a gun. Does it follow, then, that tomorrow's terrorist may be able to do more damage with a keyboard than with a bomb? New term, old game Terrorism is a much-used term with many definitions. The US Department of State defines it as 'premeditated, politically motivated violence perpetrated against non-combatant targets by sub-national groups or clandestine agents'. If we combine this definition with the term 'cyber', we end up with a working definition of cyber-terrorism: 'The premeditated, politically motivated attack against information, computer systems, computer programs and data

which result in violence against non-combatant targets by sub-national groups or clandestine agents' (Politt 1998). For the term 'cyber-terrorism' to have any meaning, we must be able to differentiate it from other kinds of computer abuse such as computer crime, economic espionage or information warfare. Using this definition, a number of things that are often miss-associated with cyber-terrorism can be eliminated. For instance non-politically motivated computer crimes, like the 16-year-old hacker's 1994 crashes of 100 US defence systems, or the creation and release of the Nimda worm (or any other worm for that matter). These were not acts of cyber-terrorism, although both were serious incidents with the potential for great harm. They lacked the essential ingredients that would allow for the term 'terrorism'. Unlike a virus or computer attack that simply causes a prevention or delay of service, a cyber-terrorist attack leads to physical violence of some sort or extreme financial harm. Therefore, possible cyber-terrorism targets include the banking industry, military installations, power plants, air traffic control centers and water systems. Cyber-terrorists are not merely individuals seeking to cause harm or damage wherever they can. They are people or groups with political agendas.¶The term 'cyber-terrorism' in itself well predates September 11. It was coined in the 1980s by Barry Collin, senior research fellow at the Institute for Security and Intelligence (www.counterterrorism.org) in Palo Alto, USA. In 1991, the US National Research Council commissioned a book on computer security entitled Computers At Risk, but although terrorist use and abuse of computer networks were discussed, the council limited itself to the ambiguous 'computer crime'. In 1996, the US government in the person of President Clinton created the Commission of Critical Infrastructure Protection (PCCIP), which identified eight critical areas in need of protection: information and communications, electrical power systems, gas and oil (production, transportation and storage), banking and finance, transportation, water supply systems, emergency services and government services (Angelica 1998).¶The resources to launch a cyber attack are commonplace; a computer and a connection to the Internet are all that is really needed to wreak havoc. The CIA created the Information Warfare Center, staffed with 1000 people and a 24-hour response team, but not much to show the taxpayer for it. The FBI investigates hackers and similar cases, and pursues banking, fraud and wiretapping cases (Wasserman 1998). The American Air Force created its own group, Electronic Security Engineering Teams, or ESETs.

Solvency – Norms

The U.S setting international cybersecurity norms is <u>impossible</u> – countries do not share U.S values on cybersecurity and Snowden leaks mean the U.S. <u>can't be an advocate for its own norms</u>

Henry **Farrell 4/6**, associate professor of political science and international affairs at George Washington University, expert in a variety of topics, including norms, the politics of the Internet and international and comparative political economy, 4/6/15, "Why it's so hard to create norms in cyberspace," http://www.washingtonpost.com/blogs/monkey-cage/wp/2015/04/06/why-its-so-hard-to-create-norms-in-cyberspace/

**no solvency

So how does one build norms if they're so important? Therein lies the problem. Norms work best when they are not the simple product of actors' material self-interest. Persuading people to accept norms involves getting them to accept the values that the norms imply. When actors have many shared values, norm building is easier. When actors have few shared values, then **norm building is hard**. Furthermore, if you want to persuade others to accept norms, you will have a hard time unless you are obviously and sincerely committed to those norms yourself. This creates two linked problems for the U.S. First – many other **important countries do not share U.S. values regarding cybersecurity**. For example, the U.S. has sought to promote an open and robust Internet. Authoritarian and semi-authoritarian countries may view an open and robust Internet as a threat to the stability of their governments. They would prefer an Internet that was not open, and that can be easily compromised if necessary to shore up their regimes. As Jack Goldsmith and Tim Wu have argued, this makes it hard to build treaties on cyber-related questions. It also makes it hard to build norms – there are not many common values that the U.S. can appeal to.¶ Second – **the U.S.'s own commitment to many of its values has been called into question**. The Snowden revelations appear to show, for example, that the NSA has tried to compromise basic cryptographic standards that are required for an open and robust Internet to work. This makes it hard for the U.S. to be an effective advocate for its norms. Some degree of hypocrisy is tolerable in international politics when others can turn a blind eye to it. However, when one's secrets have been leaked, other states may neither want to, nor be able to, ignore the difference between the U.S.'s lofty normative aspirations, and its self-interested behavior. The result, all too often, is battles over norms where neither side is likely to persuade the other. For example, the U.S. and China are facing off over commercial cyber-espionage aimed to grab the trade secrets of firms located in other countries, and pass them on to one's own businesses. The U.S. regards this as normatively unjustified, while other states regard it as an unexceptionable form of spying. The problem is that both sides' position obviously stems from self interest. As Goldsmith says:¶ It is not surprising that the United States would seek to craft a nuanced rule about economic espionage that serves its interests. This happens all the time in international affairs. Nor is it surprising that so many nations are unimpressed with the United States' attempt to limit the one form of economic espionage (theft of foreign corporate trade secrets to give to a local firm) that so obviously harms U.S. interests, especially since the United States engages in other forms of economic espionage.

Legislation doesn't solve government-private sector trust and data sharing – companies can maintain cybersecurity on their own

Jody **Westby 6/15**, expert in data flow and IT governance, serves as Adjunct Professor at Georgia Institute of Technology's School of Computer Science, author of Carnegie Mellon's 'Governing for Enterprise Security and Implementation Guide,' founded Global Cyber Risk, specialized in serving government and private sector clients associated with information tech, appointed to the United Nations' ITU High Level Experts Group on Cyber Security, "The Government Shouldn't Be Lecturing Private Sector On Cybersecurity," 6/15/15,

http://www.forbes.com/sites/jodywestby/2015/06/15/the-government-shouldnt-be-lecturing-the-private-sector-on-cybersecurity/

Every time there has been a major private sector cybersecurity incident, we have heard various government officials call for Congress to pass a law that would solve the cybercrime problem. Public officials, military generals, and even the President, generally pounce on private sector breaches as proof that the private sector needs a federal nudge to get its cybersecurity in order. This has been couched in various terms, but these statements generally have followed a path that (1) risks to critical infrastructure companies present a risk to national and economic security, and (2) a federal law is needed to enable public-private sector information sharing.¶ In 2012, we beat back legislation aimed at these two goals that also would have imposed enormous compliance burdens on most companies. Since then, legislative efforts have been aimed at improving public-private information sharing. I always have believed that the federal government plays on the "feel good" sound of information sharing as an acceptable reason for enacting legislation that would enable it to get hooks into every company's data center.¶ Information sharing is possible today and we do not need a law to enable public-private information sharing. Here is why:¶ The U.S. Department of Justice has repeatedly assured industry that it would not launch antitrust cases against companies for sharing cyber threat information with each other.¶ The sharing of cyber incident data involves highly technical log and communications traffic data and rarely involves disclosing personally identifiable information (PII) or other information that might lead to compliance issues. In April, some of the country's top engineers sent a letter to House and Senate backers stating that, "We do not need new legal authorities to share information that helps us protect our systems from future attacks." An additional problem is that the bills include language providing companies with broad protections against liability. This is a particularly dangerous concept because such protections actually will discourage companies from funding and continually improving their security programs.¶ The federal government can share any information it wants. All it has to do is declassify it (if it is classified) or put it in a format that is unclassified. It does not need a law from Congress to do this. It already has this authority. I launched a company that was funded and founded by the CIA to find unclassified solutions to the intelligence community's most pressing technology problems — In-Q-Tel. The CIA gave me their three most pressing technology problems in an unclassified format so we could present them to the research community. If the CIA can do that, I fail to understand why DHS or any other federal agency thinks it is so hard to put cyber threat data in an unclassified format or why they need Congress to pass a law to enable them to share information that could be critical to national or economic security. DHS has taken the bizarre approach of requiring companies to enlist in its Cybersecurity Enhanced Services program in order to obtain cyber threat information to enable them to better protect their systems. Has it not occurred to them that cyber threats spread to all systems? Limiting their threat information to a handful of "approved" companies simply puts everyone else who is not vetted at greater risk.¶ So, set aside the argument that legislation is needed for information sharing. And set aside the notion that the private sector needs the federal government's assistance in managing cyber threats. What the private sector does need is:¶ Adequately trained cybercrime investigators in police departments around the country to help them track and trace cyber incidents; and¶ Better use of their tax money in developing and maintaining cybersecurity programs in federal agencies and departments.

^^ HIGHLIGHT MANIA!!!!!!!!

The U.S can't lead private sector on cybersecurity – lack of trust either way - NIST solves private sector cybersecurity

Jody **Westby 6/15**, expert in data flow and IT governance, serves as Adjunct Professor at Georgia Institute of Technology's School of Computer Science, author of Carnegie Mellon's 'Governing for Enterprise Security and Implementation Guide,' founded Global Cyber Risk, specialized in serving government and private sector clients associated with information tech, appointed to the United Nations' ITU High Level Experts Group on Cyber Security, "The Government Shouldn't Be Lecturing Private Sector On Cybersecurity," 6/15/15, http://www.forbes.com/sites/jodywestby/2015/06/15/the-government-shouldnt-be-lecturing-the-private-sector-on-cybersecurity/

It is time that business leaders begin publicly rejecting the notion that the U.S. government should be leading the private sector on good cybersecurity practices. Or to put it in more crass terms, companies need to cast a suspicious eye on cybersecurity legislation and flatly reject any attempt to impose government regulation on private sector cybersecurity programs. Why? Because the U.S. government has some of the worst security programs and, based on what has been reported, the U.S. government has had the worst cybersecurity breaches on the planet. Three at the top of the list are:Bradley (now Chelsea) Manning's 2010 theft of around 750,000 classified and unclassified but sensitive military and diplomatic cables that were given to Wikileaks and disclosed. The documents embarrassed U.S. government officials and played a role in igniting the Arab Spring.¶ Edward Snowden's 2013 theft of what appears to be the NSA's shared drive. Edward Snowden downloaded so many files that in May, 2014, Gen. Keith Alexander, former head of NSA and Cyber Command, admitted in an interview that the government really doesn't know how many documents he obtained, but they know it was more than a million.The 2015 breach of the Office of Personnel Management's (OPM) files on government employees and security clearance background files.¶ History of Government Cyber Incidents¶ David Inserra and Paul Rosenzweig of the Heritage Foundation produced a good (but admittedly not complete) listing of more than 20 federal government cybersecurity breaches in 2013 and 2014. The U.S. General Accountability Office (GAO) released a report in April 2014 that found that 24 major federal agencies did not consistently demonstrate that they are effectively responding to cyber incidents. In addition, they were not adequately determining the impact of the incident or appropriately documenting it in accordance with NIST guidance. The GAO notes that in 2013, the 24 major U.S. agencies reported 43,391 incidents to US-CERT. That is an average of 1,808 incidents per agency that year.¶ The GAO's findings are in line with what happened at OPM. The breach first occurred in December 2014. Now — nearly six months later — OPM is disclosing that it discovered 4.1 million records on current and former government employees was breached and that the investigation revealed a separate intrusion into the background check database. To me, this indicates OPM is riddled with gaps and deficiencies in its security program and its incident response capabilities are lacking. Likewise, the Manning and Snowden breaches were not detected internally, but revealed by third parties.¶ The U.S. government needs to get its own house in order before it begins to tell the private sector how to manage cyber threats. NIST has developed world-class information security materials that are free, well written, and aligned with internationally accepted best practices and standards. The Federal Information Security

Management Act (FISMA), enacted in 2002, is one of the best pieces of legislation on the books. It requires an enterprise security program and incorporates NIST guidance.¶ Best Practices That Would Have Prevented Manning, Snowden and OPM Breaches¶ The problem? The government doesn't follow its own laws and guidance.

Cyber attacks – power grid

Cyber attacks on power grids have happened before and there was no power outage – barely any attacks on power grids are cyber

Jazz Shaw 3/25, a heretical, Northeastern former RINO and the weekend editor at HotAir.com, expert in security-related issues, "Are we ready for an attack on the power grid?," 3/25/15, http://hotair.com/archives/2015/03/25/are-we-ready-for-an-attack-on-the-power-grid/

While cyber attacks garner a lot of the media attention, they aren't as numerous as the headline numbers would indicate. The report lists 362 attacks on power stations and utilities between 2011 and 2014, but of those, only 14 were cyber attacks. The vast majority of assaults were "physical" in nature and the method may come as something of a surprise. People are shooting up transformers. A lot of these might be attributed to random acts of vandalism or drunken stunts by teenagers. In 2013, however, there was an actual assault which was clearly more than just dangerous hijinks:

"Some of the worst fears of those in charge of the power grid's security came true shortly before 1 a.m. on April 16, 2013, when unknown attackers unleashed a coordinated attack on Pacific Gas & Electric's Metcalf substation in northern California.

The attackers severed six underground fiber-optic lines before firing more than 100 rounds of ammunition at the substation's transformers, causing more than $15 million in damage.

The intentional act of sabotage, likely involving more than one gunman, was unlike any previous attack on the nation's grid in its scale and sophistication.

The Metcalf attack was fairly well covered in the press, but the story faded quickly from the national consciousness. The reason for this is something which might inspire a bit more confidence in the current system than some analysts are demonstrating. Even though the attackers essentially destroyed some huge, expensive transformers and severed multiple cables, there was no power outage as a result of it. The grid adjusted, shifted the loads and kept the power flowing. To take out a large section of the grid takes a bit more effort – and knowledge – than that."

Cyber-attacks – military retaliation

Non-unique – there's been dozens of cyber-attacks, military retaliation hasn't happened yet

Riley **Walters 14**, Research Assistant, Douglas and Sarah Allison Center for Foreign and National Security Policy, The Davis Institute for National Security and Foreign Policy at The Heritage Foundation, "Cyber Attacks on U.S. Companies in 2014," 10/27/14, http://www.heritage.org/research/reports/2014/10/cyber-attacks-on-us-companies-in-2014

The spate of recent data breaches at big-name companies such as JPMorgan Chase, Home Depot, and Target raises questions about the effectiveness of the private sector's information security. According to FBI Director James Comey, "There are two kinds of big companies in the United States. There are those who've been hacked…and those who don't know they've been hacked."[1]

A recent survey by the Ponemon Institute showed the average cost of cyber crime for U.S. retail stores more than doubled from 2013 to an annual average of $8.6 million per company in 2014.[2] The annual average cost per company of successful cyber attacks increased to $20.8 million in financial services, $14.5 million in the technology sector, and $12.7 million in communications industries.

This paper lists known cyber attacks on private U.S. companies since the beginning of 2014. (A companion paper discussed cyber breaches in the federal government.)[3] By its very nature, a list of this sort is incomplete. The scope of many attacks is not fully known. For example, in July, the U.S. Computer Emergency Readiness Team issued an advisory that more than 1,000 U.S. businesses have been affected by the Backoff malware, which targets point-of-sale (POS) systems used by most retail industries.[4] These attacks targeted administrative and customer data and, in some cases, financial data.

This list includes only cyber attacks that have been made known to the public. Most companies encounter multiple cyber attacks every day, many unknown to the public and many unknown to the companies themselves.

The data breaches below are listed chronologically by month of public notice.

January

Target (retail). In January, Target announced an additional 70 million individuals' contact information was taken during the December 2013 breach, in which 40 million customer's credit and debit card information was stolen.[5]

Neiman Marcus (retail). Between July and October 2013, the credit card information of 350,000 individuals was stolen, and more than 9,000 of the credit cards have been used fraudulently since the attack.[6] Sophisticated code written by the hackers allowed them to move through company computers, undetected by company employees for months.

Michaels (retail). Between May 2013 and January 2014, the payment cards of 2.6 million Michaels customers were affected.[7] Attackers targeted the Michaels POS system to gain access to their systems.

Yahoo! Mail (communications). The e-mail service for 273 million users was reportedly hacked in January, although the specific number of accounts affected was not released.[8]

April

Aaron Brothers (retail). The credit and debit card information for roughly 400,000 customers of Aaron Brothers, a subsidiary of Michaels, was compromised by the same POS system malware.[9]

AT&T (communications). For two weeks AT&T was hacked from the inside by personnel who accessed user information, including social security information.[10]

May

eBay (retail). Cyber attacks in late February and early March led to the compromise of eBay employee log-ins, allowing access to the contact and log-in information for 233 million eBay customers.[11] eBay issued a statement asking all users to change their passwords.

Five Chinese hackers indicted. Five Chinese nationals were indicted for computer hacking and economic espionage of U.S. companies between 2006 and 2014. The targeted companies included Westinghouse Electric (energy and utilities), U.S. subsidiaries of SolarWorld AG (industrial), United States Steel (industrial), Allegheny Technologies (technology), United Steel Workers Union (services), and Alcoa (industrial).[12]

Unnamed public works (energy and utilities). According to the Department of Homeland Security, an unnamed public utility's control systems were accessed by hackers through a brute-force attack[13] on employee's log-in passwords.[14]

June

Feedly (communications). Feedly's 15 million users were temporarily affected by three distributed denial-of-service attacks.[15]

Evernote (technology). In the same week as the Feedly cyber attack, Evernote and its 100 million users faced a similar denial-of-service attack.[16]

P.F. Chang's China Bistro (restaurant). Between September 2013 and June 2014, credit and debit card information from 33 P.F. Chang's restaurants was compromised and reportedly sold online.[17]

August

U.S. Investigations Services (services). U.S. Investigations Services, a subcontractor for federal employee background checks, suffered a data breach in August, which led to the theft of employee personnel information.[18] Although no specific origin of attack was reported, the company believes the attack was state-sponsored.

Community Health Services (health care). At Community Health Service (CHS), the personal data for 4.5 million patients were compromised between April and June.[19] CHS warns that any patient who visited any of its 206 hospital locations over the past five years may have had his or her data compromised. The sophisticated malware used in the attack reportedly originated in China. The FBI warns that other health care firms may also have been attacked.

UPS (services). Between January and August, customer information from more than 60 UPS stores was compromised, including financial data,[20] reportedly as a result of the Backoff malware attacks.

Defense Industries (defense). Su Bin, a 49-year-old Chinese national, was indicted for hacking defense companies such as Boeing.[21] Between 2009 and 2013, Bin reportedly worked with two other hackers in an attempt to steal manufacturing plans for defense programs, such as the F-35 and F-22 fighter jets.

September

Home Depot (retail). Cyber criminals reportedly used malware to compromise the credit card information for roughly 56 million shoppers in Home Depot's 2,000 U.S. and Canadian outlets.[22]

Google (communications). Reportedly, 5 million Gmail usernames and passwords were compromised.[23] About 100,000 were released on a Russian forum site.

Apple iCloud (technology). Hackers reportedly used passwords hacked with brute-force tactics and third-party applications to access Apple user's online data storage, leading to the subsequent posting of celebrities' private photos online.[24] It is uncertain whether users or Apple were at fault for the attack.

Goodwill Industries International (retail). Between February 2013 and August 2014, information for roughly 868,000 credit and debit cards was reportedly stolen from 330 Goodwill stores.[25] Malware infected the chain store through infected third-party vendors.

SuperValu (retail). SuperValu was attacked between June and July, and suffered another malware attack between late August and September.[26] The first theft included customer and payment card information from some of its Cub Foods, Farm Fresh, Shop 'n Save, and Shoppers stores. The second attack reportedly involved only payment card data.

Bartell Hotels (hotel). The information for up to 55,000 customers was reportedly stolen between February and May.[27]

U.S. Transportation Command contractors (transportation). A Senate report revealed that networks of the U.S. Transportation Command's contractors were successfully breached 50 times between June 2012 and May 2013.[28] At least 20 of the breaches were attributed to attacks originating from China.

October

J.P. Morgan Chase (financial). An attack in June was not noticed until August.[29] The contact information for 76 million households and 7 million small businesses was compromised. The hackers may have originated in Russia and may have ties to the Russian government.

Dairy Queen International (restaurant). Credit and debit card information from 395 Dairy Queen and Orange Julius stores was compromised by the Backoff malware.[30]

Snapsave (communications). Reportedly, the photos of 200,000 users were hacked from Snapsave, a third-party app for saving photos from Snapchat, an instant photo-sharing app.[31]

Foreign and domestic companies are moving against the USFG over outrage at backdoors – spurring data localization and losses in cloud computing sector

Mieke **Eoyang 14**, director of the National Security Program at Third Way, served on the staff of the House Intelligence and Armed Services Committees, and was chief of staff to Rep. Anna G. Eshoo, 11/24/14, "A Modest Proposal: FAA Exclusivity for Collection Involving U.S. Technology Companies," http://www.lawfareblog.com/modest-proposal-faa-exclusivity-collection-involving-us-technology-companies

Even if the USA Freedom Act had moved forward on the Senate floor during the lame duck session, it would not have been sufficient to address all the concerns raised in the current electronic surveillance debates. The USA Freedom Act focuses on limiting collection of data on Americans here in the US under Section 215 of the PATRIOT ACT, and as such, it's a crucial reform.¶Under existing statutes on electronic surveillance, Section 215 and the FISA Amendments Act (FAA), the government can compel cooperation from the companies that hold the data under certain statutory conditions. Both of these statutes authorize collection programs that the companies are aware of and must participate in. In these programs, the government knocks at the front door to get the data it needs.¶But reforming these programs doesn't address another range of problems---those that relate to allegations of overseas collection from US companies without their cooperation.¶Beyond 215 and FAA, media reports have suggested that there have been collection programs that occur outside of the companies' knowledge. American technology companies have been outraged about media stories of US government intrusions onto their networks overseas, and the spoofing of their web pages or products, all unbeknownst to the companies. These stories suggest that the government is creating and sneaking through a back door to take the data. As one tech employee said to me, "the back door makes a mockery of the front door."¶As a result of these allegations, **companies are moving** to encrypt their data **against their own government**; they are **limiting** their **cooperation with NSA**; and they are pushing for reform. Negative international reactions to media reports of certain kinds of intelligence collection abroad have resulted in a backlash against American technology companies, **spurring data localization** requirements, rejection or cancellation of American contracts, and raising the specter of **major losses in the cloud computing industry**. These allegations could dim one of the few bright spots in the American economic recovery: tech.¶Without commenting on the accuracy of these media reports, the perception is still a problem even if the media reports of these government collection programs are not true---or are only partly true. The tech industry believes them to be true, and more importantly, their customers at home and abroad believe them to be true, and that means they have huge impact on American business and huge impact as well on the relationship between these businesses and an intelligence community that depends on their cooperation.¶So, how should we think about reforms in response to this series of allegations the Executive Branch can't, or won't, address? How about making the FAA the exclusive means for conducting electronic surveillance when the information being collected is in the custody of an

American company? This could clarify that the executive branch could not play authority shell-games and claim that Executive Order 12333 allows it to obtain information on overseas non-US person targets that is in the custody of American companies, unbeknownst to those companies.¶ As a policy matter, it seems to me that if the information to be acquired is in the custody of an American company, the intelligence community should ask for it, rather than take it without asking. American companies should be entitled to a higher degree of forthrightness from their government than foreign companies, even when they are acting overseas. Under the FAA, we have a statutory regime that creates judicial oversight and accountability to conduct electronic surveillance outside the US for specific purposes: foreign intelligence (or traditional espionage), counter-terrorism, and prevention of WMD proliferation. It addresses protections for both non-US and US persons. It creates a front-door, though compelled, relationship under which the intelligence community can receive communications contents without individual warrants but with programmatic judicial oversight.¶ FAA exclusivity would say to the rest of the world that when the US conducts bulk electronic surveillance overseas, we are doing so for a particular, national security purpose. The FAA structure with FISC review provides an independent check that the statutory purposes are met. Through transparency agreements with the government, the American companies are able to provide their customers with some sense of how many requests are made.¶

International mistrust over NSA programs have accelerated internet fragmentation – domestic legislation is the only way to solve

Laura **Donohue 15**, Professor of Law at Georgetown Law, Director of Georgetown's Center on National Security and the Law, and Director of the Center on Privacy and Technology, writes on U.S. Constitutional Law, and national security and counterterrorist law in the US, A.B., Dartmouth; M.A., University of Ulster, Northern Ireland; Ph.D., Cambridge University; J.D., Stanford, March 2015, "High Technology, Consumer Privacy, and U.S. National Security," http://scholarship.law.georgetown.edu/facpub/1457/

Documents released over the past year detailing the National Security Agency's ("NSA") telephony metadata collection program and interception of international content under the Foreign Intelligence Surveillance Act (FISA) implicated U.S. high technology companies in government surveillance. 1 The result was an immediate, and detrimental, impact on U.S. corporations, the economy, and U.S. national security. The first Snowden documents, printed on June 5, 2013, revealed that the government had served orders on Verizon, directing the company to turn over telephony metadata under Section 215 of the USA PATRIOT Act. The following day, The Guardian published classified slides detailing how the NSA had intercepted international content under Section 702 of the FISA Amendments Act. The type of information obtained ranged from E-mail, video and voice chat, videos, photos, and stored data, to Voice over Internet Protocol, file transfers, video conferencing, notifications of target activity, and online social networking. The companies involved read like a who's who of U.S. Internet giants: Microsoft, Yahoo, Google, Facebook, PalTalk, YouTube, Skype, AOL, and Apple. More articles highlighting the extent to which the NSA had become embedded in the U.S. high tech industry

followed. In September 2013 ProPublica and the New York Times revealed that the NSA had enjoyed considerable success in cracking commonly used cryptography.The following month the Washington Post reported that the NSA, without the consent of the companies involved, had obtained millions of customers' address book data. In one day alone, some 444,743 email addresses from Yahoo, 105,068 from Hotmail, 82,857 from Facebook, 33,697 from Gmail, and 22,881 from other providers The extent of upstream collection stunned the public, as did slides demonstrating how the NSA had bypassed the companies' encryption, intercepting data as it transferred between the public Internet and the Google cloud. 8 Documents further suggested that the NSA had helped to promote encryption standards for which it already held the key or whose vulnerabilities the agency understood but had not taken steps to address. 9 Beyond this, press reports indicated that the NSA had at times posed as U.S. companies—without their knowledge—in order to gain access to foreign targets. In November 2013 Der Spiegel reported that the NSA and the United Kingdom's Government Communications Headquarters ("GCHQ") had created bogus versions of Slashdot and LinkedIn, so that when employees from the telecommunications firm Belgacom tried to access the sites from corporate computers, their requests were diverted to the replica sites that then injected malware into their machines.10 As a result of the growing public awareness of these programs, U.S. companies have lost revenues, even as non-U.S. firms have benefited. 11 In addition, numerous countries, concerned about consumer privacy as well as the penetration of U.S. surveillance efforts in the economic and political spheres, have **accelerated data localization initiatives**, begun restricting U.S. companies' access to local markets, and introduced new privacy protections, with implications for the future of Internet governance and U.S. economic growth. These effects raise attendant concerns about U.S. national security. It could be argued that some of these effects, such as data localization initiatives, are merely opportunistic—i.e., other countries are merely using the NSA revelations to advance national commercial and political interests.12 Even if true, however, the NSA programs provide other countries with an opportunity. They have weakened the U.S. hand in the international arena. Congress has the ability to redress the current situation. First, and most importantly, **reform of the Foreign Intelligence Surveillance Act** would provide for greater restrictions on NSA surveillance. Second, **new domestic legislation could extend better protections to consumer privacy.** These shifts would allow U.S. industry legitimately to claim a change in circumstance, which would help them to gain competitive ground. Third, the integration of economic concerns at a programmatic level within the national security infrastructure would help to ensure that economic matters remain central to national security determinations in the future.

Laundry list of countries are already adapting data localization laws – US surveillance costs jobs and competitive edge

Laura **Donohue 15**, Professor of Law at Georgetown Law, Director of Georgetown's Center on National Security and the Law, and Director of the Center on Privacy and Technology, writes on U.S. Constitutional Law, and national security and counterterrorist law in the US, A.B., Dartmouth; M.A., University of Ulster, Northern Ireland; Ph.D., Cambridge University; J.D., Stanford, March 2015, "High Technology, Consumer Privacy, and U.S. National Security," http://scholarship.law.georgetown.edu/facpub/1457/

Over the past eighteen months, countries around the world have increasingly adopted data localization laws, restricting the storage, analysis, and transfer of digital information to national borders.45 To some extent, the use of barriers to trade as a means of incubating tech-based industries predated the Snowden releases.46 In the aftermath of the leaks, the dialogue has gained momentum. The asserted purpose is to protect government data and consumer privacy. As of the time of writing, China, Greece, Malaysia, Russia, South Korea, Venezuela, Vietnam, Iran, and others have already implemented local data server requirements. 47 Turkey has introduced new privacy regulations preventing the transfer of personal data (particularly locational data) overseas.48 Others, such as Argentina, India, and Indonesia are actively considering new laws, even as Brazilian president, Dilma Rousseff, has been promoting a law that would require citizens' personal data to be stored within domestic bounds. 49 Germany and France are considering a Schengen routing system, retaining as much online data in the European Union as possible.50 As a regional matter, the European Union (EU) Commission's Vice President, Viviane Reding, is pushing for Europe to adopt more expansive privacy laws.51 In March 2014, the European Parliament passed the Data Protection Regulation and Directive, imposing strict limits on the handling of EU citizens' data.52 Reding announced, "The message the European Parliament is sending is unequivocal: This reform is a necessity, and now it is irreversible. Europe's directly elected parliamentarians have listened to European citizens and European businesses and, with this vote, have made clear that we need a uniform and strong European data protection law, which will. . . strengthen the protection of our citizens." 53 Regardless of where the information is based, those handling the data must obtain the consent of the data subjects to having their personal information processed. They also retain the right to later withdraw consent. Those violating the directive face steep fines, including up to five percent of revenues.54 Apart from the new directive, the Civil Liberties, Justice, and Home Affairs Committee of the European Parliament passed a resolution calling for the end of the US/EU Safe Harbor agreement. 55 Some 3000 U.S. companies rely on this framework to conduct business with the EU.56 In May 2014, the EU Court of Justice ruled that users have a "right to be forgotten" in their use of online search engines. 57 The case derived from a complaint lodged against a Spanish newspaper, as well as Google Spain and Google Inc., claiming that notice of the plaintiff's repossessed home on Google's search engine infringed his right to privacy because the incident had been fully addressed years before. He requested that the newspaper be required to remove or alter the pages in question to excise data related to him, and that Google Spain or Google Inc. be required to remove the information.58 The EU court found that even where the physical server of a company processing information is not located in Europe, as long as the company has a branch or subsidiary and is doing business in a Member state, the 1995 Data Protection Directive applies.59 Because search engines contain personal data, they are subject to such data protection laws. The court recognized that, under certain conditions, individuals have the "right to be forgotten"—i.e., the right to request that search engines remove links containing personal information. Data that is inaccurate, inadequate, irrelevant, or excessive may be removed. Not absolute, the right to be forgotten must be weighed against competing rights, such as freedom of expression and the media.60 Various country-specific privacy laws are similarly poised to be introduced. Their potential economic impact is substantial. The Information Technology and Innovation Fund estimates that data privacy rules could retard the growth of the technology industry by up to four percent, impacting U.S. companies' ability to expand and forcing them out of existing markets.61 The current dialogue is merely the latest in a series of growing concerns about the absence of effective privacy protections within the U.S. legal regime. High tech companies appear to see this as a concern. As Representative Justin Amash (MI-R) has explained, "Businesses increasingly recognize that our government's out-of-control surveillance hurts their bottom line and costs American jobs. It violates the privacy of their customers and it erodes American businesses' competitive edge."62 It is with the impact of lack of privacy controls in the surveillance sphere on U.S. competitiveness in mind that, in December 2013, some of the largest U.S. Internet companies launched a campaign to pressure the government to reform the NSA programs. Microsoft General Counsel Brad Smith explained: "People won't use technology they don't trust." He added, "Governments have put this trust at risk, and governments need to help restore it."63 Numerous high technology CEOs supported the initiative, such Google's Larry Page, Yahoo's Marissa Mayer, and Facebook's Mark Zuckerberg. 64 The aim is to limit government authority to collect user data, to institute better oversight and accountability, to ensure greater transparency about what the government is requesting (and obtaining), to increase respect for the free flow of data across borders, and to avoid political clashes on a global scale. Mayer, explained, "Recent revelations about government surveillance activities have shaken the trust of our users, and it is time for the United States government to act to restore the confidence of citizens around the world."65

Censorship I/L

Countries are using NSA leaks as justification for fragmentation and censorship

Laura **Donohue 15**, Professor of Law at Georgetown Law, Director of Georgetown's Center on National Security and the Law, and Director of the Center on Privacy and Technology, writes on U.S. Constitutional Law, and national security and counterterrorist law in the US, A.B., Dartmouth; M.A., University of Ulster, Northern Ireland; Ph.D., Cambridge University; J.D., Stanford, March 2015, "High Technology, Consumer Privacy, and U.S. National Security," http://scholarship.law.georgetown.edu/facpub/1457/

There are various ways in which the NSA's apparent failure to take account of the potential impact of public knowledge of the programs on U.S. industry may have acted to undermine U.S. security beyond weakening the economy. The backlash risks shielding foreign government actions from public scrutiny. It potentially undermines the ability of the United States to develop international norms against ubiquitous surveillance, which can be used for political or economic espionage. And it raises the possibility that the country will lose digital sight of active threats against the United States As was previously noted, the data localization movement, given momentum by the NSA revelations, risks the creation of distinct, parallel Internets, which would stifle the free flow of information that connects not just economies, but cultures and people, with potential rollbacks for an increasingly globalized world. This would affect the country's interest in democratic engagement and it would harm the United States' international reach. The creation of national search engines, national email systems, and national social networks, moreover, means that foreign governments will have direct control over electronic communication networks, facilitating censorship and domestic surveillance and limiting outside view of the extent to which such steps are being taken. When Turkish Prime Minister Recep Erdoğan, for instance, tried to shut town¶ Twitter, the international community was immediately put on notice. 111¶ #TwitterisblockedinTurkey #dictatorerdogan, and #occupytwitter quickly moved¶ to popular trending topics internationally. 112 The United States, EU, and others¶ formally objected to the action through diplomatic channels. Had Turkey been an isolated network, it may have secretly censored the politically damaging information (in this case, leaks revealing corruption in the Erdoğan government),¶ without generating such immediate, international attention. Along the same lines, in July 2014 President Vladimir Putin signed a new law requiring Internet companies to store all Russian users' data within domestic borders. Russia's media and parliament members have used Edward Snowden's leaks about NSA spying to rally support for the new law. 113 The legislation,¶ though, serves to intensify Putin's control over Internet companies. 114 With internal data centers, it will be easier for the Russian president to enforce censorship policies and to collect information about members of the political opposition. The law could also give Putin an excuse to shut down major social media networks if they fail to comply with the new regulations.

Exposed NSA programs have made China push for internet fragmentation and increase censorship – only repeal solves

Cyber Forum 5/11, a joint project of the Haifa Center for Law & Technology and the Minerva Center for the Rule of Law, dedicated to the study of cyber regulation, it's main goal is to promote and fund experts and research activities in the fields of Cyberspace and Law and tech and relay them to the public, ""Balkanization" of the Internet as a Response to Cybersecurity Threats – a Viable Solution or a Serious Obstacle for the Future of the Net? / Ido Kilovaty,"5/11/15, http://weblaw.haifa.ac.il/he/Research/ResearchCenters/cyberforum/cyberblog/Lists/Posts/Post.aspx?ID=13

One of the main revolutionary aspects of the Internet is attributed to its universality, or, in other words, the fact that the Internet is borderless, provides a medium for free flow of information and easy communication with nearly any computer in the world. However, these great advantages gradually began to take their toll. Today, the main vulnerabilities of many computer systems are precisely because they are accessible from any location in the world, and with the growing national dependency on the internet, this access is oftentimes abused for malicious purposes, such as surveillance, disruption of service, and more rarely, destruction of hardware. There is a variety of methods to respond to severe cybersecurity threat, however, each method has its advantages and disadvantages, and in any case, new cyber threats will be able to challenge the defensibility of any cyber infrastructure. Recently, this reality gave rise to calls to locally segregate the Internet in certain countries, so that foreign access to the Internet in these particular countries will be heavily filtered and limited. This phenomenon is often referred to as "balkanization" of the Internet, "splinternet", or more simply – fragmentation of the Internets, all of which are synonyms for "networks that are walled off from the rest of the Web".[i] As far back as 1997, MIT researchers Alstyne and Brynjolfsson argued that increased connectivity of the Internet will not necessarily lead to a "global village" but that "It is also possible that improving communications access through emerging technology will fragment society and balkanize interactions." However, recently exposed NSA surveillance program sparked the debate over the balkanization of the Net once again, as countries became worried about the fact that most Internet's traffic is routed through the United States, thus making it vulnerable to abuse.[ii] Tim Berners-Lee, founder of the World Wide Web, warned that "We risk losing all that we have gained from the Web so far and all the great advances still to come."[iii] Berners-Lee's point is very aptly put, because certain countries have already splintered in one way or the other from the universal Internet network, and some countries are very seriously considering fragmenting their national Internet networks. China, for example, developed over the last decade its own system of filtering and censoring foreign traffic. "The Golden Shield" (or, colloquially, "The Great Firewall of China") is China's strict method of blocking unwanted traffic entering into China's Net.[iv] In fact, it is not only that Chinese information databases and governmental websites are difficult to access from abroad, but also that access to foreign websites and services, such as Facebook, Twitter and YouTube are often blocked for Internet users within China.[v] Additionally, possible loopholes in the system, such as the use of Virtual Private Networks (VPN) are also tackled by the Chinese Government. Brazil's President, Dilma Rouseff, called upon UN Member States to "disconnect from U.S. Internet hegemony and develop their own sovereign Internet and governance structures" in her speech at the UN General Assembly.[vi] Following the aftermath of Snowden revelations on the NSA surveillance programs, Brazil announced its plans to promote its own networking technology, and to promote local routing of traffic within Brazil.[vii] According to Brazil, these plans represent a defensive response to U.S. "out-of-control surveillance machine."[viii]

Additional countries are currently considering walling-off part of their Internet. For example, both France and Germany proposed to create "Schengen routing"[ix], a European data network that will route EU Internet traffic only within the borders of the EU.[x] This is to show that even U.S.'s closest allies are in a way deeply concerned that the private data of their citizens will be prone to spying. While their motivations could vary, the various plans to wall-off national Internet networks within certain countries would undermine the main purposes and characteristics of the Internet. Firstly, wholly or partially walling-off the Internet will not necessarily protect information from being accessed by "insiders." Edward Snowden is obviously the most popular example to the capabilities and threats posed by insiders.[xi] Hence, information, whether in China or Brazil, is still accessible by individuals within the territories of these countries. In addition, certain blocked activities from abroad could still take place by the use of BotNets (computers that receive and execute commands received from a remote computer) that are located in these countries. Secondly, splintering the Internet will be devastating for economic cooperation and free flow of information. The splintering of the Internet will mean that services such as Google and Facebook will have to establish local operational centers in the splintered countries to maintain service in that country.[xii] In addition, information from the walled-off networks will not be easily accessible globally, which will lead to an informational barrier which has its apparent economic and political effects.

In addition to analyzing official risk communication efforts, this chapter also¶ explores a secondary yet intertwining theme, namely, the construction of¶ containment discourses through narratives about the panicked public who¶ calmed down after official interventions. As official risk discourses repeat edly claimed that SARS was brought under control, in-depth analysis of the¶ containment discourses can help to shed light on how these risk discourses¶ helped to persuade the panicked public, at least temporarily, that the epidemic¶ was indeed contained by clinicians and researchers.¶ Despite existing claims of mass panic as common responses to crises,¶ studies of people's responses to disasters and fire situations reveal that the¶ trope of the panicked public is inaccurate (Quarantelli, "Panic Behavior,"¶ "Sociology"; Wenger). Paul Slovic, Melissa L. Finucane, Ellen Peters, and¶ Donald MacGregor emphasize the interactive relationship between emotion¶ and reason, the wide range of meanings conveyed by such emotions, and,¶ thus, the need for risk analysts to take the emotions of the public seriously.¶ Similarly, Sabine Roeser argues that instead of connecting reason and emotion with rationality and irrationality, respectively, emotional responses to¶ risks are rational, and they range from "choice, control, and responsibility as¶ well as uncertainty and insecurity" depending on the "serious consideration¶ of [individual] responsibilities" and of future reactions (xi).¶ Citing examples of ad hoc volunteers working alter the September ll¶ attacks and public responses in the 1918 Spanish influenza pandemic (Barry,¶ "Determined Volunteers"; Crosby), Thomas A. Glass and Monica Schoch-¶ Spana argue that public responses to crises have been examples of "resource-¶ fulness, civility, and mutual aid" (2l8). Therefore, characterizing people's¶ crisis responses as irrational is counterproductive. In addition to bringing no benefit, it also "leads public health professionals and emergency managers¶ to miss the opportunity to harness the capacities of the civilian population¶ to enhance the effectiveness of a large-scale response" (Wenger; Glass and¶ Schoch-Spana 217). Glass and Schoch-Spana emphasize the context sensitive nature of behavioral responses because in times of disaster, "the action¶ of emergency managers may determine the extent and duration of panic"¶

(218). ln addition, because of the dominance of the “command-and-control'¶ model of disaster management," "behavior that is not sanctioned by officials¶ is erroneously defined as panic, rather than as an effective response of rersourceful people acting in concert" (Glass and Schoch-Spana 218). The fact¶ that mass panic took place in Guangdong before the official press conference¶ indicates the close connections between the panicked public and the lack of¶ timely official risk communication in this case. Beijing witnessed a similar¶ pattern of mass panic following official denial: "Unable to rely on government¶ reports, Beijing`s citizens were forced to depend on the rumor mill, which¶ was turning at 1,000 R.P.M about quarantining the capital and shop closure¶ in late April (Beech).¶ Several studies investigate how media and medicine employ rhetorical¶ strategies to produce containment discourses and to dispel public panic about¶ emerging epidemics. Sheldon Ungar examines what he calls a “containment¶ package” employed by American media to frame the hot crisis of Ebola virus¶ outbreak in Zaire in 1995. Such a package consists of the following components: citing authorities to play down the anxiety and to offer assurance to¶ counter public panic, resorting to the metaphor of otherness to create distance between people in the United States and those living in Zaire, blaming a failed poor state as the origin of the disease, stressing protection offered by local strict infection-control measures, and finally offering disease detective narratives about intervening foreign experts and about the search for its host. Priscilla Wald adds a few more elements for containment discourses: offering advice against panic, predicting the curative power of science, stressing personal responsibility, and reinforcing safety practices.¶ The analysis here of the containment strategies employed in governmental¶ and media discourses suggests the use of some common strategies and reveals¶ some radically different approaches. Governmental authorities and medical experts were cited repeatedly to offer assurance that all-out efforts had¶ been made and that desirable outcomes had been achieved in the battlefield¶ against SARS. Collaborative institutional efforts ofd isinfection, cleansing, and rumor dispelling received prominent media coverage. In addition, the¶ media used two terms, containment and control, simultaneously to provide¶ different and confusing claims about the success of the local anti-SA RS campaign. The term under control quickly became adopted as the official way to¶ describe an all-out victory in the regional battle against SARS.¶ Interesting but perhaps not surprising, with SARS being a novel disease¶ originating from a province, little scapegoating took place in risk discourses.¶ In addition, because of the widespread panic, much emphasis was placed on¶ the containment of social side effects of SARS: overpricing, rumormongering,¶ and panic buying. Indeed, the institutional policies of selective censorship¶ and partial disclosure helped to successfully transfer the impression of the¶ success control of side effects of SARS to that of a total success in containing¶ the epidemic of SARS itself

Internet fragmentation causes de-globalization

Eugene **Kaspersky 13**, specialist in the information security field, he heads the global IT security company Kaspersky Lab, Kaspersky Lab operates in almost 200 countries, “What will happen if countries carve up the internet?”, 3/2/13, http://www.theguardian.com/media-network/media-network-blog/2013/dec/17/internet-fragmentation-eugene-kaspersky

Twenty years ago, there was nothing like the internet we have today, the global all-connecting network that has become an integral part of our lives. Over the last few decades, we have all witnessed how it has grown exponentially and come to change our everyday existence – keeping most of us online all the time (with accompanying frustrations as well as benefits) and making communications and information exchange unprecedentedly seamless and fast.¶ But I fear that we are at a turning point for the internet, and may even be going into reverse. The utopia of a borderless digital global village may be coming to an end. Fragmentation of the world wide web is already taking place – along national borders.¶ Edward Snowden's revelations on the scale of US online surveillance – the Guardian's massive scoop of 2013 – may be giving rise to a new era in history. The disclosures have already given rise to significant changes, including skyrocketing growth of the number of users striving for online privacy and choosing anonymity tools and browsers, and the astonishing swell in the value of bitcoins, the most widely used anonymous online peer-to-peer currency.¶ media & tech network.¶ But what may prove to be the ultimate game-changer is the fragmentation of the internet. A number of countries, among them Brazil and Germany, are considering carving out their own sectors of the internet, or may even **have already started the process**. If the trend spreads, which is likely, such fragmentation will bring about the creation of parallel networks as governments the world over try to isolate their critically important communications. Such networks with no physical connection to the internet are already widely used for military communications.¶ The new networks will serve only governments and large enterprises with the aim of protecting national critical infrastructure from any possible foreign intrusion. This will mean they'll be more secure and reliable, but they'd come at a price, quite literally. Building such networks requires both huge investment over many years (funded by taxpayers) and a great deal of technical expertise (diverted from public services and innovative projects).¶ This is probably good news if you're graduating with an IT engineering degree soon. Less so if you want to work abroad, because governments will prefer homegrown talent that can pass all the necessary security checks. Also, many countries – even some high-tech giants like Germany, Japan and France – could face a deficit of such workers.¶ Internet fragmentation will bring about a paradoxical **de-globalisation of the world**, as communications within national borders among governmental bodies and large national companies become increasingly localised.¶ Ordinary users will hardly perceive any change while these state-run parallel networks are being built, but there is another aspect of this global trend that will affect everyone directly**. Some countries are already seriously considering** making sure as much of their internet traffic as possible stays within their national borders.¶ In some countries, for example Brazil, there's talk about forcing global giants such as Google and Facebook to locate their data centres locally to process local communications. If this trend gains worldwide momentum, it will be a disaster for global IT giants and pose a threat of **full-blown Balkanisation of the internet.** The process would probably foster the creation of local search engines, email systems, social networks and so on – an intimidating prospect for publicly listed companies.¶

De-globalization Impacts

De-globalization hinders economic growth and causes war and poverty

Evan **Hillebrand 10**, Professor of International Economics at the Patterson School, Associate Professor of International Economics, Ph.D and M.A. in Economics, expert in

geopolitical modeling, economic statecraft and globalization, May 2010, "Deglobalization Scenarios: Who Wins? Who Loses?," http://www.uky.edu/~ehill2/dynpage_upload/files/DeglobalizationScenarios.pdf

Deglobalization in the form of reduced trade interdependence, reduced capital¶ flows, and reduced migration has few positive effects, based on this analysis with¶ the International Futures Model. **Economic growth is cut** in all but a handful of¶ countries, and is cut more in the non-OECD countries than in the OECD¶ countries. Deglobalization has a mixed impact on equality. In many non-OECD¶ countries, the cut in imports from the rest of the world increases the share of¶ manufacturing and in 61 countries raises the share of income going to the poor.¶ But since average productivity goes down in almost all countries, this gain in¶ equality comes at the expense of reduced incomes and **increased poverty in** almost¶ **all countries**. The only winners are a small number of countries that were small and poor and not well integrated in the global economy to begin with—and the gains from deglobalization even for them are very small.¶ Politically, deglobalization makes for less stable domestic politics and a greater **likelihood of war**. The likelihood of state failure through **internal war**,¶ projected to diminish through 2035 with increasing globalization, rises in the deglobalization scenario particularly among the non-OECD democracies. Similarly, deglobalization makes for more fractious relations among states and the probability for interstate war rises. These are dramatic results and have strong implications for policy. For the United States and other OECD countries, deglobalization might economically benefit a small fraction of citizens and companies, but it would cut overall economic growth and reduce average living standards. It would seem far better to deal with the negative aspects of globalization directly by improving trade adjustment assistance, providing more secure access to health care, by upgrading the skills of the workforce, and by refocusing academic research toward areas that will spur productivity growth. For the non-OECD countries, deglobalization has even worse results, suggesting that those countries need to reengage in global trade negotiations and seek compromises that can benefit all participants.

De-globalization hurts the global economy and sparks conflict between countries

Matthew **Boesler 13**, reporter for Business Insider, hosted Benzinga Radio, business news and investing program, holds a degree in economics from the University of Michigan, 10/1/13, "MORGAN STANLEY ECONOMIST: I Worry About A 1913 Scenario With Dire Consequences For The Global Economy," http://www.businessinsider.com/economist-worries-about-de-globalization-2013-10

In his latest note to clients, Morgan Stanley head of global economics Joachim Fels relays an idea he says has him increasingly worried these days, even though, in his words, it is "no more than a tentative thesis that still needs to be fleshed out and checked for robustness."¶ "In short, I wonder whether just as 1913 marked the end of first Golden Age of globalisation that had begun in 1870, 2013 may mark the end of our age of globalisation, which accelerated since the 1980s and 1990s

after many emerging markets opened up to international trade and capital flows," says Fels. "To be sure, I'm not predicting the world wars, mass sufferings and economic depressions of the three dark decades following 1913, but I do worry about a creeping trend towards a de-globalisation of economic activity and capital flows."¶ Fels points to the Federal Reserve's easy-money policies following the financial crisis, which caused investors to scramble into investments in emerging markets, a trend that is now reversing.¶ The economist envisions problems down the road as a result, as he explains in his note (emphasis added):¶ Why worry now if even the Great Financial Crisis of 2008 didn't result in a de-globalisation of economic activity and financial markets? Well, neither did the Panic of 1907 on Wall Street, which preceded the final hurrah of the Golden Age of globalisation and paved the way for the creation of the Federal Reserve in, yes, 1913. Following the 2008 crisis, central banks and governments around the world opened the floodgates to prevent a depression (and rightly so) and fuelled a powerful rebound in economic growth, global trade, asset markets and capital flows. Yet, one unintended consequence of QE and ZIRP was a rush of liquidity into emerging markets, which offered a seemingly successful growth model and thus higher expected returns.¶ Five years on, the EM growth model looks severely challenged, as Manoj Pradhan and I already pointed out more than a year ago. Many companies in the old industrialised countries are repatriating production that they sent offshore during the globalisation frenzy, and investors who burned their fingers in the quest for higher returns in EM are reconsidering their decision to globalise their portfolios. A localisation or renationalisation of investment has already taken place in euro area financial markets in response to the euro area debt crisis. Could we now see a similar move globally? I hope not, but I wouldn't rule it out.¶ Needless to say, a de-globalisation of economic activity and financial markets **would have dire economic consequences for the global economy** and markets overall, but would also redistribute wealth and create a lot of losers and winners, in my view. And large redistributions of wealth **create conflicts within societies and between countries.** This is what I really worry about. Surely our societies and governments have learned the lessons of history, you may say. The long-term optimist in me believes they have. But then again, back in 1913 at the peak of the Golden Age of globalisation, nobody had a sense of what would unfold.

[In the 1ac under this adv., there's already an economic decline → war card, so this would just fit in there as another scenario]

Surveillance revelations tank U.S cloud-computing competitiveness – tech companies re-localizing in other countries in fear of U.S surveillance – this costs billions

Laura **Donohue 15**, Professor of Law at Georgetown Law, Director of Georgetown's Center on National Security and the Law, and Director of the Center on Privacy and Technology, writes on U.S. Constitutional Law, and national security and counterterrorist law in the US, A.B., Dartmouth; M.A., University of Ulster, Northern Ireland; Ph.D., Cambridge University; J.D., Stanford, March 2015, "High Technology, Consumer Privacy, and U.S. National Security," http://scholarship.law.georgetown.edu/facpub/1457/

Billions of dollars are on the line because of **worldwide concern** that the services provided by U.S. information technology companies are neither secure nor private.13 Perhaps **nowhere is this more apparent than in cloud computing**.¶ Previously, approximately 50% of the worldwide cloud computing revenues¶ derived from the United States.14 The domestic market thrived: between 2008 and¶ 2014, it more than tripled in value.¶ 15 But within weeks of the Snowden leaks, reports had emerged that U.S. companies such as Dropbox, Amazon Web Services,¶ and Microsoft's Azure were losing business.¶ 16 By December 2013, ten percent of the Cloud Security Alliance had cancelled U.S. cloud services projects as a result of the Snowden information.17 In January 2014 a survey of Canadian and British¶ businesses found that one quarter of the respondents **were moving their data outside the U**nited **S**tates.18¶ The Information Technology and Innovation Foundation estimates that¶ declining revenues of corporations that focus on cloud computing and data storage alone could reach $35 billion over the next three years.19 Other commentators, such as Forrester Research analyst James Staten, have put actual losses as high as **$180 billion** by 2016, unless something is done to restore confidence in data held¶ by U.S. companies.20¶ The monetary impact of the NSA programs extends beyond cloud computing to the high technology industry. Cisco, Qualcomm, IBM, Microsoft, and HewlettPackard¶ have all reported declining sales as a direct result of the NSA programs.21¶ Servint, a webhosting company based in Virginia, reported in June 2014 that its¶ international clients had dropped by 50% since the leaks began.22 Also in June, the¶ German government announced that because of Verizon's complicity in the NSA¶ program, it would end its contract with the company, which had previously¶ provided services to a number of government departments.23 As a senior analyst at¶ the Information Technology and Innovation Foundation explained, "It's clear to every single tech company that this is affecting their bottom line."24 The European¶ commissioner for digital affairs, Neelie Kroes, predicts that the fallout for U.S.¶ businesses in the EU alone will amount to billions of Euros.25¶ Not only are U.S. companies losing customers, but they have been forced to spend billions to add encryption features to their services. IBM has invested more than a billion dollars to build data centers in London, Hong Kong, Sydney, and elsewhere, in an effort to reassure consumers outside the United States that their information is **protected from U.S. government surveillance**. 26 Salesforce.com made a similar announcement in March 2014.27 Google moved to encrypt terms¶ entered into its browser.¶ 28 In June 2014 it took the additional step of releasing the¶ source code for End-to-End, its newly-developed browser plugin that allows users¶ to encrypt email prior to it being sent across the Internet.29 The following month¶ Microsoft announced Transport Layer Security for inbound and outbound email,¶ and Perfect Forward Secrecy encryption for access to OneDrive.30 Together with the establishment of a Transparency Center, where foreign governments could review source code to assure themselves of the integrity of Microsoft software, the company sought to put an end to both NSA back door surveillance and doubt about the integrity of Microsoft products.¶ 31¶ Foreign technology companies, in turn, are seeing revenues increase. Runbox,¶ for instance, an email service based in Norway and a direct competitor to Gmail¶ and Yahoo, almost immediately made it publicly clear that it does not comply with¶ foreign court requests for its customers' personal information. 32 Its customer base¶ increased 34% in the aftermath of the Snowden leaks.¶ 33 Mateo Meier, CEO of¶ Artmotion, Switzerland's biggest offshore data hosting company, reported that¶ within the first month of the leaks, the company saw a 45% rise in revenue.34¶ Because Switzerland is not a member of the EU, the only way to access data in a¶ Swiss data center is through an official court order demonstrating guilt or liability;¶ there are no exceptions

for the United States.35 In April 2014, Brazil and the EU,¶ which previously used U.S. firms to supply undersea cables for transoceanic communications, decided to build their own cables between Brazil and Portugal,¶ using Spanish and Brazilian companies in the process. 36 OpenText, Canada's largest software company, now guarantees customers that their data remains outside the United States. Deutsche Telekom, a cloud computing provider, is similarly gaining more customers.37 Numerous foreign companies are **marketing their products as "NSA proof"** or "safer alternatives" to those offered by U.S. firms, **gaining market share** in the process.

NSA leaks destroy cloud-computing competitiveness – companies already cancelling contracts

Elizabeth **MacDonald 13**, a veteran business journalist and is the stocks editor for Fox Business and Fox News, covered the markets, corporate accounting scandals, "NSA Leaks Slam Cloud Computing Industry," 8/9/13, http://www.foxbusiness.com/government/2013/08/09/nsa-leaks-slam-cloud-computing-industry/

U.S. technology companies warn they could lose between $21.5 billion to $35 billion in global cloud computing contracts over the next three years due to negative fallout from the U.S. National Security Agency (NSA) spying programs on Internet users, including emails. A new report from the Information Technology & Innovation Foundation (ITIF), a Washington, D.C.-based think tank, estimates that U.S. cloud computing companies could lose 10% to 20% of the cloud computing market to European or Asian companies due to U.S. spying. That means major players including Google (GOOG), Amazon (AMZN) and Microsoft (MSFT) could be hurt.¶ Global spending on cloud computing is expected to double between 2012 and 2016, whereas the global IT market will only grow by 3%. The global cloud computing market is estimated to be a $207 billion industry by 2016, ITIF says.¶ The NSA's programs "will likely have an immediate and lasting impact on the competitiveness of the U.S. cloud computing industry if foreign customers decide the risks of storing data with a U.S. company outweigh the benefit," the Information Technology & Innovation Foundation warns in a statement. ¶ Neelie Kroes, european commissioner for Digital Affairs, has said: "If European cloud customers cannot trust the United States government, then maybe they won't trust U.S. cloud providers either. If I am right, there are multibillion-euro consequences for American companies. If I were an American cloud provider, I would be quite frustrated with my government right now."¶ The report by ITIF shows that U.S. companies which sell file storage and computing in cloud systems – where information can be stored and accessed anywhere in the world – are increasingly worried about the effects of U.S. government spying and data gathering through projects such as PRISM. The PRISM program lets the federal government tap into user information and emails held by internet companies.¶ Some tech companies told the Cloud Security Alliance that they have already lost customers. Tech companies in Europe also said that UK and European businesses are pulling back on entrusting their cloud data to American units, which might have to turn it over secretly to the National Security Agency (NSA).¶ More than half of the cloud computing companies situated outside the U.S., some 56%, told the Cloud Security Alliance in a survey done between June and July that they would be less likely to use a U.S.-based cloud computing service due to NSA spying.¶ One out of 10 non-U.S. cloud companies said they had already canceled a project with a

U.S.-based cloud company as a result of the spying. For U.S. residents, slightly more than a third, 36%, said that the NSA leaks made it more difficult for them to do business outside of the U.S.¶ Already, German data protection authorities have called for suspending all data transfers to U.S. companies under the U.S.-EU Safe Harbor program because of PRISM.¶ Artmotion, Switzerland's largest hosting company, reported a 45% increase in revenue in the month after Edward Snowden revealed details of the NSA's PRISM program, ITIF notes.¶ The report also says that European businesses are already exploiting the U.S. spying program in order to steal customers. ¶ It notes that "Reinhard Clemens, CEO of Deutsche Telekom's T-systems group, argued in 2011 that creating a German or European cloud computing certification could advantage domestic cloud computing providers" over U.S. cloud companies.¶ He stated, "The Americans say that no matter what happens I'll release the data to the government if I'm forced to do so, from anywhere in the world. Certain German companies don't want others to access their systems. That's why we're well-positioned if we can say we're a European provider in a European legal sphere and no American can get to them."¶ German Interior Minister Hans-Peter Friedrich has also said: "Whoever fears their communication is being intercepted in any way should use services that don't go through American servers."¶ And Jörg-Uwe Hahn, a German justice minister, has already called for a boycott of U.S. cloud companies.

De-globalization solves inequality and economic shocks

Pablo **Solon 14**, Executive director of Focus on the Global South, an activist think tank, and former ambassador of Bolivia to the UN, expert on global economics, 3/18/14, "'Deglobalization' Is the Way to Reduce Inequality," http://www.huffingtonpost.com/pablo-erick-solon-romero-oroza/deglobalization-is-the-globalization_b_4985403.html

The race of globalization is leaving the majority of the world's population far behind. According to Unicef, the richest 20 percent of the population gets 83 percent of global income, while the poorest quintile has just 1 percent. This trend is getting worse. A new UNDP report called "Humanity Divided" estimates that 75 percent of the population lives in societies where income distribution is less equal now than it was in the 1990s, although global GDP ballooned from $22 trillion to $72 trillion.¶For developing economies in Asia, the Gini coefficient -- which measures income inequality on a scale from zero to one where one is worst -- rose from 0.33 in 1990 to 0.46 in 2010.¶ Inequality corresponds with greater economic uncertainty, lower investment and high social tensions and political instability -- with the **potential for violence and conflicts** between groups. It demolishes human rights for the vast majority, especially for vulnerable groups like women, children and the elderly.¶What causes inequality? The UNDP states, "Specific aspects of globalization, such as inadequately regulated financial integration and trade liberalization processes, whose benefits have been distributed very unequally across and within countries, have played a significant role in determining the upward trend observed over the last decades."¶ **Globalization causes inequality** for various reasons. One is that trade and financial globalization have weakened the bargaining position of relatively immobile labor in relation to fully mobile capital, driving down wages. The chief economist of the Asian Development Bank, in an article that argues that **inequality jeopardizes economic growth**, notes that between the mid-1990s and the mid-2000s, labor income as a percentage of manufacturing output fell from 48 percent to 42 percent in China and from 37 percent to 22 percent in India.¶The UNDP also says dependence on capital flows made countries **more vulnerable to economic and financial shocks**, causing lower growth and employment, which both disproportionately affect the poor.¶If globalization drives inequality, what are the remedies? The usual list of cures from UN agencies, the World Bank and IMF include measures to stop tax evasion, more progressive income tax policies, incentives for foreign investment, conditional cash transfers, subsidies and credits for small businesses and agriculture, limited expansion of public investment and social safety nets.¶ Two key things are apparent in these "remedies." First, they talk about redistributing income, but don't address unequal access to sources of wealth, such as land or assets. They also avoid mentioning examples of nationalizations that have reduced extreme inequality in some countries.¶ Second, they don't deal with the process of globalization. The most ambitious among them suggest some kind of regulation of speculative financial markets to minimize volatility. The World Bank clearly states that measures to reduce inequality should not affect "free trade."¶ The measures to combat inequality touted by international financial institutions ignore the structural causes of inequality. Don't be fooled by their fashionable new name: "inclusive growth." This

idea repeats old remedies and is more concerned with profit than inequality.¶ If we care about reducing inequality, we must seek new solutions to the problem. One approach is "deglobalization," a proposal developed by Walden Bello and Focus on the Global South in response to the Asian financial crisis of 1997.¶ Focus on the Global South wrote:¶ Deglobalization is not a synonym for withdrawing from the world economy. It means a process of restructuring the world economic and political system so that the latter builds the capacity of local and national economies instead of degrading it. Deglobalization means the transformation of a global economy from one integrated around the needs of transnational corporations to one integrated around the needs of peoples, nations and communities."¶ For deglobalisation, there is no "one size fits all" model like neoliberalism or centralized bureaucratic socialism. Instead, according to this scheme, diversity is expected and encouraged, as it is in nature.

One fateful question for 2013 is this: What happens to globalization? For decades, growing volumes of cross-border trade and money flows have fueled strong economic growth. But something remarkable is happening; trade and international money flows are slowing and, in some cases, declining. David Smick, the perceptive editor of the International Economy magazine, calls the retreat "deglobalization." What's unclear is whether this heralds prolonged economic stagnation and rising nationalism or, optimistically, makes the world economy more stable and politically acceptable.

De-globalization revitalizes manufacturing and jobs – the US will maintain advantages over other countries

Robert Samuelson 12, writes a weekly economics in The Post, columnist for Newsweek for decades, attended Harvard College, expert in economics and global relations, "Robert Samuelson: Can globalization survive 2013?," 12/30/12, http://www.washingtonpost.com/opinions/robert-samuelson-can-globalization-survive-2013/2012/12/30/84f89dba-52b2-11e2-bf3e-76c0a789346f_story.html?hpid=z3

**empirical examples – also functions as uniqueness card for manufacturing, all in this card

To Americans, some aspects of deglobalization will seem delicious. Take manufacturing. Globalization has sucked factory jobs from the United States. Now, the tide may be turning. Just recently, Apple announced a $100 million investment to return some Mac computer production home. Though tiny, the decision reflects a trend. General Electric's sprawling Appliance Park in Louisville once symbolized the United States' post-World War II manufacturing prowess, with employment peaking at 23,000 in 1973. Since then, jobs have shifted abroad or succumbed to automation. But now GE is returning production of water heaters, refrigerators and other appliances to Appliance Park from China and Mexico. Year-end employment is reckoned at 3,600, up 90 percent from a year earlier, writes Charles Fishman in an excellent article in December's Atlantic. Nor is GE alone, Fishman notes. Otis is moving some elevator production from Mexico to South Carolina. Wham-O is shifting Frisbee molding from China to California. The changes are harbingers, contends the Boston Consulting Group (BCG), which predicts a

manufacturing revival. China's labor cost advantage has eroded, it argues. In 2000, Chinese factory wages averaged 52 cents an hour, but annual double-digit percentage increases will bring that to $6 an hour in high-skilled industries by 2015. Although wages of U.S. production workers average $19 an hour, BCG argues that other non-wage factors favor the United States. American workers are more productive; automation has reduced labor's share of expenses; and cheap natural gas further reduces costs. Finally, higher oil prices have boosted freight rates for imports. By 2015, China's overall cost advantage will shrivel to 7 percent, BCG forecasts. As important, it says, the United States will maintain significant cost advantages over other developed-country manufacturers: 15 percent over France and Germany; 21 percent over Japan; and 8 percent over Great Britain. The United States will be a more attractive production platform. Imports will weaken; exports will strengthen. BCG predicts between 2.5 million and 5 million new factory jobs by 2020. (For perspective: 5.7 million manufacturing jobs disappeared from 2000 to 2010.)

Bigger sectors of the economy are increasing – cloud-computing insignificant in comparison

Even if cloud-computing competitiveness falls, other, bigger sectors are rising and will fill in any gaps

Sam Becker 14, a business and automotive writer for The Cheat Sheet, "What Are the Most Important Sectors in the U.S. Economy?," 7/1/14, http://www.cheatsheet.com/business/what-are-the-most-important-sectors-in-the-u-s-economy.html/?a=viewall

**this card also acts as an economy uniqueness card

The economy has been on a slow, winding recovery over the past several years. Things hit rock bottom in 2008 and 2009, during the apex of the financial crisis, and for many it seems that things never quite recovered. Job numbers have returned to pre-recession levels (finally), however many of those jobs are not nearly as lucrative or rewarding as they were before. But people are getting back to work, business is picking up steam, and consumer confidence is climbing the ladder as well. Despite some glaring problems that will take some long-term effort to adjust, there is a sense of financial stability floating around the country that hasn't been felt in years.¶ The return of industry has been a major driving force behind the economy's resurgence, with plenty of entrepreneurs finding various means of profit in a landscape left barren by layoffs, shuttering businesses and general feelings of hopelessness among a good percentage of the population. There have been areas that have really shined — like technology for example — and others that were decimated, like manufacturing. But inch by inch, Americans are clawing back.¶The Bureau of Economic Analysis, an arm of the U.S. Department of Commerce, has released a report detailing the breadth and depth of the economic recovery through improving numbers in gross

domestic product. The details contained in the report cover in-depth information across 22 sectors of the economy, along with indicators revealing exactly how those specific sectors performed over a given time period. Overall, the GDP of the United States grew by 1.9 percent 2013, which did show some deceleration from 2012, in which it grew by 2.8 percent.¶The good news is that not only did the economy grow and add jobs, but that growth was relatively widespread, spanning nineteen of the twenty-two sectors the Department of Commerce measures.¶By going into detail with their GDP reporting, the Department of Commerce is able to supply us with information that makes it easy to identify the fastest-growing sectors of the economy. In post-financial crisis and and post-recession times, the fastest-growing industries can also be viewed as the most valuable. As industries grow, they onboard jobs, escalate revenues and built wealth for business owners, which (in theory) is then reinvested into the economy and the company's workforce. It's a bit of a snowball effect.¶In 2013, the most important sectors to the U.S. economy were agriculture, forestry, fishing, and hunting, which saw a huge jump of 16.4 percent. For comparison, that sector grew by a measly 0.3 percent in 2012, a year in which many crops and harvests were destroyed by severe droughts and climatic conditions.¶Other areas of concentrated growth were in real estate and rental and leasing, which saw a 1.6 percent bump. Growth in this sector in particular can mean good news for several across the country, in terms of increasing values in property and home ownership. Specifically, increased home values riding the economic recovery is being seen to show benefits in increased consumer confidence at this very moment, where more people are expected to travel for holidays this summer than in previous years. More confidence in the value of assets, as well as a willingness to take on more debt were found to be the major contributing factors to travelers hitting the road.¶Other sectors across the economy that saw increases were in company and enterprise management, which went up by 5.8 percent. Manufacturing of non-durable goods also went up, with an increase of 5.3 percent.

Credibility Advantage

The Freedom act doesn't go far enough to curtail programs – hardly affected the NSA and there's still confusion as to whether or not it's being implemented

Williams **Pelegrin 15**, writer for Digital Trends, 6/30/15, "Court gives the NSA permission to continue phone metadata collection for now," http://www.digitaltrends.com/mobile/court-rules-nsa-resume-phone-metadata-collection/

The Freedom Act amended Section 215 to require the government to define a "specific selection term," such as a phone number, to access the phone companies' records. The law also forbids the collection of "all call detail records" held by phone companies.

All of this was done in response to a ruling by the United States Court of Appeals for the Second Circuit, which stated that Section 215 could not be interpreted as allowing any kind of bulk collection. However, the Freedom Act did not include any language to address the ruling, so it remained unclear whether the data collection was legal or not.

Then, in late June, Judge Michael W. Mosman stated that the program could resume for the remaining 180 days granted by the Freedom Act and argued that the Second Circuit was wrong in saying that the program was not authorized to collect that data.

"Second Circuit rulings are not binding on the FISC and this court respectfully disagrees with that court's analysis, especially in view of the intervening enactment of the U.S.A. Freedom Act," wrote Judge Mosman in his 26-page decision.

In response, the American Civil Liberties Union (ACLU) stated that it will ask the Second Circuit Court — which initially ruled against the NSA program — to issue a temporary injunction to prevent the resumption of the program. Of course, even if the NSA is forced to stop metadata collection, that doesn't mean all of its programs will be gone for good.

Even the Freedom Act, which Senator Ron Wyden (D-Or.) hailed as "the most significant victory for Americans' privacy rights in more than a decade," still includes questionable provisions, such as the "roving wiretap" and "lone wolf." These provisions allow local and federal law enforcement to track and tap an individual's activities and devices, even if there aren't proven links between the user and any known terrorist organizations.

NSA surveillance undermines overall smart power and justifies authoritarian control--- smart power is the best and only way to evaluate security implications of surveillance

Eileen **Donahoe 14**, former U.S. ambassador to the UNHRC, 3/6/14, "Why the NSA undermines national security," http://blogs.reuters.com/great-debate/2014/03/06/why-nsa-surveillance-undermines-national-security/

Questions about the legitimacy and efficacy of the mass-surveillance techniques used by the National Security Agency continue to swirl around the globe. The debate in the United States has mostly focused on a misleading trade-off between security and privacy.

"If you don't have anything to hide," goes the refrain, "you shouldn't mind if the government collects information to prevent another terrorist attack." In this trade-off, security will always trump privacy, especially when political leaders rightly see preventing terrorist acts as their top national security responsibility.

But this zero-sum framework ignores the significant damage that the NSA's practices have done to U.S. national security. In a global digital world, national security depends on many factors beyond surveillance capacities, and over-reliance on global data collection can create unintended security vulnerabilities.

There's a better framework than security-versus-privacy for evaluating the national security implications of mass-surveillance practices. Former Secretary of State Hillary Clinton called it "smart power."

Her idea acknowledges that as global political power has become more diffuse, U.S. interests and security increasingly depend on our ability to persuade partners to join us on important global security actions. But how do we motivate disparate groups of people and nations to join us? We exercise smart power by inspiring trust and building credibility in the global community.

Developing these abilities is as important to U.S. national security as superior military power or intelligence capabilities.

I adopted the smart-power approach when serving as U.S. ambassador to the United Nations Human Rights Council. Our task at the council was to work with allies, emerging democracies and human rights-friendly governments to build coalitions to protect international human rights. We also built alliances with civil society actors, who serve as powerful countervailing forces in authoritarian systems. These partnerships can reinforce stable relationships, which enhances U.S. security.

The NSA's arbitrary global surveillance methods fly in the face of smart power. In the pursuit of information, the spy agency has invaded the privacy of foreign citizens and political leaders, undermining their sense of freedom and security. NSA methods also undercut U.S. credibility as a champion of universal human rights.

The U.S. model of mass surveillance will be followed by others and could unintentionally invert the democratic relationship between citizens and their governments. Under the cover of preventing terrorism, authoritarian governments may now increase surveillance of political opponents. Governments that collect and monitor digital information to intimidate or squelch political opposition and dissent can more justifiably claim they are acting with legitimacy.

Continuing NSA surveillance strains EU-US relations and kills the Transatlantic Trade and Investment Partnership and the Terrorist Finance Tracking Program

Committee on Civil Liberties, Justice and Home Affairs 14, Committee in the EU Parliament, 3/12/14, "US NSA: stop mass surveillance now or face consequences, MEPs say,"

http://www.europarl.europa.eu/pdfs/news/expert/infopress/20140307IPR38203/20140307IPR38203_en.pdf

Parliament's consent to the EU-US trade deal "could be endangered" if blanket mass surveillance by the US National Security Agency (NSA) does not stop, MEPs said on Wednesday, in a resolution wrapping up their six-month inquiry into US mass surveillance schemes. The text also calls on the EU to suspend its bank data deal with the US and the "Safe Harbour agreement" on data privacy. The fight against terrorism can never justify secret and illegal mass surveillance, it adds.

The resolution, in which MEPs set out their findings and recommendations to boost EU citizens' privacy, was backed by 544 votes to 78, with 60 abstentions. "The Snowden revelations gave us a chance to react. I hope we will turn those reactions into something positive and lasting into the next mandate of this Parliament, a data protection bill of rights that we can all be proud of", said Civil Liberties inquiry rapporteur Claude Moraes (S&D, UK). "This is the only international inquiry into mass surveillance. (...) Even Congress in the United States has not had an inquiry", he added.

Parliament's should withhold its consent to the final Transatlantic Trade and Investment Partnership (TTIP) deal with the US unless it fully respects EU fundamental rights, stresses the resolution, adding that data protection should be ruled out of the trade talks. This consent "could be endangered as long as blanket mass surveillance activities and the interception of communications in EU institutions and diplomatic representations are not fully stopped", notes the text.

MEPs also call for the "immediate suspension" of the Safe Harbour privacy principles (voluntary data protection standards for non-EU companies transferring EU citizens' personal data to the US). These principles "do not provide adequate protection for EU citizens" say MEPs, urging the US to propose new personal data transfer rules that meet EU data protection requirements.

The Terrorist Finance Tracking Programme (TFTP) deal should also be suspended until allegations that US authorities have access to EU citizens' bank data outside the agreement are clarified, insist MEPs.

Current NSA programs do not benefit counter terrorism efforts

Ellen **Nakashima 14**, reporter for the Washington Post, 1/12/14, "NSA phone record collection does little to prevent terrorist attacks, group says," The Washington Post, https://www.washingtonpost.com/world/national-security/nsa-phone-record-collection-does-little-to-prevent-terrorist-attacks-group-says/2014/01/12/8aa860aa-77dd-11e3-8963-b4b654bcc9b2_story.html

An analysis of 225 terrorism cases inside the United States since the Sept. 11, 2001, attacks has concluded that the bulk collection of phone records by the National Security Agency "has had no discernible impact on preventing acts of terrorism."

In the majority of cases, traditional law enforcement and investigative methods provided the tip or evidence to initiate the case, according to the study by the New America Foundation, a Washington-based nonprofit group.

The study, to be released Monday, corroborates the findings of a White House-appointed review group, which said last month that the NSA counterterrorism program "was not essential to preventing attacks" and that much of the evidence it did turn up "could readily have been obtained in a timely manner using conventional [court] orders."

The TFTP is a vital component of counter-terrorism and to holding other countries accountable for their actions – curtailing now is key

John **Rosenthal 10**, European Relations Specialist for the Weekly Standard, 3/29/10, "Germany's War on the War on Terror," The Weekly Standard, VOL. 15, NO. 27, http://www.weeklystandard.com/articles/germany%E2%80%99s-war-war-terror?page=3

As was already made clear by the 9/11 attacks, Germany itself has been a major hub of jihadist activism and terror financing. Americans will largely be aware of the Hamburg cell and of the three suicide pilots—Mohammed Atta, Ziad Jarrah, and Marwan al-Shehhi—who came from Germany to America to train for and carry out the attacks. But they might be less aware that even after the arrival of the trio in the United States, their Hamburg cell co-conspirator Ramzi Binalshibh continued to play a crucial role in facilitating the attacks from German soil. Among other things, he did so, notably, by transferring funds.

It was indeed the discovery of Binalshibh's Hamburg phone number among Zacarias Moussaoui's personal affairs that would allow investigators to connect Moussaoui to the 9/11 plot. Binalshibh is known to have transferred $14,000 to Moussaoui in America. Binalshibh is also suspected of having been involved in the planning of the October 2000 attack on the USS Cole. He had lived in Germany since the mid-1990s.

At Moussaoui's 2006 trial, FBI agent Michael Anticev complained about the lack of cooperation of German authorities with American counterterrorism investigations. Asked whether it was difficult to obtain phone records from Germany in 2001, Anticev replied, "Extremely, extremely." He explained, moreover, that phone numbers that were furnished would often be truncated, the last "three or four digits" having been dropped off. Asked whether obtaining financial records was equally difficult, Anticev replied that it was "a little bit easier," but that the process was "not automatic" and, in any case, typically took "months."

In September 1998—at a time when, under the chancellorship of Helmut Kohl, German officials were more cooperative—al Qaeda financier and cofounder Mamdouh Mahmud Salim was arrested near Munich while on a visit to Germany. Also known as "Abu Hajer al Iraqi," he would subsequently be extradited to the United States to face trial for his role in the August 1998 terrorist attacks against American embassies in Africa.

Two other well-known al Qaeda financiers remain free men in Germany. Mamoun Darkazanli held power of attorney over a joint German bank account with Salim. In a 2002 report on terror financing prepared for the U.N. Security Council, Jean-Charles Brisard stated that Darkazanli provided "financial and logistical support" to the Hamburg cell. Darkazanli is also suspected of involvement in the African embassies plot. He is on both the U.S. and U.N. lists of terrorist persons and entities. He is wanted by Interpol. And he is under indictment in Spain. The 2005 Spanish indictment describes him as "the permanent interlocutor and assistant of Osama bin Laden in Germany."

German prosecutors have themselves confirmed Darkazanli's activities on behalf of al Qaeda, but they have somehow managed to conclude that these activities are "without criminal relevance." German authorities have not only declined to bring charges against Darkazanli, but have also refused to extradite him to face charges abroad.

The case of Reda Seyam, a naturalized German citizen of Egyptian origin, is perhaps even more astonishing. Seyam is widely believed by intelligence sources and terror experts to have organized the financing for the 2002 Bali bombings, which killed over 200 people. He had already been arrested by Indonesian authorities on suspicion of involvement in terrorist activity several weeks before the attacks.

After his arrest, Germany's Federal Crime Bureau (BKA) dispatched agent Michael von Wedel to Indonesia to investigate the charges. In his 2008 memoir Die Abrech-nung ("Settling Accounts"), von Wedel described how his investigations would confirm Seyam's involvement in jihadist financing in Southeast Asia.

But he also described how his own assignment in Indonesia morphed from investigating Seyam into protecting him from possible "rendition" by the CIA. In July 2003, a BKA team whisked Seyam safely home to Germany. German authorities have never brought charges against him.

Since his return, incidentally, Seyam has made no secret of his jihadist convictions. He has, for instance, told a reporter that Muslims have an "obligation to kill kafir [unbelievers]" and even named one of his many children "Jihad." In a documentary that was broadcast by Germany's ARD public television in February 2007, Seyam explained that al Qaeda "is fighting for the good cause." Asked what he thought of al Qaeda terror attacks, he replied, "No comment" and then broke into a broad mischievous grin.

Another prominent member of the rogues' gallery of terror facilitators who have operated out of Germany is Christian Ganczarski. The German convert to Islam is presently serving an 18-year prison sentence in France for membership in a terrorist organization—al Qaeda—and complicity in the 2002 Djerba synagogue bombing. Shortly before the attack, the suicide bomber called Ganczarski at his home in North Rhine-Westphalia to ask for his blessing. We know this, because German police were listening in on the conversation. But German prosecutors never saw fit to bring charges against Ganczarski. In June 2003, he made the mistake of changing planes in Paris while on a trip from Saudi Arabia to Germany. The French police were waiting for him. Otherwise, he might never have been brought to justice.

When it emerged that one of the suspects arrested in March 2004 in the aftermath of the Madrid train bombings had previously spent time in Darmstadt, the Frankfurter Allgemeine Zeitung ran a slightly defensive article with the telling headline "There Is Always a Clue that Leads to Germany." It would later turn out that no less than the presumed mastermind of the attacks, Rabei Osman Sayed Ahmed, had moved to Spain from Germany in September 2001.

How many of the clues uncovered by the Terrorist Finance Tracking Program led to Germany? We probably will never know. We do know that American law enforcement officials tipped off their German counterparts about the Sauerland cell. Would the plotters' envisioned inferno at the American Air Force base in Ramstein have come to pass were it not for the TFTP? The 2006 U.K.-based transatlantic airliners plot is also reported to have had a German connection.

Now, however, it appears that there are to be no more clues. As a consequence of the annulment of the SWIFT agreement—as well indeed as the German Constitutional Court's quashing of the data retention law—Germany is sure to become an even more secure haven for terrorists and their financiers than it already has been. And, as we know, when Germany is a safe haven for terrorists and terror financing, it is a danger for the United States and the rest of the world.

Terrorism produces human rights violations, crime, war, and economic downturn but counter-terrorism efforts must also not violate rights

Office of the UN High Commissioner for Human Rights 08, Office of the UN dedicated to protecting human rights, July 2008," Human Rights, Terrorism and Counter-terrorism," http://www.ohchr.org/Documents/Publications/Factsheet32EN.pdf

Terrorism aims at the very destruction of human rights, democracy and the rule of law. It attacks the values that lie at the heart of the Charter of the United Nations and other international instruments: respect for human rights; the rule of law; rules governing armed conflict and the protection of civilians; tolerance among peoples and nations; and the peaceful resolution of conflict.

Terrorism has a direct impact on the enjoyment of a number of human rights, in particular the rights to life, liberty and physical integrity. Terrorist acts can destabilize Governments,

undermine civil society, jeopardize peace and security, threaten social and economic development, and may especially negatively affect certain groups. All of these have a direct impact on the enjoyment of fundamental human rights.

The destructive impact of terrorism on human rights and security has been recognized at the highest level of the United Nations, notably by the Security Council, the General Assembly, the former Commission on Human Rights and the new Human Rights Council.7 Specifically, Member States have set out that terrorism:

• Threatens the dignity and security of human beings everywhere, endangers or takes innocent lives, creates an environment that destroys the freedom from fear of the people, jeopardizes fundamental freedoms, and aims at the destruction of human rights;

• Has an adverse effect on the establishment of the rule of law, undermines pluralistic civil society, aims at the destruction of the democratic bases of society, and destabilizes legitimately constituted Governments;

• Has links with transnational organized crime, drug trafficking, money-laundering and trafficking in arms, as well as illegal transfers of nuclear, chemical and biological materials, and is linked to the consequent commission of serious crimes such as murder, extortion, kidnapping, assault, hostage-taking and robbery;

• Has adverse consequences for the economic and social development of States, jeopardizes friendly relations among States, and has a pernicious impact on relations of cooperation among States, including cooperation for development; and

• Threatens the territorial integrity and security of States, constitutes a grave violation of the purpose and principles of the United Nations, is a threat to international peace and security, and must be suppressed as an essential element for the maintenance of international peace and security.

International and regional human rights law makes clear that States have both a right and a duty to protect individuals under their jurisdiction from terrorist attacks. This stems from the general duty of States to protect individuals under their jurisdiction against interference in the enjoyment of human rights. More specifically, this duty is recognized as part of States' obligations to ensure respect for the right to life and the right to security.

The right to life, which is protected under international and regional human rights treaties, such as the International Covenant on Civil and Political Rights, has been described as "the supreme right"8 because without its effective guarantee, all other human rights would be without meaning.9 As such, there is an obligation on the part of the State to protect the right to life of every person within its territory10 and no derogation from this right is permitted, even in times of public emergency. The protection of the right to life includes an obligation on States to take all appropriate and necessary steps to safeguard the lives of those within their jurisdiction. As part of this obligation, States must put in place effective criminal justice and law enforcement systems, such as measures to deter the commission of offences and investigate violations where they occur; ensure that those suspected of criminal acts are prosecuted; provide victims with effective remedies; and take other necessary steps to prevent a recurrence of violations.11 In addition, international and regional human rights law has recognized that, in specific circumstances, States have a positive obligation to take preventive operational measures to protect an individual or individuals whose life is known or suspected to be at risk from the criminal acts of another individual,12 which certainly includes terrorists. Also important to highlight is the obligation on States to ensure the personal security of individuals under their jurisdiction where a threat is known or suspected to exist.13 This, of course, includes terrorist threats.

In order to fulfill their obligations under human rights law to protect the life and security of individuals under their jurisdiction, States have a right and a duty to take effective counter-terrorism measures, to prevent and deter future terrorist attacks and to prosecute those that are responsible for carrying out such acts. At the same time, the countering of terrorism poses grave challenges to the protection and promotion of human rights. As part of States' duty to protect individuals within their jurisdiction, **all measures taken to combat terrorism must themselves also comply with States'**

obligations under international law, in particular international human rights, refugee and humanitarian law.

The TTIP will stimulate the entire global economy

Joseph **Francois 13**, Managing Director and professor of economics at the World Trade Institute, March 2013, "Reducing Transatlantic Barriers to Trade and Investment An Economic Assessment," http://trade.ec.europa.eu/doclib/docs/2013/march/tradoc_150737.pdf

This study provides new estimates of the economy wide impact of removing both tariff and non-tariff barriers to transatlantic trade between the EU and the US. Several scenarios are analysed in the report. On the one hand specific trade liberalisation with regards to tariffs only, services only or procurement only is discussed. On the other hand, the option of comprehensive trade and investment liberalisation is scrutinised. The first FTA scenario, a moderately ambitious FTA assumed a 10 per cent reduction in NTBs-related costs and an "almost full" elimination of tariffs. The second, ambitious FTA scenario assumes the elimination of 25 per cent of costs linked to NTBs together with full tariff elimination.

The results indicate positive and significant gains for both the EU and the US. GDP is estimated to increase by 68-119 billion euros for EU and 50-95 billion euros for the US (under the less ambitious and the ambitious FTA scenarios, respectively). However, if the trade initiative would be limited to tariff liberalisation only, or services or procurement liberalisation only, the estimated gains would be significantly lower. An FTA limited to tariff liberalisation would lead to 24 billion euros increase in GDP for the EU and 9 billion euros increase for the US. Thus implementing a comprehensive FTA would bring greater benefits to both economies.

A core message following from our results is that a focus on NTBs is critical to the logic of transatlantic liberalization. Different approaches to the same regulatory challenges can have the unintended consequence of increasing costs for firms, and so dragging down labour productivity. Negotiation on NTBs provides the opportunity to pursue a mix of cross-recognition and regulatory convergence to reduce these barriers. The estimates reported here point to substantial gains, if reductions in the costs of NTBs can be achieved. Limiting the exercise to tariffs alone would lead to positive effects, but these would be much more limited leaving a huge potential for economic and welfare gains untapped.

In terms of labour market impacts, wage effects are in line with changes in output and so are consistent with an interpretation of general cost savings that lead to productivity gains as firms operate with lower NTB-related costs for transatlantic commerce. It should be stressed that the model is a long-run model, where sources of employment and unemployment are "structural." In this sense, changes in labour demand are captured through wage changes (in this case rising wages) rather than aggregate employment levels. As wages increase in the experiments, this means a rising demand for labour. At sector level, roughly 0.2 to 0.5 per cent of the EU labour force (in terms of allocation across sectors) is de-located. However, this is due to "pull factors" as expanding sectors (like motor vehicles in the case of the EU) hire workers away from other sectors (like metals).

The impact on the rest of the world is estimated to be positive and amounts to a total of approximately 99 billion euros as an upper bound in the ambitious FTA scenario. The EU and US, collectively, are a huge economic force. To the extent that they can work together to better promote establishment and recognition in standards, reduce regulatory divergence, and otherwise reduce the impact on rules and regulations on the cost of business, it is likely that parts of such a framework (for example recognized product or safety standards) will be adopted elsewhere, reducing trade costs for third markets, which is captured in the model by introducing spill-overs to the simulations. To the extent the EU and US together drive global standards, this has potential to promote economic gains across the globe.

Depending on the approach followed, EU-US trade liberalisation has the potential to make a positive contribution not only to the transatlantic economy but also to the global economy.

The TTIP is vital to avoid a litany of impacts – especially European economic decline

Carl **Bildt and** Javier **Solana 15**, Former foreign and prime minister of Sweden and former EU High representative for Foreign and Security Policy, 1/6/15, Project Syndicate, "A Comeback Strategy for Europe," http://www.project-syndicate.org/commentary/2015-ttip-conclusion-critical-by-carl-bildt-and-javier-solana-2015-01

Even more compelling than the benefits of achieving an agreement, though, are the potentially catastrophic consequences of failure. For starters, a breakdown of TTIP talks would give considerable ammunition to those in the United Kingdom who advocate withdrawal from the EU; conversely, if the TTIP were implemented, the UK would be unwise - and thus unlikely - to leave.

Moreover, the perception that the EU's internal squabbles had led it to squander a strategic opportunity would probably drive the US to accelerate its disengagement from the continent. And Russian President Vladimir Putin would invariably regard the EU's failure as a major opportunity to exert more influence over parts of Europe.

All of this contributes to a starkly fundamental strategic risk: If the TTIP stalls or collapses while the TPP moves forward and succeeds, the global balance will tip strongly in Asia's favor – and Europe will have few options, if any, for regaining its economic and geopolitical influence.

European economic collapse causes global nuclear war

Gommes 11—Former Columbia Law Review senior editor [Thomas, publisher of Periscope Post, former corporate lawyer, "Eurozone in crisis: The death of the euro could trigger World War III," December 9, 2011, www.periscopepost.com/2011/12/eurozone-in-crisis-the-death-of-the-euro-could-trigger-world-war-iii/]

Eurozone in crisis: The death of the euro could trigger **World War III** The slow-motion demise of the euro isn't just financial Armageddon—it could just be one step down the slippery path to World War III. At the risk of being accused of scaremongering, I'll state my point simply and up front: Things in Europe are not as bad as they seem—they're worse. And though the commentariat is queuing up to predict the imminent demise of the euro currency and to lament the ongoing recession, that's not even the half of it: We're looking at World War III. As major corporations start drawing up contingency plans for a world without the euro and as weaknesses in government finances become ever more glaring, the end of the euro currency becomes an increasingly realistic prospect. Related, the total absence of business growth, or trading among European nations raises the question of what benefits a unified trading block offers. The driving motive behind the original Coal and Steel alliance that ultimately became today's European Union was a desire among nations, traumatised by the worst war in their collective history, to provide a deterrent against another war. My concern is that that trauma has faded, and that the fear of war has been replaced by the fear of recession. As anyone with even a fleeting familiarity with European history can confirm, ours is not exactly a history of love and peace. In fact, the period since the end of World War II has been probably the longest period of relative peace the region has ever known. Arguably, it's no coincidence that that period of peace has coincided exactly with the ever strengthening ties that have been forged between European nations over these past 60 years. If the bonds that tie Europe an nations together are weakened, the incentives to avoid **total war** dwindle. And its not as dramatic or far fetched a theory as it may at first sound. The end of the euro currency and a reversion to national currencies could quite possibly provide the impetus for a further dissolution of the union. The unraveling of painstakingly negotiated ties becomes easier and easier as each strand frays and breaks. Combine this unraveling with an ongoing or even deepening recession, and it all makes for a **combustible atmosphere**. Unfortunately, it is human nature to blame others for our woes. In an environment of unemployment, austerity, and general resentment, it is not difficult to imagine nations starting to point the finger at their neighbours. And without the unifying effect of a common currency, thriving trading relations, free movement of peoples, and common interests, Europe would find itself **increasingly susceptible to war**. Moreover, as so few Europeans in my generation, let alone subsequent generations, have even the slightest inkling about how horrific war is, it may be tempting to consider it as a solution to problems, or at minimum an acceptable response to perceived slights.

NSA surveillance undermines smart power and infrastructure

Eileen **Donahoe 14**, former U.S. ambassador to the UNHRC, 3/6/14, "Why the NSA undermines national security," http://blogs.reuters.com/great-debate/2014/03/06/why-nsa-surveillance-undermines-national-security/

Superior information is powerful, but sometimes it comes at greater cost than previously recognized. When trust and credibility are eroded, the opportunity for collaboration and partnership with other nations on difficult global issues collapses. The ramifications of this loss of trust have not been adequately factored into our national security calculus.

What is most disconcerting is that the NSA's mass surveillance techniques have compromised the security of telecommunication networks, social media platforms, private-sector data storage and public infrastructure security systems. Authoritarian governments and hackers now have a roadmap to surreptitiously tap into private networks for their own nefarious purposes.

By weakening encryption programs and planting backdoor entries to encryption software, the NSA has demonstrated how it is possible to infiltrate and violate information-security systems. In effect, the spy agency has modeled anarchic behavior that makes everyone less safe.

Some have argued, though, that there is a big difference between the U.S. government engaging in mass-surveillance activities and authoritarian governments doing so. That "big difference" is supposed to be democratic checks and balances, transparency and adherence to the rule of law. Current NSA programs, however, do not operate within these constraints.

With global standards for digital surveillance now being set, our political leaders must remember that U.S. security depends upon much more than unimpeded surveillance capabilities. As German Chancellor Angela Merkel, one of President Barack Obama's most trusted international partners, has wisely reminded us, just because we can do something does not mean that we should do it.

National security policies that fail to calculate the real costs of arbitrary mass surveillance threaten to make us less secure. Without trusted and trusting partners, U.S. priority initiatives in complex global negotiations will be non-starters.

The president, his advisers and our political leaders should reassess the costs of the NSA's spy programs on our national security, our freedom and our democracy. By evaluating these programs through a smart-power lens, we will be in a stronger position to regain the global trust and credibility so central to our national security.

Loss of smart power undermines effective democracy promotion

J. Brian **Atwood 11**, former Administrator of the U.S. Agency for International Development, 5/25/11, "The Importance of 'Democracy Promotion'," http://www.huffingtonpost.com/j-brian-atwood/the-importance-of-democra_b_358363.html

The overly enthusiastic embrace of "democracy promotion" by the Bush administration could have smothered that phrase for years to come (even though both U.S. parties previously had endorsed the policy). Fortunately President Obama resisted the temptation to abandon it. Eloquent and culturally-sensitive speeches by

the President in Prague, Cairo, and Accra effectively promoted this fundamental American value and with a "tough love" approach that implied we wanted to maintain a high standard.

The Bush administration often sounded as though it was lecturing from on high, while at the same time it pursued policies in its war on terror that made it sound hypocritical. When President Bush used democratic change as a rationale for the war in Iraq, many around the world began to see the promotion of democracy as a euphemism for regime change.

The Obama administration has set a high bar in advancing this value proposition. It must now take care to promote democratic change the right way, creatively integrating its sophisticated engagement approach, development strategies, and "smart power" philosophy. This means joining others in supporting democratic change, avoiding any hint of ambivalence even where security seems the overriding immediate concern, and providing resources to civil society organizations to support counterparts in transitional states.

A "smart power" foreign policy assumes a realist's understanding of geo-strategic considerations, but it also appreciates the benefits of positive American values in a world arena where ideology still has a role to play. We promote these values through public diplomacy, foreign assistance programs, and diplomatic and citizen initiatives that reflect our nation's democratic ideals.

Democracy is key to global security

Alexander T.J. **Lennon 09**, professor at Georgetown University, March 2009, "Democracy in U.S. Security Strategy From Promotion to Support," http://csis.org/files/media/csis/pubs/090310_lennon_democracy_web.pdf

Interviews began by asking every subject: "Why if at all, is the spread of democracy in the U.S. strategic interest today?" Every person, without exception, said yes, but for a variety of reasons. Many simply started with the fundamental role that seeking the spread of democracy has historically played in U.S. foreign policy. "It's our heritage," said one former senior diplomat, or "it's organic to who we are as a nation and as a people," said another former official. "As far as I know, every U.S. president except John Quincy Adams … and certainly every post-Cold War president" sought the spread of democracy from "George Washington, on the eve of his presidency, where he says that the success of what we're doing is going to basically influence the future of self-government" and "the Jefferson-Hamilton debates when Washington was president" through Theodore Roosevelt, Woodrow Wilson, Franklin D. Roosevelt, and Bill Clinton. Perhaps more cynically, some thought that democracy simple "resonates with the American public" or "for candidates and for politicians it is irresistible, and has been from the early days of the republic." More emotively, at least one non-American strategist thought "instinctively that America was always not only about power, but was always also about an idea." Grounding it in government practice, a former senior diplomat advised: "I think it's terribly important that we honor the basic democratic traditions of this country by trying through policy, as much as we can, to see democracy succeed elsewhere."

Beyond this basic sense of U.S. identity, many subjects cited at least one of three strategic reasons why the spread of democracy is in the U.S. interest. First, many invoked an enduring belief in some version of the "democratic peace theory" that democracies do not fight each other or that "if there was genuine democracy around the world, [the world] would be a more peaceful and prosperous place." The basic rationale is "restraint…it encourages negotiation and compromise as opposed to domination and conquest" or that, as one former senior policy maker said, "If you have a band of democratically minded countries that accept rule of law, then they will look toward other means to resolve disputes, not undertaking aggressive behavior." Nearly every conversation admitted this relationship was not absolute, and respondents believed "not the very strong version, but a moderately strong version" of this relationship "which basically is true" that democracies "less frequently," "infrequently," or "nearly" do not fight. In other words, that democracy "might contribute to peace" or that democracy "tended to" restrain countries.

TFTP

The TFTP is an irreplaceable cooperative counter-terrorism program that protects privacy

Office of the Press Secretary 10, Part of the executive branch that provides information to the press, 7/8/10, "Statement by the President on the U.S.-European Union Agreement on the Terrorist Finance Tracking Program (TFTP)," https://www.whitehouse.gov/the-press-office/statement-president-us-european-union-agreement-terrorist-finance-tracking-program-

The United States welcomes today's decision by the European Parliament to join the Council and Commission of the European Union in approving a revised agreement between the United States and the European Union on the processing and transfer of financial messaging data for the Terrorist Finance Tracking Program (TFTP). We look forward to the Council's completion of the process, allowing the agreement to enter into force on August 1, 2010, thus fully restoring this important counterterrorism tool and resuming the sharing of investigative data that has been suspended since January 2010. The threat of terrorism faced by the United States and the European Union continues and, with this agreement, all of our citizens will be safer.

The TFTP has provided critical investigative leads -- more than 1,550 to EU Member States -- since its creation after the September 11, 2001 terrorist attacks. These leads have aided countries around the world in preventing or investigating many of the past decade's most visible and violent terrorist attacks and attempted attacks, including Bali (2002), Madrid (2004), London (2005), the liquids bomb plot against transatlantic aircraft (2006), New York's John F. Kennedy airport (2007), Germany (2007), Mumbai (2008), and Jakarta (2009).

This new, legally binding agreement reflects significant additional data privacy safeguards but still retains the effectiveness and integrity of this indispensable counterterrorism program.

Protecting privacy and civil liberties is a top priority of the Obama Administration. We are determined to protect citizens of all nations while also upholding fundamental rights, using every legitimate tool available to combat terrorism that is consistent with our laws and principles.

The United States values the European Union's partnership in meeting the complex challenges of this era. Putting the TFTP on this cooperative course is another example of how we can work with our European partners to prevent terrorism and simultaneously respect the rule of law. This cooperation strengthens our transatlantic ties and makes all our people safer.

TTIP

The TTIP would be beneficial overall for both sides of the agreement

Shayerah Ilias **Akhtar and** Vivian C. **Jones 14**, Specialists in International Trade and Finance, 6/11/14, Congressional Research Service, "Proposed Transatlantic Trade and Investment Partnership (T-TIP): In Brief," http://www.fredsakademiet.dk/ordbog/tord/ttip.pdf

Members of Congress have a direct interest in the implications of T-TIP for the U.S. economy as a whole, as well as their specific states and/or districts. The slow economic growth in both the United States and EU are a major incentive for the T-TIP negotiations. Many policymakers view the T-TIP as a low-cost economic stimulus for supporting U.S. exports, employment, and economic growth. However, there is debate about how the economic effects of the T-TIP may be borne by various stakeholders. With any FTA, the benefits of trade liberalization tend to be diffuse, extending to businesses, workers, consumers, and other stakeholders. In contrast, the costs of FTAs tend to be highly concentrated—for example, with increased foreign competition resulting from an FTA adversely affecting certain firms and workers.

NSA surveillance endangers the future of the TTIP and TPP

Laura K. **Donohue 15**, Associate professor of law at Georgetown University, 2015, "High Technology, Consumer Privacy, and U.S. National Security," http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2469&context=facpub

The NSA programs, and media coverage of them, have further impacted bi and multi-lateral trade negotiations, undermining U.S. economic security. Consider two of the most important talks currently underway: the Transatlantic Trade and Investment Partnership (TTIP) and the Trans-Pacific Partnership (TPP). TTIP is a trade and investment negotiation that is being conducted between the European Commission and the United States. The purpose of the agreement is to create better trade relations between the two region, enabling companies on both sides of the Atlantic to thrive. The revelations about NSA activities have had a profound impact on the negotiations.

In March 2014 the European Parliament passed a resolution noting "the impact of mass surveillance." It stated, "the revelations based on documents leaked by former NSA contractor Edward Snowden put political leaders under the obligation to address the challenges of overseeing and controlling intelligence agencies in surveillance activities and assessing the impact of their activities on fundamental rights and the rule of law in a democratic society." 39 It recognized that the programs had undermined "trust between the EU and the US as transatlantic partners." Not least were concerns that the information could be used for "economic and industrial espionage"—and not merely for the purpose of heading off potentially violent threats. Parliament strongly emphasized, "given the importance of the digital economy in the relationship and in the cause of rebuilding EU-US trust," that its "consent to the final TTIP agreement could be endangered as long as the blanket mass surveillance activities and the interception of communications in EU institutions and diplomatic representations are not completely abandoned and an adequate solution is found for the data privacy rights of EU citizens." The resolution underscored that any agreement to TTIP would hinge on the protection of the data privacy rights as reflected in the protection of fundamental rights in the EU Charter.40

Even if the surveillance programs do not entirely derail TTIP, they have the potential to significantly retard negotiations.41 Much is at stake. The Center for Economic Policy Research in London, for instance, estimates that a successful TTIP could improve U.S. workers' wages, provide new jobs, and increase the country's GDP by $100 billion per year. 42 Another study, conducted by the Bertelsmann Foundation, suggests that TTIP "could increase GDP per capita in the United States by 13 percent over the long term."43 To the extent that the programs weaken the U.S. position in the negotiations, the impact could be significant.44 Although the United States Trade Representative is trying to counter the political fallout from the NSA debacle by putting local data protection initiatives on the table in the TTIP negotiations, the EU has steadfastly resisted any expansion into this realm.

TPP, in turn, is a trade agreement that the United States is negotiating with 11 countries in the Asia-Pacific region (Australia, Brunei Darussalam, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, and Vietnam). TPP (with participation of Japan), accounts for nearly 40% of global GDP, about 1/3 of world trade. Two of the United States' objectives in these negotiations are directly implicated by the Snowden releases: e-commerce / telecommunications, and intellectual property rights.

The NSA programs relate to a number of categories under e-commerce—such as rules preventing discrimination based on the country of origin, and efforts to construct a single, global Internet. Nevertheless, as discussed below, some of the countries involved in TPP have already adopted data localization laws. The NSA programs have thus weakened the United States' negotiation position in these discussions, by making it more difficult to reach agreement in key areas. In addition to e-commerce considerations, as part of the TPP negotiations, the United States has prioritized intellectual property rights. Some 40 million American jobs are directly or indirectly tied to "IP-intensive" industries. These jobs tend to be high-paying and stimulate approximately 60% of U.S. merchandise exports, as well as a significant portion of services. Efforts to make progress in TPP by developing stronger protections for patents, trademarks copyrights, and trade secrets—including safeguards against cyber theft of trade secrets—is made more perilous by the existence of the NSA programs.

TPP

TPP solves multiple scenarios for conflict throughout asia and east asia – impact D and thumpers don't apply *trumps every alt cause, thumper, and impact d - - it's the necessary and sufficient condition for every internal link*

Economist 14. [11-15-14 --- http://www.economist.com/news/special-report/21631797-america-needs-push-free-trade-pact-pacific-more-vigorously-americas-big-bet]

In September, just days after Mr Abe reiterated in America that TPP was crucial for raising Japan's agricultural competitiveness and helping it adjust to an ageing society, TPP talks between the two countries abruptly broke down. Each side blamed the other, though Americans continue to suspect that the problem is not Mr Abe's own commitment but the weight the farmers carry with his bureaucrats. The Japanese, for their part, realise that their best offer may never be good enough for Congress, so **without TPA there is unlikely to be TPP.** Mr Froman, the trade tsar, puts TPP into a dauntingly ambitious context. He calls it **central to America's pivot to Asia**, a chance to **show the country's commitment** to **creating institutions** that **moderate territorial disputes**, and an opportunity to show emerging economies (meaning China) what economic **rules the global economy should follow**. "At a time when there is **uncertainty about the direction of the global trading system**, TPP can play a **central role in setting rules of the road** for a **critical region** in flux," he says. The flipside of this is that **failure becomes an even bigger risk**, which Mr Froman acknowledges. Perhaps in an effort to prod a somnolent, introspective Congress into action, he makes the dramatic claim that failure could mean **America "would forfeit its seat at the centre of the global economy".** Many pundits in Washington agree that **American leadership in Asia is on the table**. Michael Green of the Centre for Strategic and International Studies says TPP failure would "**undermine the impression of the United States as a Pacific power and look like an abdication of leadership**". It would also take pressure off Japan and China to reform their economies. Mireya Solís, a Japan expert at the Brookings Institution, says it would be a "**devastating blow to the United States' credibility**". Those views are echoed in East Asia. Mr Tay in Singapore says TPP **failure would be a disaster:** "If the domestic issues of these two countries cannot be resolved, there is **no sense that the US-Japan alliance can provide any kind of steerage for the region."** Deborah Elms, head of the Singapore-based Asian Trade Centre, suggests that so far the American pivot has manifested itself mainly as an extra 1,000 marines stationed in Australia.

"**Without TPP, all the pivot amounts to is a few extra boots on the ground** in Darwin," she says. Even members of America's **armed forces are worried**. As one senior serving officer in the Pacific puts it, "the TPP **unites countries** that are **committed to a trade-based future, transparency and the rule of law.** It is the **model** that the United States and Europe have advanced versus that advanced by China. It is an opportunity to **move the arc of Chinese development,** or identify it as a non-participant." Yet when Mr Obama mentions TPP, he talks mostly about protecting American jobs rather than safeguarding America's place in the world. The president has never fully **put his back into forcing a congressional vote on TPA**. There is **still time** for him and Mr Abe to rescue the trade talks. But **unless Mr Obama leads from the front, America's own leadership in the Pacific will seem less convincing** than he has repeatedly promised.

EXT: Freedom Act

The Freedom act doesn't go far enough to curtail surveillance – hardly affected the NSA

Jennifer **Granick 15**, Director of Civil Liberties at the Standford Center for Internet, 5/28/15, "A Sunset is a Beautiful Thing," http://www.forbes.com/sites/valleyvoices/2015/05/28/a-sunset-is-a-beautiful-thing/2/

Some reformers support the USA Freedom Act (USAF) passed by the House of Representatives, which would prohibit "bulk" collection on everyone but still allow "bulky" collection potentially effecting hundreds of thousands of people. Section 215 as people understood it when passed didn't allow this. But after the NSA's bastardized interpretation of 215 was accepted by the FISA court, and after years of an indiscriminate phone dragnet, USAF was a compromise between reauthorizing dragnet surveillance and assuring less dragnet surveillance plus some oversight and transparency safeguards.

That was then, but this is now. USAF was negotiated at a time when straight reauthorization was a real danger. It no longer is. USAF was negotiated at a time when the only judges ruling on the dragnet were FISA court judges approving it. A few weeks ago, however, the Second Circuit issued a stinging rebuke to the NSA and those FISC judges, ruling that Section 215 doesn't allow dragnet surveillance.

USAF was negotiated at a time when we had very little information on whether and how the FBI, as opposed to the NSA, was using the provision for dragnet spying on Americans. In fact, USAF exempts the FBI from certain reporting requirements. But just this week, the government released a Department of Justice Inspector General (IG) report yesterday, which tells us the FBI has also been abusing section 215 for bulk collection. The Justice Department, supposed to oversee the FBI, for seven years failed to create privacy rules required by the permissive FISA Court. Perhaps the worst part is that the FBI has, get this, a classified definition of what it means to be a United States Person entitled to privacy protections under intelligence laws. You don't even know if you are entitled to be treated as an American or not. If this doesn't blow your mind, you aren't paying attention. This is a great reason to hold off on USAF. We can't be sure USAF fixes the problem if we are still learning what the problems are.

EXT: EU Perception

NSA surveillance causes the EU to view the US as something to defend itself from

Committee on Civil Liberties, Justice and Home Affairs 14, Committee in the EU Parliament, 3/12/14, "US NSA: stop mass surveillance now or face consequences, MEPs say," http://www.europarl.europa.eu/pdfs/news/expert/infopress/20140307IPR38203/20140307IPR38203_en.pdf

The text also calls for a "European whistle-blower protection programme", which should pay particular attention to the "complexity of whistleblowing in the field of intelligence". EU countries are also asked to consider granting whistleblowers international protection from prosecution.

Furthermore, Europe should develop its own clouds and IT solutions, including cybersecurity and encryption technologies, to ensure a high level of data protection, adds the text.

The UK, France, Germany, Sweden, the Netherlands and Poland should clarify the allegations of mass surveillance - including potential agreements between intelligence services and telecoms firms on access to and exchange of personal data and access to transatlantic cables - and their compatibility with EU laws, the resolution says.

Other EU countries, in particular those participating in the "9-eyes" (UK, Denmark, France and the Netherlands) and "14-eyes" arrangements (those countries plus Germany, Belgium, Italy, Spain and Sweden) are also urged to review their national laws to ensure that their intelligence services are subject to parliamentary and judicial oversight and that they comply with fundamental rights obligations.

AT: Credibility Advantage

1NC – Terrorism Turn

Turn - The NSA programs are a major component of our counter-terrorism efforts, curtailing decreases effective CT

Sean **Sullivan 13**, reporter for the Washington Post, 6/18/13, "NSA head: Surveillance helped thwart more than 50 terror plots," The Washington Post, http://www.washingtonpost.com/blogs/post-politics/wp/2013/06/18/nsa-head-surveillance-helped-thwart-more-than-50-terror-attempts/

Alexander had previously said the intelligence gathering helped in the cases of Najibullah Zazi, an Afghan American who pleaded guilty to planning suicide attacks in New York, and Pakistani American David Headley, who conducted surveillance in support of the 2008 attacks in Mumbai, India. Joyce elaborated on the two previously revealed cases on Tuesday.

Alexander said he would provide details of the 50 examples he cited Tuesday to lawmakers in a classified setting on Wednesday.

"Those 50 cases right now have been looked at by the FBI, CIA and other partners within the community, and the National Counterterrorism Center is validating all the points so that you know that what we've put in there is exactly right," said Alexander.

Alexander also said that if the surveillance programs had been in place before the Sept. 11 attacks, the United States would have known that hijacker Khalid Muhammad Abdallah al-Mihdhar was in San Diego and communicating with a known al Qaeda safehouse in Yemen.

Alexander's testimony came a day after President Obama defended his administration's right to engage in such surveillance in an interview with PBS host Charlie Rose, saying the programs had adequate checks and balances.

The Foreign Intelligence Surveillance Court, Obama argued, provided sufficient oversight of the National Security Agency's activities and said the government was "making the right trade-offs" in balancing privacy rights with national security prerogatives.

"What I can say unequivocally is that if you are a U.S. person, the NSA cannot listen to your telephone calls, and the NSA cannot target your e-mails," he added, before Rose interjected, "And have not."

"And have not," Obama reiterated. "They cannot and have not, by law and by rule, and unless they — and usually it wouldn't be 'they,' it'd be the FBI — go to a court, and obtain a warrant, and seek probable cause, the same way it's always been, the same way when we were growing up and we were watching movies, you want to go set up a wiretap, you got to go to a judge, show probable cause."

1NC - TFTP Useless

The TFTP is limited in its capabilities and effectiveness and often falsely accuses people of terrorism

Mara **Wesseling 13**, PhD Candidate at University of Amsterdam, August 2013, "Terrorism financing barely traceable using data analysis," http://www.uva.nl/en/news-events/news/uva-news/content/news/2013/08/terrorism-financing-barely-traceable-using-data-analysis.html

Immediately following the terrorist attacks on 11 September 2001, the European Union created the EU Action Plan for Combating Terrorism, which included action against terrorism financing as a 'core component'. Politicians, policymakers and legal experts stress the importance of combating terrorism financing, as they see money as a crucial element in the propagation of terrorism. Specific programmes have been set up to address the problem.

'My research shows that it cannot yet be demonstrated whether these programmes have had much success with regard to tracking down suspected terrorists or preventing terrorist attacks. In light of the meagre and sometimes debatable results of both programmes, the question arises whether the social and political changes instituted as part of the data-analysis-driven fight against terrorism are (still) desirable or justified,' Wesseling says.

Terrorist Finance Tracking Program

In her research, Wesseling analysed the Terrorist Finance Tracking Program (TFTP – better known as the SWIFT programme in the wake of the 'SWIFT affair') and the Third European AML/CFT directive. These two programmes constitute the most significant initiatives in the European fight against the financing of terrorism.

It has been shown that risk analyses carried out by banks as part of the Third European AML/CFT directive have revealed virtually no patterns that point to terrorism financing. Wesseling goes on to say that the preventive power of the TFTP to detect terrorist networks at an early stage is also limited. What is more, both programmes could lead (and in practice have led) to the registration and arrest of persons who are then wrongfully depicted as terrorists. Furthermore, she adds that there is a relationship between the TFTP and the imprisonment of alleged terrorists, including those at Guantanamo Bay.

1NC -TPP

TPP won't curb China's power

Clyde **Prestowitz 1/22**/15, president of the Economic Strategy Institute and the author most recently of "The Betrayal of American Prosperity." He served in the Reagan administration and was vice chairman of President Clinton's Commission on Trade and Investment in the Asia-Pacific Region, "**The Trans-Pacific Partnership won't deliver jobs or curb China's power**," LA Times, www.latimes.com/opinion/op-ed/la-oe-prestowitz-tpp-trade-pact-20150123-story.html

In any case, the ever-closer linking of the U.S. economy to those of the TPP countries over the last 35 years has not prevented the rise of Chinese power, nor has it deterred U.S. trade partners and allies from developing ever closer ties with China. Further, the GDP of the combined TPP countries already dwarfs that of China. But this means nothing. The TPP is not going to bring together nations such as Mexico, Peru, Chile, New Zealand, Australia, Singapore, Malaysia and

Brunei to gang up against China. That is just not going to happen.¶ Thus **the TPP fails on both economic and political grounds**. It is no more than a late lament for the dying age of free-trade agreements.

2NC - TPP

No effect on trade—protectionism is low in the squo and TPP's barriers offset gains

Dean **Baker 14**, PhD in Economics, co-director of the Center for Economic and Policy Research in Washington, D., News for Washington Post: Politicians Don't Always Tell the Truth and TPP Is Not a Free-Trade Agreement, 12/27, http://www.cepr.net/index.php/blogs/beat-the-press/new-for-washington-post-politicians-dont-always-tell-the-truth-and-tpp-is-not-a-free-trade-agreement

The piece also repeatedly refers to **the TPP as liberalizing trade**. This **is not at all clear**. Most of the trade barriers between the United States and the countries in the agreement are already low. While the TPP will reduce many of these barriers further, it will also increase protectionist barriers in the form of patent and copyright protection. It is entirely possible that the increase in protectionism due to stricter and longer protections in these areas will most than offset any reduction in the remaining tariff and quota barriers.¶ It is also worth noting that the deal will likely include nothing about regulating currency values. The decision of many developing countries to deliberately keep their currencies low against the dollar has been the major factor sustaining the U.S. trade deficit, which is now more than $500 billion annually (@ 3 percent of GDP). This loss of demand is the major cause of the "secular stagnation" that economists like Larry Summers have been writing about lately. Opponents of this trade deal have argued that currency should be included in the pact given the enormous damage caused by the resulting trade deficits.

1NC - TTIP

Their evidence is overly optimistic – no one knows the true impact the TTIP will have and it's likely to be negative

Sandra **Bernick 15**, economist with the New Economics Foundation, 4/24/15, The New Economic Foundation, "Does TTIP really make (economic) sense?," http://www.neweconomics.org/blog/entry/does-ttip-really-make-economic-sense

Several studies have already looked at the impacts TTIP is likely to produce (detailed in Figure 1 above). Overall they find negligibly small positive to negative impacts. A rise in exports of between 0.9% and 7.6% is projected and should translate to an increase of GDP between 0.30% and 0.49% by 2027.

Results on jobs, however, are not detailed by three of the five studies. Two of these, prepared by CEPR and Ecorys on behalf of the European Commission, assume the amount of labour as fixed, excluding through this assumption any impacts on jobs. Other studies that include employment impacts put these at a plus of 1.3 million and a reduction of 583,000 across Europe. An increase of €545 in disposable income for a four person household by 2027 advertised by the Commission is far too little to lift living standards.

All of these are long-term impacts so we know very little about what effects will be experienced before 2027, in particular for jobs and wages. Yet even the long-term outcomes are hardly what one would imagine a "comeback for Europe" to look like. The same is true when we look at modelled impacts for individual countries.

Looking at estimates for the UK specifically, the story does not change. Again, we see very low positive to negative estimates for exports (between +2.95 and -0.95%) and little additional growth, ranging from +0.35% (CEPR study) to -0.07% (Capaldo). The LSE

in their study even outright proclaimed that there is "little reason to think that an EU-US investment chapter will provide the UK with significant economic benefits". Equally, there will likely be no employment benefits either with Capaldo estimating a small reduction. Cleary this is hardly a "once in a generation prize".

The costs and benefits of TTIP are hard to assess when you have an incomplete picture. Many existing studies focus on specifying impacts in later years, and few include useful information on the levels of employment and the quality of jobs. Even if these were available, we would not be getting a full picture of how the agreement impacts our economy, society and environment.

A full overview of TTIP's true costs and benefits, taking into account externalities, could not be more paramount given the scale and scope of the deal. The EU already has a commitment to assess social and environmental impacts when concluding trade deals. Yet the Sustainable Impact Assessment remains unpublished, even as negotiations reach their final stages. Until this is published, ignore the bravado – no one can say for sure what impact TTIP will have on the still-vulnerable European economy.

1NC – Democracy

Alt causes to loss of US credibility

Mike **Green 13**, professor of international relations @ Georgetown University, 11/4/13, "The NSA Leaks Are Bad, but Syria Hurt U.S. Credibility More," http://foreignpolicy.com/2013/11/04/the-nsa-leaks-are-bad-but-syria-hurt-u-s-credibility-more/

For an administration that built its foreign policy strategy around "restoring our reputation abroad" (and the media that played along with that narrative), it is cause for alarm that European allies like Germany are now mad at us. Western European opinion, after all, was the evidence that academics, the New York Times, and the Democratic Congress used to illustrate America's declining reputation under Bush (never mind that the U.S. reputation in Asia and Africa generally went up in polling from 2001-2008, and in the Middle East has rapidly declined since Bush left office). This was the same mindset that led President Obama to give his global zero speech in Berlin instead of say, Tokyo or Jerusalem, which actually face the threat of nuclear armed missiles.

Now the media is lamenting Asian outrage over the NSA scandal. In the wake of reports in the Washington Post on joint U.S.-Australian collaboration to monitor Chinese and Southeast Asian communications, the Chinese government spokesman expressed "deep concern" (Beijing was shocked…shocked!), while the Indonesian Foreign Ministry called in the Australian Ambassador in Jakarta to protest this "violation of diplomatic norms." Google this latest round of Snowden leaks on Asia and you will find a dozen headlines that say something like "Outrage over NSA Spying Spreads to Asia."

And yet, what has struck me in numerous recent discussions with senior politicians and officials from East Asian allies is how little the NSA revelations come up in conversation. Our East Asian allies know that Henry Stimson ("gentlemen do not read other gentlemen's mail") is no longer Secretary of State. With a rising China and a nuclear armed North Korea, they have become quintessential realists and know how the game is played. What worries them much, much more than Snowden is Syria. It comes up in private conversation all the time. I have tried to explain that our "never mind" on Syria should not lead governments in Seoul or Tokyo to question the resolve of Americans to defend our allies against growing threats in East Asia. I have pointed to recent surveys showing that more Americans than ever say we should fight to protect Korea if it comes under attack from the North. And I have noted that despite the Asia pivot's drift in recent months, the U.S. military continues giving top priority to the region.

We are fortunate to have Shinzo Abe in Tokyo, Park Geun-hye in Seoul, and Tony Abbott in Canberra. They are not going to give up on us as easily as the Saudis and other Gulf allies have over Syria and Iran policy. Nor are our friends in Southeast Asia, who express outrage over the NSA stories because they can, but keep American close as China rises because they must. But even though the NSA story dominates the

headlines, the administration's prevarications over Syria continue to linger for the elites who drive national strategy in these countries. Yes, they want to like us — but they also need our enemies to fear us.

US Credibility is already at rock bottom and there hasn't been a decrease in global security

Mark **Eades 13**, journalist for US News, 12/16/13, US News, "U.S. Credibility Around the World Damaged by Afghanistan War," http://www.usnews.com/opinion/blogs/world-report/2013/12/16/us-credibility-around-the-world-damaged-by-afghanistan-war

American credibility is not simply at risk but has already suffered damage – and remains in a deteriorating spiral. The gulf between the words and deeds of the United States regarding Afghanistan over the past decade has been so vast that trust in America has been severely degraded. There are real consequences to this loss of trust and if this trend is not reversed, vital American interests may one day be placed at risk.

Following initial deployment of surge forces into Afghanistan, Gen. Stanley McChrystal, then the commander of U.S. troops in the country, told the New York Times, "I think we have made significant progress in setting the conditions in 2009 ... and that we'll make serious progress in 2010." Gen. David Petraeus followed McChrystal in command and in March 2011 testified before the House Armed Services Committee that "as a bottom line up front, it is [the International Security Assistance Force's] assessment that the momentum achieved by the Taliban in Afghanistan since 2005 has been arrested in much of the country and reversed in a number of important areas." Next in line came Gen. John Allen, who claimed at his change of command ceremony in February 2013 that in fact, "This is victory. This is what winning looks like".

After 12 full years of war, however, this is what "victory" actually looks like:

"Afghanistan's opium production surged this year to record levels, despite international efforts over the past decade to wean the country off the narcotics trade, according to a report released Wednesday by the U.N.'s drug control agency," Fox News reported.

Transparency International's Corruption Perception Index ranks Afghanistan as dead-last at 174th out of 174 nations evaluated.

The United Nations General Assembly Security Council reported that "from 16 May to 15 August [2013], 5,922 [security] incidents were recorded, an 11 per cent increase compared with the same period in 2012 (5,317 incidents)."

And the United Nations Assistance Mission in Afghanistan documented "1,319 civilian deaths and 2,533 injuries (3,852 casualties) from January to June 2013, marking a 14 percent increase in deaths, 28 percent increase in injuries and 23 percent increase in total civilian casualties compared to the same period in 2012."

When the world hears American leader after leader make claims of victory and success year after year – yet sees with their eyes that in fact the war has been an unmitigated failure – they can't help but lose faith in the word of our country.

What credibility, then, should the leaders of other nations place in the judgment of America's senior civilian and uniformed leaders when we make assessments on security matters, especially when we might then ask those nations to contribute their treasure or risk their blood in support?

There's only a small loss of credibility and it will be regained in the long term

David **Francis 13**, editor for the Fiscal Times, 11/4/13, The Fiscal Times, "Why Europe Won't Punish the U.S. over NSA Scandal," http://www.thefiscaltimes.com/Articles/2013/11/04/Why-Europe-Won-t-Punish-US-over-NSA-Scandal

But is this truly the case? Expressing anger over NSA practices is one thing; actually making policy changes because of the behavior is entirely another. A close examination of statements made by European officials shows their tone softening.

There is not likely to be any long-term fallout in two key areas: economic negotiations over a $287 billion EU/U.S. trade pact are going to continue, and intelligence is still likely to pass back and forth across the Atlantic. The only real damage has been to the standing of the United States with the European public and fringe lawmakers.

1) Economic cooperation. There are growing concerns that the European Union could make it tougher for private businesses to operate in Europe. According to reports, some European lawmakers are considering suspending the "Safe Harbor" agreement that allows American firms to process European personal data, effectively ending the ability of companies like Apple to sell their products in Europe.

But the cornerstone of EU/U.S. economic ties is the Transatlantic Trade and Investment Partnership, a deal currently being negotiated. According to a study by the U.S. Chamber of Commerce, the agreement would increase trade between the partners by $120 billion within five years. At the same time, it would add some $180 billion to U.S.-EU gross domestic product.

After the initial reports on U.S. snooping, some European lawmakers called for the EU to abandon the deal. But the economic reality in the European Union makes this impossible. The euro zone s struggling to grow, and Europe needs the help more than America. Estimates put forth by the European Commission suggest a new trade pact could increase annual GDP by 0.5 percent in the EU and 0.4 percent in the U.S. by 2027.

Even Merkel dismissed any thought of abandoning the deal, saying on Friday, "Maybe the talks are more important right now considering the current situation."

2) Intelligence sharing. Reports out of Germany indicate that Berlin and Washington are set to sign an agreement forbidding espionage against one another some time next year. This agreement would go a long way toward placating Germany anger.

But each side will not stop sharing intelligence. Numerous reports indicate that the German foreign intelligence service uses NSA information to track terrorist on German soil. In fact, authorities have used this information to foil attacks in Germany.

The same kind of exchange is also set to continue among other NATO allies. All partners share information that could be used to prevent attacks. Some former European intelligence officials have even admitted that European NATO members also spy on the United States.

"The Americans spy on us on the commercial and industrial level like we spy on them," Bernard Squarcini, former head of the French secret services said last week. "No one is fooled."

3) American standing. Merkel, in her phone call with the president, said that the NSA targeting of her phone amounted to a breach of trust. This sense of betrayal has spread among lawmakers across the continent.

Fortunately, Obama has a well of good will to draw upon with the European public. They might be angry with the NSA, but so far, this anger has not been directed at the president himself.

Impact D - TPP

No Asia war

Nick **Bisley 14**, Professor of IR @ La Trobe University (Australia) and Executive Director of La Trobe Asia, "It's not 1914 all over again: Asia is preparing to avoid war", 3/10, http://theconversation.com/its-not-1914-all-over-again-asia-is-preparing-to-avoid-war-22875

Asia is cast as a region as complacent about the risks of war as Europe was in its belle époque. Analogies are an understandable way of trying to make sense of unfamiliar circumstances. In this case, however, the historical parallel is deeply misleading. Asia is experiencing a period of uncertainty and strategic risk unseen since the US and China reconciled their differences in the mid-1970s. Tensions among key powers are at very high levels: Japanese prime minister Shinzo Abe recently invoked the 1914 analogy. But there are very good reasons, notwithstanding these issues, why Asia is **not about to tumble into** a **great power war.** China is America's second most important trading partner. Conversely, the US is by far the most important country with which China trades. Trade and investment's **"golden straitjacket"** is a basic reason to be optimistic. Why should this be seen as being more effective than the high levels of interdependence between Britain and Germany before World War One? Because Beijing and Washington are not content to rely on markets alone to keep the peace. They are **acutely aware of how much they have at stake**. Diplomatic infrastructure for peace The two powers have established a **wide range of institutional links** to manage their relations. These are designed to improve the level and quality of their communication, to lower the risks of misunderstanding **spiralling** out of control and to manage the trajectory of their relationship. Every year, around 1000 officials from all ministries led by the top political figures in each country meet under the auspices of the Strategic and Economic Dialogue. The dialogue has demonstrably improved US-China relations across the policy spectrum, leading to collaboration in a wide range of areas. These range from disaster relief to humanitarian aid exercises, from joint training of Afghan diplomats to marine conservation efforts, in which Chinese law enforcement officials are hosted on US Coast Guard vessels to enforce maritime legal regimes. Unlike the near total absence of diplomatic engagement by Germany and Britain in the lead-up to 1914, today's two would-be combatants have a **deep** level of **interaction** and practical co-operation. Just as the extensive array of common interests has led Beijing and Washington to do a lot of bilateral work, Asian states have been busy the past 15 years. These nations have created a broad range of **multilateral institutions** and mechanisms intended to **improve trust**, generate a sense of common cause and promote regional prosperity. Some organisations, like the Asia-Pacific Economic Cooperation (APEC), have a high profile with its annual leaders' meeting involving, as it often does, the common embarrassment of heads of government dressing up in national garb. Others like the ASEAN Regional Forum and the ASEAN Defence Ministers' Meeting Plus Process are less in the public eye. But there are more than **15** separate multilateral bodies that have a focus on regional security concerns. All these organisations are trying to build what might be described as an infrastructure for peace in the region. While these mechanisms are not flawless, and many have rightly been criticised for being long on dialogue and short on action, they have been crucial in managing **specific crises** and allowing countries to clearly state their commitments and priorities.

Deterrence and economics check

Paul **Dibb 14**, emeritus professor of strategic studies @ The Australian National University, "Why A Major War In Asia Is Unlikely," March 31, East Asia Forum, Economy Watch, http://www.economywatch.com/features/why-a-major-war-in-asia-is-unlikely.31-03.html

Even so, there are two major reasons why a major power **war in Asia is unlikely**. First, there is the **iron discipline of nuclear deterrence**, which has prevented a major war for almost 70 years, even at the most dangerous heights of the Cold War. An all-out nuclear war between the US and China would involve the deaths of hundreds of millions of people on both sides in a matter of hours. For all intents and purposes, they would cease to exist as modern functioning societies. This is an existential threat unlike any faced by humankind previously. Once nuclear weapons are used it would be practically impossible to avoid full-blown escalation. The second factor is the **unprecedented economic and technological interdependence** that now intertwines virtually **every economy in the region**. Assertions that globalisation was even deeper in 1914 are simply untrue. Global supply chains for almost every product consumed in the Asia Pacific make every country in the region **critically vulnerable** to the outbreak of war. And that includes China as much — or even more so — as any other country. China is now crucially dependent on imports for its economic securi ty (for example, it accounts for 60 per cent of global seaborne iron ore trade). So, as the doyen of US international relations studies Professor Joseph Nye of Harvard University argues, we should be wary of analysts wielding historical analogies, particularly if they have a whiff of inevitability. War, he observes, is never inevitable, though the belief that it is can become one of its causes.

Trade is irrelevant for war

Katherine **Barbieri 13**, Associate Professor of Political Science at the University of South Carolina, Ph.D. in Political Science from Binghamton University, "Economic Interdependence: A Path to Peace or Source of Interstate Conflict?" Chapter 10 in Conflict, War, and Peace: An Introduction to Scientific Research, google books

How does interdependence affect war, the most intense form of conflict? Table 2 gives the **empirical results**. The rarity of wars makes any analysis of their causes quite difficult, for variations in interdependence will seldom result in the occurrence of war. As in the case of MIDs, the log-likelihood ratio tests for each model suggest that the inclusion of the various measures of interdependence and the control variables improves our understanding of the factors affecting the occurrence of war over that obtained from the null model. However, the individual interdependence variables, alone, are not statistically significant. This is not the case with contiguity and relative capabilities, which are both statistically significant. Again, we see that contiguous dyads are more conflict-prone and that dyads composed of states with unequal power are more pacific than those with highly equal power. Surprisingly, no evidence is provided to support the commonly held proposition that democratic states are less likely to engage in wars with other democratic states.¶ The evidence from the pre-WWII period provides support for those arguing that **economic factors have little, if any, influence** on affecting leaders' decisions to engage in war, but many of the control variables are also statistically insignificant. These results should be interpreted with caution, since the sample does not contain a sufficient number wars to allow us to capture great variations across different types of relationships. Many observations of war are excluded from the sample by virtue of not having the corresponding explanatory measures. A variable would have to have an extremely strong influence on conflict—as does contiguity—to find significant results. ¶ 7. Conclusions This study provides **little empirical support** for the liberal proposition that trade provides a path to interstate peace. **Even after** controlling for the influence of contiguity, joint democracy, alliance ties, and relative capabilities, the evidence suggests that **in most instances trade fails to deter conflict**. Instead, extensive economic interdependence increases the likelihood that dyads engage in militarized dispute; however, it **appears to have little influence on the incidence of war**. The greatest hope for peace appears to arise from symmetrical trading relationships. However, the dampening effect of symmetry is offset by the expansion of interstate linkages. That is, extensive economic linkages, be they symmetrical or asymmetrical, appear to pose the greatest hindrance to peace through trade.

Impact D - General

Their evidence is predicated in alarmist reactions to counter-terrorism

Mathieu **Deflem and** Shannon **McDonough 15**, Professor of Sociology at the University of South Carolina, 1/15/15, "The Fear of Counterterrorism: Surveillance and Civil Liberties," http://link.springer.com/article/10.1007/s12115-014-9855-1#page-1

The prior analysis shows that civil liberties claims are not only a function of actual violations, but also result from a culturally entrenched fear of counterterrorism and the power of surveillance. In such a hyper-sensitive civil liberties culture, there is an intimate and ironic relationship between fear and surveillance. Fear justifies and motivates the use of surveillance, while the expansion of surveillance produces a cultural fear of its capabilities and consequences. The notion of a culturally embedded fear of counterterrorism in the United States can be substantiated on the basis of national survey data such as those provided by Gallup and the Pew Research Center, two widely respected organizations conducting public opinion polls.

First, it is noteworthy that since the terrorist attacks of September 11, 2001, Americans have decreasingly perceived of terrorism as a top priority facing the country. Gallup data show that just before the attacks of 9/11, less than half of 1 % of Americans mentioned terrorism as the most important problem facing the United States today (Newport 2010). Not surprisingly, that number rose dramatically to 46 % in October 2001. But since then, Americans decreasingly perceive of terrorism as a central problem facing the country. By January 2003, the number of Gallup respondents seeing terrorism as a top concern had already declined to about 10 %, and by September 2010 only 1 % of Americans surveyed mentioned terrorism as a top issue of concern for the country. Similarly, Gallup polls show that Americans decreasingly perceive it to be likely that a terrorist attack will take place in their country (Saad 2011). After the events of 9/11, no less than 85 % of those surveyed thought another terrorist attack against the United States was likely, a number that decreased to 52 % by 2002 and stood at 38 % in 2011.

Second, along with a dwindling fear of terrorism since 9/11, data show that Americans express considerable concerns over counterterrorism measures and are less willing to accept such measures in the name of the fight against terrorism. Since the events of September 11, Gallup polls show, US citizens increasingly less favor counterterrorism measures that might violate civil liberties (Gallup 2013). In January 2002 no less than 47 % of surveyed Americans stated that the government could take necessary steps against terrorism even if civil liberties were violated, but by 2011 only 25 % approved and no less than 71 % disapproved of such measures. Also, whereas in June of 2002 only 11 % of respondents felt that the administration had gone too far in restricting civil liberties, 41 % felt that this was the case as early as May 2006.

Data from the Pew Research Center substantiate these findings by showing that increasingly fewer Americans feel that it is necessary to give up civil liberties to curb terrorism (Doherty 2013). In the immediate aftermath of 9/11, a majority of 55 % of those surveyed stated it was necessary to give up civil liberties in the name of counterterrorism, while 35 % expressed the opposite viewpoint. By 2011, the situation was reversed, with a majority of 54 % stating it would not be necessary to curb civil liberties and 40 % expressing the opposite opinion.

Successful counterterrorism interventions by security agencies can be expected to influence attitudes. Recently noteworthy, for instance, is the sympathy many Americans showed towards law enforcement following the capture of the perpetrators of the Boston Marathon bombings in April 2013. Yet, such situational factors can easily be offset by other, more problematic interventions and more long-standing suspicions towards government power. Favorable sentiments created by the immediacy of the problems posed by a terrorist suspect being on the loose in Boston cannot be expected to carry over into a general embrace of a more permanent expansion of law enforcement powers because of long-standing American concerns over privacy.

Indeed, Gallup data show that Americans have since 9/11 steadily affirmed their concerns over privacy and civil liberties (Gallup 2013). Findings show that from 2003 to 2011 some 65 to 71 % of respondents feel that government actions against terrorism should not violate Americans' civil liberties. Such concerns over privacy are also found to be felt among large segments of the American public with respect to both government as well as private-business conduct, sentiments which strikingly unite respondents who identify as Republican, Democratic, or Independent (Doherty 2013). In 2012, respectively 72, 74, and 77 % of respondents from these groups stated that business was collecting too much personal information, while 72, 60, and 65 % stated that the government was collecting too much information.

A surge in privacy concerns among Americans has most recently been experienced since Edward Snowden in June 2013 was reported to have leaked information about NSA surveillance programs, re-awakening the debate on the NSA Terrorist Surveillance Program that was secretly ordered by President George W. Bush in 2002 (Deflem 2010). Between June 1, 2013 and January 18, 2014, major newspapers in Lexis-Nexis published no less than 3,266 stories with the term 'privacy' in the headline, up from 999 in the prior 1-year period. Not surprisingly, survey data show that a large majority, 90 %, of Americans presently feel that they have less privacy than previous generations when it comes to personal information (Bowman and Rugg 2013). Also, Gallup data collected in June 2013 show that a majority of 53 % of Americans disapprove of government surveillance programs (with 37 % approving), even though sentiments were split on whether Snowden did the right thing or not, with 44 % claiming he did the right thing and 42 % that he was wrong to have leaked classified information (Newport 2013). It is hereby not so much striking to note that presumed NSA spying activities have moved to the foreground of public debate since Snowden's accusations as that the extent and intensity of this debate reveal the cultural sensitivities surrounding surveillance programs regardless of whether violations of personal rights actually took place.

Surveillance and counterterrorism activities are by definition oftentimes secretive and raise sensitive matters on rights and justice. Such issues are particularly important in a democratic society where violations of civil liberties by intelligence and other security agencies, even in an area as pressing as terrorism, cannot be condoned. Yet, a democratically committed society will also be more likely to produce a cultural climate in which concerns surrounding privacy and civil liberties can lead to claims over rights-related violations that cannot be substantiated on the basis of actual incidents of such violations. Our findings suggest that the amount of civil rights violations in the post-9/11 context is relatively small when compared to the alleged threat to civil liberties suggested in the surveillance discourse among academicians and advocates.

In view of our analysis, it is important for social-science scholars to understand the social realities involved with surveillance and counterterrorism as involving a subjective dimension related to legitimacy—especially the lack thereof— that co-exists with objective conditions that are rooted in technology and bureaucratic development. For whereas government and private measures against terrorism and other security concerns have certain measurable consequences, it is also to be noted that they are evaluated by a citizenry that is more or less concerned about such issues irrespective of actual violations. The need is thereby affirmed for sociologists to examine the social conditions affecting security measures regardless of stated motives. Since the classic contributions of Emile Durkheim on the role of law and punishment (Durkheim 1893), it can no longer suffice to view counterterrorism (and other forms of social control) as a mere dependent variable related to terrorism (and other crimes). Instead, as our analysis shows, a more useful framework examines the entire range of factors shaping surveillance activities, ranging from situational factors to deep-rooted cultural tradition.

Impact D – Democracy Promotion

Democratic peace theory is inherently flawed – there's no benefit to spreading American ideals

Sebastian **Rosato 03**, Associate Professor of Political Science at the University of Notre Dame, November 2003, American Political Science Review, Issue 4, pp 585-602, "The Flawed Logic of Democratic Peace Theory," http://journals.cambridge.org/action/displayAbstract?fromPage=online&aid=191046&fileId=S0003055403000893

The causal logics that underpin democratic peace theory cannot explain why democracies remain at peace with one another because the mechanisms that make up these logics do not operate as stipulated by the theory's proponents. In the case of the normative logic, liberal democracies do not reliably externalize their domestic norms of conflict resolution and do not treat one another with trust and

respect when their interests clash. Similarly, in the case of the institutional logic, democratic leaders are not especially accountable to peaceloving publics or pacific interest groups, democracies are not particularly slow to mobilize or incapable of surprise attack, and open political competition offers no guarantee that a democracy will reveal private information about its level of resolve. In view of these findings there are good reasons to doubt that joint democracy causes peace.

Democratic peace theorists could counter this claim by pointing out that even in the absence of a good explanation for the democratic peace, the fact remains that democracies have rarely fought one another. In addition to casting doubt on existing explanations for the democratic peace, then, a comprehensive critique should also offer a positive account of the finding.

One potential explanation is that the democratic peace is in fact an imperial peace based on American power. This claim rests on two observations. First, the democratic peace is essentially a post-World War II phenomenon restricted to the Americas and Western Europe. Second, the United States has been the dominant power in both these regions since World War II and has placed an overriding emphasis on regional peace.

There are three reasons we should expect democratic peace theory's empirical claims to hold only in the post- 1945 period. First, as even proponents of the democratic peace have admitted, there were few democracies in the international system prior to 1945 and even fewer that were in a position to fight one another. Since 1945, however, both the number of democracies in the international system and the number that have had an opportunity to fight one another have grown markedly (e.g., Russett 1993, 20). Second, while members of double democratic dyads were not significantly less likely to fight one another than members of other types of dyads prior to World War II, they have been significantly more peaceful since then (e.g., Farber and Gowa 1997). Third, the farther back we go in history the harder it is to find a consensus among both scholars and policymakers on what states qualify as democracies. Depending on whose criteria we use, there may have been no democratic wars prior to 1945, or there may have been several (see, e.g., Layne 1994; Ray 1995; Russett 1993; Spiro 1994). Since then, however, we can be fairly certain that democracies have hardly fought each other at all.

Most of the purely democratic dyads since World War II can be found in the Americas and Western Europe. My analysis includes all pairs of democracies directly or indirectly contiguous to one another or separated by less than 150 miles of water between 1950 and 1990 (Przeworski et al. 2000; Schafer 1993). This yields 2,427 double democratic dyads, of which 1,306 (54%) were comprised of two European states, 465 (19%) were comprised of two American states, and 418 (17%) comprised one American state and one European state. In short, 90% of purely democratic dyads have been confined to two geographic regions, the Americas and Western Europe.

American preponderance has underpinned, and continues to underpin stability and peace in both of these regions. In the Americas the United States has successfully adopted a two-pronged strategy of driving out the European colonial powers and selectively intervening either to ensure that regional conflicts do not escalate to the level of serious military conflict or to install regimes that are sympathetic to its interests. The result has been a region in which most states are prepared to toe the American line and none have pretensions to alter the status quo. In Europe, the experience of both World Wars persuaded American policymakers that U.S. interests lay in preventing the continent ever returning to the security competition that had plagued it since the Napoleonic Wars. Major initiatives including the Marshall Plan, the North Atlantic Treaty, European integration, and the forward deployment of American troops on German soil should all be viewed from this perspective. Each was designed either to protect the European powers from one another or to constrain their ability to act as sovereign states, thereby preventing a return to multipolarity and eliminating the security dilemma as a factor in European politics. These objectives continue to provide the basis for Washington's European policy today and explain its continued attachment to NATO and its support for the eastward expansion of the European Union. In sum, the United States has been by far the most dominant state in both the Americas and Western Europe since World War II and has been committed, above all, to ensuring that both regions remain at peace.24

Evaluating whether the democratic peace finding is caused by democracy or by some other factor such as American preponderance has implications far beyond the academy. If peace and security are indeed a consequence of shared democracy, then international democratization should continue to lie at the heart of American grand strategy. But if, as I have suggested, democracy does not cause peace, then American policymakers are expending valuable resources on a policy that, while morally praiseworthy, does not make America more secure.

Obama's current democracy promotion policies are working – too much promotion and our efforts will fail

Hal **Brands 14**, Assistant Professor in the Sanford School of Public Policy at Duke University, 3/13/14, The National Interest, "The Enduring Dilemmas of Democracy Promotion," http://nationalinterest.org/commentary/the-enduring-dilemmas-democracy-promotion-10042?page=2

In their eyes, pushing too hard for democratic changes overseas can easily backfire. It can endanger other foreign-policy interests like the preservation of stability in key regions, or the establishment of productive diplomatic ties with flawed but potentially cooperative regimes. It can also turn counterproductive in other ways, allowing repressive governments to claim that reformers are really "made-in-America."

Accordingly, it might be advantageous to push democratic reform through quiet diplomacy of similarly subtle measures, or to take a particularly compelling and easy opportunity when it arises. But democracy promotion should not be a leading tenet of U.S. foreign policy, and it should certainly not be pursued to the detriment of other geopolitical goals.

On the other side of the debate are the activists, those who favor a more forward-leaning approach. Activists understand that promoting democracy is hard work—and that consolidating democracy can be the work of decades. But they argue that U.S. power can nonetheless play a critical role in empowering reformers and increasing the strains on authoritarian regimes. Applied selectively but energetically, it can help tip the internal balance between dictatorship and democracy, or push the advance of liberal reform into areas where it might otherwise be stymied.

George W. Bush's "freedom agenda," and the attempt to catalyze the spread of democracy in the Middle East by invading Iraq in 2003, represent perhaps the most ambitious recent examples of the activist tendency. Yet that tendency has a long historical heritage, reaching back to Ronald Reagan's democracy-promotion efforts in the 1980s, Jimmy Carter's human-rights campaign, John F. Kennedy's Alliance for Progress during the early 1960s, and other examples as well.

Where does the Obama administration fit within this longstanding debate? Although the president has demonstrated signs of both restraint and activism, he tends to lean more toward the first camp than the second. He did intervene to aid the Libyan rebels overthrow Muammar Qaddhafi in 2011, but not without considerable reluctance, and the administration sought to keep direct U.S. involvement as minimal as possible. With regard to the Middle East more broadly, Obama's Cairo speech in 2009 played down his predecessor's emphasis on political democracy. The president then noticeably kept his distance from Iran's Green movement, and his administration has generally been very cautious in dealing with the Arab Spring and its aftershocks.

Most recently in Ukraine, U.S. officials did seek a settlement that would bring the opposition into the government, but Obama himself kept his distance from the protest movement until very late in the game. Deputy National Security Adviser Ben Rhodes has characterized the administration's view of the democracy issue in a way that fits comfortably within the canon of restraint: "These democratic movements will be more sustainable if they are seen as not an extension of America or any other country, but coming from within these societies."

The administration's relatively restrained approach to Ukraine, the Middle East, and democracy promotion in general has the virtues of discretion and prudence. It recognizes the limits of U.S.

power, and the dangers of overreaching. It is sensitive to the fact that the United States has goals beyond the spread of democracy, and that pursuing the latter too ambitiously can undermine the former.

At a time of austerity and retrenchment, and coming on the heels of the Bush administration's experience in the Middle East, these advantages of restraint are not to be underestimated. Indeed, one can easily point to other historical examples—Jimmy Carter's dealings with Iran and Nicaragua, for instance—where it was precisely this absence of restraint that proved so catastrophically destabilizing.

Current policies regarding privacy fail

Julie E. **Cohen 12**, associate professor of law at Georgetown University, 11/20/12, "What Privacy is For," http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2175406

Privacy rights protect individuals, but to understand privacy simply as an individual right is a mistake. The ability to have, maintain, and manage privacy depends heavily on the attributes of one's social, material, and informational environment. Recall that privacy in the dynamic sense is "an interest in breathing room to engage in socially situated processes of boundary management."65 That interest has distinct structural entailments, which efforts to design effective legal protection for privacy must acknowledge. In addition, privacy does not only protect individuals. Privacy furthers fundamental public policy goals relating to liberal democratic citizenship, innovation, and human flourishing, and those purposes too must be taken into account when making privacy policy. The paradigm of "new privacy governance" that has been evolving within the U.S. legal system is unlikely to serve either individual or public interests in privacy well, because it is rooted in a regulatory ideology that systematically downplays the need to hold market actors accountable for harms to the public interest. Effective privacy protection must target the qualities of precision and opacity that together enable modulation.

Surveillance chills civil liberties and creates a disparity between the watcher and the watched

Neil M. **Richards 13**, Professor of Law at George Washington University, 2012-2013, 126 Harv. L. Rev. 1934, "The Dangers of Surveillance," http://heinonline.org/HOL/Page?handle=hein.journals/hlr126&div=89&g_sent=1&collection=journals&men_tab=citnav&men_hide=false

At the level of theory, I will explain why and when surveillance is particularly dangerous and when it is not. First, surveillance is harmful because it can chill the exercise of our civil liberties. With respect to civil liberties, consider surveillance of people when they are thinking, reading, and communicating with others in order to make up their minds about political and social issues. Such intellectual surveillance is especially dangerous because it can cause people not to experiment with new, controversial, or deviant ideas. To protect our intellectual freedom to think without state oversight or interference, we need what I have elsewhere called "intellectual privacy." A second special harm that surveillance poses is its effect on the power dynamic between the watcher and the watched. This disparity creates the risk of a variety of harms, such as discrimination, coercion, and the threat of selective enforcement, where critics of the government can be prosecuted or blackmailed for wrongdoing unrelated to the purpose of the surveillance.

Government surveillance practices undermine the norm-based coordination required for privacy and individuation

Richard **Warner and** Robert H. **Sloan 15**, associate professors at the Chicago-Kent College of Law and the University of Illinois at Chicago, 2015, "The Self, the Stasi, the NSA: Privacy, Knowledge, and Complicity in the Surveillance State," http://scholarship.kentlaw.iit.edu/cgi/viewcontent.cgi?article=3394&context=fac_schol

A. The Ideal of a Multifaceted Self

We begin with William James. "I am," James writes, often confronted by the necessity of standing by one of my . . . selves and relinquishing the rest. Not that I would not, if I could, be both handsome and fat and well dressed, and a great athlete, and make a million a year, be a wit, a bon vivant, and a lady killer, as well as a philosopher, and a philanthropist, states man, warrior, and African explorer, as well as a 'tone poet' and saint. But the thing is simply impossible . . . Such characters may at the outset of life be alike possible to a man. But to make anyone of them actual, the rest must be more or less suppressed. So the seeker of his truest, strongest, deepest self must review the list carefully, and pick out the one on which to stake his salvation. You make yourself who you are by what you "stand by," by the commitments you strive to realize.

We take this to be a widely shared conception of the self—with one emendation. James is wrong when he suggests that one central commitment defines who you are; instead, as John Gray notes,

We are none of us defined by membership in a single community or form of moral life. We are . . . heirs of many distinct, sometimes conflicting, intellectual and moral traditions . . . The complexity and contradictions of our cultural inheritance give to our identities an aspect of complexity and even of plurality which is . . . essential to them. . . . [T]he power to conceive of ourselves in different ways, to harbour dissonant projects and perspectives, to inform our thoughts and lives with divergent categories and concepts, is integral to our identity as reflective beings.

The self you seek to realize is a multifaceted self. People differ of course both in how much multiplicity they seek and in how assiduously they try to realize that multiplicity, but, subject to those differences, the realization of a multifaceted self is a widespread personal ideal. This conception of the self also underlies liberal political philosophy,52 the tradition in which we place ourselves. The traditional political ideal is that the state should ensure, if not actual self-realization, at least adequate opportunity to realize a multifaceted self.

B. Social Roles

Social roles mediate self-realization.53 You could not, for example, be a journalist in a society that does not recognize that role. Try to imagine the opposite. Imagine you live in a society in which magazines, news media, and the like do not exit. You are the lone deviant who does the things that journalists do in other Societies. You regularly investigate events, collect and analyze material, and conduct interviews. You do so with the primary intention informing the public on a variety of issues you find important.54 You are still not a journalist in the sense that, for example, Bob Woodward is.55 To be a journalist in that sense is to fulfill a recognized role. Contemporary society recognizes that behavior pattern as a vocation, not as deviant and bizarre, and this means that Woodward can refer to this role to explain his activities to himself and other others. You cannot do that. You are just deviant.

Similar examples abound. You cannot be a whistleblower, an undercover agent, or university professor except in a society with the appropriate institutions and practices. Even being a parent, child, lover, or spouse takes on different meanings and definitions depending on the society in which the relationship is realized.56

Realizing a multifaceted self means realizing multiple social roles, and that requires privacy in public. Perhaps the most obvious reason is that combining roles may violate others' expectations. Consider: parent and gay or lesbian; politician and explorer of sexuality in sex clubs;57 exemplary elementary school teacher and connoisseur of legal pornography; FBI agent and whistleblower.58 The consequences of disappointing others' expectations can range from disapproval to reprisal to ostracism.

Avoiding disapproval and reprisal are not, however, the only reasons to seek privacy in public. Imagine, for example, that you eat frequently in a small Italian trattoria. You want to play the role of "customer they know very little about" in order to have an experience as disconnected as possible from the rest of your life. You want a pleasant break from that life. Your concern is not with their approval or disapproval. It is just with what they know. You do not merely care that more knowledge would change the way they relate to you. You do not want to have even to think about whether it might do that. The restaurant example illustrates two key points. First, social roles are typically defined in part by the way you appear to others when you are in them. Second, how you appear to others depends on what those others know. The student/teacher and journalist/confidential source examples illustrate the same two points. The parties in those relationships cannot fulfill those roles without the control over how they appear.

Control over how you appear to the government is an important component of the control over appearance required for successful self-realization. People play a wide variety of roles in relation to the government, including: dissident, political activist, member of the Sierra Club, academic critic of the government, anonymous political critic, member of the Democratic or Republican party, politically uninvolved, and so on. How you appear to the government has a profound impact on your prospects for self-realization. Some, for example, long to take center stage in support of or in opposition to the government; for others, that would be their worst nightmare.

In general, different requirements on what one is allowed, expected, or required to reveal or not reveal define different relationships with governmental authorities, acquaintances, colleagues, friends, family, employers, and so on.59 The point is a familiar one in sociology. As the sociologist Nippert-Eng emphasizes:

At its core, managing privacy is about managing relationships between the self and others. . . . privacy . . . [is] a "boundary regulatory process by which a person (or group) makes himself more or less accessible and open to others." When we regulate our accessibility to others—including the accessibility of information, objects, space, time, or anything else that we deem private—we simultaneously regulate our relationships with them.60

"Secrecy," she explains, "is a means to an end, a process in which we actively work to manage our private matters."61 Indeed,

No matter what the secret, no matter how it is manipulated or what its fate, to consider a secret is to simultaneously consider the relationships (perhaps entire social networks) that it throws into relief. Indeed, from a sociological perspective, perhaps the most significant aspect of secrets is their selectively shared nature. There are secrets with and secrets from, intentionally disclosed to and concealed from specific individuals at specific times and in specific ways. Simultaneously inclusive and exclusive, secrets are quite effective at achieving social boundary work, an excellent measure of the social distance between individuals.62

Section IV argues that the government's current surveillance practices can undermine the norm-based coordination required for privacy in public and thus can seriously curtail self realization. Section III provides essential background.

Loss of the right to privacy activates a slippery slope that ends in tyranny – protecting it is our only defense

Eugene **Volokh 03**, Associate professor of law at UCLA, 2002-2003, "THE MECHANISMS OF THE SLIPPERY SLOPE," http://www2.law.ucla.edu/volokh/slippery.pdf

Recognizing slippery slope concerns might lead us to modify the rules of thumb we use for evaluating the potential downstream effects of proposals. For example, people often urge others not to make a big deal out of small burdens: if a new proposal seems to have low costs (to liberty or the public fisc), it should be supported, or at least not strongly opposed, even if its likely benefits are low. 34 Many say this about modest restrictions on privacy, gun ownership, abortion, and other behavior - the restrictions may not offer huge benefits, but neither do they seriously restrict rights, so why not try them? Maybe the experiment will pleasantly surprise us, or give us some helpful information about which proposals work and which don't. And beyond this, fighting a modest experiment might make us seem foolishly intransigent - an argument often levied against abortion rights or gun rights "extremists."

But the more we believe that one step now may lead to other steps later, the more we may view such experimentation with concern. We might therefore adopt a rebuttable presumption against even small changes, under which we oppose any proposal A (in certain areas) unless we see it as having great benefits, because even a seemingly modest restriction has the added cost of increasing the chances of undesirable broader restrictions B in the future. And this concern, if it can be persuasively articulated, can provide a response to the "You're an extremist" argument.

Likewise, we are often cautioned against ad hominem arguments and against impugning our political opponents' motives, and there is much to these cautions. Nonetheless, the existence of some slippery slope mechanisms suggests that what one might call an ad hominem heuristic - a policy of presumptively opposing even minor proposals made by certain groups that also support broader proposals, unless the proposals clearly seem to be very good indeed - may be more pragmatically rational than one might think.35

9. These heuristics 36 may also shed light on the behavior of advocacy groups such as the ACLU or the NRA. Public consciousness of the possibility of slippage may help prevent the slippage, either by preventing the first steps or by building opposition to the subsequent ones. One role of advocacy groups is to alert the public to slippery slope risks, partly by trying to instill the heuristics mentioned above. This strategy can be dangerous for advocacy groups because it may make them seem extremist. But, as I discuss throughout and summarize in section VII.B, real slippery slope risks may make such a strategy necessary.

i0. Thinking about legislative slippery slopes illuminates two aspects of judicial decisionmaking: reliance on precedent (where judicialjudicial slippery slopes may appear) and deference to the legislature (where legislative-judicial slippery slopes may operate). These parts of the judicial process, it turns out, are closely connected to analogous processes in legislative decisionmaking.37

ii. Thus, slippery slopes present a real risk - not always, but often enough that we cannot lightly ignore the possibility of such slippage. "In the absence of absolute knowledge and consequently absolute control over the consequences of our actions and decisions, we cannot afford to ignore the possible misuses of proposed reforms. '38

Our approach addresses how the public and private sector interact and is the only way to solve

Neil M. **Richards 13**, Professor of Law at George Washington University, 2012-2013, 126 Harv. L. Rev. 1934, "The Dangers of Surveillance," http://heinonline.org/HOL/Page?handle=hein.journals/hlr126&div=89&g_sent=1&collection=journals&men_tab=citnav&men_hide=false

At a practical level, I propose a set of four principles that should guide the future development of surveillance law, allowing for a more appropriate balance between the costs and benefits of

government surveillance. First, we must recognize that surveillance transcends the public/private divide. Public and private surveillance are simply related parts of the same problem, rather than wholly discrete. Even if we are ultimately more concerned with government surveillance, any solution must grapple with the complex relationships between government and corporate watchers. Second, we must recognize that secret surveillance is illegitimate and prohibit the creation of any domestic-surveillance programs whose existence is secret. Third, we should recognize that total surveillance is illegitimate and reject the idea that it is acceptable for the government to record all Internet activity without authorization. Government surveillance of the Internet is a power with the potential for massive abuse. Like its precursor of telephone wiretapping, it must be subjected to meaningful judicial process before it is authorized. We should carefully scrutinize any surveillance that threatens our intellectual privacy. Fourth, we must recognize that surveillance is harmful. Surveillance menaces intellectual privacy and increases the risk of blackmail, coercion, and discrimination; accordingly, we must recognize surveillance as a harm in constitutional standing doctrine. Explaining the harms of surveillance in a doctrinally sensitive way is essential if we want to avoid sacrificing our vital civil liberties.

The only way to solve for low quality of life and health is through addressing de-individuation and psychic death

Søren **Ventegodt and** Joav **Merrick 03**, scientists at the Quality of Life Research Center, 10/13/03, "Measurement of Quality of Life VII. Statistical Covariation and Global Quality of Life Data: The Method of Weight-Modified Linear Regression," http://www.hindawi.com/journals/tswj/2003/462303/abs/

Low global quality of life is statistically connected to poor health[3]. In accordance with this, the life mission theory predicts a very high prevalence of sickness for the group with a very low global quality of life[4]. To understand the nature of life crises, we have to understand the structure of the ego. In order to radically improve global quality of life, it seems necessary to have a fundamental transformation of the psyche. Such a shift in personality has been labeled an "ego death" in Buddhism[5] or a psychic death by Jung[6,7], because it implies a shift back to the existential position of the natural self, i.e., living the true purpose of life[4]. The problem of healing and improving the global quality of life seems strongly connected to the unpleasantness of the ego-death experience, and often a person who lacks the understanding necessary for personal development chooses death instead of personal transformation. The quality-of-life peak experience, which is typically described as moments of total being, great clarity, intense happiness, and deep understanding of life, occurs spontaneously for only a few percent of the population[8].

It is therefore not difficult to understand why population surveys including psychometric variables of global quality of life have an extreme low representation of individuals with very low quality of life. As the commonly used statistical methods do not put a special focus on persons in the rare groups, these groups often drown in very huge and statistically dominating center groups, sometimes making the connections seem smaller than they are.

Loss of privacy condones tyranny and loss of individuality

Bruce **Schneier 06**, fellow at the Berkman Center and computer security specialist, May 2006, "The Value of Privacy," https://www.schneier.com/blog/archives/2006/05/the_value_of_pr.html

Cardinal Richelieu understood the value of surveillance when he famously said, "If one would give me six lines written by the hand of the most honest man, I would find something in them to have him hanged." Watch someone long enough, and you'll find something to arrest -- or just blackmail -- with. Privacy is important because without it, surveillance information will be abused: to peep, to sell to marketers and to spy on political enemies -- whoever they happen to be at the time.

Privacy protects us from abuses by those in power, even if we're doing nothing wrong at the time of surveillance.

We do nothing wrong when we make love or go to the bathroom. We are not deliberately hiding anything when we seek out private places for reflection or conversation. We keep private journals, sing in the privacy of the shower, and write letters to secret lovers and then burn them. Privacy is a basic human need.

A future in which privacy would face constant assault was so alien to the framers of the Constitution that it never occurred to them to call out privacy as an explicit right. Privacy was inherent to the nobility of their being and their cause. Of course being watched in your own home was unreasonable. Watching at all was an act so unseemly as to be inconceivable among gentlemen in their day. You watched convicted criminals, not free citizens. You ruled your own home. It's intrinsic to the concept of liberty.

For if we are observed in all matters, we are constantly under threat of correction, judgment, criticism, even plagiarism of our own uniqueness. We become children, fettered under watchful eyes, constantly fearful that -- either now or in the uncertain future -- patterns we leave behind will be brought back to implicate us, by whatever authority has now become focused upon our once-private and innocent acts. We lose our individuality, because everything we do is observable and recordable.

How many of us have paused during conversation in the past four-and-a-half years, suddenly aware that we might be eavesdropped on? Probably it was a phone conversation, although maybe it was an e-mail or instant-message exchange or a conversation in a public place. Maybe the topic was terrorism, or politics, or Islam. We stop suddenly, momentarily afraid that our words might be taken out of context, then we laugh at our paranoia and go on. But our demeanor has changed, and our words are subtly altered.

This is the loss of freedom we face when our privacy is taken from us. This is life in former East Germany, or life in Saddam Hussein's Iraq. And it's our future as we allow an ever-intrusive eye into our personal, private lives.

Too many wrongly characterize the debate as "security versus privacy." The real choice is liberty versus control. Tyranny, whether it arises under threat of foreign physical attack or under constant domestic authoritative scrutiny, is still tyranny. Liberty requires security without intrusion, security plus privacy. Widespread police surveillance is the very definition of a police state. And that's why we should champion privacy even when we have nothing to hide.

******FOR THE WHISTLEBLOWER ADDON*** Government surveillance hinders whistleblowing and allows unchecked federal overreach***

Richard **Warner and** Robert H. **Sloan 15**, associate professors at the Chicago-Kent College of Law and the University of Illinois at Chicago, 2015, "The Self, the Stasi, the NSA: Privacy, Knowledge, and Complicity in the Surveillance

State," http://scholarship.kentlaw.iit.edu/cgi/viewcontent.cgi?article=3394&context=fac_schol

We discuss two examples. The first involves use and the second merely knowing. Greenwald and Snowden's initial attempts to communicate provide the first example. The first point to note is that they were involved in an Assurance Game. We describe the preferences using the "cooperate"/"defect" terms. "Cooperate" means collaborating with each other to expose the NSA. For Greenwald to cooperate is for him to seek to secure publication in mainstream media. For Snowden, it includes providing information sufficient to expose the NSA. "Defect" means not cooperating—for example, because the NSA prevented it, or because, for Snowden, he did not really have the requisite information, or because, for Greenwald, he could not convince editors to publish the stories. Given this understanding, their preferences were as follows. (1) Cooperate when the other cooperates. This is what both clearly want most.162 (2) Defect when the other defects. Neither wants to waste time and take risks attempting to cooperate if the other is not going to cooperate. (3) Defect when the other cooperates. Neither wants to pass up a chance to expose the NSA when it is possible to do so. (4) Cooperate when the other defects. Cooperating when the other defects means wasting time and pointlessly running the risk of governmental reprisals.

If surveillance had not been a concern, they would have easily both cooperated since Snowden would have revealed enough to remove Greenwald's conviction that he was just another person offering him a "huge story" that would turn out "to be nothing." Snowden's concern about surveillance prevented that. He was certain that the government would detect unencrypted communication and intervene to prevent his exposing the NSA. Cooperating meant installing encryption software, and Greenwald was unwilling. His unwillingness is exactly what the Assurance Game model predicts.

It does, that is, given plausible assumptions about how Greenwald valued the various options. There is need to argue that the following values "really are Greenwald's." A fictional Greenwald makes as good an example as the real one. We use a 10 to -10 scale again. (1) Mutual cooperation rates 10. Exposing the NSA was extremely important to Greenwald. (2) Greenwald did not want to waste time pursuing worthless leads, so assign a rating of 3 to defecting when Snowden defects. (3) Greenwald would hate to miss the opportunity to expose the NSA, so -5 is a reasonable rating for defecting when Snowden cooperates. (4) Cooperating when Snowden defects means wasting time and running pointless risks of reprisals, so rate it -10. These numbers exactly parallel Victoria's (we picked the numbers with this in mind), so it follows that Greenwald will cooperate only if he thinks the probability of Snowden's doing so is at least 76%, but he did not think the probability was anywhere in that range. He thought it highly likely Snowden would "defect" by not really having documents that would expose the NSA.

To illustrate the effect of governmental merely knowing, consider any journalist and whistleblowing confidential source. We give "cooperate" and "defect" somewhat more general meanings. For the journalist, to cooperate is to seek publication while maintaining secrecy of the source's identity, and to defect is to fail to obtain publication or to fail to maintain secrecy. For the source, to cooperate is to provide documents that adequately document governmental wrong doing, and to defect is not to do so. The journalist and the source share the following Assurance Game preferences. (1) Cooperate when the other cooperates. Both want most to expose governmental wrongdoing. (2) Defect when the other defects. Neither wants wasted effort. (3) Defect when the other collaborates. Neither wants to pass up the opportunity to expose wrongdoing. (4) Cooperate when the other defects. Neither wants to run the risks of cooperation for no gain.

Governmental merely knowing can lead the source to defect even when the journalist cooperates. Governmental knowledge comes from covert surveillance and from "unwritten protective rules that govern how the establishment media report on official secrets."163 Those rules ensure that a "protracted negotiation takes place over what will and will not be published."164 Imagine a source who is willing to supply evidence of wrongdoing only if his or her identity can remain secret. The source's objection is not, or not only, that the government will use the information to

the source's detriment. The objection is that the source does not want to appear to the government and the public as a whistleblower. That is inconsistent with the path of self-realization the source has chosen and wishes to continue. The source would have this objection even if disclosing the information had no other adverse consequences.

The source has two ways to preserve the secrecy of his or her identity. One to rely on the journalist's coordination (recall we defined cooperation to include maintaining secrecy); the other is to defect and so avoid interactions that would put the source's identity at risk of disclosure. When will the source defect to preserve secrecy? That depends of course on how the source values the relevant options. Suppose, as is plausible, that they parallel the Greenwald/Victoria values. Thus: (1) Cooperate when the journalist cooperates: 10. (2) Defect when the journalist defects: 3. (3) Defect when the journalist cooperates: -5. (4) Cooperate when the journalist defects: -10. In this case, the source will defect unless he or she believes the probability that the journalist will cooperate (and thus maintain secrecy) is fairly high (0.76). The Bush and Obama administrations' readiness to investigate and prosecute journalists and their confidential sources may well have convinced some sources that secrecy was much less likely than that. As The New York Times journalist Philip Shenon remarked, after the Bush administration seized his phone records, "My goodness, if I were one of my sources, I would never talk to me again, even about stories that really would have been a public service."[165]

Journalist/source is just one of a vast number of relationships in which people exchange information under the protective shield of informational norms. Massive governmental data collection means the government may know a great deal about those relationships. When will people react like the source in the example above and "defect" from relationships by abandoning them or by continuing them while withholding information that they would have readily conveyed in the absence of governmental surveillance? They will if, like the source, they see a sufficiently large downside in the government's knowing certain information and think the probability sufficiently high that the government knows it. Will that happen? Uncertainty makes it more likely.

Snowden changed overall perception – squo is solving for the harms of the aff now

David **Sirota 15**, senior fellow at the Campaign for America's Future, 6/14/15, Truthdig, "Has America Changed Since Edward Snowden's Disclosures?," http://www.truthdig.com/report/item/has_america_changed_since_edward_snowdens_disclosures_20150611

Two years ago this month, a 29-year-old government contractor named Edward Snowden became the Daniel Ellsberg of his generation, delivering to journalists a tranche of secret documents shedding light on the government's national security apparatus. But whereas Ellsberg released the Pentagon Papers detailing one specific military conflict in Southeast Asia, Snowden released details of the U.S. government's sprawling surveillance machine that operates around the globe.

On the second anniversary of Snowden's historic act of civil disobedience, it is worth reviewing what has changed—and what has not.

On the change side of the ledger, there is the politics of surveillance. For much of the early 2000s, politicians of both parties competed with one another to show who would be a bigger booster of the NSA's operations, fearing that any focus on civil liberties risked their being branded soft on terrorism. Since Snowden, though, the political paradigm has dramatically shifted.

The most illustrative proof that came last month, when the U.S. Senate failed to muster enough votes to reauthorize the law that aims to allow the NSA to engage in mass surveillance. Kentucky Republican Sen. Rand Paul's prominent role in that episode underscored the political shift—a decade after the GOP mastered the art of citing 9/11-themed arguments about terrorism to win elections, one of the party's top presidential candidates proudly led the fight against one of the key legislative initiatives of the so-called war on terror.

There has also been a shift in public opinion, as evidenced by a new ACLU-sponsored poll showing that almost two thirds of American voters want Congress to curtail the NSA's mass surveillance powers. The survey showed that majorities in both parties oppose renewing the old Patriot Act.

Metadata isn't as big of a deal as the aff implicates

National Review 15, political magazine, 6/22/15, "D.C. Gambles with America's Safety," National Review, Vol. 67 Issue 11, pp 14

This wasn't true, as many national security hawks pointed out repeatedly, and President Obama did once or twice. First, metadata is just the numbers called and duration of calls—not the content of the calls, and not even the names of the phone subscribers involved. The program allowed the **NSA** to store huge amounts of data, but it could be accessed and analyzed only by a tiny number of agents, subject to congressional and judicial oversight. The president bowed to the media firestorm nonetheless, convening a task force to examine intelligence procedures, which produced a number of recommendations that made it into the USA Freedom Act. He backed

the bill, even though he had defended the usefulness of the Patriot Act as it existed. The underlying issue was the same, but the politics had changed—and our commander-in-chief went along with the crowd.
The Freedom Act reforms did not go far enough for Senator Paul, who blocked its advancement, repeatedly and single-handedly ensuring that the NSA's abilities went dark for some time. The practical significance of that blackout is probably not great, but Senator Paul's crusade against the **NSA** and politically feasible reforms to it has done much more for his notoriety than it has for anyone's civil liberties.
Mitch McConnell had the right idea all along—reauthorize the metadata program as is—although the statute should have been clarified to unmistakably authorize the continuation of the program as it exists. (A federal appeals court recently ruled that the law did not authorize collection as broad as that which the **NSA** has carried out.)

1NC - Circumvention

Privacy is an unobtainable right – it always trades off with itself leading to circumvention of the plan's efforts

David **Pozen 15**, Associate Professor of Law at Columbia University, 6/28/15, 83 U. CHI. L. REV. __ (2015), "Privacy-Privacy Tradeoff," http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2624281

Privacy clashes with important social values. We are told as much all the time.1 Commentators struggle to reconcile privacy and security,2 privacy and efficiency,3 privacy and technological innovation,4 and privacy and free speech, among other (real or imagined) antinomies. Privacy is constantly being juxtaposed with competing goods and interests, balanced against alternative needs and demands. Legal and policy debates about privacy revolve around these tradeoffs.

But privacy also clashes with itself. That is to say, in myriad social and regulatory contexts, enhancing or preserving privacy along a certain dimension may entail compromising privacy along another dimension. If they wish to be more analytically rigorous, theorists and decisionmakers must take such privacy-privacy tradeoffs into account. If they wish to advance the cause of privacy, civil libertarians must do the same.

Privacy-privacy tradeoffs come in a variety of flavors. Sometimes they are unexpected and unwanted. When EU citizens began exercising their right to be forgotten last year and flooded Google with "delete me" requests, the deleted links quickly reappeared—in more concentrated form—on a website devoted to documenting Internet censorship.7 Other times, privacy-privacy tradeoffs are consciously cultivated and promoted. The Transportation Security Administration's PreCheck program invites travelers to "volunteer personal information in advance" if they wish "to leave on their shoes, belts and light outerwear and keep their laptops in their bags." 8 Enhanced governmental access to your data can be traded for reduced access to your body and belongings.

In many cases, privacy-privacy tradeoffs simply follow from scarce resources and opportunity costs. A tenant on a fixed budget who spends money soundproofing her walls will have less to spend on mending her window curtains or protecting her online identity. Alternatively, these tradeoffs may be caused by behavioral responses and dynamic feedback effects. Increasing airline-passenger privacy levels from X at Time 1 to a multiple of X at Time 2 may increase the odds of a terrorist attack, with the consequence that passengers' privacy levels will be reduced to a fraction of X at Time 3. In still other cases, risk is redistributed across different aspects or bearers of privacy. By establishing a forensic DNA database, law enforcement officials may impair the privacy of everyone whose DNA is included but protect the privacy of a smaller group who will not be needlessly

investigated for the crimes of others. By stripping its analysts of "any privacy or anonymity when they look at [collected] data,"9 an intelligence agency may deter them from exceeding their investigative mandates and thereby secure a measure of privacy for the rest of society—or at least for the analysts' love interests. 10

1NC – Alt Causes

Alt causes to invasions of privacy

Amitai **Etzioni 12**, founder of the communitarian movement and author, March 2012, "THE PRIVACY MERCHANTS: WHAT IS TO BE DONE?," http://chicago.ssrn.com/delivery.php?ID=385026099094126020119095115088072068041004073092033010069098125096115126113107080010025002099017116122046075082018091115029094037074093029019087089115028074096118054049040068025003104082000099089070071112019079028110002081099023100006105105004084&EXT=pdf&TYPE=2

Most informed citizens probably know by now that corporations collect information about them, but they may well be unaware of the extent and scope of the invasions of privacy that are now widespread. Many may be aware of tracking tools referred to as "cookies." Cookies are installed on one's computer by visited Web sites. They are used to identify the person and to remember his or her preferences. Some people have learned to protect themselves from such tracking by employing software that allows one to clear cookies from one's computer. However, corporations have recently begun to install "supercookies" that are very difficult to detect and, if removed, secretly reinstall themselves.2 As one report concluded: "This means that privacy-sensitive consumers who 'toss' their HTTP cookies to prevent tracking or remain anonymous are still being uniquely identified online by advertising companies."3

Major cell phone and mobile technology companies offer services that allow lovers, ex-spouses, lawyers, or anyone else to find out where a person is—and track their movements—by using the GPS capabilities of their cell phones.4 A German politician who inquired about location storage information discovered that over a six-month period, his longitude and latitude had been recorded over 35,000 times.5

There are two kinds of corporations that keep track of what Internet users buy, read, visit, and drink, and who they call, e-mail, date, and much else. Some merely track users' activity on their sites as part of their regular business; recording purchases and viewed products helps them increase sales. This is true for nearly every major online retailer. Other corporations make shadowing Internet users—and keeping very detailed dossiers on them—their main line of business. One can call these the "Privacy Merchants." They sell information to whoever pays the required price. In 2005, one such company— Choicepoint—had records on over 220 million people.6 Professor Christopher Slobogin notes that the amount of information culled by corporate data miners

2NC – Alt Causes

Plan can't solve for private alternate causes to massive invasions of privacy

Neil M. **Richards 13**, Professor of Law at George Washington University, 2012-2013, 126 Harv. L. Rev. 1934, "The Dangers of Surveillance,"

http://heinonline.org/HOL/Page?handle=hein.journals/hlr126&div=89&g_sent=1&collection=journals&men_tab=citnav&men_hide=false

Surveillance is not just for governments either. Private companies big and small generate vast fortunes from the collection, use, and sale of personal data. At the broadest level, we are building an Internet that is on its face free to use, but is in reality funded by billions of transactions where advertisements are individually targeted at Internet users based upon detailed profiles of their reading and consumer habits." Such "behavioral advertising" is a multibillion-dollar business, and is the foundation on which the successes of companies like Google and Facebook have been built," One recent study concludes that this form of surveillance is so ingrained into the fabric of the Internet "that a small number of companies have a window into most of our movements online."° Other technologies engage in similar forms of private surveillance. "Social reading" applications embedded into Facebook and other platforms enable the disclosure of one 's reading habits, while electronic readers like the Kindle and the Nook track reader behavior down to the specific page of the specific book on which a user's attention is currently lingering."

In recent years, industry, media, and scholars have increasingly focused their attention on the concept of "Big Data," an unwieldy term often used to describe the creation and analysis of massive data sets." Big Data is notable not just because of the amount of personal information that can be processed, but because of the ways data in one area can be linked to other areas and analyzed to produce new inferences and Endings. As social scientists danah boyd and Kate Crawford put it, "Big Data is fundamentally networked. Its value comes from the patterns that can be derived by making connections between pieces of data, about an individual, about individuals in relation to others, about groups of people, or simply about the structure of information itself?" Big Data holds much potential for good in areas as diverse as medical research, the "smart" electrical grid, and traffic management."

But Big Data also raises many potential problems in areas such as privacy and consumer power. For example, the retail superstore Target uses Big Data analytics to infer which of its customers are pregnant based upon their purchases of other products and upon personally identifying data from other sources. As the New York Times Magazine reports, new parents are highly desirable customers not just because they buy many new products, but because their normally stable purchasing habits are "up for grabs" in the chaotic exhaustion that accompanies the birth of a child." Target uses Big Data to snare new parents because, as one of its data analysts concedes, "[w]e knew that if we could identify them in their second trimester, there's a good chance we could capture them for years .... As soon as we get them buying diapers from us, they're going to start buying everything else too." Big Data analytics enabled Target to discover that expectant parents display a change in buying habits (for example, buying unscented lotion and magnesium supplements) that mark them as expectant, allowing this kind of (appropriately enough) "targeted" marketing. Big Data surveillance and analysis thus affect the commercial power of consumers, identifying their times of relative weakness and allowing more effective marketing to nudge them in the directions that watchful companies desire.

The incentives for the collection and distribution of private data are on the rise. The past fifteen years have seen the rise of an Internet in which personal computers and smartphones have been the dominant personal technologies. But the next fifteen will likely herald the "Internet of Things," in which networked controls, sensors, and data collectors will be increasingly built into our appliances, cars, electric power grid, and homes, enabling new conveniences but subjecting more and more previously unobservable activity to electronic measurement, observation, and control." Many of us already carry GPS tracking devices in our pockets, not by government command, but in the form of powerful multifunction smartphones. Sociologists Zygmunt Bauman and David Lyon have identified the spread of surveillance beyond nonconsensual state watching to a sometimes-private surveillance in which the subjects increasingly consent and participate - a phenomenon that they call "liquid surveillance.""' Professor Scott Peppet foresees the "unraveling" of privacy," as economic incentives lead consumers to agree to surveillance devices like Progressive lnsurance's "MyRate" program, which offers reduced insurance rates in exchange for the installation of a device that monitors driving speed, time, and habits." Peppet argues that this unraveling of privacy creates a novel challenge to privacy law, which has long focused on unconsented surveillance rather than on surveillance as part of an economic transaction."

It might seem curious to think of information gathering by private entities as "surveillance" Notions of surveillance have traditionally been concerned with the watchful gaze of government actors like police and prison officials rather than companies and individuals. But in a postmodern age of "liquid surveillance," the two phenomena are deeply intertwined. Government and nongovernment surveillance support each other in a complex manner that is often impossible to disentangle. At the outset, the technologies of surveillance - software, RFID chips, GPS trackers, cameras, and other cheap

sensors are being used almost interchangeably by government and nongovernment watchers." Private industry is also marketing new surveillance technologies to the state. Though it sounds perhaps like a plot from a paranoid science fiction novel, the Guardian reports that the Disney Corporation has been developing facial recognition technologies for its theme parks and selling the technology to the U.S. military." Nor do the fruits of surveillance respect the public private divide. Since the September 11 attacks, governments have been eager to acquire the massive consumer and Internet-activity databases that private businesses have compiled for security and other purposes, either by subpoena." or outright purchase," information can also flow in the other direction; the U.S, government recently admitted that it was giving information to insurance companies that it had collected from automated license-plate readers at border crossings."

Framing

Even outside the bounds of utilitarianism – we have a moral imperative to prevent existential catastrophe

Nick **Bostrom 13**, Philosopher at the University of Oxford, February 2013,"Existential Risk Prevention as Global Priority, http://www.existential-risk.org/concept.pdf

We have thus far considered existential risk from the perspective of utilitarianism (combined with several simplifying assumptions). We may briefly consider how the issue might appear when viewed through the lenses of some other ethical outlooks. For example, the philosopher Robert Adams outlines a different view on these matters:

I believe a better basis for ethical theory in this area can be found in quite a different direction—in a commitment to the future of humanity as a vast project, or network of overlapping projects, that is generally shared by the human race. The aspiration for a better society—more just, more rewarding, and more peaceful—is a part of this project. So are the potentially endless quests for scientific knowledge and philosophical understanding, and the development of artistic and other cultural traditions. This includes the particular cultural traditions to which we belong, in all their accidental historic and ethnic diversity. It also includes our interest in the lives of our children and grandchildren, and the hope that they will be able, in turn, to have the lives of their children and grandchildren as projects. To the extent that a policy or practice seems likely to be favorable or unfavorable to the carrying out of this complex of projects in the nearer or further future, we have reason to pursue or avoid it. … Continuity is as important to our commitment to the project of the future of humanity as it is to our commitment to the projects of our own personal futures. Just as the shape of my whole life, and its connection with my present and past, have an interest that goes beyond that of any isolated experience, so too the shape of human history over an extended period of the future, and its connection with the human present and past, have an interest that goes beyond that of the (total or average) quality of life of a population-at-a-time, considered in isolation from how it got that way. We owe, I think, some loyalty to this project of the human future. We also owe it a respect that we would owe it even if we were not of the human race ourselves, but beings from another planet who had some understanding of it (Adams, 1989, pp. 472–473).

Since an existential catastrophe would either put an end to the project of the future of humanity or drastically curtail its scope for development, we would seem to have a strong prima facie reason to avoid it, in Adams' view.

We also note that an existential catastrophe would entail the frustration of many strong preferences, suggesting that from a preference-satisfactionist perspective it would be a bad thing. In a similar vein, an ethical view emphasising that public policy should be determined through informed democratic deliberation by all stakeholders would favour existential-risk mitigation if we suppose, as is plausible, that a majority of the world's population would come to favour such

policies upon reasonable deliberation (even if hypothetical future people are not included as stakeholders). We might also have custodial duties to preserve the inheritance of humanity passed on to us by our ancestors and convey it safely to our descendants.23 We do not want to be the failing link in the chain of generations, and we ought not to delete or abandon the great epic of human civilisation that humankind has been working on for thousands of years, when it is clear that the narrative is far from having reached a natural terminus. Further, many theological perspectives deplore naturalistic existential catastrophes, especially ones induced by human activities: If God created the world and the human species, one would imagine that He might be displeased if we took it upon ourselves to smash His masterpiece (or if, through our negligence or hubris, we allowed it to come to irreparable harm).24

We might also consider the issue from a less theoretical standpoint and try to form an evaluation instead by considering analogous cases about which we have defi- nite moral intuitions. Thus, for example, if we feel confi- dent that committing a small genocide is wrong, and that committing a large genocide is no less wrong, we might conjecture that committing omnicide is also wrong.25 And if we believe we have some moral reason to prevent natural catastrophes that would kill a small Existential Risk Prevention as Global Priority 23 Global Policy (2013) 4:1 ª 2013 University of Durham and John Wiley & Sons, Ltd. number of people, and a stronger moral reason to prevent natural catastrophes that would kill a larger number of people, we might conjecture that we have an even stronger moral reason to prevent catastrophes that would kill the entire human population.

We have a moral imperative to ensure the privacy of others and ourselves

Anita L. **Allen 13**, Professor of Law and philosophy at the University of Pennsylvania, 1/1/13, "An Ethical Duty to Protect One's Own Information Privacy?," http://scholarship.law.upenn.edu/cgi/viewcontent.cgi?article=1450&context=faculty_scholarship

Yet, if we are to take normative ethics seriously-and I recognize that not everyone wants to or can-we have to be open to the possibility that some of what we do and enjoy doing may not be ethically good or best. We may have ethical reasons and obligations to do things differently. The fact that a new generation has rewritten the rules of privacy or abandoned privacy as a value altogether would not prove that privacy was or is mostly worthless. Admittedly, values do erode; values can outlive their times.22 In my lifetime, it was widely considered immoral-and illegal-for unmarried people and people of different races to cohabitate.23 It is not especially problematic to say, with ethics in mind, that someone has an obligation to protect other people's privacy. That we can understand and agree with. We have no problem saying that people have a moral obligation not to make gratuitous, cruel, unconsented-to information disclosures about others. In 20 I 0, Rutgers University student Dharun Ravi violated that ethical duty with horrendous consequences. He surreptitiously webcast his roommate Tyler Clementi being intimate with another man, which prompted a mortified Clementi to commit suicide. More than an excusable prank, it is plain wrong to secretly broadcast someone's date with a consenting adult in his own home.

Now, as to duties to protect your own privacy, can we sensibly ascribe these? With prudence in mind, it is fairly common to ascribe obligations of self-care relating to informational privacy and data protection. To protect my reputation and feelings there are certain practical precautions I should take. Prudent self-interest demands that I password-protect electronic access to my banking accounts at Wells Fargo. If I download my medical records from myuniversitymedicine.com, I should use the password-protect option. I should periodically

change my university.edu e-mail password. I should think hard about what I put into Dropbox,24 about what I reveal about my location via Foursquare,25 and about the content of my Tumblr6 postings. But are self-regarding moral duties, as well as self-interested practical strategies, implicated in online life?

Sometimes people are so inattentive to their privacy that moral and ethical values do appear to come into play. Recall former Congressman Anthony Weiner, a Democratic member of the United States House of Representatives from New York. 27 Congressman Weiner sent sexually suggestive images of his pelvic region clad in tight-fitting underwear that revealed the outlines of his penis. He sent the images in Twitter messages to young women, ages 21 and 17, whom he d id not know .

28 As a consequence of this reckless behavior, Weiner was forced to resign from office in 201 1. Weiner disrespected himself, displ aying l ittle regard for the privacy of his body and sexu al urges.29 The Weiner case shines a l ight on the specific question I want to explore in this lecture: whether anyone h as a moral obligation to protect h is or her own information privacy, and if so, whether such an obligation ought to influence choice, policy, or the law. If people have an ethical obligation to protect their own privacy, there are more than merely prudential grounds for privacy v igilance. If a person has a moral obligation to protect her own privacy, then assuming moral obl igations creates prima facie reasons for acting, she would have a reason over and above prudent self-interest to adopt measures to safeguard important privacies. To protect informational privacy, ethical goodness might require that she, for e xample, not aim sexy pictures at minors or the general publ ic. Ethics might require that she secure financial information when transacting business online. Ethics might require that she keep u nder wraps whole-genome-sequencing data generated from clinical care or research. She might even have an obligation to moderate free speech and the use of social media that w idely reveal her location, plans, activities, feelings, and beliefs.

SQUO CT program Is effective- key to prevent future terrorist attacks

Fred **Flietz** 20**15**, senior vice president for policy and programs with the Center for Security Policy, held U.S. government national security positions for 25 years with the CIA, DIA, and the House Intelligence Committee staff, served as Chief of Staff to John R. This is why Senator Mitch McConnell recently introduced a "clean" — that is, with no changes at all — reauthorization of the Patriot Act, which extends three of its provisions on electronic-surveillance programs used to protect our country against terrorist attacks. The most controversial is the NSA metadata program enacted in Section 215 of the Patriot Act. Opponents of the 215 program claim it is an unconstitutional violation of privacy rights and say that it has played no role in protecting the United States from terrorist attacks. Both of these claims are untrue. Under the metadata program, the NSA collects large numbers of phone records — not the contents of phone calls — and uses them to make connections between terror suspects. The program is subject to strong oversight by the executive branch, Congress, and the courts and is used only for national-security investigations. Only 22 people at the NSA are allowed access to these metadata, and they are barred from any data-mining, even in connection with an investigation.While its detractors refuse to admit it, the 215 program has been a successful tool in stopping terrorist attacks. It has been strongly defended by many intelligence officials and members of Congress, including Senator Dianne Feinstein (D., Calif.), vice chairman of the Senate Intelligence Committee, who said during a January 14, 2014, Judiciary Committee hearing that this program had helped stop terrorist plots to bomb the New York City subways, the New York stock exchange, and a Danish newspaper. "Had the [metadata] program been in place more than a decade ago, it would likely have prevented 9/11," according to a former CIA official. Former deputy CIA director Michael Morell said in a December 27, 2013, Washington Post op-ed: "Had the [metadata] program been in place more than a decade ago, it would likely have prevented 9/11. And it has the potential to prevent the next 9/11."

Counterterrorism is becoming more difficult- 3 reasons.

The Economist 20**15**, Established Newspaper Thing, 1/17/15,"Going Dark" "http://www.economist.com/news/leaders/21639506-just-threat-terrorism-increasing-ability-western-security-agencies-defeat

OVER the past decade Western security agencies have been remarkably successful in keeping jihadist terrorists at bay. Put it down to diligence, surveillance technology, financial resources, the manageable numbers of potential terrorists and, often, good luck. The spooks have foiled complex plots, such as the one in 2009 to bring down airliners in mid-Atlantic. They have brought a steady stream of would-be terrorists before the courts. Occasionally, loners and misfits have succeeded in carrying out attacks, such as the bombing of the Boston marathon and the beheading of a British soldier in London, both in 2013. But until the murders in Paris last week,

most people would have had Islamist terrorism low on their list of concerns. But counter-terrorism is getting harder for three reasons.

The first is a consequence of the collapse of several Arab countries, above all the unending civil war in Syria and the rise of Islamic State (IS). This week, the head of the European police agency estimated that up to 5,000 European Union citizens had joined the jihadists' ranks, many of whom would return home as hardened fighters. Furthermore, the ascendancy of IS has presented a challenge to al-Qaeda. The brothers who carried out the Charlie Hebdo murders appear to have been operating under orders from the Yemen branch of the terrorist network, Al-Qaeda in the Arabian Peninsula, well-known for wanting to take the fight to the "far enemy" in the West.

The second is that commando-style assaults, such as the one in Paris, are easy to plan and thus hard to disrupt. They may not kill as many people as blowing up an aircraft, but the "propaganda of the deed" is achieved by paralysing ordinary life in a big city and dominating 24-hour news channels.

Third, Western spooks say they are losing the technological edge that has enabled them to monitor the communications of potential terrorists. Tech companies are competing in their efforts to provide their customers with unbreachable privacy through sophisticated and sometimes "default" encryption. The heads of both America's FBI and Britain's MI5 have complained about their inability to prevent suspects from "going dark"—dropping off the radar screen of surveillance. David Cameron has promised to legislate to give his spies a back door into British phone and internet services.

Imperative to fight terrorism, domestic terrorist activity has been at a high currently.

David **Inserra** 2015, research associate in The Heritage Foundation's Allison Center for Foreign and National Security Policy, Ryan Spaude, member of the Young Leaders Program at The Heritage Foundation, 7/2/15, "Threat of Terrorism Remains Very Real During July 4", http://dailysignal.com//2015/07/02/threat-of-terrorism-remains-very-real-during-july-4th-weekend/

The U.S. is currently experiencing the most active period of domestic terrorist activity since 9/11. Law enforcement has foiled a total of nine terrorist plots already this year, including plots in Boston, New York City, and Morganton, N.C., last month.

In response, the FBI has increased its monitoring and surveillance efforts. While there are no known targets at this time, the agency has opened hundreds of investigations spread across all 50 states, with several arrests occurring just recently and more possible before July 4.

In particular, the Islamic State (ISIS) poses a serious threat to U.S. interests abroad and security at home. Beyond its quest for territory in the Middle East, ISIS is actively recruiting new followers through social media and hard-to-track technologies. In the U.S., its radical message resonates with terrorist converts and encourages them to take up arms.

The Founding Fathers fought a long war for independence, and it's time to recognize that we are currently in a long, protracted conflict with Islamist terrorism.

To fight terrorism at home and abroad, the U.S. must:

Support stronger action against Islamist terrorist groups abroad;

Ensure that the FBI shares information more readily and regularly with state and local law enforcement and treats them as critical actors in the fight against terrorism;

Designate an office in DHS to coordinate countering violent extremism (CVE) efforts;

Support state, local, and civil society partners, who are in the best position to recognize and counter radicalization in their own communities;

Maintain essential counterterrorism tools, including legitimate government surveillance programs; and

Build up local cyber capabilities, especially in high-risk urban areas.

The U.S. needs to provide law enforcement officers with the tools they need to stop terrorists before they strike. In addition, America and her allies need to take more effective steps to undermine and ultimately defeat ISIS and terrorist groups around the world.

We need domestic surveillance to prevent terrorist attacks- Garland event shows .

Fred **Flietz** 20**15**, senior vice president for policy and programs with the Center for Security Policy, held U.S. government national security positions for 25 years with the CIA, DIA, and the House Intelligence Committee staff, served as Chief of Staff to John R. Although the Obama administration refuses to say that the attempted massacre by two heavily armed assailants at a "draw Mohammed" contest in Garland, Texas, was an act of terrorism directed by ISIS, there is little doubt this was the case. One of the heavily armed attackers had been in touch through Twitter with jihadists in Australia and Somalia who were associated with ISIS and who had called for attacks on the Garland event. ISIS also seemed to know about the attack in advance and immediately claimed responsibility for it. Pamela Geller, the organizer of the "draw Mohammed" contest, wrote this week that whether ISIS leaders actually directed the attack or only had foreknowledge of it is a distinction without a difference, since ISIS has called for attacks on the United States and published manuals explaining how homegrown Islamist terrorists can construct bombs and kill infidels. The Garland attack was stopped in a matter of seconds — but only because of a heavy police presence assigned to the event and a traffic cop who somehow killed both assailants with his service revolver even though they were wearing body armor. However, this will certainly not be the last attack in the United States by homegrown terrorists inspired or directed by ISIS and al-Qaeda. There may not be heavy security in place the next time ISIS attacks.

Link Boosters---2NC

Low link threshold---intel-gathering is long-term and piecemeal---any restriction has ripple effects that undermine effective CT

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture.

In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this.

Err neg---surveillance is the <u>most effective</u> CT tool, and the risk is increasing

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often in cooperation with other countries, including the United States.

Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.

No offense---surveillance is globally inevitable---curtailing U.S. programs can only hurt CT

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

We do not know the full scope of success for these programs. The traditional explanation is that the failures of intelligence services will be on every front page but their successes will never be known. We do know that ending NSA's role in mass surveillance will not end mass surveillance in Europe or other parts of the world. What it will do is reduce cooperation among allied and friendly services and the United States and restrict access to extraregional counterterrorism data. Cooperation will not end, but will be less effective at a time when jihadi fighters are beginning to return from Syria. There will be an increase in the risk that a plot will go undetected, but how much risk will increase is difficult to estimate.

Surveillance Key---2NC

Terror group splintering means the risk is uniquely high now and domestic surveillance is key to prevent attacks

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.24 European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.25 The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.26 If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences.

A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but . On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia.

Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western

European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces.

The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new "front" for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets.27

The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. These attacks are the threat that mass surveillance was created to prevent. The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

The link magnitude is huge---surveillance is the one, national-level tool to prevent mass-casualty terrorist attacks

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

The echoes of September 11 have faded and the fear of attack has diminished. We are reluctant to accept terrorism as a facet of our daily lives, but major attacks—roughly one a year in the last five years—are regularly planned against U.S. targets, particularly passenger aircraft and cities. America's failures in the Middle East have spawned new, aggressive terrorist groups. These groups include radicalized recruits from the West—one estimate puts the number at over 3,000—who will return home embittered and hardened by combat. Particularly in Europe, the next few years will see an influx of jihadis joining the existing population of homegrown radicals, but the United States itself remains a target.

America's size and population make it is easy to disappear into the seams of this sprawling society. Government surveillance is, with one exception and contrary to cinematic fantasy, limited and disconnected. That exception is communications surveillance, which provides the best and perhaps the only national-level solution to find and prevent attacks against Americans and their allies. Some of the suggestions for alternative approaches to surveillance, such as the recommendation that NSA only track "known or suspected terrorists," reflect both deep ignorance and wishful thinking. It is the unknown terrorist who will inflict the greatest harm.

Surveillance is key to CT and the U.S. is key overall---no fill-in

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Mass surveillance serves counterterrorism purposes. It provides a means of identifying terrorists and their networks for targeted collection. The mass collection programs conducted by NSA were done in cooperative arrangements with European security services and those of other nations; that this was largely unknown to European populations and legislatures is more a reflection of the weaknesses of the oversight of their own intelligence activities by Europeans.15

The United States had unique advantages for counterterrorism on a global level. These include its relationships with a range of foreign intelligence partners, its technical resources, and the information it obtained from its operations in Iraq and Afghanistan. A captured cell phone can provide names and numbers that allow for more precise targeting. Using sophisticated software and combined with information from other intelligence services, NSA was able to take the billions of calls and emails sent each day and winnow them down to a few thousand messages to which an intelligence analyst actually listened.

On June 5, 2013, the Guardian broke the first story in what would become a flood of revelations regarding the extent and nature of the NSA's surveillance programs.1 Facing an uproar over the threat such programs posed to privacy, the Obama administration scrambled to defend them as legal and essential to U.S. national security and counterterrorism. Two weeks after the first leaks by former NSA contractor Edward Snowden were published, President Obama defended the NSA surveillance programs during a visit to Berlin, saying: "We know of at least 50 threats that have been averted because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved."2 Gen. Keith Alexander, the director of the NSA, testified before Congress that: "the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50 potential terrorist events in more than 20 countries around the world."3 Rep. Mike Rogers (RMich.), chairman of the House Permanent Select Committee on Intelligence, said on the House floor in July that "54 times [the NSA programs] stopped and thwarted terrorist attacks both here and in Europe – saving group.

AT: Surveillance Fails---2NC

Their arg uses the wrong metrics---surveillance doesn't prevent attacks in isolation---it makes key contributions to the larger intelligence framework that are tough to quantify from the outside

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents.

Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios.

Surveillance is valuable because it excludes potential leads---means it has to be broad and their indicts that the data's useless are wrong

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination

that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects.

This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine, but this is crucial for assessing the value of domestic surveillance programs.

If the risk of attack is increasing, it is not the right time to change the measures the United States has put in place to deter another 9/11. If risk is decreasing, surveillance programs can be safely reduced or eliminated. A more complicated analysis would ask if the United States went too far after 9/11 and the measures it put in place can be reduced to a reasonable level without increasing risk. Unfortunately, precise metrics on risk and effectiveness do not exist, 12 and we are left with the conflicting opinions of intelligence officials and civil libertarians as to what makes effective intelligence or counterterrorism programs. There are biases on both sides, with intelligence officials usually preferring more information to less and civil libertarians can be prone to wishful thinking about terrorism and opponent intentions.13

Interviews with current and former intelligence officials give us some guidance in deciding this. The consensus among these individuals is that 215 is useful in preventing attacks, but the least useful of the programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215 before any others, but ending 215 would not come without some increase in risk.

Impact

Impact Calc---Err Neg

Err neg---the risk of terrorism is latent and non-apparent---surveillance is key to prevent attacks even if the risk doesn't seem high

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) almost every year since 9/11. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq.

The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia's then-attorney general said in August 2013 that communications surveillance had stopped four "mass casualty events" since 2008. The constant planning and preparation for attack by terrorist

groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode.

The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm.

Turns Case---2NC

Disad turns the case---surveillance will be replaced by increasing security service personnel which has a much greater chilling effect on liberties---doesn't solve the disad because it's less effective at CT

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate," http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Broad surveillance of communications is the least intrusive method and most effective means for discovering terrorist activity. The alternatives to mass surveillance are straightforward. Countries can replace communications surveillance by increasing the number of security service personnel responsible for monitoring terrorism or they can decrease surveillance and accept some increase in the level of risk of a successful attack. The dilemma with choosing this course of action is that the number of agents required to replace communications surveillance is expensive and overtly intrusive in a way the communications surveillance is not. Hundreds of thousands of additional agents would be required to provide national coverage, may lack sufficient global reach to detect activity being planned or undertaken outside U.S. territory, and the creation of such a large force risks creating a much greater chilling effect on liberties

EXT: Garland

Garland event shows that it's imperative to prevent terrorist attacks because of the growing amount of homegrown terrorists-that's Flietz. Garland was the 68th Islamist terrorist plot- we need to reestablish the importance of counterterrorism.

David **Inserra** 2015, research associate in The Heritage Foundation's Allison Center for Foreign and National Security Policy, 5/18/15, "68th Terrorist Plot Calls for major counterterrorism Reforms", http://www.heritage.org/research/reports/2015/05/68th-terrorist-plot-calls-for-major-counterterrorism-reforms

This 68th Islamist terrorist plot or attack [Garland] is the 57th homegrown terrorist attack or plot and the 10th targeting a mass gathering, the third most common target. The attack also comes as part of a recent wave of attacks and plots, as this is the sixth Islamist terrorist plot or attack in 2015. All of the plots and attacks this year have been perpetrated by individuals who claim to support the Islamic State to varying degrees. The FBI has stated that Simpson wanted to commit jihad with ISIS, and press reports indicate that he may have been in secret communications with ISIS members.[6]

Regardless, with these attacks and the increasing numbers of individuals in the U.S. seeking to support or join ISIS and al-Qaeda affiliates, the U.S. is currently facing what is arguably the most concentrated period of terrorist activity in the homeland since 9/11. Director James Comey of the FBI has recent warned that "hundreds, maybe thousands" of individuals across the U.S. are being directly solicited by ISIS and urged to attack. Other senior officials, including Secretary of Homeland Security Jeh Johnson, the Director of National Intelligence James Clapper, and the director of the National Counterterrorism Center Nicholas Rasmussen have also noted the increasing threat of terrorism here at home.[7]

Strengthening the Counterterrorism Enterprise

In light of these warnings, the U.S. cannot be passive. Heritage has recommended numerous counterterrorism policies for Congress to address, including:

Streamlining U.S. fusion centers. Congress should limit fusion centers to the approximately 30 areas with the greatest level of risk as identified by the Urban Area Security Initiative (UASI). Some exceptions might exist, such as certain fusion centers that are leading cybersecurity or other important topical efforts. The remaining centers should then be fully funded and resourced by UASI.

Pushing the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working to integrate intelligence and law enforcement activities. This will require overcoming cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI.

Ensuring that the FBI shares information more readily and regularly with state and local law enforcement and treats state and local partners as critical actors in the fight against terrorism.State, local, and private-sector partners must send and receive timely information from the FBI. The Department of Homeland Security (DHS) should play a role in supporting these partners' efforts by acting as a source or conduit for information to partners and coordinating information sharing between the FBI and its partners.

Designating an office in DHS to coordinate countering violent extremism (CVE) efforts. CVE efforts are spread across all levels of government and society. DHS is uniquely situated to lead the federal government's efforts to empower local partners. Currently, DHS's CVE working group coordinates efforts across DHS components, but a more substantial office will be necessary to manage this broader task.

Supporting state, local, and civil society partners. Congress and the Administration should not lose sight of the fact that all of the federal government's efforts must be focused on empowering local partners. The federal government is not the tip of the spear for CVE efforts; it exists to support local partners who are in the best position to recognize and counter radicalization in their own communities.

Maintaining essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations, however, does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.

Ensuring Security

In the midst of this surge in terrorist activity, the U.S. must recommit itself to counterterrorism efforts. Improving intelligence tools, information sharing with state and local law enforcement, and local civil society outreach to counter radicalization should be a priority for Congress.

AT: Cyber Impact

Impractical- Won't Lead to War because of attribution and U.S isn't willing to go to war

Russ **Wellen 2013**, editor and blogger, 7/16/13, "Cyber war and Nuclear War. The Most Dangerous of All Conflations"

The Pentagon's Defense Science Board concluded this year that China and Russia could develop capabilities to launch an "existential cyber attack" against the United States. … "While the manifestation of a nuclear and cyber attack are very different," the board concluded, "in the end, the existential impact to the United States is the same."

Yes, I know. How can you conflate the effects of a nuclear attack with that of a cyber attack, no matter how devastating? Clarke and Andreasen continue.

Because it will be impossible to fully defend our systems against existential cyberthreats, the board argued, the United States must be prepared to threaten the use of nuclear weapons to deter cyberattacks.

A salient passage of the report, titled Resilient Military Systems and the Advanced Cyber Threat, reads:

In the process of conducting this study, it became apparent that the full spectrum cyber threat represented by a Tier V-VI capability is of such magnitude and sophistication that it could not be defended against. As such, a defense-only strategy against this threat is insufficient to protect U.S. national interests and is impossible to execute. Therefore, a successful DoD cyber strategy must include a [nuclear] deterrence component.

The Board took its cue from the 2010 Nuclear Posture Review which, Colby writes, stated that the

… United States would only consider the use of nuclear weapons in "extreme circumstances." … Presumably one would characterize a catastrophic Tier V-VI adversary cyber attack on the United States as "extreme circumstances" … so that is not precluded in the stated policy, but it is not explicitly mentioned.

At the National Interest, Eldridge Colby, a representative of the Department of Defense in New START negotiations, responding to Clarke and Andreasen's op-ed, elaborates on what makes an attack worthy of nuclear reprisal. It would have to threaten our survival and be

… of such magnitude and duration that it would be essentially unmistakable as an existential attack … attacks which lead to planes falling out of the sky, water and power shutting off, communications dying, food rotting, and the like.

Colby writes that along with "the costliness of cyber defenses, and the affordability of cyber offenses," attribution makes "the contemporary cyber domain a classic offense-dominant arena, one in which the attacker has huge advantages."

The word "attribution" is often applied to determining the origins of a nuclear-weapons attack, especially if mounted by a terrorist group that fails to identify itself. In other words, attribution not only makes cyberspace an "offense-dominant arena," as Colby asserts, it makes it difficult to decide who to retaliate against. From the report itself:

There are more dangerous threats than cyberattacks.

Ben **Lerner** 20**15**, VP for Government Relations, held a senior government relations role with a foreign affairs advocacy organization, gained experience in both the House and Senate, 4/2/15, "Securing The Grid Against More Than the Cyberthreat"

Tackling the cyberthreat will go a long way toward protecting our critical infrastructure, including arguably the most critical piece of that infrastructure: the electric grid that powers our way of life. While addressing the cyberthreat, however, we cannot afford to let our guard down on other equally present—and perhaps even more catastrophic—threats to the grid that have yet to receive the same level of badly needed attention.

To be sure, the cyberthreat to our electric grid is real and growing. Late last year, Adm. Michael Rogers, head of both the National Security Agency and U.S. Cyber Command, warned that China, and possibly other countries, have the ability to shut down the U.S. electric grid with a cyberattack. Recently, the Office of the Director of National Intelligence (ODNI) issued its report indicating that cyberattacks are the greatest danger to U.S. national security, noting for example that "Russian cyberactors" are developing the ability to infiltrate electric power grids and other critical infrastructure components. Notably, the ODNI has concluded for now that a single catastrophic cyberattack on our critical infrastructure is less likely than "a series of low-to-

moderate level cyberattacks from a variety of sources over time, which will impose cumulative costs on U.S. economic competitiveness and national security."

A threat that does have the capacity to produce catastrophic results for our electric grid in a single instance is that of an electromagnetic pulse (EMP) attack. As the federal government has acknowledged, our electrical grid is vulnerable to an EMP attack from a nuclear device delivered by a ballistic missile detonated outside the atmosphere, which would release immense levels of electromagnetic energy that would take down our grid for an extended period. There are indications that China and Russia already have such a capability, and North Korea is likely not far behind.

A similar effect can be produced in nature by major solar flaring, or geomagnetic disturbances (GMD); we narrowly missed being hit by a solar storm in 2012 that could have had catastrophic consequences for our grid, and scientists put the likelihood of such an event hitting earth at 12 percent over the next decade (about the same chance of a major earthquake striking California).

Current Encryptions Are Weak Because of the NSA's desire to install backdoors.

Dimitri **Tokmetzis** 20**15**, Dutch data journalists, 4/17/15, "How to protect privacy and security in the Crypto Wars", https://www.gccs2015.com/sites/default/files/documents/How%20to%20protect%20privacy%20and%20security%20in%20the%20crypto%20wars.pdf

We thought that the Crypto Wars of the nineties were over, but **renewed** fighting has erupted since the Snowden revelations. On one side, law enforcement and intelligence agencies are afraid that broader use of encryption on the Internet will make their work harder or even impossible. On the other, security experts and activists argue that installing backdoors will make everyone unsafe. Is it possible to find some middle ground between these two positions? 'This is the story of how a handful of cryptographers "hacked" the NSA. It's also a story of encryption backdoors, and why they **never quite work out** the way you want them to.' So began the blog post on the FREAK attack, one of the most ironic hacks of recent years. Matthew Green, assistant professor at John Hopkins university, and a couple of international colleagues **exploited** a nasty bug on the servers that host the NSA website. By forcing the servers to use an old, almost forgotten and weak type of encryption which they were able to crack within a few hours, they managed to gain access to the backend of the NSA website, making it possible for them to alter its content. Worse still, the cryptographers found that the same weak encryption was used on a **third of the 14 million** other websites they scanned. For instance, if they had wanted to, they could have gained access to **whitehouse.gov or tips.fbi.gov**. Many smartphone apps turned out to be vulnerable as well. The irony is this: this weak encryption was **deliberately** designed for software products exported from the US in the nineties. The NSA wanted to snoop on foreign governments and companies if necessary and pushed for a **weakening** of encryption. This weakened encryption somehow found its way back onto the servers of **US** companies and government agencies. 'Since the NSA was the organization that demanded export-grade crypto, it's only fitting that they should be the first site affected by this vulnerability', Green gleefully wrote.

NSA Bulk Surveillance Bad- - Government Claims Greatly Exaggerated and proven with 3 key points - Not Key To Counterterrorism.

Peter **Bergen** 2014, journalist and CNN national security analyst and member of the Homeland Security Project, David **Sterman** 2014, research assistant and a program associate, Emily **Schneider** 2014, senior program associate and assistant editor, Bailey **Cahall** 20**14**, policy analyst, 1/13/14, Do NSA's Bulk Surveillance Programs Stop Terrorists?, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf

However, our review of the government's claims about the role that NSA "bulk" surveillance of phone and email communications records has had in keeping the United States safe from terrorism shows that these claims are **overblown** and even **misleading**.* An in-depth analysis of 225 individuals recruited by al-Qaeda or a like-minded group or inspired by al-Qaeda's ideology,

and charged in the United States with an act of terrorism since 9/11, demonstrates that traditional investigative methods, such as the use of informants, tips from local communities, and targeted intelligence operations, provided the initial impetus for investigations in the **majority** of cases, while the contribution of NSA's bulk surveillance programs to these cases was **minimal**. Indeed, the controversial bulk collection of American telephone metadata, which includes the telephone numbers that originate and receive calls, as well as the time and date of those calls but not their content, under Section 215 of the USA PATRIOT Act, appears to have played an identifiable role in, at most, **1.8 percent** of these cases. NSA programs involving the surveillance of non-U.S. persons outside of the United States under Section 702 of the FISA Amendments Act played a role in 4.4 percent of the terrorism cases we examined, and NSA surveillance under an unidentified authority played a role in **1.3 percent** of the cases we examined. Regular FISA warrants not issued in connection with Section 215 or Section 702, which are the **traditional** means for investigating foreign persons, were used in at least 48 (**21 percent**) of the cases we looked at, although it's unclear whether these warrants played an initiating role or were used at a later point in the investigation. (Click on the link to go to a database of all 225 individuals, complete with additional details about them and the government's investigations of these cases: http://natsec.newamerica.net/nsa/analysis). Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terroristrelated activity, such as fundraising for a terrorist group. Furthermore, our examination of the role of the database of U.S. citizens' telephone metadata in the single plot the government uses to justify the importance of the program – that of Basaaly Moalin, a San Diego cabdriver who in 2007 and 2008 provided $8,500 to al-Shabaab, al-Qaeda's affiliate in Somalia – **calls into question the necessity** of the **Section 215 bulk collection program**.5 According to the government, the database of American phone metadata allows intelligence authorities to quickly **circumvent** the traditional burden of proof associated with criminal warrants, thus allowing them to "connect the dots" **faster** and prevent future 9/11-scale attacks. Yet in the Moalin case, after using the NSA's phone database to link a number in Somalia to Moalin, the FBI waited two months to begin an investigation and wiretap his phone. Although it's unclear why there was a delay between the NSA tip and the FBI wiretapping, court documents show there was a two-month period in which the FBI was not monitoring Moalin's calls, despite official statements that the bureau had Moalin's phone number and had identified him.6,7 This undercuts the government's theory that the database of Americans' telephone metadata is necessary to expedite the investigative process, since it clearly didn't expedite the process in the single case the government uses to extol its virtues. Additionally, a careful review of three of the key terrorism cases the government has cited to defend NSA bulk surveillance programs reveals that government officials have **exaggerated** the role of the NSA in the cases against David Coleman Headley and Najibullah Zazi, and the significance of the threat posed by a notional plot to bomb the New York Stock Exchange. In 28 percent of the cases we reviewed, court records and public reporting do not identify which specific methods initiated the investigation. These cases, involving 62 individuals, may have been initiated by an undercover informant, an undercover officer, a family member tip, other traditional law enforcement methods, CIA- or FBI generated intelligence, NSA surveillance of some kind, or any number of other methods. In 23 of these 62 cases (37 percent), an informant was used. However, we were unable to determine whether the informant initiated the investigation or was used after the investigation was initiated as a result of the use of some other investigative means. Some of these cases may also be too recent to have developed a public record large enough to identify which investigative tools were used. We have also identified three additional plots that the government has not publicly claimed as NSA

successes, but in which court records and public reporting suggest the NSA had a role. However, it is not clear whether **any** of those three cases involved bulk surveillance programs. Finally, the overall problem for U.S. counterterrorism officials is not that they need vaster amounts of information from the bulk surveillance programs, but that they don't sufficiently understand or widely share the information they already possess that was derived from **conventional** law enforcement and intelligence techniques. This was true for two of the 9/11 hijackers who were known to be in the United States before the attacks on New York and Washington, as well as with the case of Chicago resident David Coleman Headley, who helped plan the 2008 terrorist attacks in Mumbai, and it is the unfortunate pattern we have also seen in several other significant terrorism cases.

While we are weakening encryptions, there is an increasing likelihood of cyber terrorism-OPM shows.

David **Greene** 2015, given the association's 2008 Merriman Smith award for deadline coverage of the presidency, an NPR foreign correspondent in Moscow, Michael **Riley** 20**15**,a cyber securityreporter with Bloomberg Business, 6/16/15, "Government Workers' High Value Data At Risk After OPM Breach", http://www.npr.org/2015/06/16/414831922/government-workers-high-value-data-at-risk-after-opm-breach

DAVID GREENE, HOST: We're learning more about the largest breach of U.S. government data ever. It was revealed recently. Hackers were after information at the Office of Personnel Management, which is basically the federal government's HR department. The cyberattack is believed to have been launched from China. Hackers obtained the records of **14 million people**. And one of the questions facing investigators is why China wanted this stuff. Michael Riley covers cybersecurity for Bloomberg Business, and he joins us in the studio. Michael, good morning.

MICHAEL RILEY: Good morning.

GREENE: So what kind of information did the hackers get here?

RILEY: It looks like they went after a bunch of different kinds of stuff. Some of it's just very basic personal information - Social Security numbers, work records, military - like, what was your military record? But the government revealed on Friday that they actually got into a very sensitive database, which is the background checks done for people who have security clearances for **top-secret** information. So if you can imagine it, these are forms that are incredibly **detailed**, and they're designed to show **vulnerabilities** that employees might have that would handle very secret information.

GREENE: OK, so this is stuff like you're applying for a job, and you have to answer all these sensitive questions about yourself, your history, your friends, your family.

RILEY: Foreign travel, foreign contacts - it's any history of drug use. It's like if we're going to give you very sensitive, top-secret information, we want to know everything about you and everything a foreign intelligence agency might use to recruit you.

GREENE: So is that what they're trying to do? They're trying to get information that's sensitive that they could use as - as what? - like, some sort of blackmail to try and recruit people?

RILEY: Yeah, this seems to be, like, just old school spy craft at a new scale of immensity. In other words, they can use this to figure out vulnerabilities of people who have information they want. And they've stolen all sorts of other information, including health records and other things that they can cross-reference.

So they know that you have a particular job in the U.S. government that might deal with a particular area of policy that affects China, for example. They now know that you handle top-secret information associated with that, and they also have health records on you. They know what kinds of drugs you take. They know what kind of conditions you have. They know what kind of - whether you failed a lie detector test. They know all sorts of things that they can use to recruit you as a spy.

GREENE: And is also the kind of thing where they could take this information and sort of act like someone that you might know...

RILEY: Yes.

GREENE: ...To try and get you to open emails from them?

RILEY: Absolutely.

GREENE: And if they're able to do that, would that then give whoever these hackers are even more access to databases if you're actually opening emails from them thinking it's just a friend writing to you?

RILEY: Absolutely. Now, I mean, it's a notion called spearfishing, which they can send an email that looks very much like, for example, your insurance company or your hospital billing agent. And it can have a lot of information that would say to you, this is actually the person that you need to talk to and give your information to. It's a very powerful weapon to have because once you open that e-mail or click on this link, then it downloads a virus which infects your computer. And again, these are people who have very sensitive information about the government and about government activities that they want.

GREENE: How are government officials so sure that this was China, if they are sure?

RILEY: You know, the U.S. government has been - has not gone on the record openly. For example, the White House spokesperson has not said that this is China. The U.S. officials have said, behind the scenes, that it's China, and they've also told other people - other agencies that have been hacked by these same guys - that this is the Chinese government. The way that they figured that out is that we have our own versions of electronic spies that watch the computers from which this come. They can actually hack back and hack the hackers, so they've done a lot of work to figure out that this is China, and so farm the word is this is China.

GREENE: Michael, you cover cybersecurity threats - all sorts of cybersecurity threats. I mean, how scary is this one?

RILEY: It's very different than other hacks we've seen, including Target, for example, where hackers grabbed millions of credit cards. And those credit card numbers can just simply be replaced. It's a problem that you can actually fix. This is something that - where they got information on people that you cannot fix, I mean, if they know your vulnerabilities. And it goes back historically to the 1980s. Some of those people who, for example, might have applied for secret clearances and didn't get them because they failed a lie detector test or because they had a

history of drug use - those people might actually be in a different part of government, or they might be in the private sector in very important jobs. And you now have this vast database of information on people that - all over the country - that do really important things. And that's a hard thing to fix.'

Weak Encryption leads to hacking into the grid which would severely hurt the U.S.

Terry **Gross** 20**10**, the host and co-producer of Fresh Air, 4/19/10, "Richard Clarke On The Growing 'Cyberwar' Threat", http://www.npr.org/templates/story/story.php?storyId=126097038

Clarke has now turned his attention to another potential security catastrophe: **computer-based** terrorism attacks. In his new book, Cyberwar: The Next Threat to National Security and What to Do About It, he and co-author Robert Knake sketch out a scenario in which hackers could hypothetically cripple the United States from behind a computer screen.

"A cyberattack could disable trains all over the country," he tells Fresh Air host Terry Gross. "It could blow up pipelines. It could cause **blackouts** and damage electrical **power grids** so that the blackouts would go on for a long time. It could **wipe out** and confuse financial records, so that we would not know who owned what, and the financial system would be badly damaged. It could do things like disrupt traffic in urban areas by knocking out control computers. It could, in nefarious ways, do things like wipe out medical records."

Clarke says that cyberattacks can come from another country — or from a lone individual. Malicious code may infect a computer via a security flaw in a Web browser, or it could be distributed through secret back doors built into computer hardware. And though the government has set up security measures to protect military and intelligence networks, he worries that not enough is being done to protect the private sector — which includes the electrical grid, the banking system and our health care records.

Terrorism Unpredictable-results in ineffective counterterrorism models and programs.

Jeff **Jonas** 20**06**, Chief Scientist of the IBM Entity Analytics Group, and Jim **Harper** 20**06**, a former counsel to committees in both the U.S. House and the U.S. Senate, in 2014 he served as Global Policy Counsel for the Bitcoin Foundation, a founding member of the U.S. Department of Homeland Security's Data Privacy and Integrity Advisory Committee, 12/11/06, "Effective Counterterrorism and the Limited Role of Predictive Data Mining", http://object.cato.org/sites/cato.org/files/pubs/pdf/pa584.pdf

One of the fundamental underpinnings of predictive data mining in the commercial sector is the use of training patterns. Corporations that study consumer behavior have millions of patterns that they can draw upon to profile their typical or ideal consumer. Even when data mining is used to seek out instances of identity and credit card fraud, this relies on models constructed using many **thousands of known examples** of fraud per year. Terrorism has **no similar** indicia. With a relatively **small** number of attempts every year and only one or two major terrorist incidents every few years—each one **distinc**t in terms of planning and execution—there are **no meaningful** patterns that show what behavior indicates planning or preparation for terrorism. Unlike

consumers' shopping habits and financial fraud, terrorism does not occur with enough frequency to enable the creation of valid predictive models. Predictive data mining for the purpose of turning up terrorist planning using all available demographic and transactional data points will produce **no better results** than the highly sophisticated commercial data mining done today. The one thing predictable about predictive data mining for terrorism is that it would be consistently wrong. Without patterns to use, one fallback for terrorism data mining is the idea that any anomaly may provide the basis for investigation of terrorism planning. Given a "typical" American pattern of Internet use, phone calling, doctor visits, purchases, travel, reading, and so on, perhaps all outliers merit some level of investigation. This theory is offensive to traditional American freedom, because in the United States everyone can and should be an "outlier" in some sense. More concretely, though, using data mining in this way could be worse than searching at random; terrorists could defeat it by acting as normally as possible. Treating "anomalous" behavior as suspicious may appear scientific, but, without patterns to look for, the design of a search algorithm based on anomaly is no more likely to turn up terrorists than twisting the end of a kaleidoscope is likely to draw an image of the Mona Lisa. Without well-constructed algorithms based on extensive historical patterns, predictive data mining for terrorism will fail. The result would be to flood the national security system with false positives—suspects who are truly innocent.

AT: SQUO Effective

The Patriot Act is ineffective - multiple reports prove.

Patrick **Eddington** 20**15**, Policy analyst in Homeland Security and Civil Liberties at the Cato Institute, Assistant professor in the Security Studies Program at Georgetown University, served as communications director and later as senior policy advisor to Rush Holt, military imagery analyst at the CIA's National Photographic Interpretation Center, won numerous accolades for analytical work, including letters of commendation from the Joint Special Operations Command, the Joint Warfare Analysis Center and the CIA's Office of Military Affairs, analytical assignments included monitoring the breakup of the former Soviet Union and providing military assessments to policymakers on Iraqi and Iranian conventional forces, 6/1/15, "The Patriot Act is Not Fit for Purpose. Nor Is Its Replacement.", http://www.cato.org/publications/commentary/patriot-act-not-fit-purpose-nor-its-replacement

Senate Majority Leader Mitch McConnell, Senate Intelligence Committee Chairman Richard Burr and presidential hopeful Senator Marco Rubio have repeated more times than I can count that these Patriot Act provisions are "vital" to preventing another 9/11.

But they are objectively wrong. Last month the Department of Justice Inspector General (DoJ IG) released a partially declassified version of a long overdue Patriot Act compliance report.

With respect to Sec. 215 of the Patriot Act, which encompasses the controversial telephone metadata program as well as a much larger business records dragnet that just expired, the report found that, "The agents we interviewed did not identify any major case developments that resulted from the records obtained in response to Section 215 orders … "

Nearly 14 years of using this provision—which has swept up tens of millions of records of innocent Americans in the process—has resulted in zero terrorist plots against America being uncovered, much less disrupted.

And this applies not simply to the telephone metadata program exposed by Edward Snowden two years ago, but to every Sec. 215-related program since the Patriot Act was enacted in October 2001. The DoJ IG report's findings mirror those of President Obama's own Review Group on Intelligence and Communications Technologies, which issued its own report over 18 months ago.

This is exactly the same dismal record uncovered by The New York Times's Charlie Savage with respect to the once-illegal Stellar Wind warrantless surveillance program initiated by then-NSA Director Michael Hayden three days after the 9/11 attacks. And both programs have cost millions to run and to store the personal data of every American who has ever used a phone, computer, or tablet—a de facto "mass surveillance tax."

AT: Encryption→ GOVT being unaware of curr. situation

The statement of the government being "left in the dark" is totally bogus the government can still understand what you're doing.

Dimitri **Tokmetzis** 20**15**, Dutch data journalists, 4/17/15, "How to protect privacy and security in the Crypto Wars", https://www.gccs2015.com/sites/default/files/documents/How%20to%20protect%20privacy%20and%20security%20in%20the%20crypto%20wars.pdf

Third and finally, there is no 'going dark'. Law enforcement and intelligence agencies can **still intercept and read** a lot of data. In fact we are living in what many security commentators call '**the golden age** of surveillance'. As more and more of our activities are mediated by technology, we leave a **growing digital trail** that reveals a great deal about ourselves. Encryption lets you hide the content of messages, but not their context – so-called metadata – which reveal for instance what you read, who you talk to and where you are. In fact, this kind of data reveals so much that the former NSA director Michael Hayden once boasted: '**we kill** people based on metadata.' Furthermore, many governments and private businesses have developed **formidable** offensive capabilities. Many intelligence and law enforcement agencies are able to hack the 'end points' in systems, i.e. the devices we use. There is a small but growing industry in finding and selling details of software vulnerabilities, so that they can be exploited. Many 5 governments use the services of companies like Gamma International (which offers the FinFisher hacking suite), Hacking Team (Remote Control System) and VUPEN (which sells so called 'zero days', software vulnerabilities that haven't yet been found by others). With the rise of ubiquitous computing and the Internet of Things, the volume of revealing data streams will **only increase**, leaving **no shortage** of data to intercept or devices to hack.

EXT: Backdoors Bad

Backdoors bad and flawed- Obama rant on China policy shows.

Trevor **Timm** 20**15**, Guardian US columnist, 3/4/15, "Building backdoors into encryption isn't only bad for China, Mr President", http://www.theguardian.com/commentisfree/2015/mar/04/backdoors-encryption-china-apple-google-nsa

Want to know why forcing tech companies to build backdoors into encryption is **a terrible** idea? Look no further than President Obama's stark criticism of China's plan to do exactly that on Tuesday. If only he would tell the FBI and NSA the same thing.

In a stunningly short-sighted move, the FBI - and more recently the NSA - have been pushing for a new US law that would force tech companies like Apple and Google to **hand over** the encryption keys or build **backdoors** into their products and tools so the government would always have access to our communications. It was only a matter of time before other governments jumped on the bandwagon, and China wasted no time in demanding **the same** from tech companies a few weeks ago.

As President Obama himself described to Reuters, China has proposed an expansive new "anti-terrorism" bill that "would essentially force all foreign companies, including US companies, to turn over to the Chinese government mechanisms where they can snoop and keep track of all the users of those services."

Obama continued: "Those kinds of restrictive practices I think would ironically hurt the Chinese economy over **the long term** because I don't think there is any US or European firm, any international firm, that could credibly **get away** with that wholesale **turning over of data,** personal data, over to a government."

Bravo! Of course these are the exact arguments for why it would be a disaster for US government to force tech companies to do the same. (Somehow Obama left that part out.)

As Yahoo's top security executive Alex Stamos told NSA director Mike Rogers in a public confrontation last week, building backdoors into encryption is like "**drilling a hole into a windshield**." Even if it's technically possible to produce the flaw - and we, for some reason, trust the US government never to abuse it - other countries will inevitably demand access for themselves. Companies will no longer be in a position to say no, and even if they did, intelligence services would find the backdoor unilaterally - or just steal the keys outright.

Backdoors hurt the economy- it prevents innovation and hurts export opportunities.

Dimitri **Tokmetzis** 20**15**, Dutch data journalists, 4/17/15, "How to protect privacy and security in the Crypto Wars", https://www.gccs2015.com/sites/default/files/documents/How%20to%20protect%20privacy%20and%20security%20in%20the%20crypto%20wars.pdf

Unsound economics The second argument is one of economics. Backdoors can **stifle** innovation. Even until very recently, communications were a matter for a few big companies, often state-owned. The architecture of their systems changed slowly, so it was relatively cheap and easy to

build a wiretapping facility into them. Today thousands of start-ups handle communications in one form or another. And with each new feature these companies provide, the architecture of the systems changes. It would be a big burden for these companies if they had to ensure that governments can always **intercept and decrypt** their traffic. Backdoors require centralized information flows, but the most exciting innovations are moving in the opposite direction, i.e. towards decentralized services. More and more web services are using peer-to-peer technology through which computers talk directly to one another, without a central point of control. File storage services as well as payment processing and communications services are now being built in this decentralized fashion. It's extremely difficult to wiretap these services. And if you were to force companies to make such wiretapping possible, it would **become impossible** for these services to continue to exist. A government that imposes backdoors on its tech companies also risks **harming their export** opportunities. For instance, Huawei – the Chinese manufacturer of phones, routers and other network equipment – is unable to gain market access in the US because of **fears** of Chinese backdoors built into its hardware. US companies, especially cloud storage providers, have lost overseas customers due to fears that the NSA or other agencies could access client data. Unilateral demands for backdoors could put companies in a tight spot. Or, as researcher Julian Sanchez of the libertarian Cato Institute says: 'An iPhone that Apple can't unlock when American cops come knocking for good reasons is also an iPhone they can't unlock when the Chinese government comes knocking for bad ones.'

EXT: Traditional>Bulk Surveillance

Traditional Investigative Methods started the majority Of Terrorism Cases- Not Bulk Surveillance.

Peter **Bergen** 2014, journalist and CNN national security analyst and member of the Homeland Security Project, David **Sterman** 2014, research assistant and a program associate, Emily **Schneider** 2014, senior program associate and assistant editor, Bailey **Cahall** 20**14**, policy analyst, 1/13/14, Do NSA's Bulk Surveillance Programs Stop Terrorists?, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf

Traditional investigative methods initiated **60 percent** of the cases we identified. In **5 percent** of the cases, a **violent incident** occurred prior to **prevention,** and in **28 percent** of the cases – involving 62 individuals – court records and public reporting **do not identify** which methods initiated the investigation. The unclear cases may have been initiated by an undercover informant, a family member tip, other traditional law enforcement methods, CIA- or FBIgenerated intelligence, NSA surveillance of some kind, or any number of other methods. Additionally, some of these cases may be too recent to have developed a public record large enough to identify which investigative tools were used. In 23 of these 62 unclear cases (37 percent), an informant was involved, though we were unable to determine whether the informant initiated the investigation. The widespread use of informants suggests that if there was an NSA role in these cases, it was limited and insufficient to generate evidence of criminal wrongdoing without the use of traditional investigative tools. NSA surveillance of any kind, whether bulk or targeted of U.S. persons or foreigners, played an initiating role in only 7.5 percent of cases. To break that down further: The controversial bulk collection of telephone metadata appears to have played an identifiable role in, at most, 1.8 percent of the terrorism cases we examined. In a further 4.4

percent of the cases, NSA surveillance under Section 702 of targets reasonably believed to be outside of the country that were communicating with U.S. citizens or residents likely played a role, while NSA surveillance under an unknown authority likely played a role in 1.3 percent of the cases we examined.

EXT: Bulk Surveillance Bad

Bulk Surveillance of metadata has had little effect on preventing terrorism.

Peter **Bergen** 2014, journalist and CNN national security analyst and member of the Homeland Security Project, David **Sterman** 2014, research assistant and a program associate, Emily **Schneider** 2014, senior program associate and assistant editor, Bailey **Cahall** 20**14**, policy analyst, 1/13/14, Do NSA's Bulk Surveillance Programs Stop Terrorists?, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf

NSA director Gen. Alexander, under tough questioning from Sen. Patrick Leahy (D-Vt.) during a Senate Judiciary Committee hearing on October 2, 2013, admitted that there was **only one plot** – that involving Basaaly Moalin – in which, due to the bulk collection of American telephone metadata under Section 215, terrorist activity was prevented.* Our findings are consistent with that admission: The Moalin case is the only plot we were able to identify in which Section 215 appeared to play a potentially key role. Basaaly Moalin, a San Diego cabdriver, provided $8,500 to al-Shabaab, al-Qaeda's affiliate in Somalia, in 2007 and 2008.9 The U.S. government claimed that it used telephone metadata under Section 215 to identify Moalin as someone who was in contact with al-Shabaab officials. Three co-conspirators – Mohamed Mohamed Mohamud, Issa Doreh, and Ahmed Nasiri Taalil Mohamud – were charged along with Moalin. Even granting the government's explanation of the case, the Moalin case does not provide a particularly **convincing** defense of the need **for bulk collection** of American telephone metadata. The total amount going to a foreign terrorist organization was around **$8,500** and the case involved **no attack plot** anywhere in the world, nor was there a **threat** to the United States or American targets. 10 The four individuals involved in the plot make up only 1.8 percent of the 225 cases we identified. The case highlights a **disconnec**t between government officials' statements defending the NSA's bulk phone metadata program as critical to American national security and how it has been **actually used**. One reason offered by officials as to why the bulk collection of Americans' phone records is necessary is that it saves valuable time in investigations.11 But this supposed efficiency cited by the government is not supported by the facts in the Moalin case. Before the House Judiciary Committee in July 2013, Stephanie Douglas, executive assistant director of the FBI's National Security Branch, said that in October 2007, the NSA provided a phone number to the FBI with an area code consistent with San Diego, saying the phone number had been in contact with someone affiliated with an al-Qaeda branch.12 But the FBI did not begin monitoring Moalin's phone calls immediately after receiving the tip. Instead, it did not start investigating Moalin and wiretapping his calls until **two months later**, in December 2007, according to the affidavit submitted by the government in support of a search warrant.13 This two-month delay is inconsistent with the justification the government has been using to defend the bulk collection of citizens' metadata. Similarly, U.S. District Judge Richard Leon, who presided over a federal court case challenging the constitutionality of the bulk collection program, and who read the government's affidavits regarding the necessity of the program for national security, ruled in favor of an injunction against the NSA programs on December 16, 2013. He noted that the plaintiffs have a "substantial

likelihood" of showing their privacy interests outweigh the Government's interest in the NSA's bulk collection of American telephone metadata, and therefore the NSA's bulk collection program constitutes an unreasonable search under the Fourth Amendment. 14 He said in his opinion that given the "utter lack of evidence that a terrorist attack has ever been prevented because searching the NSA database was faster than other investigative tactics," he had "serious doubts about the efficacy of the metadata collection program as a means of conducting time-sensitive investigations in cases involving imminent threats of terrorism."15 By contrast, on December 27, 2013, a federal judge in New York, William H. Pauley III, ruled that the NSA bulk surveillance programs were legal and he observed in his ruling that the NSA programs are the U.S. government's "counter-punch" against the al-Qaeda terrorist network.16 However, Judge Pauley's decision exhibited substantial deference to the government's broad claims regarding its use of bulk collection under Section 215 and little examination of the particular cases beyond the government's statements, for instance, arguing "offering examples is a dangerous stratagem for the Government because it discloses means and methods of intelligence gathering."17 Judge Pauley's overall representation of the importance of bulk collection under Section 215 also is at odds with the findings of the President's own review commission. The White House review panel commissioned by President Obama said in their report released on December 18, 2013, that "the information contributed to terrorist investigations by the use of section 215 telephony meta-data was not essential to preventing attacks."18 Geoffrey Stone, a member of the White House review panel and a University of Chicago law professor, said in an interview with NBC News that the panel was trying to answer whether the collection of telephone metadata had actually stopped "any [terror attacks] that might have been really big" but that "the results were very thin."19 His conclusion: "We found none."20 But he did note that the comparison between Section 702 overseas intercepts and Section 215 bulk collection of American telephone metadata was "night and day."21 This statement further suggests that, even in the Moalin case, the administration exaggerated when Gen. Alexander and Deputy Director Inglis argued that the case represented an instance where terrorist activity would have continued but for the Section 215 program. While administration officials have admitted that there was only one terrorism case in which bulk collection of telephone metadata was supposedly critical, they have also cited higher numbers when talking about the purported "contribution" to other terrorism cases from evidence gathered under Section 215. For example, NSA Deputy Director Inglis stated during a Senate Judiciary committee hearing in July 2013: "We have previously cited in public testimony, that Section 215 made a contribution to 12 of the 13 terror plots with a U.S. nexus, amongst the 54 worldwide plots cited earlier."24 But even by the administration's own account, this contribution appears limited. In his 2013 speech at the Black Hat security conference, Gen. Alexander said that in four of the 12 plots, the examination of bulk records did not produce a lead: "It had a role in 12 of those 13. In four, it came up with no results that was operation – (inaudible) – value to the FBI. In the other eight, it provided leads for the FBI to go after."25 Below and on the next page are breakdowns of the NSA's surveillance programs that shows the terrorism plots in which they have been involved and statement by officials about the NSA's role in these cases.

The U.S Government is falsely advertsing NSA surveillance- it is not as effective as it may seem.

Peter **Bergen** 2014, journalist and CNN national security analyst and member of the Homeland Security Project, David **Sterman** 2014, research assistant and a program associate, Emily **Schneider** 2014, senior

program associate and assistant editor, Bailey **Cahall** 20**14**, policy analyst, 1/13/14, Do NSA's Bulk Surveillance Programs Stop Terrorists?, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf

Despite the government's narrative that NSA surveillance of some kind prevented 13 domestic "events" or "attacks" in the United States, of the eight cases we have identified as possibly involving the NSA, including the three the government has not claimed, only one can be said to involve an operational al-Qaeda plot to conduct an attack within the United States, three were notional plots, and one involved an attack plan in Europe. And in three of the plots we identified as possibly having been prevented by the NSA – Moalin, Muhtorov and Jumaev, and Warsame – the defendants were committing or allegedly committing crimes of support for a terrorist group, rather than plotting terrorist attacks. The administration has also deliberately tried to present the issue as one of preventing future 9/11s, taking advantage of the emotional resonances of that day. However, our review suggests that this rhetorical framing does not in any way accurately reflect the character of the plots that might be cited to justify the NSA programs. NSA talking points acquired by Al Jazeera through a Freedom of Information Act request, for example, demonstrate that the administration considered the 9/11 attacks a key point in its defense of the NSA programs. The talking points included statements such as, "NSA AND ITS PARTNERS MUST MAKE SURE WE CONNECT THE DOTS SO THAT THE NATION IS NEVER ATTACKED AGAIN LIKE IT WAS ON 9/11."46 Spokespeople were also encouraged to use "SOUND BITES THAT RESONATE," specifically, "I MUCH PREFER TO BE HERE TODAY EXPLAINING THESE PROGRAMS, THAN EXPLAINING ANOTHER 9/11 EVENT THAT WE WERE NOT ABLE TO PREVENT."47

EXT: Hurts Credibility + Privacy + Economy

Weakening Cyber security is a bad idea overall; it hurts our privacy, credibility, and the economy.

Trevor **Timm** 20**15**, columnist, 3/4/15, "Building backdoors into encryption isn't only bad for China, Mr President", http://www.theguardian.com/commentisfree/2015/mar/04/backdoors-encryption-china-apple-google-nsa

It's downright bizarre that the US government has been warning of the grave cybersecurity risks the country faces while, at the very same time, arguing that we should pass a law that would weaken cybersecurity and put every single citizen at more risk of having their private information stolen by criminals, foreign governments, and our own.

Forcing backdoors will also be disastrous for the US economy as it would be for China's. US tech companies - which already have suffered billions of dollars of losses overseas because of consumer distrust over their relationships with the NSA - would lose all credibility with users around the world if the FBI and NSA succeed with their plan.

The White House is supposedly coming out with an official policy on encryption sometime this month, according to the New York Times – but the President can save himself a lot of time and just apply his comments about China to the US government. If he knows backdoors in encryption are bad for cybersecurity, privacy, and the economy, why is there even a debate?

The USFG's is "drilling a hole through a windshield-" even NSA leader concedes that.

Tom **McCarthy** 20**15**, nationals affairs correspondent, 2/23/15, "NSA director defends plan to maintain 'backdoors' into technology companies", http://www.theguardian.com/us-news/2015/feb/23/nsa-director-defends-backdoors-into-technology-companies

Rogers [the director of NSA] admitted that concerns about US government infiltration of US companies' data represented a business risk for US companies, but he suggested that the greater threat was from cyber-attacks.

"I think it's a very valid concern to say 'Look, are we losing US market segment here?'" Rogers said. "What's the economic impact of this? I just think, between a combination of technology, legality and policy, we can get to a better place than we are now."

US technology companies have bridled at government pressure to introduce weaknesses in encryption systems in order to ensure government access to data streams, and technical experts have warned that there is no way to create a "backdoor" in an encryption system without summarily compromising it. An appearance by Obama at a cybersecurity conference at Stanford University last week to tout cooperation between the government and US tech companies was upstaged by an impassioned speech by Apple;s chief executive, Tim Cook, whowarned of the "dire consequences" of sacrificing the right to online privacy.

The basic discomfort of the new partnership the government would like to see with technology companies once again burst into full view on Monday when Alex Stamos, the chief information security officer at Yahoo, challenged Rogers on his recommendation for built-in "defects-slash-backdoors, or golden master keys" to serve government purposes.

Stamos asked Rogers how companies such as Yahoo, with 1.3 billion users worldwide, would be expected to reply to parallel requests for backdoors from foreign governments, and told Rogers such backdoors would be like "drilling a hole through a windshield".

"I've got a lot of world-class cryptographers at the National Security Agency," replied Rogers, skipping over the question of foreign government requests. "I think that this is technically feasible. Now it needs to done within a framework."

The NSA's efforts for breaking encryption has lead to lack of trust from customers and exploitation weakness.

Kim **Zetter** 20**14**, award-winning senior staff reporter at Wired covering cybercrime, privacy, and security, 7/29/14, "Personal Privacy Is Only One Of The Costs Of NSA Surveillance", http://www.wired.com/2014/07/the-big-costs-of-nsa-surveillance-that-no-ones-talking-about/

Out of all the revelations to come to light in the past year, the most shocking may well be the NSA's persistent campaign to undermine encryption, install backdoors in hardware and software and amass a stockpile of zero-day vulnerabilities and exploits.

"For the past decade, N.S.A. has led an aggressive, multipronged effort to break widely used Internet encryption technologies," according to a 2010 memo from Government Communications Headquarters, the NSA's counterpart in the UK, leaked by Edward Snowden.

Furthermore, a story from Pro Publica noted, the NSA "actively engages the US and foreign IT industries to covertly influence and/or overtly leverage their commercial products' designs" to

make them more amenable to the NSA's data collection programs and more susceptible to exploitation by the spy agency.

The NSA, with help from the CIA and FBI, also has intercepted network routers from US manufacturers like Cisco to install spy tools before they're shipped to overseas buyers, further undermining customer trust in US companies. Cisco senior vice president Mark Chandler wrote in a company blog post that his and other companies ought to be able to count on the government not interfering "with the lawful delivery of our products in the form in which we have manufactured them. To do otherwise, and to violate legitimate privacy rights of individuals and institutions around the world, undermines confidence in our industry."

All of these activities are at direct odds with the Obama administration's stated goal of securing the internet and critical infrastructure and undermine global trust in the internet and the safety of communications. The actions are particularly troubling because the insertion of backdoors and vulnerabilities in systems doesn't just undermine them for exploitation by the NSA but makes them more susceptible for exploitation by other governments as well as by criminal hackers.

NSA's priorities lead to weak cybersecurity and the decrease of U.S tech companies' success.

Julian **Sanchez** 20**13**, served as the Washington Editor, Cato writer, 9/6/13, "NSA's War on Global Cybersecurity", http://www.cato.org/blog/nsas-war-global-cybersecurity

In its myopic quest to ensure that no digital communication remains hidden from its panoptic gaze, the National Security Agency has worked to undermine the security of all Internet users, a new story in the New York Times reveals. As security expert Bruce Schneieraptly summarizes the report, "Government and industry have betrayed the internet, and us."

In this case, the Times notes, the NSA has not just arrogated power to itself in secret, but has done so after unambiguously losing an extended public political debate in the 1990s over whether the government should be legally provided with backdoor access to encrypted communications, or attempt to prevent strong encryption software from being available to users around the world. As security experts understood, and successfully argued at the time, ensuring that companies and individual users around the world could trust the security of their communications was vastly more important than ensuring the NSA or FBI would never encounter a message they couldn't decipher—something that, in any event, would be impossible to guarantee.

Having justly lost the public debate, the NSA secretly decided to sacrifice the rest of the world's interests to its own goals anyway:

According to an intelligence budget document leaked by Mr. Snowden, the N.S.A. spends more than $250 million a year on its Sigint Enabling Project, which "actively engages the U.S. and foreign IT industries to covertly influence and/or overtly leverage their commercial products' designs" to make them "exploitable." Sigint is the acronym for signals intelligence, the technical term for electronic eavesdropping. […]

Simultaneously, the N.S.A. has been deliberately weakening the international encryption standards adopted by developers. One goal in the agency's 2013 budget request was to "influence policies, standards and specifications for commercial public key technologies," the most common encryption method.

Cryptographers have long suspected that the agency planted vulnerabilities in a standard adopted in 2006 by the National Institute of Standards and Technology and later by the International Organization for Standardization, which has 163 countries as members.

Classified N.S.A. memos appear to confirm that the fatal weakness, discovered by two Microsoft cryptographers in 2007, was engineered by the agency. The N.S.A. wrote the standard and aggressively pushed it on the international group, privately calling the effort "a challenge in finesse."

In some cases, it sounds as though the NSA has arranged for backdoors to be placed in equipment used by specific adversaries, such as foreign goverments, which may well be a reasonable tactic. But here we are talking about something much worse: the deliberate introduction of vulnerabilities in widely used commercial products and, even more far reaching, into the abstract technical standards followed by the designers of security software.

This is a bit like publishing faulty medical research just to prevent a particular foreign dictator from being cured. It makes everyone on the Internet more vulnerable, increasing the chances that dissidents will be uncovered by despotic regimes and that corporations will fall victim to cybercriminals. It's in the nature of the Internet that sensitive data will sometimes flow in unpredictable ways, through untrustworthy systems, on the way to its destination—which means our ability to use the Internet for anything remotely sensitive, whether it's an intimate conversation or just an online credit card purchase—depends critically on our trust in the strength of the encryption systems protecting that data. The NSA has been doing its best to ensure that trust is unwarranted—which is an additional shame for U.S. tech companies, whose corproate clients must already be busy looking for providers who won't sell them deliberately broken security products.

The NSA hurts foreign relationships- many foreign countries backing out of deals- leads to financial suffering.

Kim **Zetter** 20**14**, award-winning senior staff reporter at Wired covering cybercrime, privacy, and security, 7/29/14, "Personal Privacy Is Only One Of The Costs Of NSA Surveillance", http://www.wired.com/2014/07/the-big-costs-of-nsa-surveillance-that-no-ones-talking-about/

NSA surveillance hurts Foreign Relationships- multiple businesses

The economic costs of NSA surveillance can be difficult to gauge, given that it can be hard to know when the erosion of a company's business is due solely to anger over government spying. Sometimes, there is little more than anecdotal evidence to go on. But when the German government, for example, specifically cites NSA surveillance as the reason it canceled a lucrative network contract with Verizon, there is little doubt that U.S. spying policies are having a negative impact on business.

"[T]he ties revealed between foreign intelligence agencies and firms in the wake of the U.S. National Security Agency (NSA) affair show that the German government needs a very high level of security for its critical networks," Germany's Interior Ministry said in a over the canceled contract.

Could the German government simply be leveraging the surveillance revelations to get a better contract or to put the US on the defensive in foreign policy negotiations? Sure. That may also be part of the agenda behind data localization proposals in Germany and elsewhere that would force telecoms and internet service providers to route and store the data of their citizens locally, rather than let it pass through the U.S.

But, as the report points out, the Germans have not been alone in making business decisions based on NSA spying. Brazil reportedly scuttled a $4.5 billion fighter jet contract with Boeing and gave it to Saab instead. Sources told Bloomberg News "[t]he NSA problem ruined it" for the US defense contractor.

Governments aren't the only ones shunning US businesses. American firms in the cloud computing sector are feeling the pressure as consumers and corporate clients reconsider using third-party storage companies in the U.S. for their data. Companies like Dropbox and Amazon Web Services reportedly have lost business to overseas competitors like Artmotion, a Swiss hosting provider. The CEO of the European firm reported that within a month after the first revelations of NSA spying went public, his company's business jumped 45 percent. Similarly, 25 percent of respondents in a survey of 300 British and Canadian businesses earlier this year said they were moving their data outside the U.S as a result of NSA spying.

The Information Technology and Innovation Foundation has estimated that repercussions from the spying could cost the U.S. cloud computing industry some $22 to $35 billion over the next few years in lost business.

NSA actions labels the U.S as hypocrites, loses credibility and influence on how rules the internet.

Kim Zetter 2014, award-winning senior staff reporter at Wired covering cybercrime, privacy, and security, 7/29/14, "Personal Privacy Is Only One Of The Costs Of NSA Surveillance"

Finally, the NSA's spying activities have greatly undermined the government's policies in support of internet freedom around the world and its work in advocating for freedom of expression and combating censorship and oppression.

"As the birthplace for so many of these technologies, including the internet itself, we have a responsibility to see them used for good," then-Secretary of State Hillary Clinton said in a 2010 speech launching a campaign in support of internet freedom. But while "the US government promotes free expression abroad and aims to prevent repressive governments from monitoring and censoring their citizens," the New American report notes, it is "simultaneously supporting domestic laws that authorize surveillance and bulk data collection." The widespread collection of data, which has a chilling effect on freedom of expression, is precisely the kind of activity for which the U.S. condemns other countries.

This hypocrisy has opened a door for repressive regimes to question the US role in internet governance bodies and has allowed them to argue in favor of their own governments having greater control over the internet. At the UN Human Rights Council in September 2013, the report notes, a representative from Pakistan—speaking on behalf of Cuba, Iran, China and other countries—said the surveillance programs highlighted the need for their nations to have a greater role in governing the internet.

Future Cyber Attacks Look Realistic-2014 Breach Supports.

Alessandra **Gennarelli** 20**15**, Intern for Center for Security Policy, 6/5/15, "The Greatest Security Breach In History? China's Cyber attack on 4 million Federal Employees. http://www.centerforsecuritypolicy.org/2015/06/05/the-greatest-security-breach-in-us-history-chinas-cyberattack-on-4-million-federal-employees/

On Thursday, Washington officials released information stating that in December 2014, hackers took data from an estimated 4 million "current and previous federal employees" in the private governmental agency, the Office of Personnel Management (OPM). However, government officials reported this morning "nearly every federal government agency was hit by the hackers." Investigators are pointing fingers at the Chinese government, when asked who is responsible for the attacks.

The breach was "discovered in April" using "new detection tools," but the DHS "said it didn't conclude until May that the records had been taken." The information hackers had access to from the OPM, according to officials, includes employees "Social Security numbers, job assignments, performance ratings and training information."

Although specific proof has not yet been provided on this hack, attacks on our cyber security from China are far from unprecedented. In March 2014, a security breach of OPM was tracked back to Chinese cyber attackers. In May 2014, five Chinese military officials were indicted on charges of "economic cyber espionage." The FBI suspects that a security intrusion on Anthem Health Insurance, which runs Blue Cross and Blue Shield health plans, in February was the work of Chinese hackers as well.

China responded Friday saying the accusations are "irresponsible and unscientific." Hong Lei, the spokesman for the Chinese Foreign Minister has stated, "We wish the United States would not be full of suspicions, catching wind and shadows, but rather have a larger measure of trust and cooperation." The Chinese President XI Jinping's first planned visit to the US is set for September, and cyber security is planned to be a topic of discussion between Presidents.

The Washington Post reports, "Intruders used a 'zero-day' – a previously unknown cyber-tool – to take advantage of a vulnerability that allowed the intruders to gain access into the system." The Department of Homeland Security reportedly used "intrusion detection system EINSTEIN" to discover the invasion of foreign entities in the cyber system. However, according to the Center for Digital Government's Cyber security expert Morgan Wright, the system has become a "failure."

The OPM website describes their role as providing "human resources, leadership, and support to Federal agencies and helps the Federal workforce achieve their aspirations as they serve the American people." The OPM is essentially the Human Resources department of the government, ensuring the entire government is running smoothly with jobs such as hiring and firing employees, managing payroll, training, confirming security clearances for government personnel and "conducting more than 90 percent of federal background investigations."

The OPM is a valuable government agency holding large amounts of information on each federal employee. Donna Seymour said of the situation, "Certainly, OPM is a high- value target. We have a lot of information about people, and that is something that our adversaries want." A few examples of what China could do with this information includes use it to conduct their own counterintelligence operations seeking to root out potential U.S. intelligence officers, sending emails from personal email addresses to other co-workers in order to target specific federal computers, or targeting government employees that could "provide useful intelligence" for espionage purposes.

Representative Adam Schiff (D-CA), the senior Democrat on the Intelligence Committeetweeted yesterday his shock with current security measures set in place by the government. Schiff also stated legislation that "passed the House last month" concerning cyber security should pass quickly in the Senate in light of the attack.

The New York Times reports, "The personnel office told current and former federal employees that they could request 18 months of free credit monitoring to make sure that their identities had not been stolen." As more details come to fruition on one of the greatest security breaches in US history, the US government will decide the necessary steps it needs to take in order to prevent future cyber attacks from not only China, but Russia as well.

The FBI said it is currently investigating the situation and promised to "hold accountable those who pose a threat in cyberspace."

NSA director Rogers says cyber attacks are difficult to defend- North Korea event shows.

Tom **McCarthy** 20**15**, a nationals affairs correspondent for Guardian U.S, 2/23/15, "NSA director defends plan to maintain 'backdoors' into technology companies", http://www.theguardian.com/us-news/2015/feb/23/nsa-director-defends-backdoors-into-technology-companies

The National Security Agency director, Mike Rogers, on Monday sought to calm a chorus of doubts about the government's plans to maintain built-in access to data held by US technology companies, saying such "backdoors" would not be harmful to privacy, would not fatally compromise encryption and would not ruin international markets for US technology products.

Rogers mounted an elaborate defense of Barack Obama's evolving cybersecurity strategy in an appearance before an audience of cryptographers, tech company security officers and national security reporters at the New America Foundation in Washington. In an hour-long question-and-answer session, Rogers said a cyber-attack against Sony pictures by North Korea last year showed the urgency and difficulty of defending against potential cyber threats.

"If you look at the topology of that attack from North Korea against Sony Pictures Entertainment, it literally bounced all over the world before it got to California," Rogers said. "Infrastructure located on multiple continents, in multiple different geographic regions."

For most of the appearance, however, Rogers was on the defensive, at pains to explain how legal or technological protections could be put in place to ensure that government access to the data of US technology companies would not result in abuse by intelligence agencies. The White House is trying to broker a deal with companies such as Apple, Yahoo and Google, to ensure holes in encryption for the government to access mobile data, cloud computing and other data.

2014 hacking incidents and increase malware raises the likelihood of hackers shutting down the grid.

Jose **Pagliery** 20**14**, CNN article reporter, 11/18/14, "Hackers attacked the U.S energy grid 79 times this year", http://money.cnn.com/2014/11/18/technology/security/energy-grid-hack/

In fiscal year 2014, there were 79 hacking incidents at energy companies that were investigated by the Computer Emergency Readiness Team, a division of the Department of Homeland Security. There were 145 incidents the previous year.

The outermost defenses aren't holding up. Between April 2013 and 2014, hackers managed to break into 37% of energy companies, according to a survey by ThreatTrack Security.

Cybersecurity firm FireEye (FEYE) identified nearly 50 types of malware that specifically target energy companies in 2013 alone, according to its annual report. Energy firms get hit with more spy malware than other industries, according to a 2014 study by Verizon (VZ, Tech30).

In March, TrustedSec discovered spy malware in the software that a major U.S. energy provider uses to operate dozens of turbines, controllers and other industrial machinery. It had been there for a year -- all because one employee clicked on a bad link in an email.

Related: U.S. weather system hacked, affecting satellites

And just last month, CERT revealed that a Russian malware called BlackEnergy had found its way onto the software that controls electrical turbines in the United States.

Investigators didn't see any attempts to damage or disrupt machines. But the malware gives hackers a backdoor to plant destructive code in the future.

So far, no computer virus has shut down any portion of the grid. But hackers are still breaking in, giving them the potential to flip switches off.

"Our grid is definitely vulnerable," said David Kennedy, Trusted Sec's CEO. "The energy industry is pretty far behind most other industries when it comes to security best practices and maintaining systems."

Terror Impact D

Impact overblown because of fear of 9/11 when the chance of that is way overflated.

John **Mueller** 2015, member of the political science department and Senior Research Scientist with the Mershon Center for International Security Studies, Mark **Stewart** 20**15**, civil engineer at the University of Newcastle in Australia, 2/24/15, "Terrorism Poses No Existential Threat to America. We Must Stop Pretending Otherwise", http://www.cato.org/publications/commentary/terrorism-poses-no-existential-threat-america-we-must-stop-pretending

One of the most unchallenged, zany assertions during the war on terror has been that terrorists present an existential threat to the United States, the modern state and civilization itself. This is important because the overwrought expression, if accepted as valid, could close off evaluation of security efforts. For example, no defense of civil liberties is likely to be terribly effective if people believe the threat from terrorism to be existential.

At long last, President Barack Obama and other top officials are beginning to back away from this absurd position. This much overdue development may not last, however. Extravagant alarmism about the pathological but self-destructive Islamic State (Isis) in areas of Syria and Iraq may cause us to backslide.

The notion that international terrorism presents an existential threat was spawned by the traumatized in the immediate aftermath of 9/11. Rudy Giuliani, mayor of New York at the time, recalls that all "security experts" expected "dozens and dozens and multiyears of attacks like this" and, in her book The Dark Side, Jane Mayer observed that "the only certainty shared by virtually the entire American intelligence community" was that "a second wave of even more devastating terrorist attacks on America was imminent". Duly terrified, US intelligence services were soon imaginatively calculating the number of trained al-Qaida operatives in the United States to be between 2,000 and 5,000.

Also compelling was the extrapolation that, because the 9/11 terrorists were successful with box-cutters, they might well be able to turn out nuclear weapons. Soon it was being authoritatively proclaimed that atomic terrorists could "destroy civilization as we know it" and that it was likely that a nuclear terrorist attack on the United States would transpire by 2014.

No atomic terrorists have yet appeared (al-Qaida's entire budget in 2001 for research on all weapons of mass destruction totaled less than $4,000), and intelligence has been far better at counting al-Qaida operatives in the country than at finding them.

But the notion that terrorism presents an existential threat has played on. By 2008, Homeland Security Secretary Michael Chertoff declared it to be a "significant existential" one - carefully differentiating it, apparently, from all those insignificant existential threats Americans have faced in the past. The bizarre formulation survived into the Obama years. In October 2009, Bruce Riedel, an advisor to the new administration, publicly maintained the al-Qaida threat to the country to be existential.

In 2014, however, things began to change.

In a speech at Harvard in October, Vice President Joseph Biden offered the thought that "we face no existential threat — none — to our way of life or our ultimate security." After a decent interval of three months, President Barack Obama reiterated this point at a press conference, and then expanded in an interview a few weeks later, adding that the US should not "provide a victory to these terrorist networks by over-inflating their importance and suggesting in some fashion that they are an existential threat to the United States or the world order." Later, his national security advisor, Susan Rice, echoed the point in a formal speech.

Transparency promotes multiple national interests

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

The illumination of the harms analysis will have a variety of consequences. First, the new narrative would expand the dialogue about the protection of liberty. While the concept of liberty means different things in different domains, it could mean greater protection for those individuals affected. It also could mean a more robust court process, with a shift toward the tenets of due process, including notice of harm and possible remedies. In the community, it could mean generally maintaining as much as feasibly possible an open, civil society, separate from military influence or control. Second, an exposed harms analysis could help to divide the confluence of different rationales, specifically any straying from appropriate uses of surveillance, which occurs when mixing together national security with national interest. National security is about protecting the nation and its citizens; national interest is about advancing economic, social and other interests of the country or segments of it. Without a harms narrative, it is all too easy for surveillance designed to protect national security to be used for other purposes. Surveillance might align with the economics of large, multi-national corporations, or simply broaden without any apparent rationale at all. As one commentator observed: "Tomorrow's police … might sit in an office or vehicle as their metal agents methodically search for interesting behavior to record and relay." 78 In addition, reframing might actually promote security, not minimize it. Some visibility would serve to sharpen the focus of the surveillance so it could pass constitutional muster, create more confidence in the system, and provide notice, a basic concern of due process, so citizens can know the broad outlines of what is being done to protect them. Also, when surveillance goes too far, it actually can create a backlash. For example, when it was discovered that United States spy agencies were listening in on Chancellor Angela Merkel's cell phone calls, it affected the United States' relations with Germany. The Chancellor declared, "Trust needs to be rebuilt."79 Thus, instead of unaccountable surveillance being placed on the defensive through leaked revelations,80 it is better to have generally visible surveillance parameters and stick to them, unless exceptional measures are warranted. Thus, privacy safeguards could actually serve national security interests by reigning in unchecked action.

Minimization programs exist, but lack a public interface

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

It has been revealed that the United States has a minimization program to limit its intrusiveness in surveillance, with the aim of limiting inadvertent data collection, the uses of stored data, and the length of time data is stored.97 These are important transparency goals, not only in protecting privacy, but in serving larger purposes. The program would be better served, though, if the program was not completely internal, and effectively invisible. If even a part of program had a public interface or any built in democratic checks, it would be more effective and consistent with the separation of powers.98 A criticism of minimization is that it risks security. While goals limiting security activities undoubtedly pose some risks for any society, in a democracy these risks are built into an open society.

Additional public reporting about FISA activity is key to transparency of surveillance

Alan **Bulter 13**, Appellate Advocate Counsel, Electronic Privacy Information Center; J.D., UCLA School of Law; B.A., magna cum laude, Economics, Washington University in St. Louis, October 2013, "Standing Up to Clapper: How to Increase Transparency and Oversight of FISA Surveillance," *New England Law Review*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2397949

The information provided in the Attorney General's annual FISA letter, as required by statute, n178 is inadequate to inform the public about the scope and effectiveness of foreign intelligence surveillance programs. The need for additional public reporting has been recognized since shortly after the passage of the USA PATRIOT Act. For example, the American Bar Association urged Congress in 2003 to conduct regular oversight and to create an annual public report on FISA investigations similar to the annual wiretap report prepared by the Administrative Office of the United States Courts. n179 A comprehensive statistical report is necessary to ensure that FISA authorities are used effectively and efficiently, and to ensure that the system adequately protects the privacy of U.S. persons. In contrast with the annual FISA letter - which only includes the number of "orders and extensions either granted, modified, or denied" for electronic surveillance and production of business records or tangible things - the Wiretap Report provides essential details about the execution and efficiency of law enforcement surveillance. n180 The wiretap reports include a detailed overview of the cost, duration, and effectiveness of investigative surveillance. They also provide a statistical breakdown of law enforcement activities based on the type of crime investigated n181 and the types of communications intercepted. n182 This data provides a basis to evaluate the effectiveness of wiretap authority, to measure its cost, and to understand the impact of surveillance on innocent individuals. These detailed public reports ensure that law enforcement resources are used appropriately and efficiently while protecting important privacy interests.

Legal interpretations of the FISC need public disclosure

Alan **Bulter 13**, Appellate Advocate Counsel, Electronic Privacy Information Center; J.D., UCLA School of Law; B.A., magna cum laude, Economics, Washington University in St. Louis, October 2013, "Standing Up to Clapper: How to Increase Transparency and Oversight of FISA Surveillance," *New England Law Review*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2397949

The failure to publish FISC opinions over the last ten years is the root of the current loss of public confidence in the Administration's use of foreign intelligence authorities. n192 The court's legal analysis and conclusions, as opposed to the operational details of surveillance activities, are part of the law that cannot properly develop without public oversight. Promulgation of the law is a central requirement of democracy; the failure to promulgate results in a "failure to make law." n193 Both the FISC and the [*87] Attorney General bear the responsibility to promote public understanding of the FISA process and what it encompasses. This is especially true where the court attempts to strike some balance between national security

and civil liberties concerns. n194 Secret law undermines our system of checks and balances by disabling the democratic oversight by which the public governs its government.n195 A number of current proposals would increase transparency and facilitate public oversight of FISA authorities. n196 Most of these proposals require that the Attorney General submit declassified versions, or summaries, of significant FISC opinions that are already submitted to the Intelligence Committees in classified form under 50 U.S.C. § 1871(c). Senator Blumenthal's proposal is significantly broader because it would require disclosure of any decision with a "significant construction or interpretation of law." n197 It would also provide for an adversarial party at the FISC, the Special Advocate, and would require disclosure of any FISC opinion appealed by the Advocate and any FISCR opinion issued on appeal. n198 It would also empower the Special Advocate to petition the FISC or the Foreign Intelligence Surveillance Court of Review ("FISCR") for release of any document, which the court can order even over the objection of the Attorney General. n199 The FISC has recently made clear that its rules do not prohibit the [*88] Government's disclosure of prior opinions, n200 but it has so far been reluctant to publish more than a handful.n201 After the NSA leaks during the summer of 2013, several FISC opinions were released by the Director of National Intelligence. n202 The problem is that no current rule or law requires either the FISC or the Attorney General to publish significant FISC opinions, and until such a rule exists both will be hesitant to take responsibility for redacting properly classified details public to facilitate dissemination. Even top administration officials have acknowledged that we have an overclassification problem, n203 and clearly there is more work to do to make legal interpretations and authorities public. The current proposals represent a strong step in the right direction because they include mandatory declassification of FISC legal interpretations (or summaries thereof) and set clear timelines for publication release by the Attorney General. The USA FREEDOM Act and Senator Blumenthal's bill would go even further by providing for a petition from the Special Advocate directly to the FISC or FISCR for release of court documents. n204

Benefits of public accountability outweigh harms to national security

Jack **Goldsmith 12**, Harvard Law School professor who has written extensively in the field of international law, civil procedure, cyber law, and national security law, 3/12/12, "Chapter Seven: The Presidential Synopticon," *Power and Constraint: The Accountable Presidency After 9/11*

Underlying this persistent restraint is a recognition – based in part on politics and in part on a powerful constitutional tradition – that press coverage of secret executive branch action serves a vital function in American democracy, even though the press often miscalculates the harm of publishing secrets and thus often harms national security. "Some degree of abuse is inseparable from the proper use of everything; and in no instance is this more true than in that of the press," said Madison. "It has accordingly been decided . . . that it is better to leave a few of its noxious branches to their luxuriant growth, than, by pruning them away, to injure the vigor of those yielding the proper fruits." Madison did not have publication of national security secrets in mind, but his reasoning applies to the issue. It is no accident that, as Brauchli notes, the nation with the largest and most powerful military and intelligence services in the world is also the nation that, by a large margin, gives its media the freest reins in discovering and publishing classified secrets. There is in theory room to tighten these reins. But the United States has basically decided that a self-serving and institutionally biased media which pursues and publishes government secrets that sometimes harm national security achieves important accountability benefits that on balance outweigh the harms to national security.

Solvency – Privacy

Transparency is key to proper privacy safeguards

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

In Tijuana, Mexico, one can now look in the night sky and possibly see a small, desk-size object flying over the city. 3 The object, a small, unmanned, low altitude aircraft commonly referred to as a drone, is capable of twenty-minute battery-operated flights. The drone sends live video to screens at police headquarters. Several drones are being used both day and night in Tijuana for crime interdiction, particularly against burglaries.4 In Great Britain, multiple cameras appear throughout the country, part of a network of closed-circuit televisions also utilized for crime interdiction.5 In the United States, there are some "red light" cameras at intersections and various other surveillance systems. The National Security Agency (NSA), for example, has multiple surveillance programs that obtain data6 from private companies,7 tap telephone calls,8 and gather massive amounts of phone metadata9 and telephone records. 10 Government agencies also are developing biometric programs, 11 such as facial recognition software like the Biometric Optical Surveillance System (BOSS),12 which are already employed in a sophisticated manner by private companies such as Facebook. These collective activities lead inexorably to the realization that we are now living in a mass surveillance world.13 The types and numbers of systems of surveillance continue to multiply, from drones to biometrics to signals analysis. As we learn from the French root of the word surveillance, surveiller, 14 meaning to watch over, our movements are being watched, stored, connected and dissected every day in myriad ways. For most surveillance to succeed, unless it is designed primarily to deter observers instead of capturing information or behavior, it is almost axiomatic that an element of secrecy is needed. 15 This is especially true when the governmental objective is national security. The problem is that the national security narrative cloaks surveillance in invisibility. In doing so, the cloaking minimizes other factors in the calculus for determining the parameters of lawful surveillance, such as the harms incurred by individuals, the Constitution and the rule of law. As a recent report by the independent Privacy and Civil Liberties Oversight Board noted, "Despite widespread support for balancing openness and secrecy, there has been equally widespread consensus within and without the government that the system tilts too far in the direction of secrecy."16 Thus, the distinction between invisible and visible surveillance has potentially profound consequences. With invisibility, there generally is no narrative, and without such a narrative, a coherent voice – the core of our adversarial court system and democracy -- cannot be raised concerning the harms of surveillance, 17 such as whether it might violate the Fourth Amendment or various statutes.18 Consequently, it is more difficult to distinguish between legitimate and illegitimate powers, creating a slippery slope of one-sided justification. 19 This paper will explore the distinctions between visible and invisible surveillance. Given the significance of these distinctions, I will argue that some visibility of surveillance — some transparency — is needed to ensure that proper privacy safeguards exist. In short, reframing the analysis to allow a narrative about the harms of indiscriminate mass surveillance hopefully will lead to greater government accountability, increased protection of liberty and a stronger rule of law.

Visible surveillance reveals potential harms to privacy

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

Why reframe the dominant narrative of surveillance when national security is undoubtedly a priority for any government? The answer lies in its marginalization of a harms analysis. Without some visibility, the national security side receives a permanent advantage, occupying the foreground of any discussion, making it less a debate than a preordained outcome. Further, with only security being considered, the true value of privacy and governmental checks will be understated. A reframing will make indiscriminate government surveillance more transparent and more accountable. While transparency for transparency's sake might be of value, the instrumental values for individuals and government efficiency are significant in a reframing that more accurately

considers the harms of such surveillance. Limiting unchecked action by unelected agency employees, unseen expenditures, inadvertent collection, indefinite storage, and Big Data-type analysis are all possible outcomes.

Visible surveillance is key to balancing privacy and security

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

There are critical differences between visible and invisible government surveillance. With invisible surveillance, a narrative of its harms remains unconstructed. Worse, invisible mass surveillance contains embedded dangers in a society that prides itself on its openness and constitutional framework. Visibility permits a narrative of harms from the surveillance, especially a legal one in courts of law that resolves disputes based on coherent arguments derived from facts. While drones might soon fly regularly over the day and night skies of American cities just as they do in Tijuana, by assigning the proper values to privacy and visible surveillance, the kind of constitutional balance[104] sought by the Framers ought to result.

Increased supervision and accountability is crucial to balancing privacy and counterterror

The Economist 15, authoritative insight and opinion on international news, politics, business, finance, science and technology, 1/17/15, "Going dark: Just as the threat of terrorism is increasing, the ability of Western security agencies to defeat it is declining," *The Economist*, http://www.economist.com/news/leaders/21639506-just-threat-terrorism-increasing-ability-western-security-agencies-defeat

That leads on to whether the intelligence will be good enough in the future and thus the much more ideological question of how to balance liberty against security. Libertarians in Silicon Valley and elsewhere point out that the spooks, especially in America, have a record of exceeding their powers, lying about what they are up to and suborning their supervisors. On the other hand, it is clear that intelligence services are being left behind in a privacy arms race between tech companies. A recent meeting between executives of Apple and British spy chiefs only demonstrated the gulf between them. Both sides should give way quickly. The tech firms must come to terms with the fact that every previous form of communication—from the conversation to the letter to the phone—has been open to some form of eavesdropping: they cannot claim their realm is so distinct and inviolate that it can imperil others' lives, especially as the number of people who need to be monitored is in the thousands. And it is far better to agree to some form of standard now, rather than wait for an atrocity plotted behind impenetrable walls to be unleashed: if that happens the Dick Cheneys and Donald Rumsfelds of the future will be setting the rules. The place where liberals should fight—and the spooks should concede—is over supervision and due process. Surveillance of individuals should require approval by independent judges, not by politicians. Accountability requires a supervisory bias towards making public as much of what the security agencies do as possible. Spies have to be able to spy; but the powers they are given must be used in ways that are both proportionate and necessary.

Solvency – Executive

Presidential 'synopticon' influence and constrain executable surveillance decisions – empirics prove

Jack **Goldsmith 12**, Harvard Law School professor who has written extensively in the field of international law, civil procedure, cyber law, and national security law, 3/12/12, "Chapter Seven: The Presidential Synopticon," *Power and Constraint: The Accountable Presidency After 9/11*

The various forms of watching and checking the presidency described in this book constitute a vibrant presidential synopticon. Empowered by legal reform and technological change, the "many" - in the form of courts, members of Congress and their staff, human rights activists, journalists and their collaborators, and lawyers and watchdogs inside and outside the executive branch - constantly gaze on the "one," the presidency. Acting alone and in mutually reinforcing networks that crossed organizational boundaries, these institutions extracted and revealed information about the executive branch's conduct in war- sometimes to adversarial actors inside the government, and sometimes to the public. The revelations, in turn, forced the executive branch to account for its actions and enabled many institutions to influence its operations. The presidential synopticon also promoted responsible executive action merely through its broadening gaze. One consequence of a panopticon, in Foucault's words, is "to induce in the inmate a state of conscious and permanent visibility that assures the automatic functioning of power": The same thing has happened in reverse but to similar effect within the executive branch, where officials are much more careful merely by virtue of being watched. The presidential synopticon is in some respects not new. Victor Davis Hanson has argued that "war amid audit, scrutiny, and self-critique" has been a defining feature of the Western tradition for 2,500 years. From the founding of the nation, American war presidents have been subject to intense scrutiny and criticism in the unusually open society that has characterized the United States. And many of the accountability mechanisms described in this book have been growing since the 19705 in step with the modern presidency. What is new, however, is the scope and depth of these modern mechanisms, their intense legalization, and their robust operation during wartime. In previous major wars the President determined when, how, and where to surveil, target, detain, transfer, and interrogate enemy soldiers, often without public knowledge, and almost entirely without unwanted legal interference from within the executive branch itself or from the other branches of government. Today these decisions are known inside and outside the government to an unprecedented degree and are heavily regulated by laws and judicial decisions that are enforced daily by lawyers and critics inside and outside the presidency. Never before have Congress, the courts, and lawyers had such a say in day-to-day military activities; never before has the Commander in Chief been so influenced, and constrained, by law.

Inherency?

Current programs are insufficient for effective oversight

Timothy B. **Lee 15**, reporter at The Washington Post, 070215, "Obama says the NSA has had plenty of oversight. Here's why he's wrong," *The Washington Post*, http://www.washingtonpost.com/blogs/wonkblog/wp/2013/06/07/obama-says-the-nsa-has-had-plenty-of-oversight-heres-why-hes-wrong/

President Obama was in San Jose on Friday to talk about the Affordable Care Act. But he took the opportunity to try to calm the furor over new revelations that his administration is presiding over unprecedented surveillance of telephone and digital communications. "These programs were originally authorized by Congress," President Obama said. "They have been repeatedly authorized by Congress. Bipartisan majorities have

approved them. Congress is continually briefed on how these are conducted. There are a whole range of safeguards involved. And federal judges are overseeing the entire program throughout." Obama's comments make it sound like the programs are subject to rigorous and continuous oversight. But the simple fact that Congress is briefed and federal judges are involved doesn't mean either branch is actually able to serve as an effective check. The excessive secrecy surrounding these programs makes that unlikely. Take Congress. When the government has briefed members of Congress on its surveillance activities, it has often been in meetings where "aides were barred and note-taking was prohibited." It's impossible for Congress to provide effective oversight under those conditions. Members of Congress rely on staff to help them keep track of legislative details. They need independent experts to advise them on complex technical issues. And they need feedback from the constituents they ultimately represent. But the senators briefed on these programs couldn't speak about them. Sens. Ron Wyden (D-Ore.) and Mark Udall (D-Colo.) were reduced to spending years trying to hint at the existence of programs they weren't able to actually tell anyone about. Only now can anyone see what it is they were trying to tell us. Meanwhile, the 2008 FISA Amendments Act cut judges out of their traditional role of reviewing individual surveillance requests. Instead, it asks judges to approve broad categories of surveillance. The law gives judges little leeway to reject proposed surveillance programs, and in any event judges lack the expertise and resources to perform this quasi-legislative oversight role effectively. With both Congress and the courts effectively neutered, their traditional functions — defining the rules and making sure they're enforced — are now largely being performed inside the executive branch. In place of legal standards defined by Congress and enforced by an independent judge, we now have "minimization procedures" defined by some executive branch officials and applied by others. There's no opportunity for public debate about these rules and no independent oversight into whether the rules are being followed in individual cases. And there's ample evidence that letting the executive branch police itself is a recipe for abuse. Supporters of the NSA's programs generally make two arguments for the current arrangement. On the secrecy front, they argue that revealing details of the government's surveillance activities could tip off terrorists to the government's capabilities, making it harder to thwart attacks. On the judicial oversight front, they argue that individualized warrant requirements prevent the government from engaging in algorithmic surveillance. Neither argument is convincing. It's conceivable that secrecy about U.S. surveillance capabilities gave the U.S. government a fleeting advantage in the early years of this century, allowing them to intercept the communications of terrorists who didn't realize the extent of America's surveillance capabilities. But regardless, that advantage is now gone. For the foreseeable future, terrorists are going to assume that the U.S. government is monitoring all forms of electronic communications where doing so is technically feasible. It may be true that automated mass surveillance programs can uncover useful intelligence that couldn't be found using traditional law enforcement activities based on individualized search warrants. But even if that's true, it's not an argument for eliminating meaningful judicial oversight. Rather, it's an argument for developing new oversight methods that are more compatible with algorithmic surveillance techniques. For example, perhaps rather than requiring a warrant every time the government acquires information, the law should allow mass information collection but require judicial oversight before the government can query the database. The key principle is that there needs to be someone monitoring each investigation to ensure the rules are being followed. That person needs to have the authority to block information requests that don't comply with the law. And that person needs the independence that only members of the judicial branch enjoy. The broad parameters of America's domestic surveillance activities should be set by Congress, not the president. The FISA Amendments Act delegated way too much of this rule-making authority to the executive branch.

Current system of transparency and accountability is flawed – three reasons

Alan **Bulter 13**, Appellate Advocate Counsel, Electronic Privacy Information Center; J.D., UCLA School of Law; B.A., magna cum laude, Economics, Washington University in St. Louis, October 2013, “Standing Up to Clapper: How to Increase Transparency and Oversight of FISA Surveillance,” *New England Law Review*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2397949

As new details have emerged about the FBI and NSA's domestic intelligence-gathering practices, it has become clear that the current system does not provide enough transparency to ensure public oversight and

trust. n42 There are three main problems with the current system: the development of a secret body of constitutional and statutory law by the FISC, structural limitations on judicial review of FISA surveillance, and rules inhibiting Congress' ability to facilitate public oversight. As a result, important questions about the scope and nature of surveillance remain unanswered, and in many cases, there is not even enough information to know which questions to ask. Over the last decade, the FISC began developing a secret body of law governing FISA surveillance and addressing important constitutional and statutory issues that should be made public. n43 This shift occurred after the Government began to expand foreign intelligence surveillance beyond the [*64] scope of individualized FISA warrants. n44 With the enactment of the FAA, Congress introduced a new role for the FISC: approval of government surveillance programs based on general targeting and minimization procedures. n45 Under Section 702 of the FAA, the FISC judge reviewing the government application and procedures must determine whether the targeting and minimization procedures are "consistent with the requirements of [the statute] and with the Fourth Amendment." n46 As a result, the FISC now regularly assesses "broad constitutional questions" and establishes "important judicial precedents, with almost no public scrutiny." n47 The secrecy of these important opinions is a flaw in the system and prevents public oversight of developing national security law. Congress plays an important role in the intelligence oversight process as well, but its oversight of FISA activity authorized under Section 702 and Section 215 is severely limited by procedural rules imposed by the Department of Justice ("DOJ") and inadequate public reporting. The law requires that the Attorney General keep the Senate Select Committee on Intelligence, n48 the House Permanent Select Committee on Intelligence, n49 and the Senate Judiciary Committee "fully informed" concerning the Government's use of FISA. n50 However, reports sent from the DOJ to the [*65] House and Senate Intelligence Committees impose strict rules on the dissemination of the government's legal interpretation of these programs.n51 For example, the detailed reports on the use of Section 215 were only available in Intelligence Committee offices for a "limited time period," no photocopies or notes could be taken out of the room, and only certain congressional staff members were allowed to attend. n52 Similar rules likely apply to the Attorney General's reports on significant FISA legal interpretations n53 and the use of Section 702 authorities. n54 Public reports regarding the extent of FISA surveillance activity give a bare minimum of information, including only the number of applications for electronic surveillance, the number granted, modified, or denied, n55 and the same information regarding requests for orders compelling production of business records. n56 Unlike the Wiretap Reports issued by the Administrative Office of the U.S. Courts, which provide a comprehensive overview of the cost, duration, and effectiveness of surveillance in criminal investigations, n57 the FISA reports do not provide sufficient detail. n58 As a result, Members of Congress and the public do not have the information [*66] they need to evaluate the efficacy and legality of these programs. n59The problem of secret law is exacerbated by the limited judicial review of important constitutional and statutory issues related to modern FISA surveillance. As one former FISA judge recently noted, the role of judges is not to make policy, it is to "review policy determinations for compliance with statutory law" - but such review must be done in the context "of [the] adversarial process." n60 The FISA does not currently provide for adversarial hearings in the FISC, even when presented with complex and novel issues. n61 And unlike warrants and other ex parte orders issued in criminal cases, judicial review of FISA activity is not guaranteed in criminal prosecutions or other subsequent proceedings. n62 Even when the government provides notice of the use of FISA-derived evidence in criminal cases, it has not specified whether such surveillance was accomplished pursuant to Section 702 authorized directives. n63As a result, the traditional means of obtaining judicial review of the ultimate [*67] constitutional question regarding modern FISA surveillance is unavailable. The Supreme Court has also made it more difficult to assert a constitutional challenge in a civil case based on Section 702 activities. n64

Steps toward governmental openness are being taken now

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

In the Report by the Privacy and Civil Liberties Oversight Board of January 23, 2014, the Board stated that it would pursue a goal of greater transparency in part by describing "the Section 215 metadata program in a more comprehensive and accurate way than has been done anywhere else so far,"90 and by doing the same for the Section 702 program." 91 This goal is consistent with the harms narrative, first illuminating what the programs actually entail in order to set up the dialogue concerning the programs' constitutionality and propriety. This transparency likely would be further utilized by a significant intermediary in this context, the media. The media has the power to amplify and engage the material, providing additional notice to the public. The media also can spur the government to provide additional information if public pressure is brought to bear. While it might not be causally related to prior disclosures, in August 2013, the Office of the Director of National Intelligence designed a new public Website called, "IC on the Record."92 It is described on the Website as "created at the direction of the President of the United States. [It] provides immediate, ongoing and direct access to factual information related to the lawful foreign surveillance activities carried out by the U.S. Intelligence Community."93 In addition, the Privacy and Civil Liberties Oversight Board recommended that the FISA court release declassified versions of its decisions with minimal redactions.94 This not only adds to the completeness of the judicial process, but also provides a more open, illuminated connection to the public at large. The potential for openness does not simply apply to government action. When the government works with private companies, part of the arrangement has been for the private companies to not disclose their participation. Now, apparently, some Web companies will have a greater opportunity to disclose information about government requests for user data as well. 95 Lastly, other important revelations might emerge with greater transparency. While greater checks and balances might not yield the disclosure of international agreements, such as the one indicating the United States has been swapping data with other countries to obtain information it could not get directly, it might at least provide some deterrence from indiscriminate mass surveillance data without a justifying rationale. 96

Existing governmental positions ensure and maintain transparency

Steven **Friedland 15**, professor of law and senior scholar, 020715, "The Difference between Invisible and Visible Surveillance in a Mass Surveillance World," *Elon University Law Legal Studies Research Paper No. 2014-02*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2392489

The Fourth Amendment was enacted to avoid the specter of the general warrant, a tool used in colonial times to search and seize in a dragnet fashion.99 Indiscriminate mass surveillance parallels the general warrant, even if it is used in to assist the fight against terrorism. Such surveillance can become organic, deploying a wider net to meet such as broader justifications national interest instead of national security, as described above. In essence, the Fourth Amendment's requirement of particularity in warrants100 is the constitutional version of the minimization of harm doctrine. The concept of particularity is a powerful one when interposed against indiscriminate surveillance -- especially if the targets are not yet known or suspected of being involved in terroristic activity. Particularity offers a form of scientific inquiry that interposes relevancy, an

articulable justification for government intrusions. In the fall of 2013, the NSA announced the creation of a new full-time position, a Civil Liberties and Privacy Officer t.101 While his augmentation does not directly deal with the particularity requirement, on a broader level it embraces a parallel objective. The appointed individual would "serve as the primary advisor to the Director of NSA for ensuring that privacy is protected and civil liberties are maintained by all of NSA's missions, programs, policies and technologies."102 This new position, therefore, will likely involve evaluating surveillance programs using the Fourth Amendment reasonableness and particularity requirements, as well as statutory parameters.103

Transparency impedes CT efforts

Jack **Goldsmith 12**, Harvard Law School professor who has written extensively in the field of international law, civil procedure, cyber law, and national security law, 3/12/12, "Chapter Seven: The Presidential Synopticon," *Power and Constraint: The Accountable Presidency After 9/11*

The presidential synopticon's production of this information enabled the questioning, criticism, and pushback that produced the counterterrorism adjustments of the last decade. That is the happy side of informational transparency. But there are large downsides to transparency as well. Many authorized disclosures of government war operations – through FOIA, congressional reporting and hearings, habeas litigation, and more – contained information that was in some respects harmful to U.S. counterterrorism efforts. A prominent example is the FOIA release of CIA and justice Department documents concerning the interrogation and detention regime. CIA Director Leon Panetta and four previous CIA Directors opposed the release of the FOIA documents, and argued for more redactions in those that were released, on the grounds that their disclosure would describe to our enemies the outer limits to which America was willing to go in interrogation, would chill future CIA actions in reliance on justice Department legal opinions, and would erode the trust of U.S. foreign intelligence services that cooperated with the United States based on promises of secrecy. President Obama did not deny these costs in deciding to release classified documents. But he made a judgment that the costs were outweighed by the benefits from releasing them. When secret information comes out pursuant to authorized disclosures in this way the Congress in drafting the disclosure laws, the courts in enforcing them, and the executive branch in implementing them exercise an official judgment that weighs the costs of disclosure against the benefits. When secret information becomes public via the American news media – as it has so often in the past decade – it is media editors, and not the government, who weigh the costs and benefits of disclosure. We have seen that these editors sometimes decide against publication, as when the Washington Post's Leonard Downie Ir. chose not to disclose the location of the European prisons. This type of media self-censorship about U.S. national security operations happens more than is generally realized, and much more than with foreign media (like Al Jazeera or The Guardian) or WikiLeaks. Nonetheless, American journalists do not always exercise this responsibility intelligently or well, and their publications sometimes cause significant national security harm. Most editors and journalists say they will not publish a secret that "puts lives at concrete and immediate risk," as Time magazine's Barton Gellman puts it. This usually means they won't publish troop movements, the identities of secret agents, and other "operational intelligence." The norms against publication of this information have broken down over the last decade as elite media outlets have told us more than before about secret identities and operations, and as many new media outlets have chucked the norms altogether. Classified disclosures of this sort can literally destroy human intelligence assets. Intelligence officials rarely talk publicly about these matters for fear that they will make matters worse by revealing relationships and operations they would rather keep secret. But then-CIA Director Michael Hayden revealed a bit in a speech in Wye River, Maryland, in 2006. "When a covert CIA presence in a denied area was revealed in the media, two assets in the area were detained and executed," Hayden said, in a purposefully roundabout way so as not to make the problem worse. A similar "spate of stories cost five promising counterterrorism and counter proliferation assets, who feared we couldn't guarantee their security," he added."

Public disclosure of surveillance destroys US credibility and CT efforts

Jack **Goldsmith 12**, Harvard Law School professor who has written extensively in the field of international law, civil procedure, cyber law, and national security law, 3/12/12, “Chapter Seven: The Presidential Synopticon,” *Power and Constraint: The Accountable Presidency After 9/11*

Even when journalists decline to publish secrets they think will cause immediate harm, they still publish secrets that cause diffuse but no less real harms. Leonard Downie Ir. credited the White House argument that disclosing the prison locations would harm ongoing intelligence operations but not its claim that publishing the secret prisons story on the whole would harm future intelligence operations with foreign liaison services. "I focus on the main impact of the story, not speculative effects," Downie explains. "Lots of things go wrong in the intelligence business, and it is hard to say that something bad that happens following one of our stories was in fact caused by one of our stories, because it might have happened anyway."lZ This is a self-serving rationale. It is obvious that the publication of national security secrets has future effects on intelligence operations with foreign intelligence officers, human sources, and private firms, all of whom are – quite rationally – less likely to cooperate with a U.S. government that cannot credibly claim to keep its operations secret.5 These harms are no less real because they are hard to discern at the time of publication. The media's resistance to this point is ironic. Reporters fiercely protect their sources because they know that revelation of a source destroys the reporter's future credibility for keeping promises discourages new sources from coming forward. But they reject this logic when the government makes the same argument. There is perhaps no area where journalists underestimate the harms of publication more than government surveillance. The best example is the U.S. program of monitoring terrorist-related financial transfers in a global banking consortium known as the "Society for Worldwide Interbank Financial Telecommunication," or SWIFT. The classified SWIFT program was executed pursuant to an administrative subpoena, it violated no American privacy laws, and it was a straightforward exercise of powers that Congress had given the President. Nonetheless, the New York Times (and two other papers) disclosed it in June 2006, over the strong objections of Secretary of the Treasury John Snow. The Times did so after concluding that the harms from publication were "oblique at best," in the words of Eric Lichtblau, one of the story's authors. The SWIFT story bore "no resemblance to security breaches, like disclosures of troop locations, that would clearly compromise the immediate safety of specific individuals," claimed a Times editorial. Such discounting of the indirect harms from publication drives national security officials crazy. "My God," responded Michael Hayden. "Like it would be permissible to compromise the long-term safety of the masses, which is exactly what the SWIFT story did! The Times’ invocation of the troop movement analogy-the inevitable example journalists invoke – is outdated. "Most of us grew up in the Cold War when the enemy was big and powerful; he wasn't hard to find, he was just hard to stop," says Hayden. In the war against terrorists in networks, however, "the enemy frankly is easy to kill; he’s just very hard to find." Hayden says that it "misses the point" to view troop movements as the real secrets to be protected. "The real secrets now are things like the SWIFT program that allowed us to track terrorist financing and locate terrorists," he notes, adding that undercutting the government's ability to track terrorists in programs like SWIFT "will just as surely lead to the deaths of Americans."

What, then, is surveillance? Scholars working throughout the English-speaking academy have produced a thick descriptive literature examining the nature, causes, and implications of the age of surveillance,° Working under the umbrella term of "surveillance studies," these scholars represent both the social sciences and humanities, with sociologists making many of the most significant contributions' Reviewing the vast surveillance studies literature, Professor David Lyon concludes that surveillance is primarily about power, but it is also about personhood." Lyon offers a definition of surveillance as "the focused, systematic and routine attention to personal details for purposes of influence, management, protection or direction."° Four aspects of this definition are noteworthy, as they expand our understanding of what surveillance is and what its purposes are. First, it is focused on learning information about individuals. Second, surveillance is systematic; it is intentional rather than random or arbitrary. Third, surveillance is routine - a part of the ordinary administrative apparatus that characterizes modem societies. '° Fourth, surveillance can have a wide variety of purposes - rarely totalitarian domination, but more typically subtler forms of influence or control."

Mass surveillance doesn't stop terrorist attacks

Schneier, Chief Technology Officer of Resilient Systems, 15

Bruce, fellow at Harvard's Berkman Center, and a board member of EFF, "This Security Expert Reckons Mass Surveillance Doesn't Stop Terror Attacks", June 26th, 2015, https://www.schneier.com/news/archives/2015/06/this_security_expert.html

Today's terrorist attack in the Rhône-Alpes region of France, involving the decapitation of a man, has been met with widespread horror and condemnation. So have those in Tunisia, killing 28, and another in Kuwait killing 25. These horrific events are sure to fuel discussion about how to stop this kind of atrocity happening again.¶ Following January's Charlie Hebdo attacks in Paris, the French government decided to expedite a new surveillance law. Two days ago, on Wednesday 24th of June, French officials at the National Assembly gave the green light to that new law. France's new surveillance law has already been compared to the late American Patriot Act—an American anti-terrorism act passed after 9/11 which was criticised for its wide-sweeping powers that meant it was used against non-terrorists.¶ Such civil liberties concerns will be felt less acutely today. The argument that it was poor intelligence and surveillance that **enabled terrorists to carry out the attack** at the gas factory in Saint-Quentin-Fallavier have started circulating on French social media.¶ Back in March, we spoke to Bruce Schneier—an American cryptographer specialising in computer security. In his latest bestseller, Data and Goliath, Schneier makes the argument that—civil liberties implications aside—**mass surveillance can't stop terrorist**

attacks. The interview takes on a renewed significance in the light of today's events.¶ VICE: The NSA uses the metaphor "connecting the dots" to justify its surveillance activities. However the US government actually struggles to ever connect those dots. Why is that?¶ Bruce Schneier: **There is too much external noise when you do mass surveillance**. The problem is that "connecting the dots" is neither the right method nor the right metaphor. When you look at a child's colouring book, connecting the dots is very easy because they are all visible—they are all on the same page and they have numbers written on them. All you have to do is move the lead of your pencil across your page, from one dot to the other, and there you go—the drawing is done.¶ In reality, those "dots" can only be seen and connected after things have occurred—so after each terrorist attack, if you want. When you look, it's easy to make the link between, say, an information request coming from Russia, a visit abroad, and other potential information gathered elsewhere. So with hindsight, we know who the terrorists are. That's why we're able to chase after them, **but not stop them**. Before an event occurs, there is an extremely huge number of potential "human dangers," and an even greater number of possible scenarios. There are so many variables to take into account that it's impossible to rely on a single potential course of events.¶ You're saying that mass surveillance cannot really stop terrorist attacks in the US. Would you say the same for France?¶ Mass surveillance is unreliable for statistical reasons, not for cultural or linguistic reasons. That analysis is valid for all countries, including France.

Dan **Froomkin 4/27**, reporter, columnist, and editor with a focus on coverage of U.S. politics and media, a nearly three-decade long career in journalism, "WHISTLEBLOWERS BACK 'SURVEILLANCE STATE REPEAL ACT'," 4/27/15, https://firstlook.org/theintercept/2015/04/27/whistleblowers-back-surveillance-state-repeal-act/

Now, Drake said, he is throwing his weight behind H.R. 1466, the Surveillance State Repeal Act.¶ The bill would completely repeal the 2001 PATRIOT Act (which the NSA cites as the legal basis for its bulk phone metadata collection), repeal the FISA Amendments Act (which ostensibly legitimizes Internet spying) and otherwise protect people's privacy.¶ It's a bipartisan but dark-horse legislative gambit that Reps. Mark Pocan, D-Wisc., and Thomas Massie, R-Ky., have thrown into the mix as Congress debates over the next few weeks what to do before three key provisions of the PATRIOT Act expire — including the one used for bulk metadata.¶ All seven whistleblowers on the panel sponsored by the pro-accountability group ExposeFacts.org – including Pentagon Papers leaker Daniel Ellsberg, NSA whistleblowers William Binney and J. Kirk Wiebe, and former FBI agent Coleen Rowley – said they backed the bill.¶ Other legislative proposals, coming nearly two years after former NSA contractor Edward Snowden informed the world about the extent of NSA surveillance, call for considerably more minor reforms – if any at all.

A bipartisan bill introduced in Congress Tuesday would end government spying on ordinary Americans by repealing the Patriot Act as advocates rush to reauthorize the law's most controversial provisions before a June deadline.¶ The Surveillance State Repeal Act, introduced by Reps. Mark Pocan (D-Wis.) and Thomas Massie (R-Ky.), would overturn the 2001 Patriot Act that allowed for mass government surveillance in the name of anti-terrorism and the destruction of any information collected under it. The bill also would repeal the 2008 FISA Amendments Act, which allows Internet spying, and would stop the government from forcing tech manufacturers to compromise encryption or privacy features to allow spying on their devices. Whistleblowers like Edward Snowden, who exposed the National Security Agency's mass surveillance in 2013, would have additional protections.¶ "Revelations about the NSA's programs reveal the extraordinary extent to which the program has invaded Americans' privacy," Pocan said in a press release. "I reject the notion that we must sacrifice liberty for security -- we can live in a secure nation which also upholds a strong commitment to civil liberties. This legislation ends the NSA's dragnet surveillance practices, while putting provisions in place to protect the privacy of American citizens through real and lasting change."

The NSA programs, and media coverage of them, have further impacted bi and¶ multi-lateral trade negotiations, undermining U.S. economic security.¶ Consider two of the most important talks currently underway: the Transatlantic¶ Trade and Investment Partnership (TTIP) and the Trans-Pacific Partnership (TPP).¶ TTIP is a trade and investment negotiation that is being conducted between the European Commission and the United States. The purpose of the agreement is to create better trade relations between the two regions, enabling companies on both¶ sides of the Atlantic to thrive. The revelations about NSA activities have had a profound impact on the negotiations. In March 2014 the European Parliament passed a resolution noting "the impact of mass surveillance." It stated, "the revelations based on documents leaked by¶ former NSA contractor Edward Snowden put political leaders under the obligation to address the challenges of overseeing and controlling intelligence agencies in surveillance activities and assessing the impact of their activities on fundamental rights and the rule of law in a democratic society." 39 It recognized that the programs had undermined "trust between the EU and the US as transatlantic

partners." Not least were concerns that the information could be used for "economic and industrial espionage"—and not merely for the purpose of heading off potentially violent threats. Parliament strongly emphasized, "given the importance of the digital economy in the relationship and in the cause of rebuilding EU-US trust," that its "consent to the final TTIP agreement could be endangered as long as the blanket mass surveillance activities and the interception of communications in EU institutions and diplomatic representations are not completely abandoned and an adequate solution is found for the data privacy rights of EU citizens." The resolution underscored that any agreement to TTIP would hinge on the protection of the data privacy rights as reflected in the protection of fundamental rights in the EU Charter.40 Even if the surveillance programs do not entirely derail TTIP, they have the potential to significantly retard negotiations.41 Much is at stake. The Center for Economic Policy Research in London, for instance, estimates that a successful TTIP could improve U.S. workers' wages, provide new jobs, and increase the country's GDP by $100 billion per year. 42 Another study, conducted by the Bertelsmann Foundation, suggests that TTIP "could increase GDP per capita in the United States by 13 percent over the long term."43 To the extent that the programs weaken the U.S. position in the negotiations, the impact could be significant.44 Although the United States Trade Representative is trying to counter the political fallout from the NSA debacle by putting local data protection initiatives on the table in the TTIP negotiations, the EU has steadfastly resisted any expansion into this realm. TPP, in turn, is a trade agreement that the United States is negotiating with 11 countries in the Asia-Pacific region (Australia, Brunei Darussalam, Canada, Chile, Japan, Malaysia, Mexico, New Zealand, Peru, Singapore, and Vietnam). TPP (with participation of Japan), accounts for nearly 40% of global GDP, about 1/3 of world trade. Two of the United States' objectives in these negotiations are directly implicated by the Snowden releases: e-commerce / telecommunications, and intellectual property rights. The NSA programs relate to a number of categories under e-commerce—such as rules preventing discrimination based on the country of origin, and efforts to construct a single, global Internet. Nevertheless, as discussed below, some of the countries involved in TPP have already adopted data localization laws. The NSA programs have thus weakened the United States' negotiation position in these discussions, by making it more difficult to reach agreement in key areas. In addition to e-commerce considerations, as part of the TPP negotiations, the United States has prioritized intellectual property rights. Some 40 million American jobs are directly or indirectly tied to "IP-intensive" industries. These jobs tend to be high-paying and stimulate approximately 60% of U.S. merchandise exports, as well as a significant portion of services. Efforts to make progress in TPP by developing stronger protections for patents, trademarks copyrights, and trade secrets—including safeguards against cyber theft of trade secrets—is made more perilous by the existence of the NSA programs.

No link - Plan creates bipartisan coalitions

Sara **Sorcher 15**, Staff writer at Christian Science Monitor, 6/8/15, "NSA surveillance debate gives rise to bipartisan Civil Liberties Coalition," ebscohost

While the fight over Section 215 aired deep divisions in Congress over surveillance practices, behind the scenes, an unusual alliance that brought together far-left Democrats and conservative Republicans had been fighting hard against a clean reauthorization of the Patriot Act and in favor of surveillance reforms. Now, that coalition is celebrating the Patriot Act's brief expiration as its first major victory – in what the group pledges will be a much longer

fight to protect civil liberties in the face of what it considers to be excessive government surveillance.

"It's a real game changer," says Becky Bond, political director of progressive activist organization Credo Action. "We found ourselves aligned fighting for the full repeal of the Patriot Act. Since we don't align on many other issues, the mission was very focused."

The loose-knit network, dubbed the Civil Liberties Coalition, spanned all corners of the political spectrum and united groups such as Credo and conservative advocacy group FreedomWorks that are usually at odds on other hot political issues. Its diversity is a rarity in Washington as it was focused on a single issue – ending mass surveillance – while at the same time not seeking the limelight media attention. Some members are even reluctant to be publicly affiliated with each other because they have such polar opposite views on issue such as health care and economic policy.

"Alone, libertarians nor progressives have not been able to make much headway," says Ms. Bond. Now, she adds, "there's a recognition that progressive and libertarians coming together can form a very powerful counterweight to the White House, security agencies, and even leadership in Congress when we line up. We have some power, where people felt really powerless before."

Government surveillance proved to be a common enemy that transcends traditional political ideologies, adds Josh Withrow, legislative affairs manager at FreedomWorks.

"Regardless of what you think about social welfare, spending policy, and the national debt, everybody is affected pretty much the same way when the government starts collecting records and surveilling you and violating that essential right to privacy that I think most Americans agree is a natural and constitutional right," Mr. Withrow says.

Two years ago this month, a 29-year-old government contractor named Edward Snowden became the Daniel Ellsberg of his generation, delivering to journalists a tranche of secret documents shedding light on the government's national security apparatus. But whereas Ellsberg released the Pentagon Papers detailing one specific military conflict in Southeast Asia, Snowden released details of the U.S. government's sprawling surveillance machine that operates around the globe.

On the second anniversary of Snowden's historic act of civil disobedience, it is worth reviewing what has changed—and what has not.

On the change side of the ledger, there is the politics of surveillance. For much of the early 2000s, politicians of both parties competed with one another to show who would be a bigger booster of the NSA's operations, fearing that any focus on civil liberties risked their being branded soft on terrorism. Since Snowden, though, the political paradigm has dramatically shifted.

The most illustrative proof that came last month, when the U.S. Senate failed to muster enough votes to reauthorize the law that aims to allow the NSA to engage in mass surveillance. Kentucky Republican Sen. Rand Paul's prominent role in that episode underscored the political shift—a decade after the GOP mastered the art of citing 9/11-themed arguments about terrorism to win elections, one of the party's top presidential candidates proudly led the fight against one of the key legislative initiatives of the so-called war on terror.

There has also been a shift in public opinion, as evidenced by a new ACLU-sponsored poll showing that almost two thirds of American voters want Congress to curtail the NSA's mass surveillance powers. The survey showed that majorities in both parties oppose renewing the old Patriot Act.

The perm solves – subjectivity and social shaping are not mutually exclusive

Julie E. **Cohen 12**, associate professor of law at Georgetown University, 11/20/12, "What Privacy is For," http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2175406

The goal of this synthesis is not, as some might have it, an illiberal model of selfhood. 15 That mode of reasoning—"if not liberal, then illiberal"—is not unusual, but it is unproductive. It is a product of the reflexive distancing too often practiced by members of different academic tribes rather than of any ineluctable reality. **Selfhood and social shaping are not mutually exclusive.** Subjectivity—and hence selfhood—exists in the gap between the experience of autonomous selfhood and the reality of social shaping. **It is real in the only way that counts**; we experience ourselves as having identities that are more or less fixed. But it is also malleable and emergent and embodied, and if we are honest that too accords with experience. Although reluctant to grapple directly with the social construction of subjectivity, important contemporary privacy theorists working within the liberal tradition emphasize the importance of contexts, spaces, bodies, and relationships for a theory of privacy. 16 This suggests a tacit acknowledgment of the need for a postliberal theory of selfhood—one capacious enough to accommodate the full spectrum of relational, emergent subjectivity.

Privacy is a necessary pre-requisite to obtaining critical subjectivity – the perm is the only way to solve the mindset of the critique

Julie E. **Cohen 12**, associate professor of law at Georgetown University, 11/20/12, "What Privacy is For," http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2175406

I call this vision of selfhood a postliberal one because its relationship to liberalism requires something more difficult and much more productive than antagonism: a realistic appraisal of the liberal model's undeniable faults and equally undeniable virtues. Liberal selfhood has an important role to play within privacy theory, but that role is different than the one that most privacy scholars have assumed. The liberal self is an aspiration—an idealized model of identity formation that can be approached only incompletely, if at all. This does not mean that all of its attributes are equally attractive and worth pursuing. Certain features of liberal selfhood have been roundly and justifiably critiqued, most notably its abstraction from embodied reality and its independence from relational ties.18 But others—most notably the liberal self's capacity for **critical independence** of thought and judgment, **its commitments to self-actualization** and reason, and its aspiration to cosmopolitanism19—are essential tools for identifying and pursuing the material and political conditions for self-fulfillment and more broadly for human flourishing.

But here we must come back to privacy, for the **development of critical subjectivity is a realistic goal only to the extent that privacy comes into play**. Subjectivity is a function of the interplay between emergent selfhood and

social shaping; privacy, which inheres in the interstices of social shaping, is what permits that interplay to occur. Privacy is not a fixed condition that can be distilled to an essential core, but rather "an interest in breathing room to engage in socially situated practices of boundary management."20 It enables situated subjects to navigate within preexisting cultural and social matrices, creating spaces for the play and the work of self-making.

And once this point is established, privacy's dynamism becomes clear. **Lack of privacy means reduced scope for self-making**—along the lines of the liberal ideal, or along other lines. Privacy does not negate social shaping. "In a world with effective boundary management, however, there is play in the joints, and that is better than the alternative. . . . Privacy's goal, simply put, is to ensure that the development of subjectivity and the development of communal values do not proceed in lockstep."21 Privacy will not always produce expressions of subjectivity that have social value, and here I mean expressly to leave open the question whether there might be particular types of privacy claims that do not merit protection or even respect.22 Even so, privacy is one of the resources that situated subjects require to flourish.

Through destruction of freedom and privacy, people will not be able to realize the alternative

Julie E. **Cohen 12**, associate professor of law at Georgetown University, 11/20/12, "What Privacy is For," http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2175406

If, as I have argued, the capacity for critical subjectivity shrinks in conditions of diminished privacy, what happens to the capacity for democratic self-government? Conditions of diminished privacy shrink the latter capacity as well, because they impair both the capacity and the scope for the practice of citizenship. But a liberal democratic society cannot sustain itself without citizens who possess the capacity for democratic self-government. **A society that permits the unchecked ascendancy of surveillance infrastructures cannot hope to remain a liberal democracy.** Under such conditions, liberal democracy as a form of government is replaced, gradually but surely, by a different form of government that I will call modulated democracy because it relies on a form of surveillance that operates by modulation. Modulation and modulated democracy emerge as networked surveillance technologies take root within democratic societies characterized by advanced systems of informational capitalism. Citizens within modulated democracies—citizens who are subject to pervasively distributed surveillance and modulation by powerful commercial and political interests—increasingly will lack the capacity to form and pursue meaningful agendas for human flourishing.

American surveillance is necessarily rooted in the fear of alterity – the plan is a proactive step against the fundamental tools of security – the perm is necessary

Rahul **Sagar 15,** Associate professor of political science at Yale and Global Ethics Fellow at the Carnegie Councl, 6/12/15, "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics and International Affairs, Volume 29 Issue 02, pp 145-159

Before analyzing the benefits and costs of communications surveillance, I want to address some common misperceptions relating to its history, rationale, and efficacy. The first misperception is that communications surveillance is a new phenomenon. In reality it has a long history. Prior to the nineteenth century, communication pivoted around the horse and rider (and the roads on which they traversed) and around boats (and the ports at which their voyages began and ended). From the tenth century BCE through to the fifteenth century CE these modes of communication were subject to rudimentary forms of surveillance: messengers were intercepted and bags were opened; ports were embargoed and ships were searched. This pattern changed as European states, increasingly administered by professionals and reliably funded by taxes, took shape. This is when we first hear of "spymasters" like John Thurloe, secretary to the English Commonwealth's Council of State, who established in 1653 a Secret Office that opened, copied, and resealed suspicious letters over the course of a night. The innovation was adopted by the Stuarts and then expanded by the Hanoverians, making it one of the first organizations dedicated to communications surveillance.

America's revolutionaries were aware of such European practices, which Congress's Committee of Secret Correspondence copied. Nonetheless, removed from European rivalries, post-Revolutionary America had little incentive to establish a surveillance apparatus. In the absence of enduring threats, the organizations created to "tap" telegraphs during the Civil War and the Spanish-American War proved short lived. It was only in the early twentieth century—when technology shrank distance and foreign entanglements grew—that the need for consistent surveillance began to be felt. Fears of German subversion provided an early impetus. The frenetic negotiations following World War I provided an opening for the "Black Chamber," the first American peacetime organization focused on intercepting diplomatic communications. A decade later came the NSA's forerunner, the Signals Intelligence Service, whose code-breaking efforts played a vital role in World War II. With Pearl Harbor still on their minds, America's post–World War II leadership resolved to build a permanent intelligence apparatus. The looming confrontation with the Soviet Union provided the immediate spur, but the decision responded to longer-term pressures emanating from a deepening involvement in international politics.

Explanation

What is in this file?

I encourage you to start by looking at the aff file. Each of the sections is just an answer to a part of the aff. So, if the aff makes an argument, this is your prepared responses to each of those arguments.

This file is useful for putting together your 1nc and then 2nc/1nr's to answer the affirmative's case for change. Each of the sections includes a 1nc and extensions that are specific to the 1nc arguments.

Solvency – this is a set of arguments that contest whether the aff is able to 'solve' the general issue of domestic surveillance.

Secrecy – answers to the secrecy advantage – with a focus on the claim that the government having secrets isn't inherently bad.

Democracy – answers to the democracy advantage. The first 1nc is similar to every other 1nc in this file. The second 1nc labeled "1nc democracy causes war" is an impact turn. It just argues that democracies are more likely to start conflicts.

Rights – answers to the rights advantage – with a focus on the argument that rights aren't absolute.

Internet Freedom – answers to the internet freedom advantage. These answers are the most interesting because you have to be careful which ones you make IF you are also reading the Internet nationalization good disadvantage.

How do I use this file?

A. Construct your 1nc by pulling the blocks labeled "1nc -____" for each relevant part of the 1ac. You should always read the solvency file since all affs should claim to 'solve'. Additionally, you would ONLY read the 1nc's that answer the advantages the aff chooses to read. So, if the aff reads the rights and secrecy advantages then you should read 1nc – Solvency, 1nc – Rights, and 1nc – Secrecy to answer each part of that 1ac in your 1nc.

B. You should notice this symbol (___) throughout the file and particularly in the 1ncs. That means that you should write up your own argument, without evidence, to answer the 1ac. Creativity and well stated arguments are encouraged. Often the biggest 'flaw' in 1ac advantages is NOT something that requires evidence. Instead, it is something you should take the time to point out during your speech. Whenever you see (___) I encourage you to write out an argument to add to your blocks.

1. Legal regulation can't stop surveillance – it's too technical and laws aren't enforced

Assange et. al, 12 (Julian, editor-in-chief of WikiLeaks. Andy Muller-Maguhn, specialist on computers, telecommunications, and surveillance. Jacob Appelbaum, computer security researcher. Jeremie Zimmerman, co-founder and spokesperson for the citizen advocacy group La Quadrature du Net. Conversation in the book "Cypherpunks: Freedom and the Future of the Internet," chapter titled "The Militarization of Cyberspace")

JÉRÉMIE: So now **it's a fact that technology enables total surveillance of every communication. Then there is the other side of that coin, which is what we do with it.** We could admit that for what you call tactical surveillance there are some legitimate uses— investigators investigating bad guys and networks of bad guys and so on may need, under the supervision of the judicial authority, to be able to use such tools— but the question is where to draw the line for this judicial supervision, where to draw the line for the control that the citizens can have over the use of those technologies. This is a policy issue. **When we get to those policy issues you have politicians that are asked to just sign something and don't understand the underlying technology**, and I think that we as citizens have a role, not only to explain how the technology functions at large, including to politicians, but also to wade in to the political debates that surround the use of those technologies. I know that in Germany there was a massive movement against generalized data retention that led to the overturn of the Data Retention law in front of the constitutional court. 46 **There is a debate going on in the EU about revising the Data Retention Directive.** 47 ANDY: **You are describing the theory of the democratic state which, of course, does need to filter out some bad guys here and there** and listen to their phone calls on the basis of a court decision with overview to make sure it is done in the proper way. **The trouble with that is that the authorities need to act in compliance with the law. If they don't do that then what are they good for? Especially with this strategic approach, democratic states** within Europe **are massively buying machines that allow them to act exactly outside the law in regard to interception because they don't need a court decision, they can just switch it on and do it, and this technology can't be controlled**. JULIAN: But are there two approaches to dealing with mass state surveillance: the laws of physics; and the laws of man? One is to use the laws of physics by actually building devices that prevent interception. The other is to enact democratic controls through the law to make sure people must have warrants and so on and to try to gain some regulatory accountability. But **strategic interception cannot** be a part of that, cannot **be meaningfully constrained by regulation. Strategic interception is about intercepting everyone regardless of whether they are innocent or guilty.** We must remember that **it is the core of the Establishment carrying such surveillance. There will always be a lack of political will to expose state spying. And the technology is inherently so complex, and its use in practice so secret that there cannot be meaningful democratic oversight**. ANDY: Or you spy on your own parliament. JULIAN: But those are excuses— the mafia and foreign intelligence— they are excuses that people will accept to erect such a system. JACOB: The Four Horsemen of the Info-pocalypse: child pornography, terrorism, money laundering, and The War on Some Drugs. JULIAN: **Once you have erected this surveillance, given that it is complex, given that it is designed to operate in secret, isn't it true that it cannot be regulated with policy?** I think that **except for very small nations like Iceland**, unless there are revolutionary conditions **it is simply not possible to control mass interception with legislation and policy. It is just not going to happen. It is too cheap and too easy to get around political accountability and to actually perform interception**. The Swedes got through an interception bill in 2008, known as the FRA-lagen which meant the Swedish signals intelligence agency the FRA could legally intercept all communication travelling through the country in bulk, and ship it off to the United States, with some caveats. 48 Now how can you enforce those caveats once you've set up the interception

system and the organization doing it is a secret spy agency? It's impossible. And in fact cases have come out showing that the FRA had on a variety of occasions broken the law previously. Many countries simply do it off-law with no legislative cover at all. So we're sort of lucky if, like in the Swedish example, they decided that for their own protection from prosecution they want to go legal by changing the law. And that's the case for most countries— there is bulk interception occurring, and when there is a legislative proposal it is to protect the ass of those who are doing it. This technology is very complex; for example in the debate in Australia and the UK about proposed legislation to intercept all metadata, most people do not understand the value of metadata or even the word itself. 49 Intercepting all metadata means you have to build a system that physically intercepts all data and then throws everything but the metadata away. But such a system cannot be trusted. **There's no way to determine whether it is in fact intercepting and storing all data without having highly skilled engineers with authorization to go in and check out precisely what is going on, and there's no political will to grant access. The problem is getting worse because complexity and secrecy are a toxic mix. Hidden by complexity. Hidden by secrecy. Unaccountability is built-in. It is a feature. It is dangerous by design.**

2. (___)

3. Mass collection of private information is inevitable and doesn't cause material harm

Posner, 13 (Eric, professor at the University of Chicago Law School, is the co-author of "Terror in the Balance" and "The Executive Unbound." "Is the N.S.A. Surveillance Threat Real or Imagined?" 6-9-13. http://www.nytimes.com/roomfordebate/2013/06/09/is-the-nsa-surveillance-threat-real-or-imagined)

Jameel, I don't see the need for systemic reform, nor do I see an offense to the Constitution. Indeed, **I don't even understand the nature of the objection to the National Security Agency programs. Exactly what harm did they cause?** Two possibilities emerge from the current public discussion.

1. A general sense of creepiness that government officials know when we make phone calls, and for how long, or may even be reading our e-mail messages. Government should not look over our shoulders as we conduct our lives.

2. A fear that the government uses this information to undermine democracy — to blackmail, harass or embarrass critics, for example.

The first objection strikes me as weak. **We already give the government an enormous amount of information about our lives, and seem to have gotten used to the idea that an Internal Revenue Service knows our finances, or that an employee of a government hospital knows our medical history, or that social workers (if we are on welfare) know our relationships with family members, or that public school teachers know about our children's abilities and personalities. The information vacuumed up by the N.S.A. was already available to faceless bureaucrats in phone and Internet companies — not government employees, but strangers just the same. Many people write as though we make some great sacrifice by disclosing private information to others, but it is in fact simply the way that we obtain services we want** — whether the market services of doctors, insurance companies, Internet service providers, employers, therapists and the rest, or the nonmarket services of the government like welfare and security.

Even so, I am exaggerating the nature of the intrusion. **The chance that human beings in government will actually read our e-mails or check our phone records is infinitesimal** (though I can understand that organizations like the A.C.L.U. that have a legitimate interest in communicating with potential government targets may be more vulnerable than the rest of us). **Mostly all we are doing is making our information available to a computer algorithm, which is unlikely to laugh at our infirmities or gossip about our relationships.**

The second objection is a lot more serious. We know that our government is capable of misusing information in this way, as occurred during the Nixon administration. Many people seem to believe that President Obama sent telepathic signals to I.R.S. workers

instructing them to harass Tea Party organizations. But **I am unaware — and correct me if I am wrong — of a single instance during the last 12 years of war-on-terror-related surveillance in which the government used information obtained for security purposes to target a political opponent, dissenter or critic. That means that, for now, this objection is strictly theoretical, and the mere potential for abuse can't by itself be a good reason to shut down a program. If it were, we would have no government.**

Ext 1 - FISA will rubberstamp

FISA will interpret the aff in the broadest possible way to allow spying to continue – intelligence agencies are functionally unconstrained by rule of law

Granick, 13 (Jennifer, Director of Civil Liberties at the Stanford Center for Internet and Society. "NSA's Creative Interpretations Of Law Subvert Congress And The Rule Of Law" 12-16-13. Forbes. http://www.forbes.com/sites/jennifergranick/2013/12/16/a-common-law-coup-detat-how-nsas-creative-interpretations-of-law-subvert-the-rule-of-law/)

In the wake of today's tremendously important ruling by the District Court for the District of Columbia that bulk collection of telephone metadata violates the Fourth Amendment, it is more important than ever that Congress end this misuse of section 215 of the USA PATRIOT Act. However, **Deputy Attorney General James Cole testified earlier this week before the Senate Judiciary Committee that the NSA might continue its bulk collection of nearly all domestic phone call records, even if the USA FREEDOM ACT passes into law. That must have come as a real surprise to** committee chairman Senator Patrick Leahy (D-VT) and the dozens of **USA FREEDOM Act's bipartisan co-sponsors, all of whom agree that the core purpose of the bill is to end NSA dragnet collection of Americans' communication data.**

Cole noted the reform legislation wouldn't necessarily inhibit the NSA's surveillance capabilities because "it's going to depend on how the court interprets any number of the provisions that are in [the legislation]." Comments like this betray a serious problem inside the Executive Branch. The Administration and the intelligence community believe they can do whatever they want, regardless of the laws Congress passes, so long they can convince one of the judges appointed to the secretive Foreign Intelligence Surveillance Court (FISC) to agree. This isn't the rule of law. This is a coup d'etat.

Leahy's proposed legislation would amend section 215 of the USA PATRIOT Act to require the government to show the records it seeks are not only relevant but also material to an authorized investigation and that the target has some connection to terrorism or espionage before it can obtain those records. This latter requirement, the USA FREEDOM Act sponsors say, will "end bulk collection".

Cole apparently disagrees. Responding to a question at yesterday's hearing on the bill, **Cole said, "Right now the interpretation of the word 'relevant' is a broad interpretation.** Adding 'pertinent to a foreign agent' or 'somebody in contact with a foreign agent' could be another way of talking about relevance as it is right now. We'd have to see how broadly the court interprets that or how narrowly." **In other words, the FISA court might let us keep doing what we're doing no matter what the law says and despite Congress' intent .**

All courts issue opinions about what the laws that legislatures pass mean. These opinions are called the "common law". But common law interpretations of statutes are only legitimate if they are fair and reasonable interpretations.

The NSA has a great track record getting FISC judges to interpret even obviously narrow phrases in surprisingly broad ways. For example, **Americans, including the Patriot Act's main sponsor** Representative Jim Sensenbrenner (R-WI) and a co-sponsor of the USA Freedom Act**, were shocked to learn last June that the NSA used Section 215 for bulk collection of phone data (and potentially other sensitive records)**. Sensenbrenner said, "[i]f Congress knew what the NSA had in mind in the future immediately after 9/11, the Patriot Act never would have passed, and I never would have supported it."

The 2004 FISC opinion authorizing the NSA's collection and use of Internet metadata under the pen register statute is another dismaying example of this phenomenon. In this opinion, Judge Colleen Kollar-Kotelly acknowledged that she was allowing an "exceptionally broad" and "novel" form of collection, but nevertheless deferred to "the fully considered judgment of the executive branch in assessing and responding to national security threats and in determining the potential significance of intelligence-related information." This opinion—called "strange" and a "head-scratcher"—later served as precedent upon which FISA Judge Claire Eagan relied in her 2006 authorization of the bulk phone records collection.

Time and again, the FISC accepts the Administration's shockingly flimsy arguments. As a set, the few public FISC opinions we've seen suggest that the Executive Branch—in cahoots with a few selected judges—has replaced legitimate public statutes with secret, illegitimate common law.

The rule of law is a basic democratic principle meaning that all members of a society—individuals, organizations, and government officials—must obey publicly disclosed legal codes and processes**. If Cole is right that, try as it might, Congress cannot end bulk collection because the secret FISA court may defer to the NSA's interpretation of the rules, there is no rule of law. The NSA is in charge, the FISA court process is just a fig leaf**, and this is no longer a democracy. There's been a coup d'etat.

Ext 3 – Inevitable

Facebook and Google engage in mass surveillance – plan doesn't effect that

Assange et. al, 12 (Julian, editor-in-chief of WikiLeaks. Andy Muller-Maguhn, specialist on computers, telecommunications, and surveillance. Jacob Appelbaum, computer security researcher. Jeremie Zimmerman, co-founder and spokesperson for the citizen advocacy group La Quadrature du Net. Conversation in the book "Cypherpunks: Freedom and the Future of the Internet," chapter titled "Private Sector Spying")

JÉRÉMIE: **State-sponsored surveillance is indeed a major issue** which challenges the very structure of all democracies and the way they function, **but there is also private surveillance and potentially private mass collection of data. Just look at Google. If you're a standard Google user Google knows who you're communicating with, who you know, what you're researching, potentially your sexual orientation, and your religious and philosophical beliefs**. ANDY: **It knows more about you than you know yourself.** JÉRÉMIE: More than your mother and maybe more than yourself. Google knows when you're online and when you're not. ANDY: **Do you know what you looked for two years, three days and four hours ago? You don't know; Google knows.** JÉRÉMIE: Actually, I try not to use Google anymore for these very reasons. JACOB: It's like the Kill Your Television of the 21st century. 55 Effective protest except the network effect prevents your protest from working. 56 Kill your television, man. JÉRÉMIE: Well it's not a protest, it is more my personal way of seeing things. ANDY: I watched these beautiful movies of people throwing their televisions out of three-storey houses. JÉRÉMIE: It's not only the state-sponsored surveillance, it's the question of privacy, the way data is being handled by third parties and the knowledge that people have of what is being done with the data. I don't use Facebook so I don't know much about it. But now **with**

Facebook you see the behavior of users who are very happy to hand out any kind of personal data, and can you blame people for not knowing where the limit is between privacy and publicity? A few years ago, before digital technologies, people who had a public life were either in show-business, politics or journalism, and now everybody has the potential for public life by clicking a publish button. "Publish" means make something public, it means handing out access to this data to the rest of the world— and, of course, **when you see teenagers sending pictures of themselves drunk or whatever, they may not have this vision that it means the whole of the rest of the world, potentially for a very, very long period of time. Facebook makes its business by blurring this line between privacy, friends, and publicity. And it is even storing the data when you think that it is only meant for your friends and the people you love. So whatever the degree of publicity that you intend your data to be under, when you click publish on Facebook you give it to Facebook first**, and then they give access to some other Facebook users after. JULIAN: Even this line between government and corporation is blurred. If you look at the expansion in the military contractor sector in the West over the past ten years, the NSA, which was the biggest spy agency in the world, had ten primary contractors on its books that it worked with. Two years ago it had over 1,000. So there is a smearing out of the border between what is government and what is the private sector. JÉRÉMIE: And it can be argued that the US spying agencies have access to all of Google's stored data. JULIAN: But they do. JÉRÉMIE: And all of Facebook's data, so in a way Facebook and Google may be extensions of these agencies. JULIAN: Do you have a Google subpoena Jake? Was a subpoena sent to Google to hand over information related to your Google account? WikiLeaks got subpoenas to our California domain name registrar dynadot, which is where the wikileaks.org registration is made. They were subpoenas from the secret ongoing Grand Jury investigation into WikiLeaks, asking for financial records, login records, et cetera, which it gave them. 57 JACOB: The Wall Street Journal reported that Twitter and Google and Sonic.net, three services that I use or have used in the past, each received a 2703(d) notice, which is this unusual form of secret subpoena. 58 JULIAN: Under the PATRIOT Act? JACOB: No. This is the Stored Communications Act, essentially. The Wall Street Journal is saying that each of these services claims that the government wanted the metadata, and the government asserted it has the right to do this without a warrant. There's an ongoing legal case about the government's right to keep its tactics secret, not only from the public, but from court records. I read the Wall Street Journal and found out like everyone else. JULIAN: So Google sucked up to the US government in its Grand Jury investigation into WikiLeaks when the government subpoenaed your records— not a conventional subpoena, but this special sort of intelligence subpoena. But the news came out earlier in 2011 that Twitter had been served a number of subpoenas, from the same Grand Jury, but Twitter fought to be able to notify the people whose accounts were subpoenaed— for the gag order to be lifted. I don't have a Twitter account, so I didn't get one, but my name and Bradley Manning's name were on all the subpoenas as the information that was being searched for. Jake, you had a Twitter account so Twitter received a subpoena in relation to you. Google also received a subpoena, but didn't fight to make it public. 59 JACOB: Allegedly. That's what I read in the Wall Street Journal. I might not be even allowed to reference it except for in connection to the Wall Street Journal. JULIAN: Is it because these orders also have a gag component? That has been found to be unconstitutional, hasn't it? JACOB: Maybe not. For the Twitter case it is public that we lost the motion for a stay where we said that disclosing this data to the government would do irreparable harm as they can never forget this data once they receive it. They said, "Yeah well, your stay is denied, Twitter must disclose this data." We're in the process of appeal, specifically about the secrecy of docketing— and I can't talk about that— but as it stands right now, **the court said that on the internet you have no expectation of privacy when you willingly reveal information to a third party, and, by the way, everyone on the internet is a third party.** JULIAN: **Even if the organization like Facebook or Twitter says that it will keep the information private**. JACOB: For sure. And this is the blurring of the state and corporation. This is actually probably the most important thing to consider here, that **the NSA and Google have a partnership in cyber-security for US national defense reasons. ANDY: Whatever cyber-security means in this context. That's a wide term.** JACOB: They are trying to exempt everything from the Freedom of Information Act and to keep it secret. **Then the US government also asserts it has the right to send an administrative subpoena, which has a lower bar than a search warrant, where the third party is gagged from telling you about it, and you have no right to fight because it is the third party that is directly involved, and the third party has no constitutional grounds to protect your data either.** JULIAN: The third party being Twitter or Facebook or your ISP. JACOB: Or anyone. **They said it was a one-to-one one-to-one map with banking privacy and with dialing a telephone. You willingly disclose the number to the phone company by using it. You knew that, right? By using the telephone you obviously are saying, "I have no expectation of privacy," when typing those numbers. There is even less explicit connection to the machine. People don't understand how the internet works— they don't understand telephone networks either— but courts have consistently ruled that this is the case**, and in our Twitter case so far, which unfortunately I can't really talk

about because I don't actually live in a free country, they assert essentially the same thing. 60 **It's absolute madness to imagine that we give up all of our personal data to these companies, and then the companies have essentially become privatized secret police. And— in the case of Facebook— we even have democratized surveillance. Instead of paying people off the way the Stasi did in East Germany, we reward them as a culture— they get laid now. They report on their friends and then, "Hey, so and so got engaged;" "Oh, so and so broke up;" "Oh, I know who to call now."**

Secrecy

1nc – Secrecy

1. There's no concrete evidence for chilling effects – public debate is more robust than ever before

Posner, 13 (Eric, professor at the University of Chicago Law School, is the co-author of "Terror in the Balance" and "The Executive Unbound." "Is the N.S.A. Surveillance Threat Real or Imagined?" 6-9-13. http://www.nytimes.com/roomfordebate/2013/06/09/is-the-nsa-surveillance-threat-real-or-imagined)

This brings me to another valuable point you made, which is that **when people believe that the government exercises surveillance, they become reluctant to exercise democratic freedoms. This is a textbook objection to surveillance**, I agree, **but it also is another objection that I would place under "theoretical" rather than real. Is there any evidence that over the last 12 years, during the flowering of the so-called surveillance state, Americans have become less politically active? More worried about government suppression of dissent? Less willing to listen to opposing voices? All the evidence points in the opposite direction.**

Views from the extreme ends of the political spectrum are far more accessible today than they were in the past. It is infinitely easier to get the Al Qaeda perspective today — one just does a Google search — than it was to learn the Soviet perspective 40 years ago, which would have required one to travel to one of the very small number of communist bookstores around the country. It is hard to think of another period so full of robust political debate since the late 1960s — another era of government surveillance.

2. (___)

3. Overall secrecy is low – we know a lot about "secret" government programs

Priest, 07 (Dana, covers the intelligence community for The Washington Post, where she has worked for 15 years. She was the paper's Pentagon correspondent for six years and then wrote exclusively about the military as an investigative reporter. "SECRECY AND GOVERNMENT: America Faces the Future" 4-12-07. http://www.lawandsecurity.org/Portals/0/Documents/SecrecyPrivacy.pdf)

More broadly, though, organizations (mainly human rights and civil rights organizations) **and lawyers have forced the courts, the public, and the Congress to debate the effectiveness, the morality, and the legitimacy of harsh interrogation techniques, the extent of and limitations on terrorist networks, and the very premise of the creation of a whole set of new laws, rules of engagement, and prisons to hold the terrorists. All sorts of these things have been debated.**

Even government investigators and auditors have started digging into the National Security Agency wiretapping program. The Foreign Intelligence Surveillance Court has changed some of the ways that it has been doing business. The Department of Justice has recently revealed that the FBI had improperly obtained telephone logs and banking records for thousands of Americans by the misuse of national security letters. So what is the scorecard now if secrecy is on one side and the public's right to know is on the other? **I think that we know a huge amount about the secret parts of our government's activities in what they call "the war on terror,"** consisting of things that they began doing after 9/11 that are new, different, and sometimes legally questionable. **We were supposed to know none of this but we know a lot. We know about the extent of special operations and CIA activities**; not the details but the framework, the importance of the liaison relationships overseas, and what we are paying some of those governments to engage in it. **We know a lot about the detainees – how they have been treated, who they are, and whether they are terrorists. We know a lot about the military's new global reach, and we have a sense of its budget, though a lot of it is classified. We are getting a better sense of terrorist networks – who they are and who they are not. We know a lot about electronic surveillance**. Of course this is just a tiny corner but it has begun to crack. **We know a lot about the use of national security letters** and, finally, the legal framework that came out of the Office of Legal Counsel at the White House – who put it together, why they put it together, what their thinking was, and how it became controversial within the government itself. The one big caveat to all this positive news is Iraq. The implications of our collective failure to unearth the secrets about Iraq that the government was hiding will be with us for generations.

The bottom line is that secrets are hard to keep in a democracy. It should be a contest. Those of us who are engaged in it should not feel discouraged. We should not feel like the sky is falling. We should feel encouraged that the sky is opening up and that there is a little bit (and in some cases a lot) of sunshine being shed upon these very secret programs. In other cases, the sky is opening slowly and there is still much more to do.

5. Secrecy improves decision making - fear of leaks causes self-censorship and undermines coordination

Fata, 11 (Daniel, Vice-President at the Cohen Group in Washington, DC. He served as the US Deputy Assistant Secretary of Defense for Europe and NATO Policy from 2005 to 2008. "Secrecy and Good Governance" http://globalbrief.ca/blog/2011/02/18/%E2%80%9Csecrecy-is-a-necessary-condition-for-good-governance%E2%80%9D/)

I acknowledge that too much informality may lead to bad governance practices and bad decision-making. **The more that government officials feel less secure about the confidentiality of things put on paper during the policy deliberation process, the less likely it is that reasoned policy can and will be developed. Such insecurity will certainly result in smaller and smaller groups being part of policy deciding-making processes, and will often keep in the dark those who are tasked with carrying out the policy on the ground or in practice. This, in turn, means that policy execution has great potential to be mishandled** – either because there are few written details on what influenced the final policy decision, or because there are differences of opinion among executive agencies on what the policy decision in question actually means for particular agencies. **This complicates the oversight role of the legislative branch, due to the degree of ambiguity about the original intent of the specific policy decision. And**, finally, as mentioned in an earlier intervention, **this insecurity puts those who have to execute the policy on the ground at great risk** – in every conceivable sense of the word.

It seems clear, post-Wikileaks, that US diplomats will likely be more reluctant to put sensitive information in cables from their posts overseas about the internal dynamics and personalities of host countries for fear that such information will be leaked and revealed. This will have a detrimental effect on policy-making because the 'context' in a foreign government's behaviour will not be well communicated to policy-makers. Sure, **such information can be conveyed in person or via teleconference, but then only a small group of high-level policy-makers will be privy to it**, and the desk officers and action officers – who are the day-to-day experts on a particular country – will likely be left in the dark.

Wikileaks will also, in turn, make foreign interlocutors less likely to share information with US diplomats for fear that what they say in confidence may end up in a leaked cable. This will doubtless deny US diplomats and government officials the ability to properly understand what is going on within a country.

We might conclude by noting that, in the case of the US, the Founding Fathers created a country of representative democracy – not direct democracy – in order that the requisite expertise be applied to the development of policies in the best interests of the American people. **The Founding Fathers, while also believing in transparency and respect for the rule of the law, expected the American people to cede some direct control to the experts or 'representatives.' Experts need their tools in order to do their job. These tools tend to come in the form of confidential information that eventually transforms into confidential deliberations, and ultimately into confidential decision-making processes – but with public announcements and public oversight.**

We ought to recognize that good public policy takes time to develop and to execute, and is never the sole domain or responsibility of just one party or actor. We ought to, most certainly, strengthen legislative oversight functions as a first step to improving transparency in government. But let us not overreact and demand too much transparency in the functioning of our executive branches. As the saying goes: be careful what you ask for; you just may get it.

6. Drone civilian casualties are overstated and alternatives are worse

Cohen, 13 (Michael A Cohen, regular columnist for the Guardian and Observer on US politics, he is also a fellow of the Century Foundation [May 23, 2013, "Give President Obama a chance: there is a role for drones," The Guardian, http://www.theguardian.com/commentisfree/2013/may/23/obama-drone-speech-use-justified)

Drone critics have a much different take. They **are passionate in their conviction that US drones are indiscriminately killing and terrorizing civilians.** The Guardian's own Glenn Greenwald argued recently that no "minimally rational person" can defend "Obama's drone kills on the ground that they are killing The Terrorists or that civilian deaths are rare". Conor Friedersdorf, an editor at the Atlantic and a vocal drone critic, wrote last year that liberals should not vote for President Obama's re-election because of the drone campaign, which he claimed "kills hundreds of innocents, including children," "terrorizes innocent Pakistanis on an almost daily basis" and "makes their lives into a nightmare worthy of dystopian novels".

I disagree. Increasingly it appears that arguments like Friedersdorf makes are no longer sustainable (and there's real question if they ever were). **Not only have drone strikes decreased, but so too have the number of civilians killed—and dramatically so.**

This conclusion comes not from Obama administration apologists but rather, Chris Woods, whose research has served as the empirical basis for the harshest attacks on the Obama Administration's drone policy.

Woods heads the covert war program for the Bureau of Investigative Journalism (TBIJ), which maintains one of three major databases tabulating civilian casualties from US drone strikes. The others are the Long War Journal and the New America Foundation (full

disclosure: I used to be a fellow there). While LWJ and NAJ estimate that drone strikes in Pakistan have killed somewhere between 140 and 300 civilians, TBIJ utilizes a far broader classification for civilians killed, resulting in estimates of somewhere between 411-884 civilians killed by drones in Pakistan. The wide range of numbers here speaks to the extraordinary challenge in tabulating civilian death rates.

There is little local reporting done on the ground in northwest Pakistan, which is the epicenter of the US drone program. As a result data collection is reliant on Pakistani news reporting, which is also dependent on Pakistani intelligence, which has a vested interest in playing up the negative consequences of US drones.

When I spoke with Woods last month, he said that a fairly clear pattern has emerged over the past year—far fewer civilians are dying from drones. "For those who are opposed to drone strikes," says Woods there is historical merit to the charge of significant civilian deaths, "but from a contemporary standpoint the numbers just aren't there."

While Woods makes clear that one has to be "cautious" on any estimates of casualties, it's not just a numeric decline that is being seen, but rather it's a "proportionate decline". **In other words, the percentage of civilians dying in drone strikes is also falling, which suggests to Woods that US drone operators are showing far greater care in trying to limit collateral damage.**

Woods estimates are supported by the aforementioned databases. In Pakistan, New America Foundation claims there have been no civilian deaths this year and only five last year; Long War Journal reported four deaths in 2012 and 11 so far in 2013; and TBIJ reports a range of 7-42 in 2012 and 0-4 in 2013. In addition**, the drop in casualty figures is occurring not just in Pakistan but also in Yemen.**

These numbers are broadly consistent with what has been an under-reported decline in drone use overall. According to TBIJ, the number of drone strikes went from 128 in 2010 to 48 in 2012 and only 12 have occurred this year. These statistics are broadly consistent with LWJ and NAF's reporting. In Yemen, while drone attacks picked up in 2012, they have slowed dramatically this year. And in Somalia there has been no strike reported for more than a year.

Ironically, these numbers are in line with the public statements of CIA director Brennan, and even more so with Senator Dianne Feinstein of California, chairman of the Select Intelligence Committee, who claimed in February that the numbers she has received from the Obama administration suggest that the typical number of victims per year from drone attacks is in "the single digits".

Part of the reason for these low counts is that the Obama administration has sought to minimize the number of civilian casualties through what can best be described as "creative bookkeeping". The administration counts all military-age males as possible combatants unless they have information (posthumously provided) that proves them innocent. Few have taken the White House's side on this issue (and for good reason) though some outside researchers concur with the administration's estimates.

Christine Fair, a professor at Georgetown University has long maintained that civilian deaths from drones in Pakistan are dramatically overstated. She argues that considering the alternatives of sending in the Pakistani military or using manned aircraft to flush out jihadists, drone strikes are a far more humane method of war-fighting.

7. Drones are inevitable - 120 countries are either developing drones or already have them

Rayne, 15 (Sierra, writer for American Thinker on national security, citing Ben Lerner, vice president for government relations at the Center for Security Policy. "The Future of Drone Warfare," 4-30-15 http://www.americanthinker.com/articles/2015/04/the_future_of_drone_warfare.html)

According to a Teal Group report that Lerner cites, **more than $6 billion is spent each year on developing drone technology worldwide, a number that is expected to double over the next decade.**

Almost 90 percent of this spending is expected to be on military applications. The RAND Corporation notes that **70 nations already have acquired drones, while 50 countries are developing them.** Defense One noted predictions from some experts that **"virtually every country on Earth will be able to build or acquire drones capable of firing missiles within the next ten years."**

Analysis by IHS Inc. shows that the United States will likely remain the largest drone user for the foreseeable future. Currently, the U.S. constitutes nearly half of the global drone market, with the U.S. Air Force at half the American demand.

Prior to 2015, the U.S. exported armed drones only to the United Kingdom, with some other NATO countries receiving unarmed drones. Starting in February 2015, the Obama administration approved widespread drone exports with certain conditions. Each case will be assessed separately, and foreign military sales regulations will apply. Potential purchasers will need to commit to basic principles of use with respect to international law on military force and human rights, agree not to use them for unlawful domestic surveillance, and agree to potential end-use monitoring. Under the non-binding Missile Technology Control Regime (MTCR), Lerner points out that the U.S. has "committed to approaching requests for our armed drones with a 'strong presumption of denial' – meaning if a country comes to us asking to buy our drones, if they have a range of more than 300 km and can carry more than 500 kg, we force that country to make a strong case for why they should have these drones."

Lerner's research further highlights a Frost & Sullivan study showing that **Israel is the largest drone exporter**, sending about half its exports to Europe, about one-third to the Asia-Pacific, and a little over 10 percent to South America. **Several European nations – such as the U.K. and France – are developing combat drones in collaborative networks to reduce their reliance on American and Israeli drones. South Korea and developing nations such as Colombia and India are also working on their own military drone capacity. Of course, China, Russia, Iran, and various non-state actors such as Hezb'allah and Hamas are also using and developing drone technology.**

Ext 1 – No Chilling Effect

Surveillance doesn't chill journalism – leaks happen frequently and journalists have an incentive to exaggerate the challenges they face

Human Rights Watch, 14 ("With Liberty to Monitor All: How Large-Scale US Surveillance is Harming Journalism, Law, and American Democracy," July. https://www.hrw.org/sites/default/files/reports/usnsa0714_ForUPload_0.pdf)

The **officials were skeptical that surveillance has undermined reporting**, or indeed, that anything else has either. **"[People argue that] this mass surveillance apparatus is going to cause whistleblowers to dry up and not be willing to talk to reporters and there's absolutely no indication of that in the press at all. There's a steady stream every day of classified information coming out.**"398 More broadly, he observed, "**We haven't really seen … any measurable change in the journalistic output."399 As the senior FBI official put it, "The First Amendment seems quite alive and well in America today."**400 Two officials suggested that **journalists have always complained about the challenges of reporting.** According to Deitz, **"These things rotate through Washington every few years. Nixon had an enemies list.** It was a matter of prestige to be on it."401 The senior intelligence official argued similarly that "this is a constant dynamic, and I think that **there is always going to be a flow of information to the press, and the press is always going to be**

complaining that they're not getting enough of it."402 When asked what would constitute sufficient evidence of a chilling effect to cause them concern, **both Deitz and the senior FBI official expressed skepticism about the reliability of self-reports by journalists or others. Deitz in particular claimed that people could exploit assertions that they are now constantly on alert for surveillance to advance their interests, observing that "the press is used as much as it uses."**403 **He appeared to be suggesting that journalists speaking to us for our research have an incentive to exaggerate their concerns about surveillance. The senior intelligence official responded that "the immediate canary in the mine would be if all of a sudden stories about leaks of classified information stopped appearing in the newspapers.**"404 While he argued that he has seen no indication that less information has made its way to the media, he acknowledged that it would be "hard to measure" such a phenomenon.405

Answer to: MIT Study

The MIT study is flawed – can't control for other factors

Pasternack, 14 (Alex, Editor-At-Large of VICE. "In Our Google Searches, Researchers See a Post-Snowden Chilling Effect," 5-5-14. http://motherboard.vice.com/read/nsa-chilling-effect)

In general, search terms with "high" privacy sensitivity declined, even as "low" privacy sensitive terms appeared to rise. Germany and South Korea were exceptions.

While the study offers an early portrait of one potential chilling effect of Edward Snowden's revelations, it carries limitations. The big data analysis alone doesn't prove that news about the NSA caused Google users to censor their searches, merely shows evidence that it might have. "At such an aggregate level," the researchers caution in their paper, "it is hard to straightforwardly assert that the changes we observe were attributable to the surveillance (and particularly the PRISM) revelations."

While the authors accounted for other factors that might explain the changes in searching, including weather and other news stories, **they could not account for all outside factors. It's also possible, they caution, that the detected effect could have been caused by tweaks made by Google itself. But the company doesn't reveal how it calculates its data; it also doesn't offer actual numbers of searches, but rather rates them on a scale based on how often a term is searched for relative to the total number of searches.**

"This is the fundamental problem with using these data; the process of generating the data is secret," said Gary King, director of Harvard's Institute for Quantitative Social Science. King has become familiar with the limitations of big data as he's examined, among other things, how censorship works on China's social media. The secrecy surrounding web metrics, he said, "has to be the case for commercial reasons, I suppose, but science does not exist without sharing information."

Google Trends has been used widely, in studies for financial and health forecasting. But claims that Google Trends can predict the flu, for instance, have been largely deflated, the result of "big data hubris." There are more playful uses of search data too: Last year, when Princeton researchers used Trends data to foretell the demise of Facebook, Facebook researchers responded with their own Trends analysis that found that Princeton was on the decline.

Ext 5 – Improves Decision Making

Secrecy is inevitable and necessary for effective government decisionmaking

Posner, 13 (Eric, professor at the University of Chicago Law School, is the co-author of "Terror in the Balance" and "The Executive Unbound." "Is the N.S.A. Surveillance Threat Real or Imagined?" 6-9-13. http://www.nytimes.com/roomfordebate/2013/06/09/is-the-nsa-surveillance-threat-real-or-imagined)

Jameel, let me focus on an important point you raise, which is that because surveillance is secret, we will often fail to learn when the government abuses its surveillance powers. The president claims to "welcome debate" about a program whose existence he kept secret while the government begins an investigation so that it can find and punish the leaker. **How can democracy function when government keeps its programs secret?**

The question raises a real paradox. If government can keep secrets, then the public cannot hold it to account for its actions. But **if government cannot keep secrets, then many programs — including highly desirable ones — are impossible.** Many commentators seem to think that the answer is to keep secrecy to an absolute minimum, but this response is far too easy.

One reason it is too easy is that it implies that secrecy can be exceptional. **Government secrecy in fact is ubiquitous in a range of uncontroversial settings. To do its job and protect the public, the government must promise secrecy to a vast range of people — taxpayers, inventors, whistle-blowers, informers, hospital patients, foreign diplomats, entrepreneurs, contractors, data suppliers and many others.** But that means that the basis of government action, which relies on information from these people, must be kept secret from the public. **Economic policy is thought to be open, but we saw during the financial crisis that government officials needed to deceive the public about the health of the financial system to prevent self-fulfilling runs on banks. Then there are countless programs that are not secret but that are too complicated and numerous for the public to pay attention to** — from E.P.A. regulation to quantitative easing. **N.S.A. surveillance blends into this incessant, largely invisible background buzz of government activity; there is nothing exceptional about it.**

And this puts even more pressure on the first prong of the paradox. If much (most?) of government activity remains invisible to the public, how can democratic accountability work? The answer, I think, is that political accountability in modern, large-scale democracies rarely takes place through informed public monitoring of specific government programs and policies. A few discrete issues (abortion, same-sex marriage) aside, and not counting political scandals, **the public largely votes on the basis of its pocketbook and its feeling of security. The political consequences of war, terrorist attacks and economic distress — all of which are publicly observable — keep officeholders in line, but they retain vast discretion to choose among means. Because some government officials are ill-motivated and others are incompetent, government abuse is inevitable, but it is the price we pay for a government large and powerful enough to regulate 300 million people.**

Think of the N.S.A. program as the security equivalent of the Affordable Care Act (which will unavoidably involve government monitoring of people's medical care on the basis of bureaucratic procedures that no one understands): in both cases, we must prepare ourselves for the inevitable abuses that accompany a large, unwieldy, hard-to-monitor program, in order to obtain the (promised) benefits.

Objections to the secrecy of the N.S.A. program are thus really objections to our political system itself, and, for all its flaws, there are no obviously superior alternatives.

Ext 7 – Drone Spread Inevitable

American restraint won't affect international drone norms

Rayne, 15 (Sierra, writer for American Thinker on national security, citing Ben Lerner, vice president for government relations at the Center for Security Policy. "The Future of Drone Warfare," 4-30-15 http://www.americanthinker.com/articles/2015/04/the_future_of_drone_warfare.html)

In terms of preventing drones from getting into the "wrong hands," Lerner says there are only two non-binding global arrangements: the MTCR and the Wassenaar Arrangement. Neither China nor Iran is a member of either agreement. While there are those who want to include drones explicitly in the U.N. Arms Trade Treaty, there is a broader push in certain circles to develop binding protocols for the production, use, and dissemination of drones. **Lerner summarizes the position of those advocating for such international rules or norms governing drones specifically as being along the lines of "our use of armed drones, particularly away from so-called 'hot battlefields', is creating a precedent where others will feel they can do what we do** – or at least, frame what they do as being no different than what we do. So we need to get in front of this and take the lead on creating norms for acceptable use of drones."

But Lerner's position takes the opposite view. He is deeply skeptical about the desirability of new "international norms" on the acceptable use of drones. When interviewed for this article, he was of the opinion that:

Such new norms are 1) unnecessary, since we already have international law on the use of force that can cover drones; and 2) unlikely to be effective, because the parties whose drone use we are most concerned about (China, Russia, Iran, terrorist groups) are least likely to be affected by new norms on drone use, because they will either have no regard for such norms (especially the case with non-state actors) **or they'll argue that their use of drones is consistent with the new norms, even if they're not, and will proceed ahead with whatever it is they want to do. In the meantime, such new norms – it seems to me – could be manipulated as another means by which to constrain U.S. use of drones, to the detriment of U.S. national security.**

Democracy

1nc – Democracy Advantage

1. The U.S. isn't and won't be a tyranny

Lane, 13 (Charles, editorial writer, specializing in economic policy, federal fiscal issues and business, and a contributor to the PostPartisan blog. In 2009 he was a finalist for the Pulitzer Prize in Editorial Writing. Op-ed in the Washington Post, 7-15-13. "NSA Surveillance is Within Democracy's Bounds." http://www.washingtonpost.com/opinions/charles-lane-nsa-surveillance-is-within-democracys-bounds/2013/07/15/d509b1ae-ed8a-11e2-9008-61e94a7ea20d_story.html)

Last week, pranksters armed with a long-range projector beamed "United Stasi of America" in giant letters across the U.S. Embassy's facade in Berlin.

Fortunately for two important causes — transatlantic relations and **sensible political discourse — Merkel has challenged this spurious equivalency.**

"For me, there is absolutely no comparison," she said in an interview with the weekly Die Zeit. "They are two completely different things, and **such comparisons only tend to minimize what the Stasi imposed on the people of East Germany. The work of intelligence services in democratic states was always indispensable for the security of citizens,** and will be in the future."

As Germany's first chancellor from the east, Merkel spoke with special authority. **It's important,** though, **to understand specifically why she is right.**

The methods of surveillance and intelligence-gathering — bribery, blackmail, wiretapping, infiltration and the rest — are not normal tools of democratic governance.

To the contrary: **There is a basic tension, or trade-off, between democracy and secrecy, and it's absurd to deny it.**

Yet it is equally absurd to suggest, as Jakob Augstein did in Der Spiegel, **that "no matter in what system or to what purpose: A monitored human being is not a free human being."**

The political goals and institutional context of a given state's intelligence-gathering make all the difference. In East Germany, the purpose of surveillance was to protect an unelected party that exercised a monopoly of political and economic power on behalf of a foreign military occupier, the Soviet Union.

The Communist Party's ideology politicized every aspect of life, rendering the pettiest deviations, in word or deed, threatening — and thus subject to secret official scrutiny.

Unchecked by any law, Stasi spying evolved into an end in itself. East Germany really was a "surveillance state."

Despite much rhetoric from Snowden's camp, the United States does not fit that admittedly vague description: No party holds or plausibly aspires to a monopoly on power in this country, with its centuries-old constitutional separation of powers, two-party system, free press, private sector and robust civil society. Many fault the Foreign Intelligence Surveillance Court as a pawn of the NSA, forgetting that it was one of many reforms

Americans instituted in the 1970s to correct previous intelligence abuses — and how rare it is for any nation to subject intelligence-gathering to even minimal judicial oversight.

Nor does the U.S. government define the normal exercise of freedom as inherently threatening; **the terrorists and other threats about which it gathers secret intelligence are not imaginary.**

As Merkel told Die Zeit, "In the past, we have gotten a series of alerts from America that protected us against serious terrorist attacks. Along with data protection, that should be considered in the debate."

Given the threats to democracy, and the technological milieu from which they may emerge, the United States needs to engage in data collection on a wide scale, both at home and abroad. The issue is whether it has checks and balances to ensure that these means remain politically and legally subordinate to legitimate ends.

On that score, there's good news and not-so-good news in **Snowden's revelations.** So far, he's **revealed no specific instance in which the NSA programs harmed any individual.**

However, the expansive FISA court reading of the Patriot Act, which authorized NSA's bulk collection of telephone metadata, may have exceeded Congress's intent. The clash between NSA data collection overseas and the domestic law of countries such as Germany is a serious diplomatic issue, for which the solution probably lies in greater consultation and transparency among allied democracies.

As Merkel suggested, though, it would help if Germans "never forget . . . that America is and has been our truest ally throughout the decades." Some of the same across-the-pond pundits who are griping about President Obama's proto-totalitarianism today used to hail him as the world's political redeemer.

In short, even the most worrisome issues Snowden has raised amount to manageable trade-offs between liberty and security, for both the United States and its allies.

He may deserve credit for energizing the debate, but not for enabling the Stasi-analogizers, or for referring to the United States with phrases like "turnkey tyranny" and "architecture of oppression." The excessiveness of that language should be more apparent to him with each day he spends in Vladimir Putin's Russia.

3. Mass surveillance won't be abused – intelligence agencies are sensitive to legal restrictions and privacy concerns

Lempert, 13 (Richard, Visiting Fellow in Governance Studies at the Brookings Foundation and the University of Michigan's Eric Stein Distinguished University Professor of Law and Sociology emeritus. "PRISM and Boundless Informant: Is NSA Surveillance a Threat?" 6-13-13. http://www.brookings.edu/blogs/up-front/posts/2013/06/13-prism-boundless-informant-nsa-surveillance-lempert)

The NSA's recently revealed PRISM project allows the NSA to monitor the internet traffic of foreigners, but sweeps up American communicators in the process while the once equally secret Boundless Information program analyzes and is fed in part by metadata on calls routed through Verizon, and it is safe to assume, other telecommunications carriers as well. **How concerned should we be?** The answer depends on what one's concerns are**. If the concern is the privacy of one's own conversations, there is little reason for all but a handful of Americans to lose sleep over this, and those most likely to lose sleep are also most likely to pose security threats.**

The programs are somewhat different, but given what we have been told so far, here's how they are likely to work. The **telecommunications data mining appears to be both vast and indiscriminate but only collects so-called metadata; that is, data on which phone numbers called which other numbers, how long the calls lasted, the locations where calls were made and received and the like. No conversations have been recorded, so what was said is forever beyond the government's reach.** If, however, a number called or called from belongs to a suspected terrorist, here or abroad, or to someone whose calling patterns or call locations arouse suspicions, the NSA, FBI or other agency will most likely be able to secure a warrant, based on probable cause, that will authorize listening to what is said in calls to and/or from the identified number. It is not, however, just those who call or are called by previously identified suspicious numbers who will be vulnerable to having their calls seen as suspicious and their conversations monitored. Data mining can cast suspicion on those who call others who have called suspicious numbers, those who call third party numbers whom suspicious callers call and the like. Still, **although the net is potentially wide, it is likely that relatively few Americans are selected for active surveillance, and then only after a court has reviewed the reasonableness of monitoring requests given patterns in the metadata and connections to known security risks.**

To give an example, consider the aftermath of the Boston Marathon bombing. The authorities feared the Tsarnaev brothers might have had domestic accomplices, and they also wanted to know if foreign instigation played a role. Through PRISM, they would have been able to retrieve archived phone data, examine calls made to and from the Tsarnaev brothers' phones and identify not only patterns that might suggest others were involved but also people they might talk to to learn more about how the Tsarnaevs had been radicalized. The data analysis would allow them to take a giant step toward answering the questions that most concerned them in a less intrusive and more objective way than by having human gumshoes patiently track down various leads and leads stemming from leads. This may explain why very soon after the bombings the authorities could tell us they were reasonably confident that the Tsarnaevs had acted alone and had hatched their plot without foreign involvement. (Given Tamerlan Tsarnaev's travels back to Russia, the latter conclusion is not yet completely safe to draw; modern technology does not obviate all needs for gumshoe detective work). President Obama, members of Congress and James Clapper, the top U.S. intelligence official, have all said that the kinds of monitoring that feed Boundless Informant have contributed to identifying terrorists and thwarting possible attacks. There is no reason to doubt their word.

PRISM appears to be a far narrower intelligence gathering program but far more intrusive. It can capture not just metadata but the content of communications transmitted via the web, including messages sent and retrieved, uploaded videos and the like. It is specifically targeted, and without a warrant neither American citizens nor permanent resident are legal targets. However, the protections citizens and permanent residents enjoy appear loose. News stories suggest that data capture is allowed to proceed whenever a responsible agent thinks it more likely than not that a possible target is foreign.

The standard, if true, means that some communications involving only Americans are inevitably captured, and Americans may be caught up in surveillance aimed at foreigners, such as recordings of foreign chat room conversations.

The protection most of us enjoy under PRISM may be more practical than legal. The amount of data that can be collected limits the reach of the program. Not only is capturing too much information from innocent Americans a waste of resources, but also suspicious communications can be lost in a forest of irrelevant data. The NSA thus has powerful reasons to limit impermissible observations, at least where there is no good reason to suspect Americans of terrorist involvements. Still we lack two bits of information important in assessing this program. One is the fate of information pertaining to Americans who should not have been observed in the first place. If this information is purged from all databases except perhaps when the person is dangerous, erroneous capture is less of a concern than it otherwise would be. Second, we don't know how monitoring targets are determined or the number of targets selected. To the extent that individuals, organizations and sites are targeted based on target-specific concerns about the threats they pose, the net cast is likely to be narrow, and even if the reasons for targeting do not rise to the level of legally cognizable probable cause, they tend in this direction. But if targets are selected based on the impersonal outputs of other data mining efforts like the telephone records that feed Boundless Informant, all bets are off. Depending on the algorithms used and the degree to which they have been empirically validated, the net could be wide or narrow, and the likelihood that a target would be involved in terrorism or that citizens would be swept into the net may be great or small. Congress in overseeing PRISM should demand this information if it is not already provided.

It is easy to be cynical about government and the respect that agencies show for the laws under which they operate. Cynicism is fed by occasional scandals and by the more frequent pseudo-scandals which make it appear that within the Beltway things are out of control. **Having spent four years as a Division Director at the National Science Foundation and three years as Chief Scientist in the Human Factors/ Behavioral Science Division of DHS's Science and Technology Directorate, I am not cynical. Time and again I have seen government employees seek to follow the law even when it seems silly and interferes with their mission. When I joined DHS I was most surprised by the fierceness of efforts to comply with the U.S. Privacy Act. At times interpretations of what the Act protected were so broad as to border on the ridiculous, and costs were real: research projects with national security implications were delayed, redesigned or even precluded because privacy officers, sometimes with little basis in the statute, felt there was a risk that personally identifiable information (PII) would be impermissibly collected.** The absence of any reason to fear revelation or misuse made no difference. The strict scrutiny applied to research that might involve PII is, to be sure, relaxed in front line operational settings like PRISM and legal restrictions may differ, but **my experience in two agencies as well as conversations with people in the intelligence community (IC) lead me to believe that it is a mistake to regard as a sham the legal restrictions on PRISM or other IC data mining and surveillance activities.**

Through its PRISM and Boundless Informant efforts, NSA is working to protect the nation, apparently with some success. The 99.9% of us who pose no threat of terrorism and do not inadvertently consort with possible terrorists should not worry that the government will track our phone or internet exchanges or that our privacy will be otherwise infringed.

5. Democratic peace theory is false – it ignores counter-examples and uses selective definitions of democracy

Gautreaux, 12 (Sergio, M.A. in International Relations from Webster University in Leiden, the Netherlands, and a B.A. in History from Louisiana State University. Sergio has previously worked at the Pax Ludens Foundation and the Organization for the Prohibition of Chemical Weapons. He is currently an international consultant based in East Asia. "Examining the Democratic Peace Hypothesis: A Neorealist Critique," International Policy Digest, 4-26-12. http://www.internationalpolicydigest.org/2012/04/26/examining-the-democratic-peace-hypothesis-a-neorealist-critique/)

Flaws of the Democratic Peace Theory

Even for a society unwavering in its messianic role in foreign affairs, **the** doctrinal **implication for a theory which stands antithetical to history is alarming. During his eight years in office, Bill Clinton overextended the American military** into regions of the world which were more concerned with settling centuries' old ethnic rivalries than the future of their domestic political institutions. **His successor, George W. Bush, used the theory as the primary justification for the war in Iraq, stating, "The reason why I'm so strong on democracy is democracies don't go to war with each other**…I've got great faith in democracies to promote peace. And that's why I'm such a strong believer that the way forward in the Middle East, the broader Middle East, is to promote democracy."

At the time of writing, President Barack **Obama's foreign policy doctrines have not become anymore measured than his immediate predecessors** with regards to what is geopolitically imperative, and what is too costly for the current economic constraints. American self-perceptions notwithstanding, all nation-states have acted in the interest of ensuring their own survival first and foremost, while paying little regard to another's culture, norms, ideals, or institutions in pursuit of its ends. Diplomatic ententes and military groupings – from the Holy Alliance to NATO – have shifted to fit the realities of the current system and will continue to do so when the national interest is at stake. As such, **the democratic peace hypothesis presents three substantial problems** for the current Westphalian international model.

The first flaw in the theory is one of conceptualization. The Polity Index, used by Russet in his examination of the democratic peace, is based on a faulty definition of democracy. In 1971, Yale University Professor, Robert Dahl, posited two very basic attributes of the system: competition and participation. The first state that granted full participation by way of universal suffrage and, as a consequence, met Dahl's requirements for a democratic society, was Finland in 1906. While the Polity Index measures the spread of democracy from the year 1800 onwards, the data omits participation as a key attribute in its determination of democratic states. By omitting such a basic, yet vital, component of democracy and failing to properly conceptualize democracy, **the very question of what it means to be a democratic state**, bent on avoiding dyadic conflict, **is called into question**.

Despite this conceptual flaw, most states listed as democratic by Russett and the Polity I-IV data do, in fact, promote universal suffrage (at least in theory) in the twenty-first century and would meet Dahl's 1971 requirements (though Russett's blanket assertion and inclusion of states without universal suffrage remains a point of contention for the emerging democracies). With this in mind, the

second error in the logic of the democratic peace theory is with Russett's "cultural/normative" model. The model assumes that a culture of peace is the standard across all democratic societies. While few would disagree that a Western liberal state such as the Netherlands is more peaceful than the various war-torn countries that comprise the very undemocratic societies of sub-Saharan Africa, the same comparison cannot be made between all democratic and autocratic societies.

Studying the post-World War II era, in which numerous former colonies gained their independence and empires were systematically disbanded, **one will find that the emerging democracies during this era, struggling with the formation of civil society structures and the demands posed by the market economy, had substantially higher crime rates** than the ardently non-democratic societies. In addition, homicide rates for so-called "full democracies" – that is, states with a long-established history of democracy (e.g. Western Europe and the United States) – increased at an alarmingly higher rate than their non-democratic counterparts during this same time period. To use a specific example, the world's current hegemon and most powerful democracy, **the United States, regularly experiences violent civil unrest**, has the tenth highest homicide rate per 100,000 people (just behind the Republic of Moldova and ahead of Uruguay), and experienced a violent civil war that claimed the lives of 650,000 Americans just a century and a half ago.

Moreover, if democratic decision-makers did actually employ their society's supposed culture of peace into their policy formation when faced with international conflict escalation, they would do so at all stages and in all instances, including when faced with a hostile challenge from a non-democratic state. History, however, shows that is not the case. **During the years 1899-1999, five of the world's current most powerful (expressed in terms of military potential; determined using quantitative troop, aircraft, and nuclear arms levels) democracies – the United States, India, the United Kingdom, France, and Israel – engaged in interstate conflict on no less than twenty-five occasions.** Furthermore, i**n twenty-nine of the recent intrastate conflicts, twenty-three of the prevailing regimes were either democratic throughout the dispute or at certain times during the dispute.** Such realities call into question the assertion that democratic societies have a culture of peace that pervades decision-making.

The third and final logical flaw of the democratic peace is that the theory itself is a myth, as democracies have gone to war with each other numerous times throughout history when it was in their interest to do so or when their sovereignty was threatened by another. From the time of the Greek wars of the 5th and 4th centuries BCE, there have been at least 14 conflicts involving states that would be listed in the "democratic" category of the Polity I-IV indexes**. When one alters the already contentious definition of "war," the number of conflicts increases to at least twenty-three and includes such international disputes as the long-running American-Indian War of the 19th century** (the Iroquois tribe had a complex but recognizable system of democracy), **the 1923 occupation of the Ruhr by the French, and the Allied (British) bombings of Finland during the Second World War. By using the very same conceptualizations that Bruce Russett and other liberal theorists use to categorize democracies, one is able to determine that their very argument – that democratic states never go to war with one another – is simply wrong.**

6. Internet activism doesn't help out democracy

Morozov, 09 (Evgeny, writer and researcher of Belarusian origin who studies political and social implications of technology. He is currently a senior editor at The New Republic. "How dictators watch us on the web," 11-18-09. http://www.prospectmagazine.co.uk/features/how-dictators-watch-us-on-the-web)

It is true that the internet is building what I call "digital civic infrastructure"—new ways to access data and networks to distribute it. This logic underlies many western efforts to reshape cyberspace in authoritarian states. The British foreign secretary David Miliband has enthused about the potential of the communications revolution

to "fuel the drive for social justice." "If it's true that there are more bloggers per head of population in Iran than in any other country, this makes me optimistic," he has also said. **In early November, US secretary of state Hillary Clinton announced Civil Society 2.0, a project to help grassroots organisations around the world use digital technology,** which will include tuition in online campaigning and how to leverage social networks.

But the emergence of this seemingly benign infrastructure can backfire on western governments. The first snag is that turning the internet into a new platform for civic participation requires certainty that only pro-western and pro-democracy forces will participate. Most authoritarian societies, however, defy easy classification into the "good guys vs bad guys" paradigms of the Bush era. In Egypt, for example, the extremist Muslim Brotherhood is a political force—albeit mostly missing from the Egyptian parliament—that can teach Hosni Mubarak a lesson about civic participation. It has an enviable digital presence and a sophisticated internet strategy: for example, campaigning online to get activists released from prison. Western governments shouldn't be surprised when groups like this become the loudest voices in new digital spaces: they are hugely popular and are commonly denied a place in the heavily policed traditional public sphere.

Similarly, **the smartest and most active user of new media in Lebanon is not the western-backed government of Saad Hariri, but the fundamentalist troublemakers of Hizbullah**, whose suave manipulation of cyberspace was on display during the 2006 war with Israel. **In Russia, the internet has given a boost to extreme right-wing groups like the Movement Against Illegal Immigration, which has been using Google Maps to visualise the location of ethnic minorities in Russian cities** and encouraging its members to hound them out. **Criminal gangs in Mexico are fond of YouTube, where they flaunt their power by uploading videos of their graphic killings**. Generally, in the absence of strong democratic norms and institutions, the internet has fuelled a drive for vigilante justice rather than the social variety Miliband was expecting.

And **it gets worse. Ultra-loyalist groups supporting Thailand's monarchy were active during both the September 2006 coup and more recent street protests, finding anti-monarchy material that needed to be censored** via a website called Protecttheking.net. In this, they are essentially doing the job usually reserved for the secret police. In much the same way, **the Iranian revolutionary guards posted online photos of the most ardent protesters at the June 2009 rallies, asking pro-Ahmadinejad Iranians to identify them**. And in August 2009 **religious fundamentalists in Saudi Arabia launched a campaign to identify YouTube videos they found offensive and pressure the company to delete them—a form of digital "hacktivism" which must be delighting the official censors.**

And it doesn't help that anyone with a computer and an internet connection can launch a cyber-attack on a sovereign nation. Last year I took part in one—purely for the sake of experiment—on the websites of the Georgian government. As the Russian tanks were marching into South Ossetia, I was sitting in a cafe in Berlin with a laptop and instructions culled from Russian nationalist blogs. All I had to do was to input the targets provided—the URLs of hostile Georgian institutions (curiously, the British embassy in Tbilisi was on that list)—click "Start" and sit back. I did it out of curiosity; thousands of Russians did it out of patriotism. And the Russian government turned a blind eye. The results of the attack were unclear. For a brief period some government emails and a few dozen websites were either slow or unavailable; some Georgian banks couldn't offer online services for a short period.

Yet **while the internet may take the power away from an authoritarian (or any other) state or institution, that power is not necessarily transferred to pro-democracy groups. Instead it often flows to groups who, if anything, are nastier than the regime. Social media's greatest assets—anonymity, "virality," interconnectedness—are also its main weaknesses.**

This brings me to another valuable point you made, which is that **when people believe that the government exercises surveillance, they become reluctant to exercise democratic freedoms. This is a textbook objection to surveillance**, I agree, **but it also is another objection that I would place under "theoretical" rather than real. Is there any evidence that over the last 12 years, during the flowering of the so-called surveillance state, Americans have become less politically active? More worried about government suppression of dissent? Less willing to listen to opposing voices? All the evidence points in the opposite direction.**

Views from the extreme ends of the political spectrum are far more accessible today than they were in the past. It is infinitely easier to get the Al Qaeda perspective today — one just does a Google search — than it was to learn the Soviet perspective 40 years ago, which would have required one to travel to one of the very small number of communist bookstores around the country. It is hard to think of another period so full of robust political debate since the late 1960s — another era of government surveillance.

Democracy doesn't solve war

Schwartz and Skinner, 01 (Research Fellow at the Hoover Institution at Stanford University, associate professor of history and political science at Carnegie Mellon University; December 22, 2001; "The Myth of Democratic Peace"; JAI Press; ORBIS)

Here we show that **neither the historical record nor the theoretical arguments advanced for the purpose provide any support for democratic pacifism. It does not matter how high or low one sets the bar of democracy. Set it high enough to avoid major exceptions and you find few, if any, democracies until the Cold War era. Then there were no wars between them, of course. But that fact is better explained by NATO and bipolarity than by any shared form of government.** Worse, the peace among the high-bar democracies of that era was part of a larger pacific pattern: peace among all nations of the First and Second Worlds. As for theoretical arguments, those we have seen rest on implausible premises. **Why, then, is the belief that democracies are mutually pacific so widespread and fervent? The explanation rests on an old American tendency to slip and slide unawares between two uses of the word "democracy": as an objective description of regimes, and as a term of praise--a label to distinguish friend from foe.** Because a democracy (term of praise) can do no wrong--or so the thinking seems to run--at least one side in any war cannot be a democracy (regime description). There lies the source of much potential mischief in

foreign policy. **The Historical Problem Democratic pacifism combines an empirical generalization with a causal attribution: democracies do not fight each other, and that is because they are democracies**. Proponents often present the former as a plain fact. Yet regimes that were comparatively democratic for their times and regions have fought each other comparatively often--bearing in mind, for the purpose of comparison, that most states do not fight most states most of the time. **The wars below are either counter-examples to democratic pacifism or borderline cases. Each is listed with the year it started and those combatants that have some claim to the democratic label.** American Revolutionary War, 1775 (Great Britain vs. U.S.) Wars of French Revolution (democratic period), esp. 1793, 1795 (France vs. Great Britain) Quasi War, 1798 (U.S. vs. France) War of 1812 (U.S. vs. Great Britain) Texas War of Independence, 1835 (Texas vs. Mexico) Mexican War, 1846 (U.S. vs. Mexico) Roman Republic vs. France, 1849 American Civil War, 1861 (Northern Union vs. Southern Confederacy) Ecuador-Columbia War, 1863 Franco-Prussian War, 1870 War of the Pacific, 1879 (Chile vs. Peru and Bolivia) Indian Wars, much of nineteenth century (U.S. vs. various Indian nations) Spanish-American War, 1898 Boer War, 1899 (Great Britain vs. Transvaal and Orange Free State) World War I, 1914 (Germany vs. Great Britain, France, Italy, Belgium, and U.S.) Chaco War, 1932 (Chile vs. Argentina) Ecuador-Peru, 1941 Palestine War, 1948 (Israel vs. Lebanon) Dominican Invasion, 1967 (U.S. vs. Dominican Republic) Cyprus Invasion, 1974 (Turkey vs. Cyprus) Ecuador-Peru, 1981 Nagorno-Karabakh, 1989 (Armenia vs. Azerbaijan) Yugoslav Wars, 1991 (Serbia and Bosnian-Serb Republic vs. Croatia and Bosnia; sometimes Croatia vs. Bosnia) Georgia-Ossetia, 1991 (Georgia vs. South Ossetia) Georgia-Abkhazia, 1992 (Georgia vs. Abkhazia and allegedly Russia) Moldova-Dnestr Republic, 1992 (Moldova vs. Dnestr Republic and allegedly Russia) Chechen War of Independence, 1994 (Russia vs. Chechnya) Ecuador-Peru, 1995 NATO-Yugoslavia, 1999 India-Pakistan, 1999

Democracies spark wars

[Sandeep Baliga, David O. Lucc, Tomas Sjöström, Domestic Political Survival and International Conflict: Is Democracy Good for Peace?, Review of Economic Studies (2011) 78 (2): 458-486]

1. INTRODUCTION

The idea that democracy promotes peace has a long history. Thomas Paine argued that monarchs go to war to enrich themselves, but a more democratic system of government would lead to lasting peace: "What inducement has the farmer, while following the plough, to lay aside his peaceful pursuit, and go to war with the farmer of another country?" (Paine, 1985 p. 169). Immanuel Kant agreed that if "the consent of the subjects is required to determine whether there shall be war or not, nothing is more natural than that they should weigh the matter well, before undertaking such a bad business" (Kant, 1795, 1903, p. 122). More recently, the democratic peace hypothesis has influenced the "neoconservative" view of international relations (Kaplan and Kristol, 2003). U.S. policy makers of different political persuasions have invoked it in support of a policy to "seek and support the growth of democratic movements and institutions in every nation and culture."1 But some anecdotal observations seem to support a more "realist" viewpoint. For example, after the breakup of Yugoslavia, democratic reforms were followed by war, not peace. When given a chance in the legislative elections of 2006, the Palestinians voted for Hamas, which did not have a particularly peaceful platform. Such anecdotes suggest that democratization does not always promote peace. Even fully democratic countries such as the U.S. sometimes turn aggressive: under perceived threats to the homeland, the democratically elected President George W. Bush declared war on Iraq.

We develop a simple game-theoretic model of conflict based on Baliga and Sjöström (2004). Each leader can behave aggressively or peacefully. A leader's true propensity to be aggressive, his "type", is his private information. Since actions are strategic complements, the fear that the other leader might be an aggressive type can trigger aggression, creating a fear spiral we call "Schelling's dilemma" (see Schelling, 1960; Jervis, 1976, Jervis, 1978; Kydd, 1997). Unlike Baliga and Sjöström (2004), we assume a leader may be

removed from power. Whether a leader can stay in power depends on the preferences of his citizens, the political system, and the outcome of the interaction between the two countries. The political system interacts with Schelling's dilemma to create a non-monotonic relationship between democracy and peace.

Like the leaders, citizens have different types. By hypothesis, the median type prefers to live in peace. This imposes a "dovish bias" on a dyad of two full democracies (whose leaders can be replaced by their median voters). Thus, a dyadic democratic peace is likely to obtain. However, when facing a country that is not fully democratic, the median voter may support aggression out of fear and may replace a leader who is not aggressive enough. (For example, Neville Chamberlain had to resign after appeasing Hitler.) This gives rise to a "hawkish bias". Thus, in a fully democratic country, a dovish bias is replaced by a hawkish bias when the environment becomes more hostile. In contrast, a dictator is not responsive to the preferences of his citizens, so there is neither a hawkish nor a dovish bias. Accordingly, a dyad of two dictators is less peaceful than a fully democratic dyad, but a dictator responds less aggressively than a democratically elected leader to increased threats from abroad.

In the model, the leader of a limited democracy risks losing power if hawks in his population turn against him. For instance, the German leaders during World War I believed signing a peace agreement would lead to their demise (Asprey, 1991, pp. 486–487, 491). Conversely, the support of the hawkish minority trumps the opposition of more peaceful citizens. **Thus, a limited democracy experiences a hawkish bias similar to a full democracy under threat from abroad but never a dovish bias. On balance, this makes limited democracies more aggressive than any other regime type.** In a full democracy, if the citizens feel safe, they want a dovish leader, but if they feel threatened, they want a hawkish leader. In dictatorships and limited democracies, the citizens are not powerful enough to overthrow a hawkish leader, but the leader of a limited democracy risks losing power by appearing too dovish. This generates a non-monotonic relationship between democracy and peace.

Our empirical analysis reassesses the link between democracy and peace using a flexible semiparametric functional form, where fixed effects account for unobserved heterogeneity across country dyads. We use Polity IV data to classify regimes as dictatorships, limited democracies or full democracies. Following the literature on the democratic peace hypothesis, we define a conflict as a militarized dispute in the Correlates of War data set. The data, which span over the period 1816–2000, contain many military disputes between limited democracies. In the nineteenth century, Britain had a Parliament, but even after the Great Reform Act of 1832, only about 200,000 people were allowed to vote. Those who owned property in multiple constituencies could vote multiple times.2 Hence, Britain is classified as a limited democracy for 58 years and becomes a full democracy only after 1879. France, Italy, Spain, and Germany are also limited democracies at key points in the nineteenth and early twentieth centuries. These countries, together with Russia and the Ottoman Empire, were involved in many militarized disputes in Europe and throughout the world. For much of the nineteenth century, Britain and Russia had many skirmishes and outright wars in the "Great Game" for domination of Central Asia (Hopkirk, 1990). France is also involved in many disputes and is a limited democracy during the Belgian War of Independence and the Franco-Prussian War. Germany is a limited democracy at the start of the First World War.

Over the full sample, the data strongly support a dyadic democratic peace hypothesis: dyads consisting of two full democracies are more peaceful than all other pairs of regime types. This is consistent with previous empirical studies (Babst, 1972, Levy, 1988, , maozrussett, Russett and Oneal, 2001). **Over the same period, limited democracies were the most aggressive regime type**. **In particular, dyads consisting of two limited democracies are more likely to experience militarized disputes than any other dyads, including "mixed" dyads where the two countries have different regime types**. These results are robust to changing the definitions of the three categories (using the Polity scores) and to alternative specifications of our empirical model. **The effects are quantitatively significant**. Parameter estimates of a linear probability model specification, suggest that the likelihood that a dyad engages in a militarized dispute falls roughly 35% if the dyad changes from a pair of limited democracies to a pair of dictatorships. We also find that if some country j faces an opponent which changes from a full democracy to another regime type, the estimated equilibrium probability of conflict increases most dramatically when country j is a full democracy. This suggests that as the environment becomes more hostile, democracies respond more aggressively than other regime types, which is also consistent with our theoretical model.

Democracies are more prone to hostility – despite studies for Democratic Peace

Theoretical and empirical work in economics and political science has investigated the relationship between political systems and war. Jackson and Morelli (2007) formalize the idea that leaders start wars when their preferences are sufficiently biased away from their citizens' preferences. Levy and Razin (2004) provide a theory of the democratic peace based on incomplete information. They assume the representative citizen is less well informed about the benefit of concessions than the leader and show that democratically elected leaders are more likely to reveal information truthfully. In Bueno De Mesquita et al. (1999), political leaders must bribe key supporters to stay in power when foreign policy fails. A dictator has to bribe fewer supporters and is therefore more likely to go to war than a democratically elected leader. On the other hand, in order to avoid being replaced, a leader may "gamble for resurrection" with an aggressive foreign policy (Downs and Rocke, 1994, Bueno De Mesquita and Silverson, 1995, Hess and Orphanides, 1995). Fearon (1994) assumes leaders suffer "audience costs" if they back down during a war of attrition. If audience costs are higher in democracies, then democracies are more committed to a conflict and may be more reluctant to enter into one. Tangeras (2008) assumes that leaders have private information about the probability of winning a war. Democratically elected leaders are more reluctant to start a war because they will lose power if the war ends badly. According to Leeds (1999), democratic leaders are more able to commit to honouring agreements and thus more able to cooperate.

These theories provide underpinnings for the democratic peace hypothesis, but it is not obvious how they can be extended to explain the non-monotonicity we find in the data. For example, a natural extension of Fearon (1994) model would be to assume the audience costs of limited democracies lie between those of dictatorships and full democracies, but this would not produce non-monotonicity. Similarly, if the leader of a limited democracy has less biased preferences than a dictator, then the Jackson and Morelli (2007) model would predict that limited democracies go to war less often than dictatorships.

Our theory incorporates an important feature of Bueno De Mesquita et al. (1999): the support for the leader's action is derived from heterogeneous preferences among the citizens. In our model, leaders of full and limited democracies suffer audience costs (as in Fearon, 1994) if they are dovish when the opposing leader is hawkish; in addition, a leader of a full democracy faces audience costs (from the median voter) if he is hawkish against a dovish opponent; a dictator faces no audience costs at all. The result is a non-monotonic relationship between democracy and peace.

Mansfield and Snyder (2005) argue that increased nationalism can cause conflict during a period of transition when a regime is being democratized. However, in our baseline empirical model, dyads of limited democracies are the most conflict ridden even when controlling for regime transitions (using Mansfield and Snyder's, 2005, transitional dummies). **This suggests that limited democracies are not only prone to conflict during periods of transition.**

Democracy Doesn't insure peace

Democracy isn't the variable for peace – no evidence puts it above other factors

C. Conclusion

This study appears to have resolved a controversy related to the democratic peace. Counter to the arguments in Oneal and Russett, 1997b, 1998, 1999, AFFINITY is not merely an artifact of liberal variables. Even the residuals from AFFINITY have a powerful pacifying effect on militarized disputes, independent of regime type, interdependence, and other variables. Further, the relationship between AFFINITY and the probability of disputes appears to be causal. Oneal and Russett acknowledge theoretical and empirical merit in a measure of preference similarity. Their critique is based on the assertion that preferences are caused by liberal variables. Since a similar claim cannot be made of the residuals of AFFINITY, there would seem to be no theoretical or empirical contradiction between the position offered by Oneal and Russett and the one offered here.

It remains to be demonstrated whether democracy itself is safely treated as an exogenous variable. Democracy is associated with the occurrence of militarized conflicts, but wealth and other variables used in standard regressions of the democratic peace anticipate democracy at least as well as they do preferences. The same rationale used by Oneal and Russett to challenge the exogeneity of preferences would seem to threaten liberal variables. At the same time, the research here is not intended to prove that the effect of democracy on the democratic peace is really attributable to economic development. I simply show that such an assertion is consistent with Oneal and Russett's own criteria and that it is compelling given their claims.

Nor should one conclude from these results that the liberal peace is in any way compromised. The findings challenge the notion that the democratic peace is due largely, or even substantially, to democracy. Conversely, the impact of economic liberalism, through trade and wealth, is substantiated by the results. Democracy is likely to continue to show itself as a significant contributor to the lessening of international violence. Democracy matters in accounting for the democratic peace. It is just that its role is less "law-like" and increasingly subject to caveats and competitors (Levy, 1988). Democracy's status in the democratic peace is certainly far from dead, but there appears to be a gradual withering away of democracy's preeminence. Other variables have been shown to account for much of what was thought to be the private domain of joint democracy. We must ask ourselves at some point whether other variables deserve greater attention given the relatively modest portion of conflict behavior that can be accounted for by pairing republics.

At the same time, by any reasonable criteria, preferences matter. The effect of preferences remains highly significant regardless of model specification, variable construction, estimation technique, or sample. Preferences as measured by AFFINITY predict roughly three times the variation in dispute propensity of the democracy variables. States with the most similar preferences are about half as likely to experience a dispute as states with the most republican governments. Much remains to be explored in terms of how preferences operate, how they matter, and why. As Oneal and Russell point out, "the theoretical interpretation of the role that preferences play in motivating states to use force is still underdeveloped. Preferences are abstract" (1999:234). Yet, the abstraction of preferences has proven powerful theoretically and empirically. Ignoring preferences in seeking to account for the democratic peace is likely to yield misleading conclusions.

Answer to – Democracy solves terrorism

democracy doesn't solve terrorism – too complex

LAPPIN 09 PhD candidate at the Centre for Peace Research and Strategic Studies at the Catholic University of Leuven in Belgium under the supervision of Prof. Dr. Luc Reychler

Richard Lappin, What Democracy? Exploring the Absent Centre of Post-Conflict Democracy Assistance, Journal of Peace, Conflict and Development, Issue 14, July 2009, http://www.humansecuritygateway.com/documents/JPCD_ExploringAbsentCentrePostConflictDemocracyAssistance.pdf

Finally, it has also been recently argued, to mixed reaction, that promoting **democrac**y in post-conflict states can be a distinct and vital method in combating international terrorism. The theoretical argument is simple and attractive and rests on the belief that the disregard for political participation and civil liberties endemic in undemocratic and conflict-torn societies can serve as a breeding ground for international terrorists. 26 In contrast, it is considered that **democrac**y lowers the costs of achieving political goals through legal means and, thus, deters groups from pursuing costly illegal terrorist activities. 27 The acceptance of this argument has been widespread in policy circles and is reflected in statements such as George W. Bush's claim that **democrac**y promotion is necessary ―to help change the conditions that give rise to extremism and terror.‖ 28

However, a closer examination of the empirical connection between terrorism and **democrac**y illustrates that the relationship is much more complex and that it is probably too premature to confidently attribute any future reduction in international terrorism to the promotion of **democrac**y overseas. 29

Answer to – Democracy is moral

Democracy fails to be ideal – it isn't more moral

Gairdner, 01. Former Chairman of Gairdner foundation. Former professor- York and Stanford Universities

(William D.;. *The Trouble with Democracy: A Citizen Speaks Out*. Pg. 289-290)

What is specifically unnerving about the twentieth century is that so many were killed by their own governments in the name of a puritanical political vision of freedom, peace, and harmony for human society. That was almost always a vision of collective freedom that became corrupted by the means employed for its realization, and thus turned into a mockery of itself. But we would be foolish to believe that the underlying democratic vision was not very real, exceedingly powerful, and appealing to millions. Even worse, we have to risk the thought that perhaps collective freedom is the eventual logical outcome of all pure democratic theory, and that systems rooted in this logic evolve at different rates in the direction of totalitarian democracy, in one form or another.

The thesis of the present chapter, then, in contrast to Rummel's, is that Hitlerism, Fascim, Communism, and their offshoots were political religions that arose straight from the logic inherent in the process of secularizing the Christian-democratic tradition, and that it is largely in the name of these different forms of modern "democracy" that more war has been made and more

democide perpetrated than any other time in history of the world. I can hear my critics grinding their teeth over such a statement. Hitlerism and Marxism you have explained, they'll say. And the Eastern European satellites, and perhaps Mssolini. But Maoism or the Khmer Rouge regime? Democratic? That's a little tougher. My answer is that we can best understand these different forms of "people's democracy," or modern Communism, whether Chinese, Cambodian, Cuban, or Vietnamese, as variations of the Marxist vision of "true democracy," often learned by Eastern intellectuals in the West and transported to the East. That vision, with its ancient roots in the deeply spiritual life of the West, surfaced as a secular political ideology with Rousseau, as we have seen, whose theoretical work was the first powerfully concentrated political metaphor for arriving methodically at a mystical unity of the people n the absence of the Christian God. Once secularized, however, it was precisely this atheistic and materialist formula, largely as identified in the universals of tolatiarian democracy, that was so easily transported and grafted onto the hysterical egalitarian spirit wherever oppression was found or imagined.

Rights

1nc – Rights

1. Rights don't trump lives – the function of the law is to be pragmatic

POSNER 03 Prof of Law at U Chicago [Richard Posner, Security Versus Civil Liberties, from Rights vs . Public Safety after 9/11, eds Amitai Etzioni and Jason H. Marsh] pages 25-28

In the wake of the September 11 terrorist attacks have come many proposals for tightening security; some measures to that end have already been taken. Civil libertarians are troubled. They fear that concerns about national security will lead to an erosion of civil liberties. They offer historical examples of supposed overreactions to threats to national security. They treat our existing civil liberties—freedom of the press, protections of privacy and of the rights of criminal suspects, and the rest—as sacrosanct, insisting that the battle against international terrorism accommodate itself to them.

I consider this a profoundly mistaken approach to the question of balancing liberty and security. The basic mistake is the prioritizing of liberty. It is a mistake about law and a mistake about history. Let me begin with law. What we take to be our civil liberties—for example, immunity from arrest except upon probable cause to believe we've committed a crime, and from prosecution for violating a criminal statute enacted after we committed the act that violates it—were made legal rights by the Constitution and other enactments. The other enactments can be changed relatively easily, by amendatory legislation. Amending the Constitution is much more difficult. In recognition of this the Framers left most of the constitutional provisions that confer rights pretty vague. The courts have made them definite.

Concretely, the scope of these rights has been determined, through an interaction of constitutional text and subsequent judicial interpretation, by a weighing of competing interests. I'll call them the public-safety interest and the liberty interest. Neither, in my view, has priority. They are both important, and their relative importance changes from time to time and from situation to situation. The safer the nation feels, the more weight judges will be willing to give to the liberty interest. The greater the threat that an activity poses to the nation's safety, the stronger will the grounds seem for seeking to repress that activity, even at some cost to liberty. This fluid approach is only common sense. Supreme Court Justice Robert Jackson gave it vivid expression many years ago when he said, in dissenting from a free-speech decision he thought doctrinaire, that **the Bill of Rights should not be made into a suicide pact**. It was not intended to be such, and the present contours of the rights that it confers, having been shaped far more by judicial interpretation than by the literal text (which doesn't define such critical terms as "due process of law" and "unreasonable" arrests and searches), are alterable in response to changing threats to national security.

If it is true, therefore, as it appears to be at this writing, that the events of September 11 have revealed the United States to be in much greater jeopardy from international terrorism than had previously been believed—have revealed it to be threatened by a diffuse, shadowy enemy that must be fought with police measures as well as military force—it stands to reason that our civil liberties will be curtailed. **They should be curtailed**, to the extent that the benefits in greater security outweigh the costs in reduced liberty. All that can reasonably be asked of the responsible legislative and judicial officials is that they weigh the costs as carefully as the benefits.

It will be argued that the lesson of history is that officials habitually exaggerate dangers to the nation's security. But the lesson of history is the opposite. It is because officials have repeatedly and disastrously underestimated these dangers that our history is as violent as it is. Consider such

underestimated dangers as that of secession, which led to the Civil War; of a Japanese attack on the United States, which led to the disaster at Pearl Harbor; of Soviet espionage in the 1940s, which accelerated the Soviet Union's acquisition of nuclear weapons and emboldened Stalin to encourage North Korea's invasion of South Korea; of the installation of Soviet missiles in Cuba, which precipitated the Cuban missile crisis; of political assassinations and outbreaks of urban violence in the 1960s; of the Tet Offensive of 1968; of the Iranian revolution of 1979 and the subsequent taking of American diplomats as hostages; and, for that matter, of the events of September 11.

It is true that when we are surprised and hurt, we tend to overreact—but only with the benefit of hindsight can a reaction be separated into its proper and excess layers. In hindsight we know that interning Japanese-Americans did not shorten World War II. But was this known at the time? If not, shouldn't the Army have erred on the side of caution, as it did? Even today we cannot say with any assurance that Abraham Lincoln was wrong to suspend habeas corpus during the Civil War, as he did on several occasions, even though the Constitution is clear that only Congress can suspend this right. (Another of Lincoln's wartime measures, the Emancipation Proclamation, may also have been unconstitutional.) But Lincoln would have been wrong to cancel the 1864 presidential election, as some urged: by November of 1864 the North was close to victory, and canceling the election would have created a more dangerous precedent than the wartime suspension of habeas corpus. This last example shows that civil liberties remain part of the balance even in the most dangerous of times, and even though their relative weight must then be less.

Lincoln's unconstitutional acts during the Civil War show that even legality must sometimes be sacrificed for other values. We are a nation under law, but first we are a nation. I want to emphasize something else, however: the malleability of law, its pragmatic rather than dogmatic character. The law is not absolute, and the slogan "Fiat iustitia ruat caelum" ("Let justice be done though the heavens fall") is dangerous nonsense. The law is a human creation rather than a divine gift, a tool of government rather than a mandarin mystery. It is an instrument for promoting social welfare, and as the conditions essential to that welfare change, so must it change.

3. The worst rights violations will continue regardless of legal reforms to mass surveillance – dissidents and racial minorities will inevitably be targeted

Kundnani and Kumar, 15 (Arun, former editor of the journal Race & Class, PhD from London Metropolitan University, writer on Islamophobia and surveillance. Deepa, associate professor of media studies and Middle Eastern studies at Rutgers University. 3-21-15. "Race, surveillance, and empire" http://www.kundnani.org/2015/03/21/race-surveillance-and-empire-2/)

Today, we are once again in a period of revelation, concern, and debate on national security surveillance. Yet if real change is to be brought about, the racial history of surveillance will need to be fully confronted—or opposition to surveillance will once again be easily defeated by racial security narratives. The significance of the Snowden leaks is that they have laid out the depth of the NSA's mass surveillance with the kind of proof that only an insider can have. The result has been a generalized level of alarm as people have become aware of how intrusive surveillance is in our society, but that alarm remains constrained within a public debate that is highly abstract, legalistic, and centered on the privacy rights of the white middle class.

On the one hand, **most civil liberties advocates are focused on the technical details of potential legal reforms and new oversight mechanisms to safeguard privacy. Such initiatives are likely to bring little change because they fail to confront the racist and imperialist core of**

the surveillance system. On the other hand, most technologists believe the problem of government surveillance can be fixed simply by using better encryption tools. While encryption tools are useful in increasing the resources that a government agency would need to monitor an individual, they do nothing to unravel the larger surveillance apparatus. Meanwhile, executives of US tech corporations express concerns about loss of sales to foreign customers concerned about the privacy of data. In Washington and Silicon Valley, what should be a debate about basic political freedoms is simply a question of corporate profits.69

Another and perhaps deeper problem is **the use of images of state surveillance that do not adequately fit the current situation—such as George Orwell's discussion of totalitarian surveillance.** Edward Snowden himself remarked that Orwell warned us of the dangers of the type of government surveillance we face today.70 Reference to Orwell's 1984 has been widespread in the current debate; indeed, sales of the book were said to have soared following Snowden's revelations.71 **The argument that digital surveillance is a new form of Big Brother is, on one level, supported by the evidence. For those in certain targeted groups—Muslims, left-wing campaigners, radical journalists—state surveillance certainly looks Orwellian. But this level of scrutiny is not faced by the general public. The picture of surveillance today is therefore quite different from the classic images of surveillance that we find in Orwell's 1984, which assumes an undifferentiated mass population subject to government control. What we have instead today in the United States is total surveillance, not on everyone, but on very specific groups of people, defined by their race, religion, or political ideology: people that NSA officials refer to as the "bad guys."**

In March 2014, Rick Ledgett, deputy director of the NSA, told an audience: "Contrary to some of the stuff that's been printed, we don't sit there and grind out metadata profiles of average people. **If you're not connected to one of those valid intelligence targets, you are not of interest to us."72 In the national security world, "connected to" can be the basis for targeting a whole racial or political community** so, even assuming the accuracy of this comment, it points to the ways that national security surveillance can draw entire communities into its web, while reassuring "average people" (code for the normative white middle class) that they are not to be troubled. In the eyes of the national security state, this average person must also express no political views critical of the status quo.

Better oversight of the sprawling national security apparatus and greater use of encryption in digital communication should be welcomed. But by themselves these are likely to do little more than reassure technologists, while racialized populations and political dissenters continue to experience massive surveillance. This is why the most effective challenges to the national security state have come not from legal reformers or technologists but from grassroots campaigning by the racialized groups most affected. In New York, the campaign against the NYPD's surveillance of Muslims has drawn its strength from building alliances with other groups affected by racial profiling: Latinos and Blacks who suffer from hugely disproportionate rates of stop and frisk. In California's Bay Area, a campaign against a Department of Homeland Security-funded Domain Awareness Center was successful because various constituencies were able to unite on the issue, including homeless people, the poor, Muslims, and Blacks. Similarly, a demographics unit planned by the Los Angeles Police Department, which would have profiled communities on the basis of race and religion, was shut down after a campaign that united various groups defined by race and class. The lesson here is that, while the national security state aims to create fear and to divide people, activists can organize and build alliances across race lines to overcome that fear. To the extent that the national security state has targeted Occupy, the antiwar movement, environmental rights activists, radical journalists and campaigners, and whistleblowers, these groups have gravitated towards opposition to the national security state. But understanding the centrality of race and empire to national security surveillance means finding a basis for unity across different groups who experience similar kinds of policing: Muslim, Latino/a, Asian, Black, and white dissidents and radicals. It is on such a basis that we can see the beginnings of an effective multiracial opposition to the surveillance state and empire.

Ext 1 – Rights don't Outweigh

Ethical policymaking requires calculation of consequences – prioritizing rights sounds nice but doesn't grapple with policymakers' responsibility for millions of lives

Gvosdev, 05 (Nikolas, Rhodes Scholar, PhD from St. Antony's College, executive editor of The National Interest ["The Value(s) of Realism," SAIS Review 25.1, Project Muse])

As the name implies, realists focus on promoting policies that are achievable and sustainable. In turn, **the morality of a foreign policy action is judged by its results**, not by the intentions of its framers. **A foreign policymaker must weigh the consequences of any course of action and assess the resources at hand to carry out the proposed task**. As Lippmann warned, Without the controlling principle that the nation must maintain its objectives and its power in equilibrium, its purposes within its means and its means equal to its purposes, its commitments related to its resources and its resources adequate to its commitments, it is impossible to think at all about foreign affairs.8 Commenting on this maxim, Owen Harries, founding editor of The National Interest, noted, "This is a truth of which Americans—more apt to focus on ends rather than means when it comes to dealing with the rest of the world—need always to be reminded."9 In fact**, Morgenthau noted that "there can be no political morality without prudence."10 This virtue of prudence—which Morgenthau identified as the cornerstone of realism—should not be confused with expediency. Rather, it takes as its starting point that it is more moral** to fulfill one's commitments than to make "empty" promises, and **to seek solutions that minimize harm and produce sustainable results.** Morgenthau concluded: [End Page 18] **Political realism does not require, nor does it condone, indifference to political ideals and moral principles, but it requires indeed a sharp distinction between the desirable and the possible, between what is desirable everywhere and at all times and what is possible under the concrete circumstances of time and place.**11 This is why, prior to the outbreak of fighting **in the former Yugoslavia, U.S. and European realists urged that Bosnia be decentralized and partitioned into ethnically based cantons as a way to head off a destructive civil war**. Realists felt this would be the best course of action, especially after the country's first free and fair elections had brought nationalist candidates to power at the expense of those calling for inter-ethnic cooperation. They had concluded—correctly, as it turned out—that the United States and Western Europe would be unwilling to invest the blood and treasure that would be required to craft a unitary Bosnian state and give it the wherewithal to function. Indeed, at a diplomatic conference in Lisbon in March 1992, the various factions in Bosnia had, reluctantly, endorsed the broad outlines of such a settlement. For the purveyors of moralpolitik, this was unacceptable. After all, for this plan to work, populations on the "wrong side" of the line would have to be transferred and resettled. Such a plan struck directly at the heart of the concept of multi-ethnicity—that different ethnic and religious groups could find a common political identity and work in common institutions. **When the United States signaled it would not accept such a settlement, the fragile consensus collapsed.** The United States, of course, cannot be held responsible for the war; this lies squarely on the shoulders of Bosnia's political leaders. Yet **Washington fell victim to** what Jonathan Clarke called "faux Wilsonianism," **the belief that "high-flown words matter more than rational calculation" in formulating effective policy**, which led U.S. policymakers to dispense with the equation of "balancing commitments and resources."12 Indeed, as he notes, **the Clinton administration had criticized peace plans calling for decentralized partition in Bosnia "with lofty rhetoric without proposing a practical alternative." The subsequent war led to the deaths of tens of thousands and left more than a million people homeless**. After three years of war, the Dayton Accords—hailed as a triumph of American diplomacy—created a complicated arrangement by which the federal union of two ethnic units, the Muslim-Croat Federation, was itself federated to a Bosnian Serb republic. Today, Bosnia requires thousands of foreign troops to patrol its internal borders and billions of dollars in foreign aid to keep its government and economy functioning. **Was the aim of U.S. policymakers, academics and journalists—creating a multi-ethnic democracy in Bosnia—not worth pursuing? No, not at all, and this is not what the argument suggests. But aspirations were not matched with capabilities. As a result of holding out for the "most moral" outcome and encouraging the Muslim-led government in Sarajevo to pursue maximalist aims rather than finding a workable compromise that could have avoided bloodshed and produced more stable conditions, the peoples of Bosnia suffered greatly**. In the end, the final settlement was very close [End Page 19] to the one that realists had initially proposed—and the one that had also been roundly condemned on moral grounds.

Ext 2 – It'll Continue / Racism

There is no "free society" to protect, and they don't solve it – surveillance of racial minorities pre-dates the Internet Age and extends well beyond mass federal surveillance

Wise, 13 (Tim, anti-racist writer, author of multiple books. "Whiteness, NSA Spying and the Irony of Racial Privilege" 6-19-13. http://www.timwise.org/2013/06/whiteness-nsa-spying-and-the-irony-of-racial-privilege/)

Let's be clear, **it's not that the NSA misdeeds, carried out by the last two administrations, are no big deal**. They're completely indefensible, no matter the efforts of the apologists for empire — from the corporate media to President Obama to Dick Cheney — to legitimize them. A free people should not stand for it.

Problem is, we are not a free people and never have been, and therein lies the rub.

The idea that with this NSA program there has been some unique blow struck against democracy, and that now our liberties are in jeopardy **is the kind of thing one can only believe if one has had the luxury of thinking they were living in such a place**, and were in possession of such shiny baubles **to begin with. And this is, to be sure, a luxury enjoyed by painfully few folks of color, Muslims in a post-9/11 America, or poor people of any color.** For the first, they have long known that their freedom was directly constrained by racial discrimination, in housing, the justice system and the job market; for the second, profiling and suspicion have circumscribed the boundaries of their liberties unceasingly for the past twelve years; and for the latter, freedom and democracy have been mostly an illusion, limited by economic privation in a class system that affords less opportunity for mobility than fifty years ago, and less than most other nations with which we like to compare ourselves.

In short, when people proclaim a desire to "take back our democracy" from the national security apparatus, or for that matter the plutocrats who have ostensibly hijacked it, they begin from a premise that is entirely untenable; namely, that there was ever a democracy to take back, and that the hijacking of said utopia has been a recent phenomenon. But there wasn't and it hasn't been.

Reaction to the most recent confirmation of this truth ranks right along with the way so many were stunned by the September 11 attacks. The shock in that instance also came from a place of naiveté, wrought by the luxury of believing that the rest of the world viewed us as we did: as a paragon of virtue, which had brought only light and happiness to the world, rather than military occupations, hellfire missiles, brutal and crippling economic sanctions, and support for dictators so long as they were serving our presumed interests. But some people — and again, they were mostly black and brown — were not stunned at all. Having long had no choice but to see the nation's warts for what they were, and having never possessed the benefit of viewing America as most whites had, peoples of color, while horrified by that day's events, were hardly likely to be knocked off stride by them. They had always known what it was like to be hated. And hunted. And solely because of who they were.

For myself, I long ago stopped being shocked by anything the empire did in the service of its continuity. Ever since I was in college, and it was revealed that the Central American solidarity group of which I was a member was being actively spied on by the FBI, I've taken it as a matter of faith that such things were probably happening, and that it would have been silly to the point of idiotic for me to assume such surveillance were a one-off thing, confined to the inner-workings of the Reagan Administration.

By 1988, at which point I was still a Democrat — hoping against hope to turn that party in a truly left direction — the realization that the government was actively spying on its citizens was fully concretized for me. It was then that I was disallowed from riding in a campaign motorcade for Michael Dukakis (despite being the head of the largest College Democrats chapter in the New Orleans area),

because my activism against U.S. policy in Nicaragua and El Salvador had earned me an FBI file and caused me to fail a Secret Service background check.

So yeah, the government is spying on you precious. And now you're pissed?

This is the irony of privilege: the fact that some have for so long enjoyed it, in its largely unfettered state, is precisely why some of those those same persons are now so exorcised at the thought of potentially being treated like everyone else has been, forever; and it is also why the state was able to get away with it for such an extended period. **So long as the only possible targets were racial and religious and class others, shock and outrage could be kept at a minimum. And so the apparatus of profiling and monitoring and snooping and data collection and even targeted assassination grew like mushrooms in the dark.** And deep down, most of the same white folks who are now so unhinged by the mere possibility — and a remote one at that — that they will be treated like those others, knew what was going on.

And they said little or nothing. White liberals — with some notable exceptions — mostly clucked their tongues and expressed how unfortunate it was that certain people were being profiled, but they rarely spoke out publicly, or challenged those not-so-random searches at the airport, or dared to challenge cops when they saw them harassing, or even brutalizing the black and brown. Plenty of other issues were more pressing. The white conservatives, of course, largely applauded either or both of those.

And now, because they mostly ignored (or even in some cases cheered) the violations of Constitutional rights, so long as the violations fell upon someone other than themselves, they are being freshly confronted with the surly adolescent version of the infant to which they gave birth, at least indirectly. And they aren't too happy with his insolence.

Yeah, well, **tell it to pretty much every Arab American, every Persian American, every Afghan American, everyone with a so-called Middle Eastern name walking through an airport in this country for the past decade or more. Tell them how now you're outraged by the idea that the government might consider you a potential terrorist.**

Tell it to the hundreds of thousands of black men in New York, stopped and frisked by the NYPD over the past fifteen years, whose names and information were entered into police databases, even though they had committed no crime, but just as a precautionary measure, in case they ever decided to commit one. Tell them how tight it makes you to be thought of as a potential criminal, evidence be damned.

Tell it to brown folks in Arizona, who worry that the mere color of their skin might provoke a local official, operating on the basis of state law (or a bigoted little toad of a sheriff), to stop them and force them to prove they belong in the country. Explain to them how patently offensive and even hurtful it is to you to be presumed unlawful in such a way as to provoke official government suspicion.

Tell it to the veterans of the civil rights struggle whose activities — in the Black Panthers, SNCC, the Young Lords, the Brown Berets, and the American Indian Movement, among others — were routinely monitored (and more to the point actively disrupted and ripped apart) by government intelligence agencies and their operatives. **Tell them how incredibly steamed you are that your government might find out what websites you surf**, or that you placed a phone call last Wednesday to someone, somewhere. **Make sure to explain how such activities are just a step away from outright tyranny and surely rank up there alongside the murder and imprisonment to which their members were subjected.** Indeed.

And then maybe, just maybe, consider how privilege — being on the upside, most of the time, of systems of inequality — can (and has) let you down, even set you up for a fall. How maybe, just maybe, all the apoplexy mustered up over the NSAs latest outrage, might have been conjured a long time ago, and over far greater outrages, the burdens of which were borne by only certain persons, and not others.

For example: stop and frisk

Christopher, 13 (Tommy, Daily Banter's White House Correspondent and Political Analyst. He's been a political reporter and liberal commentator since 2007, and has covered the White House since the beginning of the Obama administration, first for

PoliticsDaily, and then for Mediaite. "This NSA Scandal Is A White People Problem," 6-14-13, gender modified. http://www.mediaite.com/online/this-nsa-scandal-is-a-white-people-problem/)

What's ridiculous about this is the proportion of the coverage. According to TV Eyes, **the NSA scandal has been mentioned on cable almost 3,000 times in a little over a week, since the Verizon story broke.** In a sense, this is commendable, because despite the American people's clear apathy about this kind of surveillance, journalists have decided that this is important. That's one of the most important functions that the Fourth Estate can serve.

Would you like to know how many mentions there have been about a story in which the government systematically performs warrantless searches of millions of innocent Americans' phone records? Two hundred and sixty-seven.

Wait, I messed that up, it wasn't 267 this past week, it was 30. It was **267 mentions these past three months. Oh, and it wasn't warrantless searches of phone numbers and call times, it was warrantless searches of actual American people's persons, their physical, IRL bodies. Conversely, then, journalists appear to have decided that this is not important**, or rather, is one one-hundredth as important as the warranted non-searches of bullsh*t.

Why is that? It's hard to tell, but **maybe it has something to do with the fact that the Stop and Frisk policy overwhelmingly affects the privacy of innocent black and Latino people.** It's not for lack of a hot news peg. Even if the merits of the story don't turn you on, the Obama administration just signaled it will file briefs in support of the plaintiff in a suit against the policy. If the last several weeks have made one thing clear about the media, it's that the best way to get them to care about government abuse, or anything, is to do it to white people.

Much like these NSA programs, the **Stop and Frisk** policy isn't inherently abusive. It **is based on a law that allows police to stop someone on the street if they have "reasonable suspicion" that the individual "is committing, has committed or is about to commit" a crime, and "demand of him his name, address and an explanation of his conduct."**

That's the "Stop" part of "Stop and Frisk." In order to move on to "Frisk," the officer must "reasonably suspect that he is in danger of physical injury."

In practice, though, the policy has resulted in over half a million stops per year, stops which have disproportionately targeted minorities, in the same way that Scooby Snacks™ disproportionately target Scooby Doo. I know there are some folks who would like to explain this as a function of minorities' inherent criminality (you know who you are), but then how do you explain this: White people, who represent about 12% of those stopped, white people were almost twice as likely to be found with drugs or weapons than black people? Are white people inherently more criminal?

I don't think so. I think the abuse of this policy is rooted in the concept of "reasonable suspicion," which, according to the Supreme Court, requires circumstances similar to these:

US Courts have held that a stop on reasonable suspicion may be appropriate in the following cases: when a person possesses unusual items (like a wire hanger) which would be useful in a crime and is looking into car windows at 2 am, when a person matches a description of a suspect given by another officer, or when a person runs away at the sight of a peace officer. However, reasonable suspicion does not apply merely because a person refuses to answer questions, declines to allow a voluntary search, or is of a particular race or ethnicity.

The sheer volume of stops indicates that the police are applying an interpretation of "reasonable suspicion" that's considerably looser than that, especially given that they are wrong 90% of the time. Whatever standard of suspicion they're using, it is apparently less reasonable than the suspicion that President Obama is the Antichrist.

But according to the program stats, the police are far more accurate at judging suspicious behavior in white people. That tells me that they could probably use to stop a few more white people, but also that they could use to become more adept at discerning suspicious behavior in others. Whatever it is that stops cops from searching more innocent white people should also be used to help them quit harassing minorities, especially black people.

Just as those Stop and Frisk stats have everything to do with the cultural biases of the power structure, so does the mainstream media's disproportionate interest in the NSA scandal over other, far more alarming injustices. While MSNBC (including Chris Hayes, whom I am not trying to pick on) has covered Stop and Frisk much more than its competitors (about 50% more than Fox News, and 900% more than CNN!), the overall discrepancy is indicative of a lack of diverse viewpoints in journalism. **Abuses like Stop and Frisk have been occurring for centuries, and have a lot more in common with J. Edgar Hoover than Barack Obama does. While we're busy having the conversation about what the government might do with Prism, maybe we could make some room for what it's already doing to millions of innocent citizens.**

Internet Freedom

1nc – Internet Freedom

1. The U.S. doesn't promote internet freedom – American policy is self-interested and just as likely to restrict internet freedom

Hill, 15 (Richard, President, Association for Proper internet Governance. A review of Shawn M. Powers and Michael Jablonski's book,The Real Cyber War: The Political Economy of Internet Freedom. "Dissecting The "Internet Freedom" Agenda" 5-6-15. http://www.ip-watch.org/2015/05/06/book-review-dissecting-the-internet-freedom-agenda/#_ftn2)

There is a vast literature on internet governance, but much of it is ideological and normative: the author espouses a certain point of view, explains why that point of view is good, and proposes actions that would lead to the author's desired outcome. There is nothing wrong with that approach: on the contrary, such advocacy is necessary and welcome.

But **a more detached analytical approach is also needed, and Powers and Jablonski provide exactly that. Their objective is to help us understand** (citing from p. 19 of the paperback edition) **"why states pursue the policies they do".** The book "focuses centrally on understanding the numerous ways in which power and control are exerted in cyberspace" (p. 19).

Starting from the rather obvious premise that states compete to shape international policies that favor their interests, and using the framework of political economy, the authors outline the geopolitical stakes and show how questions of power, and not human rights, are the real drivers of much of the debate about Internet governance. **They show how the United States has deliberately used a human rights discourse to promote policies that further its geo-economic and geo-political interests.** And how it has used subsidies and government contracts to help its private companies to acquire or maintain dominant positions in much of the ICT sector.

Powers and Jablonski dissect the mechanisms by which vibrant government institutions deliberately transferred power to US corporations in order to further US geo-economical and geo-political goals**. In particular, they show how a "freedom to connect" narrative is used by the USA to attempt to transform information and personal data into commercial commodities that should be subject to free trade.**

Yet all states (including the US) regulate, at least to some extent, **the flow of information within and across their borders.** If information is the "new oil" of our times, then it is not surprising that states wish to shape the production and flow of information in ways that favor their interests. Thus it is not surprising that states such as China, India, and Russia have started to assert sovereign rights to control some aspect of the production and flow of information within their borders, and that European Union courts have made decisions on the basis of European law that affect global information flows and access.

As the authors put the matter (p. 6): "the [US] doctrine of internet freedom … is the realization of a broader [US] strategy promoting a particular conception of networked communication that depends on American companies …, supports Western norms …, and promotes Western products." (I would personally say that it actually supports US norms and US products and services.) As the authors point out, one can ask (p. 11): "If states have a right to control the types of people allowed into their territory (immigration), and how its money is exchanged with foreign banks, then why don't they have a right to control information flows from foreign actors?"

To be sure, any such controls would have to comply with international human rights law. But the current US policies go much further, implying that those human rights laws must be implemented in accordance with the US interpretation, meaning few restrictions on freedom of speech, weak protection of privacy, and ever stricter protection for intellectual property. As Powers and Jablonsky point out (p. 31)**, the US does not hesitate to promote restrictions on information flows when that promotes its goals.**

Again, **the authors do not make value judgments: they explain how the US deliberately attempts to shape (to a large extent successfully) international policies, so that both actions and inactions serve its interests and those of the large corporations that increasingly influence US policies.**

The authors also explain how the US military-industrial complex has morphed into an information-industrial complex, with deleterious consequences for both industry and government, consequences such as "weakened oversight, accountability, and industry vitality and competiveness"(p. 23) that create risks for society and democracy. As the authors say, the shift "from adversarial to cooperative and laissez-faire rule making is a keystone moment in the rise of the information-industrial complex" (p. 61). They show how the network effects, economies of scale, and externalities that are fundamental features of the internet favor first-movers, which are mostly US companies.

The remedy to such situations is well known: government intervention – widely accepted regarding air transport, road transport, pharmaceuticals, etc., and yet unthinkable for many regarding the internet. But why? As the authors put the matter (p. 24): "While heavy-handed government controls over the internet should be resisted, so should a system whereby internet connectivity requires the systematic transfer of wealth from the developing world to the developed." But freedom of information is put forward to justify specific economic practices which would not be easy to justify otherwise, for example "no government taxes companies for data extraction or for data imports/exports, both of which are heavily regulated aspects of markets exchanging other valuable commodities"(p. 97).

The authors discuss the very current topic of mass surveillance, and its relation to anonymity, showing how, **when the US presents the internet and "freedom to connect" as analogous to public speech and town halls, it is deliberately arguing against anonymity and against privacy – and this of course in order to avoid restrictions on its mass surveillance activities.**

Thus the authors posit that there are tensions between the US call for "internet freedom" and other states' calls for "information sovereignty", and analyze the 2012 World Conference on International Telecommunications from that point of view.

Not surprisingly, the authors conclude that international cooperation, recognizing the legitimate aspirations of all the world's peoples, is the only proper way forward. As the authors put the matter (p. 206): **"Activists and defenders of the original vision of the Web as a 'fair and humane' cyber-civilization need to avoid lofty 'internet freedom' declarations and instead champion specific reforms required to protect the values and practices they hold dear."** And it is with that in mind, as a counterweight to US and US-based corporate power, that a group of civil society organizations have launched the Internet Social Forum.

3. US internet credibility is hurt for lots of other reasons – global surveillance is one – the plan doesn't change that.

Eades, 13 (Mark, American writer and educator currently residing in Shanghai, China. He has taught at both Shanghai International Studies University and Fudan University. 7-17-13. "Western Governments Lose Credibility as Global Surveillance Scandal Grows" http://www.atlantic-community.org/-/western-governments-lose-credibility-as-global-surveillance-scandal-grows)

As revelations of secret surveillance programs by Western governments appear almost daily and the drama of American whistleblower Edward Snowden's bid for freedom continues to unfold, **the governments of the US and its Western allies are quickly losing credibility globally. In order to regain credibility, the West must come clean about its global surveillance activities**, take steps to cease or at least significantly reduce such activities, and end persecution of whistleblowers such as Snowden.

Ongoing reveals from former US National Security Agency (NSA) analyst Edward Snowden implicate the US and other Western governments in spying and surveillance activities that appear to violate the rights of citizens and go far beyond the bounds of national security interests. **These revelations**, and America's relentless pursuit of Snowden with the acquiescence of European governments, **have severely damaged the credibility of Western governments internally and externally.**

Chief among the offending parties is the US, whose extensive domestic and global surveillance activities include monitoring civilian internet, e-mail, and telephone use, both within the US and around the world, as well as spying on European Union diplomats. **The revelation that the US has been spying on innocent civilians domestically and internationally, as well as on its EU allies, undercuts America's insistence that such activities are carried out only as necessary for national security. It also severely tarnishes America's image as a champion of democracy, human rights, and civil liberties. US accusations of spying and computer hacking by countries like China will now likely fall on deaf ears.** Simply put, America has come off looking like a hypocrite.

America's chief partner in crime in these activities is the United Kingdom. Documents released by Snowden reveal that the UK's Government Communications Headquarters (GCHQ) spied on delegates at the 2009 G-20 summit in London and has been intercepting and storing mass quantities of fiber-optic internet traffic in concert with the NSA. The German government has also been implicated in NSA spying on German citizens. Reports unrelated to Snowden have further revealed that France's intelligence agency, the General Directorate for External Security (DGSE), has been using NSA-style methods to spy on the internet use, e-mail, and telephone communications of French citizens.

These revelations have led many to conclude that we are now living in the era of the "Global Surveillance State." The subjects of alleged Western spying activities are not mainly rogue states or terrorist groups, but ordinary private citizens and allies. The prominent and highly profitable role played by private security firms in these activities, at public expense, increases suspicion that spying is motivated by more than just national security interests. In an age of austerity, the taxpayers of Western nations are paying their own governments to spy on them, at great profit to the security firms doing the spying. Public services may suffer, but corporate spies are handsomely paid from the public coffers.

Meanwhile, the pursuit of Snowden increasingly seems vindictive and foolish as the US relentlessly pressures other countries to cooperate. Feigning nonchalance on the matter in public as a face-saving measure, the US works feverishly behind the scenes to capture Snowden and make an example of him for other would-be whistleblowers. Recently an airplane carrying Bolivian president Evo Morales from Russia to Bolivia was turned away from France and Portugal and grounded in Vienna for ten hours because it was suspected that Snowden might be on board. Snowden was not aboard Morales's flight, and Latin Americans were enraged by the incident. Despite expressed outrage at the alleged spying, EU

5. US created ICANN to solve the complaints – means there is no threat to larger freedom

Stacie L. **Pettyjohn**, 4/10/**2014**. Political Scientist at the RAND Corporation. "Net Gain: Washington Cedes Control of ICANN," Foreign Affairs, http://www.foreignaffairs.com/articles/141122/stacie-l-pettyjohn/net-gain.

For over a decade, the United States has promoted a free and open Internet as a central tenet of its foreign policy. To date, this has most visibly involved shaming governments that limit access to online content and

developing tools that help individuals circumvent censorship and surveillance. Perhaps even more important, though, have been Washington's efforts to ensure that the Internet remains regulated by public as well as private stakeholders -- not just governments alone.

The latest debate over Internet governance centers on the relationship between the United States and the Internet Corporation for Assigned Names and Numbers, a private, nonprofit organization that manages domain names and Internet Protocol, or IP, addresses. Since its creation, ICANN has been under contract with the U.S. Department of Commerce, giving Washington a critical say in how the Internet is regulated. Last month, the department announced plans to let its contract with ICANN expire in 2015 and transition toward a "global multi-stakeholder model," the details of which are still being developed. This has led to criticism that Washington is naively giving up its long-standing role as a guarantor of Internet freedom. The move, however, is a shrewd one. **Handing over control of ICANN will defuse mounting criticism of Washington's outsized influence on Internet governance -- and head off efforts by repressive states that want to expand their own**.

Understanding the full impact of the decision requires some context. At the broadest level, Internet governance involves managing the technical architecture of cyberspace, which was imbued by its original designers with an open infrastructure and nonproprietary standards. Until his death in 1998, one of them -- Jon Postel, a computer science professor at the University of Southern California -- single-handedly ran the domain name system, which matches IP numbers to Web site addresses. (Although the U.S. government funded the Internet in its infancy, it gave up control over its development early on.) The Internet's rapid growth, however, quickly outstripped Postel's capacity to administer it. In 1998, the Clinton administration stepped in by establishing ICANN, a nonprofit organization under contract with the Commerce Department.

To this day, ICANN's primary mission is to guarantee that anyone who enters a Web address anywhere in the world will be directed to the appropriate site. It does so by assigning and coordinating the unique identifiers (IP addresses and URLs) that link computers together, thereby ensuring that the Web really is a worldwide network. Notably, ICANN preserved some of the Internet's original characteristics by creating an inclusive organization that invites all stakeholders -- including the tech community, civil society, the private sector, and governments -- to participate in consensus-based policymaking. This model has largely worked; it remains difficult for any one stakeholder or type of stakeholder to dominate decisions, which ultimately preserves Internet openness.

ICANN is not the only organization responsible for managing the Web. The Internet Engineering Task Force, the Internet Architecture Board, and the World Wide Web Consortium, among other groups, contribute to developing and maintaining open technical standards. All have played an important role in assuring that the Internet runs smoothly. None, however, has been as controversial as ICANN. Although some nations had objected to U.S. oversight of ICANN in the past, a growing number of states are now voicing opposition to the arrangement. Specifically, they have demanded that ICANN's regulatory powers be transferred to the United Nations International Telecommunications Union (ITU). In effect, the move would shift responsibility for managing the domain name system from a nonprofit inclusive of a variety of stakeholders to an international organization dominated by national governments.

China and Russia have spearheaded the drive to wrest control of the Internet from ICANN. Their primary goal is to dilute U.S. influence over the Internet by empowering other states, namely, themselves. They also see an opportunity to facilitate censorship and surveillance. Simply put, having a greater say in managing the Internet's "central chokepoint" would almost certainly enhance their ability -- and that of other authoritarian states -- to control what their citizens can see and say online. If they manage to empower the ITU at the expense of ICANN, Beijing and Moscow could marginalize ICANN's nongovernmental stakeholders and legitimize repressive practices such as blocking Web sites and building closed national intranets. Not surprisingly, nations that heavily monitor and censor the Internet, including Algeria, Egypt, Saudi Arabia, Sudan, and the United Arab Emirates, have been the strongest supporters of this initiative.

Although the United States has successfully fended off efforts to hand over power to the ITU in the past, the National Security Agency surveillance scandal has revived calls for modifying the current structure of Internet governance. Of course, recent revelations about NSA spying have nothing to do with ICANN. But they have fed the perception that Washington has too much power over a major global good and bolstered the case for radical reforms -- giving authoritarian states an opportunity to usurp control over the Internet's existing technical standards. Outraged by reports of extensive NSA spying, even liberal states such as Brazil and Germany have considered nationalizing pieces of the Internet's infrastructure. The European Union, which still supports the current open model, has also joined the chorus ofcritics who want to internationalize ICANN. The NSA backlash could thus tip the scales in the critics' favor.

The outcome of this latest struggle over Internet governance will have enormous implications: It will determine whether the Internet remains open, united, and transparent, or becomes closed, balkanized, and subject to opaque national controls. Counterintuitive as it may seem, **Washington's decision to sever its ties to ICANN might have been the best way to guarantee openness**, especially since the Commerce Department has stipulated that it will not implement the decision if Internet regulation falls to a government-led or government-only organization. This approach appears to be working, as many countries -- including some former critics -- have welcomed Washington's announcement. Had the United States kept its fist clenched around ICANN, it would have undermined faith in the multistakeholder model of Internet governance and empowered the ITU. Instead, **Washington has disarmed critics and helped ensure that the Internet will remain open and free**.

6. Nationalization doesn't "end the Internet."

Gordon M. **Goldstein**, 6/25/**2014**. Served as a member of the American delegation to the World Conference on International Telecommunications. "The End of the Internet?" The Atlantic, http://m.theatlantic.com/magazine/archive/2014/07/the-end-of-the-internet/372301/.

Some experts anticipate a future with a Brazilian Internet, a European Internet, an Iranian Internet, an Egyptian Internet—all with different content regulations and trade rules, and perhaps with contrasting standards and operational protocols. Eli Noam, a professor of economics and finance at Columbia Business School, believes that such a progressive fracturing of the global Internet is inevitable. "We must get used to the idea that the standardised internet is the past but not the future," he wrote last fall. "And that the future is a federated internet, not a uniform one." Noam thinks that can be managed, in part through the development of new intermediary technologies that would essentially allow the different Internets to talk to each other, and allow users to navigate the different legal and regulatory environments.

7. Internet isn't good at solving problems

Eli M. **Noam**, 8/28/**2002**. Professor and Finance and Economics, Director, Columbia Institute for Tele-Information, Graduate School of Business, Columbia University. "Will the Internet Be Bad for Democracy?" Financial Times Online, http://www.citi.columbia.edu/elinoam/articles/int_bad_dem.htm.

When the media history of the 20th Century will be written, the Internet will be seen as its major contribution. Television, telephone, and computers will be viewed as its early precursors, merging and converging into the new

medium just as radio and film did into TV. The Internet's impact on culture, business, and politics will be vast, for sure. Where will it take us? To answer that question is difficult, because the Internet is not simply a set of interconnecting links and protocols connecting packet switched networks, but it is also a construct of imagination, an inkblot test into which everybody projects their desires, fears and fantasies.

Some see enlightenment and education. Others see pornography and gambling. Some see sharing and collaboration; others see e-commerce and profits. Controversies abound on most aspects of the Internet. Yet when it comes to its impact on democracy process, the answer seems unanimous.[1] The Internet is good for democracy. It creates digital citizens (Wired 1997) active in the vibrant teledemocracy (Etzioni, 1997) of the Electronic Republic (Grossman 1995) in the

Digital Nation (Katz 1992).Is there no other side to this question? Is the answer so positively positive?

The reasons why the Internet is supposed to strengthen democracy include the following.

1.The Internet lowers the entry barriers to political participation.

2.It strengthens political dialogue.

3.It creates community.

4.It cannot be controlled by government.

5.It increases voting participation.

6.It permits closer communication with officials.

7.It spreads democracy world-wide.

Each of the propositions in this utopian populist, view, which might be called is questionable. But they are firmly held by the Internet founder generation, by the industry that now operates the medium, by academics from Negroponte (1995) to Dahl (1989), by gushy news media, and by a cross-party set of politicians who wish to claim the future, from Gore to Gingrich, from Bangemann to Blair.

I will argue, in contrast, that the Internet, far from helping democracy, is a threat to it. And I am taking this view as an enthusiast, not a critic. But precisely because the Internet is powerful and revolutionary, it also affects, and even destroys, all traditional institutions--including--democracy. To deny this potential is to invite a backlash when the ignored problems eventually emerge.[2]

My perspective is different from the neo-Marxist arguments about big business controlling everything; from neo-Luddite views that low-tech is beautiful; and from reformist fears that a politically disenfranchised digital underclass will emerge. The latter, in particular, has been a frequent perspective. Yet, the good news is that the present income-based gap in Internet usage will decline in developed societies. Processing and transmission becomes cheap, and will be anywhere, affordably. Transmission will be cheap, and connect us to anywhere, affordably. And basic equipment will almost be given away in return for long-term contracts and advertising exposure.

That is why what we now call basic Internet connectivity will not be a problem. Internet connectivity will be near 100% of the households and offices, like electricity, because the Internet will have been liberated from the terror of the PC as its gateway, the most consumer-unfriendly consumer product ever built since the unicycle.

Already, more than half of communications traffic is data rather than voice, which means that it involves fast machines rather than slow people.These machines will be everywhere.Cars will be chatting with highways.Suitcases will complain to airlines.Electronic books will download from publishers.Front doors will check in with police departments.Pacemakers will talk to hospitals.Television sets will connect to video servers.

For that reason, my skepticism about the Internet as a pro-democracy force is not based on its uneven distribution. It is more systemic. The problem is that most analysts commit a so-called error of composition. That is, they confuse micro behavior with macro results. They think that if something is helpful to an individual, it is also helpful to society at large, when everybody uses it.

Suppose we would have asked, a century ago, whether the automobile would reduce pollution. The answer would have been easy and positive: no horses, no waste on the roads, no smell, no use of agricultural land to grow oats. But we now recognize that in the aggregate, mass motorization has been bad for the environment. It created emissions, dispersed the population, and put more demand on land.

The second error is that of inference. Just because the Internet is good for democracy in places like North Korea, Iran, or Sudan does not mean that it is better for Germany, Denmark, or the United States. Just because three TV channels offer more diversity of information than one does not mean that 30,000 are better than 300.

So here are several reasons why the Internet will not be good for democracy, corresponding to the pro-democracy arguments described above.

§The Internet Will Make Politics More Expensive and Raise Entry Barriers

The hope has been that online public space will be an electronic version of a New England or Swiss town meeting, open and ongoing. The Internet would permit easy and cheap political participation and political campaigns. But is that true?

Easy entry exists indeed for an Internet based on narrowband transmission, which is largely text-based. But the emerging broadband Internet will permit fancy video and multimedia messages and information resources. Inevitably, audience expectations will rise. When everyone can speak, who will be listened to? If the history of mass media means anything, it will not be everyone. It cannot be everyone. **Nor will the wisest or those with the most compelling case or cause be heard, but the best produced, the slickest, and the best promoted**. And that is expensive.

Secondly, because of the increasing glut and clutter of information, those with messages will have to devise strategies to draw attention. Political attention, just like commercial one, will have to be created. Ideology, self-interest, and public spirit are some factors. But in many cases, attention needs to be bought, by providing entertainment, gifts, games, lotteries, coupons, etc, That, too, is expensive. The basic cost of information is rarely the problem in politics; it's the packaging. It is not difficult or expensive to produce and distribute handbills or to make phone calls, or to speak at public events. But it is costly to communicate to vast audiences in an effective way, because that requires large advertising and PR budgets.

Thirdly, effective politics on the Internet will require elaborate and costly data collection. The reason is that Internet media operate differently from traditional mass media. They will not broadcast to all but instead to specifically targeted individuals.Instead of the broad stroke of political TV messages, "netcasted" politics will be customized to be most effective.This requires extensive information about individuals' interests and preferences. Data banks then become a key to political effectiveness. Who would own and operate them? In some cases the political parties. But they could not maintain control over the data banks where a primary exist that is open to many candidates. There is also a privacy problem, when semi-official political parties store information about the views, fears, and habits of millions of individuals. For both of those reasons the ability of parties to collect such data will be limited.

Other political data banks will be operated by advocacy and interest groups. They would then donate to candidate's data instead of money. The importance of such data banks would further weaken campaign finance laws and further strengthen interest group pluralism over traditional political parties.

But in particular, political data banks will maintained through what is now known as political consultants. They will establish permanent and proprietary permanent data banks and become still bigger players in the political environment and operate increasingly as ideology-free for –profit consultancies.

Even if the use of the Internet makes some political activity cheaper, it does so for everyone, which means that all organization will increase their activities rather than spend less on them.[3] If some aspects of campaigning become cheaper, they would not usually spend less, but instead do more.

Thus, any effectiveness of early adopters will soon be matched by their rivals and will simply lead to an accelerated, expensive, and mutually canceling political arms-race of investment in action techniques and new--media marketing technologies.

The early users of the Internet experienced a gain in their effectiveness, and now they incorrectly extrapolate this to society at large. While such gain is trumpeted as the empowerment of the individual over Big Government and Big Business, much of it has simply been a relative strengthening of individuals and groups with computer and online skills (who usually have significantly about-average income and education) and a relative weakening of those without such resources. Government did not become more responsive due to online users; it just became more responsive to them.

•The Internet will make reasoned and informed political dialog more difficult.

True, the Internet is a more active and interactive medium than TV. But is its use in politics a promise or a reality?

Just because the quantity of information increase does not mean that its quality rises. To the contrary. **As the Internet leads to more information clutter, it will become necessary for any message to get louder. Political information becomes distorted, shrill, and simplistic**.

One of the characteristics of the Internet is disintermediation, the Internet is in business as well as in politics. In politics, it leads to the decline of traditional news media and their screening techniques. The acceleration of the news cycle by necessity leads to less careful checking, while competition leads to more sensationalism. Issues get attention if they are visually arresting and easily understood. This leads to media events, to the 15 min of fame, to the sound bite, to infotainment. The Internet also permits anonymity, which leads to the creation of, and to last minute political ambush. The Internet lends itself to dirty politics more than the more accountable TV.

While the self-image of the tolerant digital citizen persists, an empirical study of the content of several political usenet groups found much intolerant behavior: domineering by a few; rude "flaming"; and reliance on unsupported assertions. (Davis, 1999) Another investigation finds no evidence that computer-mediated communication is necessarily democratic or participatory (Streck, 1998).

•The Internet disconnects as much as it connects

Democracy has historically been based on community. Traditionally, such communities were territorial — electoral districts, states, and towns. Community, to communicate — the terms are related: community is shaped by the ability of its members to communicate with each other. If the underlying communications system changes, the communities are affected. As one connects in new ways, one also disconnects the old ways. As the Internet links with new and far-away people, it also reduces relations with neighbors and neighborhoods.

The long-term impact of cheap and convenient communications is a further geographic dispersal of the population, and thus greater physical isolation. At the same time, the enormous increase in the number of information channels leads to an individualization of mass media, and to fragmentation. Suddenly, critics of the "lowest common denominator" programming, of TV now get nostalgic for the "electronic hearth" around which society huddled. They discovered the integrative role of mass media.

On the other hand, the Internet also creates electronically linked new types of community. But these are different from traditional communities. They have less of the averaging that characterizes physical

communities–-throwing together the butcher, the baker, the candlestick maker.Instead, these new communities are more stratified along some common dimension, such as business, politics, or hobbies. These groups will therefore tend to be issue - driven, more narrow, more narrow-minded, and sometimes more extreme, as like-minded people reinforce each other's views.

Furthermore, many of these communities will be owned by someone.They are like a shopping mall, a gated community, with private rights to expel, to promote, and to censor.The creation of community has been perhaps the main assets of Internet portals such as AOL.It is unlikely that they will dilute the value of these assets by relinquishing control.

If it is easy to join such virtual communities, it also becomes easy to leave, in a civic sense, one's physical community.Community becomes a browning experience.

•Information does not necessarily weaken the state.

Can Internet reduce totalitarianism? Of course. Tyranny and mind control becomes harder. But Internet romantics tend to underestimate the ability of governments to control the Internet, to restrict it, and to indeed use it as an instrument of surveillance.How quickly we forget.Only a few years ago, the image of information technology was Big Brother and mind control. That was extreme, of course, but the surveillance potential clearly exists. Cookies can monitor usage.Wireless applications create locational fixes.Identification requirements permit the creation of composites of peoples' public and private activities and interests.Newsgroups can (and are) monitored by those with stakes in an issue.

A free access to information is helpful to democracy.But the value of information to democracy tends to get overblown. It may be a necessary condition, but not a sufficient one.

Civil war situations are not typically based on a lack of information. Yet there is an undying belief that if people "only knew", eg. by logging online, they would become more tolerant of each other. That is wishful and optimistic hope, but is it based on history? Hitler came to power in a republic where political information and communication were plentiful.

Democracy requires stability, and stability requires a bit of inertia. The most stable democracies are characterized by a certain slowness of change. Examples are Switzerland and England. The US operates on the basis of a 210-year old Constitution. Hence the acceleration of politics made the Internet is a two-edged sword.

The Internet and its tools accelerate information flows, no question about it. But same tools are also available to any other group, party, and coalition. Their equilibrium does not change, except temporarily in favor of early adopters. All it may accomplish in the aggregate is a more hectic rather than a more thoughtful process.

•Electronic voting does not strengthen democracy

The Internet enables electronic voting and hence may increase voter turnout.But it also changes democracy from a representative model to one of direct democracy.

Direct democracy puts a premium on resources of mobilization, favoring money and organization.It disintermediates elected representatives.It favors sensationalized issues over "boring" ones.Almost by definition, it limits the ability to make unpopular decisions.It makes harder the building of political coalition (Noam, 1980, 1981).The arguments against direct democracy were made perhaps most eloquently in the classic arguments for the adoption of the US Constitution, by James Madison in the Federalist Papers #10.

Electronic voting is not simply the same as traditional voting without the inconvenience of waiting in line.When voting becomes like channel clicking on remote, it is left with little of the civic engagement of voting.When voting becomes indistinguishable from a poll, polling and voting merge.With the greater ease and anonymity of voting, a market for votes is unavoidable.Participation declines if people know the expected result too early, or where the legitimacy of the entire election is in question.

§Direct access to public officials will be phony

In 1997, Wired magazine and Merrill Lynch commissioned a study of the political attitudes of the"digital connected".The results showed them more participatory, more patriotic, more pro-diversity, and more voting-active.They were religious (56% say they pray daily); pro-death penalty (3/4); pro-Marijuana legalization (71%); pro-market (%) and pro-democracy (57%).But are they outliers or the pioneers of a new model?At the time of the survey (1997) the digitally connected counted for 9% of the population; they were better educated, richer (82% owned securities); whites; younger; and more Republican than the population as a whole.In the Wired/Merrill Lynch survey, none of the demographic variables were corrected for.Other studies do so, and reach far less enthusiastic results.

One study of the political engagement of Internet users finds that they are only slightly less likely to vote, and are more likely to contact elected officials.The Internet is thus a substitute for such contacts, not their generator.Furthermore, only weak causality is found.(Bimber 1998)

Another survey finds that Internet users access political information roughly in the same proportions as users of other media, about 5% of their overall information usage (Pew, 1998).Another study finds that users of the Internet for political purposes tend to already involved.Thus, the Internet reinforces political activity rather than mobilizes new one (Norris, Pippa, 1999)

Yes, anybody can fire off email messages to public officials and perhaps even get a reply, and this provides an illusion of access.But the limited resource will still be scarce: the attention of those officials. By necessity, only a few messages will get through.Replies are canned, like answering machines.If anything, the greater flood of messages will make gatekeepers more important than ever: power brokers that can provide access to the official. As demand increases while the supply is static, the price of access goes up, as does the commission to the middle-man. This does not help the democratic process.

Indeed, public opinion can be manufactured.Email campaigns can substitute technology and organization for people.Instead of grass roots one can create what has been described as "Astroturf",. i.e. manufactured expression of public opinion.

Ironically, the most effective means of communication (outside of a bank check) becomes the lowest in tech: the handwritten letter (Blau, 1988)

If, in the words of a famous cartoon, on the Internet nobody knows that you are a dog, then everyone is likely to be treated as one.

•The Internet facilitates the International Manipulation of Domestic Politics.

Cross-border interference in national politics becomes easier with the Internet.Why negotiate with the US ambassador if one can target a key Congressional chairman by an e-mail campaign,chat group interventions, and misinformation, and intraceable donations.People have started to worry about computer attacks by terrorists.They should worry more about state-sponsored interferences into other countries' electronic politics.

Indeed, it is increasingly difficult to conduct national politics and policies in a globalized world, where distance and borders are less important than in the past, even if one does not share the hyperbole of the "evaporation" of the Nation State (Negroponte 1995).The difficulty of societies to control their own affairs leads, inevitably, to backlash and regulatory intervention.

Conclusion:

It is easy to romanticize the past of democracy as Athenian debates in front of an involved citizenry, and to believe that its return by electronic means is neigh. A quick look to in the rear-view mirror, to radio and then TV, is sobering. Here, too, the then new media were heralded as harbingers of a new and improved political dialogue. But the reality of those media has been is one of cacophony, fragmentation, increasing cost, and declining value of "hard" information.

The Internet makes it easier to gather and assemble information, to deliberate and to express oneself, and to organize and coordinate action.(Blau, 1998).

It would be simplistic to deny that the Internet can mobilize hard-to-reach groups, and that it has unleashed much energy and creativity. Obviously there will be some shining success stories.

But it would be equally naïve to cling to the image of the early Internet - - nonprofit, cooperative, and free - - and ignore that it is becoming a commercial medium, like commercial broadcasting that replaced amateur ham radio. Large segments of society are disenchanted with a political system is that often unresponsive, frequently affected by campaign contributions, and always slow. To remedy such flaws, various solutions have been offered and embraced. To some it is to return to spirituality. For others it is to reduce the role of government and hence the scope of the democratic process. And to others, it is the hope for technical solution like the Internet. Yet, **it would only lead to disappointment if the Internet would be sold as the snake oil cure for all kinds of social problems**. It simply cannot simply sustain such an expectation. Indeed if anything, **the Internet will lead to less stability, more fragmentation, less ability to fashion consensus, more interest group pluralism**. High capacity computers connected to high-speed networks are no remedies for flaws in a political system. There is no quick fix. There is no silver bullet. There is no free lunch.

Ext 3 – Alternate Causes

The U.S. is pushing TPP – that destroys internet freedom

Nevins, 15 (Sean, Washington DC based staff writer for MintPress focusing on foreign affairs, and the intersection of politics and policy. 5-7-15. "The TPP Threatens A Free And Open Internet" http://www.mintpressnews.com/the-tpp-could-curtail-internet-freedom-national-sovereignty-free-open-internet/205383/)

Legislation to "fast track" the Trans-Pacific Partnership (TPP) has moved through both committees in the House and the Senate. This legislation, which would enable President Barack Obama to negotiate the terms of the international agreement without congressional input, is now on the floor of the House.

While the TPP has come under increasing scrutiny for its potential to erode the sovereignty of countries, **an often overlooked aspect of the treaty is its threat to a free and open Internet.**

"The Trans-Pacific Partnership is pushing the worst parts of U.S. copyright policy on the rest of the world without expanding protections for fair use," said Evan Greer, campaign manager with Fight for the Future, an organization dedicated to protecting Internet freedoms.

Speaking to MintPress News, Greer explained that **the TPP has the potential to create a system in which content could be censored with a copyright claim without maintaining basic protections to protect freedom of speech and innovation on the Internet. This could potentially allow copyright laws to be used by powerful institutions to pull down legitimate free speech on the Internet.**

Yet Greer also acknowledged that nothing about the TPP is known for sure.

"The fundamental problem here is that we don't know enough about it to know how it might affect us," he said. "That's one of the biggest problems. Internet users should have a say and a voice to access policy when it affects them."

SOPA and the TPP

Fight for the Future formed in the lead up to fight the Stop Online Piracy Act (SOPA) and PROTECT IP Act (PIPA) in 2012. Aiming to combat copyright infringement, those acts were promoted by Hollywood entertainment companies to censor websites caught broadcasting their content.

However, t**he legislation would have enabled law enforcement to wield much larger powers.** The Electronic Frontier Foundation explains:

"Although the bills were ostensibly aimed at reaching foreign websites dedicated to providing illegal content, their provisions would allow for removal of enormous amounts of non-infringing content including political and other speech from the Web."

Fight for the Future was instrumental in launching the SOPA Strike, the largest online protest in history. An array of companies and personal websites participating blacked out their websites for 12 hours on Jan. 18, 2012, many using Fight for the Future's online tools. Some of those companies included Internet giants like Google, WordPress, Wikipedia and Flickr.

There is a direct line from SOPA to the TPP. Some of the same Hollywood lobbying firms that helped to write legislation and promote SOPA are now working on the Internet copyright chapter of the TPP, according to Greer. These firms include the Recording Industry Association of America and the Motion Picture Association of America.

"Essentially, after SOPA they realized they were never going to be able to get these draconian laws passed publically, so they've been trying to get them pushed into these secretive trade agreements," Greer said.

According to the EFF, the TPP could potentially criminalize Internet users for non-commercial activities like file sharing. The organization, which works to defend civil liberties in the digital world, explained that the United States is attempting to put language in the treaty that would criminalize anyone who publishes work on a "commercial scale," with penalties including prison and hefty monetary fines.

EFF explains the problem with the text's language:

"As anyone who has ever had a meme go viral knows, it is very easy to distribute content on a commercial scale online, even without it being a money-making operation. That means fans who distribute subtitles to foreign movies or anime, or archivists and librarians who preserve and upload old books, videos, games, or music, could go to jail or face huge fines for their work. Someone who makes a remix film and puts it online could be under threat. Such a broad definition is ripe for abuse, and we've seen such abuse happen many times before."

Ext 7 – Internet not that great

Your data is bad --- the internet isn't that important

Charles **Kenny**, 6/17/**2013**. senior fellow at the Center for Global Development. "Think the Internet Leads to Growth? Think Again," Bloomberg Business Week, http://www.businessweek.com/articles/2013-06-17/think-the-internet-leads-to-growth-think-again.

Remember the year 2000 in the months after the Y2K bug had been crushed, when all appeared smooth sailing in the global economy? When the miracle of finding information online was so novel that The Onion ran an article, "Area Man Consults Internet Whenever Possible?" It was a time of confident predictions of an ongoing economic and political renaissance powered by information technology. Jack Welch—then the lauded chief executive officer of General Electric (GE)—had suggested the Internet was "the single most important event in the U.S. economy since the Industrial Revolution." The Group of Eight highly industrialized nations—at that point still relevant—met in Okinawa in 2000 and declared, "IT is fast becoming a vital engine of growth for the world economy. … Enormous opportunities are there to be seized by us all." In a 2000 report, then-President Bill Clinton's Council of Economic Advisers suggested (PDF), "Many economists now posit that we are entering a new, digital economy that could inaugurate an unprecedented period of sustainable, rapid growth."

It hasn't quite worked out that way. Indeed, if the last 10 years have demonstrated anything, it's that for all the impact of a technology like the Internet, thinking that any new innovation will set us on a course of high growth is almost certainly wrong.

That's in part because **many of the studies purporting to show a relationship between the Internet and economic growth relied on shoddy data and dubious assumptions**. In 1999 the Federal Reserve Bank of Cleveland released a study that concluded (PDF), "… the fraction of a country's population that has access to the Internet is, at least, correlated with factors that help to explain average growth performance." It did so by demonstrating a positive relationship between the number of Internet users in a country in 1999 with gross domestic product growth from 1974 to 1992. Usually we expect the thing being caused (growth in the 1980s) to happen after the things causing it (1999 Internet users).

In defense of the Fed, researchers at the World Bank recently tried to repeat the same trick. They estimated that a 10 percent increase in broadband penetration in a country was associated with a 1.4 percentage point increase in growth rate. This was based on growth rates and broadband penetration from 1980 to 2006. Given that most deployment of broadband occurred well after the turn of the millennium, the only plausible interpretation of the results is that countries that grew faster from 1980 to 2006 could afford more rapid rollouts of broadband. Yet the study is widely cited by broadband boosters. Many are in denial about the failure of the IT revolution to spark considerable growth.

Innovation in information technology has hardly dried up since 2000. YouTube(GOOG) was founded in 2005, and Facebook (FB) is only a year older. Customer-relations manager Salesforce.com (CRM), the first cloud-based solution for business, only just predates the turn of the millennium. And there are now 130 million smartphones in the U.S., each with about the same computing power as a 2005 vintage desktop. Meanwhile, according to the U.S. Department of Commerce (PDF), retail e-commerce as a percentage of total retail sales has continued to climb—e-commerce sales were more than 6 percent of the total by the fourth quarter of 2012, up from less than 2 percent in 2003.

Yet despite continuing IT innovation, we've seen few signs that predictions of "an unprecedented period of sustainable, rapid growth" are coming true. U.S. GDP expansion in the 1990s was a little faster than the 1980s—it climbed from an annual average of 3 percent to 3.2 percent. But GDP growth collapsed to 1.7 percent from 2000 to 2009. Northwestern University economist Robert Gordon notes that U.S. labor productivity growth spiked briefly—rising from 1.38 percent from 1972 to 1996 to 2.46 percent from 1996 to 2004—but fell to 1.33 percent from 2004 and 2012.

Part of the labor productivity spike around the turn of the century was because of the rapidly increasing efficiency of IT production (you get a lot more computer for the same cost nowadays). Another part was because of considerable investments in computers and networks across the economy—what economists call "capital deepening." But even during the boom years it was near-impossible to see an economywide impact of IT on "total factor productivity"—or the amount of output we were getting for a given input of capital and labor combined.

Within the U.S., investment in the uses of the Internet for business applications had an impact on wage and employment growth in only 6 percent of counties—those that already had high incomes, large populations, high skills, and concentrated IT use before 1995, according to a recent analysis (PDF) by Chris Forman and colleagues in the American Economic Review. Investments in computers and software did yield a return for most companies—but the return wasn't anything special.

So what happened to the promised Internet miracle? While the technology has had a dramatic impact on our lives, it hasn't had a huge impact on traditional economic measures. Perhaps that shouldn't come as a surprise.

To understand why, think about television in the 1970s. Broadcast to the home for free, and all we had to pay for was the set and the electricity to run it. Despite that small expenditure, we spent hours a day watching TV. Fast-forward four decades: 209 million Americans spent an average 29 hours online in January, according toNielsen; 145 million U.S. Facebook visitors spent an average six hours in January on that site alone. And each month, YouTube users spend 6 billion hours watching videos—or 684,000 times as long as it took to paint the Sistine Chapel. They pay for the PC and Internet connection, but per hour, surfing the Web is a cheap form of entertainment.

And all that time online has knock-on effects. Andirana Bellou at the University of Montreal suggests that broadband adoption has led to increasing marriage rates among 21- to 30-year-olds as they meet online in chatrooms and dating sites, but has "significantly reduced the time young people spend on socializing and physically communicating." This may be why the link between Internet usage and measures of contentment are pretty weak. According to the World Database of Happiness, answers to a poll that asked if you were not happy (a score of 1), somewhat happy (2), or very happy (3) averaged 2.28 in the U.S. in 1990. That fell to 2.11 in 2010. Studies of Internet use tend to suggest that people who spend more time online are less happy (PDF) than the rest of us—although it may be that less happy people are surfing more rather than surfing being the cause of their misery. Regardless, the Internet has been behind a massive shift in our use of time during the past two decades, and not necessarily one that has generated a huge amount of positive feelings.

Of course, we also use the Internet to sell stuff on e-Bay and look for jobs. While Betsy Stevenson has suggested (PDF) in a National Bureau of Economic Research paper that the widespread use of the Internet in job searches may be one factor behind employed people switching jobs more often, she concludes there's little evidence that the Web helps the unemployed find jobs faster.

Perhaps one reason we haven't seen a huge impact on productivity because of access to the Internet is because, once we find a job, we spend quite a lot of time surfing the Web at the office. (Some of that time is used to look for a different job, apparently.) Ninety percent of workers with a PC also say they surf recreational sites at work. Almost the same number say they send personal e-mails, and more than half report they cybershop. The reality may be worse: Tracking software suggests that 70 percent of employees visit retail sites, and more than one-third check out X-rated sites. Perhaps we're using the Internet to do more in less time at work. Yet we're using the extra hours to check out pictures of Kate Upton or cats playing the piano rather than producing more widgets for the boss.

Terrorism

All tools are necessary to prevent a terrorist attack

Dooley and Saenz 5/31 (Erin and Arlette, journalists for ABC News, "NSA Domestic Surveillance Program 'Likely' to Expire Tonight, Former Counterterrorism Official Says," ABC News, 5/31/15, http://abcnews.go.com/Politics/nsa-domestic-surveillance-program-expire-tonight-counterterrorism-official/story?id=31429802)//kjz

"It probably is not as big a deal as the president is making out," he said, noting that the FBI can use other tools, like warrants, in the interim. "We're likely to be faced with only a few days where the FBI won't have a handful of tools that, frankly, they don't often use," said Clarke, who in 2013 recommended that the Obama administration end bulk metadata collection. But CIA Director John Brennan doesn't seem to agree. "I think terrorist elements have watched very carefully what has happened here in the United States," Brennan said on CBS's "Face the Nation" Sunday when asked whether terrorists would take advantage of a brief lapse. "They are looking for the seams to operate within, and this is something that we can't afford to do right now. "Unfortunately, I think that there has been a little too much political grandstanding," Brennan told anchor Bob Schieffer. "These tools are important to American lives." Three provisions of the PATRIOT Act -- including Section 215, which gives the NSA the authority to collect phone metadata -- are set to expire automatically at midnight tonight unless Congress works out a deal. Two other provisions could also run out tonight: one that allows law enforcement to impose roving wiretaps on terror suspects who frequently switch phones, and another that allows officials to monitor suspected terrorists even if they can't establish a connection to a known terrorist organization. (This "lone wolf" provision has never been used.) Some lawmakers, including Senate Majority Mitch McConnell, R-Ky., want Congress to reauthorize the act as-is. Others, like Sens. Ted Cruz, R-Texas, and Patrick Leahy, D-Vermont, are urging Congress to pass instead the USA Freedom Act, which would abolish bulk metadata collection but leave the roving wiretaps and lone wolf provisions intact. (Rather than allowing the NSA to retain metadata, the Freedom Act would put those records in the hands of phone providers, who would turn them over only if the government obtained a specific warrant.) Though the House of Representatives passed the bill 303-121, it fell just three votes short of moving forward in the Senate. In his weekly address, President Obama lauded the House for passing the measure, and encouraged the Senate to do the same. "Terrorists like al Qaeda and ISIL aren't suddenly going to stop plotting against us at midnight tomorrow. And we shouldn't surrender the tools that help keep us safe," the president warned. "It would be irresponsible. It would be reckless. And we shouldn't allow it to happen."

SSRA and encryption hurt counter terror efforts

Kelly 4/2 (Erin, reporter for USA Today "Bill would stop feds from mandating 'backdoor' to data," USA Today, 4/2/15, http://www.usatoday.com/story/news/politics/2015/04/02/encryption-bill-tech-companies-federal-law-enforcement/70734646/)//kjz

WASHINGTON — A bipartisan group of lawmakers is set to push for legislation that would bar federal agents from forcing tech companies to give them access to customers' emails, texts and photos. "I think you have the right to go about your business without government — in a Big

Brother way — listening to your phone calls or reading your emails," said Rep. Mark Pocan, D-Wis. Pocan is sponsoring the Surveillance State Repeal Act with Rep. Thomas Massie, R-Ky. The bill includes a provision that the federal government cannot require electronics or software manufacturers to build in a mechanism to allow the government to bypass privacy technology. The issue, which will come up this spring as part of the debate over whether to reauthorize the Patriot Act, underscores a growing struggle between federal law enforcement agencies and the tech industry over data encryption. The bill's sponsors plan to push for the legislation after Congress returns from its two-week recess. As consumers in the USA and overseas demand more privacy on their electronic devices, tech companies such as Apple and Google have strengthened their data encryption to protect personal information from cyber criminals and government surveillance. Privacy concerns have risen in the wake of the 2013 revelations by former National Security Agency contractor Edward Snowden that the NSA was collecting the phone data of millions of Americans. USA TODAY Phone surveillance critics see chance to end NSA program Top officials at the FBI and the Department of Justice have responded angrily, saying encryption — especially encryption that can only be turned off by users — will hamper efforts to monitor criminal activity and catch bad guys. Federal law enforcement officials want tech companies to give them a "backdoor" into encrypted cellphones and other devices. "The problem," Massie said, "is that If we put in backdoors for the convenience of the government, those backdoors can be exploited by hackers as well." The tech industry says there is no way to create a secure backdoor that cannot be exploited by cyber criminals. "We feel quite confident that it is not technologically possible to only allow good guys to get in," said Josh Kallmer, vice president for global policy at the Information Technology Industry Council. The council's members include Apple, Facebook, Google, Microsoft and Twitter. USA TODAY Broad alliance emerges to fight Obama tech policies Although there is currently no law forcing tech companies to build in ways for the government to bypass privacy technology on electronic communication, Pocan and Massie say there is heavy pressure on companies to do so. FBI Director James Comey has publicly chastised tech companies for installing automatic encryption into their devices and has urged Congress to pass legislation that would prohibit it. Attorney General Eric Holder also has weighed in, saying that quick access to phone data can help law enforcement officers find victims snatched by kidnappers and child molesters. FBI Director James Comey speaks at the Brookings Institution FBI Director James Comey speaks at the Brookings Institution in Washington on Oct. 16. (Photo: Jose Luis Magana, AP) "Encryption threatens to lead us all to a very, very dark place," Comey said during a public appearance at the Brookings Institution in October. "Have we become so mistrustful of government and law enforcement in particular that we are willing to let bad guys walk away, willing to leave victims in search of justice?"

Parts of the SSRA curtail crucial elements for the war on terror

Department of Justice, ’08, (“The USA PATRIOT Act: Preserving Life and Liberty,” Department of Justice, 2008, http://www.justice.gov/archive/ll/highlights.htm)//erg

Congress enacted the Patriot Act by overwhelming, bipartisan margins, **arming law enforcement with new tools to detect and prevent terrorism**: The USA Patriot Act was passed nearly unanimously by the Senate 98-1, and 357-66 in the House, with the support of members from across the political spectrum. The Act Improves Our Counter-Terrorism Efforts in Several Significant Ways: 1. **The Patriot Act allows investigators to use the tools that were already available to investigate organized crime and drug trafficking**. Many of the tools the Act

provides to law enforcement to fight terrorism have been used for decades to fight organized crime and drug dealers, and have been reviewed and approved by the courts. As Sen. Joe Biden (D-DE) explained during the floor debate about the Act, "the FBI could get a wiretap to investigate the mafia, but they could not get one to investigate terrorists. To put it bluntly, that was crazy! What's good for the mob should be good for terrorists." (Cong. Rec., 10/25/01) Allows law enforcement to use surveillance against more crimes of terror. Before the Patriot Act, courts could permit law enforcement to conduct electronic surveillance to investigate many ordinary, non-terrorism crimes, such as drug crimes, mail fraud, and passport fraud. Agents also could obtain wiretaps to investigate some, but not all, of the crimes that terrorists often commit. The Act enabled investigators to gather information when looking into the full range of terrorism-related crimes, including: chemical-weapons offenses, the use of weapons of mass destruction, killing Americans abroad, and terrorism financing. Allows federal agents to follow sophisticated terrorists trained to evade detection. For years, law enforcement has been able to use "roving wiretaps" to investigate ordinary crimes, including drug offenses and racketeering. A roving wiretap can be authorized by a federal judge to apply to a particular suspect, rather than a particular phone or communications device. Because international terrorists are sophisticated and trained to thwart surveillance by rapidly changing locations and communication devices such as cell phones, the Act authorized agents to seek court permission to use the same techniques in national security investigations to track terrorists. Allows law enforcement to conduct investigations without tipping off terrorists. In some cases if criminals are tipped off too early to an investigation, they might flee, destroy evidence, intimidate or kill witnesses, cut off contact with associates, or take other action to evade arrest. Therefore, federal courts in narrow circumstances long have allowed law enforcement to delay for a limited time when the subject is told that a judicially-approved search warrant has been executed. Notice is always provided, but the reasonable delay gives law enforcement time to identify the criminal's associates, eliminate immediate threats to our communities, and coordinate the arrests of multiple individuals without tipping them off beforehand. These delayed notification search warrants have been used for decades, have proven crucial in drug and organized crime cases, and have been upheld by courts as fully constitutional.

FISA, Patriot Act, and warrant system are key for counter-terror operations' effectiveness—modern tech and efficiency

Department of Justice, '08, ("The USA PATRIOT Act: Preserving Life and Liberty," Department of Justice, 2008, http://www.justice.gov/archive/ll/highlights.htm)//erg

Prosecutors and investigators used information shared pursuant to section 218 in investigating the defendants in the so-called "Virginia Jihad" case. This prosecution involved members of the Dar al-Arqam Islamic Center, who trained for jihad in Northern Virginia by participating in paintball and paramilitary training, including eight individuals who traveled to terrorist training camps in Pakistan or Afghanistan between 1999 and 2001. These individuals are associates of a violent Islamic extremist group known as Lashkar-e-Taiba (LET), which operates in Pakistan and Kashmir, and that has ties to the al Qaeda terrorist network. As the result of an investigation that included the use of information obtained through FISA, prosecutors were able to bring charges against these individuals. Six of the defendants have pleaded guilty, and three were convicted in March 2004 of charges including conspiracy to levy war against the United States and conspiracy to provide material support to the Taliban. These nine defendants received sentences ranging

from a prison term of four years to life imprisonment. 3. The Patriot Act updated the law to reflect new technologies and new threats. The Act brought the law up to date with current technology, so we no longer have to fight a digital-age battle with antique weapons-legal authorities leftover from the era of rotary telephones. When investigating the murder of Wall Street Journal reporter Daniel Pearl, for example, law enforcement used one of the Act's new authorities to use high-tech means to identify and locate some of the killers. Allows law enforcement officials to obtain a search warrant anywhere a terrorist-related activity occurred. Before the Patriot Act, law enforcement personnel were required to obtain a search warrant in the district where they intended to conduct a search. However, modern terrorism investigations often span a number of districts, and officers therefore had to obtain multiple warrants in multiple jurisdictions, creating unnecessary delays. The Act provides that warrants can be obtained in any district in which terrorism-related activities occurred, regardless of where they will be executed. This provision does not change the standards governing the availability of a search warrant, but streamlines the search-warrant process.

Patriot Act is vital to prevent ALL types of terrorism—deterrence, harsh punishments, and empirical success

Department of Justice, '08, ("The USA PATRIOT Act: Preserving Life and Liberty," Department of Justice, 2008, http://www.justice.gov/archive/ll/highlights.htm)//erg

Allows victims of computer hacking to request law enforcement assistance in monitoring the "trespassers" on their computers. This change made the law technology-neutral; it placed electronic trespassers on the same footing as physical trespassers. Now, hacking victims can seek law enforcement assistance to combat hackers, just as burglary victims have been able to invite officers into their homes to catch burglars. 4. The Patriot Act increased the penalties for those who commit terrorist crimes. Americans are threatened as much by the terrorist who pays for a bomb as by the one who pushes the button. That's why the Patriot Act imposed tough new penalties on those who commit and support terrorist operations, both at home and abroad. In particular, the Act: Prohibits the harboring of terrorists. The Act created a new offense that prohibits knowingly harboring persons who have committed or are about to commit a variety of terrorist offenses, such as: destruction of aircraft; use of nuclear, chemical, or biological weapons; use of weapons of mass destruction; bombing of government property; sabotage of nuclear facilities; and aircraft piracy. Enhanced the inadequate maximum penalties for various crimes likely to be committed by terrorists: including arson, destruction of energy facilities, material support to terrorists and terrorist organizations, and destruction of national-defense materials. Enhanced a number of conspiracy penalties, including for arson, killings in federal facilities, attacking communications systems, material support to terrorists, sabotage of nuclear facilities, and interference with flight crew members. Under previous law, many terrorism statutes did not specifically prohibit engaging in conspiracies to commit the underlying offenses. In such cases, the government could only bring prosecutions under the general federal conspiracy provision, which carries a maximum penalty of only five years in prison. Punishes terrorist attacks on mass transit systems. Punishes bioterrorists. Eliminates the statutes of limitations for certain terrorism crimes and lengthens them for other terrorist crimes. **The government's success in preventing another catastrophic attack on the American homeland since September 11, 2001, would have been much more difficult, if not impossible, without the USA Patriot Act.** The

authorities Congress provided have substantially enhanced our ability to prevent, investigate, and prosecute acts of terror.

Crime

The Patriot Act is essential for successful crime fighting

Department of Justice, '08, ("The USA PATRIOT Act: Preserving Life and Liberty," Department of Justice, 2008, http://www.justice.gov/archive/ll/highlights.htm)//erg

Allows federal agents to ask a court for an order to obtain business records in national security terrorism cases. Examining business records often provides the key that investigators are looking for to solve a wide range of crimes. Investigators might seek select records from hardware stores or chemical plants, for example, to find out who bought materials to make a bomb, or bank records to see who's sending money to terrorists. Law enforcement authorities have always been able to obtain business records in criminal cases through grand jury subpoenas, and continue to do so in national security cases where appropriate. These records were sought in criminal cases such as the investigation of the Zodiac gunman, where police suspected the gunman was inspired by a Scottish occult poet, and wanted to learn who had checked the poet's books out of the library. In national security cases where use of the grand jury process was not appropriate, investigators previously had limited tools at their disposal to obtain certain business records. Under the Patriot Act, the government can now ask a federal court (the Foreign Intelligence Surveillance Court), if needed to aid an investigation, to order production of the same type of records available through grand jury subpoenas. This federal court, however, can issue these orders only after the government demonstrates the records concerned are sought for an authorized investigation to obtain foreign intelligence information not concerning a U.S. person or to protect against international terrorism or clandestine intelligence activities, provided that such investigation of a U.S. person is not conducted solely on the basis of activities protected by the First Amendment. 2. The Patriot Act facilitated information sharing and cooperation among government agencies so that they can better "connect the dots." **The Act removed the major legal barriers that prevented the law enforcement, intelligence, and national defense communities from talking and coordinating their work to protect the American people** and our national security. The government's prevention efforts should not be restricted by boxes on an organizational chart. **Now police officers, FBI agents, federal prosecutors and intelligence officials can protect our communities** by "connecting the dots" to uncover terrorist plots before they are completed. As Sen. John Edwards (D-N.C.) said about the Patriot Act, "we simply cannot prevail in the battle against terrorism if the right hand of our government has no idea what the left hand is doing" (Press release, 10/26/01)

FISA and the Patriot Act are key to searches and gathering of information for law enforcement

ACLU, no date, ("SURVEILLANCE UNDER THE USA PATRIOT ACT," American Civil Liberties Union, https://www.aclu.org/surveillance-under-usa-patriot-act)//erg

Under the Patriot Act, the FBI can secretly conduct a physical search or wiretap on American citizens to obtain evidence of crime without proving probable cause, as the Fourth Amendment explicitly requires. A 1978 law called the Foreign Intelligence Surveillance Act (FISA) created an exception to the Fourth Amendment's requirement for probable cause when the purpose of a wiretap or search was to gather foreign intelligence. The rationale was that since the search was not conducted for the purpose of gathering evidence to put someone on trial, the standards could be loosened. In a stark demonstration of why it can be dangerous to create exceptions to fundamental rights, however, the Patriot Act expanded this once-narrow exception to cover wiretaps and searches that DO collect evidence for regular domestic criminal cases. FISA previously allowed searches only if the primary purpose was to gather foreign intelligence. But the Patriot Act changes the law to allow searches when "a significant purpose" is intelligence. That lets the government circumvent the Constitution's probable cause requirement even when **its main goal is ordinary law enforcement.** The eagerness of many in law enforcement to dispense with the requirements of the Fourth Amendment was revealed in August 2002 by the secret court that oversees domestic intelligence spying (the "FISA Court"). Making public one of its opinions for the first time in history, the court revealed that it had rejected an attempt by the Bush Administration to allow criminal prosecutors to use intelligence warrants to evade the Fourth Amendment entirely. The court also noted that agents applying for warrants had regularly filed false and misleading information. That opinion is now on appeal.

Reps. Mark Pocan (D-Wis.) and Thomas Massie (R-Ky.) on Tuesday unveiled their Surveillance State Repeal Act, which would overhaul American spying powers unlike any other effort to reform the National Security Agency. "This **isn't just tinkering around the** edges," Pocan said during a Capitol Hill briefing on the legislation. "This is a **meaningful overhaul** of the system, getting rid of essentially all parameters of the Patriot Act." The bill would completely repeal the Patriot Act, the sweeping national security law passed in the days after Sept. 11, 2001, as well as the 2008 FISA Amendments Act, another spying law that the NSA has used to justify collecting vast swaths of people's communications through the Internet. It would also reform the secretive court that oversees the nation's spying powers, prevent the government from forcing tech companies to create "backdoors" into their devices and create additional protections for whistleblowers. "Really, what we need are new whistleblower protections so that the next Edward Snowden doesn't have to go to Russia or Hong Kong or whatever the case may be just for disclosing this," Massie said. The bill is likely to be a **nonstarter for leaders in Congress**, who have been worried that even much milder reforms to the nation's spying laws would tragically handicap the nation's ability to fight terrorists. A similar bill was introduced in 2013 but failed to gain any movement in the House.

Washington, D.C. – Last week, Reps. Mark Pocan (D-Wis.) and Thomas Massie (R-Ky.), introduced bipartisan legislation, H.R. 1466, to completely repeal the PATRIOT act. The bill would reform the National Security Agency (NSA), and dramatically revamp America's overall espionage apparatus and posture. Aptly named the Surveillance State Repeal Act, the bill, if enacted, would be the **single biggest legislative check** against the unwarranted government overreach and draconian surveillance of Americans that has transpired subsequent the events of 9/11, while at the same time restoring our civil liberties. The bill would also give whistleblowers like Edward Snowden, who exposed the National Security Agency's mass surveillance in 2013, additional protections under the law. "Really, what we need are new whistleblower protections so that the next Edward Snowden doesn't have to go to Russia or Hong Kong or whatever the case may be just for disclosing this," Rep. Massie said. The PATRIOT Act was passed as a fear-based reaction to the events of 9/11 and gave the federal government an unprecedented amount of power to monitor the private communications of U.S. citizens without a warrant. This law is a clear violation of the 4th Amendment, yet it has been allowed to transform our republic into something almost unrecognizable. The Surveillance State Repeal Act would prohibit the government from collecting information on U.S. citizens obtained through private communications without a warrant. In addition, it would also mandate that the Government Accountability Office (GAO) provide monitoring of domestic surveillance programs to ensure compliance with the law. "This isn't just tinkering around the edges," Rep. Pocan said during a Capitol Hill briefing on the legislation. "This is a meaningful overhaul of the system, getting rid of essentially all parameters of the Patriot Act." Another section of the bill specifically disallows the government from mandating that electronic manufacturers install "back door" spy software into their products. This is a legitimate concern due to recent comments by FBI Director James Comey regarding legally forcing companies to provide "back doors" to products so the government could potentially access customer data. According to The Hill: The bill would completely repeal the Patriot Act, the sweeping national security law passed in the days after Sept. 11, 2001, as well as the 2008 FISA Amendments Act, another spying law that the NSA has used to justify collecting vast swaths of people's communications through the Internet. It would also reform the secretive court that oversees the nation's spying powers, prevent the government from forcing tech companies to create "backdoors" into their devices and create additional protections for whistleblowers. The bill is looked at by congressional watchers as a **non-starter**, as there are far too many congressional leaders on both sides of the aisle in Congress that have **strong interests in the Military/Intelligence Industrial Complex**. A similar bill was introduced in 2013 but **didn't garner any traction** as typical militarist talking heads in Congress feigned fear over reforming the nation's domestic spying operations claiming it would endanger U.S. national security.

Last month, Massie introduced a bill going much further. His Surveillance State Repeal Act, co-sponsored with Wisconsin Democrat Mark Pocan, would repeal the entire Patriot Act and a landmark 2008 expansion of the Foreign Intelligence Surveillance Act. As well, the bill carries protections for national-security whistleblowers against retaliation and makes probable cause the basis for foreign-intelligence surveillance of an American or someone on US soil. But the bill, with only five current co-sponsors , **faces questions about its viability**, which even **Massie concedes**. "It's very **long odds**, but it's a statement about what needs to happen. It's a stronger Freedom Act that's not going to get watered down," Massie said. After the NSA briefing on Tuesday, Massie said he sees a "tremendous opportunity" for surveillance reform, and said he thinks the newest members of Congress are likely to determine the fate of the expiring Patriot Act provisions. "A lot of it is going to hinge on the freshmen. Right now, as far as I can tell, the select **intelligence committee is making a real strong play** to persuade the freshmen that all of these public concerns are overblown," Massie said.

As the expiration of controversial Patriot Act provisions nears, anti-mass surveillance congressmen and privacy advocates are pushing for wholesale repeal of that 2001 law. "We need to repeal all of this junk and just start over," Rep. Thomas Massie, R-Ky., said Tuesday at a Capitol Hill briefing geared toward congressional staffers. Massie is working with Rep. Mark Pocan, D-Wis., to rally support for a bill that would do just that. The bill, the Surveillance State Repeal Act, would abolish the entire Patriot Act and the FISA Amendment Act of 2008, which gave legal footing to more ambitious Bush administration surveillance programs. "This isn't just tinkering around the edges," Pocan told about two dozen event attendees. The bill would require warrants for collecting Americans' communications, attempt to restrain mass surveillance of Americans under Executive Order 12333 and ban spy agencies from foisting surveillance-enabling product redesigns on tech companies, a reform that passed the House 293-123 last year before being cut from a large spending bill by congressional leaders. Massie said the bill would significantly enhance whistleblower protections, meaning "the next Edward Snowden doesn't need to go to Russia or Hong Kong." Snowden, a former contractor who exposed vast U.S. phone and Internet surveillance beginning in June 2013, "couldn't have come to me legally and exposed it to me," Massie said. His only option would have been to speak with intelligence committee members sympathetic to the programs, he said, "[and] they'd probably take him right to jail." Massie scoffed at what he sees as **fear-mongering from executive branch officials** who, he says, actually hold up photos of the twin towers burning while lobbying against mass surveillance reform in closed congressional hearings. An earlier version of the surveillance-repealing package was introduced in 2013 by Rep. Rush Holt, D-N.J., who has since left Congress. On hand to sell the bill Tuesday were policy advocates who **promised pressure** on members and who attempted to make staffers comfortable with the idea of wholesale repeals. Cato Institute policy analyst Patrick Eddington, a former Holt aide, said it was time to "**raise the bar** on what constitutes reform." Eddington said it was "very disturbing" that NSA officials exaggerated the usefulness of programs such as the dragnet collection of U.S. phone records immediately after Snowden's first leaks, and he questioned whether anything in the Patriot Act prevented a terror attack. Panels probing 9/11 found a lack of information-sharing, not information itself, he said. NSA spy programs, Eddington reminded staffers, did not prevent jihadis from bombing the 2013 Boston Marathon, murdering 13 troops at Fort Hood in 2009 or from boarding and attempting to bomb aircraft with explosives hidden in underwear and shoes. CREDO Mobile campaign manager Zach Malitz said that as the Patriot Act provisions' June expiration approaches, "**the Obama administration will put overwhelming pressure" on lawmakers to renew spy authorities**, likely with a few "flimsy superficial reforms."

SSRA Unpopular – Bipartisan Opposition

SSRA is unpopular – there's a bipartisan coalition opposing passage—2013 proves

Wachtler 2015, Mark Wachtler, 4/11/2015, HR 1466 Surveillance State Repeal Act of 2015, http://www.whiteoutpress.com/articles/2015/q2/hr-1466-surveillance-state-repeal-act-2015/

Considering the overwhelming outrage by the American people over the government's blanket domestic espionage programs, it's surprising that the 2013 Surveillance State Repeal Act didn't garner more support. The Bill accumulated ten co-sponsors, was assigned to four Committees and six Sub-Committees. But not a single vote was ever taken to advance them out of Committee and to the full House. Supporters of the effort to stop the universal surveillance of the American people hope this year's effort will be more successful.¶ HR 1466 - Surveillance State Repeal Act of 2015¶ In 2013, Rep Mark Pocan (D-WI) was one of ten Democrat Congressmen who co-sponsored the Patriot Act repeal Bill. This time, he's the main sponsor and he has a Republican co-sponsor signed on with him. Introduced on March 19, 2015, the new Bill was proposed by five Congressmen and already has an additional Representative who's signed on since then. The sponsors include Rep Pocan, Rep Thomas Massie (R-KY), Rep Alan Grayson (D-FL), Rep James McGovern (D-MA), Rep Lloyd Doggett (D-TX), Rep Michael Capuano (D-MA).¶ As detailed by the House website, HR 1466 was immediately referred to a number of House Committees upon its introduction. The summary explains that the Surveillance State Repeal Act of 2015 was, 'Referred to the Committee on the Judiciary, and in addition to the Committees on Intelligence (Permanent Select), Financial Services, Foreign Affairs, Energy and Commerce, Education and the Workforce, Transportation and Infrastructure, and Armed Services, for a period to be subsequently determined by the Speaker.'¶ What the Bill would repeal and require¶ HR 1466's official description gives a brief overview of the Bill's ramifications. The legislation, 'Repeals the USA PATRIOT Act and the FISA Amendments Act of 2008 (thereby restoring or reviving provisions amended or repealed by such Acts as if such Acts had not been enacted), except with respect to reports to Congress regarding court orders under the Foreign Intelligence Surveillance Act of 1978 (FISA) and the acquisition of intelligence information concerning an entity not substantially composed of US persons that is engaged in the international proliferation of weapons of mass destruction.'¶ As currently written, the Bill would also prohibit the government from collecting information on an American citizen, 'without a warrant based on probable cause.' If passed, it would also force the Director of the Office of National Intelligence, and its 16 spy agencies to, 'destroy any information collected under the repealed Acts, or acquired under Executive Order 12333 without a warrant.'¶ The law would also protect electronics manufacturers from being forced by the government to include encryption-free back doors to their devices and services allowing spy agencies to monitor their customers. Finally, the Bill attempts to protect future whistleblowers that come forward with evidence that the government isn't abiding by the law.¶ Little chance of passage¶ Illustrating that once you go from Republic to Empire, it's nearly impossible to go back, experts are already warning that HR 1466 has almost no chance of passing. Much like previous attempts to reign in the government's massive blanket domestic espionage programs, this latest effort will most likely pit regular Americans from all walks of the political spectrum supporting the Bill against a bipartisan coalition of the most powerful establishment leaders from both Parties opposing it.¶ That uphill fight isn't deterring the Bill's main sponsor however. "This isn't just tinkering around the edges," Rep Mark Pocan was reported by The Hill explaining during a Capitol Hill briefing after he introduced the legislation, "This is a meaningful overhaul of the system, getting rid of essentially all parameters of the Patriot Act."¶ Republican co-sponsor Rep Thomas Massie also commented on the Bill with targeted remarks about the whistleblower portion of the newly proposed HR 1466. "Really, what we need are new whistleblower protections so that the next Edward Snowden doesn't have to go to Russia or Hong Kong or whatever the case may be just for disclosing this," he said, "We need to repeal all of this junk and just start over."¶ Illustrating the uphill battle the co-sponsors and their supporters have in front of them, The Hill writes, 'The bill is likely to be a nonstarter for leaders in Congress, who have been worried that even much milder reforms to the nation's spying laws would tragically [hurt] handicap the nation's ability to fight terrorists. A similar bill was introduced in 2013 but failed to gain any movement in the House.'

Macri 2015, Giuseppe Macri, Tech Editor for the Daily Caller, 3/24/2015, House Revives Bill To Completely Repeal The Patriot Act, Dismantle NSA Spying,

Wisconsin Democratic Rep. Mark Pocan and Kentucky Republican Rep. Thomas Massie announced in a press release their intention to reintroduce the Surveillance State Repeal Act — a bill first introduced following the Snowden leaks in 2013 that would completely repeal the Patriot Act and the 2008 FISA Amendments Act, as well as introduce reforms to the Foreign Intelligence Surveillance Court.¶ The bill would legally dismantle the National Security Agency's most aggressive surveillance programs, including the bulk collection and retention of virtually all Americans' landline phone records justified under Section 215 of the Patriot Act. The repeal of the 2008 FISA Amendments Act would also prevent the agency from tapping the physical infrastructure of the Internet, such as undersea fiber cables, to intercept "upstream" data in bulk, which critics including the ACLU claim the NSA uses to collect data on Americans. (RELATED: Wikipedia Tells Reddit Why It Thinks It Can Win A Lawsuit Against NSA)¶ Under the new law the FISA Court, which approves secret surveillance requests by the NSA and other intelligence agencies, would be appointed technology experts to advise judges on the privacy implications of government surveillance requests. The court would also be held to new standards for issuing warrants for all surveillance based on probable cause, as opposed to the current lesser standard of reasonable suspicion.¶ The bill would make it illegal to prosecute whistleblowers like former NSA contractor Edward Snowden and prevent the government from mandating companies build "backdoors" into their privacy encryption products like those currently sought by the FBI. (RELATED: Wyden: Don't Give The FBI Backdoors Into Americans' Cellphones)¶ "Really, what we need are new whistleblower protections so that the next Edward Snowden doesn't have to go to Russia or Hong Kong or whatever the case may be just for disclosing this," Massie said during a Capitol Hill briefing Tuesday, according to The Hill.¶ "The warrantless collection of millions of personal communications from innocent Americans is a direct violation of our constitutional right to privacy," Pocan said in the statement. "Revelations about the NSA's programs reveal the extraordinary extent to which the program has invaded Americans' privacy."¶ "I reject the notion that we must sacrifice liberty for security — we can live in a secure nation which also upholds a strong commitment to civil liberties. This legislation ends the NSA's dragnet surveillance practices, while putting provisions in place to protect the privacy of American citizens through real and lasting change."¶ After failing the first time in 2013 amid the immediate public backlash from the Snowden leaks, the bill will likely be dead on arrival in Congress, where much weaker reforms failed to pass the Senate as a result of last-minute Republican attacks — all that while the chamber was still in Democratic control.

Krieger 2015, former Economic Analyst, Michael Krieger, 3/25/2015, Meet the "Surveillance State Repeal Act" – A Bipartisan Bill to Fully Repeal the Patriot Act, http://libertyblitzkrieg.com/2015/03/25/meet-the-surveillance-state-repeal-act-a-bipartisan-bill-to-fully-repeal-the-patriot-act/

Before discussing the bill in question, some background information is helpful. While the bill appears to have **little chance of going anywhere** due to the total embrace of fascism within Congressional leadership, its introduction seems in part related to positioning ahead of the expiration of key provisions of the Patriot Act, set to expire on June 1st.¶ The Hill covered the importance of this earlier in the year. Here are a few excerpts:¶ In five months, key provisions of the Patriot Act are set to expire, potentially eliminating spying programs that intelligence officials say are critical to keeping the nation safe from terrorists. ¶ The battle over what changes should be made to that law — and whether it should be reauthorized at all — is likely to be an early test of Republican leaders' ability to keep their party unified while controlling both chambers of Congress.¶ "I think there is going to be a very inconvenient and strong difference of opinion within the Republican Party about how to proceed here," said Kevin Bankston, policy director at the New America Foundation's Open Technology Institute and a supporter of reforms to the spying law.

AT Bipartisan

Bipartisanship doesn't make it popular – it has limited bipartisan support, even if it's on both sides of the aisle, and experienced congressmen oppose it

Ward 2015, Stan Ward, writer for Best VPN, 4/20/2015, With Section 215 to Sunset , the NSA and FBI go on the offensive, https://www.bestvpn.com/blog/17490/with-section-215-to-sunset-the-nsa-and-fbi-go-on-the-offensive/

Gaining some traction as an alternative is a measure that has bi-partisan support. Titled the Surveillance State Repeal Act, it would repeal the entire Patriot Act,plus a landmark 2008 expansion of the Foreign Intelligence Surveillance Act (Fisa). The proposed legislation also includes protection from prosecution for whistleblowers, and raises the bar for warrants under Fisa to having to show probable cause. But **though it has backers on both side of the aisle**, the Surveillance State Repeal Act **only has ten co-sponsors**.¶ The fate of surveillance reform, and the demise of the Patriot Act, apparently reside in the hands of many freshman Congressman who are being lobbied hard by both supporters and opponents of strong surveillance. Seasoned veteran Congressmen – especially those on the Select Intelligence Committee – are attempting to play down public outcry from those who champion surveillance reform.

US counterterrorism is effective now, but threats are increasing

Paul **Richter 6/20**, State Department and foreign policy correspondent for the LA Times, "Terrorist attacks soared in 2014," 6/20/15, www.telegram.com/article/20150620/NEWS/150629898

WASHINGTON — Terrorist violence exploded around the world last year, driven by a surge in attacks by the Islamic State extremist group in the Middle East and Boko Haram in West Africa, the State Department said in a report Friday.¶ The number of terrorist **attacks jumped 35 percent**, to 13,500, while the number of **fatalities soared 81 percent**, to 33,000, the report says. A major factor was an increase in especially deadly attacks, including 20 assaults that killed 100 or more people.¶ The surge in lethality comes as governments have collapsed or come under attack in parts of the Middle East and Africa, including in Syria, Iraq, Yemen, Libya and Nigeria.¶ The number of people kidnapped or taken hostage tripled, to more than 9,400, largely at the hands of Islamic State and Al Nusra Front in Syria and Boko Haram in Nigeria.¶ Tina Kaidanow, the State Department's counterterrorism coordinator, said much of the terrorist violence was confined to a few troubled nations.¶ But she said the **threat of "lone wolf attacks" is growing in the West**, in part because Western governments are making it harder for recruits to travel to join extremist groups abroad. Still, an estimated 16,000 foreign fighters joined Islamic State in Syria and Iraq in 2014.¶ The extremist groups' effective outreach on social media and the Internet is also driving zealots to plot and launch attacks, Kaidanow said. She cited lethal assaults last year by gunmen in Ottawa and Sydney.¶ The statistics came in an annex to the State Department's annual "Country Reports on Terrorism," which was released Friday.¶ At a news briefing, Kaidanow argued that the negative trends, while troubling, aren't a good measure of how well the Obama administration's counter-terrorism programs have performed.¶ Kaidanow said the administration has helped other nations **improve border security, strengthen counterterrorism laws and increase information sharing** to sharpen their defenses against terrorist violence.¶ "We have been **effective in dealing with the capabilities of our partners** globally," she said. "This is not a battle … the United States can undertake alone."¶ She said the threat posed by the core al-Qaida network continued to diminish in 2014 after the deaths and arrests of leaders in Pakistan, Afghanistan and Yemen.

*Surveillance is vital to effective counter-terrorism – **any lapse** creates vulnerabilities*

AFP 6/1, Agence France Presse, "CIA chief: Ending NSA spying would boost terror threat," 6/1/15, www.abs-cbnnews.com/global-filipino/world/05/31/15/cia-chief-ending-nsa-spying-would-boost-terror-threat

WASHINGTON, United States - CIA chief John Brennan warned Sunday that allowing vital surveillance programs to expire could **increase terror threats**, as the US Senate convened for a crunch debate on whether to renew the controversial provisions.¶ With key counterterrorism programs set to expire at midnight Sunday, the top intelligence official made a final pitch to senators, arguing that the bulk data collection of telephone records of millions of Americans unconnected to terrorism has not abused civil liberties and only serves to safeguard citizens.¶ "This is something that **we can't afford to** do right now," Brennan said of **allow**ing **the expiration of counterterrorism provisions**, which "sunset" at the end of May 31.¶ "Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago," he said CBS' "Face the Nation" talk show.¶ Brennan added that groups like Islamic State have followed the developments "very carefully" and are "looking for the seams to operate."¶ The House has already passed a reform bill, the USA Freedom Act, that would end the telephone data dragnet by the National Security Agency and require a court order for the NSA to access specific records from the vast data base retained by telecommunications companies.¶ If no action is taken by the Senate Sunday, authorities will be forced to shut down the bulk collection program and two other provisions, which allow roving wiretaps of terror suspects who change their mobile phone numbers and the tracking of lone-wolf suspects.¶ Senator Rand Paul, a Republican 2016 presidential candidate adamantly opposed to reauthorizing the surveillance, is threatening to delay votes on the reform bill or an extension of the original USA Patriot Act.¶ That would force the counterterrorism provisions to lapse until at least

Wednesday.¶ Former NSA chief Michael Hayden, who is also a former CIA director, equated such a temporary lapse as "giving up threads" in a broader protective fabric.¶ "It may not make a difference for a while. Then again, it might," he told CNN's State of the Union.¶ "Over the longer term, I'm willing to wager, **it will indeed make a difference**."

*And, Tehran is backing terrorists now – any deal makes an attack **more likely***

Matthew **Lee 6/19**, Bradley Klapper, "Report shows Iran terrorism threat on the rise as nuke deadline nears," 6/19/15, http://www.theglobeandmail.com/news/world/report-shows-iran-terrorism-threat-on-the-rise-as-nuke-deadline-nears/article25047201/

Iran's support for international terrorist groups remained undiminished last year and even expanded in some respects, the Obama administration said Friday, less than two weeks before the deadline for completing a nuclear deal that could provide Tehran with billions of dollars in relief from economic sanctions.¶ The assessment offered a worrying sign of even worse terror-related violence to come after a year in which extremists in the Middle East, Africa and Asia committed **35 per cent more terrorist acts**, **killed nearly twice as many** people and almost tripled the number of kidnappings worldwide. Statistics released by the State Department on Friday also pointed to a **tenfold surge in the most lethal kinds of attacks**.¶ Yet even as the Islamic State and the Taliban were blamed for most of the death and destruction in 2014, the department's annual terrorism report underscored the ongoing threat posed by Iran and its proxies across the Islamic world and beyond.¶ **Tehran increased its assistance to Shia militias** fighting in Iraq and continued its long-standing military, intelligence and financial aid to Lebanon's **Hezbollah**, Syrian President Bashar **al-Assad**'s embattled government, and Palestinian groups **Hamas** and **Islamic Jihad**. While the study said Iran has lived up to interim nuclear deals with world powers thus far, it gave no prediction about how an Iran flush with cash from a final agreement would behave.¶ World powers and Iran are trying to conclude an accord by the end of the month, setting 15 years of restrictions on Iran's nuclear program in exchange for significant relief from the international sanctions that have crippled the Iranian economy.¶ The negotiations don't involve Iran's support for militant groups beyond its border. But Israel and the Sunni monarchies of the Persian Gulf, Iran's regional rivals, fear a **fresh wave of terrorism as a result of any pact**. President Barack Obama, hoping to ease their fears, has said most of the money would go to Iran's economic development.¶ The United States's "grave concern about **Iran's support for terrorism remains unabated**," White House spokesman Eric Shultz said. "That is all the more reason that we need to make sure they don't obtain a nuclear weapon."¶ In total past year, nearly 33,000 people were killed in almost 13,500 terrorist attacks around the world, up from just over 18,000 deaths in nearly 10,000 attacks in 2013. Twenty-four Americans were killed by extremists in 2014, and abductions soared to 9,428 in the calendar year from 3,137 in 2013. The report attributes the rise in attacks to increased terror activity in Iraq, Afghanistan and Nigeria and the sharp spike in deaths to a growth in lethal attacks in those countries and elsewhere.

Joseph F. Pilat and Nathan E. Busch, 5/15/15, pp. 419-420

But we now live in an age that includes a few groups intent on inflicting large-scale destruction to achieve more global objectives. In the 1990s, the japanese terror cult Anni Shinrikyo first sought to buy nuclear weapons in Russia, then to make them themselves, before turning to biological weapons and the nerve gas they ultimatelv used in the Tokyo subways.¶ Starting also in the 19905, al Qaeda repeatedly sought nuclear

materials and the expertise needed to make them into a nuclear bomb. Ultimately, al Qaeda put together a focused program reporting directly to Ayman al-Zawahiri (now head of the group), which progressed as far as carrying out crude but sensible conventional explosive tests for the nuclear program in the desert of Afghanistan.' ¶ The killing of Osama bin Laden and the many other blows against al Qaeda have surely reduced the risk that al Qaeda could put together and carry through a nuclear bomb project. But by how much? The core organization of al Qaeda has proved resilient in the past.There is every reason to believe Al-Zawahiri **remains eager to inflict destruction on a nuclear scale**. Indeed, despite the large number of al Qaeda leaders who have been killed or captured, **nearly all of the key players in al Qaeda's nuclear program remain alive and at large** - including Abdel Aziz al-Masri, an Egyptian explosives expert who was al Qaeda's "nuclear CEO." No one knows what capabilities a secret cell of al Qaeda may have managed to retain or build. And regional affiliates and other groups in the broader violent Islamic extremist movement — particularly some of the deadly Pakistani terrorist groups — may someday develop the capability and intent to follow a similar path.¶ North Caucasus terrorist groups sought radiological weapons and threatened to sabotage nuclear reactors.There is significant, though less conclusive, **evidence that they sought nuclear weapons** as well — particularly confirmation from senior Russian officials that two teams were caught carrying out reconnaissance at Russian nuclear weapon storage sites, whose very locations are a state secret.¶ More fundamentally, with at least two, and probably three, groups having gone down this path in the past twenty-five years, **there is no reason to expect they will be the last**. The **danger of nuclear terrorism will remain** as long as nuclear weapons, the materials needed to make them, and terrorist groups bent on large-scale destruction co-exist.

Several powerful trends have aligned to profoundly change the way that the world works. Technology ¶ now allows stateless groups to organize, recruit, and fund ¶ themselves in an unprecedented fashion. That, coupled ¶ with the extreme difficulty of finding and punishing a stateless group, means that stateless groups are positioned to be ¶ lead players on the world stage. They may act on their own, ¶ or they may act as proxies for nation-states that wish to ¶ duck responsibility. Either way, stateless groups are forces ¶ to be reckoned with.¶ At the same time, a different set of technology trends ¶ means that small numbers of people can obtain incredibly ¶ lethal power. Now, for the first time in human history, a ¶ small group can be as lethal as the largest superpower. Such ¶ a group could execute an attack that could kill millions of ¶ people. It is technically feasible for such a group to kill billions of people, to end modern civilization—perhaps even ¶ to drive the human race to extinction. Our defense establishment was shaped over decades to ¶ address what was, for a long time, the only strategic threat ¶ our nation faced: Soviet or Chinese missiles. More recently, ¶ it has started retooling to address tactical terror attacks like ¶ those launched on the morning of 9/11, but the reform ¶ process is incomplete and inconsistent. A real defense will ¶ require rebuilding our **military and intelligence capabilities** from the ground up. Yet, so far, strategic terrorism has ¶ received relatively little attention in defense agencies, and ¶ the efforts that have been launched to combat this existential threat seem fragmented.¶ History suggests what will happen. The only thing that shakes America out of complacency is a direct threat from a determined adversary that confronts us with our shortcomings by **repeatedly attacking** us or hectoring **us for decades**.

The head of al Qaeda's branch in Yemen, which U.S. officials say poses the greatest terrorist threat to America, has been killed in a U.S. drone strike, according to Yemeni media reports and statements from the terrorist organization's members.¶ If Nasir al-Wuhayshi was killed—a claim that U.S. officials are so far not disputing—his death would be a significant blow to the already-fragile al Qaeda terrorist organization. And it would be the second major hit in a matter of days on a key al Qaeda leader, following a series of U.S. airstrikes over the weekend in Libya that killed another notorious jihadi, Mokhtar Belmokhtar.¶ Wuhayshi is arguably the bigger prize, having been promoted two years ago to run **all of al Qaeda's global terror attacks**. U.S. intelligence officials have said that his division, al Qaeda in the Arabian Peninsula, or AQAP, has been perfecting methods for sneaking explosives onto airplanes, hidden inside devices that don't alert security screening systems.¶ In other words, as far as the U.S. intelligence community is concerned, Wuhayshi is al Qaeda's No. 1 threat. If he is gone, it would be seen as a **major win for American counterterror operations**.¶ Reports emerged Monday on Twitter from purported AQAP members mourning Wuhayshi's death and praising his already named successor, Qassem al Rimi. The rapid appointment of a new leader speaks to how critical Wuhayshi's position was within the organization. But it also suggests that the group's overall structure remains strong because he was so quickly replaced.¶ "Decapitation strikes have yet to defeat an [al Qaeda] franchise. **It won't defeat AQAP**," Bruce Riedel, a former CIA officer and al Qaeda expert now at the Brookings Institution, told The Daily Beast. "**But it's a welcome development** if true."

Domestic surveillance is high now – the Freedom Act expanded de facto powers

Harold **Pease 6/17**, Professor of Political Science at Taft University, "Spy law looks the same," 6/17/15, www.harlandaily.com/news/opinion_columns/154125060/Spy-law-looks-the-same

Critics find the new spy law more hype than substance with only slightly less intrusive spying laws than the previous citizen spy law — The Patriot Act. Private **communications are still confiscated and stored** against the will of its owner and **without probable cause or warrant**. Once a conspiracy theory, until Edward Snowden, two years ago, provided the indisputable evidence that the government actively spies on its own people in the "freest land in the world."¶ Deep Orwellian governmental intrusion into the lives of innocent Americans is the new normal and is to continue as before with one difference. The notorious Section 215, authorizing bulk data collection, was changed **requiring private telecommunication companies to collect the bulk data** (it is now illegal for them not to) and store the information themselves at their own expense, rather than to immediately give it to the government as before. Amazingly this is just after a US Department of Justice report revealed "the FBI did not identify any major case developments that resulted from use of the

records obtained in response to Section 215 orders." If it has not helped the government catch a single bad guy in all these years, why then do we do it? This is never explained. It must be about power.¶ Section 215 was also used to track financial data and transactions and to obtain companies' Internet business records. It was Edward Snowden who enlightened us on the extent of its invasiveness to personal information. He wrote: "The NSA has built an infrastructure that allows it to intercept almost everything. With this capability, the vast majority of human communications are automatically ingested without targeting. If I wanted to see your emails or your wife's phone, all I have to do is use intercepts. I can get your emails, passwords, phone records, credit cards."¶ Telecommunication **companies now must provide the information** when requested by the **f**ederal **g**overnment. They have lost their freedom not to collect and not to give your private information. They are now, in essence, agents of the federal government and bulk data collection continue under them. As such the USA Freedom Act provides these corporations liability protection should you wish to sue for their disclosure of your sensitive information. Some call it a shell game; the federal government still gets your information just as before.¶ Probably columnist Daniel Mcadams said it best in an article "The Freedom Act is WORSE than the Patriot Act," because it "turns private telecommunications companies into depositories of 'pre-crime' data for future use of state security agencies…. In other words, an individual under no suspicion of any crime and thus deserving full Fourth and Fifth Amendment protection will nevertheless find himself providing evidence against his future self should that person ever fall under suspicion. That is not jurisprudence in a free society." Ironically the 2nd U.S. Circuit Court of Appeals just ruled bulk collection of citizens' records an illegal act. Congress ignored this ruling and essentially declared the same practice legal in the USA Freedom Act. Mcadams asks, "How does making an unconstitutional and illegal act into a legal one a benefit to civil liberties?"¶ Moreover, the Freedom Act **expanded the phone records program** to include cell phone records in addition to landline records. An act to curb the unruly NSA merely enlarged it. **Roving wiretaps** and **lone wolf surveillance** (those deemed by the federal government to be dangerous but not connected with an international terrorist organization) authority remains in place. The Patriot Act is now repackaged with a new name, The USA Freedom Act. And as with the first, which had nothing to do with patriotism, the real patriots are those who oppose and expose this power grab, its sister act has noting to do with freedom. After the change strangely **everything remains the same**.

FISC authorization sidesteps amicus oversight

PressTV 6/20, Tehran-based international news network, "US secretive court to renew NSA phone spying," 6/20/15, www.presstv.ir/Detail/2015/06/20/416692/US-NSA-phone-collection-spying

A secretive federal court in the US plans to reauthorize the controversial phone records collection by the National Security Agency for another six months.¶ The Foreign Intelligence Surveillance Court (FISC) that oversees US government spying requests plans to renew the NSA spying in spite of a new reform law that ended the program.¶ Section 215 of the Patriot Act enables the NSA to collect any telephone and business records relevant to a counter-terrorism investigation. The section expired without renewal on June 1.¶ In an order released on Friday, the FISC said a short lapse in some Patriot Act provisions **would not ban the court from allowing the NSA's surveillance**.¶ The court "has the authority to grant the applications and issue the requested orders," FISC Judge F. Dennis Saylor wrote. Saylor noted that the court **does not need approval of an "amicus,"** or panel, of privacy advocates, which was created under the USA Freedom Act.¶ "The statute provides some limited guidance, in that it clearly contemplates that there will be circumstances where an amicus curiae is unnecessary (that is, 'not appropriate')," Saylor said.¶ "At a minimum, it seems likely that those circumstances would include situations where" the court can choose not to use the assistance or advice of amicus curiae as the legal issue is relatively simple or it needs "a single reasonable or rational outcome."

Link – Bulk Surveillance

Bulk surveillance is key to counter-terrorism – financing and cross-referencing

Sergei **Boeke 15**, research fellow at the International Center for Counter-Terrorism, LLM from Vrije Universiteit Amsterdam, Quirine Eijkman, "State surveillance in cyberspace," from Terrorism Online: Politics, Law and Technology ed. Jarvis, MacDonald, Chen, 3/24/15, pp. 133-134

The targets of intelligence services are therefore well aware of the risks of using phones and the Intemet, and when they cannot avoid doing so their wording will be careful. From this perspective Snowden's disclosures will not significantly change their modus operandi, although the second order effects of the leaks - such as ISPS improving security and encryption — will make it more challenging for the services to follow their targets in the cat and mouse game. The disruptive effect of surveillance programmes on terrorism also extends to the **financing of terror groups**, an aspect that is considered **essential in combating terror**. In the realm of dissuasion and disruption the distinction between bulk surveillance and targeted intelligence operations is irrelevant. For the target person in question, bulk surveillance would probably lead to a **perception of greater risk**, although the impact factor and consequences can only be guessed at. There are scenarios, however, where bulk collection can be combined with a legal framework to **significantly aid the tracking of specific individuals**. If, for instance, it is known that a person suspected of terrorist activities visits certain places at specified times, **bulk interception of all signals at these locations can enable cross referencing** and provide a new number to follow and intercept. This hypothetical case would involve discriminating factors, and could merit a legal warrant as it concerns the search for a particular terrorist, but rests on the assumption that the technical **capacity for bulk collection is in place and available**.

Link – Digital Surveillance

Digital surveillance is key – obstructs terrorist organization and execution

Sergei **Boeke 15**, research fellow at the International Center for Counter-Terrorism, LLM from Vrije Universiteit Amsterdam, Quirine Eijkman, "State surveillance in cyberspace," from Terrorism Online: Politics, Law and Technology ed. Jarvis, MacDonald, Chen, 3/24/15, pp. 133

**modified for gendered language; original text retained

Digital surveillance or eavesdropping does, however, have a **severe disruptive effect on the workings of terrorist groups** and their operations. Despite the shroud of secrecy that intelligence services would like to maintain over SIGINT collection, terrorists are well aware of the risks of using the telephone and the Internet. One reason that the search for bin Laden took ten years was his systematic avoidance of all phones and the Internet. It would be his courier, Al Kuwaiti, who would lead the CIA to bin Laden's hideout in Abbottabad, Pakistan. SIGINT, nonetheless, played a vital role. In the summer of 2010, for the first time in almost a year, Al Kuwaiti, a known acquaintance of bin Laden, used the cellphone sim card that US intelligence had linked to him, and he accepted a call with that sim card close to bin Laden's compound (ABC News 2011). He had previously always followed fastidious operational security, driving more than an hour-and-a-half from the compound before inserting the battery in his cell phone, thereby preventing the NSA from pinpointing his starting point. The call he accepted in 2010 was from an old friend who asked what he was up to. Al Kuwaiti replied that he was back with the people he was with before, eliciting the response "may God facilitate" (Woodward 2011). This set analysts on the trail, mobilising further human sources and satellite imagery to finally identify the compound where bin Laden was hiding. This example of targeted surveillance illustrates three important points. First, it makes clear that top terrorist operators follow strict operational security procedures, whereby some avoid telephones completely and others can have many different ones, switching their use and taking the batteries out when they can. The terrorist leaders who avoid phones altogether are forced to communicate through other means, often reverting to the old fashioned letter. This places **serious impediments on the organisation and its ability to**

execute of complex attacks.'" Second, there are indications that whereas terrorist leaders are often exceptionally careful with their telephone or Internet communications when it concerns their "professional" activities, **they can be more careless with their social contacts**. Unless a terrorist is acting completely alone and has perfect online and telephone discipline there is a good chance that somewhere in the chain of cvcnts [they] ~~he~~ cannot resist an old friends call or place a digital misstep during which [they compromise themself] ~~he compromises himself~~ (Schmidt and Cohen 2013). Third, content and context remain essential. Without a good translation (preferably by native speakers) and knowledge of the context, Al Kuwaiti's words would have remained meaningless and the value of his call misunderstood.

*Internet surveillance is key to counter **homegrown terrorism** – threats are **underestimated***

Victor **Beattie 5/11**, Editor of Voice of America, official external broadcast institution of the United States federal government, "Homeland Security Chief: Global Terror Threat Has Entered 'New Phase'," 5/11/15, www.voanews.com/content/us-security-chief-warns-of-new-phase-in-terrorist-threat/2762237.html

U.S. Homeland Security Secretary Jeh Johnson says the fight against global terrorism has entered a new phase with groups like the Islamic State (IS) successfully using social media to inspire others to join them or to launch domestic attacks. Johnson's comments Sunday on the ABC program This Week followed the revelation that federal **law enforcement has hundreds of investigations underway to determine who might pose a threat of homegrown terrorism**.¶ Secretary Johnson noted the Islamic State group's ability to reach into the homeland to recruit homegrown jihadists.¶ "Because of the use of the Internet, **we could have little, or no, notice** in advance of an independent attacker attempting to strike. And so, that's why **law enforcement at the local level needs to be ever more vigilant**, and we're constantly reminding them to do that," said Johnson.¶ Johnson says every attack or attempted attack represents a lesson learned and, as the threat evolves since the September 11, 2001 attacks, there has been closer cooperation among federal, state and local law enforcement officials.¶ Last week, the director of the Federal Bureau of Investigation (FBI), James Comey, warned there might be thousands of **I**slamic **S**tate followers online in the United States and the challenge is to determine who among them poses a real threat.¶ Earlier this month, two gunmen attacked an event near Dallas, Texas, where cartoons of Islam's Prophet Muhammad were being judged in a contest. The gunmen were killed in an exchange of gunfire with police, in which a security guard was also wounded. Comey said his agency had warned the Garland, Texas police to be on the lookout for Elton Simpson and accomplice Nadir Soofi hours before the attack.¶ Johnson said he and other federal officials are trying to counter social media recruitment efforts by reaching out to the Muslim community in the United States.¶ "Since I have been secretary, I have personally participated in engagements with community leaders in the Islamic community and elsewhere. I've been to New York, Boston, Minneapolis, Chicago, Los Angeles and other places where I personally meet with community leaders about countering violent extremism in their communities. That has to be part of our efforts in this new phase," said Johnson.¶ Johnson said a lot of the counter-narrative to what he acknowledges to be a "slick and effective" message by the IS group to would-be terrorists on social media must come from those communities.¶ "It has to come from Islamic leaders who, frankly, can talk the language better than the federal government can and so, when I meet with community leaders, Islamic leaders, it's one of the things we urge them to do. Some have begun it. We've seen some good progress, but **there's a lot more than can be done**," he said.¶ Johnson described as prudent and cautious steps taken by the U.S. military to increase security at bases across the country, after the FBI warned that Islamist militants could target troops or local police.¶ Appearing on the Fox News Sunday broadcast from Paris, Congressman Michael McCaul, chairman of the House Homeland Security Committee, said there has been an uptick in threat streams against local police and military bases.¶ "We're seeing these on an almost daily basis. It's very concerning. I'm over here with the French counter-terrorism experts on the Charlie Hebdo

case, how we can stop foreign fighters coming out of Iraq and Syria to Europe. But then, we have this phenomenon in the United States where they (terrorists) can be activated by the Internet. And, really, **terrorism has gone viral**," said McCaul.¶ McCaul said **the potential terror threat may even be greater** than the FBI has outlined. He said the United States faces two threats: one from fighters coming out of the Middle East and the other from thousands at home who will take up the call to arms when the IS group sends out an Internet message. He warned the threat will only get worse, largely because of the existence of so many failed states in the Middle East and North Africa.

Link – Surveillance-Proof Channels

Any surveillance-proof channels will be used by terrorists

Rahul **Sagar 15**, Associate Professor of Political Science at Yale-NUS College, "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics & International Affairs 29(2),, pp. 145-159

A second deficiency relates to the disproportionality of the disclosures. Even though the NSA's domestic surveillance program was deemed lawful by the FISC, we could take the view that the lack of public debate about the capture of domestic metadata justified Snowden and Greenwald's disclosure of this particular program. But even so, it is hard to see how we could justify their disclosure of domestic surveillance methods, bearing in mind that these methods could help gather intelligence on what even Snowden and Greenwald might consider legitimate targets, namely, **domestic terror plots**.¶ It is harder still to understand what purpose was served by disclosing NSA foreign surveillance methods such as the deployment of "backdoors" in commonly used hardware and software. Apparently the purpose was to alert countries and individuals around the world to the threat that the NSA poses to their privacy. Snowden and Greenwald have since encouraged countries to develop new infrastructure so that their communications do not have to transit through the United States, and have urged individuals to employ encryption and to cease using the services of companies that collaborate with the NSA. But this approach misses the point: if channels of communication that are immune to surveillance exist, these **would be used not only by dissidents but also by terrorists**. This is why the NSA is obliged to use all available means to crack new channels of communications (or else they could rightly be accused of negligence in the wake of a **terrorist attack that relies on such channels**). The approach taken by the President's Review Group is more balanced. Troubled by the prospect that aggressive surveillance methods could lead to a loss of trust in Internet-based services, they recommend that the United States should typically disclose known vulnerabilities in widely used software and hardware, but allow nonetheless that "in rare instances" the government may "briefly authorize" using such a vulnerability for "priority intelligence collection."27

AT: Cyber Link Turn

*The link outweighs the turn – they can't solve cyberterror because the database **still exists**, BUT **any period** without data collection **increases the risk of an attack***

Christi **Parsons 5/28**, Brian Bennett, "If NSA surveillance program ends, phone record trove will endure," 5/28/15, www.latimes.com/nation/la-na-nsa-phones-20150529-story.html#page=1

The National Security Agency will mothball its mammoth archive of Americans' telephone records, isolating the computer servers where they are stored and blocking investigators' access, but **will not destroy the database** if its legal authority to collect the material expires on schedule this Sunday, officials said Thursday.¶ The NSA's determination to keep billions of domestic toll records for counter-terrorism and espionage investigations adds another note of uncertainty to a debate that pits the Obama administration's national security team against opponents who argue the government data trove violates Americans' privacy and civil liberties.¶ The political and legal dispute will come to a head Sunday when the Republican-led Senate returns to work a day early to seek a resolution — hours before the law used to authorize the controversial NSA program, and several other key counter-terrorism provisions, expires at 11:59 p.m.¶ The final eight hours — starting at 3:59 p.m. Sunday — will see a flurry of activity at U.S. phone companies and at the NSA as engineers take

down servers, reconfigure monitoring software and unplug hardware from the main pipeline of telephone data traffic, according to several senior administration officials.¶ If the Senate stalemate pushes past 7:59 p.m., holes in the incoming data will begin to appear — and will grow — until nothing is collected after midnight, the officials said, speaking on condition of anonymity to discuss internal planning.¶ "We're in uncharted waters," one official said. "We have not had to confront addressing the terrorist threat without these authorities. And it's going to be fraught with unnecessary risk."¶ At that point, even if the Senate acts, the officials said it could take three or four days to go back to the Foreign Intelligence Surveillance Court, also known as the FISA court, for a legal order to restart the system and to reboot the complex data transfer networks at the telephone companies and at the NSA headquarters at Ft. Meade, Md.¶ Any Senate action short of approving legislation that already has passed the House will result in a gap in the NSA archive of so-called metadata — records that show the time, date and numbers called, but not the contents — of virtually every domestic phone call.¶ Letting the bulk collection program go dark **even for a few days** is "playing **national security Russian roulette**," said another official, and "hoping that we don't have an instance where the FBI need [the data] to do a national security investigation."¶ If lawmakers vote before 8 p.m. Sunday, the NSA could reverse the shutdown and prevent a gap, the officials said. But that last-hour possibility appears unlikely.¶ Sen. Rand Paul (R-Ky.), who is running for the GOP presidential nomination and who has fought the NSA domestic program and filibustered to stop it, told supporters in a fundraising letter Thursday that he was determined to "relegate the NSA's illegal spy program to the trash bin of history, where it belongs."¶ Administration officials have stepped up their own alarms. On Wednesday, Atty. Gen. Loretta Lynch said a failure to act would cause "**a serious lapse in our ability to protect the American people**."¶ The provision in the law used to authorize the NSA's bulk collection program is one of three legal authorities set to expire. U.S. intelligence and law enforcement officials say all three are **vital to tracking potential terrorists** in the United States.¶ The bulk collection of U.S. phone records was started in secret after the Sept. 11, 2001, terrorist attacks. It was specifically authorized by the FISA court starting in 2006, and was revealed to the public in 2013 in documents leaked by renegade former NSA contractor Edward Snowden.¶ President Obama vowed to change the NSA program after Snowden's disclosures sparked an uproar, and the White House has embraced the so-called USA Freedom Act, which passed the House on May 13 by a bipartisan vote of 338 to 88.¶ The measure would shift the burden of holding the data back to the telephone companies, and require them to configure their systems so the NSA could access the data. It also would require the government to get a court order to search the records for phone numbers linked to suspected terrorists at home and abroad. It sets a six-month transition period for the changes to take effect.¶ Lynch and James R. Clapper, the director of national intelligence, assured House leaders in a letter this month that the bill "preserves the essential operational capabilities of the telephone metadata program and enhances other intelligence capabilities needed to protect our nation and its partners."¶ But the Senate debate hit a roadblock when Paul and others, including Democratic Sen. Ron Wyden of Oregon, argued that the NSA program should simply expire, and efforts to pass the House bill foundered in disarray Saturday before the lawmakers decamped for a weeklong holiday recess.¶ At that point, the NSA put planning teams on "hot standby" and started working through telecommunications engineering to prepare for shutting down the networks that now connect investigators to the phone records, according to one senior official involved in the planning.¶ The NSA contacted telephone companies to explain their plans and discuss how to help the private companies stop the automatic provision of calling records.¶ They also have sought to configure monitoring software so officials can't access the archive. If they do, alerts will trigger and features will block the delivery of off-limits information.¶ "You can't make a mistake on this," said one of the officials. "This is the most regulated thing that we do at NSA." If the authority lapses, he added, the agency would "lock it down with the same certainty with which we operate."¶ The NSA won't wipe the collected data off its servers, officials said, but will lock all doors into the system. Investigators could use the trove only if Congress acts and the FISA court approves new searches.¶ In addition to cutting off the phone searches, the expiration of the law would end the "roving wiretap" authority that lets FBI agents keep up with suspected terrorists or spies who switch "burner" phones to evade surveillance.¶ Another authority set to expire is the "lone wolf" provision that lets the FBI apply to the court for permission to conduct wiretaps on a target they think is engaged in a terrorist activity but who isn't linked to a specific terrorist group.¶ That authority hasn't been used, but it becomes more valuable every time Islamic State militants use the Internet to urge supporters to launch independent attacks, said one senior domestic security official.¶ "As we face a decentralized and increasingly dispersed terrorism threat, and one where [Islamic State] is extolling actors to conduct opportunistic attacks, **this is not a tool that we want to see go away**," the official said.¶ **Counter-terrorism officials would be facing "a big roll of the dice"** if the authorities are allowed to expire, Rep. Adam B. Schiff (D-Burbank), ranking member of the House Intelligence Committee, said in a telephone interview from Los Angeles.

AT: Info Overload

*Surveillance is **necessary** and **effective** – independent reports prove*

Rahul **Sagar 15**, Associate Professor of Political Science at Yale-NUS College, "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics & International Affairs 29(2), pp. 145-159

Greenwald also raises objections from a national security perspective. He warns that mass surveillance undermines national security because "it swamps the intelligence agencies with so much data that they cannot possibly sort through it effectively."11 He also questions the efficacy of communications surveillance, arguing that it has little to show in terms of success in combating terrorism. But these criticisms are equally **unpersuasive**. It is certainly possible that a surveillance program could generate so much raw data that an important piece of information is overlooked. But in such a case **the appropriate response would not be to shut down the program but rather to bulk up the processing power** and manpower devoted to it. Finally, both the **P**resident's **R**eview **G**roup and the **P**rivacy and **C**ivil **L**iberties **O**versight Board have examined the efficacy of the NSA's programs. Both report that the NSA's foreign surveillance programs have contributed to **more than fifty counterterrorism investigations**, leading them to conclude that **the NSA "does in fact play an important role** in the nation's effort to prevent terrorist attacks across the globe."12

AT: Doesn't Solve

It's try-or-die for counter-terrorism – empirics are meaningless in the context of prevention

Rachel **Brand 14**, Senior Advisor to the U.S. Chamber Litigation Center and member of the Privacy and Civil Liberties Oversight Board, "Report on the Telephone Records Program Conducted under Section 215 of the USA PATRIOT Act and on the Operations of the Foreign Intelligence Surveillance Court," 1/23/14, https://www.pclob.gov/library/215-Report_on_the_Telephone_Records_Program.pdf

There is no easy way to calculate the value of this program. But the test for whether the program's potential benefits justify its continuation **cannot be simply whether it has already been the key factor in thwarting a previously unknown terrorist attack**. Assessing the benefit of a preventive program such as this one **requires a longer-term view**.¶ The overwhelming majority of the data collected under this program remains untouched, unviewed, and unanalyzed until its destruction. But its immediate availability if it is needed is the program's primary benefit. Its usefulness may not be fully realized until we face another large-scale terrorist plot against the United States or our citizens abroad. But if that happens, analysts' ability to very quickly scan historical records from multiple service providers to establish connections (or avoid wasting precious time on futile leads) could be **critical in thwarting the plot**.¶ Evidence suggests that if the data from the Section 215 program had been available prior to the attacks of September 11, 2001, it **could have been instrumental in preventing those attacks**.693 The clear implication is that **this data could help the government thwart a future attack**. Considering this, I cannot recommend shutting down the program without an adequate alternative in place, especially in light of what I view to be the relatively small actual intrusion on privacy interests.

Death counts don't quantify efficacy – domestic surveillance confers numerous strategic benefits

Elizabeth **Cook 14**, member of the Privacy and Civil Liberties Oversight Board, "Report on the Telephone Records Program Conducted under Section 215 of the USA PATRIOT Act and on the Operations of the Foreign Intelligence Surveillance Court," 1/23/14, https://www.pclob.gov/library/215-Report_on_the_Telephone_Records_Program.pdf

Finally, I have a different view from the Board as to the efficacy and utility of the Section 215 program. Although the Report purports to consider whether the program might be valuable for reasons other than preventing a specific terrorist attack, the tone and focus of the Report make clear that the Board does believe that to be the most important (and possibly the only) metric. **I consider this conclusion to be unduly narrow**. Among other things, in today's world of multiple threats, a tool that allows investigators to triage and focus on those who are more likely to be doing harm to or in the United States is both good policy and potentially privacy-protective. Similarly, **a tool that allows investigators to more fully understand our adversaries** in a relatively nimble way, allows investigators to **verify and reinforce intelligence** gathered from other programs or tools, **and provides "peace of mind," has value**.¶ I would, however, recommend that the NSA and other members of the Intelligence Community develop metrics for assessing the efficacy and value of intelligence programs, particularly in relation to other tools and programs. The natural tendency is to focus on the operation of a given program, without periodic reevaluations of its value or whether it could be implemented in more privacy-protective ways. Moreover, the natural tendency of the government, the media, and the public is to ask whether a particular program has allowed officials to thwart terrorist attacks or save identifiable lives. Periodic assessments would not only encourage the Intelligence Community to continue to explore more privacy protective alternatives, but also allow the government to explain the **relative value of programs in more comprehensive terms**. I hope that our Board will have the opportunity to work with the Intelligence Community on such an effort.

*Statistics are irrelevant – effective counter-terrorism is a question of **political clout***

Beatrice **de Graaf 10**, Bob de Graaff, "Bringing politics back in: the introduction of the 'performative power' of counterterrorism," Critical Studies on Terrorism 3(2), 2010

In sum, it is almost impossible to measure arithmetically the outcome of counterterrorism efforts. However, this does not mean that we cannot and should not try to assess the effect of governmental policies. The issues outlined above suggest that it is not necessarily the policy measures and their intended results as such, but much more **the way in which they are presented and perceived** that determine the overall effect of the policy in question.¶ The key question is therefore really: What do counterterrorism policy-makers want? They set the agenda with respect to the phenomenon of terrorism, define it in a certain way and link it to corresponding measures. Subsequently, they execute these measures, behind closed doors, and with the tacit permission of the public – or, conversely, they feel forced to 'market' their measures first, in order to generate a substantial level of public and political support.¶ The way in which they perform, or in other words carry out the process of countering terrorism, can have **more impact than the actual arrests being made** (or not being made). This is what we call the performativity of counterterrorism, or its 'performative power'. The authors would like to introduce the concept 'performativity' 1 in this discussion, expressing the extent to which a national government, by means of its official counterterrorism policy and corresponding discourse (in statements, enactments, measures and ministerial remarks), is successful in 'selling' its representation of events, its set of solutions to the terrorist problem, as well as being able to set the tone for the overall discourse regarding terrorism and counterterrorism – thereby **mobilising (different) audiences** for its purposes. 2

AT: Sunset Thumper

Sunset provisions allowed for continuing investigations

Benjamin **Wittes 14**, Senior Fellow in Governance Studies at the Brookings Institution, "On the oddity of the Patriot Act sunset provisions," Nov 2014, http://www.lawfareblog.com/2014/11/on-the-oddity-of-the-patriot-act-sunset-provisions/

Last week, the New York Times's Charlie Savage had what seems to me a pretty big, if under-discussed, scoop—or perhaps we should say that he channelled to the public a pretty big scoop by former Senate Intelligence Committee chief counsel Michael Davidson. The news, which certainly caught me unawares, is that the Patriot Act sunset provision—stated in Section 105 of this law and extended until June 1, 2015 in this one—doesn't quite say what everyone—from advocates to members of Congress to the administration itself—seems to think it says. Writes Savage: The law says that Section 215, along with another section of the Patriot Act, expires on "June 1, 2015, except that **former provisions continue in effect** with respect to any particular foreign intelligence investigation that began before June 1, 2015, or with respect to any particular offense or potential offense that began or occurred before June 1, 2015." Michael Davidson, who until his retirement in 2011 was the Senate Intelligence Committee's top staff lawyer, said this meant that **as long as there was an older counterterrorism investigation still open, the court could keep issuing Section 215 orders** to phone companies indefinitely for that investigation. "It was always understood that no investigation should be different the day after the sunset than it was the day before," Mr. Davidson said, adding: "There are important reasons for Congress to legislate on what, if any, program is now warranted. But considering the actual language of the sunset provision, no one should believe the present program will disappear solely because of the sunset." Mr. Davidson said the widespread assumption by lawmakers and executive branch officials, as well as in news articles in The New York Times and elsewhere, that the program must lapse next summer without new legislation was incorrect.

Impact

2NC OV – Nuke Terror

Curtailing domestic surveillance devastates counter-terrorism efforts – causes extinction via nuclear terror – the impact is massive and it's try-or-die for risk reduction

Matthew **Bunn 15**, Professor of Practice at Harvard University's John F. Kennedy School of Government, Nickolas Roth, Research Associate at the Project on Managing the Atom in the Belfer Center for Science and International Affairs at Harvard Kennedy School, "Reducing the risks of nuclear theft and terrorism," from Routledge Handbook of Nuclear Proliferation and Policy ed. Joseph F. Pilat and Nathan E. Busch, 5/15/15, pp. 421

Consequences, probabilities, and risks

The consequences of **nuclear terrorism would be catastrophic**. The heart of a major city could be reduced to a smoldering radioactive ruin, leaving tens to hundreds of thousands of people dead. The perpetrators or others might claim to have more weapons already hidden in other major cities and threaten to set them off if their demands were not met — potentially provoking uncontrolled evacuation of many urban centers. **Devastating economic consequences** would reverberate worldwide. Kofi Annan, while serving as Secretary-General of the United Nations, warned that the global economic effects of a nuclear terrorist attack in a major city would push "**tens of millions** of people into **dire poverty**," creating a "**second death toll throughout the developing world**."" Nuclear security is not a US problem but a **global problem**.¶ No one knows what the real probability of such an event might be. But the consequences are so extreme that **even a small probability is enough to justify urgent action** to reduce the risk. No one would operate a nuclear power plant upwind of a major city if the probability of a catastrophic release were one in a hundred each year — the risk would be agreed by all to be too high. Yet the world community may face a **still higher risk of catastrophic disaster** from the way that nuclear weapons and the materials needed to make them are managed in the world today.

Threats Now

Attacks are increasing – incidence and fatalities

Micah **Zenko 6/19**, Douglas Dillon fellow in the Center for Preventive Action at the Council on Foreign Relations, "Terrorism Is Booming Almost Everywhere But in the United States," 6/19/15, https://foreignpolicy.com/2015/06/19/terrorism-is-booming-almost-everywhere-but-in-the-united-states-state-department-report/

First, the phenomenon of terrorism has **significantly worsened**, in terms of the number of attacks, their lethality, as well as the size of terrorist organizations. The number of attacks increased 35 percent from 9,707 in 2013 to 13,463 last year. There were 17,981 fatalities in 2013, growing 81 percent to 32,727 in 2014. To give you a fuller sense of how vastly contemporary terrorism has grown, just a dozen years ago, only 725 people were killed worldwide. In President Barack Obama's first full year in office, in 2010, it was 13,186. In other words, **terror deaths grew by more than 4,000 percent** from 2002 and by 160 percent in the past four years.The size of several groups grew in strength, in particular the self-declared Islamic State, which was estimated to include both between 1,000 and 2,000 members in Iraq and a "significant portion" of the 26,000 extremist fighters in Syria in 2013,

and grew in strength to between 20,000 and 31,500 in 2014. Boko Haram also expanded from "hundreds to a few thousand" to "several thousand" fighters. In addition, there were 33 new organizations identified as perpetrators of terrorist attacks in 2014, indicating that more groups are forming to employ this deadly tactic.

AT: Empirics

Empirics don't predict magnitude

Rahul **Sagar 15**, Associate Professor of Political Science at Yale-NUS College, "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics & International Affairs 29(2),, pp. 145-159

In order to ascertain the rightful bounds on communications surveillance we need to weigh the interests it furthers against those it threatens. The interest it furthers is national security. Greenwald questions this link on a number of grounds. He argues that surveillance is a disproportionate response to the threat of terrorism, which has been "plainly exaggerated" because the "risk of any American dying in a terrorist attack is . . . considerably less than the chance of being struck by lightning."4 Furthermore, even if the threat of terrorism is real, surveillance is unjustified because to "venerate physical safety above all other values" means accepting "a life of paralysis and fear."5 He also questions surveillance's relevance to national security on the grounds that it is often employed to further other national or commercial interests. He asks how, for instance, does "spying on negotiation sessions at an economic summit or targeting the democratically elected leaders of allied states" serve national security?6¶ Arguably these criticisms miss the mark. **That terrorist plots thus far have been amateurish does not mean that terrorists will not learn and eventually succeed** in causing greater harm. Nor is being concerned about terrorism tantamount to "pursuing absolute physical safety."7 The terror in terrorism comes from the **unpredictability and the brutality of the violence** inflicted on civilians. There is a difference between voluntarily undertaking a somewhat risky bicycle ride in rush hour traffic and being unexpectedly blown to bits while commuting to work. Finally, it is widely accepted that **countries have a right to pursue their national interests**, subject of course to relevant countervailing ethical considerations. It is not hard to imagine how intercepting Chancellor Angela Merkel's conversation could serve the United States' national security interests (for example, it could provide intelligence on Europe's dealings with Russia).

Terror Real

Terror is a real threat driven by forces the aff can't resolve---we should reform the war on terror, not surrender---any terror attack turns the entire case

Peter **Beinart 8**, associate professor of journalism and political science at CUNY, The Good Fight; Why Liberals – and only Liberals – Can Win the War on Terror and Make America Great Again, vii-viii

APPLYING THAT TRADITION today is not easy. Cold war liberals devel- oped their narrative of national greatness in the shadow of a totalitarian ¶ superpower. Today, the United States faces no such unified threat. Rather, it faces a web of dangers—from disease to environmental degradation to weapons of mass destruction—all fueled by globalization, which leaves America increasingly vulnerable to pathologies bred in distant corners of the world. And at the center of this nexis sits jihadist terrorism, a new totalitarian movement that lacks state power but harnesses the power of globalization instead. ¶ Recognizing that the United States again faces a totalitarian foe does not provide simple policy

prescriptions, because today's totalitarianism takes such radically different form. But it reminds us of something more basic, **that liberalism does not find its enemies only on the right**—a lesson sometimes forgotten in the age of George W. Bush. ¶ Indeed, it is because liberals so despise this president that they increasingly reject his trademark phrase, the "war on terror." Were this just a semantic dispute, it would hardly matter; better alternatives to war on terror abound. But the rejection signifies something deeper: a turn away from the very idea that anti-totalitarianism should sit at the heart of the liberal project. For too many liberals today, George W. Bush's war on terror is the only one they can imagine. This alienation may be understand- able, but that does not make it any less disastrous, for it is liberalism's principles—even more than George W. Bush's—that jihadism threatens. If today's liberals cannot rouse as much passion for fighting a movement that flings acid at unveiled women as they do for taking back the Senate in 2006, they have strayed far from liberalism's best traditions. And if they believe it is only George W. Bush who threatens America's freedoms, they should ponder what will happen if the United States is hit with a nuclear or contagious biological attack. **No matter who is president**, Republican or Democrat, **the reaction will make John Ashcroft look like the head of the ACLU**.

Terrorism studies are epistemologically and methodologically valid---our authors are self-reflexive

Michael J. **Boyle '8**, School of International Relations, University of St. Andrews, and John Horgan, International Center for the Study of Terrorism, Department of Psychology, Pennsylvania State University, April 2008, "A Case Against Critical Terrorism Studies," Critical Studies On Terrorism, Vol. 1, No. 1, p. 51-64

Jackson (2007c) calls for the development of an explicitly CTS on the basis of what he argues preceded it, dubbed 'Orthodox Terrorism Studies'. The latter, he suggests, is characterized by: (1) its poor methods and theories, (2) its state centricity, (3) its problemsolving orientation, and (4) its institutional and intellectual links to state security projects. Jackson argues that the major defining characteristic of CTS, on the other hand, should be 'a skeptical attitude towards accepted terrorism "knowledge"'. An implicit presumption from this is that terrorism scholars have laboured for all of these years without being aware that their area of study has an implicit bias, as well as definitional and methodological problems. In fact, terrorism scholars are not only well aware of these problems, but also have provided their own searching critiques of the field at various points during the last few decades (e.g. Silke 1996, Crenshaw 1998, Gordon 1999, Horgan 2005, esp. ch. 2, 'Understanding Terrorism'). Some of those scholars most associated with the critique of empiricism implied in 'Orthodox Terrorism Studies' have also engaged in deeply critical examinations of the nature of sources, methods, and data in the study of terrorism. For example, Jackson (2007a) regularly cites the handbook produced by Schmid and Jongman (1988) to support his claims that theoretical progress has been limited. But this fact was well recognized by the authors; indeed, in the introduction of the second edition they point out that they have not revised their chapter on theories of terrorism from the first edition, because the failure to address persistent conceptual and data problems has undermined progress in the field. The point of their handbook was to sharpen and make more comprehensive the result of research on terrorism, not to glide over its methodological and definitional failings (Schmid and Jongman 1988, p. xiv). Similarly, Silke's (2004) volume on the state of the field of terrorism research performed a similar function, highlighting the shortcomings of the field, in particular the lack of rigorous primary data collection. A non-reflective community of scholars does not produce such scathing indictments of its own work.

Yes Nuke Terror – Theft

High risk of theft and transfer – massive security vulnerabilities now

Matthew **Bunn 15**, Professor of Practice at Harvard University's John F. Kennedy School of Government, Nickolas Roth, Research Associate at the Project on Managing the Atom in the Belfer Center for Science and International Affairs at Harvard Kennedy School, "Reducing the

risks of nuclear theft and terrorism," from Routledge Handbook of Nuclear Proliferation and Policy ed. Joseph F. Pilat and Nathan E. Busch, 5/15/15, pp. 422

Despite the many elements of nuclear security progress, **serious vulnerabilities remain**. Around the world, there are stocks of nuclear weapons or materials whose security systems are not sufficient to protect against the full range of plausible outsider and insider threats they may face. As incidents like the 2012 intrusion at the Y-12 nuclear facility — where three activists spent more than an hour in a heavily secured area before being detained — make clear, many nuclear facilities and transporters still grapple with serious problems of security culture. It is fair to say that every country where nuclear weapons, weapons-usable nuclear materials, major nuclear facilities, or dangerous radiological sources exist has more to do to ensure that these items are sustainably secured and accounted for. Nuclear security measures in most countries are shrouded in secrecy. **No government or international organization has a complete understanding of the risks of theft** posed by all the different sites and transport operations around the world. Based on the very partial information available in unclassified sources, it appears that some of the most substantial remaining risks are:¶ In **Russia**, which has the world's largest stockpiles of nuclear weapons and materials in the world's largest number of buildings and bunkers, and nuclear security measures that, while much improved, still have important weaknesses (particularly in protecting against **insider theft**):¶ In **Pakistan**, which has a relatively small but rapidly growing nuclear stockpile, at a small number locations, and a substantial nuclear security effort - but where that effort must protect against enormous threats from both insiders and outsiders;¶ In **India**, which also has a relatively small but growing stockpile, a **substantial terrorist threat** (though not comparable to the threat in Pakistan), and which has declined most cooperation on nuclear security; and¶ At **HEU-fueled research reactors**, which often have only **minimal nuclear security measures** in place.¶ More broadly, the global nuclear security framework remains weak. Remarkably, there are no global rules that specify how secure nuclear weapons or the material needed to make them should be; no agreed mechanisms to verify or build confidence that states really have put effective nuclear security measures in place; and, once the nuclear security summits come to an end, no obvious forum for continuing high-level dialogue on what the next steps in nuclear security should be.

Could terrorists plausibly **get nuclear material**?¶ Unfortunately, the answer to this question is also "**yes**." There are approximately twenty welldocumented cases of actual theft and **smuggling of plutonium or HEU** in the public record." Many of these involved only gram quantities of material, but often the smugglers claimed these were only samples of much larger quantities they had available. In all but one of these cases, no one noticed that the material was missing until it was seized — suggesting that **other thefts have likely gone undetected**.¶ At least three lines of evidence confirm that important nuclear security weaknesses continue to exist. First, seizures of stolen HEU and separated plutonium continue to occur, including, mostly recently, HEU seizures in 2003, 2006, 2010 and 2011. These seizures may result from material stolen long ago, but, at a minimum, they make clear that stocks of HEU and plutonium remain **outside of regulatory control**. Second, in cases where countries do realistic tests to probe whether security systems can protect against teams of clever adversaries determined to find a weak point, the adversaries sometimes succeed — even when their

capabilities are within the set of threats the security system is designed to protect against. Third, in real nonnuclear thefts and terrorist attacks around the world, adversaries sometimes demonstrate capabilities and **tactics well beyond** what many **nuclear security systems** would likely be able to handle."

Joseph F. Pilat and Nathan E. Busch, 5/15/15, pp. 420-421

Could terrorists build a nuclear bomb?¶ Unfortunately, **it does not take a Manhattan Project to make a nuclear bomb**. Indeed, over 90 percent of the Manhattan Project effort was focused on making the nuclear materials, not on designing and building the weapons. Numerous studies by the United States and other governments have concluded that it is plausible that a sophisticated terrorist group could make a crude nuclear bomb if it got enough separated plutonium or highly enriched uranium (HEU). A "gun-type" bomb, such as the weapon that obliterated Hiroshima, fundamentally involves slamming two pieces of HEU together at high speed. An "implosion-type" bomb, which is needed to get a substantial explosive yield from plutonium, requires using explosives to crush nuclear material to a higher density — a more complex task, but **still plausible** for terrorists, especially if they got knowledgeable help.¶ Long before the existence of the Internet and the vast amount of information it made available, and long before globalization and the remarkable resulting spread of technology, a study by the US Office of Technology Assessment summed up the situation:¶ A small group of people, none of whom have ever had access to the classified literature, could possibly design and build a crude nuclear explosive device. Only modest machine-shop facilities that could be contracted for without arousing suspicion would be required.' ¶ Many analysts argue that, since states spend billions of dollars and assign hundreds or thousands of people to building nuclear weapons, it is totally implausible that terrorists could carry out this task. Unfortunately, this argument is wrong. for two reasons. First, by getting **stolen nuclear material**, terrorists would be bypassing making nuclear material, which is what states spend billions seeking to accomplish. Second, it is **far easier to make a crude, unsafe**, unreliable **bomb** of uncertain yield, which might be delivered in the back of a truck, than to make the kind of nuclear weapon a state would want in its arsenal - a safe, reliable weapon of known yield that can be delivered by missile or combat aircraft.

Disparate values and deep distrust shape the environment for negotiation. Fundamental differences over values, despite formal acceptance of universal human rights, means that the initial set of norms likely to be acceptable to many states is limited. **Ultimately, increased stability and security in cyberspace will require common understandings** among states on their national responsibilities, on how the laws of war apply, where restraint in the use of the new military capability is possible, and where red lines or thresholds for escalation might exist. But there is too much distrust among competitors to move immediately towards global norms for cybersecurity. This suggests that international efforts should first focus on CBMs as a foundational element in creating stability and security in cyberspace. CBMs, which require agreement on process rather than on values, could be more attainable in the early phase of creating an international framework for cybersecurity. **Incremental steps that focus on reaching multilateral agreement on confidence-building processes for transparency and communication —such as increased transparency in doctrine— may be the most productive approach for reaching agreement in the near term.**

Gambling Regulations Will Help Obama's World Internet Freedom Mandate President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet, so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." **That statement may have been much better received had the US not had their own blocks on Internet freedom**. **The Internet gambling industry** currently **is operating as a black market in the US** due to the 2006 Unlawful Internet Gambling Enforcement Act. The law is a form of Internet censorship that Representative Barney Frank and other lawmakers have been trying to repeal. In the quest for Internet freedom, **the US proclaims themselves as leaders, however, the country must be careful with their plea**. **If the US can place Internet bans on certain industries, then little could be done to stop other countries from banning different industries** or websites because of their beliefs. For instance, in countries where religion is unified, there could be bans on any material that the country finds outside the rules of their particular religion. In other countries, bans could be placed on industries that are run largely by foreign operators. President Obama took a strong first step today by **promoting Internet freedom. The next step will be making sure the US leads by example**, **and one area to start would be** by **lifting the ban on Internet gambling**. The president has laid down the gauntlet, and now it is time for him to follow his own lead.

(Steven, "Strategic Horizons: Transparency and American Security", 6-26, http://www.worldpoliticsreview.com/articles/13052/strategic-horizons-transparency-and-american-security, ldg)

Two factors kept Americans from accepting government scrutiny as readily as during the Cold War. First, al-Qaida was not as dangerous as a Soviet Union armed with nuclear weapons, massive conventional forces and a global web of sympathizers and left-leaning organizations willing to give it a hand. Second was the coalescence of a transnational anti-authoritarian movement empowered by the intense connectivity of the Internet. Extremists in this movement believed that all information should be freed of government control and all government actions should be transparent to the public. While intellectually descended from the mistrust of government that

inspired America's creators, transparency extremists did not understand what the Founding Fathers did: that if the virtue of government transparency and openness was pushed too far, it became a liability, potentially a dangerous one. In the latest twist, what had been a domestic American debate over transparency and openness is merging with global geopolitics. It is not a coincidence that the nations most interested in helping Snowden avoid arrest and sustain his access to the international media are precisely the ones, like China and Russia, that consider containment of the United States a core strategic objective. That repressive dictatorships should use the current U.S. debate over personal privacy and freedom against the United States borders on the absurd. For instance, the official news agency of North Korea—the most closed and repressive state on earth—wrote that Snowden's disclosure of "such serious human rights abuses as massively gathering information by tapping phone messages and Internet usage of Americans . . . is clear evidence showing the true colors of the U.S. as a criminal state where human rights abuses are organized and legitimatized." While it is easy to dismiss North Korea's farcical rants, the involvement of China and Russia is both more important and more ominous. Being largely immune to domestic political criticism and having no qualms about invasive surveillance for the defense of their respective regimes, Beijing and Moscow are exploiting the extremist position on transparency and openness personified by Julian Assange and the other leaders of WikiLeaks, along with Manning and Snowden, **as part of a broad, sophisticated and multifaceted strategy designed to weaken the United States**. Just as the Soviets attempted to hijack legitimate organizations concerned with civil and labor rights during the Cold War—even though Soviet citizens had few rights of their own—the Russians and Chinese may increasingly try to use organizations focused on government openness and accountability both to hobble the ability of the U.S. government to collect security-related information and as a strategic distraction. However well-intentioned the transparency movement is, it risks becoming the tool of states with values antithetical to its own. As this issue unfolds in the coming years, it should be obvious that the extremist position—demanding that all government actions and programs should be public knowledge—is unrealistic. The Founding Fathers knew this and so too should 21st-century Americans. At the same time, simply trusting the government to collect and use information as it deems appropriate would be dangerous. **The key is building a system that maximizes transparency and openness without giving a decisive advantage to America's enemies, w**hether pathological substate entities like al-Qaida or dictatorial states that are not quite enemies but certainly not friends.

For now, greater transparency about U.S. policies governing the use of cyber weapons is a modest and practical approach to establishing international norms for cyber attacks. The United States could articulate a narrative about how it conducts cyber attacks, why, and against what types of countries and targets. U.S. officials must answer these questions to develop a doctrine for the effective use of cyber weapons in any case. The United States could explain its criteria and process for evaluating a cyber attack's risks of unintended and unanticipated damage. Is there a task force that provides an independent "red team" risk assessment of potential operations? Is there a higher threshold for attacks on targets connected to the internet? Is there a testing process for new cyber weapons? Do all cyber attacks require presidential authorization? Explaining how the United States

applies the law of armed conflict to cyber attacks, rather than simply asserting that the law applies, would set a powerful example. **Some countries might not care, but others might impose similarly strict standards on their own operations. At the very least, U.S. officials would have credibility when advocating for tacit or nonbinding standards of conduct in cyberspace.**

Solvency—Transparency Key

Cyber-norms fail without transparency

Matthew, "Cultivating Cyberattack Norms After Snowden and Sony", March 3 2015, Hoover Institution, www.hoover.org/research/cultivating-cyberattack-norms-after-snowden-and-sony

Most discussion and commentary about developing international norms for cyberspace brings to mind formal and centralized international processes, such as multilateral negotiations conducted under the auspices of the United Nations or other international groupings. Especially when it comes to international security and national defense, however, norms and interpretations of international law develop mostly through decentralized state practice: states defend their actions and counteractions with arguments and counterarguments that win support or fail among important international constituencies. That process of developing and refining norms generally works well for conventional military activities because they are so visible. It doesn't work well, though, for activities that take place in the shadows. For that reason I've argued that **intense secrecy around states' cyber capabilities will slow the development and clarification of international law governing cyberattacks** or responses to them. The concealment and low visibility of some states' responsive actions in cyberspace make it difficult to develop consensus understandings even of the fact patterns on which states' legal claims and counterclaims are based, assuming those claims are even leveled publicly at all. Furthermore, secrecy makes it difficult to engage in sustained diplomacy about rules. Officials can talk about them at high levels of generality, but can't get very specific about detailed examples, and it's therefore hard to reach agreement. Secrecy makes it difficult to verify commitments or demonstrate compliance. Perceived distance between mere words and true actions may be large amid high degrees of secrecy. Some transparency — and resistance to the natural tendency of security agencies to protect operational secrecy — is often therefore critical to a strategy of promoting norms.

Solvency—AT: Surveillance Key

Signal of the CP is enough-people aren't looking for tangible restrictions

Lewis, CSIS senior fellow, 2011

(James, “Confidence-building and International Agreement in Cybersecurity”, http://citizenlab.org/cybernorms2012/Lewis2011.pdf, ldg)

The military use of cyber attack is not the most pressing problem for international security, but it is linked to other malicious behaviours and, in some ways, it offers the easiest approach to agreement, given the many applicable precedents in international security. The more difficult problems revolve around the use of cyber techniques for intelligence purposes and engagement with non-state actors. Both issues, however, fall within the ambit of state responsibilities (although the linkages are not yet well-defined), meaning that it is possible to develop measures and norms that limit risk. The effect of norms can be reinforced by confidence-building measures (CBMs), actions taken between states to prevent or reduce ambiguity, doubt and suspicion and improve international cooperation. Norms and CBMs to increase stability in the military use of cyberspace could reduce the concern shared by many states over the potential for cyberwarfare. Common understandings among states about cyberconflict increase the likelihood of deterring malicious action and they also allow for tacit communication in the event of a conflict with an opponent. **Developing such understandings would make cyberconflict easier to prevent or manage**. There is a shared perception among governments that the threat of cyberconflict is escalating out of control—this explains the explosion of national cyber strategies as more than 70 states develop plans and organizations to reduce risk. There is a new willingness to approach the problem of international cybersecurity as an issue that states can manage using established tools of negotiation and agreement. But translating a shared fear into concrete action has proven difficult. Cyberwar has only recently been considered an issue for international discussion despite more than a decade of breathless media accounts of Pearl Harbors and Armageddons. Before 2000, only a few states had just begun to develop attack capabilities, the potential damage from such attack was limited, and these military programmes were highly classified. This was in contrast to the ongoing and energetic international discussions of internet governance, reflecting both the lack of expertise in the internet community and an inability to perceive potential risks to national interests.

Wunsch-Vincent, former visiting fellow, is Senior Economic Officer in the Office of the Chief Economist of the World Intellectual Property Organization (WIPO), **2006** Sacha, “The Internet, cross-border trade in services, and the GATS: lessons from US–Gambling” http://www.iie.com/publications/papers/wunsch1205.pdf

The rapid development of the Internet and information technology (IT) has led to the growing electronic cross-border delivery of services.1 Reports and analytical studies on the 'outsourcing' and the cross-border trade of services and digital products, such as software, abound. Yet this type of electronic service trade is still a relatively new phenomenon **when viewed through the lens of international trade rules.** In 1998, the Members of the World Trade Organization (WTO) started a comprehensive WTO Work Programme on E-Commerce.2 Since, the WTO has – in a non-negotiation and non-binding form — started to ask questions on how the multilateral trading sys- tem and in particular the General Agreement on Trade in Services (GATS) **should be applied** in the context of cross-border electronic trade.* But while regional trade agreements increasingly innovate as regards the cross-border deliver)' of services and incorporate chapters on c-commerce,* on the multilateral level the WTO Work Programme on E-Commerce never came to tangible conclusions. Furthermore, as WTO Members have been reluctant to bring cases under the GATS, a few of its core concepts remain ill-defined. This significantly **weakens the function of the GATS, which is supposed to provide a framework for the ever- growing cross-border service trade.**1 A recent GATS case under the WTO dispute settlement system has **advanced matters.** In April 2005, the Appellate Body brought closure to the WTO case 'United States — Measures Affecting the Crass-Border Supply of Gambling and Betting Services' {US—Gambling)} At issue was a complaint by Antigua and Barbuda (hereinafter 'Antigua*) concerning certain measures of the US that allegedly make it unlawful for suppliers located outside the US to supply on-line gambling and betting services to its consumers over the Internet. This case marked the first WTO Dispute Settlement Body's (**DSB) judgment** directly relating to the Internet and only the second case which **centered exclusively on the GATS**. Consequently, hopes were high that the judgments would bring clarity to the thorniest issues concerning cross-border trade in services and thus **maintain the relevance of the multilateral trade framework in a changing technological environment**. It has even been suggested that US—Gambling could function as the **'last nail in the coffin of the WTO Work Programme on E-Commerce*,**s i.e. **effectively resolving most if not all questions raised in the afore- mentioned Work Programme on E-Commerce and thus leading to its conclusion.** The objective of this article is two-fold. It discusses the judgments of the Panel and Appellate Body and distills the relevance of its substantive conclusions in relation to Internet-supplied services, questions raised in the WTO Work Programme on E-Commerce and the GATS. With these insights, it also sheds light on the case's implications for the services negotiations under the ongoing multi- lateral trade round - the Doha Development Agenda (DDA). The latter negotiations have entered a new phase since the Hong Kong Ministerial Declaration in December 2005 in which WTO Members pledged to expand the specific GATS commitments, while committing to a new deadline for revised offers of 31 July 2006 and to final draft schedules by 31 October 2006.' 1. What was the 'gamble' between the US and Antigua about? In 2003, Antigua requested the WTO's DSB to establish a Panel regarding measures applied in the US that affect the cross-border supply of gambling services of foreign providers.10 Antigua claimed that a list of US federal and state measures is making unlawful the supply of gambling and betting services on a cross-border basis, mainly violating GATS Article XVI :1 guaranteeing market access. Whereas the cross-border supply of these services was denied by the US claiming that all types of Internet- supplied gambling were illegal (from domestic or foreign providers alike), Antigua claimed that the US could not uphold such a prohibition in the face of GATS mode 1 commitments. Furthermore, it claimed that the US was allowing and/or tolerating US domestic Internet operators to provide these services," effectively discriminating between domestic and foreign service suppliers, despite of full specific GATS commitments. The US responded that it had never made specific GATS commitments on cross- border gambling services. It argued that any remote supply of such services — no matter if from domestic or foreign suppliers - is prohibited in the US and that this prohibition is enforced equally against domestic and foreign service suppliers. The US also asserted that commitments under GATS Article XVI do not render impossible the 'total prohibition' of the electronic supply of certain services, given that this Article is only concerned with avoiding specified quantitative limitations. Finally, the US argued that, in any case, the GATS exemptions under Article XIV would justify the derogation from existing specific GATS commitments due to overriding public policy considerations such as public morals, fraud and security. The most important aspects at issue in the Panel and Appellate Body decisions were: (i) whether the US GATS Schedule includes specific commitments on Internet-supplied gambling and betting services, (ii) whether a prohibition on the remote supply of gambling and betting services is a limitation within the meaning of Article XVI and whether the underlying US measures thus are inconsistent with these obligations, and (iii) whether the US measures address concerns which fall within the scope of, and arc 'necessary* to, protect 'public morals* and/or 'public order* and whether these measures arc not applied in a manner which would constitute a means of arbitrary or unjustifiable discrimination between countries where like conditions prevail, or a disguised restriction on trade in services [chapeau of GATS Article XIV). The Appellate Body supported the Panel's finding that the US GATS Schedule includes specific commitments on gambling services and that these specific commitments under GATS Article XVI prevent it from upholding a prohibition on the cross-border supply of these services. The Appellate Body also supported the Panel's findings that the US prohibition on the remote supply of gambling can be justified as a general exception to the GATS rules, because the US measures attempt to protect 'public morals' and/or 'public order' pursuant to GATS Article XPV. The difference between the Panel's and the Appellate Body's findings lies mainly with the assessment of whether the US measures are 'necessary to protect public morals or maintain public order', in accordance with the chapeau and paragraph (a) of GATS Article XIV. Contrary to the Panel, the Appellate Body ruled that three out of four US laws at stake arc 'necessary' to protect public morals. The US can thus continue to maintain these measures and will only have to amend one measure (i.e. the Interstate Horscracing Act — IHT) which seems to permit electronic gambling to domestic service providers.12 In sum, foreign pro- viders will not be able to supply electronic gambling services into the US. The DSB adopted the Appellate Body report and the modified Panel report in April 2005. The 'reasonable period of time' for the US to implement the rulings of the DSB expired on 3 April 2006.11 While the US Administration has, in consultation with the US Congress, been working on appropriate steps to resolve this matter, so far the US has not amended or clarified the measure in question." According to Antigua, to date the us has failed to comply with the recommendations and the rulings of the DSB.15 2. GATS now ready for the digital economy and international outsourcing 2. 1 GATS rules and commitments apply to electronically delivered services The rulings in US—Gambling have brought about more legal certainty as to the applicability of WTO and GATS commitments to the electronic cross-border delivery of services. To date, **the situation prevailed that no basic affirmation concerning the applicability of WTO rules to cross-border electronic services has been forthcoming** from WTO Members. During the Work Programme on E-Commerce, certain GATS Members questioned whether the GATS obligations and commitments undertaken in 1994 apply to

services transmitted by a technology that was not yet envisioned at the time of the negotiations (i.e. the Internet). Some WTO Members went as far as stating that new specific commitments may be needed for cross-border electronic service transactions.16 Other Members called for a common understanding that Internet-supplied services are within the scope of the GATS. Given this con- fusion, **the US also has - so far without success - asked for a positive reaffirmation that electronic transactions arc covered by existing GATS commitments.**"1 The greatest progress of US—Gambling is the confirmation that WTO rules are indeed applicable to e-commerce and/or to electronically supplied services. Both rulings apply the GATS framework to the concerned electronic cross-border de- livery of services without hesitation, finding that the specific sub-sector of the US GATS schedule **includes specific commitments** on Internet-delivered gambling services. In particular, the Panel finds that the particular US regulations (e.g. the Wire Act) prohibit the use of at least one or potentially several means of deliver)' included in GATS mode 1,19 and that, accordingly, these regulations **'constitute a zero quota** for, respectively, one, several or all of those means of deliver)",20 'constituting a limitation in the form of numerical quotas within the meaning of GATS Article XVI:2(a) and a limitation "in the form of a quota" within the meaning of GATS Article XVI:2(c). This judgment was confirmed by the Appellate Body.25 For the negotiations under the Doha Development Agenda, this means that the GATS rules and - existing and revised — specific GATS commitments **fully apply to cross-border Internet-based service transactions**. New services that arise through the Internet benefit from a liberal trade treatment, if they are **adequately captured by existing specific GATS commitments and thus the corresponding classifications**. However, as of now WTO Members making new GATS mode 1 commitments must carefully consider and accept that these commitments extend to services electronically supplied across borders. In fields such as gambling, but also in the educational, medical, and other regulated service sectors, **the consequences of these commitments must be taken seriously**; especially in the light of Section 3.1 which illustrates that the total prohibition of the electronic deliver)' of such a service is **not compatible with a specific GATS mode 1 commitment**. 2.2 GATS mode 1 commitments relevant to the cross-border electronic delivery of services US—Gambling may have brought about **improved legal certainty** as to which GATS mode and related commitments apply to the cross-border electronic delivery of services. At the minimum, this ruling provides a good starting point for Members to finalise a related understanding. So far, WTO Members have had difficulties determining whether the electronic cross-border delivery of a service is a service supplied over GATS mode 1 or over mode 2 (sec Table 1).23 In the case of an electronically supplied service, the problem is to determine whether a service supplier was providing a service on a cross-border basis: if one applies GATS Article 1:2 the distinction depends on whether the service is produced abroad and sent across borders to a foreign consumer or whether it is the consumer who 'travels' abroad to consume a service. The answer to this categorization is important because the 'quality' of existing specific GATS commitments-i.e. the level of liberalization - differ widely depending on which mode- applies. Generally, concessions under mode 2 are more liberal than under mode 1 .2* In the WTO Work Programme on E-Commerce, this modal classification debate has not been solved.2* The US sought the most liberal classification and thus questioned whether a mode 2 classification would be preferable, given that there are more mode 2 specific commitments with fewer limitations than mode l.2* To support this position, the US argued that the consumer actually 'visits' the website of an Internet service provider in another country - an argument easily applied to the Internet gambling as well.87 In US—Gambling, it is of interest to find that the concerned parties, Antigua and the US, as well as the Panel and the Appellate Body rulings imply that indeed GATS mode 1 commitments are applicable to cross-border electronic service delivery.28 Whereas Antigua argues that the uncertainty over mode 1 versus mode 2 classification does not arise in this case,29 other parties such as the European Communities (EC) also build their arguments on the understanding that GATS mode I commitments are applicable to these Internet-delivered services. The Panel and Appellate Body followed this interpretation. To begin with, the Panel established that 'cross-border' supply must be distinguished from 'remote' supply.10 It used the term 'remote' supply to refer to 'any situation where the supplier, whether domestic or foreign, and the consumer of gambling and betting services are not physically together*. The logic is that the GATS does not distinguish between remote or on-site supply but between four modes of supply out of which — according to the Panel - only GATS mode 1 can be remote. More importantly, the Panel limits its analysis under GATS Article XVI to the market access column 'mode 1' while clearly stating that *[t]his dispute concerns one of the four modes of supply under the GATS', that is, the so-called 'cross-border supply' of gambling and betting services" and while building on paragraph 19 of the 1993 Scheduling Guidelines.12 The Appellate Body has followed this line of reasoning and has only assessed the US GATS mode 1 commitments.31 In the light of the concerned gambling services, which are supplied over a foreign web page - a text book example for arguing that a US customer effectively 'visits a foreign service supplier operating under a different legal regime' and thus that GATS mode 2 is applicable - this seeming finding on the applicability of mode 1 seems even more evident.3* Based on these facts, it is tempting to conclude that US—Gambling has brought closure to this important uncertainty over the applicable GATS mode. But as neither the Panel nor the Appellate Body had been requested to pronounce themselves on the difference between mode 1 and mode 2 this important question may be less than fully settled.35 The current negotiations under the Doha Development Agenda have shown increased awareness with respect to eliminating this problem.36 So far efforts to reduce this modal imbalance and uncertainty have mainly centered on asking for similar and preferably full commitments in both GATS modes 1 and 2 in as many sectors as possible (i.e. in most cases, to increase the commitment level of mode 1 to the one of mode 2)." These suggestions have resurfaced as India and other Members are growing more interested in pre-empting protectionism with respect to services outsourcing.38 But the Hong Kong Ministerial Declaration only suggests that commitments on mode 2 should be made where commitments on mode 1 exist (which is usually already the case).39 Moreover, so far the revised GATS offers available in June 2006 had rarely achieved identical commitment levels between both modes. In this light, WTO Members should use the opportunity of the US-Gambling rulings to enter into a final binding agreement declaring GATS mode I as fully applicable to all cross-border electronic transactions. Otherwise, further dispute settlement may be needed to bring full legal certainty to the matter. 2.3 WTO members responsible for the clarity of their GATS commitments US—Gambling has **provided important guidelines on how to unmistakably schedule commitments** for specific service sectors and sub-sectors. At the minimum, it has provided a clear warning to those WTO Members who do not. Most GATS Members made sectoral commitments on the basis of the GATS Services Sectoral Classification List (so-called W/12040 that makes numerical reference to the 1991 Provisional Central Product Classification, CPC).41 WTO Members are free to include only certain sectors of the less detailed W/120 in their GATS commitment schedules. They also have the choice of committing sub- activities of a certain sector while omitting others.48 In US—Gambling, it was questioned whether a specific US GATS commitment on 'other recreational services' covered gambling services as supplied by Antigua. Problematically, the US had not used the provisional CPC to enter their GATS commitments, making the straightforward interpretation of its schedule more complicated. In the underlying case, the US has become a victim of this lack of

clarity as the Panel decided that gambling services arc committed through the US commitment on 'other recreational services' (in CPC, gambling and betting services is a sub-classification of 'other recreational services').41 This holds true even though (i) the Scheduling Guidelines arc facilitative and not normative or mandatory; and that (ii) the US had not indicated in its schedules that it was following the CPC." The Panel built its argumentation on the 1993 Scheduling Guidelines, which prescribe that the 'greatest possible degree of clarity in the description of each sector and sub-sector is necessary and that where it is necessary to refine further a sectoral classification, this should he done on the basis of the CPC or other inter- nationally recognised classification*." The Appellate Body ruled in the same way, while using a different methodology.'" Considering the ongoing GATS negotiations, this call for precision in scheduling commitments comes at an important time and will - if taken seriously - increase the clarity of future GATS commitments. Practically speaking. Members are assumed to use the W/120 or an equally precise classification system in the Doha Negotiations and to follow the 2001 GATS Scheduling Guidelines or to state clearly if they deviate from these accepted standards." The Hong Kong Ministerial Declaration reiterates the importance of this precision (note that the US has now inserted CPC numbers in its revised GATS offer!).4*1 In times of **rapid technological evolution,** which increases the tradability and the type of existing services, the clear scheduling of commitments is ever-more important. Since 1994 — the date of the conclusion of the first GATS round - many new services that can be delivered across borders have surfaced.49 In fact, the CPC was updated twice to do justice to the rapid evolutions shaping economic activities and technologies since the end of the Uruguay Round.1* Moreover, a final draft of the third revision of the CPC (i.e. CPC, 2007), containing many updates as regards IT-related services, is now available.11 However, these changes have not been replicated in the WTO, meaning that the ongoing services negotiations arc still based on the provisional W/120 and the CPC of 1991.

Strong GATS key to internet liberalization

Chander, 2009 Anupam Chander, Visiting Professor, Yale Law School; Professor, University of California, Davis, School of Law, 102 Am. Soc'y Int'l L. Proc. 37, 2009, "International Trade and Internet Freedom"

Proponents of human rights have often found themselves at odds with free traders. The desire to liberalize the flow of goods across borders in service of efficient production has at times been insufficiently attentive to the rights of workers and the health of the environment. Cyberspace, however, may offer a context in which the desire for free trade and the wish to promote political freedom go hand-in-hand. **By liberalizing trade in cyberspace, international trade law can bolster the circulation of information that authoritarian regimes would repress**. In this essay, I want to sketch a hopeful possibility: how the Internet under the governance of international trade law might bolster political freedom around the world. Unexpectedly, the **G**eneral **A**greement on **T**rade in **S**ervices 1 **might emerge as a human rights document.** The new bugaboos of repressive governments are search engines, electronic bulletin boards, blogs and YouTube. These are technologies that allow ordinary individuals to communicate outside the mainstream media channels that often prove subservient to governments. 2 This feature, of course, also represents the original nature of the World Wide Web itself, as it eschewed any central intermediating authority in information circulation. **If international trade law can help protect the free circulation of information in cyberspace, it can serve** the cause of **political freedom around the world.** The Intersection of International Trade and Human Rights Human rights law has typically sought to regulate the production of goods in order to avoid the exploitation of labor (or relatedly, the environment). But with respect to trade in services delivered over the Internet, the nature of the work and the presence of an often highly-educated workforce significantly reduce fears of worker exploitation. This does not mean that labor rights are no longer of concern with respect to trade in services, 3 but those concerns are less with sweatshops, below living wage, child labor or perilous working conditions than with the right to organize and the right to privacy. In trade mediated via cyberspace, human rights law comes to bear in a largely novel fashion: to help further the right of individuals to share and receive information. **Trade in services shifts the locus of human rights attention from the production process to its delivery and consumption.** Thus, cyberspace offers new and fertile opportunity for human rights law. Human rights law requires that nations not only provide their citizens with free speech rights within their nation, but also the right to impart information ''regardless of frontiers.'' This formulation is repeated in both the Universal Declaration of Human Rights and in the International Covenant on Civil and Political Rights as well. 4 The Declaration describes the right to ''impart information and ideas through any media regardless of frontiers,'' and the Covenant subsequently reiterated the ''freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers.'' While the legal status of the Universal Declaration is open to question, it nonetheless offers ''the primary source of global human rights standards.'' 5 Because of its nature as an international treaty, the Covenant carries more binding force than the Declaration. 6 The Covenant makes clear that one country's inhabitants have the right both to send and to receive information from another country, and thus imposes obligations on both countries to allow the information exchange. Of course, information regulation is a central business of governments, and governments and courts are unlikely to interpret the human rights principles as putting them out of this business when it comes to domestic or foreign information. Like the freedom of speech guaranteed by the Constitution, the international free speech norm tolerates regulation within appropriate bounds. Indeed, it contemplates it, permitting limitations set forth by law and necessary to support public order. 7 As history's best medium for transmitting information worldwide, the Internet will test the limits of such regulation of crossborder information flows. **International trade law puts pressure on state**

repression of information through two principal mechanisms. First, the **transparency obligations of GATS require** what is often absent in authoritarian states—a set of public rules that governs both citizens and governmental authorities. WTO member states must publish regulations governing services and establish inquiry points where foreign service providers can obtain information about such regulations. 8 A publication requirement written for the benefit of foreigners may prove useful for local citizens, who will be given the opportunity to understand the rules that bind them—and the opportunity therefore to challenge those rules or their interpretation. Second, the market access and national treatment commitments 9 provide opportunities for foreign information service providers to disseminate information that local information service providers might eschew. Censorship by itself may not necessarily constitute either a market access or a national treatment violation. But consider three scenarios: what if a country (1) declared foreign blogging sites off-limits, or (2) required foreign information service providers to route their offerings through special traffic cops, or (3) required local Internet service providers to deny access to certain foreign services in toto?10 In cases like these, the **censorship measures would** likely **run afoul of a country's market access and national treatment obligations.** 11 But that does not end the inquiry. GATS permits derogation for measures ''necessary to protect public morals or to maintain public order.''12 A tricky question for trade law over the coming years will be whether states will be able to derogate from the above responsibilities in ways that sustain the repression of political information. In order to avoid the exception swallowing the trade liberalization obligation, GATS limits permissible derogations through two general requirements: (1) they must be ''necessary'' for the public morals or public order goal; and (2) there must be no ''reasonably available alternative'' to the trade restrictive measure. The necessity requirement is stated directly in GATS article XIV. The second requirement rests in the Appellate Body's review of its first Internet dispute. In that dispute, the United States defended its right to derogate from its free trade agreements with respect to online gambling, asserting the following public order and public morality grounds: ''(1) organized crime; (2) money laundering; (3) fraud; (4) risks to youth, including underage gambling; and (5) public health.''13 The Appellate Body largely upheld the U.S. derogation, but only after concluding that no reasonably available alternatives had been presented to the challenged trade-restrictive measure. The Appellate Body elaborated that a ''reasonably available alternative'' is one that ''preserve[s] for the responding Member its right to achieve its desired level of protection with respect to'' its public order or public morality objectives.14 If one considers the array of recent efforts to censor material mediated by the Internet, **it seems clear** that **many** of them would **fall afoul of the ''reasonably available alternative'' requirement.** That is, many of the stated public order or public morality goals could have been achieved at the desired level of protection by less trade-restrictive means. Consider, for example, the shuttering of Blogger because of one or two offending blogs, or the disabling of YouTube because of one objectionable video, or shutting off of access to Wikipedia presumably because of a few politically charged entries.15

Solves China – 2NC

The counterplan is key to set a precedent to cause Chinese Internet liberalization.

Rivlin 8/22/07 Online gambling case pits Antigua against U.S. and challenges WTO http://www.nytimes.com/2007/08/22/business/worldbusiness/22iht-gamble.4.7214682.html?pagewanted=all&_r=0

The WTO allowed that Washington probably did not intend to include online gambling when it agreed to the inclusion of "recreational services" and other similar language in agreements reached during the early 1990s. But the organization says it has no choice but to enforce the plain language of the pacts. One reason for all the interest is the David-and-Goliath aspect of the case. Another is that the dispute, **as the WTO's first to deal with the Internet**, is likely to **serve as a major precedent** in establishing rules of commerce in an online age and dealing with such **prickly issues as China's attempts to block online content it finds offensive**. Yet another reason the fraternity of trade lawyers and experts is so closely watching the case, said Lode Van Den Hende, an international trade lawyer with the firm of Herbert Smith in Brussels, is "that the U.S. is not behaving as one would expect." **"One day they're out there saying how scandalous it is that China doesn't respect WTO decisions**," Van Den Hende said. "**But then the next day there's a dispute that doesn't go their way and their attitude is: The decision is completely wrong, these judges don't know what they're doing, why should we comply**?"

Gambling is the key precedent for Chinese internet liberalization.

Erixon et al 2009 Fredrik, Director of the European Centre for International Political Economy, Protectionism Online: Internet Censorship and International Trade Law, ECIPE Working Paper • No. 12/2009 http://www.ecipe.org/media/publication_pdfs/protectionism-online-internet-censorship-and-international-trade-law.pdf

A case brought before the WTO over censorship would be very likely to give rise to a debate about sovereignty and the ever-expanding scope of trade-related issues under the WTO. However, such a case would mark an important borderline against disproportionate and arbitrary censorship when a partial blockage would be sufficient to achieve the aims of the censors. It would also be economically significant. Censorship is the most important non-tariff barrier to the provision of online services, and a case might clarify the circumstances in w:hich different forms of censorship arc WTO consistent. Such clarification would reduce legal uncertainty for online businesses. Not all WTO rulings, however, result in actual compliance — as mentioned, the member found to be employing WTO-inconsistent measures might decide to continue to use them and accept the consequent retaliation. Even before the ruling in Online Gambling, the US Trade Representative implied that the offending Federal law could not be changed, and that the only way to correct the "drafting error" was to withdraw from its commitments on "other recreational services",** which it is free to do with three months notice under GATS Article XXI. In following this course, how- ever, the US was required to compensate countries injured by its withdrawal from the commit- ment, i.e. to make a deal that not only satisfied Antigua and Barbuda, but all countries who make a claim of having interests against the US in the dispute settlement. In Online Gambling, Australia, Costa Rica, India, Macau, Canada, Japan and the EU joined in with costly demands for compensa- tion . A defendant in a case over censorship who was found to have behaved inconsistently with its WTO obligations, but refused to lift the censorship or correct its form, would therefore have to cither accept authorised retaliation against it or withdrawal from the relevant obligation through compensation. THE WAY AHEAD WEAKNESS OF UNILATERAL ACTION The issue of online censorship can be approached through various different routes under inter- national trade law. Each route has its own limitations, opportunities and political consequences. A regulation, like the once-proposed US Global Online Freedom Act, would discourage invest- ment and market access. Proposals for such types of legislation have been greeted with scepti- cism, whether the proposal is to be put into effect by the EU, the US, or both together. This route has the disadvantage that it damages the companies seeking to export its services by prohibiting businesses from making certain types of investment abroad, and further penalising those w:ho are already limited in their trade through subjection to a censorship regime. Simply put, it taxes the competitiveness of the actors own companies commercially or limits the room for manoeuvre. Furthermore, past experiences from other embargoes show that they are seldom effective to- wards economies that represent significant commercial market potentials. There is also a question of equal treatment between various sectors of industry, in this case the manufacturers versus services. The routers and servers that make up the Great Firewall/Golden Shield of China were provided by IT firms in EU and US—with the consent of their governments, and in some case, these manufacturers even provide training to the personnel in the ministries that administer the censorship. The question of liability, with potential effects (or lack thereof) makes it a dangerous route. POSSIBLE ACTION THROUGH THE WTO The WTO provides principles of proportionality and can impose sanctions on breaches by its members of their WTO obligations; although it has difficulty in ensuring that members found to have acted inconsistently with the WTO restore WTO consistency rather than treating the sanctions as the price of maintaining the inconsistent policy. It is also true that a WTO member found to have violated its WTO obligations could withdraw from the obligation (as the US did after Online Gambling). These are not cheap options, however. Maintaining a policy that has been found to be WTO in- consistent or withdrawing from a commitment is likely to be expensive in terms of losses of trade or direct compensation, and may also be costly in terms of reductions in terms of capital inflows, investment and know-how and losses of service trade. Creating a great fuss in order to maintain censorship, moreover, might be embarrassing, both in terms of attention drawn to the censor- ship and of the air of desperation that would attach to policy shifts for the purpose of maintaining censorship. The WTO route is weak given it is unlikely to be able to abolish

censorship as such. It may, however, have the potential to discipline the clumsier manifestations of censorship: outright blockages by a government that is capable of enforcing selective filtering for example, **and will persuade governments to use more selective and less trade-disruptive means**. Another drawback of the WTO route is that an online industry wishing to use WTO dispute-settlement cannot do so on its own account, but must convince its government to take action. Also, some countries that might be targets of such action are not members of the WTO (for example, Russia, Iran and North Korea). As final note, although the dispute settlement mechanism of neither the WTO nor other trade instruments could be used to eliminate Internet censorship, they might limit the use of its more commercially damaging forms. For businesses, trade with countries ruled by authoritarian re- gimes, or with countries where the concept of the rule of law: is still under development, will always be difficult —if not outright dangerous. Contesting arbitrary and disproportionate blocks on access to such markets will incrementally help to reduce legal uncertainty and therefore contribute in the long run to a regulatory environment where the risks and costs of market par- ticipation are foreseeable.

International cybersecurity norms prevent major conflict now

Valeriano, senior lecturer at the University of Glasgow, 15

Brandon, Ryan C. Maness, Visiting Fellow of Security and Resilience Studies, Northeastern University, "The Coming Cyberpeace: The Normative Argument Against Cyberwarfare", May 13 2015, Foreign Affairs, https://www.foreignaffairs.com/articles/2015-05-13/coming-cyberpeace

The era of cyberconflict is upon us; at least, experts seem to accept that cyberattacks are the new normal. In fact, however, evidence suggests that **cyberconflict is not as prevalent as many believe**. Likewise, **the severity of individual cyber events is not increasing**, even if the frequency of overall attacks has risen. And an emerging norm against the use of severe state-based cybertactics contradicts fear-mongering news reports about a coming cyberapocalypse. The few isolated incidents of successful state-based cyberattacks do not a trend make. Rather, what **we are seeing** is **cyberespionage and probes, not cyberwarfare**. Meanwhile, the international consensus has stabilized around a number of limited acceptable uses of cybertechnology—one that prohibits any dangerous use of force. Despite fears of a boom in cyberwarfare, **there have been no major or dangerous hacks between countries**. The closest any states have come to such events occurred when Russia attacked Georgian news outlets and websites in 2008; when Russian forces shut down banking, government, and news websites in Estonia in 2007; when Iran attacked the Saudi Arabian oil firm Saudi Aramco with the Shamoon virus in 2012; and when the United States attempted to sabotage Iran's nuclear power systems from 2007 to 2011 through the Stuxnet worm. The attack on Sony from North Korea is just the latest overhyped cyberattack to date, as the corporate giant has recovered its lost revenues from the attack and its networks are arguably more resilient as a result. Even these are more probes into vulnerabilities than full attacks. Russia's aggressions show that Moscow is willing to use cyberwarfare for disruption and propaganda, but not to inflict injuries or lasting infrastructural damage. The Shamoon incident allowed Iran to punish Saudi Arabia for its alliance with the United States as Tehran faced increased sanctions; the attack destroyed files on Saudi Aramco's computer network but failed to do any lasting damage. The Stuxnet incident also failed to create any lasting damage, as Tehran put more centrifuges online to compensate for virus-based losses and strengthened holes in their system. Further, these supposedly successful cases of cyberattacks are balanced by many more examples of unsuccessful ones. If the future of cyberconflict looks like today, **the international community must reassess the severity of the threat. Cyberattacks have demonstrated themselves to be more smoke than fire.** This is not to suggest that incidents are on the decline, however. Distributed denial-of-service attacks and infiltrations increase by the minute—every major organization is probed constantly, but only for weaknesses or new infiltration methods for potential use in the future. Probes and pokes do not destabilize states or change trends within international politics. Even common cyber actions have little effect on levels of cooperation and conflict between states. NORMCORE IS HERE TO STAY **A protocol of restraint has emerged** as the volume of cyberattacks has increased. State-based cyberattacks are expected, and in some cases tolerated, as long as they do not rise to the level of total offensive operations—direct and malicious incidents that could destroy infrastructure or critical facilities. **These options are** apparently

off the table for states, since they would lead to physical confrontation, collateral damage, and economic retaliation. **The reproducibility of cyberattacks has also led states to exercise restraint**. Enemies can replicate successful cyberweapons easily if source code and programs find their way into the wild or are reverse-engineered. Cyberweapons are not simple to design, either, which makes their use limited: Stuxnet took years of work by U.S. intelligence (with help from Israel) and cost hundreds of millions of dollars—**and it still failed**. The risk of creating collateral damage is high, since cyberweaponry cannot provide surgical precision and can spread into other networks of possible allies of the attackers. For example, the Stuxnet worm, intended for Iran's nuclear program's network, showed up in Azerbaijan, India, Indonesia, and Pakistan, among other countries. As witnessed in the Russian attack on Georgia, the potential for conflict diffusion is high, as third-party allies can enter conflicts easily. Estonia sent its Computer Emergency Readiness Team experts to Georgia to keep the country's crucial networks up and running. Poland freed up bandwidth for servers in its territory to keep Georgian government websites up and its people informed. Finally, the risk of retaliation is high, as it is in any war, especially as attribution of perpetrators is getting easier to trace with better forensic techniques. The only drawback is that exposing attribution capabilities often exposes ongoing infiltration methods. **All of these considerations have meant that, so far, cyberconflict has adhered to existing international conflict norms**. That there have been no major operations resulting in death or the destruction of physical equipment (outside of the Saudi Aramco incident and Stuxnet) suggests **trends toward stability and safety.** Cyberoperations are increasing, but only in terms of small-scale actions that have limited utility or damage potential. The truly dangerous cyberactions that many warn against have not occurred, even in situations where observers would think them most likely: within the Ukrainian conflict or during NATO's 2011 operations in Libya. The only demonstrable cyberactivity in the Ukraine crisis has been espionage-level attacks. There is no propaganda, denial of service, or worm or virus activity, as there was in past conflicts involving Russia and post-Soviet states. **The overall trend in cyberwarfare indicates that the international community is enjoying a period of stability**. The chart below demonstrates that although cybertactics are increasingly popular, the severity of these attacks remains low. On a scale of one to five, where one is a nuisance attack (a website being defaced, for example) and five is a cyber-related death, few attacks register above a two.

The US has been formally pushing for international cyber-norms for months

Marks, covers cybersecurity for POLITICO Pro, 15

Joseph, "U.S. makes new push for global rules in cyberspace", Politico, May 5 2015, www.politico.com/story/2015/05/us-makes-new-push-for-global-rules-in-cyberspace-117632.html

The U.S. government has launched an all-out diplomatic push to impose peacetime international rules of the road on cyberspace. Officials have been promoting the idea of guidelines for acceptable nation-state cyber behavior in conferences and bilateral meetings across the globe for several months. Now, in the most significant move to date, the U.S. government has formally proposed a slate of such peacetime cyber "norms" to a United Nations body — norms that U.S. military and civilian

officials pledge to honor and think other nations ought to live by too, a person knowledgeable about the negotiations tells POLITICO. The primary task for the UN Group of Governmental Experts that met in New York earlier this month is to outline how international law should apply in cyberspace during wartime, once the threshold of armed conflict has been crossed. The group, made up of officials from 20 nations, is basically working out how internationally binding humanitarian legal principles — such as proportionality and the obligation to minimize civilian property damage and casualties — will apply to cyberwar. The U.S. submission went a step further, adding a trio of peacetime norms that it believes nations should honor in cyberspace for the sake of global stability. According to POLITICO's source, the norms state that nations should — not launch or support cyberattacks that intentionally damage or impair other nations' critical infrastructure; — not launch cyberattacks that intentionally prevent other nations' cyber emergency responders from dealing with cyber incidents or use their own such teams to launch cyberattacks; and — cooperate with other nations' law enforcement investigations into cybercrime, or efforts to stop cyberattacks, launched from their territories. A norm is a principle in international law that hasn't been formalized through a treaty or through customary state practice —something scholars and officials often call "soft law." Most scholars believe, for example, there was a soft-law norm banning torture before it was codified into a treaty. Some believe that a similar norm is slowly emerging against the death penalty.

Developing international cyber-norms will fail—key countries don't think restrictions are in their self-interest, and the US refuses to restrain its offensive operations

Mazanec, senior defense analyst and professor @ George Mason University, 15

Brian M., "Why International Order in Cyberspace Is Not Inevitable", Strategic Studies Quarterly, Summer 2015, www.au.af.mil/au/ssq/digital/pdf/Summer_2015/mazanec.pdf

National investments in cyberwarfare capabilities and the development of doctrine and strategies for cyberwarfare provide insight into state perceptions of self-interest and the expectations for behavior and emerging norms for cyberwarfare. So where do state cyberwarfare programs stand today in China, Russia, and the United States? **The three key states** discussed here **are the most significant, due to the breadth and sophistication of their capabilities and activities and the likelihood that these states are serving as the model for many other nations preparing to operate in cyberspace. These states are the key norm leaders in the emerging multipolar world** that norm evolution theory identifies as important to achieving norm emergence. Accordingly, reviewing Chinese, Russian, and US interests and approaches to cyberwarfare is essential to predicting norm evolution and validating or refuting the Forsyth-Pope argument that state interest will converge around constraining international norms. Chinese Interest in Cyberwarfare **China's early activity and interest in cyberwarfare indicate that it likely does not consider the emergence of constraining norms in its selfinterest.** The country has been largely unconstrained by cyber norms and is preparing to use cyberweapons to cause economic harm, damage critical infrastructure, and influence kinetic armed conflict. As such, it is unlikely to be a vocal norm leader. China is best known for its expansive efforts conducting espionage-style cyber operations. For example, in February 2013, the US cybersecurity firm Mandiant released a study detailing extensive and systematic cyberattacks, originating from Chinese military facilities of at least 141 separate US-affiliated commercial and government targets.21 These attacks have led the US Department of Defense (DOD) to classify China as one of "the world's most active and persistent perpetrators of economic espionage" and to point out that China is also "looking at ways to use cyber for offensive operations."22 It is this latter point that is of most interest to this article. China is increasingly developing and fielding advanced capabilities in cyberspace, while its interests in cyberwarfare appear to be asymmetric and strategic. Russian Interest in Cyberwarfare **Like China, Russia's early**

cyberwarfare activity—especially the attacks on Estonia and Georgia—**indicate that it is largely unconstrained by restrictive cyber norms** and is preparing to use cyberweapons in a wide range of conflicts and against a variety of targets. **Russia likely does not consider the emergence of constraining norms in its self-interest.** As such, one would think the nation unlikely to be a vocal norm leader. However, Russia has been a leading proponent of a total ban on cyberweapons. This is similar to the Soviet Union's efforts early in the nuclear era to demonize US possession of nuclear weapons while simultaneously pursuing such weapons themselves. This helps illustrate how powerful states acting in their own self-interest can inadvertently act as norm leaders while simultaneously flouting the touted candidate norm. However, Russia's confusing support for fully constraining norms for cyberwarfare (based on its behavior in the UN and proposal for an "International Code of Conduct for Information Security") may be based on its broader definition of cyberwarfare and the nation's interest in using a constraining norm to prevent what it perceives as "propaganda" inside Russia and in its near abroad.23 However, Russia's position may also be disingenuous, as it was when supporting the Biological Weapons Convention while simultaneously launching a massive, illicit biological weapons program. To achieve any real convergence among the main cyber actors, the authoritarian interest in constraining free speech must be addressed, which could deflate Russian support. That the Russian Federation has a general interest in cyberwarfare is widely known. However, outside of the Estonia and Georgia attacks, little is known of Russia's cyber capabilities. Some believe Russia is a "little too quiet" and that the lack of notoriety is indicative of a high level of sophistication which enables Russian hackers to evade detection.24 That said, there are some indicators of Russian intent as their doctrine now states that future conflict will entail the "early implementation of measures of information warfare to achieve political objectives without the use of military force, and in the future to generate a favorable reaction of the international community to use military force."25 US Interest in Cyberwarfare While China is perhaps the noisiest and Russia the most secretive when it comes to cyberwarfare, the United States is the most sophisticated. The United States is in the process of dramatically expanding its military organization committed to engaging in cyberwarfare and regularly engages in "offensive cyber operations."26 However, unlike Russian attacks and Chinese planning, **the United States appears to exercise restraint** and avoids targeting nonmilitary assets. **This seems to indicate that the United States is acting as a norm leader** for at least a certain category of constraining cyber norms, **although the nation's general "militarization" of cyberspace may be negating the norm-promoting effects of this restraint.** While the United States has recently developed classified rules of engagement for cyberwarfare, the nation has articulated few, if any, limits on its use of force in cyberspace or response to hostile cyberattacks. For example, the May 2011 International Strategy for Cyberspace states that the United States reserves "the right to use all necessary means" to defend itself and its allies and partners, but that it will "exhaust all options before [the use of] military force."27 Additionally, former US Deputy Secretary of Defense William Lynn clearly asserted that "the United State reserves the right, under the law of armed conflict, to respond to serious cyberattacks with an appropriate, proportional, and justified military response."28 **Ultimately, the US behavior and interest in cyberwarfare indicate that it does not consider the emergence of robust constraining norms in its self-interest.**

2NC—AT: International Norms—Norms Fail

Cyber-norms fail—it's too late to preemptively establish norms

Mazanec, senior defense analyst and professor @ George Mason University, 15

Brian M., "Why International Order in Cyberspace Is Not Inevitable", Strategic Studies Quarterly, Summer 2015, www.au.af.mil/au/ssq/digital/pdf/Summer_2015/mazanec.pdf

Too Late to Preemptively Establish Norms for Cyberwarfare Another challenge for norm emergence is that establishing such norms is generally more successful if the candidate norm can be permanently and preemptively established before the weapon exists or is fully capable or widespread. **With cyberwarfare, the train has already left the station** so to speak. From 2006 to 2013, James Andrew Lewis of the Center for Strategic and International Studies identifies 16 significant CNA-style cyberattacks.36 These include major attacks across the globe, occurring in such divergent locations as the former Soviet states of Estonia and Georgia and the Middle Eastern states of Iran and Saudi Arabia. While no one has yet been killed by a cyberattack, the opportunity for permanent preemptive establishment of a norm has long since passed.0

Public-private cooperation over cybersecurity is high now—new executive order

Stone, reporter @ International Business Times, 15

Jeff, "Obama Executive Order Takes Aim At 'Wild West' World Of Cybersecurity", Feb 13 2015, IBT, www.ibtimes.com/obama-executive-order-takes-aim-wild-west-world-cybersecurity-1815982

U.S. President Barack **Obama signed an executive order** Friday that marks his administration's **most significant attempt to simplify the sharing of information about cyberattacks between the public and private sectors**, as well as within the latter. The order came after a number of devastating hacks of U.S. companies and amid heavy criticism that the White House's efforts to protect the country against hackers have fallen short. Obama announced he signed the executive order during a speech at Stanford University in California. **The new initiative would help get "all of us working together** to achieve what none of us can do alone," the president said. "I've been grappling with how government protects the American people from adverse events while at the same time making sure the government itself isn't abusing its capabilities. It's hard," Obama said. "This cyberworld is the Wild West, and to some degree we're asked to be the sheriff." Under the executive order, the Department of Homeland Security will become the hub between the government and companies attempting to share security data. Firms that choose to participate will alert their peers as well as the DHS about new information centered on cyberattacks or malware. Participation will be voluntary. The DHS has been added to the list of federal agencies allowed to OK classified-information sharing arrangements. Security professionals have previously complained that threats they have reported to the government were classified as secret, effectively ending their attempts at cooperating with the government. **Giving the DHS more discretion could solve this problem.**

2NC—AT: Public-Private Trust—High Now

Even with the Snowden leaks, companies are beginning to cooperate with the government over sensitive information sharing

Buhr, Writer for TechCrunch, 15

Sarah, Alex Wilhelm, "Obama Signs Executive Order Encouraging Private-Sector Companies To Share Cyber Security Information", Feb 13 2015, Tech Crunch, techcrunch.com/2015/02/13/obama-cyber-security/#.lxjyep:Zno3

President Barack Obama asked for more collaboration and the open sharing of information between private-sector companies and the U.S. government at the White House Cybersecurity Summit at Stanford today. While pushing for that collaboration, he admitted it would be a challenge to both keep up with cyber threats and protect American's right to privacy at the same time. "Protecting the American people while making sure government is not abusing its capabilities is hard. The cyber world is sort of the Wild Wild West and to some degree we are asked to be the sheriff," he told a crowd at the Memorial Auditorium. To encourage the sharing of information between the government and private industry in case of cybersecurity threats, Obama signed an Executive Order at the end of his speech. One of those provisions encourages information sharing and analysis organizations (ISAOs), which would serve as points of contact for information sharing between the government and the private sector. The order added the Department of Homeland Security to the list of government organizations that would be able to approve the sharing of classified information and ensure that proper information is shared between entities. Obama said in his speech that neither the government nor the private sector could take on cyber threats alone and that they would need to come together to share information as partners. The big question here is whether the private sector will be willing to offer this information. Many companies are still reeling from Edward Snowden's revelations that they were handing over consumer information to the U.S. government and have since taken measures to encrypt data, even from themselves. Obama acknowledged the challenge to protect American citizens from cyber threats, but at the same time protect their right to privacy. He mentioned companies such as Symantec, Intel and PG&E as stepping up and using the government's new Cybersecurity Framework, but likened the process of technological development to building a cathedral. "[T]hat cathedral will not just be about technology but about the values we have embedded in this system. It will be about privacy and security and about connection. A magnificent cathedral and we're all going to be a part of that," he said.

II. BARRIERS TO EFFECTIVE COOPERATION Despite its importance and the potentially significant impact of a campaign to harmonize the efforts of the government and private sector in cybersecurity, **there exist legal, pragmatic, cultural, and competitive hurdles to effective cooperation** that need to be addressed. These hurdles mean that many companies may be inclined to refrain from extensive cooperation in addressing their cybersecurity challenges. And, despite the pervasive and persistent threat, a number of **companies only consider working with the government once they are in crisis mode** and responding to a cybersecurity incident, rather than on an ongoing and proactive basis. Major categories of obstacles to effective cooperation between public and private actors combatting pervasive cyberthreats include: (1) issues surrounding trust and control of incident response; (2) questions about obligations regarding disclosure and exposure; (3) the evolving liability and regulatory landscape; (4) challenges faced in the cross-border investigation of cybercrime; and (5) cross-border data transfer restrictions that impede the ability of companies to respond nimbly to cyberthreats and incidents.

The disclosure/exposure paradox—companies don't want to admit security vulnerabilities to the government because of the risk of negative press

2. Disclosure & Exposure Yet another barrier to effective public-private sector cooperation is the matter of disclosure and exposure. Many companies remain reluctant to reveal security vulnerabilities, especially before they fully have assessed the scope of the problem. They are concerned that doing so will mean they could face negative press, regulatory scrutiny, and civil litigation. Yet, nationally and internationally, a patchwork of data breach notification laws require prompt disclosure of breaches, on the premise that such notice enables those affected to take protective action, including by changing passwords and more closely monitoring, or shutting down, compromised accounts. This fragmented landscape, however, is complicated by the

wide range of government actors involved, each of which has a different role and focus. For example, the Federal Trade Commission (FTC) is primarily concerned with consumer rights; the Securities and Exchange Commission (SEC) focuses on regulated entities' behavior and disclosure requirements; and the Department of Justice (DOJ) deals primarily with preventing, investigating and prosecuting cyber crime and addressing domestic cyber threats. The National Security Agency and U.S. Cyber Command, meanwhile, are focused on intelligence matters and the use of cyber capabilities by the military. Companies also are reluctant to contact the government for help addressing a cybersecurity incident out of fear they will be exposed in a government press release (or subject to a press leak), which may have negative repercussions for the company before the company has assessed the level of damage or implemented a fix for the security breach. This loss of control over the timing, content, and process of a disclosure makes some companies reluctant—or at least hesitant—to contact the government for help when a vulnerability or breach is discovered.

Regulatory confusion—companies are unable to affectively address vulnerabilities because of various overlapping administrative bodies

3. Cybersecurity's Evolving Regulatory & Liability Landscape19 The evolving cybersecurity regulatory and liability landscape compounds the challenges that companies face from cyberattacks and further complicates the ability of corporate executives and their advisors to understand and effectively manage cyber risk. Companies must prepare for and respond to a potential cyberattack's direct damage, including financial and data loss, system and service interruptions, reputational harm, and compromised security. However, cyberattacks also expose companies to diverse and uncertain regulatory and civil liabilities. Although these risks generally become apparent post-breach, they must be contemplated and managed proactively before a breach occurs. Theories of liability revolve around both the actual breach and the company's response to the breach, including regarding the content and timing of notice and disclosure. And exposure can be grounded in statutory, regulatory, and common law. Recent breaches have triggered a variety of claims based on inadequate security measures constituting unfair or deceptive practices, breach of contract, negligence, unjust enrichment, breach of fiduciary duty and duty of care, and negligent misrepresentation. Ultimately, the divergent theories of liability against which companies might need to defend themselves derive from important differences in the goals and methods of diverse cyber actors, as well as the various institutions within the United States that have responsibility for cybersecurity. Different government agencies take different approaches to disclosure, with some encouraging enhanced cooperation, while others increasingly focus on holding companies accountable, civilly and possibly criminally, when their systems are breached. This challenge underscores why cybersecurity collaboration must be approached with an open mind and innovative approach to problem solving. The SEC, FTC, and state attorneys general, for example, all have different mandates and focuses when guarding against different kinds of harms. When the perpetrator is an organized crime group, whose objective is to steal and then sell PC or other personal data for a quick profit, there may be a large number of people affected, some of whom will subsequently turn into plaintiffs. The Department of Homeland Security, FBI, Secret Service, and other national security-focused

government agencies, in turn, tend to seek different kinds of relationships with companies that have been the subject of a breach. They also tend to address different kinds of threats, namely state-sponsored advanced persistent threats seeking sensitive intellectual property and valuable trade secrets, which do not always lead to identifiable harms outside the company that will generate lawsuits. The decision-making of companies that are facing systematic and strategic cyberthreats, therefore, is fraught with legal uncertainty about the implications of how they prepare for and respond to the threat. With piecemeal statutes and regulations, and emerging technologies, companies must navigate myriad potential sources of civil and criminal liability related to cyber incidents whose doctrinal contours are unsettled. Concerns include, for example, how to: institute and monitor security protections; implement cyber incident response policies and procedures; disclose threat, vulnerability, and incident information; and determine when, whether, and how best to inform, and potentially cooperate with, government agencies and industry counterparts. In addition to the inherent difficulties in determining how to address these concerns, companies must also evaluate how each of those decisions may impact litigation risk. The regulatory duties and liability risks that companies now face take many forms and go far beyond requiring a determination of whether and when a breach is sufficiently material to trigger applicable SEC and state disclosure obligations. Companies might also face enforcement and private civil actions brought by, for example, the FTC, the SEC, state attorneys general, the DOJ, plaintiffs whose data is compromised (e.g., customers, clients, corporate partners, vendors, unrelated third-parties like affected banks, etc.), and shareholders. Congress has also conducted inquires of varying levels of formality in response to data breaches and companies may be accountable to regulatory agencies, including the Consumer Financial Protection Bureau, Federal Communications Commission, and Department of Health and Human Services, among others. Litigation concerns are compounded by the fragmentary condition of state and federal laws governing cybersecurity obligations. The mixture includes statutes and regulations and evolving common law standards that pose an obstacle to formulating stable expectations about cybersecurity behavior. Despite legislative efforts and extensive discussions, there is currently no federal data breach notification law. Instead, there exists a patchwork of, sometimes contradictory, state data breach notification laws

Cyber Impact D

1NC Cyber Impact D—Conventional Terror Outweighs

Conventional terror is more probable and higher magnitude than cyberterror – cost, scope, and inherent limitations

Caroline Kennedy-**Pipe 15**, Professor of Politics and International Studies at the University of Hull, England, Gordon Clubb, Simon Mabon, "Terrorism and Political Violence," 2/16/15, Google Books

A first major reason for scepticism regarding the threat posed by cyberterrorism may be found in analyses of the costs that it poses in relation to other forms of attack (Ratlnnell, 1999).

Although estimations of costs are often challenging and imprecise, it is possible to contrast the (financial) expense of more traditional, offline forms of terrorism with the relatively more prohibitive costs of cyberattacks. Beginning with the former, even a major, coordinated attack such as the 1998 bombing of the US embassies in Kenya an Tanzania cost no more than $10,000, according to the CIA (cited in Hoffman, 2006: 134); 'itself cost less than $500,000, according to the 9/11 Commission (Hoffman, 2006), while Conway (2014) notes that the average cost of constructing a car bomb in Afghanistan in 2006 was $1675. The cost of the 1995 Oklahoma City bombing which resulted in the eath of 168 people was less than $5000. In contrast to these relatively low figures, Giacomello (2004: 397) estimates the cost of a cyberattack on a hydroelectric dam at $1.2-1.3 million, including logistical and personnel costs, and estimates the total cost of an attack against an air-traffic-control system at $2.5-3 million, or five to six times that of the 9/11 attacks. If terrorism is always a 'choice among alternatives' (McCormick, 2003: 474), then so too are the instruments of its conduct; analysed thus cyber weapons appear a relatively unattractive option.

Second, beyond the perceived costs of cyberterrorism **is the issue of its potential benefits**. Many of those who are most sceptical of worst-case scenarios around cyberterrorism are so because of the limited utility they see cyberattacks possessing for terrorist groups. For some, such as Conway (2014), terrorism (and consequently cyberterrorism) have an important communicative or performative dimension. That is, the purpose of terrorism is to impact upon – and, specifically, to cause fear within - an external audience not directly or immediately affected by an attack. Seen in this way, the benefits of cyberterrorism are limited because there is no guarantee that they would generate the publicity sought by their protagonists. As Conway (2014) argues, a cyberattack might go uttnoticed even by its initial target, he mistakenly identified as an accident rather than a deliberate, malicious attack, or might even be hidden by governments or corporations seeking to downplay vulnerabilities to citizens and shareholders.

A third reason for scepticism relates to the difficulties that would be faced by a terrorist organisation seeking to perpetrate a cyberattack. Thus, irrespective of motivation, there are important questions to be asked in relation to the extent to which critical infrastructures are actually vulnerable to penetration (Dunn Cavelty, 2008: 20), and of the technical competence of would-be terrorists seeking to attack via the internet. As Weimann (2005: 143) notes, 'Many computer security experts do not believe that it is possible to use the Internet to inflict death on a large scale.' This is. not least, because of considerable investment in cyber security by governments, corporations and other potential targets. as well as due to the development of techniques such as 'air-gapping' in which nuclear weapons and other military systems are deliberately not connected to the internet (Weimann, 2005). While these mechanisms might not guarantee security from cyberterrorism. they do add a sceptical counterbalance to the more concerned perspectives considered above.

2NC Cyber Impact D—Conventional Terror Outweighs

Terrorists are more likely to use conventional methods instead of a cyber-attack—the means and motivation don't exist

Jason Koebler 14, Vice staff writer, "Cyberterrorism (Probably) Isn't Terrifying Enough for ISIS," 9/29/14, motherboard.vice.com/read/cyberterrorism-probably-isnt-terrifying-enough-for-isis

Is the Islamic State planning a cyber terrorist attack on American companies or American critical infrastructure? Let's face it—probably not. Why? Because, well, has there ever been a horrifying, evocative, or even remotely "terrifying" cyberattack on the West? Does "cyberterrorism" even really fit with a jihadist organization's goals? Not to nitpick, but, just because a hack or an attack comes from a terrorist organization does not necessarily make it terrifying. That didn't stop the FBI from issuing a notice late last week to companies noting that "extremist hackers and hacktivists groups, including but not limited to those aligned with the ISIL ideology, will continue to threaten and may attempt offensive cyber actions against the United States in response to perceived or actual US military operations in Iraq or Syria." The FBI noted that it has "no information at this time to indicate specific cyber threats to US networks or infrastructure." Cyberterrorism has been a buzzword on Capitol Hill for well over a decade now and, while cybersecurity is certainly and has been a serious issue for the US government and American companies, cyberterrorism—that is, hacks or attacks pulled off by strictly jihadist or terror-aligned have been few and far between and haven't exactly captured the public's consciousness in a way that an actual terrorist attack would. In fact, former NSA director Michael Hayden said earlier this year is that **cyber terrorism isn't even a thing (yet): "I don't have a single example of cyber terrorism. Not one incident,"** he said. These are not, for instance, Chinese hackers looking to steal American intellectual property. These are people who want to kill or hurt the West (at least, according to everything they've suggested so far). Lots of people have come to this conclusion: In 2009, the UN Security Council said that "there is not yet an obvious terrorist threat in the [cybersecurity] area." Last week, a paper by the Bipartisan Policy Center asked what should be two very obvious questions: "When it comes to assessing whether terrorists are a likely cyber threat, two critical questions are worth raising. First, under which scenarios could a cyber attack cause the kind of terror among the population that terrorists hope to achieve?" the paper suggested. "Second, is a cyber attack actually the easiest way for terrorists to achieve that goal or are traditional methods cheaper and more effective?" The most apparent answer to the first question is that groups like ISIS and al-Qaeda are looking to kill or otherwise harm western citizens. A cyberattack that causes physical harm is certainly not outside the realm of possibility: An attack on the power grid, or on a wastewater management system, or hell, even on a traffic light could hurt or kill people. But the most sophisticated and destructive cyberattack ever, Stuxnet, was (we think) a clandestine operation undertaken by the best hackers the United States and Israel had (and even that didn't kill anyone and wasn't particularly "terrifying"). There's no doubt that ISIS is tech saavy. But cutting a video using Final Cut Pro and engineering a cyberattack that's sophisticated enough to cause serious physical harm are two completely different skill sets. More likely, the kind of cyberattack that ISIS could pull off would be one similar to those we've seen from the Syrian Electronic Army in recent years. While those attacks have garnered plenty of attention for the group, the attention that temporarily defacing a website or co-opting The Onion's Twitter feed for a few minutes got them pales in comparison to the attention and fear ISIS created when it beheaded journalist James Foley. Even the FBI admits in its warning that the most likely attacks would be "website defacements" that would contain messages supporting ISIS or, perhaps, pictures or video of one of ISIS's decapitations. It cites only "probably aspirational threats" from social media accounts as the impetus for issuing the warning. That brings us to the second question raised in the Bipartisan Policy Center paper: Is a cyber attack easier to pull off and more evocative than, say, a plot to decapitate a random person in Australia? Is it even more evocative than taking a photo of the ISIS flag in front of the White House (even on an iPhone)? Is any cyber attack even remotely likely to conjure up the images we saw or the terror we felt on 9/11? Of course not. At least not anytime soon.

Despite everyone having capabilities no one attack each other-norms and deterrence solve now.

Stuxnet was followed by the Flame virus: a new form of malware that infiltrated several networks in Iran and across the Middle East earlier this year. Flame copied text, recorded audio, and deleted fileson the computers into which it hacked. Israel and the United States are again the suspected culprits but deny responsibility. These two attacks generated substantial buzz in the media and among policymakers around the world. Their dramatic nature led some experts to argue that cyberwarfare will fundamentally change the future of international relations, forcing states to rethink their foreign policy. In a speech to the New York business community on October 11, 2012, U.S. Defense Secretary Leon Panetta expressed fear that a cyber version of Pearl Harbor might take the United States by surprise in the near future. He warned that the U.S. government, in addition to national power grids, transportation systems, and financial markets, are all at risk and that cyberdefense should be at the top of the list of priorities for President Barack Obama's second term. The Stuxnet and Flame attacks, however, are not the danger signs that some have made them out to be. First of all, the viruses needed to be physically injected into Iranian networks, likely by U.S. or Israeli operatives, suggesting that the tactic still requires traditional intelligence and military operation methods. Second, Stuxnet derailed Iran's nuclear program for only a short period, if at all. And Flame did nothing to slow Iran's nuclear progression directly, because it seems to have been only a data-collection operation. Some cyberattacks over the past decade have briefly affected state strategic plans, but none has resulted in death or lasting damage. For example, the 2007 cyberattacks on Estonia by Russia shut down networks and government websites and disrupted commerce for a few days, but things swiftly went back to normal. The majority of cyberattacks worldwide have been **minor**: easily corrected annoyances such as website defacements or basic data theft -- basically the least a state can do when challenged diplomatically. Our research shows that although warnings about cyberwarfare have become more severe, **the actual magnitude and pace of attacks do not match popular perception**. Only 20 of 124 active rivals -- defined as the most conflict-prone pairs of states in the system -- engaged in cyberconflict between 2001 and 2011. And there were only 95 total cyberattacks among these 20 rivals. The number of observed attacks pales in comparison to other ongoing threats: a state is 600 times more likely to be the target of a terrorist attack than a cyberattack. We used a severity score ranging from five, which is minimal damage, to one, where death occurs as a direct result from cyberwarfare. Of all 95 cyberattacks in our analysis, the highest score -- that of Stuxnet and Flame -- was only a three. To be sure, states should defend themselves against cyberwarfare, but throwing vast amounts of money toward a low-level threat does not make sense. The Pentagon estimates it spent $2.6 to $3.2 billion on cybersecurity in fiscal year 2012. And it is likely that such spending will only increase. The U.S. Air Force alone anticipates spending $4.6 billion on cybersecurity in the next year. Even if the looming "fiscal cliff" guts the Defense Department's budget, Panetta has made clear that cybersecurity will remain a top funding priority. At a New York conference on October 12, 2012, he described the United States as being in a "pre-9/11 moment" with regards to cyberwarfare and said that the "attackers are plotting," in reference to the growing capabilities of Russia, China, and Iran. Of the 20 ongoing interstate rivals in our study, China and the United States cybertargeted each other the most. According to our study, Beijing attacked U.S. assets 18 times and Washington returned fire twice. Two notable attacks were the 2011 Pentagon raid, which stole sensitive files from the Defense Department, and the 2001 theft of Lockheed Martin's F-35 fighter-jet schematics. These attacks get only a moderate severity score because they targeted specific, nonessential state documents and were not intended to affect the general public. Over the same time span, India and Pakistan targeted each other 11 times (India five times, Pakistan six), as did North and South Korea, with North Korea being the aggressor ten times and South Korea launching one return attack. These ranged from minor incidents, such as Pakistan defacing an Indian government website, to more serious ones, such as North Korea stealing sensitive state documents from South Korea. Israeli-Iranian tensions have risen in recent months, but despite all the talk, this conflict is not playing out in the cybersphere. There were only eight cyberattacks between these states from 2001 to 2011, four launched by Israel, four by Iran. Although Stuxnet and Flame were more severe, Iranian attempts to disrupt government websites have not been very sophisticated. And Israel's near-insistence on an armed conventional attack proves that even the most sophisticated cyberattacks are not changing state behavior. Cyberattacks are rare, and when they do occur, states are **cautious** in their use of force. As with conventional and nuclear conflict, some of the principles of **deterrence and mutually assured destruction** apply. Any aggressor in cyberspace faces the acute threat of blowback: having techniques replicated and repeated against the initiator. Once developed, a cyberweapon can easily be copied and used by a tech-savvy operative with access to a critical system such as the Defense Department's network, which foreign-government hackers have had success infiltrating. Far from making interstate cyberwarfare more common, the ease of launching an attack actually keeps the tactic in check. Most countries' cyberdefenses are weak, and a state

trying to exploit an adversary's weakness may be similarly vulnerable, inviting easy **retaliation**. An unspoken but powerful international **norm against civilian targets** further limits the terms of cyberwarfare.

2NC Cyber Impact D—Deterrence Solves

Cyberattacks impossible – empirics and defenses solve

Rid, King's College war studies reader, 2012

(Thomas, "Think Again: Cyberwar", March/Aprl, http://www.foreignpolicy.com/articles/2012/02/27/cyberwar?page=full, DOA: 10-13-12, ldg)

"Cyberwar Is Already Upon Us." No way. "Cyberwar is coming!" John Arquilla and David Ronfeldt predicted in a celebrated Rand paper back in 1993. Since then, it seems to have arrived -- at least by the account of the U.S. military establishment, which is busy competing over who should get what share of the fight. Cyberspace is "a domain in which the Air Force flies and fights," Air Force Secretary Michael Wynne claimed in 2006. By 2012, William J. Lynn III, the deputy defense secretary at the time, was writing that cyberwar is "just as critical to military operations as land, sea, air, and space." In January, the Defense Department vowed to equip the U.S. armed forces for "conducting a combined arms campaign across all domains -- land, air, maritime, space, and cyberspace." Meanwhile, growing piles of books and articles explore the threats of cyberwarfare, cyberterrorism, and how to survive them. **Time for a reality check: Cyberwar is still more hype than hazard**. Consider the definition of an act of war: It has to be potentially violent, it has to be purposeful, and it has to be political. The cyberattacks we've seen so far, from Estonia to the Stuxnet virus, simply don't meet these criteria. Take the dubious story of a Soviet pipeline explosion back in 1982, much cited by cyberwar's true believers as the most destructive cyberattack ever. The account goes like this: In June 1982, a Siberian pipeline that the CIA had virtually booby-trapped with a so-called "logic bomb" exploded in a monumental fireball that could be seen from space. The U.S. Air Force estimated the explosion at 3 kilotons, equivalent to a small nuclear device. Targeting a Soviet pipeline linking gas fields in Siberia to European markets, the operation sabotaged the pipeline's control systems with software from a Canadian firm that the CIA had doctored with malicious code. No one died, according to Thomas Reed, a U.S. National Security Council aide at the time who revealed the incident in his 2004 book, At the Abyss; the only harm came to the Soviet economy. But did it really happen? After Reed's account came out, Vasily Pchelintsev, a former KGB head of the Tyumen region, where the alleged explosion supposedly took place, denied the story. There are also no media reports from 1982 that confirm such an explosion, though accidents and pipeline explosions in the Soviet Union were regularly reported in the early 1980s. Something likely did happen, but **Reed's book is the only public mention of the incident and his account relied on a single document**. Even after the CIA declassified a redacted version of Reed's source, a note on the so-called Farewell Dossier that describes the effort to provide the Soviet Union with defective technology, the agency did not confirm that such an explosion occurred. **The available evidence on the Siberian pipeline blast is so thin that it shouldn't be counted as a proven case of a successful cyberattack**. Most other commonly cited cases of cyberwar are even less remarkable. Take the attacks on Estonia in April 2007, which came in response to the controversial relocation of a Soviet war memorial, the Bronze Soldier. The well-wired country found itself at the receiving end of a massive distributed denial-of-service attack that emanated from up to 85,000 hijacked computers and lasted three weeks. The attacks reached a peak on May 9, when 58 Estonian websites were attacked at once and the online services of Estonia's largest bank were taken down. "What's the difference between a blockade of harbors or airports of sovereign states and the blockade of government institutions and newspaper websites?" asked Estonian Prime Minister Andrus Ansip. Despite his analogies, the attack was no act of war. It was certainly a nuisance and an emotional strike on the country, but the bank's actual network was not even penetrated; it went down for 90 minutes one day and two hours the next. The attack was not violent, it wasn't purposefully aimed at changing Estonia's behavior, and no political entity took credit for it. **The same is true for the vast majority of cyberattacks on record**. Indeed, **there is no known cyberattack that**

has caused the loss of human life. No cyberoffense has ever injured a person or damaged a building. And if an act is not at least potentially violent, it's not an act of war. Separating war from physical violence makes it a metaphorical notion; it would mean that there is no way to distinguish between World War II, say, and the "wars" on obesity and cancer. Yet those ailments, unlike past examples of cyber "war," actually do kill people. "A Digital Pearl Harbor Is Only a Matter of Time." **Keep waiting**. U.S. Defense Secretary Leon Panetta delivered a stark warning last summer: "We could face a cyberattack that could be the equivalent of Pearl Harbor." Such **alarmist predictions have been ricocheting inside the Beltway for the past two decades**, and some scaremongers have even upped the ante by raising the alarm about a cyber 9/11. In his 2010 book, Cyber War, former White House counterterrorism czar Richard Clarke invokes the specter of nationwide power blackouts, planes falling out of the sky, trains derailing, refineries burning, pipelines exploding, poisonous gas clouds wafting, and satellites spinning out of orbit -- events that would make the 2001 attacks pale in comparison. But the empirical record is less hair-raising, even by the standards of the most drastic example available. Gen. Keith Alexander, head of U.S. Cyber Command (established in 2010 and now boasting a budget of more than $3 billion), shared his worst fears in an April 2011 speech at the University of Rhode Island: "What I'm concerned about are destructive attacks," Alexander said, "those that are coming." He then invoked a remarkable accident at Russia's Sayano-Shushenskaya hydroelectric plant to highlight the kind of damage a cyberattack might be able to cause. Shortly after midnight on Aug. 17, 2009, a 900-ton turbine was ripped out of its seat by a so-called "water hammer," a sudden surge in water pressure that then caused a transformer explosion. The turbine's unusually high vibrations had worn down the bolts that kept its cover in place, and an offline sensor failed to detect the malfunction. Seventy-five people died in the accident, energy prices in Russia rose, and rebuilding the plant is slated to cost $1.3 billion. Tough luck for the Russians, but here's what the head of Cyber Command didn't say: The ill-fated turbine had been malfunctioning for some time, and the plant's management was notoriously poor. On top of that, the key event that ultimately triggered the catastrophe seems to have been a fire at Bratsk power station, about 500 miles away. Because the energy supply from Bratsk dropped, authorities remotely increased the burden on the Sayano-Shushenskaya plant. The sudden spike overwhelmed the turbine, which was two months shy of reaching the end of its 30-year life cycle, sparking the catastrophe. If anything, the Sayano-Shushenskaya **incident highlights how difficult a devastating attack would be to mount**. The plant's washout was an accident at the end of a complicated and unique chain of events. **Anticipating** such vulnerabilities in advance **is extraordinarily difficult** even for insiders; creating comparable coincidences from cyberspace would **be a daunting challenge at best for outsiders**. If this is the most drastic incident Cyber Command can conjure up, perhaps it's time for everyone to take a deep breath. "Cyberattacks Are Becoming Easier." **Just the opposite**. U.S. Director of National Intelligence James R. Clapper warned last year that the volume of malicious software on American networks had more than tripled since 2009 and that more than 60,000 pieces of malware are now discovered every day. The United States, he said, is undergoing "a phenomenon known as 'convergence,' which amplifies the opportunity for disruptive cyberattacks, including against physical infrastructures." ("Digital convergence" is a snazzy term for a simple thing: more and more devices able to talk to each other, and formerly separate industries and activities able to work together.) Just because there's more malware, however, **doesn't mean that attacks are becoming easier**. In fact, potentially damaging or life-threatening cyberattacks should be more difficult to pull off. Why? **Sensitive systems generally have built-in redundancy and safety systems, meaning an attacker's likely objective will not be to shut down a system**, since merely forcing the shutdown of one control system, say a power plant, could trigger a backup and cause operators to start looking for the bug. To work as an effective weapon, malware would have to influence an active process -- but not bring it to a screeching halt. If the malicious activity extends over a lengthy period, it has to remain stealthy. That's a more difficult trick than hitting the virtual off-button. Take Stuxnet, the worm that sabotaged Iran's nuclear program in 2010. It didn't just crudely shut down the centrifuges at the Natanz nuclear facility; rather, the worm subtly manipulated the system. Stuxnet stealthily infiltrated the plant's networks, then hopped onto the protected control systems, intercepted input values from sensors, recorded these data, and then provided the legitimate controller code with pre-recorded fake input signals, according to researchers who have studied the worm. Its objective was not just to fool operators in a control room, but also to circumvent digital safety and monitoring systems so it could secretly manipulate the actual processes. Building and deploying Stuxnet required **extremely detailed intelligence** about the systems it was supposed to compromise, and the same will be true for other dangerous cyberweapons. Yes, "convergence," standardization, and sloppy defense of control-systems software could increase the risk of generic attacks, but the same trend has also caused **defenses against the most coveted targets to improve steadily and has made reprogramming highly specific installations on legacy systems more complex**, not less.

Low risk of cyberwar-too hard to take down multiple targets and keep them down. Only 3 percent of attacks are actually scary.

Cavelty, Center for Security Studies, 2012

(Myriam Dunn, "The Militarisation of Cyber Security as a Source of Global Tension", 10-22, http://isn.ch/Digital-Library/Articles/Special-Feature/Detail/?lng=en&id=153888&tabid=1453350669&contextid774=153888&contextid775=153903, ldg)

However, in the entire history of computer networks, there are no examples of cyber attacks that resulted in actual physical violence against persons (nobody has ever died from a cyber incident), and only very few had a substantial effect on property (Stuxnet being the most prominent). So far, cyber attacks have not caused serious long-term disruptions. They are risks that can be dealt with by individual entities using standard information security measures, and their overall costs remain low in comparison to other risk categories such as financial risks. **These facts tend to be almost completely disregarded in policy circles.** There are several reasons why the threat is overrated. First, as combating cyber threats has become a highly politicised issue, official statements about the level of threat must also be seen in the context of competition for resources and influence between various bureaucratic entities. This is usually done by stating an urgent need for action and describing the overall threat as big and rising. Second, psychological research has shown that risk perception, including the perception of experts, is highly dependent on intuition and emotions. Cyber risks, especially in their more extreme form, fit the risk profile of so-called 'dread risks', which are perceived as catastrophic, fatal, un- known, and basically uncontrollable. **There is a propensity to be disproportionally afraid of these risks despite their low probability,** which translates into pressure for regulatory action of all sorts and the willingness to bear high costs of uncertain benefit Third, the media distorts the threat perception even further. There is no hard data for the assumption that the level of cyber risks is actually rising– beyond the perception of impact and fear. Some IT security companies have recently warned against over-emphasising sophisticated attacks just because we hear more about them. **In 2010, only about 3 per cent of all incidents were considered so sophisticated that they were impossible to stop.** The vast majority of attackers go after low-hanging fruit, which are small to medium sized enterprises with bad defences. These types of incidents tend to remain under the radar of the media and even law enforcement. Cyber war remains unlikely Since the potentially devastating effects of cyber attacks are so scary, the temptation is very high not only to think about worst-case scenarios, but also to give them a lot of (often too much) weight despite their very low probability. However, most experts agree that strategic cyber war remains highly unlikely in the foreseeable future, mainly due to the uncertain results such a war would bring, the lack of motivation on the part of the possible combatants, and their shared inability to defend against counterattacks. Indeed, it is hard to see how cyber attacks could ever become truly effective for military purposes: **It is exceptionally difficult to take down multiple, specific targets and keep them down over time**. The key difficulty is proper reconnaissance and targeting, as well as the need to deal with a variety of diverse systems and be ready for countermoves from your adversary. Furthermore, nobody can be truly interested in allowing the unfettered proliferation and use of cyber war tools, least of all the countries with the offensive lead in this domain. Quite to the contrary, strong arguments can be made that the world's big powers have an overall strategic interest in developing and accepting internationally agreed norms on cyber war, and in creating agreements that might pertain to the development, distribution, and deployment of cyber weapons or to their use (though the effectiveness of such norms must remain doubtful). The most obvious reason is that the countries that are currently openly discussing the use of cyber war tools are precisely the ones that are the most vulnerable to cyber warfare attacks due to their high dependency on information infrastructure. The features of the emerging information environment make it extremely unlikely that any but the most limited and tactically oriented instances of computer attacks could be contained. More likely, computer attacks could 'blow back' through the interdependencies that are such an essential feature of the environment. Even relatively harmless viruses and worms would cause considerable random disruption to businesses, governments, and consumers. This risk would most likely weigh much heavier than the uncertain benefits to be gained from cyber war activities. Certainly, thinking about (and planning for) worst-case scenarios is a legitimate task of the national security

apparatus. Also, it seems almost inevitable that until cyber war is proven to be ineffective or forbidden, states and non-state actors who have the ability to develop cyber weapons will try to do so, because they appear cost-effective, more stealthy, and less risky than other forms of armed conflict. However, cyber war should not receive too much attention at the expense of more plausible and possible cyber problems. Using too many resources for high- impact, low-probability events – and therefore having less resources for the low to middle impact and high probability events – does not make sense, neither politically, nor strategically and certainly not when applying a cost-benefit logic.

2NC Cyber Impact D—Low Risk

Risk is systemically over-estimated and has been for decades

Eighty years ago, the generals of the U.S. Army Air Corps were sure that their bombers would easily topple other countries and cause their populations to panic, claims which did not stand up to reality. **A study of the 25-year history of cyber conflic**t, by the Atlantic Council and Cyber Conflict Studies Association, **has shown a similar dynamic where the impact of disruptive cyberattacks has been consistently overestimated.** Rather than theorizing about future cyberwars or extrapolating from today's concerns, the history of cyberconflict that have actually been fought, shows that cyber incidents have so far tended to have effects that are either widespread but fleeting or persistent but narrowly focused. **No attacks, so far, have been both widespread and persistent**. There have been no authenticated cases of anyone dying from a cyber attack. Any widespread disruptions, even the 2007 disruption against Estonia**, have been short-lived causing no significant GDP loss**.

1NC Cyber Impact D—Not Likely

No risk of cyberattack and no impact

Birch, former AP foreign correspondent, 10-1-12

(Douglas, "Forget Revolution", Foreign Policy, http://www.foreignpolicy.com/articles/2012/10/01/forget_revolution?page=full, DOA: 10-12-12, ldg)

"That's a good example of what some kind of attacks would be like," he said. "You don't want to overestimate the risks. You don't want somebody to be able to do this whenever they felt like it, which is the situation now. But this is not the end of the world." The question of how seriously to take the threat of a cyber attack on critical infrastructure surfaced recently, after Congress rejected a White House measure to require businesses to adopt stringent- new

regulations to protect their computer networks from intrusions. The bill would have required industries to report cyber security breaches, toughen criminal penalties against hacking and granted legal immunity to companies cooperating with government investigations. Critics worried about regulatory overreach. But the potential cost to industry also seems to be a major factor in the bill's rejection. A January study by Bloomberg reported that banks, utilities, and phone carriers would have to increase their spending on cyber security by a factor of nine, to $45.3 billion a year, in order to protect themselves against 95 percent of cyber intrusions. Likewise, some of the bill's advocates suspect that in the aftermath of a truly successful cyber attack, the government would have to bail the utilities out anyway. Joe Weiss, a cyber security professional and an authority on industrial control systems like those used in the electric grid, argued that a well-prepared, sophisticated cyber attack could have far more serious consequences than this summer's blackouts. "The reason we are so concerned is that cyber could take out the grid for nine to 18 months," he said. "This isn't a one to five day outage. We're prepared for that. We can handle that." But pulling off a cyber assault on that scale is no easy feat. Weiss agreed that hackers intent on inflicting this kind of long-term interruption of power would need to use a tool capable of inflicting physical damage. And so far, the world has seen only one such weapon: Stuxnet, which is believed to have been a joint military project of Israel and the United States. Ralph Langner, a German expert on industrial-control system security, was among the first to discover that Stuxnet was specifically designed to attack the Supervisory Control and Data Acquisition system (SCADA) at a single site: Iran's Natanz uranium-enrichment plant. The computer worm's sophisticated programs, which infected the plant in 2009, caused about 1,000 of Natanz's 5,000 uranium-enrichment centrifuges to self-destruct by accelerating their precision rotors beyond the speeds at which they were designed to operate. Professionals like Weiss and others warned that Stuxnet was opening a Pandora's Box: Once it was unleashed on the world, they feared, it would become available to hostile states, criminals, and terrorists who could adapt the code for their own nefarious purposes. But two years after the discovery of Stuxnet, **there are no reports of similar attacks** against the United States. What has prevented the emergence of such copycat viruses? A 2009 paper published by the University of California, Berkeley, may offer the answer. The report, which was released a year before Stuxnet surfaced, found that in order to create a cyber weapon capable of ~~crippling~~ (destroying) a specific control system ---- like the ones operating the U.S. electric grid -- six coders might have to work for up to six months to reverse engineer the targeted center's SCADA system. Even then, the report says, hackers likely **would need the help of someone with inside knowledge** of how the network's machines were wired together to plan an effective attack. "Every SCADA control center is configured differently, with different devices, running different software/protocols," wrote Rose Tsang, the report's author. Professional hackers are in it for the money -- and it's a lot more cost-efficient to search out vulnerabilities in widely-used computer programs like the Windows operating system, used by banks and other affluent targets, than in one-of-a-kind SCADA systems linked to generators and switches. According to Pollard, only the world's industrial nations have the means to use the Internet to attack utilities and major industries. But given the integrated global economy, there is little incentive, short of armed conflict, for them to do so. "If you're a state that has a number of U.S. T-bills in your treasury, you have an economic interest in the United States," he said. "You're not going to have an interest in mucking about with our infrastructure." There is also the threat of retaliation. Last year, the U.S. government reportedly issued a classified report on cyber strategy that said it could respond to a devastating digital assault with traditional military force. The idea was that if a cyber attack caused death and destruction on the scale of a military assault, the United States would reserve the right to respond with what the Pentagon likes to call "kinetic" weapons: missiles, bombs, and bullets. An unnamed Pentagon official, speaking to the Wall Street Journal, summed up the policy in less diplomatic terms: "If you shut down our power grid, maybe we will put a missile down one of your smokestacks." Deterrence is sometimes dismissed as a toothless strategy against cyber attacks because hackers have such an easy time hiding in the anonymity of the Web. But investigators typically come up with key suspects, if not smoking guns, following cyber intrusions and assaults -- the way suspicions quickly focused on the United States and Israel after Stuxnet was discovered. **And with the U.S. military's global reach, even terror groups have to factor in potential retaliation when planning their operations.**

Cyber war infeasible-multiple reasons and rigorous analysis

Clark, AMU Intelligence studies MA caudate and Chenega Federal Systems senior analyst, 2012

(Paul, "The Risk of Disruption or Destruction of Critical U.S. Infrastructure by an Offensive Cyber Attack", 4-28, http://www.academia.edu/1538543/The_Risk_of_Disruption_or_Destruction_of_Critical_U.S._Infrastructure_by_an_Offensive_Cyber_Attack, DOA: 10-13-12, ldg)

The Department of Homeland Security worries that our critical infrastructure and key resources (CIKR) may be exposed, both directly and indirectly, to multiple threats because of CIKR reliance on the global cyber infrastructure, an infrastructure that is under routine cyberattack by a "spectrum of malicious actors" (National Infrastructure Protection Plan 2009). CIKR in the extremely large and complex U.S. economy spans multiple sectors including agricultural, finance and banking, dams and water resources, public health and emergency services, military and defense, transportation and shipping, and energy (National Infrastructure Protection Plan 2009). The disruption and destruction of public and private infrastructure is part of warfare, without this infrastructure conflict cannot be sustained (Geers 2011). Cyber-attacks are desirable because they are considered to be a relatively "low cost and long range" weapon (Lewis 2010), but prior to the creation of Stuxnet, the first cyber-weapon, the ability to disrupt and destroy critical infrastructure through cyber-attack was theoretical. The movement of an offensive cyber-weapon from conceptual to actual has forced the United States to question whether offensive cyber-attacks are a significant threat that are able to disrupt or destroy CIKR to the level that national security is seriously degraded. It is important to understand the risk posed to national security by cyber-attacks to ensure that government responses are appropriate to the threat and balance security with privacy and civil liberty concerns. The risk posed to CIKR from cyber-attack can be evaluated by measuring the threat from cyber-attack against the vulnerability of a CIKR target and the consequences of CIKR disruption. As the only known cyber-weapon, Stuxnet has been thoroughly analyzed and used as a model for predicting future cyber-weapons. The U.S. electrical grid, a key component in the CIKR energy sector, is a target that has been analyzed for vulnerabilities and the consequences of disruption predicted – the electrical grid has been used in multiple attack scenarios including a classified scenario provided to the U.S. Congress in 2012 (Rohde 2012). Stuxnet will serve as the weapon and the U.S. electrical grid will serve as the target in **this risk analysis that concludes that there is a low risk of disruption or destruction of critical infrastructure** from a an offensive cyber-weapon because of the complexity of the attack path, the limited capability of non-state adversaries to develop cyber-weapons, and the existence of multiple methods of mitigating the cyber-attacks. To evaluate the threat posed by a Stuxnet-like cyber-weapon, the complexity of the weapon, the available attack vectors for the weapon, and the resilience of the weapon must be understood. The complexity – how difficult and expensive it was to create the weapon – identifies the relative cost and availability of the weapon; inexpensive and simple to build will be more prevalent than expensive and difficult to build. Attack vectors are the available methods of attack; the larger the number, the more severe the threat. For example, attack vectors for a cyberweapon may be email attachments, peer-to-peer applications, websites, and infected USB devices or compact discs. Finally, the resilience of the weapon determines its availability and affects its usefulness. A useful weapon is one that is resistant to disruption (resilient) and is therefore available and reliable. These concepts are seen in the AK-47 assault rifle – a simple, inexpensive, reliable and effective weapon – and carry over to information technology structures (Weitz 2012). The evaluation of Stuxnet identified malware that **is "unusually complex and large"** and required code written in multiple languages (Chen 2010) in order to complete a variety of specific functions contained in a "vast array" of components – it is one of the most complex threats ever analyzed by Symantec (Falliere, Murchu and Chien 2011). To be successful, Stuxnet required a high level of technical knowledge across multiple disciplines, a laboratory with the target equipment configured for testing, and a foreign intelligence capability to collect information on the target network and attack vectors (Kerr, Rollins and Theohary 2010). The malware also needed careful monitoring and maintenance because it could be easily disrupted; as a result Stuxnet was developed with a high degree of configurability and was upgraded multiple times in less than one year (Falliere, Murchu and Chien 2011). Once introduced into the network, the cyber-weapon then had to utilize four known vulnerabilities and four unknown vulnerabilities, known as zero-day exploits, in order to install itself and propagate across the target network (Falliere, Murchu and Chien 2011). **Zero-day exploits are incredibly difficult to find and fewer than twelve out of the 12,000,000 pieces of malware discovered each year utilize zero-day exploits** and this rarity makes them valuable, zero-days can fetch $50,000 to $500,000 each on the black market (Zetter 2011). The use of four rare exploits in a single piece of malware is "unprecedented" (Chen 2010). Along with the use of four unpublished exploits, Stuxnet also used the "first ever" programmable logic controller rootkit, a Windows rootkit, antivirus evasion techniques, intricate process injection routines, and other complex

interfaces (Falliere, Murchu and Chien 2011) all wrapped up in "layers of encryption like Russian nesting dolls" (Zetter 2011) – including custom encryption algorithms (Karnouskos 2011). As the malware spread across the now-infected network it had to utilize additional vulnerabilities in proprietary Siemens industrial control software (ICS) and hardware used to control the equipment it was designed to sabotage. Some of these ICS vulnerabilities were published but some were unknown and required such a high degree of inside knowledge that there was speculation that a Siemens employee had been involved in the malware design (Kerr, Rollins and Theohary 2010). The unprecedented technical complexity of the Stuxnet cyber-weapon, along with the extensive technical and financial resources and foreign intelligence capabilities required for its development and deployment, indicates that the malware was likely developed by a nation-state (Kerr, Rollins and Theohary 2010). Stuxnet had very limited attack vectors. When a computer system is connected to the public Internet a host of attack vectors are available to the cyber-attacker (Institute for Security Technology Studies 2002). Web browser and browser plug-in vulnerabilities, cross-site scripting attacks, compromised email attachments, peer-to-peer applications, operating system and other application vulnerabilities are all vectors for the introduction of malware into an Internetconnected computer system. **Networks that are not connected to the public internet are "air gapped,"** a technical colloquialism to identify a physical separation between networks. Physical separation from the public Internet is a common safeguard for sensitive networks including classified U.S. government networks. If the target network is air gapped, infection can only occur through physical means – an infected disk or USB device that must be physically introduced into a possibly access controlled environment and connected to the air gapped network. The first step of the Stuxnet cyber-attack was to initially infect the target networks, a difficult task given the probable disconnected and well secured nature of the Iranian nuclear facilities. Stuxnet was introduced via a USB device to the target network, a method that suggests that the attackers were familiar with the configuration of the network and knew it was not connected to the public Internet (Chen 2010). This assessment is supported by two rare features in Stuxnet – having all necessary functionality for industrial sabotage fully embedded in the malware executable along with the ability to self-propagate and upgrade through a peer-to-peer method (Falliere, Murchu and Chien 2011). Developing an understanding of the target network configuration was a significant and daunting task based on Symantec's assessment that Stuxnet repeatedly targeted a total of five different organizations over nearly one year (Falliere, Murchu and Chien 2011) with physical introduction via USB drive being the only available attack vector. The final factor in assessing the threat of a cyber-weapon is the resilience of the weapon. There are two primary factors that make Stuxnet non-resilient: the complexity of the weapon and the complexity of the target. Stuxnet was highly customized for sabotaging specific industrial systems (Karnouskos 2011) and needed a large number of very complex components and routines in order to increase its chance of success (Falliere, Murchu and Chien 2011). The malware required eight vulnerabilities in the Windows operating system to succeed and therefore would have failed if those vulnerabilities had been properly patched; four of the eight vulnerabilities were known to Microsoft and subject to elimination (Falliere, Murchu and Chien 2011). Stuxnet also required that two drivers be installed and required two stolen security certificates for installation (Falliere, Murchu and Chien 2011); driver installation would have failed if the stolen certificates had been revoked and marked as invalid. Finally, the configuration of systems is ever-changing as components are upgraded or replaced. There is no guarantee that the network that was mapped for vulnerabilities had not changed in the months, or years, it took to craft Stuxnet and successfully infect the target network. Had specific components of the target hardware changed – the targeted Siemens software or programmable logic controller – the attack would have failed. Threats are less of a threat when identified; this is why zero-day exploits are so valuable. Stuxnet went to great lengths to hide its existence from the target and utilized multiple rootkits, data manipulation routines, and virus avoidance techniques to stay undetected. The malware's actions occurred only in memory to avoid leaving traces on disk, it masked its activities by running under legal programs, employed layers of encryption and code obfuscation, and uninstalled itself after a set period of time, all efforts to avoid detection because its authors knew that detection meant failure. As a result of the complexity of the malware, the changeable nature of the target network, and the chance of discovery, Stuxnet is not a resilient system. It is a fragile weapon that required an investment of time and money to constantly monitor, reconfigure, test and deploy over the course of a year. There is concern, with Stuxnet developed and available publicly, that the world is on the brink of a storm of highly sophisticated Stuxnet-derived cyber-weapons which can be used by hackers, organized criminals and terrorists (Chen 2010). As former counterterrorism advisor Richard Clarke describes it, there is concern that the technical brilliance of the United States "has created millions of potential monsters all over the world" (Rosenbaum 2012). Hyperbole aside, technical knowledge spreads. The techniques behind cyber-attacks are "constantly evolving and making use of lessons learned over time" (Institute for Security Technology Studies 2002) and the publication of the Stuxnet code may make it easier to copy the weapon (Kerr, Rollins and Theohary 2010). However, this is something of a zero-sum game because **knowledge works both ways and cyber-security techniques are also evolving**, and "understanding attack techniques more clearly is the first step toward increasing security" (Institute for Security Technology Studies 2002). Vulnerabilities are discovered and patched, intrusion detection and malware signatures are expanded and updated, and monitoring and analysis processes and methodologies are expanded and honed. **Once the element of surprise is lost, weapons and tactics are less useful**, this is the core of the argument that "uniquely surprising" stratagems like Stuxnet are single-use, like Pearl Harbor and the Trojan Horse, the "very success [of these attacks] precludes their repetition" (Mueller 2012). This paradigm has already been seen in the "son of Stuxnet" malware – named Duqu by its discoverers – that is based on the same modular code platform that created Stuxnet (Ragan 2011). With the techniques used by Stuxnet now known, other variants such as Duqu are being discovered and countered by security researchers (Laboratory of Cryptography and System Security 2011). It is obvious that the effort required to create, deploy, and maintain Stuxnet and its variants is massive and

it is not clear that the rewards are worth the risk and effort. Given the location of initial infection and the number of infected systems in Iran (Falliere, Murchu and Chien 2011) it is believed that Iranian nuclear facilities were the target of the Stuxnet weapon. A significant amount of money and effort was invested in creating Stuxnet but yet the expected result – assuming that this was an attack that expected to damage production – was minimal at best. Iran claimed that Stuxnet caused only minor damage, probably at the Natanz enrichment facility, the Russian contractor Atomstroyeksport reported that no damage had occurred at the Bushehr facility, and an unidentified "senior diplomat" suggested that Iran was forced to shut down its centrifuge facility "for a few days" (Kerr, Rollins and Theohary 2010). Even the most optimistic estimates believe that Iran's nuclear enrichment program was only delayed by months, or perhaps years (Rosenbaum 2012). The actual damage done by Stuxnet is not clear (Kerr, Rollins and Theohary 2010) and the primary damage appears to be to a higher number than average replacement of centrifuges at the Iran enrichment facility (Zetter 2011). Different targets may produce different results. The Iranian nuclear facility was a difficult target with limited attack vectors because of its isolation from the public Internet and restricted access to its facilities. What is the probability of a successful attack against the U.S. electrical grid and what are the potential consequences should this critical infrastructure be disrupted or destroyed? An attack against the electrical grid is a reasonable threat scenario since power systems are "a high priority target for military and insurgents" and there has been a trend towards utilizing commercial software and integrating utilities into the public Internet that has "increased vulnerability across the board" (Lewis 2010). **Yet the increased vulnerabilities are mitigated by an increased detection and deterrent capability** that has been "honed over many years of practical application" now that power systems are using standard, rather than proprietary and specialized, applications and components (Leita and Dacier 2012). The security of the electrical grid is also **enhanced by increased awareness** after a smart-grid hacking demonstration in 2009 and the identification of the Stuxnet malware in 2010; as a result **the public and private sector are working together in an "unprecedented effort" to establish robust security guidelines** and cyber security measures (Gohn and Wheelock 2010).

We're currently told that the death toll in Japan will be at least **10,000 people of whom** approximately **zero seem to have perished in nuclear accidents**. **What happens when a tsunami hits an offshore drilling platform or a natural gas pipeline? What happens to a coal mine in an earthquake**? How much environmental damage is playing out in Japan right now because of gasoline from cars pushed around? **The main lesson is "try not to put critical infrastructure near a fault line"** but Japan is an earthquakey country, so what are they really supposed to do about this?¶ This is a good point: **energy sources of all kind cause problems. Sometimes the problems create screaming headlines** (nuke meltdowns, offshore oil explosions, mining disasters) **and sometimes they don't** (increased particulate pollution, global warming, devastation of salmon runs). **But the dangers are there for virtually every type of energy production**.¶ Still, it's worth pointing out that **the problem with nuclear power isn't** so much **its immediate capacity to kill people**. As Matt points out, **no one has died in Japan from the partial meltdowns at its damaged nuclear plants, and it's unlikely anyone ever will. The control rods are in place, and even in the worst case the containment vessels will** almost certainly **restrict** the worst **damage**.

Meltdowns don't cause extinction

WNA 2012

(World Nuclear Association, "Safety of Nuclear Power Reactors", March, http://www.world-nuclear.org/info/inf06.html, DOA: 10-12-12, ldg)

In the 1950s attention turned to harnessing the power of the atom in a controlled way, as demonstrated at Chicago in 1942 and subsequently for military research, and applying the steady heat yield to generate electricity. This naturally gave rise to concerns about accidents and their possible effects. However, with nuclear power safety depends on much the same factors as in any comparable industry: intelligent planning, proper design with conservative margins and back-up systems, high-quality components and a well-developed safety culture in operations. A particular nuclear scenario was loss of cooling which resulted in melting of the nuclear reactor core, and this motivated studies on both the physical and chemical possibilities as well as the biological effects of any dispersed radioactivity. Those responsible for nuclear power technology in the West devoted extraordinary effort to ensuring that a meltdown of the reactor core would not take place, since it was assumed that a meltdown of the core would create a major public hazard, and if uncontained, a tragic accident with likely multiple fatalities. In avoiding such accidents the industry has been very successful. In over 14,500 cumulative reactor-years of commercial operation in 32 countries, there have been only three major accidents to nuclear power plants - Three Mile Island, Chernobyl, and Fukushima - the second being of little relevance to reactor design outside the old Soviet bloc. It was not until the late 1970s that detailed analyses and large-scale testing, followed by the 1979 meltdown of the Three Mile Island reactor, began to make clear that even the worst possible accident in a conventional western nuclear power plant or its fuel would not be likely to cause dramatic public harm. The industry still works hard to minimize the probability of a meltdown accident, but it is now clear that no-one need fear a potential public health catastrophe simply because a fuel meltdown happens. Fukushima has made that clear, with a triple meltdown causing no fatalities or serious radiation doses to anyone, while over two hundred people continued working on the site to mitigate the accident's effects. The decades-long test and analysis program showed that less radioactivity escapes from molten fuel than initially assumed, and that most of this radioactive material is not readily mobilized beyond the immediate internal structure. Thus, even if the containment structure that surrounds all modern nuclear plants were ruptured, as it has been with at least one of the Fukushima reactors, it is still very effective in preventing escape of most radioactivity. It is the laws of physics and the properties of materials that mitigate disaster, more than the required actions by safety equipment or personnel. In fact, licensing approval for new plants now requires that the effects of any core-melt accident must be confined to the plant itself, without the need to evacuate nearby residents. The three significant accidents in the 50-year history of civil nuclear power generation are: Three Mile Island (USA 1979) where the reactor was severely damaged but radiation was contained and there were no adverse health or environmental consequences Chernobyl (Ukraine 1986) where the destruction of the reactor by steam explosion and fire **killed 31 people** and had significant health and environmental consequences. The death toll has since increased to about 5 Fukushima (Japan 2011) where three old reactors (together with a fourth) were written off and the effects of loss of cooling due to a huge tsunami were inadequately contained. A table showing all reactor accidents, and a table listing some energy-related accidents with multiple fatalities are appended. **These three significant accidents occurred during more than 14,000 reactor-years of civil operation.** Of all the accidents and incidents, only the Chernobyl and Fukushima accidents resulted in radiation doses to the public greater than those resulting from the exposure to natural sources. The Fukushima accident resulted in some radiation exposure of workers at the plant, but not such as to threaten their health, unlike Chernobyl. Other incidents (and one 'accident') have been completely confined to the plant. Apart from Chernobyl, no nuclear workers or members of the public have ever died as a result of exposure to radiation due to a commercial nuclear reactor incident. Most of the serious radiological injuries and deaths that occur each year (2-4 deaths and many more exposures above regulatory limits) are the result of large uncontrolled radiation sources, such as abandoned medical or industrial equipment. (There have also been a number of accidents in experimental reactors and in one military plutonium-producing pile - at Windscale, UK, in 1957, but none of these resulted in loss of life outside the actual plant, or long-term environmental contamination.) See also Table 2 in Appendix.

They conflate minor blackouts with attempted attacks, their evidence is rhetorical hyperbole

Schneier 10 (Bruce, Security Technologist and author of several books on cyber security, "Threat of 'cyberwar' has been hugely hyped" 7/7/10 http://edition.cnn.com/2010/OPINION/07/07/schneier.cyberwar.hyped/)

"The United States is fighting a cyberwar today, and we are losing," said former NSA director -- and current cyberwar contractor -- Mike McConnell. "Cyber 9/11 has happened over the last ten years, but it happened slowly so we don't see it," said former National Cyber Security Division director Amit Yoran. Richard Clarke, whom Yoran replaced, wrote an entire book hyping the threat of cyberwar. General Keith Alexander, the current commander of the U.S. Cyber Command, hypes it every chance he gets. This isn't just rhetoric of a few over-eager government officials and headline writers; the entire national debate on cyberwar is plagued with exaggerations and hyperbole. Googling those names and terms -- as well as "cyber Pearl Harbor," "cyber Katrina," and even "cyber Armageddon" -- gives some idea how pervasive these memes are. Prefix "cyber" to something scary, and you end up with something really scary. Cyberspace has all sorts of threats, day in and day out. Cybercrime is by far the largest: fraud, through identity theft and other means, extortion, and so on. Cyber-espionage is another, both government- and corporate-sponsored. Traditional hacking, without a profit motive, is still a threat. So is cyber-activism: people, most often kids, playing politics by attacking government and corporate websites and networks. These threats cover a wide variety of perpetrators, motivations, tactics, and goals. You can see this variety in what the media has mislabeled as "cyberwar." The attacks against Estonian websites in 2007 were simple hacking attacks by ethnic Russians angry at anti-Russian policies; these were denial-of-service attacks, a normal risk in cyberspace and hardly unprecedented. A real-world comparison might be if an army invaded a country, then all got in line in front of people at the DMV so they couldn't renew their licenses. If that's what war looks like in the 21st century, we have little to fear. Similar attacks against Georgia, which accompanied an actual Russian invasion, were also probably the responsibility of citizen activists or organized crime. A series of power blackouts in Brazil was caused by criminal extortionists -- or was it sooty insulators? China is engaging in espionage, not war, in cyberspace. And so on. One problem is that there's no clear definition of "cyberwar." What does it look like? How does it start? When is it over? Even cybersecurity experts don't know the answers to these questions, and it's dangerous to broadly apply the term "war" unless we know a war is going on. Yet recent news articles have claimed that China declared cyberwar on Google, that Germany attacked China, and that a group of young hackers declared cyberwar on Australia. (Yes, cyberwar is so easy that even kids can do it.) Clearly we're not talking about real war here, but a rhetorical war: like the war on terror. We have a variety of institutions that can defend us when attacked: the police, the military, the Department of Homeland Security, various commercial products and services, and our own personal or corporate lawyers. The legal framework for any particular attack depends on two things: the attacker and the motive. Those are precisely the two things you don't know when you're being attacked on the Internet. We saw this on July 4 last year, when U.S. and South Korean websites were attacked by unknown perpetrators from North Korea.Korea -- or perhaps England. Or was it Florida?

(Gib, "The Many Shades of Project Grey Goose," RSA Conference)

As I noted in my previous post about a recent 60 Minutes segment, we often rely on rumor and innuendo as the basis for journalism in critical infrastructure. If a current or former high-ranking public official says he heard something, then it must be true. Unfortunately, Project Grey Goose, whose stated objective was "to answer the question of whether there has been any successful hacker attacks against the power grid, both domestically and internationally," falls victim to much of the same fear, uncertainty, and doubt. As in all media reports, there are factual bases for findings that **exaggerated the true state of the electric grid.** For example, their statement that "90% of the U.S. Department of Defense's (DOD) most critical assets are entirely dependent on the bulk power grid" is presumably taken from a Government Accountability Office (GAO) report noting that 85 percent of critical DoD assets rely on commercial electric power. However, the "entirely dependent" statement **ignores the wide variety of backup generators that support these assets**, and while not adequate, are nonetheless **a significant contribution to the reliability of critical DoD assets.** So rather than sounding the alarm that military bases, for the most part, do not have their own power plants, a better response would have been to suggest that the military expand the use of backup generators and micro-grid technology to augment commercial power as the GAO report does. Of course, that would not grab as many headlines.

Similarly, the Grey Goose Report note that "[m]ost Grid asset owners and operators have been historically resistant to report cyber attacks against their networks as well as make the necessary investments to upgrade and secure their networks." While it may be true that incidents are underreported, the implication that the electricity industry is deficient compared to other industrial sectors is misleading or even wrong. Most companies do not report security incidents unless legally required to or to mitigate the harm to their customers, and even then the evidence of an intrusion and theft of data had better be definitive. Lost laptops and backup tapes are one thing. You cannot say they are within your control if they go missing. However, organizations in general have a horrible record of even detecting when a successful attack has occurred let alone what was taken. Like many industries, the electricity industry has struggled to pinpoint the source of many disruptions associated with their network infrastructure. More often than not, the problems were inadvertent and not malicious. We can certainly do better, and with technologies like Smart Grid, we have to. However, calling out the electricity industry for failures that we've all been subjected to is not very productive.

The other statements made about the vulnerabilities in the electricity sector are misleading. While North American Electric Reliability Corporation Critical Infrastructure Protection (NERC CIP) still does not apply to many aspects of the electrical grid for a variety of jurisdictional reasons, where it does apply, it is not voluntary, as the many utilities subjected to rigorous and painful audits can attest. The process may not be perfect, but utilities are being subjected to scrutiny. Moreover, anyone receiving stimulus grants under the Department of Energy's Smart Grid grant program has to demonstrate a very rigorous approach to cyber security through the entire implementation life cycle.

Finally, the report cites a litany of vulnerabilities discovered in various Smart Grid devices such as meters and perpetuates speculation about the potential impact on the grid without considering compensating security controls. Nowhere does the report cite names of vulnerable vendors nor does it provide any information about whether these vulnerable products have actually been implemented. It's like saying that tests on personal computers showed that they were vulnerable to attack without identifying the operating system or the applications running on the device.

Net Neutrality sets a global model for open internet – overwhelms the NSA scandal

Savov, writer @ The Verge, 2-6-15

(Vlad, "Thank you, America, for finally acting sane about the internet," http://www.theverge.com/2015/2/6/7992195/net-neutrality-and-american-leadership)

I recount this experience now — which will be familiar to countless nations around the world — because this week we finally have a chance to celebrate our global Americanization. On Wednesday, the US government did something right for a change — at this point, it's impressive when it does anything at all — **by deciding to wholeheartedly endorse net neutrality.** As egotistical as the USA can often seem, this decision is one with truly global implications. The Netherlands, Finland, and other countries may have stronger commitments to universal broadband access and net neutrality, but **they don't have the world's ear the way that the US does.** I don't believe that the US embracing net neutrality will automatically enforce the principle around the world, but I am confident that it couldn't get very far without American approval. The United States is deeply invested in setting the world's policy agenda, whether it be through legal means such as the copyright-enforcing Trans-Pacific Partnership (which is still being negotiated) or extra-legal ones as used to undermine the Castro regime in Cuba. Edward Snowden's revelations about the NSA and the Five Eyes spying network also show a country that's actively manipulating and exploiting the internet in destructive ways, forcing others like Brazil to consider breaking off from the global network. American control over the internet is deliberate and a recognition of **net neutrality by this hegemon can only be a good thing. NET NEUTRALITY REVERSES A TRACK RECORD OF THE USA SCREWING UP THE INTERNET** One of the all-time favorite sayings of British economists is that when America sneezes the whole world catches a cold. It's a cliché that was truer in the 1990s than it is today, with China steadily ascending in global economic importance, but it **remains valid when it comes to the internet**. The future of the internet is **shaped by decisions made in the United States**. While the policymakers on the east coast set the rules on how we access it, the tech industry clustered on the west coast determines what we do with it. The iPhone was proudly designed in California, and so were most of the apps and services through which we use the web on a daily basis. Twitter, Facebook, Google, Microsoft, and Amazon all have their headquarters on the western American coast, and it's in their boardrooms and idea labs that the next evolution of the web will take form.

Net Neutrality solves the internal link – it shows the US is committed to free and open internet which reverses old perceptions of our policy – overwhelms Snowden because it demonstrated a new commitment to openness – that's Savov, UN human right experts agree

The United States Federal Communications Commission's (FCC) decision to establish new regulations protecting so-called net n0eutrality, or the equal treatment of all Internet traffic, **is "a real victory" for freedom of expression and access to information, a United Nations human rights expert said today.** "I hope the new rules may serve as a model for other governments seeking to protect or expand an open and secure Internet," the Special Rapporteur on freedom of expression, David Kaye, explained in a news release. "It is especially important that the new rules prevent ISPs [internet service providers] from discriminating against some types of content in favour of others, either by slowing down delivery speeds or by creating a fast lane to ensure quicker delivery for only some content providers that have paid extra fees." With the FCC decision, the United States (US) joins a small number of countries – Brazil, Chile, and the Netherlands – that have adopted net neutrality rules in an effort to support "a free and open" Internet and ensure continued access to any lawful content individuals choose, "without **restriction or interference from ISPs.** In addition, the decision classifies broadband Internet as a **public utility**, permitting its regulation by the FCC similar to the way the agency regulates telephone service and other utilities.

No solvency – leadership in the public and private sector has to change to enhance US legitimacy

Walker, Executive Editor of the Government Publishing Group at FierceMarkets, 15

(Molly, "US leadership in the global Internet debate at risk, says former NSC cyber director," http://www.fiercegovernmentit.com/story/us-leadership-global-internet-debate-risk-says-former-nsc-cyber-director/2015-01-07)

While there's been a common **perception** that the United States has an outsized influence on Internet governance, many now want to see that change in light of ongoing leaks about widespread U.S. spying programs, according to a new paper. Such leaks have accelerated an international call to shift such governance to the United Nations, International Telecommunication Union, or other similar organization, says the paper (pdf) by Melissa Hathaway, the former cyber director of the National Security Council. She is now a senior advisor at Harvard Kennedy School's Belfer Center for Science and International Affairs. Additionally, some countries believe the United States, through the California-based Internet Corporation for Assigned Names and Numbers, is unfairly controlling the Domain Name System, which tracks Internet names and addresses, and argue for an alternative, more regional or local system of Internet governance. For the United States to maintain its influential position, Hathaway writes that it must develop and deliver "a new message focused on economic competitiveness and business opportunity that respects the rights of individuals in their liberty, thoughts, and possessions." To further stem such calls for change, she adds it will take more than new rhetoric that portrays U.S. Internet policies as legitimate, fair and transparent. **It may require new people. "Without a new cadre of leaders – both in the government and in the private sector** – it will be very difficult for the United States to engage around the globe without

being **perceived as colonialist or paternalistic," writes Hathaway.** The United States also should also try to create a common vision of how the Internet and its infrastructure should operate in an effort to unify governments.

US – China conflict over internet liberalization is inevitable – thumps all of their balkanization arguments

Creemers, Research Officer in Policy @ Oxford, 15

(Rogier, "Disarming the Great Canon," http://foreignpolicy.com/2015/04/10/great-cannon-china-internet-cyber-attack-baidu/)

China, long known to block undesired online information with an electronic barrier known as the Great Firewall, may now have added to its censorship arsenal **a powerful new cudgel.** Researchers in the United States and Canada **have traced a March cyberattack to a new tool they have dubbed the "Great Cannon,"** apparently utilized by Chinese government authorities to manipulate and redirect foreign web traffic, and in the future perhaps even to expand online surveillance capabilities. Yet while Chinese authorities maintain that such censorship is justified by legitimate national security imperatives, the United States **holds that it severely undermines the integrity of the global Internet. The two conflicting positions present a serious challenge to multilateral Internet governance and the future security of the global Internet.** In late March, a sustained denial of service attack targeted GreatFire.org, a U.S.-based non-governmental organization that seeks to analyze and circumvent the Great Firewall, and its section on the open-source code platform GitHub. The attack, attributed to China's Internet authorities, took place through the insertion of malicious code—which researchers now believe was accomplished using the Great Cannon–into analytics code of Baidu, China's largest search engine. As a result, traffic from all computers accessing websites in which this code was embedded, was redirected towards these websites, drastically slowing service. According to Jason Ng, a fellow at The Citizen Lab at the University of Toronto, both sides have sought to leverage the many passive, apolitical users of the Internet. GitHub is a platform used by many Chinese programmers, and so taking it down would cause a domestic backlash. GreatFire's use of this platform is, in Ng's words in an April 1 ChinaFile Conversation, a "high-stakes dare." The attackers, on the other hand, relied on the substantive quantities of ordinary netizens who, in their daily web use, were unaware of the presence of Baidu's analytics code, let alone its use in the cyberattack. These facts elicit complex questions about public-private relations in cyberspace, in particular with regard to the definition of online security and aggression. In the worst case, they might herald a medieval escalation into continuous wrangling between anyone who can muster enough mercenary forces (and with no guarantee that those mercenaries are actually aware of what is happening). At the heart of this attack lie two fundamentally conflicting views of legitimate governance and security in cyberspace. From the Chinese point of view, the Great Firewall is a critical piece of national security infrastructure that protects against relentless attempts by "foreign hostile powers" to undermine the stability of the regime. The avowed mission of GreatFire.org to unblock censored websites is, in that sense**, an act of sabotage that impinges on China's sovereign right of self-determination.** From the Western point of view, GreatFire.org, which not only monitors censorship trends on the Chinese Internet, but also seeks to unblock censored information, is a courageous defender of the online rights and liberties of China's citizens, as well as of the integrity of the global Internet. From this angle, China's tactics undermine trust in Chinese businesses and regulators and risk the balkanization of the web. **Both positions are self-serving.** One might argue that the U.S. cyber practices revealed in the Snowden revelations did as much to endanger network integrity as any attack from the Chinese side. If the argument is about human rights, the treatment of whistleblowers such as Chelsea Manning and Edward Snowden, or more broadly America's continued pursuit of what has been called extrajudicial murder, provide easy ammunition to allege hypocrisy. For its part, the Chinese side often overlooks the fact that its astonishing economic success owes more than a little to the willingness of other states to accommodate China in the global trading system, often at significant domestic cost. In any case, **these arguments can only lead to a prolonged, unproductive shouting match**. We are already seeing an escalation of threats in cyberspace, including the sanctions targeting foreign hackers President Obama announced a few days ago. If this status quo is undesirable, a deal is necessary. This deal can either be made relatively quickly, or after a prolonged period of strife and recriminations that merely allow for more harm to be inflicted, without shifting the goalposts. In other words, it is time for a bit of realpolitik. The ingredients of an agreement are

relatively simple: defining the nature of online threats to security, defining the role of various parties, including governments, corporations, and individual citizens in maintaining security, as well as liability for alleged aggression, and defining protocols for the attribution of cyberattacks. But such **a deal would be very difficult to sell internally** in either country: it is a characteristic of many governments, and particularly security services, to want others to be bound to rules that they themselves can disregard. Crucially, **mutual trust is non-existent at the moment.** But we are not discussing a typical state-to-state issue. Privately owned online giants, from Apple to Google to Chinese companies like Tencent and Baidu, **wield power in the information space that rivals that of national governments**. And it's also possible for a very small number of individuals with no corporate affiliation to inflict significant damage through the network. The power of these private actors greatly complicates notions of security and aggression. It would be relatively easy to formulate standards for what constitutes inter-state aggression online; international law on conflicts already provides enough handholds in this respect. But civilian acts present a more difficult challenge. If we recognize that all states have legitimate security concerns, a series of difficult choices presents itself: either states need to agree on a mutually recognized list of such concerns, or each state gets to do that for themselves. If the latter is the case, what should the government of country X do when a private party located in that country launches an attack against country Y? If country X does nothing, would it then be legitimate for country Y to retaliate against said private party?

Competitiveness

Competitive Now – 1NC

US internet is competitive now and the plan doesn't address structural alt causes

Layton '13

Roslyn Layton is a PhD fellow in internet economics at Center for Communication, Media and Information Technologies at Aalborg University in Denmark, "America's Broadband Service Is Not Falling Behind," http://www.american.com/archive/2013/february/americas-broadband-service-is-not-falling-behind

A new report from the Washington-based Information Technology and Innovation Foundation (ITIF) provides an excellent review of major broadband studies from the Organization for Economic Cooperation and Development (OECD), the Federal Communications Commission (FCC), Akamai, and others. Each study has a unique focus and methodology, and it is easy to confuse measures such as deployment (the geographic reach of broadband networks) with adoption (the number of users who subscribe). There is no doubt that one could cherry-pick a data point to say the United States is failing, but taking into account the whole picture that the studies provide, the conclusion is clear: the United States is doing well in broadband. End-user prices may be cheaper in some countries, but prices don't tell the whole story. The real cost of broadband may be borne by taxpayers through subsidies or other factors such as South Korean landlords required to upgrade their apartment buildings. Population density drives lower prices for broadband. It takes more equipment, and hence more money, to wire the United States, a largely suburban nation with many single-family homes. Japan, South Korea, and the Netherlands, on the other hand, are much more densely populated, and in Denmark, the population is concentrated in the major cities. But before you pack up and move abroad, keep in mind that people in these countries pay more for gasoline and consumer products than do Americans. Some critics call the American market uncompetitive, but American carriers fight fiercely for customers. A look at the FCC's National Broadband Plan website shows that there are four or more competitors in many markets. But competition is not necessarily driven by the number of players; it's driven by the technology. Where I live in Denmark, the wireline incumbent controls more than 50 percent of that market, but there are still low prices. This is because mobile operators are in a race to upgrade their infrastructure, so the incumbent keeps prices down so its DSL customers won't flock to mobile. Indeed, the United States is rated third in the OECD for intercarrier competition between cable and DSL (behind Belgium and the Netherlands). The ITIF also notes that the United States has the OECD's second-lowest price for entry-level broadband; what you pay scales with what you consume. For some time, adoption of broadband in the United States was hindered by people not having a computer. With the prices for mobile devices falling (half of all Americans owned a smartphone in 2012) coupled with the world's biggest rollout of 4G/LTE, lower-income Americans increasingly purchase broadband. We are reinventing the Internet with mobile while wired networks continue to innovate. In Denmark in 2000, no fewer than 14 local utility cooperatives attempted to create their own fiber networks, arguing that there is little difference between bringing fiber or electricity to homes. They estimated that once one is in the business of providing electricity, the transition can easily be made to providing another pipe service: broadband. Their business case never

worked because the price of broadband on other networks plummeted. Today, fewer than 200,000 Danish homes subscribe to these fiber networks, a number that's small even for Denmark. The Norwegian Centre for Integrated Care and Telemedicine, the world's leading institute for telemedicine, notes that most applications run fine on average broadband levels (for example, video consultation), and even the most advanced app would require no more than 10 megabits per second (Mbps). Indeed the limiting factor for telemedicine is not broadband but rather health care providers who are resistant to change.1 This finding echoes the U.S. Chamber of Commerce study of broadband in schools, which found that many American schools have the requisite level of broadband, **but the bottleneck is teachers who are not up to speed on technology**. Thus, public funds may be better spent on digital literacy and teacher training than on fiber. To be sure, the country with the fastest broadband speeds has bragging rights. Making a broadband target of 100 Mbps or greater is politically expedient, but not necessarily meaningful. It's not the speed that matters, but what you do with it. In South Korea, which has the world's fastest speed of 45 Mbps, the primary uses of broadband by far are still entertainment for consumers and video conferencing for businesses. While broadband has enabled productivity in many industries and supported a marginal "Gangnam Style" entertainment economy, make no mistake: the real money in South Korea's economy still comes from electronics, automobiles, shipbuilding, semiconductors, steel, and chemicals — the same growth engines from the pre-broadband days. Ditto for Japan and Sweden. The United States, however, has diversified its economy because of broadband, and boasts the world's largest internet companies and innovation economy. This was achieved with massive but wise investment in multiple wireline and wireless broadband networks, and shows that we get bang for our broadband buck. In South Korea the national broadband project has not yielded the jobs that were expected. Broadband has enabled entertainment but not employment. A new report by the Korea Information Society Development Institute, "A Study on the Impact of New ICT Service and Technology on Employment," bemoans the situation of "jobless growth." The government is also concerned about internet addiction, which afflicts some 10 percent of the country's children aged between 10 and 19, who essentially function only for online gaming but not in other areas of society. In crafting broadband policy, European Commission Vice President Neelie Kroes is looking not at Sweden or South Korea, but the United States, where she notes "high speed networks now pass more than 80 percent of homes; a figure that quadrupled in three years." Furthermore, she advocates private along with public investment to achieve broadband goals. It is no small accomplishment that some $250 billion of private investment funded American broadband between 2008 and 2011, and that investment continues today. In the last few years, American telecom firms bought more fiber than all of Europe combined. It's easy to think that the grass is greener abroad, but when it comes to broadband being delivered efficiently, there's no place like home.

Zero Sum – 1NC

Internet innovation is not zero sum

Paul '10

Fredric, Editor in Chief, Enterprise Efficiency, "Does Innovation Have to Be a Zero-Sum Game?," 9/23/10, http://www.enterpriseefficiency.com/author.asp?section_id=898&doc_id=197418

The latest EnterpriseEfficiency.com poll confirms that IT leaders are worried about the United States losing its lead in IT innovation. But even if the trend is real, is it really a problem? The results of the poll are unmistakable. When asked to describe the nation's position in the information technology industry, two thirds of respondents called the country "A strong player, but one that is losing its lead." Another 12 percent dissed America as "A former leader whose best days are behind it." Only 22 percent confidently believed the United States is "A global leader that will maintain its influence." Those results roughly mirror the results of a major InformationWeek Analytics report -- "Innovation Mandate" -- as well as the instant poll we ran during a recent EnterpriseEfficiency.com Webcast -- "The Future of Innovation – 5 Critical Factors." OK, I get it. We're all worried that other countries are catching up with the United States in technology innovation. But here's the thing. What if this isn't really a zero-sum competition? Even as the US sees its leadership position erode, that doesn't necessarily mean that innovation is slowing down here. It could just as likely mean that other countries are finally getting their economic and technological acts together and beginning to catch up. If you ask me, that's inevitable, and it's actually a good thing. The entire world is a better place when innovation occurs everywhere, not just in a few places. In today's interconnected world, we

all share in the fruits of innovation, no matter where it occurs. The more innovation, the better. Now, that doesn't mean the United States doesn't have innovation issues, or that we don't need to continue to work both harder and smarter. I just don't believe that the idea of "leadership" is the most helpful way to think about this issue. In fact, innovation builds upon itself, and a breakthrough in China may be followed by a process improvement in Eastern Europe and a commercialization idea in Silicon Valley, with manufacturing happening in Vietnam. Everyone plays a part, and -- hopefully -- everyone benefits. On the other hand, if all the innovation comes from one place, how is the rest of the world supposed to earn enough cash to pay for what gets created? Bottom line: If the United States is falling behind in innovation because we're doing a bad job, then we're definitely in trouble. But if the real situation is simply that the rest of the world is catching up, that's a classic example of how to bake a bigger pie.

Innovation Not Key – 1NC

Innovation isn't key – military developments are inevitable and they're being more efficient.

Sargent, 2013 Anne-Wainscott, forbes citing NSR senior analyst, "Military Bets: Balancing Bandwidth Needs with Increased Efficiency" http://www.satellitetoday.com/publications/2013/11/19/military-betsbalancing-bandwidth-needs-with-increased-efficiency/

"We're focused on how we can be **more efficient with our bandwidth**, how we compress data **more efficiently,** and how we can get access to places that have less-than-adequate infrastructure," says Bruce Bennett, program executive officer for DISA, who oversees the bulk of DoD's strategic satcom transport infrastructure for warfighters. With fewer eyes on the ground, the military will deploy increasingly more sensors. That is especially true as the U.S. military pivots towards Asia, a far-flown geography six times the size of Europe, and two and a half the expanse of North America. Having a mix of space and terrestrial, access and flexibility are key. "I don't care if you give me another 10 WGSs, it would be doubtful that we could cover all the scenarios in the Pacific," says Bennett. He adds that fewer ground forces and the sheer size of the Asia landscape will increase the government's need to partner with commercial operators. Assessing the Asia region, **NSR senior analyst Claude Rousseau doesn't believe the bandwidth concerns are as dire as some think**, considering the number of Ka-band systems coming online in the next few years. NSR reports that from 2012 to 2022, the global government and military satellite communications **market will grow from 632,000 in-service units to close to 1.1 million by the end of 2021**."There are going to be a lot more sensors on airplanes and UAVs, which will make it much easier for anyone in the region to scan and see who is out there," he notes. Miguel Angel Garcia Primo, chief operating officer of Spanish government satellite operator, HisdeSat, says there has alredy been an increase of activity. "We're seeing more requests for providing connectivity to mobile platforms, be it land, sea or aircraft, and the need to use smaller and smaller terminals with higher and higher data rates," he says. Greater Commercial Collaboration At least one global operator, Astrium Services, personifies the power of a public-private partnership (PPP) model. For the last nine years, the company has operated first the Skynet 4 and then the hardened Skynet 5 constellation for the U.K. Ministry of Defense, an approach that Simon Kershaw, executive director, government communications, Astrium Services, contends has enabled his company to better anticipate and respond to the U.K. military's changing requirements. "The PPP model can often work very well for that because we are able to move much faster or anticipate more than the institutions themselves can. We're able to be very nimble, very flexible and be in front when we see a requirement," says Kershaw. "We're seeing much more rapid deployments around the world," he adds, noting that when something happens in a region, it requires a quick response – one that embodies flexibility. In addition, operators need a complete picture of the situation, which underscores the need for integrating UAV imagery with other sources such as telemetry and communications on the ground. **Multi-band, Smaller Terminals on the Rise** As the demand for bandwidth to support high-definition sensors grows, satellite operators and terminal manufacturers alike are achieving **much greater throughput using much smaller systems.** More rugged, lightweight, high bandwidth satcom on the move can be found in terminals such as Astrium's SCOT Patrol terminals being deployed on six U.K. Royal Navy ships over the next five years, and their smaller airborne equivalent, AIR Patrol, flying with the

Canadian Department of National Defense. “It uses the world’s first three-Axis carbon fiber antenna – the lightness of it makes it an easy fit for a small vessel,” explains Kershaw.

Joseph, former Dean of the Harvard Kennedy School of Government, The Regime Complex for Managing Global Cyber Activities, May 2014
http://dash.harvard.edu/bitstream/handle/1/12308565/Nye-GlobalCommission.pdf

Some analysts reinforce their pessimistic projections by pointing to realist theories about the decline of US hegemony over the Internet, In its early days, the Internet was largely American, but today, China has twice as many users as the United States. Where once only roman characters were used on the internet and HTML tags were based on abbreviated English words, now there are generic top-level domain names in Chinese, Arabic and Cyrillic scripts, with more alphabets expected to come online shortly (ICANN 2013). And in 2014, the United States announced that it would relax its Department of Commerce's supervision of ICANN and the IANA function. Some experts worried that this would open the way for authoritarian states to try to exert control over the system of root zone servers, and use that to censor the addresses of opponents. Such fears seem exaggerated both on technical grounds and in their underlying premises. Not only would such censorship be difficult, but, as liberal institutionalist theories point out, there are self-interested grounds for states to avoid such fragmentation of the Internet, In addition, the descriptions in the decline in US power in the cyber regime are overstated. Not only does the United States remain the second-largest user of the Internet, but it is also the home of eight of the 10 largest global information companies (Statista 2013).5 Moreover, when one looks at the composition of voluntary multi- stakeholder communities such as the IETF, one sees a disproportionate number of Americans participating for path dependent and technical expertise reasons. From an institutionalist or constructivist viewpoint, the loosening of US influence over ICANN could be seen as a strategy for strengthening the institution and reinforcing the American multi-stakeholder philosophy rather than as a sign of defeat (Zittrain 2014).

2NC Internet Impact D—No Balkanization

“Balkanization” is inaccurate - their impact claims are media-driven confusion

Tim **Maurer and** Robert **Morgus** 2-19-**2014**; Tim Maurer focuses on international affairs and Internet policy at the New America Foundation's Open Technology Institute. Robert Morgus is a researcher at New America's Open Technology Institute.Stop Calling Decentralization of the Internet "Balkanization" http://www.slate.com/blogs/future_tense/2014/02/19/stop_calling_decentralization_of_the_internet_balkanization.html

It's the end of the Internet. That was the headline of the prominent Swiss newspaper NZZ on Feb. 9. And Tim Berners-Lee, the creator of the World Wide Web, recently called for a re-decentralization, declaring, "I want a Web that's open, works internationally, works as well as possible, and is not nation-based." These are the latest voices in the growing chorus over the "balkanization" of the Internet and the emergence of "splinternets"—networks that are walled off from the rest of the Web. This is an important debate, one that will affect the future of the Internet. And with a major global conference on this topic taking place in Brazil in April and the World Summit on the Information Society +10 scheduled for 2015, it is high time to bring more clarity and nuance to it.Unfortunately, the term balkanization itself creates problems. Depending on whom you ask, balkanization can be a positive or negative process. For some, the term represents a move toward freedom from oppression. For others, it is a reminder of centuries of **bloody struggle** to hold together a region that ultimately ended in **violent** fragmentation**,** which makes use of the word **offensive** to some. **Fragmentation** of the Internet is the term we'll use, but maybe a creative mind somewhere will find a better, more evocative way to describe it. The question is: What does fragmentation mean, exactly? Is it the end of the Internet if domain names can no longer only be written using the Roman alphabet? If so, **the Internet ended in 2009**, when ICANN approved alternative alphabet domain names. Is it fragmentation if people around the world using Weibo and Yandex in lieu of Google and Twitter? Or is it data localization and national routing – subjecting data transfers to national boundaries? This debate is a **lot more complex** than most headlines suggest. The Internet is more than Facebook and it is more than the Web itself—more than the content people access every day. However, popular discussion tends to lump these various dimensions together. It obscures the fragmentation efforts that truly undermine the openness and interoperability of the network.

1NC Internet Impact D—Doesn't Solve War

Internet doesn't solve conflict

Elias, 2012 Phillip Elias, board member of the New Media Foundation, 20 January 2012, "Will humanity perish without the internet?," http://www.mercatornet.com/articles/view/will_humanity_perish_without_the_internet

The new Encyclopaedists make the opposite mistake about the future. Inherent in their worldview is the idea that setting up a system where information can be shared quickly, widely, and freely will somehow eliminate corruption, greed and violence from the world. It is almost as though human foibles were glitches in the software of society. But **human vices can never be reduced to social viruses**. They come from deep within us and can find their way **into the most scientific settings**. Do Wikipedians think themselves immune from the temptation to wield their power towards their own ends? Free access to information for everyone could be said to be the Wikipedian creed. It encapsulates the Enlightenment values of liberty and equality. But, like the French terror of the 1790s, it neglects that other ideal needed to give them gumption -- a genuine concern for other human beings. But fraternité is not achieved by giving everyone more information, more freedom and more equality. And it is what is so often lacking on the internet, on blogs, and in other forms of web communication. **Online interaction is so often vitriolic it is unreadable**, and it is at its worst **when the tech-savvy confront each other**. I have seen very few geeks who try to love their enemies. Fraternité comes from empathising with others. This is difficult to learn online. But without it, how can we understand the point of view of those who have different

concepts of freedom or equality, or of troglodytes who don't blog, or of nematodes **who don't have access to the internet**. Believe it or not, there is a life offline and wisdom is wider than the web.

2NC Internet Impact D—Doesn't Solve War

Suitcase internet disproves the "only a risk we solve" logic

Glanz, 2011 (James, New York Times, "U.S. Underwrites Internet Detour Around Censors" 6/12, http://www.nytimes.com/2011/06/12/world/12internet.html?pagewanted=all&_r=0)

The Obama administration **is leading a global effort** to deploy "shadow" Internet and mobile phone systems that dissidents can use to undermine repressive governments that seek to silence them by censoring or shutting down telecommunications networks. The effort includes secretive projects to create independent cellphone networks inside foreign countries, as well as one operation out of a spy novel in a fifth-floor shop on L Street in Washington, where a group of young entrepreneurs who look as if they could be in a garage band are fitting deceptively innocent-looking hardware into a prototype "Internet in a suitcase." Financed with a $2 million State Department grant, the suitcase could be secreted across a border and quickly set up to allow wireless communication over a wide area with a link to the global Internet. The American effort, revealed in dozens of interviews, planning documents and classified diplomatic cables obtained by The New York Times, ranges in scale, cost and sophistication. Some projects involve technology that the United States is developing; others pull together tools that have already been created by hackers in a so-called liberation-technology movement sweeping the globe. The State Department, for example, is financing the creation of stealth wireless networks that would enable activists to communicate outside the reach of governments in countries like Iran, Syria and Libya, according to participants in the projects.

Failed States D

1NC Failed States D—No Impact

No impact to failed states – they aren't a security threat and there is no incentive for massive intervention

Patrick 11 – Stewart M., Senior Fellow and Director of the International Institutions and Global Governance Program, "Why Failed States Shouldn't Be Our Biggest National Security Fear" http://www.cfr.org/fragile-or-failed-states/why-failed-states-shouldnt-our-biggest-national-security-fear/p24689

Failed states have become the bogeyman of the international order, the nightmare that inspires our national security doctrines and keeps our top officials up at night. It began with Sept. 11, 2001. Al-Qaeda's ability to launch the attacks from one of the world's most wretched and poverty-stricken lands — Afghanistan — persuaded the foreign policy establishment that "America is now threatened less by conquering states than we are by failing ones," as President George W. Bush's 2002 national security strategy put it. In the Obama administration, the fear endures. "In the decades to come, the most lethal threats to the United States' safety and security — a city poisoned or reduced to rubble by a terrorist attack — are likely to emanate from states that cannot adequately govern themselves or secure their own territory," Defense Secretary Robert Gates explained last May. "Dealing with such

fractured or failing states is . . . the main security challenge of our time." And just last month, Secretary of State Hillary Rodham Clinton said military intervention in Libya was justified to prevent that country from becoming "a giant Somalia." The message is clear: Failed states are the weak link in the world's collective security. In truth, while failed states may be worthy of America's attention on **humanitarian** and development grounds, most of them are **irrelevant to U.S. national security**. The risks they pose are mainly to their own inhabitants. Sweeping claims to the contrary are not only **inaccurate** but **distracting** and **unhelpful**, providing little guidance to policymakers seeking to prioritize scarce attention and resources. In 2008, I collaborated with Brookings Institution senior fellow Susan E. Rice, now President Obama's permanent representative to the United Nations, on an index of state weakness in developing countries. The study ranked all 141 developing nations on 20 indicators of state strength, such as the government's ability to provide basic services. More recently, I've examined whether these rankings reveal anything about each nation's role in major global threats: transnational terrorism, proliferation of **w**eapons of **m**ass **d**estruction, international crime and infectious disease. The findings are startlingly clear. **Only a handful of the world's failed states pose security concerns** to the United States. Far greater dangers emerge from stronger developing countries that may suffer from corruption and lack of government accountability but come nowhere near qualifying as failed states. The link between failed states and transnational terrorism, for instance, **is tenuous**. Al-Qaeda franchises are concentrated in South Asia, North Africa, the Middle East and Southeast Asia but are **markedly absent in most failed states,** including in sub-Saharan Africa. Why? From a terrorist's perspective, the notion of finding haven in a failed state is an **oxymoron**. Al-Qaeda discovered this in the 1990s when seeking a foothold in anarchic Somalia. In intercepted cables, operatives bemoaned the insuperable difficulties of working under chaos, given their need for security and for access to the global financial and communications infrastructure. Al-Qaeda has generally found it easier to maneuver in **corrupt but functional states**, such as Kenya, where sovereignty provides some protection from outside interdiction. Pakistan and Yemen became sanctuaries for terrorism not only because they are weak but because their governments lack the will to launch sustained counterterrorism operations against militants whom they value for other purposes. Terrorists also need support from local power brokers and populations. Along the Afghanistan-Pakistan border, al-Qaeda finds succor in the Pashtun code of pashtunwali, which requires hospitality to strangers, and in the severe brand of Sunni Islam practiced locally. Likewise in Yemen, al-Qaeda in the Arabian Peninsula has found sympathetic tribal hosts who have long welcomed mujaheddin back from jihadist struggles. Al-Qaeda has met less success in northern Africa's Sahel region, where a moderate, Sufi version of Islam dominates. But as the organization evolves from a centrally directed network to a diffuse movement with autonomous cells in dozens of countries, it is as likely to find haven in the banlieues of Paris or high-rises of Minneapolis as in remote Pakistani valleys. What about failed states and **w**eapons of **m**ass **d**estruction? Many U.S. analysts worry that poorly governed countries will pursue nuclear, biological, chemical or radiological weapons; be unable to control existing weapons; or decide to share WMD materials. **These fears are misplaced**. With two notable exceptions — North Korea and Pakistan — the world's weakest states pose minimal proliferation risks, since they have limited stocks of fissile or other WMD material and are unlikely to pursue them. Far more threatening are capable countries (say, Iran and Syria) intent on pursuing WMD, corrupt nations (such as Russia) that possess loosely secured nuclear arsenals and poorly policed nations (try Georgia) through which proliferators can smuggle illicit materials or weapons. When it comes to crime, the story is more complex. Failed states do dominate production of some narcotics: Afghanistan cultivates the lion's share of global opium, and war-torn Colombia rules coca production. The tiny African failed state of Guinea-Bissau has become a transshipment point for cocaine bound for Europe. (At one point, the contraband transiting through the country each month was equal to the nation's gross domestic product.) And Somalia, of course, has seen an explosion of maritime piracy. Yet failed states have little or no connection with other categories of transnational crime, from human trafficking to money laundering, intellectual property theft, cyber-crime or counterfeiting of manufactured goods. Criminal networks typically prefer operating in functional countries that provide baseline political order as well as opportunities to corrupt authorities. They also accept higher risks to work in nations straddling major commercial routes. Thus narco-trafficking has exploded in Mexico, which has far stronger institutions than many developing nations but borders the United States. South Africa presents its own advantages. It is a country where "the first and the developing worlds exist side by side," author Misha Glenny writes. "The first world provides good roads, 728 airports . . . the largest cargo port in Africa, and an efficient banking system. . . . The developing world accounts for the low tax revenue, overstretched social services, high levels of corruption throughout the administration, and 7,600 kilometers of land and sea borders that have more holes than a second-hand dartboard." Weak and failing African states, such as Niger, simply cannot compete. Nor do failed states pose the greatest threats of pandemic disease. Over the past decade, outbreaks of SARS, avian influenza and swine flu have raised the specter that fast-moving pandemics could kill tens of millions worldwide. Failed states, in this regard, might seem easy incubators of deadly viruses. In fact, recent fast-onset pandemics have bypassed most failed states, which are relatively isolated from the global trade and transportation links needed to spread disease rapidly. Certainly, the world's weakest states — particularly in sub-Saharan Africa — suffer disproportionately from disease, with infection rates higher than in the rest of the world. **But their**

principal health challenges are endemic diseases with local effects, such as malaria, measles and tuberculosis. While U.S. national security officials and Hollywood screenwriters obsess over the gruesome Ebola and Marburg viruses, outbreaks of these hemorrhagic fevers are rare and self-contained. I do not counsel complacency. The world's richest nations have a moral obligation to bolster health systems in Africa, as the Obama administration is doing through its Global Health Initiative. And they have a duty to ameliorate the challenges posed by HIV/AIDS, which continues to ravage many of the world's weakest states. But poor performance by developing countries in preventing, detecting and responding to infectious disease is often shaped less by budgetary and infrastructure constraints than by conscious decisions by unaccountable or unresponsive regimes. Such deliberate inaction has occurred not only in the world's weakest states but also in stronger developing countries, even in promising democracies. The list is long. It includes Nigeria's feckless response to a 2003-05 polio epidemic, China's lack of candor about the 2003 SARS outbreak, Indonesia's obstructionist attitude to addressing bird flu in 2008 and South Africa's denial for many years about the causes of HIV/AIDS. Unfortunately, misperceptions about the dangers of failed states have transformed budgets and bureaucracies. U.S. intelligence agencies are mapping the world's "ungoverned spaces." The Pentagon has turned its regional Combatant Commands into platforms to head off state failure and address its spillover effects. The new Quadrennial Diplomacy and Development Review completed by the State Department and the U.S. Agency for International Development depicts fragile and conflict-riddled states as epicenters of terrorism, proliferation, crime and disease. Yet such preoccupations reflect **more hype than analysis**. U.S. national security officials would be better served — and would serve all of us better — if they turned their strategic lens toward stronger developing countries, from which transnational threats are more likely to emanate.

AT: China Scenario—No Isolation

Internet censorship doesn't isolate China

Dewey 2013

Caitlin, runs The Intersect blog, writing about digital and Internet culture at the Washington Post, Study: China's 'Great Firewall' may not actually isolate Internet users, http://www.washingtonpost.com/blogs/worldviews/wp/2013/05/29/study-chinas-great-firewall-may-not-actually-isolate-internet-users/

Everyone from Hillary Clinton to Amnesty International has bashed China's "Great Firewall" as an impediment to free speech and democracy. That's what makes a new study out of Northwestern University both odd and intriguing: According to its authors, media researchers Harsh Taneja and Angela Xiao Wu, Chinese censorship actually has little impact on what people there read online, and Chinese Internet users aren't particularly isolated, even vis-a-vis users in countries with unrestricted access. What's more, they essentially argue, the Internet isn't that grand, global community that connects and equalizes everyone. Instead, users self-select the cultural communities and content they're most comfortable with -- rather like real life. Claims that firewalls like China's isolate users, they write, "are based on an assumption that Internet users would use all websites if given access. On the contrary, a large body of research on global cultural consumption shows that audiences prefer products that are closer to their culture, even when they have access to products from abroad." But let's step back for a moment and consider the methodology behind these surprising findings. Taneja and Wu came to their conclusions by analyzing data from the Internet's 1,000 most popular Web sites, according to traffic data from ComScore. Using this data, they looked for Web sites with audiences that overlapped more than was typical: Sina Weibo and Renren, the Chinese Twitter and Facebook equivalents, would be expected to overlap, for instance. English-language versions of those social networks would presumably overlap, as well. Those overlaps gradually surfaced a number of interconnected clusters, each corresponding to a corner of the Internet most popular among a certain group. The researchers call these clusters "culturally defined markets," or CDMs, and conclude that they generally correspond to languages or geographic areas. Nothing to this point should seem surprising; after all, the Internet is a big place, and plenty of researchers have demonstrated already that surfing habits vary based on what language you speak and where you

live. (You'll remember this map of which countries tend to e-mail each other most, which found -- surprise! -- that countries with cultural or geographic similarities often had the most to send.) The unusual part of this study is that, when Taneja and Wu went on to measure the isolation of each CDM, they found that China was no more isolated than any other group. In fact, the opposite was true -- despite the state's blocking of certain popular foreign Web sites, including social networks and media sites like NYTimes.com, Chinese users were more connected to the greater Internet than people in Turkey, Vietnam, Italy and Poland. The researchers conclude, essentially, that even if they could access these sites, few Chinese would choose to; that, in other words, "rather than assuming that people use indiscriminatingly [sic] all the websites they have access to, we believe that they mainly prefer culturally proximate websites on the global Internet" -- i.e., Renren and Weibo to the blocked Facebook and Twitter. The conclusion is a bit of a bombshell, given popular wisdom on the Great Firewall (and the great myth of the Internet as a borderless, democratizing utopia). At times, the authors seem a little too forgiving -- even glib -- about the state of Chinese censorship. At one point, for instance, they argue that "only a small number of foreign sites are blocked," when their own research found that one of every 10 sites they tested was not available in China. And their attempts to reduce the Great Firewall to mere politics on the part of pesky Americans seems to underestimate the principle of the thing -- the idea that Chinese users should have the choice to access the greater web, even if they (like us) would usually choose to access local sites. Still, Taneja and Wu make a compelling point that state censorship of messages within the Chinese Internet, such as government filtering on Weibo, could ultimately impact freedom of speech far more than the highly-hyped content blocking. Basically, Chinese Internet users would be more likely to encounter that material, so its absence is more conspicuous. Considering the volume of Chinese censorship, it would be conspicuous anyway: A recent study found the government takes down 12 percent of all messages sent on Weibo, with an eye for political subjects. "Compared to removing the [Great Firewall] of China, on which most policy, popular, and scholarly discourse tends to concentrate, battling against content censorship over domestic websites may bring about much more substantial changes in what Chinese people make use of on the Internet," they write. But it may be harder for outside advocates to fight that battle between China and Chinese Web sites -- particularly since Chinese Internet users don't really seem to mind. A poll by the Pew Internet & American Life Project found that more than 80 percent of Chinese users think the Internet should be censored, and that the government should be the one to do it.

Jing Yuechen, the founder of an Internet start-up here in the Chinese capital, has no interest in overthrowing the Communist Party. But these days she finds herself cursing the nation's smothering cyberpolice as she tries — and fails — to browse photo-sharing websites like Flickr and struggles to stay in touch with the Facebook friends she has made during trips to France, India and Singapore. Gmail has become almost impossible to use here, and in recent weeks the authorities have gummed up Astrill, the software Ms. Jing and countless others depended on to circumvent the Internet restrictions that Western security analysts refer to as the Great Firewall. Credit Ng Han Guan/Associated Press "If it was legal to protest and throw rotten eggs on the street, I'd definitely be up for that," Ms. Jing, 25, said. China has long had some of the world's most onerous Internet restrictions. But until now, the authorities had effectively tolerated the proliferation of V.P.N.s as a lifeline for millions of people, from archaeologists to foreign investors, who rely heavily on less-fettered access to the Internet. But earlier this week, after a number of V.P.N. companies, including StrongVPN and Golden Frog, complained that the Chinese government had disrupted their services with **unprecedented**

sophistication, a senior official for the first time acknowledged its hand in the attacks and implicitly promised more of the same. The move to disable some of the most widely used V.P.N.s has provoked a torrent of outrage among video artists, entrepreneurs and professors who complain that in its quest for so-called cybersovereignty — Beijing's euphemism for online filtering — the Communist Party is stifling the innovation and productivity needed to revive the Chinese economy at a time of slowing growth. "I need to stay tuned into the rest of the world," said Henry Yang, 25, the international news editor of a state-owned media company who uses Facebook to follow American broadcasters. "I feel like we're like frogs being slowly boiled in a pot." Continue reading the main story RELATED IN OPINION Editorial: In Foiling Gmail, China Foils Itself DEC. 31, 2014 Multinational companies are also alarmed by the growing online constraints. Especially worrisome, they say, are new regulations that would force foreign technology and telecom companies to give the government "back doors" to their hardware and software and require them to store data within China. Like their Chinese counterparts, Western business owners have been complaining about their inability to gain access to many Google services since the summer. A few weeks ago, China cut off the ability to receive Gmail on smartphones through third-party email services like Apple Mail or Microsoft Outlook. The recent disabling of several widely used V.P.N.s has made it difficult for company employees to use collaborative programs like Google Docs, although some people have found workarounds — for the time being. "In order to attract and promote world-class commercial enterprises, the government needs to encourage the use of the Internet as a crucial medium for the sharing of information and ideas to promote economic growth and development." Chinese authorities have long had the ability to interfere with V.P.N.s, but **their interest in disrupting such programs has mounted** alongside the government's drive for cybersovereignty, especially since President Xi Jinping came to power two years ago. Lu Wei, the propaganda official Mr. Xi appointed as Internet czar, has been unapologetic in promoting the notion that China has the right to block a wide array of online content. A co-founder of Greatfire.org, which tracks online censorship in China, suggested the government had decided that soaring V.P.N. use among ordinary Chinese warranted a more aggressive attack on such software. "This is just a further, logical step," said the co-founder, who requested anonymity to avoid government scrutiny. "**The authorities are hellbent on establishing cybersovereignty in China**. If you look at what has taken place since last summer it is quite astounding." Government officials have denied any role in blocking Google and they have dismissed accusations that Chinese authorities were behind a "man-in-the-middle" attack on Outlook two weeks ago as well as other hacking incidents involving Yahoo and Apple.

US efforts to curtail Chinese censorship fail - they've already snuffed Washington out of the debate and wont back down

Xu 15 - Media Censorship in China Author: Beina Xu Updated: April 7, 2015 CFR Backgrounders (http://www.cfr.org/china/media-censorship-china/p11515) CM

The Chinese government has long kept tight reins on both traditional and new media to avoid potential subversion of its authority. Its tactics often entail strict media controls using monitoring systems and firewalls, shuttering publications or websites, and jailing dissident journalists, bloggers, and activists. Google's battle with the Chinese government over Internet censorship, and the Norwegian Nobel Committee's awarding of the 2010 Peace Prize to jailed Chinese activist Liu Xiaobo, have also increased international attention to censorship issues. At the same time, the country's burgeoning economy relies on the web for growth, and experts say the growing need for Internet freedom is testing the regime's control. Official Media Policy China's constitution affords its citizens freedom of speech and press, but the opacity of Chinese media regulations allows authorities to crack down on news stories by claiming that they expose state secrets and endanger the country. The definition of state secrets in China remains vague, facilitating censorship of any information that authorities deem harmful (PDF) to their political or economic interests. CFR Senior Fellow Elizabeth C. Economy says the Chinese government is in a state of "schizophrenia" about media policy as it "goes back and forth, testing the line, knowing they need press freedom and the information it provides, but worried about opening the door to the type of freedoms that could lead to the regime's downfall." In May 2010, the government issued its first white paper on the Internet that emphasized the concept of "Internet sovereignty," requiring all Internet users in China, **including foreign organizations** and individuals, to abide by Chinese laws and regulations. Chinese Internet companies are now required to sign the "Public Pledge on Self-Regulation and Professional Ethics for China Internet Industry," which entails even stricter rules than those in

the white paper, according to Jason Q. Ng, a specialist on Chinese media censorship and author of Blocked on Weibo. How Free Is Chinese Media? The France-based watchdog group Reporters Without Borders ranked China 175 out of 180 countries in its 2014 worldwide index of press freedom (PDF). Former CFR Edward R. Murrow Press Fellow Matt Pottinger says Chinese media outlets usually employ their own monitors to ensure political acceptability of their content. Censorship guidelines are circulated weekly from the Communist Party propaganda department and the government Bureau of Internet Affairs to prominent editors and media providers. Certain websites that the government deems potentially dangerous—like Wikipedia—are blocked during periods of controversy, such as the June 4 anniversary of the Tiananmen Square massacre. Specific material considered a threat to political stability is also banned, including controversial photos and search terms. The government is particularly keen on blocking reports of issues that could incite social unrest, like official corruption and ethnic strife. The websites of Bloomberg news service and the New York Times were blacked out in 2012 after each ran reports on the private wealth of then Party Secretary Xi Jinping and Premier Wen Jiabao. Restrictions were also placed on micro-blogging services in April 2012 in response to rumors of a coup attempt in Beijing involving the disgraced former Chongqing party chief Bo Xilai. Censors were also swift to block any mention of an October 2013 attack on Tiananmen Square by individuals from Xinjiang province, home to the mostly Muslim Uighur minority group. The Censorship Groups More than a dozen government bodies review and enforce laws related to information flow within, into, and out from China. The most powerful monitoring body is the Communist Party's Central Propaganda Department (CPD), which coordinates with General Administration of Press and Publication and State Administration of Radio, Film, and Television to ensure content promotes party doctrine. Ng says that the various ministries once functioned as smaller fiefdoms of control, but have recently been more consolidated under the State Council Information Office, which has taken the lead on Internet monitoring. Some estimates say that the government employs roughly 100,000 people, hired both by the state and private companies, to constantly monitor China's Internet. Additionally, the CPD gives media outlets editorial guidelines as well as directives restricting coverage of politically sensitive topics. In one high-profile incident involving the liberal Guangdong magazine Southern Weekly, government censors rewrote the paper's New Year's message from a call for reform to a tribute to the Communist Party. The move triggered mass demonstrations by the staff and general public, who demanded the resignation of the local propaganda bureau chief. While staff and censors reached a compromise that would theoretically relax some controls, much of the censorship remained in place. **Exerting Control** The Chinese government deploys myriad ways of censoring the Internet. The Golden Shield Project, colloquially known as the Great Firewall, is the center of the government's online censorship and surveillance effort. Its methods include bandwidth throttling, keyword filtering, and blocking access to certain websites. According to Reporters Without Borders, the firewall makes large-scale use of Deep Packet Inspection technology to block access based on keyword detection. As Ng points out, the government also employs a diverse range of methods to induce journalists to censor themselves, including dismissals and demotions, libel lawsuits, fines, arrests, and forced televised confessions. "To the degree that China's connection to the outside world matters, the digital links are deteriorating." —Evan Osnos, New Yorker As of December, 2014, forty-four journalists were imprisoned in China, according to the Committee to Protect Journalists, a U.S.-based watchdog on press freedom issues. In 2009, Chinese rights activist Liu Xiaobo was sentenced to eleven years in prison for advocating democratic reforms and freedom of speech in Charter 08, a 2008 statement signed by more than two thousand prominent Chinese citizens that called for political and human rights reforms and an end to one-party rule. When Liu won the Nobel Peace Prize, censors blocked the news in China. A year later, journalist Tan Zuoren was sentenced to five years in prison for drawing attention to government corruption and poor construction of school buildings that collapsed and killed thousands of children during the 2008 earthquake in Sichuan province. Early 2014 saw the government detain Gao Yu, a columnist who was jailed on accusations of leaking a Party communiqué titled Document 9. The State Internet Information Office tightened content restrictions in 2013 and appointed a new director of a powerful Internet committee led by President Xi Jinping, who assumed power in late 2012. A July 2014 directive on journalist press passes bars reporters from releasing information from interviews or press conferences on social media without permission of their employer media organizations. And in early 2015, the government cracked down on virtual private networks (VPNs), making it more difficult to access U.S. sites like Google and Facebook. "By blocking these tools, the authorities are leaving people with fewer options and are forcing most to give up on circumvention and switch to domestic services," writes Charlie Smith [pseudonym], a co-founder of FreeWeibo.com and activist website GreatFire.org. "If they can convince more Internet users to use Chinese services—which they can readily censor and easily snoop on—then they have taken one further step towards cyber sovereignty." The restrictions mount on a regular basis, adds the New Yorker's Evan Osnos. "To the degree that China's connection to the outside world matters, the digital links are deteriorating," he wrote in an April 2015 article. "How many countries in 2015 have an Internet connection to the world that is worse than it was a year ago?" Foreign Media China requires foreign correspondents to obtain permission before reporting in the country and has used this as an administrative roadblock to prevent journalists from reporting on potentially sensitive topics like corruption. Eighty percent of respondents in a 2014 survey conducted by the Foreign Correspondents' Club of China said their work conditions had worsened or stayed the same compared to 2013. International journalists regularly face government intimidation, surveillance, and restrictions on their reporting, writes freelance China correspondent Paul Mooney, who was denied a visa in 2013. "Some people in China don't look at freedom of speech as an abstract ideal, but more as a means to an end." —Emily Parker Austin Ramzy, a China reporter for the New York Times, relocated to Taiwan in early 2014 after failing to receive his accreditation and visa. New York Times reporter Chris Buckley was reported to have been expelled in early January 2013—an incident China's foreign ministry said was a visa application suspension due to improper credentials. China observers were most notably shaken by the 2013 suspension of Bloomberg's China correspondent, Michael Forsythe, after Bloomberg journalists accused the news agency of withholding investigative articles for fear of reprisal from Chinese authorities. The treatment of foreign reporters has become a diplomatic issue. In response to the Arab Spring protests in early 2011, then Secretary of State Hillary Clinton pledged to continue U.S. efforts to weaken censorship in countries with repressive governments like China and Iran. In response,

Beijing warned Washington to not meddle in the internal affairs of other countries. On a December 2013 trip to Beijing, Vice President Joe Biden pressed China publicly and privately about press freedom, directly raising the issue in talks with Chinese President Xi Jinping and meeting with U.S. journalists working in China. U.S. Technology in China In more recent years, China has made it exceedingly difficult for foreign technology firms to compete within the country. The websites of U.S. social media outlets like Facebook, Twitter, and Instagram are blocked. Google, after a protracted battle with Chinese authorities over the banning of search terms, quietly gave up its fight in early 2013 by turning off a notification that alerted Chinese users of potential censorship. In late 2014, China banned Google's email service Gmail, a move that triggered a concerned response from the U.S. State Department. In January 2015, China issued new cybersecurity regulations that would force technology firms to submit source code, undergo rigorous inspections, and adopt Chinese encryption algorithms. The move triggered an outcry from European and U.S. companies, who lobbied governmental authorities for urgent aid in reversing the implementation of new regulations. CFR's Adam Segal writes that although the Chinese government has promoted these types of policies in that past, "the fact that the regulations come from the central leading group, and that they seem to reflect an ideologically driven effort to control cyberspace at all levels, **make it less likely that Beijing will back down**."

American primacy is also rooted in the county's position as the world's leading technological power. The United States remains dominant globally in overall R&D investments, high-technology production, commercial innovation, and higher education (table 2.3). Despite the weight of this evidence, elite perceptions of U.S. power had shifted toward pessimism by the middle of the first decade of this century. As we noted in chapter 1, this was partly the result of an Iraq-induced doubt about the utility of material predominance, a doubt redolent of the post-Vietnam mood. In retrospect, many assessments of U.S. economic and technological prowess from the 1990s were overly optimistic; by the next decade important potential vulnerabilities were evident. In particular, chronically imbalanced domestic finances and accelerating public debt convinced some analysts that the United States once again confronted a competitiveness crisis.23 If concerns continue to mount, this will count as the fourth such crisis since 1945; the first three occurred during the 1950s (Sputnik), the 1970s (Vietnam and stagflation), and the 1980s (the Soviet threat and Japan's challenge). None of these crises, however, shifted the international system's structure: multipolarity did not return in the 1960s, 1970s, or early 1990s, and each scare over competitiveness ended with the American position of primacy retained or strengthened.24 Our review of the evidence of U.S. predominance is not meant to suggest that the United States lacks vulnerabilities or causes for concern. In fact, it confronts a number of significant vulnerabilities; of course, this is also true of the other major powers.25 The point is that adverse trends for the United States will not cause a polarity shift in the near future. If we take a long view of U.S. competitiveness and the prospects for relative declines in economic and technological dominance, one takeaway stands out: **relative power shifts slowly.** The United States has accounted for a quarter to a third of global output for over a century. No other economy will match its combination of wealth, size, technological capacity, and productivity in the foreseeable future (tables 2.2 and 2.3). The depth, scale, and projected longevity of the U.S. lead in each critical dimension of power are noteworthy. But what truly distinguishes the current distribution of capabilities is American dominance in all of them simultaneously. The chief lesson of Kennedy's 500-year survey of leading powers is that nothing remotely similar ever occurred in the historical experience that informs

modern international relations theory. The implication is both simple and underappreciated: the counterbalancing constraint is inoperative and will remain so until the distribution of capabilities changes fundamentally. The next section explains why.

In theory, globalization should help developing countries obtain and absorb advanced technology. In practice, however, this may not occur because some of the knowledge and infrastructure necessary to absorb certain technologies cannot be specified in a blueprint or contained within a machine. Instead they exist in peoples' minds and can be obtained only through "hands-on" experience. The World Bank recently calculated that 80 percent of the wealth of the United States is made up of intangible assets, most notably, its system of property rights, its efficient judicial system, and the skills, knowledge, and trust embedded within its society. If this is the case, then a huge chunk of what separates the United States from China is not for sale and cannot be copied. Economies and militaries used to consist primarily of physical goods (e.g., conveyor belts and tanks), but today they are composed of systems that link physical goods to networks, research clusters, and command centers. 72 Developing countries may be able to purchase or steal certain aspects of these systems from abroad, but many lack the supporting infrastructure, or "absorptive capacity," necessary to integrate them into functioning wholes. 73 For example, in the 1960s, Cummins Engine Company, a U.S. technological leader, formed joint ventures with a Japanese company and an Indian company to produce the same truck engine. The Japanese plant quickly reached U.S. quality and cost levels while the Indian plant turned out second-rate engines at three to four times the cost. The reason, according to Jack Baranson, was the "high degree of technical skill . . . required to convert techniques and produce new technical drawings and manufacturing specifications." 74 This case illustrates how an intangible factor such as skill can lead to significant productivity differences even when two countries have access to identical hardware. Compared to developing countries such as China, the United States is primed for technological absorption. Its property rights, social networks, capital markets, flexible labor laws, and legions of **m**ulti**n**ational **c**ompanies not only help it innovate, but also absorb innovations created elsewhere. Declinists liken the U.S. economic system to a leaky bucket oozing innovations out into the international system. But in the alternative perspective**, the United States is more like a sponge, steadily increasing its mass by soaking up ideas, technology, and people from the rest of the world. If this is the case, then the spread of technology around the globe may paradoxically favor a concentration of technological and military capabilities in the United States.**

Stability exists independently of US power – advocates of unipolarity are biased by a superiority complex

Fettweis, 2014 Christopher, Associate Professor of Political Science at Tulane University, former post-doctoral fellow at the Mershon Center for International Security at Ohio State University, Ph.D. in international relations from the University of Maryland, October 7, "Delusions of Danger: Geopolitical Fear and Indispensability in US Foreign Policy," *A Dangerous World?: Threat Perception and U.S. National Security*, Kindle Edition

According to what might be considered the indispensability fallacy, many Americans believe that U.S. actions are primarily responsible for any stability that currently exists. "All that stands between civility and genocide, order and mayhem," explain Lawrence Kaplan and William Kristol, "is American power." 37 That belief is an offshoot, witting or not, of what is known as "hegemonic stability theory," which proposes that international peace is possible only when one country is strong enough to make and enforce a set of rules. 38 Were U.S. leaders to abdicate their responsibilities, that reasoning goes, unchecked conflicts would at the very least bring humanitarian disaster and would quite quickly threaten core U.S. interests. 39 Brzezinski is typical in his belief that "outright chaos" and a string of specific horrors could be expected to follow a loss of hegemony, from renewed attempts to build regional empires (by China, Turkey, Russia, and Brazil) to the collapse of the U.S. relationship with Mexico as emboldened nationalists south of the border reassert 150- year-old territorial claims. Overall, without U.S. dominance, today's relatively peaceful world would turn "violent and bloodthirsty." 40 The liberal world order that is so beneficial to all would come tumbling down. Like many believers, proponents of hegemonic stability theory **base their view on faith alone.** 41 There is precious **little evidence** to suggest that the United States is responsible for the pacific trends that have swept across the system. In fact, the world remained equally peaceful, relatively speaking, while the United States cut its forces throughout the 1990s, as well as while it doubled its military spending in the first decade of the new century. 42 Complex statistical methods should not be needed to demonstrate that levels of U.S. military spending have been essentially **unrelated to global stability.** Hegemonic stability theory's flaws go way beyond the absence of simple correlations to support them, however. The theory's supporters have never been able to explain adequately how precisely 5 percent of the world's population could force peace on the other 95 percent, unless, of course, **the rest of the world was** simply **not intent on fighting.** Most states are quite free to go to war without U.S. involvement but choose not to. The United States can be counted on, especially after Iraq, to steer well clear of most civil wars and ethnic conflicts. It took years, hundreds of thousands of casualties, and the use of chemical weapons to spur even limited interest in the events in Syria, for example; surely internal violence in, say, most of Africa would be unlikely to attract serious attention of the world's policeman, much less intervention. The continent is, nevertheless, more peaceful today than at any other time in its history, something for which U.S. hegemony cannot take credit. 43 Stability exists today in many such places to which U.S. hegemony simply does not extend. Overall, proponents of the stabilizing power of U.S. hegemony should keep in mind one of the most basic observations from cognitive psychology: rarely are our actions as important to others' calculations as we perceive them to be. 44 The so-called egocentric bias, which is essentially ubiquitous in human interaction, suggests that although it may be natural for **U.S. policymakers** to interpret their role as crucial in the maintenance of world peace, they are almost certainly **overestimating their own importance.** Washington is probably not as central to the myriad decisions in foreign capitals that help maintain international stability as it thinks it is. The indispensability fallacy owes its existence to a couple of factors. First, although all people like to bask in the reflected glory of their country's (or culture's) unique, nonpareil stature, Americans have long been **exceptional in their exceptionalism.** 45 The short history of the United States, which can easily be read as an almost uninterrupted and certainly unlikely story of success, has **led to a** (perhaps natural) **belief that it is morally, culturally, and politically superior to other**, lesser **countries.** It is no coincidence that the exceptional state would be called on by fate to maintain peace and justice in the world. Americans have always combined that feeling of divine providence with a sense of mission to spread their ideals around the world and battle evil wherever it lurks. It is that sense of destiny, of being the object of history's call, that most obviously separates the United States from other countries. Only an American president would claim that by entering World War I, "America had the infinite privilege of fulfilling her destiny and saving the world." 46 Although many states are motivated by humanitarian causes, no other seems to consider promoting its values to be a national duty in quite the same way that Americans do. "I believe that God wants everybody to be free," said George W. Bush in 2004. "That's what I believe. And that's one part of my foreign policy." 47 When Madeleine Albright called the United States the "indispensable nation," she was reflecting a traditional, deeply held belief of the American people. 48 Exceptional nations, like exceptional people, have an obligation to assist the merely average. Many of the factors that contribute to geopolitical fear — Manichaeism, religiosity, various vested interests, and neoconservatism—also help explain American exceptionalism

and the indispensability fallacy. And **unipolarity makes hegemonic delusions possible.** With the great power of the United States comes a sense of great responsibility: to serve and protect humanity, to drive history in positive directions. More than any other single factor, the people of the United States tend to believe that they are indispensable because they are powerful, and power tends to blind states to their limitations. "Wealth shapes our international behavior and our image," observed Derek Leebaert. "It brings with it the freedom to make wide-ranging choices **well beyond common sense.**" 49 It is quite likely that **the world does not need the United States to enforce peace.** In fact, if virtually any of the overlapping and mutually reinforcing explanations for the current stability are correct, the trends in international security may well prove difficult to reverse. None of the contributing factors that are commonly suggested (economic development, complex interdependence, nuclear weapons, international institutions, democracy, shifting global norms on war) seem poised to disappear any time soon. 50 The world will probably continue its peaceful ways for the near future, at the very least, **no matter what the United States chooses to do** or not do. As Robert Jervis concluded while pondering the likely effects of U.S. restraint on decisions made in foreign capitals, "It is very unlikely that pulling off the American security blanket would lead to thoughts of war." 51 The United States will remain fundamentally safe no matter what it does—in other words, despite widespread beliefs in its inherent indispensability to the contrary.

Alliances are out dated, multi-polarity is stable and there is no scenario for war in a world of US decline

Friedman et al., MIT political science PhD candidate, 2012

(Benjamin, "Why the U.S. Military Budget is 'Foolish and Sustainable", Orbis, 56.2, Science Direct)

Standard arguments for maintaining the alliances come in two contradictory strains. One, drawn mostly from the run-up to World War II, says that without American protection, the ally would succumb to a rival power, either by force or threat of force, heightening the rival's capability and danger to the United States. The other argument says that without the United States, the ally would enter a spiral of hostility with a neighbor, creating instability or war that disrupts commerce and costs America more than the protection that prevented it. The main problem with the first argument is that no hegemon today threatens to unify Europe or Asia. Europe is troubled by debt, not conquest. Russian GDP is today roughly equivalent to that of Spain and Portugal combined. Whatever Russia's hopes, it has no ability to resurrect its Soviet Empire, beyond perhaps those nations in its near abroad that Americans have no good reason to defend. Even today, the military capabilities of Europe's leading powers are sufficient to defend its eastern flank, and they could increase their martial exertions should a bigger threat arise. Asia is tougher case. South Korea's military superiority over its northern neighbor is sufficient to deter it from an attempt at forcible reunification. By heightening North Korea's security, nuclear weapons may reinforce its capacity for trouble-making, but they do not aid offensive forays. U.S. forces long ago became unnecessary to maintaining the peninsula's territorial status quo. Chinese efforts to engage in old-fashioned conquest are unlikely, at least beyond Taiwan. Its more probable objective is a kind of Asian Monroe doctrine, meant to exclude the United States.6 China naturally prefers not to leave its maritime security at the whim of U.S. policymakers and, thus, has sought to improve its anti-access and area-denial capabilities. In the longer term, China's leaders will likely pursue the ability to secure its trade routes by building up longer-range naval forces. They may also try to leverage military power to extract various concessions from nearby states. Washington's defense analysts typically take those observations as sufficient to establish the necessity that U.S. forces remain in Asia to balance Chinese military power. But to justify a U.S. military presence there, one also needs to show both that Asian nations cannot or will not balance Chinese power themselves and that their failure to do so would greatly harm U.S. security. **Neither is likely**. Geography and economics suggest that the states of the region will successfully balance Chinese power—even if we assume that China's economic growth allows it to continue to increase military spending.7 Bodies of water are natural

defenses against offensive military operations. They allow weaker states to achieve security at relatively low cost by investing in naval forces and coastal defenses. That defensive advantage makes balances of power more stable. Not only are several of China's Asian rivals islands, but those states have the wealth to make Chinese landings on their coast prohibitively expensive. India's mountainous northern border creates similar dynamics. **The prospects of Asian states successfully deterring future Chinese aggression will get even better if, as seems likely, threats of aggression provoke more formal security alliances**. Some of that is already occurring. Note for example, the recent joint statement issued by the Philippines and Japan marking a new "strategic partnership" and expressing "common strategic interests" such as "ensuring the safety of sea lines of communication."8 This sort of multilateral cooperation would likely deepen with a more distant U.S. role. Alliances containing disproportionately large states historically produce free-riding; weaker alliance partners lose incentive to shore up their own defenses.9 Even if one assumes that other states in the region would fail to balance China, it is unclear exactly how U.S. citizens would suffer. China's territorial ambitions might grow but are unlikely to span the Pacific. Nor would absorbing a few small export-oriented states slacken China's hunger for the dollars of American consumers. The argument that U.S. alliances are necessary for stability and global commerce is only slightly more credible. One problem with this claim is that U.S. security guarantees can create moral hazard—emboldening weak allies to take risks they would otherwise avoid in their dealings with neighbors. Alliances can then discourage accommodation among neighboring states, heightening instability and threatening to pull the United States into wars facilitated by its benevolence. Another point against this argument is that even if regional balancing did lead to war, it would not obviously be more costly to the U.S. economy than the cost of the alliance said to prevent it. **Neutrality historically pays**.10 The larger problem with the idea that our alliances are justified by the balancing they prevent is that **wars generally require more than the mutual fear that arms competition provokes**. Namely, there is usually a territorial conflict or a state bent on conflict. Historical examples of arms races alone causing wars are few.11 This confusion probably results from misconstruing the causes of World War I—seeing it as a consequence of mutual fear alone rather than fear produced by the proximity of territorially ambitious states.12 Balances of power, as noted, are especially liable to be stable when water separates would-be combatants, as in modern Asia. Japan would likely increase defense spending if U.S. forces left it, and that would likely displease China. But that **tension is very unlikely to provoke a regional conflagration. A**nd even that remote scenario is far more likely than the Rube Goldberg scenario needed to argue that peace in Europe requires U.S. forces stationed there. It is not clear that European states would even increase military spending should U.S. troops depart. If they did do so, one struggles to imagine a chain of misperceived hostility sufficient to resurrect the bad old days of European history.

No transition wars – interdependence and diplomacy check
Fettweis, Poli Sci Prof @ Tulane University, 10

(Christopher, "Dangerous Times?: The International Politics of Great Power Peace," pp. 173-175)

If the only thing standing between the world and **chaos is the U.S. military presence**, then an adjustment in grand strategy would be exceptionally counter- productive. But it is worth recalling that **none of the other explanations for the decline of war—nuclear weapons**, **complex economic interdependence**, inter- national and domestic political institutions, evolution in ideas and norms— necessitate an activist America to maintain their validity. Were America to be- come more restrained, nuclear weapons would still affect the calculations of the would-be aggressor; the process of globalization would continue, deepening the complexity of economic interdependence; the United Nations could still deploy peacekeepers where necessary; and democracy would not shrivel where it cur- rently exists. Most importantly, **the idea that war is a worthwhile way to resolve conflict**

would have no reason to return. As was argued in chapter 2, normative evolution is typically unidirectional. Strategic restraint in such a world would be virtually risk-free.

VI. Discussion and conclusions A. Implications for our theories of political instability and conflict The state is not a prize?—Warlord politics and the state prize logic lie at the center of the most influential models of conflict, state development, and political transitions in economics and political science. Yet we see no evidence for this idea in economic shocks, even when looking at the friendliest cases: fragile and unconstrained states dominated by extractive commodity revenues. Indeed, we see the opposite correlation: if anything, **higher rents from commodity prices** weakly 22 **lower the risk and length of conflict.** Perhaps shocks are the wrong test. Stocks of resources could matter more than price shocks (especially if shocks are transitory). But combined with emerging evidence that war onset is no more likely even with rapid increases in known oil reserves (Humphreys 2005; Cotet and Tsui 2010) we regard the state prize logic of war with skepticism.17 Our main political economy models may need a new engine**.** Naturally, an absence of evidence cannot be taken for evidence of absence. Many of our conflict onset and ending results include sizeable positive and negative effects.18 Even so, commodity price shocks are highly influential in income and should provide a rich source of identifiable variation in instability. It is difficult to find a better-measured, more abundant, and plausibly exogenous independent variable than price volatility. Moreover, other time-varying variables, like rainfall and foreign aid, exhibit robust correlations with conflict in spite of suffering similar empirical drawbacks and generally smaller sample sizes (Miguel et al. 2004; Nielsen et al. 2011). Thus we take the absence of evidence seriously. Do resource revenues drive state capacity?—State prize models assume that rising revenues raise the value of the capturing the state, but have ignored or downplayed the effect of revenues on self-defense. We saw that a growing empirical political science literature takes just such a revenue-centered approach, illustrating that resource boom times permit both payoffs and repression, and that stocks of lootable or extractive resources can bring political order and stability. This countervailing effect is most likely with transitory shocks, as current revenues are affected while long term value is not. Our findings are partly consistent with this state capacity effect. For example, conflict intensity is most sensitive to changes in the extractive commodities rather than the annual agricultural crops that affect household incomes more directly. The relationship only holds for conflict intensity, however, and is somewhat fragile. We do not see a large, consistent or robust decline in conflict or coup risk when prices fall. A reasonable interpretation is that the state prize and state capacity effects are either small or tend to cancel one another out. Opportunity cost: Victory by default?—Finally, the inverse relationship between prices and war intensity is consistent with opportunity cost accounts, but not exclusively so. As we noted above, the relationship between intensity and extractive commodity prices is more consistent with the state capacity view. Moreover, we shouldn't mistake an inverse relation between individual aggression and incomes as evidence for the opportunity cost mechanism. The same correlation is consistent with psychological theories of stress and aggression (Berkowitz 1993) and sociological and political theories of relative deprivation and anomie (Merton 1938; Gurr 1971). Microempirical work will be needed to distinguish between these mechanisms. Other reasons for a null result.—Ultimately, however, the fact that commodity **price shocks have no discernible effect on new conflict onsets**, but some effect on ongoing conflict, suggests that political stability **might be less sensitive** to income or temporary shocks than generally believed. One possibility is that successfully mounting an insurgency is no easy task. It comes with considerable risk, costs, and coordination challenges. Another possibility is that the counterfactual is still conflict onset. In poor and fragile nations, income shocks of one type or another are ubiquitous. **If a nation is so fragile that a change in prices could lead to war, then other shocks may trigger war even in the absence of a price shock.** The same argument has been made in debunking the myth that price shocks led to fiscal collapse and low

growth in developing nations in the 1980s.19 B. A general problem of publication bias? More generally, these findings should heighten our concern with publication bias in the conflict literature. Our results run against a number of published results on commodity shocks and conflict, mainly because of select samples, misspecification, and sensitivity to model assumptions, and, most importantly, alternative measures of instability. Across the social and hard sciences, there is a concern that the majority of published research findings are false (e.g. Gerber et al. 2001). Ioannidis (2005) demonstrates that a published finding is less likely to be true when there is a greater number and lesser pre-selection of tested relationships; there is greater flexibility in designs, definitions, outcomes, and models; and when more teams are involved in the chase of statistical significance. The cross-national study of conflict is an extreme case of all these. Most worryingly, almost no paper looks at alternative dependent variables or publishes systematic robustness checks. Hegre and Sambanis (2006) have shown that the majority of published conflict results are fragile, though they focus on timeinvariant regressors and not the time-varying shocks that have grown in popularity. We are also concerned there is a "file drawer problem" (Rosenthal 1979). Consider this decision rule: scholars that discover robust results that fit a theoretical intuition pursue the results; but if results are not robust the scholar (or referees) worry about problems with the data or empirical strategy, and identify additional work to be done. If further analysis produces a robust result, it is published. If not, back to the file drawer. In the aggregate, the consequences are dire: a lower threshold of evidence for initially significant results than ambiguous ones.20

Economic collapse doesn't cause war

Daniel **Drezner 14**, IR prof at Tufts, The System Worked: Global Economic Governance during the Great Recession, World Politics, Volume 66. Number 1, January 2014, pp. 123-164

The final significant outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.42 They voiced genuine concern that the global economic downturn would lead to an increase in conflict—whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fueled impressions of a surge in global public disorder. **The aggregate data suggest otherwise**, however. The Institute for Economics and Peace has concluded that "the average level of peacefulness in 2012 is approximately the same as it was in 2007."43 Interstate violence in particular has declined since the start of the financial crisis, as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has not triggered any increase in violent conflict, as Lotta Themner and Peter Wallensteen conclude: "[T]he pattern is one of relative stability when we consider the trend for the past five years."44 The secular decline in violence that started with the end of the Cold War has not been reversed. Rogers Brubaker observes that "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."43

Decline doesn't cause war

Jervis 2011 Robert, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December 2011, "Force in Our Times," Survival, Vol. 25, No. 4, p. 403-425

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

Interp-Domestic Surveillance finds non-public information about US Citizens.

Small 8 (Matthew, US Air Force Academy, "His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power during Times of National Crisis," 2008, http://cspc.nonprofitsoapbox.com/storage/documents/Fellows2008/Small.pdf)//ghs-VA

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to narrow the scope of the term "domestic surveillance." **Domestic surveillance is a subset of intelligence gathering**. **Intelligence**, as it is to be understood in this context, **is "information that meets the stated** or understood **needs of policy makers** and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, **domestic surveillance is a means to an end; the end being intelligence**. **The intelligence community best understands domestic surveillance as the acquisition of nonpublic information concerning United States persons** (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept.

The FISA Amendments Act of 2008 is surveillance of foreign persons

The FISA Amendments Act of 2008 provides critically important authority for the U.S. Intelligence Community to acquire foreign intelligence information **by targeting foreign persons reasonably believed to be outside the United States**. It ensures that the Intelligence Community has the flexibility and agility it needs to identify and respond to terrorist and other foreign threats to our security.

The SSRA repeals the FISA act, which conducts foreign surveillance; this is un-topical. The wall between criminal and foreign investigations is murky.

"**Section 218. Amending the FISA Standard"** https://apps.americanbar.org/natsecurity/patriotdebates/section-218 **7/6/05 crc)**

Section 218 amends FISA by changing the certification requirement when the government seeks a FISA surveillance or search order. Previously, the government was required to certify that "the purpose" of the application was to obtain foreign

intelligence information. After section 218, the government must certify that obtaining foreign intelligence information is "a significant purpose" of the application. This change was designed to promote information sharing between intelligence and law enforcement officials and to eliminate what has become known as the "wall" that separated law enforcement and intelligence investigations.¶ The FISA, passed in 1978, sets forth procedures for the conduct of electronic surveillance and physical searches for foreign intelligence purposes. Over the years, the Department of Justice interpreted FISA's requirement that "the purpose" of collection be foreign intelligence to restrict the use of FISA collection procedures when a law enforcement investigation was involved. The restriction was designed to ensure that prosecutors and criminal investigators did not use FISA to circumvent the more rigorous warrant requirements for criminal cases. But law enforcement and foreign intelligence investigations often overlap, and enforcing this separation between intelligence and law enforcement investigations—the "wall"—inhibited coordination of these investigations and the sharing of foreign intelligence information with law enforcement officials. The change to "significant purpose" was intended to clarify that no such separation is necessary.¶ It is not clear whether the change in section 218 was legally necessary to eliminate the "wall." The Department of Justice argued to the FISA Court of Review in 2002 that the original FISA standard did not require the restrictions that the Department of Justice imposed over the years, and the court appears to have agreed. This leaves the precise legal effect of a sunset of section 218 somewhat murky.

The 2008 FISA Amendments are a form of foreign surveillance

FISA Amendments Act of 2008(Text of the 2008 FISA Amendments Act http://www.gpo.gov/fdsys/pkg/BILLS-110hr6304enr/pdf/BILLS-110hr6304enr.pdf)

there are procedures in place that have been approved, have been submitted for approval, or will be submitted with the certification for approval by the Foreign Intelligence Surveillance Court that are reasonably designed to— ‘‘(I) ensure that an acquisition authorized under subsection (a) is limited to targeting persons reasonably believed to be located outside the United States

The foreign powers that are targeted by FISA are international, making SSRA un-topical.

McCarthy 05 (Andrew, an attorney, and a Senior Fellow at the Foundation for the Defense of Democracies in Washington, DC, an organization that conducts research and education in national security issues. “**Section 218. Amending the FISA Standard”** https://apps.americanbar.org/natsecurity/patriotdebates/section-218 **7/6/05 crc)**

¶ The suggestion that a "foreign power" under FISA could be any "political organization" comprised predominantly of non-citizens is overwrought. One isn't told what Prof. Cole means by a "political organization"—Hezbollah, Hamas and Sinn Fein, for example, describe themselves as such—but the foreign powers FISA targets, by statutory definition, are those engaged in clandestine intelligence gathering activities, sabotage or international terrorism. See 50 U.S.C. §§ 1801(b)(2)(A), (C).¶ Atop his faulty premise that FISA is suspect, Prof. Cole piles the additional myth that Section 218 is suspect because it permits FISA searches and surveillance "undertaken primarily for criminal law purposes." To the contrary, as the FISA Court of Review reasoned in its 2002 opinion, FISA as written never limited the government to searches whose primary purpose was intelligence gathering. By mandating that intelligence gathering be "a primary purpose," Section 218 actually constrains the government in a way that neither the Fourth Amendment nor FISA does. Given that FISA easily passes Fourth Amendment muster, a provision such as Section 218, which narrows it, a fortiori is not constitutionally suspect.¶ Finally, Professor Cole's mythical account

skews the history of the wall and the purpose of Section 218. Nobody is saying FISA "mandated a 'wall' between law enforcement officials and intelligence agents"—and when I argued that FISA did not require a wall, that palpably was an assertion, not, as Professor Cole oddly spins it, a "conce[ssion]." Yes, the wall was unnecessarily erected by the courts and the Justice Department. But that it was a mistake did not make it any less real. And that there may have been cultural impediments to intelligence sharing does not mean the structural ones manufactured by the wall were not critical.

We meet—repealing SSRA curtails domestic surveillance

Buttar 13 (Shahid, a constitutional lawyer, grassroots organizer and executive director of the Bill of Rights Defense Committee. "USA vs. NSA: Legislative Efforts to Curtail Spying" http://www.truth-out.org/news/item/18122-the-nsa-vs-usa 8/14/13 crc)

The sustained grass-roots uproar over domestic surveillance has reached the ear of Congress, which is considering more than a dozen legislative measures to curtail the National Security Agency's various programs that spy on Americans en masse. While most address merely the pieces of the problem, one in particular would address the many facets hidden even in the wake of the Snowden leaks.¶ Even relative to the Leahy and Conyers-Amash proposals, the widest-ranging bill among those pending in Congress is the "Surveillance State Repeal Act" (HR 2818) introduced by Rep. Rush Holt, D-New Jersey, a former Princeton physics professor and former leader of the House Intelligence Committee. The Holt bill, unlike any of the other measures proposed, would fully repeal the Patriot Act and the 2008 FISA amendments in their entirety, essentially restoring limits on executive power and unwinding the surveillance abuses of the George W. Bush and Obama administrations at once.¶ The first two enjoy bipartisan support: the "FISA Accountability and Privacy Protection Act" (SB 1215), introduced by Senate Judiciary Chairman Patrick Leahy, D-Vermont, as well as the Libert-E Act (HR 2399), co-sponsored by Reps. John Conyers, D-MI, and Justin Amash, R-MI. Both bills would curtail powers extended in the FISA amendments of 2008, as well as portions of the Patriot Act.

The FISA amendment act pertains to domestic surveillance

Cato institute 12- ("The Surveillance Iceberg: The FISA Amendments Act and Mass Spying without Accountability") http://www.cato.org/events/surveillance-iceberg-fisa-amendments-act-mass-spying-without-accountability

History teaches that government spying is naturally subject to abuse without strong oversight, yet only the tiniest fraction of electronic surveillance of Americans—the tip of a vast and rapidly growing iceberg—is meaningfully visible to Congress, let alone the general public. Under the controversial FISA (Foreign Intelligence Surveillance Act) Amendments Act of 2008, set to expire at the end of the year, the National Security Agency is empowered to vacuum up the

international communications of Americans under sweeping authorizations that dispense with the need for individual warrants. Despite reports of large-scale overcollection of Americans' e-mails and phone calls**, including purely domestic traffic**, the NSA has brazenly refused to give Congress any estimate of how many citizens' private conversations are being captured in its vast databases, and legislators have shown little willingness to demand greater transparency as they prepare to reauthorize the law. Increasingly, even ordinary criminal investigations employ off-the-books electronic surveillance techniques that circumvent federal reporting requirements. The public is informed about the few thousand wiretaps authorized every year but remains largely in the dark about newer and far more prevalent techniques, such as the routine use of cell phones as sophisticated tracking devices.

A. Limits- The AFF only being only restricted to the word domestic opens the doors up to plenty of clash. The negative has more the enough time to prep for any plan that is only affecting the U.S. Now we are only allowed to being up any AFFS within the resolution.
B. Topic education- Under our interpretation we are only surveiling the U.S citizens. We are not surveiling anyone else. We are debating about the core topic here so the negative doesn't lose education.

Reasonability- All the AFF has to do is prove that we meet enough. Reasonability is better because

A. There will be no need to debate interpretations. Debating the interpretations just promotes lazy negative debating.

"FIX FISA - END WARRANTLESS WIRETAPPING" https://www.aclu.org/fix-fisa-end-warrantless-wiretapping)

The FISA Amendments Act, passed in 2008 and reauthorized in 2012, gives the National Security Agency almost unchecked power to monitor Americans' international phone calls and emails. On October 29, 2012, the Supreme Court heard arguments in the ACLU's challenge to the law. In February 2013, the Supreme Court dismissed the ACLU's lawsuit. The Foreign Intelligence Surveillance Act (FISA), enacted by Congress after the abuses of the 1960s and 70s, regulates the government's conduct of intelligence surveillance inside the United States. It generally requires the government to seek warrants before monitoring Americans' communications. In 2001, however, President Bush authorized the NSA to launch a warrantless wiretapping program, and in 2008 Congress ratified and expanded that program.

By contrast, the FAA allows surveillance of a foreign entity without specifying the people to be monitored or the facilities, places, premises, or property at which surveillance will be directed. Because the target can be any foreign entity, the government can direct surveillance at any facility, even those on American soil, and monitor unspecified Americans' international communications to or from suspected agents of the foreign entity, or even about that entity. However, the government may not target Americans or intentionally acquire purely domestic communications.

Neolib Link—SSRA

Neoliberalism has created an expository society—to ensure profit, public and private actors work to move populations online into "digital amusement parks" to maximize consumption—curtailing surveillance isn't the solution, because surveillance isn't the problem—the problem is we willingly disclose personal information online in order to exist in our digitized neoliberal age—the underlying goal of the aff is to distract citizens with false promises of cyber-security in order to continue the flow of consumers into their digital theme parks

Harcourt, Professor of Law at Columbia University, 14

Bernard, His scholarship intersects social and political theory, the sociology of punishment, and penal law and procedure, served most recently as the Julius Kreeger Professor of Law and Political Science at The University of Chicago, "Digital Security in the Expository Society: Spectacle, Surveillance, and Exhibition in the Neoliberal Age of Big Data", SSRN, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2455223

How then do we conceptualize and visualize relations of power in our digitized neoliberal age? Where can we find the architectural schematic to understand digital security? **Both of the classic forms—spectacle and surveillance—seem no longer adequate**, and to be honest, the contrast between the two may well have been drawn too sharply. As W.J.T. Mitchell presciently observes in The Spectacle Today, neither term can possibly be understood as mutually exclusive in our contemporary condition; rather, spectacle and surveillance should be seen, as Mitchell explains, as "dialectical forces in the exertion of power and resistance to power."54 I would go further, though, and suggest that **both forms—spectacle and surveillance—are overshadowed or surpassed today**, or ought to be complemented, **by a third: exposure, or exposition, or, perhaps better, the exhibition. Today, we are not coerced into revealing our most intimate desires.** There is no telescreen forcibly anchored into the wall of our apartments that we cannot turn off,55 nor are we forcibly detained in a see-through cell within the omnipresent view of a central watchtower. We are neither forced into the arena, nor compelled to reveal our most intimate desires.56 **No, we are not being surveilled today, so much as we are exposing or exhibiting ourselves knowingly and willingly**, with all our love, lust, and passion. **The relation is now inversed: we, digital subjects, we homo digitalis, we "digital persons,"** 57 **we give ourselves up happily, voluntarily, in a mad frenzy of disclosure.** We expose our most intimate details in play, in love, in desire, in consumption, in a stream of texts, Tweets, emoticons and Instagrams, e-mails and Snapchats, Facebook posts, links, shares and likes—throughout our digital lives, in our work, for our political convictions, to satisfy our appetites, **to become ourselves** Even those of us who do not partake in the rich world of social media have no alternative but to share our intimate lives and political views in texts, e-mails, and Skype conversations—knowing that we are exposing ourselves. We write love notes and political comments, we share intimate photos and inside jokes, we throw ourselves onto the screen in our virtual spectacular forms—often wishing more than anything to be seen, to be "liked," to feel connected, or simply because it is the only way to communicate today. For most of us, **our digital existence is our life—it is practically the pulse, the bloodstream, the very current of our daily routines. We need to be plugged not just to feel fully alive, but to**

be human all too human. Guy Debord spoke of "the society of the spectacle." Foucault drew our attention instead to "the punitive society." But it seems as if, today, **we live in the expository society**. How then can we visualize the architecture of this society of the exhibition? And recall that there are two key stages to visualize: first, the neoliberal moment, with its mix of private and public, of consumption and consumerism, of responsibilization and reregulation, of maximizing and minimizing; and second, the digitization of every aspect of the neoliberal paradigm—digital security. Let's turn first to the neoliberal aspect. **How can we schematize relations of power in our neoliberal condition? What I would propose, as the architectural schema that best captures the neoliberal moment, is the amusement park** or the theme park—or more generally, the themed space. **A private commercial space, for profit, that has been underwritten and made possible by state and municipal governments. A mixed private-public space—or perhaps, more accurately, a space of private profit and public expenditures—that practices a form of management or control of flows of populations, to maximize the number of visitors, to attract more advertising, to stimulate consumption, to facilitate spending. These are quintessential spaces that seek to optimize the movement of large populations in order to maximize their consumption, while at the same time minimizing labor and other expenditures. This is not just a spectacle, because everything is scattered. The goal is to** distribute, not concentrate, the population. To **avoid amassing consumers on any one spectacle. The goal is to** optimize and redirect queues, to make them feel shorter than they are, to learn how to **manage the patience of consumers who want to see, but who are** in fact, **never**, or almost never, **sitting in the arena**. To be sure, **surveillance goes on**; but that is only one dimension of the endeavor. There are, naturally, a large number of CCTV cameras. **The watchful eye is everywhere That is** in fact, **what renders Disneyland so popular—the feeling that everything is monitored, that everything is secure, that the children, or rather the parents have nothing to fear. There is continuous surveillance, but not in a panoptic form. We do not internalize the gaze, we are reassured by it.**

Neolib Alt—SSRA

The alternative solves best—both teams agree that the state depends on private corporate services for surveillance—we need critical frameworks that consider NOT ONLY the domestic security apparatus, but the international capitalist formations that motivate neoliberal abuses of state intelligence for private gains

Convergence of State and Corporate Metadata Dreams¶ The past two decades brought an accelerated independent growth of corporate and governmental electronic surveillance programs tracking metadata and compiling electronic dossiers. The NSA, FBI, Department of Defense, and CIA's metadata programs developed independently from, and with differing goals from, the consumer surveillance systems that used cookies and consumer discount cards, sniffing Gmail content, compiling consumer profiles, and other means of tracking individual Internet behaviors for marketing purposes. Public acceptance of electronic monitoring and metadata collection transpired incrementally, with increasing acceptance of corporate-based consumer monitoring programs, and reduced resistance to governmental surveillance.¶ These two surveillance tracks developed with separate motivations, one for security and the other for commerce, but both desire to make individuals and groups legible for reasons of anticipation and control. The collection and use of this metadata finds a synchronic convergence of intrusions, as consumer capitalism and a U.S. national security state leaves Americans vulnerable, and a world open to the probing and control by agents of commerce and security. As Bruce Schneier recently observed, "surveillance is still the business model of the Internet, and every one of those

companies wants to access your communications and your metadata."7¶ But this convergence carries its own contradictions. Public trust in (and the economic value of) cloud servers, telecommunications providers, email, and search engine services suffered following revelations that the public statements of Verizon, Google, and others had been less than forthright in declaring their claims of not knowing about the NSA monitoring their customers. A March 2014 USA Today survey found 38 percent of respondents believed the NSA violates their privacy, with distrust of Facebook (26 percent) surpassing even the IRS (18 percent) or Google (12 percent)—the significance of these results is that the Snowden NSA revelations damaged the reputations and financial standing of a broad range of technology-based industries.8 With the assistance of private ISPs, various corporations, and the NSA, our metadata is accessed under a shell game of four distinct sets of legal authorizations. These allow spokespersons from corporate ISPs and the NSA to make misleading statements to the press about not conducting surveillance operations under a particular program such as FISA, when one of the other authorizations is being used.9¶ **Snowden's revelations reveal a world where the NSA is dependent on private corporate services for the outsourced collection of data, and where the NSA is increasingly reliant on corporate owned data farms where the storage and analysis of the data occurs**. In the neoliberal United States, Amazon and other private firms lease massive cloud server space to the CIA, under an arrangement where it becomes a share cropper on these scattered data farms. These arrangements present nebulous security relationships raising questions of role confusion in shifting patron–client relationships; and whatever resistance corporations like Amazon might have had to assisting NSA, CIA, or intelligence agencies is further compromised by relations of commerce. This creates relationships of culpability, as Norman Solomon suggests, with Amazon's $600 million CIA data farm contract: "if Obama orders the CIA to kill a U.S. Citizen, Amazon will be a partner in assassination."10 Such arrangements diffuse complicity in ways seldom considered by consumers focused on Amazon Prime's ability to speedily deliver a My Little Pony play set for a brony nephew's birthday party, not on the company's links to drone attacks on Pakistani wedding parties.¶ The Internet developed first as a military-communication system; only later did it evolve the commercial and recreational uses distant from the initial intent of its Pentagon landlords. Snowden's revelations reveal how the Internet's architecture, a compromised judiciary, and duplexed desires of capitalism and the national security state are today converging to track our purchases, queries, movements, associations, allegiances, and desires. The rise of e-commerce, and the soft addictive allure of social media, rapidly transforms U.S. economic and social formations. Shifts in the base are followed by shifts in the superstructure, and new generations of e-consumers are socialized to accept phones that track movements, and game systems that bring cameras into the formerly private refuges of our homes, as part of a "new surveillance normal."11¶ **We need to develop critical frameworks considering how NSA and CIA surveillance programs articulate not only with the United States' domestic and international security apparatus, but with current international capitalist formations.** While secrecy shrouds our understanding of these relationships, **CIA history provides examples of some ways that intelligence operations have supported and informed past U.S. economic ventures**. When these historical patterns are combined with details from Snowden's **disclosures we find continuities of means, motive, and opportunity for neoliberal abuses of state intelligence for private gains.**

No chance of war from economic decline---best and most recent data

Daniel W. **Drezner 12**, Professor, The Fletcher School of Law and Diplomacy, Tufts University, October 2012, "The Irony of Global Economic Governance: The System Worked," http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf

The final outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.37 Whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict, there were genuine concerns that the global economic downturn would lead to an increase in conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fuel impressions of surge in global public disorder.

The aggregate data suggests otherwise, however. The Institute for Economics and Peace has constructed a "Global Peace Index" annually since 2007. A key conclusion they draw from the 2012 report is that "The average level of peacefulness in 2012 is approximately the same as it was in 2007."38 Interstate violence in particular has declined since the start of the financial crisis – as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has not triggered any increase in violent conflict; the secular decline in violence that started with the end of the Cold War has not been reversed.39 Rogers Brubaker concludes, "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."40

None of these data suggest that the global economy is operating swimmingly. Growth remains unbalanced and fragile, and has clearly slowed in 2012. Transnational capital flows remain depressed compared to pre-crisis levels, primarily due to a drying up of cross-border interbank lending in Europe. Currency volatility remains an ongoing concern. Compared to the aftermath of other postwar recessions, growth in output, investment, and employment in the developed world have all lagged behind. But the Great Recession is not like other postwar recessions in either scope or kind; expecting a standard "V"-shaped recovery was unreasonable. One financial analyst characterized the post-2008 global economy as in a state of "contained depression."41 The key word is "contained," however. Given the severity, reach and depth of the 2008 financial crisis, the proper comparison is with Great Depression. And by that standard, the outcome variables look impressive. As Carmen Reinhart and Kenneth Rogoff concluded in This Time is Different: "that its macroeconomic outcome has been only the most severe global recession since World War II – and not even worse – must be regarded as fortunate."42

No federalism conflicts or federal overreach

Donald C. **Langevoort 6**, Thomas Aquinas Reynolds Professor at Georgetown Law, "Federalism in Corporate/Securities Law: Reflections on Delaware, California, and State Regulation of Insider Trading," 40 U.S.F. L. Rev. 879-892 (2006), http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=1535&context=facpub

The approach set forth above decribes the situation but does not necessarily make a normative judgment. To summarize, it describes the political economy of state-federal relations in corporate and securities law in top-down terms, noting that the division of authority reflects Congress' political preference rather than some natural order of things. ¶ The description helps one to pose the questions that grow out of the more recent controversies properly. Once again, everyone should **stop speaking of federal "incursions" into state corporation law**. Congress holds the ultimate power on matters of

interstate commerce, and only by congressional preference do the states have any role in regulating beyond their own borders. Putting aside questions about its wisdom, Sarbanes-Oxley is a national response to a perceived national problem. It exists as a revision of a long-standing political bargain **rather than a power grab**. And one could say the same about SEC initiatives. Statutory authority governs the question: how much of this policy-making did Congress delegate to the Commission, and how much did it keep for itself? "States' rights" do not exist in the relevant analysis apart from Congress' preferences. Given that the SEC acts as Congress' primary agent for holding the potential of federalization over the states,46 a considerable degree of delegation exists. However, without a doubt, Congress wishes, for political reasons if nothing else, to keep some choices to itself.¶ Turning to state activity, federal preference again governs. Some securities laws reflect a policy preference that the SEC cannot deal with some-presumably localized-securities matters. Thus, state enforcement serves as a useful supplement. Because one **cannot easily articulate the dividing line** between what constitutes a localized or a national matter, the statutes do not limit the scope of the state action. Hence, any judicial challenge to the states' activity would have to argue that the federal government's actions have filled the field completely, which is unlikely to be true. For instance, even in mutual fund regulation, which has laws that probably exhibit the same scope as any law at the federal level, courts and the SEC have long recognized the concurrent role of state law.47¶ One could argue that state laws address conduct insufficiently connected to the acting state, making them invalid under the Commerce Clause. But, with few exceptions, the states' aggressiveness has not gone that far. For example, Eliot Spitzer targeted schemes that were launched mainly on Wall Street and had significant effects there. Thus, Congress will have to be much clearer than it has been for "incursions" like Spitzer's to be impermissible.¶ Whether those incursions are normatively good or bad is another matter entirely. Simply from a public policy standpoint, the argument for having aggressive state enforcement beyond essentially local matters underscores Roe's point. Because Congress presumptively centralizes the matter at the federal level, it is easier for business interests to influence the regulatory process in a way that denigrates the interests of the less-well-organized-retail investors particularly. Having fifty states with potentially concurrent jurisdiction creates a check on that, and there exists reason to suspect that Spitzer and other state officials have caused the SEC to act in ways in which it would not have otherwise.¶ That said, however, the absence of any clear line tempts the states to overreach, especially in times of scandal when the threat of federal backlash decreases. The dangers of state criminal prosecution, especially on the fairly loose standards of something like New York's Martin Act,48 are disabling enough to give prosecutors leverage on matters of industry conduct that those in the industry would otherwise resist.49 Local state-level politics should not determine basic policies in the securities industry. Thus, Congress always has a principled argument for removing particular matters from state authority.¶ What the future will bring depends on the states. There exists some reason to believe that some state regulators value their expanded vision of the states' role for both political and economic reasons-financial settlements have produced a good deal of money as well as publicity. And now that everyone recognizes the states' role, it would be hard for the states to pull back without seemingly bowing to political pressure. But the states need to remember that they compete with federal regulation in a way which may be constitutionally aggressive and that, under the circuinstances, Congress could change at any time. I suspect that **all the relevant actors know this**, and the states will judiciously stop short of triggering a backlash. Indeed, as scandals and troubles fade, less incentives will exist to press the issue in the first place. If so, **the federalism tensions will quiet down**, at least until the next episode of troubles and scandals arise.

State and federal law is synergistic---they don't invade each other's territory

Z. Jill **Barclift 11**, Associate Professor of Law, Hamline University School of Law, "Governance in the Public Corporation of the Future: The Battle for Control of Corporate Governance," *Chapman Law Review*, vol 15(1), 2011, http://www.chapman.edu/law/_files/publications/CLR-15-z-jill-barclift.pdf

The relationship between federal securities laws and state corporate law is best described as **synergistic and complimentary**.8 Federal securities laws and regulations, with their emphasis on public disclosures and financial reporting, are complimentary to state law's focus on the relationships between shareholders and corporate managers, and the fiduciary obligations of the board.9 Recognizing the complimentary order of federal and state law, **Congress has been careful not to intrude into areas reserved for state governance** while carving out disclosure rules, which enables shareholders to make informed decisions.10 The D-F Act provides an example of how Congress balances disclosure with state fiduciary obligations of directors. Language in the D-F Act on non-binding shareholders' vote on executive compensation specifically provides a rule of construction in which the non-binding shareholders' vote does not overrule a decision by the board, create or imply a change to fiduciary duties, or create additional fiduciary duties for directors.¶ Notwithstanding the complimentary relationship of state and federal rules, the D-F Act and recent SEC rulemaking continue to demonstrate the

effective use of disclosure rules to influence corporate governance.12 Corporate governance requirements remain within states' regulatory purview and Delaware remains the dominant state for public company incorporation.13 However, it is the truce between federal securities laws and Delaware corporate law, which continues to illustrate how governance, in particular fiduciary duties, develops in response to Congress' desire to act in the face of corporate crises.14 History suggests that Congress acts in response to public pressures for reform.15 Correspondingly, Delaware reacts by either amending its corporate laws or further defining fiduciary obligations of directors.16 As Leo Strine writes, "why the American model of corporate governance has served investors so well is the **synergies** that **arise** from the combination of a strong regulatory structure governing public disclosures and financial integrity, and a more nimble and enabling state law approach to the relations between corporate managers and stockholders."17

Reject their rhetoric---SOX is nothing new

Reza **Dibadj 6**, Associate Professor, University of San Francisco School of Law, "From Incongruity to Cooperative Federalism," *University of San Francisco Law Review*, Vol. 40, Summer 2006, http://lawblog.usfca.edu/lawreview/wp-content/uploads/2014/09/A215.pdf

THE CONVENTIONAL wisdom has been that state law governs the internal affairs of corporations and federal law governs disclosure. Distinguished commentators lament Sarbanes-Oxley's ("SOX") 1 "unprecedented intrusions into corporate governance" 2 and claim that the "federal regime had until then consisted primarily of disclosure requirements rather than substantive corporate governance mandates, which were traditionally left to state corporate law."'3 These assertions, however, have **little basis in today's reality**.¶ Contrary to the usual exhortations, SOX is not a watershed: significant federal layering has been going on for decades.4 As Mark Roe has shown in a series of articles, SOX is **just the latest** in an array of federal incursions, which include the Securities Act of 1933,5 the Securities Exchange Act of 1934,6 the Williams Act,7 and the Foreign Corrupt Practices Act8 . 9 Roe concludes that¶ in nearly **every decade** of the twentieth century, the decade's major corporate law issue either went federal or federal authorities threatened to take it over-from early twentieth-century merger policy, to the 1930s securities laws, to the 1950s proxy fights, to the 1 9 60s Williams Act, to the 1970s going-private transactions.'¶ John Coates sums up the current confusing state of affairs:¶ Commentators have often noted the odd division of labor between federal securities law and state corporate law. Federal regulation of proxies, tender offers, and insider trading are all arguably much more integral to the substantive relationships among investors, firms, directors, and managers that are at the heart of corporate law, than they are to the disclosure-oriented emphasis of the existing federal securities statutes. On the other hand, cash tender offers, mergers and recapitalizations involve investment decisions as important as an initial decision to invest and present similar opportunities for fraud and deception."¶ Indeed, as I have argued elsewhere, a series of layers or "bandages" has developed to recover from recurring scandals-much like an antiquated computer operating system requires downloading patches to hobble along. 12¶ Why the layers? Commentators such as Roe suggest that the mere threat of federal intervention serves as a check on states' powers.' 3 A more Machiavellian reasoning, however, suggests that the federal government helps maintain the status quo by serving as a buffer that deflects attention from what state courts, most prominently in Delaware, are not doing. 14 Regardless of which account one believes, the status quo provides insufficient protections to shareholders. On the one hand, layers of regulation exist everywhere; on the other, problems fester and scandals routinely erupt.

Dodd-Frank alt cause to corporate federalism

Brian R. **Cheffins 14**, University of Cambridge Faculty of Law, European Corporate Governance Institute, "The Race to the Bottom Recalculated: Scoring Corporate Law Over Time," Temple University Bea sley School of Law, Legal Studies Research Paper No. 38, 2014, http://www.hbs.edu/businesshistory/Documents/Cheffins2014.pdf

The Dodd-Frank Act of 2010 constituted another **substantial federal incursion** into the corporate law realm.48 While this post-financial crisis legislation focused primarily on the regulation of banks, it contained a sub-title entitled "Strengthening Corporate Governance" applicable to **all issuers falling under the SEC's jurisdiction**, not just financial companies.49 This sub-title amended federal securities law to

instruct the SEC to introduce rules requiring companies that had failed to split the chief executive officer and chairman of the board roles to explain why and to authorize the SEC to develop a "proxy access" rule permitting shareholders with significant stakes to nominate under prescribed circumstances directors on a company's own proxy card. Another sub-title of the Act dealt with executive compensation, 50 amending Federal securities laws to mandate an advisory "say on pay" vote and additional compensation disclosures for all publicly traded companies subject to SEC jurisdiction.

Even massive economic decline has zero chance of war

Robert **Jervis 11**, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December 2011, "Force in Our Times," Survival, Vol. 25, No. 4, p. 403-425

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, **it is hard to believe that the conflicts could be great enough** to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that **even if the more extreme versions of free trade and economic liberalism become discredited**, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen **such a sharp economic down-turn** without **anyone** suggesting that force of arms is the solution shows that **even if bad times bring about greater economic conflict**, **it will not make war thinkable**.

Interdependence means zero chance that economic decline causes war

Leslie H. **Gelb 10**, President Emeritus of the Council on Foreign Relations; was a senior official in the U.S. Defense Department from 1967 to 1969 and in the State Department from 1977 to 1979, November/December 2010, "GDP Now Matters More Than Force," Foreign Affairs, Vol. 89, No. 6

To an unprecedented degree, the major powers now need one another to grow their economies, and they are loath to jeopardize this interdependence by allowing traditional military and strategic competitions to escalate into wars. In the past, U.S. enemies--such as the Soviet Union--would have rejoiced at the United States' losing a war in Afghanistan. Today, the United States and its enemies share an interest in blocking the spread of both Taliban extremism and the Afghan-based drug trade. China also looks to U.S. arms to protect its investments in Afghanistan, such as large natural-resource mines. More broadly, no great nation is challenging the balance of power in either Europe or Asia. Although nations may not help one another, they rarely oppose one another in explosive situations.

Given the receding threat of great-power war, leaders around the world can afford to elevate economic priorities as never before. To be sure, leaders throughout history have pursued economic strength as the foundation of state power, but power itself was equated

with military might. Today, the prevailing idea is that economic strength should be applied primarily toward achieving economic--not military--ends. Money is what counts most, so most nations limit their spending on standing armies and avoid military interventions. What preoccupies most leaders is trade, investment, access to markets, exchange rates, additional riches for the rich, and a better life for the rest.

This trend is plain among the rising regional powers known as the BRIC countries (Brazil, Russia, India, and China) and among such others as Indonesia, Mexico, South Africa, and Turkey. Although these countries' leaders have major security concerns--such as India with regard to Pakistan--their paramount objective has become economic strength. For most, economic growth is their prime means of fending off internal political opposition.

China makes perhaps the best case for the primacy of economics. Although it might emerge as a spoiler decades hence, Beijing currently promotes the existing economic order and does not threaten war. Because Beijing has been playing the new economic game at a maestro level--staying out of wars and political confrontations and zeroing in on business--its global influence far exceeds its existing economic strength. China gains extra power from others' expectations of its future growth. The country has become a global economic giant without becoming a global military power. Nations do not fear China's military might; they fear its ability to give or withhold trade and investments.

AT: Federalism---SOX Not Key

Federal encroachment on state securities law inevitable---repealing SOX doesn't solve

Robert B. **Thompson 3**, New York Alumni Chancellor's Professor of Law, Professor of Management, Vandy Law, expert in corporate law and securities regulation, "Securities Fraud as Corporate Governance: Reflections Upon Federalism," Vanderbilt University Law School, Law & Economics Working Paper Number 02-27, SSRN

Federal securities law and enforcement via securities fraud class actions today has become the **most visible presence** in regulating corporate governance. State law, long at center stage in discussions of corporate governance, continues to provide the legal skeleton for the corporate form and state fiduciary duty litigation continues as a frequent means to monitor managers. Yet, in today's world, state law does so almost entirely in the specific contexts of decisions about acquisitions or in self-dealing transactions. The **empirical evidence** in this Article illustrates that corporate governance outside of these areas **has passed to federal law** and in particular to shareholder litigation under Rule 10b-5.¶ The Sarbanes-Oxley Act of 2002, passed by Congress in the wake of the current corporate accountability scandals, provides new evidence of the expanded role of federal law. **But**, the move to federal corporate governance is **broader than that law** and has a **longer history** than the current scandals. The ascendancy of federal law in corporate governance reflects at least three factors. First, disclosure has become the most important method to regulate corporate managers and disclosure has been predominantly a federal, not a state, methodology. Second, state law has focused largely on the duties and liabilities of directors, and not officers, and federal law has increasingly occupied the space defining the duties and liabilities of officers. Officers have become the fulcrum of governance in today's corporations. Third, federal shareholder litigation based on securities fraud has several practical advantages over state shareholder litigation based on fiduciary duty that have contributed to the greater use of the federal forum. As a result of these trends, federal law now occupies the **largest part of the legal corporate governance infrastructure** in the 21st century. The outpouring of suggested reforms that have followed in the wake of Enron and WorldCom have focused on federal law and on the conduct of officers and directors, rather than state law, which in practice, focuses mainly on directors. Indeed, the discussions about reforms have excluded state law almost entirely.

AT: Federalism---No IL/No Conflicts

No federalization of corporate law or slippery slope

John C. **Coates 14**, John F. Cogan, Jr. Professor of Law and Economics at Harvard Law School, and Research Director of the Center on the Legal Profession, "SOX After Ten Years: A Multidisciplinary Review," forthcoming in *Accounting Horizons*, January 2014, http://www.law.harvard.edu/programs/olin_center/papers/pdf/Coates_758.pdf

One prominent criticism immediately following SOX was that it "federalized" corporate law (e.g., Romano 2005; Butler and Ribstein 2006). Straightforwardly, **the law did not do this**. Other than through the changes in the audit committee / audit firm relationship discussed above, and a relatively toothless ban on loans to public company executive officers, **SOX did little directly to alter "corporate governance**" or the state laws and stock exchange listing standards that shape governance practices. While major changes in corporate governance did coincide with SOX, they were the result of changes in listing standards adopted by stock exchanges themselves (see Coates 2007: 109-112) for more discussion).¶ However, it remained possible that SOX would have powerful effects on corporate governance in two indirect ways. First, it might pave the way for more Congressional intervention, representing a step on a slippery slope to a series of federal legislative changes to corporate law and governance (e.g., Ribstein and Butler 2006). Second, it might result in changes in state law as a result of shareholders suing under state law but using SOX's requirements as a basis for doing so, with the result that SOX would effectively create new standards of conduct for corporate directors (e.g., Burch 2006; Ferola 2007; Jones 2004).¶ Ten years later, it is apparent that **neither of these possibilities has come about**. While the Dodd-Frank Act may represent a modest example of the first possible indirect effect, in that it contained general corporate governance provisions that went beyond the financial industry, those changes are even more modest than those in SOX itself. "Say on pay" is perhaps the most well-known part of Dodd-Frank's corporate governance provisions, but that requirement merely imposes a non-binding shareholder vote on executive compensation, and fewer than two percent of US public companies have experienced a negative vote since its implementation. Other aspects of Dodd-Frank fall squarely into the "comply or explain" category, such as a requirement that public companies disclose whether they have two different individuals serving as chairman of the board and CEO, or are extremely modest in their effects, with its authorization for (but not a requirement that) the SEC to adopt regulations permitting shareholders to nominate one to three directors in the company's proxy statement (allowing economization on costs for nomination of a minority of directors), a step that Kahan and Rock (2011) call ―insignificant.‖ Further, the most significant set of changes to US securities laws since SOX can be found not in Dodd-Frank, but in JOBS Act, a 2012 law that mandated the SEC adopt a number of new exemptions from the disclosure and registration requirements of the federal securities laws – precisely **in the opposite direction** that SOX critics predicted. Indeed, by expanding exemptions for widely traded but unlisted firms, the JOBS Act greatly cut back the scope of SOX's coverage.¶ Turning to state law, a comprehensive review of all Delaware court decisions (n=1293) in the period 2002 to 2012 shows that only fifteen referred in any way to SOX or its provisions. Of those, **not one imposed liability on directors** for failing to adhere to standards or live up to obligations created by SOX. In fact, no such decision even allowed such a claim to go to trial. Nor has there been a material change in the formal standards of Delaware case law (for example by tightening the definition of what it means to be an ―independent‖ director, as asserted by Ferola 20074). Nor is there **any evident pattern** in outcomes of decisions holding corporate directors personally liable (see Black, Cheffins, and Klausner 2006), or in a significantly higher risk of liability for officers, despite section 302 of the Act (see Vogel 2009). Broad claims that SOX has distorted Delaware case law turn out to be overstated at best. Roe (2009) may be right that the fact or threat of lawmaking by Congress or the SEC influences Delaware judges, but the influences are subtle and hard to see in the case law overall. It may be more accurate to understood both federal and state lawmakers reacting simultaneously to timevarying public pressures and political demand for corporate accountability.¶ In sum, whatever the effects of SOX more broadly, it has not had the effect of "federalizing" corporate law to any meaningful extent. Delaware (and other states) laws, together with stock exchange listing standards, remain the core of corporate governance in the US, even for public companies. (We discuss data on SOX's effect on federal securities litigation, as opposed to state corporate litigation, below.)

Enron. Worldcom. Adelphia. Global Crossing. Tyco. Corporate scandals have made the front pages. Congress has gotten in the act. Members have held numerous hearings, given speeches, and, ultimately, passed the Sarbanes-Oxley Act.1 The Securities and Exchange Commission ("SEC") has been busy writing regulations and leaning on the stock exchanges to modify their listing requirements, all in order to restore "investor confidence." Federal prosecutors have indicted executives of Enron, Worldcom, and Adelphia and their minions in the auditing and investment banking industries.2 State officials have also been active. Several states have passed statutes that **resemble or go beyond the strictures of Sarbanes-Oxley**.3 Robert Morgenthau, the Manhattan District Attorney, has indicted the CEO and other officers of Tyco.4 And New York Attorney General Eliot Spitzer has vastly increased his political standing by taking on the brokerage houses, perhaps following in the footsteps of Rudolf Giuliani, another renowned prosecutor of corporate criminals.5 The leaders of corporate America have been galvanized to action, forming committees and task forces, issuing reports, and giving speeches.¶ But where has Delaware been through all this? No bills have been introduced in Delaware's legislature; no hearings held by its committees; its law enforcement agents have taken no action; and its executives have stayed mum. How is it that Delaware—the home of what has long been viewed as the de facto national corporate law—has sat on the sidelines?¶ In this Article, we take a step back from the recent scandals and the responses they have generated and ask some logically prior questions. What is the structure of corporate lawmaking in the United States? What is the relation between federal and state corporate lawmaking?6 And how does that relationship shape the style and content of corporate law?¶ The relationship between federal lawmaking power and state— in particular Delaware—corporate law has become the focus of significant scholarly attention. In a recent article, Mark Roe has argued that, because of the possibility of federal intervention, most Delaware corporate law rules either mimic the rules favored by federal lawmakers or get preempted by federal law.7 In Roe's world, states, and in particular Delaware, are basically federal implementation agents who enjoy little autonomy. Roe views the federal enactment of the Sarbanes-Oxley Act as the ultimate proof of his thesis, with the federal authorities "[d]ropping [p]retense" and "squelching the states with [their] own substantive law."8¶ Responding to Roe in an article contemporaneous to ours, Roberta Romano argues that states compete largely unimpeded by federal threats because states correlatively exercise control over Congress.9 According to Romano, the key components of state corporate law—fiduciary duties and the allocation of authority between managers and shareholders—have not been changed by federal law.10 The Sarbanes-Oxley Act is, at most, a fairly narrow exception as it arguably alters the allocation of authority only in its audit committee provisions.11¶ The articles by Roe and Romano represent the latest chapter of the classic state-competition debate in corporate law, where some scholars posit that federal regulation is needed to prevent a race to the bottom,12 while others maintain that federal intervention is undesirable and existing federal rules should be repealed in order not to impede a race to the top.13 Roe's thesis implies that the whole debate is misconceived because the federal authorities call all the shots. Romano contends that state competition, and the concomitant race to the top, is alive and well even after Sarbanes-Oxley.¶ Our position differs both from Roe's and Romano's. We argue that the possibility of federal preemption constitutes a threat to Delaware, but this threat is significant only in times—such as during the recent corporate scandals—when systemic change is seen as generating a significant populist payoff. Sarbanes-Oxley is **neither the death knell for state competition**, as Roe suggests, **nor an aberration**, as Romano argues, but a response to a particular political climate that constitutes a threat to Delaware's highly-profitable chartering business.¶ We further suggest that Delaware has adapted to this threat by pursuing what we will call a classical or 19th century common law model of lawmaking. But this classical model of lawmaking entails some intrinsic limitations, including that legal change is slow, standard-based, and incremental. These limitations explain how Delaware responded to the recent corporate scandals and, in turn, create a space where the relationship between federal rules and Delaware law is **symbiotic, rather than competitive** as depicted by the classical state-competition debate. Our thesis thus seeks to explain the structure of Delaware corporate law and to offer a proper domain for federal law even for commentators broadly sympathetic to the race-to-the-top view.¶ In Part I, we analyze the institutional and political landscape of corporate lawmaking. Although Delaware exercises a significant lawmaking role, it is faced with an omnipresent specter of a federal takeover, which could threaten the substantial income the state derives from franchise fees. The principal threat for Delaware is the possibility that federal intervention will be triggered by a situation in which systemic change generates significant populist political payoffs. This danger is aggravated by Delaware's apparent lack of democratic legitimacy: why should a small state set national policy for corporate law? It is in Delaware's interest to structure its law to minimize its exposure to such an attack. In addition, Delaware must take account of the rules on personal jurisdiction and on conflict of laws embedded in the federal structure.¶ Part II identifies a number of salient traits that characterize Delaware's corporate law. Most important and controversial legal rules are the product of judge-made law. Judicial opinions are filled with quasi-deterministic reasoning. Statutory amendments to the corporation law are initially drafted by a bar committee, are adopted without change or debate by the legislature, and address largely technical and noncontroversial matters. Delaware's judiciary has substantial expertise on corporate law and is nonpolitical. In contrast to Delaware's first-rate system for the private enforcement of corporate laws, public enforcement is virtually nonexistent. And the scope of corporate law is largely confined to the regulation of the internal affairs of a corporation.¶ In Part III, we argue that these traits can be understood as adaptations to the political and institutional landscape in which Delaware operates. In many respects, Delaware's corporate law may be the last vestige of the classical 19th century common law model in America: most important legal rules are promulgated by a nonpartisan, expert judiciary; these rules are presented as derived from long-standing and widely accepted principles; the law is enforced through civil litigation brought by private parties; and even legislative amendments generate neither debate nor controversy. All this has the effect of creating and enhancing a technocratic, apolitical gloss over Delaware's corporate law and thus helps to shield Delaware from being attacked for lacking democratic legitimacy. At the same time, the scope of Delaware's corporate law is designed to minimize conflicts by assuring that Delaware has the requisite personal jurisdiction over defendants to enforce its law effectively and that the prevailing conflict rules point to substantive Delaware law as applicable to a dispute.¶ In Part IV, we assess Delaware's response to the recent corporate scandals and the division of corporate lawmaking roles between Delaware and the federal government. We argue that Delaware's response to the scandals—or rather, the lack thereof— flows from its adherence to the

classical common law model. Faced with corporate scandals, calls for action, and Sturm und Drang, Congress passed sweeping legislation and Eliot Spitzer crusaded against Wall Street. But Delaware waits until a legal dispute is brought in its courts, and even then addresses the issues only in an incremental fashion. While this means that Delaware has been out of the limelight, potentially hurting its image in the short term, staying out of the political limelight is in Delaware's long-term interest. Spitzer may be a successful politician, and he may even be the right Attorney General for New York, but he would not be the best person to assure that hundreds of millions in annual franchise fees keep flowing into Delaware's coffers. But because the classical common law style, together with jurisdictional and conflict rules, constrain Delaware, federal law is needed to complement Delaware's. This is so where Delaware's common law regime cannot effectively supply the optimal legal regime—e.g., because it requires public enforcement or is highly regulatory—or where the rules on personal jurisdiction or conflicts inhibit Delaware's ability to regulate. In that respect, the relation between federal law and Delaware law is symbiotic, rather than competitive: Delaware is happy to have federal law pick up the slack and thereby reduce the likelihood that ineffective regulation produces a populist backlash.

SOX not an overreach

Lisa M. **Fairfax 5**, Associate Professor of Law, University of Maryland School of Law, "Sarbanes-Oxley, Corporate Federalism, and the Declining Significance of Federal Reforms on State Director Independence Standards," *Ohio Northern University Law Review*, vol 31, 2005, SSRN

However, after analyzing the Act and its impact on corporate boards over the last few years, this Article concludes that the alarming cry by commentators might have raised a **false problem**, because the federal intrusion into states' discretion over concepts of director independence appears to be limited at best. This Article further asserts that given the perceived defects with states' treatment of director independence and the critical role independent directors play in adequate monitoring of corporate affairs, this lack of intrusion might hinder the Act's ability to alter the corporate governance system in any meaningful manner. In fact, this Article argues that Sarbanes-Oxley should have more forcibly intervened in state law by directing listing agencies and states to alter their director independence standards in a manner that accounts for all compromising affiliations, including personal and social ones.¶ Part I of this Article discusses the concept of director independence and its importance to our system of corporate accountability, and then demonstrates how Sarbanes-Oxley appears to preempt state law in the area of director independence. Focusing on Delaware law, Part II reveals that the Act **does not reflect a significant departure from state law rules** and corporate governance norms in existence prior to Sarbanes-Oxley's enactment. Part II then evaluates Delaware law post-Sarbanes-Oxley and illustrates that the Act initially appeared to encourage Delaware courts to alter their independence standards, particularly with respect to considering personal and social relationships when evaluating director's independence. Part II, however, also reveals that Delaware now appears to be retreating from this alteration because the Delaware Supreme Court's recent decision involving director independence significantly discounts the impact of such relationships on director's impartiality. Part II concludes that this apparent retrenchment by Delaware might prevent Sarbanes-Oxley from having any lasting impact on that state's decisions in this area.

AT: Director Independence IL --- Sarbanes-Oxley doesn't preempt state director independence law

Lisa M. **Fairfax 5**, Associate Professor of Law, University of Maryland School of Law, "Sarbanes-Oxley, Corporate Federalism, and the Declining Significance of Federal Reforms on State Director Independence Standards," *Ohio Northern University Law Review*, vol 31, 2005, SSRN

By contrast, Sarbanes-Oxley's focus on defining director independence might be more invasive on state law. Delaware statutes do not define independence. Instead, courts determine a director's independence on a case-by-case basis.85 Under this approach, Delaware courts have articulated a broad definition of independence similar to the one adopted by the NYSE and Nasdaq. Thus, Delaware defines an independent director as one who is not under the domination of, or beholden to, another director or officer.86 How ever, Delaware courts have not identified any specific categories of relation ships that would presumptively prohibit a director from being independent. In fact, those courts have

specifically refused to adopt such rigid categorizations. In doing so, Sarbanes-Oxley reforms appear to deprive Delaware courts of the discretion to make individual assessments of directors' independence. This deprivation may reflect a significant intrusion upon state's power.¶ Moreover, at least one of the relationships that would disqualify a director from being independent under the reforms would not have the same impact under Delaware law. Sarbanes-Oxley disqualifies directors who have received payment of consulting, advisory, or other compensatory fees other than director fees. By contrast, Delaware courts do not view receipt of such fees as compromising a director's independence. To the extent that Sarbanes-Oxley would require Delaware courts to follow its rules for director independence, this inconsistency suggests a true preemption of that state's law.¶ However, Sarbanes-Oxley and related reforms **do not require Delaware to apply their concepts of independence** to the derivative suit analysis or in **any other context** where issues involving independence traditionally arise under state law. Indeed, Sarbanes-Oxley's independence rules only govern the audit committee and hence have a **very limited application to state law**. Certainly the listing standards apply more broadly to the majority of the board and at least two additional board committees. Yet even those standards do not mandate that states apply such criteria to other committees of the board, such as the special litigation committee, or in other contexts involving directors. Because of this lack of mandate, Professors Lyman Johnson and Mark Sides argue that Sarbanes-Oxley does not reflect an express federal intention to "occupy the field" in the area of director independence, and hence cannot be construed as a form of federal preemption.9° In their views, Sarbanes-Oxley introduces a system of dual regulation of directors, which system **leaves state law standards of independence largely intact.**9' Given that the listing standards apply to at least a majority of the board, it is hard to imagine that those standards will not generate some spillover intrusion into state's discretion, ensuring that most directors satisfy federal standards of independence. However, this spillover effect appears to be a limited intrusion into state's authority, underscoring the notion that Sarbanes-Oxley allows states **tremendous freedom** to fashion their own director independence rules.¶ Then too, even this intrusion is not as significant as it appears because there are many parallels between the reforms' definitions of director independence and the manner in which Delaware assesses such independence. For example, the reforms address familial relationships in a manner similar to Delaware law. Thus, reforms not only disqualify directors whose family members are involved in prohibited relationships, but they broadly define family to include a wide range of familial relationships.92 Thus, under both NYSE and Nasdaq rules, immediate family members include spouses, parents, siblings, children, in-laws, and anyone living with the director. In this same vein, Delaware courts have recognized the compromising nature of such relationships and broadly construed construing those relationships. Hence, courts have found the grandson of an interested director to lack independence as well as the brother-in-law of an interested officer. Delaware's disqualification of these relationships appears consistent—and in some cases more expansive—with those covered under the listing standards.¶ Most importantly, the reforms mirror state law's failure to focus on close social or personal ties when assessing a director's independence. With the exception of familial bonds—which both the reforms and state law address— the reforms appear to view independence in terms of financial ties, without specifically focusing on personal and social ties among directors. Given that reports surrounding corporate governance scandals recognized that social and personal ties might have comprised director independence,96 this exclusion appears both significant and troubling. Like many aspects of the reforms, however, this exclusion is consistent with Delaware law. Indeed, Delaware courts have been reluctant to conclude that non-economic relationships compromise independence. Thus, Delaware courts consistently have held that allegations of close personal friendships among directors and corporate officers, even lifelong friendships, would be insufficient to discredit directors' independence. In one case, for example, a fifteen-year personal relationship between a CEO and a director was not sufficient to raise a reasonable doubt as to a director's independence from the CEO. Emphasizing this point, Delaware Supreme Court Chief Justice Norman Veasey has insisted that courts should not rely on any presumption that "friendship, golf companion ship, and social relationships" jeopardize directors' independence.'00 His position underscores Delaware's basic refusal to give credence to such relationships when assessing director independence. This refusal appears to be mirrored in federal reforms' failure to specifically characterize those relationships as detrimental to directors' independence.¶ As this discussion reveals, Sarbanes-Oxley **reflects rather than alters existing corporate rules** and norms regarding director independence. This reflection **minimizes any preemptive impact** that the Act has on state law in this area.

AT: Federalism---Dodd-Frank Alt Cause

Dodd-Frank comparatively outweighs SOX

Jill E. **Fisch 13**, Perry Golkin Professor of Law, University of Pennsylvania Law School, "Leave it to Delaware: Why Congress Should Stay Out of Corporate Governance," *Delaware Journal of Corporate Law*, vol 37, 2013, http://www.djcl.org/wp-content/uploads/2014/07/LEAVE-IT-TO-DELAWARE-WHY-CONGRESS-SHOULD-STAY-OUT-OF-CORPORATE-GOVERNANCE.pdf

Following the governance scandals of the late 1990s, including Enron, WorldCom, and HealthSouth, Congress made its most significant intrusions into state regulation of corporate law.6 In the Sarbanes-Oxley Act of 2002 ("Sarbanes-Oxley")7 Congress imposed certification requirements on corporate officials,8 mandated audit committees,9 and barred loans to corporate officers.10 Commentators criticized these requirements, warning of the creeping federalization of corporate law.11 The characterization of Sarbanes-Oxley as intruding upon state regulation of corporate governance, however, was **largely overstated**. The primary focus of SarbanesOxley—accounting regulation and the auditing process—had historically been a component of **federal rather than state regulation**.12 Sarbanes-Oxley did little to alter the core concern of state corporate law–the balance of power among officers, directors, and shareholders.¶ With its adoption of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2012 ("Dodd-Frank"),13 Congress **went further** than it did in Sarbanes-Oxley. For the first time, Congress intruded into the allocation of decision-making authority within the corporate entity. In Dodd-Frank, Congress enacted two provisions that specifically enhance shareholder power: say on pay14 and proxy access.15 Congress also required the Securities and Exchange Commission ("SEC") and stock exchanges to adopt additional corporate governance disclosure requirements.16 In so doing, Congress made a deliberate determination that the financial crisis had exposed shareholders' inability to ensure management accountability. The corporate governance provisions in Dodd-Frank reflect a congressional decision to afford shareholders greater control over the election process in general and give them a greater voice, especially on executive compensation issues.

Outsourcing/Manufacturing Advantage

No Compliance Costs/Delisting

SOX compliance costs don't drive delisting from the United States

Lys, 2009, Eric L. Kohler Chair in Accounting, Professor of Accounting Information & Management (Thomas, "Driven Offshore", http://insight.kellogg.northwestern.edu/article/driven_offshore)

Delisting to Protect Private Benefits Nevertheless, the study produced a clear conclusion. "The [delisting] firms experienced a significantly negative price reaction to their delisting announcements—**a result that is contrary to the argument that these SOX-related delistings are primarily undertaken on the basis of cost savings that is associated with the burdensome SOX requirements**," the team writes. "Instead, the evidence suggests that the delistings are motivated by [managers'] desire to protect their private benefits that SOX would curb and investors seem to understand that these delistings are not value enhancing for outside shareholders." From a positive point of view, the team finds no evidence suggesting that the large compliance costs imposed by SOX have played a driving role in foreign firms' delisting decisions, and hence that the legislation has not undermined the competitiveness of U.S. capital markets. However, Lys adds, "The purpose of SOX was to force companies with poor governance to improve. Paradoxically, the ones that stayed were those that have the better governance and the ones that left had poorer governance. In the effort to improve, SOX lost the ability to control." As Lys sees it, his group's research sends a dual message on the success of SOX. "If your primary goal is to prevent U.S. investors investing in assets in which they can be defrauded, you'll want them to improve or leave. To that extent, SOX has been successful. But if you want to make a better world, you have moved these companies offshore—making the rest of the world worse off since overseas regulations are weaker."

There's no impact to costs---profits are still high and SOX had benefits

Robert **Prentice 7**, Ed & Molly Smith Centennial Professor of Business Law, McCombs School of Business, UTA, "Sarbanes-Oxley: The Evidence Regarding the Impact of SOX 404," *Cardozo Law Review*, vol 29(2), 2007, http://section404.org/UserFiles/File/research/CARDOZO_LAW_REVIEW.pdf

Corporations now complaining about SOX are also racking up record profits that were **88% higher in 2006 than in 2002**.62 Although Wall Street has been howling about SOX 404, in 2006 and early 2007 the Dow Jones Industrial Average reached heights that were not touched even during the unsustainable frenzy of the dot-com boom.63 All major Wall Street investment banks reported record profits in 2006.64 Thus, it is **extremely difficult** to find any macro evidence to support assertions that SOX 404 has been throwing "buckets of sand into the gears of the market economy."65 Rather, consider that in October 2002, "the dark days when the market was most nervous about the quality of financial reporting,"66 credit spreads for investment grade companies were 2.5 percentage points over Treasury rate, whereas by 2006 that spread had shrunk to 0.85%. The managing director of Moody's Investors Services has stated that not all of that shrinkage can be "attribute[d] to 404, but if only 10 percent of that reduction is due to 404, put those numbers in your calculator and you get a benefit that is **absolutely enormous**."67

Costs will come down in the future---including for small firms

Robert **Prentice 7**, Ed & Molly Smith Centennial Professor of Business Law, McCombs School of Business, UTA, "Sarbanes-Oxley: The Evidence Regarding the Impact of SOX 404," *Cardozo Law Review*, vol 29(2), 2007, http://section404.org/UserFiles/File/research/CARDOZO_LAW_REVIEW.pdf

Additionally, SOX 404 costs have generally **come down substantially** after initial implementation, which is more expensive than annual maintenance. A 2006 study found a **44% drop for larger companies** and a **30% drop for smaller firms**.157 Two important reasons for the decline are (a) software improvements making the internal control monitoring process more efficient, and (b) firms becoming a little more relaxed–for a time firms all overdid it because no CEO or auditor wanted to be the next headline in The Wall Street Journal.¶ Costs will continue to decline because the SEC and PCAOB have (quite belatedly) begun to issue guidance aimed at reducing costs by clarifying what they expect under SOX 404.159 Because what was required was unclear and corporate managers were risk-averse (and not unreasonably so), auditors exercised the whip hand and seemingly took advantage in order to replace the consulting revenues they lost because of Sarbanes-Oxley with 404 audit revenues.160 By clarifying the need for firms to focus on the kinds of internal processes that create the highest risks to the integrity of financial statements (and to skip trivial matters such as checking employee timesheets), the new guidelines should help to restore the proper balance between auditor and client, thereby **continuing to reduce costs**.

Offshoring Now

Offshoring now and alt causes make it inevitable

Adam **Hersh 14**, Senior Economist at the Center for American Progress, "Offshoring Work Is Taking a Toll on the U.S. Economy," 7/30/14, https://www.americanprogress.org/issues/economy/news/2014/07/30/94864/offshoring-work-is-taking-a-toll-on-the-u-s-economy/

The global economy is becoming a more integrated and competitive neighborhood. Driven by new investments and the jobs that come with them, the expansion of the global economy into coordinated production and supply chains brings both benefits and opportunities. It also raises questions about the source and location of future jobs and growth.¶ Offshoring, the practice of moving production to foreign locales while continuing to sell goods to the U.S. market, is a **pervasive feature of the U.S. economy today**. Market pressures drive businesses to seek reduced production costs, often in places where standards of living and protections for workers and the environment are more lax than in the United States. Moreover, an ineffective tax structure further encourages the relocation of assets and production to foreign countries with lower costs. Policies such as a tax credit that reduces the costs a company incurs when it reshores jobs back to the United States would help slow this trend. In addition, the financial incentive to bring production back would help workers here at home, where production loss has led to broad downward pressure on wages across the economy, even in industries relatively insulated from international trade competition.¶ Offshoring is a **prevalent feature of the U.S. economy**, with much of this trade occurring within multinational companies' corporate families. Figures 1A and 1B show U.S. Census data on imports and exports to and from the United States that occurred between related corporate entities as a share of overall U.S. goods trade from 2002 to 2013. As is clear from Figure 1A, the share of products imported to the United States from related corporate entities constitutes nearly half of all U.S. imports since 2004. As more businesses moved production to lower-cost regions, this share increased to 50 percent in 2013, up from 48 percent in 2004.¶ When looking specifically at the manufacturing sector, imports for capital-intensive industries such as machinery and chemicals—primary drivers of productivity growth and innovation—illustrate the **hollowing out of U.S. industry** through their disproportionately high share of trade between related corporate entities relative to the overall economy average. Paradoxically, U.S. companies were much less likely to engage in production relocation in low-capital and low-skill, labor-intensive manufacturing industries over the past decade, indicating that U.S. and global businesses see the U.S. market more as a destination for sales than as place to invest in production.¶ In comparison to Figure 1A, the related-party exports shown as a share of overall U.S. exports in Figure 1B indicate that offshoring is a two-way street. Multinational companies from other countries are locating production in the United States for sale in other countries' markets but are doing so at a much lower rate than the U.S.-based companies locating production offshore to supply goods to the U.S. market.¶ In reality, offshoring is an **even more pervasive** phenomenon than is displayed here as these data capture only the related-party aspects of the practice. Outsourcing—offshoring through arms-length contractual relationships between separate entities—is common as well.¶ The recent rising U.S. surplus in services trade—particularly financial and legal services and licensing income from intellectual properties—also reflects the offshoring phenomenon, not merely the competitive strength of U.S. service industries. Data from the Bureau of Economic Analysis show the share of trade in services exports that occurs within related corporate entities. (see Figure 2) Starting around 1993, the share of U.S. service exports to related corporate entities began to grow, reaching nearly 68 percent of overall service exports in 2011. This was up from around 45 percent in 1987. The trend is clear: As offshoring practices increase, companies need to provide more wraparound services—the things needed to run a businesses besides direct production—to their offshore production and research and development activities. Rather than indicating the competitive strength of U.S. services businesses to expand abroad, the growth in services exports follows the pervasive offshoring of manufacturing and commercial research activities.¶ The United States tax code actually **incentivizes moving production, jobs, and profits overseas** by favoring overseas investment with a lower effective tax rate. According to a Tax Law Review article by Melissa Costa and Jennifer G. Gravelle, foreign-source income for U.S. multinational corporations saw an average tax rate of 15.7 percent as of 2007, while domestic-based income saw an average rate of 26 percent, a disparity of around 10 percentage points. As noted in a Center for American Progress report on corporate tax reform, this distortion in the tax treatment of foreign and domestic corporate income "violates economic neutrality and does not serve our national interest."¶ Finally, offshoring and import competition are taking a toll on wages in the United States. Recent research from Michael Elsby of the University of Edinburgh, Bart Hobijn of the Federal Reserve Bank of San Francisco, and Aysegul Sahin of the Federal Reserve Bank of New York shows that the more a U.S. industry is exposed to offshoring pressures, the more downward pressure is put on the wage share within it. (see Figure 4) The authors show that this wage effect, steadily building over the past 25 years, has been felt broadly across the economy even—though less intensely—in non-import-competing industries.¶ As is evident from the figures above, increased economic competition, market pressures, and an ineffective tax system have resulted in an increase in the practice of moving production to offshore locales and then selling goods back to the U.S. market. Policies such as a tax credit that reduces the costs of reshoring jobs back to the United States would go far to ameliorate this trend. Similarly, a tax credit could help slow the growing negative pressure on wages evident in most import-competing industries.

Offshoring now

Aird, 2010, Global Leader of the PwC Shared Services and Outsourcing advisory and Business Services Transformation (Charles, "Offshoring in the manufacturing industry", https://www.pwc.com/us/en/outsourcing-shared-services-centers/assets/offshoring-in-the-manufacturing-industry.pdf)

Innovation has always been considered a core competence that should be developed and maintained within an organization. However, over the past decade the growth of global innovation sourcing—driven mainly by the globalization of both technology markets and knowledge workers—has begun to challenge this conventional wisdom. Offshoring goes far beyond the migration of relatively routine tasks like administrative work, IT infrastructure, or call center staffing and now includes product development and design, and research and development. Although the concept of offshoring is not new for manufacturing companies, its previous application usually involved labor arbitrage in low-level, routine manufacturing jobs. Findings from the 2009 Offshoring Research Network (ORN) survey reveal that manufacturing companies are now among the major practitioners of innovation offshoring, including engineering services, research and development, and product design. Chart 1 summarizes the percentage of manufacturing companies that are offshoring a particular function, and clearly demonstrates that, compared to other functions, innovation services are growing the fastest, surpassing other major offshore activities such as information technology and contact center. This trend within manufacturing is particularly noteworthy given its absence from other industries more typically associated with information technology offshoring. Take finance and insurance industry as example. Chart 2 illustrates the slow growth of innovation offshoring in finance and insurance industry in which only 18 percent of companies are currently offshoring their innovation activities. Overall distribution of offshoring by manufacturing companies (Chart 3) shows that more than 60 percent of manufacturing companies engage in innovation offshoring, where their main destinations (see Chart 4) include India (33 percent), China (27 percent) and Western Europe (17 percent). This finding is consistent with service providers' expectations (2009 ORN service provider survey). In response to the question about their expectations of growing destinations for a particular function, **over 30 percent of service providers named India and China as high-growth destinations for innovation offshoring** (see Chart 5). More than a third of participating manufacturers reveal that information technology, finance and accounting, and procurement are among their top offshoring operations. One finding that stands out from the survey is offshore destination choices of manufacturing companies. While India generally remains the most attractive offshoring destination, participating manufacturing companies articulated a strong preference for using European providers for finance and accounting, marketing and sales, and contact center offshoring. Forty-four percent of manufacturing companies offshore their marketing and sales operations to western European providers, with only 10 percent to going to Indian providers. Similarly, Western (22 percent) and Eastern (32 percent) Europe are also the favorite locations for finance and accounting offshoring by manufacturing companies. Cost overruns and declining efficiencies (mostly due to wage inflation and uncoordinated growth of offshoring activities across the company) often trigger a reconsideration of the organizations' offshoring activities, which in many cases results the implementation of corporate-wide strategies for guiding offshoring decisions. According to the 2009 ORN survey, **the top two reasons for contract termination specified by participating service providers are clients' unrealistic expectations and the lack of a clear outsourcing strategy** (see Chart 6). In the context of offshoring and outsourcing, the adoption of a corporate-wide offshoring strategy likely represents a transitional stage in the evolutionary process of developing more elaborated offshoring and outsourcing capabilities. Reflecting this overall trend, the 2009 ORN survey shows a dramatic increase in the number of organizations adopting a company-wide strategy for guiding their offshoring decisions at the business unit and function levels. Compared with the overall sample in which 57 percent of companies have implemented a company-wide strategy guiding their offshoring implementations, only 47 percent of manufacturing industry participants report doing so (see Chart 7). As companies gain offshoring experience, they increasingly adopt a company-wide strategy for guiding offshoring decisions at the business unit and function levels. However, it is notable that more than half of the manufacturing companies in the sample report that although an offshoring strategy has been implemented at a function level it has yet to reach the C-suite. This reality might reflect the decentralized nature of most diversified industrial manufacturing companies. In fact, the manufacturing companies sample includes at least two case studies of companies that began offshoring various processes and functions having first adopted a corporate-wide offshoring strategy. In one case, the offshoring strategy was implemented from the top, down and in the second, from

the bottom, up. During follow-up interviews, manufacturing companies that have yet to adopt company-wide offshoring strategies indicated that they are considering doing so. In moving to a company-wide strategy, companies hope to guide and standardize offshoring decisions across business units and functions such as IT infrastructure (to achieve economies of scale via third-party providers), accounting and finance, and global sourcing of innovation-related work.

SOX was net beneficial---all aff criticisms are wrong and empirically denied

Julia **Hanna 14**, associate editor of the HBS Alumni Bulletin, "The Costs And Benefits Of Sarbanes-Oxley," 3/10/14, http://www.forbes.com/sites/hbsworkingknowledge/2014/03/10/the-costs-and-benefits-of-sarbanes-oxley/

Its intent was to improve corporate governance and restore the faith of investors, but many in the business world spoke out against SOX, viewing it as a politically motivated over-correction that would lead to a loss of risk-taking and competitiveness.¶ HBS Associate Professor Suraj Srinivasan and Harvard Law School Professor John C. Coates leverage the benefit of hindsight to assess research findings from over 120 papers in accounting, finance, and law to evaluate the act's impact and establish takeaways to guide the creation of future legislation.¶ While current measurement systems are insufficient to make an unambiguous, overarching judgment of the act's net benefits, Srinivasan and Coates isolate a few clear findings and make a case for flexibility and experimentation to guide future laws and reforms in the financial arena.¶ One thing is clear: Despite severe criticism, the act and the institutions it created have survived almost intact since enactment. But so have condemnations. It's a puzzle, say the authors, that "on the one hand, the law continues to be **fiercely and relentlessly attacked** in the US" while those most affected by the act as implemented express "**acquiescence or even mild praise**."¶ The paper, SOX after Ten Years: A Multidisciplinary Review, is scheduled to be published later this year in Accounting Horizons.¶ "We took a cost/benefit approach when considering SOX," explains Srinivasan. The most worrisome part of the act on the business side was the mandate that required public companies to obtain an independent audit of their internal control practices. The cost of this requirement, he says, was felt most acutely by smaller companies, although it was ultimately deferred for companies with market caps of less than $75 million and made permanent in the Dodd-Frank Act. Audit standards also were modified in 2007, a change that reportedly reduced costs for many firms by 25 percent or more per year.¶ "That aspect of flexibility—being able to exempt some smaller companies from the mandate and make it easier for others to implement—is an **important quality** to keep in mind when we discuss future regulation," says Srinivasan, who also cites the important role of the Public Company Accounting Oversight Board (PCAOB), a nonprofit private corporation created by SOX that oversees auditors of SEC-registered companies.¶ MARKETS HAVE BENEFITTED¶ Despite high initial costs of the internal control mandate, evidence shows that it has proved beneficial. "Markets have been able to use the information to assess companies more effectively, managers have improved internal processes, and the internal control testing has become more cost-effective over time," according to Srinivasan.¶ The research does not support the fear that SOX would reduce levels of risk-taking and investment in research and growth. Another concern that the act would shrink the number of IPOs **has not been borne out either**; in fact, the pricing of IPOs post-SOX became less uncertain. The cost of being a publicly traded company did cause some firms to go private, but research shows these were primarily organizations that were smaller, less liquid, and **more fraud-prone**.¶ "Yes, SOX may have cut off public market financing to these companies, but the question is whether it was appropriate for them to be in public markets in the first place," Srinivasan says. "That is a value judgment, to be sure. But **it may not be a bad thing** if certain companies are restricted in their access to financing, simply because loss of trust in public capital markets has big consequences for the entire economy."¶ A 2005 survey by the Financial Executives Research Foundation found that **83 percent of large company CFOs agreed that SOX had increased investor confidence**, with 33 percent agreeing that it had reduced fraud.

No competitiveness impact to Sarbanes-Oxley

Robert **Prentice 7**, Ed & Molly Smith Centennial Professor of Business Law, McCombs School of Business, UTA, "Sarbanes-Oxley: The Evidence Regarding the Impact of SOX 404," *Cardozo Law Review*, vol 29(2), 2007, http://section404.org/UserFiles/File/research/CARDOZO_LAW_REVIEW.pdf

Beyond direct costs, the most urgent complaint about SOX 404 is its impact on the competitiveness of U.S. securities markets. Because the U.S. share of global stock market activity in 2005 was about 50%, slightly higher than the 47% figure of a decade before,186 these complaints should be **closely scrutinized**. Even according to its critics, SOX 404 is not the sole or perhaps even primary part of SarbanesOxley allegedly causing competitiveness problems, and there are also numerous non-legal factors adversely affecting the U.S. securities industry that **no rollbacks of any portion of SOX could impact**. As a final introductory point, over the last decade foreign capital markets have gained on U.S. markets by some measures187 while their governments increased rather than decreased the stringency of their securities regulation.188 In other words, foreign markets have been gaining competitively by **imitating U.S. capital market regulation.**

Hegemony Impact Defense

Heg resilient

Michael **Beckley 12**, research fellow in the International Security Program at Harvard Kennedy School's Belfer Center for Science and International Affairs and assistant professor of political science at Tufts University, "China's Century? Why America's Edge Will Endure," Winter 2011/2012, International Security, Vol. 36, No. 3, belfercenter.ksg.harvard.edu/files/Chinas_Century.pdf

To be sure, the costs of maintaining U.S. military superiority are substantial. By historical standards, however, they are exceptionally small.41 Past hegemons succumbed to imperial overstretch after fighting multifront wars against major powers and spending more than 10 percent (and often 100 or 200 percent) of their GDPs on defense.42 The United States, by contrast, spends 4 percent of its GDP on defense and concentrates its enmity on rogue nations and failed states. Past bids for global mastery were strangled before hegemony could be fully consolidated. The United States, on the other hand, has the advantage of being an extant hegemon—it did not overturn an existing international order; rather, the existing order collapsed around it. As a result, its dominant position is entrenched to the point that "any effort to compete directly with the United States is futile, so no one tries."43¶ The dollar's global role may handicap American exports, but it also comes with perks including seigniorage,44 reduced exchange rate risks for U.S. firms involved in international commerce, competitive advantages for American banks in dollarized financial markets, and the ability to delay and deflect current account adjustments onto other countries.45 More important, foreign governments that hold dollar reserves depend on U.S. prosperity for their continued economic growth and are thus "entrapped," unable to disentangle their interests from those of the United States.46 Rather than seeking to undermine the American economy, they invest in its continued expansion.47¶ Finally, given its position at the top of the world trade regime, the United States can distort international markets in its favor.48 Declinists expect the

hegemon to use its power magnanimously. According to the alternative perspective, however, American foreign economic policy involves the routine use of diplomatic leverage at the highest levels to create opportunities for U.S. firms.49 U.S. trade officials, "acting as self-appointed enforcers of the free trade regime, asserted the right with their own national law to single out and punish countries they judged to be unfair traders."50 Globalization, therefore, may not be a neutral process that diffuses wealth evenly throughout the international system, but a political process shaped by the United States in ways that serve its interests.

Best data concludes no impact to heg

Benjamin H. **Friedman et al 13**, research fellow in defense and homeland security studies; Brendan Rittenhouse Green, the Stanley Kaplan Postdoctoral Fellow in Political Science and Leadership Studies at Williams College; Justin Logan, Director of Foreign Policy Studies at the Cato Institute Fall 2013, "Correspondence: Debating American Engagement: The Future of U.S. Grand Strategy," International Security, Vol. 38, No. 2, p. 181-199

Brooks et al. argue that the specter of U.S. power eliminates some of the most baleful consequences of anarchy, producing a more peaceful world. U.S. security guarantees deter aggressors, reassure allies, and dampen security dilemmas (p. 34). "By supplying reassurance, deterrence, and active management," Brooks et al. write, primacy "reduces security competition and does so in a way that slows the diffusion of power away from the United States" (pp. 39–40). There are three reasons to reject this logic: security competition is declining anyway; if competition increases, primacy will have difficulty stopping it; and even if competition occurred, it would pose little threat to the United States. an increasingly peaceful world. An array of research, some of which Brooks et al. cite, indicates that factors other than U.S. power are diminishing interstate war and security competition.2 These factors combine to make the costs of military aggression very high, and its benefits low.3 A major reason for peace is that conquest has grown more costly. Nuclear weapons make it nearly suicidal in some cases.4 Asia, the region where future great power competition is most likely, has a "geography of peace": its maritime and mountainous regions are formidable barriers to conflict.5 Conquest also yields lower economic returns than in the past. Post-industrial economies that rely heavily on human capital and information are more difficult to exploit.6 Communications and transport technologies aid nationalism and other identity politics that make foreigners harder to manage. The lowering of trade barriers limits the returns from their forcible opening.7 Although states are slow learners, they increasingly appreciate these trends. That should not surprise structural realists. Through two world wars, the international system "selected against" hyperaggressive states and demonstrated even to victors the costs of major war. Others adapt to the changed calculus of military aggression through socialization.8 managing revisionist states. Brooks et al. caution against betting on these positive trends. They worry that if states behave the way offensive realism predicts, then security competition will be fierce even if its costs are high. Or, if nonsecurity preferences such as prestige, status, or glory motivate states, even secure states may become aggressive (pp. 36-37).9 These scenarios, however, are a bigger problem for primacy than for restraint. Offensive realist security paranoia stems from states' uncertainty about intentions; such states see alliances as temporary expedients of last resort, and U.S. military commitments are unlikely to comfort or deter them.10 Nonsecurity preferences are, by definition, resistant to the security blandishments that the United States can offer under primacy Brooks et al.'s revisionist actors are unlikely to find additional costs sufficient reason to hold back, or the threat of those costs to be particularly credible. The literature that Brooks et al. cite in arguing that the United States restrains allies actually suggests that offensive realist and prestige-oriented states will be the most resistant to the restraining effects of U.S. power. These studies suggest that it is most difficult for strong states to prevent conflict between weaker allies and their rivals when the restraining state is defending nonvital interests; when potential adversaries and allies have other alignment options;11 when the stronger state struggles to mobilize power domestically12; when the stronger state perceives reputational costs for non-involvement;13 and when allies have hawkish interests and the stronger state has only moderately dovish interests.14 In other words, the cases where it would be most important to restrain U.S. allies are those in which Washington's efforts at restraint would be least effective. Highly motivated actors, by definition, have strong

hawkish interests. Primacy puts limits on U.S. dovishness, lest its commitments lack the credibility to deter or reassure. Such credibility concerns create perceived reputational costs for restraining or not bailing out allies. The United States will be defending secondary interests, which will create domestic obstacles to mobilizing power. U.S. allies have other alliance options, especially in Asia. In short, if states are insensitive to the factors incentivizing peace, then the United States' ability to manage global security will be doubtful. Third-party security competition will likely ensue anyway. costs for whom? Fortunately, foreign security competition poses little risk to the United States. Its wealth and geography create natural security. Historically, the only threats to U.S. sovereignty, territorial integrity, safety, or power position have been potential regional hegemons that could mobilize their resources to project political and military power into the Western Hemisphere. Nazi Germany and the Soviet Union arguably posed such threats. None exist today. Brooks et al. argue that "China's rise puts the possibility of its attaining regional hegemony on the table, at least in the medium to long term" (p. 38). That possibility is remote, even assuming that China sustains its rapid wealth creation. Regional hegemony requires China to develop the capacity to conquer Asia's other regional powers. India lies across the Himalayas and has nuclear weapons. Japan is across a sea and has the wealth to quickly build up its military and develop nuclear weapons. A disengaged United States would have ample warning and time to form alliances or regenerate forces before China realizes such vast ambitions. Brooks et al. warn that a variety of states would develop nuclear weapons absent U.S. protection. We agree that a proliferation cascade would create danger and that restraint may cause some new states to seek nuclear weapons. Proliferation cascades are nonetheless an unconvincing rationale for primacy. Primacy likely causes more proliferation among adversaries than it prevents among allies. States crosswise with the United States realize that nuclear arsenals deter U.S. attack and diminish its coercive power. U.S. protection, meanwhile, does not reliably stop allied and friendly states from building nuclear weapons. Witness British, French, and Israeli decisionmaking. Proliferation cascades were frequently predicted but never realized during the Cold War, when security was scarcer.15 New research argues that security considerations are often a secondary factor in the proliferation of nuclear weapons, and that states with the strongest appetites for proliferation often lack the technical and managerial capacities to acquire the bomb.16 Finally, even if proliferation cascades occur, they do not threaten U.S. security. Few, if any, states would be irrational enough to court destruction at the hands of the U.S. nuclear arsenal, especially if the United States is not enmeshed in their conflicts.

Hegemony's no longer key to peace---decline just means allies fill in

Elizabeth Cobbs **Hoffman '13**, professor of American foreign relations at San Diego State University, 3/4/13, "Come Home, America," http://www.nytimes.com/2013/03/05/opinion/come-home-america.html?nl=todaysheadlines&emc=edit_th_20130305&pagewanted=print&_r=0

> EVERYONE talks about getting out of Iraq and Afghanistan. But what about Germany and Japan? The sequester — $85 billion this year in across-the-board budget cuts, about half of which will come from the Pentagon — gives Americans an opportunity to discuss a question we've put off too long: Why we are still fighting World War II? Since 1947, when President Harry S. Truman set forth a policy to stop further Soviet expansion and "support free peoples" who were "resisting subjugation by armed minorities or by outside pressures," America has acted as the world's policeman. For more than a century, Britain had "held the line" against aggression in Eurasia, but by World War II it was broke. Only two years after the Allies met at Yalta to hammer out the postwar order, London gave Washington five weeks' notice: It's your turn now. The Greek government was battling partisans supplied by Communist Yugoslavia. Turkey was under pressure to allow Soviet troops to patrol its waterways. Stalin was strong-arming governments from Finland to Iran. Some historians say Truman scared the American people into a broad, open-ended commitment to world security. But Americans were already frightened: in 1947, 73 percent told Gallup that they considered World War III likely. From the Truman Doctrine emerged a strategy comprising multiple alliances: the Rio Pact of 1947 (Latin America), the NATO Treaty of 1949 (Canada and Northern and Western Europe), the Anzus Treaty of 1951 (Australia and New Zealand) and the Seato Treaty of 1954 (Southeast Asia). Seato ended in 1977, but the other treaties remain in force, as do collective-defense agreements with Japan, South Korea and the Philippines. Meanwhile, we invented the practice of foreign aid, beginning with the Marshall Plan. It was a profound turn even from 1940, when Franklin D. Roosevelt won a third term pledging not to plunge the United States into war. Isolationism has had a rich tradition, from Washington's 1796 warning against foreign entanglements to the 1919 debate over the Treaty of Versailles, in which Henry Cabot Lodge argued, "The less we undertake to play the part of umpire and thrust ourselves into European conflicts the better for the United States and for the world." World War II, and the relative impotence of the United Nations, convinced successive administrations that America had to fill the breach, and we did so, with great success. The world was far more secure in the second half of the 20th century than in the disastrous first half. The percentage of the globe's population killed in conflicts between states fell in each decade after the Truman Doctrine. America experienced more wars (Korea, Vietnam, the two Iraq wars, Afghanistan) but the world, as a whole, experienced fewer.

We were not so much an empire — the empire decried by the scholar and veteran Andrew J. Bacevich and celebrated by the conservative historian Niall Ferguson — as an umpire, one that stood for equal access by nation-states to political and economic gains; peaceful arbitration of international conflict; and transparency in trade and business. But conditions have changed radically since the cold war. When the United States established major bases in West Germany and Japan, they were considered dangerous renegades that needed to be watched. Their reconstructed governments also desired protection, particularly from the Soviet Union and China. NATO's first secretary general, Hastings Ismay, famously said the alliance existed "to keep the Russians out, the Americans in, and the Germans down." Today, our largest permanent bases are still in Germany and Japan, which are perfectly capable of defending themselves and should be trusted to help their neighbors. It's time they foot more of the bill or operate their own bases. China's authoritarian capitalism hasn't translated into territorial aggression, while Russia no longer commands central and eastern Europe. That the military brass still talk of maintaining the capacity to fight a two-front war — presumably on land in Europe, and at sea in the Pacific — speaks to the irrational endurance of the Truman Doctrine. Our wars in the Middle East since 2001 doubled down on that costly, outdated doctrine. The domino theory behind the Vietnam War revived under a new formulation: but for the American umpire, the bad guys (Al Qaeda, Iran, North Korea) will win. Despite his supporters' expectations, President Obama has followed a Middle East policy nearly identical to his predecessor's. He took us out of Iraq, only to deepen our commitment to Afghanistan, from which we are just now pulling out. He rejected the most odious counterterrorism techniques of George W. Bush's administration, but otherwise did not change basic policies. Mr. Obama's gestures toward multilateralism were not matched by a commensurate commitment from many of our allies. Cynics assert that the "military-industrial complex" Dwight D. Eisenhower presciently warned against has primarily existed to enrich and empower a grasping, imperialist nation. But America was prosperous long before it was a superpower; by 1890, decades before the two world wars, it was already the world's largest and richest economy. We do not need a large military to be rich. Quite the opposite: it drains our resources. Realists contend that if we quit defending access to the world's natural resources — read, oil — nobody else would. Really? It's not likely that the Europeans, who depend on energy imports far more than the nation that owns Texas and Alaska would throw up their hands and bury their heads in the sand. It's patronizing and naïve to think that America is the only truly "necessary" country. Good leaders develop new leaders. The Libyan crisis showed that our allies can do a lot. The United States can and should pressure Iran and North Korea over their nuclear programs. It must help to reform and strengthen multilateral institutions like the United Nations, the International Monetary Fund and the World Bank. It must champion the right of small nations, including Israel, to "freedom from fear." But there are many ways of achieving these goals, and they don't all involve more borrowing and spending. Partisan debates that focus on shaving a percentage point off the Pentagon budget here or there won't take us where we need to go. Both parties are stuck in a paradigm of costly international activism while emerging powers like China, India, Brazil and Turkey are accumulating wealth and raising productivity and living standards, as we did in the 19th century. The long-term consequences are obvious. America since 1945 has paid a price in blood, treasure and reputation. Umpires may be necessary, but they are rarely popular and by definition can't win. Perhaps the other players will step up only if we threaten to leave the field. Sharing the burden of security with our allies is more than a fiscal necessity. It's the sine qua non of a return to global normalcy.

Emerging powers and regional organizations solve every conceivable impact to hegemony---unipolarity's dead

Amitav **Acharya 14**, Professor of International Relations at American University, 6/19/14, "UNIPOLAR NO MORE: THE OBAMA DOCTRINE AND THE EMERGING POWERS," http://warontherocks.com/2014/06/unipolar-no-more-the-obama-doctrine-and-the-emerging-powers/

The problem with Obama's assertion that if America does not lead, "no one else will," is not just that it sounds a trifle self-serving and arrogant, but it also does not take into account different forms of leadership exercised by others such as Canada, Australia, the EU, and the Scandinavian countries in promoting human rights, transitional justice, and humanitarian law. Collective action can also be decentralized to the regional level. At West Point, Obama talked mostly about NATO, more so than the U.N. or any other global or regional multilateral group and made only passing references to other regional groups (he did mention the OSCE and ASEAN). The emerging powers don't share the same love for NATO. Strangely enough, Obama did not even mention the EU, preferring to use terms such as Europe and European allies. He ignored other non-Western regional groupings such as the African Union and the Organization of American States. Yet, only a relatively blinded analyst of the contemporary world order would fail to recognize that regional multilateral groups such as the EU, ASEAN and the AU have an important place in shaping the security of their respective regions. The United States itself recognizes Indonesia's leadership in Southeast Asia and ASEAN's role in Asia-Pacific security. Regional powers such as Japan, South Africa, and Brazil have played key roles in regional economic development and diplomacy. This does not mean regional organizations are always effective or can substitute for the U.N. But as Hillary Clinton had recognized in her new American moment speech, "few, if any, of today's challenges can be understood or solved without working through a regional context." In that speech, Clinton mentioned region (including "region," "regional," "regionally," "regions," etc.) no less than 24 times. There was an entire section on strengthening regional architecture, (excluding discussion of NATO, which was under a separate preceding section on alliances), and this section was longer than that on global institutions in the 21st century. Instead of claiming leadership solely for itself, might it not be better for the United States to help these other actors lead in different issue areas where they have special interest and expertise? Many regional groups in the developing world could do with greater authority from the U.N. Security Council and support in material resources from powers like the United States in advancing collective action. The unipolar moment in international relations is over and the emerging world order is not multipolar, as many mistakenly characterize it. It is better described as a multiplex world (further elaboration in my book, The End of American World Order). Like in a multiplex cinema running several shows with different scripts, actors, directors, producers within one complex, we live in a global system with multiple key players (traditional great powers, emerging powers, international institutions and non-state actors) interacting closely with each other while bound by complex forms of interdependence. Indeed, when Rice referred to the challenge of U.S. leadership in "a world that is more complex and more interdependent than ever before," she provided an apt description of the multiplex world. But collective action to manage stability of the multiplex world requires shared leadership. The Obama Doctrine's vision for that shared leadership lacks clarity and consistency.

They don't meet "its" – surveillance is done by the Public Company Accounting Oversight Board – explicitly not part of the federal government

Sarbanes-Oxley Act of 2002, text of the Sarbanes-Oxley Act, http://www.gpo.gov/fdsys/pkg/PLAW-107publ204/html/PLAW-107publ204.htm

(a) **Establishment of Board**.--There is established **the Public Company Accounting Oversight Board**, to oversee the audit of public companies that are subject to the securities laws, and related matters, in order to protect the interests of investors and further the public interest in the preparation of informative, accurate, and independent audit reports for companies the securities of which are sold to, and held by and for, public investors. The Board shall be a body corporate, operate as a nonprofit corporation, and have succession until dissolved by an Act of Congress. (b) Status.--**The Board shall not be an agency or establishment of the United States Government**, and, except as otherwise provided in this Act, shall be subject to, and have all the powers conferred upon a nonprofit corporation by, the District of Columbia Nonprofit Corporation Act. **No member or person employed by, or agent for, the Board shall be deemed to be an officer or employee of or agent for the Federal Government by reason of such service**. (c) Duties of the Board.--The Board shall, subject to action by the Commission under section 107, and once a determination is made by the Commission under subsection (d) of this section-- (1) register public accounting firms that prepare audit reports for issuers, in accordance with section 102; (2) establish or adopt, or both, by rule, auditing, quality control, ethics, independence, and other standards relating to the preparation of audit reports for issuers, in accordance with section 103; (3) conduct inspections of registered public accounting firms, in accordance with section 104 and the rules of the Board; (4) conduct investigations and disciplinary proceedings concerning, and impose appropriate sanctions where justified upon,

Vote neg for limits and ground---allowing surveillance not done by the USFG explodes the limit on topic actors and makes any act of "looking topical"---it also removes all neg ground based on the information going to the USFG like the terrorism DA or counterplans based on the word "curtail" which are central to negative ground.

Douglas F. **Brent 10,** attorney, June 2, 2010, "Reply Brief on Threshold Issues of Cricket Communications, Inc.," online: http://psc.ky.gov/PSCSCF/2010%20cases/2010-00131/20100602_Crickets_Reply_Brief_on_Threshold_Issues.PDF) **Italics and bold in the original**

AT&T also argues that Merger Commitment 7.4 only permits extension of "any given" interconnection agreement for a single three year term. AT&T Brief at 12. Specifically, AT&T asserts that because Cricket adopted the interconnection agreement between Sprint and AT&T, which itself was extended, Cricket is precluded from extending the term of its agreement with AT&T. Id

This argument relies upon an inaccurate assumption: that the agreement (contract) between Sprint and AT&T, and the agreement (contract) between Cricket and AT&T, are one and the same. In other words, to accept AT&T's argument the Commission must conclude that two separate contracts, i.e. the interconnection between Sprint and AT&T in Kentucky ("Sprint Kentucky Agreement") and the interconnection between Cricket and AT&T in Kentucky ("Cricket Kentucky Agreement"), are one and the same.

Upon this unstated (and inaccurate) premise AT&T asserts that "***the ICA*** was already extended"; id. at 14, and "***the ICA*** Cricket seeks to extend was extended by Sprint . . . ."; id. at 15, and, finally, "Cricket cannot extend ***the same ICA*** a second time . . . ." Id. (emphasis added in all). Note that in the quoted portions of the AT&T brief (and elsewhere) AT&T uses vague and imprecise language when referring to either the Sprint Kentucky Agreement, or the Cricket Kentucky Agreement, in hopes that the Commission will treat the two contracts as one and the same.

But it would be a mistake to do so. The contract governing AT&T's duties and obligations with Sprint is a legally distinct and separate contract from that which governs AT&T's duties with Cricket. The Sprint Kentucky Agreement was approved by the Commission in September of 2001 in Case Number 2000-00480. The Cricket Kentucky Agreement was approved by the Commission in September of 2008 in Case Number 2008-033 1.

AT&T ignores the fact that these are two separate and distinct contracts because it knows that the merger commitments apply to ***each*** agreement that an individual telecommunications carrier has with AT&T. Notably, Merger Commitment 7.4 states that "AT&T/BellSouth ILECs shall permit ***a requesting telecommunications carrier*** to extend ***its*** current interconnection agreement . . . . As written, the commitment allows any carrier to extend "***its***" agreement. Clearly, the use of the pronoun "its" in this context is possessive, such that the term "its" means - ***that*** particular carrier's agreement with AT&T (and **not any other carrier's agreement**). Thus, the merger commitment applies to each agreement that an individual carrier may have with AT&T. It necessarily follows then, that Cricket's right to extend its agreement under Merger Commitment 7.4 is separate and distinct right from another carrier's right to extend its agreement with AT&T (or whether such agreement has been extended).

"Its" is a singular possessive pronoun referring to central federal government

Updegrave 91 – W.C., "Explanation of ZIP Code Address Purpose", 8-19, http://www.supremelaw.org/ref/zipcode/updegrav.htm

More specifically, looking at the map on page 11 of the National ZIP Code Directory, e.g. at a local post office, one will see that the first digit of a ZIP Code defines an area that includes more than one State. The first sentence of the explanatory paragraph begins: "A ZIP Code is a numerical code that identifies areas within the United States and its territories for purposes of ..." [cf. 26 CFR 1.1-1(c)]. Note the singular possessive pronoun "its", not "their", therefore carrying the implication that it relates to the "United States" as a corporation domiciled in the District of Columbia (in the singular sense), not in the sense of being the 50 States of the Union (in the plural sense). The map shows all the States of the Union, but it also shows D.C., Puerto Rico and the Virgin Islands, making the explanatory statement literally correct.

The PCAOB is a private sector organization---it's overseen by the SEC, but it's separate---prefer government definitions

SEC 13, Securities and Exchange Commission, "Public Company Accounting Oversight Board (PCAOB)," modified January 16, 2013, http://www.sec.gov/answers/pcaob.htm

The Public Company Accounting Oversight Board (also known as the PCAOB) is a **private-sector, nonprofit corporation** created by the Sarbanes-Oxley Act of 2002 to oversee accounting professionals who provide independent audit reports for publicly traded companies. The PCAOB's responsibilities include the following:

registering public accounting firms;

establishing auditing, quality control, ethics, independence, and other standards relating to public company audits;

conducting inspections, investigations, and disciplinary proceedings of registered accounting firms; and

enforcing compliance with Sarbanes-Oxley.

When Congress created the PCAOB, it gave the SEC the authority to **oversee the PCAOB's operations**, to appoint or remove members, to approve the PCAOB's budget and rules, and to entertain appeals of PCAOB inspection reports and disciplinary actions. You can find SEC orders and other releases concerning the PCAOB in the "Regulatory Actions" section of our website under "PCAOB Rulemaking."

Limits---Link

Their interpretation blows the topic wide open---allowing any non-governmental surveillance be topical allows to remove any law that might <u>somehow affect</u> information that <u>anyone gathers</u>---that allows the aff to change things like individual parole policies, laws affecting things like Facebook and other interpersonal data, etc.

This is a <u>whole separate lit base</u>---the government collects data and does surveillance in a lot of different areas which provides a solid base for the topic---their interpretation shifts debate away from that sector of the literature and makes it impossible to have any coherent topic discussion about surveillance

Limits---Impact

Limits are key to debate's pedagogical benefits---they're necessary to allow the neg to <u>clash</u> with the aff and create in-depth engagement with the substance of the 1AC---training us to debate against a <u>well-prepared opponent</u> is the only true benefit that debate provides and is a necessary skill for action beyond debate---outweighs any fairness or innovation arguments

Ground Overview

Their interpretation <u>nukes</u> neg ground---all topic disads are based on the way that the government uses certain data for things like terrorism and financial regulation, and all counterplans are based on repealing <u>less</u> than the aff in terms of government action or changing the <u>process</u> by which government surveillance occurs---their interpretation makes that lit base irrelevant and shifts debate to how individuals use information about each other

Surveillance

Topicality---Surveillance---1NC

Surveillance is defined as the acquisition of private information

Bedan, 7 - J.D. Candidate, Indiana University School of Law (Matt, "Echelon's Effect: The Obsolescence of the U.S. Foreign Intelligence Legal Regime," Federal Communications Law Journal: Vol. 59: Iss. 2, Article 7. Available at: http://www.repository.law.indiana.edu/fclj/vol59/iss2/7

The definition of surveillance, in pertinent form, is the acquisition of a communication either sent or received by a "particular, known United States person who is in the United States," if the communication was acquired by "intentionally targeting" that person, and if the circumstances are such that they have a reasonable expectation of privacy. 53 Alternatively, "surveillance" also means the acquisition of any communication to or from someone located in the United States, if the acquisition occurs within the United States.54

It is clear from both FISA and Supreme Court precedent that an individual must have a reasonable expectation of privacy for "surveillance" to occur. In United States v. Miller, the Supreme Court held that individuals have no expectation of privacy in information held by a third party.55 Through the use of National Security Letters, the FBI and the NSA routinely exploit this rule of law to acquire vast amounts of personal information on U.S. citizens from private corporations, such as phone companies and Internet service providers. 56 Because FISA's definition of surveillance fails to account for this practice, the government is not required to get a warrant or make any certification of probable cause. Considering how much the technological capacity of the private sector for gathering and retaining personal information has increased in recent years, the privacy implications of government access to this data are huge.

Domestic surveillance means the acquisition of non-public information – it's distinct from the broader 'intelligence gathering' and requires an expectation to privacy

Small, 8 - United States Air Force Academy (Matthew, "His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power during Times of National Crisis" http://cspc.nonprofitsoapbox.com/storage/documents/Fellows2008/Small.pdf

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to **narrow the scope of the term "domestic surveillance**." Domestic surveillance is a subset of intelligence gathering. Intelligence, as it is to be understood in this context, is "information that meets the stated or understood needs of policy makers and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, domestic surveillance is a means to an end; the end being intelligence. The intelligence community best understands domestic surveillance as the acquisition of **nonpublic** information concerning United States persons (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept.

This paper's analysis, in terms of President Bush's policies, focuses on electronic surveillance; specifically, wiretapping phone lines and obtaining caller information from phone companies. Section f of the USA Patriot Act of 2001 defines electronic surveillance as:

[T]he acquisition by an electronic, mechanical, or other surveillance device of the contents of any wire or radio communication sent by or intended to be received by a particular, known United States person who is in the United States, if the contents are acquired by intentionally targeting that United States person, under circumstances in which a person has a reasonable expectation of privacy and a warrant would be required for law enforcement purposes;

Adhering to the above definition allows for a focused analysis of one part of President Bush's domestic surveillance policy as its implementation relates to the executive's ability to abridge certain civil liberties. However, since electronic surveillance did not become an issue of public concern until the 1920s, there would seem to be a problem with the proposed analysis.

Considering an American citizen's claim to a right to privacy, the proposed analysis is not limited to electronic surveillance alone but rather includes those actions that would seek, or at least appear, to abridge a civil liberty. The previously presented definition of electronic surveillance itself implies an infringement into a person's expected right, in this case the right is to privacy. Acknowledging the intrusion **inherent in the definition**, the question of how far the president can push this intrusion becomes even more poignant. As such, President Bush's policies are not the sole subject of scrutiny, but rather his supposed power to abridge civil liberties in the interest of national security. The first part of the analysis, then, turns to a time where the national security of the United States was most at jeopardy, during its fight for independence.

Violation---the aff gathers information on public corporations---that's distinct from private companies for whom compliance is simply voluntary

Megan N. **Gates 11**, Co-chair of the Securities & Capital Markets Practice Group, concentrates her practice on providing counsel to public companies with respect to compliance and disclosure obligations under the Securities Exchange Act of 1934, "The Impact of Sarbanes-Oxley on Private Companies and Corporate Governance Best Practices," 2011

This Note examines the provisions of the Sarbanes-Oxley Act of 2002 (SOX) that **apply to both private and public companies**. Furthermore, this Note discusses the benefits a company can reap in complying with SOX. In addition, this Note discusses the regulatory burdens under SOX and how SOX affects private companies' best practices. The Sarbanes-Oxley Act of 2002 (SOX) Create far-reaching changes in corporate governance practices, financial statement disclosure, and auditor independence requirements. Generally, **SOX requires public companies to implement practices and policies to ensure that:** A company's financial statements fairly present the condition of the business. Effective internal control systems monitor financial reporting. SOX left few aspects of the corporate governance systems of public companies untouched. SOX and the related rules issued by the SEC address topics including: The Role, duties, and qualifications of a company's audit committee. How companies prepare their reports to the SEC. The code of ethics a company's senior officers must follow. The relationship that a company has with its independent public accountants. The majority of SOX's provisions only apply to companies that either: Have a class of securities registered under Section 12 of the Securities Exchange Act of 1934, as amended (Exchange Act). Are required to file reports under Section 15(d) of the Exchange Act. Have filed a registration statement under the Securities Act of 1933, as amended (Securities Act), that the registrant has not withdrawn. Although **the primary intent of SOX was to regulate the activities and behavior of public companies**, SOX has also significantly elevated the standard of conduct for many private companies in the areas of corporate governance and financial oversight and compliance. By voluntarily complying with some or all of SOX's requirements, larger private companies (or companies with aspirations of achieving significant growth, going public or being acquired by a public company) may be able to reap the rewards associated with:

Exts---Surveillance = Private Not Public

It requires the elimination of a privacy interest – otherwise they make all trivial uses of information 'surveillance'

Huey, 9 – assistant professor of sociology at the University of Western Ontario (Laura, Surveillance: Power, Problems, and Politics. Hier, Sean P., and Greenberg, Joshua, eds. p. 221-222, ebrary

The past few years have witnessed incredible growth in the field of surveillance studies. Remarkably, despite this growth, there is no consensus on what forms of human activity are encompassed by the term "surveillance." Derived from the French for watching over, surveillance encompasses the basic activity of watching others. Brian Martin (1993, 115) uses surveillance in this sense when he describes it as "keeping a close watch on others." However, this basic definition has been variously expanded upon and/or challenged. Gary Marx (1998), among others, suggests that there has been a notable shift in what constitutes surveillance. Marx distinguishes between what he terms traditional surveillance, involving close observation of a targeted individual (e.g., the police officer who trails a suspect), and the new surveillance: technologies designed to systematically extract and collect personal data (e.g., the database that collects, sorts, and creates data profiles of targeted individuals and groups). Whereas traditional surveillance is an exceptional activity, proliferating technologies have made the new surveillance a routine, everyday activity that is largely invisible to those people whom it targets. What these two forms of surveillance share, however, is that each seeks to "eliminate privacy in order to determine normative compliance or to influence the individual" (Marx 2003, 370).

For Colin Bennett (2005), such an understanding of surveillance is insufficient. Bennett argues that the use of technology to systematically capture and analyze data must be understood in relation to institutional, cultural, and political contexts and goals: **an action alone does not constitute surveillance**; it does so **only in relation to its stated uses** and goals. To illustrate this point, Bennett distinguishes between the mundane collection and use of his personal data when taking a flight to Toronto and the experience of someone who has been targeted for close observation and special treatment by virtue of his or her name or meal preferences. According to Bennett, then, understanding surveillance as the simple act of watching over – the mother over the child, for example – **"trivializes" its meanings**, its uses, and the experiences of its targets.

Even the broadest definition doesn't include information provided with consent

Pounder 9 – PhD, Director, Amberhawk Training and Amberhawk Associates

(Chris, "NINE PRINCIPLES FOR ASSESSING WHETHER PRIVACY IS PROTECTED IN A SURVEILLANCE SOCIETY," Scholar)

This paper uses the term "surveillance" in its widest sense to include data sharing and the revealing of identity information in the **absence of consent** of the individual concerned. It argues that the current debate about the nature of a "surveillance society" needs a new structural framework that allows the benefits of surveillance and the risks to individual privacy to be properly balanced.

Governmental surveillance is **not** about the government collecting the information you're sharing publicly and willingly; it's about collecting the information you don't think you're sharing at all, such as the online searches you do on search engines... or private emails or text messages... or the location of your mobile phone at any time.

Baker 5 – MA, CPP, CPO

(Brian, "Surveillance: Concepts and Practices for Fraud, Security and Crime Investigation," http://www.ifpo.org/wp-content/uploads/2013/08/surveillance.pdf)

Surveillance is defined as **covert** observations of places and persons for the purpose of obtaining information (Dempsey, 2003). The term covert infers that the operative conducting the surveillance is **discreet and secretive**. Surveillance that maintains a concealed, hidden, undetected nature clearly has the greatest chance of success because the subject of the surveillance will act or perform naturally. Remaining undetected during covert surveillance work often involves physical fatigue, mental stress, and very challenging situations. Physical discomfort is an unfortunate reality for investigators, which varies from stinging perspiration in summer to hard shivers during the winter.

Exts---Surveillance = Personal Data

Surveillance is the focused, systematic and routine collection of personal details – it excludes surveillance of places or other things

Keiber, 14 – PhD dissertation for the Graduate Program in Political Science at Ohio State (Jason, "The Surveillance of Individuals in International Politics" https://etd.ohiolink.edu/!etd.send_file?accession=osu1397573412&disposition=inline

The study of surveillance has its own discipline, yet it is relatively new. The field of Surveillance Studies "covers a **huge range** of activities and processes, but what they have in common is that, for whatever reason, people and populations are under scrutiny."65 A representative definition of "surveillance" is: "the focused, systematic and routine" collection and analysis of "personal details for purposes of influence, management, protection or direction.66

Various elements of the definition deserve attention. First, surveillance is focused and routine. This suggest it is, at the very least, purposive, and incidental acquisition of data would not count as surveillance proper. Second, it includes both collection and analysis. Note also that collection entails the activity of gathering information as well as the storage of it. Storage, for example of data in a database, is an important component of surveillance because it enables those conducting surveillance to keep track of information over time and recall that information when needed. Analysis is included because often the collected data does not speak for itself. For example most information is classified (sorted) as it gets stored, and classification is itself a form of analysis. Moreover, technology increasingly enables automated data analysis and data mining to discover patterns and novel information. Third, according to the definition above different actors can conduct surveillance—governments, corporations, civic organizations, parents, etc. For my purposes the focus will be on governmental forms of surveillance.

Finally, surveillance is about people. Students of international politics may pause here—what about surveillance of material things like missile sites and nuclear enrichment facilities. Surveillance Studies, which has roots in sociology and human geography, is primarily interested in surveillance as a social and political phenomenon. That being said, sometimes surveillance of objects can provide a lot of information about what certain people are doing. This is well within the purview of surveillance studies. For an IR example, IAEA monitoring of gas centrifuges is similar to workplace monitoring intended to check whether or not employees are doing their job. On the other hand there is some material-focused surveillance which Surveillance Studies doesn't address. For example satellites and seismic and atmospheric monitoring constantly operate to detect nuclear detonations, but this is activity that Surveillance Studies is not too interested in.

Surveillance is defined as 'social sorting'---the deliberate collection of personal information for the purpose of management, protection or detection

Tucker and Wang 14 – *PhD, Professor of Computer Science, **PhD, Professor @ U Portsmouth

(Victoria and John, "On the Role of Identity in Surveillance," http://arxiv.org/pdf/1408.3438.pdf)

David Lyon has emphasised a general conception of surveillance, which he has characterised as "the focused, systematic and routine attention to personal details for purposes of influence, management, protection or detection" (2007a: 14). Furthermore, "this attention to personal details is not random, occasional or spontaneous; it is deliberate and depends on certain protocol and techniques" (ibid.). Lyon (2003, 2007b) has emphasised the significance of considering contemporary surveillance as social sorting. He defined the term to mean the "focus on the social and economic categories and the computer codes by which personal data is organized with a view to influencing and managing people and populations" (Lyon, 2003: 2). **Social sorting** has become the **main purpose** of surveillance, since surveillance today is **overwhelmingly about personal data**. The rise of surveillance leads to an emphasis on monitoring the behaviours from selected individuals, through groups of people, to the entire population. The growth and effectiveness of the monitoring are made possible by all sorts of new technologies, especially software technologies. However, surveillance as social sorting is becoming increasingly significant, not merely because of the abundance and availabilities of new technological devices. Rather, these devices are required because of the increasing number of perceived and actual

risks,∂ and consequently, the desire to monitor the behaviour of the entire population (cf. Lyon,∂ 2003).

Systematic observation and identification of particular attributes of individuals

Tucker and Wang 14 – *PhD, Professor of Computer Science, **PhD, Professor @ U Portsmouth

(Victoria and John, "On the Role of Identity in Surveillance," http://arxiv.org/pdf/1408.3438.pdf)

Indeed, surveillance is about data and essential to contemporary surveillance practices are∂ software technologies and hardware devices that collect, store and process data. Currently,∂ the growth and effectiveness of surveillance are made possible by all sorts of new∂ technologies, especially software technologies. They are increasingly becoming a natural∂ component of our everyday life as various forms of surveillance practices are routinely built∂ into our physical and virtual environments. Surveillance is a process of data gathering that∂ involves the systematic observation of behaviours and individuals, and the identification of∂ the ones that are deemed to have specific attributes (see: Figure 1).

Systematic observation of persons

Wang 11 – PhD, Vice President for Information Services and Chief Information Officer for the RF

(Hao, "Protecting Privacy in China," p. 27)

Surveillance is defined as the systematic investigation or monitoring of the actions or communications of one or more **persons**. Traditionally, surveillance has been undertaken by physical means, such as guarding prisons. In recent decades, it has been enhanced through image amplification devices such as high-resolution satel¬lite cameras.6"1 Most of them are readily available in China today. However, some of them are also privacy invasive. They render current Chinese legal protections seriously inadequate. These devices may include: (I) microphones or listening devices that can be concealed; (2) miniature tape recorders; (3) hidden cameras such as cell phone cameras; (4) hidden monitors that operated by remote control; (5) infrared devices enabling photographs to be taken at night; (6) miniature transmitters; and so on.

Dictionary definitions are bad – don't provide a policy context

Marx, 4 – Professor Emeritus from M.I.T. (Gary, "Some Concepts that may be Useful in Understanding the Myriad Forms and Contexts of Surveillance, Intelligence and National Security," 19:2, 226-248, DOI: 10.1080/0268452042000302976

WHAT IS SURVEILLANCE? The dictionary definition of surveillance as it is applied to many contemporary new forms such as video, computer dossiers, electronic location and work monitoring, drug testing and DNA analysis is **woefully inadequate** or worse.7 For example in the Concise Oxford Dictionary surveillance is defined as 'close observation, especially of a suspected person'. Yet today many of the new surveillance technologies are not 'especially' applied to 'a suspected person'. They are commonly applied categorically. In broadening the range of subjects the term 'a suspected person' takes on a different meaning. In a striking innovation, surveillance is also applied to contexts (geographical places and spaces, particular time periods, networks, systems and categories of person), not just to a particular person whose identity is known beforehand. The dictionary definition also implies a clear distinction between the object of surveillance and the person carrying it out and a non-co-operative relationship. In an age of servants listening behind closed doors, binoculars and telegraph interceptions, that separation made sense. It was easy to distinguish the watcher from the person watched. Yet self-surveillance, cosurveillance and reciprocal surveillance have emerged as important themes, often blurring the easy distinction between agent and subject of surveillance. Well-publicised warnings that surveillance might be present seek to create self-restraint. A general ethos of self-surveillance is also encouraged by the availability of home products such as those that test for alcohol level, pregnancy, AIDS and other medical conditions. Nor does the traditional definition capture contemporary cases of 'cooperative' parallel or co-monitoring, involving the subject and an external agent in which the former voluntarily sends a remote message (as with location and some implanted physiological monitoring devices). Individuals may agree to wear badges and have transmitters for toll roads or as anti-theft means installed on their cars. They may join programmes that invite police to search their vehicles if driven late at night. Many bio-metric forms involve some degree of co-operation, or at the least, implicit co-operation by the failure to take steps to block transmission. The border between the watched and the watcher may also be blurred in that there can be a continuous transmission link between sender and receiver as with brain waves or scents. The sender and receiver are in one sense electronically joined. It may be difficult to say where the subject stops and the agent begins. As with questions of copyright and electronic media, new issues of the ownership and control of property appear. Such transmissions are 'personal' but leave the person's body and control. The line between what is public and private is hazy in such settings. The term 'close observation' also fails to capture contemporary practices. Surveillance may be carried out from afar, as with satellite images or the remote monitoring of communications and work. Nor need it be 'close' as in detailed – much initial surveillance involves superficial scans looking for patterns of interest to be pursued later in greater detail. It is both farther away and closer than the conventional definition implies. The dated nature of the definition is further illustrated in its seeming restriction to visual means as implied in 'observation'. The eyes do contain the vast majority of the body's sense receptors and the visual is a master metaphor for the other senses (for example, saying 'I see' for understanding or being able to 'see through people'). Indeed, 'seeing through' is a convenient short-hand for the new surveillance. To be sure the visual is usually an element of surveillance, even when it is not the primary means of data collection (for example, written accounts of observations, events and conversations, or the conversion to text or images of measurements from heat, sound or movement). Yet to 'observe' a text or a printout is in many ways different from a detective or supervisor directly observing behaviour. The eye as the major means of direct surveillance is increasingly joined or replaced by hearing, touching and smelling. The use of multiple senses and sources of data is an important characteristic of much of the new surveillance. A better definition of contemporary forms of surveillance is needed. The new forms of surveillance involve scrutiny through the use of technical means to extract or create personal data, whether from individuals or contexts. The data sought may or may not be known by the subject, who may be willing or unwilling to have it discovered or revealed. It may involve revealed information for which verification is sought. The use of 'technical means' to extract and create the information implies the ability to go beyond what is offered to the unaided senses or voluntarily reported. Many of the examples involve an automated process and most extend the senses by using material artefacts or software of some kind, but the means for rooting out can also be sophisticated forms of deception as with undercover operations, ruses and pretexts. The use of 'contexts' along with 'individuals' recognises that much modern surveillance also looks at settings and patterns of relationships. Systems as well as persons are of interest. This definition excludes the routine,

non-technological surveillance that is a part of everyday life such as looking before crossing the street or seeking the source of a sudden noise or of smoke. An observer on a nude beach or police interrogating a co-operative suspect would also be excluded, because in these cases the information is volunteered and the unaided senses are sufficient. I use the more neutral and broader verb 'scrutinise' rather than 'observe' (with its tilt toward the visual) in the definition because the nature of the means (or the senses involved) suggests sub-types and issues for analysis that ought not to be foreclosed by a definition. For example how do visual, auditory, text and other forms of surveillance compare with respect to factors such as intrusiveness or validity? In addition much surveillance is automated and hence 'observation' (if that is what it is by a machine, is of a different sort). While the above definition captures some common elements among new surveillance means, contemporary tactics are enormously varied.8 There is need for a conceptual language that brings some parsimony and unity to the vast array of old and new surveillance activities and which can permit more systematic comparisons and explanations. The next section suggests dimensions that can be used to categorise the means aspect of surveillance.

Corporate Federalism Bad

First is the US turn:

SOX promotes competition between the states and federal government---that's net better for corporate governance

Renee **Jones 4**, Associate Professor, Boston College Law School, JD Harvard Law, "Rethinking Corporate Federalism in the Era of Corporate Reform," 1/1/2004, Boston College Law School Faculty Papers, http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=1559&context=lsfp

"If we don't fix it, Congress will, but I hope they've gone as far as they're going to have to go."2 This statement from one of our country's most respected jurists forms part of an ongoing effort to retain the state of Delaware's legitimacy and power in the realm of corporate law, in the face of recent federal encroachments on state law territory. Delaware Supreme Court Chief Justice E. Norman Veasey made this statement in the wake of recent corporate scandals and Congress' subsequent adoption of the Sarbanes-Oxley Act of 20023 ("Sarbanes-Oxley" or the "Act").¶ Chief Justice Veasey's words are an unusually blunt acknowledgment that in determining the legal rules that affect America's largest corporations, the state of Delaware is constrained most significantly by the federal government. His words suggest that standard arguments prevalent in academic literature which extol the benefits of competition among states for corporate charters are misconceived. Instead, Chief Justice Veasey tacitly admits that the federal government is Delaware's **main rival** in the development of corporate law rules. This implied **absence of state-to-state competition** suggests the need to reconsider the appropriate role of the federal government as a corporate regulator.¶ To some, Sarbanes-Oxley represents an ill-advised advance in the "creeping federalization of corporate law."4 The Act does indeed federalize some aspects of corporate law, and **properly so.** Because of Delaware's dominant position in the market for out-of-state incorporations, the federalization of corporate law (or at least the threat of federalization) is **necessary** to ensure that corporate law developed at the state level adequately addresses concerns of national scope, rather than furthering **purely local interests**.¶ The longstanding academic debate about whether competition among states for corporate charters has led to a "race-to-the-bottom" or a "race-to-the-top" in corporate law,5 **exaggerates the true extent of competition** among states for corporate charters. Instead, recent scholarship suggests no race exists at all.6 That is, when a corporation considers a state other than its home state in which to incorporate, it almost invariably chooses Delaware.7 These same commentators have observed that other states do not actively compete with Delaware for charters.8 Neither the statutes, the court systems, nor the corporate franchise tax structures of these states appear designed to allow the states to generate additional revenue by attracting out-of-state incorporations.¶ For years, scholars have argued that competition among states leads to greater innovation and experimentation in the development of corporate law rules. The recent assertion that no meaningful interstate competition exists for out-of-state incorporations **detracts from the market-based arguments these scholars invoke** to refute the prescriptions of others who advocate national standards of corporate conduct. The dearth of competition also weakens these same scholars' arguments that the federal system of corporate law has led to the development of efficient or optimal corporate law rules.¶ For regulatory competition actually to impact the development of corporate law in a manner that properly balances management and shareholder interests, **Delaware must have a rival**. **Only the federal government** can offer an alternative regulatory scheme that can compete with Delaware for the public's acceptance. This Article's vision of regulatory competition departs sharply from the model of horizontal competition that dominates corporate law scholarship. In this view, regulatory competition is not driven by the

pursuit of additional corporate charters or franchise fees. Instead, the rival regulators compete for the public's confidence and concomitant regulatory authority and power.¶ In this paradigm, voters play the primary role in achieving a desirable balance between federal and state power in corporate regulation. If the public disapproves of the actions of federal regulators in a substantive area, voters can elect representatives at the national level who will defer to states on such issues. In the context of corporate regulation, if Delaware, the dominant state for corporate law, regulates corporate affairs competently, then Delaware and other states should continue to enjoy broad regulatory authority. Conversely, if the public loses confidence in the existing regulatory regime, voters would be expected to pressure Congress to adopt laws that impose more appropriate standards. Such public pressure might lead Congress to preempt certain provisions of state corporate law. Such pressure may also lead states to take measures to forestall preemption by modifying state law to more closely comport with the demands of the voting public.¶ Delaware's response to the enactment of Sarbanes-Oxley suggests that Congress has the ability to prod Delaware to adopt corporate law rules preferred by voters, without resorting to wholesale replacement of state law with federal law. The Act has been described as "the most far-reaching reforms of American corporate practices since the time of Franklin Delano Roosevelt."10 Unlike the reforms of the Roosevelt era, the Act departs from the securities laws' traditional model of disclosure regulation and mandates corporate governance reforms that previously had been the exclusive province of the states. Among other interventions, the Act forbids all corporate loans to directors and executive officers and dictates the composition and responsibilities of the audit committee of the board of directors.11 With these provisions, the Act displaces some of the basic tenets of state corporate law.¶ The realistic threat of federal preemption posed by Sarbanes-Oxley seems to have **influenced Delaware's judiciary**. In recent decisions, its judges have taken a firmer stance against directors when evaluating shareholders' fiduciary duty claims. It is likely that Sarbanes-Oxley and other corporate reform proposals of national scope prompted or contributed to this shift in Delaware jurisprudence. Delaware's judicially-led reforms suggest that limited preemption of state law can play an **important role** in the development of corporate law at the state level. This dynamic, if fostered, can afford the national citizenry a voice in shaping the corporate law rules devised by a nonrepresentative body of policy-makers, which, in turn, could lead to a **more democratic and more principled regulatory scheme**.¶ In this Article, I argue that the recently renewed federal engagement in corporate law issues should be welcomed and sustained. However, in contrast to other proposals, I do not advocate wholesale federal preemption or the development of an optional federal regulatory scheme.12 Instead, I urge a sustained vigilance from Congress and a willingness to take limited preemptive measures when state corporate law rules fall short in providing adequate protection for investors.¶ Part II reviews the longstanding debate on the corporate law race and, like other recent commentators, concludes that no race exists at all. Part III reviews current thinking about corporate federalism. Part IV proposes an alternative model of vertical regulatory competition, and argues that it represents a better paradigm for analyzing regulatory competition in the corporate law arena. Part V describes the political factors that led Congress to adopt Sarbanes-Oxley. Part VI explains how the Delaware courts have led the state's response to Sarbanes-Oxley's preemptive threat. It analyzes recent developments in Delaware law and argues to the federal preemptive threat prompted them.

A race among states doesn't solve US corporate governance

Mark J. **Roe 5**, professor at Harvard Law School, where he teaches corporate law and corporate bankruptcy, "Regulatory Competition in Making Corporate Law in the United States—And Its Limits," *Oxford Review of Economic Policy*, vol 21, no 2, Oxford Journals

The first and perhaps most significant consequence is that the structure of American corporate law is **much more complicated** than a race between states. In assessing how and why corporate law is made in America we cannot rely on a market that we celebrate (because it races to the top) or denigrate (because it is captured by managers). Federal authorities are **big players**. States might be ready to give managers autonomy, but then federal authorities might tighten up. States might get the relationship between managers and shareholders right, and then Congress could upset a well-tuned balance. And we might conjecture that federal authorities leave to the states the issues that the national players—and American public opinion—care little about, or at least what they, within a range of acceptable state actions, tolerate.¶ With this better understanding of the structure of American corporate lawmaking in mind, we will have to **reinterpret the race**, the public choice structure of American corporate lawmaking, and why Delaware survives. In parallel work, I start to do so (Roe, 2003, 2005).

Second is the EU turn:

The EU models US corporate governance

Manish **Gupta 8**, Attorney at Daller, Greenberg & Dietrich, LLP, J.D.,2006, Temple University Beasley School of Law, "Elan, Enron, and the Aftermath of Scandal: A Comparative Analysis of Recent Irish and American Corporate Governance Legislation," *California Western International Law Journal*, Fall 2008, vol 39, no 1, http://scholarlycommons.law.cwsl.edu/cgi/viewcontent.cgi?article=1091&context=cwilj

A flowchart mapping the development of corporate governance might show that new ideas **come from the United States**, are distilled by the European Union, and applied by Member States as they see fit. Ireland saw fit to copy the audit regulator, the audit committee, and the requirement that directors must personally sign off on financial statements.274 European countries do not wholly plagiarize U.S. legislation, however; the Irish statutes borrow provisions relating to audit regulators, audit committees, and sign-off rules but require different behavior from each.275 Nonetheless, corporate governance rules are converging and Irish laws show this movement.¶ The governments of Ireland, the European Union, and the United States all require foreign auditors to register with a regulatory body, and all three have tightened rules about how auditors may provide non-audit work. The IAASA followed the PCAOB in taking away auditor self-regulation. If the European Union had its way, auditors' self-regulation would end completely because every Member State would set up an auditor regulator of its own.2 7 6 The PCAOB and IAASA surely have their differences: the members of the PCAOB are all independent regulators, whereas accounting bodies comprise IAASA membership.2 7 7 But auditors on both sides of the Atlantic are now governed by and paying fees to a regulator that did not exist prior to the corporate scandals.¶ **Convergence in board structure** has brought the audit committee to Ireland, and it has been described as "a new concept in Irish company law." 278 Where previously optional, audit committees are now required in the United States and Ireland, and the European Union wants all Member State companies to have them. All three governments insist that the committees be comprised of independent directors even though they define independence differently. 279 Here, there are issues of efficacy:¶ [t]he parallels with America's corporate scandals do not end with the fallibility of auditors. The lack of independence of nonexecutive directors on the board is another issue in common. Parmalat's was stuffed with family members and local cronies. Despite a 1999 reform that imposed independent directors on listed Italian companies, big ones such as Parmalat were allowed to opt out.¶ Both SOX and the CAAA make directors personally liable for their company's financial statements by requiring that they sign the statements to attest to their accuracy. 281 There are differences between the laws as well: Ireland requires directors, companies, and auditors to sign off on the accuracy of financial statements, 282 whereas the United States only requires executives to sign compliance statements.283 Some have questioned whether this will hurt Ireland's position as an attractive location for foreign investment.¶ Enron was the catalyst for change in Europe as well as in the United States. The EU Action Plan stated that its goal was to "review further corporate governance and auditing issues in the light of the Enron case.",285 Similarly, commentators have noted "Europeans should stop smugly believing that corporate malfeasance is an American vice that cannot occur in the old continent. Instead, they should fix their corporate-governance and accounting problems with as much vigour as their American cousins showed after the Enron wake-up call.",286 Others have commented on the impact of U.S. legislation in Europe, stating that SOX "seems to have kicked Europe's protracted process into gear. 'Parmalat was an extra boost, but the real motor was Sarbanes-Oxley ... Europe had to stand up and be counted.'"¶ B. Proportionality¶ Commentators often note how quickly SOX became law: Enron collapsed on November 9, 2001, and President George W. Bush signed SOX into law less than nine months later.288 By contrast, the Irish took more time before passing legislation.289 The reason for this disparity may be founded on the size of the problem faced in the respective countries.¶ The U.S. scandals were much larger than those in Ireland. In the United States, scandals were measured in billions, while the Irish scandals were only measured in millions. A U.S. imprimatur touches every old-world scandal: Elan is headquartered in New York, trades on the New York Stock Exchange, and conducts its activities mainly in the United States.290 AIB's troubles came from an American trader working at a U.S. subsidiary; it was sued by an American investor in an American court.291 Ahold's problems were the result of malfeasance at USF, an American subsidiary.2 92 Parmalat could not have hidden so much debt for so long without the complicity of Bank of America, Grant Thornton, and Deloitte & Touche. Clearly, scandals in Ireland and Europe are as much American as they are Irish and European.¶ When Ireland passed the CAAA, it responded harshly to scandals small in comparison to those in the United States. The CAAA contains many provisions similar to SOX: both create auditing regulatory bodies, address auditors and non-audit work, mandate audit committees, have "report up, report out" provisions, and require certification of financial statements.293 However, there are numerous differences among the similarities: the CAAA has criminal penalties; Irish auditors are only barred from providing services that lead to conflicts of interest whereas U.S. auditors may not provide any nonaudit services; Irish directors, even if they are not currently employed by the company, may not sit on the audit committee if they worked for the company within the last three years; and Ireland requires directors, companies, and auditors to certify the accuracy of financial statements whereas the United States only requires executives to sign compliance statements. 294 SOX merely allows attorneys to "report up, report out" whereas the CLEA requires auditors to report company law breaches to the DCE.295 Furthermore, Irish companies have to deal with the DCE whose sole job is to enforce the Companies Acts-criminal provisions and all. When one considers the full extent of the Companies Acts, 296 the vast power of the DCE, and the fact that Ireland had less of a corporate crisis to begin with, Irish attempts to prevent future corporate malfeasance are disproportionate to the problem.¶ Surely Ireland had corporate problems, but they were compliance issues, not governance issues. Ireland's compliance problems received their due response: a watchdog in the DCE. The CLEA deals more with compliance than governance-it was passed in early 2001, before Enron and the other corporate scandals came to light, and it forced companies to answer to the government rather than to various stakeholders. Even so, the CLEA is harsh; the DCE has incredible power-police power, prosecutorial power, regulatory power, even banishment power.2 97 The Director himself can make a company's life very hard; there is not any one U.S. regulator with that much influence.¶ With regard to the EU's role in its Member States' affairs, the British newspaper The Economist concisely explained the need for EU corporate regulation:¶ Italy has a reputation for poor corporate governance combined with the shameless exploitation of minority shareholders. But much the same can be said of other European countries, including France, the Netherlands and Switzerland, where this week Adecco, the world's largest temporary-employment agency, said it expects to delay the announcement of its 2003 results because of "possible accounting, control and compliance issues ... in certain countries." Most European countries have mere codes of practice for corporate governance, rather than legal statutes, and progress towards meeting the standards of the codes has been patchy at best.¶ Yet instead of mandating those statutes, the EU's response seems more academic than binding. The main conclusion of the Action Plan was that the European Union did not need a Europe-wide corporate governance code. 299 The European Union sees its role as a body that facilitates the exchange of best practices rather than as a creator or 300 sc enforcer of such practices. In such a role, the European Union should study the effects of SOX, the CLEA, and the CAAA and propose their pearls to other European countries. The European Union created the European Corporate Governance Forum to do just that, notwithstanding the fact that the Forum has had the predictable result of much talk and only one substantive recommendation. 30¶ VI. CONCLUSIONS¶ Convergence is necessary because Parmalat was not just an Italian problem, AIB was not just an Irish concern, and Enron was not just an American crisis. "The question is whether Europe's principles-based approach can endure., 30 2 The answer seems to be no: with Ireland as an indication, Europe is moving to a rules-based approach where government mandates accounting standards and nearly every aspect of the company is regulated.¶ Convergence, however, is not without its critics. As reported in The Economist:¶ America's rules are much more prescriptive and numerous. For example, the American ban on accounting firms providing some (but not all) non-audit work to audit clients, the

certification of company accounts by company bosses and the requirement that a "financial expert" (painstakingly defined by the SEC) be on each audit committee do not feature in the ... (EU) proposals.¶ Europeans have questioned the efficacy of some American ideas: "[r]otation of auditors-one of the more controversial measures introduced in July 2002 by the Sarbanes-Oxley act [sic] . . . seems to have been of little use [in the Parmalat scandal]. 30 4 Even if the rotation of auditors was of little use in Parmalat, we simply cannot know how many time bombs such an auditor rotation may have diffused.¶ On balance, the United States has the **soft power to influence worldwide corporate governance** and the European Union has the hard power to converge its Members' laws. Through its legislative power to direct Member State law, the European Union can streamline European corporate law and governance. If proposals and action plans are any indication, the European Union plans to do more. Ireland is a prime example of the European move towards American-style, rulebased governance.

The attempt to model American-style corporate federalism in Europe causes regulatory failure---the success of certain types of federalism is dependent on particular institutional conditions which differ between the US and Europe---means federal regulation in Europe is advantageous and necessary, and decentralization destroys corporate governance

Simon **Deakin 6**, Professor of Law at the University of Cambridge, specializing in labour law, private law, company law, EU law, law and economics, law and development and empirical legal studies, Director of the Centre for Business, co-Chair of the University's Strategic Research Initiative in Public Policy, "Legal Diversity and Regulatory Competition: Which Model for Europe?" *European Law Journal*, Vol. 12, No. 4, July 2006, pp. 440–454, Ebsco

All markets rest on institutional foundations.2 These 'rules of the game' are not solely concerned with protecting existing markets, by enforcing contracts and penalising collusion. At a more basic level, they constitute markets by defining the elements of exchange, and in so doing inevitably frame the process of competition. The market for laws is no different. The possibility of regulatory competition only exists because of rules that set limits to what is permissible by way of arbitrage. Often referred to as 'derogations' from the principle of freedom of movement, these constraints might better be thought of as **constitutive norms**, without which the market process itself would lack necessary form and definition.¶ There is a tendency to think of competition as a neutral and technical process which serves no particular end, other than the goal of efficiency. Since 'efficiency' is to be understood in terms of the maximisation of the aggregate welfare or, in certain alternative formulations, the wealth of market actors,3 it is a goal that is likely to command general assent. Legal rules, by contrast, and in particular legislative ones, are seen as serving political goals, which are often redistributive in nature, and so likely to be highly contested. But if markets are, themselves, 'instituted' orders,4 which cannot operate in the absence of certain normative underpinnings, they too can be seen all too clearly to serve particular purposes and values, values that cannot be reduced to the all-embracing logic of welfare or wealth maximisation. So it is with the case of **regulatory competition**: outcomes are critically dependent on the way in which the rules of the game are designed.¶ The design of those rules will for the foreseeable future be perhaps the most pressing issue in global economic governance. A number of models are available for consideration. The experience of federal and quasi-federal systems of law operating within national and transnational trading blocks will be drawn upon. Thus the US model of inter-state competition provides one possible template for global trading rules. However, it is not the only model available. The **Western European experience**, exemplified in the law governing the construction of the single market, is also an important one, which offers an alternative perspective. In particular, it suggests ways in which the 'framing' of regulatory competition can reconcile the conflicting demands of transnational economic integration and national legal diversity. The distinctiveness of the European approach is nevertheless under threat, in part because it is being compared to an **idealised version of the US experience**, one that abstracts from its historical origins and **glosses over some of its consequences**.¶ To address these themes, this article will first of all outline rival theories of regulatory competition, and in doing so will compare the assumptions underlying, respectively, the US and European Union approaches to this issue (Section II). It will then contrast the experience of harmonisation and convergence in the fields of corporate and labour law in the American and European contexts, drawing out the essential differences between them (Section III). Section IV concludes by reflecting on the future of the European model.¶ II Theories and Varieties of Regulatory Competition¶ Regulatory competition can be defined as a process whereby legal rules are selected and de-selected through competition between decentralised, rule-making entities, which could be nation states, or other political units, such as regions or localities. A number of beneficial effects are expected to flow from this process. In so far as it avoids the imposition of rules by a centralised, 'monopoly' regulator, it promotes diversity and experimentation in the search

for effective laws. In addition, by providing mechanisms for the preferences of the different users of laws to be expressed and for alternative solutions to common problems to be compared, it enhances the flow of information on what works in practice. Above all, it allows the content of rules to be matched more effectively to the preferences or wants of those consumers, that is, the citizens of the polities concerned. In some versions of the theory, the first two of these goals are, in essence, simply the means by which the third is achieved.¶ The idea of regulatory competition is not new,5 but it was first formalised within the framework of modern welfare economics in the mid-1950s, in relation to the issue of the production of local public goods. The timing is significant: Tiebout's celebrated article, entitled 'A pure theory of public expenditure', was, essentially, an application of theories of general equilibrium that were prevalent at the time.6 The article constructs a model in which competition operates on the basis of mobility of persons and resources across the boundaries of local government units within a sovereign state. In the model, local authorities compete to attract residents by offering packages of services in return for levying taxes at differential rates. Consumers with similar wants then 'cluster' in particular localities. The effect is to match local preferences to particular levels of service provision, thereby maximising the satisfaction of wants, while also maintaining diversity and promoting information flows between jurisdictions.¶ Tiebout's model is of wider interest because laws, like aspects of local public infrastructure, can be seen as indivisible public goods. By showing formally that they can be understood as products which jurisdictions supply in response to the demands of consumers of the laws, Tiebout demonstrated the relevance, even to public goods of this kind, of a market analogy. However, in Tiebout's 'pure theory', freedom of movement was assumed for the purpose of setting up the formal economic model. The model was aimed at showing that, given an effective threat of exit, spontaneous forces would operate in such a way as to discipline states against enacting laws that set an inappropriately high (or low) level of regulation. Tiebout's article did not set out the institutional conditions that would have to be met for the process of competition to occur in the '**real' world**; in common with other applications of the general equilibrium model at this time, these conditions were **simply assumed**. However, the model could be, and was, used as a benchmark against which to judge institutional measures aimed at creating regulatory competition. Since the mid-1950s, the identification of these conditions has become the central question uniting various new-institutional movements in economics and law; it is no longer adequate simply to assume their existence. Sensitivity to the need to consider the institutional framework has not, however, avoided a tendency on the part of many analyses to present the 'pure model' of unfettered competition as the goal to which laws and institutions should be directed, and the debate over regulatory competition is no exception to this.¶ The most obvious institutional implication of the Tieboutian model is that regulatory competition, in its various forms, requires a particular division of labour between different levels of rule making. It cannot work unless effective regulatory authority is exercised by entities operating at a devolved or local level. Law-making powers should be conferred on lower-level units, subject only to the principle that there must be some level below which further decentralisation becomes infeasible because of diseconomies of scale.¶ But even this gives rise to a need for a federal or transnational body that involves **superintending the process of competition** between the lower level units. Individual units could shut down competition unilaterally, either by placing barriers to the movement of the factors of production beyond their own territory, or by denying access to incoming capital, labour, and services, or both. Hence the central or federal authority has the task of guaranteeing effective freedom of movement. This task, in and of itself, may well require active interventions of various kinds.¶ Since, in the 'real' world, mobility of persons and of non-human economic resources is self-evidently more limited than it is in the world of pure theory, three prerequisites for making exit effective may be identified. One is the legal guarantee of freedom of movement—entry and exit—for persons and resources. The second is a requirement of non-discrimination, sometimes described in terms of 'mutual recognition' or the concept of 'most favoured nation' status in international economic law. The third is the acceptance of the presence of unwanted side effects of competition: 'externalities' or spill-over effects of various kinds. Even if there is in general a presumption against federal intervention and in favour of allowing rules to emerge through the competitive process, a space remains for **harmonisation to protect standards against a 'race to the bottom'**. Only the most Panglossian or willfully unobservant would deny that this problem exists; the controversy relates to how serious it is, and whether harmonisation at the federal level is the best way to deal with it.¶ According to the school of thought that can be identified with the theory known as 'competitive federalism', the task of analysis is to identify how far the 'real world' departs from the pure theory, and to use legal mechanisms to realign the two. Selected institutional interventions can be deployed in such a way as to bring supply and demand for laws into equilibrium. Van den Bergh7 has described how this approach would work in the context of the European Union: it could be used, in principle, to justify a range of mechanisms, including the development by the Court of Justice of its extensive case law on mutual recognition and non-discrimination. The Cassis de Dijon8 principle can be seen as speeding-up regulatory competition, since in requiring free movement of goods subject to a mutual recognition principle, it not only sets into competition producers from different countries, but does the same for the different regulatory régimes under which they were producing. The principle of freedom of movement for goods, regarded as a fundamental principle within the legal order of the EU and as foundation of the internal market, is also a means to the end of more efficient law making within the quasi-federal order.¶ The theory of competitive federalism could also be used to justify measures aimed at harmonisation in clear cases of a negative externality arising from imperfect competition. However, Van den Bergh argued that there should be a presumption against federal-level harmonising legislation, because the negative effects of politically motivated rent-seeking, that is to say, wealth-destroying conflicts over distribution. This was because there would be no equivalent, at federal level, to the inter-state competition that was going on at the lower levels, and that would (according to this approach) restrain rent-seeking.9¶ Just as there is more than one model of competition in economics, so there is more than way of understanding regulatory competition. One alternative to competitive federalism has been called the model of **reflexive harmonisation**. 10 This begins with the idea that competition is not so much a state of affairs in which welfare is maximised, but a process of discovery through which knowledge and resources are mobilised, the end point of which cannot necessarily be known. This type of competition depends on norms that establish a balance between 'particular' and 'general' mechanisms,11 between, that is, the autonomy of local actors, and the effectiveness of mechanisms for learning based on experience and observation. One essential prerequisite is the preservation of local-level diversity, since without diversity, the stock of knowledge and experience on which the learning process depends is necessarily limited in scope.¶ The observation that 'hidden in

the historical experience of economic integration, there is...a very important aspect of "system dynamics": international competition in the field of the welfare state serves as a kind of process of discovery to identify which welfare state package—for whatever reason—turns out to be economically viable in practice'12 might seem to rule out substantial harmonising legislation, and, indeed, it was advanced with precisely this goal in mind, at a time when there was an active debate about extending labour law directives to avoid 'social dumping'. In the vein of a neo-Austrian or Hayekian economic analysis, intervention with the aim of curing so-called imperfections that prevent the market from arriving at an optimal allocation, if not simply beside the point, is actively harmful. These 'imperfections', which are simply the differences between systems, are the very basis on which learning can take place in a federal order. In this sense, diversity of national systems is an objective in its own right. It is only on the basis of diversity that a wide range of potential solutions to common regulatory problems can emerge.¶ One implication of this point of view is that to intervene with the aim of institutionalising a single 'best' solution, through harmonisation, would be misguided. However, there is another implication, which is that **federal-level harmonisation** has a role in maintaining the appropriate relationship between 'particular' mechanisms operating at the sub-federal level, and the 'general' mechanisms by which learning across the federal unit as a whole takes place. The model of reflexive harmonisation holds that the principal objectives of judicial intervention and legislative harmonisation alike are two-fold: first, to protect the autonomy and diversity of national or local rule-making systems, while, second, seeking to 'steer' or channel the process of adaptation of rules at state level away from 'spontaneous' solutions that would lock in sub-optimal out-comes, such as a '**race to the bottom'**.13 In this model, the process by which states may observe and emulate practices in jurisdictions to which they are closely related by trade and by institutional connections is more akin to the concept of 'co-evolution' than to convergence around the 'evolutionary peak' or end-state envisaged by Tiebout's general equilibrium model. The idea of co-evolution, borrowed from the modern evolutionary synthesis in the biological sciences, argues that a variety of diverse systems can coexist within an environment, with each one retaining its viability.14 It thereby combines diversity and autonomy of systems with their interdependence within a single, overarching set of environmental parameters.¶ More generally, theories of reflexive law aim to move beyond a straightforward dichotomy between, on the one hand, 'instrumentalist' theories of regulation and, on the other, 'deregulatory' theories that argue for the removal of all external regulatory controls.15 One of the problems with the competitive federalism model is that it appears to envisage **just two forms of regulation**: 'monopoly' control from the centre, and the complete absence of such formal controls, in favour of competitive forces. In practice, **a range of options is available,** some of which combine regulation and competition. Reflexive law theory maintains that it is possible for regulatory interventions to achieve their ends not by direct prescription, but by inducing 'second-order effects' on the part of social actors. Thus this approach aims to 'couple' external regulation with self-regulatory processes including those of the market. The 'procedural' orientation of reflexive finds expression in laws, for example, which underpin and encourage autonomous processes of adjustment, in particular by supporting mechanisms of group representation and participation, an approach also finds a concrete manifestation in legislation which seeks, in various ways, to devolve or confer rule-making powers to self-regulatory bodies. Thus, laws that allow collective bargaining by trade unions and employers to make qualified exceptions to limits on working time or similar labour standards,16 or that confer statutory authority on the rules drawn up by professional associations for the conduct of financial transactions,17 are examples of this effect.¶ In essence, the idea of reflexive harmonisation takes this idea from reflexive law theory in general, and applies it to the level of transnational economic law and the 'rules of the game' that govern regulatory competition. However, the distinction between competitive federalism, derived from general equilibrium economics and the economic analysis of law, and reflexive harmonisation, derived from systems theory, is not simply an abstract or theoretical one; it is rooted in practice. In particular, as the next section explains, it reflects the **different experience of regulatory competition in the USA and the European Union**.¶ III Regulatory Competition and the Evolution of the Law Governing the Business Enterprise in the USA and the EU¶ The case of Delaware is rightly seen as key to understanding the dynamics of regulatory competition in the USA. The state of Delaware is the principal site for the incorporation of larger US companies: over 40% of companies listed on the New York Stock Exchange, and over 50% of the top Fortune 500 companies are incorporated in that state. At the two extremes of the debate over the Delaware effect are two views: one holds that the Delaware legislature and courts attracted incorporations by diluting standards of shareholder protection, thereby engineering a 'race to the bottom';18 the other maintains that Delaware has succeeded because its laws offer the best available set of solutions to the problem of agency costs arising between shareholders and managers.19 Adherents of the 'race to the bottom' hypothesis claim that, although the process of law making in Delaware is susceptible to the threat of disincorporation by companies, it is managers rather than shareholders who typically take decisions relating to the company's legal domicile. In the event of potential conflicts of interests between shareholders and managers, it is the interests of the latter that will tend to prevail. This can be seen in the willingness in the 1990s of the Delaware legislature, and to a certain extent of the courts, to adopt rules that can be construed as pro-management in the sense of allowing potential takeover targets to put defensive mechanisms in place against the threat of hostile takeover,20 and in the passage in the 1990s of a law allowing companies to opt out of stringent standards of care with respect to directors' liability for negligence.21 The idea that Delaware law represents a lowest common denominator has, however, been challenged by accounts which insist that any attempt by managers to downgrade shareholder interests would, over time, have led to a hostile response by the capital markets. Managers would have an incentive to incorporate under the law of a state which favoured shareholder interests and to shun states that harmed investors, in such a way as to drive up the cost of capital.¶ Despite the huge literature that this argument has produced,23 it is unlikely that the debate over the optimality or otherwise of Delaware laws will ever be clearly resolved, not least because Delaware's dominance of US corporate law makes it difficult to find meaningful benchmarks against which its own performance can be measured. At its best, the claim that Delaware's laws have been selected for their efficiency lends an air of **ex-post rationalisation** to a process that would have looked very different at most stages in its evolution. Delaware's preeminence is the result of a series of unexpected turns, but also of institutional steps that were taken in the nineteenth century, which had the effect (not necessarily intended) of putting in place the conditions for inter-state competition over incorporations. These are often neglected in the debate.¶ Thus US regulatory competition rests upon the existence of a set of prior conditions, which provided the basis for freedom of companies to incorporate in the state of their choice. A nineteenth-century US Supreme Court decision, Paul v Virginia (1868),24 established that states were not able to attach special requirements to corporations that had been chartered in other jurisdictions as a condition of allowing

them to do business on their territory. This was later interpreted as meaning that states had to operate a rule of mutual recognition, according to which an incorporation that was effective in one state was acknowledged by the others.25 This shift occurred in the final quarter of the nineteenth century, when New-York based corporations began to reincorporate in New Jersey to take advantage of a looser regulatory régime, designed by members of the New York corporate bar. In the 1890s and 1900s Delaware displaced New Jersey when the latter, under the influence of the Progressive political movement, introduced a number of regulatory constraints on large corporations, including controls over the holding of shares in one company by another. The Delaware corporate régime had been initially designed to facilitate the operations of the Du Pont corporation, which, at that stage, was the only significant company that was registered in the state. The Delaware law had been 'drafted under the auspices of the Du Pont family to protect their managerial and shareholder interests', and 'appeared relatively favourable to managersshareholders of other corporations as well'.26 Since it obtained its initial advantage, a number of factors have served to consolidate Delaware's position. In particular, specialisation means that Delaware now enjoys an advantage over other states in terms of the large body of case law that it has built up, the expertise of its courts, and the speed with which they can deal with complex corporate litigation, and a concentration of professional legal and financial expertise with links to the state.¶ There has been no tendency towards convergence in European company law to parallel that of the Delaware effect in the United States. This could be ascribed, straightforwardly enough, to the much shorter period of time during which convergence could have taken place since the foundation of the European Community in the 1950s. Alternatively, the currently influential theory of legal origin could be invoked:28 given the variety of legal systems, common law, and civil law (French, German, and Scandinavian) present in the European Union, by contrast to the overwhelmingly common-law origin of the legal systems of the USA, convergence was not to be expected.¶ However, it is important, again, to avoid reading history in a teleological fashion, so as to confer an overly functional explanation on outcomes that could well have turned out differently. The Treaty of Rome of 1957 contained far-reaching powers to introduce harmonising measures in the field of company law. These were (and remain) essentially ancillary to the rights of freedom of establishment in Articles 43 (ex 52) and 48 (ex 58) of the EC Treaty. Some degree of parity or equivalence in the laws protecting shareholders and 'others'—the latter term could include a range of stakeholder groups29—was deemed by the Treaty's drafters to be necessary in order to remove disincentives to the movement of companies from one Member State to another. Moreover, during the early development of the Community's company law programme, an active case for harmonisation was made that echoed the claims advanced at around the same time by the 'race to the bottom' school in the USA.30 It was in this spirit of protective regulation that the early company law directives, the so-called first generation directives, which were heavily prescriptive in their approach, were adopted.31 However, this early emphasis on uniformity and prescription soon gave way to more flexible approaches that placed greater stress on member state autonomy. 'Second-generation' measures typically laid down basic accounting and audit standards in the form of a set of options that essentially represented the predominant approaches which were then in operation in various member states, while 'third' and 'fourth generation' directives opened up the harmonisation process to the influence of norms generated outside the legal process by inter-professional and sectoral bodies.¶ Why, if harmonisation has not resulted in uniformity, has the alternative of a market for incorporations emerged, so far at any rate, in the EU? This is in large part the consequence of the lack of a consistent approach on the part of the EU Member States on the issue of the applicable law of corporate constitutions, which in turn is a function of legal diversity. The UK, along with Ireland, The Netherlands, and Denmark, operates a 'state of incorporation' rule, according to which the applicable law is that of the state in which the company is incorporated or registered. The effect of the incorporation approach is that, as in the United States, the applicable law is a matter of choice for managers of the company or, in the final analysis, for its shareholders (to the extent that they can mandate the board to take a particular view of this issue, which is by no means always the case, or bring about the same outcome through a proxy fight to replace one set of directors with another); a company can carry on business in one Member State while being incorporated in another. The company laws of the state of incorporation will prevail.¶ This is in contrast to the position in Member States that have operated the so-called 'real seat' or siège réel doctrine. The effects of the siège réel doctrine are complex and differ from one state to another, and according to the context that is being considered. Essentially, however, it means that courts will regard the applicable law as that of the Member State in which the company has its main centre of operations—its head office or principal place of business. If the company in question has incorporated elsewhere, a number of consequences may then follow. In some instances, the effect will be to deny certain advantages of corporate form to the shareholders; in others, the law of the state in which the company has its head office will be applied over that of the state of incorporation. In either event, the effect of the siège réel doctrine is to limit freedom of incorporation; in that sense, it obstructs the emergence of a 'Delaware effect', since a key aspect of that is the principle that entities can be incorporated in a state where they have no physical or other business presence.¶ The legality of the siège réel doctrine under EU law has often been called into question under the EC Treaty, most importantly as a result of the Centros decision of the European Court of Justice of 9 March 1999, and later cases in the same line, Überseering and Inspire Art. 32 In Centros, two Danish citizens incorporated a private company of which they were the sole shareholders, named Centros Ltd., in the UK. One of the two shareholders then applied to have a 'branch' of the company registered in Denmark for the purposes of carrying on business there. A 'branch', for this purpose, refers not to a subsidiary company, but simply to a business or trading presence, in one country, of a company that is registered in another country.¶ The Danish Registrar of companies refused to register the branch as requested, on the grounds that what the company was trying to do was not to register a branch but, rather, its principal business establishment. The Registrar took the view that by incorporating in the UK, which has no minimum capital requirement for private companies, and subsequently seeking to carry on business in Denmark through a branch, the company's owners were seeking to evade the Danish minimum capital requirements, which are designed to protect third-party creditors and minimise the risk of fraud. In ruling that the refusal to accede to the registration request was contrary to the right of freedom of establishment under Article 43 (ex 52) of the Treaty, read with Articles 46 (ex 56) and 48 (ex 58), the Court of Justice took a wide view of the market access principle.33 It is essential to note that at the time of the registration request, Centros Ltd. had never traded in the UK, nor was it intended to. Thus the issue in this case was not whether the founders of the company could have access to British company law—they could, had they wished to trade anywhere but Denmark—nor whether they could trade in Denmark—they could have done that too, by incorporating a company there. The issue was purely whether their inability to take advantage of UK company law was a sufficiently significant distortion of the 'competitive space' of the internal market to constitute an interference with freedom of establishment. In finding that it did, the Court of Justice was placing itself at the outer limits of free movement jurisprudence, since this was a case involving, at best, a de facto rather than a formal barrier to market access. Nor was this a clear case of discrimination on the grounds of nationality. In then going on to conclude that the Danish government had failed to show that the refusal to register was proportionate in the circumstances, it substituted its own view for that of the legislature on the far from straightforward question of how to control for the likely negative effects on third parties of liberalising incorporation rules.¶ The judgment of the Court of Justice in Centros does not necessarily signify the demise of the siège reel principle. Denmark was one of the states that operated under the incorporation rule, so the siège reel principle was not, strictly speaking, before the Court of Justice. Nevertheless, dicta in Centros suggest that the siège reel principle, as such, may well at some point be seen as contrary to the single market rules. The post-Centros case law suggests that this is the direction in which the Court of Justice is heading.35 Thus Centros is likely to herald a move, sooner or later, towards greater jurisdictional competition in EU company law.36 There is empirical evidence to the effect that this is already happening, as the number of start-ups from other EU Member States that are incorporated in the United Kingdom has sharply increased since the early 2000s, while minimum capital requirements have been **watered down** in several countries.¶ A market for incorporations would therefore empower shareholders, and possibly managers; it is less clear what its effects on other corporate constituencies, such as creditors and employees,

would be. The Centros case itself illustrates how creditors might be negatively affected: if companies had the right to move between jurisdictions at will, they would be able to **avoid otherwise mandatory state laws** that were designed for the protection of creditors such as, in this case, a minimum capital requirement. A 'race to the bottom' could well result.¶ In the same way, companies could choose whether to observe mandatory laws relating to employee participation or co-determination rights, insofar as the application of such laws was a function of the legal domicile of the company as opposed to its physical or economic presence on the territory of a particular jurisdiction. The principle of territoriality tends to determine the application of most labour law rights, rather than the domicile of the company.39 This is not always the case, however. The German rules on stakeholder membership of supervisory boards relate to the corporate form or legal entity through which an organisation is constituted, and not just to its physical or business presence. Moreover, EU law may one day take a more critical view of the territoriality principle in labour law. If that occurs, the type of distinctions drawn by the Court of Justice in the Centros case will begin to loom large for the future of social policy and not simply for corporate law.¶ If companies could outflank co-determination laws, for example, through reincorporation outside the jurisdiction, avoiding the principle of the territorial effect of labour laws, there would be little point in states retaining them. If legislators and policy makers begin to act in the way predicted by the theory of regulatory competition, they will **repeal such mandatory laws** with the aim of attracting more incorporations or retaining those which they already have. The implications for third parties excluded from the decision on incorporation will most likely be negative: 'states competing to attract incorporations will have an incentive to focus on the interests of managers and shareholders and to ignore the interests of third parties not involved in incorporation decisions'.40 It seems highly possible, then, that a market for incorporations would lead to a reduction in mandatory employment and insolvency laws of all kinds. It is not even necessary for there to be large-scale corporate movements for this to occur; **the threat might be sufficient**.¶ The siège réel principle was not an historical accident; it was a manifestation of the organisational emphasis and stakeholder orientation of the company law systems of those member states that had long recognised it. As long as that principle remained in place, it was a significant obstacle to convergence of systems upon a shareholder-orientated model. In that sense it was also a significant guarantor of the diversity that the European Union systems demonstrated, and which distinguished the European model from the American one. If the siège réel principle is now fraying at the edges, the implications for the future of European corporate law are profound.¶ In the context of the case law on freedom of movement, Centros is an outlier, dependent upon what are arguably artificial notions of what constitutes an obstacle to market access.41 In terms of its implications for the construction of the single market, it threatens to replace the distinctive approach to regulatory competition that has marked the European experience to date. It is not difficult to believe that the Court of Justice has had an eye on the Delaware experience in developing its approach in the Centros line of cases. But if that is the case, it may well have overvalued the supposed benefits of the Delaware effect, and underestimated its drawbacks.¶ This difference between the USA and Europe is not a straightforward distinction between a US solution, which favours competitive solutions and a European one, which favours regulation. US corporate law contains many highly regulative and rigid elements. The essence of the Delaware effect is a race neither to the top nor the bottom, but a race to converge. Delaware represents a race to converge through competition, and has arrived at the predictable result, for such unregulated competition, of a near-monopoly supplier.42 But it is also important to bear in mind the **role of the federal regulator**. The recent adoption of the Sarbanes-Oxley Act is a reminder that there are extensive federal powers to legislate in the field of corporate and securities law, and that Delaware's pre-eminence is to a large degree the consequence of the decision of the federal legislature not to intervene when it could do so. There is, indeed, a substantial track record of intervention by the federal legislature when inter-state competition is seen to have failed. Moreover, harmonisation here tends to take a particularly rigid form that is **largely absent from EU corporate and labour law**: this is the solution of federal preemption. This is, perhaps, why critics of US federal regulation in such areas as company law and labour law argue so vociferously that it acts as a 'monopoly regulator', excluding all scope for state initiative.43 The restriction of state initiative has occurred in relation both to securities regulation and the law governing collective bargaining. In each of these areas, the federal legislature intervened in the 1930s to cure what were seen as fundamental failings of state-level regulation. The courts subsequently applied the preemption doctrine to hold that these federal regulations 'occupied the field' in such a way as to prevent the states legislating in the area. This form of pre-emption contains a strong version of centrally imposed uniformity: where it applies, states are not simply prevented from derogating from the standards set by the federal legislature; it is very often the case that they cannot improve on them either. The Securities Act of 1933, the Securities and Exchange Act 1934 and the National Labor Relations Act 1935 are still very largely in force today, notwithstanding long-standing criticisms from commentators on all sides of the policy debate who argue that a return to state autonomy would better serve the policy goals of intervention in these areas.¶ A core characteristic of US-style competitive federalism, then, is not simply the presence of a particular form of inter-state competition, but also the use of a certain type of centralised regulation as a way of achieving policy goals when inter-state competition breaks down. The description of a 'monopoly regulator' that US critics use to attack federal intervention is entirely appropriate in a system that tends to react to extreme failures in the market for regulation by shutting down competition entirely. The criticisms may be justified, but the critics should also recognise that the counterpoint of unbridled competition versus monopoly regulation has a certain logic to it: it is precisely because the system of decentralised lawmaking so often led to extreme coordination failures, as in the case of the capital markets and labour markets of the 1930s, that the federal legislature, in its turn,

came to intervene with the goal of shutting down inter-competition entirely in contexts where it was perceived to have failed.¶ A different logic underpins the transnational harmonisation of laws in the European Community. Here, the purpose of harmonisation is not to substitute for state-level regulation; hence, the transnational standard **only rarely operates to 'occupy the field'** in the manner of a 'monopoly regulator'. Rather, transnational standards in effect seek to promote diverse, local-level approaches to regulatory problems by creating a space for autonomous solutions to emerge when, because of market failures, they would not otherwise do so.44 Directives in the areas of labour law offer a good example of this, since they are almost invariably interpreted as setting basic standards in the form of a 'floor of rights'. Although 'downwards' derogation is prohibited, Member States are allowed, and implicitly encouraged, to improve on the standards set centrally.45 **Far from being a 'straitjacket'**, then, which restricts local autonomy, central-level intervention is the precondition for continued local-level experimentation.¶ Directives in the area of corporate law have also drawn on this philosophy. In particular, company law harmonisation was influenced by the 'new approach' to harmonisation that the Commission instituted around the time of the passage of the Single European Act in 1986 and the initiation of the single market programme. The 'new approach' began in the context of product standard harmonisation, where it estab-lished a principle that Community intervention should be limited to the harmonisation of essential safety-related requirements. It also established the 'reference to standards' approach, under which it was presumed that a product that conformed to a standard set by a European-level body, or, failing that, with the relevant national standard, also complied with EC law.46 In this context, the Twelfth Company Law Directive, on single-member private companies (1989),47 which was adopted in pursuance of the Community's goal of promoting the growth of small and medium-sized enterprises, explicitly left a range of regulatory issues concerning disclosure of information and creditor protection to be decided at Member-State level. Later measures took the process a stage further by adopting a 'framework' model for directives. This again favoured the articulation of general principles or standards rather than the promulgation of rigidly prescriptive rules. However, new techniques were also involved. The aim was to achieve policy goals by linking regulatory interventions to the activities and processes of autonomous rule-making bodies, such as industry-level associations and self-governing professional organisations in the financial sector. The more recent Thirteenth Directive,48 on takeover bids, exemplifies this approach, in particular in the scope it provides for its general principles to be implemented through local-level action by self-regulatory bodies such as takeover panels, and in the specific provision which it makes for continued national-level divergence on matters such as takeover defences and the role of employee consultation.¶ In short, **there is no one, all-embracing model of regulatory competition**. The Delaware experience is the singular case of a particular trajectory, possibly unique, and is unlikely to be repeated in the same form elsewhere. The European Union's different trajectory reflects the particular conditions under which the national systems evolved and under which the harmonisation programme developed. In both systems, it can be seen that the nature of regulatory competition is **dependent on the particular institutional environment** or 'framework' that defines the relevant relationships between the different levels of rule making. Systems that approximate to the model described above in terms of 'competitive federalism' tend to give rise to a race to converge that could be either a race to the top or to the bottom; an optimal outcome is not guaranteed. The solution to extreme market failures, which would otherwise lock in inefficient rules, is pre-emption, that is, federal intervention that occupies the field to the complete exclusion of local initiative; but this, too, risks locking in inefficiency. By contrast, in the model of 'reflexive harmonisation', intervention has the goal of preserving diversity in order to **make it possible for regulatory competition to operate** as a process of discovery, based on mutual learning between states.¶ IV Conclusion: the Prospects for the European Model of Regulatory Competition¶ This article has argued that regulatory competition in corporate and labour law in Europe has taken a distinctive form, through which harmonisation, far from limiting national diversity as some of its critics have feared, has served to maintain it. This is a feature of a particular regulatory style, referred to here as 'reflexive harmonisation', which developed to match the highly divergent régimes that operate within the EU for the regulation of the business enterprise. By contrast, the predominant regulatory style in the USA has been a 'race to converge' through, on the one hand, jurisdictional competition that has been unmediated by any harmonising framework of basic rules and, second, federal legislation which, where it applies, pre-empts state-level initiative. It was further suggested that the advantages of inter-state competition as a mode of regulatory inteaction should be thought of in terms of the learning process that it engenders, which presupposes the maintenance of diversity, rather than in terms of the convergence of systems on a supposedly single best model.¶ At a fundamental level, the debate between European and American approaches is one of the prevailing conception of the relationship between regulation and the market. The US literature, particularly the standard law and economics approach, **views regulation as external interference** in private ordering, to be justified only where a clear market failure can be demonstrated. By contrast, the predominant European approach has been to see regulation, and the legal system more generally, as **constituting the market order**, an approach that is compatible with the idea that regulatory and market forces will more often complement than oppose each other. It would be **paradoxical**, under these circumstances, for the European approach to mimic US practice, and seek to initiate a Delaware-style process of interstate competition in company law, or any other area for that matter. That may well be **the direction to which EU policy is leaning**. But when state laws are seen as a 'distortion' of competition in the otherwise empty 'space' of the single market, a reassessment of that policy is overdue.

Corporate fraud destroys the EU economy---effective corporate governance is key

Stylianos **Andreadakis 10**, LL.B, LL.M, Faculty of Law, University of Leicester, thesis submitted for PhD, "Corporate Governance in the Aftermath of the Scandals: The EU Response and the Role of Ethics," January 2010, https://lra.le.ac.uk/bitstream/2381/9532/2/Andreadakis%20PhD%20Thesis.pdf

Going back to the early history of business organizations is quite instructive, as it has clearly illustrated that the problem caused by bad corporate governance is no new phenomenon. In actual fact, corporate governance is a subject area that is as old as the corporate form itself.103 The examination of the corporate scandals showed that all the corporate governance mechanisms, from the management and the directors to the shareholders and the auditors, either failed in their role or their performance was below standard. This problem requires a solution that we should continue to search for. The regulators failed, the same happened with the supervisors and so far no set of rules seems good enough to cure all corporate diseases and eliminate fraud and corruption. In this context, what are the odds of having a **European Enron** or WorldCom in the near future? ¶ Even someone, who is inherently optimistic, would not confident in giving a negative answer to the above question and this is by no means satisfactory. Nobody wishes the repetition of such a disaster, especially during the current financial crisis. The crisis is not directly linked with corporate governance as such, but there are some **common symptoms**: failure to exercise proper due diligence, unsound risk management practices and weak supervision. Moreover, the causes can be traced back to the pre-crisis phase, the _tranquillity period'. During the period of strong global growth and prolonged stability, market participants sought higher yields without an adequate appreciation of the risks and failed to keep pace with financial innovation, or take into account the systemic ramifications of domestic regulatory actions.104 Instead _in the middle of the crisis, when circumstances look dire and chunks of the financial system are falling off, proposals get radical. But after each crisis is over, these radical plans are tidied away' and what remains is calls for better disclosure, greater transparency independence and risk management. 105 The current financial crisis drew our attention to an old lesson that we need to revise. Legislation needs to be proactive rather than reactive. It is essential to **control the period of growth and stability**, in order to be able to avoid - or at least to predict - any forthcoming crises. Action should be focused on achieving that end. We cannot keep our fingers crossed or just hope that new scandals will not take place.¶ The EU has made **significant steps forward** and corporate regulation has been one of the priorities during the last few years. The jigsaw is not yet complete. Adding the missing pieces will allow everybody to have a clear picture of the final regulatory face of Europe. So far the regulatory framework looks deficient, as the Commission has not produced a complete legal framework for corporate governance. The EU is not ready to face the new challenges and a possible wave of scandals will find Europe ill-prepared. New scandals will have **disastrous consequences** on the European capital markets and the **public confidence will hit rock-bottom**. This is not a pessimistic prediction; it is a realistic one. If an Enron-like scandal happens in Europe soon, it would destroy the current atmosphere of positivism. In such an occasion, nobody can predict the real impact of the scandal and the economic knock-on effects globally. One scenario is that the EU institutions will be obliged to follow the American course of action being in a **state of panic**. It will not make any difference whether the final choice is the adoption of SoX as it is, or the adoption of identical provisions through a number of consequent Directives. An alternative scenario is the creation of a pan-European Code of Corporate Governance, which will be introduced in a rush (as with the SoX), simply in order to reverse the negative climate, boost investor confidence and prevent another stock market crisis.

European economic collapse causes global nuclear war

Gommes 11—Former Columbia Law Review senior editor [Thomas, publisher of Periscope Post, former corporate lawyer, "Eurozone in crisis: The death of the euro could trigger World War III," December 9, 2011, www.periscopepost.com/2011/12/eurozone-in-crisis-the-death-of-the-euro-could-trigger-world-war-iii/]

Eurozone in crisis: The death of the euro could trigger **World War III** The slow-motion demise of the euro isn't just financial Armageddon—it could just be one step down the slippery path to World War III. At the risk of being accused of scaremongering, I'll state my point simply and up front: Things in Europe are not as bad as they seem—they're worse. And though the commentariat is queuing up to predict the imminent demise of the euro currency and to lament the ongoing recession, that's not even the half of it: We're looking at World War III. _As major corporations start drawing up contingency plans for a world without the euro and as weaknesses in government finances become ever more glaring, the end of the euro currency becomes an increasingly realistic prospect. Related, the total absence of business growth, or trading among European nations raises the question of what benefits a unified trading block offers. The driving motive behind the original Coal and Steel alliance that ultimately became today's European Union was a desire among nations, traumatised by the worst war in their collective history, to provide a deterrent against another war. My concern is that that

trauma has faded, and that the fear of war has been replaced by the fear of recession. As anyone with even a fleeting familiarity with European history can confirm, ours is not exactly a history of love and peace. In fact, the period since the end of World War II has been probably the longest period of relative peace the region has ever known. Arguably, it's no coincidence that that period of peace has coincided exactly with the ever strengthening ties that have been forged between European nations over these past 60 years. If the bonds that tie Europe an nations together are weakened, the incentives to avoid **total war** dwindle. And its not as dramatic or far fetched a theory as it may at first sound. The end of the euro currency and a reversion to national currencies could quite possibly provide the impetus for a further dissolution of the union. The unraveling of painstakingly negotiated ties becomes easier and easier as each strand frays and breaks. Combine this unraveling with an ongoing or even deepening recession, and it all makes for a **combustible atmosphere**. Unfortunately, it is human nature to blame others for our woes. In an environment of unemployment, austerity, and general resentment, it is not difficult to imagine nations starting to point the finger at their neighbours. And without the unifying effect of a common currency, thriving trading relations, free movement of peoples, and common interests, Europe would find itself **increasingly susceptible to war**. Moreover, as so few Europeans in my generation, let alone subsequent generations, have even the slightest inkling about how horrific war is, it may be tempting to consider it as a solution to problems, or at minimum an acceptable response to perceived slights.

Exts---States Bad

Devolution to the states is much worse---doesn't solve econ

Reza **Dibadj 6**, Associate Professor, University of San Francisco School of Law, "From Incongruity to Cooperative Federalism," *University of San Francisco Law Review*, Vol. 40, Summer 2006, http://lawblog.usfca.edu/lawreview/wp-content/uploads/2014/09/A215.pdf

One proposal is to devolve securities regulation to the states, where corporate law ostensibly resides. The most eloquent proponent of this approach is Roberta **Romano**, who argues that firms should be allowed to "select their securities regulator from among the fifty states and the District of Columbia, the SEC, or other nations." 15 She would thus prefer "a market-oriented approach of competitive federalism that would expand, not reduce, the role of the states in securities regulation."¶ On one level, the argument is quite seductive. After all,¶ [c]ompetitive federalism harnesses the high-powered incentives of markets to the regulatory state in order to produce regulatory arrangements compatible with investors' preferences. This is because firms will locate in the domicile whose regime investors prefer in order to reduce their cost of capital, and states have financial incentives (such as incorporation and registration fees) to adapt their securities regimes to firms' locational decisions.¶ Consistent with her work in corporate law, Romano assumes that such an approach would lead to a "race to the top. 18 s The thesis, however, relies on a **host of implausible assumptions**, notably that investors have perfect information and that the corporate form does not present externalities. Charles Tiebout's hypothetical and perfectly informed citizen-voter is **magically assumed** to be a real-world investor.¶ A little bit of history should drive the point home. Over the past century, states competed for charters by offering **reduced public regulatory oversight** of the corporation. 20 Delaware, of course, has taken the lead in the quest to attract incorporations. To do so, it has created a legal regime protective of insiders, leading some critics to label it "the brothel of corporate law." 2 1 It is unfair, however, to single out Delaware. As Jill Fisch has pointed out, "state corporation statutes contain relatively little substantive variation. Careful empirical research reveals that corporate codes tend toward uniformity."2 2 The reason for this consistency is intimately related to the competition for incorporations: state corporate codes must be attractive enough both for new local companies to incorporate at home rather than bear the additional costs of going to Delaware, 23 as well as for existing local corporations to remain in-state rather than reincorporate in Delaware.¶ Lured by contractarianism, corporate law statutes are "enabling."25 Through clever tools such as the business judgment rule, fiduciary rules set "standards of review" well below "standards of

conduct."26 They focus on directors, **not officers who actually run a corporation**. 27 And the list goes on.28 The bottom line is simple: impressive-sounding obligations can be carefully skirted through clever process. 29 As Edward Rock suggests in his study of how Delaware cor-porate law is actually made, "we come much closer to understanding the role of courts in corporate law if we think of judges more as preachers than as policemen."'¶ Predictably, as a fresh batch of scandals began rocking the corporate world in 2001, state law was **conspicuously absent**:¶ But where has Delaware been through all this? No bills have been introduced in Delaware's legislature; no hearings held by its committees; its law enforcement agents have taken no action; and its executives have staid mum. How is it that Delaware-the home of what has long been viewed as the defacto national corporate law-has sat on the sidelines?¶ The problem, of course, is not confined to Delaware.3 2 As Robert Thompson notes, "the response in state corporate law has been largely one of silence that has left any modifications in corporate governance to ... other actors"3 3 ; in the end, "no one thought that state law was the place to address these problems."¶ In the wake of corporate scandals, Romano has written a strong rebuke of SOX, 3 5 instead suggesting an enabling statute akin to those in corporate law. 36 Tellingly though, she does not discuss the possibility that contractarian state corporate statutes and anemic fiduciary duties might have **allowed scandals to develop**. After all, it would be difficult to argue that the perpetrators in the recent corporate scan-dals were either careful or loyal. 37 Perhaps "the SOX initiatives are not to be found in any state corporation codes"38 precisely because state corporation codes have not protected shareholders. 39¶ Indeed, devolving to simple dual regulation will likely **make things worse, not better**, by making Delaware's position even more prominent than it is today.40 This will exacerbate the existing "democratic deficit"41 in corporate law, where a small state with approximately 800,000 citizens enjoys making de facto national law. 42 A cynic might be forgiven for wondering whether dual federalism could serve as an apologia for naive deregulation of securities regulation. 43

No state competition for corporate law---makes state corporate governance failure inevitable

Renee **Jones 4**, Associate Professor, Boston College Law School, JD Harvard Law, "Rethinking Corporate Federalism in the Era of Corporate Reform," 1/1/2004, Boston College Law School Faculty Papers, http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=1559&context=lsfp

Despite the longevity of the race debate, **recent empirical studies** demonstrate the fallacy of the fundamental assumption upon which the great debate rests—that states actively compete for corporate charters. In separate studies, Lucian Bebchuk and Assaf Hamdani, and Marcel **Kahan** and Ehud **Kamar** have asserted that the interstate competition which has been credited with fueling the corporate law race is largely illusory.30 These commentators show that not only is Delaware the clear leader in chartering publicly-traded corporations, but that **no other state serves as a credible rival** to Delaware in attracting charters from out-of-state corporations.¶ It is common knowledge that Delaware is the state of incorporation for more than half of all publicly-traded companies.32 Yet, the true extent of Delaware's dominance in the market for corporate charters becomes apparent only when the field is defined as the market for "out-of-state" incorporations. With the market so defined Delaware's market share increases to **85%.**33 In addition, several factors protect Delaware from being displaced from its dominant position by other states. Much of the value that Delaware's legal system offers corporations stems from the large number of other firms that choose to incorporate there. For example, Delaware's extensive body of corporate law decisions developed only because of the volume and diversity of cases presented to its courts.34 In addition, Delaware's institutional infrastructure, including its specialized court system, expert judiciary, and specialized bar would be difficult for other states to readily duplicate. These advantages work together to protect Delaware's dominant position.35 As a result, Delaware has **no meaningful competition** in the market for out-of-state incorporations.¶ In addition to Bebchuk's and Hamdani's insights, Professors Kahan and Kamar argue that contrary to the central assumption in the corporate race debate, other states are not making serious efforts to compete with Delaware for corporate charters.37 Kahan and Kamar analyzed the corporate franchise tax and fee structures of all states, and concluded that states other than Delaware stand to gain little economically from attracting additional incorporations.38 For example, Nevada, the so-called "Delaware of the West," earns marginal annual revenues of only $26,200 from the eighteen companies that went public as Nevada corporations between 1996 and 2000.¶ By persuasively demonstrating the absence of interstate competition

in the development of corporate law, these recent studies detract from the standard arguments of corporate federalists who advance and defend the free-market approach to corporate law embodied in the states' enabling corporate law codes.40 Because there is no meaningful interstate competition for corporate charters, competition could not have affected the development of corporate law in the way that corporate federalists posit. Thus, corporate federalists' defense of the states' enabling corporate codes must rest on other grounds.¶ The absence of vigorous competition among states for corporate charters does not by itself establish that fundamental problems exist in the corporate law rules that states created. It is one thing to refute the assertion that interstate competition exists, and has led to optimal corporate law rules, and quite another to demonstrate that the existing rules are flawed. Nonetheless, there are valid reasons to suspect that **certain problems will persist** in corporate law when the rules are established through a political process that managerial interests dominate. Such problems are likely to arise with respect to three broad categories of issues: (1) management's ability to retain its **powers and privileges** (i.e., election of directors and takeover defenses); (2) **managerial self-dealing** (i.e., executive compensation, conflicts of interest, unfair dealing with minority interests); and (3) interests of stakeholders and society (i.e., rights of creditors, employees and externalities).¶ Simply put, when legal rules require a balancing of competing interests, a lack of input in the regulatory process from all concerned interests makes it **unlikely that an optimal balance will be achieved**. An extensive body of literature explores the legal problems that arise in the areas identified above.42 Part VI of this Article examines corporate law doctrine in Delaware and highlights many of the problems implicated here.

Vertical competition involving federal influence is far superior to state-only competition

Renee **Jones 4**, Associate Professor, Boston College Law School, JD Harvard Law, "Rethinking Corporate Federalism in the Era of Corporate Reform," 1/1/2004, Boston College Law School Faculty Papers, http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=1559&context=lsfp

The vertical model has **normative appeal** because it recognizes the need for policymakers to consider a broader range of interests than the horizontal competition model deems important. As Cary and others have observed, a policymaking process characterized by horizontal competition encourages policy makers to appeal to management interests, to the **exclusion of the interests of all other corporate constituents,** because management initiates the selection of the state of incorporation and retains control over any reincorporation decision.66¶ The race-to-the-top paradigm advanced by Winter and others relegates investors to a reactive role and accepts their exclusion from participation in the policy debate when legal rules are crafted. In Winter's paradigm, the only role for shareholders in the regulatory process is that of ratifying or rejecting management's choice by choosing whether or not to invest in a corporation chartered in a particular state. Under this model, investors face a "take it or leave it" proposition. Because of the convergence of modern corporate law rules, the law of all states is essentially the same and investors are deprived of any meaningful choice.¶ In contrast, the presence of vertical competition pushes policy-makers at both the state and federal level to give **greater consideration to the interests of investors and broader societal issues**. Nationally dispersed shareholders lack direct political influence in Delaware, while management interests are well-represented.67 At the national level, in contrast, representatives of shareholder interests, can participate directly in policy debates.68 Sophisticated and organized aggregations of shareholders can and do lobby Congress and the SEC to ensure that shareholder interests are considered. Labor unions, public pension funds, and trade groups such as the Council for Institutional Investors have the wherewithal to make a persuasive case to Congress and the SEC.69¶ As a policy matter, encouraging vertical competition is **preferable to promoting horizontal competition** among states. Federal engagement provides voters throughout the country an opportunity to persuade Congress to preempt those state law provisions that lack popular support. This dynamic allows investors to influence state corporate law, if only indirectly. A posture of absolute federal deference to state regulators would deprive citizens of this power, **enhancing management's dominance** of the state regulatory process.

The federal government has a <u>huge role</u> in corporate governance---sole state action is irrelevant

Mark J. **Roe 5**, professor at Harvard Law School, where he teaches corporate law and corporate bankruptcy, "Regulatory Competition in Making Corporate Law in the United States—And Its Limits," *Oxford Review of Economic Policy*, vol 21, no 2, Oxford Journals

Who makes American corporate law? And what institutional structure surrounds its passage?¶ The usual answer is that states make American law, that states compete to make that law, and that a large tax prize—now about $500m annually—goes to the winner. The idea of jurisdictional competition—of a race—is deeply embedded in American corporate-law scholarship; and the nature of state competition for corporate charters—is it a race to the top, or to the bottom?—has been one of American corporate law's enduring controversies, one that dates back to the early-twentieth-century origins of the modern American corporation.¶ Yet there has always been a curious undertow here. Commentators often argue that this or that corporate governance rule was made in Washington, contravening the usual understanding that American corporate law is state-made. States make merger law, they make the rules on how stock is voted, they authorize and hence control the rules governing the structure of the American boardroom, and they decide what duties shareholders and managers have. But a commentator or two notices that (as an exception, they usually say) Washington makes merger law—indeed from 1968, with the passage of the Williams Act, to 1987, Washington was a key player in merger law, especially in keeping the states in the 1980s from making strong anti-takeover laws. Then another commentator shows how stock-exchange rules demanded by the Securities and Exchange Commission (SEC) determine key structures of the American board, by forcing an audit committee and requiring the independence of its members. And then another analyses shareholder voting only through the SEC's proxy rules while ignoring state rules. And then another argues that SEC rules effectively determine (or strongly influence) the duties shareholders and managers have inside the firm and to one another. These are nearly always thought to be exceptions for a particularly big issue, and not the normal run of American corporate law.¶ Here I argue that the cumulative impact of these exceptions to the concept of a state race makes that race debate misconceived—and **badly so**. The undertow here is as important as the tide. Whether or not the states are racing, and whether they are racing to the top or to the bottom, the United States is a federal system where Washington can, and often does, take over economic issues of national importance. The issues most likely to move into the national arena are precisely those that could affect firm value **so much** that they would be central to state-to-state competition. That happened for securities trading during the Depression, takeovers in the 1970s and 1980s, and corporate governance after the Enron and WorldCom scandals. And if fundamental issues of corporate governance **often move into the federal arena**, then Delaware and the states are not deciding all key corporate-law matters. The United States does not just have competition among states to make the law that governs large public corporations. It has two parallel systems of corporate law. One is statemade and one—incomplete but powerful—is Washington-made.¶ Some examples from three groups of statutes: The 1933 and 1934 securities laws, the Williams Act in 1968, and Sarbanes–Oxley in 2002, were all made in Washington, not in Delaware and the states. The securities laws govern most issues of share voting through Section 14 of the 1934 Act.2 They also govern insider trading. (States could deal with insider trading, but generally did not attack it as vigorously as have federal authorities; under some state law, insider trading is legal.) The Williams Act, passed by Congress in 1968, was a mild takeover statute. But it was interpreted during the 1980s as being the supreme law of the United States on takeovers, pre-empting most state efforts seriously to regulate takeovers (i.e. striking down those state laws as not permitted under the Williams Act), making much of American takeover law federal rather than state during that critical era for takeovers. (The United States Supreme Court reversed its earlier interpretation of the Williams Act in 1987, thereafter allowing states to act more freely.) The **Sarbanes–Oxley Act** of 2002 and related reforms mandate much corporate governance, including the relationships between accountants and the firm and the structure of boardroom committees.¶ In addition to these major statutes, federal authorities have acted on—or threatened to act on—the major transactions of most decades (and some minor ones as well). In the 1950s they made the most important rules concerning proxy contests to gather the votes of shareholders in the public corporation. In the 1960s and 1970s they expanded federal anti-fraud law so that federal law was effectively displacing the Delaware common law judge in regulating fiduciary fairness. In the 1970s, the SEC regularly acted on the quintessential transactions of that time—the 'going private' transactions (in which a controlling shareholder by fiat eliminated the minority stockholders, paying them for their stock)—with SEC Commissioner A. A. Sommer castigating state-made law there, asking, 'Where state law provides inadequate protection for shareholders, particularly minority shareholders, should federal law be interpreted broadly to supply safeguards lacking in state law?' (Sommer, 1974, 1975). For the SEC's concept release on going private, see SEC (1975). Eventually the SEC promulgated important rules regulating the transactions,

stating as it did so that it had its eye on the states in considering whether to push its (limited) authority to act even further: 'Further developments in the remedies provided by state law for unfairness in going private transactions will . . . be important' (SEC, 1979, p. 46,736). Moreover, federal authorities often tell institutional investors what kind of duties they have in holding stock, how they must treat their proxy for voting in annual corporate elections, and how they must construct their portfolios; these instructions deeply affect the structure and governance of the American public corporation. And the SEC twisted the arms of the American stock exchanges to force corporate governance rules on the American public corporation: nearly three decades ago, it demanded that the stock exchanges mandate that the boardroom of the American public company have an audit committee independent of management (NYSE, 1977, pp. 14,793, 14,794, and n. 11). When it lacked direct authority to bar dual-class common stock—a common structural feature for many corporations in several European countries—it induced the American stock exchanges to ban changes to dual-class stock for most listed companies. The American dual-class rule is functionally federal-made, not state-made.¶ Thus, we have the first qualification to the jurisdictional-competition concept for the United States: there are vast areas of American corporate governance that states simply have not governed alone, or sometimes at all—Washington has. Since **it is the mix that ultimately determines the effect of law on the economics of corporate governance**, organization, and ownership, some portion—and it intuitively seems to be a very large portion—of the law governing the corporation is **not made in a jurisdictional race** but by a national political authority— either Congress or the SEC or the federal courts.¶ And that reality of powerful federal action leads to the second qualification: since Congress and the federal authorities could act, and have acted in quite powerful ways in American corporate governance, that which persists at the state level is that which the federal authorities tolerate. One needs to assess state law's importance in light of the vast federal presence and the vast federal potential: anything could be federalized, at any time. Yes, federal authorities do give the states a wide range in which to act, but that range for the states is not without limit. And when scandals and economic reversals occur—when corporate transactions grab the attention of the American public and the United States Congress—Congress could act and often does act; if the state results are grossly out of line with what a Washington consensus wants, Washington is more likely to act. Yes, Washington acts only sporadically, it is often divided, and it often has more important things than corporate governance rules on its agenda; it is that inattention that gives the states in general—and Delaware in particular—room to manoeuvre. But that range, as I say, although quite wide, is not without limit.¶ That federal potential to act even more leads to the third and more contestable qualification to the conventional story: Delaware players are not oblivious to the possibility that federal authorities can act. When the issue is big enough to attract Washington's attention, they have reason to consider what Washington would do, and they often have reason not to instigate Washington to displace them; they have reason to act inside the Washington boundaries; and they have said often enough that they are taking Washington into account. And there is good reason why: the raw fact is that the big gorilla of American economic lawmaking is the United States Congress, not the Delaware Chancery Court, not the Delaware legislature, and not the Delaware corporate law council, which drafts Delaware's corporate law.¶ Thus, I argue here, we must **reconceptualize who makes American corporate law**, and how it is made. Yes, Delaware must look to what the other states do. But that is not where American corporate law ends: Washington is not just a potential big player, but an actual big player, nearly always considering and usually acting on the most important corporate governance issues of nearly every decade of the twentieth century. And Washington could always do more. This reality of Washington action and potential suggests that the American jurisdictional structure is more triangular—states at the base, the federal authority at the top vertex—than just horizontal.

Pure competition is impossible---means EU corporate federalism fails without considering federal influence

Mark J. **Roe 5**, professor at Harvard Law School, where he teaches corporate law and corporate bankruptcy, "Regulatory Competition in Making Corporate Law in the United States—And Its Limits," *Oxford Review of Economic Policy*, vol 21, no 2, Oxford Journals

Is it a market of competing states that produces American corporate law? A market, we might think, produced American corporate law, and markets hone efficiency, and often do so better than governments. A market may well have produced American corporate law, but that widely believed conclusion is harder to assess than is commonly thought. The reason it is harder to assess

is that there is a **vast federal presence** in the law governing the American corporation, and there could be more of it. That there is not even more may indicate that the broad polity in the United States tolerates Delaware's shareholder- and manager-oriented corporate law. European policy-makers, however, might find it **harder to construct jurisdictional competition** if deference to shareholder and manager values would be the outcome, as it is in the United States, and if the European polity is less tolerant of having its major corporations run for shareholders and managers, with little regard for other constituencies.¶ Properly conceived, the movement from a state forum to a federal forum need not even involve the identical issue. Consider this: we can array the rules on a continuum of managerial autonomy versus shareholder control. States might, say, shut down the takeover market with strong anti-takeover laws. But then shareholders might go federal and induce the SEC to loosen up restrictions on shareholders in policing management. A case can be made that this is what happened in the late 1980s and early 1990s: states passed anti-takeover laws and their courts rendered anti-takeover decisions, then institutional investors asked the SEC to loosen up restrictions on their organizing to toss out directors. And the SEC then did so. We are only beginning to scratch the surface conceptually and empirically on how this interplay works, but we have to realize that there is a major federal legal presence in the governance of the American public corporation. The complementarity, substitutability, and interaction of federal and state corporate law are all in play, and they still need to be better analysed.¶ American corporate lawmaking should be seen not as horizontal regulatory competition, but as **triangular**. Firms arise in their home states, corresponding roughly to an EU real seat. Then they decide whether to stay put or move to Delaware, usually when they take on a big transaction, such as an initial public offering or a merger (Bebchuk and Cohen, 2003). So on the left-hand corner of that triangle is the home state; on the right-hand corner is Delaware. In between are the other states. Sitting atop the triangle, though—and thereby giving the structure verticality—is **Washington**, which sporadically enters the world of corporate governance—often in reaction to a scandal, as with Sarbanes–Oxley, or an economic downturn—and could always do more.¶ The play of interest groups and ideas differs between Delaware and Congress. Delaware's interest groups are narrow, basically shareholders, managers, and their advisors. Congress has more interest groups, and broader ideas of efficiency, fairness, and sometimes power-levelling are in play in Washington. In the EU, these might roughly translate as social policy considerations. Depending on one's view of the importance and relevance of social policy to corporate law, these considerations induce analysts to applaud Delaware—because it minimizes such considerations—or induce critics to be wary of it, if their policy preference is to keep social considerations in play in making corporate law.¶ Thus, the mechanisms that would make for a pure interstate race are absent in a true federal system such as America's. Yes, there is interstate mobility for corporations in the United States. But that is not all there is. Hardly a decade has gone by in which the federal government did not consider taking over the major corporate issue of the time. Oftentimes, it did. Thus, Delaware's strongest competitor has been, and probably still is, Washington. The interplay between the horizontal movement and the vertical authority **needs to be taken into account** for any full conceptualization of the making of American corporate law. This federal reality weakens the mechanisms of a strong race because, if the issue is important, it often becomes a federal one. The race analysis therefore must yield to a wider perspective on what is, and who makes, corporate law. And in understanding whether jurisdictional competition would be valuable for the EU or not, one must keep in mind that it is not just the state-to-state, or nation-to-nation, relationships that count, but also the strength, effectiveness, play of interests, and good sense at the centre—in Washington in the United States, and **in Brussels** in the EU.¶ The simple and clear facts are that there is today a very large federal presence in corporate law in the United States. In nearly every decade of the twentieth century the major corporate issue either went federal or threatened to go federal. Delaware has a great deal of discretion, especially on technical matters, but that discretion, even though wide, is not without limit. When the issue is big, it is often Washington that acts.

Regulatory competition in Europe causes a race to the bottom in corporate law

Martin **Gelter 8**, Olin Fellow in Law and Economics at Harvard Law School, "The Structure of Regulatory Competition in European Corporate Law," Discussion Paper No. 20, July 2008, SSRN

We have seen that countries seeking to offer attractive corporate law could employ two alternative strategies, one that seems desirable ("firm value maximization") and one that seems undesirable ("maximization of private benefits"), as private benefits will almost certainly decrease firm value beyond a certain level. Conceivably, we might see states pursuing either strategy. However, if there were actually fierce competition between Member States, a **movement "to the bottom**" could happen if it is easier to leave private benefits of control unchecked than to develop "good law" maximizing firm value for competing states. Instead of using political clout within a particular county to maintain private benefits, large blockholders might **capture the regulatory competition process**.161 Thus, if in a control-oriented system of corporate governance, pressures from

capital market and even the need to resort to them are smaller, one should, at the very least, expect a greater danger of a movement to the bottom than in a corporate governance system characterized of public corporations with dispersed ownership such as the one of the US.¶ Admittedly, one factor that could mitigate possible negative effects of regulatory competition would be product markets. A firm with excessive private benefits will most likely be at a competitive disadvantage in the long run.¶ Still, if one follows the theory that developed legal minority protection is correlated to or even a prerequisite for the development of dispersed ownership and capital markets,162 one might even predict a weakening of minority protection in some countries **and**, as a consequence, **of stock markets** as a result of regulatory competition (in the absence of significant countervailing factors). The US is **not a good model with which to oppose this argument**: First, dispersed ownership was firmly in place as early as 1932, allowing Berle and Means to write their pathbreaking study on the separation of ownership and control.163 More importantly, other mechanisms were in place that prevented the rise of controlling shareholders.¶ Race-to-top advocates might conclude that European laws will remain more strongly committed to a regulatory approach in corporate law: Where the forces of capital markets are weaker in disciplining managers and controlling shareholders an approach favoring mandatory law may be economically superior.165 Given that controlling shareholders will usually be able also to initiate a reincorporation, they might want to find a way of committing to a regime friendly to the minority, for example by enhanced supermajority requirements in the company's charter. However, such a commitment to a specific mandatory corporate law regime would be difficult and probably come with costs of reduced flexibility. It seems much more likely that companies would rather subject themselves to a strong regime of securities regulation,166 which would not necessarily affect the development of corporate law.¶ Following the hypothesis that Delaware law is tailored to the needs of typical American publicly traded firms, one would expect the European market to exhibit more fragmentation and less uniformity also because of ownership patterns, even once it extends also to large corporations. As long as many large public companies continue to deviate from what has been called the "standard model" of corporate law168, the market should be expected to demand a high degree of diversity to accommodate a great variety of idiosyncratic structures and problems, which precludes the existence of a one-size-fits-all solution.

Total devolution to state competition is unstable and causes regulatory failure

Stylianos **Andreadakis 10**, LL.B, LL.M, Faculty of Law, University of Leicester, thesis submitted for PhD, "Corporate Governance in the Aftermath of the Scandals: The EU Response and the Role of Ethics," January 2010, https://lra.le.ac.uk/bitstream/2381/9532/2/Andreadakis%20PhD%20Thesis.pdf

In this context, EU corporate governance regulation cannot be seen isolated from the whole system of law-making and its characteristics. The creation of the internal market has created a vigorous debate about whether harmonization is the most appropriate method. Globalization and the multinational character of modern companies have raised a lot of questions about whether there is one method that can safely lead to the much-desired convergence of corporate governance laws. Harmonization has been the choice of the EU legislators, but it cannot be so easily applied in practice, as we have witnessed in the last few years. Harmonization in the area of company law has proved to be remarkably burdensome and there were several difficulties due to the different legal systems and traditions. Differences in terminology and multiplicity in the legal concepts have led the EU legislators to adopt a strategy of common minimum standards, according to which a limited number of topics are harmonized. This 'salami' process of harmonization is not consistent and inevitably leads to lack of homogeneity, as only a certain number of topics are covered, while other closely related ones remain unaffected. 46 Such a solution cannot be characterized as successful and has been at the centre of criticism as being a '**fragmentary and compromise solution**'.¶ Mutual recognition, minimum standards and subsidiarity provide a framework for regulatory competition, which **reduces the scope for strategic regulation** and dilemmas.48 Regulatory competition includes a comparative element, and the idea of searching for the best solution created high expectations for better results than the Commission-driven harmonization. Nevertheless, regulatory competition can become **unstable** if, for example, mutual recognition is not achieved. Additionally, there is always the fear that regulatory competition will end up leading to a race to the bottom if there is no framework to control and regulate it. Lastly, 'the more pluralistic orientation of many

European company laws (for instance, towards employee representation) **does not permit a simple choice** between the different national laws which would be necessary for an effective competition'. 49 In the United States, the result has been an 'uneasy and fluid allocation of corporate law between the federal government on the one hand and the individual states (led by Delaware) on the other'. 50 For this reason, actually, the SoX dealt with corporate governance from an extensive scope, limiting the autonomy of the states.¶ From what it appears, both harmonization and regulatory competition are neither a panacea nor a menace. In fact, they should be seen as complements, rather than substitutes to one another.51 Reflexive harmonization, which seems to be an **intermediate solution**, considers diversity among Member States as a 'resource, which, when coupled with mutual monitoring and benchmarking, provides a basis for experimentation and mutual learning'.52 As discussed in chapter 2, the focus is on the process and the methods used, not on the end result as such. It is a new and innovative solution that builds on the weaknesses of the other options and the special requirements of the EU environment. It will soon become obvious whether it can stand the test of time and prove to be more successful than the two previously mentioned solutions.

Federal regulatory harmonization is occurring the EU now---key to maintain growth

Stylianos **Andreadakis 10**, LL.B, LL.M, Faculty of Law, University of Leicester, thesis submitted for PhD, "Corporate Governance in the Aftermath of the Scandals: The EU Response and the Role of Ethics," January 2010, https://lra.le.ac.uk/bitstream/2381/9532/2/Andreadakis%20PhD%20Thesis.pdf

Following the introduction of the Company Law Directives, the adoption of the FSAP and the overall progress of the EU Law harmonization project, the EU has made **significant progress in most areas of corporate governance regulation**, such as disclosure, corporate mobility, shareholders rights, and remuneration of directors. The goal of harmonization has not yet been accomplished, but we should not neglect the fact that the objective of the EU was not to create homogeneity in the Common Market, but a well-functioning Internal Market.67 National legal systems must be compatible, if not harmonized, sharing good practices and respecting diversity. If the corporate governance standards are raised and competitiveness is promoted, **market confidence and credibility of national markets** to foreign investors will be increased. The Union still needs to modernize its company law and corporate governance regulatory framework, in order to overcome the obstacles standing in its way to the future: the continuous integration of the European capital markets, the challenges of the recent enlargements, the Lisbon Treaty objectives, as well as the impact of corporate scandals and the financial crisis. In this context, the Action Plan looks more like a means to an end, rather than an end itself; it is a toolbox, which the Commission has used and will continue to use until all barriers for businesses are removed from the EU and/or the dream of harmonization of law becomes a reality.

Yes Modeling---Corporate Law

The EU's current initiatives for corporate governance were enacted BECAUSE of Sarbanes-Oxley (also uniqueness?)

Luca **Enriques 6**, Professor of Business Law, University of Bologna, and ECGI Research Assistant, "The Uneasy Case for Top-Down Corporate Law Harmonization in the European Union," *University of Pennsylvania Journal of International Economic Law*, vol 27(4), 2006, http://scholarship.law.upenn.edu/cgi/viewcontent.cgi?article=1203&context=jil

Following the wave of U.S. corporate scandals and the prompt, tough response by Congress with the **Sarbanes-Oxley Act** of 2002,152 the European Commission **decided it needed to play a major role** in reforming corporate governance to restore public confidence.153 In May 2003, the

Commission released a comprehensive action plan, Modernising Company Law and Enhancing Corporate Governance in the European Union (the "Action Plan"), containing twenty-four proposed measures, some of which have already been enacted and the rest of which are expected mainly before 2009.154 In December 2005, the European Commission launched a public consultation on the future priorities of the Action Plan.

Yes Modeling---Federalism

The EU models the federal structure of the US

ABSTRACT¶ The United States has long been a source of **influence and inspiration** to the developing federal system in the European Union. As E.U. federalism matures, increasingly both systems may have the opportunity to profit from each other's experience in federal regulatory theory and practice. This article analyzes aspects of the federal ordering in each system, comparing both historical approaches and current developments. It focuses on three legal topics, and the relationship between them: (1) the federal regulation of matters of private law; (2) rules of the conflict of laws, which play a critical role in regulating cross-border litigation in an era of global communications, travel and trade; and (3) "subsidiarity," which is a key constitutional principle in the European Union, and arguably also plays an implicit and underanalyzed role in **U.S. federalism**. The central contention of this Article is that the treatment of each of these areas of law is related —that they should be understood collectively as part of the range of competing regulatory strategies and techniques of each federal system. It is not suggested that "solutions" from one system can be simply transplanted to the other, but rather that the experiences of each federal order demonstrate the interconnectedness of regulation in these three subject areas, offering **important insights** from which each system might benefit.¶ INTRODUCTION¶ It has long been recognized that the **maturing federal system** of the European Union has much to learn from what is commonly considered the oldest enduring federal system in the world—the United States. As the European Union develops its own regulatory theories and practices, increasingly both systems may have the opportunity to profit from each other's experience. The fields of **federal private law** and conflict of laws,3 which have been areas of intensive and controversial regulatory and academic activity in the history of the development of E.U. and U.S. law, are particularly apposite subjects for comparative study. The central contention of this Article is that the treatment of these two areas of law is related, and that this can be highlighted through analysis of a third, the principle of "subsidiarity," which has a key constitutional role in the European Union, and a largely latent but potentially important role in the United States. This Article thus explores the interrelation of subsidiarity, federal private law, and the conflict of laws, comparing approaches and developments in E.U. and U.S. federalism.

Effective federalized corporate governance overwhelms alt causes and solves the EU economy

Since the summer of 2007, the EU has slipped into and been in the midst of the **deepest financial turmoil since the 1930s**, involving banking systems, stock markets, and the flow of credit. As of the writing of this article, one of the most influential regional economies, the Eurozone, is facing its greatest challenge so far: the depth of the current debt crisis.71 Confronting this catastrophic situation, EU legislators have once more decided to resort to the dubious remedy of a coordinated framework, which will predictably lead to even more strenuous efforts towards integration.72 In particular, further legislative action at the EU level to develop a **synchronized corporate governance framework** is seen as crucial in achieving this policy priority.73 Corporate governance plays a central role in running and regulating modern enterprises in globally integrated markets, and it is anticipated that a well-coordinated framework will **overcome the current Eurozone contagion** fear as well as create the necessary climate for investment and economic revival. As noted, a harmonious EU corporate governance framework will "inspire investor and lender confidence, spur both domestic and foreign investment, and improve corporate competitiveness."

European Scandals Possible/Likely

European corporate fraud is possible and likely

Stylianos **Andreadakis 10**, LL.B, LL.M, Faculty of Law, University of Leicester, thesis submitted for PhD, "Corporate Governance in the Aftermath of the Scandals: The EU Response and the Role of Ethics," January 2010,

Many Europeans were of the impression that corporate scandals were supposed to be strictly American affairs. A classic short-sighted response to a collapse like Enron's is that '**it will not happen in our company'** or 'it could not happen here'. Such a response sounds rather **selfish or self-centered**, because as it is naïve to believe that the US scandals had nothing to do with Europe. The incentive, and the opportunity, to commit fraud are not limited to any particular system of goernance, geographic region, industry, or size of company.32 This point should have been clear, even before the scandals of Parmalat and Ahold. It was definitely the 'American sense of greed' 33 that encouraged executives at Enron and WorldCom to falsify the financial results of the company and cross the line between lawful (creative) accounting and fraudulent accounting accompanied with conspiracy and corruption. The significance of Enron is further highlighted by it being the first time in corporate history that a foreign scandal initiated a Company Law reform. 34 But what Enron also made clear was that the world market is interdependent and any abnormality can rapidly cross the Atlantic Ocean and becomes a '**European problem'** as well. Europe felt its impact and, consequently, had to change its perspective regarding corporate regulation. The thrust wave of the American scandals, in combination with the subsequent European scandals, revealed that there is **no shield protecting Europe** from mismanagement. The fraudulent behaviour at Parmalat was equally **large and widespread**. Profits were overstated, fictitious bank accounts with billions of euros were created and approximately €1 billion of investors' money was siphoned off for personal use by Parmalat's founder, Calisto Tanzi, and his friends and family.

EU---Impact

Exts---EU Decline = War

European economic collapse causes multiple scenarios of global war.

Wright 12, Thomas, fellow with the Managing Global Order at the Brookings Institution, Summer 2012, "What if Europe Fails?" The Washington Quarterly, http://csis.org/files/publication/twq12SummerWright.pdf, Accessed 7/25/14

Yet, verbal warnings from nervous leaders and economists aside, there has been remarkably little analysis of what **the end of European integration** might mean for Europe and the rest of the world. **This article does not predict that failure will occur it only seeks to explain the geopolitical implications if it does.** The severity and trajectory of the crisis since 2008 suggest that **failure is a high-impact event with a non-trivial probability.** It may not occur, but it certainly merits serious analysis. Failure is widely seen as an imminent danger.¶ **Would the failure of the Euro really mean the beginning of the end of democracy in Europe? Could the global economy survive** without a vibrant European economy? What would European architecture look like after the end of European integration? What are the implications for the United States, China, and the Middle East? **Since the international order has** been primarily a Western construction, with **Europe as a key pillar, would the disintegration of the** European Union or the **Eurozone have lasting and deleterious effects on world politics in the coming decade?¶** Thinking through and prioritizing the consequences of a failed Europe yield five of the utmost importance. First, **the most immediate casualty of the failure of the European project would be the global economy. A disorderly collapse** (as opposed to an orderly failure, which will be explained shortly) **would** probably **trigger a new depression and** could **lead to the unraveling of economic integration as countries introduce protectionist measures to limit the contagion effects of a collapse. Bare survival would** drag down Europe's economy and would **generate increasing and dangerous levels of volatility in the international economic order.¶** Second, the geopolitical consequences of an economic crisis depend not just on the severity of the crisis but also the geopolitical climate in which it occurs. **Europe's geopolitical climate is as healthy as can be** reasonably **expected.** This would prevent a simple repeat of the 1930s in Europe, which has been one of the more alarming predictions from some observers, **although** certain **new and fragile democracies in Europe might come under pressure.¶** Third, **failure would cement Germany's rise as the leading country in Europe and as an indispensable hub in the E**uropean **U**nion and Eurozone, if they continue to exist, **but anti-Germanism would be**come a **more potent force in politics on the European periphery.¶** Fourth, **economic downturn** as a result of disintegration **would undermine political authority** in those parts of the world **where** the **legitimacy of governments is shallow, and** it would **exacerbate international tensions where the geopolitical climate is relatively malign. The places most at risk are the Middle East and China.¶** Fifth, **disintegration would weaken Europe on the world stage–**it would **severely damage the transatlantic alliance**, both **by sapping** its **resources and** by **diverting Europe's attention to its internal crisis–and** would, finally, **undermine the multilateral order.¶** Taking these five implications in their totality, one thing is clear. **Failure will badly damage Europe and the international order,** but some types of failure–most notably a disorderly collapse–are worse than others. Currently, the pain is concentrated on the so-called European periphery (Greece, Portugal, Spain, Italy, and Ireland). **Disorderly collapse would affect all European countries, as well as North America and East Asia.** If a solution to the Eurocrisis is perceived as beyond reach, leaders of the major powers will shift their priorities to managing failure in order to contain its effects. This will be strenuously resisted on the periphery, which is already experiencing extremely high levels of pain and does not want to accept the permanence of the status quo. Consequently, their **electorates will become more risk-acceptant and** will **pressure Germany and other** core **member states to accommodate them through financial transfers** and assistance in exchange for not deliberately triggering a break-up. **This bitter split will divide** and largely define **a failing Europe.** Absent movement toward a solution, EU politics is about to take an ugly turn.

Ethnic conflict in Eastern Europe is likely --- violent nationalist parties are being elected now and the core issues behind conflict haven't been resolved.

Irina **Papkova**, Spring **2008**. PhD Comparative Politics @ Georgetown, MA in Russian and East European Studies @ Georgetown, Assistant Professor @ Central European University. "ETHNIC AND NATIONAL CONFLICT IN EASTERN EUROPE AND EURASIA," http://www.hc.ceu.hu/ires/courses0708/ethnic_and_national.html.

The collapse of the communist bloc from 1989-1991 was accompanied by numerous bloody conflicts in the former Yugoslavia as well as the new states of Georgia, Armenia, Azerbaijan, Tajikistan, the Russian Federation, and Moldova. In all of these cases national and ethnic identity occupied central stage as societies entering a new mode of political and economic organization were torn apart by conflicting visions of the new order. With the emergence of these violent confrontations nationalism suddenly seemed on the rise as a political force that would increasingly shape world politics. This was unexpected. As an ideology, nationalism had contributed directly to the violence of both World Wars, and in their aftermath had been widely condemned. Entire political institutions – including the United Nations and what would become the European Union – were erected to ensure that nationalism would not erupt again as a destructive force. The sudden reappearance of nationalism/ethnic identity as potent political forces in the last decade of the 20th century required scholars to engage in a serious rethinking of their theoretical understanding of these phenomena. Though the violence seems to have largely subsided, none of the conflicts mentioned above have reached a satisfactory resolution of the core issues driving the conflict, thus **making it possible that the cycle of violence will reignite at any time**. At the same time, even in those post-communist countries that have generally been regarded as peaceful and successful models of democratic transition – the countries of Eastern and Central Europe outside of Yugoslavia – we see the recent intensification of nationalism and xenophobia, accompanied by the rise of nationalist political parties that seem less and less interested in a conflict-free relationship with their neighbors (the recent troubles between Hungary and Slovakia being only one example of this tendency). Thus, it appears that **nationalism is alive and well, and with it the possibility of ethnic/national conflict remains a real threat in the region of Eastern Europe and Eurasia**.

Europe war causes nuclear escalation

Glaser 93 (Charles, Assistant Prof. Public Policy Studies—U. Chicago, International Security, "Why NATO is Still Best: Future Security Arrangements for Europe", 18:1, JSTOR)

However, although the lack of an imminent Soviet threat eliminates the most obvious danger, U.S. security has not been entirely separated from the future of Western Europe. The ending of the Cold War has brought many benefits, but has not eliminated the possibility of major power war, especially since such a war could grow out of a smaller conflict in the East. And, although nuclear weapons have greatly reduced the threat that a European hegemony would pose to U.S. security, a sound case nevertheless remains that a major European war could threaten U.S. security. The United States could be drawn into such a war, even if strict security considerations suggested it should stay out. A major power war could escalate to a nuclear war that, especially if the United States joins, could include attacks against the American homeland. Thus, the United States should not be unconcerned about Europe's future.

Europe economic decline collapses the US economy

Robert **Kahn** 8/16/**13**, Steven A. Tananbaum Senior Fellow for International Economics at the Council on Foreign Relations, What is the impact of the Eurozone crisis on the U.S. economy?, http://www.cfr.org/financial-crises/impact-eurozone-crisis-us-economy/p31407

Europe's debt crisis and recession have been felt around the world, and the United States has not been spared. The economies of all seventeen euro-area countries comprised 17 percent of the world economy in 2012, generating $12.2 trillion in GDP (close to the $15.7 trillion U.S. economy). Germany's economy alone is the fourth largest in the world. Strong trade, investment, and financial ties with the United States ensure that shocks in one region have important effects on the other.

The crisis in Europe has been directly felt through lost trade, as lower European incomes reduce demand for U.S. goods. The eurozone is the third largest export destination of the United States, accounting for 15 percent of total U.S. goods exports and one-third of service exports.

Cross-border investments have increased dramatically in recent decades. U.S. assets abroad and foreign-owned assets in the United States increased more than six fold between 1994 and 2010, according to a U.S. government report, and it has been estimated that one quarter of the earnings of top U.S. companies come directly or indirectly from Europe. Consequently, U.S. companies and investors have an important stake in a European recovery.

Financial sector linkages also matter. While U.S. banks do not have many direct financial holdings in Europe's "peripheral" countries experiencing the most formidable fiscal woes, the indirect effects of a European debt blow-up could be "quite significant" in U.S. financial markets, according to Federal Reserve Chairman Ben Bernanke.

UQ---European Econ High

Europe economy high

- Strong growth forecasts
- Cheap oil → consumer spending
- Weak euro → exports
- Stimulus from ECB
- Deflation risk gone
- Unemployment falling

Mark **Thompson 3/5**, writer @ CNN Money, "Three reasons to cheer Europe's economy," http://money.cnn.com/2015/03/05/news/economy/europe-economy-recovery/

But here are three reasons to buy champagne (or perhaps Spanish cava), even if you may want to keep it on ice for a while: 1. **Growth returning**: The European Central Bank upgraded its forecast for eurozone growth in 2015 to **1.5%** Thursday. If achieved, that would represent a **significant acceleration** over last year's meager expansion of 0.9%. "We expect the economic recovery to **broaden and strengthen** gradually," ECB President Mario

Draghi told reporters. **Cheap oil** is helping consumers, the weak euro is giving exporters an edge, and anticipation of massive stimulus by the ECB is already having an impact, even though it hasn't yet begun. Borrowing costs for homeowners, companies and governments have sunk to record lows, and in some cases even turned negative as investors pile into bonds before the ECB starts buying on Monday at a rate of €60 billion a month. Surveys suggest confidence is growing, with companies in manufacturing and services the most **bullish** they've been since July 2014. Even reform laggard France appears to be emerging from stagnation. **All four of the eurozone's biggest economies saw expansion in February.** Related: European stocks love QE. Can the rally last? 2. Deflation risk fading: The risk that falling prices could create a vicious circle of weak demand, and then even weaker prices, prompted the ECB to unveil its €1.1 trillion stimulus program in January. Consumer prices across the eurozone fell for a third consecutive month in February, but at 0.3% the rate of deflation was half that of January. The ECB, and many independent experts, say there could be a few more months of falling prices before inflation returns to the eurozone around the middle of this year. Inflation should then pick up to around 1.5% in 2016. That's still below the ECB's target of just below 2%, hence its plan to continue buying assets until September 2016 and beyond if necessary. 3. Unemployment falling: 18 million people are still out of work in the 19 countries that make up the eurozone, with Greece and Spain suffering the most. But **unemployment is falling** -- it dropped to 11.2% in January, down from nearly 12% a year ago and the lowest rate recorded in nearly three years. About a million fewer people are without work now than a year ago. Germany's labor market is in robust health, and its powerful unions are beginning to win big pay rises again. There are encouraging signs elsewhere too. Spain saw the eurozone's biggest monthly fall in unemployment in January, although with a rate of more than 23% it still has a long way to go.

Quantitative easing solves

Keating 3/9 Dave Keating - European Voice "Draghi's medicine: the health claims may be overblown," www.europeanvoice.com/article/draghis-medicine-the-health-claims-may-be-overblown/

In a similar vein, merely the **declaration** that the ECB was ready to embark on **q**uantitative **e**asing (in the face of determined opposition from the QE-averse head of the German central bank, Jens Weidmann) is now being credited with **transformative powers** – at least by Draghi himself. He said last Thursday, as he gave details of the QE plans, that January's declaration had **already had** an effect on inflation – or rather, on the developing problem of deflation. "Our monetary policy decisions have stopped a decline in inflation expectations that had started at the end of July last year," he said. "The risks remain on the downside, but have diminished." He also announced that the ECB was raising its forecast for economic growth in the eurozone this year from 1% to 1.5%. He was gracious enough to acknowledge that this was not all attributable to the ECB's declaration of QE intent or to low interest rates: the sharp drop in the price of oil had played a big part. What is important to note here is that at least parts of the eurozone economy are **already on the mend** even without QE. Retail sales figures in Germany and even in France suggest a revival in consumer demand. So controversial is QE – and the argument over whether the eurozone should pursue this course is almost ideological – that we should expect fierce arguments in the coming months over how much credit to attribute to QE for any subsequent improvement in the economy.

AT: Greece Alt Cause

Grexit doesn't have an impact on Europe

Clem **Chambers 6/9**/15, contributor to Forbes, Grexit: Will Greece Leave The Euro And What Will Happen If It Does?, http://www.forbes.com/sites/investor/2015/06/09/grexit-will-greece-leave-the-euro-and-what-will-happen-if-it-does/

A no to Greece from Europe means the birth of the "new drachma." (I'd like to be short of that right now.) The new drachma will pay wages and pensions in the public sector and likely pay non-secured debts, like hospital drugs bill and anything outstanding without preference. It **will settle all government bills** and convert 1:1 on the moment of the issue of the new currency.

1 euro = 1 new drachma.

Of course if the drachma tumbles, it will be euro versus Swiss franc this spring, all over again, but bigger.

"Foop," is a word I've heard to describe what happens next. The new drachma collapses. How far? Imagine if Greece got a 50% debt forgiveness. They would be cock-a-hoop. So imagine the drachma halving in short order with Greece in euro debt default.

The new drachma, if it floats, should reach equilibrium roughly where it is worth to pay Greece's foreign debts at. If it can revitalize its economy being able to print its own cash, it can then slowly retire the euro debt.

Lots of wriggle room spins off from the malfunction of default. It's the Argentinian solution and it's grizzly **but it won't look too bad on either side of the economic-political divide**. The G-less PIIS (PIIGS) will look on aghast and not want to go the Syriza route. The austere north will tut tut, "told you so."

Grexit fears overblown

Jain 2/16 Siddharth Jain - Senior Vice President & Managing Director, South Asia, for Turner International India Private Limited (Turner), "Grexit: An Overblown Fear?," https://ilcmarkets.wordpress.com/2015/02/16/grexit-an-overblown-fear/

Greece has been a thorn in the Eurozone's side ever since its bailout in 2009. Now, because of an early parliamentary election, the Eurozone may be forced to relieve the pain of the sovereign debt crisis. The winner of the elections was a far-left Populist Party called Syriza. More importantly, the party and its leader, Alexis Tsipras, plan to end the country's austerity program and stop paying back its debt to wealthier European nations. With Greece's membership in the Eurozone already controversial, Syriza's victory has frustrated many national leaders, particularly Germany's chancellor Angela Merkel. In response, the ECB has refused to provide emergency liquidity to Greece's banks or buy up its bonds unless Ms. Tsipras' government finds an agreement with its creditors. Although Mr. Tsipras insists he wants Greece to stay in the euro, there is now a decent possibility of a Grexit. The first time these fears arose, Germany eventually gave in to pressure and bailed Greece out. However, after two bailouts, even the Netherlands and Finland are hesitant to keep Greece in and this political victory could mean a big change for the euro. There are two potential effects of Tsipras' policies: Stimulus—Europe's austerity may have been excessive, as both the continent and Greece have struggled post-recession. A massive spending spree can potentially stimulate the Greek economy; however abandoning privatization and raising the minimum wage will dampen the efficacy of such a program. Domino effect—Greece's decision will shape what other countries decide to do in regards to their own austerity policies. Voters in countries like Spain and Portugal may also demand an end to their own austerity and populists in France and Italy would be able to more effectively fight against their countries' membership in the euro. Although the markets have become more volatile due to a potential Grexit, fears are probably **overblown**. Mr. Tsipras' ability to steamroll such aggressive legislation is **limited** and the Eurozone provides the **stability** that he will need in his first few months in office. Unless creditors raise their limit on short-term borrowing, the country may run out of cash as soon as early March and have **no choice** but to abide to Germany's wishes. With Greeks already rapidly yanking cash from banks, over 15 billion euros in 2 months, there is a high risk of a bank run absent a big injection of cash. In addition, the ECB's massive bond buyback program should neutralize the effect of Greek turbulence on the market and introduce the possibility of a modest debt restructuring that could prevent a Greek exit. So to conclude, keep your eyes open for negotiations between Greek officials and Eurozone leaders, but don't expect anything too drastic. For all of Mr. Tsipras' grandstanding, change is painful and unlikely to happen.

China Impact

Eurozone collapse leads to Chinese Trade wars

Reuters 11 (5-20, "Euro Woes Increase Risk of Trade Wars", http://blogs.reuters.com/great-debate/2010/05/20/euro-woes-increase-risk-of-trade-wars/)

Europe won't just be exporting deflation to the rest of the world, it will exportserious trade tensionsas well: first between the United States and China, and, possibly, eventually between Europe and the United States. The austerity required to get Greece and other weak euro zone nations' budgets in shape will exert a powerful deflationary force, as many countries which formerly imported more than they exported will be forced to cut back. As well, the euro has dropped very sharply. Germany's quixotic campaign against speculators — banning naked short selling against government debt and government credit default swaps — gave the euro its latest shove downward, but the trend has been strong for months. The euro is now about 15 percent below where it started the year against the dollar, making U.S. exports less competitive and adding to pressure on the United States to be the world's foiegras goose: being force-fed everyone else's exports while its own unemployment rate remains high. That Britain is now embarking on its own round of budget cuts will only make matters worse, adding up to one more important actor trying to consume less and export more courtesy of a devaluing currency. Perhaps the best outcome isrisingtrade and currency tensions between the United States and China, while at worst this could set the stage for **broader conflicts** and a round of tit-for-tat tariffs to match similar currency devaluations. Michael Pettis, a professor at Peking University, explains the issue succinctly on his blog, in which he says: "Make no mistake, if southern European trade deficits decline, someone somewhere must bear the brunt of the corresponding adjustment. The only question is who?" The scale of the adjustment is large; taken together Spain, Italy, Portugal and Greece account for about 16 percent of global trade deficits. Add in France, which will surely share some of the pain, and we get up to about 20 percent. You simply cannot have savage recessions and budget cutbacks in these countries without it exerting a powerful force on their trade partners. Clearly the first fault lines will not be across the Atlantic. Talk of the potential for coordinated intervention to support the euro, or at least to make its fall against the dollar a two-way market, attest to the strength of U.S.-European relationships. This is a group that managed the 2007 and 2008 conflagration without ending up at each others' throats. CHINA MAY BALK AT REVALUATION Pettis points out that within China there is an attitudethat the fall in the euro against the dollar, which has made theyuan correspondingly stronger against the euro, is an argument for caution by China in revaluing its currency. Remember too that the European Union comprises China's largest export market, so it will suffer a double blow, once now by a rising currency and again going forward as Europe adjusts. U.S. Treasury Secretary Timothy Geithner is traveling to Beijing next week to press trade and currency issues. Expectations had been that this would lay the groundwork for some measure of a revaluation of the yuan, which is kept artificially low by the Chinese. The euro zone mess seems to have put paid to that immediate hope. Washington and Geithner are unlikely to want to make already fragile international markets even more so by talking tough next week, but, as the U.S. elections in November near, and, if U.S. unemployment fails to fall, the pressure to take action against China in the form of not just verbal battering but actual tariffs may become too much. I'd note that the U.S. primary elections on Tuesday showed voter anger is focused on incumbents in general and Washington in specific. It would not be a surprise for the administration to try to focus that anger outside the country. So, rising trade tensions with China, but there is also a meaningful chance that tensions will rise eventually between the United States and Europe. Thus far European efforts to address euro zone issues have been disorganized and riven by internal dissension. Germany did not, it appears, consult its partners about its short selling plan. While the European Central Bank's excellent relationship with the Federal Reserve will help, there is a real chance that the euro suffers a disorganized meltdown and that Europe cannot agreeamong itself about how, or whether, to stop it. That, especially if combined with Chinese intransigence, could prove to be intolerable for the United States. Trade wars added greatly to the depth and length of the Great Depression. The world's ability to avoid a similar fight has been one of the blessings of the last two years. Not everyone can export their way back into the black, at least not everyone at the same time. How that is resolved as Europe melts into another recession will be one of the key issues of 2010 and 2011.

That spills over into Chinese military conflict

Landy 7 (Ben, Director of Research and Strategy at the Atlantic Media Company, publisher of the Atlantic Monthly, National Journal, and Government Executive magazines April 3, http://chinaredux.com/2007/04/03/protectionism-and-war/#comments)

The greatest threat for the 21st century is that these economic flare-ups between the US and China will not be contained, but mightspill over intothe realm ofmilitary aggressionbetween these two world powers. Economic conflict breeds military conflict. The **stakes of trade override the ideological power of the Taiwan issue**. China's ability to continue growing at a rapid rate takes precedence,

since there can be no sovereignty for China without economic growth. The United States' role as the world's superpower is dependent on its ability to leadeconomically. As many of you will know from reading this blog, I do not believe that war between the US and China is imminent, or a foregone conclusion in the future. I certainly do not hope for war. But I have little doubt that **protectionist policies** on both sides **greatly increase the likelihood of conflict–far more than increases in military budgets and anti-satellite tests.**

Escalates to nuclear war

Sydney J. **Freedberg** Jr. **13**, deputy editor for defense publication Breaking Defense and 13 year journalist at National Journal and has won awards from the association of Military Reporters & Editors in 2008 and 2009, as well as an honorable mention in 2010, 10/1/13, China's Fear Of US May Tempt Them To Preempt: Sinologists, http://breakingdefense.com/2013/10/chinas-fear-of-us-may-tempt-them-to-preempt-sinologists/

Because China believes it is much weaker than the United States, they are more likely to launch a massive **preemptive strike** in a crisis. Here's the other bad news: The current US concept for high-tech warfare, known as Air-Sea Battle, might escalate the conflict even further towards a "limited" **nuclear war**, says one of the top American experts on the Chinese military. [This is one in an occasional series on the crucial strategic relationship and the military capabilities of the US, its allies and China.] What US analysts call an "anti-access/area denial" strategy is what China calls "counter-intervention" and "active defense," and the Chinese appraoch is born of a deep sense of vulnerability that dates back 200 years, China analyst Larry Wortzel said at the Institute of World Politics: "The People's Liberation Army still sees themselves as an inferior force to the American military, and that's who they think their most likely enemy is." That's fine as long as it deters China from attacking its neighbors. But if deterrence fails, the Chinese are likely to go big or go home. Chinese **military history** from the Korean War in 1950 to the Chinese invasion of Vietnam in 1979 to more recent, albeit vigorous but non-violent, grabs for the disputed Scarborough Shoal suggests a preference for a sudden use of overwhelming force at a crucial point, what Clausewitz would call the enemy's "center of gravity." "What they do is very heavily built on preemption," Wortzel said. "The problem with the striking the enemy's center of gravity is, for the United States, they see it as being in Japan, Hawaii, and the West Coast.…That's **very escalatory**." (Students of the American military will nod sagely, of course, as we remind everyone that President George Bush made preemption a centerpiece of American strategy after the terror attacks of 2001.) Wortzel argued that the current version of US Air-Sea Battle concept is also likely to lead to escalation. "China's dependent on these ballistic missiles and anti-ship missiles and satellite links," he said. Since those are almost all land-based, any attack on them "involves striking the Chinese mainland, which is pretty escalatory." "You don't know how they're going to react," he said. "They do have nuclear missiles. They actually think we're more allergic to nuclear missiles landing on our soil than they are on their soil. They think they can withstand a limited nuclear attack, or even a big nuclear attack, and **retaliate**."

The euro is now about 15 percent below where it started the year against the dollar, making U.S. exports less competitive and adding to pressure on the United States to be the world's foiegras goose: being force-fed everyone else's exports while its own unemployment rate remains high. That Britain is now embarking on its own round of budget cuts will only make matters worse, adding up to one more important actor trying to consume less and export more courtesy of a devaluing currency. Perhaps the best outcome isrisingtrade and currency tensions between the United States and China, while at worst this could set the stage for **broader conflicts** and a round of tit-for-tat tariffs to match similar currency devaluations. Michael Pettis, a professor at Peking University, explains the issue succinctly on his blog, in which he says: "Make no mistake, if southern European trade deficits decline, someone somewhere must bear the brunt of the corresponding adjustment. The only question is who?" The scale of the adjustment is large; taken together Spain, Italy, Portugal and Greece account for about 16 percent of global trade deficits. Add in France, which will surely share some of the pain, and we get up to about 20 percent. You simply cannot have savage recessions and budget cutbacks in these countries without it exerting a powerful force on their trade partners. Clearly the first fault lines will not be across the Atlantic. Talk of the potential for coordinated intervention to support the euro, or at least to make its fall against the dollar a two-way market, attest to the strength of U.S.-European relationships. This is a group that managed the 2007 and 2008 conflagration without ending up at each others' throats. CHINA MAY BALK AT REVALUATION Pettis points out that within China there is an attitudethat the fall in the euro against the dollar, which has made theyuan correspondingly stronger against the euro, is an argument for caution by China in revaluing its currency. Remember too that the European Union comprises China's largest export market, so it will suffer a double blow, once now by a rising currency and again going forward as Europe adjusts. U.S. Treasury Secretary Timothy Geithner is traveling to Beijing next week to press trade and currency issues. Expectations had been that this would lay the groundwork for some measure of a revaluation of the yuan, which is kept artificially low by the Chinese. The euro zone mess seems to have put paid to that immediate hope. Washington and Geithner are unlikely to want to make already fragile international markets even more so by talking tough next week, but, as the U.S. elections in November near, and, if U.S. unemployment fails to fall, the pressure to take action against China in the form of not just verbal battering but actual tariffs may become too much. I'd note that the U.S. primary elections on Tuesday showed voter anger is focused on incumbents in general and Washington in specific. It would not be a surprise for the administration to try to focus that anger outside the country. So, rising trade tensions with China, but there is also a meaningful chance that tensions will rise eventually between the United States and Europe. Thus far European efforts to address euro zone issues have been disorganized and riven by internal dissension. Germany did not, it appears, consult its partners about its short selling plan. While the European Central Bank's excellent relationship with the Federal Reserve will help, there is a real chance that the euro suffers a disorganized meltdown and that Europe cannot agreeamong itself about how, or whether, to stop it. That, especially if combined with Chinese intransigence, could prove to be intolerable for the United States. Trade wars added greatly to the depth and length of the Great Depression. The world's ability to avoid a similar fight has been one of the blessings of the last two years. Not everyone can export their way back into the black, at least not everyone at the same time. How that is resolved as Europe melts into another recession will be one of the key issues of 2010 and 2011.

Trade conflicts escalate to global war

Patrick 09 – Director of the Program on International Institutions & Global Governance CFR

(Stewart-, March 13, National Interest, "Protecting Free Trade", http://www.nationalinterest.org/Article.aspx?id= 21084; Jacob)

President Obama has committed to working with U.S. trade partners to avoid "escalating protectionism." He is wise to do so. As never before, U.S. national security requires a commitment to open trade.

President Obama and his foreign counterparts should reflect on the lessons of the 1930s—and the insights of Cordell Hull. The longest-serving secretary of state in American history (1933–1944), Hull helped guide the United States through the Depression and World War II. He also understood a fundamental truth: "When goods move, soldiers don't."

In the 1930s, global recession had catastrophic political consequences—in part because policymakers took exactly the wrong approach. Starting with America's own Smoot Hawley Tariff of 1930, the world's major trading nations tried to insulate themselves by adopting inward looking protectionist and discriminatory policies. The result was a vicious, self-defeating cycle of tit-for-tat retaliation. As states took refuge in prohibitive tariffs, import quotas, export subsidies and competitive devaluations, international commerce devolved into a desperate competition for dwindling markets. Between 1929 and 1933, the value of world trade plummeted from $50 billion to $15 billion. Global economic activity went into a death spiral, exacerbating the depth and length of the Great Depression.

The economic consequences of protectionism were bad enough. The political consequences were worse. As Hull recognized, global economic fragmentation lowered standards of living, drove unemployment higher and increased poverty—accentuating social upheaval and leaving destitute populations "easy prey to dictators and desperadoes." The rise of Nazism in Germany, fascism in Italy and militarism in Japan is impossible to divorce from the economic turmoil, which allowed demagogic leaders to mobilize support among alienated masses nursing nationalist grievances.

Open economic warfare poisoned the diplomatic climate and exacerbated great power rivalries, raising, in Hull's view, "constant temptation to use force, or threat of force, to obtain what could have been got through normal processes of trade." Assistant Secretary William Clayton agreed: "Nations which act as enemies in the marketplace cannot long be friends at the council table."

This is what makes growing protectionism and discrimination among the world's major trading powers today so alarming. In 2008 world trade declined for the first time since 1982. And despite their pledges, seventeen G-20 members have adopted significant trade restrictions. "Buy American" provisions in the U.S. stimulus package have been matched by similar measures elsewhere, with the EU ambassador to Washington declaring that "Nobody will take this lying down." Brussels has resumed export subsidies to EU dairy farmers and restricted imports from the United States and China. Meanwhile, India is threatening new tariffs on steel imports and cars; Russia has enacted some thirty new tariffs and export subsidies. In a sign of the global mood, WTO antidumping cases are up 40 percent since last year. Even less blatant forms of economic nationalism, such as banks restricting lending to "safer" domestic companies, risk shutting down global capital flows and exacerbating the current crisis.

If unchecked, such economic nationalism could raise diplomatic tensions among the world's major powers. At particular risk are U.S. relations with China, Washington's most important bilateral interlocutor in the twenty-first century. China has called the "Buy American" provisions "poison"—not exactly how the Obama administration wants to start off the relationship. U.S. Treasury Secretary Timothy Geithner's ill-timed comments about China's currency "manipulation" and his promise of an "aggressive" U.S. response were not especially helpful either, nor is Congress' preoccupation with "unfair" Chinese trade and currency practices. For its part, Beijing has responded to the global slump by rolling back some of the liberalizing reforms introduced over the past thirty years. Such practices, including state subsidies, collide with the spirit and sometimes the law of open trade.

The Obama administration must find common ground with Beijing on a coordinated response, or risk retaliatory protectionism that could severely damage both economies and escalate into political confrontation. A trade war is the last thing the United Statesneeds, given that China holds $1 trillion of our debt and will be critical to solving flashpoints ranging from Iran to North Korea.

In the 1930s, authoritarian great-power governments responded to the global downturn by adopting more nationalistic and aggressive policies. Today, the economic crisis may well fuel rising nationalism and regional assertiveness in emerging countries. Russiais a case in point. Although some predict that the economic crisis will temper Moscow's international ambitions,evidence for such geopolitical modesty is slim to date. Neither the collapse of its stock market nor the decline in oil prices has kept Russia from flexing its muscles from Ukraine to Kyrgyzstan. While some expect the economic crisis to challenge Putin's grip on power, there is no guarantee that Washington will find any successor regime less nationalistic and aggressive.

Beyond generating great power antagonism, misguided protectionism could also exacerbate political upheaval in the developing world. As Director of National Intelligence Dennis Blair recently testified, the downturn has already aggravated political instability in a quarter of the world's nations. In many emerging countries, including important players like South Africa, Ukraine and Mexico, political stability rests on a **precarious balance**.Protectionist policies could well push developing economies and emerging market exporters **over the edge.** InPakistan, a protracted economic crisis could precipitate the collapse of the regime and fragmentation of the state. No surprise, then, that President Obama is the first U.S. president to receive a daily economic intelligence briefing, distilling the security implications of the global crisis.

What guidance might Cordell Hull give to today's policymakers? To avoid a protectionist spiral and its political spillovers, the United States must spearhead multilateral trade liberalization involving all major developed and developing countries.

Sarbanes-Oxley controls corporate fraud now---repeal causes catastrophe

Terrance **Heath 12**, campaigner and online producer at Campaign for America's Future, "Mitt Romney Takes Us Back To The Age of Enron," 3/5/12, http://ourfuture.org/20120305/Mitt_Romney_Takes_Us_Back_To_The_Age_of_Enron

Mitt Romney, just in time for Super Tuesday, says he wants to take us back to that. Well, not in so many words. Romney actually pledged to repeal the Sarbanes-Oxley Act (SOX) — which would leave nothing to prevent another Enron disaster, and almost **guarantee a repeat of the scandal**.¶ Mitt Romney pledged during a campaign event Saturday to repeal the Sarbanes-Oxley corporate accounting overhaul.¶ After Mr. Romney vowed to repeal President Barack Obama's health care overhaul and the Dodd-Frank financial regulation law, a voter in the crowd asked whether his list of repeals would include Sarbanes-Oxley, as well.¶ "Yes," Mr. Romney said. "People who have spent their life in Washington in many cases … don't understand that when they write a piece of legislation what kind of impact that's going to have in the private sector, how many people's lives will be affected by it."¶ Mr. Romney's 59-point economic plan offers a more modest proposal to deal with the law. It includes a line item to amend the law "to relieve mid-size companies from onerous requirements."¶ This latest tactical (not ideological) shift pretty much marks the demise of the 59-point plan Romney introduced in September of last year — just six months ago. It's also the latest stage in the Romney's metamorphosis from "Massachusetts Moderate" to a candidate now within spitting distance of positioning himself to the right of Rick Santorum and Newt Gingrich. (In fact, with this latest tactical/ideological transformation, Romney has caught up to Gingrich, who said back in December that — with the help of the Republican majorities his supporters will elect to Congress — he would sign the repeal of Sarbanes-Oxley on Inauguration Day.¶ Let's back up a minute, and answer the obvious question: What is Sarbanes-Oxley? According to the "Sarbanes-Oxley For Dummies" cheat sheet:¶ Enacted in the wake of corporate mismanagement and accounting scandals, Sarbanes-Oxley (SOX) offers guidelines and spells out regulations that publicly traded companies must adhere to. Sarbanes-Oxley guidelines offer best-practice principles for any company, especially those providing services to other businesses bound by SOX.¶ If that's not clear enough, Wikipedia says that it covers everything from "board responsibilities to criminal penalties, and requires the Securities and Exchange Commission to implement ruling on the requirements to comply with the law." Basically, SOX brought some standards of governance to "U.S. public company boards, management and public accounting firms," where the standard-operating-procedure rivaled the **mythic lawlessness of the "wild west**."¶ Seriously. To understand the importance of SOX, you have to first understand that in 2002 it passed the House by a vote of 423 to 3, and passed the Senate by a vote of 99 to 1. In other words, 10 years ago, there was almost no one in Washington, Democrat or Republican, who didn't want this thing passed. That's because a spate of "corporate wilding" made clear the need for "a new sheriff in town."¶ 2002 was the year of the corporate scandal—as company after company was revealed to have claimed "assets" to their stockholders and stakeholders that were actually nothing but vapor. A major corporate reform bill, Sarbanes-Oxley, passed as a result. What have we learned? Not much. Now it's banks like Citigroup writing down phantom assets. When conservative failures infect the government, it's always corporations gone wild.¶ As mentioned before, there was Enron — the big one, credited with giving birth to SOX. In truth, SOX had many corporate criminal fathers, including: Tyco International, Adelphi Communications, Qwest, Peregrine Systems, WorldCom, and lots more. It was a painful birth for countless people who lost their livelihoods, retirement savings, and with them any hope of economic security.¶ SOX was born to help keep the the one percent from engaging in fiscal shenanigans that **wreak havoc on the 99 percent**, or at least keep them from getting away with it. And, while it's not perfect, SOX works.¶ Cast your mind back. The scandals erupted in some of the purportedly best, most recognizable companies in America. Enron and WorldCom were the two biggest names and the two biggest failures. Tyco and Adelphia were in the second tier. But there were appalling accounting disgraces at HealthSouth, Rite Aid and Sunbeam. Waste Management and Xerox barely survived theirs.¶ Today, there are certainly debates about stocks and their valuations — and some questionable accounting — but no company that finds itself under scrutiny now is anywhere near as large, respected or publicized as those were then.¶ Something else characterized those dark days: the frauds often lasted and lasted. Investors known as short-sellers, who make money when stocks collapse, waged battles for years over certain companies. Today, accounting disputes are **finished before they start**. An accounting scandal at Groupon, the online coupon company, came and went in a matter of weeks back in the fall — resolved by the regulators before the company went public.¶ …The main criticisms of the law **haven't panned out**. Corporate earnings have soared, and no company has ever missed a quarterly estimate because it was spending too much on its accounting and internal controls.¶ Critics railed that it would cost small companies too much, which it may have, though the evidence is debated. They also argued that it would hurt initial public offerings, which it didn't. Yet, there remains vestigial criticism from the right; Newt Gingrich called for its repeal the other day on the campaign trail.¶ That, of course, explains why conservatives want to do away with it. It amounts to a return to the "bad old

days" because, as with health care and financial reform, conservatives are long on "repeal" rhetoric and short on solutions that will "replace" the reforms they want to erase, and address the problems that revealed the need for and gave rise to those reforms.¶ That's because there are some problems conservatives don't want to solve, don't believe should be solved, and don't even recognize as problems in the first place. In the conservative mind, corporate wilding that costs hard-working Americans their livelihoods and their retirement "nest eggs" isn't the problem. Reforms that prohibit corporate executives from engaging in fraud and theft to further line their pockets at the expense of the other 99 percent is a huge problem.¶ Whether Mitt Romney believes this or not is anybody guess. Mitt Romney believes he should be president. Thus Romney's pandering grows more obvious with each passing day. He says whatever he thinks he needs to say to get his party's nomination, and thus get his shot at the Oval Office.¶ Even many Republicans don't care if he believes it nor not. As Grover Norquist says, at bare minimum they need a president with opposable thumbs, who can hold a pen and sign what they pass. Thus it matters to the rest us, whether Romney believes it or not, if elected conservatives will expect him to practice what he pandered to get elected, and put his name on whatever they pass.¶ So, if conservatives manage to repeal Sarbanes-Oxley, President Romney will sign it if he wants to keep his job. And **the days of Enron will be upon us once more**.

Corporate fraud collapses the economy

M.L. **Bhasin 13**, Bang College of Business, KIMEP University, Almaty, Republic of Kazakhstan, "Corporate Accounting Fraud: A Case Study of Satyam Computers Limited," March 2013, *Open Journal of Accounting*, 2, 26-38

Moreover, financial statement fraud was a contributing factor to the recent financial crisis and it threatened the **efficiency, liquidity and safety** of both debt and capital markets [6]. Furthermore, it has **significantly increased uncertainty and volatility** in financial markets, shaking investor confidence worldwide. It also reduces the creditability of financial information that investors use in investment decisions. When taking into account the loss of investor confidence, as well as, reputational damage and potential fines and criminal actions, it is clear why financial misstatements should be every manager's **worst** fraud-related **nightmare**.

U.S. growth is key to the overall global economic order---failure causes global great power war

John F. **Troxell 14**, Research Professor of National Security and Military Strategy, Strategic Studies Institute, U.S. Army War College, 7/15/14, "Op-Ed: Global Leadership — Learning From History," http://www.strategicstudiesinstitute.army.mil/index.cfm/articles/Global-Leadership-Learning-From-History/2014/07/15

Leader complacency, caused by repeatedly running to the edge of crises prior to reaching a resolution, leads to a false sense of security. Our political establishment has mastered the art of kicking the can down the road and muddling through, and has become complacent about the need to address pressing problems, most readily demonstrated in our fiscal mismanagement. How many times have we dangerously approached the fiscal cliff? The need for a grand bargain to balance revenues, entitlements, and government services has been recognized, studied, and "commissioned" for years without effective action. Bruce Jones, author of the recent and appropriately titled book, Still Ours to Lead, offers this thought, ". . . if the United States does not rectify a perception that it is becoming incapable of managing its global financial role, the willingness to participate in a system still overwhelmingly managed by the United States will be undermined."7

Perhaps we have become complacent in another matter. In a recent Brookings Essay, Margaret MacMillan argues that:

Like our predecessors a century ago, we assume that large-scale, all-out war is something we no longer do. In short, we have grown accustomed to peace as the normal state of affairs. We expect that the international community will deal with conflicts when they arise, and that they will be short-lived and easily containable. But this is not necessarily true.8

Decreased attention may already have contributed to worsening situations in the Middle East, Ukraine, and the Western Pacific.

World War I was botched on the front end and the back end.9 The failure to achieve a just and lasting peace in 1919 led to the outbreak of World War II. Economic distress during the interwar years resulted in the rise of fascist states and easily rekindled the embers of nationalist revanchism. President Woodrow Wilson's 14 points were not adhered to, including the all-important point 3: "the removal, as far as possible, of all economic barriers and the establishment of an equality of trade conditions among all nations consenting to the peace and associating themselves for its maintenance." In terms of post-war economic relations, the opposite occurred as nations scrambled to respond to the 1929 crash. Nations participated in a series of competitive devaluations and enacted crippling tariffs, sending the global economy into a death spiral.

Our second major commemoration of this summer is the Bretton Woods conference, convened shortly after the D-Day landings and well before the end of World War II. It was focused on creating a post-war international regime based on rules designed to govern the global economy. Following the collapse of the Soviet empire, these rules now govern the vast majority of the globally interconnected economy. The results of this conference point to the importance of institutional arrangements to monitor and support the global economy, including the International Monetary Fund (IMF) and the European Bank of Reconstruction and Development, better known today as it has evolved into the World Bank (WB); and the commitment to free trade. Conference attendees initially debated the creation of the International Trade Organization, which at the time proved to be a bridge too far, and thus they settled on the General Agreement on Tariffs and Trade (GATT). Through a series of multinational negotiating rounds and agreements, culminating in the creation of the World Trade Organization (WTO) in 1995, GATT, and now the WTO, have succeeded in broad tariff reductions and a dramatic increase in global trade. The liberal world economy, based on open markets and free trade, and managed by rules-based, international monetary and trade regimes, has furthered both individual and collective interests and promoted international cooperation. When it comes to the support for international institutions, the President is correct in highlighting their importance. But some of that support should also be expressed in action, particularly as it relates to the global economy. Once again the President is right to focus on the "key source of American strength: a growing economy," and there is nothing wrong with domestic nation building, but only if it does not replace an equal emphasis on the management and continued engagement in geoeconomic affairs.

International regimes, particularly those related to the global economy, require the willingness to fight for proven common benefits. Globalization has provided proven benefits, but it has always been a hard sell with the American people and thus our politicians need to continue to make the case. The United States is currently engaged in two potential game changing trade negotiations: the Trans-Pacific Partnership (TPP), and the Trans-Atlantic Trade and Investment Partnership (TTIP). These are both characterized as comprehensive and high-standard 21st century trade agreements and could knit together most of the major trading nations, generating increased economic benefits for all. Of the two, the TPP holds the most promise because of the possibility that China may join, further integrating their economy into the international rules-based trading regime. Encouraging our negotiating partners to take the necessary political risks to finalize these agreements would be facilitated if the United States showed leadership and passed Trade Promotion Authority. The President called for this action in his State of the Union address, and was immediately rejected by Senator Harry Reid. Congress also needs to make progress on IMF reforms. Economics represents a positive-sum game and leads to international cooperation. The United States needs to level with the American people and show leadership in this area.

Bretton Woods points to the essential role of the United States in supporting these global economic arrangements. The Bretton Woods conference represented "a made in America" approach to the global economy,10 and the United States was willing to fulfill that essential leadership role. Political economist Robert Gilpin argues that:

there can be no liberal international economy unless there is a leader that uses its resources and influence to establish and manage an international economy based on free trade, monetary stability, and freedom of capital movement. The leader must also encourage other states to obey the rules and regimes governing international economic activities.11

Global economic leadership requires the United States to lead by example and demonstrate competent policy outcomes.

Corporate governance is high now---SOX is key---consensus of sources

Paul **Sweeney 12**, freelance writer in Austin, TX, writing for *Financial Executive*, "Sarbanes-Oxley – A Decade Later," *Financial Executive*, July/August 2012, http://www.financialexecutives.org/KenticoCMS/Financial-Executive-Magazine/2012_07/Sarbanes-Oxley--A-Decade-Later.aspx#axzz3dlDpibw8

"If you look at the cases of stock-option backdating," Henning says, "they **all occurred before 2002**. It's likely the practice would have continued had not Sarbanes-Oxley stopped it **dead in the water**."¶ This important yet largely unheralded achievement of Sarbanes-Oxley is only one of many striking effects of the law described in interviews with a diverse array of sources, including financial executives, representatives of the Big Four accounting firms, former government regulators, forensic accountants, attorneys, academic experts and investor advocates, as well as one noted whistleblower. All were asked to comment on the major impact of the legislation as it turns 10 years old.¶ Despite criticism from free-market advocates and politicians of the conservative stripe that Sarbanes-Oxley has been costly to business and a poster child for regulatory overreach, a **much-stated opinion** of business and professional sources — including defense lawyers tasked with pleading the cases of alleged violators of Sarbanes-Oxley — is that the law has had a salutary effect on business, commerce, finance, the accounting profession and the United States economy.¶ "Regardless of which partner you talk to at our firm and probably at all the largest ones as well, most would say that Sarbanes-Oxley has been incredibly beneficial," says Laura Cox-Kaplan, principal in charge of government and regulatory affairs at PwC and a former deputy assistant secretary for banking and finance at the U.S. Treasury Department.¶ Paul Regan, president of accountancy Hemming Morse in San Francisco and a pioneer forensic accountant, notes that "there's still plenty of fraud. But if we didn't have Sarbanes-Oxley, the misstatements would be **significantly worse**."¶ Barbara Roper, director of investor protection at the Consumer Federation of America, expresses reservations about the law's efficacy but only because of continued congressional tampering and persistent legal assaults from disgruntled parties.¶ "Sarbanes-Oxley has clearly enhanced the integrity of the financial markets and the quality of financial reporting," she says. "My criticism is that the reforms are being eroded. It's chugging along but still facing challenges."¶ Signed into law a decade ago on July 30, 2002 by President George W. Bush, the Sarbanes-Oxley Act was enacted by spectacularly lopsided votes in both chambers of Congress: 423-3 in the House and 99-0 in the 100-member Senate. The 78-page document was designed to shore up the integrity of financial statements after accounting fraud and deceit at several brand-name companies had become public.¶ "Starting in the 1990s, there was a spate of corporate fraud and fraudulent accounting statements at Sunbeam, Waste Management, Rite-Aid and some others even before you got to the gargantuan cases in the early 2000s involving Enron, WorldCom, Adelphia, Qwest and Global Crossing," recalls Lynn Turner, former chief accountant at the SEC.¶ To accomplish massive fraud, corporate schemers invented fictitious sales and bogus revenue streams, concealed losses, inflated inventories and manufactured phony profits.¶ Sarbanes-Oxley makes it **far more difficult** for such deceit to occur, especially at large public companies, says April Klein, an accounting professor at the Stern School of Business at New York University. "We don't want another Enron or WorldCom and the law has been very successful at preventing that," she says.¶ The act created the Public Company Accounting Oversight Board to police the accounting profession and set auditing standards. It shored up the role of the audit committee, making it independent and responsible for hiring, firing and overseeing external auditors, removing that authority from management.¶ Under Section 404, companies were required to establish internal controls and procedures for financial reporting. Another section mandated that both the chief executive and chief financial officer personally attest that they have reviewed the auditors' report and that it "does not contain any material untrue statements or material omission" or anything that could be "considered misleading."¶ Sarbanes-Oxley also instituted "clawback" provisions requiring CEOs and CFOs to return ill-gotten gains to their employer. In one notable case, Ian McCarthy, former CEO at Atlanta-based Beazer Homes USA Inc., and former CFO James O'Leary both agreed to return all of their cash bonuses, incentive and equity-based compensation for 2006. McCarthy had to relinquish more than $5.7 million in cash plus $772,232 in stock sale profits along with some 120,000 in restricted stock shares; O'Leary returned $1.4 million.¶ One wrinkle in the case: neither McCarthy nor O'Leary was directly to blame for the fraudulent financial reporting. The chief accounting officer, Michael Rand, was. He engineered the fraud and was eventually convicted of seven criminal counts.¶ Deborah Meshulam, a law partner at DLA Piper in Washington, D.C., and former SEC enforcement attorney, says, "Generally I think Sarbanes-Oxley

has met its goals. But to me the concept that the SEC can claw back money from CEOs and CFOs who may not have been at fault for misstatements is troubling."¶ The message has been sent. No longer can corporate chieftains plead ignorance, or say "I'm not an accountant," as Enron's former (and now-imprisoned) CEO Jeffrey Skilling claimed in congressional testimony. Says Les Brorsen, vice-chair for Public Policy at Ernst & Young: "The law was spawned by massive inaccuracies and massive restatements. So all the changes in the law were designed to improve — and have improved — the accuracy of financial reporting."¶ ¶ Strengthening Financial Reporting¶ Toby Bishop, director of the Chicago-based forensic center at Deloitte, says: "From the perspective of someone who enjoys a nice big juicy fraud, life has become a little boring. What I am seeing, though, is that small- and medium-sized companies that have not been through the Sarbanes-Oxley process have weaknesses in their internal controls that can be exploited."¶ Section 404 of Sarbanes-Oxley, which requires management to assess and disclose the adequacy of internal controls over financial reporting, has been the whipping boy of the legislation. So much so that it has twice been modified by regulators, most recently in 2007, and targeted for changes by Congress.¶ An in-depth examination commissioned by the SEC sought to determine whether Section 404 "imposed large out-of-pocket and opportunity costs without commensurate benefits" and "adds layers of financial reporting procedures to no avail." After questioning 3,138 "corporate insiders" at 2,907 companies, the four-person research team concluded that this "common view" was "overstated."¶ Gary Kabureck, vice president and chief accounting officer at Xerox Corp., an FEI member and a member of FEI's Committee on Corporate Reporting, says of the changes wrought by Section 404: "It's been good for us. We've got a robust set of internal control procedures and my closes go smoother, audits go easier and there are very few surprises that weren't already observed."¶ At Corning Inc., the costs of complying with Section 404 shot up by as much as 60 percent in the first year and persisted for another two years before returning to prior levels, reports Tony Tripeny, corporate controller and principal accounting officer.¶ "It took some additional spending but we took advantage of the law to look at our internal controls process and make it stronger," he says. "We made the decision to get something positive out of it." Tripeny, an FEI member, serves on FEI's Committee on Corporate Reporting.¶ Meanwhile, many other public companies were forced to reckon with — and disclose — inadequacies, notes Turner.¶ A March 2006 report by corporate-governance research firm Glass Lewis disclosed that the number of restatements of financial reports by publicly traded companies ballooned to 1,295 in 2005, or roughly one in 12 U.S. companies. That record number was more than triple the total in 2002, the year Sarbanes-Oxley was enacted.¶ ¶ Sarbanes-Oxley Limitations¶ Sarbanes-Oxley is sometimes faulted for not preventing the financial crisis and the great recession of 2008-09, from which the U.S. economy has yet to recover. But defenders argue that it wasn't designed to do more than **insure that accounting rules were followed**.¶ "If you've got employees who are stealing stuff out the back door of the warehouse, Sarbanes-Oxley would tell you whether you have inventory controls in place, not whether the door is locked," Kabureck says.¶ Turner faults lax law enforcement as "the number one reason we had a financial crisis. We've got lots of laws saying, 'You can't rob a bank,' " he says. "But if people realize the cops won't do anything, they'll do it anyway." At mortgage lenders and financial companies where shady lending practices proliferated, Turner notes, "we really didn't see much in the way of prosecution."¶ That also rankles Sherron Watkins, the whistleblower at Enron who was named one of three "Persons of the Year" by Time magazine in 2002. She questions, for example, why charges weren't brought under Sarbanes-Oxley against top executives at the banks, mortgage lenders and Wall Street firms playing fast and loose with the law.¶ "Dick Fuld of Lehman Brothers Holdings Inc. was signing off on the financial statements," she notes. "I fear that the Department of Justice was politicized."¶ One consolation, says Turner, is that Sarbanes-Oxley no doubt mitigated the force of the financial crisis, which could have been worse. "We didn't see the huge rash of fraudulent reporting like we saw in the 1996-2002 time period," he says. "So that would tell you, 'Yes, **the legislation did accomplish its goal.**' "¶ Ernst & Young's Brorsen sees creation of the PCAOB to police the auditing profession — coupled with corporate governance rules' putting a public company's board-level audit committee, rather than company management, in charge of the auditing process — as "the top two fundamental changes" brought about by the act. "It's fair to say that the largest single impact of Sarbanes-Oxley was to end 100 years of self-regulation," he says.¶ Related to that, Brorsen adds, "**Improved corporate governance** is one of the hallmarks of the legislation."

SOX massively strengthened auditing

James S. **Turley 12**, Global Chairman and CEO of Ernst & Young accounting, "The Sarbanes-Oxley Act at 10," July 2012

SOX was designed to enhance the reliability of financial reporting and to improve audit quality. At Ernst & Young, we believe it has done both; although, more work surely remains. SOX forged a **new era for the US audit profession** by ending over 100 years of self-regulation and establishing independent oversight of public company audits by the Public Company Accounting Oversight Board (PCAOB). SOX strengthened corporate governance, shifting responsibility for the external auditor relationship away from corporate management to independent audit committees. It instituted whistleblower programs, CEO and CFO certification requirements and stricter criminal penalties for wrongdoing, including lying to the auditor. These measures and others were geared toward improving the reliability of corporate financial reporting.¶ Over the last 10 years, key elements of the Act have been replicated around the world, perhaps the purest form of flattery. Today, on the heels of the global financial crisis, many jurisdictions are looking anew at policy improvements similar to those instituted by SOX.¶ To be sure, Sarbanes-Oxley has received its share of criticism over the years, the bulk of which has focused on Section 404 relating to internal controls over financial reporting. Such concerns have been addressed since the passage of SOX through a series of regulatory and legislative

actions, including changes enacted earlier this year.¶ At Ernst & Young, we believe history has shown, and will continue to show, that the Sarbanes-Oxley Act as a whole has afforded a substantial benefit to investors and US capital markets. We believe that one of the greatest successes of the Sarbanes-Oxley Act was to align the interests of **auditors**, **independent audit committees** and **audit oversight authorities** with those of shareholders. In our view, as the 10th anniversary of the Sarbanes-Oxley Act approaches, the Act continues to provide a solid foundation from which to further this alignment.

AT: Counterexamples/Recession

SOX isn't perfect but it's still offense for the neg and still works

Jesse **Eisinger 12**, senior reporter at ProPublica, covering Wall Street and finance, writes a regular column for The New York Times's Dealbook section, Pulitzer Prize winner, two-time finalist for the Goldsmith Prize for Investigative Reporting, "To Envision Dodd-Frank's Future, Look to Its Predecessor," 2/8/12, http://dealbook.nytimes.com/2012/02/08/to-envision-dodd-franks-future-look-to-its-predecessor/?_r=0

As fears mount that Dodd-Frank, the financial overhaul law, is about to be emasculated, it's worth reflecting on the 10-year anniversary of **a major regulatory success**.¶ I'm speaking of the mocked, patronized and vilified Sarbanes-Oxley, the law that cleaned up American corporate accounting.¶ SOX, as it's known, was a response to an epidemic in corporate accounting fraud that swept American business in the late 1990s and early 2000s. Because the 2008 financial crisis dwarfs that earlier round of scandal, it's easy to forget how rotten things were, said Broc Romanek, editor of TheCorporateCounsel.net, a site devoted to securities law and corporate governance. "Everyone had lost faith in the numbers put out by big public companies," he said.¶ Cast your mind back. The scandals erupted in some of the purportedly best, most recognizable companies in America. Enron and WorldCom were the two biggest names and the two biggest failures. Tyco and Adelphia were in the second tier. But there were appalling accounting disgraces at HealthSouth, Rite Aid and Sunbeam. Waste Management and Xerox barely survived theirs.¶ Today, there are certainly debates about stocks and their valuations — and some questionable accounting — but no company that finds itself under scrutiny now is anywhere near as large, respected or publicized as those were then.¶ Something else characterized those dark days: the frauds often lasted and lasted. Investors known as short-sellers, who make money when stocks collapse, waged battles for years over certain companies. Today, accounting disputes are finished before they start. An accounting scandal at Groupon, the online coupon company, came and went in a matter of weeks back in the fall — resolved by the regulators before the company went public.¶ When SOX was passed, it was attacked — almost exactly like Dodd-Frank is today. Sarbanes-Oxley got "horrible press," said Jack T. Ciesielski, who edits the Analyst's Accounting Observer. People mocked it for requiring companies "to flow chart the keys to the executive washroom," he said. But the result is that accounting at American companies is **much cleaner today**.¶ The main criticisms of the law haven't panned out. Corporate earnings have soared, and no company has ever missed a quarterly estimate because it was spending too much on its accounting and internal controls.¶ Critics railed that it would cost small companies too much, which it may have, though the evidence is debated. They also argued that it would hurt initial public offerings, which it didn't. Yet, there remains vestigial criticism from the right; Newt Gingrich called for its repeal the other day on the campaign trail.¶ Is Sarbanes-Oxley perfect? Of course not. The financial crisis included accounting problems. The books of the American International Group, Lehman Brothers and Merrill Lynch misrepresented the true state of the companies. The auditors have managed to skirt blame — even more so than other gatekeepers, like the ratings agencies, have. But at its heart, the financial crisis **wasn't an accounting scandal**. It was a bubble, albeit one exacerbated by some book-cooking.¶ But the evidence in SOX's favor is that one big dog didn't bark. Even as the financial panic turned into the Great Recession, corporate America weathered the worst of the downturn without a series of major accounting frauds.¶ SOX required that chief executives and chief financial officers personally sign off on their companies' financial statements. That seems minor. No doubt a Madoff wouldn't be deterred by a little dissembling signature. But blackhearts aren't the typical accounting fraudsters.¶ At huge corporations, corruption usually develops slowly, incrementally, starting with a minor crossing of the line. At the end of a quarter, a sale is booked before it was actually ordered — to make the numbers for Wall Street. Over time, the fraud builds on itself and it's easier to keep the game going than to clean it up. ¶ Requiring a step where the top dogs actually have to mark the books as their own territory halts that process. It steels their concentration and improves the culture, preventing those initial halting steps toward fraud.¶ The accounting industry has been improved as well. The new SOX-created industry overseer, the Public Company

Accounting Oversight Board, has made inroads. Accountants have done a better job, remembering the devastating collapse of the accounting firm Arthur Andersen in the wake of the Enron debacle.

AT: Doesn't Work

SOX works---multiple studies confirm

Yousef **Jahmani 8**, Associate Professor of Accounting in the College of Business Administration at Savannah State University, "The Impact of Sarbanes-Oxley Act," *Journal of Business & Economics Research*, vol 6, no 10, October 2008, http://cluteinstitute.com/ojs/index.php/JBER/article/viewFile/2479/2525

The original purpose behind the effort that produced SOX was to restore public confidence in the financial statements prepared by public companies. One of the main of objectives of the internal control must be to produce reliable financial information as the more effective internal controls are, the more reliable the information produced will be. As one of SOX's requirements is the maintenance of effective internal controls one should reasonably expect that reliable information would be produced. Support for this expectation can be found in **several studies**.¶ Hammersly and et al. (2005) examined changes in price and trading volume to SOX disclosures of material internal control weaknesses. Their results indicated that on the day of the disclosure of a material internal control weakness, returns were significantly negative for disclosing firms. Clearly, the market expects appropriate controls and punishes those firms where controls are found to be deficient.¶ DeFranco et al. (2005) found that the market reacted negatively to corporate reports of internal control deficiencies, suggesting, "Investors did not previously have the information and they deemed it economically significant".¶ **Further support** for the worth of SOX can be found in Chang et al. (2006). In this study the researchers determined that the "bid-asked" spread decreased after 302 certifications by CEOs and CFOs. This was interpreted as a market affirmation of the worth of such certifications on the reliability of the information.¶ Li, Pincus, and Rego in 2004 and Jain and Rezaee in 2006 found that SOX was a **significant contributing factor** in restoring public confidence and trust in the integrity of capital markets and marker participants' willingness to execute trades based on the company's published financial information.¶ (2) Strengthening Corporate Governance:¶ Organizations possessing strong corporate governance provide discipline for employees and a tacit structure for the company as a whole. The presence of ethical values and of a business culture of "honesty" results in better bottom line performance. Prentice and Spence (2007) show significant positive correlation between corporate governance and financial performance.¶ Governance Metrics International (2005) found in a study of 2500 international companies that SOX led to a 10% improvement in corporate governance performance of U.S. companies versus their foreign counterparts.¶ Shadab (2007) demonstrated that corporate governance structures have a powerful positive impact on innovation by public corporations. SOX places more emphasis on financial reporting and control. It increases the independence of and size of the board of directors. SOX increases both director and manager turnover and heightens the companies' focus on **regulatory compliance at all levels**.¶ (3) Reduction of Financial Statement Fraud:¶ Again, a major impetus behind the Sarbanes-Oxley Act was deliberate financial statement fraud. When committed on a large scale (as was the case with Enron and WorldCom), billions of dollars can be lost and investor confidence in financial market will be reduced. Since SOX was enacted, there has not been a major domestic corporate financial scandal uncovered other than the options back-dating scandal that occurred before July 2002 (Prentice, 2007). Further, evidence suggests that the incidence of fraud has **declined relative to the pre-SOX era** (Cornerstone Research 2007). Finally, with respect to this topic, in a review of SEC enforcement releases, Deloitte (2007) reported a decline in fraud incidences. This can only be interpreted as suggesting that SOX has had a positive impact.¶ (4) Model for private and nonprofit companies:¶ SOX's requirements have attracted many private and nonprofit companies to implement its provisions as best practice. This is the case even though SOX was never intended for non-public and nonforprofit companies. In a survey of the fastest-growing private US companies conducted by PriceWaterhouseCoopers' (2005), thirty percent (30%) of the companies surveyed indicated that they were impacted or would be impacted in the near future by SOX. The most significant outcomes associated with SOX compliance was perceived by the private companies to be (1) improving documentation and testing,(2) strengthening of

governance procedures, (3) strengthening of ethics and conduct codes,(4) the adopting of the “best practices" by public companies, and (5) the updating or addition of “whistleblower" policies. Most private companies see these SOX initiatives as ex ante preventative maintenance rather than ex post problem solving. Motivation was ranked as the second reason behind the adoption of SOX following the adoption as “a best business practice”. Apparently, like their public counterparts, private companies are adopting SOX provisions in the quest to gain value through operational and control efficiencies.

SOX whistleblower provisions are key to SEC action against fraud---state action doesn't solve

Gwendolyn Yvonne **Alexis 9**, Associate Professor at Monmouth University, PhD, New School for Social Research, JD, Harvard Law School, MAR, Yale University Divinity School, “Legislative Excess or Regulatory Brilliance? Corporate Governance after SARBOX,” chapter 11 of *DOING WELL AND GOOD: The Human Face of the New Capitalism*, 2009, http://www.researchgate.net/publication/236980618_Legislative_Excess_or_Regulatory_Brilliance_Corporate_Governance_after_SARBOX

More than any other provisions of SARBOX, the whistleblowing provisions symbolize **regulatory brilliance**. With the SARBOX whistleblowing incentives and directives, Congress has instituted a system of checks and balances within the corporate environment that improves the corporate moral climate while lightening the regulatory burden on the SEC. Like most federal agencies, the SEC must carry out both administrative and regulatory functions while staying within tight budgetary constraints and operating with limited manpower. The Enforcement staff can only investigate a small fraction of the securities fraud cases that occur during any given year; and these investigations are long and drawn out due to the immense complexity of these types of cases, especially in this age of sophisticated communications technology. ¶ It is therefore **imperative** that the SEC be able to conscript those inside the corporation to supplement its efforts to detect wrongdoing. Mandatory whistleblowing for attorneys and accountants is an **essential tool in the regulatory arsenal**. The SEC enforcement effort would be **greatly hampered** if these professionals were allowed to remain mum even after their special expertise allows them to detect irregularities in the accounting practices of a company months, and very often years before the SEC could uncover these irregularities by monitoring the corporate filings of the companies. Likewise, Section 806—which encourages the low-level non-managerial employee to come forward—is critical to the enforcement effort. It is generally low-level employees who are coerced into straying from generally accepted accounting principles by supervisors who stand to gain from having the corporate financial picture presented in the most favorable light. Clearly, these non-managerial employees offer the best chance of stopping a corporate scheme to defraud during the early stages.¶ **State corporations law cannot be relied upon as an adequate substitute** for a federal-level statute that encourages whistleblowers to come forward (Sections 307 and 806), protects employees who do blow the whistle from retaliation (Section 1107) and creates coercive incentives for corporations to put whistleblowing systems in place (Sections 301 and 805). The federal interest is so overwhelming when it comes to whistleblowing that preemption is not really an issue; indeed, the federal action is the **only game in town**.

SEC enforcement is a key internal link

Thomas O. **Gorman 13**, attorney at Dorsey & Whitney, has practiced in a wide range of civil and criminal securities and business litigation matters, “The SEC Should Make Financial Fraud an Enforcement Priority Now,” 6/3/13,

http://www.lexisnexis.com/legalnewsroom/securities/b/securities/archive/2013/06/03/the-sec-should-make-financial-fraud-an-enforcement-priority-now.aspx

What was not mentioned is enforcement. While standard setting is clearly important, **effective implementation requires consistent enforcement.** Over the years financial fraud has been a critical focus for the SEC. In recent years, however, the number of actions brought in this area has significantly declined, according to a report issued earlier this year by Cornerstone Research (here).¶ The decline in financial fraud cases could be based on the success of the Sarbanes Oxley and the Board. At the same time, that point seems difficult to fully harmonize with the findings in the same Cornerstone Report that about 60% of the securities class actions being brought center on financial and related disclosure issues. Concerns raised by that finding are bolstered by the fact that a significant number of CFO's who responded to a recent E&Y survey stated that they would be willing to engage in improper conduct to win business for the firm (here). These factors suggest that if accounting principles are going to accurately reflect the substance of transactions, enforcement by the SEC **continues to be important**.¶ Recent reports that the agency may again be focusing on financial fraud and is developing a computer program to read the tags on Edgar filings, seems to recognize this point. While searches on a computer are a good start, they are not enough. Someone has to analyze the financial data and conduct what are often difficult investigations. That takes expertise and dedication which requires time to develop. Now is that time. Before the next scandal emerges - and history tells us there will be one - the SEC has the opportunity to get ahead of the curve. Now is the time to form a specialty group focused on financial fraud, develop the expertise and make rooting out financial fraud a priority.

Dodd-Frank goes in the opposite direction

Paul **Sweeney 12**, freelance writer in Austin, TX, writing for *Financial Executive*, "Sarbanes-Oxley – A Decade Later," *Financial Executive*, July/August 2012, http://www.financialexecutives.org/KenticoCMS/Financial-Executive-Magazine/2012_07/Sarbanes-Oxley--A-Decade-Later.aspx#axzz3dlDpibw8

But Congress has been moving in the opposite direction. Two recent laws — the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 and this year's Jumpstart Our Business Startups Act (the JOBS Act) — have largely served to **weaken Sarbanes-Oxley**.¶ Dodd-Frank exempted public companies with a "public float" below $75 million, thereby removing 42 percent of public companies, according to figures cited by the Council of Institutional Investors and Center for Audit Quality in a joint letter last November. The letter implored both the chairman and ranking member of the House Financial Services Committee to not further reduce safeguards, to no avail.

Link---Auditor Independence

SOX key to auditor independence---independently key to prevent devastating corporate fraud

Don **Moore 12**, associate professor, Berkeley Haas School of Business, "How can we prevent another Enron, or worse?" 7/10/12, http://fortune.com/2012/07/10/how-can-we-prevent-another-enron-or-worse/

FORTUNE — Remember the adage that those who forget the past are condemned to repeat it? Unfortunately, history lessons don't seem to appeal much to the corporate world, even the firms tasked with making sure companies' books are on the up and up: **the auditors**.¶ Take the case, for example, of Ernst & Young, one of the Big Four audit firms. E&Y also operates a lobbying firm that also works with its audit clients, including companies like Amgen AMGN 0.37% , Verizon VZ -0.65% , and yes, Groupon GRPN -1.81% . Groupon stock is now trading around $8 per share, down from a February high of over $24. In March, the startup revised its profit numbers downward and E&Y voiced concerns about the company's accounting systems. Wasn't E&Y required to voice such concerns before Groupon's November 2011 IPO? No, it turns out that audit regulation applies to public companies, not to companies planning to go public. Nor does the law require Groupon to disclose what other services E&Y has provided the tech company.¶ Although Ernst & Young has argued that its work complied with the rules, we think the rules may be the problem. Just think back a few years to when Arthur Andersen was auditing Enron's books. While that auditing firm was approving the company's misleading financial statements, it was also collecting some $27 million in consulting fees from Enron. Arthur Andersen also argued that its arrangement didn't violate auditor independence rules.¶ The problem is not compliance with the rules. No, the problem is the rules themselves, which permit conflicts of interest and ultimately undermine auditor independence.¶ Auditor independence is a **cornerstone of our capital markets**. It means that auditors should be able to objectively assess whether publicly traded companies are telling the truth about their finances. And this independence is threatened by cozy, long-term partnerships that develop between firms and their auditors.¶ So, then, what can we do to make sure we don't have to face yet another (and another) Enron, **or worse**?¶ Enter the Public Companies Accounting Oversight Board (PCAOB), which was **created by the Sarbanes-Oxley Act** to oversee the auditing profession. Make no mistake, they have a difficult task ahead of them as they consider regulatory reform — a task made all the more difficult since it's being done without the benefit of the kind of public anger that immediately follows a scandal. Reforms born from that sort of post-mortem pressure, however, typically close the barn door after the horse has been stolen. This time, the PCAOB has anticipated a **likely cause of future scandals** and iss considering closing the door before it's too late.¶ Speaking at a meeting of the PCAOB last spring, we identified three core threats to independence, all of which focus on the incentives auditors have to keep their clients happy. First is the desire to retain the audit client. Auditor rotation is a useful response to this threat. We also noted that selling other services like consulting or lobbying undermines independence. Finally, auditors taking jobs in the firms they audit also leads to conflicts. All these should be under careful scrutiny by the PCAOB.¶ Reform will not come easily. There are entrenched interests lined up to oppose any change that disturbs the convenient and lucrative status quo. That is what happened with Sarbanes-Oxley in 2002. As drafted, the act included audit firm rotation, but thanks to heavy lobbying by accounting firms, it was watered down to require only the rotation of the manager from the audit firm overseeing the audit. When we testified before the PCAOB, one of the corporations speaking against reform had been with its accounting firm for 129 years. Teaching new auditors about their financial systems every 10 years, it argued, would lead to increased costs and reduced flexibility. We think that's a small price to pay for honest audits.¶ The benefits of a system that delivers true auditor independence are enormous. **Equity markets depend** on the truthful and reliable public disclosure of information about public companies. If reforming our system could reduce the probability of another Enron or WorldCom, even by a little bit, we should be willing to endure costly and disruptive change to do it.

It's key to prevent future scandals

Marianne **Ojo 6**, School of Sciences and Law, Oxford Brookes University, "Avoiding Another Enron: The Role of the External Auditor in Financial Regulation and Supervision," June 2006, http://mpra.ub.uni-muenchen.de/1591/1/MPRA_paper_1591.pdf

Section 404 of the Act places a requirement on directors to document and confirm the effectiveness of internal controls on spending and usage of company assets and also to report on any discovered weaknesses. A representative of the European Employers' Federation, Jerome Chauvin, stated that European companies felt that costs of Sarbanes Oxley were disproportionate and that there was need for reform so that objectives of Sarbanes Oxley were met at a reasonable cost. Other criticisms directed at the Sarbanes Oxley Act include: The fact that disclosure has proven to be a more efficient means of regulating markets and reduces the need for substantive regulation; that increasing substantive regulation would prevent issuers from coming to the markets; that substantive regulation is likely to increase costs and that markets can regulate themselves. Espinosa (2004) counters these arguments by concluding amongst other things that disclosure does not reduce the need for substantive regulation and that strong regulation does not prevent access to the markets. He also concludes that the US Congress, in adopting Sarbanes Oxley, considered that though disclosure was still vital in ensuring transparency within the financial markets, reforms were still necessary to ensure that the source of such disclosure was free from conflicts of interests and thereby obtain correct and accuarte disclosure.¶ CONCLUSION¶ The role of the external auditor in financial services regulation and supervision is one which could be harnessed in such a way as to **prevent further corporate scandals such as Enron.** This is possible

where necessary safeguards are in place to ensure that the external auditor's integrity, objectivity and independence are not compromised. The Sarbanes Oxley Act **has gone a long way** to ensure this.¶ A post Enron consequence is the decline in auditors' undertaking consultancy or non-audit services and an increased perception of auditor independence. Post Enron developments, in particular the US Sarbanes – Oxley Act meant that financial services firms with a US listing were not allowed to have their auditors undertaking consultancy work. Section 166 skilled persons' reports being commissioned by Britain's Financial Services Authority and if undertaken by auditors, arguably should not be classified as "consultancy". lxxvi However if the FSA perceived a conflict of interest, it had the power to require others to be appointed.¶ Following the collapse of Enron, a lot of comparisons were drawn between the principles based approach which exists in the UK and the US rules-based approach. Under David Tweedie's guidance during the 1990s, the UK Accounting Standards Board developed accounting standards which relied heavily on rules but still looked at the substance of the transactions, and if the rules did not produce the right answer, then one would have to look to the substance to produce the answer. One of the major problems with Enron was the off balance-sheet debt which resulted from direct following of rules without being able because the accounting standards did not permit, to consider the substance of the transaction. Many of the differences between the UK and US accounting practices resulted from changes driven by corporate collapses of the 80s and early 1990s and such differences need to be considered when deciding whether to adopt certain post Enron reforms which have been adopted in the US.¶ In contrast to the US, the European Union's reaction to financial scandals has been less stringent. Whilst the US has enacted rules on corporate governance to ensure full and accurate dsclosure, the EU issued codes of ethics for public companies. In view of all that has already been mentioned in this paper, although the US would need to embrace international trends – including the possibility of adopting a single regulator operating on a federal level, Europe could also well benefit from considering a move towards Sarbanes Oxley. Historical developments, differences between the regulatory and accounting practices existing between the different jurisdictions involved would need to be considered. Conglomeratisation and globalisation are however factors peculiar to both the EU and the US and which justify a need for change. One of the greatest benefits of having a single regulator for financial services is the ability of a single regulator to manage cross sector services' risks more effectively. ¶ Debates about whether the UK has its principles-based regulatory tool to thank for avoiding another major corporate scandal are sure to continue. The impact of the adoption of a single regulator of financial services in the UK is a significant move which cannot be ignored. The **crucial role** that can be played by external auditors within this framework governed by the single financial services regulator is one which should be exploited.

Link---Financial Statements/Misdisclosure

Repeal causes runaway fraud and misdisclosure---independent internal link to the economy

Matt **Kelly 12**, editor & publisher of Compliance Week, writer on regulatory developments, legislative actions in Washington, and other events in the area of compliance and corporate governance, "Congress Moves to Turn Back SOX, Dodd-Frank Compliance," 3/12/12, https://www.complianceweek.com/blogs/the-big-picture/congress-moves-to-turn-back-sox-dodd-frank-compliance#.VYSXTvlViko

Congress enacted the Sarbanes-Oxley Act in 2002 to achieve one goal: improve the reliability of financial statements. We had seen a whole parade of businesses restating results—many due to simple management competence, but the most egregious due to outright fraud—and the voting public wanted better assurances that scam artists on Wall Street wouldn't **tank the market** and ruin their 401(k) balances. SOX was the result.¶ As usually happens with Congress, the result was far from perfect—but it did work. Companies started cracking open their accounting systems in 2004, found all sorts of flaws, restated all sorts results in 2005 and 2006, and then… things got better! Corporate America, particularly those subject to Section 404(b), started reporting fewer financial restatements. Number of restatements from accelerated filers in 2005: 513. Number of restatements from that same group in 2010: 136.¶ Compliance with SOX 404 is nobody's idea of a good time, but we do live under a capitalist system. Owners of capital—a group often overlooked in Congress, commonly known as "investors"—need an accurate understanding of their risks, including the risk of restatement, if the market is going to set accurate prices for company stock. When you under-estimate that risk (by exempting companies from Section 404(b) of SOX), the investment seems safer, so the price rises. That enriches the company insiders and the Wall Street firms taking a startup public, but should a restatement ever occur, the pain will be **that much sharper** for the rest of the market.¶ Consider, for example, Groupon. Had this jobs bill been in effect last year, Groupon could have submitted a confidential registration statement to the SEC for a preliminary review before its IPO last fall—and nobody would have known that the SEC objected to Groupon's cockamamie, self-invented accounting metric to make its growth prospects more promising. That would be no service to the investing public, which is entitled to know when a company going public is run by unimpressive executives. Groupon, by the way, is currently trading at half its offering price.¶ Do

you want to say that financial reporting rules have grown too complex? I agree. But wishing away the need to test controls is not the solution, any more than wishing away the building inspector makes a complex construction project safer to build. We have much need for reform of capital markets in this country—but repealing **prudent inspection** of companies entering those markets **isn't one of them.**

[Graphs omitted]

While much criticism has been directed at Sarbanes-Oxley, there is substantial data to indicate that there have also been **significant benefits**. Some of the benefits are arguably quantifiable, but others, such as a change in tone at the top levels of management, are more amorphous. 14 1 One clear trend is that, immediately following the enactment of Sarbanes-Oxley, there was a dramatic increase in the number of financial restatements filed by public companies. This trend is illustrated by the graph on the following page:¶ In discussing the upsurge in restatements in 2003 and 2004, a report by the Huron Consulting Group (the "Huron Report") opined:¶ The intense focus brought by Section 404 and its requirements for the management of public registrants to thoroughly document, test and take responsibility for the effectiveness of their company's safeguards for quality financial reporting has resulted in an unprecedented period of scrutiny on how registrants produce financial results for investors.¶ The Huron Report also noted that 15% of the 2004 restatements were by "repeat filers" who had reported erroneous information on more than one occasion since 1997.143 In addition, the number of companies reporting errors in at least three of the prior annual periods rose to nearly 40%.144 If a company files restatements for multiple periods, that suggests the company has "flawed accounting policies, practices and errors occurring over a period of time, as opposed to one-time errors." 145 Thus, Sarbanes-Oxley has brought increased attention to the way in which companies conduct their accounting, forcing necessary changes that **might have otherwise gone unnoticed**.¶ The Business Roundtable even acknowledged that Sarbanes-Oxley has done some good. Thomas Lehmer, a spokesman for the Business Roundtable, stated, "There is without question greater accountability in the board room . . . . In the minds of the investing public, [the Sarbanes-Oxley requirements] are important safeguards, and I think they are."' 146 Officials at a publicly traded company that spent $2.5 million and 10,000 hours of employee time opined that the costs were excessive, but acknowledged that the company was now a better-run business. 147 They stated, "[d]irectors meet more often without executives present. Multiple ombudsmen field employee complaints. Ethics training is more rigorous."' 148 The CEO of the company now requires his lieutenants to take more responsibility for their results and concluded, "[I]nvestors are better protected because Sarbanes-Oxley regulations have been put in place."¶ The Interim Report attempted to conduct a quantitative analysis of whether the benefits of Sarbanes-Oxley outweigh the costs. 150 It used two approaches. One was based on a 2006 GAO study that analyzed the market responses to announcements of a financial restatement by comparing the stock price the day before the announcement with the stock price at a point in time thereafter. 151 The Interim Report concluded that the benefits approximate cost.152 However, it may have understated the benefits because it used the price from the day before the restatement was announced, whereas companies may have announced an intent to restate at a previous point in time. In addition, the news may well have leaked into the market.¶ The second approach was to use a cost of capital analysis based on two different studies that examined the impact of disclosure by firms that reported internal control deficiencies. 153 One study found a Sarbanes-Oxley benefit to be $85-255 billion, whereas another study found no impact on cost of capital. 154 These latter two analyses seem contradictory and inconclusive at best.¶ In addition to the restatement data, there is compelling evidence that companies have been manipulating earnings, something that is less likely after Sarbanes-Oxley began requiring top management certification. Former SEC Chairman Arthur Levitt spotlighted this problem during his tenure. He stated that "we are witnessing an erosion in the quality of earnings, and therefore, the quality of financial reporting. Managing may be giving way to manipulation; integrity may be losing out to illusion."' 155 Given the frequency with which Chairman Levitt raised this issue, the problem could hardly be a surprise to anyone.¶ Chairman Levitt focused on five of what he considered the "more popular" techniques to manufacture earnings. 156 The first was the "Big Bath" restructuring charges in which a company overstates the charges so that earnings will take a one-time hit; later, those charges are converted into earnings when the charges turn out to be less than reserved against. 157 The second was "creative acquisition accounting" in which companies classify part of the acquisition price as in process research and development so the amount can be written off in a onetime charge. 158 The third is the "Cookie Jar" reserve approach, which involves utilizing unrealistic assumptions to estimate liabilities for such items as sales returns, loan losses or warranty costs. 159 In this approach, the company stashes accruals in cookie jars during the good times to utilize in bad times by reducing recognized expenses because of the accruals already made. 160 The fourth technique involves revenue recognition. 161 This has been a fairly common problem. 162 It involves recognizing revenue before sale is complete, before the product is delivered, or when the customer still has options to terminate or delay the sale.¶ The fifth technique involves misusing the concept of materiality. Chairman Levitt set forth the following model:¶ [S]ome companies misuse the concept of materiality. They intentionally record errors within a defined percentage ceiling. They then try to excuse that fib by arguing that the effect on the bottom line is too small to matter. If that's the case, why do they work so hard to create these errors? Maybe because the effect can matter, especially if it picks up that last penny of the consensus estimate. When either management or the outside auditors are questioned about these clear violations of GAAP, they answer sheepishly.. "It doesn't matter. It's immaterial."¶ In markets where missing an earnings projection by a penny can result

in a loss of millions of dollars in market capitalization, I have a hard time accepting that some of these so-called non-events simply don't matter.¶ The Interim Report argued that the SEC should define materiality in terms of a 5% pre-tax income threshold. 165 The assumption is that a less than 5% error in earnings would be immaterial and of no concern to investors. As Chairman Levitt pointed out, however, missing an earnings projection by a penny can have a **multimillion dollar impact** on market capitalization. Moreover, there is a huge difference between a company reporting flat earnings versus 5% growth, particularly when the market is expecting 5% growth. The effect on value is compounded because earnings will be less, and the price-earnings multiple could well be reduced also.¶ Lest there be any question as to whether earnings manipulation is prevalent, CFO Magazine reported that financial executives can use "allowable discretion" to boost or lower earnings by a few percentage points. 167 The magazine conducted a survey in which they asked CFOs how much discretion they could use to affect reported earnings.¶ The results of the survey, set forth in the chart below, show that almost half of the CFOs could boost or lower earnings 3-5%, a change that could have a huge impact on investors. 168¶ In commenting upon the situation, the magazine stated:¶ And the methods involved don't require a Ph.D. in finance. Operational levers include such time-honored tactics as delaying operational spending, accelerating order processing, and driving the sales team harder. Accounting steps, which are less common, include changing the timing of an accounting charge and adjusting estimates, both of which can be permissible under [Generally Accepted Accounting Principles]. ¶ On a positive note, thus far in 2007, the number of accounting restatements has decreased. 170 This may indicate that executives are playing less loosely with their financials, possibly because the certification requirements in Sarbanes-Oxley have pushed management toward placing a greater emphasis on internal controls.

Link---CEO Overconfidence

SOX is key to solve CEO overconfidence

Suman **Banerjee 14**, Associate Prof @ Wyoming, PhD, University of Iowa, MA, Delhi School of Economics, "Restraining Overconfident CEOs Through Improved Governance: Evidence from the Sarbanes-Oxley Act," 10/20/14, forthcoming in the *Review of Financial Studies*, http://www.valuewalk.com/2015/05/overconfident-ceos-mergers/

We have several important findings. We first examine the investment choices by overconfident CEOs. Our results indicate that, prior to SOX, overconfident CEOs invest more aggressively than their peers. However, after the passage of SOX, overconfident CEOs appear to **moderate their capital expenditures**, bringing them more in line with the CEOs of otherwise comparable firms in their industries. For example, before SOX, the average CAPEX/Assets for our entire sample was about 5.8%, whereas the average for firms run by overconfident CEOs was about 6.7%. After SOX, firms with overconfident CEOs significantly reduced CAPEX/Assets to around 6.02%. SOX is also associated with a reduction in asset growth and PP&E growth. The pattern is similar for Sales, General and Administrative expenses (SG&A). In this, we follow the argument in Chen et al. (2013) that overconfident CEOs are less likely to downward-adjust SG&A, reflecting their inflated beliefs about future growth prospects and SG&A needs. Focusing on the firms that were not compliant with SOX before its passage, for the median firm, SOX led to a 52% reduction in CAPEX, and a 39.7% reduction in PP&E, as compared to the firms that were compliant with SOX's provisions prior to its passage.¶ SOX also affects the sensitivity of investment to cash flows of overconfident managers. As Malmendier and Tate (2005) show, overconfident CEOs spend more of their cash flows on capital expenditures, reflecting their greater propensity to invest available internal funds. We find that, post-SOX, overconfident CEOs' investment-sensitivity-to-cash-flow decreases. In addition, post-SOX, firms with overconfident CEOs exhibit a **significant drop in risk**, both systematic and firm-specific.¶ An important question is whether the reduction in investment and risk-taking works to the benefit of shareholders. In other words, does SOX curb the value-destroying tendencies of overconfident CEOs or does it, instead, hinder value-creation by these CEOs and force them to abandon positive-NPV projects? For our tests, we use several measures of firm performance. We use both market-based and accounting-based measures of firm performance, namely Tobin's Q, Earnings Before Interest & Tax (EBIT), and Standard & Poor's Earning Quality (EQ) measure. We also examine the impact of overconfidence on the value of R&D and CAPEX. Our results are unambiguous – along with the reduction in investment-expenditure and risk, overconfident CEOs create **more shareholder value post-SOX.** For example, relative to other CEOs, overconfident

CEOs are associated with a 0.043 point lower Tobin's Q prior to SOX and a 0.026 point larger Q afterwards, representing an increase of 0.069 in Tobin's Q. Similarly, when we focus on the firms that were not compliant with SOX prior to its passage, we find that, for the median firm, SOX improved the impact of CEO overconfidence on Q by around 13.87% relative to the firms that were compliant.¶ Next we examine the performance of overconfident CEOs in the context of acquisitions. Malmendier and Tate (2008) find that overconfident CEOs tend to undertake acquisitions that create significantly less shareholder wealth. After the passage of SOX, however, takeovers by overconfident CEOs create **relatively more long-term shareholder wealth** (or equivalently, destroy less shareholder wealth). Another issue is that of dividend payout. With the drop in investment expenditure of overconfident CEOs, firms would have more free-cash-flow available to distribute in the form of dividend payout. We find that while payout tends to be low for overconfident firms (see e.g., Deshmukh et al., 2013), there is a significant increase in payout, post- SOX. While it is difficult to disentangle the impact of SOX from that of the (nearly) contemporaneous dividend tax cut, when coupled with the reduction in expenditures, SOX appears to encourage overconfident CEOs to distribute cash to shareholders.¶ We conduct a number of robustness tests to increase our confidence in the results and their interpretation. As noted above, we conduct falsification tests to show that, for the most part, these SOX-related changes are concentrated in the companies that were not previously compliant with SOX and the listing rule requirements (in relation to the need for an independent audit committee and a majority independent board). Specifically, by using both difference-indifference type tests, and sub-sample tests, we find that the impact of SOX on overconfident CEOs concentrates in those firms that were previously non-compliant with SOX's mandates.3 Also, the SOX-related effects observed for overconfident managers are not present for CEOs with confidence in the bottom quartile. Together, these falsification tests suggest that our results reflect the impact of SOX in moderating the implications of CEO overconfidence.¶ We undertake several additional robustness tests in order to mitigate econometric issues. As noted, we control for various firm, CEO, and governance characteristics, and include firm/industry and year fixed effects. Given that our results relate to a strong exogenous event (SOX), and we support these results with the aforementioned falsification tests, endogeneity (reverse-causality) is unlikely to drive our results. Nonetheless, we conduct some **additional robustness tests** to mitigate reverse-causality concerns. We confirm that overconfi- dence tends to be 'sticky' over time (as Malmendier and Tate, 2005, have previously shown), suggesting that it is a stable behavioral characteristic rather than a function of contemporaneous firm performance. We also conduct robustness tests using alternative measures of CEO overconfidence: it is shown that results hold when using a press-based measure of overconfidence; a Holder67 measure of overconfidence; and a measure based on the value of the CEO's vested-but-unexercised options scaled by his/her salary.

Key to prevent fraud and mismanagement

Suman **Banerjee 14**, Associate Prof @ Wyoming, PhD, University of Iowa, MA, Delhi School of Economics, "Restraining Overconfident CEOs Through Improved Governance: Evidence from the Sarbanes-Oxley Act," 10/20/14, forthcoming in the *Review of Financial Studies*, http://www.valuewalk.com/2015/05/overconfident-ceos-mergers/

Overconfident CEOs, by definition, are **overly optimistic** about their investments and opportunities. They are more likely to undertake hubristic takeovers (see e.g., Hayward and Hambrick, 1997; Roll, 1986), and to spend more resources internally i.e., in CAPEX or asset growth (Malmendier and Tate, 2008). Overconfident CEOs also engage in **increased personal and corporate risk-taking** (see e.g., Cain and McKeon, 2013). The argument is that because overconfident CEOs over-estimate the expected value of their investments, and under-estimate the downside risk, they are more likely to increase corporate risk than are other CEOs.¶ The Sarbanes-Oxley Act of 2002 (SOX) is ostensibly intended to **restrict managerial excesses**, increase transparency, and improve corporate governance. Several of its provisions are aimed at enhancing corporate governance (for a complete summary, see Coates, 2007): These include having an independent audit committee (Section 301), executive certification of financial reports (Section 302), disclosure of managerial assessment of internal controls (Section 404), and a code of ethics for senior financial officers (Section 406). SOX also prevents accounting firms from providing both auditing and non-auditing services to the same firm and increased penalties for corporate fraud. Put together, the increased environment of disclosure and monitoring by a more independent board, can help to moderate managerial excesses. Consistent with this, Duarte et al. (2014) argue that SOX significantly reduced the ability of insiders to extract value from minority shareholders. It is an empirical question as to whether such constraints can restrain CEO overconfidence and enhance shareholder wealth.¶ There is evidence suggesting that SOX might impose significant costs on some companies (see e.g., Iliev, 2010; Leuz et al., 2008). However, despite the potential

costs, there is evidence that SOX enables better protection for minority shareholders against extraction of value by insiders (Duarte et al., 2014), improvements in disclosure and governance (see e.g., Arping and Sautner, 2013; Ashbaugh-Sakife et al., 2009), and increases in market value (Switzer, 2007). Overall, the literature suggests that SOX is generally associated with better governance and disclosure. Given that overconfident CEOs might be expected to overinvest and to assume more risk than optimal from a shareholder's perspective, and may be less likely to learn from past mistakes when doing so (Chen et al., Forthcoming), we hypothesize that stronger governance may curtail these excesses. This is all the more so in light of prior evidence that overconfident CEOs are **more likely to be dismissed** than other CEOs in boards dominated by outsiders (Campbell et al., 2011). The above discussion gives rise to the following hypotheses:¶ Hypothesis 1. SOX reduces the impact of CEO overconfidence on corporate investment. ¶ Hypothesis 2. SOX weakens the impact of CEO overconfidence on firms' exposure to systematic as well as unsystematic risk.

AT: Overconfidence Good

SOX eliminates negative effects of overconfidence but maintains its benefits

Suman **Banerjee 14**, Associate Prof @ Wyoming, PhD, University of Iowa, MA, Delhi School of Economics, "Restraining Overconfident CEOs Through Improved Governance: Evidence from the Sarbanes-Oxley Act," 10/20/14, forthcoming in the *Review of Financial Studies*, http://www.valuewalk.com/2015/05/overconfident-ceos-mergers/

The literature suggests that CEO overconfidence can convey benefits as well as costs. While CEO overconfidence is associated with innovation (see e.g., Hirshleifer et al., 2012), it is also associated with over-investment and risk-taking (see e.g., Malmendier and Tate, 2005, 2008), potentially leading to increased CEO turnover (Campbell et al., 2011). We hypothesize that improving internal governance and disclosure can help to restrain overconfident CEOs. Hence, appropriate changes to governance and advisory structures could help **capiltalize on the optimism of overconfident-CEOs to create shareholders value**. The concurrent passage of Sarbanes-Oxley and changes to the NYSE/NASDAQ listing rules (collectively 'SOX'), though not usually attributed to CEO overconfidence, serves as a natural experiment to test whether increased oversight and exposure to diverse view-points from majority independent boards improves decision-making by overconfident CEOs.¶ We find that SOX reduces over-investment and risk-taking by overconfident CEOs. Further, **SOX enhances the impact of CEO-overconfidence** on firm-value, earnings, earningsquality, the value of R&D, and the value of CAPEX. Post-SOX, overconfident CEOs' acquisitions create significantly more value (or at least destroy significantly less value). We also find evidence that SOX is associated with an increase in dividends by overconfident CEOs

Overconfidence is net bad

Guoli **Chen 14**, INSEAD Assistant Professor of Strategy, "Can Your Firm Afford an Overconfident CEO?" 8/4/14, http://knowledge.insead.edu/leadership-organisations/can-your-firm-afford-an-overconfident-ceo-3494

Overconfident CEOs are innovative and fearless but are also prone to **repeat mistakes**.¶ It's no secret that firms often make mistakes. Whether it's a simple manufacturing over-run or a catastrophic blunder like the Fukushima Daiichi nuclear disaster, mistakes can be sudden and brutal.¶ Companies respond to this negative reaction in very different ways. Some deal with product recalls and declining product sales by fundamentally overhauling production processes or making substantial investments in research and development, while others may make small, superficial changes.¶ The ultimate decision on how a company reacts is a reflection of its CEO and is indicative of whether the mistake will be repeated again.¶ Making the same mistakes all over again¶ Diligent CEOs will assess what went wrong, how the company was to blame and what they could have done better. They will accept the mistakes as

valuable lessons and move on. CEOs who don't listen to the feedback, those who refuse to believe an error was the result of something they had control over and instead see it as the consequence of external or accidental forces, are likely to keep **making the same mistakes again and again** to the detriment of the company.¶ To date, there has been very little research focusing on the characteristics of CEOs when seeking a better understanding of why firms act as they do. In our research paper – Making the Same Mistake All Over Again: CEO Overconfidence and Corporate Resistance to Corrective Feedback, we look at how a CEO's overconfidence impacts his or her firm's actions, specifically the extent to which his or her firm incorporates and responds to corrective feedback ensuing from prior errors. Overconfidence, one of the most widely-studied cognitive biases, refers to the extent to which individuals overestimate the veracity of their knowledge and judgments. Overconfident people tend to be generally optimistic and to underestimate the likelihood they may have made an error. Like most individuals who succeed at a task or have their predictions proven correct, overconfident people tend to take credit themselves. However, when they fail or are proven incorrect, they blame bad luck and unforeseeable factors. As with all cognitive biases, the extent and nature of overconfidence varies substantially.¶ While past documentation associates a CEO's overconfidence with a firm's acquisition frequency, the size of acquisitions, and general risk taking, we looked at how the overconfidence levels of top executives influenced their responsiveness to corrective feedback in improving management forecasts, using forecasting behaviours of more than 300 CEOs over a 15-year period.¶ Forecasting accuracy is a powerful mechanism by which CEOs and firms build positive reputations in capital markets. While forecasting errors (the difference between a management forecast and actual earnings) are inevitable in an uncertain business environment, significant misjudgments have negative consequences for CEOs and investors. These errors are easy to measure and provide important feedback to executives as they construct subsequent management forecasts.¶ Ignoring feedback¶ Overconfidence has been measured in a number of different ways. To ensure our findings were robust, we assessed it in **three different ways**, taking into account the CEO's portrayal in the media, their tendency to hold on to "in-the-money" stock options, and their recent successes.¶ As expected, the more overconfident CEOs were, the less notice they took of previous errors when making subsequent earnings forecast. By ignoring this feedback, they made **significantly smaller improvements in forecast accuracy** over time compared to their less overconfident counterparts.¶ We also found CEOs with low levels of overconfidence were more likely to cease issuing voluntary forecasts if a significant error was made, while CEOs with high levels of overconfidence continued to make regular forecasts regardless of prior errors, which is consistent with their attributing these previous errors to random, period-specific events.¶ Further analysis showed that the negative relationship between CEO overconfidence and improvement in forecast accuracy was more pronounced when there had been a long period of time between the management forecast date and the fiscal year-end. This suggests that when overconfident CEOs were more able to attribute blame to external factors, they were even less likely to learn from their mistakes.¶ These results can be extended beyond the context of corporate earnings forecasts. Firms with highly overconfident CEOs can be expected to be much slower to react when faced with major accidents or evidence of pervasive corporate malfeasance, and may be more likely to attribute events to bad luck, external parties such as customers, suppliers or to a few "bad apples" within the company. By shifting the blame, they are less likely to investigate the root cause of errors and are therefore **more likely to repeat them**.¶ The attractiveness of an overconfident leader¶ Struggling firms have a tendency to "search for a saviour" when engaging a new CEO. They look for an individual who is larger than life. But be warned - charismatic leaders with visibility and track records of success are more likely to possess high levels of overconfidence.¶ In some situations, this may work to a firm's advantage. In fact, there may be some situations where a high level of overconfidence is a highly desirable attribute in a firm's senior executives. Overconfident CEOs may be more likely to persevere with a product or strategy that has been initially unsuccessful, and in doing so can help promote an innovative culture within a firm. But, although an overconfident CEO's optimism can create an energetic and positive work environment, this may also **come with a cost.** As we document in this study, overconfident CEOs tend to be significantly less responsive to corrective feedback, suggesting that their firms are more likely to make the same mistakes all over again.

AT: Self-Regulation

Auditor self-regulation fails---oversight key

James R. **Doty 12**, chairman of the Public Company Accounting Oversight Board, "Sarbanes-Oxley and the Importance of Independent Audit Oversight," 7/24/12, http://www.nytimes.com/roomfordebate/2012/07/24/has-sarbanes-oxley-failed/sarbanes-oxley-and-the-importance-of-independent-audit-oversight

The board has replaced the auditing profession's self-regulation, which had been based on peer reviews of standards **written by the firms themselves**. In 25 years of operation, the profession's self-regulatory system never issued an adverse or qualified report on a major accounting firm. Yet board inspections have identified **scores of problems** in audits by firms in each of the large accounting firm networks and other firms that audit public company financial statements. The inspection process doesn't stop there; it focuses firms on the need to do something to correct deficient audits. The board does not oversee or interact with public companies themselves, but in numerous instances, the audit-firm response to these deficiencies has led to restatements or other corrections to financial statements. These are **big differences from the pre-Enron days**.¶ What's not different from the pre-Enron days, though, is that public companies still appear to structure transactions for no other reason than to reach strained accounting results, and auditors are pressured to sign off on those accounts. Those pressures can destroy an auditor's objectivity.¶ Through rigorous and skillful inspections and enforcement, the board aims to maintain auditing as the attest function it is intended to be. Many things went wrong in the recent financial crisis, but the investing public would have been **worse off without independent audit oversight**. We are again at a point where new reforms are needed to strengthen investor protection. In a nutshell, the global audit firm is not too big to fail, and it is **too important to leave unregulated**.¶ Our federal securities laws were not premised on the government's making business judgments for enterprise, but on a vision that investor protection would further our national interest in capital formation and build investor confidence in our markets. That has worked for us, and we need to hold fast to that vision.

Government regulation key

Cary **Coglianese 4**, Edward B. Shils Professor of Law and professor of political science at the University of Pennsylvania, director of the Penn Program on Regulation, "The Role of Government in Corporate Governance," Regulatory Policy Program, Kennedy School of Government, Harvard, 2004, http://www.hks.harvard.edu/m-rcbg/research/rpp/reports/RPPREPORT8.pdf

Recent corporate scandals have led to public pressure to reform business practices and increase regulation. Of course, dishonesty, greed, and cover-ups are not new societal concerns. Indeed, much of the existing system of corporate regulation in the United States emerged in response to vagaries of the late 1920s and the subsequent stock market crash. What has changed in recent years, though, is the **frequency and public salience** of corporate scandals. As a measure of public attention, consider that, in 1998, The Economist published no editorials devoted to corporate governance issues. By 2002, it published twenty of them, followed by twenty more in 2003 and more still in 2004.¶ The public outcry over the recent scandals has made it clear that **the status quo is no longer acceptable**; the public is demanding accountability and responsibility in corporate behavior. It is widely believed that it will take **more than just leadership by the corporate sector** to restore public confidence in our capital markets and ensure their ongoing vitality. It will also take effective government action, in the form of reformed regulatory systems, improved auditing, and stepped up law enforcement.¶ Already policymakers have adopted numerous reforms. In 2002, Congress speedily passed the Sarbanes-Oxley Act, imposing (among other things) new financial control and reporting requirements on publicly traded companies. The Securities and Exchange Commission (SEC) and the self-regulatory organizations it oversees—both the New York Stock Exchange (NYSE) and the National Association of Securities Dealers (NASD)—have adopted new standards for public companies and securities dealers. The newly created Public Company Accounting Oversight Board (PCAOB) is working to revamp oversight of auditors. Finally, state and federal enforcement officials have responded by aggressively pursuing a number of highly publicized prosecutions against corporate leaders and others accused of violating financial rules.¶ These

responses make clear that the governance of corporations has become a central item on the public policy agenda. The recent scandals themselves demonstrate that lax regulatory institutions, standards, and enforcement can have **huge implications for the economy and for the public.** Of course, government responses to scandals should be well considered and effective. Regulatory reforms that over-react or that address symptoms while ignoring underlying causes can be costly and counterproductive. Government's task is to restore corporate integrity and market confidence without stifling the dynamism that underlies a strong economy.

Global economic order's fragile---great power war's possible and causes extinction

Chas W. **Freeman 14**, served in the United States Foreign Service, the State and Defense Departments in many different capacities over the course of thirty years, past president of the Middle East Policy Council, co-chair of the U.S. China Policy Foundation and a Lifetime Director of the Atlantic Council, 9/13/14, "A New Set of Great Power Relationships," http://chasfreeman.net/a-new-set-of-great-power-relationships/

We live in a time of great strategic fluidity. Borders are shifting. Lines of control are blurring. Long-established spheres of influence are fading away. Some states are decaying and dissolving as others germinate and take root. The global economic order is precarious. New economic and geopolitical fault lines are emerging.

The great powers of North and South America are barely on speaking terms. Europe is again riven by geopolitical antagonisms. Ukraine should be a prosperous, independent borderland between the European Union and Russia. It has instead become a cockpit of strategic contention. The United States and Russia have relapsed into hostility. The post-Ottoman borders of West Asia and North Africa are being erased. Neither Europeans, nor Russians, nor Americans can now protect or direct their longstanding clients in the Middle East. Brazil, China, and India are peacefully competing for the favor of Africa. But, in the Indo-Pacific, China and Japan are at daggers drawn and striving to ostracize each other. Sino-American relations seem to be following US-Russian relations into mutual exasperation and intransigence.

No one surveying this scene could disagree that the world would benefit from recrafting the relationships between its great powers. As President Xi Jinping has proposed, new types of relations might enable the great powers to manage their interactions to the common advantage while lowering the risk of armed conflict. This is, after all, the nuclear age. A war could end in the annihilation of all who take part in it. Short of that, unbridled animosity and contention between great powers and their allies and friends have high opportunity costs and foster the tensions inherent in military posturing, arms races, instability, and impoverishment.

Perception of global economic decline triggers lashout and global war---economic institutions won't check, which answers impact D

Harold **James 14**, Professor of history at Princeton University's Woodrow Wilson School who specializes in European economic history, 7/2/14, "Debate: Is 2014, like 1914, a prelude to world war?," http://www.theglobeandmail.com/globe-debate/read-and-vote-is-2014-like-1914-a-prelude-to-world-war/article19325504/

As we get closer to the centenary of Gavrilo Princip's act of terrorism in Sarajevo, there is an ever more vivid fear: it could happen again. The approach of the hundredth anniversary of 1914 has put a spotlight on the fragility of the world's political and economic security systems.

At the beginning of 2013, Luxembourg's Prime Minister Jean-Claude Juncker was widely ridiculed for evoking the shades of 1913. By now he is looking like a prophet. By 2014, as the security situation in the South China Sea deteriorated, Japanese Prime Minister Shinzo Abe cast China as the equivalent to Kaiser Wilhelm's Germany; and the fighting in Ukraine and in Iraq is a sharp reminder of the dangers of escalation.

Lessons of 1914 are about more than simply the dangers of national and sectarian animosities. The main story of today as then is the precariousness of financial globalization, and the consequences that political leaders draw from it.

In the influential view of Norman Angell in his 1910 book The Great Illusion, the interdependency of the increasingly complex global economy made war impossible. But a quite opposite conclusion was possible and equally plausible – and proved to be the case. Given the extent of fragility, a clever twist to the control levers might make war easily winnable by the economic hegemon.

In the wake of an epochal financial crisis that almost brought a complete global collapse, in 1907, several countries started to think of finance as primarily an instrument of raw power, one that could and should be turned to national advantage.

The 1907 panic emanated from the United States but affected the rest of the world and demonstrated the fragility of the whole international financial order. The aftermath of the 1907 crash drove the then hegemonic power – Great Britain - to reflect on how it could use its financial power.

Between 1905 and 1908, the British Admiralty evolved the broad outlines of a plan for financial and economic warfare that would wreck the financial system of its major European rival, Germany, and destroy its fighting capacity.

Britain used its extensive networks to gather information about opponents. London banks financed most of the world's trade. Lloyds provided insurance for the shipping not just of Britain, but of the world. Financial networks provided the information that allowed the British government to find the sensitive strategic vulnerabilities of the opposing alliance.

What pre-1914 Britain did anticipated the private-public partnership that today links technology giants such as Google, Apple or Verizon to U.S. intelligence gathering. Since last year, the Edward Snowden leaks about the NSA have shed a light on the way that global networks are used as a source of intelligence and power.

For Britain's rivals, the financial panic of 1907 showed the necessity of mobilizing financial powers themselves. The United States realized that it needed a central bank analogous to the Bank of England. American financiers thought that New York needed to develop its own commercial trading system that could handle bills of exchange in the same way as the London market.

Some of the dynamics of the pre-1914 financial world are now re-emerging. Then an economically declining power, Britain, wanted to use finance as a weapon against its larger and faster growing competitors, Germany and the United States. Now America is in turn obsessed by being overtaken by China – according to some calculations, set to become the world's largest economy in 2014.

In the aftermath of the 2008 financial crisis, financial institutions appear both as dangerous weapons of mass destruction, but also as potential instruments for the application of national power.

In managing the 2008 crisis, the dependence of foreign banks on U.S. dollar funding constituted a major weakness, and required the provision of large swap lines by the Federal Reserve. The United States provided that support to some countries, but not others, on the basis of an explicitly political logic, as Eswar Prasad demonstrates in his new book on the "Dollar Trap."

Geo-politics is intruding into banking practice elsewhere. Before the Ukraine crisis, Russian banks were trying to acquire assets in Central and Eastern Europe. European and U.S. banks are playing a much reduced role in Asian trade finance. Chinese banks are being pushed to expand their role in global commerce. After the financial crisis, China started to build up the renminbi as a major international currency. Russia and China have just proposed to create a new credit rating agency to avoid what they regard as the political bias of the existing (American-based) agencies.

The next stage in this logic is to think about how financial power can be directed to national advantage in the case of a diplomatic tussle. Sanctions are a routine (and not terribly successful) part of the pressure applied to rogue states such as Iran and North Korea. But financial pressure can be much more powerfully applied to countries that are deeply embedded in the world economy.

The test is in the Western imposition of sanctions after the Russian annexation of Crimea. President Vladimir Putin's calculation in response is that the European Union and the United States cannot possibly be serious about the financial war. It would turn into a boomerang: Russia would be less affected than the more developed and complex financial markets of Europe and America.

The threat of systemic disruption generates a new sort of uncertainty, one that mirrors the decisive feature of the crisis of the summer of 1914. At that time, no one could really know whether clashes would escalate or not. That feature contrasts remarkably with almost the entirety of the Cold War, especially since the 1960s, when the strategic doctrine of Mutually Assured Destruction left no doubt that any superpower conflict would inevitably escalate.

The idea of network disruption relies on the ability to achieve advantage by surprise, and to win at no or low cost. But it is inevitably a gamble, and raises prospect that others might, but also might not be able to, mount the same sort of operation. Just as in 1914, there is an enhanced temptation to roll the dice, even though the game may be fatal.

This does not mean that global economic governance will continue to function effectively going forward. It is worth remembering that there were genuine efforts to provide global public goods in 1929 as well, but they eventually fizzled out. The failure of the major economies to assist Austria after the CreditAnstalt bank failed in 1931 led to a cascade of bank failures across Europe and the United States. The collapse of the 1933 London conference guaranteed an ongoing absence of policy coordination for the next several years.

The start of the Great Depression was bad. International policy coordination failures made it worse. Such a scenario could play out again. There is no shortage of latent or ongoing crises that could lead to a serious breakdown in global economic governance. The IMF's reluctance to take more critical actions to address the eurozone crisis have already prompted one angry resignation letter from an IMF staffer. The summer 2012 drought in the midwestern United States could trigger another spike in food prices. The heated protectionist rhetoric of the 2012 presidential campaign in the United States, or the nationalist rhetoric accompanying China's 2012 leadership transition, could spark a Sino-American trade war. If global economic growth continues to be mediocre, the surprising effectiveness of global economic governance could peter out. Incipient signs of backsliding in the WTO and G-20 might mushroom into a true "GZero" world.

AT: Resilience

Global economy's no longer resilient---rapid change in financial architecture makes shocks to the system highly destabilizing

Walter Russell **Mead 14**, Professor of Foreign Affairs and Humanities at Bard College; Editor-at-Large of The American Interest magazine, 11/13/14, "The Risk of Nation-State Conflict," http://www.the-american-interest.com/2014/11/16/the-risk-of-nation-state-conflict/

Finally, one should note that international economic policy has been one of America's best tools in ensuring the development of a peaceful and stable international order. However, the same rapid change that destabilizes international politics has made and will make the task of international economic management significantly more challenging. It is not only that the international economy is developing both financial and trade linkages that challenge the ability of policy makers to develop effective policies to stabilize the international financial and economic systems. It is also the case that technological advances are steadily transforming financial markets, speeding up the pace of trading, allowing for the development of increasingly complex financial instruments and trading strategies that collectively produce new kinds of risk that both market participants and regulators struggle to understand. Economic theory and economic policy tools are likely to lag behind the new economic realities that will be created in the coming years and decades; this will be an added factor that tends to destabilize international politics.

The recent USA Freedom Act, did not reform the NSA's the mass collection of domestic communication under Section 702 of the FISA Amendments Act.

Goitein 15,

Elizabeth, Co-Director of the Brennan Center for Justice's Liberty and National Security Program, 6-5-2015, "Who really wins from NSA reform?," MSNBC, http://www.msnbc.com/msnbc/freedom-act-who-really-wins-nsa-reform

The USA Freedom Act will end the bulk collection of phone metadata and prohibit similar programs for any type of business records under foreign intelligence collection authorities. For phone records, the government may obtain metadata on an ongoing basis only for suspected terrorists and those in contact with them. For other types of records, the government must tie its request for records to a "specific selection term," such as a person, address, or account. Given the surge in surveillance since 9/11, the USA Freedom Act's imposition of constraints on collection is historic. Indeed, the USA Freedom Act is the most significant limitation on foreign intelligence surveillance since the 1970s. If faithfully implemented – a critical caveat, to be sure – the law will meaningfully curtail the overbroad collection of business records. Even under USA Freedom,

however, the government is still able to pull in a great deal of information about innocent Americans. Needless to say, not everyone in contact with a suspected terrorist is guilty of a crime; even terrorists call for pizza delivery. Intelligence officials also may need to obtain records – like flight manifests – that include information about multiple people, most of whom have nothing to do with terrorism. Some of this "overcollection" may be inevitable, but its effects could be mitigated. For instance, agencies could be given a short period of time to identify information relevant to actual suspects, after which they would have to destroy any remaining information. USA Freedom fails to impose such limits. More fundamentally, bulk collection of business records is only one of the many intelligence activities that abandoned the individualized suspicion approach after 9/11. Until a few years ago, if the NSA, acting within the United States, wished to obtain communications between Americans and foreigners, it had to convince the FISA Court that the individual target was a foreign power or its agent. Today, under Section 702 of the FISA Amendments Act, the NSA may target any foreigner overseas and collect his or her communications with Americans without obtaining any individualized court order. Under Executive Order 12333, which governs the NSA's activities when it conducts surveillance overseas, the standards are even more lax. The result is mass surveillance programs that make the phone metadata program seem dainty in comparison. Even though these programs are nominally targeted at foreigners, they "incidentally" sweep in massive amounts of Americans' data, including the content of calls, e-mails, text messages, and video chats. Limits on keeping and using such information are weak and riddled with exceptions. Moreover, foreign targets are not limited to suspected terrorists or even agents of foreign powers. As the Obama administration recently acknowledged, foreigners have privacy rights too, and the ability to eavesdrop on any foreigner overseas is an indefensible violation of those rights. Intelligence officials almost certainly supported USA Freedom because they hoped it would relieve the post-Snowden pressure for reform. Their likely long-term goal is to avoid changes to Section 702, Executive Order 12333, and the many other authorities that permit intelligence collection without any individualized showing of wrongdoing. Privacy advocates who supported USA Freedom did so because they saw it as the first skirmish in a long battle to rein in surveillance authorities. Their eye is on the prize: a return to the principle of individualized suspicion as the basis for surveillance. If intelligence officials are correct in their calculus, USA Freedom may prove to be a Pyrrhic victory. But if the law clears the way for further reforms across the full range of surveillance programs, history will vindicate the privacy advocates who supported it. The answer to what USA Freedom means for our liberties lies, not in the text of the law, but in the unwritten story of what happens next.

And, the NSA has massively expanded its surveillance since 2008, American internet communication have been intercepted by NSA surveillance operations far more often than the intended surveillance targets.

Gellman, 2014

Barton Gellman, Washington Post national staff. Contributed to three Pulitzer Prizes for The Washington Post, 7-5-2014, "In NSA-intercepted data, those not targeted far outnumber the foreigners who are," Washington Post, https://www.washingtonpost.com/world/national-security/in-nsa-intercepted-data-those-not-targeted-far-outnumber-the-foreigners-who-are/2014/07/05/

Ordinary Internet users, American and non-American alike, far outnumber legally targeted foreigners in the communications intercepted by the National Security Agency from U.S. digital networks, according to a four-month investigation by The Washington Post. Nine of 10 account holders found in a large cache of intercepted conversations, which former NSA contractor Edward Snowden provided in full to The Post, were not the intended surveillance targets but were caught in a net the agency had cast for somebody else. Many of them were Americans. Nearly half of the surveillance files, a strikingly high proportion, contained

names, e-mail addresses or other details that the NSA marked as belonging to U.S. citizens or residents. NSA analysts masked, or "minimized," more than 65,000 such references to protect Americans' privacy, but The Post found nearly 900 additional e-mail addresses, unmasked in the files, that could be strongly linked to U.S. citizens or U.S.residents. The surveillance files highlight a policy dilemma that has been aired only abstractly in public. There are discoveries of considerable intelligence value in the intercepted messages — and collateral harm to privacy on a scale that the Obama administration has not been willing to address. Among the most valuable contents — which The Post will not describe in detail, to avoid interfering with ongoing operations — are fresh revelations about a secret overseas nuclear project, double-dealing by an ostensible ally, a military calamity that befell an unfriendly power, and the identities of aggressive intruders into U.S. computer networks. Months of tracking communications across more than 50 alias accounts, the files show, led directly to the 2011 capture in Abbottabad of Muhammad Tahir Shahzad, a Pakistan-based bomb builder, and Umar Patek, a suspect in a 2002 terrorist bombing on the Indonesian island of Bali. At the request of CIA officials, The Post is withholding other examples that officials said would compromise ongoing operations. Many other files, described as useless by the analysts but nonetheless retained, have a startlingly intimate, even voyeuristic quality. They tell stories of love and heartbreak, illicit sexual liaisons, mental-health crises, political and religious conversions, financial anxieties and disappointed hopes. The daily lives of more than 10,000 account holders who were not targeted are catalogued and recorded nevertheless. In order to allow time for analysis and outside reporting, neither Snowden nor The Post has disclosed until now that he obtained and shared the content of intercepted communications. The cache Snowden provided came from domestic NSA operations under the broad authority granted by Congress in 2008 with amendments to the Foreign Intelligence Surveillance Act. FISA content is generally stored in closely controlled data repositories, and for more than a year, senior government officials have depicted it as beyond Snowden's reach.The Post reviewed roughly 160,000 intercepted e-mail and instant-message conversations, some of them hundreds of pages long, and 7,900 documents taken from more than 11,000 online accounts. The material spans President Obama's first term, from 2009 to 2012, a period of exponential growth for the NSA's domestic collection. Taken together, the files offer an unprecedented vantage point on the changes wrought by Section 702 of the FISA amendments, which enabled the NSA to make freer use of methods that for 30 years had required probable cause and a warrant from a judge. One program, code-named PRISM, extracts content stored in user accounts at Yahoo, Microsoft, Facebook, Google and five other leading Internet companies. Another, known inside the NSA as Upstream, intercepts data on the move as it crosses the U.S. junctions of global voice and data networks. No government oversight body, including the Justice Department, the Foreign Intelligence Surveillance Court, intelligence committees in Congress or the president's Privacy and Civil Liberties Oversight Board, has delved into a comparably large sample of what the NSA actually collects — not only from its targets but also from people who may cross a target's path.

1AC – Privacy Rights

Advantage One is Privacy

First, surveillance under Section 702 is a substantial invasive of privacy because of the broad targetting guidelines in the FISA Amendments Act.

Laperruque, 2014,

Section 702 Surveillance Is Fundamentally More Invasive

While incidental collection of the communications of a person who communicates with a target is an inevitable feature of communications surveillance, it is tolerated when the reason for the surveillance is compelling and adequate procedural checks are in place. In other instances of communications surveillance conducted in the US, surveillance requires court approval of a target, and that target must be a suspected wrongdoer or spy, a terrorist, or another agent of a foreign power. Section 702 requires neither of these elements.

Under Section 702, targeting can occur for the purpose of collecting foreign intelligence information even though there is no court review of any particular target. Instead, the super secret FISA court merely determines whether the guidelines under which the surveillance is conducted are reasonably designed to result in the targeting of non-Americans abroad and that "minimization guidelines" are reasonable. This means incidental surveillance may occur purely because someone communicated with an individual engaged in activities that may have broadly defined "foreign intelligence" value. For example, the communications of someone who communicates with a person abroad whose activities might relate to the conduct of U.S. foreign affairs can be collected, absent any independent assessment of necessity or accuracy.

As another example, under traditional FISA – for intelligence surveillance in the U.S. of people in the U.S. – your communications could be incidentally collected only if you were in direct contact with a suspected agent of a foreign power, and additionally if the Foreign Intelligence Surveillance Court had affirmed this suspicion based on probable cause. Under Section 702, your personal information could be scooped up by the NSA simply because your attorney, doctor, lover, or accountant was a person abroad who engaged in peaceful political activity such as protesting a G8 summit.

And, these invasions are magnified because the data is the full content of the communication.

And, indiscriminate wide-scale NSA Surveillance erodes privacy rights and violates the constitution

Sinha, 2014

G. Alex Sinha is an Aryeh Neier fellow with the US Program at Human Rights Watch and the Human Rights Program at the American Civil Liberties Union, July 2014 "With Liberty to Monitor All How Large-Scale US Surveillance is Harming Journalism, Law, and American Democracy" Human Rights Watch, http://www.hrw.org/node/127364

The United States government today is implementing a wide variety of surveillance programs that, thanks to developments in its technological capacity, allow it to scoop up personal information and the content of personal communications on an unprecedented scale. Media reports based on revelations by former National Security Agency (NSA) contractor Edward Snowden have recently shed light on many of these programs. They have revealed, for example, that the US collects vast quantities of information—known as "metadata"—about

phone calls made to, from, and within the US. It also routinely collects the content of international chats, emails, and voice calls. It has engaged in the large-scale collection of massive amounts of cell phone location data. Reports have also revealed a since-discontinued effort to track internet usage and email patterns in the US; the comprehensive interception of all of phone calls made within, into, and out of Afghanistan and the Bahamas; the daily collection of millions of images so the NSA can run facial recognition programs; the acquisition of hundreds of millions of email and chat contact lists around the world; and the NSA's deliberate weakening of global encryption standards. In response to public concern over the programs' intrusion on the privacy of millions of people in the US and around the world, the US government has at times acknowledged the need for reform. However, it has taken few meaningful steps in that direction. On the contrary, the US—particularly the intelligence community—has forcefully defended the surveillance programs as essential to protecting US national security. In a world of constantly shifting global threats, officials argue that the US simply cannot know in advance which global communications may be relevant to its intelligence activities, and that as a result, it needs the authority to collect and monitor a broad swath of communications. In our interviews with them, US officials argued that the programs are effective, plugging operational gaps that used to exist, and providing the US with valuable intelligence. They also insisted the programs are lawful and subject to rigorous and multi-layered oversight, as well as rules about how the information obtained through them is used. The government has emphasized that it does not use the information gleaned from these programs for illegitimate purposes, such as persecuting political opponents. The questions raised by surveillance are complex. The government has an obligation to protect national security, and in some cases, it is legitimate for government to restrict certain rights to that end. At the same time, international human rights and constitutional law set limits on the state's authority to engage in activities like surveillance, which have the potential to undermine so many other rights. The current, large-scale, often indiscriminate US approach to surveillance carries enormous costs. It erodes global digital privacy and sets a terrible example for other countries like India, Pakistan, Ethiopia, and others that are in the process of expanding their surveillance capabilities. It also damages US credibility in advocating internationally for internet freedom, which the US has listed as an important foreign policy objective since at least 2010.As this report documents, US surveillance programs are also doing damage to some of the values the United States claims to hold most dear. These include freedoms of expression and association, press freedom, and the right to counsel, which are all protected by both international human rights law and the US Constitution.

And, these privacy violations are more dangerous than any risk of terrorism, which is magnified by the fact that surveillance fails to prevent attacks.

Schneier, 2014

Bruce Schneier a fellow at the Berkman Center for Internet and Society at Harvard Law School, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the CTO at Resilient Systems, Inc.,1-6-2014, "Essays: How the NSA Threatens National Security," Schneier On Security, https://www.schneier.com/essays/archives/2014/01/how_the_nsa_threaten.html

We have no evidence that any of this surveillance makes us safer. NSA Director General Keith Alexander responded to these stories in June by claiming that he disrupted 54 terrorist plots. In October, he revised that number downward to 13, and then to "one or two." At this point, the only "plot" prevented was that of a San Diego man sending $8,500 to support a Somali militant group. We have been repeatedly told that these surveillance programs would have been able to stop 9/11, yet the NSA didn't detect the Boston bombings—even though one of the two terrorists was on the watch list and the other had a sloppy social media trail. Bulk collection of data and metadata is an ineffective

counterterrorism tool. Not only is ubiquitous surveillance ineffective, it is extraordinarily costly. I don't mean just the budgets, which will continue to skyrocket. Or the diplomatic costs, as country after country learns of our surveillance programs against their citizens. I'm also talking about the cost to our society. It breaks so much of what our society has built. It breaks our political systems, as Congress is unable to provide any meaningful oversight and citizens are kept in the dark about what government does. It breaks our legal systems, as laws are ignored or reinterpreted, and people are unable to challenge government actions in court. It breaks our commercial systems, as U.S. computer products and services are no longer trusted worldwide. It breaks our technical systems, as the very protocols of the Internet become untrusted. And it breaks our social systems; the loss of privacy, freedom, and liberty is much more damaging to our society than the occasional act of random violence. And finally, these systems are susceptible to abuse. This is not just a hypothetical problem. Recent history illustrates many episodes where this information was, or would have been, abused: Hoover and his FBI spying, McCarthy, Martin Luther King Jr. and the civil rights movement, anti-war Vietnam protesters, and—more recently—the Occupy movement. Outside the U.S., there are even more extreme examples. Building the surveillance state makes it too easy for people and organizations to slip over the line into abuse.

The First impact is the loss of personal autonomy and agency. Privacy is a gateway right, it enables all of our other freedoms.

PoKempne 2014,

Dinah, General Counsel at Human Rights Watch, "The Right Whose Time Has Come (Again): Privacy in the Age of Surveillance" 1/21/14 http://www.hrw.org/world-report/2014/essays/privacy-in-age-of-surveillance

Technology has invaded the sacred precincts of private life, and unwarranted exposure has imperiled our security, dignity, and most basic values. The law must rise to the occasion and protect our rights. Does this sound familiar? So argued Samuel Warren and Louis Brandeis in their 1890 Harvard Law Review article announcing "The Right to Privacy." We are again at such a juncture. The technological developments they saw as menacing—photography and the rise of the mass circulation press—appear rather quaint to us now. But the harms to emotional, psychological, and even physical security from unwanted exposure seem just as vivid in our digital age. Our renewed sense of vulnerability comes as almost all aspects of daily social life migrate online. At the same time, corporations and governments have acquired frightening abilities to amass and search these endless digital records, giving them the power to "know" us in extraordinary detail.

In a world where we share our lives on social media and trade immense amounts of personal information for the ease and convenience of online living, some have questioned whether privacy is a relevant concept. It is not just relevant, but crucial.

Indeed, privacy is a gateway right that affects our ability to exercise almost every other right, not least our freedom to speak and associate with those we choose, make political choices, practice our religious beliefs, seek medical help, access education, figure out whom we love, and create our family life. It is nothing less than the shelter in which we work out what we think and who we are; a fulcrum of our autonomy as individuals.

The importance of privacy, a right we often take for granted, was thrown into sharp relief in 2013 by the steady stream of revelations from United States government files released by former National Security Agency (NSA) contractor

Edward Snowden, and published in the Guardian and other major newspapers around the world. These revelations, supported by highly classified documents, showed the US, the UK, and other governments engaged in global indiscriminate data interception, largely unchecked by any meaningful legal constraint or oversight, without regard for the rights of millions of people who were not suspected of wrongdoing.

The Second impact is Totalitarianism, the loss of autonomy due to surveillance enables "turnkey totalitarianism," destroying democracy.

Haggerty, 2015

Kevin D. Professor of Criminology and Sociology at the University of Alberta, "What's Wrong with Privacy Protections?" in A World Without Privacy: What Law Can and Should Do? Edited by Austin Sarat p. 230

Still others will say I am being alarmist. My emphasis on the threat of authoritarian forms of rule inherent in populations open to detailed institutional scrutiny will be portrayed as overblown and over dramatic, suggesting I veer towards the lunatic fringe of unhinged conspiracy theorists.66 But one does not have to believe secret forces are operating behind the scenes to recognize that our declining private realm presents alarming dangers. Someone as conservative and deeply embedded in the security establishment as William Binney – a former NSA senior executive – says the security surveillance infrastructure he helped build now puts us on the verge of "turnkey totalitarianism."67 The contemporary expansion of surveillance, where monitoring becomes an ever-more routine part of our lives, represents a tremendous shift in the balance of power between citizens and organizations. Perhaps the greatest danger of this situation is how our existing surveillance practices can be turned to oppressive uses. From this point forward our expanding surveillance infrastructure stands as a resource to be inherited by future generations of politicians, corporate actors, or even messianic leaders. Given sufficient political will this surveillance infrastructure can be re-purposed to monitor – in unparalleled detail – people who some might see as undesirable due to their political opinions, religion, skin color, gender, birthplace, physical abilities, medical history, or any number of an almost limitless list of factors used to pit people against one another. The twentieth century provides notorious examples of such repressive uses of surveillance. Crucially, those tyrannical states exercised fine-grained political control by relying on surveillance infrastructures that today seem laughably rudimentary, comprised as they were of paper files, index cards, and elementary telephone tapping.68 It is no more alarmist to acknowledge such risks are germane to our own societies than it is to recognize the future will see wars, terrorist attacks, or environmental disasters – events that could themselves prompt surveillance structures to be re-calibrated towards more coercive ends. Those who think this massive surveillance infrastructure will not, in the fullness of time, be turned to repressive purposes are either innocent as to the realities of power, or whistling past a graveyard. But one does not have to dwell on the most extreme possibilities to be unnerved by how enhanced surveillance capabilities invest tremendous powers in organizations. Surveillance capacity gives organizations unprecedented abilities to manipulate human

behaviors, desires, and subjectivities towards organizational ends – ends that are too often focused on profit, personal aggrandizement, and institutional self-interest rather than human betterment.

Freedom and dignity are ethically prior to security.

The threat posed by mass, warrantless surveillance technologies

Presently, such a threat to human freedom and dignity lies in the technological erosion of human privacy through the ever-evolving development and deployment of a global, government system of mass, warrantless surveillance. Taken to its logical conclusion, this is a systematic means of spying on, and ultimately manipulating and controlling, virtually every aspect of everybody's private life—a thoroughgoing, global dissolution of personal space, which is supposed to be legally protected. In such a governmental state of "total (or virtually total) information awareness," the potential for government control and manipulation of the people's deepest and most personal beliefs, feelings, and values can transform into an Orwellian reality—and nightmare. As will be discussed in Chapter 6, the technology that has the potential to remove such scenarios from the realm of science fiction to that of true science is currently being developed. This is not to deny the legitimate government interest in "national security"; however, the exceptional disruption of privacy for legitimate state reasons cannot and should not be mistaken for a usual and customary rule of mass invasion of people's private lives without their informed consent. Benjamin Franklin wisely and succinctly expressed the point: "Those who surrender freedom for security will not have, nor do they deserve, either one." In relinquishing our privacy to government, we also lose the freedom to control, and act on, our personal information, which is what defines us individually, and collectively, as free agents and a free nation. In a world devoid of freedom to control who we are, proclaiming that we are "secure" is an empty platitude.

1AC – Economy Advantage

Advantage Two is the Economy.

NSA surveillance has put the US ecomony and competive advantage at risk because of losses in the technology sector. The USA freedom act won't solve the problem.

Failure to reform National Security Administration spying programs revealed by Edward Snowden could be more economically taxing than previously thought, says a new study published by the Information Technology and Innovation Foundation Tuesday. The study suggests the programs could be affecting the technology sector as a whole, not just the cloud-computing sector, and that the costs could soar much higher than previously expected. Even modest declines in cloud computing revenues from the revealed surveillance programs, according to a previous report, would cost between $21.5 billion and $35 billion by 2016. New estimates show that the toll "will likely far exceed ITIF's initial $35 billion estimate." "The U.S. government's failure to reform many of the NSA's surveillance programs has damaged the competitiveness of the U.S. tech sector and cost it a portion of the global market share," a summary of the report said. Revelations by defense contractor Snowden in June 2013 exposed massive U.S. government surveillance capabilities and showed the NSA collected American phone records in bulk, and without a warrant. The bulk phone-record revelations, and many others in the same vein, including the required complacency of American telecom and Internet companies in providing the data, raised questions about the transparency of American surveillance programs and prompted outrage from privacy advocates. The study, published this week, argues that unless the American government can vigorously reform how NSA surveillance is regulated and overseen, U.S. companies will lose contracts and, ultimately, their competitive edge in a global market as consumers around the world choose cloud computing and technology options that do not have potential ties to American surveillance programs. The report comes amid a debate in Congress on what to do with the Patriot Act, the law that provides much of the authority for the surveillance programs. As of June 1, authority to collect American phone data en masse expired, though questions remain as to whether letting that authority expire is enough to protect privacy. Supporters of the programs argue that they provide the country with necessary capabilities to fight terrorism abroad. A further reform made the phone records collection process illegal for the government, and instead gave that responsibility to the telecom companies.

Reform is necessary to regain US leadership in the global marketplace.

When historians write about this period in U.S. history it could very well be that one of the themes will be how the United States lost its global technology leadership to other nations. And clearly one of the factors they would point to is the long-standing privileging of U.S. national security interests over U.S. industrial and commercial interests when it comes to U.S. foreign policy. This has occurred over the last few years as the U.S. government has done relatively little to address the rising commercial challenge to U.S. technology companies, all the while putting intelligence gathering first and foremost. Indeed, policy decisions by the U.S. intelligence community have reverberated throughout the global economy.

If the U.S. tech industry is to remain the leader in the global marketplace, then the U.S. government will need to set a new course that balances economic interests with national security interests. The cost of inaction is not only short-term economic losses for U.S. companies, but a wave of protectionist policies that will systematically weaken U.S. technology competiveness in years to come, with impacts on economic growth, jobs, trade balance, and national security through a weakened industrial base. Only by taking decisive steps to reform its digital surveillance activities will the U.S. government enable its tech industry to effectively compete in the global market.

The US is the driving force behind global economic recovery

"American shopper," 2-14, http://www.economist.com/news/leaders/21643188-world-once-again-relying-too-much-american-consumers-power-growth-american-shopper

A Global economy running on a single engine is better than one that needs jump leads. The American economy is motoring again, to the relief of exporters from Hamburg to Hangzhou. Firms added more than 1m net new jobs in the past three months, the best showing since 1997 (see article). Buoyed up by cheap petrol, Americans are spending; in January consumer sentiment jumped to its highest in more than a decade. The IMF reckons that American growth will hit 3.6% in 2015, faster than the world economy as a whole. All this is good. But growing dependence on the American economy—and on consumers in particular—has unwelcome echoes. A decade ago American consumers borrowed heavily and recklessly. They filled their ever-larger houses with goods from China; they fuelled gas-guzzling cars with imported oil. Big exporters recycled their earnings back to America, pushing down interest rates which in turn helped to feed further borrowing. Europe was not that different. There, frugal Germans financed debt binges around the euro area's periphery.After the financial crisis, the hope was of an end to these imbalances. Debt-addicted Americans and Spaniards would chip away at their obligations; thrifty German and Chinese consumers would start to enjoy life for once. At first, this seemed to be happening. America's trade deficit, which was about 6% of GDP in 2006, had more than halved by 2009. But now the world is slipping back into some nasty habits. Hair grows faster than the euro zone, and what growth there is depends heavily on exports. The countries of the single currency are running a current-account surplus of about 2.6% of GDP, thanks largely to exports to America. At 7.4% of GDP, Germany's trade surplus is as large as it has ever been. China's growth, meanwhile, is slowing—and once again relying heavily on spending elsewhere. It notched up its own record trade surplus in January. China's exports have actually begun to drop, but imports are down by more. And over the past year the renminbi, which rose by more than 10% against the dollar in 2010-13, has begun slipping again, to the annoyance of American politicians. America's economy is warping as a result. Consumption's contribution to growth in the fourth quarter of 2014 was the largest since 2006. The trade deficit is widening. Strip out oil, and America's trade deficit grew to more than 3% of GDP in 2014, and is approaching its pre-recession peak of about 4%. The world's reliance on America is likely to deepen. Germans are more interested in shipping savings abroad than investing at home (see article). Households and firms in Europe's periphery are overburdened with debt, workers' wages squeezed and banks in no mood to lend. Like Germany, Europe as a whole is relying on exports. China is rebalancing, but not fast enough: services have yet to account for more than half of annual Chinese output.

Additionally, NSA surveillance has created a global move towards "data nationalisation" which threatens to fragment the internet.

Omtzigt 15,

Pieter Herman Omtzigt is a Dutch politician. As a member of the Christian Democratic Appeal he was an MP from June 3, 2003 to June 17, 2010 and is currently an MP since October 26, 2010. He focuses on matters of taxes, pensions and additions. "Explanatory memorandum by Mr Pieter Omtzigt, rapporteur" Committee on Legal Affairs and Human Rights, Mass surveillance Report, 1/26/2015, http://website-pace.net/documents/19838/1085720/20150126-MassSurveillance-EN.pdf

108. In response to growing discontent with US surveillance, one political response has been to push for more "technological sovereignty" and "data nationalisation". The Snowden disclosures have therefore had serious implications on the development of the Internet and hastened trends to "balkanize" the Internet to the detriment of the development of a wide, vast and easily accessible online network. The Internet as we knew it, or believed we knew it, is a global platform for exchange of information, open and free debate, and commerce. But Brazil and the European Union, for example, announced plans to lay a $185 million undersea fibre-optic cable between them to thwart US surveillance. German politicians also called for the development of a "German internet" for German customers' data to circumvent foreign servers and the information to stay on networks that would fully be under Germany's control. 159 Russia passed a law obliging internet companies to store the data of Russian users on servers in Russia.160 After a six-month inquiry following the Snowden disclosures, the European Parliament adopted a report on the NSA surveillance programme in February 2014 161, which argues that the EU should suspend bank data and 'Safe Harbour' agreements on data privacy (voluntary data protection standards for non-EU companies transferring EU citizens' personal data to the US) with the United States. MEPs added that the European Parliament should only give its consent to the EU-US free trade deal (TTIP) that is being negotiated, if the US fully respects EU citizens' fundamental rights. The European Parliament seeks tough new data protection rules that would place US companies in the difficult situation of having to check with EU authorities before complying with mandatory requests made by US authorities. The European Parliament's LIBE Committee also advocated the creation of a "European data cloud" that would require all data from European consumers to be stored or processed within Europe, or even within the individual country of the consumer concerned. Some nations, such as Australia, France, South Korea, and India, have already implemented a patchwork of data-localisation requirements according to two legal scholars.162

This regional fragmentation of the internet would collapse the global economy and create the necessary conditions for global instability.

Jardine, 2014

Eric CIGI Research Fellow, Global Security & Politics, 9-19-2014, "Should the Average Internet User in a Liberal Democracy Care About Internet Fragmentation? ," Cigi, https://www.cigionline.org/blogs/reimagining-internet/should-average-internet-user-liberal-democracy-care-about-internet-fragme

Even though your average liberal democratic Internet user wouldn't see it, at least at the content level, the fragmentation of the Internet would matter a great deal. If the Internet was to break apart into regional or even national blocks, there would be large economic costs in terms of lost future potential for global GDP growth. As a recent McKinsey & Company report illustrates, upwards of 15 to 25 percent of Global GDP is currently determined by the movement of goods,

money, people and data. These global flows (which admittedly include more than just data flows) contribute yearly between 250 to 400 billion dollars to global GDP growth. The contribution of global flows to global GDP growth is only likely to grow in the future, provided that the Internet remains a functionally universal system that works extraordinarily well as a platform for e-commerce. Missing out on lost GDP growth harms people economically in liberal democratic countries and elsewhere. Average users in the liberal democracies should care, therefore, about the fragmentation of the broader Internet because it will cost them dollars and cents, even if the fragmentation of the Internet would not really affect the content that they themselves access.Additionally, the same Mckinsey & Company report notes that countries that are well connected to the global system have GDP growth that is up to 40 percent higher than those countries that have fewer connections to the wider world. Like interest rates, annual GDP growth compounds itself, meaning that early gains grow exponentially. If the non-Western portions of the Internet wall themselves off from the rest (or even if parts of what we could call the liberal democratic Internet do the same), the result over the long term will be slower growth and a smaller GDP per capita in less well-connected nations. Some people might look at this situation and be convinced that excluding people in non-liberal democracies from the economic potential of the Internet is not right. In normative terms, these people might deserve to be connected, at the very least so that they can benefit from the same economic boon as those in more well connected advanced liberal democracies. In other words, average Internet users in liberal democracies should care about Internet fragmentation because it is essentially an issue of equality of opportunity.Other people might only be convinced by the idea that poverty, inequality, and relative deprivation, while by no means sufficient causes of terrorism, insurgency, aggression and unrest, are likely to contribute to the potential for an increasingly conflictual world. Most average Internet users in Liberal democracies would likely agree that preventing flashes of unrest (like the current ISIL conflict in Iraq and Syria) is better than having to expend blood and treasure to try and fix them after they have broken out. Preventive measures can include ensuring solid GDP growth through global interconnection in every country, even if this is not, as I mentioned before, going to be enough to fix every problem every time. Overall, the dangers of a fragmented Internet are real and the average user in liberal democracies should care. With truly global forces at play, it is daunting to think of what the average user might do to combat fragmentation. Really only one step is realistic. Users need to recognize that the system works best and contributes most to the content and material well-being of all Internet users when it approaches its ideal technical design of universal interoperability. Societies will rightly determine that some things need to be walled off, blocked or filtered because this digital content has physical world implications that are not acceptable (child pornography, vitriolic hate speech, death threats, underage bullying on social media, etc.). However, in general, citizens should resist Internet fragmentation efforts in any form by putting pressure on their national politicians, Internet Service Providers, and content intermediaries, like Google, to respect the fundamental (and fundamentally beneficial) universally interoperable structure of the Internet. To do otherwise is to accept the loss of potential future global prosperity and to encourage a world that is unequal and prone to conflict and hardship.

The impact of economic decline is great power war.

James, 2014

Harold, Princeton history professor,"Debate: Is 2014, like 1914, a prelude to world war?", 7-2, http://www.theglobeandmail.com/globe-debate/read-and-vote-is-2014-like-1914-a-prelude-to-world-war/article19325504/

Some of the dynamics of the pre-1914 financial world are now re-emerging. Then an economically declining power, Britain, wanted to use finance as a weapon against its larger and faster growing competitors, Germany and the United States. Now America is in turn obsessed by being overtaken by China – according to some calculations, set to become the world's largest economy in 2014. In the aftermath of the 2008 financial crisis, financial institutions appear both as dangerous weapons of mass destruction, but also as potential instruments for the application of national power. In managing the 2008 crisis, the dependence of foreign banks on U.S. dollar funding constituted a major weakness, and required the provision of large swap lines by the Federal Reserve. The United States provided that support to some countries, but not others, on the basis of an explicitly political logic, as Eswar Prasad demonstrates in his new book on the "Dollar Trap." Geo-politics is intruding into banking practice elsewhere. Before the Ukraine crisis, Russian banks were trying to acquire assets in Central and Eastern Europe. European and U.S. banks are playing a much reduced role in Asian trade finance. Chinese banks are being pushed to expand their role in global commerce. After the financial crisis, China started to build up the renminbi as a major international currency. Russia and China have just proposed to create a new credit rating agency to avoid what they regard as the political bias of the existing (American-based) agencies. The next stage in this logic is to think about how financial power can be directed to national advantage in the case of a diplomatic tussle. Sanctions are a routine (and not terribly successful) part of the pressure applied to rogue states such as Iran and North Korea. But financial pressure can be much more powerfully applied to countries that are deeply embedded in the world economy. The test is in the Western imposition of sanctions after the Russian annexation of Crimea. President Vladimir Putin's calculation in response is that the European Union and the United States cannot possibly be serious about the financial war. It would turn into a boomerang: Russia would be less affected than the more developed and complex financial markets of Europe and America. The threat of systemic disruption generates a new sort of uncertainty, one that mirrors the decisive feature of the crisis of the summer of 1914. At that time, no one could really know whether clashes would escalate or not. That feature contrasts remarkably with almost the entirety of the Cold War, especially since the 1960s, when the strategic doctrine of Mutually Assured Destruction left no doubt that any superpower conflict would inevitably escalate. The idea of network disruption relies on the ability to achieve advantage by surprise, and to win at no or low cost. But it is inevitably a gamble, and raises prospect that others might, but also might not be able to, mount the same sort of operation. Just as in 1914, there is an enhanced temptation to roll the dice, even though the game may be fatal.

1AC – Internet Freedom

NSA spying has undermined American foreign policy. It undercut any credibility to push for democratic freedom in repressive regimes, repressive surveillance is growing worldwide as a result.

Schneier 15

Bruce Schneier a fellow at the Berkman Center for Internet and Society at Harvard Law School, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the CTO at Resilient Systems, Inc 3/2/15, *Data and Goliath: The Hidden Battles to Collect Your Data and Control Your World.* P. 106

In 2010, then secretary of state Hillary Clinton gave a speech declaring Internet freedom a major US foreign policy goal. To this end, the US State Department funds and supports a variety of programs worldwide, working to counter censorship, promote encryption, and enable anonymity, all designed "to ensure that any child, born anywhere in the world, has access to the global Internet as an open platform on which to innovate, learn, organize, and express herself free from undue interference or censorship." This agenda has been torpedoed by the awkward realization that the US and other democratic governments conducted the same types of surveillance they have criticized in more repressive countries. Those repressive countries are seizing on the opportunity, pointing to US surveillance as a justification for their own more draconian Internet policies: more surveillance, more censorship, and a more isolationist Internet that gives individual countries more control over what their citizens see and say. For example, one of the defenses the government of Egypt offered for its plans to monitor social media was that "the US listens in to phone calls, and supervises anyone who could threaten its national security." Indians are worried that their government will cite the US's actions to justify surveillance in that country. Both China and Russia publicly called out US hypocrisy. This affects Internet freedom worldwide. Historically, Internet governance—what little there was—was largely left to the United States, because everyone more or less believed that we were working for the security of the Internet instead of against it. But now that the US has lost much of its credibility, Internet governance is in turmoil. Many of the regulatory bodies that influence the Internet are trying to figure out what sort of leadership model to adopt. Older international standards organizations like the International Telecommunications Union are trying to increase their influence in Internet governance and develop a more nationalist set of rules. This is the cyber sovereignty movement, and it threatens to fundamentally fragment the Internet. It's not new, but it has been given an enormous boost from the revelations of NSA spying. Countries like Russia, China, and Saudi Arabia are pushing for much more autonomous control over the portions of the Internet within their borders. That, in short, would be a disaster. The Internet is fundamentally a global platform. While countries continue to censor and control, today people in repressive regimes can still read information from and exchange ideas with the rest of the world. Internet freedom is a human rights issue, and one that the US should support.

Further, this hypocrisy has created the conditions that will accelerate the global rise of authoritarianism.

Chenoweth & Stephan 2015

Erica Chenoweth, political scientist at the University of Denver.& Maria J. Stephan, Senior Policy Fellow at the U.S. Institute of Peace, Senior Fellow at the Atlantic Council.7-7-2015, "How Can States and Non-State Actors Respond to Authoritarian Resurgence?," Political Violence @ a Glance, http://politicalviolenceataglance.org/2015/07/07/how-can-states-and-non-state-actors-respond-to-authoritarian-resurgence/

Chenoweth: Why is authoritarianism making a comeback? Stephan: There's obviously no single answer to this. But part of the answer is that democracy is losing its allure in parts of the world. When people don't see the economic and governance benefits of democratic transitions, they lose hope. Then there's the compelling "stability first" argument. Regimes around the world, including China and Russia, have readily cited the "chaos" of the Arab Spring to justify heavy-handed policies and consolidating their grip on power. The "color revolutions" that toppled autocratic regimes in Serbia, Georgia, and Ukraine inspired similar dictatorial retrenchment. There is nothing new about authoritarian regimes adapting to changing circumstances. Their resilience is reinforced by a combination of violent and non-coercive measures. But authoritarian paranoia

seems to have grown more piqued over the past decade. Regimes have figured out that "people power" endangers their grip on power and they are cracking down. There's no better evidence of the effectiveness of civil resistance than the measures that governments take to suppress it—something you detail in your chapter from my new book. Finally, and importantly, democracy in this country and elsewhere has taken a hit lately. Authoritarian regimes mockingly cite images of torture, mass surveillance, and the catering to the radical fringes happening in the US political system to refute pressures to democratize themselves. The financial crisis here and in Europe did not inspire much confidence in democracy and we are seeing political extremism on the rise in places like Greece and Hungary. Here in the US we need to get our own house in order if we hope to inspire confidence in democracy abroad.

American surveillance is the primary driver behind this authoritarian accelleration.

The plan is necessary to restore US credibility.

Jackson, 2015

Dean Jackson is an assistant program officer at the International Forum for Democratic Studies. He holds an M.A. from the University of Chicago's Committee on International Relations, 7-14-2015, "The Authoritarian Surge into Cyberspace," International Forum For Democratic Studies, http://www.resurgentdictatorship.org/the-authoritarian-surge-into-cyberspace/

This still leaves open the question of what is driving authoritarian innovation in cyberspace. Deibert identifies increased government emphasis on cybersecurity as one driver: cybercrime and terrorism are serious concerns, and governments have a legitimate interest in combatting them. Unfortunately, when democratic governments use mass surveillance and other tools to police cyberspace, it can have the effect of providing cover for authoritarian regimes to use similar techniques for repressive purposes—especially, as Deibert notes, since former NSA contractor Edward Snowden's disclosure of US mass surveillance programs. Second, Deibert observes that authoritarian demand for cybersecurity technology is often met by private firms based in the democratic world—a group that Reporters Without Borders (RSF) calls the "Corporate Enemies of the Internet." Hacking Team, an Italian firm mentioned in the RSF report, is just one example: The Guardian reports that leaked internal documents suggest Hacking Team's clients include the governments of "Azerbaijan, Kazakhstan, Uzbekistan, Russia, Bahrain, Saudi Arabia, and the United Arab Emirates." Deibert writes that "in a world where 'Big Brother' and 'Big Data' share so many of the same needs, the political economy of cybersecurity must be singled out as a major driver of resurgent authoritarianism in cyberspace." Given these powerful forces, it will be difficult to reverse the authoritarian surge in cyberspace. Deibert offers some possible solutions: for starters, he writes that the "political economy of cybersecurity" can be altered through stronger export controls, "smart sanctions," and a monitoring system to detect abuses. Further, he recommends that cybersecurity trade fairs open their doors to civil society watchdogs who can help hold governments and the private sector accountable. Similarly, Deibert suggests that opening regional cybersecurity initiatives to civil society participation could mitigate violations of user rights. This might seem unlikely to occur within some authoritarian-led intergovernmental organizations, but setting a normative expectation of civil society participation might help discredit the efforts of bad actors. Deibert concludes with a final recommendation that society develop "models of cyberspace security that can show us how to prevent disruptions or threats to life and property without sacrificing liberties and rights." This might restore democratic states to the moral high ground and remove oppressive regimes' rhetorical cover, but developing such models will require confronting powerful vested interests and seriously examining the tradeoff between cybersecurity and Internet freedom. Doing so would be worth it: the Internet is far too important to cede to authoritarian control.

The impact – the failure of global democratic consolidation causes extinction.

Diamond, 1995

Larry, Senior Fellow at the Hoover Institution, Promoting Democracy in the 1990s, December, http://www.wilsoncenter.org/subsites/ccpdc/pubs/di/fr.htm

This hardly exhausts the lists of threats to our security and well-being in the coming years and decades. In the former Yugoslavia nationalist aggression tears at the stability of Europe and could easily spread. The flow of illegal drugs intensifies through increasingly powerful international crime syndicates that have made common cause with authoritarian regimes and have utterly corrupted the institutions of tenuous, democratic ones. Nuclear, chemical, and biological weapons continue to proliferate. The very source of life on Earth, the global ecosystem, appears increasingly endangered. Most of these new and unconventional threats to security are associated with or aggravated by the weakness or absence of democracy, with its provisions for legality, accountability, popular sovereignty, and openness. LESSONS OF THE TWENTIETH CENTURY The experience of this century offers important lessons. Countries that govern themselves in a truly democratic fashion do not go to war with one another. They do not aggress against their neighbors to aggrandize themselves or glorify their leaders. Democratic governments do not ethnically "cleanse" their own populations, and they are much less likely to face ethnic insurgency. Democracies do not sponsor terrorism against one another. They do not build weapons of mass destruction to use on or to threaten one another. Democratic countries form more reliable, open, and enduring trading partnerships. In the long run they offer better and more stable climates for investment. They are more environmentally responsible because they must answer to their own citizens, who organize to protest the destruction of their environments. They are better bets to honor international treaties since they value legal obligations and because their openness makes it much more difficult to breach agreements in secret. Precisely because, within their own borders, they respect competition, civil liberties, property rights, and the rule of law, democracies are the only reliable foundation on which a new world order of international security and prosperity can be built.

1AC – Plan

Plan: The United States federal government should limit the scope of its domestic surveillance under Section 702 of the Foreign Intelligence Surveillance Act to communications whose sender or recipient is a valid intelligence target and whose targets pose a tangible threat to national security.

1AC – Solvency

The plan solves, limiting the purposes of 702 collection to a "tangible threat to national security" is critical to solve overcollection.

Sinha, 2014

G. Alex Sinha is an Aryeh Neier fellow with the US Program at Human Rights Watch and the Human Rights Program at the American Civil Liberties Union, July 2014 "With Liberty to Monitor All How Large-Scale US Surveillance is Harming Journalism, Law, and American Democracy" Human Rights Watch, http://www.hrw.org/node/127364

Narrow the purposes for which all foreign intelligence surveillance may be conducted and limit such surveillance to individuals, groups, or entities who pose a tangible threat to national security or a comparable state interest. o Among other steps, Congress should pass legislation amending Section 702 of FISA and related surveillance authorities to narrow the scope of what can be acquired as "foreign intelligence information," which is now defined broadly to encompass, among other things, information related to "the conduct of the foreign affairs of the United States." It should be restricted to what is necessary and proportionate to protect legitimate aims identified in the ICCPR, such as national security. In practice, this should mean that the government may acquire information only from individuals, groups, or entities who pose a tangible threat to national security narrowly defined, or a comparable compelling state interest.

And, this limit solves without damaging counterterrorism.

Laperruque 2014,

"Why Average Internet Users Should Demand Significant Section 702 Reform," Center For Democracy & Technology., 7-22-2014, https://cdt.org/blog/why-average-internet-users-should-demand-significant-section-702-reform/

Where Do We Go From Here? There are sensible reforms that can significant limit the collateral damage to privacy caused by Section 702 without impeding national security. Limiting the purposes for which Section 702 can be conducted will narrow the degree to which communications are monitored between individuals not suspected of wrongdoing or connected to national security threats. Closing retention loopholes present in the Minimization Guidelines governing that surveillance will ensure that when Americans' communications are incidentally collected, they are not kept absent national security needs. And closing the backdoor search loophole would ensure that when Americans' communications are retained because they communicated with a target of Section 702 surveillance, they couldn't be searched unless the standards for domestic surveillance of the American are met.

And, the plan eliminates the collection of communication "about" targets -that solves upstream collection.

Nojeim, 2014

Greg, Director, Project on Freedom, Security & Technology Comments To The Privacy And Civil Liberties Oversight Board Regarding Reforms To Surveillance Conducted Pursuant To Section 702 Of Fisa April 11, 2014
https://d1ovv0c9tw0h0c.cloudfront.net/files/2014/04/CDT_PCLOB-702-Comments_4.11.13.pdf

C. Collection of communications "about" targets that are neither to nor from targets should be prohibited. The Government takes the position that Section 702 permits it to collect not only communications that are to or from a foreign intelligence target, but also communications that are "about" the target because they mention an identifier associated with the target.17 The practice directs the focus of surveillance away from suspected wrongdoers and permits the NSA to target communications between individuals with no link to national security investigations. Because this is inconsistent with the legislative history of the statute, and raises profound constitutional and operational problems, PCLOB should recommend that "about" collection be ended, and that Section 702 surveillance be limited to communications to and from targets. Section 702 authorizes the government to target the communications of persons reasonably believed to be abroad, but it never defines the term "target." However, throughout Section 702, the term is used to refer to the targeting of an individual rather content of a communication.18 Further, the entire congressional debate on Section 702 includes no reference to collecting communications "about" a foreign target, and significant debate about collecting communications to or from a target.19 To collect "about" communications, the NSA engages in "upstream" surveillance on the Internet backbone,20 meaning "on fiber cables and infrastructure as data flows past,"21 temporarily copying the content of the entire data stream so it can be searched for the same "selectors" used for the downstream or "PRISM" surveillance. As a result, the NSA has the capability to search any Internet communication going into or out of the U.S.22 without particularized intervention by a provider. Direct access creates direct opportunity for abuse, and should not be permitted to a military intelligence agency. This dragnet scanning also results in the collection of "multi-communication transactions," (MCTs) which include tens of thousands wholly domestic communications each year.23 The FISC required creation of new minimization rules for MCTs in 2011, but did not limit their collection.24 The mass searching of communications content inside the United States, knowing that it the communications searched include tens of thousands of wholly domestic communications each year, raises profound constitutional questions. Abandoning collection of communications "about" targets would remove any justification for upstream collection, eliminate the serious problems posed by direct government access to the Internet infrastructure, eliminate the collection of tens of thousands of wholly domestic

communications in contravention of the statute, an make surveillance under Section 702 consistent with the congressional intent.

And, these limits restore US leadership.

Edgar, 2015

He was the national security counsel for the American Civil Liberties Union from 2001 to 2006. He is a graduate of Harvard Law School and Dartmouth College, 4-13-2015, "The Good News About Spying," Foreign Affairs, https://www.foreignaffairs.com/articles/united-states/2015-04-13/good-news-about-spying

The United States should also pivot from its defensive position and take the lead on global privacy. The United States has an impressive array of privacy safeguards, and it has even imposed new ones that protect citizens of every country. Despite their weaknesses, these safeguards are still the strongest in the world. The U.S. government should not be shy about trumpeting them, and should urge other countries to follow its lead. It could begin by engaging with close allies, like the United Kingdom, Germany, and other European countries, urging them to increase transparency and judicial supervision of their own communications surveillance activities.

Finally, the plan is a critical step to fight the politics of fear and regain privacy rights.

Snowden, 2015,

Edward J. Snowden, a former Central Intelligence Agency officer and National Security Agency contractor, is a director of the Freedom of the Press Foundation. 6-4-2015, "Edward Snowden: The World Says No to Surveillance," New York Times, http://www.nytimes.com/2015/06/05/opinion/edward-snowden-the-world-says-no-to-surveillance.html

Though we have come a long way, the right to privacy — the foundation of the freedoms enshrined in the United States Bill of Rights — remains under threat. Some of the world's most popular online services have been enlisted as partners in the N.S.A.'s mass surveillance programs, and technology companies are being pressured by governments around the world to work against their customers rather than for them. Billions of cellphone location records are still being intercepted without regard for the guilt or innocence of those affected. We have learned that our government intentionally weakens the fundamental security of the Internet with "back doors" that transform private lives into open books. Metadata revealing the personal associations and interests of ordinary Internet users is still being intercepted and monitored on a scale unprecedented in history: As you read this online, the United States government makes a note. Spymasters in Australia, Canada and France have exploited recent tragedies to seek intrusive new powers despite evidence such programs would not have prevented attacks. Prime Minister David Cameron of Britain recently mused, "Do we want to allow a means of communication between people which we cannot read?" He soon found his answer, proclaiming that "for too long, we have been a passively tolerant society, saying to our citizens: As long as you obey the law, we will leave you alone." At the turning of the millennium, few imagined that citizens of developed democracies would soon be required to defend the concept of an open society against their own leaders. Yet the balance of power is beginning to

shift. We are witnessing the emergence of a post-terror generation, one that rejects a worldview defined by a singular tragedy. For the first time since the attacks of Sept. 11, 2001, we see the outline of a politics that turns away from reaction and fear in favor of resilience and reason. With each court victory, with every change in the law, we demonstrate facts are more convincing than fear. As a society, we rediscover that the value of a right is not in what it hides, but in what it protects.

T-Domestic

Interpretation – Domestic surveillance deals with communication inside the US

HRC 14 (Human Rights Council 2014, IMUNC2014, https://imunc.files.wordpress.com/2014/05/hrc-study-guide.pdf)
Domestic surveillance: Involves the monitoring, interception, collection, analysis, use, preservation, retention of, interference with, or access to **information that includes, reflects, or arises from or a person's communications in the past, present or future with or without their consent or choice, existing or occurring inside a particular country.**

Violation – the affirmative limits the scope of foreign intelligence collection under section 702 of FISA, which is distinct from domestic surveillance

McCarthy 6 (Andrew, former assistant U.S. attorney, now contributing editor of National Review and a senior fellow at the National Review Institute, National Review It's Not "Domestic Spying"; It's Foreign Intelligence Collection, May 15, 2006, http://www.nationalreview.com/corner/122556/its-not-domestic-spying-its-foreign-intelligence-collection-andrew-c-mccarthy)

Eggen also continues the mainstream media's propagandistic use of the term "domestic surveillance [or 'spying'] program." In actuality, the electronic surveillance that the NSA is doing — i.e., eavesdropping on content of conversations — is not "domestic." **A call is not considered "domestic" just because one party to it happens to be inside the U.S., just as an investigation is not "domestic" just because some of the subjects of interest happen to reside inside our country.** Mohammed Atta was an agent of a foreign power, al Qaeda. Surveilling him — had we done it — would not have been "domestic spying." **The calls NSA eavesdrops on are "international," not "domestic." If that were not plain enough on its face, the Supreme Court made it explicit in the Keith case** (1972). There, even though it held that judicial warrants were required for wiretapping purely domestic terror organizations**, the Court excluded investigations of threats posed by foreign organizations and their agents operating both within and without the U.S.** That is, the Court understood what most Americans understand but what the media, civil libertarians and many members of Congress refuse to acknowledge: **if we are investigating the activities of agents of foreign powers inside the United States, that is not DOMESTIC surveillance. It is FOREIGN counter-intelligence.** That, in part, is why the statute regulating wiretaps on foreign powers operating within the U.S. — the one the media has suddenly decided it loves after bad-mouthing it for years as a rubber-stamp — is called the FOREIGN Intelligence Surveillance Act (FISA). **The United States has never needed court permission to conduct wiretapping outside U.S. territory; the**

wiretapping it does inside U.S. territory for national security purposes is FOREIGN INTELLIGENCE COLLECTION, not "domestic surveillance."

Security K

Framing the economy in terms of security discourse leads states to implement unreliable policies, destroying the economic strength they attempt to preserve

Lipschutz 98 (Ronnie Lipschutz, PhD in Politics and Director at UC Santa Cruz, 1998, "On Security" p. 11-12, http://people.ucsc.edu/~rlipsch/index.html/A.Lipschutz%20VITA.11.pdf)

The ways in which the framing of threats is influenced by a changing global economy is seen nowhere more clearly than in recent debates over competitiveness and "economic security." What does it mean to be competitive? Is a national industrial policy consistent with global economic liberalization? How is the security component of this issue socially constructed? Beverly **Crawford** (Chapter 6: "Hawks, Doves, but no Owls: The New Security Dilemma Under International Economic Interdependence") **shows how strategic economic interdependence**--a consequence of the growing liberalization of the global economic system, the increasing availability of advanced technologies through commercial markets, and the ever-increasing velocity of the product cycle--**undermines the ability of states to control those technologies that, it is often argued, are critical to economic strength and military might. Not only can others acquire these technologies, they might also seek to restrict access to them. Both contingencies could be threatening.** (Note, however, that by and large the only such restrictions that *have* been imposed in recent years have all come at the behest of the United States, which is most fearful of its supposed vulnerability in this respect.) **What, then, is the solution to this "new security dilemma,"** as Crawford has stylized it? According to Crawford**, state decisionmakers can respond in three ways. First, they can try to restore state autonomy through self-reliance although, in doing so, they are likely to undermine state strength via reduced competitiveness. Second, they can try to restrict technology transfer to potential enemies, or the trading partners of potential enemies**, although this begins to include pretty much everybody. **It also threatens to limit the market shares of those corporations that produce the most innovative technologies. Finally, they can enter into co-production projects or encourage strategic alliances among firms. The former approach may slow down technological development; the latter places control in the hands of actors who are driven by market, and not military, forces. They are, therefore, potentially unreliable. All else being equal, in all three cases, the state appears to be a net loser where its security is concerned.** But this does not prevent the state from trying to gain.

Limiting surveillance to resolve the fear of apocalypse creates an endless cycle of violence and governmentality

Coviello 2K (Peter, Professor of English and Acting Program Director of Africana Studies – Bowdoin College, Queer Frontiers, p. 40-41, https://books.google.com/books/about/Queer_frontiers.html?id=GR4bAAAAYAAJ)

Perhaps. But to claim that American culture is at present decisively postnuclear is not to say that the world we inhabit is in any way postapocalyptic. Apocalypse, as I began by saying, changed-it did not go away. And here I want to hazard my second assertion**: if, in the nuclear age of yesteryear, apocalypse signified an event threatening everyone and everything with** (in Jacques Derrida's suitably menacing phrase) `remainderless and a-symbolic **destruction,"**6 **then in the postnuclear world apocalypse is an affair whose parameters are definitively local**. In shape and in substance, **apocalypse is defined now by the affliction it brings somewhere else, always to an "other" people whose very presence might then be written as a kind of dangerous contagion, threatening the safety and prosperity of a cherished "general population:'** This fact seems to me to stand behind Susan Sontag's incisive observation, from 1989, that, "**Apocalypse is now a long-running serial: not `Apocalypse Now' but 'Apocalypse from Now On.""** The decisive point here in the perpetuation of the threat of apocalypse (the point Sontag goes on, at length, to miss) is that **apocalypse is ever present because, as an element in a vast economy of power, it is ever useful. That is, through the perpetual threat of destruction-through the constant reproduction of the figure of apocalypse-agencies of power ensure their authority to act on and through the bodies of a particular population**. No one turns this point more persuasively than Michel Foucault, who in the final chapter of his first volume of The History of Sexuality addresses himself to the problem of a power that is less repressive than productive, less life-threatening than, in his words, "life-administering:' Power, he contends, "exerts a positive influence on life . . . [and] endeavors to administer, optimize, and multiply it, subjecting it to precise controls and comprehensive regulations:' In his brief comments on what he calls "the atomic situation;' however, Foucault insists as well that the productiveness of modern power must not be mistaken for a uniform repudiation of violent or even lethal means. For **as "managers of life and survival, of bodies and the race," agencies of modern power presume to act "on the behalf of the existence of everyone:' Whatsoever might be construed as a threat to life and survival in this way serves to authorize any expression of force, no matter how invasive or, indeed, potentially annihilating. "If genocide is indeed the dream of modern power;**' Foucault writes, **"this is not because of a recent return to the ancient right to kill; it is because power is situated and exercised at the level of life, the species, the race, and the large-scale phenomena of population:'8 For a state that would arm itself** not with the power to kill its population, but **with a more comprehensive power over the patterns and functioning of its collective life, the threat of an apocalyptic demise, nuclear or otherwise, seems a civic initiative that can scarcely be done without.**

Reject the affirmative's fear-drive politics-critical analysis of the politics of security and resultant militarism gives us a new political view to articulate a truly democratic politics---activating your role as an ethical educator is the only way to avoid war

Giroux 13 (Henry, Chair in English and Cultural Studies at McMaster University, Violence, USA, 2013, monthlyreview.org/2013/05/01/violence-usa)

In addition, as the state is hijacked by the financial-military-industrial complex, the "most crucial decisions regarding national policy are not made by representatives, but by the financial and military elites."**53 Such massive inequality and the suffering and political corruption it produces point to the need for critical analysis in which the separation of power and politics can be understood. This means developing terms that clarify how power becomes global even as politics continues to function largely at the national level**, with the effect of reducing the state primarily to custodial, policing, and punishing functions—at least for those

populations considered disposable. The state exercises its slavish role in the form of lowering taxes for the rich, deregulating corporations, funding wars for the benefit of the defense industries, and devising other welfare services for the ultra-rich. There is no escaping the global politics of finance capital and the global network of violence it has produced. **Resistance must be mobilized globally and politics restored to a level where it can make a difference in fulfilling the promises of a global democracy. But such a challenge can only take place if the political is made more pedagogical and** matters **of education take center stage in the struggle for desires, subjectivities, and social relations that refuse the normalizing of violence** as a source of gratification, entertainment, identity, and honor. **War** in its expanded incarnation **works in tandem with a state organized around the production of widespread violence. Such a state is necessarily divorced from public values and the formative cultures that make a democracy possible.** The result is a weakened civic culture that allows violence and punishment to circulate as part of a culture of commodification, entertainment, distraction, and exclusion. In opposing the emergence of the United States as both a warfare and a punishing state**, I am not appealing to a form of left moralism meant simply to mobilize outrage** and condemnation. These are not unimportant registers, but they do not constitute an adequate form of resistance. **What is needed are modes of analysis that do the hard work of uncovering the effects of the merging of** institutions of capital, wealth, and power, and how this merger has extended the reach of a **military-industrial-carceral and academic complex**, especially since the 1980s. **This complex of ideological and institutional elements designed for the production of violence must be addressed by making visible its** vast national and **global interests and militarized networks**, as indicated by the fact that the United States has over 1,000 military bases abroad.54 Equally important is the need to highlight how this military-industrial-carceral and academic complex uses punishment as a structuring force to shape national policy and everyday life. **Challenging the warfare state also has an important educational component**. C. Wright Mills was right in arguing that **it is impossible to separate the violence of an authoritarian social order from the cultural apparatuses that nourish it.** As Mills put it, the major cultural apparatuses not only "guide experience, they also expropriate the very chance to have an experience rightly called 'our own.'"55 This narrowing of experience shorn of public values locks people into private interests and the hyper-individualized orbits in which they live. Experience itself is now privatized, instrumentalized, commodified, and increasingly militarized. **Social responsibility gives way to organized infantilization and a flight from responsibility. Crucial here is the need to develop new cultural and political vocabularies that can foster an engaged mode of citizenship capable of naming the corporate and academic interests that support the warfare state and its apparatuses of violence, while simultaneously mobilizing social movements to challenge and dismantle its vast networks of power. One central pedagogical and political task in dismantling the warfare state is, therefore, the challenge of creating the cultural conditions and public spheres that would enable the U.S. public to move from being spectators of war and everyday violence to being informed and engaged citizens. Unfortunately, major cultural apparatuses like** public and **higher education**, which have been historically responsible for educating the public, **are becoming little more than market-driven and militarized knowledge factories**. In this particularly insidious role, **educational institutions deprive students of the capacities that would enable them not only to assume public responsibilities, but also to actively participate in the process of governing. Without the public spheres for creating a formative culture equipped to challenge the educational, military,** market, and religious **fundamentalisms that dominate U.S. society, it will be virtually impossible to resist the normalization of war as a matter of domestic and foreign policy. Any viable notion of resistance to the current authoritarian order must also address the issue of what it means pedagogically to imagine a more democratically oriented notion of knowledge, subjectivity, and agency and what it might mean to bring such notions into the public sphere**. This is more than what Bernard Harcourt calls "**a new grammar of political disobedience."56 It is a reconfiguring of the nature and substance of the political so that matters of pedagogy become central to the very definition of what constitutes the political and the practices that make it meaningful. Critical understanding motivates transformative action, and the**

affective investments it demands can only be brought about by breaking into the hardwired forms of common sense that give war and state-supported violence their legitimacy. War does not have to be a permanent social relation, nor the primary organizing principle of everyday life, society, and foreign policy. The war of all-against-all and the social Darwinian imperative to respond positively only to one's own self-interest represent the death of politics, civic responsibility, and ethics, and set the stage for a dysfunctional democracy, if not an emergent authoritarianism. The existing neoliberal social order produces individuals who have no commitment, except to profit, disdain social responsibility, and loosen all ties to any viable notion of the public good. This regime of punishment and privatization is organized around the **structuring forces of violence and militarization, which produce a surplus of fear, insecurity, and a weakened culture of civic engagement—one in which there is little room for reasoned debate, critical dialogue, and informed intellectual exchange**. Patricia Clough and Craig Willse are right in arguing that **we live in a society "in which the production and circulation of death functions as political and economic recovery."57 The** United States understood as a **warfare state prompts a new urgency for a collective politics and a social movement capable of negating the current regimes of political and economic power, while imagining a different and more democratic social order. Until the ideological and structural foundations of violence** that are pushing U.S. society over the abyss **are addressed, the current warfare state will be transformed into a full-blown authoritarian state that will shut down any vestige of democratic values, social relations, and public spheres. At the very least, the U.S. public owes it to its children and future generations, if not the future of democracy itself, to make visible and dismantle this machinery of violence** while also reclaiming the spirit of a future that works for life rather than death—the future of the current authoritarianism, however dressed up they appear in the spectacles of consumerism and celebrity culture. **It is time for educators**, unions, young people, liberals, religious organizations, and other groups **to connect the dots, educate themselves, and develop powerful social movements that can restructure the fundamental values and social relations of democracy while establishing the institutions and formative cultures that make it possible. Stanley Aronowitz is right in arguing that: the system survives on the eclipse of the radical imagination**, the absence of a viable political opposition with roots in the general population, **and the conformity of its intellectuals who, to a large extent, are subjugated by their secure berths in the academy** [and though] we can take some solace in 2011, the year of the protester…it would be premature to predict that decades of retreat, defeat and silence can be reversed overnight without a commitment to what may be termed "a long march" through the institutions, the workplaces and the streets of the capitalist metropoles.58 The current protests among young people, workers, the unemployed, students, and others are making clear that **this is not—indeed, cannot be—only a short-term project for reform, but must constitute a political and social movement of sustained growth, accompanied by the reclaiming of public spaces**, the progressive use of digital technologies**, the development of democratic public spheres, new modes of education, and the safeguarding of places where democratic expression, new identities, and collective hope can be nurtured and mobilized**. Without broad political and social movements standing behind and uniting the call on the part of young people for democratic transformations, any attempt at radical change will more than likely be cosmetic. **Any viable challenge to the new authoritarianism and its theater of cruelty and violence must include developing a variety of cultural discourses and sites where new modes of agency can be imagined and enacted, particularly as they work to reconfigure a new collective subject, modes of sociality, and "alternative conceptualizations of the self and its relationship to others."59 Clearly, if the United States is to make a claim to democracy, it must develop a politics that views violence as a moral monstrosity and war as virulent pathology**. How such a claim to politics unfolds remains to be seen. In the meantime, resistance proceeds, especially among the young people who now carry the banner of struggle against an encroaching authoritarianism that is working hard to snuff out all vestiges of democratic life.

Tangible threat requires facts of danger

Supreme Court of Georgia 6 ("Decatur County v. Bainbridge Post Searchlight", SUPREME COURT OF GEORGIA, Fulton County D. Rep. 2191, July 6, 2006, Lexis)

In our litigious society, a governmental agency always faces some threat of suit. To construe the term "potential litigation" to include an unrealized or idle threat of litigation would seriously undermine the purpose of the Act. Such a construction is overly broad. HN4Go to this Headnote in the case. Construing OCGA § 50-14-2 (1) narrowly, we hold that a meeting may not be closed to discuss potential litigation under the attorney-client exception unless the governmental entity can show a realistic and **tangible threat** of legal action against it or its officer[s] or employee[s], **a threat that goes beyond a mere fear or suspicion** of being sued. A realistic and **tangible threat** of litigation is one that **can be characterized with reference to objective factors** which may include, but which are not limited to, (1) a formal demand letter or some comparable writing that presents the party's claim and manifests a solemn intent to sue, [cit.]; (2) previous or pre-existing litigation between the parties or proof of ongoing litigation concerning similar claims, [cit.]; or (3) proof that a party has both retained counsel with respect to the claim at issue and has expressed an intent to sue, [cit.] This list is not intended to be exhaustive but merely illustrative of circumstances that a trial court may consider, in the exercise of its discretion, that take the threat of litigation out of the realm of "remote and speculative" and into the realm of "realistic and tangible."

NSA surveillance on real and fake treats have thwarted terrorism

Sterman et al 14 (David, a program associate at New America and holds a master's degree from Georgetown's Center for Security Studies, gis work focuses on homegrown extremism and the maintenance of New America's datasets on terrorism inside the United States and the relative roles of NSA surveillance and traditional investigative tools in preventing such terrorism, Emily Schneider, senior program associate for the International Security Program at New America, Peter Bergen, Vice President, Director of Studies, Director, International Security, Future of War, and Fellows Programs, "DO NSA'S BULK SURVEILLANCE PROGRAMS STOP TERRORISTS?", January 13th 2014, https://www.newamerica.org/international-security/do-nsas-bulk-surveillance-programs-stop-terrorists/)

On June 5, 2013, the Guardian broke the first story in what would become a flood of revelations regarding the extent and nature of the NSA's surveillance programs. Facing an uproar over the threat such programs posed to privacy, the Obama administration scrambled to defend them as legal and essential to U.S. national security and counterterrorism. Two weeks after the first leaks by former NSA contractor Edward Snowden were published, **President Obama defended the NSA surveillance programs during a visit to Berlin, saying: "We know of at least 50 threats that have been averted** because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved." Gen. Keith Alexander, the director of the NSA, testified before Congress that: "**the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50 potential terrorist events in more than 20 countries around the world."** Rep. Mike Rogers (R-Mich.), chairman of the House Permanent Select Committee on Intelligence, said on the House floor in July that "**54 times [the NSA programs] stopped and thwarted terrorist attacks** both here and in Europe – saving real lives."

Increasing transparency alerts terrorists of NSA tactics – increases the risk of cyberterrorism

De 14 (Rajesh,General Counsel, National Security Agency, "The NSA and Accountability in an Era of Big Data", JOURNAL OF NATIONAL SECURITY LAW & POLICY, May 8th 2014,p.4, http://jnslp.com/wp-content/uploads/2014/05/The-NSA-and-Accountability-in-an-Era-of-Big-Data.pdf)

Perhaps the most alarming trend is that the digital communications infrastructure is increasingly also becoming the domain for foreign threat activity. In other words, it is no longer just a question of "collecting" or even "connecting" the dots in order to assess foreign threats amidst more and more digital noise, it is also a question of determining which of the so-called "dots" may constitute the threat itself. As President Obama has recognized, "the cyber threat to our nation is one of the most serious economic and national security challenges we face." Many of us read in the papers every day about cyber-attacks on commercial entities. Hackers come in all shapes and sizes, from foreign government actors, to criminal syndicates, to lone individuals. But as former Secretary of Defense Leon Panetta warned a few months ago, "the greater danger facing us in cyberspace goes beyond crime and it goes beyond harassment. A cyber-attack perpetrated by nation states or violent extremist groups **could be as destructive as the terrorist attack on 9/11**." And as the President warned in his recent State of the Union address, **we know that our enemies are "seeking the ability to sabotage our power grid, our financial institutions, our air-traffic control systems." We also have seen a disturbing trend in the evolution of the cyber threat** around the world. As General Keith Alexander, the Director of NSA, describes it, **the trend is one from "exploitation" to "disruption" to "destruction."** In fundamental terms, the cyber threat has evolved far beyond simply stealing – the stealing of personal or proprietary information, for example-to include more disruptive activity, such as distributed denial of service attacks that may temporarily degrade websites; and more alarmingly, we now see an evolution toward truly destructive activity. Secretary Panetta, for example, recently discussed what he described as "probably the most destructive attack the private sector has seen to date" – a computer virus used to infect computers in the Saudi Arabian State Oil Company Aramco in mid-2012, which virtually destroyed 30,000 computers. *** Within this context, big data presents opportunities and challenges for the government and the private sector. Improving our ability to gain insights from large and complex collections of data holds the promise of accelerating progress across a range of fields from health care to earth science to biomedical research. But perhaps nowhere are the challenges and opportunities of big data as stark as in the national security field, where the stakes are so high – both in terms of the threats we seek to defeat, and of the liberties we simultaneously seek to preserve. This reality is readily apparent in the evolving and dynamic cyber environment, and perhaps no more so than for an agency at the crossroads of the intelligence and the defense communities, like NSA. Of course, **NSA must necessarily operate in a manner that protects its sources and methods from public view.** If a person being investigated by the FBI learns that his home phone is subject to a wiretap, common sense tells us that he will not use that telephone any longer. The same is true for NSA**. If our adversaries know what NSA is doing and how it is doing it – or even what NSA is not doing and why it is not doing it – they could well find ways to evade surveillance, to obscure themselves and their activities, or to manipulate anticipated action or inaction by the U.S. government. In sum, they could more readily use the ocean of big data to their advantage.**

Cyberterrorists could break into computers and launch an attack on a nuclear state—triggers global nuclear war

Fritz 09

(Jason, May 2009, International Commission on Nuclear Non-Proliferation and Disarmament, "Hacking Nuclear Command and Control," Jason is a defense researcher, served as a cavalry officer in the US Army for 6 years, masters in IR @ Bond University, icnnd.org/documents/jason_fritz_hacking_nc2.doc, 7/15/15)

In order to see how cyber terrorists could detonate a nuclear weapon it is important to identify the structures which they would be attempting to penetrate. Nuclear command and control (NC2), sometimes referred to as nuclear command and control and communications (NC3) includes the personnel, equipment, communications, facilities, organisation, procedures, and chain of command involved with maintaining a nuclear weapon capability. A Command and Control Centre is typically a secure room, bunker, or building in a government or military facility that operates as the agency's dispatch centre, surveillance monitoring centre, coordination office and alarm monitoring centre all in one. A state may have multiple command and control centres within the government and military branches which can act independently or, more commonly, be used in the event a higher node is incapable of performing its function. A minimum of eight states possess a nuclear arsenal, providing eight varying nuclear command and control structures for cyber terrorist to target. The eight states which possess nuclear weapons are, in order of acquisition, the US, Russia (former Soviet Union), the UK, France, China, India, Pakistan, and North Korea. South Africa formerly possessed nuclear weapons, but has since dismantled its arsenal. Israel is also widely believed to have nuclear weapons, but has not officially confirmed their status as a nuclear state. There are approximately 20,000 active nuclear weapons in the world. The vast majority of these belong to the US and Russia, stemming from the Cold War. ∂ Nuclear command and control has inherent weaknesses in relation to cyber warfare. The concept of mutually assured destruction means a state must have the capability to launch nuclear weapons in the event of a decapitating strike. This requires having nuclear weapons spread out in multiple locations (mobility and redundancy), so an enemy could not destroy all of their capabilities. Examples of this include land based mobile launch platforms and submarine-launched ballistic missiles (SLBM). This provides terrorists with multiple locations for attaining access to these weapons. Further, under NATO nuclear weapons sharing, the US has supplied nuclear weapons to Belgium, Germany, Italy, the Netherlands, and Turkey for storage and possible deployment. **This further increases the number of access points for terrorists, allowing them to assess not only installations and procedures, but also which borders and state specific laws may be easier to circumvent**. The weapons themselves may all be under the complete control of the US, but the operational plans of terrorists may include items such as reconnaissance, social engineering, and crossing borders which remain unique between states. The potential collapse of a state also presents a challenge. Following the collapse of the Soviet Union, Belarus, Kazakhstan, and Ukraine were in possession of nuclear weapons. These have since been transferred to Russia, but there was, and still is, considerable concern over the security and integrity of those weapons, especially in the face of a destabilized government and civilian hardship. Mutually assured destruction also promotes a hair trigger launch posture and the need for launch orders to be decided on quickly. The advent of SLBMs increased this high pressure tension, as the ability of a submarine to sneak up close to a state's border before launch significantly reduced response time. These short decision times make it easier for terrorists to provoke a launch as little time, and little discussion, is given to assess a situation in full. The desire to reduce the time it takes to disseminate plans to nuclear forces may expand the use of computers in nuclear command and control, or lead to the introduction of fail-deadly and autonomous systems.∂ This chapter is by no means comprehensive, However it sheds some light on the operations of nuclear command and control and the difficulties in defending those systems from cyber terrorism. Many of the details of nuclear command and control are classified, so the information provided below may be outdated. However it points towards a pattern, and there is no certainty these systems and procedures have been updated since entering open source knowledge. Further, terrorists do not have to restrict themselves to unclassified data, and therefore may be able to obtain up to date information.∂ The United States∂ The US employs a nuclear deterrence triad consisted of nuclear-capable long range bombers, SLBMs, and land based intercontinental ballistic missiles (ICBMs), as well as an arsenal of nonstrategic (tactical) nuclear weapons. US nuclear command and control covers a geographically dispersed force with the US President, as Commander in Chief, being the highest authority in the decision to make a nuclear launch. There is a hierarchy of succession in the event the President cannot perform this duty, such as if the President were killed in an attack. Additionally, once the order to launch is given, it travels down a chain of command; the President does not press the button, so to speak, nor is the President physically present at the launch location. These locations would be targets in a nuclear war, so it is imperative that the leader not be there. Additionally, multiple independent launch locations make this impossible (except for cases in which multiple missiles are tied together in a Single Integrated Operational Plan). So it is theoretically possible to subvert this control by falsifying the order at any number of locations down that chain of command. The infrastructure that supports the President in his decision to launch nuclear weapons is the Nuclear Command and Control System (NCCS). "The NCCS must support situation monitoring, tactical warning and attack assessment of missile launches, senior leader decision making, dissemination of Presidential force-direction orders, and management of geographically dispersed forces" (Critchlow 2006).∂ Key US nuclear command centres include fixed locations, such as the National Military Command Center (NMCC) and the Raven Rock Mountain Complex (Site R), and mobile platforms, such as the E-4B National Airborne Operations Center (NAOC) and the Mobile Consolidated Command Center (MCCC). The US seeks to integrate its nuclear forces into its vision of command, control, computers, communications, intelligence, surveillance, and reconnaissance (C4ISR) hinting towards a greater reliance on computer technology in maintaining and upgrading its nuclear force, not only to combat against Cold War style nuclear war, but also against perceived emerging threats from China, Iran and North Korea. In particular the US recognises these states' potential to use nuclear weapons detonated at high altitude to create an electromagnetic pulse (EMP). The threat of EMP was known during the Cold War, and a considerable amount of attention has been paid to hardening nuclear systems (Critchlow 2006).∂ The Minimum Essential Emergency Communications Network (MEECN) links to the ICBMs, bombers, and submarine forces. Information widely available on the internet shows the US is seeking to upgrade the MEECN's satellite communications capability through Advanced Extremely High Frequency and the Transformational Communications Satellite programs. Cyber terrorists may use this knowledge to research these new forms, or to expose weaknesses in the old system before upgrades are completed. Early warning systems and communications are essential to assessing whether a nuclear launch has been made and communicating the orders to launch a retaliatory strike. Falsifying the data provided by either of these systems would be of prime interest to terrorists. Commands emanating from the NAOC for example, include Extremely High Frequency and Very Low Frequency/Low Frequency links, and its activation during a traditional terrorist attack, as happened on 9/11, could provide additional clues as to its vulnerabilities. Blogging communities have also revealed that the 9/11 terrorist attacks revealed insights into the US continuity of operations plan as high level officials were noted heading to specific installations (Critchlow 2006).∂ One tool designed by the US for initiating a nuclear launch is the 'nuclear football'. It is a specially outfitted briefcase which can be used by the President to authorize a nuclear strike when away from fixed command centres. The President is accompanied by an aide carrying the nuclear football at all times. This aide, who is armed and possibly physically attached to the football, is part of a rotating crew of Presidential aides (one from each of the five service branches). The football contains a secure satellite communication link and any other material the President may need to refer to in the event of its use, sometimes referred to as the 'playbook'. The attack options provided in the football include single ICBM launches and large scale pre-determined scenarios as part of the Single Integrated Operational Plan. Before initiating a launch the President must be positively identified using a special code on a plastic card, sometimes referred to as 'the gold codes' or 'the biscuit'. The order must also be approved by a second member of the

government as per the two-man rule (Pike 2006). ∂ In terms of detecting and analysing a potential attack, that is, distinguishing a missile attack from the launch of a satellite or a computer glitch, the US employs dual phenomenology. This means two different systems must be used to confirm an attack, such as radar and satellite. Terrorists trying to engage a launch by falsifying this data would need to determine which two systems were being used in coordination at the target location and spoof both systems. Attempting to falsify commands from the President would also be difficult. Even if the chain of command is identified, there are multiple checks and balances. For example, doctrine recommends that the President confer with senior commanders. The Chairman of the Joint Chiefs of Staff is the primary military advisor to the President. However, the President may choose to consult other advisors as well. Trying to identify who would be consulted in this system is difficult, and falsification may be exposed at any number of steps. The 2006 Quadrennial Defense Review emphasizes that new systems of command and control must be survivable in the event of cyber warfare attacks. On the one hand, this shows that the US is aware of the potential danger posed by computer network operations and are taking action to prevent it. On the other hand, this shows that they themselves see computer network operations as a weakness in their system. And the US continues to research new ways to integrate computer systems into their nuclear command and control, such as IP-based communications, which they admit, "has not yet been proven to provide the high degree of assurance of rapid message transmission needed for nuclear command and control" (Critchlow 2006).∂ The US nuclear arsenal remains designed for the Cold War. This means its paramount feature is to survive a decapitating strike. In order to do so it must maintain hair-trigger posture on early warning and decision-making for approximately one-third of its 10,000 nuclear weapons. According to Bruce G. Blair, President of the Center for Defense Information, and a former Minuteman launch officer:∂ Warning crews in Cheyenne Mountain, Colo., are allowed only three minutes to judge whether initial attack indications from satellite and ground sensors are valid or false. Judgments of this sort are rendered daily, as a result of events as diverse as missiles being tested, or fired — for example, Russia's firing of Scud missiles into Chechnya — peaceful satellites being lofted into space, or wildfires and solar reflections off oceans and clouds. If an incoming missile strike is anticipated, the president and his top nuclear advisors would quickly convene an emergency telephone conference to hear urgent briefings. For example, the war room commander in Omaha would brief the president on his retaliatory options and their consequences, a briefing that is limited to 30 seconds. All of the large-scale responses comprising that briefing are designed for destroying Russian targets by the thousands, and the president would have only a few minutes to pick one if he wished to ensure its effective implementation. The order would then be sent immediately to the underground and undersea launch crews, whose own mindless firing drill would last only a few minutes (Blair 2003). ∂ These rapid response times don't leave room for error. Cyber terrorists would not need deception that could stand up over time; they would only need to be believable for the first 15 minutes or so. The amount of firepower that could be unleashed in these 15 minutes, combined with the equally swift Russian response, **would be equivalent to approximately 100,000 Hiroshima bombs** (Blair 2008).

Surveillance outweighs and privacy violations are overstretched post-Snowden – solves security threats

Gallington 13 -- (Daniel J. Gallington, senior policy and program adviser at the George C. Marshall Institute in Arlington VA, served in senior national policy positions in the Office of the Secretary of Defense, the Department of ?Justice, and as bipartisan general counsel for the U.S. Senate Select Committee on Intelligence, "The Case for Internet Surveillance," US News, http://www.usnews.com/opinion/blogs/world-report/2013/09/18/internet-surveillance-is-a-necessary-part-of-national-security, Accessed 07-02-15)

If the answer to these questions continues to be yes – and it most likely is – then the recent public debate brought on by Edward Snowden's disclosures is **far more mundane, and far less sensational** than the media would perhaps like it to be. Also In that case, the real issue set boils down to the following set of key questions, best answered by our Congress – specifically the Intelligence committees working with some other key committees – after a searching inquiry and a series of hearings, as many of them open as possible. Were the established and relevant laws, regulations and procedures complied with? Are the established laws, regulations and procedures up to date for current Internet and other technologies? Is there reason to add new laws, regulations and procedures? Is there a continued requirement – based on public safety – to be able to do intrusive surveillance, including Internet surveillance, against spies, terrorists or criminals? In sum, the idea that we have somehow "betrayed" or "subverted" the Internet (or the telephone for that matter) is – as my mom also used to say – "**just plain silly**." Such kinds of inaccurate statements are emotional and intended mostly for an audience with preconceived opinions or that hasn't thought very hard about the

dangerous consequences of an Internet totally immune from surveillance. In fact, it seems time for far less sensationalism – primarily by the media – and far more objectivity. In the final analysis, my mom probably had it right: "Those kind of people, sure".

The public doesn't feel strongly about surveillance.

Rieff 13

(David, Author with focus on immigration, international conflict, and humanitarianism, "Why Nobody Cares About the Surveillance State", August 22, 2013, http://foreignpolicy.com/2013/08/22/why-nobody-cares-about-the-surveillance-state/, kc)

And yet, apart from some voices from the antiwar left and the libertarian right, the reaction from this deceived public has been strangely muted. Polls taken this summer have shown the public almost evenly split on whether the seemingly unlimited scope of these surveillance programs was doing more harm than good. Unlike on issues such as immigration and abortion, much of the public outrage presupposed by news coverage of the scandal does not, in reality, seem to exist.¶ It is true that the revelations have caused at least some on the mainstream right, both in Congress and in conservative publications like National Review, to describe the NSA's activities as a fundamental attack on the rights of citizens. For their part, mainstream Democrats find themselves in the uncomfortable position of either defending what many of them view as indefensible or causing trouble for a beleaguered president who seems increasingly out of his depth on most questions of national security and foreign policy.¶ The press can certainly be depended on to pursue the story, not least because of a certain "guild" anger over the detention recently of Guardian journalist Glenn Greenwald's partner, David Miranda, by British police at London's Heathrow Airport, and the British government's decision to force the Guardian to destroy the disks it had containing Snowden's data — in the paper's London office with two officials from CGHQ, the British equivalent of the NSA, looking on. But while the surveillance scandal has both engaged and enraged the elites, when all is said and done, the general public does not seem nearly as concerned.¶ Why? In an age dominated by various kinds of techno-utopianism — the conviction that networking technologies are politically and socially emancipatory and that massive data collection will unleash both efficiency in business and innovation in science — the idea that Big Data might be your enemy is antithetical to everything we have been encouraged to believe. A soon-to-be-attained critical mass of algorithms and data has been portrayed as allowing individuals to customize the choices they make throughout their lives. Now, the data sets and algorithms that were supposed to set us free seem instead to have been turned against us.

Siegel 11 (Lee Siegel, a columnist and editor at large for The New York Observer, is the author of "Against the Machine: How the Web Is Reshaping Culture and Commerce — and Why It Matters. "'The Net Delusion' and the Egypt Crisis", February 4, 2011, http://artsbeat.blogs.nytimes.com/2011/02/04/the-net-delusion-and-the-egypt-crisis)

¶Morozov takes the ideas of what he calls "cyber-utopians" and shows how reality perverts them in one political situation after another. In Iran, the regime used the internet to crush the internet-driven protests in June 2009. In Russia, neofascists use the internet to organize pogroms. And on and on. Morozov has written hundreds of pages to make the point that technology is amoral and cuts many different ways. Just as radio can bolster democracy or — as in Rwanda — incite genocide, so the internet can help foment a revolution but can also help crush it. This seems obvious, yet it has often been entirely lost as grand claims are made for the internet's positive, liberating qualities. ¶And suddenly here are Tunisia and, even more dramatically, Egypt, simultaneously proving and refuting Morozov's argument. In both cases, social networking allowed truths that had been whispered to be widely broadcast and commented upon. In Tunisia and Egypt — and now across the Arab world — Facebook and Twitter have made people feel less alone in their rage at the governments that stifle their lives. There is nothing more politically emboldening than to feel, all at once, that what you have experienced as personal bitterness is actually an objective condition, a universal affliction in your society that therefore can be universally opposed. ¶Yet at the same time, the Egyptian government shut off the internet, which is an effective way of using the internet. And according to one Egyptian blogger, misinformation is being spread through Facebook — as it was in Iran — just as real information was shared by anti-government protesters. This is the "**dark side of internet freedom"** that Morozov is warning against. It is the freedom to wantonly crush the forces of freedom. ¶All this should not surprise anyone. It seems that, just as with every other type of technology of communication, the internet is not a solution to human conflict but an amplifier for all aspects of a conflict. As you read about pro-government agitators charging into crowds of protesters on horseback and camel, you realize that nothing has changed in our new internet age. The human situation is the same as it always was, except that it is the same in a newer and more intense way. Decades from now, we will no doubt be celebrating a spanking new technology that promises to liberate us from the internet. And the argument joined by Morozov will occur once again.

Econ

Growth rates are unsustainable – we are exceeding the earth's biophysical limits

Klitgaar and Krall 11 (Kent A. Klitgaard, , Lisi Krall, ,"Ecological economics, degrowth, and institutional change", 12/12/2011, Ecological Economics journal issue no. 84 pages 247-248, www.elsevier.com/ locate/ecolecon)

The age of economic growth is coming to an end. The mature economies of the industrial North have already entered the initial stages of the era of degrowth. This is evidenced by data that show overall economic activity has increased at a decreasing rate since the "Golden Age" of 1960s postwar capitalism turned into the era of stagflation in the 1970s. Despite the supposed revival of growth in the neoliberal age, percentage growth rates have continued their secular decline. In the United States real GDP growth was lower in the1980s and 1990s than in the 1970s and lower still in the first years of the 21st century (Tables 1). While percentage growth rates may have declined over the last five decades the absolute size of the economy, as measured by real gross domestic product (for all its flaws) has increased, more than tripling from 1970 until 2011. This creates a dilemma within our present institutional context. Absolute growth, which uses more resources, especially fossil fuel resources, destroys more habitat, and emits more carbon and other pollutants

into the planet's sinks, has grown exponentially. At the same time, relative, or percentage growth, upon which employment depends, has fluctuated over the same decades and shows a downward trend. We are growing too fast to remain within the limits of the biophysical system. At the same time the world economy is growing too slowly to provide sufficient employment and there appears to be a secular decline at work. Despite rapid and sustained rates of economic growth in many newly emerging market economies (e.g. Brazil, India and China) patterns of declining growth rates also exist for the world economy (Table 2). The reduction in the long-term growth rates, especially for mature market economies, is not something we must contend with in the distant future. They have been occurring for decades. Neither are they simply the result of "misguided" policy, as growth rates have fallen in times of both liberal and conservative policy regimes. Rather, we believe the growth rate decline is embedded deeply within the institutional structure of the economy, as well as within biophysical limits. Clearly a better understanding of the complex dynamics of the interactions of the economic and biophysical systems is needed to provide important insights for the degrowth and steady-state agendas. While ecological economics has addressed ecological limits, it has not explored as fully the limits to growth inherent in a market system. The analysis of biophysical limits has been the strength of ecological economics. Beginning with the work of Herman Daly, who placed the economy within the context of a finite and non-growing biophysical system, through the first 1997 text by Robert Costanza and colleagues, ecological economists have carefully delineated limits such as the climate change, the human appropriation of the products of photosynthesis, and biodiversity loss (Costanza et al., 1997). Subsequent analyses by Rees and Wackernagel showed that the human ecological footprint now exceeds the earth's biocapacity, and the Limits to Growth studies by Meadows et al. concluded that human activity has overshot the carrying capacity and the scale of human activity is unlikely to be maintained into the next century. The work of many energy analysts (Campbell, 2005; Campbell and Laherrere, 1998; Deffeyes, 2001; Hall and Klitgaard, 2011; Hallock et al., 2004; Heinberg, 2005; Simmons, 2006) concludes that we are at or near the global peak of fossil hydrocarbons and future economic activity will be impacted strongly by more expensive and less available petroleum. The second set of limits is internal and is to be found in the dynamics of the accumulation process, involving the complex structural interaction of production, consumption, and distribution. The internal limits that gear the economy toward both cyclical variation and secular stagnation have not been considered systematically by ecological economists. When the economy reached these limits historically the result has been a series of periodic recessions and depressions. Renewed growth has been the answer, just as it is now. If the system reaches its own internal limits at the same time the world reaches its external biophysical limits we will have a profound challenge because we need a way to facilitate decent standards of living when economic growth can no longer be the vehicle to maintain incomes and assure social stability. In the last instance, a system in overshoot can neither growits way out of its inherent tendency toward stagnation, nor can it grow its way into sustainability. We believe it is unlikely that the present system of capitalism, dominated by multinational corporations, globalization, speculative finance, and dependence upon fossil fuels, can adjust to the era of degrowth and remain intact as is. In order to devise an economy that meets human needs as it approaches both sets of limits, ecological economics needs to understand more fully the structural and institutional dimensions of the internal and external limits, as well as the interaction between the two. This is our challenge, and it is a difficult one. Ecological economics can better understand the necessary institutional configuration of the non-growing economy only by an improved understanding of the dynamics of growth and capital accumulation, because it is here that the inherent tendencies to stagnate and the resolution to stagnation are found.

Only econ collapse solves in the necessary timeframe

Abramsky 10 (Koyla, visiting fellow at the Institute of Advanced Studies in Science, Technology and Society; fmr. coordinator of the Danish-based World Wind Energy Institute, Racing to "Save" the Economy and the Planet: Capitalist or Post capitalist Transition to a Post-petrol World?, in Sparking A Worldwide Energy Revolution, ed. Koyla Abramsky, pg. 7)

The stark reality is that the only two recent periods that have seen a major reduction in global CO2 emissions both occurred in periods of very sudden, rapid, socially disruptive, and painful periods of forced economic degrowth-namely the breakdown of the Soviet bloc and the current financial-economic crisis. Strikingly, in May 2009, the International Energy Agency reported that, for the first time since 1945, global demand for electricity was expected to fall. Experience has town that a lot of time and political energy have been virtually wasted on developing a highly-ineffective regulatory framework to tackle climate change. Years of COPs and MOPs-the international basis for regulatory efforts have simply proven to be hot am And, not surprisingly, hot air has resulted in global warming. **Only unintended degrowth** has had the effect that years of intentional regulations sought to achieve. Yet, the dominant approaches to-climate change continue to focus on promoting regulatory reforms, rather than on more fundamental changes in social relations. This is true for governments, multilateral institutions, and also large sectors of so-called 'civil society:' especially the major national and international trade unions and their federations, and NOOs. And despite the patent inadequacy of this approach, regulatory efforts will certainly continue to be pursued. Furthermore, they may well **contribute to shoring up legitimacy**, at least in the short term, and in certain predominantly-northern countries where the effects Of climate changes are less immediately visible and impact on pepplds lives less directly. Nonetheless, it is becoming increasingly clear that solutions will not be found at this level.

The impact is linear – the greater growth, the quicker extinction happens. It magnifies all impacts and social problems

Pradanos 15 (Luis Pradanos, writer and Assistant Professor of Spanish at Miami University, "An economy focused solely on growth is environmentally and socially unsustainable", 4/7/2015, The Conversation, http://theconversation.com/an-economy-focused-solely-on-growth-is-environmentally-and-socially-unsustainable-39761)

Most world leaders seem to believe that economic growth is a panacea for many of society's problems. Yet there are many links between our society's addiction to economic growth, the disturbing ecological crisis, the rapid rise of social inequality and the decline in the quality of democracy. These issues tend to be explored as disconnected topics and often misinterpreted or manipulated to match given ideological preconceptions and prejudices. The fact is that they are deeply interconnected processes. A large body of data and research has emerged in the last decade to illuminate such connections. Studies in social sciences consistently show that, in rich countries, greater economic growth on its own does very little or nothing at all to enhance social well-being. On the contrary, reducing income inequality is an effective way to resolve social problems such as violence, criminality, imprisonment rates, obesity and mental illness, as well as to improve children's educational performance, population life expectancy, and social levels of trust and mobility. Comparative studies have found that societies that are more equal do much better in all the aforementioned areas than more unequal ones, independent of their gross

domestic product (GDP). Economist Thomas Piketty, in his recent book Capital in the Twenty-First Century, has assembled extensive data that shows how unchecked capitalism historically tends to increase inequality and undermine democratic practices. The focus of a successful social policy, therefore, should be to reduce inequality, not to grow the GDP for its own sake. Placing economic growth above all else contributes to environmental degradation and social inequality. Concurrently, recent developments in earth system science are telling us that our frenetic economic activity has already transgressed several ecological planetary boundaries. One could argue that the degradation of our environmental systems will jeopardize socioeconomic stability and worldwide well-being. Some scientists suggest that we are in a new geological epoch, the Anthropocene, in which human activity is transforming the earth system in ways that may compromise human civilization as we know it. Many reports insist that, if current trends continue, humanity will soon face dire and dramatic consequences. If we consider all these findings as a whole, a consistent picture emerges, and the faster the global economy grows, the faster the living systems of the planet collapse. In addition, this growth increases inequality and undermines democracy, multiplying the number of social problems that erode human communities. In a nutshell, we have created a dysfunctional economic system that, when it works according to its self-imposed mandate of growing the pace of production and consumption, destroys the ecological systems upon which it depends. And when it does not grow, it becomes socially unsustainable. In a game with these rules, there is no way to win!

Decoupling means US isn't key to the global economy

Bloomberg 10 ["Wall Street Sees World Economy Decoupling From U.S.", October 4th, 2010, http://www.bloomberg.com/news/2010-10-03/world-economy-decoupling-from-u-s-in-slowdown-returns-as-wall-street-view.html, Chetan]

The main reason for the divergence: "Direct transmission from a U.S. slowdown to other economies through exports is just not large enough to spread a U.S. demand problem globally," Goldman Sachs economists Dominic Wilson and Stacy Carlson wrote in a Sept. 22 report entitled "If the U.S. sneezes..." Limited Exposure Take the so-called BRIC countries of Brazil, Russia, India and China. While exports account for almost 20 percent of their gross domestic product, sales to the U.S. compose less than 5 percent of GDP, according to their estimates. That means even if U.S. growth slowed 2 percent, the drag on these four countries would be about 0.1 percentage point, the economists reckon. Developed economies including the U.K., Germany and Japan also have limited exposure, they said. Economies outside the U.S. have room to grow that the U.S. doesn't, partly because of its outsized slump in house prices, Wilson and Carlson said. The drop of almost 35 percent is more than twice as large as the worst declines in the rest of the Group of 10 industrial nations, they found. The risk to the decoupling wager is a repeat of 2008, when the U.S. property bubble burst and then morphed into a global credit and banking shock that ricocheted around the world. For now, Goldman Sachs's index of U.S. financial conditions signals that bond and stock markets aren't stressed by the U.S. outlook. Weaker Dollar The break with the U.S. will be reflected in a weaker dollar, with the Chinese yuan appreciating to 6.49 per dollar in a year from 6.685 on Oct. 1, according to Goldman Sachs forecasts. The bank is also betting that yields on U.S. 10-year debt will be lower by June than equivalent yields for Germany, the U.K., Canada, Australia and Norway. U.S. notes will rise to 2.8 percent from 2.52 percent, Germany's will increase to 3 percent from 2.3 percent and Canada's will grow to 3.8 percent

from 2.76 percent on Oct. 1, Goldman Sachs projects. Goldman Sachs isn't alone in making the case for decoupling. Harris at BofA Merrill Lynch said he didn't buy the argument prior to the financial crisis. Now he believes global growth is strong enough to offer a "handkerchief" to the U.S. as it suffers a "growth recession" of weak expansion and rising unemployment, he said. Giving him confidence is his calculation that the U.S. share of global GDP has shrunk to about 24 percent from 31 percent in 2000. He also notes that, unlike the U.S., many countries avoided asset bubbles, kept their banking systems sound and improved their trade and budget positions. Economic Locomotives A book published last week by the World Bank backs him up. "The Day After Tomorrow" concludes that developing nations aren't only decoupling, they also are undergoing a "switchover" that will make them such locomotives for the world economy, they can help rescue advanced nations. Among the reasons for the revolution are greater trade between emerging markets, the rise of the middle class and higher commodity prices, the book said. Investors are signaling they agree. The U.S. has fallen behind Brazil, China and India as the preferred place to invest, according to a quarterly survey conducted last month of 1,408 investors, analysts and traders who subscribe to Bloomberg. Emerging markets also attracted more money from share offerings than industrialized nations last quarter for the first time in at least a decade, Bloomberg data show. Room to Ease Indonesia, India, China and Poland are the developing economies least vulnerable to a U.S. slowdown, according to a Sept. 14 study based on trade ties by HSBC Holdings Plc economists. China, Russia and Brazil also are among nations with more room than industrial countries to ease policies if a U.S. slowdown does weigh on their growth, according to a policy- flexibility index designed by the economists, who include New York-based Pablo Goldberg. "Emerging economies kept their powder relatively dry, and are, for the most part, in a position where they could act countercyclically if needed," the HSBC group said. Links to developing countries are helping insulate some companies against U.S. weakness. Swiss watch manufacturer Swatch Group AG and tire maker Nokian Renkaat of Finland are among the European businesses that should benefit from trade with nations such as Russia and China where consumer demand is growing, according to BlackRock Inc. portfolio manager Alister Hibbert. "There's a lot of life in the global economy," Hibbert, said at a Sept. 8 presentation to reporters in London.

No impact—statistics prove

Drezner 12 – Daniel is a professor in the Fletcher School of Law and Diplomacy at Tufts. ("The Irony of Global Economic Governance: The System Worked", October 2012, http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf)

The final outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.37 Whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict, there were genuine concerns that the global economic downturn would lead to an increase in conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fuel impressions of surge in global public disorder. The **aggregate data suggests otherwise**, however. The Institute for Economics and Peace has constructed a "Global Peace Index" annually since 2007. A key conclusion they draw from the 2012 report is that "The average level of peacefulness in 2012 is approximately the same as it was in 2007."38 Interstate violence in particular has declined since the start of the financial

crisis – as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has **not triggered any increase in violent conflict**; the secular decline in violence that started with the end of the Cold War has not been reversed.39 Rogers Brubaker concludes, "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."40 None of these data suggest that the global economy is operating swimmingly. Growth remains unbalanced and fragile, and has clearly slowed in 2012. Transnational capital flows remain depressed compared to pre-crisis levels, primarily due to a drying up of cross-border interbank lending in Europe. Currency volatility remains an ongoing concern. Compared to the aftermath of other postwar recessions, growth in output, investment, and employment in the developed world have all lagged behind. But the Great Recession is not like other postwar recessions in either scope or kind; expecting a standard "V"-shaped recovery was unreasonable. One financial analyst characterized the post-2008 global economy as in a state of "contained depression."41 The key word is "contained," however. Given the severity, reach and depth of the 2008 financial crisis, the proper comparison is with Great Depression. And by that standard, the outcome variables look impressive. As Carmen Reinhart and Kenneth Rogoff concluded in This Time is Different: "that its macroeconomic outcome has been only the most severe global recession since World War II – and not even worse – must be regarded as fortunate."42

Internet Freedom

And US allies destroy i-freedom signal

Hanson 10/25/12, Nonresident Fellow, Foreign Policy, Brookings

Another challenge is dealing with close partners and allies who undermine internet freedom. In August 2011, in the midst of the Arab uprisings, the UK experienced a different connection technology infused movement, the London Riots. On August 11, in the heat of the crisis, Prime Minister Cameron told the House of Commons: Free flow of information can be used for good. But it can also be used for ill. So we are working with the police, the intelligence services and industry to look at whether it would be right to stop people communicating via these websites and services when we know they are plotting violence, disorder and criminality. This policy had far-reaching implications. As recently as January 2011, then President of Egypt, Hosni Mubarak, ordered the shut-down of Egypt's largest ISPs and the cell phone network, a move the United States had heavily criticized. Now the UK was contemplating the same move and threatening to create a rationale for authoritarian governments everywhere to shut down communications networks when they threatened "violence, disorder and criminality." Other allies like Australia are also pursuing restrictive internet policies. As OpenNet reported it: "Australia maintains some of the most restrictive Internet policies of any Western country…" When these allies pursue policies so clearly at odds with the U.S. internet freedom agenda, several difficulties arise. It undermines the U.S. position that an open and free internet is something free societies naturally want. It also gives repressive authoritarian governments an excuse for their own monitoring and filtering activities. To an extent, U.S. internet freedom policy responds even-handedly to this challenge because the vast bulk of its grants are for open source circumvention tools that can be

just as readily used by someone in London as Beijing, but so far, the United States has been much more discreet about criticising the restrictive policies of allies than authoritarian states.

Even absent data localization private companies will voluntarily self-censor – nominal internet freedom is irrelevant

Morozov 11 (Evgeny Morozov, visting scholar at Stanford University, Schwartz Fellow at the New America Foundation, 2011, "The Net Delusion," ch. 8)

What is clear is that, contrary to the expectations of many Western policymakers, **Facebook is hardly ideal for promoting democracy; its own logic, driven by profits or ignorance of the increasingly global context in which it operates, is, at times, extremely antidemocratic.** Were Kafka to pen his novel The Trial—in which the protagonist is arrested and tried for reasons that are never explained to him—today, El Ghazzali's case could certainly serve as inspiration. That much of digital activism is mediated by commercial intermediaries who operate on similar Kafkaesque principles is cause for concern, if only because it introduces too much unnecessary uncertainty into the activist chain, imagine that El Ghazzali's group was planning a public protest on the very day that its page got deleted: The protest could have easily been derailed. Until there is complete certainty that a Facebook group won't be removed at the most unfortunate moment, many dissident groups will shy away from making it their primary channel of communication. In reality, there is no reason why Facebook should even bother with defending freedom of expression in Morocco, which is not an appealing market to its advertisers, and even if it were, it would surely be much easier to make money there without crossing swords with the country's rulers. We do not know how heavily Facebook polices sensitive political activity on its site, but we do know of many cases similar to El Ghazzali s. In February 2010, for example, Facebook was heavily criticized by its critics in Asia for removing the pages of a group with 84,298 members that had been formed to oppose the Democratic Alliance for the Betterment and Progress of Hong Kong, the pro-establishment and pro-Beijing party. According to the group's administrator, the ban was triggered by opponents flagging the group as "abusive" on Facebook. This was not the first time that Facebook constrained the work of such groups. In the run-up to the Olympic torch relay passing through Hong Kong in 2008, it shut down several groups, while many pro-Tibetan activists had their accounts deactivated for "persistent misuse of the site." It's not just politics: Facebook is notoriously zealous in policing other types of content as well. In July 2010 it sent multiple warnings to an Australian jeweler for posting photos of her exquisite porcelain doll, which revealed the doll's nipples. Facebook's founders may be young, but they are apparently puritans. Many other intermediaries are not exactly unbending defenders of political expression either. Twitter has been accused of silencing online tribute to the 2008 Gaza War. Apple has been bashed for blocking Dalai Lama-related iPhone apps from its App Store for China (an application related to Rebiya Kadeer, the exiled leader of the Uighur minority, was banned as well). Google, which owns Orkut, a social network that is surprisingly popular in India, has been accused of being too zealous in removing potentially controversial content that may be interpreted as calling for religious and ethnic violence against both Hindus and Muslims. Moreover, a 2009 study found that Microsoft has been censoring what users in the United Arab Emirates, Syria, Algeria, and Jordan could find through its Bing search engine much more heavily than the governments of those countries.

Solvency

Also permanent are National Security Letters or NSLs, which allow the FBI to obtain a more limited range of telecommunications and financial records without even needing to seek judicial approval. Unsurprisingly, the government loves these streamlined tools, and used them so promiscuously that the FBI didn't even bother using 215 for more than a year after the passage of the Patriot Act. Inspector General reports have also made clear that the **FBI is happy to substitute NSLs for 215 orders** when even the highly accommodating FISC manages a rare display of backbone. In at least one case, when the secret court refused an application for journalists' records on First Amendment grounds, the Bureau turned around and **obtained the same data** using National Security Letters.

Two months later, many of the same companies and organizations issued another letter supporting surveillance transparency legislation proposed by Senator Al Franken (D-MN) and Representative Zoe Lofgren (D-CA) that would have implemented many of the original letter's recommendations.334 Elements of both bills, consistent with the coalition's recommendations, were included in the original version of the USA FREEDOM Act introduced in the House and the Senate—as were new strong transparency provisions requiring the FISA court to declassify key legal opinions to better educate the public and policymakers about how it is interpreting and implementing the law. Such strong new transparency requirements are consistent with several recommendations of the President's Review Group335 and would help address concerns about lack of transparency raised by the UN High Commissioner for Human Rights.336

T-Domestic

Interpretation – Domestic surveillance deals with communication inside the US

HRC 14 (Human Rights Council 2014, IMUNC2014, https://imunc.files.wordpress.com/2014/05/hrc-study-guide.pdf)
Domestic surveillance: Involves the monitoring, interception, collection, analysis, use, preservation, retention of, interference with, or access to **information that includes, reflects, or arises from or a person's communications in the past, present or future with or without their consent or choice, existing or occurring inside a particular country.**

Violation – the affirmative limits the scope of foreign intelligence collection under section 702 of FISA, which is distinct from domestic surveillance

McCarthy 6 (Andrew, former assistant U.S. attorney, now contributing editor of National Review and a senior fellow at the National Review Institute, National Review It's Not "Domestic Spying"; It's Foreign Intelligence Collection, May 15, 2006, http://www.nationalreview.com/corner/122556/its-not-domestic-spying-its-foreign-intelligence-collection-andrew-c-mccarthy)

Eggen also continues the mainstream media's propagandistic use of the term "domestic surveillance [or 'spying'] program." In actuality, the electronic surveillance that the NSA is doing — i.e., eavesdropping on content of conversations — is not "domestic." **A call is not considered "domestic" just because one party to it happens to be inside the U.S., just as an investigation is not "domestic" just because some of the subjects of interest happen to reside inside our country.** Mohammed Atta was an agent of a foreign power, al Qaeda. Surveilling him — had we done it — would not have been "domestic spying." **The calls NSA eavesdrops on are "international," not "domestic." If that were not plain enough on its face, the Supreme Court made it explicit in the Keith case** (1972). There, even though it held that judicial warrants were required for wiretapping purely domestic terror organizations**, the Court excluded investigations of threats posed by foreign organizations and their agents operating both within and without the U.S.** That is, the Court understood what most Americans understand but what the media, civil libertarians and many members of Congress refuse to acknowledge: **if we are investigating the activities of agents of foreign powers inside the United States, that is not DOMESTIC surveillance. It is FOREIGN counter-intelligence.** That, in part, is why the statute regulating wiretaps on foreign powers operating within the U.S. — the one the media has suddenly decided it loves after bad-mouthing it for years as a rubber-stamp — is called the FOREIGN Intelligence Surveillance Act (FISA). **The United States has never needed court permission to conduct wiretapping outside U.S. territory; the wiretapping it does inside U.S. territory for national security purposes is FOREIGN INTELLIGENCE COLLECTION, not "domestic surveillance."**

Plan: The United States federal government should limit the scope of its domestic surveillance under Section 702 of the Foreign Intelligence Surveillance Act to communications whose sender or recipient is a valid intelligence target and whose targets pose a threat to national security.

Tangible threat requires facts of danger

Supreme Court of Georgia 6 ("Decatur County v. Bainbridge Post Searchlight", SUPREME COURT OF GEORGIA, Fulton County D. Rep. 2191, July 6, 2006, Lexis)

In our litigious society, a governmental agency always faces some threat of suit. To construe the term "potential litigation" to include an unrealized or idle threat of litigation would seriously undermine the purpose of the Act. Such a construction is overly broad. HN4Go to this Headnote in the case. Construing OCGA § 50-14-2 (1) narrowly, we hold that a meeting may not be closed to discuss potential litigation under the attorney-client exception unless the governmental entity can show a realistic and **tangible threat** of legal action against it or its officer[s] or employee[s], **a threat that goes beyond a mere fear or suspicion** of being sued. A realistic and **tangible threat** of litigation is one that **can be characterized with reference to objective factors** which may include, but which are not limited to, (1) a formal demand letter or some comparable writing that presents the party's claim and manifests a solemn intent to sue, [cit.]; (2) previous or pre-existing litigation between the parties or proof of ongoing litigation concerning similar claims, [cit.]; or (3) proof that a party has both retained counsel with respect to the claim at issue and has expressed an intent to sue, [cit.] This list is not intended to be exhaustive but merely illustrative of circumstances that a trial court may consider, in the exercise of its discretion, that take the threat of litigation out of the realm of "remote and speculative" and into the realm of "realistic and tangible."

NSA surveillance on real and fake treats have thwarted terrorism

Sterman et al 14 (David, a program associate at New America and holds a master's degree from Georgetown's Center for Security Studies, gis work focuses on homegrown extremism and the maintenance of New America's datasets on terrorism inside the United States and the relative roles of NSA surveillance and traditional investigative tools in preventing such terrorism, Emily Schneider, senior program associate for the International Security Program at New America, Peter Bergen, Vice President, Director of Studies, Director, International Security, Future of War, and Fellows Programs, "DO NSA'S BULK SURVEILLANCE PROGRAMS STOP TERRORISTS?", January 13th 2014, https://www.newamerica.org/international-security/do-nsas-bulk-surveillance-programs-stop-terrorists/)

On June 5, 2013, the Guardian broke the first story in what would become a flood of revelations regarding the extent and nature of the NSA's surveillance programs. Facing an uproar over the threat such programs posed to privacy, the Obama administration scrambled to defend them as legal and essential to U.S. national security and counterterrorism. Two weeks after the first leaks by former NSA contractor Edward Snowden were published, **President Obama defended the NSA surveillance programs during a visit to Berlin, saying: "We know of at least 50 threats that have been averted** because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved." Gen. Keith Alexander, the director of the NSA, testified before Congress that: "**the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50 potential**

terrorist events in more than 20 countries around the world." Rep. Mike Rogers (R-Mich.), chairman of the House Permanent Select Committee on Intelligence, said on the House floor in July that "**54 times [the NSA programs] stopped and thwarted terrorist attacks** both here and in Europe – saving real lives."

Broad NSA access to US data is crucial to preventing terrorist attacks in the US – their authors vastly underestimate the probability of attack. You need to evaluate link through a very high probability of attempted attack

Lewis 14 (James, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, Underestimating Risk in the Surveillance Debate, http://csis.org/files/publication/141209_-Lewis_UnderestimatingRisk_Web.pdf)

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) almost every year since 9/11. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia's then-attorney general said in August 2013 that communications surveillance had stopped four "mass casualty events" since 2008. **The constant planning and preparation for attack by terrorist groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm.** The Evolution of Privacy Some of the unhappiness created by the Edward Snowden leaks reflects the unspoken recognition that online privacy has changed irrevocably. The precipitous decline in privacy since the Internet was commercialized is the elephant in the room we ignore in the surveillance debate. America's privacy laws are both limited in scope and out of date. Although a majority of Americans believe privacy laws are inadequate, the surveillance debate has not led to a useful discussion of privacy in the context of changed technologies and consumer preferences. Technology is more intrusive as companies pursue revenue growth by harvesting user data. Tracking online behavior is a preferred business model. On average, there are 16 hidden tracking programs on every website. The growing market for "big data" to predict consumer behavior and target advertising will further change privacy. Judging by their behavior, Internet users are willing to exchange private data for online services. A survey in a major European country found a majority of Internet users disapproved of Google out of privacy concerns, but more than 80 percent used Google as their search engine. The disconnect between consumer statements and behavior reduces the chances of legislating better protections. We have global rules for finance and air travel, and it is time to create rules for privacy, but governments alone cannot set these rules, nor can a single region impose them. Rules also need to be reciprocal. NSA bears the brunt of criticism, but its actions are far from unique. All nations conduct some kind of communications surveillance on their own populations, and many collect against foreign targets. Getting this consensus will be difficult. There is no international consensus on privacy and data protection. EU efforts to legislate for the entire world ignore broad cultural differences in attitudes toward privacy, and previous EU privacy rules likely harmed European companies' ability to innovate. Finding a balance between privacy, security, and innovation will not be easy since unconstrained collection creates serious concerns while a toorestrictive approach threatens real economic harm. Espionage and Counterterrorism NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is

portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this. **Spying on Allies NSA's mass surveillance programs for counterterrorism were carried out in cooperation with more than 30 countries.** Unilateral U.S. collection programs focused on national security problems: nonproliferation, counterintelligence (including Russian covert influence operations in Europe), and arms sales to China. The United States failed to exercise sufficient oversight over intelligence collection, but the objectives set for NSA reflect real security problems for the United States and its allies. The notion that "friends don't spy on friends" is naive. The United States has friends that routinely spy on it and yet are strong security partners. Relations among powerful states are complex and not explained by simple bromides drawn from personal life. The most startling thing about U.S. espionage against Germany was the absence of a strategic calculation of risk and benefit. There are grounds for espionage (what other major power has a former leader on Russia's payroll?), but the benefits were outweighed by the risk to the relationship. The case for spying on Brazil is even weaker. While Brazil is often antagonistic, it poses no risk to national security. If economic intelligence on Brazil is needed, the private sector has powerful incentives and legitimate means to obtain information and usually has the best data. Risk Is Not Going Away **Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity,** often in cooperation with other countries, including the United States. Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, **the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.**

NSA mass surveillance is critical – we're drawing down in every other area of intelligence gathering which means it's essential to preventing terrorism

Wittes 14 (Benjamin, Senior Fellow @ the Brookings Institute, "Is Al Qaeda Winning: Grading the Administration's Counter terrorism Policy", April 8th 2014 Brookings Institute)

As I said at the outset of this statement, the question of intelligence collection under Section 702 of the FAA may seem connected to the AUMF's future in only the most distant fashion. In fact, **the connection between intelligence collection authorities and the underlying regime authorizing the conflict itself is a critical one. Good intelligence is key to any armed conflict and good technical intelligence is a huge U.S. strength in the fight against Al Qaeda.** Yet ironically, the more one attempts to narrow the conflict, the more important technical intelligence becomes. The fewer boots on the ground we have in Afghanistan, for example, the greater our reliance will become on technical collection. The more we rely on drone strikes, rather than large troop movements, in areas where we lack large human networks, the more we rely on technical intelligence. Particularly if one imagines staying on offense against a metastasizing Al Qaeda in the context of a withdrawal from Afghanistan and a narrowing—or a formal end—of the AUMF conflict, the burden on technical intelligence collection to keep us in the game will be huge even ignoring the many other foreign intelligence and national security interests Section 702 surveillance supports.¶ **Section 702** is a complicated statute, and it is only one part of a far more complicated, larger statutory arrangement. But broadly speaking, it **permits the NSA to acquire without an individualized warrant the communications of non-US persons reasonably believed to be overseas when those communications are transiting the United States or stored in the United States. Under these circumstances, the NSA can order production of such communications from telecommunications carriers and internet companies under broad programmatic orders issued by the Foreign Intelligence Surveillance Court (FISC), which reviews both targeting and minimization procedures under which the collection then takes place.** Oversight is thick, both within the executive branch, and in reporting requirements to the congressional intelligence

committees.¶ Make no mistake: **Section 702 is a very big deal in America's counterterrorism arsenal**. It is far more important than the much debated bulk metadata program, which involves a few hundred queries a year. **Section 702 collection, by contrast, is vast, a hugely significant component not only of contemporary counterterrorism but of foreign intelligence collection** more generally. In 2012, the Senate Select Committee on Intelligence wrote that "[T]he authorities provided [under section 702] have greatly increased the government's ability to collect information and act quickly against important foreign intelligence targets. . . . [**The] failure to reauthorize [section 702] would 'result in a loss of significant intelligence and impede the ability of the Intelligence Community to respond quickly to new threats and intelligence opportunities.'"[8] The President's Review Group** on Intelligence and Communications Technologies, after quoting this language, **wrote that "Our own review is not inconsistent with this assessment. . . . [W]e are persuaded that section 702 does in fact play an important role in the nation's effort to prevent terrorist attacks across the globe."[9] The Washington Post has reported that 702 was in 2012 the single most prolific contributor to the President's Daily Brief.[10]**

Increasing transparency alerts terrorists of NSA tactics – increases the risk of cyberterrorism

De 14 (Rajesh,General Counsel, National Security Agency, "The NSA and Accountability in an Era of Big Data", JOURNAL OF NATIONAL SECURITY LAW & POLICY, May 8th 2014,p.4, http://jnslp.com/wp-content/uploads/2014/05/The-NSA-and-Accountability-in-an-Era-of-Big-Data.pdf)

Perhaps the most alarming trend is that the digital communications infrastructure is increasingly also becoming the domain for foreign threat activity. In other words, it is no longer just a question of "collecting" or even "connecting" the dots in order to assess foreign threats amidst more and more digital noise, it is also a question of determining which of the so-called "dots" may constitute the threat itself. As President Obama has recognized, "the cyber threat to our nation is one of the most serious economic and national security challenges we face." Many of us read in the papers every day about cyber-attacks on commercial entities. Hackers come in all shapes and sizes, from foreign government actors, to criminal syndicates, to lone individuals. But as former Secretary of Defense Leon Panetta warned a few months ago, "the greater danger facing us in cyberspace goes beyond crime and it goes beyond harassment. A cyber-attack perpetrated by nation states or violent extremist groups **could be as destructive as the terrorist attack on 9/11**." And as the President warned in his recent State of the Union address, **we know that our enemies are "seeking the ability to sabotage our power grid, our financial institutions, our air-traffic control systems." We also have seen a disturbing trend in the evolution of the cyber threat** around the world. As General Keith Alexander, the Director of NSA, describes it, **the trend is one from "exploitation" to "disruption" to "destruction."** In fundamental terms, the cyber threat has evolved far beyond simply stealing – the stealing of personal or proprietary information, for example-to include more disruptive activity, such as distributed denial of service attacks that may temporarily degrade websites; and more alarmingly, we now see an evolution toward truly destructive activity. Secretary Panetta, for example, recently discussed what he described as "probably the most destructive attack the private sector has seen to date" – a computer virus used to infect computers in the Saudi Arabian State Oil Company Aramco in mid-2012, which virtually destroyed 30,000 computers. *** Within this context, big data presents opportunities and challenges for the government and the private sector. Improving our ability to gain insights from large and complex collections of data holds the promise of accelerating progress across a

range of fields from health care to earth science to biomedical research. But perhaps nowhere are the challenges and opportunities of big data as stark as in the national security field, where the stakes are so high – both in terms of the threats we seek to defeat, and of the liberties we simultaneously seek to preserve. This reality is readily apparent in the evolving and dynamic cyber environment, and perhaps no more so than for an agency at the crossroads of the intelligence and the defense communities, like NSA. Of course, **NSA must necessarily operate in a manner that protects its sources and methods from public view.** If a person being investigated by the FBI learns that his home phone is subject to a wiretap, common sense tells us that he will not use that telephone any longer. The same is true for NSA**. If our adversaries know what NSA is doing and how it is doing it – or even what NSA is not doing and why it is not doing it – they could well find ways to evade surveillance, to obscure themselves and their activities, or to manipulate anticipated action or inaction by the U.S. government. In sum, they could more readily use the ocean of big data to their advantage.**

Requiring individualized determinations for targets creates a massive bureaucratic drain, disturbing investigations

Cordero 15 (Carrie, Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform)

1. "End Programmatic Surveillance"…"or If Programmatic Surveillance Continues, Reform It" One of the major criticisms of the government's use of FISA to emerge in the recent debate is that the Court has shifted from approving individual surveillance or search requests directed at a particular agent of a foreign power or foreign power, to a practice of approving "programmatic" requests for collection authority. The criticism is a repudiation of not only the bulk telephone metadata program, but also of section 702 of FISA, which was added to the Act in 2008. Section 702 authorizes the Director of National Intelligence and the Attorney General to issue directives to communications service providers under a set of procedures and certifications that have been approved by FISC. Referring to the collection authorized by Section 702 as "programmatic" can lead to misunderstanding. **Acquisition under section 702 is programmatic in the sense that the Court approves rules and procedures by which the acquisition takes place. The Court does not, under section 702, make a substantive finding about a particular target. It does not approve individual requests for collection. Instead, the FISC approves the rules and procedures, and then intelligence community personnel abide by a decision-making process in which there are actual intended targets of acquisition**. In his February 4, 2015 remarks at Brookings, ODNI General Counsel Bob Litt described it this way: "Contrary to some claims, **this [section 702 collection] is not bulk collection; all of the collection is based on identifiers**, such as telephone numbers or email addresses, **that we have reason to believe are being used by non-U.S. persons** abroad to communicate or receive foreign intelligence information." Regardless of the characterization, however, it is correct to say that **section 702 allows the intelligence community, not the Court, to make the substantive determination about what targets to collect against. Those decisions are made consistent with intelligence community leadership and policymaker strategic priorities**, which Litt also discussed in his February 4th remarks. **Targets are selected based on their anticipated or demonstrated foreign intelligence value**. And targeting decisions are subject to continuous oversight by compliance, legal and civil liberties protection authorities internal to NSA, and external at the Office of the Director of National Intelligence and the Department of Justice. The question, then, is why was the change needed in 2008? And, if the Brennan Center's recommendation were accepted, what would be the alternatives? What follows is a shorthand answer to the first question (which I previously addressed here): basically, the change was needed because the pre-2008 definitions in FISA technically required that the government obtain a probable-cause based order from the Court in order to collect the communications of Terrorist A in Afghanistan with Terrorist B in Iraq. This was a problem for at least two reasons: one, as non-U.S. persons outside the United States, Terrorist A and Terrorist B are not entitled to Constitutional protections; and two, **the**

bureaucratic manpower it took to supply and check facts, prepare applications and present these matters to the Court were substantial. As a result, only a subset of targets who may have been worth covering for foreign intelligence purposes were able to be covered. This is an extremely condensed version of the justification for 702 and does not cover additional reasons that 702 was sought. But, from my perspective, **it is the bottom line**, and one **that cannot be overlooked when suggestions are made to scale back 702 authority.**

Section 702 has empirically been used to stop terrorist attacks

Young 14 (Mark, President and General Counsel of Ronin Analytics, LLC. and former NSA senior leader, "National Insecurity: The Impacts of Illegal Disclosures of Classified Information", I/S: A Journal of Law and Policy for the Information Society, 2014, http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Young-Article.pdf)

The Deputy Attorney General has noted that the Federal Bureau of Investigation benefited from NSA's Section 702 collection in the fall of 2009. **Using Section 702 collection** and "while monitoring the activities of Al Qaeda terrorists in Pakistan, **the** National Security Agency **(NSA) noted contact from an individual in the U.S. that the** Federal Bureau of Investigation **(FBI)** subsequently **identified as Colorado-based Najibulla Zazi. The U.S. Intelligence Community, including the FBI and NSA, worked in concert to determine his relationship with Al Qaeda, as well as identify any foreign or domestic terrorist links**."44 "The FBI tracked Zazi as he traveled to New York to meet with co-conspirators, where they were planning to conduct a terrorist attack. **Zazi and his co-conspirators were subsequently arrested**. Zazi, upon indictment, **pled guilty to conspiring to bomb the NYC subway system. Compelled collection (authorized under Foreign Intelligence Surveillance Act, FISA, Section 702) against foreign terrorists was critical to the discovery and disruption of this threat against the U.S."**45 Regardless of the accuracy of the information released by Snowden, the types of programs described by the material contribute to national security and its release, regardless of its validity, will negatively impact US security.

Limiting section 702 means probable cause requirements would be applied to foreign investigations

Cordero 15 (Carrie, Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform)

Which brings us to the second question I posed above—what are the alternatives if Section 702 authority, were, as the Brennan Center recommends, repealed? **One option is to revert to the pre-2008 practice: obtaining Court approval based on probable cause for non-U.S. persons located outside the United States**. **The operational result would be to forego collection on legitimate targets of foreign intelligence collection, thereby potentially losing insight on important national security threats**. Given the challenging and complex national security picture the United States faces today, I would think that most responsible leaders and policymakers would say, "no thanks" to that option. A second option would be to conduct the acquisition, but without FISC supervision. This would be a perverse outcome of the surveillance debate. It is also, probably, in the current environment, not possible as a practical matter, because an additional reason **702 was needed was to be able to serve lawful process, under a statutory framework, on communications service providers, in order to effectuate the collection. In light of these options: collect less information pertaining to important**

foreign intelligence targets, or, collect it without statutory grounding (including Congressional oversight requirements) **and judicial supervision, the collection framework established under 702 looks pretty good.**

Framing the economy in terms of security discourse leads states to implement unreliable policies, destroying the economic strength they attempt to preserve

Lipschutz 98 (Ronnie Lipschutz, PhD in Politics and Director at UC Santa Cruz, 1998, "On Security" p. 11-12, http://people.ucsc.edu/~rlipsch/index.html/A.Lipschutz%20VITA.11.pdf)

The ways in which the framing of threats is influenced by a changing global economy is seen nowhere more clearly than in recent debates over competitiveness and "economic security." What does it mean to be competitive? Is a national industrial policy consistent with global economic liberalization? How is the security component of this issue socially constructed? Beverly **Crawford** (Chapter 6: "Hawks, Doves, but no Owls: The New Security Dilemma Under International Economic Interdependence") **shows how strategic economic interdependence**--a consequence of the growing liberalization of the global economic system, the increasing availability of advanced technologies through commercial markets, and the ever-increasing velocity of the product cycle--**undermines the ability of states to control those technologies that, it is often argued, are critical to economic strength and military might. Not only can others acquire these technologies, they might also seek to restrict access to them. Both contingencies could be threatening.** (Note, however, that by and large the only such restrictions that *have* been imposed in recent years have all come at the behest of the United States, which is most fearful of its supposed vulnerability in this respect.) **What, then, is the solution to this "new security dilemma,"** as Crawford has stylized it? According to Crawford**, state decisionmakers can respond in three ways. First, they can try to restore state autonomy through self-reliance although, in doing so, they are likely to undermine state strength via reduced competitiveness. Second, they can try to restrict technology transfer to potential enemies, or the trading partners of potential enemies**, although this begins to include pretty much everybody. **It also threatens to limit the market shares of those corporations that produce the most innovative technologies. Finally, they can enter into co-production projects or encourage strategic alliances among firms. The former approach may slow down technological development; the latter places control in the hands of actors who are driven by market, and not military, forces. They are, therefore, potentially unreliable. All else being equal, in all three cases, the state appears to be a net loser where its security is concerned.** But this does not prevent the state from trying to gain.

Limiting surveillance to resolve the fear of apocalypse creates an endless cycle of violence and governmentality

Coviello 2K (Peter, Professor of English and Acting Program Director of Africana Studies – Bowdoin College, Queer Frontiers, p. 40-41, https://books.google.com/books/about/Queer_frontiers.html?id=GR4bAAAAYAAJ)

Perhaps. But to claim that American culture is at present decisively postnuclear is not to say that the world we inhabit is in any way postapocalyptic. Apocalypse, as I began by saying, changed-it did not go away. And here I want to hazard my second assertion**: if, in the nuclear age of yesteryear, apocalypse signified an event threatening**

everyone and everything with (in Jacques Derrida's suitably menacing phrase) `remainderless and a-symbolic **destruction,"**6 **then in the postnuclear world apocalypse is an affair whose parameters are definitively local**. In shape and in substance, **apocalypse is defined now by the affliction it brings somewhere else, always to an "other" people whose very presence might then be written as a kind of dangerous contagion, threatening the safety and prosperity of a cherished "general population:'** This fact seems to me to stand behind Susan Sontag's incisive observation, from 1989, that, "**Apocalypse is now a long-running serial: not `Apocalypse Now' but 'Apocalypse from Now On."'"** The decisive point here in the perpetuation of the threat of apocalypse (the point Sontag goes on, at length, to miss) is that **apocalypse is ever present because, as an element in a vast economy of power, it is ever useful. That is, through the perpetual threat of destruction-through the constant reproduction of the figure of apocalypse-agencies of power ensure their authority to act on and through the bodies of a particular population**. No one turns this point more persuasively than Michel Foucault, who in the final chapter of his first volume of The History of Sexuality addresses himself to the problem of a power that is less repressive than productive, less life-threatening than, in his words, "life-administering:' Power, he contends, "exerts a positive influence on life . . . [and] endeavors to administer, optimize, and multiply it, subjecting it to precise controls and comprehensive regulations:' In his brief comments on what he calls "the atomic situation;' however, Foucault insists as well that the productiveness of modern power must not be mistaken for a uniform repudiation of violent or even lethal means. For **as "managers of life and survival, of bodies and the race," agencies of modern power presume to act "on the behalf of the existence of everyone:' Whatsoever might be construed as a threat to life and survival in this way serves to authorize any expression of force, no matter how invasive or, indeed, potentially annihilating. "If genocide is indeed the dream of modern power;**' Foucault writes, "**this is not because of a recent return to the ancient right to kill; it is because power is situated and exercised at the level of life, the species, the race, and the large-scale phenomena of population:'8 For a state that would arm itself** not with the power to kill its population, but **with a more comprehensive power over the patterns and functioning of its collective life, the threat of an apocalyptic demise, nuclear or otherwise, seems a civic initiative that can scarcely be done without.**

Reject the affirmative's fear-drive politics-critical analysis of the politics of security and resultant militarism gives us a new political view to articulate a truly democratic politics---activating your role as an ethical educator is the only way to avoid war

Giroux 13 (Henry, Chair in English and Cultural Studies at McMaster University, Violence, USA, 2013, monthlyreview.org/2013/05/01/violence-usa)

In addition, as the state is hijacked by the financial-military-industrial complex, the "most crucial decisions regarding national policy are not made by representatives, but by the financial and military elites."**53 Such massive inequality and the suffering and political corruption it produces point to the need for critical analysis in which the separation of power and politics can be understood. This means developing terms that clarify how power becomes global even as politics continues to function largely at the national level**, with the effect of reducing the state primarily to custodial, policing, and punishing functions—at least for those populations considered disposable. The state exercises its slavish role in the form of lowering taxes for the rich, deregulating corporations, funding wars for the benefit of the defense industries, and devising other welfare services for the ultra-rich. There is no escaping the global politics of finance capital and the global network of violence it has produced. **Resistance must be mobilized globally and politics restored to a level where it can make a difference in fulfilling the promises of a global democracy. But such a challenge can only take place if the political is made more pedagogical and** matters **of education take center stage in the struggle for desires, subjectivities, and social relations that refuse the normalizing of violence** as a source of

gratification, entertainment, identity, and honor. **War** in its expanded incarnation **works in tandem with a state organized around the production of widespread violence. Such a state is necessarily divorced from public values and the formative cultures that make a democracy possible.** The result is a weakened civic culture that allows violence and punishment to circulate as part of a culture of commodification, entertainment, distraction, and exclusion. In opposing the emergence of the United States as both a warfare and a punishing state**, I am not appealing to a form of left moralism meant simply to mobilize outrage** and condemnation. These are not unimportant registers, but they do not constitute an adequate form of resistance. **What is needed are modes of analysis that do the hard work of uncovering the effects of the merging of** institutions of capital, wealth, and power, and how this merger has extended the reach of a **military-industrial-carceral and academic complex**, especially since the 1980s. **This complex of ideological and institutional elements designed for the production of violence must be addressed by making visible its** vast national and **global interests and militarized networks**, as indicated by the fact that the United States has over 1,000 military bases abroad.54 Equally important is the need to highlight how this military-industrial-carceral and academic complex uses punishment as a structuring force to shape national policy and everyday life. **Challenging the warfare state also has an important educational component**. C. Wright Mills was right in arguing that **it is impossible to separate the violence of an authoritarian social order from the cultural apparatuses that nourish it.** As Mills put it, the major cultural apparatuses not only "guide experience, they also expropriate the very chance to have an experience rightly called 'our own.'"55 This narrowing of experience shorn of public values locks people into private interests and the hyper-individualized orbits in which they live. Experience itself is now privatized, instrumentalized, commodified, and increasingly militarized. **Social responsibility gives way to organized infantilization and a flight from responsibility. Crucial here is the need to develop new cultural and political vocabularies that can foster an engaged mode of citizenship capable of naming the corporate and academic interests that support the warfare state and its apparatuses of violence, while simultaneously mobilizing social movements to challenge and dismantle its vast networks of power. One central pedagogical and political task in dismantling the warfare state is, therefore, the challenge of creating the cultural conditions and public spheres that would enable the U.S. public to move from being spectators of war and everyday violence to being informed and engaged citizens. Unfortunately, major cultural apparatuses like** public and **higher education**, which have been historically responsible for educating the public, **are becoming little more than market-driven and militarized knowledge factories**. In this particularly insidious role, **educational institutions deprive students of the capacities that would enable them not only to assume public responsibilities, but also to actively participate in the process of governing. Without the public spheres for creating a formative culture equipped to challenge the educational, military,** market, and religious **fundamentalisms that dominate U.S. society, it will be virtually impossible to resist the normalization of war as a matter of domestic and foreign policy. Any viable notion of resistance to the current authoritarian order must also address the issue of what it means pedagogically to imagine a more democratically oriented notion of knowledge, subjectivity, and agency and what it might mean to bring such notions into the public sphere**. This is more than what Bernard Harcourt calls "**a new grammar of political disobedience."56 It is a reconfiguring of the nature and substance of the political so that matters of pedagogy become central to the very definition of what constitutes the political and the practices that make it meaningful. Critical understanding motivates transformative action, and the affective investments it demands can only be brought about by breaking into the hardwired forms of common sense that give war and state-supported violence their legitimacy. War does not have to be a permanent social relation,** nor the primary organizing principle of everyday life, society, and foreign policy. The war of all-against-all and the social Darwinian imperative to respond positively only to one's own self-interest represent the death of politics, civic responsibility, and ethics, and set the stage for a dysfunctional democracy, if not an emergent authoritarianism. The existing neoliberal social order produces individuals who have no commitment, except to profit, disdain social responsibility, and loosen all ties to any viable notion of the public good. This regime of punishment and privatization is organized

around the **structuring forces of violence and militarization, which produce a surplus of fear, insecurity, and a weakened culture of civic engagement—one in which there is little room for reasoned debate, critical dialogue, and informed intellectual exchange**. Patricia Clough and Craig Willse are right in arguing that **we live in a society "in which the production and circulation of death functions as political and economic recovery."57 The** United States understood as a **warfare state prompts a new urgency for a collective politics and a social movement capable of negating the current regimes of political and economic power, while imagining a different and more democratic social order. Until the ideological and structural foundations of violence** that are pushing U.S. society over the abyss **are addressed, the current warfare state will be transformed into a full-blown authoritarian state that will shut down any vestige of democratic values, social relations, and public spheres. At the very least, the U.S. public owes it to its children and future generations, if not the future of democracy itself, to make visible and dismantle this machinery of violence** while also reclaiming the spirit of a future that works for life rather than death—the future of the current authoritarianism, however dressed up they appear in the spectacles of consumerism and celebrity culture. **It is time for educators**, unions, young people, liberals, religious organizations, and other groups **to connect the dots, educate themselves, and develop powerful social movements that can restructure the fundamental values and social relations of democracy while establishing the institutions and formative cultures that make it possible. Stanley Aronowitz is right in arguing that: the system survives on the eclipse of the radical imagination**, the absence of a viable political opposition with roots in the general population, **and the conformity of its intellectuals who, to a large extent, are subjugated by their secure berths in the academy** [and though] we can take some solace in 2011, the year of the protester…it would be premature to predict that decades of retreat, defeat and silence can be reversed overnight without a commitment to what may be termed "a long march" through the institutions, the workplaces and the streets of the capitalist metropoles.58 The current protests among young people, workers, the unemployed, students, and others are making clear that **this is not—indeed, cannot be—only a short-term project for reform, but must constitute a political and social movement of sustained growth, accompanied by the reclaiming of public spaces**, the progressive use of digital technologies**, the development of democratic public spheres, new modes of education, and the safeguarding of places where democratic expression, new identities, and collective hope can be nurtured and mobilized**. Without broad political and social movements standing behind and uniting the call on the part of young people for democratic transformations, any attempt at radical change will more than likely be cosmetic. **Any viable challenge to the new authoritarianism and its theater of cruelty and violence must include developing a variety of cultural discourses and sites where new modes of agency can be imagined and enacted, particularly as they work to reconfigure a new collective subject, modes of sociality, and "alternative conceptualizations of the self and its relationship to others."59 Clearly, if the United States is to make a claim to democracy, it must develop a politics that views violence as a moral monstrosity and war as virulent pathology.** How such a claim to politics unfolds remains to be seen. In the meantime, resistance proceeds, especially among the young people who now carry the banner of struggle against an encroaching authoritarianism that is working hard to snuff out all vestiges of democratic life.

2NC – Framework

Interp: The aff must defend the political implications of the plan as well as the epistemological and methodological groundings of the 1AC. The securitized ideology of the 1ac must be justified, before moving on to questions of policy.

Giroux says Debate is primarily an educational activity – the signal sent intellectually outweighs any specific policy proposal- our method is comparatively better than any roleplaying strategy- we must use pedagogical approaches to deconstruct the securitized logic. Only through critical analysis can we create a new political vocabulary that challenges the militarism of the squo

1. Education –

A) Real world – as intellectuals we can move thought in the direction of a new modernity that challenges securitization and the assumptions behind the plan – the same way that intellectuals during the Enlightenment contributed to a general shift in human thinking – if our vision of the world would result in less violence, you should vote for it.

B) Policy failure – if their assumptions continually result in data/error replication, there is no reason to use debate to train us to be advocates in that system – focusing on short-term problem solving instead of broader theoretical issues guarantees policy failure – that's Cuomo- we have to deal with the way war is woven into the fabric of life or else it will result in crisis politics that results in constant securitization – look at what happened after 9/11 and WW2

Security politics assures the constant reproduction of the very problems it seeks to eradicate

Dillon & Reid 00 (Michael, Senior Lecturer in Politics and International Relations at the University of Lancaster, & Julian, Lecturer in International Relations in the Department of War Studies at King's College London, Alternatives: Global, Local, Political, 25:1, Jan-Mar, "Global Governance, Liberal Peace, and Complex Emergency," http://www.jstor.org/stable/40644986?seq=1#page_scan_tab_contents)

More specifically, **where there is a policy problematic there is expertise, and where there is expertise there, too, a policy problematic will emerge**. Such problematics are detailed and elaborated in terms of discrete forms of knowledge as well as interlocking policy domains. **Policy domains reify the problematization of life in certain ways by turning these epistemically and politically contestable orderings of life into "problems" that require the continuous attention** of policy science and the continuous resolutions of policymakers. Policy "actors" develop and compete on the basis of the expertise that grows up around such problems or clusters of problems and their client populations. Here, too, we may also discover what might be called "epistemic entrepreneurs."

Albeit the market for discourse is prescribed and policed in ways that Foucault indicated, bidding to formulate novel problematizations they seek to "sell" these, or otherwise have them officially adopted. In principle, **there is no limit to the ways in which the management of population may be problematized**. All aspects of human conduct, any encounter with life, is problematizable. Any problematization is capable of becoming a policy problem. **Governmentality thereby creates a market for policy**, for science and for policy science, in which problematizations go looking for policy sponsors while policy sponsors fiercely compete on behalf of their favored problematizations.¶ Reproblematization of problems is constrained by the institutional and ideological investments surrounding accepted "problems," and by the sheer difficulty of challenging the inescapable ontological and epistemological assumptions that go into their very formation. There is nothing so fiercely contested as an epistemological or ontological assumption. And there is nothing so fiercely ridiculed as the suggestion that the real problem with problematizations exists precisely at the level of such assumptions. Such **"paralysis of analysis" is** precisely **what policymakers seek to avoid** since they are compelled constantly to respond to circumstances over which they ordinarily have in fact both more and less control than they proclaim. What they do not have is precisely the control that they want. **Yet serial policy failure--the fate and the fuel of all policy--compels them into a continuous search for the new analysis** that will extract them from the aporias in which they constantly find themselves enmeshed.[35]¶ **Serial policy failure is no simple shortcoming that** science and policy--and **policy science--will ultimately overcome. Serial policy failure is rooted in the ontological and epistemological assumptions that fashion the ways in which global governance encounters and problematizes life as a process** of emergence through fitness landscapes **that** constantly adaptive and **changing ensembles have continuously to negotiate. As a particular kind of intervention into life, global governance promotes the very changes and unintended outcomes that it then serially reproblematizes in terms of policy failure. Thus, global liberal governance is not a linear problem-solving process committed to the resolution of objective policy problems** simply by bringing better information and knowledge to bear upon them. A **nonlinear economy of power/knowledge, it deliberately installs socially specific and radically inequitable distributions of wealth, opportunity, and mortal danger both locally and globally through the very detailed ways in which life is variously (policy) problematized by it.¶ In consequence, thinking and acting politically is displaced by the institutional and epistemic rivalries that infuse its power/ knowledge networks, and by the local conditions of application that govern the introduction of their policies**. These now threaten to exhaust what "politics," locally as well as globally, is about.[36] It is here that the "emergence" characteristic of governance begins to make its appearance. For it is increasingly recognized that **there are no definitive policy solutions to objective, neat, discrete policy problems**. The "subjects" of policy increasingly also become a matter of definition as well, since the concept population does not have a stable referent either and has itself also evolved in biophilosophical and biomolecular as well as Foucauldian "biopower" ways.

Democratic global peace is an act of securitization that ensures total war

Burke 7 (Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales, Beyond Security, Ethics and Violence: War against the Other pg 231-232,https://books.google.com/books/about/Security_Strategy_and_Critical_Theory.html?id=RYgi4GOgy_0C)

Yet **the first act in America's 'forward strategy of freedom' was to invade and attempt to subjugate Iraq, suggesting that, if 'peace' is its object, its means is war**: **the engine of history is violence, on an enormous and tragic scale, and violence is ultimately its only meaning**. This

we can glimpse in 'Toward a Pacific Union', a deeply disingenuous chapter of Fukuyama's The End of History and the Last Man. This text divides the earth between a 'post-historical' world of affluent developed democracies where 'the old rules of power-politics have decreasing relevance', and a world still 'stuck in history' and 'riven with a variety of religious, national and ideological conflicts'. The two worlds will maintain 'parallel but separate existences' and interact only along axes of threat, disturbance and crucial strategic interest: oil, immigration, terrorism and the proliferation of weapons of mass destruction. Because 'the **relationship between democracies and nondemocracies will still be characterised by mutual distrust and fear', writes Fukuyama, the 'post-historical half must still make use of realist methods when dealing with the part still in history ... force will still be the ultima ratio in their relations**'. For all the book's Kantian pretensions, **Fukuyama naturalises war and coercion as the dominant mode of dealing with billions of people defined only through their lack of 'development' and 'freedom'. Furthermore, in his advocacy of the 'traditional moralism of American foreign policy' and his dismissal of the United Nations in favour of a NATO-style 'league of truly free states ... capable of much more forceful action to protect its collective security against threats arising from the non-democratic part of the world' we can see an early premonition of the historicist unilateralism of the Bush administration. 72 In this light, we can see the invasion of Iraq as continuing a long process of 'world-historical' violence that stretches back to Columbus' discovery of the Americas, and the subsequent politics of genocide, warfare and dispossession through which the modem United States was created and then expanded - initially with the colonisation of the Philippines and coercive trade relationships with China and Japan, and eventually to the self-declared role Luce had argued so forcefully for: guarantor of global economic and strategic order after 1945. This role involved the hideous destruction of Vietnam and Cambodia, 'interventions' in Chile, El Salvador, Panama, Nicaragua and Afghanistan (or an ever more destructive 'strategic' involvement in the Persian Gulf that saw the United States first building up Iraq as a formidable regional military power, and then punishing its people with a 14-year sanctions regime that caused the deaths of at least 200,000 people), all of which we are meant to accept as proof of America's benign intentions, of America putting its 'power at the service of principle'. They are merely history working itself out, the 'design of nature' writing its bliss on the world.73 The bliss 'freedom' offers us, however, is the bliss of the graveyard, stretching endlessly into a world marked not by historical perfection or democratic peace, but by the eternal recurrence of tragedy, as ends endlessly disappear in the means of permanent war and permanent terror**. This is how we must understand both the prolonged trauma visited on the people of Iraq since 1990, and the inflammatory impact the US invasion will have on the new phenomenon of global antiWestern terrorism. American exceptionalism has deluded US policymakers into believing that they are the only actors who write history, who know where it is heading, and how it will play out, and that in its service it is they (and no-one else) who assume an unlimited freedom to act. As a senior adviser to Bush told a journalist in 2002: 'We're an empire now, and when we act, we create our own reality . . We're history's actors."

Economic security discourse attempts to violently re-order the world

Neocleous 08 (Mark, Professor of Critique of Political Economy at Brunel University 2008, "Critique of Security", Pg. 101-102, https://books.google.com/books/about/Critique_of_Security.html?id=OFaB6_OgP94C)

In other words, **the new international order moved very quickly to reassert the connection between economic and national security:** the commitment to the former simultaneously a commitment to the latter, and vice versa. As the doctrine of **national security was being born, the major player on the international stage would aim to use** perhaps its most important power of all – **its economic strength – in order to re-order the world**. And **this** re-ordering **was conducted through the idea of 'economic security'.** Despite the fact that 'economic security' would never be formally defined beyond 'economic order' or economic

well-being', the significant conceptual consistency between economic security and liberal order-building also had a strategic ideological role**. By playing on notions of 'economic well-being', economic security seemed to emphasize economic and thus 'human' needs over military ones. The reshaping of global capital**, international order **and the exercise of state power could** thus **look decidedly liberal and 'humanitarian'. This** appearance **helped co-opt the liberal Left into the process and**, of course, **played on individual desire for personal security by using notions such as 'personal freedom' and 'social equality'**. Marx and Engels once highlighted the historical role of the bourgeoisie in shaping the world according to its own interests. "The need of a constantly expanding market for its products chases the bourgeoisie over the whole surface of the glove. It must nestle everywhere, settle everywhere, establish connections everywhere… It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them… to become bourgeois in themselves. In one word, it creates a world after its own image." In the second half of the twentieth century this ability to 'batter down all Chinese walls' would still rest heavily on the logic of capital, but would also come about it part under the guise of security. **The whole world became a garden to be cultivated – to be recast according to the logic of security. In the space of fifteen years the concept 'economic security' had moved** from connoting insurance policies for working people **to the desire to shape the world in a capitalist fashion** – and back again. **In fact, it has constantly shifted between these registers ever since, being used for the constant reshaping of world order and resulting in a comprehensive level of intervention and policing all over the globe. Global order has come to be fabricated and administered according to a security doctrine underpinned by the logic of capital-accumulation and a bourgeois conception of order**. By incorporating within it a particular vision of economic order, the concept of national security implies the interrelatedness of so many different social, economic, political and military factors that more or less any development anywhere can be said to impact on liberal order in general and America's core interests in particular. **Not only could bourgeois Europe be recast around the regime of capital, but so too could the whole international order as capital not only nestled, settled and established connections, but also 'secured' everywhere.**

Their model of economic security commodifies risk by framing the future as a product to be appropriated by private actors

Kessler 2011 (Oliver, Kyung Hee University, South Korea and University of Groningen, The Netherlands, "Beyond sectors, before the world: Finance, security and risk," Security Dialogue 42:2, http://sdi.sagepub.com/content/42/2/197.)

For example, in security studies the argument is made that the concept of security prevalent within the discipline of international relations does not capture contemporary security practices.21 While the notion of security signifies an existential threat that triggers the employment of exceptional measures, **the notion of risk highlights how security practices have become part of our everyday lives and take place in airports, railway stations and the private home computer**. The change from security to risk highlights how the exception becomes routinized, how the exception becomes **everyday experience**. Within political economy, it has been pointed out that **economic risk models are constitutive for financial practices and have created their own reality** (see, in particular, MacKenzie, 2006). Economics is a part of economic practices, yet it is unable to reflect the consequences of a practical application of economic models. Further, **economists' general disregard for true uncertainty has blinded them to questions related to the systemic risks that new practices like securitization produce** (see Kessler, 2009b). In both areas, the notion of **risk captures the way in which the future is 'commodified' or made subject to the art of government**. In security studies, for example**, it highlights the changing relationship between the present and the future by introducing ideas of precaution. Through an assemblage of material and discursive elements, risk enacts actors and is therefore** not just a characteristic of our society but is '**ordering our world through managing social**

problems and surveying populations' (Aradau and Van Munster, 2007: 97). In particular, the **employment of precautionary measures acting on the 'limits' of knowledge, or probably even beyond those limits, enables the governance of the unknown**. As a result, '**global risks' are divided and controlled through proactive security policies and the surveillance of populations and movements** (or circulations), where **private actors make profits not by reducing risks (even if they claim otherwise), but by managing and controlling contingency**. In finance, the trends are quite similar: **banks do not make money from the risks they avoid, but from the risks they make tradable. The temporality of derivatives is detached from production** chains and **markets and works on the level of anticipated cash flows,** movements, futures. In the social dimension, **we witness in both areas a de-bordering of world politic**s. Up to the 1970s, the risk discourse formed part of a broader discourse of war and peace. Major economic topics like exchange rates or capital controls were subject to security considerations. Since the 1980s, however, **the transformation of global finance and the redefinition of national borders that accompanied it have brought new 'masters of risk'** (Sinclair, 2005) who are dispersed globally. Today, **financial data are given meaning by an assemblage of economic actors, models and practices** – and not by nation-states' representatives. In addition, **the 'war on terror' has been redefining the social dimension of world society** in three ways. First, we witness the advent of new security actors and practices. Increasingly, **insurance companies and banks are seen as security actors that shape practices** (Aradau & Van Munster, 2007). Insurances and banks may hedge terrorism-related risks, **dividing those risks up and selling them** to those willing to take the risks (Lobo-Guerrero, 2008). Second, **private military companies are increasingly seen as stand-alone actors**. Third, as Mick Dillon and Luis Lobo-Guerrero (2008) have pointed out, **security** is not something that takes place at national borders, but **affects our everyday lives (see also Lobo-Guerrero, 2008). New security practices change the ways in which 'human beings' are included and excluded. Ultimately, risk even impacts on how things, events, facts are produced. Risk redefines the boundary between knowledge and non-knowledge, defining the kind of knowledge that is constitutive for producing something as a political,** legal or financial entity. In this context, it is noteworthy that some commentators speak of a commodification of the future, of life and of security (Krahmann, 2006: 379–404).

Democratic peace theory is used to justify military interventions and mask war-making—it doesn't result in democracy

Mueller 9 (John, pol sci prof and IR, Ohio State. Widely-recognized expert on terrorism threats in foreign policy, AB from U Chicago, MA in pol sci from UCLA and PhD in pol sci from UCLA, Faulty Correlation, Foolish Consistency, Fatal Consequence: Democracy, Peace, and Theory in the Middle East, 15 June 2007, http://psweb.sbs.ohio-state.edu/faculty/jmueller/KENT2.pdf)

Philosophers and divines not only encased democracy in a vaporously idealistic or ideological mystique, they have done the same for the democracy-peace correlation. After all, if correlation is taken to be cause, it follows that peace will envelop the earth right after democracy does. Accordingly for those who value peace, the promotion of democracy, by force or otherwise, becomes a central mission. This notion has been brewing for some time. Woodrow Wilson's famous desire to "make the world safe for democracy" was in large part an antiwar motivation. He and many others in Britain, France, and the United States had become convinced that, as Britain's Lloyd George put it, "Freedom is the only warranty of Peace" (Rappard 1940, 42-44). With the growth in the systematic examination of the supposed peace-democracy connection by the end of the century, such certain pronouncements became commonplace. Notes Bruce Russett, sentiments like those have "issued from the White House

ever since the last year of the Reagan administration" (2005, 395). Foolish consistency, fatal consequence: the role of little statesmen It was left to George W. Bush to put mystique into practice. As he stressed to reporter Bob Woodward during the runup to his war with Iraq, "I say that freedom is not America's gift to the world. Freedom is God's gift to everybody in the world. I believe that. As a matter of fact, I was the person that wrote that line, or said it. I didn't write it, I just said it in a speech. And it became part of the jargon. And I believe that. And I believe we have a duty to free people. I would hope we wouldn't have to do it militarily, but we have a duty" (2004, 88-89). And in an address shortly before the war, he confidently proclaimed, "The world has a clear interest in the spread of democratic values, because stable and free nations do not breed the ideologies of murder. They encourage the peaceful pursuit of a better life" (quoted, Frum and Perle 2003, 158). In this, Bush was only trying to be consistent (foolishly so, perhaps, but nonetheless), a quality that endears him to so many of his followers. **If democracy is so wonderful, and if in addition it inevitably brings both peace and creates favorable policy preferences, then forcefully jamming it down the throats of the decreasing number of nondemocratic countries in the world must be all to the good**. He had already done something like that, with a fair amount of success, in Afghanistan; his father had crisply slapped Panama into shape; Reagan had straightened out Grenada; and Bill Clinton had invaded Haiti and bombed the hell out of Bosnia and Serbia with the same lofty goal at least partly in mind. Further, the Australians had recently done it in East Timor and the British in Sierra Leone (Mueller 2004, ch. 7). Critics have argued that democracy can't be spread at the point of a gun, but these cases, as well as the experience with the defeated enemies after World War II, suggests that it sometimes can be, something that supporters of the administration were quick to point out (Kaplan and Kristol 2003, 98-99. Frum and Perle 2003, 163). Even Russett, a prominent democratic-peace analyst, eventually, if rather reluctantly, concedes the possibility (2005, 398-400; see also Peceny and Pickering 2006). **However, Bush and some of his supporters--particularly those in the neo-Conservative camp--foolishly, if consistently, extrapolated to develop an even more extravagant mystique. Not only would the invasion crisply bring viable democracy to Iraq, but success there would have a domino effect: democracy would eventually spread from its Baghdad bastion to envelop the Middle East. This would not only bring (it needs hardly to be said) blissful peace in its wake (because, as we know, democracies never fight each other), but the new democracies would also adopt all sorts of other policies** as well including, in particular, love of, or at least much diminished hostility toward, the United States and Israel (because, as we know, the democratic process itself has a way of making people think nice thoughts). Vice President Dick Cheney attests, reports Woodward, to Bush's "abiding faith that if people were given freedom and democracy, that would begin a transformation process in Iraq that in years ahead would change the Middle East" (Woodward 2004, 428). Moreover, since force can establish democracy and since democracies rather automatically embrace peaceful and generally nice thoughts, after Iraq was forced to enter the democratic (and hence peaceful and nice-thinking) camp, military force would be deftly applied as necessary to speed up the domino-toppling process wherever necessary in the area. Such extravagant, even romantic, visions fill war-advocating neo-Conservative fulminations. **In their book, The War Over Iraq, Lawrence Kaplan and William Kristol apply due reverence to the sanctified correlation--"democracies rarely, if ever, wage war against one another"--and then extrapolate fancifully to conclude that "The more democratic the world becomes, the more likely it is to be congenial to America"** (2003, 104-5). And war architect Paul Wolfowitz also seems to have believed that the war would become an essential stage on the march toward freedom and democracy (Woodward 2004, 428). In a 2004 article proposing what he calls "democratic realism," Charles Krauthammer urges taking "the risky but imperative course of trying to reorder the Arab world," with a "targeted, focused" effort that would (however) be "limited" to "that Islamic crescent stretching from North Africa to Afghanistan" (2004 23, 17). And in a speech in late 2006, he continued to champion what he calls "the only plausible answer," an ambitious undertaking that involves "changing the culture of that area, no matter how slow and how difficult the process. It starts in Iraq and Lebanon, and must be allowed to proceed." Any other policy, he has divined, "would ultimately bring ruin not only on the U.S. but on the very idea of freedom." And Kaplan and Kristol stress that "The mission begins in Baghdad, but does not end there....War in Iraq represents but the first installment...Duly armed, the United States can act to secure its safety and to advance the cause of liberty--in Baghdad and beyond" (2003, 124-25). **With that**, laments Russett, democracy and **democratic peace theory became "Bushwhacked"** (2005). Democratic processes of pressure and policy promotion were deftly used by a dedicated group to wage costly war to establish both peace and congenial policy in the otherwise intractable Middle East. It could be argued, then, that the little statesmen of the Bush administration had the courage of the mystical convictions of the democracy and democratic peace philosophers and divines. However, although Bush's simple faith in democracy may perhaps have its
