endearing side, how deeply that passion is (or was) really shared by his neo-Conservative allies could be questioned. That is, did they really believe that the United States which, as Francis Fukuyama notes, "cannot eliminate poverty or raise test scores in Washington, DC," could "bring democracy to a part of the world that has stubbornly resisted it and is virulently anti-American to boot" (2004, 60)? Although they hype democracy, David Frum and Richard Perle carefully caution that "in the Middle East, democratization does not mean calling immediate elections and then living with whatever happens next," but rather "opening political spaces," "creating representative institutions," "deregulating the economy," "shrinking and reforming the Middle Eastern pubic sector," and "perhaps above all" changing the educational system (2003, 162-63). Similarly, Krauthammer's "democratic realism" approach doesn't seem, actually, to stress democracy all that much. (Its wildly extravagant calls for massive warfare over a very substantial portion of the globe--only "limited" in comparison to Bush's exuberant crusadery--suggests it is rather lacking in realism as well.) Most interesting is a call issued by neo-Conservatism's champion guru, Norman Podhoretz, in the runup to the war. He strongly advocated expanding Bush's "axis of evil" beyond Iraq, Iran, and North Korea "at a minimum" to embrace "Syria and Lebanon and Libya, as well as 'friends' of America like the Saudi royal family and Egypt's Hosni Mubarak, along with the Palestinian Authority." However**, Podhoretz proved to be less mystical (or simply less devious) than other neocons about democracy by pointedly adding "the alternative to these regimes could easily turn out to be worse, even (or especially) if it comes into power through democratic elections**." Accordingly, he emphasized, "it will be necessary for the United States to impose a new political culture on the defeated parties."14 (Although Podhoretz may be more realistic that others about democracy, his extravagant notion that the US would somehow have the capacity to impose a new political culture throughout the non-Israeli Middle East is, like Krauthammer's comparable vision, so fantastic as to border on the deranged.) **Indeed, after one looks beneath the boilerplate about democracy and the democratic peace, what seems to be principally motivating at least some of these people is a strong desire for the United States to use military methods to make the Middle East finally and once and for all safe for Israel** (Drew 2003, 22; Fukuyama 2004; Roy 2003). All of them are devoted supporters of Israel, and they seem to display far less interest in advocating the application of military force to deal with unsavory dictatorial regimes in other parts of the world that do not seem to threaten Israel--such as Burma, Zimbabwe, Sudan, Haiti, or Cuba. As John Mearsheimer and Stephen Walt point out in their discussion of what they call "The Israel Lobby" (2006), such policy advocacy is entirely appropriate and fully democratic: "There is nothing improper about American Jews and their Christian allies attempting to sway US policy" (although they also note that Jewish Americans generally actually were less likely to support the war than was the rest of the population). Democracy, as noted earlier, is centrally characterized by the contestings of isolated, self-serving, and often tiny special interest groups and their political and bureaucratic allies. **What happened with Iraq policy was democracy in full flower**. It does not follow, of course, that policies so generated are necessarily wise, and Mearsheimer and Walt consider that the results of much of the Lobby's efforts--certainly in this case--have been detrimental to American (and even Israeli) national interest, although their contentions that the Lobby was "critical" or "a key factor" in the decision to go to war or that that decision would "have been far less likely" without the Lobby's efforts would need more careful analysis. It is also their view that the Lobby has too much influence over U.S foreign policy--a conclusion, as it happens, that is shared by 68 percent of over 1000 international relations scholars who responded to a 2006 survey.15 However that may be, it could certainly be maintained that, as an Israeli scholar puts it, the United States by its action eliminated what Israel considered at the time to be a most "threatening neighbor" (Baram 2007). Following this line of thinking, then, **the Israel Lobby and its allies skillfully and legitimately used democracy to Bushwhack the democracy and democratic peace mystiques as part of its effort to nudge, urge, or impel the United States into a war that, as it happens, has proven to be its greatest foreign debacle in its history after Vietnam.** It should be noted, however, that, although Bush and Cheney and at least some of the neocons may actually have believed their pre-war fantasies about the blessings that imposed democracy would in turn impose on the Middle East, the arguments they proffered for going to war stressed national security issues, not democracy ones--the notion that Saddam's Iraq was a threat to the United States because of its development, or potential development, of weapons of mass destruction and of its connections to terrorist groups out to get the United States (Roy 2003). **The democracy argument rose in significance**, notes Russett, only **after those security arguments for going to war proved to be empty** (2005, 396). As Fukuyama has crisply put it, a prewar request to spend "several hundred billion dollars and several thousand American lives in order to bring democracy to...Iraq" would "have been laughed out of court" (2005). Moreover, when given a list of foreign policy goals, the American public has rather consistently ranked the promotion of democracy lower--often much lower--than

such goals as combating international terrorism, protecting American jobs, preventing the spread of nuclear weapons, strengthening the United Nations, and protecting American businesses abroad (see Figure 1).

2NC – Alternative

A complete rejection of dominant security allows us to recraft security to include a structuralist and pluralist paradigm-The affsvision views of security fail in the context of Latin America

Pettiford 96 (Lloyd, "Changing Conceptions of Security in the Third World" Third World Quarterly, vol. 17, no. 2, pg. 289-306, Published by Taylor and Francis Group, http://www.jstor.org/stable/3993094)

Security is potentially **a more complex** concept **than is traditionally understood** ¶ and the increasing number of people working on the concept suggests that it will ¶ be an important area for future investigation. **The traditional Realist definition of ¶ security in International Relations is relatively simple. However, Pluralist and ¶ Structuralist paradigms emphasise that other linkages exist between various ¶ actors and issues, the inclusion of which might enrich current concepts of ¶ security. ¶ Security as understood in the traditional sense is not free of political meaning ¶ and interest. The traditional definition** of security **developed to represent the ¶ view of the most important issue for Western developed states. Security thus ¶ came to be a dominant organizing concept in the study of International Relations ¶ but it was not the only way of looking at the subject.** Non-Realist interpretations ¶ 303 ¶ This content downloaded from 129.105.215.146 on Tue, 23 Jul 2013 20:53:29 PM¶ All use subject to JSTOR Terms and ConditionsLLOYD PETTIFORD ¶ of International Relations from the Pluralist and Structuralist paradigms suggest ¶ that **traditional concepts of security have kept important issues off the political ¶ agenda.** Of course, attempts to re-conceptualise security will not be free of ¶ political implications either. ¶ With the ending of the Cold War and the recognition of, for example, ¶ environmental problems, even for Western developed states, other concerns have ¶ become a part of the mainstream political and International Relations agenda. ¶ **Thus some attempts to expand the concept of security seem to fit the new ¶ interests of the world's powerful** in the extent to which they include environmen- ¶ tal matters and the definition of sustainable development used. In redefining ¶ security to include the environment in ways which do not suggest the need for ¶ significant restructuring of the global political economy, the concerns of the ¶ world's most powerful states are kept at the forefront of International Relations. ¶ In this sense the definition of security may be changing but it will still be a ¶ concept which, while it can be applied to the Third World, will be inadequate ¶ for a full understanding of it. ¶ **One can go beyond the traditional definition of security** or the limited ¶ expansion envisaged by those arguing for environmental security**. Security can ¶ be re-conceptualised** as, or including, ecological sustainability and the need for ¶ fundamental structural changes in the political system. There seems to be an ¶ important danger in this; too many new concerns may be squeezed into security, ¶ causing the concept to become so broad that the division between security and ¶ International Relations in general become very blurred. ¶ It is thus difficult to avoid the conclusion that the debate over expanding ¶ security is not entirely useful. **Traditional concepts of security developed for ¶ reasons which were valid at the time for the people who used them. However, ¶ they are clearly limited in attempting to understand Third World regions such as ¶ Central America.** But getting involved in complex debates over how to redefine ¶ security may not be the answer. To improve our understanding of InternThe traditional concept of security does not show itself amenable to stretching. ¶ Stretching causes the concept to lose meaning without offering any compensat- ¶ ing advantage. Thus, rather than redefine security, as traditionally understood, it ¶ might be enough to recognise its limitations in terms of when and where it ¶ should be applied, and to investigate its linkages to other areas of International ¶ Relations. Traditional security could then continue to exist alongside more ¶ serious considerations of problems of more interest to Third World states, such ¶ as environmental problems and survival within the world economy, using ¶ non-Realist tools of analysis. ¶ The current period of change and uncertainty about the future suggests that ¶ International Relations would be well served by a period of coexistent ational ¶ Relations it may be more important to recognise that the current historical ¶ juncture allows us to broaden the focus of what is seen as important and worthy ¶ of study. **Pluralist and Structuralist paradigms make us aware of actors and ¶ issues other than the state and its security from external attack, and consequently ¶ give new insights into International Relations. In the case of Central**

America, ¶ a Structuralist approach, based on sustainability, would seem a particularly ¶ valuable path to take. ¶ The traditional concept of security does not show itself amenable to stretching. ¶ Stretching causes the concept to lose meaning without offering any compensat- ¶ ing advantage. Thus**, rather than redefine security,** as traditionally understood, **it ¶ might be enough to recognise its limitations** in terms of when and where it ¶ should be applied, **and to investigate its linkages to other areas of International ¶ Relations.** The current period of change and uncertainty about the future suggests that ¶ International Relations would be well served by a period of coexistent paradigms. However, **if the position of Realism is not weakened the conse- ¶ quences might be serious.** The evidence brought to light by **research on Central ¶ America suggests that a traditional Realist concept of security fails to recognise ¶ or adequately deal with important environmental problems which may ultimately ¶ threaten life on earth; neither does it address fundamental structural disadvan- ¶ tages in the world economy which condemn ever larger numbers of people to ¶ live in misery.**

Your intellectual choices influence war more than specific policy – academic actvity is key

Jones 99 (Richard Wyn, Professor International Politics @ Aberystwyth University, Security, Strategy, and Critical Theory, p. 155-163, https://books.google.com/books/about/Security_Strategy_and_Critical_Theory.html?id=RYgi4GOgy_0C)

The central political task of the intellectuals is to aid in the construction of a counterhegemony and thus undermine the prevailing patterns of discourse and interaction that make up the currently dominant hegemony. This task is accomplished through educational activity, because, as Gramsci argues, **"every relationship of 'hegemony' is necessarily a pedagogic relationship"** (Gramsci 1971: 350). Discussing the relationship of the "philosophy of praxis" to political practice, Gramsci claims: It [the theory] does not tend to leave the "simple" in their primitive philosophy of common sense, but rather to lead them to a higher conception of life. If it affirms the need for contact between intellectuals and "simple" it is not in order to restrict scientific activity and preserve unity at the low level of the masses, but precisely in order to construct an intellectual-moral bloc which can make politically possible the intellectual progress of the mass and not only of small intellectual groups. (Gramsci 1971: 332-333). According to Gramsci, this attempt to construct an alternative "intellectual-moral bloc" should take place under the auspices of the Communist Party – a body he described as the "modern prince." Just as Niccolo Machiavelli hoped to see a prince unite Italy, rid the country of foreign barbarians, and create a virtu-ous state, Gramsci believed that the modern price could lead the working class on its journey toward its revolutionary destiny of an emancipated society (Gramsci 1971: 125-205). Gramsci's relative optimism about the possibility of progressive theorists playing a constructive role in emancipatory political practice was predicated on his belief in the existence of a universal class (a class whose emancipation would inevitably presage the emancipation of humanity itself) with revolutionary potential. It was a gradual loss of faith in this axiom that led Horkheimer and Adorno to their extremely pessimistic prognosis about the possibilities of progressive social change. But does a loss of faith in the revolutionary vocation of the proletariat necessarily lead to the kind of quietism ultimately embraced by the first generation of the Frankfurt School? The conflict that erupted in the 1960s between them and their more radical students suggests not. Indeed, contemporary critical theorists claim that the deprivileging of the role of the proletariat in the struggle for emancipation is actually a positive move. Class remains a very important axis of domination in society, but it is not the only such axis (Fraser 1995). Nor is it valid to reduce all other forms of domination – for example, in the case of gender – to class relations, as orthodox Marxists tend to do. To recognize these points is not only a first step toward the development of an analysis of forms of exploitation and exclusion within society that is more attuned to social reality; it is also a realization that there are other forms of emancipatory politics than those associated with class conflict.1 This in turn suggests new possibilities and problems for emancipatory theory. Furthermore, the abandonment of faith in revolutionary parties is also a positive development. The history of the European left during the twentieth century provides myriad examples of the ways in which the fetishization of party organizations has led to bureaucratic immobility and the confusion of means with ends (see, for example, Salvadori 1990). The failure of the Bolshevik experiment illustrates how disciplined, vanguard parties are an ideal vehicle for totalitarian domination (Serge 1984). Faith in the "infallible party" has obviously been the source of strength and comfort to many in this period and, as the experience of the southern Wales coalfield demonstrates, has inspired brave and progressive behavior (see, for example, the account of support for the Spanish Republic in Francis 1984). But such parties have so often been the enemies of emancipation that they should be treated with the utmost caution. Parties are necessary, but their fetishization is potentially disastrous. **History furnishes examples of progressive developments that have been positively influenced by organic intellectuals operating outside the bounds of a particular party structure** (G. Williams 1984). **Some of these developments have occurred in the particularly intractable realm of security. These examples may be considered as "resources of hope" for critical security studies** (R. Williams 1989). **They illustrate**

that ideas are important or, more correctly, that **change is the product of the dialectical interaction of ideas and material reality. One clear** security-related **example** of the role of critical thinking and critical thinkers in aiding and abetting progressive social change is the experience of **the peace movement of the 1980s**. At that time **the ideas of dissident defense intellectuals** (the "alternative defense" school) **encouraged and drew strength from peace activism. Together they had an effect not only on short-term policy but on the dominant discourses of strategy and security, a far more important result in the long run. The synergy** between critical security intellectuals and critical social movements and the potential influence of both working in **tandem can be witnessed** particularly clearly **in the fate of common security**. As Thomas Risse-Kappen points out, the term "common security" originated in the contribution of peace researchers to the German security debate of the 1970s (Risse-Kappen 1994: 186ff.); it was subsequently popularized by the Palme Commission report (Independent Commission on Disarmament and Security Issues 1982). **Initially, mainstream defense intellectuals dismissed the concept as hopelessly idealistic**; it certainly had no place in their allegedly hardheaded and realist view of the world. **However, notions of common security were taken up by a number of different intellectuals communities**, including the liberal arms control community in the United States, Western European peace researchers, security specialists in the center-left political parties of Western Europe, and Soviet "institutchiks" – members of the influential policy institutes in the Soviet Union such as the United States of America and Canada Institute (Landau 1996: 52-54; Risse-Kappen 1994: 196-200; Kaldor 1995; Spencer 1995). These communities were subsequently **able to take advantage of public pressure exerted through social movements in order to gain broader acceptance for common security.** In Germany, for example, "in response to social movement pressure, German social organizations such as churches and trade unions quickly supported the ideas promoted by peace researchers and the SPD" (Risse-Kappen 1994: 207). **Similar pressures even had an effect on the Reagan administration**. As Risse-Kappen notes: When the Reagan administration brought hard-liners into power, the US arms control community was removed from policy influence. **It was the American peace movement and what became known as the "freeze campaign" that revived the arms control process** together with pressure from the European allies. (Risse-Kappen 1994: 205; also Cortright 1993: 90-110). Although it would be difficult to sustain a claim that the combination of critical movements and intellectuals persuaded the Reagan government to adopt the rhetoric and substance of common security in its entirety, it is clear **that it did at least have a substantial impact on ameliorating U.S. behavior. The most dramatic** and certainly the most unexpected **impact of** alternative defense ideas **was felt in the Soviet Union**. Through various East-West links, which included arms control institutions, Pugwash conferences, interparty contacts, and even direct personal links, **a coterie of Soviet policy analysts and advisers were drawn toward common security** and such attendant notions as "nonoffensive defense" (these links are detailed in Evangelista 1995; Kaldor 1995; Checkel 1993; Risse-Kappen 1994; Landau 1996 and Spencer 1995 concentrate on the role of the Pugwash conferences). **This group**, including Palme Commission member Georgii Arbatov, Pugwash attendee Andrei Kokoshin , and Sergei Karaganov, a senior adviser who was in regular contact with the Western peace researchers Anders Boserup and Lutz Unterseher (Risse-Kappen 1994: 203), **then influenced** Soviet leader Mikhail **Gorbachev.** Gorbachev's subsequent championing of common security may be attributed to several factors. It is clear, for example, that **new Soviet leadership had a strong interest in alleviating tensions in East-West relations in order to facilitate much-needed domestic reforms** ("the interaction of ideas and material reality"). But what is significant is that **the Soviets' commitment to common security led to significant changes in force sizes and postures. These in turn aided in the winding down of the Cold War, the end of Soviet domination over Eastern Europe, and even the collapse of Russian control over much of the territory of the former Soviet Union**. At the present time, in marked contrast to the situation in the early 1980s, common security is part of the common sense of security discourse. As MccGwire points out, the North Atlantic Treaty Organization (NATO) (a common defense pact) is using the rhetoric of common security in order to justify its expansion into Eastern Europe (MccGwire 1997). **This points to an interesting and potentially important aspect of the impact of ideas on politics. As concepts** such as common security, and collective security before it (Claude 1984: 223-260), **are adopted by governments and military services, they inevitably become somewhat debased. The hope is that enough of the residual meaning can survive to shift the parameters of the debate in a potentially progressive direction**. Moreover, the adoption of the concept of common security by official circles provides critics with a useful tool for (immanently) critiquing aspects of security policy (as MccGwire 1997 demonsrates in relation to NATO expansion). The example of common security is highly instructive. First, it indicates that **critical intellectuals can be politically engaged and play a role** – a significant one at that **– in making the world a better and safer place. Second, it points to potential future addressees for critical international theory in general, and critical security studies in particular. Third, it also underlines the role of ideas in the evolution in society. C**RITICAL SECURITY STUDIES AND THE

THEORY-PRACTICE NEXUS Although most proponents of critical security studies reject aspects of Gramsci's theory of organic intellectuals, in particular his exclusive concentration on class and his emphasis on the guiding role of the party, the desire for engagement and relevance must remain at the heart of their project. The example of the peace movement suggests that critical theorists can still play the role of organic intellectuals and that this organic relationship need not confine itself to a single class; it can involve alignment with different coalitions of social movements that campaign on an issue or a series of issues pertinent to the struggle for emancipation (Shaw 1994b; R. Walker 1994). Edward **Said captures this broader orientation when he suggests that critical intellectuals "are always tied to and ought to remain an organic part of an ongoing experience in society:** of the poor, the disadvantaged, the voiceless, the unrepresented, the powerless" (Said 1994: 84). In the specific case of critical security studies, **this means placing the experience of those men and women and communities for whom the present world order is a cause of insecurity rather than security at the center of the agenda and making suffering humanity rather than raison d'etat the prism through which problems are viewed**. Here the project stands full-square within the critical theory tradition**. If "all theory is for someone and for some purpose," then critical security studies is for "the voiceless, the unrepresented, the powerless," and its purpose is their emancipation. The theoretical implications** of this orientation have already been discussed in the previous chapters. They **involve a fundamental reconceptualization of security with a shift in referent object and a broadening of the range of issues considered** as a legitimate part of the discourse. They also involve a reconceptualization of strategy within this expanded notion of security. **But the question remains at the conceptual level of how these alternative types of theorizing** – even if they are self-consciously aligned to the practices of critical or new social movements, such as peace activism, the struggle for human rights, and the survival of minority cultures – **can become "a force for the direction of action."** Again, Gramsci's work is insightful. In the Prison Notebooks, Gramsci advances a sophisticated analysis of how dominant discourses play a vital role in upholding particular political and economic orders, or, in Gramsci's terminology, "historic blocs" (Gramsci 1971: 323-377). Gramsci adopted Machiavelli's view of power as a centaur, ahlf man, half beast: a mixture of consent and coercion. Consent is produced and reproduced by a ruling hegemony that holds sway through civil society and takes on the status of common sense; it becomes subconsciously accepted and even regarded as beyond question. Obviously, for Gramsci, there is nothing immutable about the values that permeate society; they can and do change. In the social realm, ideas and institutions that were once seen as natural and beyond question (i.e., commonsensical) in the West, such as feudalism and slavery, are now seen as anachronistic, unjust, and unacceptable. In Marx's well-worn phrase, "All that is solid melts into the air." Gramsci's intention is to harness this potential for change and ensure that it moves in the direction of emancipation. To do this he suggests a strategy of a "war of position" (Gramsci 1971: 229-239). Gramsci argues that in states with developed civil societies, such as those in Western liberal democracies, any successful attempt at **progressive social change requires a slow, incremental, even molecular, struggle to break down the prevailing hegemony and construct an alternative counterhegemony** to take its place. Organic intellectuals have a crucial role to play in this process by helping to undermine the "natural," "commonsense," internalized nature of the status quo. This in turn helps create political space within which alternative conceptions of politics can be developed and new historic blocs created. I contend that Gramsci's strategy of a war of position suggests an appropriate model for proponents of critical security studies to adopt in relating their theorizing to political practice. THE TASKS OF CRITICAL SECURITY STUDIES **If the project of critical security studies is conceived in terms of war of position, then the main task of those intellectuals who align themselves with the enterprise is to attempt to undermine the prevailing hegemonic security discourse. This may be accomplished by utilizing** specialist information and **expertise to engage in an immanent critique of the prevailing security regimes, that is, comparing the justifications of those regimes with actual outcomes. When this is attempted in the security field, the prevailing structures and regimes are found to fail grievously on their own terms. Such an approach also involves challenging the pronouncements of those intellectuals**, traditional or organic, **whose views serve to legitimate, and hence reproduce, the prevailing world order. This challenge entails teasing out the often subconscious and certainly unexamined assumptions that underlie their arguments while drawing attention to the normative viewpoints that are smuggled into mainstream thinking about security behind its positivist façade**. In this sense, **proponents of critical security studies approximate to Foucault's notion of "specific intellectuals" who use their expert knowledge to challenge the prevailing "regime of truth"** (Foucault 1980: 132). However, critical theorists might wish to reformulate this sentiment along more familiar Quaker lines of "speaking truth to power" (this sentiment is also central to Said 1994) or even along the eisteddfod lines of speaking "truth against the world." Of course, traditional strategists can, and indeed do, sometimes claim a similar role. Colin S. Gray, for example, states that "strategists must be prepared to 'speak truth to power'" (Gray 1982a: 193). But the difference between Gray and proponents of critical security studies is that, whereas the former seeks to influence policymakers in particular directions without questioning the basis of their power, the latter aim at a thoroughgoing critique of all that traditional security studies has taken for granted. Furthermore, **critical theorists base their critique on the presupposition, elegantly stated by Adorno, that "the need to lend suffering a voice is the precondition of all truth"** (cited in Jameson 1990: 66). The aim of critical security studies in attempting to undermine the prevailing orthodoxy is ultimately educational. As Gramsci notes,

"every relationship of 'hegemony' is necessarily a pedagogic relationship" (Gramsci 1971: 350; see also the discussion of critical pedagogy in Neufeld 1995: 116-121). Thus, **by criticizing the hegemonic discourse and advancing alternative conceptions of security** based on different understandings of human potentialities, **the approach is simultaneously playing apart in eroding the legitimacy of the ruling historic bloc and contributing to the development of a counterhegemonic position**. There are a number of avenues of avenues open to critical security specialists in pursuing this educational strategy. **As teachers, they can try to foster and encourage skepticism toward accepted wisdom and open minds to other possibilities. They can also take advantage of the seemingly unquenchable thirst of the media for instant pundistry to forward alternative views onto a broader stage. Nancy Fraser argues: "As teachers, we try to foster an emergent pedagogical counterculture …. As critical public intellectuals we try to inject our perspectives into whatever cultural or political public spheres we have access to"** (Fraser 1989: 11). Perhaps significantly, support for this type of emancipatory strategy can even be found in the work of the ultrapessimistic **Adorno, who argues: In the history of civilization there have been not a few instances when delusions were healed not by focused propaganda, but**, in the final analysis**, because scholars, with their unobtrusive yet insistent work habits, studied what lay at the root of the delusion.** (cited in Kellner 1992: vii) Such "unobtrusive yet insistent work" does not in itself create the social change to which Adorno alludes**. The conceptual and the practical dangers of collapsing practice into theory must be guarded against. Rather, through their educational activities, proponent of critical security studies should aim to provide support for those social movements that promote emancipatory social change. By providing a critique of the prevailing order and legitimating alternative views, critical theorists can perform a valuable role in supporting the struggles of social movements**. That said, the role of theorists is not to direct and instruct those movements with which they are aligned; instead, the relationship is reciprocal. The experience of the European, North American, and Antipodean peace movements of the 1980s shows how influential social movements can become when their efforts are harnessed to the intellectual and educational activity of critical thinkers. For example, in his account of New Zealand's antinuclear stance in the 1980s, Michael C. **Pugh cites the importance of the visits of critical intellectuals such as Helen Caldicott and Richard Falk in changing the country's political climate and encouraging the growth of the antinuclear movement** (Pugh 1989: 108; see also COrtright 1993: 5-13). In the 1980s peace movements and critical intellectuals interested in issues of security and strategy drew strength and succor from each other's efforts. If such critical social movements do not exist, then this creates obvious difficulties for the critical theorist. But even under these circumstances, the theorist need not abandon all hope of an eventual orientation toward practice. Once again, the peace movement of the 1980s provides evidence of the possibilities. At that time, the movement benefited from the intellectual work undertaken in the lean years of the peace movement in the late 1970s. Some of the theories and concepts developed then, such as common security and nonoffensive defense, were eventually taken up even in the Kremlin and played a significant role in defusing the second Cold War. Those ideas developed in the 1970s can be seen in Adornian terms of the a "message in a bottle," but in this case, contra Adorno's expectations, they were picked up and used to support a program of emancipatory political practice. Obviously, one would be naïve to understate the difficulties facing those attempting to develop alternative critical approaches within academia. Some of these problems have been alluded to already and involve the structural constraints of academic life itself. Said argues that many problems are caused by what he describes as the growing "professionalisation" of academic life (Said 1994: 49-62). **Academics are now so constrained by the requirements of job security and marketability that they are extremely risk-averse. It pays** – in all senses **– to stick with the crowd and avoid the exposed limb by following the prevalent disciplinary preoccupations**, publish in certain prescribed journals, and so on. **The result is the navel gazing so prevalent in the study of international relations and the seeming inability of security specialists to deal with the changes brought about by the end of the Cold War (Kristensen 1997 highlights the search of U.S. nuclear planners for "new targets for old weapons").** And, of course, the **pressures for conformism are heightened in the field of security studies when governments have a very real interest in marginalizing dissent. Nevertheless, opportunities for critical thinking do exist, and this thinking can connect with the practices of social movements and become a "force for the direction of action."** The experience of the 1980s, when, in the depths of the second Cold War, critical thinkers risked demonization and in some countries far worse in order to challenge received wisdom, thus arguably playing a crucial role in the very survival of the human race, should act as both an inspiration and a challenge to critical security studies.

Individual analysis of security allows us to resituate our relationship to others

Burke 7 (Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales, "Beyond Security, Ethics and Violence: War Against the Other",https://books.google.com/books?id=4vd9AgAAQBAJ&pg=PA52&lpg=PA52&dq=It+is+perhaps+easy+to+become+despondent,+but+as+countless+struggles+for+freedom&source=bl&ots=Mg50LDvj3o&sig=vMxj5FZMultitajyYke6z5Th0K4&hl=en&sa=X&ved=0CB8Q6AEwAGoVChMIrYnS8Ir1xgIVSaseCh3WSwXp#v=onepage&q=It%20is%20perhaps%20easy%20to%20become%20despondent%2C%20but%20as%20countless%20struggles%20for%20freedom&f=false)

It is perhaps easy to become despondent, but as **countless struggles for freedom, justice, and social transformation have proved, a sense of seriousness can be tempered with the knowledge that many tools are already available—and where they are not, the ef-fort to create a productive new critical sensibility is well advanced.** There is also a crucial political opening within the liberal problematic itself, in the sense that it assumes that power is most effec-tive when it is absorbed as truth, consented to and desired—which creates an important space for refusal. As Colin Gordon argues, Foucault thought that the very possibility of governing was condi-tional on it being credible to the governed as well as the govern-ing. This throws weight onto the question of how security works as a technology of subjectivity. It is to take up Foucault's challenge, framed as a reversal of the liberal progressive movement of being we have seen in Hegel, not to discover who or what we are so much as to refuse what we are. Just as security rules subjectivity as both a totalizing and individualizing blackmail and promise, it is at these levels that we can intervene. **We can critique the machinic frame-works of possibility represented by law, policy, economic regulation, and diplomacy, while challenging the way these institutions deploy language to draw individual subjects into their consensual web.** This suggests, at least provisionally, a dual strategy. The first as-serts the space for agency, both in challenging available possibilities for being and their larger socioeconomic implications. Roland Bleiker formulates an idea of agency that shifts away from the lone (male) hero overthrowing the social order in a decisive act of re-bellion to one that understands both the thickness of social power and its "fissures," "fragmentation," and "thinness." **We must**, he says, "**observe how an individual may be able to escape the discur-sive order and influence its shifting boundaries.** ... By doing so, **discursive terrains of dissent all of a sudden appear where forces of domination previously seemed invincible." Pushing beyond security requires tactics that can work at many-levels—that empower individuals to recognize the larger social, cul-tural, and economic implications of the everyday forms of desire, subjection, and discipline they encounter, to challenge and rewrite them, and** that in turn contribute to collective efforts to **transform the larger structures of** being, exchange, and **power** that sustain (and have been sustained by) these forms. As Derrida suggests, this is to open up aporetic possibilities that transgress and call into question the boundaries of the self, society, and the international that security seeks to imagine and police. The second seeks new ethical principles based on a critique of the rigid and repressive forms of identity that security has heretofore offered. Thus writers such as Rosalyn Diprose, William Con-nolly, and Moira Gatens have sought to imagine a new ethical rela-tionship that thinks difference not on the basis of the same but on the basis of a dialogue with the other that might, allow space for the unknown and unfamiliar, for a "debate and engagement with the other's law and the other's ethics"—an encounter that involves a transformation of the self rather than the other. Thus while the sweep and power of **security must be acknowledged, it must also be refused: at the simultaneous levels of individual identity, social order, and macroeconomic possibility, it would entail another kind of work on "ourselves"—a political refusal of the One, the imagination of an other that never returns to the same. It would be to ask if there is a world after security, and what its shimmering possi-bilities might be.**

Voting neg opens up the space necessary for emancipation from endless securitization

Neocleous 8 (Mark, Professor of Critique of Political Economy at Brunel University 2008, "Critique of Security", Pg. 185-186, https://books.google.com/books/about/Critique_of_Security.html?id=OFaB6_OgP94C)

The only way out of such a dilemma, to escape the fetish, is perhaps to eschew the logic of security altogether - to reject it as so ideologically loaded in favour of the state that any real political thought other than the authoritarian and reactionary should be pressed to give it up. That is clearly something that can not be achieved within the limits of bourgeois thought and thus **could never even begin to be imagined by the security intellectual. It is** also something **that the constant iteration of the refrain 'this is an insecure world' and reiteration of one fear**, anxiety and insecurity after another **will also make it hard to do**. But **it is something that the critique of security suggests we may have to consider if we want a political way out of the impasse of security.** This impasse exists because **security has now become so all-encompassing that it marginalises all else, most notably the constructive conflicts, debates and discussions that animate political life. The constant prioritising of a mythical security as a political end - as the political end constitutes a rejection of politics in any meaningful sense of the term. That is, as a mode of action in which differences can be articulated, in which the conflicts and struggles** that arise from such differences **can be** fought for and **negotiated, in which people might come to believe that another world is possible -** that they might transform the world and in turn be transformed. Security politics simply removes this; worse, it remoeves it while purportedly addressing it. In so doing it **suppresses all issues of power and turns political questions into debates about the most efficient way to achieve 'security'**, despite the fact that we are never quite told - never could be told - what might count as having achieved it. **Security politics is, in this sense, an anti-politics**,"' dominating political discourse in much the same manner as the security state tries to dominate human beings, **reinforcing security fetishism and the monopolistic character of security on the political imagination. We therefore need to get beyond security politics, not add yet more 'sectors' to it** in a way that simply expands the scope of the state and legitimises state intervention in yet more and more areas of our lives. Simon Dalby reports a personal communication with Michael Williams, co-editor of the important text Critical Security Studies, in which the latter asks: if **you take away security, what do you put in the hole that's left behind?** But I'm inclined to agree with Dalby: **maybe there is no hole**."' The mistake has been to think that there is a hole and that this hole needs to be filled with a new vision or revision of security in which it is re-mapped or civilised or gendered or humanised or expanded or whatever. All of these ultimately remain within the statist political imaginary, and consequently end up reaffirming the state as the terrain of modern politics, the grounds of security. **The real task is not to fill the supposed hole** with yet another vision of security, **but to fight for an alternative political language which** takes us beyond the narrow horizon of bourgeois security and which therefore **does not constantly throw us into the arms of the state**. That's the point of critical politics: to develop a new political language more adequate to the kind of society we want. Thus while much of what I have said here has been of a negative order, part of the tradition of critical theory is that **the negative may be as significant as the positive in setting thought on new paths.** For if security really is the supreme concept of bourgeois society and the fundamental thematic of liberalism, then **to keep harping on about insecurity and to keep demanding 'more security'** (while meekly hoping that this increased security doesn't damage our liberty) **is to blind ourselves to the possibility of building real alternatives to the authoritarian tendencies in contemporary politics. To situate ourselves against security politics would allow us to circumvent the** debilitating effect achieved through the constant securitising of social and political issues, debilitating in the **sense that 'security' helps consolidate the power of** the existing **forms of social domination** and justifies the short-circuiting of even the most democratic forms. **It would also allow us to forge another kind of politics centred on a different conception of the good**. We need a new way of thinking and talking about social being and politics that moves us beyond security. **This would perhaps be emancipatory in the true sense of the word. What this might mean,** precisely, must be open to debate. But it certainly requires recognising that security is an illusion that has forgotten it is an illusion; it requires recognising that security is not the same as solidarity**; it requires accepting that insecurity is part of the human condition, and thus** giving up the search for the certainty of security and instead **learning to tolerate the uncertainties, ambiguities and 'insecurities' that come with being human;** it requires accepting that **'securitizing' an issue does not mean dealing with it politically, but**

bracketing it out and handing it to the state; it requires us to be brave enough to return the gift."'

2NC – Impact

This quest for security in an inherently chaotic and insecure world guarantees extinction

Burke 7 (Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales, Beyond Security, Ethics and Violence: War against the Other, https://books.google.com/books/about/Security_Strategy_and_Critical_Theory.html?id=RYgi4GOgy_0C)

Bacon thought of the new scientific method not merely as way of achieving a purer access to truth and epistemological certainty, but as liberating a new power that would enable the creation of a new kind of Man. He opened the Novum Organum with the statement that 'knowledge and human power are synonymous', and later wrote of his 'determination...to lay a firmer foundation, and extend to a greater distance the boundaries of human power and dignity'.67 In a revealing and highly negative comparison between 'men's lives in the most polished countries of Europe and in any wild and barbarous region of the new Indies' -- one that echoes in advance Kissinger's distinction between post-and pre-Newtonian cultures -- Bacon set out what was at stake in the advancement of empirical science: anyone making this comparison, he remarked, 'will think it so great, that man may be said to be a god unto man'.68 # **We may be forgiven for blinking, but in Bacon's thought 'man' was indeed in the process of stealing a new fire from the heavens and seizing God's power over the world for itself. Not only would the new empirical science lead to 'an improvement of mankind's estate, and an increase in their power over nature', but would reverse the primordial humiliation** of the Fall of Adam: For man, by the fall, lost at once his state of innocence, and his empire over creation, both of which can be partially recovered even in this life, the first by religion and faith, the second by the arts and sciences. For creation did not become entirely and utterly rebellious by the curse, but in consequence of the Divine decree, 'in the sweat of thy brow thou shalt eat bread'; she is now compelled by our labours (not assuredly by our disputes or magical ceremonies) at length to afford mankind in some degree his bread...69 # **There is a breathtaking, world-creating hubris in this statement -- one that, in many ways, came to characterise western modernity itself, and which is easily recognisable in a generation of modern technocrats like Kissinger.** The Fall of Adam was the Judeo-Christian West's primal creation myth, one that marked humankind as flawed and humbled before God, condemned to hardship and ambivalence. Bacon forecast here a return to Eden, but one of man's own making. This truly was the death of God, of putting man into God's place, and **no pious appeals to the continuity or guidance of faith could disguise the awesome epistemological violence which now subordinated creation to man**. Bacon indeed argued that inventions are 'new creations and imitations of divine works'. As such, there is nothing but good in science: 'the introduction of great inventions is the most distinguished of human actions...inventions are a blessing and a benefit without injuring or afflicting any'.70 # And what would be mankind's 'bread', the rewards of its new 'empire over creation'**? If the new method and invention brought modern medicine, social welfare, sanitation, communications, education and comfort, it also enabled the Armenian genocide, the Holocaust and two world wars; napalm, the B52, the hydrogen bomb, the Kalashnikov rifle and military strategy. Indeed some of the 20th Century's most far-reaching inventions** -- radar, television, rocketry, computing, communications, jet aircraft, the Internet -- **would be the product of drives for national security and militarisation. Even the inventions Bacon thought so marvellous and transformative -- printing, gunpowder and the compass -- brought in their wake upheaval and tragedy: printing, dogma and bureaucracy; gunpowder, the rifle and the artillery battery; navigation, slavery and the genocide of indigenous peoples. In short, the legacy of the new empirical science would be ambivalence as much as certainty; degradation as much as enlightenment; the destruction of nature as much as its utilisation**. Doubts and Fears: Technology as Ontology # If Bacon could not reasonably be expected to foresee many of these developments, the idea that scientific and technological progress could be destructive did occur to him. However it was an anxiety he summarily dismissed: ...let none be alarmed at the objection of the arts and sciences becoming depraved to malevolent or luxurious purposes and the like, for the same can

be said of every worldly good; talent, courage, strength, beauty, riches, light itself...Only let mankind regain their rights over nature, assigned to them by the gift of God, and obtain that power, whose exercise will be governed by right reason and true religion.71 # By the mid-Twentieth Century, after the destruction of Hiroshima and Nagasaki, such fears could no longer be so easily wished away, as the physicist and scientific director of the Manhattan Project, J. Robert Oppenheimer recognised. He said in a 1947 lecture: We felt a particularly intimate responsibility for suggesting, for supporting and in the end in large measure achieving the realization of atomic weapons...In some sort of crude sense which no vulgarity, no humor, no over-statement can quite extinguish, the physicists have known sin, and this is a knowledge they cannot lose.72 # Adam had fallen once more, but into a world which refused to acknowledge its renewed intimacy with contingency and evil. Man's empire over creation -- **his discovery of the innermost secrets of matter and energy, of the fires that fuelled the stars -- had not 'enhanced human power and dignity' as Bacon claimed, but instead brought destruction and horror. Scientific powers that had been consciously applied in the defence of life and in the hope of its betterment now threatened its total and absolute destruction**. This would not prevent a legion of scientists, soldiers and national security policymakers later attempting to apply Bacon's faith in invention and Descartes' faith in mathematics to make of the Bomb a rational weapon. # Oppenheimer -- who resolutely opposed the development of the hydrogen bomb -- understood what the strategists could not: that **the weapons resisted control, resisted utility, that 'with the release of atomic energy quite revolutionary changes had occurred in the techniques of warfare'**.73 Yet Bacon's legacy, one deeply imprinted on the strategists, was his view that truth and utility are 'perfectly identical'.74 In 1947 Oppenheimer had clung to the hope that 'knowledge is good...it seems hard to live any other way than thinking it was better to know something than not to know it; and the more you know, the better'; by 1960 he felt that 'terror attaches to new knowledge. It has an unmooring quality; it finds men unprepared to deal with it.'75 # Martin Heidegger questioned this mapping of natural science onto the social world in his essays on technology -- which, as 'machine', has been so crucial to modern strategic and geopolitical thought as an image of perfect function and order and a powerful tool of intervention. He commented that, given that modern technology 'employs exact physical science...the deceptive illusion arises that modern technology is applied physical science'.76 Yet as the essays and speeches of Oppenheimer attest**, technology and its relation to science, society and war cannot be reduced to a noiseless series of translations of science for politics, knowledge for force, or force for good**. # Instead, Oppenheimer saw a process frustrated by roadblocks and ruptured by irony; in his view there was no smooth, unproblematic translation of scientific truth into social truth, and technology was not its vehicle. **Rather his comments raise profound and painful ethical questions that resonate with terror and uncertainty.** Yet this has not prevented technology becoming a potent object of desire, not merely as an instrument of power but as a promise and conduit of certainty itself. In the minds of too many rational soldiers, strategists and policymakers, **technology brings with it the truth of its enabling science and spreads it over the world. It turns epistemological certainty into political certainty; it turns control over 'facts' into control over the earth**. # Heidegger's insights into this phenomena I find especially telling and disturbing -- because they underline the ontological force of the instrumental view of politics. In The Question Concerning Technology, Heidegger's striking argument was that in the modernising West technology is not merely a tool, a 'means to an end'. Rather technology has become a governing image of the modern universe, one that has come to order, limit and define human existence as a 'calculable coherence of forces' and a 'standing reserve' of energy. Heidegger wrote: 'the threat to man does not come in the first instance from the potentially lethal machines and apparatus of technology. The actual threat has already affected man in his essence.'77 # This process Heidegger calls 'Enframing' and through it the scientific mind demands that 'nature reports itself in some way or other that is identifiable through calculation and remains orderable as a system of information'. **Man is not a being who makes and uses machines as means, choosing and limiting their impact on the world for his ends; rather man has imagined the world as a machine and humanity everywhere becomes trapped within its logic. Man, he writes, 'comes to the very brink of a precipitous fall...where he himself will have to be taken as standing-reserve. Meanwhile Man, precisely as the one so threatened, exalts himself to the posture of lord of the earth.'78 Technological man not only becomes the name for a project of lordship and mastery over the earth, but incorporates humanity within this project as a calculable resource. In strategy, warfare and geopolitics human bodies, actions and aspirations are caught, transformed and perverted by such calculating, enframing reason: human lives are reduced to tools, obstacles, useful or obstinate matter.**

Focus on security undermines human security and human rights

Aravena 2 (Francisco Rojas, Aravena is Director of the Facultad Latinoamericana de Ciencias Sociales (FLACSO)-Chile, Human Security: Emerging Concept of Security in the Twenty-First Century, 2002, http://www.peacepalacelibrary.nl/ebooks/files/UNIDIR_pdf-art1442.pdf)

Globalization has universalized such values as human rights, democracy and the market.22 This 'universalization' has a strongly western flavour. Associated technological and economic processes have generated greater global interdependence with both positive and negative aspects, such as increased trade, wider dissemination of scientific knowledge and more global information. There is also greater danger to the environment, terrorism has acquired a global dimension, organized crime is worldwide, and financial crises know no borders. Generating stability and global governance without proper institutions is hard. Significant deficiencies can be observed in this area. In turn, there is increasing differentiation and multiplication of international actors and that has a bearing on the degree of importance and means of power with which each one deals with the processes and seeks to influence future courses of action. A vision of the future is essential. In **this framework within the international system's current period, various different global concepts in specific areas such as security have not been honed. Human security visualizes a new global order founded on global humanism. The core issue is to solve the population's basic needs within the framework of globalization and interdependence.** This delicate balance demands, on the one hand, a tendency to unify behaviour, consumption and ideals centred on universal values and, on the other, the requirement to recognize and respect diversity and particular identities and cultures. We have seen, however, that globalization also increases differences and does not—in and of itself—meet any needs. **It also has an adverse effect on cultural practices and national and local identities. All of this is taking place in a context of economic and social polarization in various areas of the world. The result is local ungovernability, which transfers instability to the global system and regional sub-systems. A 'zero-sum' security concept asserts that there is no absolute security and that the greater security of one actor must mean a greater degree of insecurity for another. In the case of human security, we can assert that the vulnerabilities of one are manifested as vulnerabilities of all.** For example, in Latin America this requires that we pay greater attention to and seek more alternatives for the Colombian conflict.

2NC – Perm

The permutation fails – you can't re-appropriate your security discourse—the 1AC leaves it unquestioned

Burke 2 (Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales "Aporias of Security," January-March 2002, http://www.jstor.org/stable/40645035?seq=1#page_scan_tab_contents)

Thus **humanist critiques of security uncover an aporia within the concept of security. An aporia is an event that prevents a metaphysical discourse from fulfilling its promised unity--not a contradiction that can be brought into the dialectic, smoothed over, and resolved into the unity of the concept, but an untotalizable problem at the heart of the concept, disrupting its trajectory, emptying out its fullness, opening out its closure**. Derrida writes of aporia being an "impasse," a path that cannot be traveled; an "interminable experience" that, however, "must remain if one wants to think, to make come or to let come any event of decision or responsibility." (13) As an event, Derrida sees the aporia as something like a stranger crossing the threshold of a foreign land: yet **the aporetic stranger "does not simply cross a given threshold" but "affects the very experience of the threshold . . . to the point of annihilating or rendering indeterminate all the distinctive signs of a prior identity, beginning with the very border that delineated a legitimate home and assured lineage, names and language**." (14)

Thus it is important to open up and focus on **aporias: they bring possibility, the hope of breaking down the hegemony and assumptions of powerful political concepts, to think and create new social, ethical, and economic relationships outside their oppressive structures of political and epistemological order**--in short, they help us to think new paths. Aporias mark not merely the failure of concepts but a new potential to experience and imagine the impossible. This is where the critical and life-affirming potential of genealogy can come into play. My particular concern with **humanist discourses of security is that**, whatever their critical value, they **leave in place (and possibly strengthen) a key structural feature of the elite strategy they oppose: its claim to embody truth and fix the contours of the real. In particular, the ontology of security/threat or security/insecurity--which forms the basic condition of the real for mainstream discourses of international policy--remains powerfully in place, and security's broader function as a defining condition of human experience and modern political life remains invisible and unexamined. This is to abjure a powerful critical approach that is able to question the very categories in which our thinking, our experience, and actions remain confined.**

Permutation only masks the security logic of the 1AC guaranteeing violence

Burke 7 (Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales, "Ontologies of War: Violence, Existence and Reason," December 7th 2007,https://muse.jhu.edu/login?auth=0&type=summary&url=/journals/theory_and_event/v010/10.2burke.html)

Schmitt claims that his theory is not biased towards war as a choice ('It is by no means as though the political signifies nothing but devastating war and every political deed a military action...it neither favours war nor militarism, neither imperialism nor pacifism') **but it is hard to accept his caveat** at face value.36 **When such a theory takes the form of a social discourse** (which it does in a general form) **such an ontology can only support, as a kind of originary ground, the** basic Clausewitzian **assumption that war can be a rational way of resolving political conflicts -- because the import of Schmitt's argument is that such 'political' conflicts are ultimately expressed through the possibility of war. As he says: 'to the enemy concept belongs the ever-present possibility of combat'.37 Where Schmitt meets Clausewitz, as I explain further below, the existential and rationalistic ontologies of war join into a closed circle of mutual support and justification.**

The permutation's is a cover for a flawed ontology—dooms their action to replicate violence.

Burke 7 ((Anthony Burke, Senior Lecturer at School of Politics and International Relations at University of New South Wales, "Ontologies of War: Violence, Existence and Reason," December 7th 2007, https://muse.jhu.edu/login?auth=0&type=summary&url=/journals/theory_and_event/v010/10.2burke.html)

I was motivated to begin the larger project from which this essay derives by a number of concerns. I felt that the **available critical, interpretive or performative languages of war -- realist and liberal international relations theories, just war theories**, and various Clausewitzian derivations of strategy -- **failed us, because they either perform or refuse to place under suspicion the underlying political ontologies that I have sought to unmask and question here. Many realists have quite nuanced and critical attitudes to the use of force, but ultimately affirm strategic thought and remain embedded within the existential framework of the nation-state. Both liberal internationalist and just war doctrines seek mainly to improve the accountability of decision-making in security affairs and to limit some of the worst moral enormities of war, but** (apart from the more radical versions of cosmopolitanism) **they fail to question the ontological claims of political community or strategic theory**.82 # In the case of a theorist like Jean Bethke Elshtain, just war doctrine is in fact allied to a softer, liberalised form of the Hegelian-Schmittian ontology. She dismisses Kant's Perpetual Peace as 'a fantasy of at-oneness...a world in which differences have all been rubbed off' and in which 'politics, which is the way human beings have devised for dealing with their differences, gets eliminated.'83 She remains a committed liberal democrat and espouses a moral community that stretches beyond the nation-state, which strongly contrasts with Schmitt's hostility to liberalism and his claustrophobic distinction between friend and enemy. However her image of politics -- which at its limits, she implies, requires the resort to war as the only existentially satisfying way of resolving deep-seated conflicts -- reflects much of Schmitt's idea of the political and Hegel's ontology of a fundamentally alienated world of nation-states, in which war is a performance of being. She categorically states that any effort to dismantle security dilemmas 'also requires the dismantling of human beings as we know them'.84 Whilst this would not be true of all just war advocates, I suspect that even as they are so concerned with the ought, moral theories of violence grant too much unquestioned power to the is. The problem here lies with the confidence in being -- of 'human beings as we know them' -- which ultimately fails to escape a Schmittian architecture and thus eternally exacerbates (indeed reifies) antagonisms. **Yet we know from the work of Deleuze and especially William Connolly that exchanging an ontology of being for one of becoming, where the boundaries and nature of the self contain new possibilities through agonistic relation to others, provides a less destructive and violent way of acknowledging and dealing with conflict and difference**.85 # My argument here, whilst normatively sympathetic to Kant's moral demand for the eventual abolition of war, militates against excessive optimism.86 Even as I am arguing that war is not an enduring historical or anthropological feature, or a neutral and rational instrument of policy -- that it **is** rather **the product of hegemonic forms of knowledge about political action and community** -- my analysis does suggest some sobering conclusions about its power as an idea and formation. Neither the progressive flow of history nor the pacific tendencies of an international society of republican states will save us. **The violent ontologies I have described here in fact dominate the conceptual and policy frameworks of modern republican states and have come, against everything Kant hoped for, to stand in for progress, modernity and reason**. Indeed what Heidegger argues, I think with some credibility, is that the enframing world view has come to stand in for being itself. Enframing, argues Heidegger, 'does not simply endanger man in his relationship to himself and to everything that is...it drives out every other possibility of revealing...the rule of Enframing threatens man with the possibility that it could be denied to him to enter into a more original revealing and hence to experience the call of a more primal truth.'87 # What I take from Heidegger's argument -- **one that I have sought to extend by analysing the militaristic power of modern ontologies of political existence and security -- is a view that the challenge is posed not merely by a few varieties of weapon, government, technology or policy, but by an overarching system of thinking and understanding that lays claim to our entire space of truth and existence. Many of the most destructive features of contemporary modernity -- militarism, repression, coercive diplomacy, covert intervention, geopolitics, economic exploitation and ecological destruction -- derive not merely from particular choices by policymakers based on their particular interests, but from calculative, 'empirical' discourses of scientific and political truth rooted in powerful enlightenment images of being**. Confined within such an epistemological and cultural universe, policymakers' choices become necessities, their actions become inevitabilities, and humans suffer and die. Viewed in this light, 'rationality' is the name we give the chain of reasoning which builds one structure of truth on another until a course of action, however violent or dangerous, becomes preordained through that reasoning's very operation and existence. It creates both discursive constraints -- available choices may simply not be seen as credible or legitimate -- and material constraints that derive from

the mutually reinforcing cascade of discourses and events which then preordain militarism and violence as necessary policy responses, however ineffective, dysfunctional or chaotic.

Case

Economy Advantage

DeDev – 1NC

Growth rates are unsustainable – we are exceeding the earth's biophysical limits

Klitgaar and Krall 11 (Kent A. Klitgaard, , Lisi Krall, ,"Ecological economics, degrowth, and institutional change", 12/12/2011, Ecological Economics journal issue no. 84 pages 247-248, www.elsevier.com/ locate/ecolecon)

The age of economic growth is coming to an end. The mature economies of the industrial North have already entered the initial stages of the era of degrowth. This is evidenced by data that show overall economic activity has increased at a decreasing rate since the "Golden Age" of 1960s postwar capitalism turned into the era of stagflation in the 1970s. Despite the supposed revival of growth in the neoliberal age, percentage growth rates have continued their secular decline. In the United States real GDP growth was lower in the1980s and 1990s than in the 1970s and lower still in the first years of the 21st century (Tables 1). While percentage growth rates may have declined over the last five decades the absolute size of the economy, as measured by real gross domestic product (for all its flaws) has increased, more than tripling from 1970 until 2011. This creates a dilemma within our present institutional context. Absolute growth, which uses more resources, especially fossil fuel resources, destroys more habitat, and emits more carbon and other pollutants into the planet's sinks, has grown exponentially. At the same time, relative, or percentage growth, upon which employment depends, has fluctuated over the same decades and shows a downward trend. We are growing too fast to remain within the limits of the biophysical system. At the same time the world economy is growing too slowly to provide sufficient employment and there appears to be a secular decline at work. Despite rapid and sustained rates of economic growth in many newly emerging market economies (e.g. Brazil, India and China) patterns of declining growth rates also exist for the world economy (Table 2). The reduction in the long-term growth rates, especially for mature market economies, is not something we must contend with in the distant future. They have been occurring for decades. Neither are they simply the result of "misguided" policy, as growth rates have fallen in times of both liberal and conservative policy regimes. Rather, we believe the growth rate decline is embedded deeply within the institutional structure of the economy, as well as within biophysical limits. Clearly a better understanding of the complex dynamics of the interactions of the economic and biophysical systems is needed to provide important insights for the degrowth and steady-state agendas. While ecological economics has addressed ecological limits, it has not explored as fully the limits to growth inherent in a market system. The analysis of biophysical limits has been the strength of ecological economics. Beginning with the work of Herman Daly, who placed the economy within the context of a finite and non-growing biophysical system, through the first 1997 text by Robert Costanza and colleagues, ecological economists have carefully delineated limits such as the climate change, the human appropriation of the products of photosynthesis, and biodiversity loss (Costanza et al., 1997). Subsequent analyses by Rees and Wackernagel showed that the human ecological footprint now exceeds the earth's biocapacity, and the Limits to Growth studies by Meadows et al. concluded that human activity has overshot the carrying capacity and the scale of human activity is unlikely to be maintained into the next century. The work of many energy analysts (Campbell, 2005; Campbell and Laherrere, 1998; Deffeyes, 2001; Hall and Klitgaard,

2011; Hallock et al., 2004; Heinberg, 2005; Simmons, 2006) concludes that we are at or near the global peak of fossil hydrocarbons and future economic activity will be impacted strongly by more expensive and less available petroleum. The second set of limits is internal and is to be found in the dynamics of the accumulation process, involving the complex structural interaction of production, consumption, and distribution. The internal limits that gear the economy toward both cyclical variation and secular stagnation have not been considered systematically by ecological economists. When the economy reached these limits historically the result has been a series of periodic recessions and depressions. Renewed growth has been the answer, just as it is now. If the system reaches its own internal limits at the same time the world reaches its external biophysical limits we will have a profound challenge because we need a way to facilitate decent standards of living when economic growth can no longer be the vehicle to maintain incomes and assure social stability. In the last instance, a system in overshoot can neither growits way out of its inherent tendency toward stagnation, nor can it grow its way into sustainability. We believe it is unlikely that the present system of capitalism, dominated by multinational corporations, globalization, speculative finance, and dependence upon fossil fuels, can adjust to the era of degrowth and remain intact as is. In order to devise an economy that meets human needs as it approaches both sets of limits, ecological economics needs to understand more fully the structural and institutional dimensions of the internal and external limits, as well as the interaction between the two. This is our challenge, and it is a difficult one. Ecological economics can better understand the necessary institutional configuration of the non-growing economy only by an improved understanding of the dynamics of growth and capital accumulation, because it is here that the inherent tendencies to stagnate and the resolution to stagnation are found.

Only econ collapse solves in the necessary timeframe

Abramsky (visiting fellow at the Institute of Advanced Studies in Science, Technology and Society; fmr. coordinator of the Danish-based World Wind Energy Institute) **10**
(Koyla, Racing to "Save" the Economy and the Planet: Capitalist or Post capitalist Transition to a Post-petrol World?, in Sparking A Worldwide Energy Revolution, ed. Koyla Abramsky, pg. 7)

The stark reality is that the only two recent periods that have seen a major reduction in global CO2 emissions both occurred in periods of very sudden, rapid, socially disruptive, and painful periods of forced economic degrowth-namely the breakdown of the Soviet bloc and the current financial-economic crisis. Strikingly, in May 2009, the International Energy Agency reported that, for the first time since 1945, global demand for electricity was expected to fall. Experience has town that a lot of time and political energy have been virtually wasted on developing a highly-ineffective regulatory framework to tackle climate change. Years of COPs and MOPs-the international basis for regulatory efforts have simply proven to be hot am And, not surprisingly, hot air has resulted in global warming. **Only unintended degrowth** has had the effect that years of intentional regulations sought to achieve. Yet, the dominant approaches to-climate change continue to focus on promoting regulatory reforms, rather than on more fundamental changes in social relations. This is true for governments, multilateral institutions, and also large sectors of so-called 'civil society:' especially the major national and international trade unions and their federations, and NOOs. And despite the patent inadequacy of this approach, regulatory efforts will certainly continue to be pursued. Furthermore, they may well **contribute to shoring up legitimacy**, at least in the short term, and in certain predominantly-northern countries where the effects Of climate changes are less immediately visible and impact on pepplds lives less directly. Nonetheless, it is becoming increasingly clear that solutions will not be found at this level.

The impact is linear – the greater growth, the quicker extinction happens. It magnifies all impacts and social problems

Pradanos 15 (Luis Pradanos, writer and Assistant Professor of Spanish at Miami University, "An economy focused solely on growth is environmentally and socially unsustainable", 4/7/2015, The Conversation, http://theconversation.com/an-economy-focused-solely-on-growth-is-environmentally-and-socially-unsustainable-39761)

Most world leaders seem to believe that economic growth is a panacea for many of society's problems. Yet there are many links between our society's addiction to economic growth, the disturbing ecological crisis, the rapid rise of social inequality and the decline in the quality of democracy. These issues tend to be explored as disconnected topics and often misinterpreted or manipulated to match given ideological preconceptions and prejudices. The fact is that they are deeply interconnected processes. A large body of data and research has emerged in the last decade to illuminate such connections. Studies in social sciences consistently show that, in rich countries, greater economic growth on its own does very little or nothing at all to enhance social well-being. On the contrary, reducing income inequality is an effective way to resolve social problems such as violence, criminality, imprisonment rates, obesity and mental illness, as well as to improve children's educational performance, population life expectancy, and social levels of trust and mobility. Comparative studies have found that societies that are more equal do much better in all the aforementioned areas than more unequal ones, independent of their gross domestic product (GDP). Economist Thomas Piketty, in his recent book Capital in the Twenty-First Century, has assembled extensive data that shows how unchecked capitalism historically tends to increase inequality and undermine democratic practices. The focus of a successful social policy, therefore, should be to reduce inequality, not to grow the GDP for its own sake. Placing economic growth above all else contributes to environmental degradation and social inequality. Concurrently, recent developments in earth system science are telling us that our frenetic economic activity has already transgressed several ecological planetary boundaries. One could argue that the degradation of our environmental systems will jeopardize socioeconomic stability and worldwide well-being. Some scientists suggest that we are in a new geological epoch, the Anthropocene, in which human activity is transforming the earth system in ways that may compromise human civilization as we know it. Many reports insist that, if current trends continue, humanity will soon face dire and dramatic consequences. If we consider all these findings as a whole, a consistent picture emerges, and the faster the global economy grows, the faster the living systems of the planet collapse. In addition, this growth increases inequality and undermines democracy, multiplying the number of social problems that erode human communities. In a nutshell, we have created a dysfunctional economic system that, when it works according to its self-imposed mandate of growing the pace of production and consumption, destroys the ecological systems upon which it depends. And when it does not grow, it becomes socially unsustainable. In a game with these rules, there is no way to win!

Growth is not sustainable—models prove

Fagnart 14 (Jean-Francois Fagnart, Marc Germain, "Energy, complexity and sustainable long-term growth", *Elsevier,* September 2nd, 2014)

This note has reconsidered what type of long-term growth is possible in a model with expanding product variety à la Gross- man and Helpman (1991) where all human activities require en- ergy. In this framework, we have linked the complexity of final production to the number of different components (or inputs) en- tering into its assembly process. We have considered two cases, whether complexity is costly or not, i.e. whether product complex- ity increases the energy requirements of production operations or not. A balanced growth path combining ''quantitative'' and ''non- quantitative'' growth has appeared possible only if the potential of energy efficiency gains is unbounded in all (production and re- search) activities. This requires in particular a decrease (towards zero) of the energy intensiveness of final production in spite of its increased complexity. Less optimistic assumptions unavoidably lead to less favourable long-term growth scenarios. If the energy intensiveness of intermediate and/or final productions is bounded from below by a strictly positive constant, quantitative growth is not sustainable in the long-run but a purely ''non-quantitative'' growth path remains possible (i) if the impact of complexity on energy consumption is nil or not too strong and (ii) if the energy intensiveness of the innovation process (the research activities in the present model) tends towards zero. If either one of these two conditions is not met, zero-growth is the most favourable long-run scenario. It is not obvious to assess the realism of the conditions under which long-term growth (even limited to its ''non quantitative'' dimension) is possible. First, even though common perception suggests an increasing complexity of human productions and pro- cesses, and of the economy as a whole, we do not have at our dis- posal an ''objective'' index of the complexity of our economies. A fortiori, we do not have a quantification of the link between complexity and energy intensiveness at the aggregate level. How- ever, the present note tends to reinforce the pessimistic view of ecological economics with respect to the feasibility of long-term growth: in a finite world, even the intermediary case of a purely non-quantitative long-term growth is only feasible under rather restrictive conditions, as discussed above.

Economic growth kills the environment – scientific study proves

Ahmet Atıl **Asici**, Istanbul Technical University, 6-18-20**12**, "Economic growth and its impact on environment: A panel data analysis" Ecological Indicators.

3. Methodology 3.1. Data and descriptive analysis: **With a panel of 213 low, middle and high-income countries, between 1970 and 2008, we employ a panel regression analysis to investigate** the relationship between log real per capita income and log real pressure on nature. Our dependent variable, per capita pressure on nature, in constant 2005 US $, is defined as; Pressure on nature p.c. = carbon dioxide damage p.c. +mineral depletion p.c. +energy depletion p.c. +net forest depletion p.c. Unless otherwise indicated, all variables are extracted from World Development Indicator (WDI) database3 of the World Bank (World Bank, 2012), and are summarized in Table 2. See Table A1 for a detailed explanation and sources of all variables. Table 1 shows that the pressure on nature takes different forms in different income groups. Comparatively, net deforestation and mineral depletion in low-income countries, energy depletion and CO2 damage in middle-income countries and energy depletion in high-income countries constitute the major sources of the pressure on nature. When we look at the shares of each component in the total pressure on nature, we come up with a similar picture. In Fig. 1 we see that, in high and middle income countries CO2 damage and energy depletion constitute the majority of the total pressure on nature, whereas in low income countries, it is dominated by forest depletion, followed by CO2 damage and mineral depletion. This uneven distribution of components across different income groups requires more attention and we will turn back to this issue in the regression analysis part. Preliminary cross-country **analysis**, by using the plot diagram in Fig. 2, **reveals** that there is a positive relationship between income and pressure on nature. In other words, **as countries grow richer, so do their pressure on nature.** However, the relationship is not linear across different income groups. Due to the possible existence of endogeneity and omitted variable biases cross-country relationship does not necessarily prove causation. Consider for example Turkey and Finland. Finland is richer and exerts less pressure on her nature, so a simple crosscountry comparison would suggest that higher per capita income causes less pressure on nature. But the right question to ask should be whether a country is more likely to exert less pressure on nature as it becomes richer or not. In Fig. 3, we plot the changes in log per capita income against changes in pressure on nature between 1970 and

2008. This helps to eliminate the time-invariant country- fixed effects. But even after eliminating them, the positive relation between income and pressure on nature remains. While differencing variables helps to remove the time-invariant characteristics of countries, it does not necessarily heal the simultaneity bias. That is, the positive relationship emerged in the plot-diagram may be arisen due to some other factor affecting both economic growth and pressure on nature. The preliminary analysis of the data by plot diagrams presented in Figs. 2 and 3 helps us to find the right econometric method to study the economic growth-environmental pressure relationship. We will come back to this issue in the next subsection. Table 2 presents the descriptive statistics of the observations included in the regression analysis.

Economic growth kills the environment – data shows income, trade, and open structure increase pressure on nature

Ahmet Atıl **Asici**, Istanbul Technical University, 6-18-20**12**, "Economic growth and its impact on environment: A panel data analysis" Ecological Indicators.

In other components, like mineral depletion and CO2 damage, regression results indicate a negative scale effect of increasing income. As for energy depletion, we do not find a statistically significant effect. Lastly, we investigate the influences of some structural and institutional covariates. Table 7 presents the fixed-effects IV model results. The results are fairly supportive of the race-to-the-bottom hypothesis which asserts that countries tend to lower down their environmental standards in order to attract more investment. Increasing integration to the global system through trade increases the pressure on environment. We found that 10% increase in openness ratio increases the per capita pressure on nature by 9.5%. This is in line with the conclusion reached by Borghesi and Vercelli (2003). The regression results support our hypothesis that the governance structure is positively related with environmental sustainability which also confirms the findings of the earlier studies mentioned above. More specifically, we found that a unit increase in the rule of law indicator decreases the per capita pressure on nature by 0.5%. Together with the effects of increasing openness to trade, **the positive relationship between rule of law** (or quality of institutions) **and environmental protection calls for a closer look at the current globalization patterns**. The environmental consequences of deregulation efforts by international institutions like IMF, WB and WTO during the sample period is worth to mention. As Tisdell (2001) and Esty (2001) argue, existing environmental and social constraints were gradually eroded by the indiscriminate deregulation of world trade. In the same spirit, Daly (1993) argues that free trade promotes competition that results in lowering of environmental standards as well as wages, which in turn, increases environmental degradation in developing and unemployment in high-income countries. The experience of Mexico, as a middleincome country receiving a good deal of foreign direct investment especially after the NAFTA agreement is telling. Steininger (1994) reports that lower environmental standards in Mexico played a crucial role in the concentration of maquiladoras along the USbordering area, and this resulted in increasing unemployment in US and environmental damage and health problems in Mexico. Coming to the education, we find a statistically significant result between the secondary school enrollment rate and pressure on nature, yet the positive sign of the estimate is not as expected, possibly due to the very limited availability of data especially for low and middle-income countries. Overall, we see that even after controlling for various structural and institutional indicators, the positive relationship between income and pressure on nature continues to hold. 5. Concluding remarks Our results suggest that **there is a positive relationship between income per capita and per capita pressure on nature.** The effect is much stronger in middle-income countries than in low and high-income countries. After controlling for various covariates, institutional and structural, the positive effect still continues to hold. Our conclusions are fairly robust to the inclusion of these covariates, and to the inclusion and exclusion of countries from the sample. The regression results shed doubts on the environmental sustainability of the growth process especially in middle-income countries. Increasing prosperity leads more consumption and thereby more pressure on nature especially in the form of CO2 damage and mineral depletion. However, we found an opposite effect on forestry resources. The institutional quality, as measured by the extent of enforceability of rule of law, has a significant negative effect on the pressure on nature along with our expectations. Our results suggest that **increasing trade has a negative impact on environment** and this finding clearly can be taken as a support for race-to-the-bottom hypothesis. Although the formulation of MDGs clearly demonstrates that economic growth and environmental protection are mutually reinforcing, there are serious doubts on our ability in decoupling of economic growth from pressure on nature in absolute terms (Moldan et al., 2011). Our results support those studies indicating that the current economic growth paradigm is unsustainable especially in middle-income countries. Given the increasing importance of these countries as recipients of FDI flows and as producers in the global supply chain, achieving environmental sustainability without jeopardizing the other determinants of human welfare continues to be a big challenge that has to be confronted.

It's resilient—global economic governance worked

Drezner 12 – Daniel is a professor in the Fletcher School of Law and Diplomacy at Tufts. ("The Irony of Global Economic Governance: The System Worked", October 2012, http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf)

It is equally possible, however, that a renewed crisis would trigger a **renewed surge in policy coordination**. As John Ikenberry has observed, "the complex interdependence that is unleashed in an open and loosely rule-based order generates some expanding realms of exchange and investment that result in a growing array of firms, interest groups and other sorts of political stakeholders who seek to preserve the stability and openness of the system."[103] **The post-2008 economic order has remained open**, entrenching these interests even more across the globe. Despite uncertain times, the open economic system that has been in operation since 1945 **does not appear to be closing anytime soon**.

Global Econ Resiliant – 2NC

Now, the global economy is resilient – 2008 proves economic decline could trigger renewed growth measurements that are likely to maintain the post 2008 economic order. Assumes their warrants for diversionary theory and decoupling – That's Drezner

Aff is one sided scenario planning – economic decline could solve all conflict - Your evidence

Merlini 11 (Senior Fellow – Brookings)

(Cesare. A Post-Secular World? Survival, Volume 53, Issue 2 April 2011 , pages 117 – 130)

The opposite scenario contemplates not an unprecedented era of peace and prosperity, but rather continuity in the international system, with further consolidation rather than rupture. Current conflicts and those most likely to emerge from existing tensions are contained, thanks to diplomatic or coercive instruments, and major wars are avoided. Economic and financial give-and-take is kept under control and gives way to a more stable global game, including increased safeguarding of public goods such as the health of the planet. This scenario does not entail the United Nations becoming a global government, nor the European Union turning into a fully fledged federation, nor the various 'Gs' becoming boards of a global corporation. But these international

organisations, reformed to improve representativeness and effectiveness, would remain to strengthen the rule of law globally.

Global Economy is resilient

Zakaria, 9 — Ph.D. in Political Science from Harvard University and Editor of Newsweek International (Fareed, "The Secrets of Stability", Newsweek, 12/21/2009, lexis)

One year ago, the world seemed as if it might be coming apart. The global financial system, which had fueled a great expansion of capitalism and trade across the world, was crumbling. All the certainties of the age of -globalization--about the virtues of free markets, trade, and technology--were being called into question. Faith in the American model had collapsed. The financial industry had crumbled. Once-roaring emerging markets like China, India, and Brazil were sinking. Worldwide trade was shrinking to a degree not seen since the 1930s. Pundits whose bearishness had been vindicated predicted we were doomed to a long, painful bust, with cascading failures in sector after sector, country after country. In a widely cited essay that appeared in The Atlantic this May, Simon Johnson, former chief economist of the International Monetary Fund, wrote: "The conventional wisdom among the elite is still that the current slump 'cannot be as bad as the Great Depression.' This view is wrong. What we face now could, in fact, be worse than the Great Depression." Others predicted that these economic shocks would lead to political instability and violence in the worst-hit countries. At his confirmation hearing in February, the new U.S. director of national intelligence, Adm. Dennis Blair, cautioned the Senate that "the financial crisis and global recession are likely to produce a wave of economic crises in emerging-market nations over the next year." Hillary Clinton endorsed this grim view. And she was hardly alone. Foreign Policy ran a cover story predicting serious unrest in several emerging markets. Of one thing everyone was sure: nothing would ever be the same again. Not the financial industry, not capitalism, not globalization. One year later, how much has the world really changed? Well, Wall Street is home to two fewer investment banks (three, if you count Merrill Lynch). Some regional banks have gone bust. There was some turmoil in Moldova and (entirely unrelated to the financial crisis) in Iran. Severe problems remain, like high unemployment in the West, and we face new problems caused by responses to the crisis--soaring debt and fears of inflation. But overall, things look nothing like they did in the 1930s. The predictions of economic and political collapse have not materialized at all. A key measure of fear and fragility is the ability of poor and unstable countries to borrow money on the debt markets. So consider this: the sovereign bonds of tottering Pakistan have returned 168 percent so far this year. All this doesn't add up to a recovery yet, but it does reflect a return to some level of normalcy. And that rebound has been so rapid that even the shrewdest observers remain puzzled. "The question I have at the back of my head is 'Is that it?' " says Charles Kaye, the co-head of Warburg Pincus. "We had this huge crisis, and now we're back to business as usual?" This revival did not happen because markets managed to stabilize themselves on their own. Rather, governments, having learned the lessons of the Great Depression, were determined not to repeat the same mistakes once this crisis hit. By massively expanding state support for the economy--through central banks and national treasuries--they buffered the worst of the damage. (Whether they made new mistakes in the process remains to be seen.) The extensive social safety nets that have been established across the

industrialized world also cushioned the pain felt by many. Times are still tough, but things are nowhere near as bad as in the 1930s, when governments played a tiny role in national economies. It's true that the massive state interventions of the past year may be fueling some new bubbles: the cheap cash and government guarantees provided to banks, companies, and consumers have fueled some irrational exuberance in stock and bond markets. Yet these rallies also demonstrate the return of confidence, and confidence is a very powerful economic force. When John Maynard Keynes described his own prescriptions for economic growth, he believed government action could provide only a temporary fix until the real motor of the economy started cranking again--the animal spirits of investors, consumers, and companies seeking risk and profit. Beyond all this, though, I believe there's a fundamental reason why we have not faced global collapse in the last year. It is the same reason that we weathered the stock-market crash of 1987, the recession of 1992, the Asian crisis of 1997, the Russian default of 1998, and the tech-bubble collapse of 2000. The current global economic system is inherently more resilient than we think. The world today is characterized by three major forces for stability, each reinforcing the other and each historical in nature.

US Not Key – 1NC

Decoupling means US isn't key to the global economy

Bloomberg 10 ["Wall Street Sees World Economy Decoupling From U.S.", October 4th, 2010, http://www.bloomberg.com/news/2010-10-03/world-economy-decoupling-from-u-s-in-slowdown-returns-as-wall-street-view.html, Chetan]

The main reason for the divergence: "Direct transmission from a U.S. slowdown to other economies through exports is just not large enough to spread a U.S. demand problem globally," Goldman Sachs economists Dominic Wilson and Stacy Carlson wrote in a Sept. 22 report entitled "If the U.S. sneezes..." Limited Exposure Take the so-called BRIC countries of Brazil, Russia, India and China. While exports account for almost 20 percent of their gross domestic product, sales to the U.S. compose less than 5 percent of GDP, according to their estimates. That means even if U.S. growth slowed 2 percent, the drag on these four countries would be about 0.1 percentage point, the economists reckon. Developed economies including the U.K., Germany and Japan also have limited exposure, they said. Economies outside the U.S. have room to grow that the U.S. doesn't, partly because of its outsized slump in house prices, Wilson and Carlson said. The drop of almost 35 percent is more than twice as large as the worst declines in the rest of the Group of 10 industrial nations, they found. The risk to the decoupling wager is a repeat of 2008, when the U.S. property bubble burst and then morphed into a global credit and banking shock that ricocheted around the world. For now, Goldman Sachs's index of U.S. financial conditions signals that bond and stock markets aren't stressed by the U.S. outlook. Weaker Dollar The break with the U.S. will be reflected in a weaker dollar, with the Chinese yuan appreciating to 6.49 per dollar in a year from 6.685 on Oct. 1, according to Goldman Sachs forecasts. The bank is also betting that yields on U.S. 10-year debt will be lower by June than equivalent yields for Germany,

the U.K., Canada, Australia and Norway. U.S. notes will rise to 2.8 percent from 2.52 percent, Germany's will increase to 3 percent from 2.3 percent and Canada's will grow to 3.8 percent from 2.76 percent on Oct. 1, Goldman Sachs projects. Goldman Sachs isn't alone in making the case for decoupling. Harris at BofA Merrill Lynch said he didn't buy the argument prior to the financial crisis. Now he believes global growth is strong enough to offer a "handkerchief" to the U.S. as it suffers a "growth recession" of weak expansion and rising unemployment, he said. Giving him confidence is his calculation that the U.S. share of global GDP has shrunk to about 24 percent from 31 percent in 2000. He also notes that, unlike the U.S., many countries avoided asset bubbles, kept their banking systems sound and improved their trade and budget positions. Economic Locomotives A book published last week by the World Bank backs him up. "The Day After Tomorrow" concludes that developing nations aren't only decoupling, they also are undergoing a "switchover" that will make them such locomotives for the world economy, they can help rescue advanced nations. Among the reasons for the revolution are greater trade between emerging markets, the rise of the middle class and higher commodity prices, the book said. Investors are signaling they agree. The U.S. has fallen behind Brazil, China and India as the preferred place to invest, according to a quarterly survey conducted last month of 1,408 investors, analysts and traders who subscribe to Bloomberg. Emerging markets also attracted more money from share offerings than industrialized nations last quarter for the first time in at least a decade, Bloomberg data show. Room to Ease Indonesia, India, China and Poland are the developing economies least vulnerable to a U.S. slowdown, according to a Sept. 14 study based on trade ties by HSBC Holdings Plc economists. China, Russia and Brazil also are among nations with more room than industrial countries to ease policies if a U.S. slowdown does weigh on their growth, according to a policy- flexibility index designed by the economists, who include New York-based Pablo Goldberg. "Emerging economies kept their powder relatively dry, and are, for the most part, in a position where they could act countercyclically if needed," the HSBC group said. Links to developing countries are helping insulate some companies against U.S. weakness. Swiss watch manufacturer Swatch Group AG and tire maker Nokian Renkaat of Finland are among the European businesses that should benefit from trade with nations such as Russia and China where consumer demand is growing, according to BlackRock Inc. portfolio manager Alister Hibbert. "There's a lot of life in the global economy," Hibbert, said at a Sept. 8 presentation to reporters in London.

US Not Key – 2NC

Now, the US isn't key to the global economy - internal resolution states with countries disincentives massive violence by limiting the effects of a single nation's economic decline, proved recently by the economic devastation in Greece's minimal impact on the economy. – That's Bloomberg

U.S. not key to the global economy.

Caryl 10 [Christian, Senior Fellow at the Center for International Studies at the Massachusetts Institute of Technology and a contributing editor to Foreign Policy. His column, "Reality Check," appears weekly on ForeignPolicy.com, Crisis? What Crisis? APRIL 5, 2010, http://www.foreignpolicy.com/articles/2010/04/05/crisis_what_crisis?page=full]

Many emerging economies entered the 2008-2009 crisis with healthy balance sheets. In most cases governments reacted quickly and flexibly, rolling out stimulus programs or even expanding poverty-reduction programs. Increasingly, the same countries that have embraced globalization and markets are starting to build **social safety nets.** And there's another factor: Trade is becoming **more evenly distributed** throughout the world. China is now a bigger market for Asian exporters than the United States. Some economists are talking about **"emerging market decoupling."** Jonathan Anderson, an emerging-markets economist at the Swiss bank UBS, showed in one recent report how car sales in emerging markets have actually been rising during this latest bout of turmoil -- powerful evidence that **emerging economies no longer have to sneeze when America catches a cold**. Aphitchaya Nguanbanchong, a consultant for the British-based aid organization Oxfam, has studied the crisis's effects on Southeast Asian economies. "The research so far shows that the result of the crisis isn't as bad as we were expecting," she says. Indonesia is a case in point: "People in this region and at the policy level learned a lot from the past crisis." Healthy domestic demand cushioned the shock when the crisis hit export-oriented industries; the government weighed in immediately with hefty stimulus measures. Nguanbanchong says that she has been surprised by the extent to which families throughout the region have kept spending money on education even as incomes have declined for some. And that, she says, reinforces a major lesson that emerging-market governments can take away from the crisis: "Governments should focus more on social policy, on health, education, and services. They shouldn't be intervening so much directly in the economy itself."

Doesn't Lead to War – 1NC

No impact—statistics prove

Drezner 12 – Daniel is a professor in the Fletcher School of Law and Diplomacy at Tufts. ("The Irony of Global Economic Governance: The System Worked", October 2012, http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf)

The final outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.37 Whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict, there were genuine concerns that the global economic downturn would lead to an increase in conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fuel impressions of surge in global public disorder.

The **aggregate data suggests otherwise**, however. The Institute for Economics and Peace has constructed a "Global Peace Index" annually since 2007. A key conclusion they draw from the 2012 report is that "The average level of peacefulness in 2012 is approximately the same as it was

in 2007."38 Interstate violence in particular has declined since the start of the financial crisis – as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has **not triggered any increase in violent conflict**; the secular decline in violence that started with the end of the Cold War has not been reversed.39 Rogers Brubaker concludes, "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."40

None of these data suggest that the global economy is operating swimmingly. Growth remains unbalanced and fragile, and has clearly slowed in 2012. Transnational capital flows remain depressed compared to pre-crisis levels, primarily due to a drying up of cross-border interbank lending in Europe. Currency volatility remains an ongoing concern. Compared to the aftermath of other postwar recessions, growth in output, investment, and employment in the developed world have all lagged behind. But the Great Recession is not like other postwar recessions in either scope or kind; expecting a standard "V"-shaped recovery was unreasonable. One financial analyst characterized the post-2008 global economy as in a state of "contained depression."41 The key word is "contained," however. Given the severity, reach and depth of the 2008 financial crisis, the proper comparison is with Great Depression. And by that standard, the outcome variables look impressive. As Carmen Reinhart and Kenneth Rogoff concluded in This Time is Different: "that its macroeconomic outcome has been only the most severe global recession since World War II – and not even worse – must be regarded as fortunate."42

Doesn't Lead to War – 2NC

Now, there Economic decline doesn't cause war – would be dis-incentivized to escalate to war if the internal state within a particular country – Prefer decoupling model – their Clarfeld evidence says countries like Europe are key to the global economy meaning the Greece debt transaction should have escalated.

Europe should have escalated – your evidence

Clarfeld 12

[Rob, Forbes Contributor, Decouple This!, 1/25/12,

http://www.forbes.com/sites/robclarfeld/2012/01/25/decouple-this/, accessed 7/20/15)

During the first few weeks of 2012, the markets are following the prevailing narrative that the U.S. economy has "decoupled" from the widely known troubles of Europe, and the somewhat less discussed prevailing risks from China. In a "decoupling" scenario, a country or region is deemed to be able to withstand the troubles going on outside of its own borders because of its own internal economic strength. I see two major problems with this thesis. First, the U.S. economy is not growing at the recently predicted robust rate of 4-5%; rather it is struggling to achieve a rate of 2-2.5%. This leaves little cushion to withstand the "contagion" from a major economic fallout from either Europe or China, or for that matter, economic shocks that have yet to surface. A significant European debt default, banking failure, natural disasters or geopolitical events, would surely impact the U.S. economy and markets beyond the current level of fragile growth – we simply don't have the levels of productivity requisite to absorb a major blow. Second, it was only a few years ago when the decoupling thesis was widely espoused following the U.S. banking crisis and ensuing recession. At the time the thinking was that the robust growth experienced in the emerging markets would be able to withstand the U.S. slowdown and pick up some of the slack in the global economy. We now know how that worked out – it didn't! When the U.S. went into a major recession it dragged down the rest of the world with it. We need to deal with it — the global economy remains highly interdependent. If a number of dominoes begin to fall, it is highly unlikely that any individual country or region will be able to escape the carnage. Again, any financial crisis would be occurring from levels of growth that have not yet fully recovered from their recessionary lows. In relative terms, some countries and regions will do better than others, but the "decoupling" thesis is highly flawed.

No link between economic decline or government instability and conflict initiation

Sirin 11 (Cigdem V. Sirin, , University of Texas at El Paso, Department of Political Science, "Is it cohesion or diversion? Domestic instability and the use of force in international crises," International Political Science Review 2011 32: 303, 5/12/11) DOI: 10.1177/0192512110380554

Specifically, when a country suffers from increased mass violence, a leader may choose to use external force with the anticipation that such foreign policy action will increase national solidarity and consequently (although indirectly) solve the problem of mass violence.4 By comparison, an economic downturn or government instability will not necessarily generate incentives for the cohesionary use of force, since increasing national solidarity does not typically constitute a

possible solution for dealing with such domestic problems. In sum, exploring the cohesionary incentives of political leaders and examining mass violence as a causal factor presents a more plausible route to untangling the relationship between domestic instability and the use of force in international crises (see DeRouen and Goldfinch, 2005). These considerations lead to my baseline hypothesis: Hypothesis 1: A country's likelihood of using external force in an international crisis increases in the presence of an increased level of mass violence within its borders. There exists a consensus among scholars that external conflict increases internal cohesion and political centralization. That said, most scholars note that the level of cohesion in a group achieved by an external conflict also depends on certain conditions pertaining to the nature of the group and   the nature of the external conflict (see Coser, 1956; Stein, 1976). Among these necessary preconditions (which act as intervening variables), the most important factors that scholars propose are (1) the presence of a degree of group consensus (solidarity) pre-dating the external conflict, and (2) a given group's perception of the external conflict as a severe threat. Regarding the nature of the external conflict, Coser (1956) – who sought to systematize and qualify Simmel's (1955) original in-group/out-group argument – differentiates between violent and non-violent conflict by arguing that only violent conflict generates a sense of a serious threat to a given group and thereby increases cohesion. Taking into account this qualification, I focus on international crises that involve violent military acts. To capture the role of pre-existing group solidarity, I take into consideration whether a given country is made up of a heterogeneous society with ethno-religious divisions. Many scholars suggest that civil violence seems to break out more frequently in countries with multiple ethnic, linguistic, or religious groups (e.g. Ellingsen, 2000; Vanhanen, 1999). I expect that one's attachment to the nation as a whole (rather than to his or her sub-national ethnic group) is likely to be weaker in a country that is composed of ethnically diverse groups compared with a country that is ethnically more homogenous. This is because sub-national group affiliations in an ethnically plural society may inhibit the potential for developing strong overall group identity affiliations at the national level. Consequently, given an identity divided between national and ethnoreligious attachments, external conflict is less likely to elicit as much cohesionary power in a plural society as it is in a more homogenous one. In such cases, the political leader of an ethnically divided country may have less incentives to resort to cohesionary external conflict and may thus choose to deal with ongoing mass violence through other policy means such as the suppression of violent groups or the co-opting of opposition groups (see Bueno de Mesquita, 1980: 361–98; Richards et al., 1993). On the other hand, I expect that a political leader of a homogenous society has more incentives to engage in external conflict in the presence of increased social unrest. This occurs because the presence of minimum divisions beyond an existing group identity at the national level makes external conflict a viable venture for increasing cohesion and, therefore, stopping ongoing mass violence. These considerations lead to the following hypothesis on the effect of mass violence, which is conditional upon the level of ethno-religious heterogeneity in a country: Hypothesis 2: Countries with lower levels of ethno-religious heterogeneity are more likely to use external force in an international crisis in the presence of an increased level of mass violence within their borders. Nevertheless, even in the presence of ethnic and religious divisions in a country, a sense of national identity may persist, especially if the defining characteristics and membership rules of such national identity go beyond ethno-religious attributes (as in the case of the United States). This brings us to the difference between civic and ethnic nationalism. Civic nationalism concerns one's membership and loyalty to a state in terms of citizenship, common laws, and political participation regardless of ethnicity and lineage (Brown, 2000; Ipperciel, 2007). Ethnic

nationalism, in contrast, defines an individual's membership in and loyalty to a nation-state in terms of ethnicity and lineage; hence, individuals belonging to different ethnicities, even if they reside in and are citizens of a state, cannot become part of the dominant national group (Alter, 1994; Ignatieff, 1993; Smith, 1991). In the case of ethnic nationalism, there already exists a strong sense of cohesion among the dominant group and little interest in extending the cohesion to domestic out-groups (see Shulman, 2002). In such instances, options for dealing with rising mass violence are likely to exclude cohesionary policy acts, since pre-existing ethnic nationalist group solidarity often produces a 'ceiling Sirin 309 effect', which limits the cohesionary influence that the external use of force may have for curbing mass violence. On the other hand, civic nationalism often fails to be the sole (or at least primary) basis for group identification and falls short of evoking strong emotional attachment to the nation. As Shulman (2002: 580) puts it: most civic components of nationhood are external to the individual, whereas ethnic and cultural components are internal. Territory, political institutions and rights, and citizenship exist outside the individual, whereas ancestry, race, religion, language, and traditions are a part of a person's physical and psychological makeup. As a result, the intensity of attachment to communities founded predominantly on the latter will likely exceed those founded predominantly on the former. When one considers regime type differences from the theoretical framework of cohesionary incentives, democracies are more likely than autocracies to promote a civic (rather than ethnic) nationalist identity (Habermas, 1996; Ipperciel, 2007; Kymlicka, 2001). Under conditions of increased mass violence, therefore, the incentives for democratic leaders to attempt to increase national cohesion through external conflict should be stronger. Accordingly, in terms of regime differences on the cohesionary use of force, I hypothesize that: Hypothesis 3a: Democracies are likely to use external force in an international crisis in the presence of an increased level of mass violence within their borders. Hypothesis 3b: In contrast to democracies, autocracies are unlikely to use external force in an international crisis in the presence of an increased level of mass violence within their borders. As a separate note, a dominant perception in the diversionary literature is that different factors of domestic instability are interchangeable with one another such that selecting one of them is a matter of conceptual taste and analytical convenience (but see, e.g., Pickering and Kisangani, 2005; Russett, 1990, 123–40). However, if different sources of domestic disturbance generate different policy incentives, the measures of domestic problems may not always act as proxies or alternatives to each other. In that sense, it would be better to incorporate these different measures simultaneously in an analytical model to control for and compare their distinctive impact on the propensity for leaders to use external force. Data and research design For empirical testing of my hypotheses, I employ data from the International Crisis Behavior (ICB) Project that covers 139 countries from 1918 to 2005. The ICB dataset is unique in the sense that it provides data on international crises and different forms of domestic problems (i.e. social, economic, and political) for a broad range of countries within a long time span. The ICB project allows one to examine the data on two different levels: actor level and system level. The variables that I use in my analyses are from the actor-level ICB dataset, with the exception of the variable 'contiguity', which I adopt from the system-level dataset. I exclude all the intra-war crises within this period to avoid confounding the results, given that such crises have already escalated to violence and war (see Brecher and Wilkenfeld, 2000; DeRouen and Sprecher, 2004). I employ a monadic analysis because the theoretical focus of this project centers on whether and how specific sources of instability in a country determine the incentives and utility of that country for using force in international crises. Specifically, I am testing whether particular sources of

310 International Political Science Review 32(3) domestic strife have an independent effect on a state's international crisis behavior rather than whether certain characteristics of the target state will influence the behavior of that state. Thus, the research question at hand requires a monadic test. Accordingly, the analytical models used here are not designed to elucidate strategic interactions between crisis actors, such as whether democracies or autocracies tend to use force against states with similar or different political systems in international crises or whether likely targets may strategically avoid violent conflict with states experiencing domestic instability. I do, however, introduce several control variables into my models to account for certain international environmental characteristics (such as power discrepancy) and crisis-specific factors (such as crisis trigger) that have been shown to affect a state's likelihood of using force in an international crisis.5 Dependent variable External use of force. The ICB 'major response' variable identifies the specific action a state takes after it perceives a threat from an event or act that triggers a crisis. This variable ranges across nine categories, from no action to violent military action. Since the focus of my analysis is the use of force, I determine the cut-off criterion for the dependent variable as violent versus non-violent acts. I collapse the variable into a dichotomous measure by coding the events that involve violent military action where the crisis actor resorts to the use of force (ICB categories 8–9; e.g. invasion of air space, border clash, etc.) as '1' and '0' otherwise (ICB categories 1–7; e.g. no response, verbal acts such as protest, economic acts such as embargo, etc.). Major independent variables Mass violence. This variable assesses the level of violence within the society of the crisis actor as evidenced by insurrections, civil war, and revolution. The ICB dataset uses a code of '1' if there is a significant increase in the level of domestic violence during the relevant period preceding the crisis, a code of '2' if the level is normal, and a code of '3' if there is a significant decrease. I collapse the ICB variable into a dichotomous variable and code it as '1' if there is a significant increase in the level of mass violence and '0' otherwise. In this way, I obtain a more direct measure to test my hypotheses. Last, the ICB dataset uses a code of '4' if the crisis actor is a newly independent state. I exclude the observations of this category from the analysis for this variable (as well as for the measures of economic downturn and government instability), since such cases do not provide information on the level of the domestic problem under investigation. Economic downturn. This variable assesses the overall state of the economy for the crisis actor during the period preceding a crisis. I base this measure on the ICB variable labeled 'economic status of actor', which provides a summary indicator of the cost of living, unemployment, food prices, labor disruption, and consumer goods shortages. Since there is a considerable amount of missing data for a number of individual economic indicators, this composite index takes advantage of the available partial information, and thus enables a more parsimonious model. The data are examined from the year of the crisis to the fourth preceding year. The ICB dataset has the values coded as '1' if there is an increase in economic problems, '2' if the economic situation is normal, and '3' if there is a decrease in economic problems. For a more direct measure of worsening economic conditions, I generate a dichotomous variable and code the cases where there is a significant increase in economic problems as '1' and '0' otherwise. Sirin 311 Government instability. The ICB actor-level dataset provides information on whether the crisis actor experiences government instability, which may include executive, constitutional, legal, and/ or administrative structure changes within the relevant period preceding an international crisis. For this measure, the ICB dataset codes the observations as '1' if there is a significant increase in government instability, '2' if the government is stable, and '3' if there is a significant decrease in government instability. For a more direct measure of escalating governmental instability, I create a dichotomous variable coding the cases where there is a

significant increase in the level of government instability as '1' and '0' otherwise. Ethno-religious heterogeneity. For the operationalization of this concept, I use two different measures that I adopt from the dataset of Fearon and Laitin's (2003) study. The first measure is the number of distinct languages spoken by groups exceeding 1 percent of the country's population (see Grimes and Grimes, 1996). The second alternative measure captures the level of religious fractionalization, which Fearon and Laitin constructed using data from the CIA Factbook and other sources. In order to test my interactive hypothesis (H2), I generate two alternative multiplicative variables by interacting mass violence separately with each of the two measures of ethno-religious heterogeneity. Regime type. The ICB dataset provides five different categories of this indicator including democratic regime, civil authoritarian regime, military-direct rule, military-indirect rule, and military dual authority. I generate a dummy variable where '1' denotes democratic regimes and '0' denotes authoritarian regimes, mainly because the original variable does not differentiate between levels of democracy while providing dissimilar types of authoritarianism.6 Control variables Power discrepancy. Several studies of state dyads have demonstrated that disparity in a dyad's capabilities reduces the likelihood of violence initiation (see, e.g., Bremer, 1992). On the other hand, some scholars argue that states that possess a power advantage over an adversary are much more likely to take military action in crisis situations (see, e.g., Prins, 2005). My model controls for this external determinant of interstate conflict by including the ICB variable 'power discrepancy'. The ICB dataset assigns a power score for each crisis actor and its principal adversary based on six separate scores measuring population size, GNP, territorial size, alliance capability, military expenditure, and nuclear capability at the onset of a crisis. The power that a crisis actor possesses and has at its disposal from alliance partners (i.e. those countries that are connected to the crisis actor through some type of collective security agreement) immediately prior to an international crisis is then compared with that of the actor's principal adversary (or adversaries) to create a final power discrepancy score, which ranges from −179 to +179. Negative values indicate a power discrepancy that is to the disadvantage of a crisis actor whereas positive values demonstrate that a crisis actor is stronger than an adversary. To generate a measure that indicates less power disparity as the score gets closer to zero (and vice versa), I take the square of the original ICB power discrepancy variable. This allows one to also capture the potential non-linear nature of this variable. Contiguity. On contiguity, Geller (2000: 413) presents two major perspectives. The first is that geographic opportunity provides physical opportunity for wars and increases a nation's   involvement in a foreign conflict. The second thesis suggests that proximity structures the 'context of interaction', which increases the probability of conflictual relations and enhances the motivations for war. At the dyad level, proximity is the strongest predictor of war probability (see Henderson, 1997; Vasquez, 1993). Hence, I control for this factor with the expectation that when crisis actors share a border, there will be a greater likelihood of the external use of force. The ICB system level data refers to this variable as the geographical proximity of principal adversaries. The coding values are '1' distant, '2' near neighbors, and '3' contiguous. Gravity. This ICB variable identifies the 'gravest' threat a crisis actor faces during a crisis, which ranges from 0 to 7. Most studies suggest that increases in this measure lead to increases in the likelihood of violence in an international crisis (see Hewitt and Wilkenfeld, 1999; Trumbore and Boyer, 2000). That said, DeRouen and Sprecher (2004) find that gravity – as a measure of domestic political loss – has a negative impact on the use of force due to a tendency to reject violence as an initial policy option when the regime is threatened. Following DeRouen and Sprecher, I recode the original ICB variable as '1' if there is a political threat and '0' otherwise to capture any serious political risk a crisis actor faces during a crisis.

Trigger level. The trigger or precipitating cause of a foreign policy crisis refers to the specific act, event, or situational change that leads to (1) a crisis actor's perception of the crisis as a threat to one's basic values, (2) constrained time pressure for responding to the threat, and (3) heightened probability of involvement in military hostilities (Brecher and Wilkenfeld, 2000). It is reasonable to expect that states will react to a crisis with the level of action (be it economic, diplomatic, or military) that matches the level of the trigger (see Trumbore and Boyer, 2000). More specifically, I expect that the likelihood of the use of force will increase in response to more violent triggers. For this variable, I employ the original ICB indicator 'trigger to foreign policy crisis', which ranges from 1 (verbal act) to 9 (violent act) in line with the trigger's level of intensity. Empirical results Some states are more likely than others to get involved in international crises, such as major powers and enduring rivals. An attempt to identify possible factors that are specific to each crisis actor would be a strenuous and redundant task. Instead, I employ a panel-estimated approach – random effects probit – to control for country-specific effects likely to be present in the error term. In accordance with my theoretical framework, I adopt the crisis actor as my unit of analysis. The baseline analytical model is as follows: Pr(Y ij = 1 | X ij , v i) = f(b 0 + b 1 (mass violence) ij + b 2 (economic downturn) ij + b 3 (government instability) ij + b 4 (power discrepancy) ij + b 5 (contiguity) ij + b 6 (gravity) ij + b 7 (trigger level) ij + b 8 (regime type) ij + v i) where Pr(Y ij = 1 | X ij , v i) denotes the probability of external use of force; vi represents unit-specific effects. For the analysis of the interactive effects of mass violence and ethno-religious heterogeneity, I add a multiplicative interaction variable to the baseline model, along with the constitutive terms of that interaction. For the testing of my hypotheses regarding regime type differences, I run the baseline model (excluding the regime type variable) for the subsets of democracies and autocracies. As the Wald λ2 results of the analyses demonstrate (see Tables 2, 3 and 4), the fit of each model is good. Downloaded from ips.sagepub.com at Harvard Libraries on October 5, 2014 Sirin 313 Table 1. Frequency of the Use of Force according to a Crisis Actor's Experience of Domestic Problems Prior to an International Crisis, 1918–2005 Mass violence Economic downturn Government instability 0 1 0 1 0 1 No use of force Use of force 443 226 76 52 317 178 151 67 403 212 117 64 Use of force % 33% 40% 36% 30% 34% 35% Table 1 provides descriptive statistics on the cross-tabulations of the use of force in international crises with three different forms of domestic problems (mass violence, economic downturn, and government instability). Among crisis actors who experience increased mass violence prior to the crisis, 40 percent use force. By comparison, if the country does not experience an increase in mass violence, only 33 percent resort to the use of force. In cases of economic decline, 30 percent of crisis actors use force, whereas cases of no economic downturn demonstrate the use of force 36 percent of the time. Finally, a change in the level of government instability indicates almost no variation across the use of force and non-use of force options (34 percent for no government instability and 35 percent for increased government instability). These preliminary results fall in line with my theoretical expectations that increased mass violence is more likely to lead to the use of force rather than other forms of domestic problems.

Internet Freedom Advantage

Doesn't Solve I-Freedom 1NC

And US allies destroy i-freedom signal

Hanson 10/25/12, Nonresident Fellow, Foreign Policy, Brookings
http://www.brookings.edu/research/reports/2012/10/25-ediplomacy-hanson-internet-freedom

Another challenge is dealing with close partners and allies who undermine internet freedom. In August 2011, in the midst of the Arab uprisings, the UK experienced a different connection technology infused movement, the London Riots. On August 11, in the heat of the crisis, Prime Minister Cameron told the House of Commons: Free flow of information can be used for good. But it can also be used for ill. So we are working with the police, the intelligence services and industry to look at whether it would be right to stop people communicating via these websites and services when we know they are plotting violence, disorder and criminality. This policy had far-reaching implications. As recently as January 2011, then President of Egypt, Hosni Mubarak, ordered the shut-down of Egypt's largest ISPs and the cell phone network, a move the United States had heavily criticized. Now the UK was contemplating the same move and threatening to create a rationale for authoritarian governments everywhere to shut down communications networks when they threatened "violence, disorder and criminality." Other allies like Australia are also pursuing restrictive internet policies. As OpenNet reported it: "Australia maintains some of the most restrictive Internet policies of any Western country…" When these allies pursue policies so clearly at odds with the U.S. internet freedom agenda, several difficulties arise. It undermines the U.S. position that an open and free internet is something free societies naturally want. It also gives repressive authoritarian governments an excuse for their own monitoring and filtering activities. To an extent, U.S. internet freedom policy responds even-handedly to this challenge because the vast bulk of its grants are for open source circumvention tools that can be just as readily used by someone in London as Beijing, but so far, the United States has been much more discreet about criticising the restrictive policies of allies than authoritarian states.

Doesn't Solve I-Freedom – 2NC

Now, the Aff doesn't solve internet freedom – The United States believes that countries inherently want free internet access and have criticized actions of authoritarian states, such as China and Iran – That's Hanson

Gambling ban spills over to internet freedom generally

Hammond 3/12/14, writer for RedState
http://www.redstate.com/diary/mikehammond/2014/03/12/crony-online-gambling-ban-threatens-gun-owners-rights/

And, frankly, the fact is that neither the sponsors nor the beneficiaries of the Internet gambling regulation are people who have given a lot of thought to constitutional principle — or the precedential impact of extending regulation into this area. Sen. Dean Heller (R-NV) is sponsoring the ban on behalf of the owner of a Las Vegas casino, and Sen. Lindsey Graham (R-SC) is

reportedly jumping on board. Heller represents Nevada and will hawk the interests of the casino owners who handed Harry Reid his current six-year term. Thanks for that! Graham has a different reason for his involvement. Billionaire casino owner Sheldon Adelson has pledged to "spend whatever it takes" to have it the federal ban enacted. And Graham, after years of stabbing conservatives in the back, has his back against the wall. With a contentious primary and polls suggesting Graham could be forced into a runoff, he would like nothing more than a billionaire casino owner to rain campaign ads from the heavens to help him survive. True, billionaire Las Vegas casino owners are on both sides of this issue. And I certainly don't begrudge billionaires their billions. But I'm staking my claim with the billionaires who don't believe that Big Government should stick its heavy hand into the market in order to protect their billions. The bottom line? **This "camel's nose in the tent" of Internet regulation creates a dangerous precedent for those concerned about Internet freedom.** It should scare those who want to stop Chuck Schumer and his gun-grabber choir form moving the central element of Barack Obama's gun control agenda. To coin a phrase, "Ideas have consequences." And regulation of Internet gaming opens the door to regulation of other things congressmen or billionaire political spenders find objectionable. Obviously, that includes firearms.

China undermines global i-freedom

Chang 14 (Research Associate, Technology & National Security Program, the Center for a New American Security)

(Amy Chang, How the 'Internet with Chinese Characteristics' Is Rupturing the Web, 12/15/2014, http://www.huffingtonpost.com/amy-chang-/china-internet-sovereignty_b_6325192.html)

China is openly undermining the United States' vision of a free and open Internet. Motivated by maintaining the fragile balance between information control, social and political stability, and continued modernization and economic growth for an online population of over 600 million, the Chinese government is attempting to alter how nations understand their role in Internet governance through a concept called "Internet sovereignty."

Internet sovereignty refers to the idea that a country has the right to control Internet activity within its own borders, and it is what China refers to as a natural extension of a nation-state's authority to handle its own domestic and foreign affairs. For the United States and other Western nations, however, Internet governance is delegated to an inclusive and distributed set of stakeholders including government, civil society, the private sector, academia, and national and international organizations (also known as the multi-stakeholder model of Internet governance).

Gambling ban undoes internet freedom promotion

Aronson 14 Institute for International Economic Policy Working Paper Series Elliott School of International Affairs The George Washington University Can Trade Policy Set Information Free? IIEP-WP-2014-9 Susan Ariel Aaronson George Washington University

http://www.gwu.edu/~iiep/assets/docs/papers/2014WP/AaronsonIIEPWP20149.pdf

T here is a contradiction at the heart of the Internet. Al though the Internet has become a platform for trade, trade policies have both enhanced and undermined Internet freedom and the open Internet. Two recent events illuminate this paradox. First, The New York Times (America's paper of record) reported it had b een repeatedly hacked after it published several articles delineating the financial holdings of the families of China's highest leaders. The hackers inserted malware and stolen its employees' e - mail account passwords, allegedly to find out information abou t the Times' sources. Soon thereafter, The Wall Street Journal, Washington Post, Bloomberg, Voice of America and other media outlets publicly claimed their computers were hacked, allegedly also by Chinese hackers. And in late February the government of A ntigua announced that it would retaliate against America's ban of Antiguan online gambling sites. The World Trade Organization (WTO) gave the small island nation approval to sell items protected under US copyright law as a means of compensation for trade p ractices that "devastated" its economy. Antigua plans to set up a website to sell US - copyrighted material without paying the copyright holders. In short , while China was using trade to steal information and in so doing reduce Internet openness , Antigua will use trade to undermine property rights while advancing information flows. Although t he global Internet is creating a virtuous circle of expanding growth, opportunity, and information flows , policymakers and market actors are taking steps tha t undermine access to information, reduce freedom of expression and **splinter the Internet**. Almost every country has adopted policies to protect privacy, enforce intellectual property rights, protect national security, or thwart cyber - theft, hacking, and sp am. While these actions may be necessary to achieve important policy goals, these policies may distort cross - border information flows and trade. Meanwhile, US, Canadian and European firms provide much of the infrastructure as well as censor ware or blockin g services to their home governments and repressive states such as Iran, Russia, and China

US Online gambling ban kills internet freedom signal

Kibbe 4/28/14 (Matt, FreedomWorks, "Coalition Letter: No Federal Ban on Internet Gambling")

We, the undersigned individuals and organizations, are writing to express our deep concerns about the Restoration of America's Wire Act (H.R. 4301), which would institute a de facto ban on internet gaming in all 50 states. The legislation is a broad overreach by the federal government over matters traditionally reserved for the states. H.R. 4301 will reverse current law in many states and drastically increase the federal government's regulatory power. As we have seen in the past, a ban will not stop online gambling. Prohibiting states from legalizing and regulating the practice only ensures that it will be pushed back into the shadows where crime can flourish with little oversight. In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior.¶ Perhaps even more concerning is the fact that this bill allows the federal government to take a heavy hand in regulating the Internet, opening the door for increased Internet regulation in the future. By banning a select form of Internet commerce**, the federal government is setting a troubling precedent** and providing fodder to those who would like to see **increased Internet regulation in the future**. We fear that H.R. 4301 will begin **a dangerous process of internet** censorship that will simultaneously be circumvented by calculated international infringers while constraining the actions of private individuals and companies in the United States.

Online gambling is the BIGGEST internal link

Braithwaite and Blitz 5/6/9 http://www.ft.com/cms/s/0/7d47231c-3a82-11de-8a2d-00144feabdc0.html#axzz3E1KKpH4h staff, Financial Times

Barney Frank, chairman of the House financial services committee, presented legislation on Wednesday that would **legalise internet gambling** in the US and pave the way for overseas companies to return to the market. Calling existing law "**the single biggest example of an intrusion" into internet freedom**, Mr Frank said he was confident of some cross-party support for the bill, which would regulate and tax online gambling.

Doesn't Solve Censorship – 1NC

Even absent data localization private companies will voluntarily self-censor – nominal internet freedom is irrelevant

Morozov 11 (Evgeny Morozov, visting scholar at Stanford University, Schwartz Fellow at the New America Foundation, 2011, "The Net Delusion," ch. 8)

What is clear is that, contrary to the expectations of many Western policymakers, **Facebook is hardly ideal for promoting democracy; its own logic, driven by profits or ignorance of the increasingly global context in which it operates, is, at times, extremely antidemocratic.** Were Kafka to pen his novel The Trial—in which the protagonist is arrested and tried for reasons that are never explained to him—today, El Ghazzali's case could certainly serve as inspiration. That much of digital activism is mediated by commercial intermediaries who operate on similar Kafkaesque principles is cause for concern, if only because it introduces too much unnecessary uncertainty into the activist chain, imagine that El Ghazzali's group was planning a public protest on the very day that its page got deleted: The protest could have easily been derailed. Until there is complete certainty that a Facebook group won't be removed at the most unfortunate moment, many dissident groups will shy away from making it their primary channel of communication. In reality, there is no reason why Facebook should even bother with defending freedom of expression in Morocco, which is not an appealing market to its advertisers, and even if it were, it would surely be much easier to make money there without crossing swords with the country's rulers. We do not know how heavily Facebook polices sensitive political activity on its site, but we do know of many cases similar to El Ghazzali s. In February 2010, for example, Facebook was heavily criticized by its critics in Asia for removing the pages of a group with 84,298 members that had been formed to oppose the Democratic Alliance for the Betterment and

Progress of Hong Kong, the pro-establishment and pro-Beijing party. According to the group's administrator, the ban was triggered by opponents flagging the group as "abusive" on Facebook. This was not the first time that Facebook constrained the work of such groups. In the run-up to the Olympic torch relay passing through Hong Kong in 2008, it shut down several groups, while many pro-Tibetan activists had their accounts deactivated for "persistent misuse of the site." It's not just politics: Facebook is notoriously zealous in policing other types of content as well. In July 2010 it sent multiple warnings to an Australian jeweler for posting photos of her exquisite porcelain doll, which revealed the doll's nipples. Facebook's founders may be young, but they are apparently puritans. Many other intermediaries are not exactly unbending defenders of political expression either. Twitter has been accused of silencing online tribute to the 2008 Gaza War. Apple has been bashed for blocking Dalai Lama-related iPhone apps from its App Store for China (an application related to Rebiya Kadeer, the exiled leader of the Uighur minority, was banned as well). Google, which owns Orkut, a social network that is surprisingly popular in India, has been accused of being too zealous in removing potentially controversial content that may be interpreted as calling for religious and ethnic violence against both Hindus and Muslims. Moreover, a 2009 study found that Microsoft has been censoring what users in the United Arab Emirates, Syria, Algeria, and Jordan could find through its Bing search engine much more heavily than the governments of those countries.

Doesn't Solve Censorship – 2NC

Non-state actors and social media monitoring make censorship impossible to counter

Morozov 11 (Evgeny Morozov, visting scholar at Stanford University, Schwartz Fellow at the New America Foundation, 2011, "The Net Delusion," ch. 4)

But governments do not need to wait until breakthroughs in artificial intelligence to make more accurate decisions about what it is they need to censor. One remarkable difference between the Internet and other media is that online information is hyperlinked. To a large extent, all those links act as nano-endorsements. If someone links to a particular page, that page is granted some importance. Google has managed to aggregate all these nano-endorsements—making the number of incom- ing links the key predictor of relevance for search results—and build a mighty business around it. Hyperlinks also make it possible to infer the context in which particular bits of information appear online without having to know the meaning of those bits. If a dozen antigovernment blogs link to a PDF published on a blog that was previously unknown to the Internet police, the latter may assume that the document is worth blocking without ever reading it. The links—the "nano-endorsements" from antigovernment bloggers—speak for themselves. The PDF is simply guilty by association. Thanks to Twitter, Facebook, and other social media, such associations are getting much easier for the secret police to trace. If authoritarian governments master the art of aggregating the most popular links that their opponents share on Twitter, Facebook, and other social media sites, they can create a very elegant, sophisticated, and, most disturbingly, accurate solution to their censorship needs. Even though the absolute amount of information—or the number of links, for that matter—may be growing, it does not follow that

there will be less "censorship" in the world. It would simply become more fine-tuned. If anything, there might be less one-size-fits-all "wasteful" censorship, but this is hardly a cause for celebration. The belief that the Internet is too big to censor is dangerously naive. As the Web becomes even more social, nothing prevents governments— or any other interested players— from building censorship engines powered by recommendation technology similar to that of Amazon and Netflix. The only difference, however, would be that instead of being prompted to check out the "recommended" pages, we'd be denied access to them. The "social graph"—a collection of all our connections across different sites (think of a graph that shows everyone you are connected to on different sites across the Web, from Facebook to Twitter to YouTube)—a concept so much beloved by the "digerati," could encircle all of us. The main reason why censorship methods have not yet become more social is because much of our Internet browsing is still done anonymously. When we visit different sites, the people who administer them cannot easily tell who we are. There is absolutely no guarantee that this will still be the case five years from now; **two powerful forces may destroy online anonymity**. From the commercial end, we see stronger integration between social networks and different websites— you can now spot Facebook's "Like" button on many sites—so there are growing incentives to tell sites who you are. Many of us would eagerly trade our privacy for a discount coupon to be used at the Apple store. From the government end, growing concerns over child pornography, copyright violations, cybercrime, and cyberwarfare also make it more likely that there will be more ways in which we will need to prove our identity online. The future of Internet control is thus a function of numerous (and rather complex) business and social forces; sadly, many of them originating in free and democratic societies. Western governments and foundations can't solve the censorship problem by just building more tools; they need to identify, publicly debate, and, if necessary, legislate against each of those numerous forces. The West excels at building and supporting effective tools to pierce through the firewalls of authoritarian governments, but it is also skilled at letting many of its corporations disregard the privacy of their users, often with disastrous implications for those who live in oppressive societies. Very litde about the currently fashionable imperative to promote Internet freedom suggests that Western policymakers are committed to resolving the problems that they themselves have helped to create. We Don't Censor; We Outsource! Another reason why so much of today's Internet censorship is invisible is because it's not the governments who practice it. While in most cases it's enough to block access to a particular critical blog post, it's even better to remove that blog post from the Internet in its entirety. While governments do not have such mighty power, companies that enable users to publish such blog posts on their sites can do it in a blink. Being able to force companies to police the Web according to a set of some broad guidelines is a dream come true for any government. It's the companies who incur all the costs, it's the companies who do the dirty work, and it's the companies who eventually get blamed by the users. Companies also are more likely to catch unruly content, as they know their online communities better than government censors. Finally, no individual can tell companies how to run those communities, so most appeals to freedom of expression are pointless. Not surprisingly, this is the direction in which Chinese censorship is evolving. According to research done by Rebecca MacKinnon, who studies the Chinese Internet at New America Foundation and is a former CNN bureau chief in Beijing, censorship of Chinese user-generated content is "highly decentralized," while its "implementation is left to the Web companies themselves". To prove this, in mid-2008 she set up anonymous accounts on a dozen Chinese blog platforms and published more than a hundred posts on controversial subjects, from corruption to AIDS to Tibet, to each of them. MacKinnon's objective was to test if and how soon they would be deleted. Responses differed widely across companies: The most vigilant ones

deleted roughly half of all posts, while the least vigilant company censored only one. There was little coherence to the companies' behavior, but then this is what happens when governments say "censor" but don't spell out what it is that needs to be censored, leaving it for the scared executives to figure out. The more leeway companies have in interpreting the rules, the more uncertainty there is as to whether a certain blog post will be removed or allowed to stay. This Kafkaesque uncertainty can eventually cause more harm than censorship itself, for it's hard to plan an activist campaign if you cannot be sure that your content will remain available. This also suggests that, as bad as Google and Facebook may look to us, they still probably undercensor compared to most companies operating in authoritarian countries. Global companies are usually unhappy to take on a censorship role, for it might cost them dearly. Nor are they happy to face a barrage of accusations of censorship in their own home countries. (:Local companies, on the other hand, couldn't care less Social networking sites in Azerbaijan probably have no business in the United States or Western Europe, nor are their names likely to be mispronounced at congressional hearings.) But this is one battle that the West is already losing. Users usually prefer local rather than global services; those are usually faster, more relevant, easier to use, and in line with local cultural norms. Look at the Internet market in most authoritarian states, and you'll probably find at least five local alternatives to each prominent Web 2.0 start-up from Silicon Valley. For a total online population of more than 300 million, Facebook's 14,000 Chinese users, by one 2009 count, are just a drop in the sea (or, to be exact, 0.00046 percent). Companies, however, are not the only intermediaries that could be pressured into deleting unwanted content. RuNet (the colloquial name for the Russian-speaking Internet), for example, heavily relies on "com-munities," which are somewhat akin to Facebook groups, and those are run by dedicated moderators. Most of the socially relevant online activism in Russia happens on just one platform, Livejournal. When in 2008 the online community of automobile lovers on Livejournal became the place to share photos and reports from a wave of unexpected protests organized by unhappy drivers in the far eastern Russian city of Vladivostok, its administrators immediately received requests from FSB, KGB's successor, urging them to delete the reports. They complied, although they complained about the matter in a subsequent report that they posted to the community's webpage (within just a few hours that post disappeared as well). Formally, though, nothing has been blocked; **this is the kind of invisible censorship that is most difficult to fight**. The more intermediaries—whether human or corporate—are involved in publishing and disseminating a particular piece of information, the more points of control exist for quietly removing or altering that information. The early believers in "dictator's dilemma" have grossly underestimated the need for online intermediaries. Someone still has to provide access to the Internet, host a blog or a website, moderate an online community, or even make that community visible in search engines. As long as all those entities have to be tied to a nation state, there will be ways to pressure them into accepting and facilitating highly customized censorship that will have no impact on economic growth.

Privacy Advantage

Surveillance Good – 1NC

Surveillance outweighs and privacy violations are overstretched post-Snowden – solves security threats

Gallington 13 -- (Daniel J. Gallington, senior policy and program adviser at the George C. Marshall Institute in Arlington VA, served in senior national policy positions in the Office of the

Secretary of Defense, the Department of ?Justice, and as bipartisan general counsel for the U.S. Senate Select Committee on Intelligence, "The Case for Internet Surveillance," US News, http://www.usnews.com/opinion/blogs/world-report/2013/09/18/internet-surveillance-is-a-necessary-part-of-national-security, Accessed 07-02-15)

If the answer to these questions continues to be yes – and it most likely is – then the recent public debate brought on by Edward Snowden's disclosures is **far more mundane, and far less sensational** than the media would perhaps like it to be. Also In that case, the real issue set boils down to the following set of key questions, best answered by our Congress – specifically the Intelligence committees working with some other key committees – after a searching inquiry and a series of hearings, as many of them open as possible. Were the established and relevant laws, regulations and procedures complied with? Are the established laws, regulations and procedures up to date for current Internet and other technologies? Is there reason to add new laws, regulations and procedures? Is there a continued requirement – based on public safety – to be able to do intrusive surveillance, including Internet surveillance, against spies, terrorists or criminals? In sum, the idea that we have somehow "betrayed" or "subverted" the Internet (or the telephone for that matter) is – as my mom also used to say – "**just plain silly**." Such kinds of inaccurate statements are emotional and intended mostly for an audience with preconceived opinions or that hasn't thought very hard about the **dangerous consequences of an Internet totally immune from surveillance**. In fact, it seems time for far less sensationalism – primarily by the media – and far more objectivity. In the final analysis, my mom probably had it right: "Those kind of people, sure".

Public Perception – 1NC

The public is only mildly concerned

Dukeman 14

(Ryan, European Union Program Undergraduate Fellow at Princeton University, "Surprisingly mild reaction to NSA surveillance", February 11, 2014, http://dailyprincetonian.com/opinion/2014/02/surprisingly-mild-reaction-to-nsa-surveillance/, kc)

One of the legacies 2013 will leave behind, as Andrea Peterson wrote recently in The Washington Post, is that it was "the year that proved your paranoid friend right." Since January of last year, we've learned that the National Security Agency is collecting massive amounts of phone call metadata, emails, location information of cell phones and is even listening to Xbox Live. Shocking as this obviously was to me, as a citizen of the country of "We the People," one founded on civil liberties, what was perhaps more shocking was how mild the reaction of many Americans was. While polls showed that a small majority of U.S. citizens opposed the NSA's collection of phone and Internet usage data, after months of reassurances by the President that the programs would be reformed and used responsibly, the numbers seem to have changed (or at least, the story seems to be dying down).¶ The problem here is that a story like this shouldn't ever go away, not until the sought reforms are accomplished or at least until we as a society reach an informed consensus about the core issues at stake. Every day that we wait, every day that such programs are allowed to continue without public scrutiny or reform, is a day in which rights are unduly sacrificed without the informed consent of the public.

Privacy is already dead- companies surveil more than the government and will not change

Gillmor 14

(Dan, Professor of Digital Media Literacy and Entrepreneurship at Arizona State University, "As we sweat government surveillance, companies like Google collect our data", April 18, 2014, http://www.theguardian.com/commentisfree/2014/apr/18/corporations-google-should-not-sell-customer-data, kc)

As security expert Bruce Schneier (a friend) has archly observed, "Surveillance is the business model of the internet." I don't expect this to change unless and until external realities force a change – and I'm not holding my breath.¶ Instead, the depressing news just seems to be getting worse. Google confirmed this week what many people had assumed: even if you're not a Gmail user, your email to someone who does use their services will be scanned by the all-seeing search and the advertising company's increasingly smart machines. The company updated their terms of service to read:¶ Our automated systems analyze your content (including e-mails) to provide you personally relevant product features, such as customized search results, tailored advertising, and spam and malware detection. This analysis occurs as the content is sent, received, and when it is stored.¶ My system doesn't do this to your email when you send me a message. I pay a web-hosting company that keeps my email on a server that isn't optimized for data collection and analysis. I would use Gmail for my email, if Google would let me pay for service that didn't "analyze (my) content" apart from filtering out spam and malware. Google doesn't offer that option, as far as I can tell, and that's a shame – if not, given its clout, a small scandal.¶ Also this week, Advertising Age, a top trade journal for the ad industry, reported that tech companies led by Google, Microsoft, Apple and Facebook are moving swiftly to fix what they plainly see as a bug in the system: It's more difficult to spy on us as effectively when we use our mobile devices than when we're typing and clicking away on our laptops. Here's a particularly creepy quote in the story, courtesy of a mobile advertising executive:¶ The universal ID today in the world is your Facebook log-in. This industry-wide challenge of mobile tracking has sort of quietly been solved, without a lot of fanfare.¶ Facebook may be getting the message that people don't trust it, which shouldn't be surprising given the company's long record of bending its rules to give users less privacy. CEO Mark Zuckerberg told the New York Times' Farhad Manjoo that many upcoming products and services wouldn't even use the name "Facebook," as the company pushes further and further into its users' lives. The report concluded:¶ If the new plan succeeds, then, one day large swaths of Facebook may not look like Facebook — and may not even bear the name Facebook. It will be everywhere, but you may not know it.¶ Maybe. But Facebook will know you. And like Google, Facebook won't let me pay for its otherwise excellent service, something I'd gladly do if it would agree not to spy on me.¶ Barring that, what I do to employ countermeasures wherever possible, and to make choices in the services I use – such as relying more and more on the DuckDuckGo search engine. DuckDuckGo isn't as likely to give me the results I want as easily as Google, but it has proved to be good enough for most purposes.¶ But in a week when news organizations (like this one) won Pulitzer prizes for revealing vast abuses of surveillance by the government, one might hope that corporations would show even the slightest sign of retreating from their longstanding practices that, if conducted by the government, would give most citizens pause.

The public doesn't feel strongly about surveillance.

Rieff 13

(David, Author with focus on immigration, international conflict, and humanitarianism, "Why Nobody Cares About the Surveillance State", August 22, 2013, http://foreignpolicy.com/2013/08/22/why-nobody-cares-about-the-surveillance-state/, kc)

And yet, apart from some voices from the antiwar left and the libertarian right, the reaction from this deceived public has been strangely muted. Polls taken this summer have shown the public almost evenly split on whether the seemingly unlimited scope of these surveillance programs was

doing more harm than good. Unlike on issues such as immigration and abortion, much of the public outrage presupposed by news coverage of the scandal does not, in reality, seem to exist.¶ It is true that the revelations have caused at least some on the mainstream right, both in Congress and in conservative publications like National Review, to describe the NSA's activities as a fundamental attack on the rights of citizens. For their part, mainstream Democrats find themselves in the uncomfortable position of either defending what many of them view as indefensible or causing trouble for a beleaguered president who seems increasingly out of his depth on most questions of national security and foreign policy.¶ The press can certainly be depended on to pursue the story, not least because of a certain "guild" anger over the detention recently of Guardian journalist Glenn Greenwald's partner, David Miranda, by British police at London's Heathrow Airport, and the British government's decision to force the Guardian to destroy the disks it had containing Snowden's data — in the paper's London office with two officials from CGHQ, the British equivalent of the NSA, looking on. But while the surveillance scandal has both engaged and enraged the elites, when all is said and done, the general public does not seem nearly as concerned.¶ Why? In an age dominated by various kinds of techno-utopianism — the conviction that networking technologies are politically and socially emancipatory and that massive data collection will unleash both efficiency in business and innovation in science — the idea that Big Data might be your enemy is antithetical to everything we have been encouraged to believe. A soon-to-be-attained critical mass of algorithms and data has been portrayed as allowing individuals to customize the choices they make throughout their lives. Now, the data sets and algorithms that were supposed to set us free seem instead to have been turned against us.

Public Perception – 2NC

Facebook proves- consumers have "privacy fatigue"- don't care about privacy anymore

Huffington Post 11

(Huffington Post, "Facebook Users Experience Privacy Fatigue", 03/11/2011, http://www.huffingtonpost.co.uk/2011/11/03/facebook-users-privacy-fatigue_n_1073131.html, kc)

Facebook Users Experience Privacy Fatigue -- Facebook users are struggling to keep up with the "dizzying" number of changes to privacy settings made by the social network, a survey has found.¶ Almost half (48%) of those questioned by consumer magazine Which? Computing confessed they had failed to keep track of all the security changes that had been introduced, while almost a fifth (19%) said they had never altered their privacy settings.¶ Despite concerns about the amount of personal information being published by users of the website, many could be suffering "privacy fatigue", the magazine suggested.¶ Although Facebook has introduced a slew of changes over the past two years, respondents had on average changed their privacy settings just twice.¶ Rob Reid, scientific policy adviser for Which?, said: "Many Facebook users have never changed their privacy settings and those who have do it far less often than Facebook makes changes.¶ "This may reflect a disregard or lack of awareness for privacy or, more worryingly, privacy fatigue stimulated by the dizzying number of changes."¶ Which? Computing interviewed 953 people in September about their Facebook use.

Public apathy about privacy violations.

Kelly 13

(Heather, Technology Reporter for CNNMoney, Writer/Producer at CNN Digital, Degree in Journalism from NYU, "Some shrug at NSA snooping: Privacy's already dead", June 10, 2013, http://www.cnn.com/2013/06/07/tech/web/nsa-internet-privacy, kc)

A series of revelations about the National Security Agency's surveillance programs sparked outrage among many this week, including the expected privacy activists and civil libertarians.¶ But there seems to be a gap between the roiling anger online and the attitudes of other people, especially younger ones, who think it's just not that big a deal.¶ It's the rare issue that crosses party lines in terms of outrage, apathy and even ignorance. When interviewing people about the topic in downtown San Francisco, we found a number of people of all ages who had not heard the news, and more than one who asked what the NSA was.¶ The rest had various reasons for not being terribly concerned.¶ Privacy is already dead¶ When the news broke on Wednesday, a number of people responded online by saying an extensive government surveillance program wasn't surprising and just confirmed what they already knew.¶ The lack of shock wasn't limited to savvy technologists who have been following reports from organizations like the Electronic Frontier Foundation, or EFF, that cover possible monitoring going back to 2007. Many people already assumed that information online was easily accessible by corporations and the government.¶ A survey conducted by the Allstate/National Journal Heartland Monitor just days before the NSA news broke found that 85% of Americans already believed their phone calls, e-mails and online activity were being monitored.¶ Allen Trember from San Luis Obispo, California, said he knew when he started using the Internet that his information wasn't going to be private, but still lamented that privacy no longer exists.¶ "I don't like it, but what can I do about it?" he said. "I'm just glad that we have as much freedom as we do."

Efficiency gains from surveillance outweigh

Swire 99 – Peter P. Swire, Chief Counselor for Privacy—United States Office of Management and Budget, Professor at the Ohio State University College of Law, 1999 (**"**F. Hodge O'Neal Corporate and Securities Law Symposium: The Modernization of Financial Services Legislation: Article: Financial Privacy and The Theory of High-Tech Government Surveillance**," LexisNexis Academic, Accessed 06-29-2015)**

In discussing the advantages of allowing flows of financial data to government, the focus has been on preventing or prosecuting illegal behavior. Greater information flows can restrict money laundering, help track deadbeat parents who fail to pay child support, and otherwise **reduce the harms to society** that inefficient surveillance permits. An even more general rationale, however, often exists for providing information to the government - **efficiency**. Free flows of information, in both the public and private sector, can lead to a variety of efficiency gains. Think, for example, of the burden of filling out government paperwork. Suppose that in an electronic future an individual would never have to provide information more than once to any government. In this technocratic utopia, the record would be entered once and then be available automatically for all authorized uses. With this efficiency in assembling and matching data, there would be far less burden on individuals who wish to apply for government benefits, enter into a contract with any government unit, file a report in connection with environmental or other regulatory programs, or otherwise transfer information to the government. Better coordination might also be possible between governments at the local, state, national, and even international levels. In the private sector, free flows of financial data also create efficiency gains. From a seller's point of view, detailed information about the buyer allows more efficient provision of goods and services. Detailed information permits "one-to-one" marketing, so buyers get precisely what they most value, and so sellers can avoid unwanted inventory and can produce exactly what buyers want. [n87] Ever-expanding computing power and the growth of the Internet mean that the costs of assembling, processing, and communicating personal data continue to fall rapidly. As the private sector develops new means for processing personal information, the information also becomes potentially available to the government. [*493] In the area of information processing, the public and private sectors are linked more closely than is often realized. Any data in private hands are only a subpoena away

from the government. The efficiency gains in the private sector mean efficiency gains for law enforcement and the government more generally.

Doesn't Solve Totalitarianism – 1NC

No impact to Totalitarianism – privacy is just as likely to be used to cursh dissent

Siegel 11 (Lee Siegel, a columnist and editor at large for The New York Observer, is the author of "Against the Machine: How the Web Is Reshaping Culture and Commerce — and Why It Matters. "'The Net Delusion' and the Egypt Crisis", February 4, 2011, http://artsbeat.blogs.nytimes.com/2011/02/04/the-net-delusion-and-the-egypt-crisis)

¶Morozov takes the ideas of what he calls "cyber-utopians" and shows how reality perverts them in one political situation after another. In Iran, the regime used the internet to crush the internet-driven protests in June 2009. In Russia, neofascists use the internet to organize pogroms. And on and on. Morozov has written hundreds of pages to make the point that technology is amoral and cuts many different ways. Just as radio can bolster democracy or — as in Rwanda — incite genocide, so the internet can help foment a revolution but can also help crush it. This seems obvious, yet it has often been entirely lost as grand claims are made for the internet's positive, liberating qualities. ¶And suddenly here are Tunisia and, even more dramatically, Egypt, simultaneously proving and refuting Morozov's argument. In both cases, social networking allowed truths that had been whispered to be widely broadcast and commented upon. In Tunisia and Egypt — and now across the Arab world — Facebook and Twitter have made people feel less alone in their rage at the governments that stifle their lives. There is nothing more politically emboldening than to feel, all at once, that what you have experienced as personal bitterness is actually an objective condition, a universal affliction in your society that therefore can be universally opposed. ¶Yet at the same time, the Egyptian government shut off the internet, which is an effective way of using the internet. And according to one Egyptian blogger, misinformation is being spread through Facebook — as it was in Iran — just as real information was shared by anti-government protesters. This is the "**dark side of internet freedom"** that Morozov is warning against. It is the freedom to wantonly crush the forces of freedom. ¶All this should not surprise anyone. It seems that, just as with every other type of technology of communication, the internet is not a solution to human conflict but an amplifier for all aspects of a conflict. As you read about pro-government agitators charging into crowds of protesters on horseback and camel, you realize that nothing has changed in our new internet age. The human situation is the same as it always was, except that it is the same in a newer and more intense way. Decades from now, we will no doubt be celebrating a spanking new technology that promises to liberate us from the internet. And the argument joined by Morozov will occur once again.

Doesn't Solve Totalitarianism – 2NC

Now, the Aff doesn't promote dissent against Totalitarianism states - New cyber utopian societies are extremely influenced by technology Increased Freedom could

result in increased technology – For example Iran government officals utilized massive freedom to quell rebel - That's Siegel

No evidence that the internet actually spurs democratization

Aday et al. 10 (Sean Aday is an associate professor of media and public affairs and international affairs at The George Washington University, and director of the Institute for Public Diplomacy and Global Communication. Henry Farrell is an associate professor of political science at The George Washington University. Marc Lynch is an associate professor of political science and international affairs at The George Washington University and director of the Institute for Middle East Studies. John Sides is an assistant professor of political science at The George Washington University. John Kelly is the founder and lead scientist at Morningside Analytics and an affiliate of the Berkman Center for Internet and Society at Harvard University. Ethan Zuckerman is senior researcher at the Berkman Center for Internet and Society at Harvard University and also part of the team building Global Voices, a group of international bloggers bridging cultural and linguistic differences through weblogs. August 2010, "BLOGS AND BULLETS: new media in contentious politics", http://www.usip.org/files/resources/pw65.pdf)

New media, such as blogs, Twitter, Facebook, and YouTube, have played a major role in episodes of contentious political action. They are often described as important tools for activists seeking to replace authoritarian regimes and to promote freedom and democracy, and they have been lauded for their democratizing potential. Despite the prominence of "Twitter revolutions," "color revolutions," and the like in public debate, policymakers and scholars know very little about whether and how new media affect contentious politics. **Journalistic accounts are inevitably based on anecdotes rather than rigorously designed research**. Although data on new media have been sketchy, new tools are emerging that measure linkage patterns and content as well as track memes across media outlets and thus might offer fresh insights into new media. The impact of new media can be better understood through a framework that considers five levels of analysis: individual transformation, intergroup relations, collective action, regime policies, and external attention. New media have the potential to change how citizens think or act, mitigate or exacerbate group conflict, facilitate collective action, spur a backlash among regimes, and garner international attention toward a given country. Evidence from the protests after the Iranian presidential election in June 2009 suggests the utility of examining the role of new media at each of these five levels. Although there is reason to believe the Iranian case exposes the potential benefits of new media, other evidence—such as the Iranian regime's use of the same social network tools to harass, identify, and imprison protesters—suggests that, like any media, **the Internet is not a "magic bullet." At best, it may be a "rusty bullet."** Indeed, it is plausible that traditional media sources were equally if not more important. Scholars and policymakers should adopt a more nuanced view of new media's role in democratization and social change, one that recognizes that new media can have both positive and negative effects. Introduction In January 2010, U.S. Secretary of State Hillary Clinton articulated a powerful vision of the Internet as promoting freedom and global political transformation and rewriting the rules of political engagement and action. Her vision resembles that of others who argue that new media technologies facilitate participatory politics and mass mobilization, help promote democracy and

free markets, and create new kinds of global citizens. Some observers have even suggested that Twitter's creators should receive the Nobel Peace Prize for their role in the 2009 Iranian protests.1 But not everyone has such sanguine views. Clinton herself was careful to note when sharing her vision that new media were not an "unmitigated blessing." Pessimists argue that these technologies may actually **exacerbate conflict**, as exemplified in Kenya, the Czech Republic, and Uganda, and help authoritarian regimes monitor and police their citizens. 2 They argue that new media encourage self-segregation and polarization as people seek out only information that reinforces their prior beliefs, offering ever more opportunities for the spread of hate, misinformation, and prejudice.3 Some skeptics question whether new media have significant effects at all. Perhaps they are simply a tool used by those who would protest in any event or a trendy "hook" for those seeking to tell political stories. Do new media have real consequences for contentious politics—and in which direction?4 The sobering answer is that, fundamentally, no one knows. To this point, little research has sought to estimate the causal effects of new media in a methodologically rigorous fashion, or to gather the rich data needed to establish causal influence. **Without rigorous research designs or rich data, partisans of all viewpoints turn to anecdotal evidence and intuition**

Mobilization and Internet access are not correlated – other factors are more important

Kuebler 11 (Johanne Kuebler, contributor to the CyberOrient journal, Vol. 5, Iss. 1, 2011, "Overcoming the Digital Divide: The Internet and Political Mobilization in Egypt and Tunisia", http://www.cyberorient.net/article.do?articleId=6212)

The assumption that the uncensored accessibility of the Internet encourages the struggle for democracy has to be differentiated. At first sight, the case studies seem to confirm the statement, since Egypt, featuring a usually uncensored access to the Internet, has witnessed mass mobilisations organised over the Internet while Tunisia had not. However, the mere availability of freely accessible Internet is not a sufficient condition insofar as mobilisations in Egypt took place when a relative small portion of the population had Internet access and, on the other hand, mobilisation witnessed a decline between 2005 and 2008 although the number of Internet users rose during the same period. As **there is no direct correlation between increased Internet use and political action** organised through this medium, we have to assume a more complex relationship. A successful social movement seems to need more than a virtual space of debate to be successful, although such a space can be an important complementary factor in opening windows and expanding the realm of what can be said in public. A political movement revolves around a core of key actors, and "netizens" qualify for this task. The Internet also features a variety of tools that facilitate the organisation of events. However, to be successful, social movements need more than a well-organised campaign. In Egypt, we witnessed an important interaction between print and online media, between the representatives of a relative elitist medium and the traditional, more accessible print media. A social movement needs to provide frames resonating with grievances of the public coupled with periods of increased public attention to politics in order to create opportunity structures. To further transport their message and to attract supporters, a reflection of the struggle of the movement with the government in the

"classical" media such as newspapers and television channels is necessary to give the movement momentum outside the Internet context.

Solvency

No Solvency – Circumvention

FISA will circumvent

Bendix and Quirk 15 (assistant professor of political science at Keene State College; Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia)

(William Bendix and Paul J. Quirk, Secrecy and negligence: How Congress lost control of domestic surveillance, Issues in Governance Studies, March 2015, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf)

Even if Congress at some point enacted new restrictions on surveillance, the executive might ignore the law and continue to make policy unilaterally. The job of reviewing executive conduct would again fall to the FISA Court.56 In view of this court's history of broad deference to the executive, Congress would have a challenge to ensure that legislative policies were faithfully implemented.

And the exec can circumvent via national security letters

Sanchez 15 (a Senior Fellow at the Cato Institute)

(Julian Don't (Just) Let the Sun Go Down on Patriot Powers, May 29, 2015, http://motherboard.vice.com/read/dont-just-let-the-sun-go-down-on-patriot-powers)

Also permanent are National Security Letters or NSLs, which allow the FBI to obtain a more limited range of telecommunications and financial records without even needing to seek judicial approval. Unsurprisingly, the government loves these streamlined tools, and used them so promiscuously that the FBI didn't even bother using 215 for more than a year after the passage of the Patriot Act. Inspector General reports have also made clear that the **FBI is happy to substitute NSLs for 215 orders** when even the highly accommodating FISC manages a rare display of backbone. In at least one case, when the secret court refused an application for journalists' records on First Amendment grounds, the Bureau turned around and **obtained the same data** using National Security Letters.

No Solvency – Foreign Surveillance

Foreign, not domestic, surveillance is what is driving data pull out – restrictions on domestic surveillance will onlu further this push

Chander and Le 15 (Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; Free Speech and Technology Fellow, California International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law)

Anupam Chander and Uyên P. Lê, DATA NATIONALISM, EMORY LAW JOURNAL, Vol. 64:677, http://law.emory.edu/elj/_documents/volumes/64/3/articles/chander-le.pdf)

First, the United States, like many countries, concentrates much of its surveillance efforts abroad. Indeed, the Foreign Intelligence Surveillance Act is focused on gathering information overseas, limiting data gathering largely only when it implicates U.S. persons.174 The recent NSA surveillance disclosures have revealed extensive foreign operations.175 Indeed, constraints on domestic operations may well have **spurred the NSA to expand operations abroad**. As the Washington Post reports, "**Intercepting communications overseas has clear advantages for the NSA, with looser restrictions and less oversight**."176 Deterred by a 2011 ruling by the Foreign Intelligence Surveillance Court barring certain broad domestic surveillance of Internet and telephone traffic,177 the NSA may have increasingly turned its attention overseas. Second, the use of malware eliminates even the need to have operations on the ground in the countries in which surveillance occurs. The Dutch newspaper NRC Handelsblad reports that the NSA has infiltrated every corner of the world through a network of malicious malware.178 A German computer expert noted that "data was intercepted here [by the NSA] on a large scale."179 The NRC Handelsblad suggests that the NSA has even scaled the Great Firewall of China,180 demonstrating that efforts to keep information inside a heavily secured and monitored ironclad firewall do not necessarily mean that it cannot be accessed by those on the other side of the earth. This is a commonplace phenomenon on the Internet, of course. The recent enormous security breach of millions of Target customers in the United States likely sent credit card data of Americans to servers in Russia, perhaps through the installation of malware on point-of-sale devices in stores.

No Solvency – No Reverse Perception

The Aff can't undo the overwhelming perception of US surveillance

Fontaine 14 (President of the Center for a New American Security)

(Richard, Bringing Liberty Online: Reenergizing the Internet Freedom Agenda in a Post-Snowden Era, SEPTEMBER 2014, Center for New American Security)

Such moves are destined to have only a modest effect on foreign reactions. U.S. **surveillance will inevitably continue** under any reasonably likely scenario (indeed, despite the expressions of outrage, not a single country has said that it would cease its surveillance activities). Many of the demands – such as for greater transparency – will not be met, simply due to the clandestine nature of electronic espionage. **Any limits** on surveillance that a govern- ment might announce **will not be publicly verifiable** and thus perhaps not fully credible. Nor will there be an international "no-spying" convention to reassure foreign citizens that their communications are unmonitored. As it has for centuries, state- sponsored espionage activities are likely to remain accepted international practice, unconstrained by international law. The one major possible shift in policy following the Snowden affair – a stop to the bulk collection of telecommunications metadata in the United States – will not constrain the activ- ity most disturbing to foreigners; that is, **America's surveillance of them**. At the same time, U.S. offi- cials are highly unlikely to articulate a global "right to privacy" (as have the U.N. High Commissioner for Human Rights and some foreign officials), akin to that derived from the U.S. Constitution's fourth amendment, that would permit foreigners to sue in U.S. courts to enforce such a right.39 The Obama administration's January 2014 presidential directive on signals intelligence refers, notably, to the "legiti- mate privacy interests" of all persons, regardless of nationality, and not to a privacy "right."40

Plan is too small to overcome requirements that are necessary to change the status quo

Kehl et al 14 (Danielle Kehl is a Policy Analyst at New America's Open Technology Institute (OTI). Kevin Bankston is the Policy Director at OTI, Robyn Greene is a Policy Counsel at OTI, and Robert Morgus is a Research Associate at OTI)
(New America's Open Technology Institute Policy Paper, Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity, July 2014)

Two months later, many of the same companies and organizations issued another letter supporting surveillance transparency legislation proposed by Senator Al Franken (D-MN) and Representative Zoe Lofgren (D-CA) that would have implemented many of the original letter's recommendations.334 Elements of both bills, consistent with the coalition's recommendations, were included in the original version of the USA FREEDOM Act introduced in the House and the Senate—as were new strong transparency provisions requiring the FISA court to declassify key legal opinions to better educate the public and policymakers about how it is interpreting and implementing the law. Such strong new transparency requirements are consistent with several recommendations of the President's Review Group335 and would help address concerns about lack of transparency raised by the UN High Commissioner for Human Rights.336

Section 702 Gonzaga

T-Domestic

1NC

Interpretation--Domestic surveillance is the acquisition of nonpublic information concerning US persons.

Small, Center for the Study of the Presidency and Congress fellow, 2008

(Matthew, "His Eyes are Watching You: Domestic Surveillance, Civil Liberties and Executive Power during Times of National Crisis", http://cspc.nonprofitsoapbox.com/publications/presidential-fellows-program/18/289-a-dialogue-on-presidential-challenges-and-leadership-papers-of-the-2007-2008-center-fellows)

Before one can make any sort of assessment of domestic surveillance policies, it is first necessary to narrow the scope of the term "domestic surveillance." Domestic surveillance is a subset of intelligence gatherin. Intelligence, as it is to be understood in this context, is "information that meets the stated or understood needs of policy makers and has been collected, processed and narrowed to meet those needs" (Lowenthal 2006, 2). In essence, domestic surveillance is a means to an end; the end being intelligence**. The intelligence community best understands domestic surveillance as the acquisition of nonpublic information concerning United States persons** (Executive Order 12333 (3.4) (i)). With this definition domestic surveillance remains an overly broad concept.

Violations---Section 702 only deals with non US persons outside the US.

McNeal, Pepperdine law professor and PhD, 2014

(Gregory, "Reforming The Foreign Intelligence Surveillance Court's Interpretive Secrecy Problem", 11-13, http://papers.ssrn.com/sol3/Papers.cfm?abstract_id=2524067)

Section 702 authorizes the targeting of persons, and persons are defined in FISA. Persons are not only individuals, but also groups, entities, associations, corporations, or foreign powers.27 As the PCLOB noted, the "definition of 'person' is therefore broad, but not limitless: a foreign government or international terrorist group could qualify as a 'person', but an entire foreign country cannot be a 'person' targeted under Section 702."28 Surveillance under section 702 may not intentionally target U.S. persons.29 To ensure that only the appropriate people are being targeted by the NSA, the agency uses selectors "such as email addresses and telephone numbers. The NSA must make determinations (regarding location, U.S. person status, and foreign intelligence value) about the users of each selector on an individualized basis. It cannot simply assert that it is targeting a particular terrorist group."30 Pursuant to the terms of the statute, the non-U.S. persons targeted by the NSA **must be "reasonably believed to be located outside the United States**."31 The statute authorizes the government to compel "electronic communication service provider[s]" to assist the government in targeting non U.S. persons reasonably believed to be located outside the United States.32 Finally, the statute makes clear that the purpose for which non-U.S. persons are to be targeted is "to acquire foreign intelligence information."**33 Further, the government cannot use "what is generally referred to as 'reverse targeting,' which would occur if the government were to intentionally target persons reasonably believed to be located outside the United States 'if the purpose of the acquisition is to target a particular, known person reasonably believed to be in the United States.'"34**

Vote NEG:

1. Limits—moving beyond domestic surveillance encompasses every surveillance activity the government conducts multiplied by the number of potential foreign targets which over extends the NEG.

2. Ground---forcing the AFF to focus on US persons is key to lock in core debates concerning constitutional protections, privacy and national security.

A2: We Meet

Section 702 targets non-Americans believed to be outside the country.

Sales, Syracuse law professor, 2014

(Nathan, "NSA SURVEILLANCE: ISSUES OF SECURITY, PRIVACY AND CIVIL LIBERTY: ARTICLE: Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", I/S: A Journal of Law and Policy for the Information Society, Summer, lexis)

The second program--known as PRISM or section 702--uses court orders issued under section 702 of FISA n18 to collect the content of certain international communications. **In particular, the NSA targets specific non-Americans who are reasonably believed to be located outside the country**, and **also engages in bulk collection of some foreign-to-foreign communications** that happen to be passing through telecommunications infrastructure in the United States. n19 The FISA [*527] court does not approve individual surveillance applications each time the NSA wishes to intercept these communications; instead, it issues once-a-year blanket authorizations. n20 As detailed below, in 2011 the FISA court struck down the program on constitutional and statutory grounds after the government disclosed that it was inadvertently intercepting a significant number of communications involving Americans; n21 the court later upheld the program when the NSA devised a technical solution t**hat prevented such over-collection. n22**

FISA by design avoids issues reltated to domestic surveillance

Morrison, NYU law professor, 2008

(Trevor, ""The Story of United States v. United States District Court (Keith): The Surveillance Power", 11-20, http://lsr.nellco.org/cgi/viewcontent.cgi?article=1047&context=columbia_pllt)

In 1978, Congress responded by passing the Foreign Intelligence Surveillance Act (FISA).194 As the Senate Judiciary Committee explained in a statement outlining the need for the legislation, "This legislation is in large measure a response to the revelations that warrantless electronic surveillance in the name of national security has been seriously abused."195 Congress sought to "'curb the practice by which the Executive Branch may conduct warrantless electronic surveillance on its own unilateral determination that national security justifies it,' while [still] permitting the legitimate use of electronic surveillance to obtain foreign intelligence information."196 FISA is sometimes viewed as a response to the Supreme Court's suggestion in Keith that Congress adopt special standards for surveillance in national security cases.197 Yet, while Keith and FISA are certainly connected in important respects,198 FISA does not take up the precise invitation issued in Keith. **That invitation applied to the category of surveillance addressed in the case—so-called "domestic security" surveillance for intelligence purposes**.199 **FISA does not cover such surveillance.** In **fact, "[n]o congressional action has ever been taken regarding the use of electronic surveillance in the domestic security area."**200 For cases falling in that area, therefore, Keith's direct application of the Fourth Amendment continues to govern.

A2: Counter Interpretation

History of FISA demonstrates there is a clear distinction between foreign and domestic and FISA is on the foreign side.

Morrison, NYU law professor, 2008

(Trevor, ""The Story of United States v. United States District Court (Keith): The Surveillance Power", 11-20, http://lsr.nellco.org/cgi/viewcontent.cgi?article=1047&context=columbia_pllt)

Although he did not develop the point at length, Judge Keith also drew a distinction between surveillance targeting purely domestic entities and surveillance targeting foreign powers: An idea which seems to permeate much of the Government's argument is that a dissident domestic organization is akin to an unfriendly foreign power and must be dealt with in the same fashion. There is great danger in an argument of this nature for it strikes at the very constitutional privileges and immunities that are inherent in United States citizenship. It is to be remembered that in our democracy all men are to receive equal justice regardless of their political beliefs or persuasions. The executive branch of our government cannot be given the power or the opportunity to investigate and prosecute criminal violations under two different standards simply because certain accused persons espouse views which are inconsistent with our present form of government.67 Judge Keith's distinction between domestic and foreign intelligence-gathering can be read in at least two different ways. One way is to stress the passage referring to the constitutional rights that come with being a citizen of the United States. Yet citizenship itself generally does not mark the boundary of the Fourth Amendment's protections; noncitizens prosecuted in U.S. courts enjoy the Amendment's protections just as citizens do. **Another (perhaps more descriptively accurate and normatively attractive) reading would treat the distinction as having to do with whether the government's actions have any proximate connection to the domestic criminal justice system, without regard to the citizenship of those involved**. On this reading, the point is that the Fourth Amendment must apply fully to "dissident domestic organization[s]" precisely because such organizations are subject to the domestic criminal justice system. "[F]oreign power[s]," on the other hand, are not likely to face prosecution in the U.S. courts. More generally, the domestic sovereign's relationship to them is qualitatively different than it is to domestic individuals and organizations. Thus, it makes sense from this perspective to distinguish between domestic and foreign targets of the government's surveillance efforts.

Domestic surveillance occurs when people who are not associated with foreign powers or agents are monitored.

Morrison, NYU law professor, 2008

(Trevor, ""The Story of United States v. United States District Court (Keith): The Surveillance Power", 11-20, http://lsr.nellco.org/cgi/viewcontent.cgi?article=1047&context=columbia_pllt)

Second, adopting the same basic distinction observed by Judge Keith and the Sixth Circuit, the Court stressed that the instant case "involves only the domestic aspects of national security. We have not addressed, and express no opinion as to, the issues which may be involved with respect to activities of foreign powers or their agents."174 The Court dropped a footnote at that point, citing two lower court cases, as well as the ABA Committee whose standards Powell had earlier worked on, as examples of authorities embracing "the view that **warrantless surveillance, though impermissible in domestic security cases**, may be constitutional where foreign powers are involved."175 An earlier draft of the opinion contained a more detailed list of authorities on that point, suggesting more strongly that foreign surveillance cases would come out the other way.176 The modification of the footnote suggests that at least some on the Court truly did not want to suggest anything one way or the other about cases involving foreign targets. The Court's embrace of the domestic/foreign distinction arguably marks another important difference between it and Powell's earlier statements. The **precise distinction that Powell had once derided as "largely meaningless" emerged by the end of Keith as potentially decisive for Fourth Amendment purposes.** How should we read this shift? One possibility is simply that Powell changed his mind. After immersing himself in the Keith materials, he may have become convinced that a distinction he earlier deemed empty can sometimes have coherent meaning.

Case Answers

Economy Adv

Global Econ Low – 1NC

The global economy will tank in 2015 no matter what.

Marvasti, Lombardi Financial research analyst, 2015

(Milad, "Global Economy Remains Weak; Another Recession Coming?", 5-19, http://www.profitconfidential.com/economic-analysis/global-economy-verge-another-recession/)

It has been six years since the global economy and U.S. entered the worst recession since the Great Depression. While many are championing the economic recovery, on closer inspection, it looks like history might repeat itself sooner rather than later. U.S. Economy Grows at Slowest Pace Since WWII The rate of growth in the U.S has been dismal since the 2008 housing bubble and financial crisis topped the country into the worst financial disaster since the Great Depression. For example, before the Great Recession, the biggest economy in the world reported annual gross domestic product (GDP) growth of 3.8% in 2004, 3.3% in 2005, and 2.7% in 2006. Then the ripples of the Great Recession began to make themselves felt. In 2007, the U.S. reported a GDP of 1.8%, followed by -0.3% in 2008 and -2.8% in 2009. (Source: Worldbank.org, last accessed May 14, 2015.) Between the devastating recovery years of 2009 and 2012, the cumulative rate of GDP growth was nearly nine percent below the average growth rate for previous recoveries. (Source: Congressional Budget Office, last accessed, May 14, 2015.) The so-called recovery has been pretty uneventful. In 2013, the U.S. reported annual GDP growth of 2.2%; last year it was just 2.3%. In the first quarter of 2015, GDP came in at a dismal 0.2%. **As it stands, weak recovery, massive budget deficits, and high debt level could push the fragile U.S. economy into another recession**. China Economy Slowing Down China, the world's second-largest economy, is also losing steam. Since 2010, the country's GDP has been steadily declining from 10.6% to 7.4% in 2014. Not surprisingly, China's money supply grew and investment growth sank to the slowest pace in over 15 years. (Source: Reuters, May 13, 2015.) The future remains bleak. For 2015, China's economy is forecast to climb at around seven percent; its slowest pace in 25 years and well below historical averages. The People's Bank of China (PBOC) has lowered its benchmark interest rate for the third time in six months. By lowering interest rates, the central bank is hoping to make borrowing cheaper and stimulate economic growth. Greek Debt Crisis Can Drive Eurozone Back into Recession **After six years, Greece emerged from a recession in 2014. But that was short-lived; falling business confidence, national debt, and deflation have driven Greece back into a recession.** To make matters worse, Greece's government has not been able to cut a deal with the International Monetary Fund (IMF) to ease its debt crisis. Greece's finance minister insisted on Thursday that he will reject any deal from international bailout creditors that does not help the country exit its economic crisis. (Source: abcnews.com May 14, 2015.) **All told, I think that the signs of deteriorating economic conditions are set to emerge in late 2015 or early 2016. With this, don't expect stock markets to perform the way they have been for some time.**

Global Econ Low – 2NC

The risk is high because governments have no tools left to intervene.

Chung, News AU correspondent, 2015

(Frank, "'Like an ocean liner without lifeboats': HSBC's dire warning for global economy", 5-27, http://www.news.com.au/finance/economy/like-an-ocean-liner-without-lifeboats-hsbcs-dire-warning-for-global-economy/story-e6frflo9-1227371228341)

THE world economy is in serious danger of falling into another recession — and if it does, governments have few tools left at their disposal to combat it. That's the dire warning from HSBC chief economist Stephen King, who describes the situation as like being on an "ocean liner without lifeboats". With interest rates at near zero across the developed world, record levels of public debt and little room for further stimulus spending, **the conventional "monetary ammunition" that has been built up following previous recessions is all but non-existent.** "In effect, the world economy is sailing across the ocean without any lifeboats to use in case of emergency," he writes in a new report, 'The world economy's titanic problem'. That's bad news. As the UK's Telegraph points out, the United Nations has cut its global growth forecast for this year to 2.8 per cent — only slightly above the 2.5 per cent which used to be regarded as a recession. **The biggest danger comes from China. If the Chinese economy weakens so much that the authorities have no other choice than to let the renminbi slide, it will have severe knock-on effect.** "[In this situation, collapsing] commodity prices lead to severe weakness elsewhere in the emerging world," Mr King writes. "The dollar surges, but the Fed is unable to respond via interest rate cuts. **The US is eventually dragged into a recession through forces beyond its control."** And the situation in China is already worse than authorities are letting on, experts have warned. China accounted for 85 per cent of global growth in 2012, 54 per cent in 2013, and 30 per cent in 2014 — that figure is expected to fall to 24 per cent this year. "If there is only one statistic that you need to know in the world right now, this is it," RBS economist Andrew Roberts told The Telegraph. In every recession since the 1970s, the US Federal Reserve has cut interest rates by a minimum of 5 percentage points. "That kind of traditional stimulus is now completely ruled out," HSBC's Mr King writes. "Meanwhile, budget deficits are still uncomfortably large and debt levels uncomfortably high." While in the past, deep recessions have typically been followed by strong recoveries, this time around, "a deep recession has been followed by an insipid recovery: more L-shaped than V-shaped". "Today, inflation isn't just low. It is, arguably, too low," he warns. When debt levels are low, interest rates are high and budget deficits are small, dealing with recessions is relatively easy, he says. "When debt levels are high, interest rates are at zero and budget deficits are large, dealing with recessions is a lot more troublesome." Attempts in various global economies to "rebuild their ammunition" over the past six years have failed. The European Central Bank had "egg on its face" after trying to raise interest rates in 2011, only to be forced to drop them again. The danger for policymakers is firstly, that it's hard to know in advance what the next financial crisis will look like; and secondly, that regardless where it comes from, none of the tools that have helped governments pull themselves out are available this time.

Emerging markets in particular are spiraling towards recession.

Wheatley, Financial Times, 2015

(Jonathan, "Emerging markets: The great unravelling", 4-1, http://www.ft.com/intl/cms/s/2/ddd8caf0-d86a-11e4-ba53-00144feab7de.html#axzz3bMQVLmBe)

Faced with recession, decade- high inflation, a fiscal crisis and water rationing, more than 1m Brazilians took to the streets last month to protest against corruption and mismanagement in their

government. In China, growth is slowing as property prices fall, propelling more than 1,000 iron ore mines toward financial collapse. The patriotic citizens of Russia, meanwhile, are deserting their nation's banks, switching savings into US dollars. **Such snapshots of growing distress in the world's largest emerging markets are echoed among many of their smaller counterparts**. Several countries in Sub-Saharan Africa are beset by dwindling revenues and rising debts. Even the turbo-powered petroeconomies of the Gulf, hit by a halving in the price of oil over the past six months to $55 a barrel, are moving into a slower lane. Though these expressions of distress derive from disparate sources, one big and insidious trend is working to forge a common destiny for almost all emerging markets . The gush of global capital that flowed into their economies in the six years since the 2008-09 financial crisis is in most countries now either slowing to a trickle or reversing course to find a safer home back in developed economies. Highest outflows since 2009 On an aggregate basis, the 15 largest emerging economies experienced their biggest absolute capital outflow since the crisis in the second half of last year, as a strong US dollar drove emerging market currencies into a swoon and investors grew nervous over the prospect of a tightening in US monetary policy, according to data compiled by ING. At the same time, low commodity prices slammed GDP growth rates across the developing world. These trends, analysts say, signal a "great unravelling" of an emerging markets debt binge that has swollen to unprecedented dimensions. Importantly, the pain inflicted by this capital flight is being felt beyond financial markets in the real economies of vulnerable countries and in a surging number of emerging market corporations that are forecast to default on their debts. "Certain parts of the world are looking really vulnerable," says Maarten-Jan Bakkum, senior emerging market strategist at ING Investment Management. "Places like Brazil, Russia, Colombia and Malaysia, that rely heavily on commodity exports, are going to get hit even harder, while those countries that have borrowed most excessively like Thailand, China and Turkey also look risky." Analysts say that while emerging markets have been the setting for several recent financial squalls, the current exodus of capital could herald more fundamental changes. Indeed, although the "taper tantrum" of mid-2013 — triggered by the US Federal Reserve signalling its intention to unwind its monetary stimulus — caused turmoil in financial markets, its impact on real emerging market economies was transitory. This time around, though, things look more serious. The International Monetary Fund said this week that total foreign currency reserves held by emerging markets in 2014 — a key indicator of capital flows — suffered their first annual decline since records began in 1995. **Without steady capital inflows, emerging market countries have less money to pay their debts, finance their deficits and spend on infrastructure and corporate expansion.** Real economic growth is set to suffer this year, analysts say. Capital Economics expects GDP growth in emerging markets to fall to 4 per cent from 4.5 per cent in 2014, as Russia slips deeper into recession, Brazil continues to struggle and China is hampered by its ailing property market. Underlying such sober projections is a sense that an inflection point has been reached with the end of the commodity "supercycle" and the advent of low oil prices. "What is going on is a great unravelling of the market conditions of the past 15 years," says Paul Hodges of International eChem, a chemicals and commodities consultancy.

No Econ Impact – 1NC

Economic collapse doesn't cause war

Drezner, Tufts IR professor, 2014

(Daniel, "The System Worked: Global Economic Governance during the Great Recession", World Poltiics, 66.1, January, proquest)

The final significant outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.42 They voiced genuine concern that the global economic downturn would lead

to an increase in conflict—whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fueled impressions of a surge in global public disorder. **The aggregate data suggest otherwise**, however. The Institute for Economics and Peace has concluded that "the average level of peacefulness in 2012 is approximately the same as it was in 2007."43 Interstate violence in particular has declined since the start of the financial crisis, as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has not triggered any increase in violent conflict, as Lotta Themner and Peter Wallensteen conclude: "[T]he pattern is one of relative stability when we consider the trend for the past five years."44 The secular decline in violence that started with the end of the Cold War has not been reversed. Rogers Brubaker observes that "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."43

No Econ Impact – 2NC

Economic collapse doesn't cause war

Bazzi et al., UCSD economics department, 2011

(Samuel, "Economic Shocks and Conflict: The (Absence of?) Evidence from Commodity Prices", November, http://www.chrisblattman.com/documents/research/2011.EconomicShocksAndConflict.pdf?9d7bd4)

VI. Discussion and conclusions A. Implications for our theories of political instability and conflict The state is not a prize?—Warlord politics and the state prize logic lie at the center of the most influential models of conflict, state development, and political transitions in economics and political science. Yet we see no evidence for this idea in economic shocks, even when looking at the friendliest cases: fragile and unconstrained states dominated by extractive commodity revenues. Indeed, we see the opposite correlation: if anything, **higher rents from commodity prices** weakly 22 **lower the risk and length of conflict.** Perhaps shocks are the wrong test. Stocks of resources could matter more than price shocks (especially if shocks are transitory). But combined with emerging evidence that war onset is no more likely even with rapid increases in known oil reserves (Humphreys 2005; Cotet and Tsui 2010) we regard the state prize logic of war with skepticism.17 Our main political economy models may need a new engine**.** Naturally, an absence of evidence cannot be taken for evidence of absence. Many of our conflict onset and ending results include sizeable positive and negative effects.18 Even so, commodity price shocks are highly influential in income and should provide a rich source of identifiable variation in instability. It is difficult to find a better-measured, more abundant, and plausibly exogenous independent variable than price volatility. Moreover, other time-varying variables, like rainfall and foreign aid, exhibit robust correlations with conflict in spite of suffering similar empirical drawbacks and generally smaller sample sizes (Miguel et al. 2004; Nielsen et al. 2011). Thus we take the absence of evidence seriously. Do resource revenues drive state capacity?—State prize models assume that rising revenues raise the value of the capturing the state, but have ignored or downplayed the effect of revenues on self-defense. We saw that a growing empirical political science literature takes just such a revenue-centered approach, illustrating that resource boom times permit both payoffs and repression, and that stocks of lootable or extractive resources can bring political order and stability. This countervailing effect is most likely with transitory shocks, as current revenues are affected while long term value is not. Our findings are partly consistent with this state capacity effect. For example, conflict intensity is most sensitive to changes in the extractive commodities rather than the annual agricultural crops that affect household incomes more directly. The relationship only holds for conflict intensity, however, and is somewhat fragile. We do not see a large, consistent or robust decline in conflict or coup risk when prices fall. A reasonable interpretation is that the state prize and state capacity effects are either small or tend to cancel one another out. Opportunity cost: Victory by default?—Finally, the inverse relationship between prices and war intensity is consistent with opportunity cost accounts, but not exclusively so. As we noted above, the relationship between intensity and extractive commodity prices is more

consistent with the state capacity view. Moreover, we shouldn't mistake an inverse relation between individual aggression and incomes as evidence for the opportunity cost mechanism. The same correlation is consistent with psychological theories of stress and aggression (Berkowitz 1993) and sociological and political theories of relative deprivation and anomie (Merton 1938; Gurr 1971). Microempirical work will be needed to distinguish between these mechanisms. Other reasons for a null result.—Ultimately, however, the fact that commodity **price shocks have no discernible effect on new conflict onsets**, but some effect on ongoing conflict, suggests that political stability **might be less sensitive** to income or temporary shocks than generally believed. One possibility is that successfully mounting an insurgency is no easy task. It comes with considerable risk, costs, and coordination challenges. Another possibility is that the counterfactual is still conflict onset. In poor and fragile nations, income shocks of one type or another are ubiquitous. **If a nation is so fragile that a change in prices could lead to war, then other shocks may trigger war even in the absence of a price shock.** The same argument has been made in debunking the myth that price shocks led to fiscal collapse and low growth in developing nations in the 1980s.19 B. A general problem of publication bias? More generally, these findings should heighten our concern with publication bias in the conflict literature. Our results run against a number of published results on commodity shocks and conflict, mainly because of select samples, misspecification, and sensitivity to model assumptions, and, most importantly, alternative measures of instability. Across the social and hard sciences, there is a concern that the majority of published research findings are false (e.g. Gerber et al. 2001). Ioannidis (2005) demonstrates that a published finding is less likely to be true when there is a greater number and lesser pre-selection of tested relationships; there is greater flexibility in designs, definitions, outcomes, and models; and when more teams are involved in the chase of statistical significance. The cross-national study of conflict is an extreme case of all these. Most worryingly, almost no paper looks at alternative dependent variables or publishes systematic robustness checks. Hegre and Sambanis (2006) have shown that the majority of published conflict results are fragile, though they focus on timeinvariant regressors and not the time-varying shocks that have grown in popularity. We are also concerned there is a "file drawer problem" (Rosenthal 1979). Consider this decision rule: scholars that discover robust results that fit a theoretical intuition pursue the results; but if results are not robust the scholar (or referees) worry about problems with the data or empirical strategy, and identify additional work to be done. If further analysis produces a robust result, it is published. If not, back to the file drawer. In the aggregate, the consequences are dire: a lower threshold of evidence for initially significant results than ambiguous ones.20

Diversionary war is wrong—qualitative AND quantitative studies go neg—decline facilitates coop

Fravel, MIT political science professor, 2010
(M Taylor, "The Limits of Diversion: Rethinking Internal and External Conflict", Security Studies, project muse)

The diversionary hypothesis offers one of the most powerful alternatives to rationalist explanations of war based on the state as a unitary actor. Strong empirical support for diversion would identify a more complete set of causal mechanisms underlying international conflict. The cases investigated in this article, however, raise doubts about the strength of the diversionary hypothesis as well as the **empirical validity** of arguments based on **diversionary mechanisms**, such as Mansfield and Snyder's theory about democratization and war.126 In Argentina and Turkey, the hypothesis fails to pass two most likely tests. In neither case was domestic unrest a necessary condition for the use of force as proponents of diversionary theory must demonstrate. Instead, **external security challenges** and **bargaining** over disputed territory better explain Argentine and Turkish decision making. The **historical record**, including leadership statements and reasoning, offers stronger evidence for a standard **realist model** and the dynamics of coercive diplomacy. Drawing definitive conclusions about diversion from just two cases is impossible. Nevertheless, the modified most likely research design used in this article weakens confidence in the strength of diversionary arguments. Diversion as a principal or primary source of some conflicts may be much less frequent than scholars assert. These two episodes should be among the easiest cases for diversion to explain. Not only did embattled leaders escalate disputes into crises and then use force, but scholars have also viewed these cases as being best explained by diversionary mechanisms. If diversion cannot account for these decisions, it is unclear what the hypothesis can in fact explain. My findings have several implications for the literature on diversionary war theory. At the most general level of analysis, the lack of support for the diversion hypothesis in Argentina and Turkey **complements** those quantitative studies of diversion that do not identify a systematic and

significant relationship between domestic politics and aggressive foreign policies, including the use of force.127 In addition, the modified most likely research design used in this article raises questions about those **quantitative studies that do provide empirical support** for diversion because it demonstrates that **despite** the presence of domestic unrest, the underlying causal mechanisms of diversion **may not account for the decisions to use force.** The lack of support for diversion raises a simple but important question: why is diversion less frequent than commonly believed, despite its plausible intuition? Although further research is required, several factors should be considered. First, the rally effect that leaders enjoy from an international crisis is generally brief in duration and unlikely to change permanently a public's overall satisfaction with its leaders.128 George H. W. Bush, for example, lost his reelection bid after successful prosecution of the 1991 Gulf War. Winston Churchill fared no better after the Allied victory in World War II.129 Leaders have little reason to conclude that a short-term rally will address what are usually structural sources of domestic dissatisfaction. Second, a selection effect may prevent embattled leaders from choosing diversion. Diversionary action should produce the largest rally effect against the most powerful target because such action would reflect a leader's skills through coercing a superior opponent. At the same time, leaders should often be **deterred from challenging stronger targets**, as the imbalance of military forces increases the risk of defeat and thus the probability of losing office at home. Although the odds of victory increase when targeting weaker states, success should have a much more muted effect on domestic support, if any, because victory would have been expected.130 Third, weak or embattled leaders can choose from a wide range of policy options to strengthen their standing at home. Although scholars such as Oakes and Gelpi have noted that embattled leaders can choose repression or economic development in addition to diversionary action**,** the range of options is even greater and carries **less risk than the failure of diversion**. Weak leaders can also seek to **deepen cooperation** with other states if they believe it will strengthen their position at home. Other studies, for example, have demonstrated that **political unrest facilitated détente** among the superpowers in the early 1970s, China's concessions in its **many territorial disputes**, support for international financial liberalization, and the formation of regional organizations such as the **A**ssociation of **S**outheast **A**sian **S**tates and the **G**ulf **C**ooperation **C**ouncil.131

Decline doesn't cause war

Jervis, Colubmia international affairs professor, 2011

(Robert, "Forces in Our Times", Survival, 25.4, December, ebsco)

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

Tech Sector High – 1NC

Tech sector is doing great---as much business as before the dot com burst

Erginsoy, PwC's Deals Practice director, 2015

(Tom, "US technology deal insights Analysis and trends in US technology 2015", February, http://www.pwc.com/en_US/us/transaction-services/publications/assets/pwc-us-technology-deal-insights-2014.pdf)

Out with a bang! Simply put, 2014 was a banner year for the technology sector. Alongside broader economic growth in the US, technology set records not seen since the dot com era. Deals remained active throughout the year, peaking in the fourth quarter as many corporate and financial investors closed large, transformative deals. In the end, technology deal activity closed out 2014 36% higher, amidst IT spending growth of less than 2%. Equity markets and IPO pricings similarly soared to new highs, and deal makers have not signaled any intent to slow down. Domestically, continued recovery in the US has been strong and the US trade deficit declined to the lowest level in decades, even in light of a strengthening dollar. The housing market continued to improve, with new housing starts at the highest level since 2007. Consumer confidence increased further and interest rates remain near record lows, each contributing to that overall growth. While the Fed is expected to increase rates in September, the US was the only major economy to receive an increase in its 2015 GDP growth forecasts by the IMF's most recent estimates. In labor markets, unemployment fell to a post-recession low of 5.6% and wage rates are anticipated to increase in the new year; however the labor participation rate hit a 30-year low of 62.7%, signaling an increase in long-term unemployment. On the political front, the US continues to make headlines. The nation's debt ceiling issue remains unresolved, and with a newly elected GOP-run Congress, the battles over immigration reform and healthcare are escalating. Abroad, Europe was the focus of cross-border technology acquisitions; however, growth estimates in the Eurozone have continually been cut throughout the year, with the IMF now projecting 1.2% GDP growth in 2015. The outlook for the UK is generally favorable, though challenged by the uncertainty within the Eurozone, for which the saga of Greece's membership in the EU continues. Russia, on the other hand, is anticipated to enter a recession more severe than that of 2008, as ongoing conflict in Ukraine, dropping oil prices, and a steep decline in the ruble lead the nation toward an economic crisis. In China, economic growth slowed to the weakest level since the Tiananmen Square sanctions of 1990, at 7.4%, and is projected to decline further below 7% in 2015, as the nation trends to a more "normal" pace of growth amid broader restructuring toward a consumption-based economy. The IMF now projects 4.3% 2015 GDP growth in developing countries, challenged by weak external demand; however, growth is expected to quickly follow recovery in the world's developed nations. US equity markets continued to set record highs, with the Dow Jones, NASDAQ, and S&P 500 rising 7.5%, 13.4%, and 11.4%, respectively, during 2014. While there was some volatility that caused immediate pull-back by lenders for a few weeks in the fourth quarter, technology M&A and IPO pricings generally mirrored the activity and valuation of the broader markets. Leading technology companies continue to remain some of the most valuable in the world, with Apple, Google, and Microsoft each holding three of the top five spots by market cap. These and other technology high-flyers have helped to maintain impressive average EBITDA multiples, with the top 25 US technology companies touting approximately 11x in 2014. IPO activity in 2014 continued to increase to the next level, becoming the most active year since 2000. In total, there were 60 technology IPOs, an increase over the 51 posted in 2013, which was already the most active year since the last recession. Technology IPOs continued to remain a key driver in the market, representing roughly 40% of IPO value and 20% of IPO volume (20% of value excluding the $21.8 billion Alibaba IPO). Proceeds from new pricings neared $35 billion, and year-to-date performance returns approximated 22%, both factors that continue to reaffirm the long-term outlook for the industry as a whole. IT spending in 2014 posted a growth rate just under 2%, lower than prior estimates given exchange rate movements, while projections anticipate an increase to approximately 2.4% growth in 2015. Cloud offerings, mobile devices, and enterprise software have remained the focal points for IT investment over the past few years, and 2015 is expected to continue along a similar path. Enterprise software is anticipated to remain the area of highest growth potential, though challenged by increasing price pressure and competition as cloud and traditional providers battle for customers. Mobile devices are expected to remain a key growth area and focal point of IT to enable their organizations, while some expect that PCs may make a comeback. In an already active deal market throughout 2014, technology M&A certainly flexed its muscle to round out the year and raise expectations for what may come. As we consider the almost $350 billion in cash and

securities on hand at the top 25 technology companies, record levels of private equity dry powder waiting to be deployed, and see indications of full pipelines from every angle of the market, 2015 promises to be another exciting year in technology M&A.

Tech Sector High – 2NC

US tech will lead the world in 2015.

Bartels, Forrester Research analyst, 2015

(Andrew, "The Global Tech Market Outlook For 2015 To 2016", 3-31, http://www.supplychain247.com/paper/the_global_tech_market_outlook_for_2015_to_2016)

As CIOs prepare and manage their 2015 tech budgets, they can confidently push for increases of 4% to 6% in their purchases of tech goods and services, depending on their country. Tech spending in the US, China, India, the UK, and the Nordics will be at the high end of this range; in the rest of Europe and Latin America, growth will be at the low end. Demand will be strongest for software - especially for analytics and cloud apps - and related services but weaker in hardware and outsourcing, creating savings opportunities. New project spending will be strong, much of it for technologies that support the business technology agenda for winning, serving, and retaining customers. Key Takeaways The Global Tech Market Will Grow By 5.3% In 2015 In Local Currencies, 5.9% In 2016 Improving economies in the US and elsewhere will help offset weakness in Japan, Europe, and oil-exporting countries, leading to moderate but improving global tech market growth. A strong US dollar in 2015 will hold dollar-denominated growth to 4.1%, with 6.3% for 2016 as the dollar weakens. The US Will Be The Major Driver Of Global Tech Market Growth **The US tech market continues to be the locomotive that pulls the rest of the tech train. The US is not only the largest and most advanced tech market in terms of adopting new technology; it will also have the fifth-fastest growth of 6.3% in 2015.** New Project Spending Will Grow, Driven By The Business Technology Agenda After two years in which uncertain economic outlooks have held back new project spending, this part of the tech budget will grow more rapidly than overall tech spending in 2015 and 2016. The key driver of faster project growth will be the business technology agenda for winning, serving, and retaining customers.

Confidence and optimism is high.

BDO Seidman 2015

("2015 BDO Technology Outlook", March, https://www.bdo.com/insights/industries/tech-life-sciences/2015-bdo-technology-outlook)

Tech CFOs Remain Upbeat About Industry's Future Last year, the technology industry experienced a robust deal environment and a high volume of investments flowing into companies. According to the 2015 BDO Technology Outlook Survey of 100 chief financial officers at U.S. technology companies, this ongoing positive environment has caused CFOs to remain optimistic about the year ahead. While the outlook is robust, finance chiefs remain cognizant of the factors that could inhibit business growth for 2015, such as data security challenges, accounting changes and tax concerns.

Finance Chiefs Confident About Revenue Growth On the heels of an exceptional year for the technology sector, a majority of CFOs (70 percent) anticipate increased sales revenue in 2015, up from 67 percent last year. Overall, finance chiefs project a revenue increase of more than 12 percent, following forecasts of an 11 percent increase in 2014 and an 8.7 percent increase in 2013, pointing to continued optimism in the industry. With Renaissance Capital reporting that tech IPO issuance rose 22 percent over last year to 55 deals—the highest level since 2007—CFOs are optimistic about IPO activity heading into 2015. A large majority of respondents (86 percent) say IPO activity will remain the same or increase in 2015. This sentiment is also reflected in the January 2015 BDO IPO Outlook Survey, with 73 percent of capital market executives at leading investment banks predicting an increase in technology offerings. What's more, venture capital-backed investments soared in 2014. According to Dow Jones VentureSource, investment returns from VC funds are on the rise as 105 VC-backed companies went public in 2014—the highest number since 2000. Thirty-nine percent of CFOs expect VC-backed companies will give rise to the most tech IPOs this year, followed by private equity (36 percent) and owner/manager or privately held businesses (25 percent; up from 18 percent in 2014). Despite recent headlines around the uncertainty of another impending tech bubble, only five percent of CFOs believe the concerns about a tech bubble will have the greatest impact on the U.S. IPO market. Meanwhile, more than one-third believe the performance of recent tech IPOs will have the largest influence on the market, followed by U.S. market volatility (25 percent), global political and economic issues (23 percent) and appeal of IPOs in foreign markets (11 percent). Recent Cyberattacks Fuel Data Security Fears An annual report by the Ponemon Institute, which conducts independent research on privacy, data protection and information security policy, found that 43 percent of companies have experienced a data breach in the past year—up 10 percent from the year before. With the number of cyberattacks increasing, more tech executives are concerned about their own IT infrastructures and response plans. According to our survey, 67 percent have increased their spending on cybersecurity measures during the past year. Of those who have taken action, 90 percent implemented new software security tools, 72 percent created a formal response plan for security breaches, 48 percent turned to an external security consultant and 30 percent hired a chief security officer. While many cyberattacks come from domestic and foreign entities, online security challenges could also stem from geopolitical issues. In fact, 14 percent of CFOs believe global political issues will be the leading barrier to industry growth in 2015. Recent threats have even captured the attention of the White House with President Obama proposing a budget that would increase cybersecurity spending to $14 billion. Along the same lines, finance chiefs are also anxious about their intellectual property (IP) protection, with 47 percent saying foreign IP infringements has had the greatest impact on their IP security, followed by changes in patent law (24 percent) and patent trolls (20 percent). Last year saw a significant uptick in M&A transactions, and according to CB Insights, technology M&A deals and IPOs combined rose 58 percent in 2014. Following this momentum, nearly all CFOs (96 percent) believe M&A activity will increase or stay the same this year, on pace with last year's forecast, and 66 percent expect that acquisitions will be primarily offensive. Close to two-thirds of CFOs (61 percent) believe the software sector, including cloud computing, will drive the most M&A activity in 2015, on trend with last year when 60 percent expressed a similar sentiment. In fact, International Data Group predicts that cloud computing initiatives will be the most important project for the majority of IT departments in 2015 and 42 percent of enterprises plan to increase their cloud computing spending this year. In addition, Forrester reports that Software-as-a-Service (SaaS) sales have been increasing at over 20 percent per year. As discussed in the Winter 2014 BDO TECH Software Newsletter, SaaS models are becoming more and more relevant as the business environment changes and the tech industry evolves. Traditionally, organizations purchased enterprise software, but on-premise solutions are becoming overpowered by SaaS, especially with the increasing use of mobile devices and related applications. "The software industry is quickly shifting from the traditional licensing model to cloud-based offerings, such as Software-as-a-Service, to meet the overwhelming need for real-time responses and easy integration," said Hank Galligan, leader of the Software Practice at BDO. "As the business environment evolves, companies are acknowledging the pressure to upgrade or introduce cloud computing services either through acquisitions or on their own." When looking at key drivers of acquisitions in today's tech market, one-third of CFOs believe increased revenue and profitability will be the primary impetus for M&A activity in 2015, followed by improved market share (25 percent), gaining engineering and research capabilities (14 percent) and enhancing technology assets and intellectual property (13 percent), which dropped from 28 percent in 2014. "Although the tech industry is cautious of overvaluation, finance chiefs are confident that deal activity will continue its momentum well into 2015. As consumers continue to demand innovative products and investments keep pouring into the sector, technology companies may be better positioned for business growth through strategic partnerships to expand their capabilities and offerings as well as to compete effectively and gain market share." said Aftab Jamil, partner and leader of the Technology and Life Sciences Practice at BDO USA, LLP. Surprisingly, CFOs are unfazed by overvaluation concerns in the industry, with 62 percent predicting that business valuations will increase this year, a 35 percent jump from 2014.

Legitimacy Adv

Alt Causes – 1NC

One shot solutions don't solve-problem is multifaceted

Miller, Wilson Center distinguished scholar, 2013

(Aaron, “Speak No Evil”, 5-28,
http://www.foreignpolicy.com/articles/2013/05/28/speak_no_evil_obama_drone_speech)

I'll take the word of those who argue that drones are the poster child for the anger Arabs and Muslims feel toward America. I can see why. But the grievances toward the United States in this region run deep, and the source of that anger is not only drones. Don't forget: The Middle East was exasperated with Washington long before droning, and it remains eager to blame America for just about everything. The list of the Arab world's grievances go on and on: America is blamed for supporting the authoritarian Arab kings, blindly backing Israel, not talking to Hamas, not intervening militarily in Syria, intervening militarily in Iraq and Afghanistan, and, according to Egyptian liberals, for supporting Egypt's Muslim Brotherhood. **And that's even before we discuss the small but determined minority of Muslims who do, in fact, hate us because of who we are** -- not just because of what we do. **No nuanced modulation of our approach on drone strikes or the closure of Gitmo is going to change any of that.**

Alt Causes – 2NC

Torture and drones undermine soft power.

Champion, Japan Times, 2014

(Marc, “U.S. soft power takes a hit in wake of report”, 12-16,
http://www.japantimes.co.jp/opinion/2014/12/16/commentary/world-commentary/u-s-soft-power-takes-a-hit-in-wake-of-report/#.VWYkjs9VhBd)

It’s hard to imagine any nation other than the United States persuading so many allies and dependents to take part in a program they must have known would one day blow up in their faces. In that sense, the Senate report isn’t only a revelation of U.S. intelligence malfeasance — it’s a testimony to U.S. soft power, the diplomatic advantage that it has long wielded over geo-political competitors such as Russia and China. One need only compare Washington’s success at finding international hosts for the CIA’s so-called black sites with Russia’s utter inability to persuade the world — aside from a small handful of countries including Cuba, Venezuela and Syria — to recognize its annexation of Crimea. **But it’s an open question whether soft power can survive being used to such grotesque ends**. One of the many reasons for which the torture program was a terrible idea was that once exposed it has deeply damaged the U.S. brand and thus eroded U.S. alliances: Forced rectal feeding just isn’t something that most people associate with the values of life, liberty and the pursuit of happiness. As many have pointed out, one great benefit of the Senate report is that it has demonstrated the ability of the U.S. political system to subject itself to scrutiny — a test that most democracies, and all autocratic regimes, routinely fail. Taken as a whole, people aren’t naïve. They understand governments do bad things and pursue their own selfish interests abroad. So when a country confesses and tries to rectify the transgression, people are impressed. If the U.S. goes on to prosecute those who approved and used the most extreme torture methods, that would do still more to repair the damage. But it’s worth remarking that torture is not the only national security policy that poses a threat to U.S. alliances. Friendly governments are still being asked to trust in the good judgment and good offices of the U.S. intelligence agencies, as well as in their effective oversight, even when there’s reason to question whether that trust is being honored. **One such policy is U.S. President Barack Obama’s expansive use of drone strikes against suspected terrorists**. The tacit rationale for this policy is that the targeted individuals are conducting activities so heinous that all nations should accept the right of the U.S. to kill these criminals without due process, wherever they may be, based on U.S. intelligence assessments. As with the arguments in support of torture, however, this justification quickly falls apart. Even Americans don’t believe in it: Look at the controversy that arose when Anwar al-Awlaki, a terrorist suspect who happened to be a U.S. citizen, was targeted and killed in a drone strike. If many Americans thought al-Awaliki deserved due process, on what basis should a Yemeni, German or Pakistani national suspected of the same heinous crimes not deserve it, too? Not surprisingly, the U.S. has very little backing worldwide for drone strikes. In July’s edition of the Pew Global Attitudes Research Project, there was net support for the policy in only four of 44 countries: Israel, Kenya,

Nigeria and the U.S. Majorities opposed the strikes even in staunch U.S. allies such as Japan (82 percent), the United Kingdom (59 percent) and Poland (54 percent).

Torture does real damage to US legitimacy.

Lord, IREX CEO and president, 2014

(Kristin, "Soft Power Outage", 12-23, http://foreignpolicy.com/2014/12/23/soft-power-outage/)

To understand the immediate damage done to U.S. influence, look no further than the commentary surrounding the report's release. According to the Washington Post, the state-run Chinese news service Xinhua editorialized that "America is neither a suitable role model nor a qualified judge on human rights issues in other countries," while a pro-government television commentator in Egypt observed, "The United States cannot demand human rights reports from other countries since this [document] proves they know nothing about human rights." The Islamic State and other extremists joined the propaganda gold rush. One tweet, quoted in a report from the SITE Intelligence Group, pointed to the audacity of the United States lecturing Muslims about brutality, adding, "Getting beheaded is 100 times more humane, more dignified than what these filthy scumbags do to Muslims." **Such reactions are galling and they do real harm to U.S. credibility.** But the fault lies not with those who released the report, as some critics argue, but with those who permitted and perpetrated acts of torture, those who lied about it to America's elected representatives, and those who willfully kept the president and senior members of the Bush administration in the dark. Their actions undermined not only American values, but also American influence and national security interests. In the words of a former prisoner of war, Sen. John McCain (R-Ariz.), the actions laid out in the Senate report "stained our national honor" and "did much harm and little practical good."

No Transition Wars – 1NC

Alliances are out dated, multi-polarity is stable and there is no scenario for war in a world of US decline

Friedman et al., MIT political science PhD candidate, 2012

(Benjamin, "Why the U.S. Military Budget is 'Foolish and Sustainable", Orbis, 56.2, Science Direct)

Standard arguments for maintaining the alliances come in two contradictory strains. One, drawn mostly from the run-up to World War II, says that without American protection, the ally would succumb to a rival power, either by force or threat of force, heightening the rival's capability and danger to the United States. The other argument says that without the United States, the ally would enter a spiral of hostility with a neighbor, creating instability or war that disrupts commerce and costs America more than the protection that prevented it. The main problem with the first argument is that no hegemon today threatens to unify Europe or Asia. Europe is troubled

by debt, not conquest. Russian GDP is today roughly equivalent to that of Spain and Portugal combined. Whatever Russia's hopes, it has no ability to resurrect its Soviet Empire, beyond perhaps those nations in its near abroad that Americans have no good reason to defend. Even today, the military capabilities of Europe's leading powers are sufficient to defend its eastern flank, and they could increase their martial exertions should a bigger threat arise. Asia is tougher case. South Korea's military superiority over its northern neighbor is sufficient to deter it from an attempt at forcible reunification. By heightening North Korea's security, nuclear weapons may reinforce its capacity for trouble-making, but they do not aid offensive forays. U.S. forces long ago became unnecessary to maintaining the peninsula's territorial status quo. Chinese efforts to engage in old-fashioned conquest are unlikely, at least beyond Taiwan. Its more probable objective is a kind of Asian Monroe doctrine, meant to exclude the United States.6 China naturally prefers not to leave its maritime security at the whim of U.S. policymakers and, thus, has sought to improve its anti-access and area-denial capabilities. In the longer term, China's leaders will likely pursue the ability to secure its trade routes by building up longer-range naval forces. They may also try to leverage military power to extract various concessions from nearby states. Washington's defense analysts typically take those observations as sufficient to establish the necessity that U.S. forces remain in Asia to balance Chinese military power. But to justify a U.S. military presence there, one also needs to show both that Asian nations cannot or will not balance Chinese power themselves and that their failure to do so would greatly harm U.S. security**. Neither is likely**. Geography and economics suggest that the states of the region will successfully balance Chinese power—even if we assume that China's economic growth allows it to continue to increase military spending.7 Bodies of water are natural defenses against offensive military operations. They allow weaker states to achieve security at relatively low cost by investing in naval forces and coastal defenses. That defensive advantage makes balances of power more stable. Not only are several of China's Asian rivals islands, but those states have the wealth to make Chinese landings on their coast prohibitively expensive. India's mountainous northern border creates similar dynamics. **The prospects of Asian states successfully deterring future Chinese aggression will get even better if, as seems likely, threats of aggression provoke more formal security alliances**. Some of that is already occurring. Note for example, the recent joint statement issued by the Philippines and Japan marking a new ''strategic partnership'' and expressing ''common strategic interests'' such as ''ensuring the safety of sea lines of communication.''8 This sort of multilateral cooperation would likely deepen with a more distant U.S. role. Alliances containing disproportionately large states historically produce free-riding; weaker alliance partners lose incentive to shore up their own defenses.9 Even if one assumes that other states in the region would fail to balance China, it is unclear exactly how U.S. citizens would suffer. China's territorial ambitions might grow but are unlikely to span the Pacific. Nor would absorbing a few small export-oriented states slacken China's hunger for the dollars of American consumers. The argument that U.S. alliances are necessary for stability and global commerce is only slightly more credible. One problem with this claim is that U.S. security guarantees can create moral hazard—emboldening weak allies to take risks they would otherwise avoid in their dealings with neighbors. Alliances can then discourage accommodation among neighboring states, heightening instability and threatening to pull the United States into wars facilitated by its benevolence. Another point against this argument is that even if regional balancing did lead to war, it would not obviously be more costly to the U.S. economy than the cost of the alliance said to prevent it. **Neutrality historically pays**.10 The larger problem with the idea that our alliances are justified by the balancing they prevent is that **wars generally require more than the mutual fear that arms competition provokes**. Namely, there is usually a territorial conflict or a state bent on conflict. Historical examples of arms races alone causing wars are few.11 This confusion probably results from misconstruing the causes of World War I—seeing it as a consequence of mutual fear alone rather than fear produced by the proximity of territorially ambitious states.12 Balances of power, as noted, are especially liable to be stable when water separates would-be combatants, as in modern Asia. Japan would likely increase defense spending if U.S. forces left it, and that would likely displease China. But that **tension is very unlikely to provoke a regional conflagration. A**nd even that remote scenario is far more likely than the Rube Goldberg scenario needed to argue that peace in Europe requires U.S. forces stationed there. It is not clear that European states would even increase military spending should U.S. troops depart. If they did do so, one struggles to imagine a chain of misperceived hostility sufficient to resurrect the bad old days of European history.

No Transition Wars – 2NC

No transition wars-other powers will cling to the US in decline

Snyder, Maryland PhD research scholar, 2012

(Quddus, "The Bipolarity of a Unipolar World: Why Secondary Powers will Stand By America", http://www.cidcm.umd.edu/workshop/papers/the_bipolarity_of_a_unipolar_system.pdf)

The stability inherent in the relationship is threatened when one party fails to live up to its end of the bargain. If the US is in decline, it is likely to scale back its international commitments. It will be less willing to underwrite the security of the many secondary powers that rely on it. A declining US may be unable and unwilling to perform hegemonic functions to the extent that it was before. It is here that secondary powers face a choice: do I stay or do I go? Because of their flawed theoretical machinery, balance of power realists believe that secondary powers will turn on a declining US and try to oppose and weaken it. **But this logic fails to account for the extent to which secondary powers do not fear the US, depend on it, and value the underlying bargain.** Unlike the Soviet Union, the US will not suddenly implode. If there is a relative decline, it is likely to be slow. Though perhaps to a lesser extent, the US will still remain engaged. It will not suddenly withdraw into pre-World War II style isolation. Under these circumstances, secondary powers are likely to adopt a strategy of accommodation. Robert Kelly describes this as a kind of "bail in" behavior where secondary powers come to the aid of a struggling hegemon that they see as legitimate.52 The US will remain far stronger, at least militarily if not also economically, than most of the secondary powers for a long time to come. While it might not be able to do as much as it used to, the US will still be able to accomplish more than most. In effect, secondary powers are likely to reason that a weakened hegemon is still much better than no hegemon. The hegemonic bargain will not be abolished. It will be adjusted in two important ways. Secondary powers will do more in areas where their vital interests are at stake. This can be seen in the way France and Britain took the lead in the Libyan intervention. Or, in the way Turkey is taking charge in responding to the Syria crisis. The US will play a very large supporting role. As every NATO operation in the post-Cold War era has demonstrated, secondary powers must ultimately increase their own power capability. This is not to balance the US, but to make up the difference. Compensating for America's lesser role, firstly, requires that secondary powers spend more on defense. The necessity of doing so will become increasingly evident as various crises threaten the interests of secondary powers and the US shows ever less enthusiasm for cleaning up the mess alone. Second, the difference can be made up through cooperation. Secondary powers are likely to move ever closer to a declining US. Deeper forms of policy coordination and the combining of capability can go a long way toward remedying individual power deficits—the animating idea behind NATO's new concept of "smart defense." Predicting NATO's demise is a perennial realist pastime. As before, their predictions will be proven wrong again. Not only will NATO persist, but as the US declines it will become more important. Interestingly, just as the American decline debate was heating up, France rejoined NATO's allied command in 2009. President Sarkozy explained that his country's "strategy cannot remain stuck in the past when the conditions of our security have changed radically."53 Sarkozy's critics grumbled that France was cozying up to the US just as the world was moving out from underneath American domination. New life will be breathed into America's alliances in the Asia Pacific region as well, as seen for example in the way Japan has recently been moving closer to the US. The US will find that secondary powers are willing to accommodate and compromise in ways that were perhaps unlikely under unipolarity. The main concern will not be the unilateral exercise of American power. Rather, secondary powers will worry about America's level of commitment to them moving forward. America will no longer be able to stack the deck in some of the ways it has before. But happily, the US will find that it holds a number of high cards in negotiating the terms of cooperation with eager secondary powers because this time the US can credibly threaten to stand by and watch. **All of this suggests that as the global field is leveled, secondary powers will not turn to balancing, but rather, they will adopt a strategy of bonding**. From time to time, weaker states have bandwagoned with more powerful or threatening states, either to appease or gain from the spoils of a hegemon's aggression.54 In this case, the US will grow less powerful and less threatening over time, suggesting altogether different motives. Bonding involves both policy accommodation and efforts to 'move closer' through deeper cooperative ties. The primary concern of secondary powers will be to keep the US engaged. After World War II, the European allies were mainly concerned about US abandonment. As Ikenberry explains, "The evolution in American policy…was a story of American reluctance and European persistence."55 **In an era of relative decline, American disengagement may again emerge as the principal problem facing many of the world's seconda0ry powers. This fear will move them to work ever harder to secure America's commitment and support.**

No transition wars-disengagement doesn't correlate with aggression

Parent et al., Miami political science professor, 2011

(Joseph, "The Wisdom of Retrenchment", Foreign Affairs, November/December, ebsco)

A somewhat more compelling concern raised by opponents of retrenchment is that the policy might undermine deterrence. Reducing the defense budget or repositioning forces would make the United States look weak and embolden upstarts, they argue. "The very signaling of such an aloof intention may encourage regional bullies," Kaplan worries. This anxiety is rooted in the assumption that the best barrier to adventurism by adversaries is forward defenses--the deployment of military assets in large bases near enemy borders, which serve as tripwires or, to some eyes, a Great Wall of America. There are many problems with this position. For starters, the policies that have gotten the United States in trouble in recent years have been activist, not passive or defensive. The U.S.-led invasion of Iraq alienated important U.S. allies, such as Germany and Turkey, and increased Iran's regional power. NATO's expansion eastward has strained the alliance and intensified Russia's ambitions in Georgia and Ukraine. More generally, U.S. forward deployments are no longer the main barrier to great-power land grabs. Taking and holding territory is more expensive than it once was, and great powers have little incentive or interest in expanding further. The United States' chief allies have developed the wherewithal to defend their territorial boundaries and deter restive neighbors. Of course, retrenchment might tempt reckless rivals to pursue unexpected or incautious policies, as states sometimes do. Should that occur, however, U.S. superiority in conventional arms and its power-projection capabilities would assure the option of quick U.S. intervention. Outcomes of that sort would be costly, but the risks of retrenchment must be compared to the risks of the status quo. In difficult financial circumstances, the United States must prioritize. The biggest menace to a superpower is not the possibility of belated entry into a regional crisis; it is the temptation of imperial overstretch. That is exactly the trap into which opponents of the United States, such as al Qaeda, want it to fall. Nor is there good evidence that reducing Washington's overseas commitments would lead friends and rivals to question its credibility. Despite some glum prophecies, the withdrawal of U.S. armed forces from western Europe after the Cold War neither doomed NATO nor discredited the United States. Similar reductions in U.S. military forces and the forces' repositioning in South Korea have improved the sometimes tense relationship between Washington and Seoul. Calls for Japan to assume a greater defense burden have likewise resulted in deeper integration of U.S. and Japanese forces. **Faith in forward defenses is a holdover from the Cold War, rooted in visions of implacable adversaries and falling dominoes. It is ill suited to contemporary world politics, where balancing coalitions are notably absent and ideological disputes remarkably mild**.

No transition war-countries buy into the system

Ikenberry, Princeton international affairs professor, 2010

(John, "The Liberal International Order and its Discontents", Millennium - Journal of International Studies, May, Sage)

Secondly, this order is also distinctive in its integrative and expansive character. In essence, it is 'easy to join and hard to overturn'. This follows most fundamentally from the fact that it is a liberal international order – in effect, it is an order that is relatively open and loosely rulebased. The order generates participants and stakeholders. Beyond this, there are three reasons why the architectural features of this post-war liberal order reinforce downward and outward integration. One is that the multilateral character of the rules and institutions create opportunities for access and participation. Countries that want to join in can do so; Japan found itself integrating through participation in the trade system and alliance partnership. More recently, China has taken steps to join, at least through the world trading system. Joining is not costless. Membership in institutional bodies such as the WTO must be voted upon by existing members and states must meet specific requirements. But these bodies are not exclusive or imperial. Secondly, the liberal order is organised around shared leadership and not just the United States. The G-7/8 is an example of a governance organisation that is based on a collective leadership, and the new G-20 grouping has emerged to provide expanded leadership. Finally, the order also provides opportunities for a wide array of states to gain access to the 'spoils of modernity'. Again, this is not an imperial system in which the riches accrue disproportionately to the centre. States across the system have found

ways to integrate into this order and experience economic gains and rapid growth along the way. Thirdly, rising states do not constitute a bloc that seeks to overturn or reorganise the existing international order. China, India, Russia, Brazil, South Africa and others all are seeking new roles and more influence within the global system. But they do not constitute a new coalition of states seeking global transformation. All of these states are capitalist and as such are deeply embedded in the world economy. Most of them are democratic and embrace the political principles of the older Western liberal democracies. At the same time, they all have different geopolitical interests. They are as diverse in their orientations as the rest of the world in regard to energy, religion and ideologies of development. They are not united by a common principled belief in a post-liberal world order. They are all very much inside the existing order and integrated in various ways into existing governance institutions.

Soft Power Fails – 1NC

Soft power doesn't cause action-multiple reasons

Cull, USC public diplomacy professor, 2013

(Nicholas, "Why projecting soft power is so hard to do", 6-14, http://russia-direct.org/content/why-projecting-soft-power-so-hard-do)

The theory of soft power, as articulated by Joseph Nye, rests on the notion that admirable culture and attractive values can be harnessed to the ends of foreign policy as power. His book "Soft Power" (2004) was subtitled "The Means to Success in World Politics." The problem is that the quest for success is not itself value neutral: a nation that is too obvious in the way it uses soft power to advance its own ends can end up repelling rather than attracting. Countries too eager to embrace soft power can come off like the stereotypical Don Juan, whose powers of attraction eventually taught women to be wary. Others, overconfident in their positive qualities, choose the wrong aspect to emphasize and end up the butt of jokes. In the context of soft power, this mockery is leveled against countries whose public diplomacy degenerates into propaganda. A further problem stems from a divergence in tastes in what is considered attractive. Soft power – like beauty – is in the eye of the beholder. The same tactics don't work in every context. For example, the soft power of the United States is rooted in an identification of its culture with the sovereignty of the individual; in contrast, Russia presents itself as guardian of the principle of the sovereignty of the nation-state. Both sets of values have their admirers, but seldom in the same location. Already powerful states attempting to deploy soft power face an additional challenge – public empathy and admiration naturally adheres to those who have suffered. Global outpourings of support for the Dalai Lama or the United States in the days after 9/11 are examples of this. Nations that hope to trade on their success are often met with increased skepticism or mistrust. What, then, does this mean for countries – the United States and Russia included – that wish to harness soft power in their dealings with the world? First, they must acknowledge that a nation's soft power is not kept in a vault at the White House or Kremlin, but lies in the mind of every one of the billions of people around the world who has an opinion about the country. Secondly, they must realize that when attempting to deploy soft power, your opinion isn't important; your audience's is. Therefore, those working on soft power campaigns must be able to step outside their own cultural context and look at their country from a foreigner's perspective. Third, what works for one country isn't guaranteed to work for another. India is able to leverage soft power in the form of Bollywood movies, which are loved by millions around the world. China has no cultural equivalent; Chinese calligraphy and ceramics will never be sufficiently relevant to a large enough number of people. Efforts focusing on promoting China's development projects or spectacular scientific discoveries would likely have more success. And finally, while there are few moral perceptions around the world that are universally accepted, a near ubiquitous mistrust of power exists. **Promoting a soft power narrative that emphasizes success and dominance in a field or organization might not be** as **effective** as one that focuses on a disadvantaged city, region or group – which exist in every country. In the final analysis, soft power lies in the allure one person feels for another. And this is why the most enduring soft power strategies have been those founded on people-to-people exchanges. Despite all the efforts of a state government to control its image through a soft power campaign, in the end it comes down to winning the hearts and minds of individuals – something that cannot be ordered from the top down.

Soft Power Fails – 2NC

Soft power doesn't lead to cooperation to solve problems.

Drezner, Tufs international politics professor, 2011

(Daniel, "Does Obama Have a Grand Strategy?", July/August, http://www.foreignaffairs.com/print/67869)

What went wrong? The administration, and many others, erred in believing that improved standing would give the **U**nited **S**tates greater policy leverage. The **U**nited **S**tates' standing among foreign publics and elites did rebound. But this shift **did not translate into an appreciable increase in** the **U**nited **S**tates' **soft power**. Bargaining in the G-20 and the UN Security Council did not get any easier. Soft power, it turns out, **cannot accomplish much** in the absence of a willingness to use hard power. The other problem was that China, Russia, and other aspiring great powers **did not view themselves as partners of the United States**. Even allies saw the Obama administration's **supposed modesty as a cover** for shifting the burden of providing global public goods from the United States to the rest of the world. **The administration's grand strategy was therefore perceived as promoting narrow U.S. interests rather than global public goods.**

Nations make decisions on an issue-by-issue basis-soft power doesn't matter.

Ogoura, Japan foundation president, 2006

(Kazuo, "The Limits of Soft Power", http://ics.leeds.ac.uk/papers/vp01.cfm?outfit=pmt&folder=7&paper=3076)

One blind spot in the soft power concept is the confusion over the source of this power. For Nye and many others, the power of soft power lies in "attraction." The problem with this idea, however, is that it views things from the perspective of the party exercising power. Seen from the viewpoint of the party being influenced by the power, the question of whether accepting the power accords with this party's own interests is likely to be a far more important consideration than the attraction of the power. Here we must keep in mind that sovereign nations in the international community act not on the basis of likes and dislikes but in accordance with their own interests**. No matter how attractive a given country may be, other countries will not accept its attractive power if it obstructs their freedom of action or** adversely affects their economic **interests**. Hollywood movies, for instance, are often cited as a source of American soft power, but in France they have been subject to partial restriction precisely because of their attractiveness. The justness and legitimacy of the exercise of power is often an issue in relation to the source of soft power. However, legitimacy is bound to be an issue regardless of whether the power is hard or soft. The fact that hard power is sometimes exercised without legitimacy stems from a peculiar way of thinking about the use of hard power, and this is a great problem. It is important to note that within the international community the exercise of military and nonmilitary power is basically the same - or, rather, it is when the power is military in nature that there is a need for strict legitimacy in its use. (But whereas military power can exert a coercive influence however vague its legitimacy, when the justification for the use of soft power is tenuous this can prompt the party on the receiving end to resist or refuse the power, preventing the party exercising the power from achieving its aims.) The other side of this problem is the need to consider just what the international justification for military action might be. Leaving this issue to one side, though, it is certainly problematic to regard the legitimacy of soft power as the source of its clout.

A2: Solves Terrorism

Soft power doesn't solve terrorism

Kroenig et al., Georgetown government professor, 2010

(Matthew, "Taking Soft Power Seriously", Comparative Strategy, http://www.matthewkroenig.com/Kroenig_Taking_Soft_Power_Seriously.pdf)

The United States has also sought to apply soft power to counter ideological support for terrorism. Again, despite a concerted effort by the United States, global support for terrorist ideology shows no sign of abating and, according to some measures, may be increasing. **The inability of the United States to counter ideological support for terrorism can be attributed to an environment hostile to the application of soft power**. The societies to which the United States has targeted its message lack a functioning marketplace of ideas and the U.S. message is not credible to the target audience. For these reasons, the application of soft power has been an ineffective tool for countering ideological support for terrorism, despite the importance of individual attitudes as a driver of terrorist behavior. In the 2005 National Defense Strategy, the United States presented a threepronged strategy for winning the War on Terror.77 The first two elements of the strategy, attacking terrorist networks and defending the homeland, were definitively in the realm of hard power. The third and, according to many Pentagon officials, the most important element of the strategy, however, was "countering ideological support for terrorism."78 As part of this soft power strategy, the United States declared its intent to "Support models of moderation in the Muslim world by helping change Muslim misperceptions of the United States and the West."79 Furthermore, the United States vowed to "delegitimate terrorism and extremists by e.g., eliminating state and private support for extremism."80 The 2006 National Strategy for Combating Terrorism continued the theme of ideological combat stating that "from the beginning, [the War on Terror] has been both a battle of arms and a battle of ideas. Not only do we fight our terrorist enemies on the battlefield, we promote freedom and human dignity as alternatives to the terrorists' perverse vision of oppression and totalitarian rule."81 According to the strategy, "winning the War on Terror means winning the battle of ideas." The United States also singled out state sponsors of terror for its soft power campaign and declared that it desired "to make clear that all acts of terrorism are illegitimate so that terrorism will be viewed in the same light as slavery, piracy, or genocide: behavior that no respectable government can condone or support and all must oppose."82 These were serious statements of policy objectives. To isolate state-sponsors of terrorism, President Bush encouraged states to choose a position "either with us or against us in the fight against terror."83 A special task force on "strategic communications" was set up at the Defense Science Board that argued that "the United States is engaged in a generational and global struggle about ideas." 84 The Board concluded that, "policies will not succeed unless they are communicated to global and domestic audiences in ways that are credible and allow them to make informed, independent judgments."85 To show the level of commitment the Bush administration made to the task of public diplomacy, President Bush appointed his trusted public relations manager, Karen Hughes, as Undersecretary of State for Public Diplomacy. 86 Under Hughes's leadership, the State Department established regional media hubs offering U.S. spokespeople with language capabilities to speak on America' behalf in media outlets throughout the Middle East.87 The United States Government also increased the budget for the United States Agency for International Development (USAID), the U.S. agency responsible for dispensing foreign aid, by 60%, from 5 billion in 1998 to 8 billion in 2003.88 The United States funded a variety of pro-American media in the Muslim world including H1 magazine, Radio Sawa, and the Al Hurra television station. 89 Furthermore, the United States established reeducation facilities, such as the "House of Wisdom" in Iraq, to teach moderate Muslim theology to detainees captured in the War on Terror.90 **Despite this widespread effort to communicate throughout the Muslim world, the United States, to date, has largely failed in its effort to apply soft power to its advantage in the War on Terror.** The War on Terror will probably be a "generational struggle," but it is nevertheless troubling that after a sustained multi-year effort to counter ideological support for terrorism, the United States has made real progress on very few of its stated objectives. The United States has, since 9/11, avoided a major terrorist attack, and while the causes of this can be debated, it is not likely the result of a waning of terrorist ideology globally as is evidenced by the string of attacks in other parts of the world. In recent years, terrorists have carried out attacks in: Algeria, Great Britain, Israel, Iraq, Jordan, Russia, Spain, and other countries.91 Despite heavy pressure from the United States in the form of hard and soft power, states still support terrorism and Al Qaeda has even reconstituted terrorist training camps in South Asia. 92 Terrorist ideology continues to flourish globally with the help of the Internet.93 The low public opinion of the United States in the Muslim world, often thought to be one of the factors contributing to terrorism against the United States, has not improved in recent years. In fact, a recent study found that people's "attitudes toward U.S. foreign policy actually worsened slightly since they started listening to Radio Sawa and Al Hurra."94 Few observers believe that U.S. efforts to combat Al Qaeda have been effective. In a recent worldwide poll, survey respondents in 22 out of 23 countries reported that the U.S.-led war on terror has not weakened Al Qaeda.95 The U.S. failure to use soft power effectively in the War on Terror is even more pronounced in some of the most important countries. In Egypt and Pakistan, for example, 60% and 41% of the respective publics possess either positive or mixed views of Al Qaeda.96 According to Doug Miller, chairman of the international polling firm Globescan, "The fact that so many people in Egypt and Pakistan have mixed or even positive views of al Qaeda is yet another indicator that the US war on terror is not winning hearts and minds."97 Why has the United States failed in its effort to use soft power to counter ideological support for terrorism? Part of the reason is that the United States has not been able to compete in a functioning marketplace of ideas in most of the societies where a threat of jihadi terrorism exists. In the 2006 National Strategy for Combating Terrorism, the United States acknowledges that "terrorists recruit more effectively from populations whose information about the world is contaminated by falsehoods and corrupted by conspiracy theories. The distortions keep

alive grievances and filter out facts that would challenge popular prejudices and self-serving propaganda."98 In other words, many countries of the Middle East and the broader Muslim world lack a functioning marketplace of ideas. They are disproportionately authoritarian. 99 These governments often take measures, generally for the purposes of domestic stability, that have the effect of preventing meaningful competition in their domestic marketplace of ideas. Foreign media content containing ideas about democracy and freedom are filtered.100 Domestic political opponents are prevented from expressing views that challenge the government.101 Radical religious groups, extremist parties, and fundamentalist madrassas are supported to shore up the legitimacy of secular regimes.102 Domestic problems are externalized and blamed on an "imperial" United States.103 The lack of a functioning marketplace of ideas in this region contributes to the pervasiveness of conspiracy theories in the region from private households to the highest levels of government.104 Due in part to these phenomena, public opinion of U.S. foreign policy is lower in the Middle East than in any other world region.105 The inability of the United States to communicate in this region is aptly described by Norman Patizz, an American media entrepreneur, who notes that "there is a media war going on [in the Muslim world] with incitement, hate broadcasting, disinformation, government censorship, self-censorship, and America is not in the race."106 Another limiting factor on the United States effort to counter ideological support for terrorism is the logic of persuasion. U.S. efforts to communicate directly with the Muslim world have been thwarted by a lack of credibility. Expert messengers are more persuasive than non-experts, but U.S. government officials are hardly qualified to discuss the intricacies of Muslim theology and the consistency, or lack thereof, of terrorism with the teachings of the Koran. U.S. strategists have recognized this and sought to adjust strategy appropriately, aiming to communicate through surrogates whenever possible.107 Attempts to channel a message through third parties face a number of challenges however. The audiences that the United States targets in the Middle East generally know which media outlets receive U.S. support and, accordingly, discount the messages that they receive from those sources. In a recent study on the effectiveness of U.S. supported media in the Middle East, a Jordanian student wrote that "Radio Sawa serves US interests and helps it spread its control over the world and to serve Zionist interests."108 A student from Palestine wrote that the United States "[spreads] lies and fabricates news" through Television Al Hurra.109 According to Al-Ahram Weekly, an Egyptian newspaper, Arab youth listen to Radio Sawa, but "they take the U.S. sound and discard the U.S. agenda."110 The United States efforts at persuasion may have also failed because they fail to speak to the intended audience at an emotional level. Shibley Telhami has described Al Hurra as adopting a style of "detached objectivity" to its coverage of highly controversial political issues. Telhami went on to criticize the futility of a mismatched approach that aims "to be precisely dispassionate while facing a passionate audience."111 As difficult as it may be for the United States to accept, the United States with all of its hard and soft power is not well-equipped to persuade international audiences about the legitimacy of terrorism as a tactic. There are undoubtedly other factors that helped to discredit the U.S. message on issues of terrorism. The U.S. military intervention in Iraq and the related prisoner abuse scandal at Abu Grhaib, for example, alienated many in the broader Middle East.112 But, these factors only further weakened U.S. credibility; the United States was never in a position to be a persuasive messenger on the subject of terrorism in the Muslim world. In the War on Terror, however, individual attitudes have had an important, though mixed, effect on international political outcomes. Ideas have a critical (but by no means exclusive) impact on individual decisions to join terrorist organization, but attitudes are less important determinants of the state sponsorship of terrorism. Exposure to radical ideology is an important component leading an individual to become a terrorist. While containing an undeniable ideological component, however, **many of the factors that convince people to turn to terrorism are material in origin, not ideational, and, thus, cannot be addressed with soft power tools. Social science research suggests that many factors may contribute to the production of a terrorist. Few opportunities for political participation, low levels of social integration, personal loss, and foreign occupation are among the variables that have been linked to a higher risk of terrorism**. 113 The United States can combat some of these risk factors through the application or withdrawal of hard power, but few of them can be addressed through the application of soft power alone. Despite America's soft power campaign, the state sponsorship of terrorism also appears to be alive and well and driven by states' core material interests. Pakistan continues to walk the fine line of allowing terrorists to operate in the tribal regions while making occasional raids against terrorist hideouts to placate the United States.114 And states that can gain through the active support of terrorism as an extension of their national power, such as Iran and Syria, continue to do so.115 The United States has been unsuccessful, so far, in its attempt to use soft power to counter global ideological support for terror. This failure is due, at least in part, to the absence of the conditions necessary for an effective soft power strategy. Attitudes may be influential in determining the strength of the international terrorist movement, but the United States was unable to participate in debates in key regions in which terrorist ideology flourishes and a lack of credibility further hindered U.S. efforts to change attitudes on important terrorism-related issues.

Secure Data Act HSS

Circumvention

Plan Gets Circumvented

The plan will be circumvented — "mandate" gets lawyered.

Newman 14 — Lily Hay Newman, Staff Writer and Lead Blogger for *Future Tense*—a partnership of Slate, New America, and Arizona State University, 2014 ("Senator Proposes Bill to Prohibit Government-Mandated Backdoors in Smartphones," *Future Tense*, December 5th, Available Online at http://www.slate.com/blogs/future_tense/2014/12/05/senator_wyden_proposes_secure_data_act_to_keep_government_agencies_from.html, Accessed 06-30-2015)

It's worth noting, though, that the Secure Data Act **doesn't actually prohibit backdoors**—it just prohibits agencies from **mandating** them. There are a lot of other types of pressure government groups could still use to influence the creation of backdoors, even if they couldn't **flat-out demand them**.

Here's the wording in the bill: "No agency may mandate that a manufacturer, developer, or seller of covered products design or alter the security functions in its product or service to allow the surveillance of any user of such product or service, or to allow the physical search of such product, by any agency."

There are loopholes that allow circumvention by FBI *and* NSA.

Cushing 14 — Tim Cushing, Contributor to *Tech Dirt*, 2014 ("Ron Wyden Introduces Legislation Aimed At Preventing FBI-Mandated Backdoors In Cellphones And Computers," *Tech Dirt*, December 5th, Available Online at https://www.techdirt.com/articles/20141204/16220529333/ron-wyden-introduces-legislation-aimed-preventing-fbi-mandated-backdoors-cellphones-computers.shtml, Accessed 06-30-2015)

Here's the actual wording of the backdoor ban [pdf link], which has **a couple of loopholes** in it.

(a) IN GENERAL.—Except as provided in subsection (b), no agency may mandate that a manufacturer, developer, or seller of covered products design or alter the security functions in its product or service to allow the surveillance of any user of such product or service, or to allow the physical search of such product, by any agency.

Subsection (b) presents the first loophole, naming the very act that Comey is pursuing to have amended in his agency's favor.

(b) EXCEPTION.—Subsection (a) shall not apply to mandates authorized under the Communications Assistance for Law Enforcement Act (47 U.S.C. 1001 et seq.).

Comey wants to alter CALEA or, failing that, get a few legislators to run some sort of encryption-targeting legislation up the Congressional flagpole for him. Wyden's bill **won't thwart these efforts** and it does leave the NSA free to continue with its pre-existing **homebrewed backdoor efforts** -- the kind that don't require mandates **because they're performed off-site without the manufacturer's knowledge**.

Terrorism/Crime DA

Terrorism

Secure Data Act would make it harder to find terrorist activity

Rolley 6/2 (Sam, writer at Personal Liberty, "After NSA fight, Rand Paul attempts to protect encryption," Personal Liberty, 6/2/15, http://personalliberty.com/after-nsa-fight-rand-paul-attempts-to-protect-encryption/)//kjz

Sen. Rand Paul (R-Ky.) again stood up to government snoops Tuesday with proposals to block the encryption backdoors so desired by top Justice Department officials and the Obama administration. In response to increasing calls for looser encryption on consumer communication gadgets from top U.S. law enforcement officials, Paul and Sen. Ron Wyden (D-Ore.) on Tuesday set about amending the Senate's surveillance reform bill to protect encryption. The lawmakers' proposals would forbid the government from coercing companies to providing access points into their encryption for law enforcement snoops. The proposals resemble provisions set forth in the Secure Data Act, a standalone bill prohibiting government backdoors in encryption, which Wyden has introduced several times in the upper legislative chamber with little luck. Unfortunately for privacy groups, Sen. Mitch McConnell (R-Ky.) did his

best Tuesday to block voting on amendments such as that presented by Paul and Wyden in favor of amendments proposed by establishment GOP lawmakers. The amendments McConnell allowed for consideration, according to 4th Amendment advocates, were ones intended to water down the USA Freedom Act rather than bolster privacy protections. And encryption protections certainly wouldn't fall in line with surveillance hawks' desire to increase the ease of government spying. Department of Homeland Security Secretary Jeh Johnson said earlier this year that heightened encryption on digital communications devices are making it easier for criminals and potential terrorists to operate throughout the U.S. "The current course we are on, toward deeper and deeper encryption in response to the demands of the marketplace, is one that presents real challenges for those in law enforcement and national security," Johnson said during a cybersecurity conference in Silicon Valley. "Encryption is making it harder for your government to find criminal activity, and potential terrorist activity," Johnson continued. James Comey, who heads up the FBI, has made similar statements about the need for the companies to lower their encryption standards. "Tech execs say privacy should be the paramount virtue," Comey told lawmakers in March. "When I hear that, I close my eyes and say, 'Try to image [sic] what the world looks like where pedophiles can't be seen, kidnapper[s] can't be seen, drug dealers can't be seen.'" In recent months the White House has been working to urge tech companies to lower encryption standards to make it easier for law enforcement to access information on Americans' digital devices. The technology community, meanwhile, continues to produce advancements that may make it impossible for government surveillance to keep up with encryption changes. That could lessen the need for privacy protections like those proposed by Paul and Wyden. Former Google CEO Eric Schmidt said during a lecture at Johns Hopkins University in November that advances in encryption could eliminate the threat of government surveillance and censorship throughout the world within 10 years.

Secure Data Act prevents government from gathering information from the private sector—key to solve terrorism

Cordero 4/19 (Carrie, a former counsel in the Justice Department's national security division and director of national security studies at Georgetown Law.,"Should Law Enforcement Have the Ability to Access Encrypted Communications? Growing encryption heightens the debate over online privacy and law enforcement. YES: We Need That Ability to Fight Terrorism" Wall Street Journal, 4/19/15, http://www.wsj.com/articles/should-law-enforcement-have-the-ability-to-access-encrypted-communications-1429499474)//kjz

We can't fight terrorism and violent crime in the dark. But that is where we're headed if law-enforcement and intelligence officials are denied the legal access they need. The fact is, communications companies often hold information that law-enforcement and national-security agencies require to pursue criminal investigations and forestall potential threats. Up until recently, agents of the government could generally file requests for court orders that, if approved, compel the companies to provide the requested information. Congress in the 1990s passed the Communications Assistance for Law Enforcement Act, or Calea, to facilitate private-sector cooperation with law enforcement. This act required telecommunications companies to configure their systems in a way that would enable them to effectively respond to court orders. But Calea predated email, cloud storage and social-media platforms. Officials now have to cope with situations and technologies that the law did not anticipate. Moreover, recent congressional proposals, such as the Secure Data Act, threaten to prohibit the government from requiring that companies design or modify communications systems or products to facilitate government requests for data.

Encryption makes it harder to prevent terrorist attacks

Thomson 14 (Iain, covers tech news for The Register, "FBI boss: We don't want a backdoor, we want the front door to phones," The Register, 10/16/14, http://www.theregister.co.uk/2014/10/16/fbi_director_we_dont_want_a_backdoor_to_your_phone_we_want_the_front_door/)//kjz

FBI director James Comey is continuing his charm offensive against phone encryption – by urging tech giants to do more to help the agency monitor people. In a speech to the Brookings Institute, Comey said the decision by Apple and Google to turn on file encryption by default in iOS and Android was seriously hampering the efforts of cops and g-men to protect the public at large. He complained to the Washington think tank that criminals were "going dark," and technology firms should be compelled to build gadgets that can be easily accessed whenever the FBI wants. He reminisced about the good old days of law enforcement, where a court order could allow the agency to tap into any phone in America. Nowadays that's not always possible, he said, and so something had to be done. "There is a misconception that building a lawful intercept solution into a system requires a so-called 'back door,' one that foreign adversaries and hackers may try to exploit," he said. "But that isn't true. We aren't seeking a back-door approach. We want to use the front door, with clarity and transparency, and with clear guidance provided by law. We are completely comfortable with court orders and legal process - front doors that provide the evidence and information we need to investigate crime and prevent terrorist attacks." Such a system should be built into new devices in the design stage, Comey said, and all carriers and technology firms should work towards this goal. He didn't mention how it was going to be possible to avoid hackers using the same backdoors to hijack victims' phones and tablets, but presumably he thinks that's not his problem. Comey said the existing US Communications Assistance for Law Enforcement Act needs to be updated to enforce this. Earlier in his speech he noted that not all companies were complying with CALEA – which requires manufacturers to

build security holes into devices for Uncle Sam to exploit to intercept communications. He accused Apple and Google of seeking a market opportunity by making file encryption the default on their devices. But he claimed doing so put their users "above the law." Last week Silicon Valley chiefs were saying quite the opposite at a roundtable in California. Google chairman Eric Schmidt said such features were not to gain new sales, but to stop the collapse of existing markets as users wanted privacy and weren't prepared to buy technology without it. Earlier this month security guru Bruce Schneier also burst one of Comey's much ballyhooed concerns, that of encryption foiling child kidnapping investigations. He pointed out that of the 3,576 warrants were granted for communications interception in 2013, one involved kidnapping. In the same year police reported being stumped by encryption nine times, and four in 2012. Comey said that unless such front-door access was granted to the Feds then "homicide cases could be stalled, suspects could walk free, and child exploitation might not be discovered or prosecuted." He also warned terrorists could use social media to "recruit, plan, and execute an attack." "I've never been someone who is a scaremonger. But I'm in a dangerous business. So I want to ensure that when we discuss limiting the court-authorized law enforcement tools we use to investigate suspected criminals that we understand what society gains and what we all stand to lose," he said. "We in the FBI will continue to throw every lawful tool we have at this problem, but it's costly. It's inefficient. And it takes time. We need to fix this problem. It is long past time."

Encryption helps the terrorists

Price 6/4 (Rob, "The FBI claims technology promoted by Apple and WhatsApp is helping ISIS," Business Insider, 6/4/15, http://www.businessinsider.com/fbi-encryption-going-dark-isis-apple-facebook-whatsapp-steinbach-lieu-2015-6)//kjz

Encryption is creating "dark spaces" that are aiding ISIS and other terrorist organisations, the FBI has warned — even as Apple and Facebook reaffirm their strong support for the technology. Speaking at a Congressional hearing on Wednesday, the AFP reports, FBI assistant director of counter-terrorism Michael Steinbach warned lawmakers that strong encryption technology allows terrorists "a free zone by which to recruit, radicalize, plot and plan." Steinbach is calling for "legal remedies" that will allow law enforcement access to encrypted communications. Strong encryption has become a contentious subject recently. The term refers to messages or data masked in such a way that it is impossible to understand unless you have the correct key to decrypt it — even if you have a warrant. Encryption can help protect people protect their communications online, but authorities fear that it puts the communications of criminals out of their reach. Following Edward Snowden's revelations about mass surveillance by the NSA, tech companies have increasingly moved to incorporate strong encryption into their products. WhatsApp uses end-to-end encryption, for example, meaning it is impossible for the messaging service to know what is being sent on its platform. Apple is a particularly outspoken defender of encryption technology. Last year, it introduced encryption on its mobile platform iOS by default, infuriating law enforcement. One senior US police officer warned that the iPhone would become "the phone of choice for the pedophile" as a result. But the Cupertino company has stuck to its guns, and this week CEO Tim Cook made an impassioned defence of encryption at an awards dinner. Cook slammed attempts by law enforcement to have backdoors introduced as "incredibly dangerous," saying encryption is "a critical feature for our customers who want to keep their data secure... If you put a key under the mat for the cops, a burglar can find it, too. Criminals are using every technology tool at their disposal to hack into people's accounts. If they know there's a key hidden somewhere, they won't stop until they find it ... Removing encryption tools from our

products altogether, as some in Washington would like us to do, would only hurt law-abiding citizens who rely on us to protect their data. The bad guys will still encrypt; it's easy to do and readily available." Steinbach's comments also come after Facebook recently introduced support for encryption on its social network. Users can now list their "public key" on their profile that others can use to contact them securely, and Facebook will also send messages to users in an encrypted format if they opt in. The senior FBI official didn't single out companies that use encryption by name, but said that "some of these [social media] companies build their business model around end-to-end encryption," the AP reports. As a result, "the companies have built a product that doesn't allow them to help." In his prepared remarks, he warned that "changing forms of internet communication are quickly outpacing laws and technology designed to allow for the lawful intercept of communication content," and that terrorist groups like ISIS and their communications are "going dark" as a result.

Crime

Encryption severely jeopardizes US crime fighting operations

Rosenblatt, '14, (Seth, senior editor, "FBI director demands access to private cell phone data," CNET, October 16, 2014, http://www.cnet.com/news/fbi-director-demands-access-to-private-cell-phone-data/)//erg

Cell phone encryption will prevent the federal government from stopping terrorists and child molesters unless the government is given special access, Federal Bureau of Investigation Director James Comey told a Washington, DC, think tank on Thursday. Comey, who noted that "**both real-time communication and stored data are increasingly encrypted," said that the trend by service providers to encrypt their customer data could prevent the government from lawfully pursuing criminals.** "**Justice may be denied, because of a locked phone or an encrypted hard drive**," Comey said in his prepared remarks at the Brookings Institute. He explained that while Communications Assistance for Law Enforcement Act (CALEA) from 1994 mandated that telephone companies build wiretapping backdoors into their equipment, no such law forces new communication companies to do the same. However, he didn't mention that CALEA was expanded from its original mandate to include broadband Internet and Voice over Internet Protocol (VoIP) systems like Skype in 2004.

Encryption and elimination of access to information hampers law enforcement effectiveness, making crime more likely

Rosenblatt, '14, (Seth, senior editor, "FBI director demands access to private cell phone data," CNET, October 16, 2014, http://www.cnet.com/news/fbi-director-demands-access-to-private-cell-phone-data/)//erg

Comey called out the default encryption in Apple's iOS 8, and the optional Android encryption that will become the default for that operating system when Android 5.0 Lollipop is released next month, as blocking law enforcement from fully gathering evidence against suspects. He said that the solution was for tech firms to build "front-doors" on consumer cell phones and smartphones. "We aren't seeking a back-door approach," Comey said, referring to a common term for encryption that has been intentionally weakened. "We want to use the front door, with clarity and

transparency, and with clear guidance provided by law," including court orders, he said. The spying scandal that kicked off when former National Security Agency contractor Edward Snowden leaked classified surveillance documents has seen tech titans including Apple, Google, Yahoo, Microsoft and Facebook scramble to build tougher encryption into their products. Google's Eric Schmidt warned that the spying will "break the Internet." The current fight over how to secure customer data isn't the first time that tech firms and the US government have gone to war over encryption. In the 1990s, the "crypto wars" saw tech companies and industry advocates force the US government to repeal laws that deemed cryptography a weapon. While evoking imagery of children at play and innocents exonerated of false accusations thanks to FBI investigations unencumbered by encryption, Comey derided concerns by the tech community that weakening encryption made devices more susceptible to cyber-criminal attacks. He acknowledged that "adversaries will exploit any vulnerability they find," but that **those exploits introduced by a backdoor could be mitigated by "developing intercept solutions during the design phase,**" he said.

Encryption makes it much harder for law enforcement to prevent horrible crimes such as abuse/assault of children

Kravets, '14, (David, ARS TECHNICA SENIOR EDITOR, "US top cop decries encryption, demands backdoors," Ars Technica, Oct 1, 2014, http://arstechnica.com/tech-policy/2014/10/us-top-cop-decries-encryption-demands-backdoors/)//erg

Attorney General Eric Holder, the US top law enforcement official, said it is "worrisome" that tech companies are providing default encryption on consumer electronics. **Locking the authorities out of being able to physically access the contents of devices puts children at risk,** he said. APPLE, GOOGLE DEFAULT CELL-PHONE ENCRYPTION "CONCERNS" FBI DIRECTOR Bureau chief says encryption allows "people to place themselves beyond the law." "It is fully possible to permit law enforcement to do its job while still adequately protecting personal privacy," Holder said during a Tuesday speech before the Global Alliance Against Child Sexual Abuse Online conference. "**When a child is in danger, law enforcement needs to be able to take every legally available step to quickly find and protect the child and to stop those that abuse children**. It is worrisome to see companies thwarting our ability to do so." Holder's remarks, while he did not mention any particular company by name, come two weeks after Apple announced its new iPhone 6 models would be equipped with data encryption that prevents authorities from accessing the contents of the phone. At the same time, Google said its upcoming Android operating system will also have default encryption. The encryption decision by two of the world's biggest names in tech is a bid to gain the trust of customers in the wake of the Edward Snowden surveillance revelations. Holder said he wants a backdoor to defeat encryption. He urged the tech sector "to work with us to ensure that law enforcement retains the ability, with court-authorization, to lawfully obtain information in the course of an investigation, such **as catching kidnappers and sexual predators."**

Encryption makes it easier for online criminals to hide

Kravets, '14, (David, ARS TECHNICA SENIOR EDITOR, "US top cop decries encryption, demands backdoors," Ars Technica, Oct 1, 2014, http://arstechnica.com/tech-policy/2014/10/us-top-cop-decries-encryption-demands-backdoors/)//erg

Recent technological advances have the potential to greatly embolden online criminals, providing new methods for abusers to avoid detection. In some cases, perpetrators are using cloud storage to cheaply and easily store tens of thousands of images and videos outside of any home or business—and to access those files from anywhere in the world. Many take advantage of encryption and anonymizing technology to conceal contraband materials and disguise their locations. The attorney general—who plans to step down from the position he has held for six years as soon as a successor takes office—is the highest-ranking member of the President Barack Obama administration to assail encryption in the wake of the Apple and Google announcements. James Comey, the Federal Bureau of Investigation director, last week said he was concerned about the marketing of smart phones that can't be physically searched by law enforcement. "What concerns me about this is companies marketing something expressly to allow people to place themselves beyond the law," Comey said. He said the bureau has reached out to Apple and Google "to understand what they're thinking and why they think it makes sense."

Access to data is necessary for combatting crime—saves lives and preserves overall national security

Dujardin, '15, (Peter, Daily Press writer, "Law enforcement worries over beefed-up phone encryption," Daily Press, April 12, 2015, http://www.dailypress.com/news/crime/dp-nws-phone-encryption-20150412-story.html#page=1)//erg

"Everything continues to move toward the cellphones," said Isle of Wight Sheriff Mark A. Marshall. "There's so much activity — from the social media pieces to everything you do — being done via these electronic devices." "Apply that to a missing kid," he said**. "Not having the ability to retrieve that data could have significant consequences … and would significantly hamper and impede law enforcement's ability to conduct an investigation."** "**It could be every kind of drug case, to a murder case to a espionage national security case,**" added York-Poquoson Sheriff J.D. "Danny" Diggs. "It's almost beyond belief that a (manufacturer) would create a product that would be an obstacle to a criminal investigation." In fact, he said companies shouldn't be allowed to make such devices that way. "Let's say this was a safe in somebody's house, and they failed to give us a combination," Diggs said. "A safe is a physical thing that if we had to take a welding torch to it … we could remove the contents. Even a safe is not exempt from a legal search. So why would a cell phone that could contain data that would be very important to a criminal investigation — why should a manufacturer even be allowed to create such a device?" Newport News Police Sgt. A.J. Matthews — who oversees the criminal intelligence unit, the division that downloads data from cellphones — also expressed concerns. His team of three detectives, using special software and an accompanying device, can retrieve data from about 80 percent of seized cellphones. He said he'd be "naive" to assume that rate won't fall with the recent changes. Hampton councilman: Lack of vote on police phone data program is "shocking" "If there's critical information inside of a phone and we can't access it, and in turn, someone dies or a case goes unsolved that would otherwise be solved … that would be a tragedy," he said. Matthews said he understands that people have a right to privacy and "we can't abuse our right to

search." But he said there should be some "give and take" on the issue, so that in "dire circumstances, if law enforcement needs access to it, that there's a manufacturer override for it." What if police got word, he said, about an attack about to happen, but needed to access a cell phone to prevent it? "It would be nice if we could say, 'Hey look, this is a very credible threat and we need access to this information,'" Matthews said.

Politics

General

Encryption legislation is a long shot and entrenched interests ensure a fight

Timm 14 - Trevor Timm is a Guardian US columnist and executive director of the Freedom of the Press Foundation, a non-profit that supports and defends journalism dedicated to transparency and accountability. ("Congress wants NSA reform after all. Obama and the Senate need to pass it," http://www.theguardian.com/commentisfree/2014/jun/20/congress-obama-nsa-reform-obama-senate 6/20/2014) STRYKER

Yes, all of these problems were exposed in some fashion by the Snowden revelations: A year ago, it was still classified that NSA was searching for the American people's data in its database of "foreign" data. President Obama said in response that NSA email and internet spying "doesn't apply to people living in the United States" – but the back-door loophole showed that it did. And the spy community's campaign for weaker encryption standards was largely in the shadows as well, Snowden files exposed it all. The public got mad, and now the House has overwhelmingly rejected those programs with legal and technical fixes, including Rep Alan Grayson's overlooked amendment to disband NSA's covert encryption sabotage campaign at Nist, the little-known government agency with a lot of power over encryption standards. (By the way, Grayson's throwing the first Congressional Crypto Party next week.) Of course, the victory is far from permanent and **could be undone rather quickly**. The FBI – not the NSA – is usually the agency that tries to **strong-arm companies** into placing back doors in technology, and you can expect intelligence agencies to try to undo the new provision against spending money on searching for US persons in secret, with a little help from Congressional intelligence committees. Still, the **real hurdle** remains in the Senate, where these strengthened provisions will still have to be adopted and passed on to Obama's desk if they have any chance of having an affect. **That is still a long shot**, but the **pressure's not going away**.

The encryption debate will be heated in Congress

Uchill 15 - Joe Uchill is a staff writer for Christian Science Monitor. ("Both sides of data encryption debate face off in Congress," http://www.csmonitor.com/World/Passcode/2015/0430/Both-sides-of-data-encryption-debate-face-off-in-Congress 4/30/2015) STRYKER

The **debate** over whether more robust encryption technology on devices such as Apple's iPhone will hamper law enforcement efforts **erupted in Congress** on Wednesday. Some of the **strongest voices** in favor of tougher encryption **faced off against law enforcement** officials, who say those kinds of technologies could impede investigators trying to obtain data needed to fight violent crime, at a hearing of the House Subcommittee on Information Technology. "As technology continues to evolve and encryption capabilities become a part of everyday life for all Americans, **this debate will only grow larger**," said subcommittee chairman Rep. Will Hurd (R) of Texas, who helped build a cybersecurity company before he was elected to Congress and appeared deeply skeptical of law enforcement's position during the hearing. "I believe we can find a way to protect the privacy of law-abiding citizens and ensure that law enforcement have the tools they need to catch the bad guys." Both Google and Apple have said they would begin offering encryption by default on their mobile operating systems, meaning phones out of the box would store data in a format that hackers – or the government – would have more trouble accessing. Those changes led the heads of the Federal Bureau of Investigation, National Security Agency, and Department of Homeland Security to express strong concerns that their agencies would face potentially harmful barriers to accessing data on cellphones even with a warrant. As a result, law enforcement and national security officials have called for tech companies to allow access to protected files – something known in cryptography as a "back door."

Encryption interests on both sides are unwilling to back down

Scola 14 - Nancy Scola is a reporter for the Washington Post. ("FBI Director Comey calls on Congress to stop unlockable encryption. Good luck with that." http://www.washingtonpost.com/blogs/the-switch/wp/2014/10/17/fbi-director-comey-calls-on-congress-to-stop-unlockable-encryption-good-luck-with-that/ 10/17/2014) STRYKER

FBI Director James Comey is urging Congress to take up the topic of encryption -- setting up a potentially **historic debate** on Capitol Hill over whether U.S. tech firms can be required to bake into their technology ways for law enforcement to legally access users' e-mails, texts and other digital communications. In remarks at the Brookings Institution on Thursday, Comey used the phrase "going dark" to describe the decisions by companies like Apple and Google to encrypt by default more and more of their services. (Comey recalled his response when he learned of those decisions: "Holy cow.") The problem, Comey argued, is that the process locks away for good some data that could be useful to law enforcement as it fights crime. The argument against that notion? That any time you create a means of access for law enforcement -- what Comey called a "front door" that the FBI can use "with clarity and

transparency" -- it increases the chances that those with ill-intentions can get at that same data. It's a **complicated dynamic**, and Comey appeared eager to punt the **confusion over to Congress**. He called for the House and Senate to begin rethinking the Communications Assistance for Law Enforcement Act, better known as CALEA, which empowers the FBI to access electronic communications. The 20-year old law, Comey argued, should require companies big and small to build into their systems "lawful intercept capabilities" that aren't stymied by encryption. One serious hiccup, though, is that plopping itself between domestic law enforcement and the increasingly politically powerful and culturally celebrated tech sector -- one largely embodied by Google and Apple -- **isn't something that Congress is eager to do**. Asked for comment on Comey's call for CALEA reconsideration, a spokesperson for Sen. Patrick Leahy (D-Vt.), the powerful chairman of the Senate Judiciary Committee, shot back nearly immediately: "Right now, Senator Leahy's top focus is passing the USA Freedome Act in November." (That bill is aimed at restricting the investigative powers of the National Security Agency and others in the intelligence sector, not domestic law enforcement.) Leahy's Republican counterpart, ranking member Sen. Charles Grassley of Iowa, noted in a statement that, "Director Comey acknowledged that it's a delicate balancing act." He is, the senator added, "reviewing this issue carefully." Google, though, was more forceful in its take on the day's events. "Encryption is simply the 21st century method of protecting personal documents," a company spokesperson said in a statement, "and we intend to provide this added security to our users while giving law enforcement appropriate access when presented with a warrant." (Apple did not respond to a request for comment on Comey's remarks.) Tech giants like Google recognize that their user bases outside the United States are growing and are central to their future prospects. They're not eager, as one audience member described it to Comey during the Brookings talk, to be seen selling an "NSA/FBI-ready iPhone" in Europe and other parts of the world. "I don't think I'd market it as "FBI/NSA-ready," the FBI director responded. That global footprint and the public cachet of Google, Apple and fellow American tech giants, indeed makes this debate different than the crypto wars of the past, says professor Lance J. Hoffman, director of George Washington University's Cyber Security Policy and Research Institute. But still, we've largely been here before, noted the author of a book on government-directed digital access called "Building in Big Brother," published in 1995. "It's the same issues," Hoffman said. "They haven't changed. It's a classic equation." And so, at Brookings, Hoffman called on Comey to finally start a public conversation around the cost-benefit analysis of forced de-encryption, taking into consideration all the factors that make the 2014 version of the debate unique -- from Edward Snowden to the impact on cloud-computing companies around the world. It won't be easy, Hoffman admitted. "It's hard to put a value on intangibles." And Thursday's session with Comey made crystal clear why the FBI is eager to have lawmakers be the ones to wrestle with the nitty-gritty of encryption: It's complicated. Again and again, Comey was asked how companies would build in access to encrypted systems that only allows that access under legal circumstances. Again and again, Comey insisted that he didn't know yet. "I'm not smart enough technically to figure out how that might work," Comey said at one point. And at another, "I haven't gamed this out completely." Comey, though, is eager for those on Capitol Hill to do the figuring. "I totally understand the market imperative" of decisions like those of Apple and Google to offer customers encryption by default, he said, adding for emphasis, "I get it." But, he said, Congress has to decide that "we as a society are willing to have American companies take that hit." That's far easier, though, for the FBI director to say than for Congress to mandate. And so Capitol Hill is going to likely find itself **stuck between the FBI and Google**. And **neither looks ready to back down**.

Intelligence Lobby

Concerted government push against SDA

Geller 15 - Eric Geller is the Deputy Morning Editor at The Daily Dot. ("Ron Wyden, the Internet's senator," http://www.dailydot.com/politics/ron-wyden-profile-senate-privacy-surveillance-reform/ 3/24/2015) STRYKER

Lofgren and Wyden also worked together on the Secure Data Act in response to comments by senior intelligence officials that companies should make it easier for the government to gather data from their products. Federal Bureau of Investigation Director James Comey has been the leading face of this **concerted government push** against device and file encryption, using issues like child molestation to make the case for special government access to cellphones, hard drives, and email accounts. "Justice may be denied because of a locked phone or an encrypted hard drive," Comey told an audience at the Brookings Institute in October 2014. As part of his push for more access to encrypted devices and services, Comey has singled out Apple and Google for adding automatic encryption to their mobile operating systems that even the companies themselves cannot break. In an interview with CBS News, Comey warned that these companies were putting their customers "beyond the law." Comey's crusade against encryption is part of a **broader government campaign against encryption**, one that Wyden and Lofgren say could leave consumers vulnerable to foreign powers and rogue hacker groups.

AT//Bipartisan

SDA drains political capital *regardless* of support

Wicklander 15 - Carl Wicklander is a 2006 graduate of Concordia University - Nebraska and is a student of history, politics, philosophy, and religion. ("Bipartisan Secure Data Act Has Votes to Pass House, But Will Lawmakers Drag Their Feet?" http://ivn.us/2015/02/09/bipartisan-secure-data-act-votes-pass-house-will-lawmakers-drag-feet/ 2/9/2015) STRYKER

In a press release, U.S. Reps. Thomas Massie (R-Ky.), James Sensenbrenner (R-Wis.), and Zoe Lofgren (D-Calif.) announced that the purpose of the Secure Data Act of 2015 is not to restrict the ability of intelligence agencies to collect data in general. However, they do intend to re-assert the role of Congress in regulating these activities: "Congress has allowed the Administration's surveillance authorities to go unchecked by failing to enact adequate reform. . . . With threats to our homeland ever prevalent, we should not tie the hands of the intelligence community. But unwarranted, backdoor surveillance is indefensible. The Secure Data Act is an important step in rebuilding public trust in our intelligence agencies and striking the appropriate balance between national security and civil liberty." The bill is an attempt to specifically guard against backdoor searches, including those where "identifiers" such as phone numbers and e-mail addresses known to belong to Americans are employed to conduct the searches. For years, privacy advocates have denounced these types of searches as a way to skirt the law. According to the Register, a UK-based tech site, "Under the proposed Secure Data Act, developers cannot be forced to insert security holes into devices and code." An ACLU lawyer quoted in the story said that the previous bill's success might indicate "that at least in the House they know how important it is to secure encryption efforts." Massie, Lofgren, and Sensenbrenner tried to pass a similar version of the Secure Data Act near the end of the 113th Congress. The legislation passed with broad support, 293-123, but was not included in the omnibus bill that passed at the end of the session. A Senate version of the Secure Data Act was introduced by Oregon U.S. Sen. Ron Wyden (D) in January. His bill is still waiting to move through the Senate Committee on Commerce, Science and Transportation. Regaining the people's trust may be one of the harder obstacles when it comes to regulations on spying and surveillance. Polls have consistently shown that Americans do not approve of the current methods of surveillance and data collection. Previous bills have passed Congress seeking to limit the power and authority of agencies like the National Security Agency. However, the final products were **severely watered down** versions of the initial legislation. **Even extensively supported bills** such as the previous Secure Data Act **failed to get anywhere in both chambers of Congress**.

Social Movement Wake

Case

Counternarrative Turn

Discursive archeology re-entrenches domination- empirics prove

Hernando '13 [Dr. Almudena Hernando Gonzalo, Associate Professor at the Department of Prehistory of the Complutense University of Madrid, her work focuses on archeological theory, "Change, individuality and reason, or how Archaeology has legitimized a patriarchal modernity," http://www.academia.edu/3984983/Change_individuality_and_reason_or_how_archaeology_has_legitimized_a_patriarchal_modernity._In_A._Gonzalez-Ruibal_ed._Reclaiming_Archaeology._Beyond_the_tropes_of_Modernity._Routledge_London_pp._155-67._2013]

In terms of legitimation procedures, archaeology as a discourse was actually not much different from myth. Mythological discourses project the group's social order onto sacred levels of agency, and then turn this relation of analogy on its head, interpreting that the group's survival as the¶ elect ¶ , the¶ chosen ones¶, is precisely confirmed and ¶ guaranteed by its resemblance to that supernatural sphere. In similar fashion modern archaeology - influenced by positivist and evolutionist paradigms - constructs the past through a projection of those elements of present day society it aims at legitimating: ignoring all other factors, the past is selectively scanned for evidence of change, power, individuality, rationality or technology, and the obvious conclusion is then triumphantly established: our (western) culture has developed all those characteristics far beyond and in advance of all others, which means it stands a far greater chance of succeeding(surviving). This discursive operation was typical of historicist and processual archaeology: it was taken for granted that no other logic but our own could preside any viable human interaction with the world. Consequently, the worldviews of present-days scholars were straightforwardly and unquestioningly projected onto other times and cultures, churning out veritable exercises in ethnocentric evolutionism that demoted all human groups in previous ages (and by the same token, also those societies with a similar level of technology in present times) to the status of mere precedents or harbingers of all that our own advanced, fully mature culture has achieved (Trigger 1984; McNiven and Russell 2005; Hernando 2006). Although postprocessual archaeology rejected the ethnocentric bias, along with positivism and evolutionism. the deep structures underpinning the discourse of archaeology remained, however, unchanged in most cases: as a discourse, it was now legitimating postmodernism's ontology of the present, which was based on the transcendental subject. Particular subjects and their differences became the aspect of the past to be scanned for (Hodder 2003: cap. 9), and individuality as a mode of personhood was hypostatized into universality (Knapp and Meskell 1997; Knapp and VanDommelen 2008; Machin 2009). Unsatisfied with the modernist subject presented by archaeology, some researchers shifted their attention to issues such as 'things' (Olsen2010), but many archaeologists (including historicist, processual and post-processual) kept producing the same kind of narratives centred on change, conflict, power, individuality, personal subjectivity, technology or rationality. Factors such as stability, recurrence, relational identity, bonding and emotion were deemed of secondary relevance or not relevant at all. Thus even when the present-day bearers of these values were taken into account (such as women and indigenous peoples), and indeed post- processual archaeologists were the first to pay attention to them, they were frequently pictured through the same modernist lens emphasizing power, change and individuality (Montón-Subías and Sánchez-Romero, 2008; McNiven and Russell 2005; Atalay 2006;C. Gnecco and A. Haber, both in this volume).

Aff Fails – Too Individualized

Their counterhegemonic storytelling method fails in the context of surveillance because it is too individualized – this just allows the dominant system to adapt and maintain control

Monahan in 6 - Associate Professor of Human and Organizational Development and Medicine at Vanderbilt University. Member of the International Surveillance Studies Network <Torin. "Counter-surveillance as Political Intervention?" SOCIAL SEMIOTICS VOLUME 16 NUMBER 4 (DECEMBER 2006) Pgs 515-531>

Another example of the dance of surveillance and counter-surveillance can be witnessed in the confrontations occurring at globalization protests throughout the world. Activists have been quite savvy in videotaping and photographing police and security forces as a technique not only for deterring abuse, but also for documenting and disseminating any instances of excessive force. According to accounts by World Trade Organization protesters, the police, in turn, now zero-in on individuals with video recorders and arrest them (or confiscate their equipment) as a first line of defense in what has become a war over the control of media representations (Fernandez 2005). Similarly, vibrant Independent Media Centers are now routinely set up at protest locations, allowing activists to produce and edit video, audio, photographic, and textual news stories and then disseminate them over the Internet, serving as an outlet for alternative interpretations of the issues under protest (Breyman 2003). As was witnessed in the beating of independent media personnel and destruction of an Indymedia center by police during the 2001 G8 protests in Genoa, Italy (Independent Media Center Network 2001; Juris 2005), those with institutional interests and power are learning to infiltrate ''subversive'' counter-surveillance collectives and vitiate their potential for destabilizing the dominant system. A final telling example of the learning potential of institutions was the subsequent 2002 G8 meeting held in Kananaskis, which is a remote and difficult to access mountain resort in Alberta, Canada. Rather than contend with widespread public protests and a potential repeat of the police violence in Genoa (marked by the close-range shooting and death of a protester), the mountain meeting exerted the most extreme control over the limited avenues available for public participation: both reporters and members of the public were excluded, and a ''no-fly-zone'' was enforced around the resort. It could be that grassroots publicizing of protests (through Indymedia, for example) are ultimately more effective than individualized counter-surveillance because they are **collective activities geared toward institutional change**. While the removal of the 2002 G8 meetings to a publicly inaccessible location was a response to previous experiences with protestors and their publicity machines, this choice of location served a symbolic function of revealing the exclusionary elitism of these organizations, thereby calling their legitimacy into question. So, whereas mainstream news outlets seldom lend any sympathetic ink or air time to anti-globalization protests, many of them did comment on the overt mechanisms of public exclusion displayed by the 2002 G8 meeting (CNN.com 2002; Rowland 2002; Sanger 2002).

Counternarratives Fail

Their form of counternarrative fails because it simply critiques the existing dominant narratives without replacing it with an alternative – ensures that their method will fail to stop violence

Tramblay in 10 <Jessika. " STORIES THAT HAVEN'T CHANGED THE WORLD: NARRATIVES AND COUNTERNARRATIVES IN THE CONTEMPORARY DEVELOPMENT COMMUNITY" PlatForum Vol. 11 (2010) Pgs 90-104>

This leads me to a brief but crucial discussion of Roe's analytical framework for understanding rural development programs, as I will be applying it to a number of development alternatives proposed in recent years. Roe proposes that the key to successful development requires a "politics of complexity" that is non-existent in the crisis scenarios or narratives that have guided policy to date (1999:4). Roe explains that when faced with highly complex and uncertain development scenarios, practitioners are often obliged to come up with a narrative or story that will stabilize policy-making. Evidence is often conflicting, contradictory, or sparse in these situations, which complicates decision-making. Crisis scenarios emerge as a solution to these conditions when they ignore the complexity of a situation and simplify the factors to make way for quick and (apparently) easy solutions. The desertification scenario, for example, proposes the "insidious, spreading process that is turning many of the world's marginal fields and pastures into barren wastelands" (Roe 1999:4-5). Where the development community has insisted for years that desertification is a major threat on the African continent, and that the problem is worsening each year, more recent studies suggest there is no evidence to support the claim. So why do we continue to act as if desertification is a major priority? Crisis scenarios and other narratives of the sort persist because

no alternatives have emerged to replace them. Roe explains that **simply criticizing the narrative by appealing to empirical evidence does nothing for policy;** what is needed is a counternarrative, or a "rival hypothesis or set of hypotheses that could plausibly reverse what appears to be the case, where the reversal in question, even if it proved factually not to be the case, nonetheless provides a possible policy option for future attention because of its very plausibility" (1999:9). If we follow Roe, then, in his application of literary theory to extremely difficult public policy issues such as development, it becomes evident that what is needed is not only a fastidious critique of the existing development narratives, but an alternative narrative that can act as a plausible solution to the repeated failures of previous development approaches (1994:1). Let me take it one step further in suggesting that a simple alt ernative is not sufficient in this sense; what is necessary is an alternative that breaks far enough away from the norm to escape the oft invisible and pernicious premises from which these narratives have sprung. And this is where my argument comes in: Sen and Easterly, in my view, have actually developed the counternarratives to which other authors have laid claim.

Aff = Academic Colonialism

Their reading of the aff and asking for the ballot reproduces the commodification of the lives of the oppressed by exploiting them and colonizing the work of subjugated communities

Thompson in 3 <Audrey. "Tiffany, friend of people of color: White investments in antiracism" QUALITATIVE STUDIES IN EDUCATION, 2003, VOL. 16, NO. 1, 7–29>

Indeed, Collins finds it suspicious that black feminism is "so well received by White women."20 Such suspicions are prompted by the history of whites' appropriation of black and brown bodies, words, songs, and symbols. As Nell Irvin Painter observes, white women have long taken up black women's texts and voices for our own activist purposes – profiting much more from the commodification of black voices than have the black women invoked in the white texts. Whereas Sojourner Truth had to sell photographic cartes de visite for 33 cents apiece to support her abolitionist work, Harriet Beecher Stowe earned money by writing about Truth and other African Americans.21 Tapping "a marketable subject" in an era when "material on the Negro was very much in demand," Stowe – who had already made a fortune from Uncle Tom's Cabin but found herself in need of further funds – "min[ed] the vein that had produced her black characters in Uncle Tom's Cabin." Writing for the prestigious Atlantic Monthly, Stowe "made Truth into a quaint and innocent exotic who disdained feminism."22 Later, in a reversal of her symbolic fortunes, Truth was appropriated for white feminist purposes. In the white feminist reform literature, Sojourner Truth became a suffragist more than an abolitionist symbol, famous mostly for having said "and ar'n't I a woman?" – a line that Frances Dana Gage, a white woman, composed and attributed to Truth.23 Like Stowe and Gage, white academics who take up the texts (and lives and projects) of people of color for progressive purposes **risk exploiting them for our own insufficiently examined ends**. Writing an open letter to Mary Daly in 1979, Audre Lorde told her, "The history of white women who are unable to hear Black women's words, or to maintain dialogue with us, is long and discouraging."24 Rather than "ever really read the work of Black women" and other women of color, white feminists tend to "finger through [such work] for quotations" that they think will "support an already-conceived idea concerning some old and distorted connection between us."25 The question Lorde asked Daly might be asked of white feminists and white progressives in general: "Have you read my work, and the work of other Black women, for what it could give you? Or did you hunt through only to find words that would legitimize your" own claims about race and racism?26 When white scholars strategically quote material by scholars of color to "support an already-conceived idea," we **colonize the work of the Other to enrich our writing and enhance our authority**. Like Stowe, we mine the lives and writings of people of color **to produce a more marketable commodity**.27 Indeed, even when we are true to the work we study, whites may profit in ways wholly out of proportion to our historical contribution to the field. Long before the academy began to accept whiteness as a distinctive area of research, it had been the subject of countless works of theory, fiction, art, and journalism by people of color. Although some of the contemporary scholarship on whiteness by white authors recognizes our indebtedness to classic and pathbreaking work by James Baldwin, Vine Deloria, Toni Morrison, and others, whiteness theory nevertheless seems to be "ours." **The very acknowledgement of our racism and privilege can be turned to our advantage.**

Aff Commodifies Suffering

The aff relies on images of suffering which become commodified for the ballot – this destroys personal identity, value to life and obscures other forms of oppression like capitalism and hegemony

Ticktin 99 <Miriam. "Selling Suffering in The Courtroom and Marketplace:An Analysis of the Autobiography of Kiranjit Ahluwalia" [PoLAR: Vol. 22, No. 1. Pgs 24-28>

Such a double bind is part of the dilemma of the transition to a more just society. How is one to act in the world, short of putting all one's energies toward revolution? How was Kiranjit supposed to act in her situation of abuse, and then in court, faced with a charge of life imprisonment? Such a double bind exists for many Asians in Britain. Already fighting poverty, racism and oppression, should they not have the ability to fight discrimination and violence by selling images, including those of suffering, on the market, counteracting other derogatory images? I want first to discuss what Radin describes as the key elements of personhood: freedom, identity, and contextuality. Next, I will relate these to Circle of Light to ask if alienating suffering in thiscontext diminishes the possibility for human flourishing. It must be noted that of course thereis no formula for what is "personal" or what ultimately constitutes personhood; as Radin herself remarks, a moral judgment is required in each case (1987:1908).7Radin asserts that freedom must be understood in relation to the contextuality aspect ofpersonhood. In other words, contextuality implies that physical and social context are integralto personal individuation and self-development; thus, self-development in accordance withone's own will (freedom) requires one to will certain interactions with the physical and socialcontext. Commodification undermines personal identity by conceiving of personal attributes, relationships, and moral commitments as monetizable and alienable from the self: examples of these are one's politics, religion, family, experiences, or sexuality. These are things and people that are at once part of one's surroundings and integral to the self. Radin argues that **to think that people's experiences or moral commitments could be fungible and commensurate with those of another, or that a person without her moral commitments is still the same person, "is to do violence to our deepest understanding of what it is to be human"** (Radin 1987:1906). If these are commodified, human flourishing is diminished, degrading the person. To answer if Circle of Light alienates aspects integral to personhood by commodifying Kiranjit's suffering, we can examine how freedom, identity and contextualization are affected in this particular case. Radin suggests that for non ideal circumstances, the double bind of market-inalienability just discussed can be solved by incomplete commodification, or degrees ofcommodification determined by each specific case. We must begin by noting that suffering isalready commoditized in many circumstances; people receive damages for pain and suffering.Media and news reporting sell the suffering associated with war and with famine in magazines,on cable television.8 How is suffering different in this case? In what capacity is it a contestedcommodity? Who is benefiting, and who is being disempowered by the commoditization?In the case of Circle of Light, I have argued that the narratives of dominance (legal and market)occupy the subjects in very specific ways, shaping them and their stories. The subjects -Kiranjit, battered women, and South Asian women - each get silenced at points, and silence each other at other points. The question is, have their experiences of suffering been altered in such a way as to lead to a degradation of personhood? Are their identities, contexts and freedombeing violated through the objectification and transformation of suffering in the book? First, I want to point out some of the contradictions in Circle of Light that let the subjects speak beyond the dominant narratives, and then I will explore whether the commodification of suffering in the book leads to empowerment or not. Circle of Light describes Kiranjit's life, but it also relates how she became a legal subject. Theprocess of "reconstructing" her is not hidden; SBS makes it clear in the "SBS story." If we readtheir construction of the process, sometimes pushing beyond it, we can see the conflicts betweensubjects (Kiranjit, SBS, Rahila Gupta) that permeate the text. As such, the book constructs split and contradictory subjects, not fully captured by either of the dominant narratives. For instance, Kiranjit's resistance to telling her story comes out in several places. In one example,a woman from SBS named Pragna was working with Kiranjit to get her information straight forthe appeal - trying to get "the truth." She admits that she was skeptical of Kiranjit. The SBSstory reveals that "trying to uncover the truth was to become almost an end in itself for Pragna,amounting to obsession" (p.347). Kiranjit's lack of acquiescence is implied in the text, in thephrase, "[Pragna] cited an example of her problems with Kiranjit." Similarly, Pragna claimsthat "[Kiranjit] was giving me contradictory statements..." (p.347). After her release, at thecelebration, the SBS story recounts how Pragna asked Kiranjit if she had told her the wholetruth. "Kiranjit laughed. 'Do you really want to know?' she said. It was partly tease and partlywarning" (p.322). Finally, in the writing up of the book, Rahila Gupta writes in her introduction how Kiranjit dealt with the power imbalance involved in the writing up process, "she wouldwant to trade information refusing to continue until I had answered a personal question" (p.xvi).These are glimpses of a subject not completely erased, not completely encompassed by largernarratives of the dominant ideology. Similarly, the Southall Black Sisters themselves demonstrate their doubts and concerns in theirhighly self-conscious production of culture and identity. They reveal their initial abhorrence ofthe idea of using a medical defense, but show how eventually they are driven by pragmatics. Inanother example, after deciding to bring culture into the appeal, Pragna had to write a report onviolence in the Asian community. The process of writing it was described as

tortuous: "She hadto tread very carefully in order to describe common aspects of Asian women's experience inthis country without creating a new racial stereotype - the battered Asian woman" (p.374). The question here would be how is the process of construction itself sold, how much is it appropriated by the racialized end product? One could see the process of deliberation adding to the validity of such images - we are urged to think that they did their best to avoid stereotypes, and that therefore the product we now consume is free of prejudice. Finally, Circle of Light contradicts itself in places. For instance, right after describing how thePrincess of Wales advised Kiranjit to write a book, Rani la Gupta writes, "none of us wanted thestory to be sensationalized" (p.xii). The very act of including Diana sensationalizes - there isperhaps no figure in the world who can match her status as a popular icon/commodity; but this demonstrates the contradictions built into this form of representation, **the difficulty of fitting empowering images and identities into narratives that will win criminal court cases and sell books**. Do these contradictions mediate the alienation of suffering, by letting the complexity of experience be seen? In asking this question, it might be argued that I'm missing the most important point of the book: the fact that Kiranjit Ahluwalia was released -that she won hercase. Is that not empowerment? Does it really matter that her experience was altered in court,that her suffering was turned into a commodity through the book? I do not want to make themistake that Spivak warns against - that of confusing darstellung with vertretung. In simpleterms, I realize that this book is an example of darstellung, or speaking about; although itspeaks about the trial, it cannot substitute for vertretung, or speaking for, in the political orlegal sense. In the end, is Kiranjit not free to walk around outside? Does this not alter the wayin which her representation is performed in the book, despite the imperial tropes? Is thatintervention not more material and ultimately more salient than one made by speaking about?Here, I draw on Sherene Razack's work on domestic violence in the context of claims forasylum on the basis of gender persecution, for the problems that she so eloquently names inthat context mirror the ones that I find with this collective self-representation. Razack agreesthat if a story of cultural othering must be told to save a woman from violence, then who can complain if we "fight sexism with racism"? (1995:72). Yet she argues that there are indeed built-in limitations to this practical approach. First, victims must be able to access readily understood racial tropes. What if Asian women were not perceived as passive and weak, inneed of a saviour from Asian men? Razack explores this reality in the context of Asian andAfrican Caribbean women in Canada, and in this same vein, I would hazard a guess that the strategies used for Kiranjit would not work for African immigrants in Britain. Second, if onemust always pathologize one's culture, there need not be a discussion of the conditions inwhich these women live; in other words, there is no need to touch on the reasons for migration,or the subsequent economic vulnerability of many abused women. As Razack states, "the lightneed never be shone on First World complicity" (p.73). Finally, racist constructs operate under the logic that Third World women are to be pitied, and ironically, if women emerge as strong enough to have escaped violent situations, this does not work in their favour. This is clear inKiranjit's case: when she was conceived of as a killer, able to muster the means to escapeabuse, she was convicted; only by turning her into a pitiable battered woman was she released.On a purely practical basis, what do women do who cannot fit their realities into imperialframes? These are the women that are discriminated against. These are the women that thisrepresentation erases. Kiranjit first got a life sentence; this was not a typical sentence given toa woman for killing her husband. As one letter printed in Circle of Light points out, a whitewoman who suffered domestic violence and committed a similar crime got two years probation.It was only when Kiranjit became a subject of a racialized imperial framework that she wasgranted the privilege that other (white) citizens often automatically possess.Yes, she was released. What does this mean for notions of personhood, empowerment, andhuman flourishing? What kind of victory is it? It is a victory, a form of empowerment for her,as an individual - but let us be clear - in a strange twist, it is empowering to her only if we seeher as an abstract individual, devoid of context. In other words, it violates the elements thatRadin describes as integral to personhood. The context in which she both suffered and acted is t**ransformed, reinterpreted; her cultural and historical background are traded in for the empowerment of universal womanhood**. Her identity - intimately connected to the context,and to her multiple commitments and histories as both a gendered, and racialized subject – is therefore also altered. Thus, for other battered Asian and minority women - the other "subjects" of this story - the case of empowerment is unclear. While glimpses of their subjectivities canbe traced in the contradictions of the narratives, we are left with an overwhelming sense thatAsian women cannot be strong and still Asian, in Britain; this forces on them the unacceptable choice of either being pathologized to be empowered, or having their historical specificity, andtheir cultural context, erased.Before I conclude, let me return to my goal in writing this piece: this is an attempt to makeroom for silences, or for that which cannot be easily articulated. My goal has been to show thecomplexity involved in representing suffering in the courtroom and the marketplace, ratherthan to dismiss the political and ethical agendas of the book. I am not criticizing their strategiesbecause I disagree with the overall project of the book; on the contrary, because their project isso important - and because some sort of public depiction of violence is inevitable in campaignsagainst violence - it is essential to examine the broader implications of "selling suffering." **Commodifying one form of suffering meant obscuring others, such as the violence of poverty,racism, and the violence done by Western hegemony**. The legal and market narratives precludedtheir appearance. In this case, I would therefore conclude that suffering be market-inalienable,as the amount that Circle of Light empowers is negligible compared to the ways in which itserves to efface the experience of suffering and of violence endured.

War Turns Structural Violence

Systemic impacts do not cause war but war causes structural violence – prioritize our impacts

Goldstein, American University International Relations Professor, **2001** [Joshua, "War and Gender. How Gender shapes the War System and Vice Versa", p.411-412]

I began this book hoping to contribute in some way to a deeper understanding of war—an understanding that would improve the caches of someday achieving real peace, by deleting war from our human repertoire. In following the thread of gender running through war, I found the deeper understanding I had hoped for - a multidisciplinary and multilevel engagement with the subject. Yet I became somewhat more pessimistic about how quickly or easily war may end. The war system emerges, from the evidence in this book, as relatively ubiquitous and robust. Efforts to change this system must overcome several dilemmas mentioned in this book. First, peace activists face a dilemma in thinking about causes of war and working for peace. Many peace scholars and activists support the approach, "if you want peace, work for justice." Then, if one believes that sexism contributes to war, one can work for gender justice specifically (perhaps among others) in order to pursue peace. This approach brings strategic allies to the peace movement (women, labor, minorities), but rests on the assumption that injustices cause war. The evidence in this book suggests that causality runs at least as strongly the other way. War is not a product of capitalism, imperialism, gender, innate aggression, or any other single cause, although all of these influence wars' outbreaks and outcomes. Rather, war has in part fueled and sustained these and other injustices.9 So, "if you want peace, work for peace." Indeed, if you want justice (gender and others), work for peace. Causality does not run just upward through the levels of analysis, from types of individuals, societies, and governments up to war. It runs downward too. Enloe suggests that changes in attitudes towards war and the military may be the most important way to "reverse women's oppression." The dilemma is that peace work focused on justice brings to the peace movement energy, allies, and moral grounding, yet, in light of this book's evidence, the emphasis on injustice as the main cause of war seems to be empirically inadequate.

Framework

1NC

A – Interpretation

Topical affirmatives must affirm the resolution through instrumental defense of action by the United States Federal Government.

B – Definitions

Should denotes an expectation of enacting a plan

American Heritage Dictionary **2000** (Dictionary.com)

should. The will to do something or have something take place: I shall go out if I feel like it.

Federal government is the central government in Washington DC

Encarta Online 2005,
http://encarta.msn.com/encyclopedia_1741500781_6/United_States_(Government).html#howtocite

United States (Government), the combination of federal, state, and local laws, bodies, and agencies that is responsible for carrying out the operations of the United States. The federal government of the United States is centered in Washington DC.

Resolved implies a policy

Louisiana House 3-8-**2005**, http://house.louisiana.gov/house-glossary.htm

Resolution A legislative instrument that generally is used for making declarations, stating policies, and making decisions where some other form is not required. A bill includes the constitutionally required enacting clause; a resolution uses the term "resolved". Not subject to a time limit for introduction nor to governor's veto. (Const. Art. III, §17(B) and House Rules 8.11 , 13.1 , 6.8 , and 7.4)

.

C – Vote neg

1 – Predictability - The resolution proposes the question the negative is prepared to answer. Even if it is good to talk about their 1AC, they must prove we could have logically anticipated it. This question comes prior to the merits of the aff because it implicates our ability to debate.

Ruth Lessl **Shively**, Assoc Prof Polisci at Texas A&M, **2000** *Political Theory and Partisan Politics* p. 181-2

The requirements given thus far are primarily negative. The ambiguists must say "no" to—they must reject and limit—some ideas and actions. In what follows, we will also find that they must say "yes" to some things. In particular, they must say "yes" to the idea of rational persuasion. This means, first, that they must recognize the role of agreement in political contest, or the basic accord that is necessary to discord. The mistake that the ambiguists make here is a common one. The mistake is in thinking that agreement marks the end of contest—that consensus kills debate. But this is true only if the agreement is perfect—if there is nothing at all left to question or contest. In most cases, however, our agreements are highly imperfect. We agree on some matters but not on others, on generalities but not on specifics, on principles but not on their applications, and so on. And this kind of limited agreement is the starting

condition of contest and debate. As John Courtney Murray writes: We hold certain truths; therefore we can argue about them. It seems to have been one of the corruptions of intelligence by positivism to assume that argument ends when agreement is reached. In a basic sense, the reverse is true. There can be no argument except on the premise, and within a context, of agreement. (Murray 1960, 10) In other words, we cannot argue about something if we are not communicating: if we cannot agree on the topic and terms of argument or if we have utterly different ideas about what counts as evidence or good argument. At the very least, we must agree about what it is that is being debated before we can debate it. For instance, one cannot have an argument about euthanasia with someone who thinks euthanasia is a musical group. One cannot successfully stage a sit-in if one's target audience simply thinks everyone is resting or if those doing the sitting have no complaints. Nor can one demonstrate resistance to a policy if no one knows that it is a policy. In other words, contest is meaningless if there is a lack of agreement or communication about what is being contested. Resisters, demonstrators, and debaters must have some shared ideas about the subject and/or the terms of their disagreements. The participants and the target of a sit-in must share an understanding of the complaint at hand. And a demonstrator's audience must know what is being resisted. In short, the contesting of an idea presumes some agreement about what that idea is and how one might go about intelligibly contesting it. In other words, contestation rests on some basic agreement or harmony.

Debate over a clear and specific controversial point of government action creates argumentative stasis – that's a prerequisite to the negative's ability to engage in the conversation — that's critical to deliberation

Steinberg 8, lecturer of communication studies – University of Miami, and Freeley, Boston based attorney who focuses on criminal, personal injury and civil rights law, **'8**

(David L. and Austin J., Argumentation and Debate: Critical Thinking for Reasoned Decision Making p. 45)

Debate is a **means of settling differences**, so there **must be a** difference of opinion or a **conflict of interest** before there can be a debate. **If everyone is in agreement** on a tact or value or policy, there is **no need for debate**: **the matter can be settled by unanimous consent**. Thus, for example, it would be pointless to attempt to debate "Resolved: That two plus two equals four," because there is simply no controversy about this statement. (Controversy is an essential prerequisite of debate. Where there is no clash of ideas, proposals, interests, or expressed positions on issues, **there is no debate**. In addition, debate **cannot produce effective decisions** without **clear identification of a question or questions to be answered**. For example, **general argument may occur about the broad topic of illegal immigration**. How many illegal immigrants are in the United States? What is the impact of illegal immigration and immigrants on our economy? What is their impact on our communities? Do they commit crimes? Do they take jobs from American workers? Do they pay taxes? Do they require social services? Is it a problem that some do not speak English? Is it the responsibility of employers to discourage illegal immigration by not hiring undocumented workers? Should they have the opportunity- to gain citizenship? Docs illegal immigration pose a security threat to our country? Do illegal immigrants do work that American workers are unwilling to do? Are their rights as workers and as human beings at risk due to their status? Are they abused by employers, law enforcement, housing, and businesses? I low are their families impacted by their status? What is the moral and philosophical obligation of a nation state to maintain its borders? Should we build a wall on the Mexican border, establish a national identification can!, or enforce existing laws against employers? Should we invite immigrants to become U.S. citizens? Surely you can think of many more concerns to be addressed by a conversation about the topic area of illegal immigration. Participation in this "debate" is likely to be emotional and intense. However, it is **not likely to be productive or useful without focus on a particular question** and identification of a line **demarcating sides in the controversy**. To be discussed and resolved effectively, **controversies must be stated clearly**. **Vague**

understanding results in **unfocused deliberation** and **poor decisions**, frustration, and emotional distress, as **evidenced by the failure of the United States Congress to make progress on the immigration debate during the summer of 2007**. Someone disturbed by the problem of the growing underclass of poorly educated, socially disenfranchised youths might observe, "Public schools are doing a terrible job! They are overcrowded, and many teachers are poorly qualified in their subject areas. Even the best teachers can do little more than struggle to maintain order in their classrooms." That same concerned citizen, facing a complex range of issues, might arrive at an unhelpful decision, such as "We ought to do something about this" or. worse. "It's too complicated a problem to deal with." Groups of concerned citizens worried about the state of public education could join together to express their frustrations, anger, disillusionment, and emotions regarding the schools, **but without a focus for their discussions**, they could easily agree about the sorry state of education **without finding points of clarity or potential solutions. A gripe session would follow**. But if a **precise question** is posed—such as "What can be done to improve public education?"—then a more **profitable area of discussion** is opened up **simply by placing a focus on the search** for a concrete solution step. One or more judgments can be phrased in the form of debate propositions, motions for parliamentary debate, or bills for legislative assemblies. The statements "Resolved: That the federal government should implement a program of charter schools in at-risk communities" and "Resolved: That the state of Florida should adopt a school voucher program" more clearly identify specific ways of dealing with educational problems in a manageable form, suitable for debate. They provide specific policies to be investigated and aid discussants in identifying points of difference. To have a **productive debate, which facilitates effective decision making** by directing and **placing limits on the decision** to be made, **the basis for argument should be clearly defined**. If we merely talk about "homelessness" or "abortion" or "crime'* or "global warming" we are likely to have an interesting discussion but not to establish profitable basis for argument. For example, **the statement "Resolved: That the pen is mightier than the sword" is debatable, yet fails to provide much basis for clear argumentation**. If we take this statement to mean that the written word is more effective than physical force for some purposes, we can identify a problem area: the comparative effectiveness of writing or physical force for a specific purpose. Although we now have a **general subject**, we have not yet stated a problem. **It is still too broad**, too loosely worded to promote well-organized argument. What sort of writing are we concerned with—poems, novels, government documents, website development, advertising, or what? What does "effectiveness" mean in this context? What kind of physical force is being compared—fists, dueling swords, bazookas, nuclear weapons, or what? A more specific question might be. "Would a mutual defense treaty or a visit by our fleet be more effective in assuring Liurania of our support in a certain crisis?" The basis for argument could be phrased in a **debate proposition** such as "Resolved: That the United States should enter into a mutual defense treatv with Laurania." Negative advocates might oppose this proposition by arguing that fleet maneuvers would be a better solution. **This is not to say that debates should completely avoid creative interpretation** of the controversy by advocates, or **that good debates cannot occur over competing interpretations of the controversy**; in fact, **these sorts of debates may be very engaging**. The point is that debate is best facilitated by the guidance provided by **focus on a particular point of difference**, which will be outlined in the following discussion.

2 - government knowledge – learning about the nuts and bolts of policy are necessary to create political change

Zwarensteyn 12, Ellen, Thesis Submitted to the Graduate Faculty of GRAND VALLEY STATE UNIVERSITY In Partial Fulfillment of the Requirements For the Degree of Masters of Science, “High School Policy Debate as an Enduring Pathway to Political Education: Evaluating Possibilities for Political Learning,” August, http://scholarworks.gvsu.edu/cgi/viewcontent.cgi?article=1034&context=theses

The first trend to emerge concerns how debate fosters in-depth political knowledge. Immediately, every resolution calls for analysis of United States federal government action. Given that each debater may debate in over a hundred different unique rounds, there is a competitive incentive thoroughly research as many

credible, viable, and in-depth strategies as possible. Moreover, the requirement to debate both affirmative and negative sides of the topic **injects a creative necessity** to defend viable arguments from a multitude of perspectives. As a result, the depth of knowledge spans questions not only of what, if anything, should be done in response to a policy question, but also questions of who, when, where, and why. This opens the door to evaluating intricacies of government branch, committee, agency, and even specific persons who may yield different cost-benefit outcomes to conducting policy action. Consider the following responses: I think debate helped me understand how Congress works and policies actually happen which is different than what government classes teach you. Process counterplans are huge - reading and understanding how delegation works means you understand that it is not just congress passes a bill and the president signs. You understand that policies can happen in different methods. Executive orders, congress, and courts counterplans have all helped me understand that policies don't just happen the way we learn in government. There are **huge chunks of processes** that you don't learn about in government that you do learn about in debate. Similarly, Debate has certainly aided [my political knowledge]. The nature of policy-making requires you to be knowledgeable of the political process because process does effect the outcome. Solvency questions, agent counterplans, and politics are tied to process questions. When addressing the overall higher level of awareness of agency interaction and ability to identify pros and cons of various committee, agency, or branch activity, most respondents traced this knowledge to the politics research spanning from their affirmative cases, solvency debates, counterplan ideas, and political disadvantages. One of the recurring topics concerns congressional vs. executive vs. court action and how all of that works. To be good at debate you really do need to have a good grasp of that. There is really something to be said for high school debate - because without debate I wouldn't have gone to the library to read a book about how the Supreme Court works, read it, and be interested in it. Maybe I would've been a lawyer anyway and I would've learned some of that but I can't imagine at 16 or 17 I would've had that desire and have gone to the law library at a local campus to track down a law review that might be important for a case. That aspect of debate in unparalleled - the competitive drive pushes you to find new materials. Similarly, I think [my political knowledge] comes from the politics research that we have to do. You read a lot of names name-dropped in articles. You know who has influence in different parts of congress. You know how different leaders would feel about different policies and how much clout they have. This comes from links and internal links. Overall, competitive debaters must have a **depth of political knowledge** on hand to respond to and formulate numerous arguments. It appears debaters then internalize both the information itself and **the motivation to learn more**. This aids the PEP value of **intellectual pluralism** as debaters seek not only an oversimplified 'both' sides of an issue, but multiple angles of many arguments. Debaters uniquely approach arguments from a multitude of perspectives – often challenging traditional conventions of argument. With knowledge of multiple perspectives, debaters often acknowledge their relative dismay with television news and traditional outlets of news media as superficial outlets for information.

A focus on policy is necessary to learn the pragmatic details of powerful institutions – acting without this knowledge is doomed to fail in the face of policy pros who know what they're talking about

McClean, Adjunct Professor of Philosophy at Molloy College in New York, '1 (David E., "The Cultural Left and the Limits of Social Hope", Conference of the Society for the Advancement of American Philosophy, http://www.americanphilosophy.org/archives/past_conference_programs/pc2001/)

> Or we might take Foucault who, at best, has provided us with what may reasonably be described as a very long and eccentric footnote to Nietzsche (I have once been accused, by a Foucaltian true believer, of "gelding" Foucault with other similar remarks). Foucault, who has provided the Left of the late 1960s through the present with such notions as "governmentality," "Limit," "archeology," "discourse" "power" and "ethics," creating or redefining their meanings, has made it overabundantly clear that all of our moralities and practices are the successors of previous ones which derive from certain configurations of savoir and connaisance arising from or created by, respectively, the discourses of the various scientific schools. But I have not yet found in anything Foucault wrote or said how

such observations may be translated into a political movement or hammered into a political document or theory (let alone public policies) that can be justified or founded on more than an arbitrary aesthetic experimentalism. In fact, Foucault would have shuddered if any one ever did, since he thought that anything as grand as a movement went far beyond what he thought appropriate. This leads me to mildly rehabilitate Habermas, for at least he has been useful in exposing Foucault's shortcomings in this regard, just as he has been useful in exposing the shortcomings of others enamored with the abstractions of various Marxian-Freudian social critiques. Yet for some reason, at least partially explicated in Richard Rorty's Achieving Our Country, a book that I think is long overdue, leftist critics continue to cite and refer to the eccentric and often a priori ruminations of people like those just mentioned, and a litany of others including Derrida, Deleuze, Lyotard, Jameson, and Lacan, who are to me hugely more irrelevant than Habermas in their narrative attempts to suggest policy prescriptions (when they actually do suggest them) aimed at curing the ills of homelessness, poverty, market greed, national belligerence and racism. I would like to suggest that it is time for American social critics who are enamored with this group, those who actually want to be relevant, to recognize that they have a disease, and a disease regarding which I myself must remember to stay faithful to my own twelve step program of recovery. The disease is the need for elaborate theoretical "remedies" wrapped in neological and multi-syllabic jargon. These elaborate theoretical remedies are more "interesting," to be sure, than the pragmatically settled questions about what shape democracy should take in various contexts, or whether private property should be protected by the state, or regarding our basic human nature (described, if not defined (heaven forbid!), in such statements as "We don't like to starve" and "We like to speak our minds without fear of death" and "We like to keep our children safe from poverty"). As Rorty puts it, "When one of today's academic leftists says that some topic has been 'inadequately theorized,' you can be pretty certain that he or she is going to drag in either philosophy of language, or Lacanian psychoanalysis, or some neo-Marxist version of economic determinism. . . . These futile attempts to philosophize one's way into political relevance are a symptom of what happens when a Left retreats from activism and adopts a spectatorial approach to the problems of its country. Disengagement from practice produces theoretical hallucinations"(italics mine).(1) Or as John Dewey put it in his The Need for a Recovery of Philosophy, "I believe that philosophy in America will be lost between chewing a historical cud long since reduced to woody fiber, or an apologetics for lost causes, ... or a scholastic, schematic formalism, unless it can somehow bring to consciousness America's own needs and its own implicit principle of successful action." Those who suffer or have suffered from this disease Rorty refers to as the Cultural Left, which left is juxtaposed to the Political Left that Rorty prefers and prefers for good reason. Another attribute of the Cultural Left is that its members fancy themselves pure culture critics who view the successes of America and the West, rather than some of the barbarous methods for achieving those successes, as mostly evil, and who view anything like national pride as equally evil even when that pride is tempered with the knowledge and admission of the nation's shortcomings. In other words, the Cultural Left, in this country, too often dismiss American society as beyond reform and redemption. And Rorty correctly argues that this is a disastrous conclusion, i.e. disastrous for the Cultural Left. I think it may also be disastrous for our social hopes, as I will explain. Leftist American culture critics might put their considerable talents to better use if they bury some of their cynicism about America's social and political prospects and help forge public and political possibilities in a spirit of determination to, indeed, achieve our country - the country of Jefferson and King; the country of John Dewey and Malcom X; the country of Franklin Roosevelt and Bayard Rustin, and of the later George Wallace and the later Barry Goldwater. To invoke the words of King, and with reference to the American society, the time is always ripe to seize the opportunity to help create the "beloved community," one woven with the thread of agape into a conceptually single yet diverse tapestry that shoots for nothing less than a true intra-American cosmopolitan ethos, one wherein both same sex unions and faith-based initiatives will be able to be part of the same social reality, one wherein business interests and the university are not seen as belonging to two separate galaxies but as part of the same answer to the threat of social and ethical nihilism. We who fancy ourselves philosophers would do well to create from within ourselves and from within our ranks a new kind of public intellectual who has both a hungry theoretical mind and who is yet capable of seeing the need to move past high theory to other important questions that are less bedazzling and "interesting" but more important to the prospect of our flourishing - questions such as "How is it possible to develop a citizenry that cherishes a certain hexis, one which prizes the character of the Samaritan on the road to Jericho almost more than any other?" or "How can we square the political dogma that undergirds the fantasy of a missile defense system with the need to treat America as but one member in a community of nations under a "law of peoples?" The new public philosopher might seek to understand labor law and military and trade theory and doctrine as much as theories of surplus value; the logic of international markets and trade agreements as much as critiques of commodification, and the politics of complexity as much as the politics of power (all of which can still be done from our arm chairs.) This means going down deep into the guts of our quotidian social institutions, into the grimy pragmatic details where

intellectuals are loathe to dwell but where the officers and bureaucrats of those institutions take difficult and often unpleasant, imperfect decisions that affect other peoples' lives, and it means making honest attempts to truly understand how those institutions actually function in the actual world before howling for their overthrow commences. This might help keep us from being slapped down in debates by true policy pros who actually know what they are talking about but who lack awareness of the dogmatic assumptions from which they proceed, and who have not yet found a good reason to listen to jargon-riddled lectures from philosophers and culture critics with their snobish disrespect for the so-called "managerial class."

And this turns the case - unauthorized, invasive surveillance is coded in the law – loose definitions and expansions in government authority are what create injustice which means engaging the state is key

Rackow in 2 - B.A. 1998, Williams College; J.D. Candidate 2003, University of Pennsylva <Sharon. "How the USA Patriot Act Will Permit Governmental Infringement upon the Privacy of

Americans in the Name of "Intelligence" Investigations" University of Pennsylvania Law Review, Vol. 150, No. 5 (May, 2002), pp. 1651-1696>

Section 218 of the USA PATRIOT Act amends FISA ? 1804(a) (7) (B). Now, in an application to the FISC, a federal officer no longer has to demonstrate that "the purpose of the surveillance is to obtain foreign intelligence information,",132 but may obtain surveillance authorization **under the less stringent showing that "a significant purpose of the surveillance is to obtain foreign intelligence information**."'133 This slight alteration in the language of 1804 **is highly significant in that it is extremely likely to increase the types of court ordered investigations** that are carried out in the name of "foreign intelligence investigations" under FISA. Considering the fact that the FISC has only turned down one surveillance application since its inception,134 it becomes even more likely that the court will authorize all forthcoming applications **under this more lenient standard**. The concern raised by this amendment is that under the new broadened scope of ? 1804, both intelligence and law enforcement agents will bring applications for electronic surveillance to the FISC when the primary purpose of the surveillance is an investigation of criminal activities. Thus, the amended FISA will be used as a means to undertake surveillance without demonstrating the heightened standard of probable cause required under Title III for criminal wiretaps. This potential end-run around the Fourth Amendment's probable cause requirement for criminal investigations contradicts the rationale for permitting a lower threshold for obtaining FISA wiretaps. No longer will this lesser standard solely authorize investigations of primarily foreign intelligence activities where the rights of Americans are generally not implicated. Instead, FISA will be employed to approve investigations of predominantly criminal activities, including purely domestic criminal acts-in explicit violation of the Fourth Amendment.135 Now, under section 218 a criminal investigation can be the primary purpose of a FISA investigation, with foreign intelligence information as a secondary, albeit "significant purpose."'36 Senator Leahy recognized that by amending the language of FISA, "the USA ActI37 would make it easier for the FBI to use a FISA wiretap to obtain information where the Government's most important motivation for the wiretap is for use in a criminal prosecution."'38 The Senator further acknowledged that "[t] his is a disturbing and dangerous change in the law."139 Furthermore, as the USA PATRIOT Act's amendment to FISA does not provide a definition of "significant purpose," it is unclear how far the FISC will stretch its interpretation of this phrase to accommodate law enforcement and intelligence agencies in their quest to increase surveillance as a response to the September 11th terrorist attacks. Yet, the consequences of this amendment to FISA go far beyond investigations of the September 11th tragedy. Now, surveillance authority for investigations seeking information primarily

pertaining to purely domestic criminal activities may be granted under FISA with no showing of probable cause that a serious crime has been or will soon be committed.

3 – Switch Side Debate - Switch side policy debates empirically promotes critical thinking and greater knowledge on social issues

Keller, et. al, 01 – Asst. professor School of Social Service Administration U. of Chicago

(Thomas E., James K., and Tracly K., Asst. professor School of Social Service Administration U. of Chicago, professor of Social Work, and doctoral student School of Social Work, "Student debates in policy courses: promoting policy practice skills and knowledge through active learning," Journal of Social Work Education, Spr/Summer 2001, EBSCOhost)

Discussion ¶ The results of the surveys suggest that debates have value as an active learning strategy to enhance student learning. On survey questions and in written comments, students expressed satisfaction with the debates. The majority of students were pleased with the debates as a class assignment. Most indicated that participation in the debates raised the level of their policy skills and knowledge. In addition, the educational value of debates was rated as higher than more traditional assignments. It should be noted, however, that a desire to report favorably on class experiences may have influenced reported satisfaction with the debates (i.e., acquiescence bias). ¶ Student comments supported the view that debates promote critical thinking by **encouraging serious consideration of both sides of a policy issue.** Comments also indicated that the active learning approach had generated more classroom interest and energy than usual. On the other hand, some comments noted how the debates might have detracted from a positive learning experience. ¶ All four hypotheses regarding changes in student-rated knowledge were supported by the analysis. Students reported statistically significant increases in knowledge on topics covered during the course--a result which is reassuring for the instructors. Gains in self-reported knowledge from simply observing debates were equivalent to gains based on traditional forms of instruction. Observing a debate appears comparable to acquiring information through a class lecture or discussion. By contrast, debate participation generated significantly greater increases in self-reported knowledge than were obtained by observing debates or by learning through traditional forms of instruction. This result, which is consistent with the principles of experiential learning, suggests the educational advantage of using debates to engage students in learning. ¶ The findings are noteworthy considering the use of conservative nonparametric statistics on a small sample. However, the results should be interpreted somewhat cautiously due to certain study limitations. First, the dependent variable was self-reported and highly subjective in nature. The study did not contain objective measures of knowledge, and the findings pertain only to students' self-perceptions of their knowledge regarding particular topics. Second, although attrition from pretest to posttest was not associated with the pretest measures, differential attrition related to unmeasured factors, including objective knowledge of the topics, is a potential source of bias. Third, the assumption of independence among cases may be questionable given that students worked closely as members of debate teams. Finally, other plausible explanations for the general increase in knowledge over time, besides taking the class, cannot be ruled out. Nevertheless, the differential improvement in self-rated knowledge in favor of debaters would still be a credible finding, and this was a main objective of the analysis. ¶ Conclusion ¶ The purposes of this article were to examine the potential of student debates for fostering the development of policy practice knowledge and skills, to demonstrate that debates can be effectively incorporated as an in-class assignment in a policy course, and to report findings on the educational value and level of student satisfaction with debates. Based on a review of the literature, the authors' experience conducting debates in a course, and the subsequent evaluation of those debates, the authors believe the development of policy practice skills and the acquisition of substantive knowledge can be advanced through structured student debates in policy-oriented courses. The authors think debates on important policy questions have numerous benefits: prompting students to deal with values and assumptions, encouraging them to investigate and analyze competing alternatives, compelling them to advocate a particular position, and motivating them to articulate a point of view in a persuasive manner. We think engaging in these analytic and persuasive activities **promotes greater knowledge by stimulating active participation in the learning process.** ¶ However, the use of debates in a classroom setting is not without certain drawbacks. Schroeder and Ebert (1983) noted several limitations which were also encountered in this

experience. First, staging debates presents logistical challenges for the instructor. These administrative concerns include creating teams, selecting topics, determining the debate format, and scheduling. Second, the amount of time devoted to the specific topic of a debate can detract from covering a wider scope of course material. Third, although debating encourages the examination of issues from two opposing positions, many policy dilemmas can be approached from several angles. A structured debate does not necessarily foster a multidimensional examination of policy options. Fourth, as in most group projects, some debate team members may have contributed more to the effort than others. Finally, the competitive aspects of debating may polarize the issue. ¶ For those interested in using debates as an instructional technique, the importance of thorough advance planning with respect to the mechanics of conducting the debates must be stressed. Flexibility to make adjustments during the process is equally important. Special attention should be given to debriefing sessions after debates to discuss perceptions of the debate experience, areas of common agreement, and possibilities for policy compromise and consensus. The integration of opposing views into a coherent and purposeful course of action is a central feature of the theoretical framework presented earlier, and students expressed a need for more resolution and closure. For example, one student suggested, "I think it would be more effective to do an active brainstorming/planning session for identifying solutions/alternatives following the debates." ¶ The final word on debates should come from students themselves. In the debriefing session immediately following a debate, one student stated, "I thought the debate was good because it forced me to articulate the position, and that is something we will need to do to be advocates." Another student described how her opinion of debating changed, "When I first heard about this assignment, I really questioned its value. I thought it would be a waste of class time. But I learned so much about family preservation services. I learned more than I ever would have any other way."

External contestation of our personal convictions is critical to ethical decision making – our blindspots about the limits of our knowledge must be tested in order for debate to produce ethical subjects – the aff results in dogmatism

Button, 2011 (Oct 5, Mark E., associate professor of political science at the University of Utah, "Accounting for Blind Spots: From Oedipus to Democratic Epistemology," p.3-5)

A moral blind spot refers to the ineluctable limitations and partialities that are folded into our moral knowledge or beliefs, and therewith, the judgments and actions that human beings make on the basis of that knowledge or belief. A moral blind spot designates the boundaries of moral identity and the limits of human knowing and judging, a limit (of practical reason and moral sentiment) that can be intuited or postulated by moral and political theory, but one whose full dimensions—its span and depth—are not available to our selfconscious perception or articulation, except perhaps a posteriori, Oedipuslike. The problem to which a moral blind spot refers overlaps with but is not identical to substantive moral or political ignorance. Substantive ignorance is a matter about which moral agents are, by and large, capable of self-conscious discernment and critical awareness; we can know and readily admit to the fact that there are numerous branches of knowledge about which we know that we do not presently know, or about which we know that we lack epistemic or practical competence relative to others. Unless we are acting in bad faith or vainly putting on airs from any one of a number of ulterior motives, a certain robust sense of epistemic–cognitive limitation is within most people's self-conscious reach. By contrast, a blind spot is a feature of our moral perception, of ourselves and others, about which we are largely unaware. The social environments and the moral and linguistic traditions in accordance with which we judge and make meaning of the world; **the economic, social, and racial or gendered privileges about which individuals are not always consciously aware;** the self- and group biases that personal introspection do not fully disclose; the partialities, commitments, and attachments that define the contours of our everyday lives as culturally situated moral subjects with an identity: all of these, and more, are the sources of our potential moral blind spots. Since we have diverse motives (both conscious and unconscious) for affirming and extending the elements of this list, individuals and groups also have strong incentives to keep blind spots in place and to avoid or resist a moral and political consideration of their operation and effects on others. The solidity of identity is served by the construction of cultural difference,5 but this sense of solidity is also protected (and partially grounded) in accordance with that which the subject does not (or will not)

"see" or feel. As the above list already indicates, to speak of moral blind spots is to address a basic sociocultural and linguistic condition of human being, but it is also a tragic condition of human existence. Blind spots define us both individually and socially and thus have a powerful influence on judgment and agency, but they also mark our (unselfconscious) moral limitations, for they exist at the periphery of our perception of what objects and relations have moral value for us by virtue of the kind of social and linguistic beings that we are and thus mark the limits of our moral sympathies. Consider the following example drawn from Adam Smith's Theory of Moral Sentiments. An economically impoverished person, according to Smith, "feels that [his poverty] places him out of the sight of mankind," or if other members of society "take any notice of him, they have scarce any fellow-felling with the misery and distress which he suffers."6 And, Smith continues, as "obscurity covers us from the daylight of honor and approbation, to feel that we are taken no notice of, necessarily damps the most agreeable hope, and disappoints the most ardent desire, of human nature." In this example, Smith illuminates a blind spot in the dominant pattern of moral beliefs and affective sentiments among the members of a modern commercial middle class. As Smith explores the full consequences of a distribution of moral sentiments that follows from a condition in which "the great mob of mankind are the admirers and worshippers of wealth and greatness," he highlights the most visible advancements (economic growth), and the largely **hidden ethical costs** (the corruption of moral sympathies for shared humanity) that attend these particular blind spots in perception and moral valuation.7 In accordance with this way of thinking about them, moral blind spots are socially and culturally variable; different subjects or questions will cross into the domain of ethical and political consideration at different stages in the life of a political society or social group, and, largely as a consequence of this broader sociocultural variation, moral blind spots are also subject to modification in the temporal span of an individual subject or group. Significantly, moral blind spots are historically contingent, and while they are recalcitrant, they are not incorrigible (a point to which I will return). The central point to make in regard to the first-order level of experience with moral identity and agency is that blind spots attend and facilitate judgment and action in the way that all forms of partiality and moral identity do by filtering the phenomenal world so as to navigate within its complexities. Yet the constitutive occlusions embedded within moral perception also shape judgment and action in ways that can subvert both **individual and collective well-being.** Surely one of the most illuminating instances of this problematic condition is provided by the example of Oedipus. In turning to Sophocles' Oedipus Tyrannus, we can also introduce the significance that second-order moral blindness has for the life of an individual and a political society.

2NC State Good

Even if engaging in the state isn't perfect it is necessary – withdrawing from institutions allows right wing hawks to take over – the only way to prevent social injustices is by engaging with the institutions that cause or control them in the first place

Mouffe 2009 (Chantal Mouffe is Professor of Political Theory at the Centre for the Study of Democracy, University of Westminster, "The Importance of Engaging the State", *What is Radical Politics Today?*, Edited by Jonathan Pugh, pp. 233-7)

In both Hardt and Negri, and Virno, there is therefore emphasis upon 'critique as withdrawal'. They all call for the development of a non-state public sphere. They call for self-organisation, experimentation, non-representative and extra-parliamentary politics. They see forms of traditional representative politics as inherently oppressive. So they do not seek to engage with them, in order to challenge them. They seek to get rid of them altogether. This disengagement is, for such influential personalities in radical politics today, the key to every political position in the world. The Multitude must recognise imperial sovereignty itself as the enemy and discover adequate means of subverting its power. Whereas in the disciplinary era I spoke about earlier, sabotage was the fundamental form of political resistance, these authors claim that, today, it should be desertion. It is indeed through desertion, through the evacuation of the places of power, that they think that battles against Empire might be won. Desertion and exodus are, for these important thinkers, a powerful form of class struggle against imperial postmodernity. According to Hardt and Negri, and Virno, radical politics in the past was dominated by the notion of 'the people'. This was, according to them, a unity, acting with one will. And this unity is linked to the existence of the state. The Multitude, on the contrary, shuns political unity. It is not representable because it is an active self-organising agent that can never achieve the status of a juridical personage. It can never converge in a general will, because the present globalisation of capital and workers' struggles will not permit this. It is anti-state and anti-popular. Hardt and Negri claim that the Multitude cannot be conceived any more in

terms of a sovereign authority that is representative of the people. They therefore argue that new forms of politics, which are non-representative, are needed. They advocate a withdrawal from existing institutions. This is something which characterises much of radical politics today. **The emphasis is not upon challenging the state. Radical politics today is** often characterised by a mood, a sense and a **feeling, that the state itself is inherently the problem**. Critique as engagement I will now turn to presenting the way I envisage the form of social criticism best suited to radical politics today. I agree with Hardt and Negri that it is important to understand the transition from Fordism to post-Fordism. But I consider that the dynamics of this transition is better apprehended within the framework of the approach outlined in the book Hegemony and Socialist Strategy: Towards a Radical Democratic Politics (Laclau and Mouffe, 2001). What I want to stress is that many factors have contributed to this transition from Fordism to post-Fordism, and that it is necessary to recognise its complex nature. My problem with Hardt and Negri's view is that, by putting so much emphasis on the workers' struggles, they tend to see this transition as if it was driven by one single logic: the workers' resistance to the forces of capitalism in the post-Fordist era. They put too much emphasis upon immaterial labour. In their view, capitalism can only be reactive and they refuse to accept the creative role played both by capital and by labour. To put it another way, they deny the positive role of political struggle. In Hegemony and Socialist Strategy: Towards a Radical Democratic Politics we use the word 'hegemony' to describe the way in which meaning is given to institutions or practices: for example, the way in which a given institution or practice is defined as 'oppressive to women', 'racist' or 'environmentally destructive'. We also point out that every hegemonic order is therefore susceptible to being challenged by counter-hegemonic practices – feminist, anti-racist, environmentalist, for example. This is illustrated by the plethora of new social movements which presently exist **in radical politics today** (Christian, anti-war, counter-globalisation, Muslim, and so on). Clearly not all of these are workers' struggles. In their various ways they have nevertheless attempted to influence and have influenced a new hegemonic order. This means that when we talk about 'the political', we do not lose sight of the ever present possibility of heterogeneity and antagonism within society. There are many different ways of being antagonistic to a dominant order in a heterogeneous society – it need not only refer to the workers' struggles. I submit that it is necessary to introduce this hegemonic dimension when one envisages the transition from Fordism to post-Fordism. This means abandoning the view that a single logic (workers' struggles) is at work in the evolution of the work process; as well as acknowledging the pro-active role played by capital. In order to do this we can find interesting insights in the work of Luc Boltanski and Eve Chiapello who, in their book The New Spirit of Capitalism (2005), bring to light the way in which capitalists manage to use the demands for autonomy of the new movements that developed in the 1960s, harnessing them in the development of the post-Fordist networked economy and transforming them into new forms of control. They use the term 'artistic critique' to refer to how the strategies of the counter-culture (the search for authenticity, the ideal of selfmanagement and the anti-hierarchical exigency) were used to promote the conditions required by the new mode of capitalist regulation, replacing the disciplinary framework characteristic of the Fordist period. From my point of view, what is interesting in this approach is that it shows how an important dimension of the transition from Fordism to post- Fordism involves rearticulating existing discourses and practices in new ways. It allows us to visualise the transition from Fordism to post- Fordism in terms of a hegemonic intervention. To be sure, Boltanski and Chiapello never use this vocabulary, but their analysis is a clear example of what Gramsci called 'hegemony through neutralisation' or 'passive revolution'. This refers to a situation where demands which challenge the hegemonic order are recuperated by the existing system, which is achieved by satisfying them in a way that neutralises their subversive potential. When we apprehend the transition from Fordism to post- Fordism within such a framework, we can understand it as a hegemonic move by capital to re-establish its leading role and restore its challenged legitimacy**. We did not witness a revolution**, in Marx's sense of the term. Rather, there have been many different interventions, challenging dominant hegemonic practices. It is clear that, **once we envisage social reality in terms of 'hegemonic' and 'counter-hegemonic' practices, radical politics is not about withdrawing** completely from existing institutions. Rather, **we have no other choice but to engage with hegemonic**

practices, in order to challenge them. This is crucial; otherwise we will be faced with a chaotic situation. Moreover, if we do not engage with and challenge the existing order, if we instead choose to simply escape the state completely, we leave the door open for others to take control of systems of authority and regulation. Indeed there are many historical (and not so historical) examples of this. **When the Left shows little interest, Right-wing and authoritarian groups are only too happy to take over the state**. The strategy of exodus could be seen as the reformulation of the idea of communism, as it was found in Marx. There are many points in common between the two perspectives. To be sure, for Hardt and Negri it is no longer the proletariat, but the Multitude which is the privileged political subject. But in both cases the state is seen as a monolithic apparatus of domination that cannot be transformed. It has to 'wither away' in order to leave room for a reconciled society beyond law, power and sovereignty. In reality, as I've already noted, others are often perfectly willing to take control. If my approach – supporting new social movements and counterhegemonic practices – has been called 'post-Marxist' by many, it is precisely because I have challenged the very possibility of such a reconciled society. To acknowledge the ever present possibility of antagonism to the existing order implies recognising that heterogeneity cannot be eliminated. As far as politics is concerned, this means the need to envisage it in terms of a hegemonic struggle between conflicting hegemonic projects attempting to incarnate the universal and to define the symbolic parameters of social life. A successful hegemony fixes the meaning of institutions and social practices and defines the 'common sense' through which a given conception of reality is established. However, such a result is always contingent, precarious and susceptible to being challenged by counter-hegemonic interventions. Politics always takes place in a field criss-crossed by antagonisms. **A properly political intervention is always one that engages with a certain aspect of the existing hegemony. It can never be merely oppositiona**l or conceived as desertion, because it aims to challenge the existing order, so that it may reidentify and feel more comfortable with that order. Another important aspect of a hegemonic politics lies in establishing linkages between various demands (such as environmentalists, feminists, anti-racist groups), so as to transform them into claims that will challenge the existing structure of power relations. This is a further reason why critique involves engagement, rather than disengagement. It is clear that the different demands that exist in our societies are often in conflict with each other. This is why they need to be articulated politically, which obviously involves the creation of a collective will, a 'we'. This, in turn, requires the determination of a 'them'. This obvious and simple point is missed by the various advocates of the Multitude. For they seem to believe that the Multitude possesses a natural unity which does not need political articulation. Hardt and Negri see 'the People' as homogeneous and expressed in a unitary general will, rather than divided by different political conflicts. Counter-hegemonic practices, by contrast, do not eliminate differences. Rather, they are what could be called an 'ensemble of differences', all coming together, only at a given moment, against a common adversary. Such as when different groups from many backgrounds come together to protest against a war perpetuated by a state, or when environmentalists, feminists, anti-racists and others come together to challenge dominant models of development and progress. In these cases, **the adversary cannot be defined in broad general terms** like 'Empire', or for that matter 'Capitalism'. **It is instead contingent upon the** particular circumstances in question – the specific states, international institutions or governmental practices that are to be challenged. Put another way, the construction of political demands is dependent upon the specific relations of power that need to be targeted and transformed, in order to create the conditions for a new hegemony. This is clearly not an exodus from politics. It is not 'critique as withdrawal', but 'critique as engagement'. It is a 'war of position' that needs to be launched, often across a range of sites, involving the coming together of a range of interests. This can only be done by establishing links between social movements, political parties and trade unions, for example. The aim is to create a common bond and collective will, engaging with a wide range of sites, and often

institutions, with the aim of transforming them. This, in my view, is how we should conceive the nature of radical politics.

Policy simulation key to creativity and decisionmaking—the detachment and disembodiment the aff criticizes are necessary skills to create meaningful change outside of the debate space

Eijkman 12 <The role of simulations in the authentic learning for national security policy development: Implications for Practice / Dr. Henk Simon Eijkman. [electronic resource] http://nsc.anu.edu.au/test/documents/Sims_in_authentic_learning_report.pdf. Dr Henk Eijkman is currently an independent consultant as well as visiting fellow at the University of New South Wales at the Australian Defence Force Academy and is Visiting Professor of Academic Development, Annasaheb Dange College of Engineering and Technology in India. As a sociologist he developed an active interest in tertiary learning and teaching with a focus on socially inclusive innovation and culture change. He has taught at various institutions in the social sciences and his work as an adult learning specialist has taken him to South Africa, Malaysia, Palestine, and India. He publishes widely in international journals, serves on Conference Committees and editorial boards of edited books and international journal

Policy simulations stimulate Creativity Participation in **policy games** has proved to be a highly effective way of developing new combinations of experience and creativity, which is precisely what innovation requires (Geurts et al. 2007: 548). **Gaming,** whether in analog or digital mode, has the power to stimulate creativity, and is one of the most engaging and liberating ways for making group work productive, challenging and enjoyable. Geurts et al. (2007) cite one instance where, in a National Health Care policy change environment, 'the many parties involved **accepted the** invitation to participate in what was a **revolutionary** and **politically very sensitive experiment precisely because it was a game'** (Geurts et al. 2007: 547). Data from other policy simulations also indicate the uncovering of issues of which participants were not aware, the emergence of new ideas not anticipated, and a perception that policy simulations are also an enjoyable way to formulate strategy (Geurts et al. 2007). Gaming puts the players in an 'experiential learning' situation, where they discover a concrete, realistic and complex initial situation, and the gaming process of going through multiple learning cycles helps them work through the situation as it unfolds. Policy gaming stimulates 'learning how to learn', as in a game, and learning by doing alternates with reflection and discussion. The progression through learning cycles can also be **much faster** than in real-life (Geurts et al. 2007: 548). The bottom line is that problem solving in policy development processes requires creative experimentation. This cannot be primarily taught via 'camp-fire' story telling learning mode but demands hands-on 'veld learning' that allow for safe creative and productive experimentation. This is exactly what good policy simulations provide (De Geus, 1997; Ringland, 2006). In simulations **participants cannot view issues solely from either their own perspective** or that of one dominant stakeholder (Geurts et al. 2007). Policy simulations enable the seeking of Consensus Games are popular because historically people seek and enjoy the tension of competition, positive rivalry and the procedural justice of impartiality in safe and regulated environments. As in games, simulations temporarily remove the participants from their daily routines, political pressures, and the restrictions of real-life protocols. In consensus building, **participants engage in extensive debate** and need to act on a shared set of meanings and beliefs to guide the policy process in the desired direction

State is inevitable and best agent of change – engagement is key

Rorty 98 - (Richard, Professor of Comparative Literature at Stanford, Achieving Our Country)

The cultural Left often seems convinced that the nation-state is obsolete, and that there is therefore no point in attempting to revive national politics. The trouble with this claim is that the government of our nation-state will be, for the foreseeable future, the only agent capable of making any real difference in the amount of selfishness and sadism inflicted on Americans. It is no comfort to

those in danger of being immiserated by globalization to be told that, since national governments are now irrelevant, we must think up a replacement for such governments. The cosmopolitan super-rich do not think any replacements are needed, and they are likely to prevail. Bill Readings was right to say that "the nation-state [has ceased] to be the elemental unit of capitalism," but it remains the entity which makes decisions about social benefits, and thus about social justice. The current leftist habit of taking the long view and looking beyond nationhood to a global polity is as useless as was faith in Marx's philosophy of history, for which it has become a substitute. Both are equally irrelevant to the question of how to prevent the reemergence of hereditary castes, or of how to prevent right-wing populists from taking advantage of resentment at that reemergence. When we think about these latter questions, we begin to realize that one of the essential transformations which the cultural Left will have to undergo is the shedding of its semi-conscious anti-Americanism, which it carried over from the rage of the late Sixties. This Left will have to stop thinking up ever more abstract and abusive names for "the system" and start trying to construct inspiring images of the country. Only by doing so can it begin to form alliances with people outside the academy – and, specifically, with the labor unions. Outside the academy, Americans still want to feel patriotic. They still want to feel part of a nation which can take control of its destiny and make itself a better place. If the Left forms no such alliances, it will never have any effect on the laws of the United States. To form them will require the cultural Left to forget about Baudrillard's account of America as Disneyland – as a country of simulacra—and and to start proposing changes in the laws of a real country, inhabited by real people who are enduring unnecessary suffering, much of which can be cured by governmental action. Nothing would do more to resurrect the American Left than agreement on a concrete political platform, a People's Charter, a list of specific reforms. The existence of such a list – endlessly reprinted and debated, equally familiar to professors and production workers, imprinted on the memory both of professional people and of those who clean the professionals' toilets – might revitalize leftist politics.

2NC Stasis

Policy debate is good for education, the development of empathy, and producing real world engagement from participants. Clear rules, a stable topic, and institutional role playing and simulation are integral to the process. The things you criticize about debate make it a unique exercise in active learning.

Lantis 8 (Jeffrey S. Lantis is Professor in the Department of Political Science and Chair of the International Relations Program at The College of Wooster, "The State of the Active Teaching and Learning Literature", http://www.isacompss.com/info/samples/thestateoftheactiveteachingandlearningliterature_sample.pdf**)**

Simulations, games, and role-play represent a third important set of **active teaching and learning approaches**. Educational objectives include **deepening conceptual understandings of** a particular phenomenon, **sets of interactions, or socio-political processes by using student interaction to bring abstract concepts to life. They provide students with a real or imaginary environment within which to act out a given situation** (Crookall 1995; Kaarbo and Lantis 1997; Kaufman 1998; Jefferson 1999; Flynn 2000; Newmann and Twigg 2000; Thomas 2002; Shellman and Turan 2003; Hobbs and Moreno 2004; Wheeler 2006; Kanner 2007; Raymond and Sorensen 2008). The aim is to **enable students to actively experience, rather than read or hear about, the "constraints and motivations for action (or inaction) experienced by real players**" (Smith and Boyer 1996:691), or **to think about what they might do in a particular situation** that the instructor has dramatized for them. As Sutcliffe (2002:3) emphasizes, "Remote theoretical concepts can be given life by placing them in a situation with which students are familiar." **Such exercises capitalize on the strengths of active learning techniques: creating memorable experiential learning events** that tap into multiple senses and emotions by utilizing visual and verbal stimuli. Early examples of simulations scholarship include works by Harold Guetzkow and colleagues, who created the Inter-Nation Simulation (INS) in the 1950s. This work sparked wider interest in **political simulations as teaching and research tools**. By the 1980s, scholars had accumulated a number of **sophisticated simulations of international politics, with names like "Crisis," "Grand Strategy,"** "ICONS," and "SALT III." More **recent literature on simulations stresses opportunities to reflect dynamics faced in the real world by individual decision makers**, by small groups like the US National Security Council, **or** even global summits organized around **international issues, and provides for a focus on**

contemporary global problems (Lantis et al. 2000; Boyer 2000). Some of the most popular simulations involve modeling international organizations, in particular United Nations and European Union simulations (Van Dyke et al. 2000; McIntosh 2001; Dunn 2002; Zeff 2003; Switky 2004; Chasek 2005). **Simulations may be** employed in one class meeting, through one week, or even over an entire semester. Alternatively, they may be **designed to take place outside of the classroom in** local, national, or international **competitions**. The scholarship on the use of games in international studies sets these approaches apart slightly from simulations. For example, Van Ments (1989:14) argues that **games are structured systems of competitive play with specific defined endpoints or solutions that incorporate** the **material to be learnt. They** are similar to simulations, but **contain specific structures or rules that dictate what it means to "win" the simulated interactions. Games place the participants in positions to make choices that** 10 **affect outcomes**, but do not require that they take on the persona of a real world actor. Examples range from interactive prisoner dilemma exercises to the use of board games in international studies classes (Hart and Simon 1988; Marks 1998; Brauer and Delemeester 2001; Ender 2004; Asal 2005; Ehrhardt 2008) A final subset of this type of approach is the role-play. **Like simulations, roleplay places students within a structured environment and asks them to take on a specific role**. Role-plays differ from simulations in that rather than having their actions prescribed by a set of well-defined preferences or objectives, **role-plays provide more leeway for students to think about how they might act when placed in the position of their slightly less well-defined persona** (Sutcliffe 2002). Role-play allows students to create their own interpretation of the roles because of role-play's less "goal oriented" focus. **The primary aim of** the **role-play is to dramatize for the students the relative positions of the actors involved and**/or **the challenges facing them** (Andrianoff and Levine 2002). This dramatization can be very simple (such as roleplaying a two-person conversation) or complex (such as role-playing numerous actors interconnected within a network). **The reality of the scenario and its proximity to a student's personal experience is** also **flexible**. While few examples of effective roleplay that are clearly distinguished from simulations or games have been published, some **recent work has laid out** some **very useful role-play exercises with clear procedures for use in the international studies classroom** (Syler et al. 1997; Alden 1999; Johnston 2003; Krain and Shadle 2006; Williams 2006; Belloni 2008). Taken as a whole, the applications and procedures for simulations, games, and role-play are well detailed in the active teaching and learning literature. **Experts recommend a set of core considerations that should be taken into account when designing effective simulations** (Winham 1991; Smith and Boyer 1996; Lantis 1998; Shaw 2004; 2006; Asal and Blake 2006; Ellington et al. 2006). These include **building the simulation design around specific educational objectives, carefully selecting the** situation or **topic to be addressed, establishing the needed roles to be played by both students and instructor, providing clear rules, specific instructions and background material, and having debriefing and assessment plans in place** in advance. There are also an increasing number of simulation designs published and disseminated in the discipline, whose procedures can be adopted (or adapted for use) depending upon an instructor's educational objectives (Beriker and Druckman 1996; Lantis 1996; 1998; Lowry 1999; Boyer 2000; Kille 2002; Shaw 2004; Switky and Aviles 2007; Tessman 2007; Kelle 2008). Finally, there is growing attention in this literature to assessment. Scholars have found that **these methods are particularly effective in bridging the gap between academic knowledge and everyday life. Such exercises also lead to enhanced student interest in the topic, the development of empathy, and acquisition and retention of knowledge.**

Competition in debate is good—it encourages education, strong community, and increases quality of work

GILLESPIE AND GORDON 2006 (William and Elizabeth, Kennesaw State University, "Competition, Role-Playing, and Political Science Education," Sep 1, http://www.allacademic.com//meta/p_mla_apa_research_citation/1/5/1/0/0/pages151007/p151007-1.php)

But, for the most part, coaches report that the competitive element enhances learning in several ways. First, many coaches perceive that competition motivates their students to put in the time and do their best work. Some indicate that no other means of motivation is as effective. Engaging in competition allows students to measure their progress. It also provides a goal, raises the stakes of the activity, and provides more rewards. Second, as one coach said, "the activity faithfully recreates many of the dynamics of the adversarial model, and my students report learning a lot." For the goal of substantive learning about how American law functions, especially in litigation, competition is an essential element. Mock trial allows students to experience some of the processes, constraints, and emotions associated with competition in a courtroom. Third, the stress of competition itself helps students gain flexibility and adaptability. Many coaches mention the ability to "think on one's feet" as a skill that students acquire in the fluid environment of a mock trial competition. "Competition enhances the learning experience. The students seem to absorb lessons more quickly and thoroughly under fire," writes one coach. Another writes: "They also learn to adjust and adapt quickly to the different evaluators. That is something they don't get from their regular classes." Fourth, some coaches explain that competing against other schools allows their students to learn by seeing different approaches to the same case. Representative comments along these lines include: "Students get to see what other teams do and learn from those experiences." "[Competition] exposes the students to different techniques and approaches that the other teams use." Fifth, many coaches explain that the competition enhances camaraderie and teamwork among their students. One coach explains that competition "gives a sense of duty to fulfill an obligation to their fellow teammates." "Students learn teamwork in an interactive and dynamic setting," reports another.

2NC Switch Side Debate

Beginning this process with a topical advocacy is essential to effective dialogue – negative strategies are constructed in expectation of refuting a topical advocacy. Failing to present a topical advocacy denies the negative an equal ability to voice their opinion, short-circuiting debate's ability to serve as a dialogue by preventing the neg from effectively informing this process

Galloway, 2007 (Ryan, professor of communication at Samford University, "Dinner and Conversation at the Argumentative Table: Reconceptualizing Debate as an Argumentative Dialogue," Contemporary Argumentation and Debate, Vol. 28 (2007), p.5-7)

Debate as a dialogue sets an argumentative table, where all parties receive a relatively fair opportunity to voice their position. Anything that fails to allow participants to have their position articulated denies one side of the argumentative table a fair hearing. The affirmative side is set by the topic and fairness requirements. While affirmative teams have recently resisted affirming the topic, in fact, the topic selection process is rigorous, taking the relative ground of each topic as its central point of departure. Setting the affirmative reciprocally sets the negative. The negative crafts approaches to the topic consistent with affirmative demands. The negative crafts disadvantages, counter-plans, and critical arguments premised on the arguments that the topic allows for the affirmative team. According to fairness norms, each side sits at a relatively balanced argumentative table. When one side takes more

than its share, competitive equity suffers. However, it also undermines the respect due to the other involved in the dialogue. When one side excludes the other, it fundamentally denies the personhood of the other participant (Ehninger, 1970, p. 110). A pedagogy of debate as dialogue takes this respect as a fundamental component. A desire to be fair is a fundamental condition of a dialogue that takes the form of a demand for equality of voice. Far from being a banal request for links to a disadvantage, fairness is a demand for respect, a demand to be heard, a demand that a voice backed by literally months upon months of preparation, research, and critical thinking not be silenced. Affirmative cases that suspend basic fairness norms operate to exclude particular negative strategies. Unprepared, one side comes to the argumentative table unable to meaningfully participate in a dialogue. They are unable to "understand what 'went on…'" and are left to the whims of time and power (Farrell, 1985, p. 114). Hugh Duncan furthers this line of reasoning: Opponents not only tolerate but honor and respect each other because in doing so they enhance their own chances of thinking better and reaching sound decisions. Opposition is necessary because it sharpens thought in action. We assume that argument, discussion, and talk, among free an informed people who subordinate themselves to rules of discussion, are the best ways to decisions of any kind, because it is only through such discussion that we reach agreement which binds us to a common cause…If we are to be equal…relationships among equals must find expression in many formal and informal institutions (Duncan, 1993, p. 196-197). Debate compensates for the exigencies of the world by offering a framework that maintains equality for the sake of the conversation (Farrell, 1985, p. 114). For example, an affirmative case on the 2007-2008 college topic might defend neither state nor international action in the Middle East, and yet claim to be germane to the topic in some way. The case essentially denies the arguments that state action is oppressive or that actions in the international arena are philosophically or pragmatically suspect. Instead of allowing for the dialogue to be modified by the interchange of the affirmative case and the negative response, the affirmative subverts any meaningful role to the negative team, preventing them from offering effective "counter-word" and undermining the value of a meaningful exchange of speech acts. Germaneness and other substitutes for topical action do not accrue the dialogical benefits of topical advocacy.

It is only through the process of contestation that the truth claims of the 1AC can be verified – you cannot evaluate the affirmative in the absence of an effective process for testing it's epistemic merit

Galloway, 2007 (Ryan, professor of communication at Samford University, "Dinner and Conversation at the Argumentative Table: Reconceptualizing Debate as an Argumentative Dialogue," Contemporary Argumentation and Debate, Vol. 28 (2007), p.7-9)

A Siren's Call: Falsely Presuming Epistemic Benefits In addition to the basic equity norm, dismissing the idea that debaters defend the affirmative side of the topic encourages advocates to falsely value affirmative speech acts in the absence of a negative response. There may be several detrimental consequences that go unrealized in a debate where the affirmative case and plan are not topical. Without ground, debaters may fall prey to a siren's call, a belief that certain critical ideals and concepts are axiological, existing beyond doubt without scrutiny. Bakhtin contends that in dialogical exchanges "the greater the number and weight" of counter-words, the deeper and more substantial our understanding will be (Bakhtin, 1990). The matching of the word to the counter-word should be embraced by proponents of critical activism in the activity, because these dialogical exchanges allow for improvements and modifications in critical arguments. Muir argues that "debate puts students into greater contact with the real world by forcing them to read a great deal of information" (1993, p. 285). He continues, "[t]he constant consumption of material…is significantly constitutive. The information

grounds the issues under discussion, and the process shapes the relationship of the citizen to the public arena" (p. 285). Through the process of comprehensive understanding, debate serves both as a laboratory and a constitutive arena. Ideas find and lose adherents. Ideas that were once considered beneficial are modified, changed, researched again, and sometimes discarded altogether. A central argument for open deliberation is that it encourages a superior consensus to situations where one side is silenced. Christopher Peters contends, "The theory holds that antithesis ultimately produces a better consensus, that the clash of differing, even opposing interests and ideas in the process of decision making…creates decisions that are better for having been subjected to this trial by fire" (1997, p. 336). The combination of a competitive format and the necessity to take points of view that one does not already agree with combines to create a unique educational experience for all participants. Those that eschew the value of such experience by an axiological position short-circuit the benefits of the educational exchange for themselves, their opponents, as well as the judges and observers of such debates. The Devil's Advocate: Advancing Activism by Learning Potential Weaknesses Willingness to argue against what one believes helps the advocate understand the strengths and weaknesses of their own position. It opens the potential for a new synthesis of material that is superior to the first (Dybvig & Iverson, 2000). Serving as a devil's advocate encourages an appreciation for middle ground and nuance (Dell, 1958). Failure to see both sides can lead to high levels of ego involvement and dogmatism (Hicks & Greene, 2000). Survey data confirms these conclusions. Star Muir found that debaters become more tolerant after learning to debate both sides of an issue (Muir, 1993). Such tolerance is predictable since debate is firmly grounded in respect for the other through the creation of a fair dialogue. Ironically, opponents of a debate as dialogue risk falling prey to dogmatism and the requisite failure to respect potential middle grounds. Perceiving the world through the lens of contingency and probability can be beneficial to real-world activism when its goal is creating consensus out of competing interests. The anti-oppression messages of critical teams would benefit from a thorough investigation of such claims, and not merely an untested axiological assumption.

We should play Devil's advocate—failure to present an alternative, worst-case look at their ideas only silences dissent, makes them hard to implement, and allows flaws to slip through

CHANDRA 2008 (Sarvajeet, Managing Partner in Master Sun Consulting, MBA in Marketing Communications from MICA, Ahmedabad. He is a mechanical engineer from MS University, "Role of Strategy Execution Team - Be a Devil's Advocate, Bad News Messenger," Dec 17, http://ezinearticles.com/?Role-of-Strategy-Execution-Team---Be-a-Devils-Advocate,-Bad-News-Messenger&id=1797944)

Become a Devil's Advocate to a Specific Strategy and look at the What Will Go Wrong We are all over-confident and over-optimistic beings. While that has spurred us on as a civilization, this over-confidence gets translated into strategic choices or strategic plans that we make. Most of us tend to believe in the veracity of our ideas, tenacity of our plans and our destiny to win (regardless of market condition and competitive activity) It is the job of the execution team therefore to assume the role of a Devil's advocate. It is the job of the execution team to do so, since they have to drive the execution. They have to question the unrealistically precise estimates of time, resources and targets. They have to imagine a worst case scenario (most strategists do not come up with very gloomy worst case scenarios). Someone has to be given the role of challenging the false consensus or group-think that may have cause the dissenters to stay quiet. The execution team has to confront and ensure that worst case scenarios is put on the table. This will help the strategy become more 'implementable', give the strategic plan more flexibility and force the strategists to become more realistic. However for this to happen the management must encourage the culture of challenge and recognize the role of the strategy execution team as a ' Devil's Advocate'

2NC T-Versions

A topical version of the aff could be to impose tougher restrictions and definitions on fusion centers, which have too little oversight and too much flexibility in the status quo allowing for surveillance of people based on race, religion or ideological association

Monahan in 11 - Associate Professor of Human and Organizational Development and Medicine at Vanderbilt University. Member of the International Surveillance Studies Network <Torin. "The Future of Security? Surveillance Operations at Homeland Security Fusion Centers" Social Justice Vol. 37, Nos. 2–3 (2010–2011) Pgs 84-94>

**fusion center = center established for information sharing purposes between agencies such as the CIA, FBI, U.S. Military and state/local governments

Given the secretive nature of fusion centers, including their resistance to freedom of information requests (German and Stanley, 2008; Stokes, 2008), the primary way in which the public has learned about their activities is through leaked or unintentionally disseminated documents. For instance, a "terrorism threat assessment" produced by Virginia's fusion center surfaced in 2009 and sparked outrage because it identified students at colleges and universities—especially at historically black universities—as posing a potential terrorist threat (Sizemore, 2009). In the report, universities were targeted because of their diversity, which is seen as threatening because it might inspire "radicalization." The report says: "Richmond's history as the capital city of the Confederacy, combined with the city's current demographic concentration of African-American residents, contributes to the continued presence of race-based extremist groups...[and student groups] are recognized as a radicalization node for almost every type of extremist group" (Virginia Fusion Center, 2009: 9). Although the American Civil Liberties Union (ACLU) and others have rightly decried the racial-profiling implications of such biased claims being codified in an official document, the report itself supports the interpretation that minority students will be and probably have been targeted for surveillance. The report argues: "In order to detect and deter terrorist attacks, it is essential that information regarding suspected terrorists and suspicious activity in Virginia be closely monitored and reported in a timely manner" (Ibid: 4). Other groups identified as potential threats by the Virginia fusion center were environmentalists, militia members, and students at Regent University, the Christian university founded by evangelical preacher Pat Robertson (Sizemore, 2009). Another threat-assessment report, compiled by the Missouri Information Analysis Center (MIAC), found "the modern militia movement" to be worthy of Homeland Security Fusion Centers 89 focused investigation. The 2009 report predicted a resurgence in right-wing militia activities because of high levels of unemployment and anger at the election of the nation's first black president, Barack Obama, who many right-wing militia members might view as illegitimate and/or in favor of stronger gun-control laws (Missouri Information Analysis Center, 2009). The greatest stir caused by the report was its claim that "militia members most commonly associate with 3rd party political groups.... These members are usually supporters of former Presidential Candidate: Ron Paul, Chuck Baldwin, and Bob Barr" (Ibid.: 7). When the report circulated, many libertarians and "Tea Party" members took great offense, thinking the document argued that supporters of third-party political groups were more likely to be dangerous militia members or terrorists. In response, libertarian activists formed a national network called "Operation Defuse," which is devoted to uncovering and criticizing the activities of fusion centers and is actively filing open-records requests and attempting to conduct tours of fusion centers. Operation Defuse could be construed as a "counter-surveillance" group (Monahan, 2006) that arose largely because of outrage over the probability of political profiling by state-surveillance agents. Fusion centers have also been implicated in scandals involving covert infiltrations of nonviolent groups, including peace-activist groups, anti-death penalty groups, animal-rights groups, Green Party groups, and others. The most astonishing of the known cases involved the Maryland Coordination and Analysis Center (MCAC). In response to an ACLU freedom of information lawsuit, it came to light in 2008 that the Maryland State Police had conducted covert investigations of at least 53 peace activists and anti-death penalty activists for a period of 14 months. The investigation proceeded despite admissions by the covert agent that she saw no indication of violent activities or violent intentions on the part of group members (Newkirk, 2010). Nonetheless, in the federal database used by the police and accessed by MCAC, activists were listed as being suspected of the "primary crime" of "Terrorism—anti-government" (German and Stanley, 2008: 8). Although it is unclear exactly what role the fusion center played in these activities, they were most likely involved in and aware of the investigation. After all, as Mike German and Jay Stanley (2008: 8) explain: Fusion

centers are clearly intended to be the central focal point for sharing terrorism-related information. If the MCAC was not aware of the information the state police collected over the 14 months of this supposed terrorism investigation, this fact would call into question whether the MCAC is accomplishing its mission. Police spying of this sort, besides being illegal absent "reasonable suspicion" of wrongdoing, could have a "chilling effect" on free speech and freedom of association. The fact that individuals were wrongly labeled as terrorists in these systems and may still be identified as such could also have negative ramifications for them far into the future. Another dimension of troubling partnerships between fusion centers and law enforcement was revealed with the 2007 arrest of Kenneth Krayeske, a Green Party member in Connecticut. On January 3, 2007, Krayeske was taking photographs of Connecticut Governor M. Jodi Rell at her inaugural parade. He was not engaged in protest at the time. While serving as the manager of the Green Party's gubernatorial candidate, he had publicly challenged Governor Rell over the issue of why she would not debate his candidate (Levine, 2007). At the parade, police promptly arrested Krayeske (after he took 23 photographs) and later charged him with "Breach of Peace" and "Interfering with Police" (Ibid.). Connecticut's fusion center, the Connecticut Intelligence Center (CTIC), had conducted a threat assessment for the event and had circulated photographs of Krayeske and others to police in advance (Krayeske, 2007). The police report reads: "The Connecticut Intelligence Center and the Connecticut State Police Central Intelligence Unit had briefed us [the police] on possible threats to Governor Rell by political activist [sic], to include photographs of the individuals. One of the photographs was of the accused Kenneth Krayeske" (quoted in Levine, 2007). Evidently, part of the reason Krayeske was targeted was that intelligence analysts, most likely at the fusion center, were monitoring blog posts on the Internet and interpreted one of them as threatening: "Who is going to protest the inaugural ball with me?... No need to make nice" (CNN.com, 2009). According to a CNN report on the arrest, after finding that blog post, "police began digging for information, mining public and commercial data bases. They learned Krayeske had been a Green Party campaign director, had protested the gubernatorial debate and had once been convicted for civil disobedience. He had no history of violence" (Ibid.). The person who read Krayeske his Miranda rights and attempted to interview him in custody was Andrew Weaver, a sergeant for the City of Hartford Police Department who also works in the CTIC fusion center (Department of Emergency Management and Homeland Security, 2008). These few examples demonstrate some of the dangers and problems with fusion centers. Fusion center threat assessments lend themselves to profiling along lines of race, religion, and political affiliation. Their products are not impartial assessments of terrorist threats, but rather betray biases against individuals or groups who deviate from—or challenge—the status quo. According to a Washington Times commentary that became a focal point for a congressional hearing on fusion centers, **as long as terrorism is defined as coercive or intimidating acts that are intended to shape government policy, "any dissidence or political dissident is suspect to fusion centers"** (Fein, 2009). Evidence from the Maryland and Connecticut fusion center cases suggests that their representatives are either involved in data-gathering and investigative work, or are at least complicit in such activities, including illegal spying operations (German and Stanley, 2008). The Connecticut case further shows that individuals working at fusion centers are actively monitoring online sources and Homeland Security Fusion Centers 91 interviewing suspects, a departure from the official Fusion Center Guidelines that stress "exchange" and "analysis" of data, not data acquisition through investigations (U.S. Department of Justice, 2006). One important issue here is that fusion centers occupy ambiguous organizational positions. Many of them are located in police departments or are combined with FBI Joint Terrorism Task Forces, but their activities are supposed to be separate and different from the routine activities of the police or the FBI. A related complication is that fusion center employees often occupy multiple organizational roles (e.g., police officers or National Guard members and fusion center analysts), which can lead to an understandable, but nonetheless problematic, blurring of professional identities, rules of conduct, and systems of accountability. Whereas in 2010 DHS and the Department of Justice responded to concerns about profiling by implementing a civil liberties certification requirement for fusion centers, public oversight and accountability of fusion centers are becoming even more difficult and unlikely because of a concerted effort to exempt fusion centers from freedom of information requests. For example, according to a police official, Virginia legislators were coerced into passing a 2008 law that exempted its fusion center from the Freedom of Information Act; in this instance, federal officials threatened to withhold classified intelligence from the state's fusion center and police if they did not pass such a law (German and Stanley, 2008). Another tactic used by fusion center representatives to thwart open-records requests is to claim that there is no "material product" for them to turn over because they only "access," rather than "retain," information (Hylton, 2009). Although it may be tempting to view these cases of fusion center missteps and infractions as isolated examples, they are probably just the tip of the iceberg. A handful of other cases has surfaced recently in which fusion centers in California, Colorado, Texas, Pennsylvania, and Georgia have recommended peace activists, Muslim-rights groups, and/or environmentalists be profiled (German, 2009; Wolfe, 2009). The Texas example reveals the ways in which **the flexibility of fusion centers** affords the incorporation of xenophobic and racist beliefs. In 2009, the North Central Texas Fusion System produced a report that argued that the United States is especially vulnerable to terrorist infiltration because the country is too tolerant and accommodating of religious difference, especially of Islam. Through several indicators, the report lists supposed signs that the country is gradually being invaded and transformed: "Muslim cab drivers in Minneapolis refuse to carry passengers who have alcohol in their possession; the Indianapolis airport in 2007 installed footbaths to accommodate Muslim prayer; public schools schedule prayer breaks to accommodate Muslim students; pork is banned in the workplace; etc." (North Central Texas Fusion System, 2009: 4). Because "the threats to Texas are significant," the fusion center advises keeping an eye out for Muslim civil

liberties groups and sympathetic individuals, organizations, or media that might carry their message: hip-hop bands, social networking sites, online chat forums, blogs, and even the U.S. Department of Treasury (Ibid.). Recent infiltration of peace groups seems to reproduce some of the sordid history of political surveillance of U.S. citizens, such as the FBI and CIA's COINTELPRO program, which targeted civil rights leaders and those peacefully protesting against the Vietnam War, among others (Churchill and Vander Wall, 2002). A contemporary case involves a U.S. Army agent who infiltrated a nonviolent, anti-war protest group in Olympia, Washington, in 2007. A military agent spying on civilians likely violated the Posse Comitatus Act. Moreover, this agent actively shared intelligence with the Washington State Fusion Center, which shared it more broadly (Anderson, 2010). According to released documents, intelligence representatives from as far away as New Jersey were kept apprised of the spying: In a 2008 e-mail to an Olympia police officer, Thomas Glapion, Chief of Investigations and Intelligence at New Jersey's McGuire Air Force Base, wrote: "You are now part of my Intel network. I'm still looking at possible protests by the PMR SDS MDS and other left wing antiwar groups so any Intel you have would be appreciated.... In return if you need anything from the Armed Forces I will try to help you as well" (Ibid.: 4). Given that political surveillance under COINTELPRO is widely considered to be a dark period in U.S. intelligence history, the fact that fusion centers may be contributing to similar practices today makes it all the more important to subject them to public scrutiny and oversight.

Another topical version of the aff could be to create a Truth and Reconciliation Commission to review biased surveillance of activists and oversight enforcement

Pasquale in 14 - Professor of Law at the University of Maryland's Francis King Carey School of Law <Frank. "We must confront the recent surveillance abuses to develop better policy moving forward" January 2014. http://eprints.lse.ac.uk/58503/1/__lse.ac.uk_storage_LIBRARY_Secondary_libfile_shared_repository_Content_American%20Politics%20and%20Policy_2014_January_blogs.lse.ac.uk-We_must_confront_the_recent_surveillance_abuses_to_develop_better_policy_moving_forward.pdf>

In his recent speech on surveillance, President Obama treated the misuse of intelligence gathering as a relic of American history. It was something done in the bad old days of J. Edgar Hoover, and never countenanced by recent administrations. But the accumulation of menacing stories—from fusion centers to "joint terrorism task forces" to a New York "demographics unit" targeting Muslims—is impossible to ignore. The American Civil Liberties Union has now collected instances of police surveillance and obstruction of First Amendment‐protected activity in over half the states. From Alaska (where military intelligence spied on an antiwar group) to Florida (where Quakers and anti-globalization activists were put on watchlists), protesters have been considered threats, rather than citizens exercising core constitutional rights. Political dissent is a routine target for surveillance by the FBI. Admittedly, I am unaware of the NSA itself engaging in politically driven spying on American citizens. Charles Krauthammer says there has not been a "single case" of abuse. But the NSA is only one part of the larger story of intelligence gathering in the US, which involves over 1,000 agencies and nearly 2,000 private companies. Moreover, we have little idea of exactly how information and requests flow between agencies. Consider the Orwellian practice of "parallel construction." Reuters has reported that the NSA gave "tips" to the Special Operations Division (SOD) of the Drug Enforcement Administration, which also shared them with the Internal Revenue Service. The legal status of such information sharing is murky at best: the national security data is not supposed to be used for law enforcement purposes. Apparently the SOD sidestepped these niceties by re-creating criminal investigations from scratch, fabricating alternative grounds for suspecting the targets. Thus the "parallel construction" of two realities for the law enforcers: one actual, secret record of how targets were selected, and another specially crafted for consumption by courts. Two senior Drug Enforcement Administration officials defended the program and called it legal, but did not disclose their reasoning. At present, the practice looks like little more than intelligence laundering. Five senators asked the Department of Justice to assess the legality of "parallel construction;" it has yet to respond. I have little doubt that the DEA used parallel construction in cases involving some pretty nasty characters. It must be tempting to apply "war on terror" tactics to the "war on drugs." Nevertheless, there are serious legal and ethical concerns here. One of the American revolutionaries' chief complaints against the British Crown was the indiscriminate use of "general warrants," which allowed authorities to search the homes of anyone without particularized suspicion they had committed a crime. Thus the 4th Amendment to the US Constitution decrees that "no Warrants shall issue, but upon probable cause." Law enforcers aren't supposed to set up "dragnet surveillance" of every communication, or use whatever data stores are compiled by the National Security Agency, unless there is a true security threat. Between 1956 and 1971, the FBI's COINTELPRO program engaged in domestic covert action designed to disrupt groups engaged in the civil

rights, antiwar, and communist movements. As Lawrence Rosenthal has observed, "History reflects a serious risk of abuse in investigations based on the protected speech of the targets," and politicians at the time responded. Reviewing intelligence agency abuses from that time period, the Church Committee issued a series of damning reports in 1975-76, leading to some basic reforms. If a new Church Committee were convened, it would have to cover much of the same ground. Moreover, it would need to put in place real safeguards against politicized (or laundered) domestic intelligence gathering. Those are presently lacking. I have yet to find a case where the parties involved in any of the intelligence politicization (or laundering) were seriously punished. Nor have I seen evidence that the victims of such incidents have received just compensation for the unwarranted intrusion on their affairs. Before we can develop better surveillance policy, we need something like a Truth and Reconciliation Commission to review (and rebuke) the politicization of intelligence gathering post-9/11. Too many privacy activists have been unwilling to admit the persistence of catastrophic threats that may only be detected by spies. But the US government has been even less moored to reality, unwilling to admit that a runaway surveillance state has engaged in precisely the types of activities that the Bill of Rights is designed to prevent. To have a debate about the proper balance between liberty and security, we need to confront the many cases where misguided intelligence personnel spied on activists with neither goal in mind.

2NC Turns Case

Secrecy and abuse of power in government surveillance are caused by vague legal codes – changing the law is necessary to effectively curtail surveillance

White in 8 <Scott. "Academia, Surveillance, and the FBI: A Short History" Surveillance and Governance: Crime Control and Beyond

Sociology of Crime, Law and Deviance, Volume 10, 151–174>

One of the more troubling aspects of the law for librarians was the secrecy written into the legislative code of the Patriot Act, in the form of a ''gag rule'' in section 215 (Schulhofer, 2002). Businesses or libraries contacted during terrorism related investigations were prohibited from disclosing any details about an FBI visit, as it could have compromised investigations. In the original Patriot Act, section 215 read as follows: (Sec. 215.501.(d)) No person shall disclose to any other person (other than those persons necessary to produce the tangible things under this section) that the Federal Bureau of Investigation has sought or obtained tangible things under this section. (USA PATRIOT Act, 2001) In a previous part of Sec. 215, the law states: Sec. 215.501.(c)(1) Upon an application made pursuant to this section, the judge shall enter an ex parte order as requested, or as modified, approving the release of records if the judge finds that the application meets the requirements of this section. Examining the language in these two sections, one could surmise that a judge is required to grant a surveillance order if it meets pre-determined criteria, and no one can talk about the order after the surveillance is executed. The text of Section 215 made it unclear what would happen if someone were to disclose that the FBI had asked for information from a business or library when conducting a terrorism investigation (Albitz, 2005; Jaeger et al., 2003). Many librarians believed this rule concentrated broad power in the hands of the executive branch of the government, and did not adequately protect library users from unwarranted FBI surveillance (Foerstel, 2004; Klinefelter, 2004). While it is often necessary for investigations to remain secret, Section 215, as originally written, **diminished the ability to conduct proper judicial and legislative oversight of FBI surveillance activities** (Swire, 2005). In its original form, Section 215 of the Patriot Act conflicted with state privacy laws requiring court orders to allow librarians to disclose information about personal library records (Foerstel, 2004). Confusion arose regarding how librarians should respond to a request for information from the FBI. For example, could managers discuss the order with their directors, or the directors with a legal entity representing the organization? The gag rule suggested that when someone is asked for information, they could not disclose any information concerning the request. The **potential for abuse by investigators is large, but could remain undetected, given the way the law is written.**

Unauthorized, invasive surveillance is coded in the law – loose definitions and expansions in government authority are what create injustice which means engaging the state is key

Rackow in 2 - B.A. 1998, Williams College; J.D. Candidate 2003, University of Pennsylva <Sharon. "How the USA Patriot Act Will Permit Governmental Infringement upon the Privacy of

Americans in the Name of "Intelligence" Investigations" University of Pennsylvania Law Review, Vol. 150, No. 5 (May, 2002), pp. 1651-1696>

Section 218 of the USA PATRIOT Act amends FISA ? 1804(a) (7) (B). Now, in an application to the FISC, a federal officer no longer has to demonstrate that "the purpose of the surveillance is to obtain foreign intelligence information,",132 but may obtain surveillance authorization **under the less stringent showing that "a significant purpose of the surveillance is to obtain foreign intelligence information**."133 This slight alteration in the language of 1804 **is highly significant in that it is extremely likely to increase the types of court ordered investigations** that are carried out in the name of "foreign intelligence investigations" under FISA. Considering the fact that the FISC has only turned down one surveillance application since its inception,134 it becomes even more likely that the court will authorize all forthcoming applications **under this more lenient standard**. The concern raised by this amendment is that under the new broadened scope of ? 1804, both intelligence and law enforcement agents will bring applications for electronic surveillance to the FISC when the primary purpose of the surveillance is an investigation of criminal activities. Thus, the amended FISA will be used as a means to undertake surveillance without demonstrating the heightened standard of probable cause required under Title III for criminal wiretaps. This potential end-run around the Fourth Amendment's probable cause requirement for criminal investigations contradicts the rationale for permitting a lower threshold for obtaining FISA wiretaps. No longer will this lesser standard solely authorize investigations of primarily foreign intelligence activities where the rights of Americans are generally not implicated. Instead, FISA will be employed to approve investigations of predominantly criminal activities, including purely domestic criminal acts-in explicit violation of the Fourth Amendment.135 Now, under section 218 a criminal investigation can be the primary purpose of a FISA investigation, with foreign intelligence information as a secondary, albeit "significant purpose."36 Senator Leahy recognized that by amending the language of FISA, "the USA Actl37 would make it easier for the FBI to use a FISA wiretap to obtain information where the Government's most important motivation for the wiretap is for use in a criminal prosecution."38 The Senator further acknowledged that "[t] his is a disturbing and dangerous change in the law."139 Furthermore, as the USA PATRIOT Act's amendment to FISA does not provide a definition of "significant purpose," it is unclear how far the FISC will stretch its interpretation of this phrase to accommodate law enforcement and intelligence agencies in their quest to increase surveillance as a response to the September 11th terrorist attacks. Yet, the consequences of this amendment to FISA go far beyond investigations of the September 11th tragedy. Now, surveillance authority for investigations seeking information primarily pertaining to purely domestic criminal activities may be granted under FISA with no showing of probable cause that a serious crime has been or will soon be committed.

A2 Kappeler

Kappeler is wrong – roleplaying is key to democracy and engagement

Rawls 99 (John, Professor Emeritus – Harvard University, The Law of Peoples, p. 54-7)

Developing the Law of Peoples within a liberal conception of justice, we work out the ideals and principles of the foreign policy of a reasonably just liberal people. I distinguish between the public reason of liberal peoples and the public reason of the Society of Peoples. The first is the public reason of equal citizens of domestic society debating the constitutional essentials and matters of basic justice concerning their own government; the second is the public reason of free and equal liberal peoples debating their mutual relations as peoples. The Law of Peoples with its political concepts and principles,

ideals and criteria, is the content of this latter public reason. Although these two public reasons do not have the same content, the role of public reason among free and equal peoples is analogous to its role in a constitutional democratic regime among free and equal citizens. Political liberalism proposes that, in a constitutional democratic regime, comprehensive doctrines of truth or of right are to be replaced in public reason by an idea of the politically reasonable addressed to citizens as citizens. Here note the parallel: public reason is invoked by members of the Society of Peoples, and its principles are addressed to peoples as peoples. They are not expressed in terms of comprehensive doctrines of truth or of right, which may hold sway in this or that society, but in terms that can be shared by different peoples. 6.2. Ideal of Public Reason. Distinct from the idea of public reason is the ideal of public reason. In domestic society this ideal is realized, or satisfied, whenever judges, legislators, chief executives, and other government officials, as well as candidates for public office, act from and follow the idea of public reason and explain to other citizens their reasons for supporting fundamental political questions in terms of the political conception of justice that they regard as the most reasonable. In this way they fulfill what I shall call their duty of civility to one another and to other citizens. Hence whether judges, legislators, and chief executives act from and follow public reason is continually shown in their speech and conduct. How is the ideal of public reason realized by citizens who are not government officials? In a representative government, citizens vote for representatives-chief executives, legislators, and the like-not for particular laws (except at a state or local level where they may vote directly on referenda questions, which are not usually fundamental questions). To answer this question, we say that, ideally, citizens are to **think of themselves as** if they were **legislators** and ask themselves what statutes, supported by what reasons satisfying the criterion of reciprocity, they would think it most reasonable to enact.7l When firm and widespread, the disposition of citizens to view themselves as ideal legislators, and to repudiate government officials and candidates for public office who violate public reason, forms part of the **political and social basis of liberal democracy** and is **vital** for its enduring strength and vigor. Thus in domestic society citizens fulfill their duty of civility and support the idea of public reason, while doing what they can to hold government officials to it. This duty, like other political rights and duties, is an intrinsically moral duty. I emphasize that it is not a legal duty, for in that case it would be incompatible with freedom of speech.

Also that turns the case – key to social change

Milbrath '96 (Lester W., Professor Emeritus of Political Science and Sociology – SUNY Buffalo, Building Sustainable Societies, Ed. Pirages, p. 289)

In some respects personal change cannot be separated from societal change. Societal transformation will not be successful without change at the personal level; such change is a necessary but not sufficient step on the route to sustainability. People hoping to live sustainably must adopt new beliefs, new values, new lifestyles, and new worldview. But lasting personal change is unlikely without simultaneous transformation of the socioeconomic/political system in which people function. Persons may solemnly resolve to change, but that resolve is likely to weaken as they perform day-today within a system reinforcing different beliefs and values. Change agents typically are met with denial and great resistance. Reluctance to challenge mainstream society is the major reason most efforts emphasizing education to bring about change are ineffective. If societal transformation must be speedy, and most of us believe it must, pleading with individuals to change is not likely to be effective.

Cap

Link – General

The focus on racialized surveillance becomes an alibi for acquiescence of class struggles – they obscure the logic of capital and ensure repetition of oppression

Zavarzadeh 94 (Mas'Ud, The Stupidity That Consumption Is Just as Productive as Production": In the Shopping Mall of the Post-al Left," College Literature, Vol. 21, No. 3, The Politics of Teaching Literature 2 (Oct., 1994),pp. 92-114)

Post-al logic is marked above all by its erasure of "production" as the determining force in organizing human societies and their institutions, and its insistence on "consumption" and "distribution" as the driving force of the social.5 The argument of the post-al left (briefly) is that "labor," in advanced industrial "democracies," is superseded by "information," and consequently "knowledge" (not class struggle over the rate of surplus labor) has become the driving force of history. The task of the post-al left is to deconstruct the "metaphysics of labor" and consequently to announce the end of socialism and with it the "outdatedness" of the praxis of abolishing private property (that is, congealed alienated labor) in the post-al moment. Instead of abolishing private property, an enlightened radical democracy which is to supplant socialism (as Laclau, Mouffe, Aronowitz, Butler, and others have advised) should make property holders of each citizen. The post-al left rejects the global objective conditions of production for the local subjective circumstances of consumption, and its master trope is what R-4 [France] so clearly foregrounds: the (shopping) "mall"?the ultimate site of consumption "with all latest high-tech textwares" deployed to pleasure the "body." In fact, the post-al left has "invented" a whole new interdiscipline called "cultural studies" that provides the new alibi for the regime of profit by shifting social analytics from "production" to "consumption." (On the political economy of "invention" in ludic theory, see Transformation 2 on "The Invention of the Queer.") To prove its "progressiveness," the post-al left devotes most of its energies (see the writings of John Fiske, Constance Penley, Michael Berube, Henry Louis Gates, Jr., Andrew Ross, Susan Willis, Stuart Hall, Fredric Jameson), to demonstrate how "consumption" is in fact an act of production and resistance to capitalism and a practice in which a Utopian vision for a society of equality is performed! The shift from "production" to "consumption" manifests itself in post-al left theories through the focus on "superstructural" cultural analysis and the preoccupation not with the "political economy" ("base") but with "representation"? for instance, of race, sexuality, environment, ethnicity, nationality, and identity. This is, for example, one reason for [Hill's] ridiculing the "base" and "superstructure" analytical model of classical Marxism (Marx, A Contribution to the Critique of Political Economy) with an anecdote (the privileged mode of "argument" for the post-al left) that the base is really not all that "basic." To adhere to the base/superstructure model for [him] is to be thrown into an "epistemological gulag." For the post-al left a good society is, therefore, one in which, as [France] puts it, class antagonism is bracketed and the "surplus value" is distributed more evenly among men and women, whites and persons of color, the lesbian and the straight. It is not a society in which "surplus value"?the exploitative appropriation of the other's labor-is itself eliminated by revolutionary praxis. The post-al left's good society is not one in which private ownership is obsolete and the social division of labor (class) is abolished. Rather it is a society in which the fruit of exploitation of the proletariat (surplus labor) is more evenly distributed and a near-equality of consumption is established. This distributionist/consumptionist theory that underwrites the economic interests of the (upper)middle classes is the foundation for all the texts in this exchange and their pedagogies. A good pedagogy in these texts therefore is one in which power is distributed evenly in the classroom: a pedagogy that constructs a classroom of consensus not antagonism (thus opposition to "politicizing the classroom" in OR-1 [Hogan]) and in which knowledge (concept) is turned through the process that OR-3 [McCormick] calls "translation"?into "consumable" EXPERIENCES. The more "intense" the experience, as the anecdotes of [McCormick] show, the more successful the pedagogy. In short, it is a pedagogy that **removes the student from his/her position in the social relations of production and places her/him in the personal relation of consumption**: specifically, EXPERIENCE of/as the consumption of pleasure. The post-al logic **obscures** the laws of motion of capital by very specific assumptions and moves-many of which are rehearsed in the texts here. I will discuss some of these, mention others in passing, and hint at several more. (I have provided a full account of all these moves in my "Post-ality" in Transformation 1.) I begin by outlining the post-al assumptions that "democracy" is a never-ending, open "dialogue" and "conversation" among multicultural citizens; that the source of social inequities is "power"; that a post-class hegemonic "coalition," as OR-5 [Williams] calls it-and not class struggle-is the dynamics of social change; that truth (as R-l [Hill] writes) is an "epistemological gulag"? a construct of power and thus any form of "ideology critique" that raises questions of "falsehood" and "truth" ("false consciousness") does so through a violent exclusion of the "other" truths by, in [Williams'] words, "staking sole legitimate claim" to the truth in question. Given the injunction of the post-al logic against binaries (truth/falsehood), the project of "epistemology" is displaced in the ludic academy by "rhetoric." The question, consequently, becomes not so much what is the "truth" of a practice but whether it "works." (Rhetoric has always served as

an alibi for pragmatism.) Therefore, [France] is not interested in whether my practices are truthful but in what effects they might have: if College Literature publishes my texts would such an act (regardless of the "truth" of my texts) end up "cutting our funding?" [he] asks. A post-al leftist like [France], in short, "resists" the state only in so far as the state does not cut [his] "funding." Similarly, it is enough for a cynical pragmatist like [Williams] to conclude that my argument "has little prospect of effectual force" in order to disregard its truthfulness. The post-al dismantling of "epistemology" and the erasure of the question of "truth," it must be pointed out, is undertaken to protect the economic interests of the ruling class. If the "truth question" is made to seem outdated and an example of an orthodox binarism ([Hill]), any conclusions about the truth of ruling class practices are excluded from the scene of social contestation as a violent logocentric (positivistic) totalization that disregards the "difference" of the ruling class. This is why a defender of the ruling class such as [Hill] sees an ideology critique aimed at unveiling false consciousness and the production of class consciousness as a form of "epistemological spanking." It is this structure of assumptions that enables [France] to answer my question, "What is wrong with being dogmatic?" not in terms of its truth but by reference to its pragmatics (rhetoric): what is "wrong" with dogmatism, [he] says, is that it is violent rhetoric ("textual Chernobyl") and thus Stalinist. If I ask what is wrong with Stalinism, again (in terms of the logic of [his] text) I will not get a political or philosophical argument but a tropological description.6 The post-al left is a New Age Left: the "new new left" privileged by [Hill] and [Williams]- the laid-back, "sensitive," listening, and dialogic left of coalitions, voluntary work, and neighborhood activism (more on these later). It is, as I will show, anti-intellectual and populist; its theory is "bite size" (mystifying, of course, who determines the "size" of the "bite"), and its model of social change is anti-conceptual "spontaneity": May 68, the fall of the Berlin Wall, and, in [Hill's] text, Chiapas. In the classroom, the New Age post-al pedagogy inhibits any critique of the truth of students' statements and instead offers, as [McCormick] makes clear, a "counseling," through anecdotes, concerning feelings. The rejection of "truth" (as "epistemological gulag"?[Hill]), is accompanied by the rejection of what the post-al left calls "economism." Furthermore, the post-al logic relativizes subjectivities, critiques functionalist explanation, opposes "determinism," and instead of closural readings, offers supplementary ones. It also celebrates eclecticism; puts great emphasis on the social as discourse and on discourse as always inexhaustible by any single interpretation? discourse (the social) always "outruns" and "exceeds" its explanation. Post-al logic is, in fact, opposed to any form of "explanation" and in favor of mimetic description: it regards "explanation" to be the intrusion of a violent outside and "description" to be a respectful, caring attention to the immanent laws of signification (inside). This notion of description which has by now become a new dogma in ludic feminist theory under the concept of "mimesis" (D. Cornell, Beyond Accommodation)?regards politics to be always immanent to practices: thus the banalities about not politicizing the classroom in [Hogan's] "anarchist" response to my text7 and the repeated opposition to binaries in all nine texts. The opposition to binaries is, in fact, an **ideological alibi for erasing class struggle**, as is quite clear in [France's] rejection of the model of a society "divided by two antagonistic classes" (see my Theory and its Other).

Class should be the starting point of this debate – the plan becomes a peace meal that destroys attempts to overcome universal capitalist oppression

GIMENEZ (Prof. Sociology at UC Boulder) **2001**

[Martha, "Marxism and Class; Gender and Race", Race, Gender and Class, Vol. 8, p. online: http://www.colorado.edu/Sociology/gimenez/work/cgr.html)

There are many competing theories of race, gender, class, American society, political economy, power, etc. but no specific theory is invoked to define how the terms race, gender and class are used, or to identify how they are related to the rest of the social system. To some extent, race, gender and class and their intersections and interlockings have become a mantra to be invoked in any and all theoretical contexts, for a tacit agreement about their ubiquitousness and meaning seems to have developed among RGC studies advocates, so that all that remains to be dome is empirically to document their intersections everywhere, for everything that happens is, by definition, raced, classed, and gendered. This pragmatic acceptance of race, gender and class, as givens, results in the downplaying of theory, and the resort to experience as the source of knowledge. The emphasis on experience in the construction of knowledge is intended as a corrective to theories that, presumably, reflect only the experience of the powerful. RGC seems to offer a subjectivist understanding of theory as simply a reflection of the experience and consciousness of the individual theorist, rather than as a body of propositions which is collectively and systematically produced under historically specific conditions of possibility which grant them historical validity for as long as those conditions prevail. Instead, knowledge and theory are pragmatically conceived as the products or reflection of experience and, as such, unavoidably partial, so that greater accuracy and relative completeness can be approximated only through gathering the experiential accounts of all groups. Such

is the importance given to the role of experience in the production of knowledge that in the eight page introduction to the first section of an RGC anthology, the word experience is repeated thirty six times (Andersen and Collins, 1995: 1-9). I agree with the importance of learning from the experience of all groups, especially those who have been silenced by oppression and exclusion and by the effects of ideologies that **mystify** their actual conditions of existence. To learn how people describe their understanding of their lives is very illuminating, for "ideas are the conscious expression -- real or illusory -- of (our) actual relations and activities" (Marx, 1994: 111), because "social existence determines consciousness" (Marx, 1994: 211). Given that our existence is shaped by the capitalist mode of production, experience, to be fully understood in its broader social and political implications, has to be situated in the context of the capitalist forces and relations that produce it. Experience in itself, however, is suspect because, dialectically, it is a unity of opposites; it is, at the same time, unique, personal, insightful and revealing and, at the same time, thoroughly social, partial, mystifying, itself the product of historical forces about which individuals may know little or nothing about (for a critical assessment of experience as a source of knowledge see Sherry Gorelick, "Contradictions of feminist methodology," in Chow, Wilkinson, and Baca Zinn, 1996; applicable to the role of experience in contemporary RGC and feminist research is Jacoby's critique of the 1960s politics of subjectivity: Jacoby, 1973: 37- 49). Given the emancipatory goals of the RGC perspective, it is through the analytical tools of Marxist theory that it can move forward, beyond the impasse revealed by the constant reiteration of variations on the "interlocking" metaphor. This would require, however, a) a rethinking and modification of the postulated relationships between race, class and gender, and b) a reconsideration of the notion that, because everyone is located at the intersection of these structures, all social relations and interactions are "raced," "classed," and "gendered." In the RGC perspective, race, gender and class are presented as **equivalent** systems of oppression with extremely negative consequences for the oppressed. It is also asserted that the theorization of the connections between these systems require "a working hypothesis of equivalency" (Collins, 1997:74). Whether or not it is possible to view class as just another system of oppression depends on the theoretical framework within class is defined. If defined within the traditional sociology of stratification perspective, in terms of a gradation perspective, class refers simply to strata or population aggregates ranked on the basis of standard SES indicators (income, occupation, and education) (for an excellent discussion of the difference between gradational and relational concepts of class, see Ossowski, 1963). Class in this non-relational, descriptive sense has no claims to being more fundamental than gender or racial oppression; it simply refers to the set of individual attributes that place individuals within an aggregate or strata arbitrarily defined by the researcher (i.e., depending on their data and research purposes, anywhere from three or four to twelve "classes" can be identified). From the standpoint of Marxist theory, however, class is **qualitatively different** from gender and race and **cannot** be considered just another system of oppression. As Eagleton points out, whereas racism and sexism are unremittingly bad, class is not entirely a "bad thing" even though socialists would like to abolish it. The bourgeoisie in its revolutionary stage was instrumental in ushering a new era in historical development, one which liberated the average person from the oppressions of feudalism and put forth the ideals of liberty, equality and fraternity. Today, however, it has an unquestionably negative role to play as it expands and deepens the rule of capital over the entire globe. The working class, on the other hand, is pivotally located to wage the final struggle against capital and, consequently, it is "an excellent thing" (Eagleton, 1996: 57). While racism and sexism have no redeeming feature, class relations are, dialectically, a unity of opposites; both a site of exploitation and, objectively, a site where the potential agents of social change are forged. To argue that the working class is the fundamental agent of change does not entail the notion that it is the only agent of change. The working class is of course composed of women and men who belong to different races, ethnicities, national origins, cultures, and so forth, so that gender and racial/ethnic struggles have the potential of fueling class struggles because, given the patterns of wealth ownership and income distribution in this and all capitalist countries, those who raise the banners of gender and racial struggles are overwhelmingly propertyless workers, technically members of the working class, people who need to work for economic survival whether it is for a wage or a salary, for whom racism, sexism and class exploitation matter. But this vision of a mobilized working class where gender and racial struggles are not subsumed but are nevertheless related requires a class conscious effort to link RGC studies to the Marxist analysis of historical change. In so far as the "class" in RGC remains a neutral concept, open to any and all theoretical meanings, just one oppression among others, intersectionality will not realize its revolutionary potential. Nevertheless, I want to argue against the notion that class should be considered equivalent to gender and race. I find the grounds for my argument not only on the crucial role class struggles play in processes of epochal change but also in the very assumptions of RGC studies and the ethnomethodological insights put forth by West and Fenstermaker (1994). The assumption of the simultaneity of experience (i.e., all interactions are raced, classed, gendered) together with the ambiguity inherent in the interactions themselves, so that while one person might think he or she is "doing gender," another might interpret those "doings" in terms of "doing class," highlight the basic issue that Collins accurately identifies when she argues that ethnomethodology ignores power relations. Power relations underlie all processes of social interaction and this is why social facts are constraining upon people. But the pervasiveness of power ought not to obfuscate the fact that some power relations are more important and consequential than others. For example, the power that physical attractiveness might confer a woman in her interactions with her less attractive female supervisor or employer does not match the economic power of the latter over the former. In my view, the flattening or erasure of the qualitative difference between class, race and gender in the

RGC perspective is the foundation for the recognition that it is important to deal with "basic relations of domination and subordination" which now appear disembodied, outside class relations. In the effort to reject "class reductionism," by postulating the equivalence between class and other forms of oppression, the RGC perspective both negates the fundamental importance of class but it is forced to acknowledge its importance by postulating some other "basic" structures of domination. Class relations -- whether we are referring to the relations between capitalist and wage workers, or to the relations between workers (salaried and waged) and their managers and supervisors, those who are placed in "contradictory class locations," (Wright, 1978) -- are of paramount importance, for most people's economic survival is determined by them. Those in dominant class positions do exert power over their employees and subordinates and a crucial way in which that power is used is through their choosing the identity they impute their workers. Whatever identity workers might claim or "do," employers can, in turn, disregard their claims and "read" their "doings" differently as "raced" or "gendered" or both, rather than as "classed," thus downplaying their class location and the class nature of their grievances. To argue, then, that class is fundamental is not to "reduce" gender or racial oppression to class, but to acknowledge that the underlying basic and "nameless" **power at the root of what happens in social interactions grounded in "intersectionality" is class power.**

Link – Race Focus

Racism was create to protect the labor production of chattel slavery – it was manufactured by elites as a means of protecting their interests – anti-racism strategies are co-opted and divide resistance – universal consciousness is key

Alexander 10 (The new Jim Crow: mass incarceration in the age of colorblindness, Michelle Alexander is an associate professor of law at Ohio State University and a civil rights advocate, who has litigated numerous class action discrimination cases and has worked on criminal justice reform issues. She is a recipient of a 2005 Soros Justice Fellowship of the Open Society Institute, has served as director of the Racial Justice Project at the ACLU of Northern California, directed the Civil Rights Clinic at Stanford Law School and was a law clerk for Justice Harry Blackmun at the U. S. Supreme Court.)

The concept of race is a relatively recent development. Only in the past few centuries, owing largely to European imperialism, have the world's people been classified along racial lines. Here, in America, the idea of race emerged as a means of reconciling chattel slavery- as well as the extermination of American Indians – with the ideals of freedom preached by whites in the new colonies. In the early colonial period, when settlements remained relatively small, indentured servitude was the dominant means of securing cheap labor. Under this system, whites and blacks struggled to survive against a common enemy, what historian Lerone Bennett Jr. describes as "the big planter apparatus and a social system that legalized terror against black and white bondsmen." Initially, blacks brought to this country were not all enslaved; many were treated as indentured servants. As plantation farming expanded, particularly tobacco and cotton farming, demand increased greatly for both labor and land. The demand for land was met by invading and conquering larger and large swaths of territory. American Indians became a growing impediment to white European "progress," and during this period, the images of American Indians promoted in books, newspapers, and magazines became increasingly negative. As sociologists Keith Kilty and Eric Swank have observed, eliminating "savages" is less of a moral problem than eliminating human beings, and therefore American Indians came to be understood as a lesser race- uncivilized savages- thus providing a justification for the extermination of the native peoples. The growing demand for labor on plantations was met through slavery. American Indians were considered unsuitable as slaves, largely because native tribes were clearly in a position to fight back. The fear of raids by Indian tribes left plantation owners to grasp for an alternative source of free labor. European immigrants were also deemed poor candidates for slavery, not because of their race, but rather because they were in short supply and enslavement would, quite naturally, interfere with voluntary immigration to the new colonies. Plantation owners thus view Africans, who were relatively powerless, as the ideal slaves. The systemic enslavement of Africans, and the rearing of their children under bondage, emerged with all deliberate speed- quickened by events such as Bacon's Rebellion. Nathaniel Bacon was a white property owner in Jamestown, Virginia, who managed to united slaves, indentured servants, and poor whites in a revolutionary effort to overthrow the planter elite. Although slaves clearly occupied the lowest position in the social hierarchy and suffered the most under the plantation, the condition of indentured whites was barely better, and the majority of free whites lived in extreme poverty. As explained by historian Edmund Morgan, in colonies like

Virginia, the planter elite, with huge land grants, occupied a vastly superior position to workers of all colors. Southern colonies did not hesitate to invent ways to extend the terms of servitude, and the planter class accumulated uncultivated lands to restrict the options of free workers. The simmering resentment against the planter class created conditions that were ripe for revolt. Varying accounts of Bacon's rebellion abound, but the basic facts are these: Bacon developed plans in 1675 to seize Native American lands in order to acquire more property for himself and others and nullify the threat of Indian raids. When the planter elite in Virginia refused to provide militia support for his scheme, Bacon retaliated, leading to an attack on the elite, their homes, and their property. He openly condemned the rich for their oppression of the poor and inspired an alliance of white and black bond laborers, as well as slaves, who demanded an end to their servitude. The attempted revolution was ended by force and false promises of amnesty. A number of the people who participated in the revolt were hanged. The events in Jamestown were alarming to the planter elite, who were deeply fearful of the multiracial alliance of bond workers and slave. Word of Bacon's rebellion spread far and wide, and several more uprisings of a similar type followed. In an effort to protect their superior status and economic position, the planters shifted their strategy for maintaining dominance. They abandoned their heavy reliance on indentured servants in favor of the importation of more black slaves. Instead of importing English-speaking slaves from the West Indies, who were more likely to be familiar with European language and culture, many more slaves were shipped directly from Africa. These slaves would be far easier to control and far less likely to form alliances with poor whites. Fearful that such measures might not be sufficient to protect their interests, the planter class took an additional precautionary step, a step that would later come to be known as a "racial bribe." Deliberately and strategically, the planter class extended special privileges to poor whites in an effort to drive a wedge between them and black slaves. White settlers were allowed greater access to Native American lands, white servants were allowed to police slaves through slave patrols and militias, and barriers were created so that free labor would not be placed in competition with slave labor. These measures effectively eliminated the risk of future alliances between black slaves and poor whites. Poor whites suddenly had a direct, personal stake in the existence of a race-based system of slavery. Their own plight had not improved by much, but at least they were not slaves. Once the planter elite split the labor force, poor whites responded to the logic of their situation and sought ways to expand their racially privileged position. By the mid-1770s, the system of bond labor had been thoroughly transformed into a racial caste system predicated on slavery. The degraded status of Africans was justified on the ground that Negros, like the Indians, were an uncivilized lesser race, perhaps even more lacking in intelligence and laudable human qualities than the red-skinned natives. The notion of white supremacy rationalized the enslavement of Africans, even as whites endeavored to form a new nation based on the ideals of equality, liberty, and justice for all. Before democracy, chattel slavery was born.

Their account of race erases connection to economics – this masks class based violence and allows it to continue

Young 6

(Robert, Prof. Critical Studies at Oxford, "Putting Materialism Back Into Race Theory", Red Critique, Spring)

I foreground my (materialist) understanding of race as a way to contest contemporary accounts of race, which erase any determinate connection to economics. For instance, humanism and poststructuralism represent two dominant views on race in the contemporary academy. Even though they articulate very different theoretical positions, they produce similar ideological effects: the suppression of economics. They collude in redirecting attention away from the logic of capitalist exploitation and point us to the cultural questions of sameness (humanism) or difference (poststructuralism). In developing my project, I critique the ideological assumptions of some exemplary instances of humanist and poststructuralist accounts of race, especially those accounts that also attempt to displace Marxism, and, in doing so, I foreground the historically determinate link between race and exploitation. It is this link that forms the core of what I am calling a transformative theory of race. The transformation of

race from a sign of exploitation to one of democratic multiculturalism, ultimately, requires the transformation of capitalism.

Capitalism racializes subjects to entrench competition and destroy class consciousness – it produces white supremacy to paper over class contradictions

SAN JUAN 3

[E., Fulbright Lecturer @ Univ. of Leuven, Belgium, "Marxism and the Race/Class Problematic: A Re-Articulation", p. online: http://clogic.eserver.org/2003/sanjuan.html)

It seems obvious that racism cannot be dissolved by instances of status mobility when sociohistorical circumstances change gradually or are transformed by unforeseen interventions. The black bourgeoisie continues to be harassed and stigmatized by liberal or multiculturalist practices of racism, not because they drive Porsches or conspicuously flaunt all the indices of wealth. Class exploitation cannot replace or stand for racism because it is the condition of possibility for it. It is what enables the racializing of selected markers, whether physiological or cultural, to maintain, deepen and reinforce alienation, mystifying reality by modes of commodification, fetishism, and reification characterizing the routine of quotidian life. Race and class are dialectically conjoined in the reproduction of capitalist relations of exploitation and domination. 30. We might take a passage from Marx as a source of guidelines for developing a historical-materialist theory of racism which is not empiricist but dialectical in aiming for theorizing conceptual concreteness as a multiplicity of historically informed and configured determinations. This passage comes from a letter dated 9 April 1870 to Meyer and Vogt in which Marx explains why the Irish struggle for autonomy was of crucial significance for the British proletariat: . . . Every industrial and commercial center in England possesses a working class divided into two hostile camps, English proletarians and Irish proletarians. The ordinary English worker hates the Irish worker as a competitor who lowers his standard of life. In relation to the Irish worker he feels himself a member of the ruling nation and so turns himself into a tool of the aristocrats and capitalists of his country against Ireland, thus strengthening their domination over himself. He cherishes religious, social, and national prejudices against the Irish worker. His attitude towards him is much the same as that of the 'poor whites' to the 'niggers' in the former slave states of the USA. The Irishman pays him back with interest in his own money. He sees in the English worker at once the accomplice and stupid tool of the English rule in Ireland. This antagonism is artificially kept alive and intensified by the press, the pulpit, the comic papers, in short by all the means at the disposal of the ruling classes. This antagonism is the secret of the impotence of the English working class, despite its organization. It is the secret by which the capitalist class maintains its power. And that class is fully aware of it (quoted in Callinicos 1993). Here Marx sketches three parameters for the sustained viability of racism in modern capitalist society. First, the economic competition among workers is dictated by the distribution of labor power in the labor-market via differential wage rates. The distinction between skilled and unskilled labor is contextualized in differing national origins, languages and traditions of workers, which can be manipulated into racial antagonisms. Second, the appeal of racist ideology to white workers, with their identification as members of the "ruling nation" affording--in W.E.B. DuBois's words--"public and psychological wage" or compensation. Like religion, white-supremacist nationalism provides the illusory resolution to the real contradictions of life for the working majority of citizens. Third, the ruling class reinforces and maintains these racial divisions for the sake of capital accumulation within the framework of its ideological/political hegemony in the metropolis and worldwide. 31. Racism and nationalism are thus modalities in which class struggles articulate themselves at strategic points in history. No doubt social conflicts in recent times have involved not only classes but also national, ethnic, and religious groups, as well as feminist, ecological, antinuclear social movements (Bottomore 1983). The concept of "internal colonialism" (popular in the seventies) that subjugates national minorities, as well as the principle of self-determination for oppressed or "submerged" nations espoused by Lenin, exemplify dialectical attempts to historicize the collective agency for socialist transformation. Within the framework of the global division of labor between metropolitan center and colonized periphery, a Marxist program of national liberation is meant to take into account the extraction of surplus value from colonized peoples through unequal exchange as well as through direct colonial exploitation in "Free Trade Zones," illegal traffic in prostitution, mail-order brides, and contractual domestics (at present, the Philippines provides the bulk of the latter, about ten million persons and growing). National oppression has a

concrete reality not entirely reducible to class exploitation but incomprehensible apart from it; that is, it cannot be adequately understood without the domination of the racialized peoples in the dependent formations by the colonizing/imperialist power, with the imperial nation-state acting as the exploiting class, as it were (see San Juan 1998; 2002). 32. Racism arose with the creation and expansion of the capitalist world economy (Wolf 1982; Balibar and Wallerstein, 1991). Solidarities conceived as racial or ethnic groups acquire meaning and value in terms of their place within the social organization of production and reproduction of the ideological-political order; ideologies of racism as collective social evaluation of solidarities arise to reinforce structural constraints which preserve the exploited and oppressed position of these "racial" solidarities. Such patterns of economic and political segmentation mutate in response to the impact of changing economic and political relationships (Geshwender and Levine 1994). Overall, there is no denying the fact that national-liberation movements and indigenous groups fighting for sovereignty, together with heterogeneous alliances and coalitions, cannot be fully understood without a critical analysis of the production of surplus value and its expropriation by the propertied class--that is, capital accumulation. As John Rex noted, different ethnic groups are placed in relations of cooperation, symbiosis or conflict by the fact that as groups they have different economic and political functions.Within this changing class order of [colonial societies], the language of racial difference frequently becomes the means whereby men allocate each other to different social and economic positions. What the type of analysis used here suggests is that the exploitation of clearly marked groups in a variety of different ways is integral to capitalism and that ethnic groups unite and act together because they have been subjected to distinct and differentiated types of exploitation. Race relations and racial conflict are necessarily structured by political and economic factors of a more generalized sort (1983, 403-05, 407). Hence race relations and race conflict are necessarily structured by the larger totality of the political economy of a given society, as well as by modifications in the structure of the world economy. Corporate profit-making via class exploitation on an international/globalized scale, at bottom, still remains the logic of the world system of finance capitalism based on historically changing structures and retooled practices of domination and subordination.

Link - Surveillance

The aff doesn't challenge imperialism it recreates it – without first addressing the system of capitalism the discourse produced by the aff is commodified and used in order to justify US moral superiority and invasions – only challenging the economic incentive for those invasions stops violence

Monahan in 6 - Associate Professor of Human and Organizational Development and Medicine at Vanderbilt University. Member of the International Surveillance Studies Network <Torin. "Counter-surveillance as Political Intervention?" SOCIAL SEMIOTICS VOLUME 16 NUMBER 4 (DECEMBER 2006) Pgs 515-531>

Michael Hardt and Antonio Negri (2000) would describe these ongoing exchanges between dominant and subordinate groups as a mutual and perhaps unwitting advancement of ''Empire''*/the larger system of global capitalism and its colonization of lifeworlds. They note, for instance, how humanitarian efforts by western countries first establish discursive universal orders*/such as ''human rights''*/as justification for intervention, and then how these universals are capitalized upon by military and economic institutions as rationales for imperialistic invasions. Similarly, activist **struggles appear to teach the system of global capitalism, or those manning its operations, how to increase strategic efficiency by controlling spaces available for political opposition**. From this perspective, the flexible ideologies of the 1960s counterculture movements may have disturbed the capitalist system, but in doing so also described a new territory (the self) and a new mode of operation for the growth of capitalism: Capital did not need to invent a new paradigm (even if it were

capable of doing so) because the truly creative moment had already taken place. Capital's problem was rather to dominate a new composition that had already been produced autonomously and defined within a new relationship to nature and labor, a relationship of autonomous production. (Hardt and Negri 2000, 276) The post-Fordist colonizations of public spaces and resources today are outgrowths of an earlier colonization of ''flexibility'' as a viable and successful challenge to the rigidities of technocratic bureaucracies. I would build upon these observations to say that the conflicts between surveillance and counter-surveillance practices today represent a larger struggle over the control of spaces and bodies. It is doubtful that police or security forces are intentionally manipulating spaces and bodies with surveillance and other strategies because they explicitly wish to neutralize democratic opportunities; in fact, they most likely believe that their actions of social control are preserving democracy by safeguarding the status quo (Monahan 2006b). Be that as it may, such activities advance neoliberal agendas by eliminating spaces for political action and debate, spaces where effective alternatives to economic globalization could emerge and gain legitimacy if they were not disciplined by police and corporate actions. Therefore, it should not be seen as a coincidence that the demise of public spaces is occurring at the same time that spatial and temporal boundaries are being erased to facilitate the expansion of global capital. The two go hand in hand. Whereas one can readily critique Hardt and Negri for their attribution of agency to capitalism or to the amorphous force of ''Empire,'' their systemic viewpoint is worth preserving in what has become a contemporary landscape of social fragmentation, polarization, and privatization. Dominant and subordinate groups serve as asymmetrical refractions of each other in emerging global regimes. Surveillance and counter-surveillance are two sets of overlapping practices selectively mobilized by many parties in this conflict, but the overall effect is unknown. Conclusions Are counter-surveillance activities political interventions? Yes, they are clearly political. The central question remains, however, as to which counter-surveillance configurations provide productive critiques and interventions. Because counter-surveillance movements, in my definition of them, seek to correct unequal distributions of power, they do destabilize status quo politics on a case- by-case basis*/on the ground, at specific, temporally bounded sites of contestation. If our vantage point is once removed, however, then individualized counter-surveillance efforts appear to provide the necessary provocations for those with institutional power to diagnose and correct inefficiencies in their mechanisms of control.

Link – Counternarratives

Their method of counternarration will be coopted by capitalism and reproduce violence – their focus on the cultural impact of white supremacy masks the way that labor creates the violence outlined in the aff through commodity fetishism

Saha in 12 <Amelia. "Locating MIA: 'Race', commodification and the politics of production" 2012. European Journal of Cultural Studies 0(0) 1–17>

The importance of this argument, and why it still represents a critical intervention, is in the way that it foregrounds the capitalist, industrial context of the politics of representation and recognition that other cultural studies approaches to 'race' and difference tend to ignore. Too often these accounts of popular music and culture focus solely on the textual, ignoring the way that cultural texts are in effect cultural commodities and the product of industrial, rationalized production that is inextricably bound up in the way that the **cultural text appears at the point of consumption.** When eventually the concept of 'commodification' is evoked in these accounts, it is often in a fleeting way, as a shorthand to describe capitalism's co-option of potentially resistive subcultures. At best, such references to commodification are cursory, on the way to another point, but at worst they represent a somewhat lethargic description of capitalism's supposed co-option of the counter-narratives of difference and the production of its own form of corporate multiculture. The term 'commodification' derives from Marxist theory, where it is conceptualized in terms of the conversion of an object or aspect of life which has not been previously considered in economic terms into a commodity with exchange value. Within this account, the commodification of culture, and the vast proliferation of cultural goods that has resulted, is critiqued subsequently in terms of how capitalists make sounds, styles, images, symbols and so on into private property, restricting access to others (primarily through copyright law). Additionally, it highlights how, **through commodity fetishism, the exploitation of labour**

that has gone into its production is masked (see Hesmondhalgh, 2007). In light of this, critical political economists such as Mosco (1996) and Garnham (2001[1979]) write against an understanding of commodification that attributes too much importance to ideology and representation (which Mosco attributes to a particular tradition of communications research). **An excessive focus on its cultural dimensions risks deflecting attention away from the real effects of commodification: that is, the extraction of surplus value and the concealment of absolute and relative forms of labour exploitation through commodity fetishism** (Mosco, 1996)

Link – Commodifying Suffering

The aff reproduces both colonialism and capitalism by commodifying the lives the experiences of the oppressed as objects that can be exchanged in the debate – the methodology relies on capitalist assumptions about personhood because it allows for the people the aff talks about to become commodified, dislocated subjects

Ticktin 99 <Miriam. "Selling Suffering in The Courtroom and Marketplace:An Analysis of the Autobiography of Kiranjit Ahluwalia" [PoLAR: Vol. 22, No. 1. Pgs 24-28>

Second, I will look at the market narrative or narrative as commodity; how is this bookdetermined by its nature as a commodity? How is language that will sell employed without selling the suffering of these women? The two dominant narratives work together in framing identities through concepts of abstract individualism. As noted by Collier et. al. (1995), the legal practices developed in Europe and its colonies since the eighteenth century are intimately connected to the development of capitalism; Pashukanis used the term "bourgeois law" to emphasize the fact that the creator and beneficiary of law is the property-owning individual(1989). As interconnected systems, both the law and capitalism are based on notions of personhood that encourage the distinction between subject and object, inside and outside, person and thing. As Radin suggests, this world of abstract beings, equal before the law and politically equal, facilitates conceiving of concrete personal attributes as commodified objects (Radin1987:1892). In this vein, I will argue that the two dominant **narratives further the commodification of suffering.** Both the legal narrative and the market narrative require intermediaries for Kiranjit. In the legal case, she speaks only through various lawyers and through representatives from the women's activist group Southall Black Sisters. These legal stories are themselves told through the book, which is in turn mediated by Rahila Gupta, the woman chosen because (as stated inher preface) "Kiranjit's English would not quite mould itself to the 'words from the heart' thatwere waiting to tumble out" (p.xii). Thus, Kiranjit never speaks directly. In order to enter a discourse in which her story can be made public, in order to be represented, we realize that **she must be a dislocated subject** (Spivak 1988).This makes it apparent that we are dealing with several different subjects of Circle of Light, each occupying different positions and having unequal access to the means of representation: South Asian women, battered women, and Kiranjit Ahluwalia. And the question is this: do the two dominant discourses occupy these subjects so completely, do they take the subjects over in such a way that they simply cannot speak the violence, the oppression? And just as importantly, how do the subjects colonize or oppress one another? Finally, which subjects - if any – are empowered by this commoditized representation of suffering?

Turns the Case/Root Cause

They misunderstand the root cause of the violence in the aff – it was the desire to manage labor that created the incentive for racialized surveillance and slavery by

providing poor whites with psychological compensation that disincentivized them from organizing with Blacks to challenge the plantation system – their author

Kundnani and Kumar in 15 - Deepa Kumar is an associate professor of Media Studies and Middle East Studies at Rutgers University. Arun Kundnani teaches at New York University. His latest book is The Muslims Are Coming! Islamophobia, Extremism, and the Domestic War on Terror. <Arun and Deepa. "Race, surveillance, and empire" International Socialist Review. Issue 96, Spring 2015.>

Class, gender, and racial security While racial security was central to the settler-colonial project in North America, territorial dispossession was only one aspect of the process of capital accumulation for the new state; the other was the discipline and management of labor. As Theodore Allen shows in The Invention of the White Race, the "white race" did not exist as a category in Virginia's colonial records until the end of the seventeenth century. Whiteness as an explicit racial identity had to be cultivated over a period of decades before it could become the basis for an organized form of oppression.17 A key moment in the production of whiteness was the response of the ruling Anglo elite to Bacon's Rebellion of 1676. The rebellion was begun by colonial settlers who wanted a more aggressive approach to securing the territory against Indigenous peoples. But it also involved African and Anglo bond laborers joining together in a collective revolt against the system of indentured servitude. This threatened not only the profitability but also the very existence of the plantation system. Over the following three decades, the Virginia Assembly passed a series of acts that racialized workers as Black and white. Those who could now call themselves white were granted some benefits by law, whereas those designated Black were turned from bond laborers (who could therefore expect to be free after a period of time) into slaves—property with no rights whatsoever and no hope of freedom. To win them to the side of the plantation bourgeoisie, poor white men were given privileges—they had access to land and enjoyed common law protections such as trial by jury and habeas corpus that were denied to Black enslaved people.18 In practice this meant that white men, for instance, could rape Black women and not be charged with a crime (because Blacks were property and so only "damages" were to be paid to the slave owner). Further, property rights and the legal notion of settled land not only denied Native American property claims but even erased the existence of Indigenous people on the basis that, because white settlers had transformed the pristine North American wilderness into productive land, they were the real "natives."19 Once the legal and ideological work had been done to naturalize race as a visible marker of inherent difference and to separate "us" from "them," **it could be made use of as a stable category of surveillance; the patrols set up to capture runaway slaves—arguably the first modern police forces in the United States20—needed only to "see" race in order to identify suspects**. Moreover, the plantation system was stabilized by enabling non-elite whites to see security as a racial privilege and shared responsibility. W. E. B. Du Bois argued in Black Reconstruction that, in the slave plantations of the South, poor whites were brought into an identification with the planter elite by being given positions of authority over Blacks as overseers, slave drivers, and members of slave patrols. With the associated feeling of superiority, their hatred for the wider plantation economy that impoverished them was displaced onto Black enslaved people: class antagonism was racialized and turned into a pillar of stability for the system. Meanwhile, in the North, labor leaders had little appetite for abolition, fearing competition from a newly freed Black workforce.21 After abolition, the same racial anxieties were mobilized to disenfranchise the Black laborer in the South. Du Bois used the term "psychological wage" to describe this sense of superiority granted to non-elite whites in the South: It must be remembered that the white group of laborers, while they received a low wage, **were compensated by a sort of public and psychological wage**. They were given public deference and titles of courtesy because they were white. They were admitted freely with all classes of white people to public functions, public parks, and the best schools. The police were drawn from their ranks, and the courts, dependent under their votes, treated them with such leniency as to encourage lawlessness.... On the other hand, in the same way, the Negro was subject to public insult; was afraid of mobs; was liable to the jibes of children and the unreasoning fears of white women; and was compelled almost continuously to submit to various badges of inferiority. The

result of this was that the wages of both classes could be kept low, the whites fearing to be supplanted by Negro labor, the Negroes always being threatened by the substitution of white labor.22 We suggest below that, since the 1970s, neoliberalism has involved a similar kind of process, in which the social wage of the New Deal welfare state was progressively withdrawn and **racialized notions of security offered in its place as a psychological compensation.**

History has been one of class struggles – confronting capitalism is a necessary prerequisite to breaking down the hierarchies of oppression the aff talks about – their method prevents a transition to a society beyond oppression

TUMINO 1

(Stephen, Prof. English @ Pitt, "What is Orthodox Marxism and Why it Matters Now More than Ever", Red Critique)

Any effective political theory will have to do at least two things: it will have to **offer an integrated understanding of social practices** and, based on such an interrelated knowledge, offer a guideline for praxis. My main argument here is that among all contesting social theories now, **only Orthodox Marxism has been able to produce an integrated knowledge of the existing social totality and provide lines of praxis that will lead to building a society free from necessity.** But first I must clarify what I mean by Orthodox Marxism. Like all other modes and forms of political theory, the very theoretical identity of Orthodox Marxism is itself contested—not just from non-and anti-Marxists who question the very "real" (by which they mean the "practical" as under free-market criteria) existence of any kind of Marxism now but, perhaps more tellingly, from within the Marxist tradition itself. I will, therefore, first say what I regard to be the distinguishing marks of Orthodox Marxism and then outline a short polemical map of contestation over Orthodox Marxism within the Marxist theories now. I will end by arguing for its effectivity in bringing about a new society based not on human rights but on freedom from necessity. I will argue that to know contemporary society—and to be able to act on such knowledge—one has to first of all know what makes the existing social totality. I will argue that the dominant social totality is based on inequality—not just inequality of power but inequality of economic access (which then determines access to health care, education, housing, diet, transportation, . . .). This **systematic inequality cannot be explained by gender, race, sexuality, disability, ethnicity, or nationality. These are all secondary contradictions** and are all determined by the fundamental contradiction of capitalism which is inscribed in the relation of capital and labor. All modes of Marxism now explain social inequalities primarily on the basis of these secondary contradictions and in doing so—and this is my main argument—legitimate capitalism. Why? Because such arguments **authorize capitalism without gender, race, discrimination and thus accept economic inequality as an integral part of human societies**. They accept a sunny capitalism—a capitalism beyond capitalism. Such a society, based on cultural equality but economic inequality, has always been the not-so-hidden agenda of the bourgeois left—whether it has been called "new left," "postmarxism," or "radical democracy." This is, by the way, the main reason for its popularity in the culture industry—from the academy (Jameson, Harvey, Haraway, Butler,. . .) to daily politics (Michael Harrington, Ralph Nader, Jesse Jackson,. . .) to. . . . For all, capitalism is here to stay and the best that can be done is to make its cruelties more tolerable, more humane. This humanization (not eradication) of capitalism is the sole goal of ALL contemporary lefts (marxism, feminism, anti-racism, queeries, . . .). Such an understanding of social inequality is based on the fundamental understanding that the source of wealth is human knowledge and not human labor. That is, wealth is produced by the human mind and is thus free from the actual objective conditions that shape the historical relations of labor and capital. Only Orthodox Marxism recognizes the historicity of labor and its primacy as the source of all human wealth. In this paper I argue that any emancipatory theory has to be founded on recognition of the priority of Marx's

labor theory of value and not repeat the technological determinism of corporate theory ("knowledge work") that masquerades as social theory.

Even if we don't win the racial bribe still functions today – economic conditions are right for a rising up of the poor against the rich, but law-and-order politics have painted poor blacks as a degenerate culture to be fought and controlled – the alt is key, otherwise the aff just gets coopted

Alexander 10 (The new Jim Crow: mass incarceration in the age of colorblindness, Michelle Alexander is an asociate professor of law at Ohio State University and a civil rights advocate, who has litigated numerous class action discrimination cases and has worked on criminal justice reform issues. She is a recipient of a 2005 Soros Justice Fellowship of the Open Society Institute, has served as director of the Racial Justice Project at the ACLU of Northern California, directed the Civil Rights Clinic at Stanford Law School and was a law clerk for Justice Harry Blackmun at the U. S. Supreme Court.)

Competing images of the poor as "deserving" and "undeserving" became central components of the debate. Ultimately, the racialized nature of this imagery became a crucial resource for conservatives, who succeeded in using law and order rhetoric in their effort to mobilize the resentment of white working-class voters, many of whom felt threatened by the sudden progress of African Americans. As explained by Thomas and Mary Edsall in their insightful book *Chain Reaction*, a disproportionate share of the costs of integration and racial equality had been borne by lower- and lower-middle-class whites, who were suddenly forced to compete on equal terms with blacks for jobs and status and who lived in neighborhood adjoining black ghettos. Their children-not the children of wealthy whites-attended schools most likely to fall under busing orders. The affluent white liberals who were pressing the legal claims of blacks and other minorities "were often sheltered, in their private lives, and largely immune to the costs of implementing minority claims." This reality made it possible for conservatives to characterize the "liberal Democratic establishment" as being out of touch with ordinary working people- thus resolving one of the central problems facing conservatives: how to persuade poor and working-class voters to join in alliance with corporate interests and the conservative elite.

“Riot” PIC

1NC “Riot” PIC

___and I advocate the method of the 1AC without endorsing the use of the term “riot”

The term “riot” is associated with illogical, violent acts and serves to criminalize Blackness and social protest – turns the case – it is their argument that the discourse we use has a material effect on the world

Campbell et al in 4 <”Remote Control: How Mass Media Delegitimize Rioting as Social Protest” Shannon Campbell, Phil Chidester, Jamel Bell and Jason Royer

Source: Race, Gender & Class, Vol. 11, No. 1, Race, Gender, Class and the 1992 L.A. "Riots" (2004), pp. 158-176>

A key result of the newspapers' coverage of the Los Angeles and Cincinnati riots is the encouragement of readers to associate rioting as a concept with perceptions of race and racial difference. At first glance, this association is anything but surprising; after all, the riots in question were racially motivated, and this motivation may well be the only aspect of the events upon which all involved clearly agreed. A more in-depth consideration of this mediated theme, however, reveals the troublesome nature of the cognitive linkage of "race" and "rioting" as necessarily associated terms in readers' minds. Dyer (1988) alleges that the concept of "race" has come to embody very specific connotative meanings for many Americans. According to the critic, Whiteness can function as a human norm precisely because White people are not racially seen or named, and thus have the power to speak for all of humanity rather than speaking exclusively for their own race. Indeed, Dyer claims, ". . . race is something only applied to non- White peoples" (p. 1). Nakayama and Krizek (1995) concur, noting that one of the strategies supporting the systemic power base of Whiteness in the U.S. today is a refusal to label Whiteness in a racial sense. As a result, Nakayama and Krizek suggest, the term "race" is left to be applied exclusively to the "other." Finally, Warren and Twine (1997) assert that Blackness serves as a metonym against which Whiteness is measured and given meaning in our contemporary society. Because of this, Whiteness exists as two general categories: White and non- White. Through this process, non-Whiteness becomes synonymous with Blackness in many Americans' minds. The implications of this cognitive association are particularly clear when it comes to media coverage of riot events. Because viewers and readers are encouraged to see riots as largely racial events, and because for many readers the term "race" is synonymous with their conceptualization of "Blackness" (Warren & Twine, 1997), riots become for these readers events that are by, for and about African Americans. Coupled with the associated framing of riots as illogical acts in response to necessary societal controls, this cognitive linkage of rioting with a specific racial group can have a staggering impact on the way readers process the "facts" about violent urban uprisings

2NC “Riot” PIC

Using the term “riot” divorces activism from its political context and criminalize it

Waldman in 15 <Katy. “Is Baltimore Beset by Protests, Riots, or an Uprising?” April 29, 2015. http://www.slate.com/blogs/lexicon_valley/2015/04/29/protest_versus_riot_versus_uprising_the_language_of_the_baltimore_freddie.html>

As Subtirelu points out, venues that present themselves as conservative are more likely to opt for riots over protests, thereby “eras[ing] the political messages and purposes of people in Baltimore.” More “moderate and progressive venues” are likelier to reach for the terms that “imbue many of the people in the

streets with political purpose." (As seen in the chart above, Slate has used both terms.) Here's exhibit C. On Monday night's live coverage of the fracas, CNN commentator Marc Lamont Hill laid bare the reasoning behind such linguistic sleights-of-hand. "I'm not calling these people rioters," he told Van Jones and Don Lemon. "I'm calling these uprisings and I think it's an important distinction to make. …There have been uprisings in major cities and smaller cities around this country for the last year because of the violence against black female and male bodies forever and I think that's what's important." What exactly is at stake in the semantic tug-of-war between riots and protests, riots and uprisings? As both Subtirelu and Hill suggest, the second two options demand that we take the people involved more seriously, as agents with purpose and grievance. The verb protest especially carries intimations of virtue; in the mid-15th century, it meant "to declare formally or solemnly," as in "to protest one's innocence." Today the word implies principled disapproval and moral fiber: The stalwart protester stands in the rain, picketing for equal pay. Indeed, one protests against something, not just for the hell of it. The act requires fortitude but—perhaps thanks to Gandhi and Martin Luther King Jr.—it is an effort of will and ethical imagination, not arm and hammer. Protest's connotations of self-discipline seem to counter the threat of wanton violence.

The word "riot" attributes activism to criminality and meaningless violence

Campbell et al in 4 <"Remote Control: How Mass Media Delegitimize Rioting as Social Protest" Shannon Campbell, Phil Chidester, Jamel Bell and Jason Royer Source: Race, Gender & Class, Vol. 11, No. 1, Race, Gender, Class and the 1992 L.A. "Riots" (2004), pp. 158-176>

According to Olzak and Shanahan (1996), riots are the violent expression of two very different types of social unrest: race/ethnic protests and race/ethnic conflicts. The first type of uprising, the researchers suggest, finds a distinct group expressing a grievance or demonstrating against the existing power structure on the basis of ethnic or racial identity, while race/ethnic conflicts involve one group attacking anotheracial/ethnic collective or a group representing the sociopolitical structure, such as the police or the military. Olzak and Shanahan conclude that large-scale riots may erupt as a result of either type of demonstration, though violence is generally not an intended purpose of race/ethnic protests, and is rarely instigated by the protesters themselves. In similar fashion, Lieberson and Silverman (1965) define riots as "... a generalized response directed at a collectivity rather than the offender" (p. 891), and further note that such actions are . . frequently misunderstood" (p. 898), often attributed to criminals and rabble rousers rather than to respectable citizens in desperate search of a means to express their dissatisfaction with current conditions and policies. Oberschall (1993) concurs, noting that such acts do indeed contain "normative and rational elements" (p. 257). In other words, while riots are clearly the by-product of more legitimate - and legitimized - forms of unrest, because the attendant violence is rarely directed at those responsible for the unrest, or even aimed specifically at larger groups seen to represent the guilty party or system, it becomes far too easy to frame these moments of collective brutality and terror as nothing more than meaningless, futile expressions of violence.

Using the word "riot" reinforces racist stereotypes and separate protests and uprisings from their political context

Eckel in 8 - BA in Political Science from McGill University in Montreal, Quebec, and MA in Social Science from the University of Chicago <Matt. "The planning of 'ethnic' violence" January 24th, 2008. http://rationalinternational.blogspot.com/2008/01/planning-of-ethnic-violence.html>

Today's BBC has a worthwhile article pointing out Human Rights Watch allegations that much of the "ethnic" (I'll explain the quotes in a second) violence ravaging Kenya is being planned and directed by political elites there. Again, worth reading, but hardly surprising to anyone who has looked at historical patterns of communal violence. The nature of media coverage of such strife is a persistent complaint of people who study ethnic conflict and ethno-nationalist politics. By framing violence as "ethnic," without adding much context to the term, reporters unwittingly frame it as a result of ancient, hardened, immutable social divisions that spontaneously flare up from time to time (I - along with many others, prefer the term "communal," because it leaves open the

possibility for boundaries to change). Furthermore, by using the word "riot" to describe the actual incidents, reporters conjure up images of pent-up anger, randomly exploding into wanton destruction (in the context of Africa, it also unwittingly reinforces racist stereotypes about tribal conflict). Recent history - from the Kristallnacht to the Rwandan Genocide to the 2002 Hindu-Muslim clashes in Gujarat - has shown that such violence is nearly always planned and directed by communal elites. "Pogrom" might be a more appropriate term.

Their call for counternarratives rely on empathetic identification by conjuring the judge/debater's liberal self-worth to get a ballot. This reinscribes suffering by making fungible the experience of the other and simultaneously destroying their experience – turns the case by recreating colonialism

Hartman, 97 <Saidya Hartman, Saidiya Hartman is a professor at Columbia University specializing in African American literature and history. She grew up in Brooklyn and received her B.A. from Wesleyan University and Ph.D. from Yale University, Scenes of Subjection>

In an epistle to his brother, John Rankin illumined the "very dangerous evil" of slavery in a description of the coffle, detailing the obscene theatricality of the slave trade: "Unfeeling wretches purchased a considerable drove of slaves how many of them were separated from husbands and wives, I will not pretend to say-and having chained a number of them together, hoisted over the flag of American liberty, and with the music of two violins marched the woe-worn, heart-broken, and sobbing creatures through the town." 1 Rankin, aghast at the spectacle and shocked by "seeing the most oppressive sorrows of suffering innocence mocked with all the lightness of sportive music," decried: "My soul abhors the crime." The violation of domesticity, the parody of liberty, and the callous defiance of sorrow define the scene in which crime becomes spectacle. The "very dangerous evil" of slavery and the "agonizing groans of suffering humanity" had been made music.2¶ Although Rankin conceded that the cruelty of slavery "far exceed[ed] the power¶ of description," he nonetheless strove to render the horrors of slavery, And in so doing, Rankin makes apparent that the crimes of slavery are **not only witnessed but staged.** This is a result of the recourse to terms like "stage," "spectacle," and "scene" in conveying these horrors, and, more important, because the "abominations of slavery" are disclosed through the reiteration of secondhand accounts and circulating stories from "unquestionable authorities" to which Rankin must act as surrogate witness. In the effort to "bring slavery close," these circulating reports of atrocity, in essence, are reenacted in Rankin epistles. The grotesqueries enumerated in documenting the injustice of slavery are intended to shock and to disrupt the comfortable remove of the reader/spectator. By providing the minutest detail of macabre acts of violence, embellished by his own fantasy of slavery's bloodstained gate, Rankin hoped to rouse the sensibility of those indifferent to slavery by exhibit ing the suffering of the enslaved and facilitating an identification between those free and those enslaved: "We are naturally too callous to the sufferings of others, and consequently prone to look upon them with cold indifference, until, in imagination we identify ourselves with the sufferers, and make their sufferings our own .... When I bring it near, inspect it closely, and find that it is inflicted on men and women, who possess the same nature and feelings with myself, my sensibility is roused" (56-57). **By bringing suffering near, the ties of sentiment are forged.** In letter after letter, Rankin strove to create this shared experience of horror in order to transform his slaveholding brother, to whom the letters were addressed, as well as the audience of readers. In this case, pain provides the common language of humanity; it extends humanity to the dispossessed and, in turn, remedies the indifference of the callous. ¶ The shocking accounts of whipping, rape, mutilation, and suicide assault the¶ barrier of indifference, for the abhorrence and indignity roused by these scenes of terror, which range from the mockery of the coffle to the dismemberment and incineration of a slave boy, give rise to a shared sentience between those formerly indifferent and those suffering. So intent and determined is Rankin to establish that slaves possess the same nature and feelings as himself, and thereby establish the common humanity of all men on the basis of this extended suffering, that he literally narrates an imagined scenario in which he, along with his wife and child, is enslaved. The "horrible scenes of cruelty that were presented to [his] mind as a consequence of this imagining aroused the "highest pitch of indignant feeling." In addition this scenario enables Rankin to speak not only for but literally in the place of the enslaved. By believing himself to be and by phantasmically becoming the enslaved, he creates the scenario for shared feelings:¶ My flighty imagination added much to the tumult of passion by persuading me, for he moment, that 1 myself was a slave, and with my

wife and children placed under the reign of terror. I began in reality to feel for myself, my wife, and my children-the thoughts of being whipped at the pleasure of a morose and capricious master, aroused the strongest feelings of resentment; but when I fancied the cruel lash was. Approaching my wife and children, and my imagination depicted in lively colors, their tears, their shrieks, and bloody stripes, every indignant principle of my bloody nature was exerted to the highest degree. (56)¶ The nature of the feelings aroused here is rather complicated. While this flight of imagination enables a vicarious firsthand experience of the lash, excoriates the pleasure experienced by the master in this brutal exercise of power, and unleashes Rankin's fiery indignation and resentment, the phantasmic vehicle of this identification is complicated, unsettling, and disturbing. Although Rankin's fantasy culminates in indignant outcries against the institution of slavery and, clearly, the purpose of this identification is to highlight the crimes of slavery, this flight of imagination and slipping into the captive's body unlatches a Pandora's box and, surprisingly, what comes to the fore is the difficulty and slipperiness of empathy. Properly speaking, empathy is a projection of oneself into another in order to better under stand the other or "the projection of one's own personality into an object, with the attribution to the object of one's own emotions."4 Yet empathy in important respects confounds Rankin's efforts to identify with the enslaved because in making the slave's suffering his own, Rankin begins to feel for himself rather than for those whom this exercise in imagination presumably is designed to reach. Moreover, by exploiting the vulnerability of the captive body as a vessel for the uses, thoughts, and feelings of others, the humanity extended to the slave inadvertently confirms the expectations and desires definitive of the relations of chattel slavery. In other words, the ease of **Rankin's empathic identification is as much due to his good intentions and heartfelt opposition to slavery as to the fungibility of the captive body.**

Our alternative is to remain opaque – this is necessary to challenge the imperial strategy that discursively seeks to know, conquer and reproduce colonialism

Walker in 11 - Ph.D., The College of William and Mary, former Chair of the Department of Africana Studies at Brown University <Corey. "How Does It Feel to be a Problem?': (Local) Knowledge, Human Interests, and The Ethics of Opacity" Transmodernity: Journal of Peripheral Cultural Production of the Luso-Hispanic World, 1(2)>

I have chosen the ground of ethics in wrestling with the question of epistemology for this particular endeavor in order to highlight "the very fact that ethics exist as unscientific" – that is resistant to and restrictive of the epistemic hegemony of Science proper – speaks to its critical dimension that "cannot be reduced to the disciplining of science," indeed of the modern, rational episteme.15 Hence the recourse to ethics in pursuit of an emancipatory project of knowledge holds out the possibility of unmasking and "denouncing all myth, all mystifications, all superstitions" that inhere in a disciplinary and disciplining logic of our contemporary categorization and organization of knowledge, particularly in the North Atlantic academy.16 Moreover, it reminds us that the question of epistemology cannot be approached without critical attention to the question of ethics, particularly for those projects that claim to be emancipatory. With this understanding, ethics is transformed into a critical discursive practice that evades uncritical "sentimentality and development, and pre[over]determined categories such as good and bad."17 Ethics proper is a discourse derived from a rigorous, vigilant, and militant theoretical site of struggle. Such struggles are not merely over "values," but rather expose the "conflicts in which [groups, formations, and classes] express their means of reproducing the very struggle that creates them – and finds emancipatory expression in their practices of resistance, pleasure, and authority."18 Ethics thus rendered is transformed into a critical terrain that fields the necessary interrogatory practices that question the normative assumptions and methodological presuppositions in raising a critical consciousness in the ongoing battle of challenging the disciplinary dictates and epistemological demands of the modern organization of knowledge. The ethics of opacity operates from a similar

position as announced by Alain Badiou, "Ethics does not exist. There is only the ethics of (of politics, of love, of science, of art)."19 Such an ethical understanding seeks to temper the imperial strategy of traditional ethics, particular ethical formulations, traditions, and prescriptives that gather under the logics and technologies of coloniality. Indeed, as Badiou puts it, "it might well be that ethical ideology, detached from the religious teachings which at least conferred upon it the fullness of 'revealed' identity, **is simply the final imperative of a conquering civilization**: 'Become like me and I will respect your difference'" (28). Inspired by the work of Charles Long, the ethics of opacity establishes the critical principle that those hegemonic knowledge systems unleashed by coloniality/modernity necessarily introduce what Long calls "that 'thing' [which] must be suppressed, but the very act of suppression introduces the thing suppressed into the symbolic universe that it stakes out."20 Long continues with recourse to the work of Paul Ricoeur who writes, "Now defilement enters into the universe of man through speech, or the word; its anguish is communicated through speech . . . the opposition of the pure and the impure is spoken. . . a stain is a stain because it is there, mute; the impure taught in the words that institute the taboo" (204). Within this nexus, the ethics of opacity suggest a critical site for the production and reproduction of the knowledges of those on the underside of modernity. Long writes, Black, the colored races, caught up into this net of the imaginary and symbolic consciousness of the West, rendered mute through the words of military, economic, and intellectual power, assimilated as if by osmosis structures of this consciousness of oppression. This is the source of the doubleness of consciousness made famous by W.E.B. Du Bois. But even in these symbolic structures there remained the inexhaustibility of the opaqueness of this symbol for those who constituted the "things" upon which the significations of the West deployed its meanings. (204)

Opacity is a necessary strategy to resolve the aff by interrupting the economy of knowledge that justifies violence against the colonized – the aff just reproduces violence and makes the infiltration they decry more likely

Walker in 11 - Ph.D., The College of William and Mary, former Chair of the Department of Africana Studies at Brown University <Corey. "How Does It Feel to be a Problem?': (Local) Knowledge, Human Interests, and The Ethics of Opacity" Transmodernity: Journal of Peripheral Cultural Production of the Luso-Hispanic World, 1(2)>

Thus, the ethics of opacity establishes a critical movement, indeed produces an ethical demand, that speaks to and is founded upon a responsibility to interrogate hegemonic epistemological production, which is "the context for the communities of color, the opaque ones of the modern world" (Long 204). Such an ethics calls into question traditional formulations and rehearsal of ethics proper and radically calls into account those "radical" formulations of emancipatory theoretical projects, i.e. scientific Marxism, dogmatic theology, Western democracy, and the host of "post-" prefixed theoretical formulations. Such an ethics of opacity also entails, or rather prescribes a critical intellectual practice that affirms the worth, value, and dignity of the "human." Long writes, "Octavio Paz tells us that they were filled with poets, proletarians, colonized peoples, the colored races. 'All these purgatories and hells lived in a state of clandestine ferment. One day in the twentieth century, the subterranean world blew up. The explosion hasn't yet ended and its splendor has illumined the agony of the age" (204).21 The ethics of opacity is animated by this vision in seeking to articulate the depth of meaning that is announced that these continuing events. In this sense, the ethics of opacity pushes the discourse of ethics to the limit. Accordingly, recourse to Levinas is quite appropriate when he suggests, "My task does not consist in constructing ethics, I only try to seek its meaning."22 The ethics of opacity presents "more than an accusation regarding the actions and behavior of the oppressive cultures; it goes to the heart of the issue. It is an accusation regarding the world view, thought structures, theory of knowledge, and so on, of the oppressors. The accusation is not simply of bad acts but, more importantly, of bad faith and bad knowledge."23 An ethics of opacity is thus defined by its critical orientation to liberation as articulated by and with the opaque ones. It is a critical intellectual posture that disrupts the

dominant logic of coloniality/modernity in exploring the hidden and unknown, the repressed and submerged narratives, histories, and epistemologies – the sites of opacity that are the conditions of im/possibility of the contemporary world. Such an ethic is available because, as Long writes, "the strategies of obscuring these peoples and cultures within the taxonomies of the disciplines of anthropology as primitives or the classification of them as sociological pathologies is no longer possible" (211). The ethics of opacity helps to structure our ability "to effect the deconstruction of the mechanisms by means of which we continue to make opaque to ourselves, attributing the origin of our societies to imaginary beings, whether the ancestors, the gods, God, or evolution, and natural selection, the reality of our own agency with respect to the programming and reprogramming of our desires, our behaviors, our minds, ourselves, the I and the we."24 Such a move has significant implications for "reimagining our forms of life" and opens up potentially emancipatory possibilities for a critical theory of knowledge in the interests of those on the underside of modernity (204). In a crucial sense, it is the emergence and existence of the opaque ones that conditions the im/possibility of the project of Enlightenment rationality. Long states, "As stepchildren of Western culture, the oppressed have affirmed and opposed the ideal of the Enlightenment and post- Enlightenment worlds. But in the midst of this ambiguity, for better or for worse, their experiences were rooted in the absurd meaning of their bodies, and it was for these bodies that they were regarded not only as valuable works but also as the locus of the ideologies that justified their enslavement . . . . The totalization of all the great ideals of Western universalization met with the factual symbol of these oppressed ones."25 The infinite meaning and depth of the "factual symbol of these oppressed ones" is the location of ethics of opacity and in turn structures the relation to epistemology. Indeed, highlighting the relation of ethics and epistemology thus becomes a critical process that cannot be evaded. The disruption produced by the ethics of opacity suggests the primacy of method of procedure as opposed to the fundamental question of ontology for the project of critical theory in the interests of humanity.26 To this end, such an ethical imperative interrupts the imperial/colonial economy of knowledge that privileges a conceptualization of knowledge that conquers through a commitment to clarity of content and transparency of method. The will to clarity and transparency within this theoretical enterprise rests on a fundamental violence that denies difference and negates alternative possibilities of thought as well as of action. The character of this will to know is marked by a process that necessarily seeks to conquer epistemologically and otherwise. Instead, an ethic of opacity develops a critical posture that welcomes the "opaque ones" as fundamental partners in the quest for knowledge. It is a reflexive injunction that reminds us that we always already think in and against particular epistemic traditions and conditions that in/form us. The challenge thus becomes how do we develop a theory of knowledge in critical relation with an ethics of opacity?

Turns Case

The aff's call for counternarratives assumes that visibility and the representational inclusion of excluded groups is inherently liberatory but is based on a false binary that erases the power of the unspoken and increases surveillance, fetishism, and colonialism – turns case

Phelan in 93 <Phelan, Peggy. Unmarked : The Politics of Performance. Florence, KY, USA: Routledge, 1993. ProQuest ebrary. Web.>

The current contradiction between "identity politics" with its accent on visibility, and the psychoanalytic/deconstructionist mistrust of visibility as the source of unity or wholeness needs to be refigured, if not resolved. 13 As the Left dedicates ever more energy to visibility politics, I am increasingly troubled by the forgetting of the problems of visibility so successfully articulated by feminist film theorists in the 1970s and 1980s. I am not suggesting that continued invisibility is the "proper" political agenda for the disenfranchised, but rather that **the binary between the power of visibility and the impotency of invisibility is falsifying. There is real power in remaining unmarked; and there are serious**

limitations to visual representation as a political goal. Visibility is a trap ("In this matter of the visible, everything is a trap": Lacan, Four Fundamental Concepts: 93); **it summons surveillance and the law; it provokes voyeurism, fetishism, the colonialist/imperial appetite for possession**. Yet it retains a certain political appeal. Visibility politics have practical consequences; a line can be drawn between a practice (getting someone seen or read) and a theory (if you are seen it is harder for "them" to ignore you, to construct a punitive canon); the two can be reproductive. While there is a deeply ethical appeal in the desire for a more inclusive representational landscape and certainly under-represented communities can be empowered by an enhanced visibility, **the terms of this visibility often enervate the putative power of these identities**. A much more nuanced relationship to the power of visibility needs to be pursued than the Left currently engages. 14 Arguing that communities of the hitherto under-represented will be made stronger if representational economies reflect and see them, progressive cultural activists have staked a huge amount on increasing and expanding the visibility of racial, ethnic, and sexual "others**." It is assumed that disenfranchised communities who see their members within the representational field will feel greater pride in being part of such a community and those who are not in such a community will increase their understanding of the diversity and strength of such communities**. Implicit within this argument are several presumptions which bear further scrutiny: 1 2 3 4 Identities are visibly marked so the resemblance between the African-American on the television and the African-American on the street helps the observer see they are members of the same community. Reading physical resemblance is a way of identifying community. The relationship between representation and identity is linear and smoothly mimetic. What one sees is who one is. If one's mimetic likeness is not represented, one is not addressed. Increased visibility equals increased power. Each presumption reflects the ideology of the visible, an ideology which erases the power of the unmarked, unspoken, and unseen.

Empathetic Identification

The aff's solvency relies on empathetic identification with the suffering and injustice outlined in the aff – it seeks to make suffering visible and intelligible which denies and erases the experience of the other

Hartman, 97 <Saidya Hartman, Saidiya Hartman is a professor at Columbia University specializing in African American literature and history. She grew up in Brooklyn and received her B.A. from Wesleyan University and Ph.D. from Yale University, Scenes of Subjection, Accessed: 4/25/14>

By making the suffering of others his own, has Rankin ameliorated indifference or only confirmed the difficulty of understanding the suffering of the enslaved? Can the white witness of the spectacle of suffering affirm the materiality of black sentience only by feeling for himself? Does this not only exacerbate the idea that black sentience is inconceivable and unimaginable but, in the very ease of possessing the abased and enslaved body, ultimately elide an understanding and acknowledgment of the slave's pain? Beyond evidence of slavery's crime, what does this exposure of the suffering body of the bondsman yield? Does this not reinforce the "thingly" quality of the captive by reducing the body to evidence in the very effort to establish the humanity of the enslaved? Does it not reproduce the hyperembodiness of the powerless? The purpose of these inquiries is not to cast doubt on Rankin's motives for recounting these events but to consider the precariousness of empathy and the thin line between witness and spectator. In the fantasy of being beaten, Rankin must substitute himself and his wife and children for the black captive in order that this pain be perceived and experienced. So, in fact, Rankin becomes a proxy and the other's pain is acknowledged to the degree that it can be imagined, yet **by virtue of this substitution the object of identification threatens to disappear.** In order to convince the reader of the horrors of slavery, Rankin must volunteer himself and his family for abasement. Put differently, the effort to counteract the commonplace callousness to

black suffering requires that the white body be positioned in the place of the black body in order to make this suffering **visible and intelligible**.Yet if this violence can become palpable and indignation can be fully aroused only through the masochistic fantasy, then it becomes clear that empathy is double-edged, for in making the other's suffering one's own, this suffering is **occluded by the others obliteration**. Given the litany of horrors that fill Rankin's pages, this recourse to fantasy reveals an anxiety about making the slave's suffering legible. This anxiety is historically determined by the denial of black sentience, the slave's status as object of property, the predicament of witnessing given the legal status of blacks, and the repression of counterdiscourses on the "peculiar institution." Therefore, Rankin must supplant the black captive in order to give expression to black suffering, and as a consequence, the dilemma-the denial of black sentience and the obscurity of suffering-is not attenuated but instantiated. The ambivalent character of empathy-more exactly, **the repressive effects of empathy**-as Jonathan Boyarin notes, **can be located in the "obliteration of otherness" or the facile intimacy that enables identification with the other only as we "feel ourselves into those we imagine as ourselves."** And as a consequence, empathy fails to expand the space of the other but merely places the self in its stead. 5 This is not to suggest that empathy can be discarded or that Rankin's desire to exist in the place of the other can be dismissed as a narcissistic exercise but rather to highlight the dangers of a too-easy intimacy, the consideration of the self that occurs at the expense of the slave's suffering, and the violence of identification.6

Their call for counternarratives rely on empathetic identification by conjuring the judge/debater's liberal self-worth to get a ballot. This reinscribes suffering by making fungible the experience of the other and simultaneously destroying their experience – turns the case by recreating colonialism

Hartman, 97 <Saidya Hartman, Saidiya Hartman is a professor at Columbia University specializing in African American literature and history. She grew up in Brooklyn and received her B.A. from Wesleyan University and Ph.D. from Yale University, Scenes of Subjection>

In an epistle to his brother, John Rankin illumined the "very dangerous evil" of slavery in a description of the coffle, detailing the obscene theatricality of the slave trade: "Unfeeling wretches purchased a considerable drove of slaves how many of them were separated from husbands and wives, I will not pretend to say-and having chained a number of them together, hoisted over the flag of American liberty, and with the music of two violins marched the woe-worn, heart-broken, and sobbing creatures through the town." 1 Rankin, aghast at the spectacle and shocked by "seeing the most oppressive sorrows of suffering innocence mocked with all the lightness of sportive music," decried: "My soul abhors the crime." The violation of domesticity, the parody of liberty, and the callous defiance of sorrow define the scene in which crime becomes spectacle. The "very dangerous evil" of slavery and the "agonizing groans of suffering humanity" had been made music.2¶ Although Rankin conceded that the cruelty of slavery "far exceed[ed] the power¶ of description," he nonetheless strove to render the horrors of slavery, And in so doing, Rankin makes apparent that the crimes of slavery are **not only witnessed but staged.** This is a result of the recourse to terms like "stage," "spectacle," and "scene" in conveying these horrors, and, more important, because the "abominations of slavery" are disclosed through the reiteration of secondhand accounts and circulating stories from "unquestionable authorities" to which Rankin must act as surrogate witness. In the effort to "bring slavery close," these circulating reports of atrocity, in essence, are reenacted in Rankin epistles. The grotesqueries enumerated in documenting the injustice of slavery are intended to shock and to disrupt the comfortable remove of the reader/spectator. By providing the minutest detail of macabre acts of violence, embellished by his own fantasy of slavery's bloodstained gate, Rankin hoped to rouse the

sensibility of those indifferent to slavery by exhibit ing the suffering of the enslaved and facilitating an identification between those free and those enslaved: "We are naturally too callous to the sufferings of others, and consequently prone to look upon them with cold indifference, until, in imagination we identify ourselves with the sufferers, and make their sufferings our own .... When I bring it near, inspect it closely, and find that it is inflicted on men and women, who possess the same nature and feelings with myself, my sensibility is roused" (56-57). **By bringing suffering near, the ties of sentiment are forged.** In letter after letter, Rankin strove to create this shared experience of horror in order to transform his slaveholding brother, to whom the letters were addressed, as well as the audience of readers. In this case, pain provides the common language of humanity; it extends humanity to the dispossessed and, in turn, remedies the indifference of the callous. ¶ The shocking accounts of whipping, rape, mutilation, and suicide assault the¶ barrier of indifference, for the abhorrence and indignity roused by these scenes of terror, which range from the mockery of the coffle to the dismemberment and incineration of a slave boy, give rise to a shared sentience between those formerly indifferent and those suffering. So intent and determined is Rankin to establish that slaves possess the same nature and feelings as himself, and thereby establish the common humanity of all men on the basis of this extended suffering, that he literally narrates an imagined scenario in which he, along with his wife and child, is enslaved. The "horrible scenes of cruelty that were presented to [his] mind as a consequence of this imagining aroused the "highest pitch of indignant feeling." In addition this scenario enables Rankin to speak not only for but literally in the place of the enslaved. By believing himself to be and by phantasmically becoming the enslaved, he creates the scenario for shared feelings:¶ My flighty imagination added much to the tumult of passion by persuading me, for he moment, that 1 myself was a slave, and with my wife and children placed under the reign of terror. I began in reality to feel for myself, my wife, and my children-the thoughts of being whipped at the pleasure of a morose and capricious master, aroused the strongest feelings of resentment; but when I fancied the cruel lash was. Approaching my wife and children, and my imagination depicted in lively colors, their tears, their shrieks, and bloody stripes, every indignant principle of my bloody nature was exerted to the highest degree. (56)¶ The nature of the feelings aroused here is rather complicated. While this flight of imagination enables a vicarious firsthand experience of the lash, excoriates the pleasure experienced by the master in this brutal exercise of power, and unleashes Rankin's fiery indignation and resentment, the phantasmic vehicle of this identification is complicated, unsettling, and disturbing. Although Rankin's fantasy culminates in indignant outcries against the institution of slavery and, clearly, the purpose of this identification is to highlight the crimes of slavery, this flight of imagination and slipping into the captive's body unlatches a Pandora's box and, surprisingly, what comes to the fore is the difficulty and slipperiness of empathy. Properly speaking, empathy is a projection of oneself into another in order to better under stand the other or "the projection of one's own personality into an object, with the attribution to the object of one's own emotions."4 Yet empathy in important respects confounds Rankin's efforts to identify with the enslaved because in making the slave's suffering his own, Rankin begins to feel for himself rather than for those whom this exercise in imagination presumably is designed to reach. Moreover, by exploiting the vulnerability of the captive body as a vessel for the uses, thoughts, and feelings of others, the humanity extended to the slave inadvertently confirms the expectations and desires definitive of the relations of chattel slavery. In other words, the ease of **Rankin's empathic identification is as much due to his good intentions and heartfelt opposition to slavery as to the fungibility of the captive body.**

External Validation

Their method relies on the external validation of suffering in order to attain empowerment and resistance – this recreates academic

colonialism – the right to conquer is intimately connected to the right to know

Tuck and Yang 2014 [Eve, & K.W., "R-Words: Refusing Research." In n D. Paris & M. T. Winn (Eds.) Humanizing research: Decolonizing qualitative inquiry with youth and communities (pp. 223-248). Thousand Oakes, CA: Sage Publications. Pp. 223-6]

Research is a dirty word among many Native communities (Tuhiwai Smith,¶ 1999), and arguably, also among ghettoized (Kelley, 1997), Orientalized¶ (Said, 1978), and other communities of overstudied Others. The ethical¶ standards of the academic industrial complex are a recent development, and like¶ so many post–civil rights reforms, do not always do enough to ensure that social¶ science research is deeply ethical, meaningful, or useful for the individual or community¶ being researched. Social science often works to collect stories of pain and¶ humiliation in the lives of those being researched for commodification. However,¶ these same stories of pain and humiliation are part of the collective wisdom that¶ often informs the writings of researchers who attempt to position their intellectual¶ work as decolonization. Indeed, to refute the crime, we may need to name it. How¶ do we learn from and respect the wisdom and desires in the stories that we (over)¶ hear, **while refusing to portray/betray them to the spectacle of the settler colonial¶ gaze?** How do we develop an ethics for research that differentiates between¶ power—which deserves a denuding, indeed petrifying scrutiny—and people? At¶ the same time, as fraught as research is in its complicity with power, it is one of¶ the last places for legitimated inquiry. It is at least still a space that proclaims to¶ care about curiosity. In this essay, we theorize refusal **not just as a "no,"** but as a¶ type of **investigation into "what you need to know and what I refuse to write in"**¶ (Simpson, 2007, p. 72). Therefore, we present a **refusal to do research**, or a **refusal¶ within research**, as a way of thinking about **humanizing researchers.**¶ We have organized this chapter into four portions. In the first three sections,¶ we lay out three axioms of social science research. Following the work of Eve¶ Kosofsky Sedgwick (1990), we use the exposition of these axioms to articulate¶ otherwise implicit, methodological, definitional, self-evident groundings (p. 12)¶ of our arguments and observations of refusal. The axioms are: (I) The subaltern¶ can speak, but is **only invited to speak her/our pain**; (II) **there are some forms of¶ knowledge that the academy doesn't deserve**; and (III) **research may not be the¶ intervention that is needed**. We realize that these axioms may not appear self evident¶ to everyone, yet asserting them as apparent allows us to proceed toward¶ the often unquestioned limits of research. Indeed, "in dealing with an open secret¶ structure, it's only by being shameless about risking the obvious that we¶ happen into the vicinity of the transformative" (Sedgwick, 1990, p. 22). In the¶ fourth section of the chapter, we theorize refusal in earnest, exploring ideas that¶ are still forming.¶ Our thinking and writing in this essay is informed by our readings of postcolonial¶ literatures and critical literatures on settler colonialism. We locate much of¶ our analysis inside/in relation to the discourse of settler colonialism, the particular¶ shape of colonial domination in the United States and elsewhere, including¶ Canada, New Zealand, and Australia. Settler colonialism can be differentiated¶ from what one might call exogenous colonialism in that the colonizers arrive at a¶ place ("discovering" it) and make it a permanent home (claiming it). The permanence¶ of settler colonialism makes it a **structure, not just an event** (Wolfe, 1999).¶ The settler colonial nation-state is dependent on destroying and erasing¶ Indigenous inhabitants in order to clear them from valuable land. The settler¶ colonial structure also requires the enslavement and labor of bodies that have¶ been stolen from their homelands and transported in order to labor the land stolen¶ from Indigenous people. Settler colonialism refers to a triad relationship, between¶ the White settler (who is valued for his leadership and innovative mind), the disappeared¶ Indigenous peoples (whose land is valued, so they and their claims to it¶ must be extinguished), and the chattel slaves (whose bodies are valuable but¶ ownable, abusable, and murderable). We believe that this triad is the basis of the¶ formation of Whiteness in settler colonial nation-states, and that the interplay of¶ **erasure**, bodies, land, and violence is characteristic of the **permanence of settler¶ colonial structures.**¶ Under coloniality, Descartes' formulation, cognito ergo sum ("I think, therefore¶ I am") transforms into ego conquiro ("I conquer, therefore I am"; Dussel, 1985;¶ Maldonado-Torres, 2007; Ndlvou-Gatsheni, 2011). Nelson Maldonado-Torres¶ (2009) expounds on this relationship of the conqueror's sense-of-self to his¶ knowledge-of-others ("I know her, therefore I am me"). **Knowledge of self/Others¶ became the philosophical justification for the acquisition of bodies and territories,¶ and the**

rule over them. Thus the right to conquer is intimately connected to¶ the right to know ("I know, therefore I conquer, therefore I am"). Maldonado-¶ Torres (2009) explains that for Levi Strauss, the self/Other knowledge paradigm¶ is the methodological rule for the birth of ethnology as a science (pp. 3–4).¶ Settler colonial knowledge is premised on frontiers; **conquest**, then, **is an exercise¶ of the felt entitlement to transgress** these limits**. Refusal**, and stances of refusal in¶ research, **are attempts to place limits on conquest and the colonization of knowledge**,¶ by marking what is **off limits**, what is **not up for** grabs or **discussion, what is¶ sacred, and** what **can't be known.¶** To speak of limits in such a way makes some liberal thinkers uncomfortable, and¶ may, to them, seem dangerous. When access to information, to knowledge, to the¶ intellectual commons is controlled by the people who generate that information¶ [participants in a research study], it can be seen as a violation of shared standards of¶ justice and truth. (Simpson, 2007, p. 74)¶ **By forwarding a framework of refusal** within (and to) research in this chapter, we¶ are not simply prescribing limits to social science research. **We are making visible¶ invisibilized limits, containments, and seizures that research already stakes out.**

Opacity Alt

Our alternative is necessary to recognize the inherent lack of safety when working within academic spaces as well as its inherent colonial foundation that must be abolished instead of survived in

Rodriguez in 12 – chair of the Department of Ethnic Studies at the University of California <Dylan. Racial/Colonial Genocide and the "Neoliberal Academy": In Excess of a Problematic", American Quarterly. Volume 64. Number 4. December 2012>

My place of employment reflects how the U.S. academy remains constituted by its gendered racist, apartheid, colonial foundations. As several students and colleagues remind me, the desecration of Indian burial grounds has guided the construction and expansion of the land grant institution at which I work, the University of California, Riverside—that is, desecration is not an incidental and fleeting moment in the campus's creation, it is the continual condition of UCR's existence as such.1 Second, recent UCR police practices are saturated with antiblack racism and "racial profiling," landmarked by a set of early-2000s exchanges between renowned African American historian Sterling Stuckey and then Chancellor Raymond Orbach. Stuckey detailed the UCRPD's yearlong harassment of one black graduate student in particular (detained multiple times by campus police while walking to the library), remarking that "circumstances at UCR [have] made it impossible for me to go on recruiting black graduate students."2 These local examples express the academy's paradigmatic ordering of bodies, vulnerabilities, and intellectual hierarchies. That is, such everyday dehumanization illustrates the systemic logics, institutional techniques, rhetorics, and epistemologies of violence and power that **undergird the academy's racial and colonial foundations** even—especially—as they resurface in our current working and thinking conditions. These dehumanizing violences exceed the effects of the academy's neoliberalization; they require an urgent, strategic, mutual centering of the analytics of racial/colonial genocide. Framed in the long historical scope of modernity, racial/colonial genocide is a logic of human extermination that encompasses extended temporal, cultural, biological, and territorial dimensions:3 the mind-boggling body counts associated with commonly recognized "genocides" are but one fragment of a larger historical regime that requires the perpetual social neutralization (if not actual elimination) of targeted populations as (white, patriarchal) modernity's premise of [End Page 809] historical-material continuity. This is why Indian reservations, the U.S. prison and criminalization regime, and even Arizona's ban on ethnic studies need to be critically addressed through a genocide analytic as well as through focused critiques of neoliberalism's cultural and economic structures: the logics of social neutralization (civil death, land expropriation, white supremacist curricular enforcement) always demonstrate the capacity (if not the actually existing political will and institutional inclination) to effectively exterminate people from social spaces and wipe them out of the social text. To appropriate a well-known phrase, I'm advancing an abolitionist praxis without guarantees—of either victory or survival. Here "**abolitionist**" invokes and identifies the genealogies of freedom struggle that emerge in **direct, radical confrontation with genocidal and protogenocidal regimes**: lineages of political-intellectual creativity and organized, collective (and at times revolutionary) insurgency that **have established the foundations on which**

people have relied to build life-sustaining movements to liberate themselves from racial chattel enslavement and its extended aftermath, colonialist conquest and contemporary settler states, apartheid (Jim Crow), the prison industrial complex, militarized border policing, and so forth. **If the ethical imperative is to abolish (rather than merely render temporarily survivable**) the social logics and institutionalized systems of violence that are mutually structured by the genealogies of neoliberalism and racial/colonial genocide, then there are places of collective power that can be cherished at the same time that they are critiqued and transformed. For better or worse, the U.S. academy (both the specific institutional site of the college/university and the broader, shifting political-intellectual terrains of "the academy") may be one fruitful place from which to catalyze this work. Activisms that form in confrontation with the academy's long historical complicities in racial/colonial genocide might be understood within an "urgency imperative" that seeks to denaturalize and ultimately dismantle the conditions in which these systems of massive violence are reproduced.4 There are thriving circuits of radical thought that aim to do just that: for example, the very presence of anticolonialism, black radicalism, Native American feminism, and prison abolitionism as recognizable streams of scholarly and pedagogical labor within institutional spaces—and more importantly, the vibrant and urgent ways in which many (though still far too few) people inhabit these spaces—has become a matter of life and death in more ways than one. The capacities to produce such scholarship (including the creation of counterarchives, vital epistemological and theoretical tools, course syllabi, and mentorship) have been hard-won by multiple histories of liberation struggle and intense intellectual innovation, and cohere in the academy through affinities of ideas, analytics, and scholars whose [End Page 810] work is mutually nourishing and critically enabling. The "activist" importance of these circuits cannot be overstated; at their best, their political-intellectual work is engaged in something resembling a collective standoff with the most mundanely violent forms of dehumanization, humiliation, displacement, and immobilization. The interrogations are grave: what are the ethical and political implications of chronicling the racial-sexual violence of U.S. lynching in continuity with less spectacular (and differently gendered) forms of antiblack state and state-condoned violence such as police abuse, welfare policy, and school segregation? To what degree have the critical renarrations of the U.S. racial colonialist project —from the Americas to the Philippines—enabled a productive denaturing of the violent, teleological mythologies of liberal white humanism, multiculturalist democracy, and national progress (all of which require a code of silence on the actual existence of colonized peoples on U.S. sovereign and occupied soil)?5 These are just two examples in which dedicated activist scholarly labor has uncovered the unexceptional normal of genocidal and protogenocidal social logics. Such intellectual practices can renarrate racial terror and misery—the forms of suffering endemic to multicultural civil society. Within this collective work, there is possibility for effective (though never permanent) denaturalizations—and politicizations—of the forms of human suffering, entrapment, and vulnerability that are otherwise routinely embedded in the current world's institutional protocols, and death-inducing organization of resources. In such instances, radical intellectuals' inhabitation of existing institutional sites can enable both ethical opposition to structures of domination and creative knowledge production that strives to glimpse the historical possibilities that are always just on the other side of terror and degradation. Intellectuals engaged in such projects are always more than "academics," in the sense that their scholarly engagement is not secured by the academy proper. This expansive grounding is an "antidisciplinarity" of a certain kind: if what animates their intellectual work is what I have tentatively named an abolitionist desire, such radical intellectuals always understand themselves to be working in alien (if not **hostile) territory**. The academy is never home: **some of us are subject to eviction and evisceration, alongside the surveillance, discipline, and low-intensity punishment that accrues to those of us who try to build modalities of sustenance and reproduction within liberationist genealogies, particularly when we are working and studying in colleges and universities**.6 I am undecided as to whether the university is capable or worthy of being "transformed" from its dominant historical purposes, or if it ought to be completely abolished. For now, I am interested in the radical creativity that can [End Page 811] come from the standoff position in-and-of-itself. Such a position reveals that the fundamental problem is not that some are excluded from the hegemonic centers of the academy but that the university (as a specific institutional site) and academy (as a shifting material network) **themselves cannot be disentangled from the long historical apparatuses of genocidal and protogenocidal social organization**. Placed in the context of the United States, we can see that (1) genocidal methodologies and logics have always constituted the academically facilitated inception of a hemispheric "America," and (2)

genocidal technologies are the lifeblood of national reproduction across its distended temporalities and geographies. The recent flourishing of scholarship that rehistoricizes regimes of incarceration, war, sexuality, settler-colonialist power, and gendered racist state violence—including much of the work that has recently appeared in this very journal—constitutes a radical reproach of institutional multiculturalism and liberal pluralism. The point to be amplified is that multiculturalism and pluralism are essential to both the contemporary formation of neoliberalism and the historical distensions of racial/colonial genocide.7 It is for this reason that I do not find the analytics of neoliberalism to be sufficient for describing the conditions of political work within the U.S. academy today. It is not just different structures of oppressive violence that radical scholars are trying to make legible, it is violence of a certain depth, with specific and morbid implications for some peoples' future existence as such. If we can begin to acknowledge this fundamental truth—that genocide is this place (the American academy and, in fact, America itself)—then our operating assumptions, askable questions, and scholarly methods will need to transform. At a moment of historical emergency, we might find principled desperation within intellectual courage.

Our alternative is to remain opaque – this is necessary to challenge the imperial strategy that discursively seeks to know, conquer and reproduce colonialism

Walker in 11 - Ph.D., The College of William and Mary, former Chair of the Department of Africana Studies at Brown University <Corey. "How Does It Feel to be a Problem?': (Local) Knowledge, Human Interests, and The Ethics of Opacity" Transmodernity: Journal of Peripheral Cultural Production of the Luso-Hispanic World, 1(2)>

I have chosen the ground of ethics in wrestling with the question of epistemology for this particular endeavor in order to highlight "the very fact that ethics exist as unscientific" – that is resistant to and restrictive of the epistemic hegemony of Science proper – speaks to its critical dimension that "cannot be reduced to the disciplining of science," indeed of the modern, rational episteme.15 Hence the recourse to ethics in pursuit of an emancipatory project of knowledge holds out the possibility of unmasking and "denouncing all myth, all mystifications, all superstitions" that inhere in a disciplinary and disciplining logic of our contemporary categorization and organization of knowledge, particularly in the North Atlantic academy.16 Moreover, it reminds us that the question of epistemology cannot be approached without critical attention to the question of ethics, particularly for those projects that claim to be emancipatory. With this understanding, ethics is transformed into a critical discursive practice that evades uncritical "sentimentality and development, and pre[over]determined categories such as good and bad."17 Ethics proper is a discourse derived from a rigorous, vigilant, and militant theoretical site of struggle. Such struggles are not merely over "values," but rather expose the "conflicts in which [groups, formations, and classes] express their means of reproducing the very struggle that creates them – and finds emancipatory expression in their practices of resistance, pleasure, and authority."18 Ethics thus rendered is transformed into a critical terrain that fields the necessary interrogatory practices that question the normative assumptions and methodological presuppositions in raising a critical consciousness in the ongoing battle of challenging the disciplinary dictates and epistemological demands of the modern organization of knowledge. The ethics of opacity operates from a similar position as announced by Alain Badiou, "Ethics does not exist. There is only the ethics of (of politics, of love, of science, of art)."19 Such an ethical understanding seeks to temper the imperial strategy of traditional ethics, particular ethical formulations, traditions, and prescriptives that gather under the logics and technologies of coloniality. Indeed, as Badiou puts it, "it might well be that ethical ideology, detached from the religious teachings which at least conferred upon it the fullness of 'revealed' identity, **is simply the final imperative of a conquering civilization**: 'Become like me and I will respect your difference'" (28). Inspired by the work of Charles Long, the ethics of opacity establishes the critical principle that those hegemonic knowledge systems unleashed by coloniality/modernity necessarily introduce what Long calls "that 'thing' [which] must be suppressed, but the very act of suppression introduces the thing

suppressed into the symbolic universe that it stakes out."20 Long continues with recourse to the work of Paul Ricoeur who writes, "Now defilement enters into the universe of man through speech, or the word; its anguish is communicated through speech . . . the opposition of the pure and the impure is spoken. . . a stain is a stain because it is there, mute; the impure taught in the words that institute the taboo" (204). Within this nexus, the ethics of opacity suggest a critical site for the production and reproduction of the knowledges of those on the underside of modernity. Long writes, Black, the colored races, caught up into this net of the imaginary and symbolic consciousness of the West, rendered mute through the words of military, economic, and intellectual power, assimilated as if by osmosis structures of this consciousness of oppression. This is the source of the doubleness of consciousness made famous by W.E.B. Du Bois. But even in these symbolic structures there remained the inexhaustibility of the opaqueness of this symbol for those who constituted the "things" upon which the significations of the West deployed its meanings. (204)

Opacity is a necessary strategy to resolve the aff by interrupting the economy of knowledge that justifies violence against the colonized – the aff just reproduces violence and makes the infiltration they decry more likely

Walker in 11 - Ph.D., The College of William and Mary, former Chair of the Department of Africana Studies at Brown University <Corey. "How Does It Feel to be a Problem?': (Local) Knowledge, Human Interests, and The Ethics of Opacity" Transmodernity: Journal of Peripheral Cultural Production of the Luso-Hispanic World, 1(2)>

Thus, the ethics of opacity establishes a critical movement, indeed produces an ethical demand, that speaks to and is founded upon a responsibility to interrogate hegemonic epistemological production, which is "the context for the communities of color, the opaque ones of the modern world" (Long 204). Such an ethics calls into question traditional formulations and rehearsal of ethics proper and radically calls into account those "radical" formulations of emancipatory theoretical projects, i.e. scientific Marxism, dogmatic theology, Western democracy, and the host of "post-" prefixed theoretical formulations. Such an ethics of opacity also entails, or rather prescribes a critical intellectual practice that affirms the worth, value, and dignity of the "human." Long writes, "Octavio Paz tells us that they were filled with poets, proletarians, colonized peoples, the colored races. 'All these purgatories and hells lived in a state of clandestine ferment. One day in the twentieth century, the subterranean world blew up. The explosion hasn't yet ended and its splendor has illumined the agony of the age" (204).21 The ethics of opacity is animated by this vision in seeking to articulate the depth of meaning that is announced that these continuing events. In this sense, the ethics of opacity pushes the discourse of ethics to the limit. Accordingly, recourse to Levinas is quite appropriate when he suggests, "My task does not consist in constructing ethics, I only try to seek its meaning."22 The ethics of opacity presents "more than an accusation regarding the actions and behavior of the oppressive cultures; it goes to the heart of the issue. It is an accusation regarding the world view, thought structures, theory of knowledge, and so on, of the oppressors. The accusation is not simply of bad acts but, more importantly, of bad faith and bad knowledge."23 An ethics of opacity is thus defined by its critical orientation to liberation as articulated by and with the opaque ones. It is a critical intellectual posture that disrupts the dominant logic of coloniality/modernity in exploring the hidden and unknown, the repressed and submerged narratives, histories, and epistemologies – the sites of opacity that are the conditions of im/possibility of the contemporary world. Such an ethic is available because, as Long writes, "the strategies of obscuring these peoples and cultures within the taxonomies of the disciplines of anthropology as primitives or the classification of them as sociological pathologies is no longer possible" (211). The ethics of opacity helps to structure our ability "to effect the deconstruction of the mechanisms by means of which we continue to make opaque to ourselves, attributing the origin of our societies to imaginary beings, whether the ancestors, the gods, God, or evolution, and natural selection, the reality of our own agency with respect to the programming and reprogramming of our desires, our behaviors, our minds, ourselves, the I and the we."24 Such a move has significant implications for "reimagining our forms of life" and opens up potentially emancipatory possibilities for a critical theory of

knowledge in the interests of those on the underside of modernity (204). In a crucial sense, it is the emergence and existence of the opaque ones that conditions the im/possibility of the project of Enlightenment rationality. Long states, "As stepchildren of Western culture, the oppressed have affirmed and opposed the ideal of the Enlightenment and post- Enlightenment worlds. But in the midst of this ambiguity, for better or for worse, their experiences were rooted in the absurd meaning of their bodies, and it was for these bodies that they were regarded not only as valuable works but also as the locus of the ideologies that justified their enslavement . . . . The totalization of all the great ideals of Western universalization met with the factual symbol of these oppressed ones."25 The infinite meaning and depth of the "factual symbol of these oppressed ones" is the location of ethics of opacity and in turn structures the relation to epistemology. Indeed, highlighting the relation of ethics and epistemology thus becomes a critical process that cannot be evaded. The disruption produced by the ethics of opacity suggests the primacy of method of procedure as opposed to the fundamental question of ontology for the project of critical theory in the interests of humanity.26 To this end, such an ethical imperative interrupts the imperial/colonial economy of knowledge that privileges a conceptualization of knowledge that conquers through a commitment to clarity of content and transparency of method. The will to clarity and transparency within this theoretical enterprise rests on a fundamental violence that denies difference and negates alternative possibilities of thought as well as of action. The character of this will to know is marked by a process that necessarily seeks to conquer epistemologically and otherwise. Instead, an ethic of opacity develops a critical posture that welcomes the "opaque ones" as fundamental partners in the quest for knowledge. It is a reflexive injunction that reminds us that we always already think in and against particular epistemic traditions and conditions that in/form us. The challenge thus becomes how do we develop a theory of knowledge in critical relation with an ethics of opacity?

Fugitivity Alt

We advocate a method of fugitivity as an alternative to the aff's call to confront colonialism and the academy – we should steal away from the aff's liberal call for cultural reform and identification with the history of the oppressed in order to truly challenge the structure of domination

Hartman in 97 <Saidiya, Prof of African American History and Literature @ Columbia, *Scenes of Subjection*, 1997 p. 65-7>

When the enslaved slipped away to have secret meetings, they would call it "stealing the meeting," as if to highlight the appropriation of space and the expropriation of the object of property necessary to make these meetings possible. Just as runaway slaves were described as "stealing themselves," so, too, even shortlived "flights" from captivity were referred to as "stealing away." "Stealing away" designated a wide range of activities, from praise meetings, quilting parties, and dances to illicit visits with lovers and family on neighboring plantations. It encompassed an assortment of popular illegalities focused on contesting the authority of the slave-owning class and contravening the status of the enslaved as possession. The very phrase "stealing away" played upon the paradox of property's agency and the idea of property as theft, thus alluding to the captive's condition as a legal form of unlawful or amoral seizure, what Hortense Spillers describes as "the violent seizing of the captive body from its motive will, its active desire." 49 Echoing Proudhon's "property is theft," Henry Bibb put the matter simply: "Property can't steal property." It is the play upon this originary act of theft that yields the possibilities of transport, **as one was** literally and figuratively carried away by one's desire.50 The appropriation of dominant space in itinerant acts of defiance contests the spatial confinement and surveillance of slave life and, ironically, reconsiders the meaning of property, theft, and agency. Despite the range of activities encompassed under this rubric, what these events shared was the centrality of contestation. Stealing away was the vehicle for the redemptive figuration of dispossessed individual and community, reconstituting kin relations, contravening the object status of chattel, transforming pleasure, and investing in the body as a site of sensual activity, sociality, and possibility, and, last, redressing the pained body. The activities encompassed in the scope of stealing away played upon the tension between the owner's possession and the slave's dispossession and sought to redress the condition of enslavement by whatever limited means available. The most direct expression of the desire for redress was the

praise meeting. The appeals made to a "God that saves in history" were overwhelmingly focused on freedom.51 For this reason William Lee said that slaves "couldn't serve God unless we stole to de cabin or de oods."52 West Turner confirmed this and stated that when patrollers discovered such meetings they would beat the slaves mercilessly in order to keep them from serving God. Turner recounted the words of one patroller to this effect: "If I ketch you here servin' God, I'll beat you. You ain't got no time to serve God. We bought you to serve us."53 Serving God as a crucial site of struggle, as it concerned issues about styles of worship, the intent of worship, and, most important, the very meaning of service, since the expression of faith was invariably a critique of the social conditions of subordination, servitude, and mastery. As Turner's account documents, the threat embodied in serving God was that the recognition of divine authority superseded, if not negated, the mastery of the slave owner. Although by the 1850s Christianity was widespread among the enslaved and most owners no longer opposed the conversion or religious instructions of slaves, there was nonetheless an ethical and political struggle waged in religious practice that concerned contending interpretations of the word and styles of religious _worship. Even those slaves whose owners encouraged religion or sent them to white churches found it important to attend secret meetings. They complained that at white churches they were not allowed to speak or express their faith in their own terms. "We used to slip off in de woods in de old slave days on Sunday evening way down in de swamps to sing and pray to our own liking. We prayed for dis day of freedom. We come from four and five miles to pray together to God dat if we don't live to see it, to please let 0ur chillen live to see it, to please let our chillen live to see a better day and be free, dat they can give honest and fair service to the Lord and all mankind everywhere. nd we'd sing 'our little meetin's about to break, chillen, and we must part. We got to part in body, but hope not in mind. Our little meetin's bound to break.' Den we used to sing 'We walk about and shake hands, fare you well my sister's, I am going home.' "54 These meetings held in "hush arbors" or covertly in the quarters illumi- nate the significant difference between the terms of faith and the import of Chris- tianity for the master and the enslaved. For example, the ring shout, a form of devotional dance, defied Christian proscriptions against dancing; the shout made the body a vehicle of divine communication with God in contrast to the Christian vision of the body as the defiled container of the soul or as mere commodity. And the attention to the soul contested the object status of the enslaved, for the exchange of blacks as commodities and their violent domination were often described in terms of being treated as if one did not have a soul 55. Freedom was the central most important issue of these meetings. According to William Adams, at these meetings they would pray to be free and sing and dance. 56 The avid belief in an imminent freedom radically challenged and nullified the gospel of slavery, which made subordination a virtue and promised rewards in the "kitchen of heaven." Elizabeth Washington stated that ministers would "preach the colored people if they would be good niggers and not steal their master's eggs and chickens and things that they might go to the kitchen of heaven when they died." It was not uncommon for slave owners to impart a vision of Christianity in which the enslaved would also attend to them in the afterlife. As one mistress stated, "I would give anything if I could have Mal'ia in heaven with me to do little things for me. "57 For the enslaved the belief in a divine authority minimized and contained the do- minion of the master. As well, these meetings facilitated a sense of collective identification through the invocation of a common condition as an oppressed people and a shared destiny. Serving God ultimately was to be actualized in the abolition of slavery. Stealing away involved unlicensed movement, collective assembly, and an abrogation of the terms of subjection in acts as simple as sneaking off to laugh and talk with friends or making noctumal visits to loved ones. 58 Sallie Johnson said that men would often sneak away to visit their wives.59 These nighttime visits to lovers and family were a way of redressing the natal alienation or enforced "kinlessness" of the enslaved, as well as practices of naming, running away, and refusing to marry a mate not of one's choosing or to remarry after a husband or wife was sold away; all of these were efforts to maintain, if not reconstitute, these ties. 60 Dora Frank's uncle would sneak off at night to see his woman. On one occasion, he failed to return by daylight, and "nigger hounds" were sent after him. He was given 100 lashes and sent to work with the blood still running down his back.61 Dempsey Jordan recognized that the risks involved in such journeys were great but slipped off at night to see his girl in spite 0f them: "I was taking a great chance. I would go and see my girl lots of nights and one time I crawled 100 yards to her room and got in the bed with her and lay there until nearly daylight talking to her. One time I was there with her and them patterollers come that night and walked all around in that mom and this here negro was in her bed down under that moss and they never found me. I sure was scared."62 The fact that the force of violence and the threat of sale did not prevent such actions illustrates the ways in which the requirements of property relations were defied in the course of everyday practices. The consequences of these small-scale challenges were sometimes life threatening, if not fatal. Fannie Moore remembered the violence that followed the discovery of a secret dance. They were dancing and singing when the patrollers invaded the dance and started beating people. When Uncle Joe's son decided it was "time to die" because he couldn't sustain another beating and fought back, the patrollers beat him to death and whipped half a dozen others before sending them home. 63 According to Jane Pyatt, if slaves had a party or a prayer meeting and they made too much noise, patrollers would beat them and sometimes would sell them. The patrollers took two of her brothers, and she never saw them again.64 Generally, the punish- ment for unlicensed assembly or travel was twenty-five to fifty lashes. Stealing away was synonymous with defiance because it necessarily involved seizing the master's property and asserting the self in transgression of the law. The trespasses that were invariably a part of stealing away were a source of danger, pride, and a great deal of boasting. Garland Monroe noted that the secret meetings he participated in were held in the open, not in huts or arbot. They were confident that they could outwit and defy patrollers. If the patrollers came, the slaves took advantage of a superior knowledge of the territory to escape capture or detection.6s Physical confrontations with patrollers were a regular feature of these accounts, and a vine stretched across the road to trip the patrollers' horses was the most common method of foiling one's pursuers.66 As James Davis bragged, "I've seen the Ku Klux in slavery times and I've cut a many grapevine. We'd be in the place dancin' and playin' the banjo and the grapevine strung across the road and the Ku Klux come ridin' along and run right into it and throw the horses down. "67 The enslaved were empowered by the collective challenge posed to power and the mutual reinforcement against fear of discovery or punishment. From this perspective, pastoral and folksy slave gatherings appear like small-scale battles with the owners, local whites, .and the Law. These day-to-day and routine forms of contestation operated within the confines of relations of power and simultaneously challenged those very relations as these covert and chameleonic practices both complied with and disrupted the demands of the system through the expression of a counterdiscourse of freedom. In the course of such gatherings, even the span of the Potomac could be made a bridge of community and solidarity. As James Deane remembered, they would blow conch shells at night to signal a gathering. "We would all meet on the bank of the Potomac River and sing across the river to the slaves in Virginia, and they would sing back to us."68 Such small-scale infringements of the law also produced cleavages in the spatial organiza- tion of domination. The play on "stealing," "taking or appropriating without right or leave and with the intent to keep or make use of wrongfully" or "to appropriate entirely to oneself or beyond one's proper share," articulates the dilemma of the subject without rights and the degree to which any exercise of agency or appropriation of the self is only intelligible as crime or already encoded as crime.69 As well, it highlights the transgression of such furtive and clandestine peregrinations since the very assertions and activity required to assemble at praise meetings, dances, et cetera, were nothing less than a fundamental challenge to and breach of the claims of slave property-the black captive as object and the ground of the master's inalienable right, being, and liberty. The agency of theft or the simple exercise of any claims to the self, however restricted, challenged the figuration of the black captive as devoid of will. 70 Stealing away ironically encapsulated the impossibility of self-possession as it exposed the link between liberty and slave property by playing with and against the terms of dispossession. The use

of the term "play" is not intended to make light of the profound dislocations and divisions experienced by the enslaved or to imply that these tentative negotiations of one's status or condition were not pained or wrenching but to highlight[s] the performative dimension of these assaults as staged, repeated, and rehearsed-what Richard Schechner terms "twice-behaved behavior. "71 Through stealing away, counterclaims about justice and freedom were advanced that denied the sanctity or legitimacy of rights of property in a double gesture that played on the meaning of theft. Implicit within the appropriation of the object of property was an insistence that flew in the face of the law: liberty defined by inalienable rights of property was theft. Stealing away exploited the bifurcated condition of the black captive as subject and object by the flagrant assertion of unlicensed and felonious behavior and by pleading innocence, precisely because as an object the slave was the very negation of an intending consciousness or will. The disruptive assertions, necessarily a part of stealing away, ultimately transgressed the law of property. Similarly, stealing away defied and subversively appropriated slave owners' designs for mastery and control-primarily the captive body as the extension of the master's power and the spatial organization of domination. Stealing away involved not only an appropriation of the self but also a disruption of the spatial organization of dominance that confined slaves to the policed location, of the quarters unless provided with written permission of the slaveholder to go elsewhere.n As well, the organization of dominant space involved the separation of public and private realms; this separation reproduced and extended the subordination and repression of the enslaved. If the public realm is reserved for the bourgeois citizen subject and the private realm is inscribed by freedom of property ownership and contractual transactions based upon free will, then in what space is the articulation of the needs and desires of the enslaved at all possible?73 How does one contest the ideological codification and containment of the bounds of the political? Ultimately, the struggle waged in everyday practices, from the appropriation of space in local and pedestrian acts, holding a praise meeting in the woods, meeting a lover in the canebrake, or throwing a sun-eptitious dance in the quatters to the contestation of one's status as transactable object or the vehicle of another's rights, was about the creation of a social space in which the assertion of needs, desires, and counterclaims could be collectively aired, thereby granting property a social life and an arena or shared identification with other slaves. Like de Cetteau's walker who challenges the disciplinary apparatus of the urban system with his idle footsteps, these practices also create possibilities within the space of domination, transgress the policed space of subordination through unlicensed travel and collective assembly across the privatized lines of plantation households, and disrupt boundaries between the public and private in the articulation of insurgent claims that make need the medium of politics.74

( ) If surveillance protects society it is* de facto *justified.

Posner 6 — Richard A. Posner, Senior Lecturer in Law at the University of Chicago, Judge on the United States Court of Appeals for the Seventh Circuit in Chicago, was named the most cited legal scholar of the 20th century by *The Journal of Legal Studies*, holds an LL.B. from Harvard University, 2006 ("Wire Trap," *New Republic*, February 6th, Available Online at http://www.newrepublic.com/article/104859/wire-trap, Accessed 04-16-2015)

The revelation by The New York Times that the National Security Agency (NSA) is conducting a secret program of electronic surveillance outside the framework of the Foreign Intelligence Surveillance Act (FISA) has sparked a hot debate in the press and in the blogosphere. But there is something odd about the debate: It is aridly legal. Civil libertarians contend that the program is illegal, even unconstitutional; some want President Bush impeached for breaking the law. The administration and its defenders have responded that the program is perfectly legal; if it does violate FISA (the administration denies that it does), then, to that extent, the law is unconstitutional. This legal debate is complex, even esoteric. But, apart from a handful of not very impressive anecdotes (did the NSA program really prevent the Brooklyn Bridge from being destroyed by blowtorches?), there[s] has been little discussion of the program's **concrete value as a counter-terrorism measure** or of the inroads it has or has not made on liberty or privacy. Not only are these questions **more important** to most people than the legal questions; they are **fundamental** to those questions. Lawyers who are busily debating legality without first trying to assess the consequences of the program have **put the cart before the horse**. Law in the United States is not a Platonic abstraction but **a flexible tool of social policy**. In analyzing all but the simplest legal questions, one is well advised to begin by asking **what social policies are at stake**. Suppose the NSA program is vital to the nation's defense, and its impingements on civil liberties are slight. That would not prove the program's legality, because not every good thing is legal; law and policy are not perfectly aligned. But a conviction that the program had great merit would **shape and hone the legal inquiry**. We would search harder for grounds to affirm its legality, and, if our search were to fail, at least we would know how to change the law--or how to change the program to make it comply with the law--without destroying its effectiveness. Similarly, if the program's contribution to national security were negligible--as we learn, also from the Times, that some FBI personnel are indiscreetly whispering--and it is undermining our civil liberties, this would push the legal analysis in the opposite direction. Ronald Dworkin, the distinguished legal philosopher and constitutional theorist, wrote in The New York Review of Books in the aftermath of the September 11 attacks that "we cannot allow our Constitution and our shared sense of decency to become **a suicide pact**." He would doubtless have said the same thing about FISA. If you approach legal issues in that spirit rather than in the spirit of ruat caelum fiat iusticia (let the

heavens fall so long as justice is done), you will want to know **how close to suicide** a particular legal interpretation will bring you **before** you decide whether to embrace it. The legal critics of the surveillance program **have not done this**, and the defenders have for the most part been content to play on the critics' turf.

( ) Rights can't be absolute and even if they were, privacy wouldn't be one of them.

Himma '7

Kenneth - Associate Professor of Philosophy, Seattle Pacific University. The author holds JD and PhD and was formerly a Lecturer at the University of Washington in Department of Philosophy, the Information School, and the Law School. "Privacy vs. Security: Why Privacy is Not an Absolute Value or Right". San Diego Law Review, Vol. 44, p. 859, 2007. Available at SSRN: http://ssrn.com/abstract=994458

It is perhaps worth noting that absolutist conceptions are not limited to privacy rights. Some people take the position that the moral right to life is absolute; on an absolutist conception of the right to life, it is never justified to take the life of a person—and this rules out not only the death penalty, but the use of deadly force in defense of the lives of innocent others from a culpable attack. Many people take an absolutist view with respect to something they call a "right to information," holding that there should be no restrictions of any kind, including legal protection of intellectual property rights, on the free flow of information. As this view has most famously, and idiosyncratically, been put by John Perry Barlow, "information wants to be free."5 When it comes to rights, absolutist talk among theorists, lawyers, and ordinary folk is not at all uncommon these days. Indeed, some people seem to think that rights are, by nature, absolute and hence that it is a conceptual truth that all rights are absolute. Consider the following quote from Patrick Murphy, a Democrat who ran for Congress in 2006: I am also very concerned about the erosion of constitutional rights and civil liberties over the past few years. I taught Constitutional Law at West Point, and it makes me so angry to see our elected leaders in Washington—specifically the White House and the Republican leadership in Congress—pushing policies that erode the foundation of this country. The equal protection clause of the constitution is absolute. The right to privacy is absolute. The right to assemble is absolute. Yet time and time again, the administration has supported, and the Congressional leadership has supported nominees and policies that do not follow the constitution. With my background, I can add to this debate. And I'm not afraid to take a stand for what's right.6 As Murphy explains it, every right in the Constitution is absolute and hence utterly without exception. As there is nothing in the Constitution or any legal instrument or norm that suggests or entails that constitutional rights are absolute, it is reasonable to think that Murphy believes, as many people do, that it is part of the very meaning of having a right that it can never justifiably be infringed. This is why debates about political issues are frequently framed in terms of whether there is some right that protects the relevant interests; rights provide the strongest level of moral or legal protection of the relevant interests. It is certainly true that rights provide a higher level of protection than any other considerations that are morally relevant, but it is not because rights are, by nature, absolute. Rights provide robust protection of the relevant interests because it is a conceptual truth that the infringement of any right cannot be justified by an appeal of the desirable consequences of doing so. No matter how many people it might make happy, it would be wrong to intentionally kill an innocent person because her right to life takes precedence over the interests of other people in their own happiness. As Ronald Dworkin famously puts this conceptual point, rights trump consequences.7 But this conceptual truth about rights does not imply rights are, by nature, absolute. The claim that rights trump consequences implies only that some stronger consideration than the desirable consequences of infringing a right can justify doing so. This latter claim leaves open the possibility that there is some such consideration that would justify infringing some rights. One such candidate, of course, is the existence of other more important rights. It is commonly thought that at least some rights are commensurable and can be ranked in a hierarchy that expresses the relative weight each right in the hierarchy has with respect to other rights. For example, one might think that the right to life is at the top of the hierarchy of commensurable rights, and that property rights are in this hierarchy also. This would explain[s] the common intuition that one may use deadly force when necessary to defend innocent lives from culpable attack, but not when necessary only to defend property rights from violation. If, as seems clear from this example, it is possible for two rights to conflict and for one to outweigh the other, it follows that rights are not, by nature, absolute. What may explain the mistaken view that rights are necessarily absolute is confusion about the relationship of various terms that flesh out the status, origin, and contours of moral rights and obligations. For example, rights are frequently described as "inviolable," meaning that a right can never be justifiably violated. This, of course, is a conceptual truth; to say that a right is violated is to say that its infringement is without justification. But this does not imply that rights can never be justifiably infringed; a person's right to life can be justifiably infringed if he (they) culpably shoots at an innocent person and there is no other way to save that person's life except through use of lethal force in defense of his life. Rights are also thought, by nature, to be supreme, relative to some system of norms—moral, social, or legal—in the sense that they cannot be defeated by other kinds of protections; moral rights are thought to be supreme over all other kinds of considerations, including social and legal rights. But this does not imply that rights are absolute because it says nothing about the relative importance of one right to another; it simply asserts that, by nature, rights outweigh all other relevant considerations. Supremacy and inviolability are part of the very nature of a right, but these properties do not entail that rights are, by nature, absolute. Of course, the negation of the claim that all rights are absolute does not imply that no rights are absolute. The possibility of conflicts between any two rights does not preclude there being one right that wins every conflict because it is absolute, and hence, without exception. A moral pacifist, for

example, takes this view of the moral right to life and holds that intentional killing of a human being is always wrong. Moreover, if there are two rights that do not come into conflict with each other and win in conflicts with all other rights, those two rights might be absolute. One might think, for example, that the rights to privacy and life can never conflict and that both are absolute. I am somewhat skeptical that any right is absolute in this strong sense, but if there are any, **it will not be privacy.** As we will see in more detail, privacy is commensurable with other rights, like the right to life, which figures into the right to security. It seems clear that privacy rights and the right to life can come into conflict. For example, a psychologist might be justified in protecting a patient's privacy interests even though doing so includes information that might prevent that person from committing a minor property crime of some kind, but she would not be justified in protecting that information if the psychologist knows its disclosure is necessary to prevent a murder. In any event, I will discuss these kinds of examples in more detail below.

( ) No Privacy violation- FISC check abuse

Branda '14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. "Amici" means "friend of the court" and – in this context - is legal reference to the Reporters Committee – October 2nd - https://www.eff.org/document/governments-smith-answering-brief)

Plaintiff provides no plausible explanation for how the program could cause that distress. She does not contend that there is any reasonable likelihood that government personnel would actually review metadata about her calls that the government may have acquired under the Section 215 program. That likelihood is particularly remote if "[n]one of her communications relate to international terrorism or clandestine intelligence activities." Pl Br. 4. Again, information in the Section 215 database is subject to substantial protections and limits on access imposed by orders of the **F**oreign **I**ntelligence **S**urveillance **C**ourt. Those orders do not permit indiscriminate access to or review of the metadata; instead, there must be an advance judicial finding (or, in cases of emergency, an advance finding by government officials and judicial approval after the fact) that a given selector is suspected of association with terrorism, and only the small fraction of metadata responsive to queries using such suspected-terrorist selectors—that is, within two steps of the judicially approved selector—may be reviewed.

( ) Biosurveillance is key to global effectiveness

McNickle 12

(Michelle McNickle, Associate Editor of InformationWeek Healthcare, "Feds To Use Social Media For Biosurveillance", http://www.informationweek.com/regulations/feds-to-use-social-media-for-biosurveillance/d/d-id/1107452?, ZS)

The U.S. Department of Homeland Security (DHS) recently awarded Accenture Federal Services a two-year contract to help the Office of Health Affairs (OHA) enhance its biosurveillance capabilities. With the help of Accenture, OHA will begin using information gathered from social media sites -- Facebook, Twitter, Tumblr, and Flickr -- to better inform and protect the public against national health emergencies, such as disease outbreaks or biological attacks. Accenture defines biosurveillance as the "monitoring of public health trends and unusual occurrences, relying on pre-existing, real-time health data -- data that s publicly available and easily obtained," according to a statement. "Because of the vast amount of data and information available and readily shared through social media … and the rapid pace information is shared, collecting and understanding information from these channels is critical." The initiative is a pilot program that

John Matchette, partner at Accenture and leader of its Public Safety agency work, said the company is hoping to have operational in approximately eight months. In an interview with InformationWeek Healthcare, Matchette described the program as using people as "sensors" to detect health issues such as pathogens or symptoms. "The best way to do this is to treat humans as sensors and let them self-report," Matchette said. Gathering more data points and reacting faster to potential threats are the two main goals for Matchette and his team, he said, and social media will make this possible. Matchette made clear the initiative isn't aimed at mining data that's secret or private. The agency is looking at public data to see where patterns exist in different geographic areas. The program is based on a key-word approach to scanning social media sites. Accenture will begin by developing a lexicon of health conversations that spans these sites to use as a baseline. "Step one is to get that identified, and then we have standard interfaces that go out and look at these websites, like Facebook and Twitter, and they watch for these trends," Matchette said. "There's a lot of health discussion at the same time, so mission one is to understand what normalcy looks like, and once you've done that, you can look for deviations from normal, and that's how you detect patterns." After developing this baseline, Matchette said the company will be in a position where it can "react and modify…. [A] lot of this is tweaking the underlying analytics to begin to run and get results." The underlying technology the company is using, he said, isn't custom code. Instead, Accenture has a collaboration platform, which integrates data sources and other off-the-shelf products. "So the effort isn't in the coding of the solution because the analytics have been developed," Matchette said. "It's deciding what the lexicon is, and then refining the results."

( ) Biosurveillance is key to solve international disease outbreaks – empirics

RTI 13

(Neely Kaydos-Daniels, RTI International, Director, Influenza Programs - Central America Region, Director of Health Security at RTI International, Epidemic Intelligence Service Officer at the Center for Disease Control, "Study: Biosurveillance Provides Early Detection of Disease Outbreaks", http://www.rti.org/newsroom/news.cfm?obj=18554B0D-5056-B100-31F8E9637DB5227A, ZS)

RESEARCH TRIANGLE PARK, N.C. – Biosurveillance – the automated monitoring of health trend data – can enhance the detection of naturally occurring or intentional disease outbreaks, according to a study by researchers at RTI International. The study, published in the March issue of Biosecurity and Bioterrorism, conducted three case studies from 2007-2008 whose biosurveillance systems cover more than 10 million people. The in-depth interviews describe how biosurveillance systems have been used by state and local public health practitioners to identify and investigate outbreaks. For example, the researchers found that in North Carolina, several university students got food poisoning at an event just before a semester break. That meant that the students ended up visiting emergency rooms throughout the state with their gastrointestinal symptoms. "Ordinarily these circumstances would have made identifying the source of this outbreak very difficult, if not impossible," said Neely Kaydos-Daniels, Ph.D., senior research epidemiologist at RTI and the paper's lead author. "However, because the data from these events were entered into the biosurveillance system, health officials were able to identify the source of the outbreak." In another case, a rapid increase of rash illness caused by itch mites was first detected by biosurveillance before it was reported by other means. Epidemiologists were able to estimate the increase in number of cases of the rash over time through the biosurveillance system.

According to the study, biosurveillance helped state and local health departments track epidemics over time. That information was instrumental in the decision-making process of health departments and hospitals to implement control measure to protect at-risk populations and prevent future cases. However, the study also showed that the systems often identify a large number of false positives and were considered more useful for outbreaks of severe disease than for milder disease, because the systems currently only pull data from emergency departments. "Biosurveillance will be even more effective if we can integrate data from primary care physicians with emergency departments," Kaydos-Daniels said. "The consideration of public health data needs for biosurveillance is critical to our population's health. Federal initiatives to encourage adoption of electronic health records among health care providers are vital to improving the utility of biosurveillance and the capacity of health departments."

( ) Bio surveillance creates info spread and awareness – it's the vital internal link

Fleming and Pamela 14

(Eric Fleming & Pamela Pamelá, Florida International University, Research Assistants to Dr. John Stack, Professor of Politics and International Relations and Law and Director of the School of International and Public Affairs, "Using Social Media as a Method for Early Indications & Warnings of Biological Threats", http://magg.fiu.edu/program/capstone-project/2014-capstone-working-papers/southcom-pam_eric_social-media-and-biosurveillance-capstone-april-2014-edited-by-dawndavies.pdf, ZS)

In a globalized world, biosurveillance needs to match the velocity and intensity of a potential viral outbreak. Therefore, **social media is being explored as a non-traditional way to detect a pandemic**. Numerous websites act as potential channels for individuals to discuss symptoms and share their geographical location, so governments and private enterprises have explored various models in detecting and tracking potential pandemics. This paper provides an overview of the existing literature on social media's potential for biological detection and existing viral tracking models. Furthermore, this paper provides examples of social media's potential for detection, provides a framework from which to analyze social media as a destabilizing power, and offers a new model and policy recommendations. Velocity and intensity are two measures that are vital in detecting and monitoring the onset of pandemics. In an era where time-space compression has manifested across the globe, and greater interconnectivity amongst populations continue to propagate, the need to detect and track microbial outbreaks **are paramount**. While globalization introduced humanity to an abundance of technology and trade, these advancements present increasingly greater challenges for monitoring viral outbreaks. Therefore, there is not only a desire, but also a need for a revolutionary system in biosurveillance. Currently, millions of humans are crossing borders and integrating with countless populations, making a viral epidemic incredibly difficult to manage. For instance, history witnessed the calamitous effects the Black Plague, Small Pox, and the Spanish Flu had on civilizations. The aftermath of the black plague led to 30-60 percent reduction in European population, with some cities having estimates of 70-80 percent mortality rate (Alchon, 2003, 21). Additionally, considerable societal changes occurred that led to a deterioration of church authority, peasant revolts, and attacks on various populations (Whipps, 2008). The threat of bioterrorism is not without warrant. Most patients with bioterrorism-related diseases experience initial symptoms that could be interpreted as common illness, such as influenza. Other indications may include acute respiratory distress, gastrointestinal symptoms, feverish hemorrhagic conditions, and similar illnesses with either

dermatologic or neurologic ailments (Bravata et al. 2004, 911). Identifying these conditions, therefore, is crucial to not only detecting the diseases they are normally linked to, but also to the discovery of bioterrorism attempts. To prevent another pandemic, **it is essential to find a new method of detecting the onset of indications and warnings before an outbreak occurs.** This new method should have the capability to mirror a pathogen's velocity and intensity in all areas of society, so government agencies, non-governmental organizations (NGOs), and international organizations could respond accordingly. Hence, there is growing literature about matching infectious diseases with another global phenomenon that is manifesting hastily across all sectors of society, with the potential to revolutionize viral antigen detection: **social media**. Social media is transforming itself into a powerful and adaptable tool that many public and private organizations increasingly seek to understand. Social media is a global digital community where individuals stay connected with each other by direct and split-second electronic exchange of information constantly throughout the day. While forms of social media have been around for ages, this is revolutionary, since people now communicate instantaneously across national borders and oceans in mere seconds. As a result, many organizations have used this to their advantage in promoting businesses or building awareness for a certain campaign. A website, such as Facebook, boasts having over one billion users worldwide, making it an incredibly large network that functions by linking individuals together and exchanging user generated content. A large global community can be sure to share information about what individuals are discussing and what news they are sharing, but can governments use it to their advantage in detecting potential biological outbreaks? Governments are now joining the social media fury. Presidential campaigns incorporate social media for promoting their message and now various agencies promote their agenda through websites. Conversely, we have also witnessed the awesome chaos and power of social media and its consequential effects on governments' attempts to control and maintain the community. The Arab Spring, Venezuela, and Ukraine are recent examples of this. However, with the ability of users to discuss their opinions, share videos, news articles, and live events in a public sphere, will it be possible to also detect an upcoming pandemic? **In a globalized world where travel and technology is rapidly evolving, social media could conceivably be a crucial tool in locating an infectious disease.** The following study will explore the various avenues social media has intersected in the area of biosurveillance. First this research will discuss defining social media and the various significant websites, then go into the successes and limitations of biosurveillance. Finally, this examination will conclude discussing the possible policy recommendations and future that social media has in regard to biosurveillance.

Backlines

Privacy Bad

Privacy is massively overvalued

Posner 13 — Richard A. Posner, Senior Lecturer in Law at the University of Chicago, Judge on the United States Court of Appeals for the Seventh Circuit in Chicago, was named the most cited legal scholar of the 20th century by *The Journal of Legal Studies*, holds an LL.B. from Harvard University, 2013 ("Privacy is overrated," *New York Daily News*, April 28th, Available Online at http://www.nydailynews.com/opinion/privacy-overrated-article-1.1328656, Accessed 04-16-2015)

There is a tendency to **exaggerate** the social value of privacy. I value my privacy as much as the next person, but there is a difference between what is valuable to an individual and what is valuable to **society**. Thirty-five years ago, when I was a law professor rather than a judge, I published an article called "The Right of Privacy," in which I pointed out that "privacy" is really just **a euphemism for concealment**, for hiding specific things about ourselves from others. We conceal aspects of our person, our conduct and our history that, if known, would make it more difficult for us to achieve our personal goals. We don't want our arrest record to be made public; our medical history to be made public; our peccadilloes to be made public; and so on. We want to present **sanitized versions of ourselves** to the world. We market ourselves the way sellers of consumer products market their wares — highlighting the good, hiding the bad. I do not argue that all concealment is bad. There is nothing wrong with concealing wealth in order to avoid being targeted by thieves or concealing embarrassing personal facts, such as a deformity or being related to a notorious criminal, that would not cause a rational person to shun us but might complicate our social and business relations. There may even be justification for allowing the concealment of facts that might, but should not, cause a person to be shunned. Laws that place a person's arrest (as distinct from conviction) record behind a veil of secrecy are based on a belief that prospective employers would exaggerate the significance of such a record, not realizing, for example, that arrests are often based on mistakes by witnesses or police officers, or are for trivial infractions. Privacy-protecting laws are paternalistic; they are based on a skepticism regarding whether people can make sensible evaluations of an arrest record or other private facts that enter the public domain. Still, a good deal of privacy just facilitates **the personal counterpart of the false advertising of goods and services**, and by doing so, reduces the well-being of society as a whole. I am not suggesting that privacy laws be repealed. I don't think that they do much harm, and they do some good, as just indicated. But I don't think they serve the public interest as well as civil libertarians contend, and so I don't think that such laws confer social benefits comparable to those of methods of surveillance that are effective against criminal and especially terrorist assaults.

Util v. Absolutism

Ethics in a vacuum is morally irresponsible.

Issac, '2

(Jeffery, Professor of Political Science at Indiana University, Dissent, Vol. 49 No. 2, Spring)

Politics, in large part, involves contests over the distribution and use of power. To accomplish anything in the political world one must attend to the means that are necessary to bring it about. And to develop such means is to develop, and to exercise, power. To say this is not to say that power is beyond morality. It is to say that power is not reducible to morality. As writers such as Niccolo Machiavelli, Max Weber, Reinhold Niebuhr, Hannah Arendt have taught, an unyielding concern with moral goodness undercuts political responsibility. The concern may be morally laudable, reflecting a kind of personal integrity, but it suffers from three fatal flaws: (1) It fails to see that the purity of one's intentions does not ensure the achievement of what one intends. Abjuring violence or refusing to make common cause with morally comprised parties may seem like the right thing, but if such tactics entail impotence, then it is hard to view them as serving any moral good beyond the clean conscience of their supporters; (2) it fails to see that in a world of real violence

and injustice, moral purity is not simply a form of powerlessness, it is often a form of complicity in injustice. This is why, from the standpoint of politics-as opposed to religion-pacifism is always a potentially immoral stand. In categorically repudiating violence, it refuses in principle to oppose certain violent injustices with any effect; and (3) it fails to see that politics is as much about unintended consequences as it is about intentions; it is the effects of action, rather than the motives of action, that is most significant. Just as the alignment with "good" may engender impotence, it is often the pursuit of "good" that generates evil. This is the lesson of communism in the twentieth century: it is not enough that one's goals be sincere or idealistic; it is equally important, **always**, to ask about the effects of pursuing these goals and to judge these effects in pragmatic and historically contextualized ways. Moral absolutism inhibits this judgment. It alienates those who are not true believers. It promotes arrogance. And it undermines political effectiveness.

No Violation of Constituion

Surveillance doesn't violate the 4th amendment – no human review *and* not invasive.

Branda '14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. "Amici" means "friend of the court" and – in this context - is legal reference to the Reporters Committee – October 2nd - https://www.eff.org/document/governments-smith-answering-brief)

In district court, plaintiff attempted to fill that gap in her claim to standing, asserting that, if the government had in fact acquired metadata about her calls, she would suffer a cognizable injury each time the government queries the Section 215 database, even if metadata about her calls were never responsive to a query. But queries of Section 215 metadata are performed electronically; a human analyst reviews only metadata that is responsive to an electronic query, and no one reviews nonresponsive information. It is no more an injury for a computer query to rule out particular telephony metadata as unresponsive to a query than it would be for a canine sniff to rule out a piece of luggage as nonresponsive to a drug investigation, see United States v. Place, 462 U.S. 696, 707 (1983) (canine sniff of luggage does not violate a reasonable expectation of privacy), or for a chemical test to rule out a particular substance being cocaine, see United States v. Jacobsen, 466 U.S. 109, 123 (1984). Where telephony metadata associated with particular calls remains unreviewed and never comes to any human being's attention, there is no invasion of any constitutionally cognizable **privacy interests,** and no injury to support standing to sue. At the very least, **the absence of any such human review would mean that no infringement of a Fourth Amendment privacy interest** demonstrably **occurred** here. See infra p. 54-55.

No impact *to a 4th Amendment violation – the Special Needs Doctrine justifies minor privacy intrusions*

Branda '14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. "Amici" means "friend of the court" and – in this context - is legal reference to the Reporters Committee – October 2nd - https://www.eff.org/document/governments-smith-answering-brief)

Even if plaintiff had a cognizable privacy interest in Verizon Wireless's business records—and she does not—the Fourth Amendment would permit the government to acquire those records under the special needs doctrine. The Section 215 telephony-metadata program serves the paramount government interest in preventing and disrupting terrorist attacks on the United States, a compelling special governmental need. And because of the significant safeguards in the program—including a requirement of court authorization based on reasonable suspicion before a human analyst accesses the data—the impact on cognizable privacy interests is at most minimal.

Social M. K2 Biosurveil

DHS contracts prove social media is necessary to effective biosurveillance – stats

McGee 12

(Marianne McGee, Staff Writer for Gov Info Security, "Using Social Media for Biosurveillance", http://www.govinfosecurity.com/using-social-media-for-biosurveillance-a-5278, ZS)

The Department of Homeland Security is testing whether scanning social media sites to collect and analyze health-related data could help identify infectious disease outbreaks, bioterrorism or other public health and national security risks. The department has signed a $3 million, one-year contract with Accenture Federal Services, which is providing software and services for the project. The biosurveillance pilot involves automatically scanning social media sites, such as Facebook and Twitter, to collect and analyze health-related data in real time, says John Matchette, managing director for Accenture's public safety portfolio. The information being collected includes a variety of health-related keywords and other information, including medical symptoms, that show up in social medial postings. The data will be collected and analyzed in aggregate, Matchette says. "The information won't be tracked back to individuals who posted it," he stresses, to help ensure privacy. But one privacy advocate questions whether DHS is taking adequate steps to ensure privacy. "Even when data is in aggregate, we don't have any clear policies around how data will be used and how it can be traced back, including if and when there are signs of an illness outbreak," says Deven McGraw, director of the health privacy project at the Center for Democracy & Technology. "I think it's a legitimate question to ask [DHS] what the guidelines are for using this data. I'd prefer they have a plan in advance for dealing with this, rather than waiting." Representatives of DHS and Accenture did not reply to a request for comment on McGraw's concerns. Watching for Trends The social media data analytics technology will "watch for trends," such as whether new or unusual clusters of symptoms in various geographic regions are being reported on social networking sites, Matchette explains. The analysis of social media data is evolving, he adds, pointing out that both recent presidential campaigns tapped into sites such as Facebook and Twitter to comb through data for trends. While Accenture's work in this pilot focuses on analysis of social media data, the biosurveillance effort has underlying capabilities that could be expanded to integrate data from other sources, such as hospital emergency departments, drug distribution companies and the Centers for Disease Control and Prevention, Matchette says. "This is big data analytics." The project is the latest in a series of DHS data analysis efforts for biosurveillance. For example, DHS already is analyzing data that's collected by the CDC from public health departments nationwide. Also, it's collecting and analyzing air samples in several cities for signs of bio-terrorist chemicals, such as anthrax. The

technology infrastructure for the social media project includes Accenture's collaboration platform software and social media analytics software from Accenture's partner in the project, SAS Institute.

( ) FISA court solves

Katyal and Caplan '8 [Neal Katyal and Richard Caplan are Law professors at Georgetown University, "The Surprisingly Stronger Case for the Legality of the NSA Surveillance Program: The FDR Precedent" Stanford Law Review, Feb. 2008, http://www.jstor.org/stable/pdf/40040407.pdf // date accessed 6/29/15 K.K]

FISA was created in 1978 as part of Congress's overhaul of intelligence activities to govern domestic electronic surveillance of agents of foreign powers.12 The Act mandates that the Chief Justice of the United States designate eleven district judges from seven of the United States judicial circuits to form a Foreign Intelligence Surveillance Court (FISC).13 Of these, at least three judges must reside within twenty miles of Washington, D.C.14 The judges of this court hear the government's applications for foreign intelligence surveillance in secret and determine whether the requested surveillance meets the requirements set forth in FISA. Once a judge of the FISA court has denied an application for surveillance, the government may not petition another judge of the same court for approval of the same application.15 In most cases, FISA requires that the government conduct domestic surveillance for foreign intelligence purposes only pursuant to judicial authorization. The standards for that authorization, however, do not comport with the Fourth Amendment's probable cause requirements for an ordinary warrant. Rather, FISA is more permissive in the type and scope of the searches it allows, requiring far less judicial supervision when the government collects intelligence about foreign powers domestically.16 In most circumstances, a federal agent seeking to use surveillance under FISA must, with the approval of the Attorney General, submit an ex parte application to the Foreign Intelligence Surveillance Court.17 That application must state, among other things, (1) the identity or description of the target of surveillance, (2) the facts relied upon to justify the belief that the target is a foreign power (or agent thereof) and that each of the places to be targeted is used by or about to be used by a foreign power (or agent thereof), (3) detailed description of the type of information sought and the type of communications to be monitored, (4) that obtaining foreign intelligence information is "a significant purpose" of the surveillance, and (5) that such information cannot reasonably be obtained by alternative methods

( ) No NSA overload – Accumulo tech solves.

Harris '13

(Not Scott Harris, because large data sets do sometimes overwhelm him… But Derrick Harris. Derrick in a senior writer at Gigaom and has been a technology journalist since 2003. He has been covering cloud computing, big data and other emerging IT trends for Gigaom since 2009. Derrick also holds a law degree from the University of Nevada, Las Vegas. This evidence is also internally quoting Adam Fuchs – a former NSA employee that was involved in software design. "Under the covers of the NSA's big data effort" – Gigaom - Jun. 7, 2013 - https://gigaom.com/2013/06/07/under-the-covers-of-the-nsas-big-data-effort/)

The NSA's data collection practices have much of America — and certainly the tech community — on edge, but sources familiar with the agency's technology are saying the situation **isn't as bad as it seems**. Yes, the agency has a lot of data and can do some powerful analysis, but, the argument goes, there are strict limits in place around how the agency can use it and who has access. Whether that's good enough is still an open debate, but here's what we know about the technology that's underpinning all that data. The technological linchpin to everything the NSA is doing from a data-analysis perspective **is Accumulo** — an open-source database the agency built in order to store and analyze huge amounts of data. Adam Fuchs knows Accumulo well because he helped build it during a nine-year stint with the NSA; he's now co-founder and CTO of a company called Sqrrl that sells a commercial version of the database system. I spoke with him earlier this week, days before news broke of the NSA collecting data from Verizon and the country's largest web companies. The NSA **began building Accumulo** in late 2007, Fuchs said, because they were trying to do automated analysis for tracking and discovering new terrorism suspects. "We had a set of applications that we wanted to develop and we were looking for the right infrastructure to build them on," he said. The problem was those technologies weren't available. He liked what projects like HBase were doing by using Hadoop to mimic Google's famous BigTable data store, but it still wasn't up to the NSA requirements around scalability, reliability or security. So, they began work on a project called CloudBase, which eventually was renamed **Accumulo.** Now, Fuchs said, "It's operating at thousands-of-nodes scale" within the NSA's data centers. There are multiple instances each storing tens of petabytes (1 petabyte equals 1,000 terabyes or 1 million gigabytes) of data and it's the backend of the agency's most widely used analytical capabilities. Accumulo's ability to handle data in a variety of formats (a characteristic called "schemaless" in database jargon) means the NSA can store data from numerous sources all within the database and add new analytic capabilities in days or even hours. "It's quite critical," he added. What the NSA can and can't do with all this data As I explained on Thursday, **Accumulo is especially adept at analyzing trillions of data points** in order to build massive graphs that can detect the connections between them and the strength of the connections. Fuchs didn't talk about the size of the NSA's graph, but he did say the database is designed to handle months or years worth of information **and let analysts move from query to query very fast.** When you're talking about analyzing call records, it's easy to see where this type of analysis would be valuable in determining how far a suspected terrorist's network might spread and who might be involved.

( ) Accumulo solves without violating privacy.

Henschen '13

Doug Henschen is Executive Editor of InformationWeek, where he covers the intersection of enterprise applications with information management, business intelligence, big data and analytics. He previously served as editor in chief of Intelligent Enterprise, editor in chief of Transform Magazine, and Executive Editor at DM News. He has covered IT and data-driven marketing for more than 15 years. "Defending NSA Prism's Big Data Tools"- Information Week - Commentary - 6/11/2013 - http://www.informationweek.com/big-data/big-data-analytics/defending-nsa-prisms-big-data-tools/d/d-id/1110318?

The more you know about NSA's Accumulo system and graph analysis, the less likely you are to suspect Prism is a privacy-invading fishing expedition. It's understandable that democracy-loving citizens everywhere are outraged by the idea that the U.S. Government has back-door access to digital details surrounding email messages, phone conversations, video chats, social networks and more on the servers of mainstream service providers including Microsoft, Google, Yahoo, Facebook, YouTube, Skype and Apple. But the more you know about the technologies being used by the National Security Agency (NSA), the agency behind the controversial Prism program revealed last week by whistleblower Edward Snowden, the less likely you are to view the project as a ham-fisted effort that's "trading a cherished American value for an unproven theory," as one opinion piece contrasted personal privacy with big data analysis. The centerpiece of the NSA's data-processing capability **is Accumulo**, a highly distributed, massively parallel processing key/value store capable of analyzing structured and unstructured data. **Accumolo** is based on Google's BigTable data model, but NSA came up with a cell-level security feature that makes it possible to set access controls on **individual bits of data.** Without that capability, valuable information might remain out of reach to intelligence analysts who would otherwise have to wait for sanitized data sets scrubbed of personally identifiable information. Sponsor video, mouseover for sound [Want more on the Prism controversy? Read NSA Prism: Inside The Modern Surveillance State.] As InformationWeek reported last September, the NSA has shared Accumulo with the Apache Foundation, and the technology has since been commercialized by Sqrrl, a startup launched by six former NSA employees joined with former White House cybersecurity strategy director (and now Sqrrl CE0) Ely Khan. "The reason NSA built Accumulo and didn't go with another open source project, like HBase or Cassandra, is that they needed a platform where they could tag every single piece of data with a security label that dictates how people can access that data and who can access that data," said Khan in an interview with InformationWeek. Having left government employment in 2010, Kahn says he has no knowledge of the Prism program and what information the NSA might be collecting, but he notes that Accumulo makes it possible to

interrogate certain details while blocking access to personally identifiable information. This capability is likely among the things James R. Clapper, the U.S. director of National Intelligence, was referring to in a statement on the Prism disclosure that mentioned "numerous safeguards that protect privacy and civil liberties." Are They Catching Bad Guys? So the NSA can investigate data with limits, but what good is partial information? One of Accumulo's strengths is finding connections among seemingly unrelated information. "By bringing data sets together, [Accumulo] allowed us to see things in the data that we didn't necessarily see from looking at the data from one point or another," Dave Hurry, head of NSA's computer science research section, told InformationWeek last fall. Accumulo gives NSA the ability "to take data and to stretch it in new ways so that you can find out how to associate it with another piece of data and find those threats."

( ) The affirmative exaggerates contact chaining – minimization, numbers collected and lack of content disprove the advantage

Mann 14 — Scott Mann is a research associate with the Strategic Technologies Program at the Center for Strategic and International Studies in Washington D.C., 2014 ("Fact Sheet: Metadata", Center For Strategic & International Studies, 2/27/14 available at http://csis.org/publication/fact-sheet-metadata-0 date accessed 7/6/14 // K.K)

Assessment: These criticisms are wildly exaggerated. Press accounts make it sound like NSA has looked at millions of records. In practice, NSA queried only 288 primary "seed" phone numbers in 2012, and its ultimate contact chain analysis only touched 6,000 numbers connected to foreign intelligence activity. To search all records would be time-consuming and hinder analysis of relevant intelligence information. Metadata collected under Section 215 is limited to the call-log records of a particular phone number. The metadata does not include the "content" of a call, nor does it include the names, addresses or any other personally identifying information; it only shows the links between phone numbers. Contrary to the ACLU claims, it cannot be used by the NSA to ascertain intimate personal information. An analyst can look at metadata only after he or she has demonstrates a "reasonable, articulable suspicion" that a phone number is associated with a foreign terrorist organization, and only 22 NSA officials can authorize a query selector. Metadata queries are closely monitored through a series of minimization procedures, which limit the retention of and access to U.S. person data. Other procedural safeguards include limiting data access, creating auditable records of all searches, requiring monthly reports on activities, time limitations on the retention of data, as well as quarterly reviews by the Foreign Intelligence Surveillance Court. Despite the care taken by the NSA to prevent the abuse of data, there is an expectation that a federal agency should not have the authority to approve its own search requests. The legitimacy of metadata program oversight may be improved if the NSA was required to get court approval for database queries.

( ) Contact chaining is key to secure the border

Chappell 14 — Bill Chappell holds a bachelor's degrees in English and History from the University of Georgia and is a reporter/producer of National Public Radio, 2014 ("NSA Reportedly Collected Millions of Phone Texts Every Day", NPR, 1/16/14, available at http://www.npr.org/sections/thetwo-way/2014/01/16/263130142/nsa-reportedly-collected-millions-of-phone-texts-every-day date accessed 7/6/15 // K.K)

As recently as 2011, the National Security Agency was collecting almost 200 million text messages each day, according to a new story by The Guardian that cites documents from former NSA contractor Edward Snowden. The texts were used to develop financial and location data, the newspaper says. An image posted by The Guardian shows a presentation slide titled "Content Extraction Enhancements For Target Analytics: SMS Text Messages: A Goldmine to Exploit." Marked "Top Secret," it resembles the slides that were previously shown as part of the trove of materials Snowden gave to journalists last year. The NSA's collection of text messages in the program, codenamed Dishfire, is arbitrary, The Guardian says, and the information is stored in a database for potential future uses. The newspaper notes that the system works globally – meaning Americans' text messages are included in the collection process. According to the presentation, texts from U.S. phone numbers are removed from the database. After the story was published Thursday afternoon, the spy agency, which has been embarrassed by revelations about its massive data collection programs since last summer, told the BBC, "The implication that NSA's collection is arbitrary and unconstrained is false." From The Guardian come these examples of the data extracted by the NSA on a normal day: • "More than 5 million missed-call alerts, for use in contact-chaining analysis (working out someone's social network from who they contact and when)" • "Details of 1.6 million border crossings a day, from network roaming alerts" • "More than 110,000 names, from electronic business cards, which also included the ability to extract and save images." • "Over 800,000 financial transactions, either through text-to-text payments or linking credit cards to phone users" The NSA's practices and abilities are slated to be the topic of a speech by President Obama Friday (you can follow that event live at NPR.org, starting at 11 a.m. ET). NPR's Scott Neuman has a preview today, listing Five Changes To The NSA You Might Hear In Obama's Speech.

( ) Hezbollah is a unique threat based on the border – sustained intelligence is key to dissuade terrorist attacks on U.S soil

Levitt 13 — Matthew Levitt is the director of the Stein Program on Counterterrorism and Intelligence at The Washington Institute for Near East Policy, 2013 ("South of the Border, A Threat From Hezbollah" Washington Institute, Spring 2013, available at http://www.washingtoninstitute.org/uploads/Documents/opeds/Levitt20130515-JISA.pdf date accessed 7/6/15 // K.K)

Hezbollah's expanding criminal networks have led to closer cooperation with organized crime networks, especially Mexican drug cartels. In a March 2012 speech at the Washington Institute for Near East Policy, Michael Braun, former DEA chief of operations, detailed Hezbollah's skill in identifying and exploiting existing smuggling and organized crime infrastructure in the region. Braun and other officials have noted that the terrain along the southern U.S. border, especially around San Diego, is similar to that on the Lebanese-Israeli border. Intelligence officials believe drug cartels, in an effort to improve their tunnels, have enlisted the help of Hezbollah, which is notorious for its tunnel construction along the Israeli border. In the relationship, both groups benefit, with the drug cartels receiving Hezbollah's expertise and Hezbollah making money from its efforts.20 In 2008, the Mexican newspaper El Universal published a story detailing how the Sinaloa drug cartel sent its members to Iran for weapons and explosives training. The article reported that the Sinaloa members traveled to Iran via Venezuela, that they used Venezuelan travel documents, and that some members of Arab extremist groups were marrying local Mexican

and Venezuelan citizens in order to adopt Latino-sounding surnames and more easily enter the United States.21 Also on the U.S. radar is the relationship between Hezbollah and the Revolutionary Armed Forces of Colombia (FARC). "One thing both Hezbollah and the FARC have in common is a demonstrated willingness to work with outside groups that do not share their same ideology or theology, but who share a common enemy," notes Latin America expert Douglas Farah.22 A July 2009 indictment exposed Jamal Youssef, a former member of the Syrian military and known international arms dealer, who attempted to make a weapons-for-cocaine trade with the FARC. Unbeknownst to him, Youssef negotiated the deal with an undercover DEA agent. The military-grade arms he agreed to provide had been stolen from Iraq and stored in Mexico by Youssef's cousin, who he claimed was a Hezbollah member.23 Staging ground and safe haven Latin America is significant for Hezbollah and other terrorist organization. The Journal of International Security Affairs 81 South of the Border, A Threat from Hezbollah tions as well: the region provides an ideal point of infiltration into the United States. In at least one instance, a highly trained Hezbollah operative, Mahmaoud Youssef Kourani, succeeded in sneaking across the border into the U.S. through Mexico in the trunk of a car. Kourani paid the owner of a Lebanese café in Tijuana $4,000 to smuggle him across the border in February 2001. The café owner, Salim Boughader Mucharrafille, admitted to assisting more than 300 Lebanese sneak into the U.S. in similar fashion over a three-year period. An attempt to establish a Hezbollah network in Central America, foiled by Mexican authorities in 2010, provides even more insight into Hezbollah's foothold in Mexico. Hezbollah operatives, led by Jameel Nasr, employed Mexican nationals who had family ties in Lebanon to set up a network targeting Western interests, the media reported. According to these reports, Nasr routinely traveled to Lebanon to receive directions from Hezbollah.24 Over the past several years, U.S. criminal investigations also have revealed links between the group's illicit activities in the United States and criminal networks in Latin America. Fertile soil For some, Hezbollah's attacks in Buenos Aires are ancient history. Indeed, the government of Argentine President Cristina Fernández de Kirchner recently announced that her country was partnering with the Islamic Republic of Iran to establish an independent truth commission to resolve the AMIA bombing.25 In fact, Argentina's own investigation into the matter has already determined beyond a shadow of a doubt that Hezbollah and Iran partnered together to carry out these bombings.26 This disturbing turn of events demonstrates how far some in the region have yet to go to get serious about the threat Hezbollah and Iran pose. The need for attention is perhaps greater today than it has been in years past, since Hezbollah—as a result of both necessity and opportunity—appears to have renewed operational planning focused on South America. Confronting the threat it poses will require close law enforcement, intelligence, and policy coordination throughout the Western Hemisphere. And with Hezbollah actively plotting terrorist attacks around the world, such cooperation should take shape as quickly as possible

Accumulo

***Data overload wrong* – Accumulo tech solves**

Gallagher '13

Sean Gallagher is the IT editor at Ars Technica. Sean is a University of Wisconsin grad, a former systems integrator, a former director of IT strategy at Ziff Davis Enterprise. He wrote his first program in high school – "What the NSA can do with "big data"" - Ars Technica - Jun 11, 2013 - http://arstechnica.com/information-technology/2013/06/what-the-nsa-can-do-with-big-data/2/

Ironically, about the same time these two programs were being exposed, Internet companies such as Google and Yahoo were solving the **big data storage and analysis problem**. In November of 2006, Google published a paper on BigTable, a database with petabytes of capacity capable of indexing the Web and supporting Google Earth and other applications. And the work at Yahoo to catch up with Google's GFS file system—the basis for BigTable—resulted in the Hadoop. BigTable and Hadoop-based databases offered a way to handle **huge amounts of data** being captured by the NSA's operations, but they lacked something critical to intelligence operations: compartmentalized security (or any security at all, for that matter). So in 2008, NSA set out to create a better version of BigTable, called **Accumulo**—now an Apache Foundation project. Accumulo is a "NoSQL" database, based on key-value pairs. It's a design similar to Google's BigTable or Amazon's DynamoDB, but **Accumulo has special security features designed for the NSA**, like multiple levels of security access. The program is built on the open-source Hadoop platform and other Apache products. One of those is called Column Visibility—a capability that allows individual items within a row of data to have different classifications. That allows users and applications with different levels of authorization to access data but see more or less information based on what each column's "visibility" is. Users with lower levels of clearance wouldn't be aware that the column of data they're prohibited from viewing existed. Accumulo also can generate near real-time reports from specific patterns in data. So, for instance, the system could look for specific words or addressees in e-mail messages that come from a range of IP addresses; or, it could look for phone numbers that are two degrees of separation from a target's phone number. Then it can spit those chosen e-mails or phone numbers into another database, where NSA workers could peruse it at their leisure. In other words, Accumulo allows the NSA to do what Google does with your e-mails and Web searches—only with everything that flows across the Internet, or with every phone call you make. It works because of a type of server process called "iterators." These pieces of code constantly process the information sent to them and send back reports on emerging patterns in the data. Querying a multi-petabyte database and waiting for a response would be deadly slow, especially because there is always new data being added. **The iterators are like NSA's tireless data elves.**

No NSA data overload - Accumulo checks.

Kelly '12

Jeff Kelly is a Principal Research Contributor at The Wikibon Project and a Contributing Editor at SiliconANGLE. He focuses on trends in Big Data and business analytics. His research has been quoted and referenced by the Financial Times, Forbes, CIO.com, Network World, GigaOM, TechTarget and more – "Accumulo: Why The World Needs Another NoSQL Database" – Wikibon Blog – August 20th - http://wikibon.org/blog/breaking-analysis-accumulo-why-the-world-needs-another-nosql-database/

If you've been unable to keep up with all the competing NoSQL databases that have hit the market over the last several years, you're not alone. To name just a few, there's HBase, Cassandra, MongoDB, Riak, CouchDB, Redis, and Neo4J. To that list you can add Accumulo, an open source database originally developed at the **N**ational **S**ecurity **A**gency. You may be wondering why the world needs yet another database to handle large volumes of multi-structured data. The answer is, of course, that no one of these NoSQL databases has yet checked all the feature/functionality boxes that most enterprises require before deploying a new technology. In the Big Data world, that means the ability to handle the three V's (**volume, variety and velocity**) of data, the ability to process multiple types of workloads (analytical vs. transactional), and the ability to maintain ACID (atomicity, consistency, isolation and durability) compliance at scale. With each new NoSQL entrant, hope springs eternal that this one will prove the NoSQL messiah. So what makes Accumulo different than all the rest? According to proponents, **Accumulo is capable of maintaining consistency even as it scales to thousands of nodes and petabytes of data**; it can both read and write data in near real-time; and, most importantly, it was built from the ground up with cell-level security functionality.

Accumulo tech solves overload – and does so without mass privacy violations.

Jackson '13

Joab Jackson covers enterprise software and general technology breaking news for the IDG News Service, and is based in New York. "NSA's Accumulo data store has strict limits on who can see the data" - PC World - Oct 31, 2013 - http://www.pcworld.com/article/2060060/nsas-accumulo-nosql-store-offers-rolebased-data-access.html

With its much-discussed enthusiasm for collecting large amounts of data, the NSA naturally found much interest in the idea of highly scalable NoSQL databases. But the U.S. intelligence agency needed some security of its own, so it developed a NoSQL data store called **Accumulo**, with built-in policy enforcement mechanisms that strictly limit who can see its data. At the O'Reilly Strata-Hadoop World conference this week in New York, one of the former National Security Agency developers behind the software, Adam Fuchs, explained how Accumulo works and how it could be used in fields other than intelligence gathering. The agency contributed the software's source code to the Apache Software Foundation in 2011. "Every single application that we built at the NSA has some concept of multi-level security," said Fuchs, who is now the chief technology officer of Sqrrl, which offers a commercial edition of the software. The NSA started building Accumulo in 2008. Much like Facebook did with its Cassandra database around the same time, the NSA used the Google Big Table architecture as a starting point. In the parlance of NoSQL databases, Accumulo is a simple key/value data store, built on a shared-nothing architecture that allows for easy expansion to thousands of nodes able to hold petabytes worth of data. It features a flexible schema that allows new columns to be quickly added, and comes with some advanced data analysis features as well. Accumulo's killer feature Accumulo's killer feature, however, is its "data-centric security," Fuchs said. When data is entered into Accumulo, it must be accompanied with tags specifying who is allowed to see that material. Each row of data has a cell specifying the roles within an organization that can access the data, which can map back to specific organizational security policies. It adheres to the RBAC (role-based access control) model. This approach allowed the NSA to categorize data into its multiple levels of classification—confidential, secret, top secret—as well as who in an organization could access the data, based on their official role within the organization. The database is accompanied by a policy engine that decides who can see what data. This model could be used anywhere that security is an issue. For instance, if used in a health care organization, Accumulo can specify that only a patient and the patient's doctor can see the patient's data. The patient's specific doctor may change over time, but the role of the doctor, rather than the individual doctor, is specified in the database. The NSA found that the data-centric approach "greatly simplifies application development," Fuchs said. Because data today tends to be transformed and reused for different analysis applications, it makes sense for the database itself to keep track of who is allowed to see the data, rather than repeatedly implementing these rules in each application that uses this data.

( ) Social media presents the façade of intimacy through self-enhancing depiction of identity

Livingstone '8 [Sonia Livingstone, Professor of Social Psychology in the Department of Media and Communications at the London School of Economics and Political Science, "Taking risky opportunities in youthful content creation: Teenagers' use of social networking sites for intimacy, privacy and self-expression", LSE Research Online, 2008 http://eprints.lse.ac.uk/27072/1/Taking_risky_opportunities_in_youthful_content_creation_(LSERO).pdf // date accessed 6/28/15 K.K]

With this in mind, Ellie, Nina and others seem to suggest that, for younger teenagers, self-attention is enacted through constructing an elaborate, highly stylized statement of identity as display. Thus a visually ambitious, 'pick and mix' profile, that frequently remixes borrowed images and other content to express continually shifting tastes offers for some a satisfactorily 'successful' self, liked and admired by peers. But this notion of identity as display – which characterizes Daphne and Danielle's profiles and, to a lesser degree, those of several of the others - is gradually replaced by the mutual construction among peers of a notion of identity through connection. On this alternative approach, elements of display are excised from the profile, replaced by the visual privileging of one's contacts, primarily through links to others' profiles and by posting photos of the peer group socializing offline. Equally stylized, albeit employing a different aesthetic, and still focused on the reflexive tasks of self-observation and self-assessment, this later phase brings to mind Giddens' (1991: 91) argument that the 'pure relationship' is replacing the traditional relationship long embedded in structures of family, work or community. As he puts it, 'the pure relationship is reflexively organized, in an open fashion, and on a continuous basis', prioritizing the values of authenticity, reciprocity, recognition and intimacy. Reminiscent of the concerns reflected by teenagers when talking about social networking, the continuous revision of the self is hinted at when Leo says, 'I'll always be adding new friends'. The implications for judging others are brought out not only by Ellie's emphasis, above, on people who are 'actually' friends and so know you already, but also by Ryan's observation about others that, 'you look at their pictures, see if they are authentic or not, so if they ain't got any comments and they're just adding people, then I can't believe them'. Now, too, we may see that Danny's omission of personal information on his profile is less a curious neglect of self than the prioritization of a self-embedded in social connections - for it is not that Danny cannot be bothered about networking: he sustains links with 299 friends and checks every day to see 'if I've got any, like, messages, new friend requests or anything like that, like, new comments'. In terms of affordances, then, social networking sites frame, but do not determine. It remains open to young people to select a more or less complex representation of themselves linked to a more or less wide network of others. These choices pose advantages and disadvantages. Elaborating the presentation of self at the node supports the biographisation of the self by prioritizing a managed and stylized display of identity as lifestyle. But it risks invasions of privacy, since the backstage self is on view (Goffman, 1959), potentially occasioning critical or abusive responses from

others. Something of the associated anxiety is evident in Ryan's comment about his profile that 'hopefully people will like it - if they don't, then screw them'. The interlinking of opportunities and risks is also apparent when Danielle discusses how her friend used Piczo to express her unhappiness when her parents separated, 'because other people can advise you what to do or say, don't worry, you can go through it'; yet she is one of the few interviewees who talked about the risk of hostile comments, noting that 'sometimes the comments are cruel and they're [her friends] all crying and upset'.

( ) Can't implement the theory – too slow technology changes.

Kerr, 2012 (Orin S., Professor of Law @ George Washington University Law School "THE MOSAIC THEORY OF THE FOURTH AMENDMENT" Michigan Law Review Lexis)

The first difficulty with the mosaic theory is the most obvious: Its implementation raises so many difficult questions that it will prove exceedingly hard to administer effectively. Because the mosaic theory departs dramatically from existing doctrine, implementing it would require the creation of a new set of Fourth Amendment rules – a mosaic parallel to the sequential precedents that exist today. The problem is not only the number of questions, but their difficulty. Many of the questions raised in Part III of this article are genuine puzzles that Fourth Amendment text, principles and history cannot readily answer. Judges should be reluctant to open the legal equivalent of Pandora's Box. It is particularly telling that not even the proponents of the mosaic theory have yet proposed answers for how the theory should be applied. For example, a group of Fellows at Yale's Information Society Project who endorse the mosaic approach simply dismissed the conceptual difficulties of its implementation on the ground that answering such puzzles is "why we have judges."198 A pro-mosaic amicus brief in Jones signed by several prominent legal academics was similarly nonresponsive. Although the mosaic approach requires "tough decisions" to be made, the brief noted, courts have encountered difficult questions elsewhere in Fourth Amendment law. 199 While one can admire such confidence in the capabilities of the judiciary, it would provide more comfort if proponents of the mosaic theory would at least be willing to venture guesses as to how it should apply. The challenge of answering the questions raised by the mosaic theory has particular force because the theory attempts to regulate use of changing technologies. Law enforcement implementation of new technologies can occur very quickly, while judicial resolution of difficult constitutional questions occurs at a more glacial pace. As a result, the constantly-evolving nature of surveillance practices could lead new questions to arise faster than courts can settle them. Old practices would likely be obsolete by the time the courts resolved how to address them, and the newest surveillance practices would arrive and their legality would remain unknown. Like Lucy and Ethel trying to package candy on the everfaster conveyor belt, 200 the mosaic theory could place judges in the uncomfortable position of trying to settle a wide range of novel questions for technologies that are changing faster than the courts can resolve how to regulate them. Consider the changes in location-identifying technologies in the last three decades. Thirty years ago, the latest in police technologies to track location was the primitive radio beeper seen in Knotts. But radio beepers have gone the way of the 8-track tape. Today the police have new tools at their disposal that were unknown in the Knotts era, ranging from GPS devices to cell-site records to license–plate cameras. This rapid pace of technological change creates major difficulties for courts trying to apply the mosaic theory: If the technological facts of the mosaic change quickly over time, any effort to answer the many difficult questions raised by the mosaic theory will become quickly outdated. Courts may devise answers to the many questions discussed in Part III, but by the time they do the relevant technology is likely to have gone the way of the radio beeper.

( ) There is a sequential approach to the Fourth Amendment now

Kerr, 2012 (Orin S., Professor of Law @ George Washington University Law School "THE MOSAIC THEORY OF THE FOURTH AMENDMENT" Michigan Law Review Lexis)

The five votes in favor of a mosaic approach in United States v. Jones do not establish the theory as a matter of law. The majority opinion in Jones failed to adopt the mosaic approach, and it only touched on the mosaic

method in passing to express skepticism of it.187 Even if five votes of the current court are ready to embrace the theory, lower courts must adhere to Supreme Court holdings even when subsequent developments suggest that the Supreme Court would reject those holdings if it reviewed them.188 For now, then, the sequential approach remains good law. At the same time, the concurring opinions in Jones invite lower courts to consider embracing some form of the mosaic approach. Our attention therefore must turn to the normative question: Should courts embrace the mosaic theory? Is the mosaic approach a promising new method of Fourth Amendment interpretation, or is it a mistake that should be avoided? This section argues that courts should reject the mosaic theory. The better course is to retain the traditional sequential approach to Fourth Amendment analysis. The mosaic theory aims at a reasonable goal. Changing technology can outpace the assumptions of existing precedents, and courts may need to tweak prior doctrine to restore the balance of privacy protection from an earlier age. I have called this process "equilibrium adjustment,"189 and it is a longstanding method of interpreting the Fourth Amendment. But the mosaic theory aims to achieve this goal in a very peculiar way.

( ) Courts are not ruling on the Mosaic theory now

Bellovin et al, 2014 (Steven M., Prof of Computer Science @ Columbia, Renee M. Hutchins, Associate Prof. of Law @ Maryland Francis King Carey School of Law, Tony Jebara, Associate Prof. of Computer Science @ Columbia, and Sebastian Zimmeck, Ph D. Candidate in Computer Science @ Columbia, "When Enough is Enough: Location Tracking, Mosaic Theory, and Machine Learning" New York University Journal of Law & Liberty Lexis)

In the context of location tracking, the Court has previously suggested that the Fourth Amendment may (at some theoretical threshold) be concerned with the accumulated information revealed by surveillance.3 Similarly, in the Court's recent decision in United States v. Jones, a majority of concurring justices indicated willingness to explore such an approach.4 However, in general, the Court has rejected any notion that technological enhancement matters to the constitutional treatment of location tracking.5 Rather, it has decided that such surveillance in public spaces, which does not require physical trespass, is equivalent to a human tail and thus not regu-lated by the Fourth Amendment. In this way, the Court has avoided a quantitative analysis of the amendment's protections. The Court's reticence is built on the enticingly direct assertion that objectivity under the mosaic theory is impossible. This is true in large part because there has been no rationale yet offered to objectively distinguish relatively short-term monitoring from its counterpart of greater duration.6 This article suggests that by combining the lessons of machine learning with the mosaic theory and apply-ing the pairing to the Fourth Amendment we can see the contours of a response. Machine learning makes clear that mosaics can be created. Moreover, there are important lessons to be learned on when this is the case.c

( ) Reasonable expectation of privacy is based on a probabilistic view of the fourth amendment. That fails because society has no idea what surveillance is common or rare.

Kerr, 2012 (Orin S., Professor of Law @ George Washington University Law School "THE MOSAIC THEORY OF THE FOURTH AMENDMENT" Michigan Law Review Lexis)

The third problem with the mosaic theory is that most formulations of it are based on a probabilistic approach to the reasonable expectation of privacy test that proves ill-suited to regulate technological surveillance practices. Supreme Court decisions have utilized several different inquiries for what makes an expectation of privacy constitutionally reasonable.201 In some cases the Court has looked to what a reasonable person would perceive as likely;202 in other cases the Court has looked to whether the particular kind information obtained is worthy of protection; 203 in some cases the Court has looked to whether the government violated some legal norm such as property in obtaining the information; 204 and in other cases the Court has simply considered whether the conduct should be regulated by the Fourth Amendment as a matter of policy.205 Use of these multiple inquiries (what I have called "models") of Fourth Amendment protection allows the Court to adopt different approaches in different contexts, ideally selecting the model that best identifies the need for regulation in that particular setting.206 For the most part, formulations of the mosaic theory rest on the first of these approaches – what a reasonable person would see as likely. I have called this the probabilistic approach to Fourth Amendment protection,207 as it rests on

a notion of the probability of privacy protection. The more likely it is that a person's will maintain their privacy, the more likely it is that government conduct defeating that expectation counts a search. Under this model, the Fourth Amendment guards against surprises. The paradigmatic example is Bond v. United States,208 which involved government agents manipulating the duffel bag of a bus passenger to identify a wrapped brick of drugs inside it. A bus passenger expects other passengers to handle his bag but not "feel the bag in an exploratory manner,"209 the Court held, so the exploratory feel violated a reasonable expectation of privacy. Both Judge Ginsburg and Justice Alito authored mosaic opinions that rely on such probabilistic reasoning. Judge Ginsburg deemed long-term GPS monitoring a search because no stranger could conduct the same level of monitoring as a GPS device. Justice Alito reached the same result on the grounds that a reasonable person would not expect the police to obtain so much information. The probabilistic approach presents a poor choice to regulate technological surveillance because most individuals lack a reliable way to gauge the likelihood of technological surveillance methods. The probabilistic expectation of privacy applied in Bond relied on widespread and repeated personal experience. Bus passengers learn the social practices of bus travel by observing it first-hand. In contrast, estimating the frequency of technological surveillance practices is essentially impossible for most people (and most judges). Surveillance practices tend to be hidden, and few understand the relevant technologies. Some people will guess that privacy invasions are common, and others will guess that they are rare. But none will know the truth, which makes such probabilistic beliefs a poor basis for Fourth Amendment regulation.

( ) Courts can't administer the mosaic theory

Kerr, 2012 (Orin S., Professor of Law @ George Washington University Law School "THE MOSAIC THEORY OF THE FOURTH AMENDMENT" Michigan Law Review Lexis)

The concurring opinions in Jones invite lower courts to experiment with a new approach to the Fourth Amendment search doctrine. The approach is well-intentioned, in that it aims to restore the balance of Fourth Amendment protection by disabling the new powers created by computerization of surveillance tools. But despite being well-intentioned, the mosaic theory represents a Pandora's Box that courts should leave closed. The theory raises so many novel and difficult questions that courts would struggle to provide reasonably coherent answers. By the time courts worked through answers for any one technology, the technology would likely be long obsolete. Mosaic protection also could come at a cost of lost statutory protections, and implementing it would require courts to assess probabilities of surveillance that judges are poorly equipped to evaluate. In this case, the game is not worth the candle. The concurring opinions in Jones represent an invitation that future courts should decline. Instead of adopting a new mosaic theory, courts should consider the need to engage in equilibrium-adjustment within the confines of the traditional sequential approach.

Social media correlates to jealousy, social tension, isolation, and depression – stats

Economist 13

("Facebook is bad for you, Get a life!", http://www.economist.com/news/science-and-technology/21583593-using-social-network-seems-make-people-more-miserable-get-life, ZS)

THOSE who have resisted the urge to join Facebook will surely feel vindicated when they read the latest research. A study just published by the Public Library of Science, conducted by Ethan Kross of the University of Michigan and Philippe Verduyn of Leuven University in Belgium, has shown that the more someone uses Facebook, the less satisfied he is with life. **Past investigations have found that using Facebook is associated with jealousy, social tension, isolation and depression.** But these studies have all been "cross-sectional"—in other words, snapshots in time. As such, they risk confusing correlation with causation: perhaps those who spend more time on social media are more prone to negative emotions in the first place. The study conducted by Dr Kross and Dr Verduyn is the first to follow Facebook users for an extended period, to track how their emotions change. The researchers recruited 82 Facebookers for their study. These volunteers, in their late teens or early 20s, agreed to have their Facebook activity observed for two weeks and to report, five times a day, on their state of mind and their direct social contacts (phone calls and meetings in person with other people). These reports were prompted by text messages, sent between 10am and midnight, asking them to complete a short questionnaire. When the researchers analysed the results, they found that the more a volunteer used Facebook in the period between two questionnaires, the worse he reported feeling the next time he filled in a questionnaire. Volunteers were also asked to rate their satisfaction with life at the start and the end of the study. Those who used Facebook a lot were more likely to report a decline in satisfaction than those who visited the site infrequently. In contrast, there was a positive association between the amount of direct social contact a volunteer had and how positive he felt. In other words, the more volunteers socialised in the real world, the more positive they reported feeling the next time they filled in the questionnaire. A volunteer's sex had no influence on these findings; nor did the size of his (or her) social network, his stated motivation for using Facebook, his level of loneliness or depression or his self-esteem. Dr Kross and Dr Verduyn therefore conclude that, rather than enhancing well-being, Facebook undermines it.

Off Case

Topicality – Curtail

1nc

1. "Curtail" means to restrict

Webster's 15 – Webster's New World College Dictionary, 4th Ed., "curtail", http://www.yourdictionary.com/curtail

verb

To curtail is defined as to restrict something, stop something or deprive of something.

An example of curtail is when a town wants to stop drunk driving.

2. "Restriction" requires binding enforcement---policies that have discouraging effects on surveillance but don't legally limit it aren't topical

Barnett 3 (Stephen R., Boalt Professor of Law Emeritus – University of California, Berkeley, "No-Citation Rules Under Siege: A Battlefield Report and Analysis", The Journal of Appellate Practice and Process, Fall, 5 J. App. Prac. & Process 473, Lexis)

C. "Restrictions" on Citation: Introducing Draft B Despite this assurance, under the present drafting it is not clear that the proposed Rule 32.1 does preserve circuit choice on the question of citation weight. When the proposed Rule says, "No prohibition or restriction may be imposed upon the citation of [unpublished] judicial opinions," **what does "restriction"** [*491] **mean? If** a circuit's rule provides - as several do 122 - that unpublished **opinions may be cited only for** their **"persuasive" value, is that not a "restriction"** on their citation**? One might think so**. And if so, it would follow that circuit rules limiting citation to persuasive value are forbidden by Rule 32.1, because no such limit is imposed on the citation of published opinions. 123 Two possible remedies come to mind. One is legislative history, or drafter's gloss. The Committee Note might declare the committee's view that the Rule deals only with citability and "says nothing whatsoever about the effect that a court must give" to the cited opinions. 124 If we may assume that the judges and lawyers operating in the federal appellate courts have no aversion to legislative history, 125 this approach might produce the committee's desired interpretation of its Rule. The other approach would proceed on the basis that if you want to permit citation, you might just say that citation is permitted. 126 Draft B thus would simply provide: Any opinion, order, judgment, or other disposition by a federal court may be cited to or by any court. This language would make quite clear the committee's view that the Rule deals only with permitting citation and says nothing about the weight to be given citations. Draft B also would take the lead out of the drafting. You don't have to be Bryan Garner to object to the present draft's double negative ("no prohibition)"; its vast passive ("may be imposed"); its [*492] awkward laundry list of unpublished dispositions; or its backhanded approach of making opinions citable by banning restrictions on citation. Before concluding, however, that the elegant Draft B should replace the

committee's cumbersome Draft A, it is necessary to consider how each draft would handle a major problem that will arise. D. Discouraging Words This is the problem of discouraging words. Although nine of the thirteen circuits now allow citation of their unpublished opinions, all nine discourage the practice; they all have language in their rules stating that such citation is "disfavored," that unpublished opinions should not be cited unless no published opinion would serve as well, that the court "sees no precedential value" in unpublished opinions, and so forth. 127 **The question is whether such discouraging words are a forbidden "restriction"** on citation under proposed Rule 32.1. The Advisory Committee addresses this question with the following Delphic pronouncement: Unlike many of the local rules of the courts of appeals, Rule 32.1(a) does not provide that citing "unpublished" opinions is "disfavored" or limited to particular circumstances (such as when no "published" opinion adequately addresses an issue). Again, it is difficult to understand why "unpublished" opinions should be subject to restrictions that do not apply to other sources. 128 The first sentence of this passage does not say that Rule 32.1 would overrule those local rules - only that it is "unlike" them. The second sentence, however, characterizes the discouraging words as "restrictions," so in the committee's apparent view, Rule 32.1 would overrule them. Four questions follow: (1) Are discouraging words "restrictions" on citation under Rule 32.1? (2) What difference, if any, does it make? (3) What is the risk of judicial resistance to [*493] no-citation rules, through discouraging words or other means? and (4) Should discouraging words be forbidden? 1. Are Discouraging Words "Restrictions" under Rule 32.1? The committee's statement notwithstanding, **it is not clear that discouraging words have to be considered "restrictions"** on citation under the proposed Rule 32.1. **These words may be wholly admonitory - and unenforceable**. The Fourth Circuit's rule, for example, states that citing unpublished opinions is "disfavored," but that it may be done "if counsel believes, nevertheless, that [an unpublished opinion] has precedential value in relation to a material issue in a case and that there is no published opinion that would serve as well." 129 On the question of what counsel "believes," surely counsel should be taken at her word; counsel's asserted belief that an unpublished opinion has precedential or persuasive value should not be considered a falsifiable fact. Hence **no sanction should be available for violating the** Fourth Circuit's **rule, and** the rule's **discouraging language in turn would not be a** "prohibition or **restriction**" that was barred by Rule 32.1 as presently drafted. In the rules of some other circuits, however, **the language disfavoring** citation of unpublished opinions is unmoored from anyone's "belief" and arguably **does impose an objective** "prohibition or **restriction**" determinable by a court. 130 A court might find, for example, that the required "persuasive value with respect to a material issue that has not been addressed in a published opinion" 131 was not present, and hence that the citation was not permitted by the circuit rule. With what result? It would follow, paradoxically, that the opinion could be cited - because the circuit rule would be struck down under Rule 32.1 as a forbidden "restriction" on citation. The committee's double-negative drafting thus creates a Hall of Mirrors in which citation of an unpublished opinion [*494] would be allowed either way. If the local rule's discouraging language is merely hortatory, it is not a "restriction" forbidden by Rule 32.1; but that doesn't matter, because such a rule does not bar the citation in the first place. **If, on the other hand, the** local rule's **language has bite and is a "restriction," then Rule 32.1 strikes it down**, and again the citation is permitted. 2. What Difference Does It Make Whether Discouraging Words Are "Restrictions"? There is one live question, however, that would turn on whether a local rule's discouraging language constituted a "restriction" on citation. If the language was a restriction, it would be condemned by Rule 32.1 132 and so presumably would have to be removed from the local circuit rule. **Each** circuit's **rule thus would have to be parsed to determine whether its discouraging words were purely hortatory or legally enforceable**; and

each circuit thus would have to decide - subject to review by the Judicial Conference? - which of its discouraging words it could keep.

3. Voting issue---

4. Limits---allowing effectual reductions explodes the topic. Any action can potentially result in less surveillance. Limits are key to depth of preparation and clash.

5. Ground---our interpretation is key to establish a stable mechanism of legal prohibition that guarantees core ground based on topic direction. They allow the Aff to defend completely different processes like "oversight" that dodge core DAs and rob the best counterplan ground.

SOP Counterplan

1nc

The United States Supreme Court should rule based on the separation of powers doctrine that the gathering of intelligence data from social networks is unconstitutional.

1st and 4th amendment challenges to surveillance fail – the counterplan is key to legitimately stopping surveillance

Slobogin 15

(Christopher -Milton Underwood Professor of Law, Chris Slobogin has authored more than 100 articles, books and chapters on topics relating to criminal procedure, mental health law and evidence. Named director of Vanderbilt Law School's Criminal Justice Program in 2009, Professor Slobogin is one of the five most cited criminal law and procedure law professors in the country, according to the Leiter Report, Vanderbilt University Law School, Standing and Covert Surveillance, Pepperdine Law Review, February 18, 2015, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2567070, JZG)

IV. A THIRD BASIS FOR CHALLENGING SURVEILLANCE: SEPARATION OF POWERS AND THE NONDELEGATION DOCTRINE One response to standing arguments based on the insights of scholars like Milligan and Richards is that they ignore the close relationship between standing and the scope of the right in question.131 Indeed, when the Fourth Amendment is the basis for the claim, the Supreme Court has explicitly conflated standing with the Amendment's substance. In Rakas v. Illinois, 132 the Court stated that the decision as to whether a defendant can make a Fourth Amendment claim "forthrightly focuses on the extent of a particular defendant's rights under the Fourth Amendment, rather than on

any theoretically separate, but invariably intertwined concept of standing."133 If a government action is not a Fourth Amendment "search" vis-à-vis the litigant, Rakas held, then the litigant lacks standing to challenge it. If that reasoning is the correct approach to standing, then in cases challenging covert surveillance on Fourth or First Amendment grounds everything rides on whether the surveillance, as it operates in the way the plaintiff describes it, infringes the plaintiff's reasonable expectations of privacy or speech and association interests.134 While such a finding would presumably be made in the Clapper case, which involved the alleged interception of the content of overseas phone calls,135 it is less certain in connection with collection and querying of metadata. The Fourth Amendment is only meant to protect reasonable expectations of privacy.136 Supreme Court case law to date strongly suggests that any privacy one might expect in one's metadata or Internet activity is unreasonable, because we assume the risk that third parties to which we knowingly impart information (here phone companies and Internet service providers) will in turn divulge it to the government.137 The same type of analysis might limit standing in cases brought under the First Amendment. As the Court intimated in Clapper, 138 one could conclude that even if speech and association are inhibited by surveillance, that inhibition proximately results from the individual's choices, not from anything the government has done to the individual.139 On this view, even if an individual can show that he or she was targeted, standing to contest surveillance does not exist unless and until the government uses the seized information against the individual, because otherwise a colorable claim that a constitutionally cognizable interest was infringed cannot be made. If, despite its impact on political participation, covert surveillance like the metadata program remains immune from Fourth and First Amendment challenges, there remains another avenue of attack, derived directly from separation of powers doctrine. In other work, I have argued that, even if the Fourth (or First) Amendment does not govern a particular type of surveillance, Ely's political process theory provides a basis for challenging panvasive actions that are the result of a seriously flawed political process.140 More specifically, panvasive surveillance might be challengeable on one of three grounds: (1) the surveillance is not authorized by the appropriate legislative body; (2) the authorizing legislative body does not meaningfully represent the group affected by the surveillance; or (3) the resulting legislation or law enforcement's implementation of it violates notions underlying the non-delegation doctrine.141 The first and third of these grounds are based explicitly on separation of powers concerns. As I pointed out, some panvasive surveillance has not been legislatively authorized or has been authorized by legislation that does not announce an "intelligible principle" governing the implementing agency.142 Panvasive surveillance is also defective under non-delegation principles if, as I have argued is true of the NSA's metadata program, it is implemented by rules or practices that are not explained, were produced through flawed or non-transparent procedures, or are applied unevenly.143 Based on several Supreme Court cases, particularly in the administrative law area,144 I concluded that any one of these deficiencies could be the basis for the claim that the legislature, the relevant law enforcement agency, or both are failing to carry out their constitutional obligations as law-making and law implementing bodies.145 Although this type of claim, like the Fourth and First Amendment claims, aims at "generalized relief," the Court itself has often granted standing to individuals making separation of powers claims.146 The rationale of these cases is not difficult to grasp, because it again reflects the political process rationale. Many years ago Justice Brandeis stated, "[T]he doctrine of the separation of powers was adopted by the convention of 1787 not to promote efficiency but to preclude the exercise of arbitrary power."147 More recently, Chief Justice Burger asserted that "checks and balances were the foundation of a structure of government that would protect liberty."148 More recently still, in Bond v. United States149 the Court stated "[t]he structural principles secured by the separation of powers protect the individual as well."150 If one accepts the possibility that a separation of powers argument can be made in covert surveillance cases, then parties who can demonstrate the type of injury described above—that is, a significant stifling of political participation that, to borrow the Second Circuit's language in its Clapper decision,151 is a reasonable, non-fanciful, and non-paranoid reaction to covert surveillance—should have standing to challenge panvasive surveillance even if it is not a search under the Fourth Amendment or does not abridge First Amendment freedom. The merits claim would not be that the surveillance is an unreasonable search or infringement of speech or

association rights, but rather that the legislature has failed in its delegation task or that the relevant law enforcement or intelligence agency has acted in an ultra vires fashion. These are the types of separation of powers claims that courts ought to hear because they assure the proper functioning of the political process that the Court is so eager to protect (with, inter alia, its standing doctrine). To requote Chief Justice Roberts, "[T]he obligation of the Judiciary [is] not only to confine itself to its proper role, but to ensure that the other branches do so as well."152

Mosaic Disadvantage

1nc Cyber Harassment

Cyberharassment is a growing problem - mosaic theory hinders apprehension.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

Cyberharassment is a widespread and growing challenge for law enforcement in the United States. These online attacks feature threats of violence, privacy invasions, reputation-harming falsehoods, impersonation, computer hacking, and extortion. They often appear in e-mails, instant messages, blog entries, message boards, or sites devoted to tormenting individuals. As the executive director of the National Center for Victims of Crime explained in her congressional testimony supporting the 2006 cyberstalking amendment to the Violence Against Women Act: Stalkers are using very sophisticated technology ... - installing spyware on your computer so that they can track all of your interactions on the Internet, your purchases, your e-mails and so forth, and then using that against you, forwarding e-mails to people at your job, broadcasting your whereabouts, your purchases, your reading habits and so on, or installing GPS in your car so that you will show up at the grocery store, at your local church, wherever and there is the stalker and you can't imagine how the stalker knew that you were going to be there... . I am happy that this legislation amends the statute so that prosecutors have more effective tools, I think, to address technology through VAWA 2005. n257 Although some attackers confine their harassment to networked technologies, others use all available tools to harass victims, including real-space contact. Offline harassment or stalking often includes abusive phone calls, vandalism, threatening mail, and physical assault. n258 According to the Bureau of Justice Statistics, 850,000 adults experienced stalking with an online component in 2006, including threats in e-mails, text messages, chat rooms, and blogs. n259 Young people are even more likely to experience some form of cyberharassment. The National Center for Education Statistics reports that, during the 2008-2009 school year, 1.5 million young people in the United States were victims of some form of cyberharassment. n260 Already a significant problem, [*789] cyberharassment is on the rise. College students now report more sexually harassing speech in online interactions than in face-to-face ones. As the National Institute of Justice explains, the "ubiquity of the Internet and the ease with which it allows others unusual access to personal information" make individuals more accessible and vulnerable to online abuse. n261 Harassing someone online is far cheaper and less personally risky than confronting them in space. n262 Cyberharassment and the identity of its victims follow the well-worn pathways of bias crimes. The most recent Bureau of Justice Statistics findings report that 74% of online stalking victims are female. n263 Perpetrators are far more likely to be men. n264 Unsurprisingly, the content of these attacks are often sexually explicit and demeaning, drawing predominantly on gender stereotypes. As one blogger observed, "the fact is, to be a woman online is to **eventually be threatened with rape and death**. On a long enough timeline, **the chances of this not occurring** drop to [*790] zero." n265 Cyberharassment also follows racial lines. A study conducted in

2009 asked 992 undergraduate students about their experience with cyberharassment. According to this study, nonwhite females faced cyberharassment more than any other group, with 53% reporting having been harassed online. Next were white females, with 45% reporting having been targeted online, with nonwhite males right behind them at 40%. The group least likely to have been harassed was white males, at 31%. n266 Across race, being lesbian, transgender, or bisexual also raised the risk of being harassed. real n267 Another disturbing feature of cyberharassment is that it tends to be perpetrated by groups rather than individuals. Those who engage in abusive online conduct often move in packs. n268 Cyberharassers frequently engage proxies to help torment their victims. n269 These group attacks bear all of the hallmarks of violent mob behavior. So much so, in fact, that one of us has dubbed them "cyber mobs." n270 As with sole practitioners, online mob harassment is more likely to be perpetrated by members of dominant demographics, and to draw on popular stigmas for the purpose of shaming and degrading their targets. n271 Of course, cold statistics and general description tell at best part of the story of legitimate government and law enforcement interests in preventing, detecting, and prosecuting cyberharassment. Recent efforts to highlight the privacy interests that compel recognition of the mosaic theory of Fourth Amendment privacy make liberal use of individual stories, in part to pluck [*791] empathetic strings in the audience. n272 In weighing the competing interests at stake in regulating access to and use of digital surveillance technologies, it is therefore fair to consider the impact of crimes like cyberharassment in individual cases. Take the publicly reported case of D.C. v. R.R. n273 D.C. was a high school student who was actively pursuing a career in the entertainment industry as a singer and actor. n274 He used a pseudonym in his professional career, n275 under which he maintained a fan site that, among other features, allowed visitors to post comments to a "guestbook." Several students at D.C.'s school, who were later identified in a civil suit, engaged in a pattern of targeted harassment of D.C. by posting comments to his website. Some were simply offensive - one student told D.C. that he was "the biggest fag in the [high school] class." n276 Others, however, went much further, threatening physical and sexual violence in graphic detail. One person posted on D.C.'s website, "I want to rip out your fucking heart and feed it to you... . If I ever see you I'm ... going to pound your head in with an ice pick. Fuck you, you dick-riding penis lover. I hope you burn in hell." n277 Another post told D.C. that he was "now officially wanted dead or alive," and a third promised to "unleash my manseed in those golden brown eyes." n278 According to a California appellate court, the contents of these posts suggested that "the students ... sought to destroy D.C.'s life, threatened to murder him, and wanted to drive him out of [his high school] and the community in which he lived." n279 In that goal they were successful. On [*792] advice of law enforcement, who consulted the Federal Bureau of Investigation, D.C. withdrew from his school and moved with his family to the other end of the state. n280 Despite these efforts, the student newspaper at his former school reported his new location and the name of his new institution. n281 As a consequence of this harassment, D.C. developed a persistent anxiety disorder. n282 Cyberharassment has also spawned a new brand of extortion labeled "sextortion." n283 This is a form of blackmail in which the extortionist threatens to publicize images or information that his target might find embarrassing unless the victim provides sexually explicit pictures and videos or agrees to participate in live sex shows via Skype or other direct video communications. n284 One infamous perpetrator of sextortion schemes invaded his targets' computers using malicious software that allowed him to mine his victims' hard drives for compromising images or to capture images using their own computer cameras. n285 He then used those images and access to his targets' computers and e-mail accounts to terrorize them until they agreed to produce sexually explicit pictures or videos for him. Young people are particularly vulnerable. n286 Teenagers who are extorted into engaging in explicit sex acts under threat and at such a formative stage of their development are also more likely to suffer scarring emotional and psychological harm. n287 As United States Attorney Joseph Hogsett put the [*793] point when commenting on a successful prosecution, "This defendant may not remember his alleged victims, but the true tragedy is that not one of them will ever forget." n288 Cyberharassers engage in telephone harassment as well. For example, in September 2010, Daniel Leonard pleaded guilty to a pattern of harassment that involved over 4,000 threatening and sexually explicit phone calls made to over 1,200 phone numbers using an Internet "spoofing" service that masked his phone number from the call recipients. n289 Others go further still by using the Internet to incite others to rape and stalk victims. Federal prosecutors recently brought a cyberstalking indictment against a man who impersonated his ex-girlfriend online over a four-year period, inciting others to stalk her in person. The man posted online advertisements with the victim's contact information and her alleged desire for sex with strangers. On porn sites, he uploaded videos of her having sex (which he filmed while they were dating) alongside her contact information. n290 Because strange men began appearing at her home demanding sex, the woman changed her name and moved to another state. Her ex-boyfriend discovered her new personal information and again posted her name, address, and an invitation to have sex on pornography sites next to her picture. The cycle repeated itself, with strange men coming to her house at night demanding sex. Although this victim was never physically assaulted, others are not so lucky. In December 2009, Ty McDowell broke into the home of a woman in Casper, Wyoming, tied her up, and raped her. During the course of the [*794] attack, he told her: "You want an aggressive man, bitch, I'll show you aggressive." n291 Although McDowell did not know his victim, his crime was not random. Rather, he had responded to an online advertisement

posted on Craigslist that purported to be from a woman seeking to fulfill her own rape fantasies. After a lengthy correspondence with the ad's poster, McDowell believed that he was fulfilling his victim's desires. n292 He was not. As a subsequent investigation would reveal, McDowell was in communication with Jebediah Stipe, who posted the ad and arranged the attack on his ex-girlfriend. n293 Stipe and McDowell were sentenced to sixty-year prison terms after pleading guilty to charges of aggravated kidnapping, rape, and burglary. n294 Cyberharassment can also be more general. Sites that encourage sexualized online abuse are all too common. The website IsAnyoneUp.com provides a notorious example. For a time, it was one of the most popular forums on the Internet for "revenge porn," which entails spurned former lovers posting sexualized pictures of their ex-wives and ex-girlfriends on a public forum so that others can leer at and demean them. n295 Although IsAnyoneUp.com eventually shut down amidst protests and outcry, its operator, Hunter Moore, started a similar site under a different name, HunterMoore.TV, which may eventually include not only pictures of women, but also an overlaid map to the homes of those featured in the pictures. n296 Consider too "Violentacrez," a notorious Reddit administrator [*795] who oversaw forums like "Jailbait," "Creepshots," "Rapebait," "Incest," "Beatingwomen," and "Picsofdeadjailbait," each of which featured pictures and commentary from his followers that celebrated the interests described by the forums' titles. n297 There is, of course, much more to be written about the incidents and dynamics of cyberharassment crimes. For present purposes, however, the foregoing is sufficient to show that there are significant and legitimate governmental interests at stake in preventing, detecting, and prosecuting various forms of cyberharassment. Although cyberharassment is relatively new, executives and legislatures have manifested these interests by setting up dedicated enforcement units and passing tailored criminal statutes. n298 As we argue in the next section, **adopting a mosaic theory of the Fourth Amendment likely will implicate these law enforcement concerns by limiting access to both existing and future digital surveillance techniques and technologies.** n299

Online harassment and the lack of response from institutions allows for threats, violence, and discrimination against women to continue unabated

Hess 14 – Amanda Hess is a Slate staff writer and popular Gender & Sexuality reporter, 2014 ("Why Women Aren't Welcome on the Internet," Pacific Standard, 1/6/14, http://www.psmag.com/health-and-behavior/women-arent-welcome-internet-72170, 7/3/15)//CM

A woman doesn't even need to occupy a professional writing perch at a prominent platform to become a target. According to a 2005 report by the Pew Research Center, which has been tracking the online lives of Americans for more than a decade, women and men have been logging on in equal numbers since 2000, but the vilest communications are still disproportionately lobbed at women. We are more likely to report being stalked and harassed on the Internet—of the 3,787 people who reported harassing incidents from 2000 to 2012 to the volunteer organization Working to Halt Online Abuse, 72.5 percent were female. Sometimes, the abuse can get physical: A Pew survey reported that five percent of women who used the Internet said "something happened online" that led them into "physical danger." And it starts young: Teenage girls are significantly more likely to be cyberbullied than boys. Just appearing as a woman online, it seems, can be enough to inspire abuse. In 2006, researchers from the University of Maryland set up a bunch of fake online accounts and then dispatched them into chat rooms. Accounts with feminine usernames incurred an average of 100 sexually explicit or threatening messages a day. Masculine names received 3.7. There are three federal laws that apply to cyberstalking cases; the first was passed in 1934 to address harassment through the mail, via telegram, and over the telephone, six decades after Alexander Graham Bell's invention. Since the initial passage of the Violence Against Women Act, in 1994, amendments to the law have gradually updated it to apply to new technologies and to stiffen penalties against those who use them to abuse. Thirty-four states have cyberstalking laws on the books; most have expanded long-standing laws against stalking and criminal threats to prosecute crimes carried out online. But making quick and sick threats has become so easy that many say the abuse has proliferated to the point of meaninglessness, and that expressing alarm is foolish. Reporters who take death threats seriously "often give the impression that this is some kind of shocking event for which we should pity the 'victims,'" my colleague Jim Pagels wrote in Slate this fall, "but anyone who's spent 10 minutes online knows that these assertions are entirely toothless." On Twitter, he added, "When there's no precedent for physical harm, it's only baseless fear mongering." My friend Jen Doll wrote, at The Atlantic Wire, "It seems like that old 'ignoring' tactic your mom taught you could work out to everyone's benefit.... These people are bullying, or hope to bully. Which means we shouldn't take the bait." In the epilogue to her book The End of Men, Hanna Rosin—an editor at Slate—argued that harassment of women online could be seen as a cause for

celebration. It shows just how far we've come. Many women on the Internet "are in positions of influence, widely published and widely read; if they sniff out misogyny, I have no doubt they will gleefully skewer the responsible sexist in one of many available online outlets, and get results." "Twitter is the place where I laugh, whine, work, schmooze, procrastinate, and flirt. It sits in my back pocket wherever I go and lies next to me when I fall asleep. And since I first started writing in 2007, it's become just one of the many online spaces where men come to tell me to get out." So women who are harassed online are expected to either get over ourselves or feel flattered in response to the threats made against us. We have the choice to keep quiet or respond "gleefully." But no matter how hard we attempt to ignore it, this type of gendered harassment—and the sheer volume of it—has severe implications for women's status on the Internet. Threats of rape, death, and stalking can overpower our emotional bandwidth, take up our time, and cost us money through legal fees, online protection services, and missed wages. I've spent countless hours over the past four years logging the online activity of one particularly committed cyberstalker, just in case. And as the Internet becomes increasingly central to the human experience, the ability of women to live and work freely online will be shaped, and too often limited, by the technology companies that host these threats, the constellation of local and federal law enforcement officers who investigate them, and the popular commentators who dismiss them—all arenas that remain dominated by men, many of whom have little personal understanding of what women face online every day. This Summer, Caroline Criado-Perez became the English-speaking Internet's most famous recipient of online threats after she petitioned the British government to put more female faces on its bank notes. (When the Bank of England announced its intentions to replace social reformer Elizabeth Fry with Winston Churchill on the £5 note, Criado-Perez made the modest suggestion that the bank make an effort to feature at least one woman who is not the Queen on any of its currency.) Rape and death threats amassed on her Twitter feed too quickly to count, bearing messages like "I will rape you tomorrow at 9 p.m ... Shall we meet near your house?" Then, something interesting happened. Instead of logging off, Criado-Perez retweeted the threats, blasting them out to her Twitter followers. She called up police and hounded Twitter for a response. Journalists around the world started writing about the threats. As more and more people heard the story, Criado-Perez's follower count skyrocketed to near 25,000. Her supporters joined in urging British police and Twitter executives to respond. Under the glare of international criticism, the police and the company spent the next few weeks passing the buck back and forth. Andy Trotter, a communications adviser for the British police, announced that it was Twitter's responsibility to crack down on the messages. Though Britain criminalizes a broader category of offensive speech than the U.S. does, the sheer volume of threats would be too difficult for "a hard-pressed police service" to investigate, Trotter said. Police "don't want to be in this arena." It diverts their attention from "dealing with something else." Feminine usernames incurred an average of 100 sexually explicit or threatening messages a day. Masculine names received 3.7. Meanwhile, Twitter issued a blanket statement saying that victims like Criado-Perez could fill out an online form for each abusive tweet; when Criado-Perez supporters hounded Mark Luckie, the company's manager of journalism and news, for a response, he briefly shielded his account, saying that the attention had become "abusive." Twitter's official recommendation to victims of abuse puts the ball squarely in law enforcement's court: "If an interaction has gone beyond the point of name calling and you feel as though you may be in danger," it says, "contact your local authorities so they can accurately assess the validity of the threat and help you resolve the issue offline." In the weeks after the flare-up, Scotland Yard confirmed the arrest of three men. Twitter—in response to several online petitions calling for action—hastened the rollout of a "report abuse" button that allows users to flag offensive material. And Criado-Perez went on receiving threats. Some real person out there—or rather, hundreds of them—still liked the idea of seeing her raped and killed. The Internet is a global network, but when you pick up the phone to report an online threat, whether you are in London or Palm Springs, you end up face-to-face with a cop who patrols a comparatively puny jurisdiction. And your cop will probably be a man: According to the U.S. Bureau of Justice Statistics, in 2008, only 6.5 percent of state police officers and 19 percent of FBI agents were women. The numbers get smaller in smaller agencies. And in many locales, police work is still a largely analog affair: 911 calls are immediately routed to the local police force; the closest officer is dispatched to respond; he takes notes with pen and paper. After Criado-Perez received her hundreds of threats, she says she got conflicting instructions from police on how to report the crimes, and was forced to repeatedly "trawl" through the vile messages to preserve the evidence. "I can just about cope with threats," she wrote on Twitter. "What I can't cope with after that is the victim-blaming, the patronising, and the police record-keeping." Last year, the American atheist blogger Rebecca Watson wrote about her experience calling a series of local and national law enforcement agencies after a man launched a website threatening to kill her. "Because I knew what town [he] lived in, I called his local police department. They told me there was nothing they could do and that I'd have to make a report with my local police department," Watson wrote later. "[I] finally got through to someone who told me that there was nothing they could do but take a report in case one day [he] followed through on his threats, at which point they'd have a pretty good lead." The first time I reported an online rape threat to police, in 2009, the officer dispatched to my home asked, "Why would anyone bother to do something like that?" and declined to file a report. In Palm Springs, the officer who came to my room said, "This guy could be sitting in a basement in Nebraska for all we know." That my stalker had said that he lived in my state, and had plans to seek me out at home, was dismissed as just another online ruse. Of course, some people are investigated and prosecuted for cyberstalking. In 2009, a Florida college student named Patrick Macchione met a girl at school, then threatened to kill her on Twitter, terrorized her with lewd videos posted to YouTube, and made hundreds of calls to her phone. Though his victim filed a restraining order, cops only sprung into action after a county sheriff stopped him for loitering, then reportedly found a video camera in his backpack containing disturbing recordings about his victim. The sheriff's department later worked with the state attorney's office to convict Macchione on 19 counts, one of which

was cyberstalking (he successfully appealed that count on grounds that the law hadn't been enacted when he was arrested); Macchione was sentenced to four years in prison. Consider also a recent high-profile case of cyberstalking investigated by the FBI. In the midst of her affair with General David Petraeus, biographer Paula Broadwell allegedly created an anonymous email account for the purpose of sending harassing notes to Florida socialite Jill Kelley. Kelley reported them to the FBI, which sniffed out Broadwell's identity via the account's location-based metadata and obtained a warrant to monitor her email activity. In theory, appealing to a higher jurisdiction can yield better results. "Local law enforcement will often look the other way," says Dr. Sameer Hinduja, a criminology professor at Florida Atlantic University and co-director of the Cyberbullying Research Center. "They don't have the resources or the personnel to investigate those crimes." County, state, or federal agencies at least have the support to be more responsive: "Usually they have a computer crimes unit, savvy personnel who are familiar with these cases, and established relationships with social media companies so they can quickly send a subpoena to help with the investigation," Hinduja says. But in my experience and those of my colleagues, these larger law enforcement agencies have little capacity or drive to investigate threats as well. Despite his pattern of abusive online behavior, Macchione was ultimately arrested for an unrelated physical crime. When I called the FBI over headlessfemalepig's threats, a representative told me an agent would get in touch if the bureau was interested in pursuing the case; nobody did. And when Rebecca Watson reported the threats targeted at her to the FBI, she initially connected with a sympathetic agent—but the agent later expressed trouble opening Watson's file of screenshots of the threats, and soon stopped replying to her emails. The Broadwell investigation was an uncommon, and possibly unprecedented, exercise for the agency. As University of Wisconsin-Eau Claire criminal justice professor Justin Patchin told Wired at the time: "I'm not aware of any case when the FBI has gotten involved in a case of online harassment." After I received my most recent round of threats, I asked Jessica Valenti, a prominent feminist writer (and the founder of the blog Feministing), who's been repeatedly targeted with online threats, for her advice, and then I asked her to share her story. "It's not really one story. This has happened a number of times over the past seven years," she told me. When rape and death threats first started pouring into her inbox, she vacated her apartment for a week, changed her bank accounts, and got a new cell number. When the next wave of threats came, she got in touch with law enforcement officials, who warned her that though the men emailing her were unlikely to follow through on their threats, the level of vitriol indicated that she should be vigilant for a far less identifiable threat: silent "hunters" who lurk behind the tweeting "hollerers." The FBI advised Valenti to leave her home until the threats blew over, to never walk outside of her apartment alone, and to keep aware of any cars or men who might show up repeatedly outside her door. "It was totally impossible advice," she says. "You have to be paranoid about everything. You can't just not be in a public place." And we can't simply be offline either. When Time journalist Catherine Mayer reported the bomb threat lodged against her, the officers she spoke to—who thought usernames were secret codes and didn't seem to know what an IP address was—advised her to unplug. "Not one of the officers I've encountered uses Twitter or understands why anyone would wish to do so," she later wrote. "The officers were unanimous in advising me to take a break from Twitter, assuming, as many people do, that Twitter is at best a time-wasting narcotic." All of these online offenses are enough to make a woman want to click away from Twitter, shut her laptop, and power down her phone. Sometimes, we do withdraw: Pew found that from 2000 to 2005, the percentage of Internet users who participate in online chats and discussion groups dropped from 28 percent to 17 percent, "entirely because of women's fall off in participation." But for many women, steering clear of the Internet isn't an option. We use our devices to find supportive communities, make a living, and construct safety nets. For a woman like me, who lives alone, the Internet isn't a fun diversion—it is a necessary resource for work and interfacing with friends, family, and, sometimes, law enforcement officers in an effort to feel safer from both online and offline violence. The Internet is a global network, but when you pick up the phone to report an online threat, you end up face-to-face with a cop who patrols a comparatively puny jurisdiction. The Polish sociologist Zygmunt Bauman draws a distinction between "tourists" and "vagabonds" in the modern economy. Privileged tourists move about the world "on purpose," to seek "new experience" as "the joys of the familiar wear off." Disempowered vagabonds relocate because they have to, pushed and pulled through mean streets where they could never hope to settle down. On the Internet, men are tourists and women are vagabonds. "Telling a woman to shut her laptop is like saying, 'Eh! Just stop seeing your family,'" says Nathan Jurgenson, a social media sociologist (and a friend) at the University of Maryland. What does a tourist look like? In 2012, Gawker unmasked "Violentacrez," an anonymous member of the online community Reddit who was infamous for posting creepy photographs of underage women and creating or moderating subcommunities on the site with names like "chokeabitch" and "rapebait." Violentacrez turned out to be a Texas computer programmer named Michael Brusch, who displayed an exceedingly casual attitude toward his online hobbies. "I do my job, go home, watch TV, and go on the Internet. I just like riling people up in my spare time," he told Adrian Chen, the Gawker reporter who outed him. "People take things way too seriously around here." Abusers tend to operate anonymously, or under pseudonyms. But the women they target often write on professional platforms, under their given names, and in the context of their real lives. Victims don't have the luxury of separating themselves from the crime. When it comes to online threats, "one person is feeling the reality of the Internet very viscerally:

the person who is being threatened," says Jurgenson. "It's a lot easier for the person who made the threat—and the person who is investigating the threat—to believe that what's happening on the Internet isn't real." When authorities treat the Internet as a fantasyland, it has profound effects on the investigation and prosecution of online threats. Criminal threat laws largely require that victims feel tangible, immediate, and sustained fear. In my home state of California, a threat must be "unequivocal, unconditional, immediate, and specific" and convey a "gravity of purpose and an immediate prospect of execution of the threat" to be considered a crime. If police don't know whether the harasser lives next door or out in Nebraska, it's easier for them to categorize the threat as non-immediate. When they treat a threat as a boyish hoax, the implication is that the threat ceases to be a criminal offense. So the victim faces a psychological dilemma: How should she understand her own fear? Should she, as many advise, dismiss an online threat as a silly game, and not bother to inform the cops that someone may want to—ha, ha—rape and kill her? Or should she dutifully report every threat to police, who may well dismiss her concerns? When I received my most recent rape and death threats, one friend told me that I should rest assured that the anonymous tweeter was unlikely to take any physical action against me in real life; another noted that my stalker seemed like the type of person who would fashion a coat from my skin, and urged me to take any action necessary to land the stalker in jail. Danielle Citron, a University of Maryland law professor who focuses on Internet threats, charted the popular response to Internet death and rape threats in a 2009 paper published in the Michigan Law Review. She found that Internet harassment is routinely dismissed as "harmless locker-room talk," perpetrators as "juvenile pranksters," and victims as "overly sensitive complainers." Weighing in on one online harassment case, in an interview on National Public Radio, journalist David Margolick called the threats "juvenile, immature, and obnoxious, but that is all they are ... frivolous frat-boy rants." When police treat a threat as a boyish hoax, the implication is that the threat ceases to be a criminal offense. Of course, the frat house has never been a particularly safe space for women. I've been threatened online, but I have also been harassed on the street, groped on the subway, followed home from the 7-Eleven, pinned down on a bed by a drunk boyfriend, and raped on a date. Even if I sign off Twitter, a threat could still be waiting on my stoop. Today, a legion of anonymous harassers are free to play their "games" and "pranks" under pseudonymous screen names, but for the women they target, the attacks only compound the real fear, discomfort, and stress we experience in our daily lives.

2nc Cyber Harrasment

Adopting the mosaic theory limits investigators ability to solve cyber harassment.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

Despite these complications, tracing an IP address is a common and effective way for authorities to identify perpetrators of cyberharassment crimes. At present, the public-observation and third-party doctrines grant law enforcement unfettered discretion to track IP addresses across the Internet. Most cyberharassment is, to one degree or another, public. Furthermore, the third-party doctrine means that law enforcement officers need a subpoena, at most, to secure user information associated with an IP address from ISPs and other third parties, including social-networking sites. n307 A mosaic theory of Fourth Amendment privacy might well change [*798] all of this. Tracking someone's online activities using an IP address over a period of time is akin to tracking a person through physical space using GPS-enabled tracking devices. By aggregating information about a user and his online

activities, law enforcement officers using these fairly basic digital surveillance techniques can therefore assemble precisely the sorts of revealing informational mosaics that worried the concurring Justices in Jones. Digital surveillance technology that offends mosaic sensibilities promises even more benefits than IP traces to law enforcement officers interested in detecting cybercrimes. Take, for example, forums such as those organized and moderated by Violentacrez. n308 Although under current law and free speech doctrine it is perfectly legal to view and comment on pictures of young women in public, law enforcement officers might have reason to worry that habitues of forums like "Jailbait" and "Creepshots" are more likely than most to produce or possess actual child pornography. It is, of course, impossible to conduct even cursory investigations of the tens and hundreds of thousands of those who visit these sites, much less to distinguish between casual curiosity seekers and practicing pedophiles. Here, broad-scale aggregation technology, in combination with ever more sophisticated data analytics designed to identify and track those patterns of online conduct that correlate with higher risks of illegal on- and offline activities, would be tremendously valuable to law enforcement. Once officers have identified a smaller universe of potential offenders, they can then further narrow their investigative fields by using passive techniques like online honey traps to more definitively identify those who are trafficking in or actively seeking to possess child pornography. n309 Again, although these digital surveillance techniques and technologies are not presently subject to Fourth Amendment review, either **individually or in the aggregate, the situation would likely change under a mosaic theory**. In fact, officers might find themselves assembling informational mosaics sufficient to trigger Fourth Amendment concerns quite by accident. n310 Regardless, law enforcement's legitimate interests in using digital surveillance technology would be affected. n311 Fusion centers also hold significant potential for law enforcement's efforts to detect and prosecute cyberharassment. The Department of Justice, in conjunction with the National Center for Missing and Exploited [*799] Children, maintains a substantial database of known images of child pornography, each of which has a unique digital fingerprint called a "hash value." n312 Fusion centers, which have access to most Internet traffic, provide a unique - although as yet unexploited - resource that law enforcement agents can use to screen for the transmission of known images of child exploitation. Outside the relatively narrow field of child pornography cases, those who engage in cyberharassment and cyberstalking still tend to use a fairly predictable pattern of words, phrases, and images. The software used by most malicious stalkers also tends to come from a stable of online resources, which again bear an identifiable digital signature. Although the true technical capacities of fusion centers are largely unknown to the public, they appear to have the ability to monitor Internet and communications traffic for precisely these sorts of markers. That same capacity is, of course, precisely what raises concerns about fusion centers from a mosaic theory point of view. Here again, the prospect of adopting a mosaic theory of Fourth Amendment privacy raises serious concerns that the legitimate and important law enforcement goals of detecting and prosecuting cybercrimes may be compromised.

Cyberharrassment leads to violations of privacy and violence in the name of "Free Speech" – this is especially true for oppressed groups

Schroder 13 - Jared C. Schroeder, doctoral candidate at the Gaylord College of Journalism & Mass Communication at the University of Oklahoma. His research focuses on free speech and free press issues as they apply to the emerging network society. Before moving to academia, he was a professional journalist for several years, 2013 ("Electronically Transmitted Threats and Higher Education: Oppression, Free Speech, and Jake Baker," Review of Higher Education 36.3, Spring 2013, Project Muse, 7/3/15)//CM

Numerous conflicts arise when the theories of the First Amendment and concepts regarding oppression are placed beside one another. This article does not seek to condemn one area of literature or the other. Instead, this section seeks to illuminate areas of conflict between the two

theoretical approaches. The Baker case is particularly relevant because it captures the challenges involved in the network society, the higher education setting, and conflicts between oppression and freedom of speech. It is not the only incident that raises questions regarding the impact of emerging online technology on providing a safe learning atmosphere. Rutgers University student Tyler Clementi committed suicide after his roommate filmed him having sex with another man and posted the video online (Starkman, 2010). The roommate and another student face criminal charges for invasion of privacy. Clearly, Clementi's privacy was invaded in an insensitive and, likely, ignorant way. In other words, the technological abilities of his tormentors outpaced their ethical understanding of the power of the new media. The scenario, though even more tragic, is similar to the Baker case. New technologies allowed a person to be oppressed and tormented, and the universities were left wondering what they could have done differently. Using Young's (2010) definition, the young woman who was named and described in Baker's story, as well as others on campus, can be viewed as oppressed. While oppression does not automatically cross the Supreme Court's threshold of true threats, it certainly raises questions about the safety and viability of the learning environment. In the Baker case, oppression comes in the form of structural norms and values; his actions can be seen as structurally accepted, to some extent, because he followed the rules created by the dominant culture. This rule-following can be seen in the court's reasoning for siding with Baker. While his behavior was viewed as deviant (United States v. Alkhabaz, 1997), the structural protections for free speech shielded him, while leaving the young woman vulnerable. This section addresses these ideas by examining the case through the violence and cultural imperialism concepts discussed by Young (2010). No physical violence occurred toward the female classmate Baker described in his story; but Young (2010) noted that oppressive violence includes [End Page 305] harassment, humiliation, and intimidation. Young (2010) explained: "The oppression of violence consists not only in direct victimization, but in the daily knowledge shared by all members of oppressed groups that they are liable to violation, solely on account of their group identitiy" (p. 43). After hearing about the violent, explicit, and deadly story she was cast in by one of her classmates, the young woman felt the effects of violent oppression. In his dissent, Judge Krupansky wrote: "Jane Doe's reaction to those threats when brought to her attention evinces a contrary conclusion of a shattering traumatic reaction that resulted in recommended psychological counseling" (United States v. Alkhabaz, 1997, p. 1507). Other women students chose not to attend class when they heard about the story. Their fear-based response is also evidence of oppressive violence. Members of the oppressed group were forced to alter the way they live because they felt vulnerable to violence. Finally, the violence was made possible and somewhat acceptable by the decision of the court. Baker did not have to stop writing and communicating his stories about the young woman. He did not have to take down his posts. The court said what he did was legal. The structures in place made the oppression possible.

1nc Police

Mosaic theory undermines the ability of undercover agents to work in law enforcement.

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

Scholars have questioned the viability of the mosaic theory, particularly as it relates to the status of government investigative practices.11 Accepting this theory puts routine government surveillance in jeopardy of Fourth Amendment restrictions.12 It seems that even the brief surveillance of an individual could reveal private information. For instance, a single trip to a particular religious gathering or political function could reveal compromising or otherwise personal information that an individual would like to keep secret. More generally, people may disagree as to what society thinks is reasonable or unreasonable surveillance.13 Perhaps even short-term monitoring of a person's public movements in a remote area where police are not likely to find themselves would also qualify as an unreasonable intrusion.14 To make matters worse, this theory also severely curtails the application of the Third Party Doctrine, the corollary to the Public Disclosure Doctrine (collectively the "Doctrines").15 The Third Party Doctrine states that any information disclosed to another person or entity—much like the public generally—loses any Fourth Amendment protection.16 This doctrine allows law enforcement to use undercover agents and surreptitiously gather information without a warrant.17 However, under the mosaic approach, one could also argue that these communications, taken in the aggregate, can reveal private information about this person (e.g., disclosures about religious or privately held beliefs) and thus should be protected, particularly if the agent goes to great lengths in gaining the confidence of the suspect.1

Police effectiveness and internet surveillance strategies are key to stopping atrocities such as child pornography

Wortley and Smallbone 12 – Richard Wortley has a PhD in psychology, and worked as a prison psychologist for ten years, and is a past national Chair of the Australian Psychological Society's College of Forensic Psychologists; Stephen Smallbone is a psychologist and Professor in the School of Criminology and Criminal Justice and an Australian Research Council 'Future' Fellow, 2012 ("Child Pornography on the Internet," Problem-Oriented Guides for Police Problem-Specific Guides Series No. 41, 5/2012, Avaliable Online at http://www.hawaii.edu/hivandaids/Child_Pornography_on_the_Internet.pdf, accessed on 7/3/15)//CM

General Considerations for an Effective Response Strategy As noted, Internet child pornography presents some unique challenges for law enforcement agencies. However, despite the difficulties involved in controlling the problem, local police have an important role to play. To maximize their contribution, local police departments need to: Acquire technical knowledge and expertise in Internet pornography. If your department does not have a specialized Internet crime unit, then find out where you can obtain assistance or training. Appendix B lists online resources that can provide information on national and international initiatives, tips and leads, technical assistance, and staff training. Establish links with other agencies and jurisdictions. It is important that local police departments share information and coordinate their activities with other jurisdictions. Appendix B also lists agencies that have specific programs or sections designed to provide a coordinated response to Internet child pornography. Establish links with ISPs. ISPs can be crucial partners for police. As has been noted, there is often a lack of specific legislation setting out ISPs' obligations. This makes it especially important for police to establish good working relations with ISPs to elicit their cooperation in the fight against Internet child pornography. Prioritize their efforts. Because of the volume of Internet child pornography crime, police forces need to prioritize their efforts and concentrate on the most serious offenders, particularly those actually involved in abusing children and producing pornographic images.60 For example, one strategy may be to cross reference lists of Internet child pornography users with sex offender registries to increase the chance of targeting hands-on offenders (see Appendix B). It has been noted that success in combating child pornography is too often judged in terms of the number of images

recovered, rather than by the more significant criterion of whether the crimes the images portray have been prevented. Specific Responses to Reduce Internet Child Pornography It is generally acknowledged that it is impossible to totally eliminate child pornography from the Internet. However, it is possible to reduce the volume of child pornography on the Internet, to make it more difficult or risky to access, and to identify and arrest the more serious perpetrators. Since 1996, ISPs have removed some 20,000 pornographic images of children from the web.62 Around 1,000 people are arrested annually in the United States for Internet child pornography offenses.63 The following strategies have been used or suggested to reduce the problem of child pornography on the Internet. Computer Industry Self Regulation ISPs have a central role to play in combating Internet child pornography. The more responsibility ISPs take in tackling the availability of child pornography images on the Internet, the more resources police can devote to addressing the production side of the problem. However, there are two competing commercial forces acting on ISPs with respect to self regulation. On the one hand, if an ISP restricts access to child pornography on its server, it may lose out financially to other ISPs who do not. Therefore, it will always be possible for offenders to find ISPs who will store or provide access to child pornography sites. On the other hand, ISPs also have their commercial reputation to protect, and it is often in their best interests to cooperate with law enforcement agencies. Most major ISPs have shown a commitment to tackling the problem of child pornography. By establishing working relationships with ISPs, and publicizing those ISPs who take self regulation seriously, police may be able to encourage greater levels of self regulation. Current self-regulatory strategies include:1. Removing illegal sites. A number of ISP associations have drafted formal codes of practice that explicitly bind members to not knowingly accept illegal content on their sites, and to removing such sites when they become aware of their existence. Service agreement contracts with clients will often set out expected standards that apply to site content. Large ISPs may have active cyber patrols that search for illegal sites.64 2. Establishing complaint sites/hotlines. Some ISP associations have set up Internet sites or hotlines that allow users to report illegal practices.65 These associations either deal directly with the complaint (e.g., by contacting the webmaster, the relevant ISP, or the police) or refer the complainant to the appropriate authorities. 3. Filtering browsers/search engines. ISPs can apply filters to the browsers and search engines their customers use to locate websites. There are numerous filtering methods. For example, filters can effectively treat certain key words as if they do not exist, so that using these words in a search will be fruitless.66 Software that can identify pornographic images is also being developed. Legislative Regulation Not everyone is satisfied with the current reliance on self regulation, and there have been calls for increased legislation to compel the computer industry to play a greater role in controlling Internet child pornography. Police may be an important force in lobbying for tighter restrictions. Among the proposals for tighter regulation are: 4. Making ISPs legally responsible for site content. ISPs' legal responsibilities to report child pornography vary among jurisdictions. In the United States, ISPs are legally required to report known illegal activity on their sites, but they are not required to actively search for such sites.68 It has been argued that ISPs' legal responsibilities should be strengthened to require a more proactive role in blocking illegal sites.69 5. Requiring the preservation of ISP records. Police may apply for a court order to seize ISP accounts.70 However, to assist in the prosecution of offenders, ISPs need to maintain good records of IP logging, caller ID, web hostings, and so forth.71 6. Requiring user verification. ISPs often exercise little control over verifying the identities of people who open Internet accounts. Accounts may be opened using false names and addresses, making it difficult to trace individuals who engage in illegal Internet activity. In addition, without verifying users' ages, there is no way of knowing if children are operating Internet accounts without adult

supervision. This problem of Internet anonymity is likely to increase as the potential to access the Internet via mobile phones becomes more common. It has been argued that both ISPs and mobile phone networks need to strengthen procedures for user verification.72 7. Regulating anonymous remailers. Remailers are servers that forward emails after stripping them of sender identification. It has been argued that much tighter regulation of remailers is necessary. Some have advocated making remailer administrators legally responsible for knowingly forwarding illegal material, while others have called for a complete ban on remailers.73 8. Using key escrowed encryption. Encryption of pornographic images is shaping to be the biggest technological problem facing law enforcement agencies. Key escrowed encryption would require anyone selling encryption software to supply a trusted third party with a key to the code.74 This has been strongly resisted by the computer industry. In the meantime, work continues on developing code-breaking software.

2nc Police

Mosaic theory kills the third party doctrine and law enforcement

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

The Third Party Doctrine would also be on shaky ground. Here, too, the mosaic theory would upset the voluntary disclosure principle that stands at the heart of this doctrine.230 Shifting the focus to what society or an individual deems reasonable (the first model of reasonable expectation of privacy) would surely frustrate the use of undercover informants or other surreptitious data collection techniques that do not require a warrant. Imagine a scenario where an informant is deep undercover for a significant period of time gaining the trust of a Or imagine an informant who dupes a suspect into allowing her into her home and disclosing private and incriminating information. suspect. Or perhaps the government simply acquires a wealth of financial records from a suspect's bank. Currently, all of these types of law enforcement tools do not trigger Fourth Amendment protection because the individual voluntarily discloses the information to another person or entity.231 However, under the mosaic theory, none of these tactics are secure.232 Societal expectations may find that these methods, too, impinge on Fourth Amendment rights as they involve unreasonable duplicity and reveal private information. Police would thus find themselves in the new position of having to secure a warrant based on probable cause before engaging in these practices. For some, this conclusion may be welcomed, particularly in today's technological world where disclosures to various entities and individuals have become ubiquitous.233 Justice Sotomayor, in fact, raises this possibility in her concurrence.234 This Article does not take such a drastic approach, nor would such a course be desirable. Any such rejection would come at the cost of jettisoning or severely curtailing essential law enforcement investigative techniques that have historically not been subject to warrant and probable cause requirements.235

Court application of the mosaic theory is impractical and hurts police investigations.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

The use of emerging and existing intrusive technologies in criminal investigations certainly has the potential to have a substantial effect on privacy. In an effort to combat the threat of such use, Maynard introduced the "mosaic theory" into Fourth Amendment law. The "mosaic theory" holds that individual law enforcement acts that are not "searches" become a "search" when aggregated, as the whole reveals more than the individual acts it comprises. This Note suggests that despite the intuitive appeal of a "mosaic theory," the use of the theory in Fourth Amendment law

is misguided. The "mosaic theory" is inconsistent with the Supreme Court's voluntary exposure analysis, which has often classified theoretical or limited disclosures of information as complete exposures warranting no Fourth Amendment protection. 176 It is also inconsistent with the Supreme Court's implicit rejection of the proposition that the Fourth Amendment analysis is altered when an investigatory technique is prolonged to the point where information may be accumulated.177 Not only is the theory inconsistent with existing Fourth Amendment jurisprudence, it is also impractical in application. A problematic question arises as to what durational threshold must be crossed in order for the use of a pattern-detecting technology to be sufficiently prolonged as to render it a search. Once this illusive threshold is crossed and a mosaic is created, the question that then arises is how to define the scope of the mosaic. If a pattern is created only through the use of multiple investigatory techniques, the entire investigation will be rendered a search. Also left unanswered is the appropriate standard of review for the use of pattern-detecting investigatory techniques in criminal investigations. The most serious implication of the theory, however, is that it calls into question a number of previously accepted investigatory techniques.

Law enforcement responses to child pornographers rely on effectiveness and surveillance

Wortley and Smallbone 12 – Richard Wortley has a PhD in psychology, and worked as a prison psychologist for ten years, and is a past national Chair of the Australian Psychological Society's College of Forensic Psychologists; Stephen Smallbone is a psychologist and Professor in the School of Criminology and Criminal Justice and an Australian Research Council 'Future' Fellow, 2012 ("Child Pornography on the Internet," Problem-Oriented Guides for Police Problem-Specific Guides Series No. 41, 5/2012, Avaliable Online at http://www.hawaii.edu/hivandaids/Child_Pornography_on_the_Internet.pdf, accessed on 7/3/15)//CM

Law Enforcement Responses In the strategies discussed so far the police role has largely involved working in cooperation with other groups or acting as educators. A number of strategies are the primary responsibility of police. As a rule, local police will not carry out major operations. Most major operations require specialized expertise and inter-agency and inter-jurisdictional cooperation. (See Appendix C for a summary of major coordinated law enforcement operations in recent years.) However, local police will almost certainly encounter cases of Internet child pornography in the course of their daily policing activities. Law enforcement responses include: 19. Locating child pornography sites. Police agencies may scan the Internet to locate and remove illegal child pornography sites. Many areas of the Internet are not accessible via the usual commercial search engines, and investigators need to be skilled at conducting sophisticated searches of the 'hidden net.' Police may issue warnings to ISPs that are carrying illegal content. 20. Conducting undercover sting operations. Law enforcement agents may enter pedophile newsgroups, chat rooms, or P2P networks posing as pedophiles and request emailed child pornography images from others in the group.82 Alternatively, they may enter child or teen groups posing as children and engage predatory pedophiles lurking in the group who may send pornography or suggest a meeting. A variation of the sting operation is to place ads on the Internet offering child pornography for sale and wait for replies.83 Recently, Microsoft announced the development of the Child Exploitation Tracking System to help link information such as credit card purchases, Internet chat room messages, and conviction histories.84 21. Setting up honey trap sites. These sites purport to contain child pornography but in fact are designed to capture the IP or credit card details of visitors trying to download images. These can be considered a type of sting operation and have resulted in numerous arrests. However, their

primary purpose is to create uncertainty in the minds of those seeking child pornography on the Internet, and, therefore, reduce the sense of freedom and anonymity they feel (see Operation Pin in Appendix C). 22. Publicizing crackdowns. Many police departments have learned to use the media to good effect to publicize crackdowns on Internet child pornography.85 Coverage of crackdowns in the mass media increases the perception among potential offenders that the Internet is an unsafe environment in which to access child pornography. 23. Conducting traditional criminal investigations. Although most media attention is often given to technological aspects of controlling Internet child pornography, in fact many arrests in this area arise from traditional investigative police work. Investigations may involve information from: The public: The public may contact police directly, or information may be received on one of the various child pornography hotlines. Computer repairers/technicians: Some states mandate computer personnel to report illegal images.86 There are cases where computer repairers have found child pornography images on an offender's hard drive and notified police.87 Police may establish relationships with local computer repairers/ technicians to encourage reporting. Victims: A point of vulnerability for producers of child pornography is the child who appears in the pornographic image. If the child informs others of his/her victimization, then the offender's activities may be exposed.88 Known traders: The arrest of one offender can lead to the arrest of other offenders with whom he has had dealings, producing a cascading effect. In some cases the arrested offender's computer and Internet logs may provide evidence of associates. (See Operation Cathedral in Appendix C.) Unrelated investigations: There is increasing evidence that many sex offenders are criminally versatile and may commit a variety of other offenses.89 Police may find evidence of Internet child pornography while investigating unrelated crimes such as drug offenses.

Mosaic theory kills effective law enforcement.

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

The most troubling part of adopting the mosaic theory is that it requires the abandonment of, or dramatic alterations to, the Doctrines. The basic problem is the inherent conflict between the first and second models of reasonable expectation. While the Doctrines embrace a per se rule focusing solely on disclosure and why this vitiates privacy, the mosaic theory rests on society's opinion and what it deems reasonable.223 Consider the Public Disclosure Doctrine. The fact that public movements are not protected under the Fourth Amendment is **critical to law enforcement investigations**.224 Visual warrantless surveillance remains a central part of police surveillance.225 It is not clear to what extent these practices will remain constitutional with the introduction of the mosaic theory. For instance, it is common for officers to track vehicles and aggregate information from various sources over a period of time.226 As Gray and Citron point out, the "mosaic theory puts these practices and the line of doctrine endorsing them in obvious jeopardy, particularly when officers are too successful and their investigations produce too much information."227 This danger is compounded by the fact that law enforcement may use a combination of visual and technology-based surveillance (a la Knotts) when investigating a suspect. "How, after all," ask Gray and Citron, "are we to distinguish 'between the supposed invasion of aggregation of data between GPS-augmented surveillance and a purely visual surveillance of substantial length'?"228 It won't do here to simply say that a specific duration of technology-dependent surveillance violates the expectation of privacy. The problem is that the Public Disclosure Doctrine treats all public movements the same, regardless of how much information is disclosed or how long it is observed.229 To carve out exceptions based on what society thinks is

unreasonable leaves vulnerable investigative techniques that are **essential to effective law enforcement.**

Expansion of the Mosaic theory kills investigations – there are no limits, retroactivity, and ensures court clog.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

Maynard left little guidance as to what durational threshold must to be crossed in order for the use of pattern-detecting technology to be sufficiently prolonged as to render it a search.93 Without a clearly demarcated **line,** law enforcement agents, judges, and individuals cannot know when an aggregate of information will receive Fourth Amendment protection. Law enforcement agents are left to speculate as to how much is too much.94 **This lack of clarity will deter law enforcement agents from utilizing the full extent of their investigatory power**. This is even more problematic with respect to the "mosaic theory's" creation of retroactive unconstitutionality.95 As soon as a pattern is created, previously permissible individual law enforcement steps become unconstitutional. Because the "mosaic theory" retroactively renders the entire mosaic unconstitutional and subject to suppression, law enforcement agents will be even more hesitant in exercising the full extent of their investigatory power. Further, if the "mosaic theory" in the Fourth Amendment is premised on the idea that "prolonged GPS monitoring reveals an intimate picture of the subject's life that he expects no one to have— short perhaps of his spouse,"96 who has the burden of proof with respect to whether the prolonged surveillance has in fact revealed an intimate picture of an individual's life and thus created a mosaic? Unless the location of a "stash-house" is an intimate detail, Maynard can be read to stand for the proposition that warrantless prolonged GPS surveillance is per se unconstitutional. Such an approach would be over-inclusive in that prolonged location monitoring that does not result in a pattern, or a pattern that does not reveal intimate details, would be rendered a search within the meaning of the Fourth Amendment and therefore subject to suppression. Once the mosaic threshold is crossed and a mosaic is created, the question that arises is to how to define the scope of the mosaic. If law enforcement officials engage in a number of sustained investigatory techniques—as they often do—it is likely that whole investigations will be called into question. That is, if a pattern is detected only through the use of multiple investigatory techniques, and the theory is applied consistently, the investigation in its entirety will be rendered a search.97 In this respect, the retroactive effect of the "mosaic theory" takes on greater significance. Rather than having the entire investigation held inadmissible and subject to suppression, law enforcement agents will be overly cautious as to the amount of surveillance conducted. The lack of clarity as to how prolonged the surveillance must be to render it a search, whether intimate details need in fact emerge, and what the proper scope of the **mosaic is will provide defendants with an arsenal to attack every police investigation.**

Using the mosaic theory hampers numerous investigative techniques.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

One of the most serious implications of the "mosaic theory" in Fourth Amendment law is that it calls into question the validity of previously accepted forms of surveillance. GPS surveillance is not the only form of surveillance that provides law enforcement with a comprehensive and detailed record of someone's movements or affairs when it is sustained on a prolonged basis. Thus, the "mosaic theory," which focuses on the resulting patterns created by individual law enforcement acts that in and of themselves are not searches, naturally calls into question other accepted investigative techniques that are performed on a sufficiently prolonged basis.98 For instance, the "mosaic theory" calls into question the use of pen registers99 and trap and trace devices,100 which have been held to not implicate the Fourth Amendment.101 The "mosaic theory" would also

seemingly implicate the prolonged use of a mail cover 102 as an investigatory technique. 103 Although the Supreme Court has yet to address the issue, courts have held that the warrantless use of a mail cover does not violate the Fourth Amendment.104 Another accepted investigatory technique that can reveal very intimate details of an individual's life— particularly if sustained for a prolonged basis—is garbage inspections. 105 It could plausibly be argued that the patterns that result from the prolonged use of garbage inspections are much more intrusive than any pattern resulting from the use of a GPS device.106 The same could be said about prolonged video surveillance.107 It is well settled that video surveillance in public areas does not give rise to a Fourth Amendment issue.108 Thus, video cameras may be placed outside of an individual's residence, and so long as the cameras are incapable of viewing the interior of the residence, no Fourth Amendment right is infringed upon.109 Since Maynard, the "mosaic theory" has in fact been used as the basis for holding a previously accepted investigatory technique a search. In In re Application of the United States of America for an Order Authorizing the Release of Historical Cell-Site Information,110 Magistrate Judge Orenstein denied the government's application for an order under the Stored Communications Act111 directing a service provider to disclose two months worth of historical cell-site location information. 112 According to Magistrate Judge Orenstein: The Maynard court's concern with sustained GPS tracking over the course of a month was not its formally continuous nature, but rather the fact that it results in a vast collection of specific data points that, viewed together, convey the "intimate picture" of a subject's life. It is the ability to amass a collection of such points, and not the ability to trace the route from each one to the next, that carries with it the ability to resolve those points into a comprehensible picture.113 Applying the "mosaic theory" to historical cell-site information, Magistrate Judge Orenstein concluded that the Fourth Amendment required the government to obtain a warrant based on a showing of probable cause.114 The most significant implication of the "mosaic theory," however, is that it calls into question the governmental use of prolonged visual surveillance in criminal investigations.115 In Maynard, the court addressed the issue of the possible extension of the "mosaic theory" to prolonged visual surveillance.116 Although the court ultimately declined to decide whether such a situation would constitute a search under the new theory, it suggested that visual surveillance would not be implicated.117 The court noted that practically, law enforcement agents do not have the capability to sustain visual monitoring for a duration that exposes information not revealed to the public.118 This argument is unpersuasive to the extent that it suggests that a mosaic is only created if the whole of one's movements is captured. A pattern can be created, and thus intimate details revealed, by the aggregation of individual law enforcement steps not necessarily constituting the whole of the investigatory techniques employed. The court implicitly recognizes this, as even continuous GPS tracking of a vehicle does not reveal the entirety of one's movements, but rather only the movements of a particular vehicle. Further, the dismissal of the implication of visual surveillance is problematic to the extent that it relies on the probability of law enforcement success. Such probability, however, must be viewed in relation to the factual context in which the investigation is conducted, and not in the abstract. To be sure, it is not beyond the realm of possibility that a properly equipped and resourced law enforcement unit would be capable of monitoring an unsuspecting individual for a continuous period of time sufficient to create a mosaic. As a theoretical matter, the court reasoned that in contrast to prolonged GPS monitoring, the extension of the "mosaic theory" to visual surveillance would fail as the means used to uncover private information would not defeat one's expectation of privacy.119 The court's analogy to the distinction between the placement of undercover agents and wiretapping120 overlooks the fact that here, warrantless GPS tracking and visual surveillance are constitutional in the first instance. In fact, the "**mosaic theory" focuses on the nature of the information revealed**—a pattern exposing intimate details—**and does not focus on the investigatory method** used to attain such information. Beyond prolonged visual and video surveillance, Maynard does not express a view as to whether other investigatory techniques would be called into question by the "mosaic theory." This analysis suggests that the "mosaic theory," if consistently applied, would implicate the cumulative effect of previously accepted surveillance methods.121 It is in this capacity that the "mosaic theory" has the potential to revolutionize the Fourth Amendment.

Big Data Disadvantage

1nc Healthcare

Applying the Mosaic Theory hampers government's use of big data.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

The amount of personal information, including health information, aggregated by government agencies, is referred to as "Big Data," and for good reason. Federal agencies, state authorities, and their private contractors store mind-boggling amounts of information. Given the quantity and scope of this information, **there can be no doubt that Big Data implicates privacy interests recognized by the mosaic theory of Fourth Amendment privacy** endorsed to varying degrees by the concurring opinions in Jones. n135 As the mosaic theory suggests, aggregations of rather [*768] innocuous information may "reveal more - sometimes a great deal more - than does the sum of its parts." n136 This is a particularly likely prospect given Big Data's use of increasingly sophisticated analytics, which promise to reveal far more about us than is disclosed by the raw bits and bytes, no matter how "big" or small the data. n137 The dangers are yet more pronounced if health-related data is part of the mix because of what this information can reveal about the most intimate of our affairs. n138 Healthcare data, by definition, contains information that the Supreme Court has already ruled fundamentally private, such as reproductive choice, n139 and information that the Court may deem private in the near future, such as genetic data. n140 But not all healthcare data is protected. In Whalen v. Roe, the Court found no threat to privacy in a law that required physicians to report to the Department of Health personal and identifying information of patients who were prescribed certain drugs. n141 Because the required disclosure was similar to existing and essential procedures, like mandatory child abuse reporting or sharing information with insurance companies for reimbursement, n142 and the statute provided adequate security against data breach, the Court held that any risk to patient privacy was [*769] insufficient to violate the Fourteenth Amendment. n143 In so holding, however, the Court hinted that, absent adequate security measures, government acquisition or disclosure of massive amounts of private data would implicate privacy protections. n144 In his concurrence, Justice Brennan did more than hint, suggesting that it may be necessary to restrain technological advancements that make such data accumulations possible. n145 A little over ten years later, the Court again considered privacy issues relating to data aggregation, this time in the form of rap sheets. n146 Although the individual criminal events that compose a rap sheet may be public record, the Court held that the rap sheet, as a summary of the total criminal events in an individual's life, represented a potential and "substantial" n147 threat to privacy, n148 particularly because of advances in technology that allowed for greater storage capacity. n149 Unlike in Whalen, where the Court emphasized the routine disclosure of confidential information under specific but frequent circumstances, the Court in U.S. Department of Justice v. Reporters Committee for Freedom of the Press took pains to illustrate the very limited and considered means by which a third party can access rap sheet data. n150 Additionally, the Court dismissed the argument that the [*770] privacy interest in the sum of public events listed on a rap sheet "approaches zero." n151 The Court concluded that "although there is undoubtedly some public interest in anyone's criminal history," the interest is not central to the government-monitoring purpose of FOIA, which is to allow citizens to monitor the government, not individuals. n152 Although neither of these cases implicated the Fourth Amendment, they involved personal data similar or identical to that which is currently being collected and stored as part of Big Data projects. Accordingly, they incorporate key factors the Court may use to decide whether large quantities of aggregated healthcare data can trigger privacy concerns. Among these seem to be the extent to which disclosure is commonplace, whether the data is aggregated or dispersed, and the intent of the law authorizing collection or release. The last factor is crucial as it relates to Big Data. The stated intent of the ACA is quite broad, ranging from quality control to fraud prevention to cost containment. n153 By giving researchers, law enforcement, and administrators access to large amounts of information, Big Data could conceivably be used for all three purposes and more.

Big data is key to healthcare

Burg 14 (Natalie, contributor to Forbes who writes about growth and business patterns – cites Dwayne Spradlin, CEO of the nonprofit Health Data Consortium, "*How Big Data Will Help Save Healthcare*", http://www.forbes.com/sites/castlight/2014/11/10/how-big-data-will-help-save-healthcare/)

More and more companies are talking about big data these days—but it's more than a buzzword. **It might just change the way healthcare works** in the U.S. From **better patient outcomes** to a more transparent healthcare system to more accessible and **affordable care**. big data could change every inch of the nation's $3 trillion healthcare industry—**all for the better.** According to Dwayne Spradlin, CEO of the nonprofit Health Data Consortium, the power to access and analyze enormous data sets can improve our ability to anticipate and treat illnesses. This data can help recognize individuals who are at risk for serious health problems. The ability to use big data to identify waste in the healthcare system can also lower the cost of healthcare across the board.

Big data's key to healthcare and solves disease – saves billions and locks in new methods of treatment and planning models

Marr 15 (Bernard, contributor to Forbes, he also basically wrote the book on internet data – called Big Data – and is a keynote speaker and consultant in strategic performance, analytics, KPIs and big data, "How Big Data Is Changing Healthcare", http://www.forbes.com/sites/bernardmarr/2015/04/21/how-big-data-is-changing-healthcare/)

If you want to find out how Big Data is helping to make the world a better place, there's **no better example** than the uses being found for it in healthcare. The last decade has seen huge advances in the amount of data we routinely generate and collect in pretty much everything we do, as well as our ability to use technology to analyze and understand it. The intersection of these trends is what we call "Big Data" and it is helping businesses in every industry to become more efficient and productive. Healthcare is no different. Beyond improving profits and cutting down on wasted overhead, Big Data in healthcare is being used to **predict epidemics**, **cure disease**, improve quality of life and avoid preventable deaths. With the world's population increasing and everyone living longer, models of treatment delivery are rapidly changing, and many of the decisions behind those changes are being **driven by data**. The drive now is to understand **as much about a patient** as possible, as early in their life as possible – hopefully picking up warning signs of serious illness at an early enough stage that treatment is far more simple (and less expensive) than if it had not been spotted until later. So to take a journey through Big Data in healthcare, let's start at the beginning – before we even get ill. Wearable blood pressure monitors send data to a smartphone app, then off to the doctor. (Photo by John Tlumacki/The Boston Globe via Getty Images) Prevention is better than cure Smart phones were just the start. With apps enabling them to be used as everything from pedometers to measure how far you walk in a day, to calorie counters to help you plan your diet, millions of us are now using mobile technology to help us try and live healthier lifestyles. More recently, a steady stream of dedicated wearable devices have emerged such as Fitbit, Jawbone and Samsung Gear Fit that allow you to track your progress and upload your data to be compiled alongside everyone else's. In the very near future, you could also be sharing this data with your doctor who will use it as part of his or her diagnostic toolbox when you visit them with an ailment. Even if there's nothing wrong with you, access to **huge, ever growing databases** of information about the **state of the health** of the general public will allow problems to be spotted **before they occur**, and remedies – either medicinal or educational – to be prepared in advance This is leading to **ground breaking work,** often by partnerships between medical and data professionals, with the potential to peer into the future and **identify problems before they happen**. One recently formed example of such a partnership is the Pittsburgh Health Data Alliance – which aims to take data from various sources (such as medical and insurance records, wearable sensors, genetic data and even social media use) to draw a comprehensive picture of the patient as an individual, in order to offer a tailored healthcare package. That person's data won't be treated in isolation. It will be compared and analyzed alongside thousands of others, highlighting specific threats and issues through patterns that emerge during the comparison. This enables sophisticated predictive modelling to take place – a doctor will be able to assess the likely result of whichever treatment he or she is considering prescribing,

backed up by the data from other patients with the same condition, genetic factors and lifestyle. Programs such as this are the industry's attempt to tackle one of the biggest hurdles in the quest for data-driven healthcare: The medical industry collects a huge amount of data but often it is siloed in archives controlled by different doctors' surgeries, hospitals, clinics and administrative departments. Another partnership that has just been announced is between Apple and IBM. The two companies are collaborating on a big data health platform that will allow iPhone and Apple Watch users to share data to IBM's Watson Health cloud healthcare analytics service. The aim is to discover new medical insights from crunching real-time activity and biometric data from millions of potential users.

Zoonotic diseases coming now – effective healthcare is key to check

Naish 12 (Reporter for Daily Mail, "The Armageddon virus: Why experts fear a disease that leaps from animals to humans could devastate mankind in the next five years Warning comes after man died from a Sars-like virus that had previously only been seen in bats Earlier this month a man from Glasgow died from a tick-borne disease that is widespread in domestic and wild animals in Africa and Asia" http://www.dailymail.co.uk/sciencetech/article-2217774/The-Armageddon-virus-Why-experts-fear-disease-leaps-animals-humans-devastate-mankind-years.html#ixzz3E5kqxjQI)

The symptoms appear suddenly with a headache, high fever, joint pain, stomach pain and vomiting. As the illness progresses, patients can develop large areas of bruising and uncontrolled bleeding. In at least 30 per cent of cases, Crimean-Congo Viral Hemorrhagic Fever is fatal. And so it proved this month when a 38-year-old garage owner from Glasgow, who had been to his brother's wedding in Afghanistan, became the UK's first confirmed victim of the tick-borne viral illness when he died at the high-security infectious disease unit at London's Royal Free Hospital. It is a disease widespread in domestic and wild animals in Africa and Asia — and one that has jumped the species barrier to infect humans with deadly effect. But the unnamed man's death was not the only time recently a foreign virus had struck in this country for the first time. Last month, a 49-year-old man entered London's St Thomas' hospital with a raging fever, severe cough and desperate difficulty in breathing. He bore all the hallmarks of the deadly Sars virus that killed nearly 1,000 people in 2003 — but blood tests quickly showed that this terrifyingly virulent infection was not Sars. **Nor was it any other virus yet known to medical science** Worse still, the gasping, sweating patient was rapidly succumbing to kidney failure, a potentially lethal complication that had never before been seen in such a case. As medical staff quarantined their critically-ill patient, fearful questions began to mount. The stricken man had recently come from Qatar in the Middle East. What on earth had he picked up there? Had he already infected others with it? Using the latest high-tech gene-scanning technique, scientists at the Health Protection Agency started to piece together clues from tissue samples taken from the Qatari patient, who was now hooked up to a life-support machine. **The results were extraordinary. Yes, the virus is from the same family as Sars. But its make-up is completely new** It has come not from humans, but from animals. Its closest known relatives have been found in Asiatic bats. The investigators also discovered that the virus has already killed someone. Searches of global medical databases revealed the same mysterious virus lurking in samples taken from a 60-year-old man who had died in Saudi Arabia in July. Scroll down for video Potentially deadly: The man suffered from CCHF, a disease transmitted by ticks (pictured) which is especially common in East and West Africa Potentially deadly: The man suffered from CCHF, a disease transmitted by ticks (pictured) which is especially common in East and West Africa When the Health Protection Agency warned the world of this newly- emerging virus last month, it ignited a stark fear among medical experts. Could this be the next bird flu, or even the next 'Spanish flu' — the world's biggest pandemic, which claimed between 50 million and 100 million lives across the globe from 1918 to 1919? **In all these outbreaks, the virus responsible came from an animal**. Analysts now believe that the Spanish flu pandemic originated from a wild aquatic bird. The terrifying fact is that viruses that manage to jump to us from animals — called zoonoses — can wreak havoc because of their astonishing ability to catch us on the hop and spread rapidly through the population when we least expect it. The virus's power and fatality rates are terrifying One leading British virologist, Professor John Oxford at Queen Mary Hospital, University of London, and a world authority on epidemics, warns that we must expect an animal-originated pandemic to hit the world within **the next five years with potentially cataclysmic effects on the human race.** Such a contagion, he believes, will be a new strain of super-flu, a highly infectious virus that may originate in some far-flung backwater of Asia or Africa, and be contracted by one person from a wild animal or domestic beast, such as a chicken or pig. By the time the first victim has succumbed to this unknown, unsuspected new illness, they will have spread it by coughs and sneezes to family, friends, and all those gathered anxiously around them. Thanks to our crowded, hyper-connected world, this doomsday virus will already have begun crossing the globe by air, rail, road and sea before even the best brains in medicine have begun to chisel at its genetic secrets. Before it even has a name, it will have started to cut its lethal swathe through the world's population. The high security unit High security: The high security unit where the man was treated for the potentially fatal disease but later died If this new virus follows the pattern of the pandemic of 1918-1919, it will cruelly reap mass harvests of young and fit people. They die because of something called a **'cytokine storm'** — a vast overreaction of their strong and efficient immune systems that is prompted by the virus. This uncontrolled response burns them with a fever and wracks their bodies with nausea and massive fatigue. **The hyper-activated immune system actually kills the person, rather than killing the super-virus.** Professor Oxford bases his prediction on historical patterns. The past century has certainly provided us with many disturbing precedents. For example, the 2003 global outbreak of Sars, the severe acute respiratory syndrome that killed nearly 1,000 people, was transmitted to humans

from Asian civet cats in China. More... Man, 38, dies from deadly tropical disease after returning to the UK from Afghanistan Nine-year-old who turns YELLOW with anger: Brianna must spend 12 hours a day under UV lights because of rare condition In November 2002, it first spread among people working at a live animal market in the southern Guangdong province, where civets were being sold. **Nowadays, the threat from such zoonoses is far greater than ever, thanks to modern technology and human population growth**. Mass transport such as airliners can quickly fan outbreaks of newly- emerging zoonoses into deadly global wildfires. The Sars virus was spread when a Chinese professor of respiratory medicine treating people with the syndrome fell ill when he travelled to Hong Kong, carrying the virus with him. By February 2003, it had covered the world by hitching easy lifts with airline passengers. Between March and July 2003, some 8,400 probable cases of Sars had been reported in 32 countries. It is a similar story with H1N1 swine flu, the 2009 influenza pandemic that infected hundreds of millions throughout the world. It is now believed to have originated in herds of pigs in Mexico before infecting humans who boarded flights to myriad destinations. Once these stowaway viruses get off the plane, they don't have to learn a new language or new local customs. **Genetically, we humans are not very diverse**, an epidemic that can kill people in one part of the world can kill them in any other just as easily. On **top of this, our risk of catching such deadly contagions from wild animals is growing massively, thanks to humankind's relentless encroachment into the world's jungles and rainforests**, where we increasingly come into contact for the first time with unknown viral killers that have been evolving and incubating in wild creatures for millennia. This month, an international research team announced it had identified an entirely new African virus that killed two teenagers in the Democratic Republic of the Congo in 2009. The virus induced acute hemorrhagic fever, which causes catastrophic widespread bleeding from the eyes, ears, nose and mouth, and can kill in days. A 15-year-old boy and a 13-year-old girl who attended the same school both fell ill suddenly and succumbed rapidly. A week after the girl's death, a nurse who cared for her developed similar symptoms. He only narrowly survived. The new microbe is named Bas-Congo virus (BASV), after the province where its three victims lived. It belongs to a family of viruses known as rhabdoviruses, which includes rabies. A report in the journal PLoS Pathogens says the virus probably originated in local wildlife and was passed to humans through insect bites or some other as-yet unidentified means. **There are plenty of other new viral candidates waiting in the wings, guts, breath and blood of animals around us**. You can, for example, catch leprosy from armadillos, which carry the virus in their shells and are responsible for a third of leprosy cases in the U.S. Horses can transmit the Hendra virus, which can cause lethal respiratory and neurological disease in people. In a new book that should give us all pause for thought, award-winning U.S. natural history writer David Quammen points to a host of animal-derived infections that now claim lives with unprecedented regularity. **The trend can only get worse**, he warns. Quammen highlights the Ebola fever virus, which first struck in Zaire in 1976. The virus's power is terrifying, with fatality rates as high as 90 per cent. The latest mass outbreak of the virus, in the Congo last month, is reported to have killed 36 people out of 81 suspected cases. According to Quammen, Ebola probably originated in bats. The bats then infected African apes, quite probably through the apes coming into contact with bat droppings. The virus then infected local hunters who had eaten the apes as bushmeat. Quammen believes a similar pattern occurred with the HIV virus, which probably originated in a single chimpanzee in Cameroon. **'It is inevitable we will have a global outbreak'** Studies of the virus's genes suggest it may have first evolved as early as 1908. It was not until the Sixties that it appeared in humans, in big African cities. By the Eighties, it was spreading by airlines to America. Since then, Aids has killed around 30 million people and infected another 33 million. There is one mercy with Ebola and HIV. They cannot be transmitted by coughs and sneezes. 'Ebola is transmissible from human to human through direct contact with bodily fluids. It can be stopped by preventing such contact,' Quammen explains. 'If HIV could be transmitted by air, you and I might already be dead. If the rabies virus — another zoonosis — could be transmitted by air, it would be the most horrific pathogen on the planet.' Viruses such as Ebola have another limitation, on top of their method of transmission. They kill and incapacitate people too quickly. In order to spread into pandemics, zoonoses need their human hosts to be both infectious and alive for as long as possible, so that the virus can keep casting its deadly tentacles across the world's population. **But there is one zoonosis that can do all the right (or wrong) things. It is our old adversary, flu.** It is easily transmitted through the air, via sneezes and coughs. Sars can do this, too. But flu has a further advantage. As Quammen points out: 'With Sars, symptoms tend to appear in a person before, rather than after, that person becomes highly infectious. Isolation: **Unlike Sars the symptoms of this new disease may not be apparent before the spread of infection Isolation**: Unlike Sars the symptoms of this new disease may not be apparent before the spread of infection 'That allowed many Sars cases to be recognised, hospitalised and placed in isolation before they hit their peak of infectivity. But with influenza and many other diseases, the order is reversed.' **Someone who has an infectious case of a new and potentially lethal strain of flu can be walking about innocently spluttering it over everyone around them for days before they become incapacitated**. Such reasons lead Professor Oxford, a world authority on epidemics, to warn that a new global pandemic of animal-derived flu is inevitable. And, he says, the clock is ticking fast. Professor Oxford's warning is as stark as it is certain: 'I **think it is inevitable that we will have another big global outbreak of flu**,' he says. 'We should plan for one emerging in 2017-2018.' But are we adequately prepared to cope? Professor Oxford warns that vigilant surveillance is the only real answer that we have. '**New flu strains are a day-to-day problem and we have to be very careful to keep on top of them,'** he says. 'We now have scientific processes enabling us to quickly identify the genome of the virus behind a new illness, so that we know what we are dealing with. The best we can do after that is to develop and stockpile vaccines and antiviral drugs that can fight new strains that we see emerging.' But the Professor is worried our politicians are not taking this certainty of mass death seriously enough. Such laxity could come at a human cost so unprecedentedly high that it would amount to criminal negligence. The race against newly-emerging animal-derived diseases is one that we have to win every time. **A pandemic virus needs to win only once and it could be the end of humankind.**

2nc – overview

Zoonotic diseases specifically cause extinction

Casadevall 12 (Arturo, M.D., Ph.D. in Biochemistry from New York University, Leo and Julia Forchheimer Professor and Chair of the Department of Microbiology and Immunology at Albert Einstein College of Medicine, former editor of the ASM journal Infection and Immunity, "The future of biological warfare," Microbial Biotechnology Volume 5, Issue 5, pages 584–587, September 2012, http://onlinelibrary.wiley.com/doi/10.1111/j.1751-7915.2012.00340.x/full)

In considering the importance of biological warfare as a subject for concern it is worthwhile to review the known existential threats. At this time this writer can identify at three major existential threats to humanity: (i) large-scale thermonuclear war followed by a nuclear winter, (ii) a planet killing asteroid impact and (iii) infectious disease. To this trio might be added climate change making the planet uninhabitable. Of the three existential threats the first is deduced from the inferred cataclysmic effects of nuclear war. For the second there is geological evidence for the association of asteroid impacts with massive extinction (Alvarez, 1987). As to an existential threat from microbes recent decades have provided unequivocal evidence for the ability of certain pathogens to cause the extinction of entire species. Although infectious disease has traditionally not been associated with extinction this view has changed by the finding that a single chytrid fungus was responsible for the extinction of numerous amphibian species (Daszak et al., 1999; Mendelson et al., 2006). Previously, the view that infectious diseases were not a cause of extinction was predicated on the notion that many pathogens required their hosts and that some proportion of the host population was naturally resistant. However, that calculation does not apply to microbes that are acquired directly from the environment and have no need for a host, such as the majority of fungal pathogens. For those types of host–microbe interactions it is possible for the pathogen to kill off every last member of a species without harm to itself, since it would return to its natural habitat upon killing its last host. Hence, from the viewpoint of existential threats environmental microbes could potentially pose a much greater threat to humanity than the known pathogenic microbes, which number somewhere near 1500 species (Cleaveland et al., 2001; Taylor et al., 2001), especially if some of these species acquired the capacity for pathogenicity as a consequence of natural evolution or bioengineering.

at: ridley

Ridley is wrong

Nuccitelli 15 (Dana Nuccitelli is a blogger on environmentguardian.co.uk. He is an environmental scientist and risk assessor, and also contributes to SkepticalScience.comJanuary 21, 2015, "Matt Ridley wants to gamble the Earth's future because he won't learn from the past" http://www.theguardian.com/environment/climate-consensus-97-per-cent/2015/jan/21/matt-ridley-wants-to-gamble-earths-future-because-wont-learn-from-past, ekr)

Have you ever watched a zombie movie and wondered if the protagonists will grow physically tired from having to repeatedly kill zombies that inevitably rise once again from the dead? That's how people often feel when confronted with climate change myths that were debunked years ago. These myths never seem to stay dead, inevitably being revived by climate contrarians no matter how conclusively and repeatedly they've been debunked. And so we have writer Matt Ridley once again published in the London Times complaining, "Rather than attack my arguments, my critics like to attack my motives." That's undoubtedly because when an individual keeps repeating the same myths over and over again, people eventually grow tired of debunking those myths and naturally question the motives of the individual who keeps making them. Let's look at a few examples from Ridley's latest article. He claims not to be worried about global warming for a few reasons, including, *The failure of the atmosphere to warm anywhere near as rapidly as predicted was a big reason: there has been less than half a degree of global warming in four decades - and it has slowed down, not speeded up.* This is incorrect – average global surface temperatures have warmed between 0.6 and 0.7°C over the past 40 years (lower atmospheric temperatures have also likely warmed more than 0.5°C, though the record hasn't yet existed for 40 years). During that time, that temperature rise has temporarily both slowed down (during the 2000s, when there was a preponderance of La Niña events) and sped up (during the 1990s, when there was a preponderance of El Niño events). Climate models accurately predicted the long-term global warming trend. Ridley continues, *Sea level has risen but at a very slow rate - about a foot per century.* Given that sea level has risen faster than predicted, if you're arguing against the dangers posed by global warming, sea level is a poor choice. Climate research projects a sea level rise in the ballpark of 1 meter (3 feet) by the year 2100 if we

follow the business-as-usual path advocated by folks like Matt Ridley. *Also, I soon realised that all the mathematical models predicting rapid warming assume big amplifying feedbacks in the atmosphere, mainly from water vapour* Here Ridley is again quite wrong. We know that water vapour (as a greenhouse gas) will amplify global warming because a warmer atmosphere can hold more of it. Observations have confirmed this is exactly what's happening in the real world. This isn't an assumption of models – it's based on scientists' understanding of basic atmospheric physics. *Another thing that gave me pause was that I went back and looked at the history of past predictions of ecological apocalypse from my youth - population explosion, oil exhaustion, elephant extinction, rainforest loss, acid rain, the ozone layer, desertification, nuclear winter, the running out of resources, pandemics, falling sperm counts, cancerous pesticide pollution and so forth. There was a consistent pattern of exaggeration, followed by damp squibs: in not a single case was the problem as bad as had been widely predicted by leading scientists. That does not make every new prediction of apocalypse necessarily wrong, of course, but it should encourage scepticism.* At least Ridley admits that this is a poor excuse for dismissing the threats posed by climate change, but it's a far poorer excuse than he realizes. The reason that the worst possible consequences from acid rain, ozone depletion, pesticide pollution, and so forth weren't realized is that we took action to mitigate those threats. Specifically, we put a price on the pollutants that caused acid rain and ozone depletion, and regulated pesticide use. Those are precisely the solutions proposed to mitigate global warming. Ridley makes a similar error when discussing IPCC global warming projections, *My best guess would be about one degree of warming during this century, which is well within the IPCC's range of possible outcomes.* A further 1°C global warming by 2100 is only a possibility in one of the scenarios considered by IPCC (called RCP2.6 or RCP3-PD, where 'PD' stands for a rapid peak and decline of carbon emissions). It's the scenario in which there is an immediate and aggressive global effort to cut carbon pollution. Specifically, human global carbon emissions peak in 2020, after which they decline at a rate of around 3.5% per year, reaching zero in 2070 and continuing to fall as we remove carbon pollution from the atmosphere. Matt Ridley opposes immediate aggressive efforts to cut global carbon pollution. It's disingenuous at best for him to argue that his beliefs about modest global warming are consistent with the IPCC projections whilst advocating against the relevant pathway. It's like arguing, "My belief that I can lose weight while eating lots of cake and ice cream is well within medical doctors' range of my possible health outcomes." There are numerous other errors and zombie myths in Ridley's piece that I won't go into. For example, he revives long-debunked myths about the 'hockey stick' and 'Climategate.' Worst of all is the conclusion to which Ridley's flawed arguments lead – that we needn't take serious action to mitigate global warming because he doesn't believe climate consequences will be serious. One need only read the climate science literature (summarized by the IPCC) to see how dangerous the potential consequences of climate change are if we fail to take serious action to avoid them. Ridley believes future warming will be relatively small and hence the impacts relatively bearable, but it's just that – his (non-expert) belief. He argues that rather than mitigate the immense risks posed by global warming, the world should share his belief and take the gamble on the best case scenario that climate change doesn't turn out to be too terrible. This is the part of the story where we're obligated to recall that Matt Ridley was the non-executive Chairman of Northern Rock, a British bank that in 2007, was the first in over 150 years to experience a run on its deposits. Under Ridley's chairmanship, the bank pursued a high-risk, reckless business strategy that eventually backfired, and had to be bailed out by British taxpayers to the tune of £27 billion ($41 billion). Ridley apparently didn't learn from that fiasco, and wants to repeat the same high-risk strategy with the global climate. His reasoning is based on zombie myths, and if he's wrong again, this time nobody will be able to step in and bail out the Earth's inhabitants.

Big data's key to the global economy – facilitates private growth and innovation on a large scale

Polonetsky and Tene 13 (Jules, Co-Chair and Director, Future of Privacy Forum, and Tene, Associate Professor, College of Management Haim Striks School of Law, Israel; Senior Fellow, Future of Privacy Forum; Affiliate Scholar, Stanford Center for Internet and Society, published in the Stanford Law Review, "*Privacy and Big Data: Making Ends Meet*", http://www.stanfordlawreview.org/online/privacy-and-big-data/privacy-and-big-data)

Big data analysis often benefits those organizations that collect and harness the data. Data-driven profits may be viewed as enhancing allocative efficiency by facilitating the "free" economy.[15] The emergence, expansion, and widespread use of innovative products and services at decreasing marginal costs **have revolutionized global economies and societal structures**, facilitating access to technology and knowledge[16] and fomenting social change.[17] With more data, businesses can **optimize distribution methods**, efficiently **allocate credit**, and robustly combat fraud, benefitting consumers as a whole.[18] But in the absence of individual value or broader societal gain, others may consider enhanced business profits to be a mere value transfer from individuals whose data is being exploited. In economic terms, such profits create distributional gains to some actors (and may in fact be socially regressive) as opposed to driving allocative efficiency. D. Society Finally, some data uses benefit society at large. These include, for example, data mining for purposes of national security. We do not claim that such practices are always justified; rather, that when weighing the benefits of national security driven policies, the effects should be assessed at a broad societal level. Similarly, data usage for fraud detection in the payment card industry helps facilitate safe, secure, and frictionless transactions, benefiting society as a whole. And large-scale analysis of geo-location data has been used for urban planning, disaster recovery, and optimization of energy consumption. E. Benefits **Big data creates enormous value for the global economy**, driving innovation, productivity, efficiency, and growth. Data has become the driving force behind **almost every interaction** between individuals, businesses, and governments.

Econ decline goes nuclear and escalates

Auslin 9 (Michael, Resident Scholar – American Enterprise Institute, and Desmond Lachman – Resident Fellow – American Enterprise Institute, "The Global Economy Unravels", Forbes, 3-6, http://www.aei.org/article/100187)

What do these trends mean in the short and medium term? The Great Depression showed how social and global chaos followed hard on economic collapse. The mere fact that parliaments across the globe, from America to Japan, are unable to make responsible, economically sound recovery plans suggests that they do not know what to do and are simply hoping for the least disruption. Equally worrisome is the adoption of more statist economic programs around the globe, and the concurrent decline of trust in free-market systems. The threat of instability is a pressing concern. China, until last year the world's fastest growing economy, just reported that 20 million migrant laborers lost their jobs. Even in the flush times of recent years, China faced upward of 70,000 labor uprisings a year. A sustained downturn poses grave and possibly immediate threats to Chinese internal stability. The regime in Beijing may be faced with a choice of repressing its own people or diverting their energies outward, leading to conflict with China's neighbors. Russia, an oil state completely dependent on energy sales, has had to put down riots in its Far East as well as in downtown Moscow. Vladimir Putin's rule has been predicated on squeezing civil liberties while providing economic largesse. If that devil's bargain falls apart, then wide-scale repression inside Russia, along with a continuing threatening posture toward Russia's neighbors, is likely. Even apparently stable societies face increasing risk and the threat of internal or possibly external conflict. As Japan's exports have plummeted by nearly 50%, one-third of the country's prefectures have passed emergency economic stabilization plans. Hundreds of thousands of temporary employees hired during the first part of this decade are being laid off. Spain's unemployment rate is expected to climb to nearly 20% by the end of 2010; Spanish unions are already protesting the lack of jobs, and the specter of violence, as occurred in the 1980s, is haunting the country. Meanwhile, in Greece, workers have already taken to the streets. Europe as a whole will face dangerously increasing tensions between native citizens and immigrants, largely from poorer Muslim nations, who have increased the labor pool in the past several decades. Spain has absorbed five million immigrants since 1999, while nearly 9% of Germany's residents have foreign citizenship, including almost 2 million Turks. The xenophobic labor strikes in the U.K. do not bode well for the rest of Europe. A prolonged global downturn, let alone a collapse, would **dramatically raise tensions** inside these countries. Couple that with possible protectionist legislation in the United States, unresolved ethnic and territorial disputes in all regions of the globe and a loss of confidence that world leaders actually know what they are doing. The result may be a series of small explosions that coalesce into a big bang.

Big data is key to the economy – jobs, new industry expansion, and revenue

Blackburn 15 (Suzanne, PR Manager at Experian and senior contributor to the Experian WhitePages. Experian is a data marketing analytics company that has been published for over 40 years. "*Why Privacy Matters in a Data-Driven Economy*", 3/26, http://www.experian.com/assets/marketing-services/p/ems-why-privacy-matters.pdf)

Beyond enabling more convenient and valuable digital experiences, data is now fueling our **national** and **global economy**. New business models and ways of doing business, while still in their early stages, are steering the global economy toward a data-driven world of unprecedented **access**, **insight**, **innovation** and **interconnectivity**. However, as data becomes fundamental to virtually every aspect of our business and professional lives, this **data-driven economy is at a crossroads**. It will only continue to grow and thrive if we collectively create the conditions where it can **remain open**, healthy and responsive to the privacy concerns of **consumers.** Kevin Dean, General Manager and Global Head of Product, Targeting, Experian Marketing Services notes, "The 'plumbing' of the data-driven economy, the part that sits out of sight behind the drywall, out of the view of most consumers, is something that many consumers are becoming aware of for the first time." This white paper will assess the rise of the data-driven economy within the media and advertising industry and the evolution of privacy in that economy: How can we ensure that data is used for good, positive and productive purposes? How can we create the conditions that will ensure a healthy and open data-driven economy that changes the world for the better, many times over? This white paper is for the digital and the data-driven, the organization and the individual, both the business-to-consumer and the business-to-business brand — every link in the

chain of the media and advertising ecosystem that is assessing its role in this economy and its future. According to McKinsey, gains for the overall economy as a result of Big Data could be up to **$610 billion** in annual productivity and cost savings. Since 2007, data-related products and services have generated about 30 percent of real personal consumption growth, according to the Progressive Policy Institute. McKinsey estimated that Big Data could yield benefits for **healthcare alone** of more than $300 billion annually. According to IDC, 570 new Websites are created **every minute**. According to IDC, in five years there will be 450 billion transactions per day. According to IBM, by 2020, the amount of information in the digital universe will grow tenfold. Advertising is an immediate example of an industry in the midst of a **data-driven growth spurt.** In this industry, innovation is taking place at a rapid rate. According to research by industry analyst Scott Brinker, the marketing technology landscape has exploded in the past four years. As of January 2015, Brinker estimates that there are nearly 1,900 marketing-technology venders, up from 947 companies in early 2014 and only 100 in 2011. According to a study conducted by Harvard Business School in 2012, the digital-advertising industry **alone** employed more than 2 million Americans in 2012, indirectly employing 3.1 million Americans in other sectors. According to the Progressive Policy Institute, the mobile app industry alone now accounts for more than 750,000 jobs. These are jobs that didn't exist a decade ago. More importantly, ubiquitous consumer data is bringing programmatic media, interactive marketing and digital-technology companies **closer together**, **forming a new hybrid industry** with a common goal: to enhance the digital experience of the consumer.

2nc – link

Healthcare Fraud is increasing only governmental use of big data can stop it.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

Any reasonable discussion of healthcare fraud must include Medicare. Medicare is a government health insurance program for the elderly and the disabled. n154 Every day, 4.5 million claims for Medicare services are [*771] processed. n155 In 2011, the program covered almost 49 million people, spending over $ 500 billion. n156 The extent of Medicare fraud is unknown, n157 but it is believed to cost the government somewhere between $ 60 billion and $ 90 billion a year. n158 Hospitalization claims are the most common source of civil fraud investigations, while outpatient, medical equipment, and lab work claims are the most common sources of criminal fraud investigations. n159 Home-health agencies and providers of durable medical equipment have particularly high fraud rates. n160 Healthcare fraud generally - and Medicare fraud in particular - frequently involves health providers' charging for services never provided, billing for unnecessary equipment, stealing medical identities, paying kickbacks for referrals, or using a Medicare number for fraudulent billing. Complex schemes often incorporate a mix of strategies. n161 To identify [*772] fraudulent billing practices, automated systems help investigators flag impossible claims, such as a provider's alleged removal of twenty toenails from three toes or bills for more therapy sessions than Newtonian physics would allow. n162 Phantom billing may involve elaborate schemes in which there are in fact no physical clinics, patients, or health practitioners. For example, a member of an Armenian organized crime group recently admitted to creating a network of clinics and providers that existed only on paper, but nevertheless billed Medicare for nearly $ 100 million and received over $ 35 million in payments. n163 Similar to phantom billing is billing for services that are not medically necessary. In one case, a doctor with a penchant for Playboy models and Picassos received "$ 1.2 million from Medicare in 2008 ... a large portion of it from physical therapy," consisting of "heat packs, massage, electrical stimulation and ultrasound." n164 Although government-funded massages are relatively harmless to patients, other unnecessary treatments can be invasive and life threatening. In a recent case, investigators discovered that patients who were disoriented and unable to control their bodily functions were being forced to attend group therapy that served no medical purpose. n165 [*773] Providers altered their records

so it would appear that patients benefited from therapy that was anything but helpful. n166 In another case, the government alleged that a nursing home required therapists to use the most expensive treatments on residents, even if the interventions were inappropriate or dangerous. n167 For example, it alleged that a ninety-two-year-old cancer patient in Orlando, who was routinely spitting up blood, nonetheless received 48 minutes of physical therapy, 47 minutes of occupational therapy, and 30 minutes of speech therapy, two days before his death. The day he died, the patient received 35 minutes of physical therapy and was scheduled for more therapy later in the day. n168 CMS reported a dermatologist who, in addition to unnecessarily removing "benign skin lesions," reused sutures, thereby exposing patients to HIV, hepatitis C, and other diseases. n169 Claims for medical equipment are another common target for fraudsters. Two Los Angeles pastors recently were found guilty of running separate schemes involving power wheelchairs. In the first, the conspirators purchased fraudulent medical documentation and billed Medicare $ 6,000 for power wheelchairs that actually cost $ 900. n170 The conspirators also offered wheelchairs and other unnecessary equipment to Medicare beneficiaries in exchange for their Medicare numbers. n171 If Medicare refused to pay for the chairs, the pastor instructed his employees to take the chairs away from the beneficiaries. n172 The funds from the scheme were diverted among sham supply companies run by the pastor's wife and other church members. n173 A second pastor and a doctor who [*774] provided fraudulent documentation pleaded guilty to running a similar conspiracy later in the same year. n174 Prescription medicines provide another rich territory for healthcare fraud. A well-known dialysis provider was accused in 2012 of intentionally wasting medication by giving multiple partial doses, instead of smaller numbers of full doses, in order to inflate charges. n175 Later that same year, a Miami pharmacy owner pleaded guilty to fraud charges for instructing his employees to retrieve from assisted-living facilities unused medication already billed to Medicare and Medicaid so that it could be repackaged and reused. n176 The repackaged medicine was distributed to other assisted-living facilities or the general public and resubmitted to insurance. n177 The pharmacist also paid assisted-living facilities to refer residents. n178 In Baltimore, a pharmacist admitted to purchasing drums of drugs from an unlicensed provider, mislabeling them, and dispensing them to customers. n179 The same pharmacist submitted claims to Medicare for prescription refills that were not dispensed to beneficiaries. n180 Still another pharmacist admitted to paying Medicare and Medicaid beneficiaries for their prescriptions and then submitting reimbursement claims to insurance companies without dispensing the medication. n181 Among his targets were [*775] patients with HIV or mental illness, whose medications are particularly expensive. n182 Patients are not always innocent victims, of course. Beneficiaries often participate in healthcare fraud schemes in exchange for services or kickbacks. n183 Kickbacks range from cash n184 and cigarettes n185 to spa services and lunches. n186 In a massive operation in New York, conspirators paid $ 500,000 to beneficiaries in a special "kickback room." n187 Some of these schemes are far more Dickensian, providing subsistence benefits, such as housing, to vulnerable beneficiaries and then threatening them with homelessness if they refuse to comply with the fraud. n188 Whether through coercion, persuasion, or deception, individuals engaged in fraud expose Medicare beneficiaries, who are often ill or limited in capacity, to substantial risks. Medical identity theft is a significant problem as well. CMS reports that, in 2011, a man was convicted of stealing his brother's medical information and using it for surgery covered under his brother's insurance. [*776] The victim's medical records in turn incorrectly included his brother's HIV-positive status, which put the true beneficiary at risk of receiving medically unnecessary drugs and procedures. n189 Perpetrators also steal the identities of unsuspecting providers who have already been approved by Medicare in order to file fraudulent claims. n190 In one case, a home-health agency owner stopped paying his licensed personnel and, when they quit, billed hundreds of claims under his former employees' licenses. n191 Organized crime is also involved, creating networks of nonexistent clinics based on stolen provider information, often leading to suspicious claims, such as "[a] pregnant woman who gets an ultrasound exam - from an ear, nose and throat doctor[, a] forensic pathologist whose patients walked into his office, rather than being rolled in with toe tags[, a] dermatologist who conducted heart tests[, or a] psychiatrist who performed M.R.I.'s." n192 Although some providers' identities are stolen, others lend, rent, or sell their identities to facilitate fraud schemes. n193 Take, for example, a case in New Jersey where a licensed provider was "frequently either not in the office at all, or was in his personal office watching television." n194 He provided "pre-signed, blank prescription forms" to the unlicensed employees who were diagnosing patients. n195 In another case, unlicensed physicians paid a licensed physician "$ 2,000 a month to review and sign medical records prepared by physician assistants." n196 [*777] Healthcare fraud is increasingly accomplished and facilitated by electronic means. n197 Rather than steal patient information on an individual basis, hackers target medical information databases. In May 2012, a group of hackers based in Eastern Europe breached Utah's healthcare database, gaining access to over 780,000 records, including Social Security numbers and medical diagnosis codes. n198 These records are essential for fraudulent billing. According to one report, "an individual healthcare record is worth more on the black market ($ 50, on average) than a U.S.-based credit card and personal identity with social security number combined." n199 **As healthcare fraud moves into the digital arena, traditional methods of detection and prosecution are simply inadequate. A cybercrime requires a cybersolution, which, in the case of healthcare fraud, will almost certainly include Big Data.**

Only robust data analysis can solve healthcare fraud – Mosaic Theory prevents that.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

The overwhelming majority of data that CMS and its contractors use to detect fraud comes from claims, payment, and referral records. n200 Now that [*778] CMS is partnering with private insurance organizations, it will have access to private claims and other health data. n201 Additionally, the Medicare Integrity Manual lists a dozen types of data that contract agencies should use when investigating suspicious activity, including: (1) the nature of the providers and staff; (2) the structure of the business, overhead costs, and its relationship to other businesses; (3) the amount of business generally and the amount of business from Medicare/Medicaid reimbursements specifically; (4) the types of services rendered; (5) location; (6) history of claims and any previous investigations; and (7) "other information needed to explain and/or clarify the issue(s) in question." n202 In part due to the involvement of international organized crime syndicates, the Department of Justice (DOJ), which investigates and prosecutes fraud cases, considers healthcare fraud an indicator of potential terrorism. n203 DOJ describes healthcare providers as "nontraditional information gatherers [that] can provide [interagency data-sharing] fusion centers with both strategic and tactical information," n204 including "health surveillance networks [and] syndromic surveillance." n205 It recommends that fusion centers, which serve as hubs for local, state, and federal information gathering and sharing, n206 collaborate with healthcare providers to develop analytical tools. n207 Access to fusion-center networks means having the ability to mine and analyze vast public databases at the state, local, and federal level; data-broker dossiers on millions of individuals; [*779] private databases held by cooperating entities; video streams from public and private cameras; and far more. In prosecuting fraud cases, DOJ will have access to CMS's data as well as any data aggregated and analyzed by fusion centers. In short, efforts to prevent, detect, and prosecute healthcare fraud are increasingly tied to Big Data. Already an important tool for regulators and law enforcement, Big Data is likely to become a more powerful and important asset in the years to come. n208 The ACA contains a provision requiring the release of some of Medicare's billing data, which previously had been blocked by a court ruling citing physician privacy. n209 CMS has discussed plans to leverage the detection benefits of Big Data to facilitate a move towards "fraud prevention," rather than the former method of paying claims and later attempting to reclaim funds fraudulently acquired. n210 To this end, CMS has developed multiple task forces and agencies that tap private-sector information technology resources. n211 The most recent initiative is the Fraud Prevention System (FPS), a response to requirements in the Small Business Jobs Act of 2010 "to implement predictive analytics technologies to [*780] identify and prevent the payment of improper claims in the Medicare fee-for-service program." n212 All of Medicare's daily 4.5 million claims run through FPS's "predictive algorithms and other sophisticated analytics," n213 which are similar to those used by credit card companies to detect fraudulent purchases. n214 Although FPS cannot automatically stop payments, it "automatically generates and prioritizes leads for review and investigation." n215 FPS addresses the problem of data silos by analyzing claims nationwide n216 and over a period of time, n217 both of which are necessary for identifying fraudulent behavior. n218 FPS also complements the Automated Provider Screening System; the two systems are now slated for integration. n219 CMS has more plans to expand the reach and power of FPS, including social network analysis n220 and adaptive analytics. n221 According to CMS, in 2011 "FPS also generated leads for 536 new ... investigations, augmented information for 511 pre-existing investigations, and prompted 617 provider interviews and 1,642 beneficiary interviews to verify legitimate provision of Medicare services and supplies." n222 CMS claims that these efforts resulted in a savings of $ 115 million. n223 Although modest when compared to the total of $ 4.1 billion that CMS recovered from fraud schemes through partnerships with private contractors and government agencies in 2011, n224 the program is just getting started, and [*781] officials expect to prevent or recover billions of dollars in losses. n225 Even when FPS was in its infancy, the Wall Street Journal drew attention to suspicious providers using simple data analysis of a database "containing records only through 2008, and including the claims of just 5% of randomly selected Medicare beneficiaries." n226 In 2010, the Journal described the suspect practices of a physical therapist who later pleaded guilty to healthcare fraud. n227 Among other charges, the doctor submitted a claim for a service that occurred while he was on vacation. n228 The Journal used the same comparatively

limited data set to identify a surgeon who was practicing in Texas after being temporarily banned from Medicare because he had performed unnecessary and harmful surgeries in New Jersey. n229 The Journal found that the readmitted doctor's death rate was seven times higher than the national average. n230 Another surgeon appeared to perform an unusually high number of multiple spinal operations per patient. n231 Investigating these types of activities requires access to Big Data. With Big Data, governmental systems can identify providers who bill more over a specified time period than other providers in the region. Claims analysis can detect providers who authorize particularly expensive equipment. Analysis of individuals' claims over time can reveal discrepancies or impossibilities, such as multiple hysterectomies, which indicate possible identity theft or kickbacks. Looking at groups of individual claims could also reveal possible kickbacks if, for instance, a sizeable population in a community suddenly switches to a less convenient pharmacy. As FPS incorporates social network models, the system will gain further leverage on its data, allowing it to compare individuals against known criminal associations, including those that work primarily in the virtual world of black-market healthcare data. The more data the system can use to build comparative models, the more accurately the models will reflect standard practice. n232 As evidence of this potential, CMS recently credited "sophisticated data analysis" for the indictment of a home-healthcare physician in "the biggest health-care fraud case brought against a single doctor." n233 The doctor certified over 5,000 patients a year for home-healthcare by having his employees complete certification forms using his forged signature. n234 Although many healthcare fraud cases originate through direct reporting, including qui tam actions, complicated schemes like those involving organized crime are more vulnerable to data analysis, which can review and compare large volumes of claims over time. To achieve its stated goal of stopping fraudulent payments before they reach the provider, CMS will need robust analytical tools that can probe massive quantities of disparate data to flag automatically suspect claims across a wide range of covered services and also evolve to identify new fraudulent behavior as it develops. That capacity is likely to be greatly enhanced in coming years as CMS programs gain access to the vast quantities of consumer and other data currently brokered through third-party aggregators. **At each turn, the government and its agents will face potential Fourth Amendment barriers erected by the mosaic theory of Fourth Amendment privacy.**

innovation solves extinction

Heaberlin 4 (Scott W, Nuclear Safety and Technology Applications Product Line @ Pacific Northwest National Laboratory, “A Case for Nuclear-Generated Electricity,” Battelle Press, 2004)

Cohen looked at all the various population estimates and concluded that most fell into the range of 4 to 16 billion. Taking the highest value when researchers offered a range, Cohen calculated a high median of 12 billion and taking the lower part of the range a low median of 7.7 billion. The good news in this is 12 billion is twice as many people as we have now. The bad news is that the projections for world population for 2050 are between 7.8 and 12.5 billion. That means we have got no more than 50 years before we exceed the nominal carrying capacity of the earth. Cohen also offers a qualifying observation by stating the "First Law of Information," which asserts that 97.6% of all statistics are made up. This helps us appreciate that application of these numbers to real life is subject to a lot of assumptions and insufficiencies in our understanding of the processes and data. However, we can draw some insights from all of this. What it comes down to is that if you choose the fully sustainable, non-fossil fuel long-term options with only limited social integration, the various estimates Cohen looked at give you a number like 1 billion or less people that the earth can support. That means 5 out of 6 of us have got to go, plus no new babies without an offsetting death. On the other hand, if you let technology continue to do its thing and perhaps get even better, the picture need not be so bleak. We haven't made all our farmland as productive as it can be. Remember, the Chinese get twice the food value per hectare as we do in the United States. There is also a lot of land that would become arable if

we could get water to it. And, of course, in case you need to go back and check the title of this book, there are alternatives to fossil fuels to provide the energy to power that technology. So given a positive and perhaps optimistic view of technology, we can look to some of the high technology assumption based studies from Cohen's review. From the semi-credible set of these, we can find estimates from 19 to 157 billion as the number of people the earth could support with a rough average coming in about 60 billion. This is a good time to be reminded of the First Law of Information. The middle to lower end of this range, however, might be done without wholesale social reprogramming. Hopefully we would see the improvement in the quality of life in the developing countries as they industrialize and increase their use of energy. Hopefully, also this would lead to a matching of the reduction in fertility rates that has been observed in the developed countries, which in turn would lead to an eventual balancing of the human population. The point to all this is the near-term future of the human race depends on technology. If we turn away from technology, a very large fraction of the current and future human race will starve. If we just keep on as we are, with our current level of technology and dependence on fossil fuel resources, in the near term it will be a race between fertility decrease and our ability to feed ourselves, with, frankly, disaster the slight odds-on bet. In a slightly longer term, dependence on fossil fuels has got to lead to either social chaos or environmental disaster. There are no other end points to that road. It doesn't go anywhere else. However, if we accept that it is technology that makes us human, that technology uniquely identifies us as the only animal that can choose its future, we can choose to live, choose to make it a better world for everyone and all life. This means more and better technology. It means more efficient technology that is kinder to the planet but also allows humans to support large numbers in a high quality of life. That road is not easy and has a number of ways to screw up. However, it is a road that can lead to a happier place, a better place.

Terrorism Links

1nc

Social media surveillance is key to solve terrorism – it's the lynchpin for ISIS and AQAP – only an increase in vigilance and crackdowns on radicalization of social media websites cuts off the key route for training, funding, recruiting, and capabilities of terrorist groups

Carmon and Stalinsky 15

(Mr. Carmon is president and founder of the Middle East Media Research Institute. Mr. Stalinsky is the executive director of MEMRI, "Terrorist Use Of U.S. Social Media Is A National Security Threat", http://www.forbes.com/sites/realspin/2015/01/30/terrorist-use-of-u-s-social-media-is-a-national-security-threat/3/, ZS)

American companies like Twitter, Facebook, Google, Apple, Microsoft, Yahoo and other popular services, including YouTube, WhatsApp, Skype, Tumblr and Instagram, **are facilitating global jihad.** This was one of the main subjects of a recent meeting between UK Prime Minister David Cameron and President Obama focusing on cybersecurity and counterterrorism. The president stated, "Social media and the Internet is the primary way in which these terrorism organizations are communicating" and that "we're still going to have to find ways to make sure that if an Al-Qaeda affiliate is operating in Great Britain or in the United States, that we can try to prevent real tragedy. And I think the companies want to see that as well. They're patriots… we're also going to be in dialogue with the companies to try to make that work." This follows Robert Hannigan, the U.K.'s Director of the Government Communications Headquarters describing "the largest U.S. technology companies" as "the command-and-control networks of choice for terrorists" in The Financial Times last November. Mr. Hannigan said out loud what for too long too few have: For almost a decade, these companies have helped Al-Qaeda, and are now helping ISIS to fundraise, recruit, indoctrinate, and train new terrorists. Nearly every day brings more news of the arrest of young Westerners for terror activity, planning attacks, or attempting to travel to the

Middle East to join a terror organization. ISIS has grasped the effectiveness of social media U.S. social media companies are at the center of each of these cases. ISIS has grasped the effectiveness of social media, culminating in its strategic decision to show the beheading of American journalist James Foley on August 19. It first uploaded the video to YouTube and tweeted a graphic blow-by-blow series of stills showing the knife cutting his throat, the removal of his head, and the placement of his severed head on his lifeless body. This act created an earthquake on social media, as thousands of these tweets went viral. The following day, Twitter CEO, Dick Costolo, tweeted, "We have been and are actively suspending accounts as we discover them related to this graphic imagery." But the release of the videos of ISIS's next four beheadings of Americans and Britons were all announced via Twitter—with more graphic images of the beheadings and their aftermath—belying his claim. Furthermore, four months later, the number of graphic jihadi tweets of beheadings and executions is at its peak. Most recently, on January 20, ISIS sent via Twitter an embedded YouTube video featuring Jihadi John, the apparent beheader in its previous videos, threatening to kill two Japanese hostages unless the Japanese government paid a ransom of $200 million within 72 hours. **Government should be asking company heads why they aren't doing more** "Why aren't YouTube, Facebook, and Twitter doing more to stop terrorists from inciting violence?" MSNBC host Ronan Farrow asked in the title of his July 10, 2014 Washington Post op-ed. This is precisely the question that U.S. government officials should be asking the heads of these companies. Farrow also noted that "these companies already know how to police and remove content that violates other laws. Every major social media network employs algorithms that automatically detect and prevent the posting of child pornography. Many, including YouTube, use a similar technique to prevent copyrighted material from hitting the web. Why not, in those overt cases of beheading videos and calls for blood, employ a preventive similar system?" Asked about terrorists' use of YouTube in a May 2013 CNN interview, Google executive chairman Eric Schmidt claimed: "If there were an algorithm to detect terrorists, trust me, we would use it." But Google is quite capable of identifying and removing content from its search engine using its algorithms—and has done so on numerous occasions. But why should national security be "entrusted" to Google employees anyway? What are their qualifications to determine what could threaten the lives of Americans? Those who support allowing jihadi content on social media state that such content should be left alone because of its intelligence value. In an October 9 Washington Post op-ed titled "We Shouldn't Stop Terrorists From Tweeting," Daniel Byman and Jeremy Shapiro of The Brookings Institute defended Twitter for allowing and not removing jihadi content: "[B]anning particular sites or individuals may make sense if the risk of recruitment and radicalization is high. But those risks have to be weighed against the intelligence value of having groups such as the Islamic State active on social media…" Such an approach is flawed. One can hardly imagine the development of the global jihad movement without the Internet. An entire generation of Muslim youth has been and continues to be radicalized online by violent images and incitements to murder. Recruitment numbers are swelling today because for too long nothing was done to stem the flow of this jihadi content hosted by these services. And, consider that jihadis who post this content are fully aware that it is being monitored by Western security agencies; the argument that allowing them to continue to use these platforms on the chance that their accounts could yield significant intelligence is simply naive. The rebuttal to this being that the government shouldn't be relying solely on social media for its intelligence gathering. **A growing threat to national security** Another reminder of the free rein afforded to jihadis online was a January 10 New York Times headline soon after the Paris attacks: "Jihadists and Supporters Take To Social Media To Praise Attack On Charlie Hebdo." The next day, justice and interior ministers of 12 European countries,

including the U.K., France and Germany, issued a joint statement expressing concerns about the Internet being used by terrorists, and calling for tech companies to do more to deal with this issue. On January 12, in further evidence of the growing threat to national security posed by Al-Qaeda's, ISIS', and other groups' cyber jihad activity, pro-ISIS hackers broke into the Twitter and YouTube accounts of U.S. Central Command – CENTCOM – leaking documents and information and live-tweeting as they went. "With the Sony attack that took place, with the Twitter account that was hacked by Islamist jihadist sympathizers yesterday, it just goes to show how much more work we need to do, both public and private sector, to strengthen our cybersecurity," President Obama warned the following day. Gen. Jack Keane (ret.), former U.S. Army Vice Chief of Staff, understands the strategic importance Al-Qaeda, ISIS, and other jihadi groups place on the use of social media and the damage done by leaving it undisrupted. He stated on Fox News on October 23: "…I think we should clearly appeal to the hosts who are running Twitter, Facebook, the various websites, and shut these things down." Time for Congress to catch up to terrorist use of the Internet and create and enforce new laws to address this problem The new Congress and the Obama administration should make this issue a priority in 2015. The long-overdue first step in doing so would be summoning the heads of social media companies and having them clarify what exactly their policies are. Solutions could require examination by constitutional law experts, and might need to go all the way to the Supreme Court. There are several clear models for U.S. policy makers to follow which European governments recently have begun to implement. On October 8, the European Commission, with ministers from all 28 EU member states, summoned major U.S. technology companies to a "private" meeting in Luxembourg on terrorist use of the Internet, against the backdrop of the "flow of so-called foreign fighters" as well as "calls for electronic jihad that the E.U. is facing." The meeting's goal was to come up with a plan for these companies to stop online radicalization on their websites. It is difficult to understand why no one in the U.S. government has taken similar action yet. These companies should be questioned in a transparent framework, and must commit to tackling the problem of eradicating violent jihadi content from their platforms. It is time for the government to catch up to terrorist use of the Internet and create and enforce new laws to address this problem. The removal of a handful of YouTube videos, Twitter accounts, and Facebook pages is hardly a serious solution.

Plan drains PC – link only goes one way – ratchet effect makes repealing current (programs/laws/authorizations) unique - – inertia and terrorism fears outweigh, strong political support only sparks bigger fight

Givens, 13 -- Austen, Prof Cybersecurity @ Utica College, Harvard National Security Journal, July,
http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/

The NSA Surveillance Controversy: How the Ratchet Effect Can Impact Anti-Terrorism Laws On June 5, 2013, the world learned that the National Security Agency (NSA), America's largest intelligence-gathering organization, had been gathering the metadata of all the phone calls made by Verizon customers since early April 2013. The next day, two prominent newspapers reported that PRISM, a top secret NSA program, had been vacuuming up customer data from some of the world's largest and best known information technology (IT) firms—including Google, Apple, Facebook, and Microsoft—directly from their servers. Director of National Intelligence James Clapper later clarified that specific requests for customer data from these IT firms were subject to tight legal controls and only targeted non-US citizens. But Clapper's comments did little to calm frayed nerves. A public outcry ensued, with some loudly opposing the NSA's surveillance programs and others forcefully defending them. The New York Times condemned the NSA surveillance in an editorial and the American Civil Liberties Union (ACLU) filed a lawsuit against the NSA, challenging the constitutionality of the NSA telephone call metadata collection program. Former Vice President Al Gore called the surveillance "obscenely outrageous" on Twitter. But others came out in support of the NSA's efforts. Senator Lindsay Graham said "I am a Verizon customer…it doesn't bother me one bit for the NSA to have my phone number." Max Boot, a senior fellow with the think tank Council on Foreign Relations, credited the NSA surveillance with helping to reduce the number of terrorist incidents on US soil since the attacks of September 11, 2001. A Pew Research Center poll suggested that there was significant support among the American public for the NSA's surveillance efforts. Despite the heated rhetoric on both sides of the surveillance debate, the NSA's collection of telephone call metadata appears to be legal based upon the Foreign Intelligence Surveillance Court's (FISC) interpretation of section 215 of the USA PATRIOT Act. Perhaps the most interesting remarks about the NSA controversy thus far came from Representative Jim Sensenbrenner, one of the original authors of the USA PATRIOT Act. He wrote that when the Act was first drafted, one of the most controversial provisions concerned the process by which government agencies obtain business records for intelligence or law enforcement purposes. Sensenbrenner stated that particular provision of the Act requires government lawyers to prove to the FISC that a request for specific business records is linked to an "authorized investigation" and further stated that "targeting US citizens is prohibited" as part of the request. Sensenbrenner argued that the NSA telephone metadata collection is a bridge too far and falls well outside the original intended scope of the Act: "[t]he administration claims authority to sift through details of our private lives because the Patriot Act says that it can. I disagree. I authored the Patriot Act, and this [NSA surveillance] is an abuse of that law." Acknowledging that Sensenbrenner's statements may have been motivated in part by political interests, the perceived creeping expansion of the USA PATRIOT Act—the "abuse" that Sensenbrenner describes in the context of the NSA surveillance controversy—is consistent with what is known as the "ratchet effect" in legal scholarship. The ratchet effect is a unidirectional change in some legal variable that can become entrenched over time, setting in motion a process that can then repeat itself indefinitely.[1] For example, some scholars argued that anti-terrorism laws tend to erode civil liberties and establish a new baseline of legal "normalcy" from which further extraordinary measures spring in future crises.[2] This process is consistent with the ratchet effect, for it suggests a "stickiness" in anti-terrorism laws that makes it harder to scale back or reverse their provisions. Each new baseline of legal normalcy represents a new launching pad for additional future anti-terrorism measures. There is not universal consensus on whether or not the ratchet effect is real, nor on how powerful it may be. Posner and Vermeule call ratchet effect explanations "methodologically suspect."[3] They note that accounts of the ratchet effect often ring hollow, for they "fail to supply an explanation of such a process…and if there is such a mechanism [to cause the ratchet effect], it is not clear that the resulting ratchet process is bad."[4] I argue that the recent controversy surrounding the NSA's intelligence collection efforts underscores the relevance of the ratchet effect to scholarly discussions of anti-terrorism laws. I do not seek to prove or disprove that the recent NSA surveillance controversy illustrates the ratchet effect at work, nor do I debate the potential strength or weakness of the ratchet effect as an explanation for the staying power or growth of anti-terrorism laws. As Sensenbrenner's recent comments make clear, part of the original intent of the USA PATRIOT Act appears to have been lost in interpretation. It is reasonable to suggest that future anti-terrorism laws may suffer a similar fate. Scholars can therefore benefit from exploring how the USA PATRIOT Act took shape and evolved, and why anti-terrorism laws can be difficult to unwind.

Colorblindness Kritik

1nc

First, the affirmative's reaction to NSA surveillance is a product of white privilege. The abuses they're outraged with aren't exceptions to the rule; they are the rule.

Wise 13 — Timothy J. Wise, anti-racist activist and writer, holds a B.A. in Political Science from Tulane University, 2013 ("Whiteness, NSA Spying and the Irony of Racial Privilege," Tim Wise's blog, June 19th, Available Online at http://www.timwise.org/2013/06/whiteness-nsa-spying-and-the-irony-of-racial-privilege/, Accessed 02-17-2015)

The idea that with this NSA program there has been **some unique blow** struck against democracy, and that now our liberties are in jeopardy is the kind of thing one can **only** believe if one has had the luxury of thinking they were living in such a place, and were in possession of such shiny baubles to begin with. And this is, to be sure, a luxury enjoyed by painfully few folks of color, Muslims in a post-9/11 America, or poor people of any color. For the first, they have long known that their freedom was directly constrained by racial discrimination, in housing, the justice system and the job market; for the second, profiling and suspicion have circumscribed the boundaries of their liberties **unceasingly for the past twelve years**; and for the latter, freedom and democracy have been **mostly an illusion**, limited by economic privation in a class system that affords less opportunity for mobility than fifty years ago, and less than most other nations with which we like to compare ourselves.

In short, when people proclaim a desire to "take back our democracy" from the national security apparatus, or for that matter the plutocrats who have ostensibly hijacked it, they begin from a premise that is entirely **untenable**; namely, that there was **ever** a democracy to take back, and that the hijacking of said utopia has been a recent phenomenon. But **there wasn't** and **it hasn't been**.

Second, their colorblind policy analysis perpetuates racism and inequality.

Wise 10 — Timothy J. Wise, anti-racist activist and writer, holds a B.A. in Political Science from Tulane University, 2010 ("With Friends Like These, Who Needs Glenn Beck? Racism and White Privilege on the Liberal-Left," Tim Wise's blog, August 17th, Available Online at http://www.timwise.org/2010/08/with-friends-like-these-who-needs-glenn-beck-racism-and-white-privilege-on-the-liberal-left/, Accessed 02-17-2015)

Liberal Colorblindness and the Perpetuation of Racism

By "liberal colorblindness" I am referring to a belief that although racial disparities are certainly real and troubling — and although they are indeed the result of discrimination and unequal opportunity — paying less attention to color or race is a progressive and open-minded way to combat those disparities. So, for instance, this is the type of colorblind stance often evinced by teachers, or social workers, or folks who work in non-profit service agencies, or other "helping" professions. Its embodiment is the elementary school teacher who I seem to meet in every town to which I travel who insists "they never even notice color" and make sure to treat everyone exactly

the same, as if this were the height of moral behavior and the ultimate in progressive educational pedagogy.

But in fact, colorblindness is exactly the opposite of what is needed to ensure justice and equity for persons of color. To be blind to color, as Julian Bond has noted, is to be blind to **the consequences** of color, "and especially the consequences of being the wrong color in America." What's more, when teachers and others resolve to ignore color, they not only make it harder to meet the needs of the persons of color with whom they personally interact, they actually help **further racism and racial inequity** by deepening denial that the problem exists, which in turn makes the problem harder to solve. To treat everyone the same — even assuming this were possible — is not progressive, especially when some are contending with barriers and obstacles not faced by others. If some are dealing with structural racism, to treat them the same as white folks who aren't is to fail to meet their needs. The same is true with women and sexism, LGBT folks and heterosexism, working-class folks and the class system, persons with disabilities and ableism, right on down the line. Identity matters. It shapes our experiences. And to not recognize that is to increase the likelihood that **even the well-intended will perpetuate the initial injury**.

Third, their decision to highlight* NSA surveillance *instead of ongoing, ubiquitous violence against people of color perpetuates white supremacy. This outweighs the case.

Wise 13 — Timothy J. Wise, anti-racist activist and writer, holds a B.A. in Political Science from Tulane University, 2013 ("Whiteness, NSA Spying and the Irony of Racial Privilege," Tim Wise's blog, June 19th, Available Online at http://www.timwise.org/2013/06/whiteness-nsa-spying-and-the-irony-of-racial-privilege/, Accessed 02-17-2015)

So yeah, the government is spying on you precious. And now you're pissed?

This is **the irony of privilege**: the fact that some have for so long enjoyed it, in its largely unfettered state, is precisely why some of those those same persons are now so exorcised at the thought of potentially **being treated like everyone else has been, forever**; and it is also why the state was able to get away with it for such an extended period. So long as the only possible targets were racial and religious and class others, shock and outrage could be **kept at a minimum**. And so the apparatus of profiling and monitoring and snooping and data collection and even targeted assassination **grew like mushrooms in the dark**. And deep down, most of the same white folks who are now so unhinged by the mere possibility — and a remote one at that — that they will be treated like those others, knew what was going on.

And they said **little or nothing**. White liberals — with some notable exceptions — mostly clucked their tongues and expressed how unfortunate it was that certain people were being profiled, but they rarely spoke out publicly, or challenged those not-so-random searches at the airport, or dared to challenge cops when they saw them harassing, or even brutalizing the black and brown. **Plenty of other issues were more pressing**. The white conservatives, of course, largely applauded either or both of those.

And now, because they mostly ignored (or even in some cases cheered) the violations of Constitutional rights, so long as the violations fell upon someone other than themselves, they are

being freshly confronted with the surly adolescent version of the infant to which they gave birth, at least indirectly. And they aren't too happy with his insolence.

Yeah, well, tell it to pretty much **every Arab American**, **every Persian American**, **every Afghan American**, everyone with a so-called **Middle Eastern name** walking through an airport in this country for the past decade or more. Tell them how **now** you're outraged by the idea that the government might consider you a potential terrorist.

Tell it to the hundreds of thousands of black men in New York, **stopped and frisked** by the NYPD over the past fifteen years, whose names and information were entered into police databases, even though they had committed no crime, but just as a precautionary measure, in case they ever decided to commit one. Tell them how tight it makes you to be thought of as a potential criminal, evidence be damned.

Tell it to brown folks in Arizona, who worry that the mere color of their skin might provoke a local official, operating on the basis of state law (or a bigoted little toad of a sheriff), to stop them and force them to **prove they belong in the country**. Explain to them how patently offensive and even hurtful it is to you to be presumed unlawful in such a way as to provoke official government suspicion.

Tell it to the veterans of the civil rights struggle whose activities — in the Black Panthers, SNCC, the Young Lords, the Brown Berets, and the American Indian Movement, among others — were **routinely monitored** (and more to the point actively disrupted and ripped apart) by government intelligence agencies and their operatives. Tell them how incredibly steamed you are that your government might find out what websites you surf, or that you placed a phone call last Wednesday to someone, somewhere. Make sure to explain how such activities are **just a step away from outright tyranny** and surely rank up there alongside the murder and imprisonment to which their members were subjected. Indeed.

And then maybe, just maybe, consider how privilege — being on the upside, most of the time, of systems of inequality — can (and has) let you down, even set you up for a fall. How maybe, just maybe, all the apoplexy mustered up over the NSAs latest outrage, might have been conjured **a long time ago**, and over **far greater outrages**, the burdens of which were borne by only certain persons, and not others.

Finally, the alternative is to react with indifference to NSA surveillance. Yes, these abuses are bad. But they're just more of the same in a country that* is not *and* has never been *free for people of color.

Wise 13 — Timothy J. Wise, anti-racist activist and writer, holds a B.A. in Political Science from Tulane University, 2013 ("Whiteness, NSA Spying and the Irony of Racial Privilege," Tim Wise's blog, June 19th, Available Online at http://www.timwise.org/2013/06/whiteness-nsa-spying-and-the-irony-of-racial-privilege/, Accessed 02-17-2015)

It's not that I'm not angry.

It's not that I'm not disturbed, even horrified by the fact that my government thinks it appropriate to spy on people, monitoring their phone calls — to whom we speak and when — among other tactics, all in the supposed service of the national interest.

That any government thinks it legitimate to so closely monitor its people is indicative of the inherent sickness of nation-states, made worse in the modern era, where the power to intrude into the most private aspects of our lives is more possible than ever, thanks to the data-gathering techniques made feasible by technological advance.

That said, I also must admit to a certain **nonchalance** in the face of the recent revelations about the National Security Agency's snooping into phone records, and the dust-up over the leaking of the NSA's program by Ed Snowden. And as I tried to figure out why I wasn't more animated upon hearing the revelations — and, likewise, why so many others were — it struck me. Those who are especially chapped about the program, about the very concept of their government keeping tabs on them — in effect profiling them as potential criminals, as terrorists — are almost entirely those for whom shit like this is new: people who have never before been presumed criminal, up to no good, or worthy of suspicion.

In short, they are mostly white. And male. And middle-class or above. And most assuredly not Muslim.

And although I too am those things, perhaps because I work mostly on issues of racism, white privilege and racial inequity — and because my mentors and teachers have principally been people of color, for whom things like this are distressingly familiar — the latest confirmation that the U.S. is far from the nation we were sold as children is hardly Earth-shattering. After all, it is only those who have had the relative luxury of remaining in a child-like, innocent state with regard to the empire in which they reside who can be driven to such distraction by something that, compared to what lots of folks deal with every day, seems **pretty weak tea**.

As Yasuragi, a blogger over at Daily Kos reminded us last week:

> (This is) the nation that killed protesters at Jackson and Kent State Universities…The nation that executed Fred Hampton in his bed, without so much as a warrant. The nation that still, still, still holds Leonard Peltier in prison. The nation that supported Noriega, the Shah, Trujillo, and **dozens of other fascist monsters** who did nothing but fuck over their own people and their neighbors. The nation of Joseph **McCarthy** and his current-day descendants. The nation that allows **stop-and-frisk**.
>
> Before all that: The nation that enforced **Jim Crow** laws. Before that, the nation that built itself on **slavery** and the slave trade. And before all of that, the nation that nearly succeeded in the **genocide** of this continent's indigenous peoples.
>
> So **why are you** so **surprised** that our government is gathering yottabytes of data on our phone calls?

Let's be clear, it's not that the NSA misdeeds, carried out by the last two administrations, are no big deal. They're completely indefensible, no matter the efforts of the apologists for empire — from the corporate media to President Obama to Dick Cheney — to legitimize them. A free people should not stand for it.

Problem is, we are not a free people and **never have been**, and therein lies the rub.

Afro-Pessimism

The only ethical demand is one that calls for the end of the world itself – the system of violent antagonisms means solving for contingent violence only reifies white supremacy and the liberal biopolitical state

Wilderson 10, Frank B Wilderson is a professor at UC Irvine, "Red, White, and Black: Cinema and Structure of US Antagonisms," NN

Leaving aside for the moment their state of mind, it would seem that the structure, that is to say the rebar, or better still the grammar of their demands—and, by extension, the grammar of their suffering—was indeed an ethical grammar. Perhaps their grammars are **the only ethical grammars available** to modern politics and modernity writ large, for they draw our attention **not to the way in which space and time are used and abused** by enfranchised and violently powerful interests, **but to the violence that underwrites the modern world's capacity to think, act, and exist spatially and temporally.** The violence that robbed her of her body and him of his land provided the stage upon which other violent and consensual dramas could be enacted. Thus, they would have to be crazy, crazy enough to **call not merely the actions of the world to account but to call the world itself to account**, and to account for them no less! The woman at Columbia was not demanding to be a participant in an unethical network of distribution: she was not demanding a place within capital, a piece of the pie (the demand for her sofa notwithstanding). Rather, she was articulating a triangulation between, on the one hand, the loss of her body, the very dereliction of her corporeal integrity, what Hortense Spillers charts as the transition from being a being to becoming a "being for the captor" (206), the drama of value (the stage upon which surplus value is extracted from labor power through commodity production and sale); and on the other, the corporeal integrity that, once ripped from her body, fortified and extended the corporeal integrity of everyone else on the street. She gave birth to the commodity and to the Human, yet she had neither subjectivity nor a sofa to show for it. In her eyes, the world—and **not its myriad discriminatory practices, but the world itself**—was unethical. And yet, the world passes by her without the slightest inclination to stop and disabuse her of her claim. Instead, it calls her "crazy." And to what does the world attribute the Native American man's insanity? "He's crazy if he thinks he's getting any money out of us"? Surely, that doesn't make him crazy. Rather it is simply an indication that **he does not have a big enough gun.** What are we to make of a world that **responds to the most lucid enunciation of ethics with violence**? What are the foundational questions of the ethico-political? Why are these questions so scandalous that they are rarely posed politically, intellectually, and cinematically—unless they are posed obliquely and unconsciously, as if by accident? Return Turtle Island to the "Savage." Repair the demolished subjectivity of the Slave. Two simple sentences, thirteen simple words, and the structure of U.S. (and perhaps **global) antagonisms would be dismantled.** An "ethical modernity" would no longer sound like an oxymoron. From there we could busy ourselves with **important conflicts that have been promoted to the level of antagonisms: class struggle, gender conflict, immigrants rights.** When pared down to thirteen words and two sentences, one cannot but wonder why questions that **go to the heart of the ethico-political,** questions of political ontology, are so unspeakable in intellectual meditations, political broadsides, and even socially and politically engaged feature films. Clearly they can be spoken, even a child could speak those lines, so they would pose no problem for a scholar, an activist, or a filmmaker. And yet, what is also clear—if the filmographies of socially and politically engaged directors, the archive of progressive scholars, and the plethora of Left-wing broadsides are anything to go by—is that what can so easily be spoken is now (five hundred years and two hundred fifty million Settlers/Masters on) so ubiquitously unspoken that these two simple sentences, these thirteen words not only render their speaker "crazy" but become themselves **impossible to**

imagine. Soon it will be forty years since radical politics, Left-leaning scholarship, and socially engaged feature films began to speak the unspeakable. In the 1960s and early 1970s the questions asked by radical politics and scholarship were not "Should the U.S. be overthrown?" or even "Would it be overthrown?" but rather when and how—and, for some, what—would come in its wake. Those steadfast in their conviction that there remained a discernable quantum of ethics in the U.S. writ large (and here I am speaking of everyone from Martin Luther King, Jr., prior to his 1968 shift, to the Tom Hayden wing of SDS, to the Julian Bond and Marion Barry faction of SNCC, to Bobbie Kennedy Democrats) were accountable, in their rhetorical machinations, to the paradigmatic zeitgeist of the Black Panthers, the American Indian Movement, and the Weather Underground. Radicals and progressives could deride, reject, or chastise armed struggle mercilessly and cavalierly with respect to tactics and the possibility of "success," but they could not dismiss revolution-as-ethic because **they could not make a convincing case**—by way of a paradigmatic analysis—that the U.S. was an ethical formation and still hope to maintain credibility as radicals and progressives. Even Bobby Kennedy (a U.S. attorney general and presidential candidate) mused that the law and its enforcers had no ethical standing in the presence of Blacks.1 One could (and many did) acknowledge America's strength and power. This seldom, however, rose to the level of an ethical assessment, but rather remained an assessment of the so-called "balance of forces." The political discourse of Blacks, and to a lesser extent Indians, circulated too widely to credibly wed the U.S. and ethics. The raw force of COINTELPRO put an end to this trajectory toward a possible hegemony of ethical accountability. Consequently, the power of Blackness and Redness to pose the question—and the power to pose the question is the greatest power of all—**retreated as did White radicals and progressives who "retired" from struggle.** The question's echo lies buried in the graves of young Black Panthers, AIM Warriors, and Black Liberation Army soldiers, or in prison cells where so many of them have been rotting (some in solitary confinement) for ten, twenty, thirty years, and at the **gates of the academy where the "crazies" shout at passers-by**. Gone are not only the young and vibrant voices that **affected a seismic shift on the political landscape**, but also the intellectual protocols of inquiry, and with them a spate of feature films that became authorized, if not by an unabashed revolutionary polemic, then certainly by a **revolutionary zeitgeist**. Is it still possible for a dream of unfettered ethics, **a dream of the Settlement and the Slave estate's destruction**, to manifest itself at the ethical core of cinematic discourse, when this dream is no longer a constituent element of political discourse in the streets nor of intellectual discourse in the academy? The answer is "no" in the sense that, as history has shown, what cannot be articulated as political discourse in the streets is doubly foreclosed upon in screenplays and in scholarly prose; but "yes" in the sense that in even the most taciturn historical moments such as ours, the grammar of Black and Red suffering breaks in on this foreclosure, albeit like the somatic compliance of hysterical symptoms—it registers in both cinema and scholarship as symptoms of awareness of the structural antagonisms. Between 1967 and 1980, we could think cinematically and intellectually of Blackness and Redness as having the coherence of full-blown discourses. But from 1980 to the present, Blackness and Redness manifests only in the rebar of cinematic and intellectual (political) discourse, that is, as unspoken grammars. This grammar can be discerned in the cinematic strategies (lighting, camera angles, image composition, and acoustic strategies/design), even when the script labors for the spectator to imagine **social turmoil through the rubric of conflict** (that is, a rubric of problems that can be posed and conceptually solved) as opposed to the rubric of antagonism (**an irreconcilable struggle between entities**, or positionalities, the resolution of which is not dialectical but entails **the obliteration of one of the positions**). In other words, even when films narrate a story in which Blacks or Indians are beleaguered with problems that the script insists are conceptually coherent (usually having to do with poverty or the absence of "family values"), the non-narrative, or cinematic, strategies of the film often disrupt this coherence by posing the irreconcilable questions of Red and Black political ontology—or non-ontology. The grammar of antagonism **breaks in on the mendacity of conflict**. Semiotics and linguistics teach us that when we speak, our grammar goes unspoken. Our grammar is assumed. It is the structure through which the labor of speech is possible. Likewise, the grammar of

political ethics—the grammar of assumptions regarding the ontology of suffering—which underwrite Film Theory and political discourse (in this book, discourse elaborated in direct relation to radical action), and which underwrite cinematic speech (in this book, Red, White, and Black films from the mid-1960s to the present) is also unspoken. This notwithstanding, film theory, political discourse, and cinema assume an ontological grammar, a structure of suffering. And the structure of suffering which film theory, political discourse, and cinema assume crowds out other structures of suffering, **regardless of the sentiment of the film or the spirit of unity mobilized by the political discourse in question**. To put a finer point on it, structures of ontological suffering stand in antagonistic, rather then conflictual, relation to one another (despite the fact that antagonists themselves may not be aware of the ontological positionality from which they speak). Though this is perhaps the most controversial and out-of-step claim of this book, it is, nonetheless, the foundation of the close reading of feature films and political theory that follows.

Blackness is always already hyper visible – the affirmative misses the point – some bodies will never have the access to anonymity because of the black aesthetic – the affirmative allows for whiteness to remain invisible and renders blackness as an attractor to violence

Yancy 13, George Yancy is a professor of philosophy at McAnulty College who focuses primarily on issues of social justice, "Walking While Black in the 'White Gaze'"
http://opinionator.blogs.nytimes.com/2013/09/01/walking-while-black-in-the-white-gaze/?_r=0**, NN**

My point here is to say that the white gaze is global and historically mobile. And its origins, while from Europe, are deeply seated in the making of America.∂ Black bodies in America continue to be reduced to their surfaces and to stereotypes that are constricting and false, that often force those black bodies to move through social spaces in ways that put white people at ease. We fear that our black bodies incite an accusation. We move in ways that help us to survive the procrustean gazes of white people. We dread that those who see us might feel the irrational fear to stand their ground rather than "finding common ground," a reference that was made by Bernice King as she spoke about the legacy of her father at the steps of the Lincoln Memorial.∂ The white gaze is also hegemonic, historically grounded in material relations of white power: it was deemed disrespectful for a black person to violate the white gaze by looking directly into the eyes of someone white. The white gaze is also ethically solipsistic: within it only whites have the capacity of making valid moral judgments.∂ Even with the unprecedented White House briefing, our national discourse regarding Trayvon Martin and questions of race have failed to produce a critical and historically conscious discourse that sheds light on what it means to be black in an anti-black America. If historical precedent says anything, this failure will only continue. **Trayvon Martin, like so many black boys and men, was under surveillance** (etymologically, "to keep watch"). Little did he know that on Feb. 26, 2012, that he would enter a space of social control and bodily policing, a kind of Benthamian panoptic nightmare that would truncate his being as suspicious; a space where he was, paradoxically, both invisible and yet hypervisible.∂ "**I am invisible, understand, simply because people [in this case white people] refuse to see me." Trayvon was invisible to Zimmerman, he was not seen as the black child that he was, trying to make it back home with Skittles and an iced tea**. **He was not seen as having done nothing wrong, as one who dreams and hopes.∂ As black, Trayvon was already known and rendered invisible.** His childhood and humanity were already criminalized as part of a white racist narrative about black male bodies. **Trayvon needed no introduction: "Look, the black; the criminal!"**

Blackness operates on an ontological register – it is impossible to make blackness acceptable within civil society

Yancy 08, George Yancy is a professor of philosophy at McAnulty College who focuses primarily on issues of social justice, "Black Bodies, White Gazes: The Continuing Significance of Race " https://books.google.com/books?id=VQAfAAAAQBAJ&pg=PA21&lpg=PA21&dq=%22On+the+elevator,+my+Black+body+is+ontologically+mapped,+its+coordinates+lead+to+that+which+is+always+immediately%22&source=bl&ots=11lq3QEyJG&sig=m116eKlVHrBtPWmV9AOYb9v0fZU&hl=en&sa=X&ved=0CCAQ6AEwAGoVChMI7u-OluGUxgIVhz2MCh0F3gf2#v=onepage&q=%22On%20the%20elevator%2C%20my%20Black%20body%20is%20ontologically%20mapped%2C%20its%20coordinates%20lead%20to%20that%20which%20is%20always%20immediately%22&f=false**, NN**

On the elevator, my Black body is ontologically mapped, its cordinates lead to that which is always immediately visible: the Black surface. The point here is that **the Black body in relation to the white gam appears in the form of a sheer exteriority, implying that the Black body "shows up," makes itself known M terms of its Black surface**. There is only the visible, the concrete, the seen, all there, all at once: a single Black thing, =individuated, threatening, ominous, Black. The white woman thinks she takes no part in this construction: she acts the name of the serious... She apparently fails to see how he identity is shot through in terms of how she construe. me. This failure is to be expected given how white privilege renders invisible, indeed, militates against the recognition of various whitely ways of being-in-the-world. Sullivan notes that the 'habits of white privilege do not merely go noticed. They actively thwart the process of conscious reflation on them, which allows them to seem non-existent even as they continue to function..l.

Reform is just reactionary conservatism – their unwillingness to accept that systemic antagonisms cannot be fixed means their project is permeated with whiteness

Haritaworn et al. 14, Haritaworn is an assistant professor of sociology, "Queer Necropolitics," http://www.deanspade.net/wp-content/uploads/2014/05/Necropolitics-Collection-Article-Final.pdf**, NN**

Critical race theorists have supplied the concept of 'preservation through∂ transformation' to describe the neat trick that civil rights law performed in this∂ dynamic (Harris 2007: 1539-1582; Siegel1997: 1111-1148). In the face of∂ significant resistance to conditions of subjection, **law reform tends to provide just∂ enough transfonnation to stabilize and preserve status quo conditions**. In the case∂ of widespread black rebellion against white supremacy in the US, civil rights law∂ and colourblind constitutionalism have operated as formal reforms that masked a∂ pe11wtuation of the status quo of violence against and exploitation of black people.∂ **Explicit exclusionary policies and practices became officially forbidden, yet the∂ disu·ibution of life chances remained the same or worsened with the growing∂ racialized concentration of wealth in the US**, the dismantling of social welfare, and∂ the explosion of criminalization that has developed in the same period as the new∂ logic of race neutrality has declared fairness and justice achieved. Lesbian and gay∂ rights politics' reproduction of the Inythology of anti-discrimination law and the∂ non-stop invocation of'equal rights' frameworks by lesbian and gay rights politics∂ marks an .investment in the legal structures of anti-blackness that have emerged in∂ the wake of Brown. The emergence of the demand for LGBT inclusive hate crime∂ laws and the accomplishment of the Matthew Shepard and james Byrd, Jr. Hate∂ Crimes Prevention Act as a

highly lauded federal legislative 'win' for lesbian and ∂ gay rights offers a particularly blatant site of the anti-blackness central to lesbian∂ and gay rights -literally an investment in the expansion ofcriminalization as a core∂ claim and desire of this purported 'frecdom'. 9 In the context of the foundational∂ nature of slavery in US political formation, it is perhaps not surprising to see a∂ political formation of white 'gay and lesbian Americans' articulate a demand fOr∂ fi-eedom that is contingent on the literal caging of black people.∂ The fantasy that fOrmal legal equality is all that is needed to eliminate∂ homophobia and transphobia is harmfUl not only because it participates in the antiblack∂ US progress narrative that civil rights law reforms resolved anti-blackness in∂ the US (thus any remaining suffering or disparity is solely an issue of 'personal∂ responsibility'), 1IJ but also because it constructs an agenda that is harmful to black∂ queer and trans people and other queer and trans people experiencing violent∂ systems mobilized by anti-blackness. Formal marriage rights will not help poor∂ people, people vvhose kids will be stolen by a racially targeted child welfire system∂ regardless of whether or not they can get married, people who do not have∂ immigration status or health benefits to share with a spouse if they had one, people∂ who have no property to pass on to their partners, or people who have no need to∂ be shielded from estate tax. In fact, the current wave of same-sex marriage advocacy∂ emerges at the same rime as another pro-marriage trend, the push by the right wing∂ to reverse feminist wins that had made marriage easier to get out of and the Bushera∂ development of marriage promotion programmes (continued by Obama)∂ targeted at women on welfare (Adams and Coltrane 2007: 17-34; Alternatives to∂ l\!larriage Project 2007; Coltrane and Adams 2003: 363-372; Feld, Rosier and∂ Manning 2002: 173-183; Pear and Kirkpatrick 2007; Rector and Pardue 2004).∂ The explicitly anti-black focus of the attacks on welfare and the mobilization of∂ racialized-genclered images to do this go hand in hand with the pro-marriage gay∂ rights frame that similarly invests in notions of 'personal responsibility', and∂ racializecl--gendered family formation norm enforcement. The articulation of a∂ desire for legal inclusion in the explicitly anti-black, anti-poor governance regime∂ of marriage, and the centralization of marriage rights as the most resourced equality∂ claim of gay and lesbian rights politics, affirms its alliance with anti-blackness.∂ It is easy to imagine other queer political interventions that would take a∂ different approach to concerns about parental rights, child custody and other∂ family law problems. Such approaches centre the experiences of queers facing the∂ worst violence of family law, those whose problems -will not be resolved by samesex∂ marriage - parents in prison, parents facing deportation, parents with∂ disabilities, youth in foster care and juvenile punishment systems, parents whose∂ children have been removed because of 'neglect' clue to their poverty. The choice∂ of seeking marriage rights, like the choice to pursue hate crime laws rather than∂ decriminalization, the choice to pursue the Uniting American Families Act 11∂ rather than opposing immigration enforcement and the war on terror, the choice∂ to pursue military service rather than demilitarization, is a choice to pursue a place∂ fOr white gay and lesbian people in constitutively anti-black legal structures.

Racial equality under the law is not only impossible but the attempts to re-create and shift the puzzle pieces of civil society mean slavery is reinvented in different ways

Woan 11, Master of Arts in Philosophy, Politics, and Law in the Graduate School of Binghamton University, “The value of resistance in a permanently white, civil society,” http://gradworks.umi.com/14/96/1496586.html NN

Stokely Carmichael and Charles V. Hamilton, in then influential Black Power, describe reformist strategies as "playing ball" with the white man. They argue that reform plays the white man's

game in order to gain rights, i.e. appeal to a white supremacist government that is the precise agent responsible for the original harms they are seeking to alleviate.9 While this may very well result in the granting of new rights previously denied, it maintains a hierarchical system between whites and nonwhites, since the latter will have to continue to appeal to the former to ask for rights they never should have been denied in the first place. This places the former in a position of power to accept or deny such requests. Thus, in Carmichael and Hamilton's view, attempting to resist white supremacy by working within white supremacist institutions maintains a dangerous system of power relations that lock in place the hierarchy between whites and nonwhites. / It is unfortunate enough that members of minority groups face public and private racial discrimination. It is worse, however, to place the burden of combating this discrimination on them. What Carmichael and Hamilton aptly point out is that the hierarchy between races mentioned above is what is responsible for this undue burden. There is not only the constant physical struggle of protesting, writing letters, and being dragged through litigation that can often get expensive, but there is the psychological struggle as well. Why am I not worthy of equal protection under the law? Why is it that others do not even notice the disparate impact of the law? Or, even worse, why is it that those who do notice, seem to not care? / What inevitably comes with these types of reformist strategies is an emotional struggle, namely, an inferiority complex that makes the victimized individual stop and wonder — who put the white man in charge of my body? **Appeals to the federal government to repeal discriminatory acts that deny minorities rights becomes analogous to asking whites to eliminate such policies and to allow others access to the same rights they enjoy every day**. The racial state becomes in charge of what nonwhites can and cannot do, and when nonwhites continue to go to whites asking them to pass certain policies, nonwhites further legitimate this system of power relations. It is difficult to see how true equality can be achieved wider such a system. / B. Missing the Root Cause: The Racial State / Omi and Winant further support this claim and explain that **it is not merely individual policies passed by the United States federal government that are racist, but that racial oppression is a structure of the government itself.**10 They describe this structure as the "racial state" to show that the state does not merely support racism, but rather, it supports the concept of race itself. As will be discussed later in this paper, Omi and Winant explain how the state is the agent that has defined race, and that this definition has evolved over time, to maintain the concept of race and support racism. / Given the existence of the racial state, Omi and Winant critique reformist strategies as falling short of achieving normative goals of eliminating racism since the reforms merely get re-equilibriated. A look at the history of racial victories in the United States further supports this critique. Racial victories for one minority were often made possible only with the entrapment of another racial minority. For example, while many celebrate the racial victory of the 1954 Brown v. Board decision, many fail to see this happened the same year as Operation Wetback, which shifted the racial discrimination to a different population, removing close to one million illegal immigrants, mostly Mexicans, from the United States.11 Moreover, soon after the ratification of the Fourteenth and Fifteenth Amendments granting citizenship and suffrage to Blacks. Congress chose to deny citizenship to Chinese immigrants.12 In 1941, shortly after the establishment of the Committee on Fair Employment Practices permitted Blacks into defense industries, Japanese Americans were taken from their homes and sent off to internment camps. Pei-te Lien argues that **all of these "coincidences" support critiques of reformist strategies that merely target individual policies, since without challenging the racial state as a whole, even the elimination of these individual policies will fail to eliminate racism, as they will simply replicate themselves or shift elsewhere and target racial minorities in different ways.1**4 / C. Separatist Movements / This helps to explain why political activists began adopting

other more revolutionary strategies. Contrary to Martin Luther King Jr. and many of his followers during the Civil Rights Movement, the Black Power Movement emerged and began advocating for more separatist strategies that rejected making reformist appeals to the United States federal government. In his speech "The Ballot or the Bullet," Malcolm X argued: / When you take your case to Washington D.C., you're taking it to the criminal who's responsible: it's like miming from the wolf to the fox. They're all in cahoots together. They all work political chicanery and make you look like a chump before the eyes of the world. Here you are walking around in America, getting ready to be drafted and sent abroad, like a tin soldier, and when you get over there, people ask you what you are fighting for, and you have to stick your tongue in your cheek. No, take Uncle Sam to court, take him before the world. / Critics of reformist strategies, such as Malcolm X, understood the **United States as being inherently racial and thus incapable of reform.** They use the "coincidences" listed above as evidence to support this claim. They view the United States federal government as a racial state that will merely continue to define race in new and more modernized ways, ensuring the permanence of racism with the passage of new policies supporting these definitions. This is why they believe reformists are wrong to attack individual policies, rather than the racial state itself. / For example, the legal enforcement of a racially discriminatory housing covenant may have been justified due to a racist belief that members of the minority race restricted from acquiring title within that neighborhood is inferior to the Caucasian race. More specifically, one might support said covenant because one believes the inferiority of that minority race and the potential they might become your neighbor will result in a decrease in the fair market value of your property. After vigorous ongoing protests from civil rights activists, that particular law enforcing those covenants might get repealed. However, the reason for the repeal of that law might arise not from an ethical epiphany, but rather an economic rationale in which the homeowner is shown his property value will remain unaffected, or perhaps even increase. Thus, that particular act may get repealed, but the policymakers responsible for its original draft will still be in power, and will maintain the same beliefs that motivated that piece of legislation in the first place. Because there has been no ethical realization of the injustice in their conduct, the chances remain high that they will construct new, apparently different but equally discriminatory policies that will force activists to join forces once again and continue the same fight. / This is why it is not the individual policies, but the government itself that is the "preeminent site of racial conflict."17 Omi and Winant's proposal of the "racial state" views the government as "inherently racial," meaning it does not simply intervene in racial conflicts, but it is the locus of racial conflict.18 In addition to structuring conceptions of race, the government in the United States is in and of itself racially structured.19 State policies govern racial politics, heavily influencing the public on how race should be viewed. The ways in which it does so changes over time, often taking on a more invisible nature. For example, Omi and Winant describe the racial state as treating race in different ways throughout different periods of time, first as a biologically based essence, and then as an ideology, etc. These policies are followed by racial remedies offered by government institutions, in response to political pressures and in accordance to these different treatments of race, varying in degree depending on the magnitude of the threats those pressures pose to the order of society. Notable achievements during the Civil Rights Movement have served as a double-edged sword. While the reformist strategies utilized during that period helped make certain advances possible, it also drove other more overt expressions of racism underground. These more invisible instantiations of racial injustice are far more difficult to identify than its previously more explicit forms. Praising these victories risks giving off the illusion that the fight is over and that racism is a description of the past. / For example, the ratification of the Fifteenth Amendment gave off the illusion that all citizens

thereafter had equal access to the right to vote. Those who supported its ratification now felt entitled to the moral credentials necessary to legitimize their ability to express racially prejudiced attitudes.21 For example, voter turnout today remains relatively low for Asian-Americans, and many blame this on cultural differences between Asians and Americans.22 Asian-Americans are labeled as apathetic in the political community and they themselves have been attributed the blame for relatively low representation of Asian-Americans in the government today.23 This however, ignores the way in which other more invisible practices serve to obstruct Asian-Americans from being able to exercise their right to vote. / Research by the United States Election Assistance Commission by the Eagleton Institute of Politics at Rutgers University, for example, indicates that restrictive voter identification requirements have effectively served to disenfranchise Asian Pacific Islanders (APIs) from voting.24 In the 2004 election, researchers found APIs in states where voters were required to present proper identification at the polls were 8.5% less likely to vote.25 This study confirmed that voter ID requirements prevented a large number of APIs from voting.26 / Voter suppression tactics also play a large role in the disenfranchisement of APIs. According to a Voter Intimidation and Vote Suppression briefing paper by Demos, a national public policy center, an estimated 50 Asian Americans were selectively challenged at the polls in Alabama during August of 2004, as being ineligible to vote due to insufficient English-speaking skills.27 Many states have allowed this selective challenging of voters to take place at the polls, resulting in a feeling of fear, intimidation, and embarrassment among APIs, driving them away from the polls. / The danger in treasuring monumental victories such as the ratification of the Fifteenth Amendment becomes apparent when people interpret this ratification as an indication that voting discrimination is no longer a problem, and that if the voter turnout of Asian-Americans is consistently low, it must be because they are politically apathetic or disinterested in American ideals. Because they originally supported the ratification of the amendment, whites can now feel as if they have the moral credentials to make conclusions such as the cultural differences rationale. The same can be seen after courts ordered the desegregation of public schools and after affirmative action programs became more widespread. People began assuming African-Americans now had an equal opportunity for education and that if they did not succeed, it must be a reflection of their intelligence or work-ethic, failing to see the ways the problem has not been solved, but rather disguised itself in other costumes, such as tracking programs in schools or teachers who view their presence as merely "affirmative action babies" and expect them to fail. / One might ask, then, why can we not change the racial state one policy at a time? Perhaps one could first work to gain the right to vote, and then move on to combat discriminatory identification requirements and political scare tactics. It would not seem entirely implausible to assume that the success of individual piecemeal reforms within the government could eventually result in a transformation of the institution itself. However, simply eliminating discriminatory policies is insufficient for an overhaul of a racial institution. / Understanding the motivating reasons for the elimination of individual racist policies is a critical factor in determining the success of a movement. While one justification for passing the Fifteenth Amendment might consist of arguments in favor of equality and exposing racial injustice, another justification might involve maintaining order and minimizing disruption, which is important to the federal government and its ability to run smoothly. Thus, the government often seeks out ways to normalize society through eliminating disruptions to preserve order. When those being denied certain rights grow significantly discontent, they rebel and become disruptions to the functioning of white, civil society. This can take the form of civil disobedience, such as protests, peaceful demonstrations, petitions, letters to the government, etc., or more revolutionary measures, such as damaging government offices or violently harassing officials to acknowledge

the injustices and change policy. / All of these measures, however peaceful or violent, disrupt society. A town cannot run smoothly if protesters are filling up the streets or blocking frequently-used road paths, and most certainly cannot run smoothly if town halls are being lit on fire. Thus, in order to return to the desired homeostasis, those in power may often compromise and offer to rectify the situation at hand by granting rights to individuals through changes in legislation in order to appease them and "eliminate" the disruption (the protests, demonstrations, etc.). The lack of effort made towards protecting these rights bolsters Bell's argument that these reforms serve more of a symbolic value rather than functional. If still operating under the racial state, these piecemeal reforms will fail to solve the original racial injustices in the long term, as they will only succeed in establishing a new unstable equilibrium, only to be followed with the replication of new racial problems.28 These new problems will once again create resentment, generate protest, and the cycle will begin to replicate itself, ensuring the permanence of racism. Omi and Winant term this cycle of continuous disruption and restoration of order as the trajectory of racial politics.29 This trajectory supports the treatment of racism as inevitable since even if the racial state mitigates racial disruption over a particular policy and "restores order," another policy based off a new definition of race will emerge triggering another racial disruption, continuing this cycle of racial politics

The only option for the slave is to reclaim its own death through self-destruction – the black must become the suicide bomber of civil society and use itself as a weapon to break down white structures – it is the most powerful form of necropower to remain incoherent to the liberal interpretations of the sovereign

Sexton 10, Jared Sexton, professor at UC Irvine, "People-of-Color-Blindness: Notes on the Afterlife of Slavery" NN

The final object of contemplation in Mbembe's rewriting of Agam- ben's rewriting of Foucault's biopolitics is the fin de siècle figure of resis- tance to the colonial occupation of Palestine: the (presumptively male) suicide bomber. The slave, "able to demonstrate the protean capabilities of the human bond through music and the very body that was supposedly possessed by another," is thus contrasted subtly with the colonized native, whose "body is transformed into a weapon, not in a metaphorical sense but in a truly ballistic sense" — a cultural politics in lieu of an armed struggle in which "to large extent, resistance and self-destruction are synonymous."35 Resistance to slavery in this account is self-preservative and forged by way of a demonstration of the capabilities of the human bond, whereas resis- tance to colonial occupation is self-destructive and consists in a demonstra- tion of the failure of the human bond, the limits of its protean capabilities. One could object, in an empiricist vein, that the slave too resists in ways that are quite nearly as self-destructive as an improvised explosive device and that the colonial subject too resists through the creation and perfor- mance of music and the stylization of the body, but that would be to miss the symptomatic value of Mbembe's theorization.¶ Mbembe describes suicide bombing as being organized by "two apparently irreconcilable logics," "the logic of martyrdom and the logic of survival," and it is the express purpose of the rubric of necropolitics to meditate upon this unlikely logical convergence.36 However, there is a discrepancy at the heart of the enterprise. Rightly so, the theorization of necropolitics as a friendly critique of Agamben's notion

of bare life involves an excursus on certain "repressed topographies of cruelty," including, first of all, slavery, in which "the lines between resistance and suicide, sacri- fice and redemption, martyrdom and freedom become blurred."37 **Yet, as noted, the logic of resistance-as-suicide-as-sacrifice-as-martyrdom is for Mbembe epitomized by the presumptively male suicide bomber at war with colonial occupation, "the most accomplished form of necropower**" in the contemporary world, rather than Hartman's resistant female slave, Celia, engaged in close-quarters combat with the sexual economy of slave society,¶ "the emblematic and paradoxical figure of the state of exception."38 Why the unannounced transposition? Because the restricted notion of homo sacer — alongside the related notions of bare life and the state of exception— is being used in confusion to account for the effects of the biopolitics of race too generally. The homo sacer, "divested of political status and reduced to bare life," is distinguished not by her vulnerability to a specific form or degree of state-sanctioned violence but by her social proscription from the honor of sacrifice.39 The homo sacer is banned from the witness-bearing function of martyrdom (from the ancient Greek martys, "witness"). Her suffering is therefore imperceptible or illegible as a rule. It is against the law to recognize her sovereignty or self-possession.

Narcissism Kritik

1nc

Social media nurtures narcissistic self-inflation – the plan intensifies narcissistic capabilities

Buffardi and Campbell '08 [Laura and Keith, psychology professors at the University of Georgia, "Narcissism and Social Networking Web Sites", Personality and Social Psychology Bulletin, 6/3/2008, http://www.swaraunib.com/indra/Sistem%20informasi/TPB/Narcissism%20and%20Social.pdf // date accessed 6/26/15 K.K]

Narcissism refers to a personality trait reflecting a grandiose and inflated self-concept. Specifically, narcissism is associated with positive and inflated self-views of agentic traits like intelligence, power, and physical attractiveness (Brown & Zeigler-Hill, 2004; Campbell, Rudich, & Sedikides, 2002; Gabriel, Critelli, & Ee, 1994; John & Robins, 1994) as well as a pervasive sense of uniqueness (Emmons, 1984) and entitlement (Campbell, Bonacci, & Shelton, 2004).2 From a basic trait perspective, narcissism is associated with a high degree of extraversion/agency and a low level of agreeableness or communion (e.g., Miller & Campbell, 2008; Paulhus & Williams, 2002). A similar high agency pattern (and negative but typically small/nonsignificant correlations with communion) is also found in narcissists' explicit self-conceptions (Campbell, Foster, & Finkel, 2002), implicit self-conceptions (Campbell, Bosson, Goheen, Lakey, & Kernis, 2007), and implicit motives (Carroll, 1987). Central to most theoretical models of narcissism in social-personality psychology is the use of social relationships in part to regulate self-esteem, self-concept positivity, or narcissistic esteem (Campbell, 1999; Campbell, Brunell, & Finkel, 2006; Morf & Rhodewalt, 2001; Raskin, Novacek, & Hogan, 1991). Narcissists do not focus on interpersonal intimacy, warmth, or other positive long-term relational outcomes, but they are very

skilled at both initiating relationships and using relationships to look popular, successful, and high in status in the short term. Narcissists participate in this dynamic "self-construction" (Morf & Rhodewalt, 2001) via relationships to constantly affirm[s] their narcissistic esteem. It has been suggested that this process is due, at least partially, to narcissists' dispositional impulsivity (Vazire & Funder, 2006). How does this narcissistic self-regulation or self-construction (we use these terms largely interchangeably) operate in the context of interpersonal relationships more specifically? First, narcissism is linked positively with relationship formation. For example, narcissism is associated with being (a) liked in initial interactions (Oltmanns, Friedman, Fiedler, & Turkheimer, 2004; Paulhus, 1998), (b) perceived as a leader (Brunell, Gentry, Campbell, & Kuhnert, 2006), (c) perceived as exciting (Foster, Shrira, & Campbell, 2003), (d) socially confident (Brunell, Campbell, Smith, & Krusemark, 2004), (e) entertaining (Paulhus, 1998), and (f) able to obtain sexual partners (Foster, Shrira, & Campbell, 2006). Second, narcissism is associated negatively with seeking out or creating long-term relationships that have qualities of closeness, empathy, or emotional warmth (Brunell et al., 2004; Campbell, 1999; Campbell & Foster, 2002). Third, narcissism is associated with using relationships as an opportunity or forum for self enhancement. For example, narcissists brag and show off (Buss & Chiodo, 1991), perform well when there is an opportunity for public glory (Wallace & Baumeister, 2002), and seek attractive, high-status, "trophy" romantic partners (Campbell, 1999). Others in relationships with narcissistic individuals, however, often suffer in the longer term as narcissism is linked to aggressiveness (Bushman & Baumeister, 1998), psychological control (Campbell, Foster, et al., 2002), game playing and infidelity (Campbell, Foster, et al., 2002; Le, 2005; Schmitt & Buss, 2001), and lower levels of commitment (Campbell & Foster, 2002). Indeed, longitudinal research on relationships has found that the initial likeability associated with narcissism fades and is even reversed in the longer term (Paulhus, 1998). Similarly, longitudinal research in clinical settings has found a significant long-term consequence of narcissism is the suffering of close others (Miller, Campbell, & Pilkonis, 2007). How might narcissism operate in a social networking Web site? These online communities may be an especially fertile ground for narcissists to self-regulate via social connections for two reasons. First, narcissists function well in the context of shallow (as opposed to emotionally deep and committed) relationships. Social networking Web sites are built on the base of superficial "friendships" with many individuals and "sound-byte" driven communication between friends (i.e., wallposts). Certainly, individuals use social networking sites to maintain deeper relationships as well, but often the real draw is the ability to maintain large numbers of relationships (e.g., many users have hundreds or even thousands of "friends"). Second, social networking Web pages are highly controlled environments (Vazire & Gosling, 2004). Owners have complete power over self-presentation on Web pages, unlike most other social contexts. In particular, one can use personal Web pages to select attractive photographs of oneself or write self-descriptions that are self-promoting. Past research shows that narcissists, for example, are boastful and eager to talk about themselves (Buss & Chiodo, 1991), gain esteem from public glory (Wallace & Baumeister, 2002), are prevalent on reality television (Young & Pinsky, 2006), and enjoy looking at themselves on videotape and in the mirror (Robins & John, 1997). Personal Web pages should present a similar opportunity for self-promotion. In sum, given the behaviors of narcissists in offline relationship contexts, we expect that they will take advantage of the new virtual arena for pursuing a similar self-regulatory agenda. This will include relatively high levels of relationship formation, self-promoting images of oneself, and an overall agentic (rather than communal) self-presentation

Narcissim is fundamentally antihumanistic – it creates the possibility for domination and when applied to foreign policy, nuclear war

Merton 65 [Thomas Merton, Card cut from the 2002 re-published version, Graduate of Columbia University, Zen Buddhist, "Love and Living", https://books.google.com/books?id=uHzsRR3OID4C&pg=PT168&lpg=PT168&dq=%22narcissism%22+AND+%22nuclear+war%22&source=bl&ots=co3kHrdfmY&sig=5heCqgYA1Xeczg5SWeXMYYvjRc4&hl=en&sa=X&ei=bNGRVbLWIcvj-QGFqoHYCA&ved=0CCcQ6AEwAg#v=onepage&q&f=false, ZS]

The key problem of humanism is the problem of that authentic love which unites man to man not simply in a symbiotic and semiconscious relationship but as person to person in the authentic freedom of a mutual gift. Here we come[s] to the question of narcissism, which is closely related to, in fact inseparable from, alienation. Alienated man is also narcissistic, because his love is regressive, undeveloped, infantile. It would be interesting here to examine the possible analogies between this modem psychological concept and the traditional Christian idea of sin, particularly original sin. They have much in common. The narcissistic personality is centered on the affirmation of itself and its own limited needs and desires. It sees other things and persons as real only insofar as they can be related to these selfish desires. Psychology and anthropology today teach us that primitive forms of religion, particularly those which make considerable use of magic rites, tend to be associated with narcissistic thinking. But we must not place all the blame only on primitive people. Narcissism remains a problem of enormous magnitude, especially in our highly developed modem technological culture, which abounds in its own hidden forms of magic thinking, superstition, ritualism. Our sophisticated modem culture has its taboos, its obsessions, and all that goes into the formation of the neuroses, individual and collective, which so often take the place of formal religion in the minds of men. Erich Fromm even goes so far as to say that much of modem society and its attitudes can be summed up as highly organized narcissism. This fascination with the self as a central and sole reality to be satisfied and catered to in everything is at the root of all idolatrous forms of religion. Narcissism spontaneously projects itself onto an idol from which the satisfaction of its desires is thought to be obtained by magic, by cajoling, by manipulation, or by ruse. The characteristic syndrome of narcissistic thought ends in this immersion in magic and quasi-omnipotent contemplation of the idol, which is the projection of a selfish and infantile need for love or power. Though narcissism can be efficiently employed in building up the immense power structures of industrial and military states, **it is essentially antihumanistic**. **Narcissism is hostile to the true development of man's capacity to love.** Narcissism **alienates man and his society in a slavery to things—money, machines, commodities, luxuries, fashions, and pseudoculture.** The idolatrous mentality of narcissism produces a fake humanism which cynically deifies man in order to cheat him of his human fulfillment and enslave him to the "rat race" for riches, pleasure, and power. Erich Fromm has pointed out the deadly alliance between the narcissistic mentality of mass-man and the destructive tendencies of a society that grows rich on the prospect of **nuclear war.**

The alternative embraces N.S.A surveillance as a means to deconstruct anonymity – policing of social media removes the drive for narcissistic tendencies

Rubenfeld 14 (Jed Rubenfeld is a professor of constitutional law at Yale Law School and co-author of the forthcoming book "The Triple Package.", "Privacy vs. anonymity in the NSA

debate", http://www.dallasnews.com/opinion/sunday-commentary/20140117-privacy-vs.-anonymity-in-the-nsa-debate.ece, ZS)

In the world of data gathering, the key concept for setting limits on government surveillance is privacy. But in the world of data mining, the key is anonymity. Anonymity is very different from privacy. Walking the streets, you're not in private, but you may be anonymous if no one recognizes you. If you go into a store and pay cash for a book, what you're doing isn't private, but, again, you may be anonymous, and that anonymity might be very important to you. When people post material on a freely accessible website, their postings are public, not private — but they may well be anonymous. In such contexts, the question is not whether privacy should be honored but whether anonymity should be protected. Anonymity can in some circumstances be a great freedom, worthy of protection. In others, it can encourage vicious behavior and enable crime. Solving the riddle of anonymity is the central question of the brave new digital world, even if our courts haven't quite yet caught on. When the government engages in data mining, anonymity deserves protection. Consider telephone metadata — the dates, times and numbers of phone calls. Is that information "private"? Thirty-five years ago, in Smith vs. Maryland, the Supreme Court said no. All that information is already turned over to and collected by phone companies. Hence the government can capture metadata without any constitutional restrictions — with no warrant, no probable cause, not even reasonable suspicion. Smith makes intuitive sense to many people. Your metadata is not nearly as personal as your communication content — what you say on the phone or what is said to you. Moreover, even the most personal information is no longer private if exposed enough to others. If you take your laundry to dry cleaners, you can't complain when they report what they see to the government (which is what phone companies are doing when they turn over your metadata to the NSA). Under Smith, William Pauley, the federal judge who found in December that the NSA metadata program did not violate privacy rights, was absolutely right. But Richard Leon, the federal judge who ruled against the NSA program last month, was also right. Leon saw that there was something wrong in the NSA program apart from whether metadata is private. Given the way cellphones are used today, Leon concluded, metadata can be mined to produce a live-streaming digital portrait of an individual's entire life. "Records that once would have revealed a few scattered tiles of information about a person," he wrote, "now reveal an entire mosaic — a vibrant and constantly updating picture of the person's life." For example, well-mined metadata could reveal a "wealth of detail" about a person's "familial, political, professional, religious and sexual associations." This is an anonymity problem: The NSA cannot create a dossier on you from your metadata unless it knows that you made the calls the agency is looking at. The privacy question is all about data gathering: Should the NSA have access to nationwide metadata? The right answer to that question is yes. But identities should be hidden. Suppose the NSA had access to all the metadata of every call a certain person made over the past five years — but didn't know who that person was. Instead, the NSA knew only that individual "H4QQ9F" made the calls in question. In that world, there's no Orwellian surveillance. But suppose that individual H4QQ9F made a call to a known al-Qaeda safe house in Yemen. Then the NSA should be permitted to pierce the veil of anonymity and find out who H4QQ9F is. Privacy was key when the question was whether, or how much of, our private lives could be monitored or recorded. That train has left the station. Today, most of us allow a great deal of our lives to be monitored and recorded — whenever we use a search engine, for example, or buy something online. Even the content of our private communications, such as emails and chats, is now routinely exposed to and stored by people at Facebook or Google. The key question isn't how to keep information about us from getting out into the world; it's how that information can

be used. The word "privacy" doesn't appear in the Constitution. Privacy jurisprudence was a creation of the 20th century. Today, we need a new jurisprudence of anonymity. We need laws and technologies that can break through anonymity when people commit crimes or torts online. But we also need laws and technologies that will protect anonymity when government engages in 21st-century data mining.

Framework

The role of the ballot is to evaluate the most in round ethical advocacy this is paramount for debate- First is fairness- It's key to neg ground and flex, as well as checks back aff side bias such as first and last speech and picks the focus of the debate. Second is education- Omitting the implications of the affirmative opens the floodgates to recreate the flawed policy. There is no high school equivalent of k education, which means default to education over fairness impacts

2nc Ext: Impact

Pathological narcissism collapses dignity and crisis

Giroux '12 [Henry Giroux currently holds the Global TV Network Chair Professorship at McMaster University in the English and Cultural Studies Department. "Disposable Youth, Racialized Memories, and the Culture of Cruelty", Taylor and Francis, 2012, K.K]

As public life is commercialized, commodified, and policed, the pathology of individual entitlement and narcissism erodes those public spaces in which the conditions for conscience, decency, self-respect, and dignity take root. The crisis of youth is symptomatic of the current crisis of democracy, and as such it hails us as much for the threat that it poses as for the challenges and possibilities it invokes. We need to liberate the discourse and spaces of freedom from the plague of consumer narcissism and casino capitalism. We need to engage the struggle to restore and build those public spaces where democratic ideals, visions, and social relations can be nurtured and developed as part of a genuinely meaningful education and politics. The time has come to take seriously the words of the great abolitionist Frederick Douglass, who bravely argued that freedom is an empty abstraction if people fail to act. Douglass insisted that "If there is no struggle there is no progress. Those who profess to favor freedom and yet depreciate agitation, are men [and women] who want crops without plowing up the ground, they want rain without thunder and lightning. They want the ocean without the awful roar of its many waters" (Douglass 1985: 204). The deteriorating state of American youth, especially poor white and minority youth, may be the most serious challenge the United States will face in the 21st century. It is a struggle that demands a new understanding of politics, one that is infused not only with the language of critique, but also with the discourse of possibility. It is a struggle that requires us to think beyond

the given, imagine the unimaginable, and combine the lofty ideals of democracy with a willingness to fight for its realization. But this is not a fight we can win through individual struggles or isolated political movements. It demands new modes of solidarity, new political organizations, and a powerful, expansive social movement capable of uniting diverse political interests and groups. It is a struggle that is as educational as it is political, one that must build upon self-awareness as well as historical consciousness. At the present moment, it is a struggle whose call for reflection and action is as necessary as it is urgent. Those of us who believe in justice and human rights need to liberate the discourse and spaces of freedom from the plagues of militarism and consumer narcissism and struggle to build those public spaces where democratic ideals, visions, and social relations can be nurtured and developed as part of a genuinely meaningful education and politics—we need along with young people to build those spaces, social relations, and institutions that give meaning to both the promise of democracy and a future in which young people matter.

Narcissistic self-promotion necessitates self-annihilation and *sustains Privacy Fatigue – turns the internal link*

Buffardi and Campbell '08 [Laura and Keith, psychology professors at the University of Georgia, "Narcissism and Social Networking Web Sites", Personality and Social Psychology Bulletin, 6/3/2008, http://www.swaraunib.com/indra/Sistem%20informasi/TPB/Narcissism%20and%20Social.pdf // date accessed 6/26/15 K.K]

This research has several implications both for narcissism and for Web page–mediated social interaction. First, the expression of narcissism on social networking Web sites is very similar to its expression in other social domains. Narcissism is related to a higher number of social relationships, self-promoting self-presentation, and the perception of having a large number of agentic characteristics. Only two differences were found between narcissism in the "real world" and in online communities. The narcissists' quotes were judged to be less entertaining than those of non narcissists. This contrasts with the general finding that narcissists are entertaining at first meeting (e.g., Paulhus, 1998). We would like to point out that our incongruent finding, however, is not sufficient to suggest that narcissists' ability to entertain others in social contexts is subdued online. Rather, it is possible that narcissists' quotes are actually quite entertaining to peers who know their context but not to our RA coders who were not acquainted with the profile owners personally. Based on our findings, it is also plausible that the extent to which the narcissists' quotes and other aspects of their profiles were viewed as selfpromoting directly interfered with the quotes' entertainment and cleverness. Therefore, additional research in which the entertainment value of narcissists' full profile, rather than just the quotes section, is necessary to determine whether narcissists are less entertaining in online contexts than in face-to-face ones. In addition, the narcissists were judged to be more attractive based on their photos than the non narcissists. This differs from past research that has found no differences in attractiveness between narcissists and nonnarcissists (Gabriel et al., 1994). Why this disparity? One possible explanation is that narcissists' self-enhancing biases might lead them to consider more attractive pictures of themselves to be more accurate representations of their true likenesses. We would also speculate, however, that the narcissists appear to be attractive on Facebook because they are strategically posting pictures that make them appear sexy and attractive; this was not an option in Gabriel and

colleagues' (1994) study. Second, unacquainted raters are able to judge Web page owners' narcissism with some level of accuracy. This finding is consistent with those concerning the accuracy of Big Five personality perception based on viewing Web pages (Marcus et al., 2006; Vazire & Gosling, 2004) in that Web page viewers can make reasonable estimates of personality from Web pages. More broadly, the correlation between self-reported narcissism and strangers' impressions of narcissism also suggests that at least on Facebook, less narcissistic participants do not seem to be using the Internet as a channel for self-promotion. That is, more modest, less self-centered individuals in real life do not appear to be self-promoting to the degree that narcissists are on the Web. Third, our results indicate that, as in past Big Five research (Marcus et al., 2006), viewers use Web page content to form impressions of the Web page owner's level of narcissism. We found that the quantity of social interaction and main photo in particular played a significant role in this process. Conversely, the raters seemed to have omitted other Facebook features that related to NPI scores, including self-promoting information about the self, self-promoting quotes, less entertaining quotes, main photo sexiness, and fun pictures, in their impression formation. Finally, narcissistic impression ratings related (falsely) to three profile characteristics that did not correlate with owners' narcissistic personality, namely, quantity of information listed about the self, self-promoting pictures, and provocative pictures. This pattern in raters' errors of omission and commission preliminarily suggests that individuals who have experience with social networking Web sites, as presumably our raters did, may have developed a system or script (Schank & Abelson, 1977) for viewing such Web pages and efficiently gleaning important information for the context of a social networking community. It is understandable, if this is the case, that an individual's social capital (how popular and socially active they are quantifiably) and attractiveness, which both can be determined quickly, play[s] an important role in impression formation, as our results suggest. In contrast, the somewhat more difficult to decipher written information, such as that in the About Me and Quotes sections, may be secondary.

Net Delusion K

1NC

Cyber utopianism strengthens authoritarians and fails to address the negatives of the internet- results in tainted policy making

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 26-8; kdf)

Most disturbingly, a dangerous self-negating prophecy is at work here: The more Western policymakers talk up the threat that bloggers pose to authoritarian regimes, the more likely those regimes are to limit the maneuver space where those bloggers operate. In some countries, such politicization may be for the better, as blogging would take on a more explicit political role, with bloggers enjoying the status of journalists or human rights defenders. But in many other countries such politicization may only stifle the nascent Internet movement, which could have been be far more successful if its advocacy were limited to pursuing social rather than political ends. Whether the West needs to politicize blogging and view it as a natural extension of dissident activity is certainly a complex question that merits broad public debate. But the fact that this debate is not happening at the moment does not mean that blogging is not being politicized, often to the point of no return, by the actions-as well as declarations-of Western policymakers. Furthermore, giving in to cyber-utopianism may preclude policymakers from considering a whole range of other important questions. Should they applaud or bash technology companies who choose to operate in authoritarian regimes, bending their standard procedures as a result? Are they harbingers of democracy, as they claim to be, or just digital equivalents of Halliburton and United Fruit Company, cynically exploiting local business opportunities while also strengthening the governments that let them in? How should the West balance its sudden urge to promote democracy via the Internet with its existing commitments to other nondigital strategies for achieving the same objective, from the fostering of independent political parties to the development of civil society organizations? What are the best ways of empowering digital activists without putting them at risk? If the Internet is really a revolutionary force that could nudge all authoritarian regimes toward democracy, should the West go quiet on many of its other concerns about the Internet-remember all those fears about cyberwar, cybercrime, online child pornography, Internet piracy-and strike while the iron is still hot? These are immensely difficult questions; they are also remarkably easy to answer incorrectly. While the Internet has helped to decrease costs for nearly everything, human folly is a commodity that still bears a relatively high price. The oft-repeated mantra of the open source movement-"fail often, fail early" -produces excellent software, but it is not applicable to situations where human lives are at stake. Western policymakers, unlike pundits and academics, simply don't have the luxury of getting it wrong and dealing with the consequences later. From the perspective of authoritarian governments, the costs of exploiting Western follies have significantly decreased as well. Compromising the security of just one digital activist can mean compromising the security-names, faces, email addresses-of everyone that individual kuows. Digitization of information has also led to its immense centralization: One stolen password now opens data doors that used not to exist (just how many different kinds of data-not to mention people-would your email password give access to, if compromised?). Unbridled cyber-utopianism is an expensive ideology to maintain because authoritarian governments don't stand still and there are absolutely no guarantees they won't find a way to turn the Internet into a powerful tool of oppression. If, on closer examination, it turns out that the Internet has also empowered the secret police, the censors, and the propaganda offices of a modern authoritarian regime, it's quite likely that the process of democratization will become harder, not easier. Similarly, if the Internet has dampened the level of antigovernment sentiment-because people have acquired access to cheap and almost infinite digital entertainment or because they feel they need the government to protect them from the lawlessness of cyberspace-it certainly gives the regime yet another source of legitimacy. If the Internet is reshaping the very nature and culture of antigovernment resistance and dissent, shifting it away from real-world practices and toward anonymous virtual spaces, it will also have significant consequences for the scale and tempo of the protest movement, not all of them positive. That's an insight that has been lost on most observers of the political power of the Internet. Refusing to acknowledge that the Web can actually strengthen rather than undermine authoritarian regimes is extremely irresponsible and ultimately results in bad policy, if only

because it gives policymakers false confidence that the only things they need to be doing are proactive-rather than reactive-in nature. But if, on careful examination, it turns out that certain types of authoritarian regimes can benefit from the Internet in disproportionally more ways than their opponents, the focus of Western democracy promotion work should shift from empowering the activists to topple their regimes to countering the governments' own exploitation of the Web lest they become even more authoritarian. There is no point in making a revolution more effective, quick, and anonymous if the odds of the revolution's success are worsening in the meantime.

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p xi-xiv; kdf)

But there is more to Obama's silence than just his reasonable attempt to present himself as anti-Bush. Most likely his silence is a sign of an extremely troubling bipartisan malaise: the growing Western fatigue with the project of promoting democracy. The project suffers not just from bad publicity but also from a deeply rooted intellectual crisis. The resilience of authoritarianism in places like Belarus, China, and Iran is not for lack of trying by their Western "partners" to stir things up with an expectation of a democratic revolution. Alas, most such Western initiatives flop, boosting the appeal of many existing dictators, who excel at playing up the threat of foreign mingling in their own affairs. To say that there is no good blueprint for dealing with modern authoritarianism would be a severe understatement. Lost in their own strategizing, Western leaders are pining for something that has guaranteed effectiveness. Many of them look back to the most impressive and most unambiguous triumph of democracy in the last few decades: the peaceful dissolution of the Soviet Union. Not surprisingly-and who can blame them for seeking to bolster their own self-confidence?-they tend to exaggerate their own role in precipitating its demise. As a result, many of the Western strategies tried back then, like smuggling in photocopiers and fax machines, facilitating the flow of samizdat, and supporting radio broadcasts by Radio Free Europe and the Voice of America, are given much more credit than they deserve. Such belated Cold War triumphalism results in an egregious logical fallacy. Since the Soviet Union eventually fell, those strategies are presumed to have been extremely effective-in fact, crucial to the whole endeavor. The implications of such a view for the future of democracy promotion are tremendous, for they suggest that large doses of information and communications technology are lethal to the most repressive of regimes. Much of the present excitement about the Internet, particularly the high hopes that are pinned on it in terms of opening up closed societies, stems from such selective and, at times, incorrect readings of history; rewritten to glorify the genius of Ronald Reagan and minimize the role of structural conditions and the inherent contradictions of the Soviet system. It's for these chiefly historical reasons that the Internet excites so many seasoned and sophisticated decision makers who should really know better. Viewing it through the prism of the Cold War, they endow the Internet with nearly magical qualities; for them, it's the ultimate cheat sheet that could help the West finally defeat its authoritarian adversaries. Given that it's the only ray of light in an otherwise dark intellectual tunnel of democracy promotion, the Internet's prominence in . future policy planning is assured. And at first sight it seems like a brilliant idea. It's like Radio Free Europe on steroids. And it's cheap, too: no need to pay for expensive programming, broadcasting, and, if everything else fails, propaganda. After all, Internet users can discover the truth about the horrors of their regimes, about the secret charms of democracy; and about the irresistible appeal of universal human rights on their own, by turning to search engines like Google and by following their more politically savvy friends on social networking sites like Facebook. In other words, let them tweet, and they will tweet their way to freedom. By this logic, authoritarianism becomes unsustainable once the barriers to the free flow of information are removed. If the Soviet Union couldn't survive a platoon of pamphleteers, how can China survive an army of bloggers? · It's hardly surprising, then, that the only place where the West (especially the United States) is still unabashedly eager to promote democracy is in cyberspace. The Freedom Agenda is out; the Twitter Agenda is in. It's deeply symbolic that the only major speech about freedom given by a senior member of the Obama administration was Hillary Clinton's speech on Internet freedom in January 2010. It looks like a safe bet: Even if the Internet won't bring democracy to China or Iran, it can still make the Obama administration appear to have the most technologically savvy foreign policy team in history. The best and the brightest are now also the geekiest. The Google Doctrine-the enthusiastic belief in the liberating power of technology accompanied by the irresistible urge to enlist Silicon Valley start-ups in the global fight for freedom-is of growing appeal to many policymakers. In fact, many of them are as upbeat about

the revolutionary potential of the Internet as their colleagues in the corporate sector were in the late 1990s. What could possibly go wrong here? As it turns out, quite a lot. Once burst, stock bubbles have few lethal consequences; **democracy bubbles, on the other hand, could easily lead to carnage**. The idea that the Internet favors the oppressed rather than the oppressor is marred by what I call cyber-utopianism: a naive belief in the emancipatory nature of online communication that rests on a stubborn refusal to acknowledge its downside. It stems from the starryeyed digital fervor of the 1990s, when former hippies, by this time ensconced in some of the most prestigious universities in the world, went on an argumentative spree to prove that the Internet could deliver what the 1960s couldn't: boost democratic participation, trigger a renaissance of moribund communities, strengthen associational life, and serve as a bridge from bowling alone to blogging together. And if it works in Seattle, it must also work in Shanghai. Cyber-utopians ambitiously set out to build a new and improved United Nations, only to end up with a digital Cirque du Solei!. Even if true-and that's a gigantic "if" -their theories proved difficult to adapt to non-Western and particularly nondemocratic contexts. Democratically elected governments in North America and Western Europe may, indeed, see an Internet-driven revitalization of their public spheres as a good thing; logically, they would prefer to keep out of the digital sandbox-at least as long as nothing illegal takes place. Authoritarian governments, on the other hand, have invested so much effort into suppressing any form offree expression and free assembly that they would never behave in such a civilized fashion. The early theorists of the Internet's influence on politics failed to make any space for the state, let alone a brutal authoritarian state with no tolerance for the rule of law or dissenting opinions. Whatever book lay on the cyber-utopian bedside table in the early 1990s, it was surely not Hobbes's *Leviathan*. Failing to anticipate how authoritarian governments would respond to the Internet, cyber-utopians did not predict how useful it would prove for propaganda purposes, how masterfully dictators would learn to use it for surveillance, and how sophisticated modern systems of internet censorship would become. Instead most cyber-utopians stuck to a populist account of how technology empowers the people, who, oppressed by years of authoritarian rule, will inevitably rebel, mobilizing themselves through text messages, Facebook, Twitter, and whatever new tool comes along next year. (The *people,* it must be noted, really liked to hear such theories.) Paradoxically, in their refusal to see the downside of the new digital environment, cyber-utopians ended up belittling the role of the Internet, refusing to see that it penetrates and reshapes all walks of political life, not just the ones conducive to democratization.

The impact turns the aff—they are a marketing ploy that ostracizes the periphery all the while diminishing the motives and coherence of the movements they attempt to help

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 303-305; kdf)

As the Internet makes technological fixes cheaper, the temptation to apply them even more aggressively and indiscriminately also grows. And the easier it is to implement them, the harder it is for internal critics to argue that such fixes should not be tried at all. In most organizations, low cost-and especially in times of profound technological change is usually a strong enough reason to try something, even if it makes little strategic sense at the time. When technology promises so much and demands so little, the urge to find a quick fix is, indeed, irresistible. Policymakers are not immune to such temptations either. When it's so easy and cheap to start a social networking site for activists in some authoritarian country, a common gut reaction is usually "It should be done:' That cramming personal details of all dissidents on one website and revealing connections among them may outweigh the benefits of providing activists with a cheaper mode of communication only becomes a concern retroactively. In most cases, if it can be done, it will be done. URLs will be bought, sites will be set up, activists will be imprisoned, and damning press releases will be issued. Likewise, given the undeniable . mobilization advantages of the mobile phone, one may start singing its praises before realizing that it has also provided the secret police with a unique way to track and even predict where the protests may break out.

The problem with most technological fixes is that they come with costs unknown even to their fiercest advocates. Historian of science Lisa Rosner argues that "technological fixes, because they attack symptoms but don't root out causes, have unforeseen and deleterious side effects that may be worse than the social problem they were intend d to solve." It's hard to disagree, even more so in the case of the Internet. When digital activism is presented as the new platform for campaigning And organizing, one begins to wonder whether its side effects-further disengagement between traditional oppositional forces who practice real politics, no matter how risky and boring, and the younger generation, passionate about campaigning on Facebook and Twitter-would outweigh the benefits of cheaper and leaner communications. If the hidden costs of digital activism include the loss of coherence, morality, or even sustainability of the opposition movement, it may not be a solution worth pursuing. Another problem with technological fixes is that they usually rely on extremely sophisticated solutions that cannot be easily understood by laypeople. The claims of their advocates are, thus, almost impenetrable to external scrutiny, while their ambitious promise-the elimination of some deeply entrenched social ill-makes such scrutiny, even If It IS possible, hard to mount. Not surprisingly, the dangerous fascination with solving previously intractable social problems with the help of technology allows vested interests to disguise what essentially amounts to advertising for their commercial products in the language of freedom and liberation. It's not by coincidence that those who are most vocal in proclaiming that the most burning problems of internet freedom can be solved by breaking a number of firewalls happen to be the same people who develop and sell the technologies needed to break them. Obviously they have no incentive to point out that one needs to be fighting other, non-technological problems or to disclose problems with their own technologies. The founders of Haystack rarely bothered to highlight the flaws in their own software-let alone disclose that it was still in the testing stage-and the media never bothered to ask. As the Haystack fiasco so clearly illustrates, even being able to ask the right technological questions requires a good grasp of the sociopolitical context in which a given technology *is* supposed to be used. This points to another commonly overlooked problem: Our growing commitment to the instruments we use to implement "technological fixes" for what may be important global problems greatly restrains our ability to criticize those who own the rights to those fixes. Every new article or book about a Twitter Revolution is not a triumph of humanity; it is a triumph of Twitter's marketing department. In fact, Silicon Valley's marketing geniuses may have a strong interest in misleading the public about the similarity between the Cold War and today: The Voice of America and Radio Free Europe still enjoy a lot of goodwill with policymakers, and having Twitter and Facebook be seen as their digital equivalents doesn't hurt their publicity.

Thus the alt- Vote negative to reject the affirmative for engaging in cyber-utopianism

The affirmative operates under a flawed methodology—paying attention to the tool instead of the environment- voting negative allows for a realistic assessment the internet

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p xv-xvii; kdf)

It was tempting to throw my hands up in despair and give up on the Internet altogether. But this would have been the wrong lesson to draw from these disappointing experiences. Similarly, it would be wrong for Western policymakers to simply dismiss the Internet as a lost cause and move on to bigger, more important issues. Such digital defeatism would only play into the hands of authoritarian governments, who would be extremely happy to continue using it as both a carrot (keeping their populace entertained) and a stick (punishing those who dare to challenge the official line). Rather, the lesson to be drawn is that the Internet is here to stay, it will continue growing in importance, and those concerned with democracy promotion need not only grapple with it but also come up with mechanisms and procedures to ensure that another tragic blunder on the scale of Abu Ghraib will never happen in cyberspace. This is not a far-fetched scenario. How hard is it to imagine a site like Face book inadvertently disclosing the private information of activists in Iran or China, tipping off governments to secret connections between the activists and the Western funders? To be truly effective, the West needs to do more than just cleanse itself of cyber-utopian bias and adopt a more realist posture. When it comes to concrete steps to promote democracy, cyber-utopian convictions often give rise to an equally flawed approach that I dub "Internet-centrism:' Unlike cyber-utopianism, Internet-

centrism is not a set of beliefs; rather, it's a philosophy of action that informs how decisions, including those that deal with democracy promotion, are made and how long-term strategies are crafted. While cyber-utopianism stipulates what has to be done, Internet-centrism stipulates how it should be done. Internet-centrists like to answer every question about democratic change by first reframing it in terms of the Internet rather than the context in which that change is to occur. They are often completely oblivious to the highly political nature of technology, especially the Internet, and like to come up with strategies that assume that the logic of the Internet, which, in most cases, they are the only ones to perceive, will shape every environment than it penetrates rather than vice versa. While most utopians are Internet-centrists, the latter are not necessarily utopians. In fact, many of them like to think of themselves as pragmatic individuals who have abandoned grand theorizing about utopia in the name of achieving tangible results. Sometimes, they are even eager to acknowledge that it takes more than bytes to foster, install, and consolidate a healthy democratic regime. Their realistic convictions, however, rarely make up for their flawed methodology, which prioritizes the tool over the environment, and, as such, is deaf to the social, cultural, and political subtleties and indeterminacies. Internet-centrism is a highly disorienting drug; it ignores context and entraps policymakers into believing that they have a useful and powerful ally on their side. Pushed to its extreme, it leads to hubris, arrogance, and a false sense of confidence, all bolstered by the dangerous illusion of having established effective command of the Internet. All too often, its practitioners fashion themselves as possessing full mastery of their favorite tool, treating it as a stable and finalized technology, oblivious to the numerous forces that are constantly reshaping the Internet not all of them for the better. Treating the Internet as a constant, they fail to see their own responsibility in preserving its freedom and reining in the ever-powerful intermediaries, companies like Google and Facebook. As the Internet takes on an even greater role in the politics of both authoritarian and democratic states, the pressure to forget the context and start with what the Internet allows will only grow. All by itself, however, the Internet provides nothing certain. In fact, as has become obvious in too many contexts, it empowers the strong and disempowers the weak. It is impossible to place the Internet at the heart of the enterprise of democracy promotion without risking the success of that very enterprise. The premise of this book is thus very simple: To salvage the Internet's promise to aid the fight against authoritarianism, those of us in the West who still care about the future of democracy will need to ditch both cyber-utopianism and Internet-centrism. Currently, we start with a flawed set of assumptions (cyber-utopianism) and act on them using a flawed, even crippled, methodology (Internet-centrism). The result is what I call the Net Delusion. Pushed to the extreme, such logic is poised to have significant global consequences that may risk undermining the very project of promoting democracy. It's a folly that the West could do without. Instead, we'll need to opt for policies informed by a realistic assessment of the risks and dangers posed by the Internet, matched by a highly scrupulous and unbiased assessment of its promises, and a theory of action that is highly sensitive to the local context, that is cognizant of the complex connections between the Internet and the rest of foreign policymaking, and that originates not in what technology allows but in what a certain geopolitical environment requires. In a sense, giving in to cyber-utopianism and Internet-centrism is akin to agreeing to box blindfolded. Sure, every now and then we may still strike some powerful blows against our authoritarian adversaries, but in general this is a poor strategy if we want to win. The struggle against authoritarianism is too important of a battle to fight with a voluntary intellectual handicap, even if that handicap allows us to play with the latest fancy gadgets.

Alt Extension/ AT: Perm

Cyber utopianism strengthens authoritarians and fails to address the negatives of the internet- results in tainted policy making

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 26-8; kdf)

Most disturbingly, a dangerous self-negating prophecy is at work here: The more Western policymakers talk up the threat that bloggers pose to authoritarian regimes, the more likely those

regimes are to limit the maneuver space where those bloggers operate. In some countries, such politicization may be for the better, as blogging would take on a more explicit political role, with bloggers enjoying the status of journalists or human rights defenders. But in many other countries such politicization may only stifle the nascent Internet movement, which could have been be far more successful if its advocacy were limited to pursuing social rather than political ends. Whether the West needs to politicize blogging and view it as a natural extension of dissident activity is certainly a complex question that merits broad public debate. But the fact that this debate is not happening at the moment does not mean that blogging is not being politicized, often to the point of no return, by the actions-as well as declarations-of Western policymakers. Furthermore, giving in to cyber-utopianism may preclude policymakers from considering a whole range of other important questions. Should they applaud or bash technology companies who choose to operate in authoritarian regimes, bending their standard procedures as a result? Are they harbingers of democracy, as they claim to be, or just digital equivalents of Halliburton and United Fruit Company, cynically exploiting local business opportunities while also strengthening the governments that let them in? How should the West balance its sudden urge to promote democracy via the Internet with its existing commitments to other nondigital strategies for achieving the same objective, from the fostering of independent political parties to the development of civil society organizations? What are the best ways of empowering digital activists without putting them at risk? If the Internet is really a revolutionary force that could nudge all authoritarian regimes toward democracy, should the West go quiet on many of its other concerns about the Internet-remember all those fears about cyberwar, cybercrime, online child pornography, Internet piracy-and strike while the iron is still hot? These are immensely difficult questions; they are also remarkably easy to answer incorrectly. While the Internet has helped to decrease costs for nearly everything, human folly is a commodity that still bears a relatively high price. The oft-repeated mantra of the open source movement-"fail often, fail early" -produces excellent software, but it is not applicable to situations where human lives are at stake. Western policymakers, unlike pundits and academics, simply don't have the luxury of getting it wrong and dealing with the consequences later. From the perspective of authoritarian governments, the costs of exploiting Western follies have significantly decreased as well. Compromising the security of just one digital activist can mean compromising the security-names, faces, email addresses-of everyone that individual kuows. Digitization of information has also led to its immense centralization: One stolen password now opens data doors that used not to exist (just how many different kinds of data-not to mention people-would your email password give access to, if compromised?). Unbridled cyber-utopianism is an expensive ideology to maintain because authoritarian governments don't stand still and there are absolutely no guarantees they won't find a way to turn the Internet into a powerful tool of oppression. If, on closer examination, it turns out that the Internet has also empowered the secret police, the censors, and the propaganda offices of a modern authoritarian regime, it's quite likely that the process of democratization will become harder, not easier. Similarly, if the Internet has dampened the level of antigovernment sentiment-because people have acquired access to cheap and almost infinite digital entertainment or because they feel they need the government to protect them from the lawlessness of cyberspace-it certainly gives the regime yet another source of legitimacy. If the Internet is reshaping the very nature and culture of antigovernment resistance and dissent, shifting it away from real-world practices and toward anonymous virtual spaces, it will also have significant consequences for the scale and tempo of the protest movement, not all of them positive. That's an insight that has been lost on most observers of the political power of the Internet. Refusing to acknowledge that the Web can actually strengthen rather than undermine authoritarian regimes is extremely irresponsible and ultimately results in bad policy, if only because it gives policymakers false confidence that the only things they need to be doing are proactive-rather than reactive-in nature. But if, on careful examination, it turns out that certain types of authoritarian regimes can benefit from the Internet in disproportionally more ways than their opponents, the focus of Western democracy promotion work should shift from empowering the activists to topple their regimes to countering the governments' own exploitation of the Web lest they become even more authoritarian. There is no point in making a revolution more effective, quick, and anonymous if the odds of the revolution's success are worsening in the meantime.

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 318-; kdf)

The way forward is not to keep coming up with new theories until they match one's existing biases about what the logic of the Internet is or should be like. Instead, one should seek to come up with a philosophy of action to help design policies that have no need for such logic as their inputs. But while it's becoming apparent that policymakers need to abandon both cyber-utopianism and Internet-centrism, if only for the lack of accomplishment, it is not yet clear what can take their place. What would an alternative, more down-to-earth approach to policymaking in the digital age-let's call it cyber-realism-look like? Here are some preliminary notes that future theorists may find useful. Instead of trying to build a new shiny pillar to foreign policy, cyberrealists would struggle to find space for the Internet in existing pillars, not least on the desks of regional officers who are already highly sensitive to the political context in which they operate. Instead of centralizing decision making about the Internet in the hands of a select few digerati who know the world of Web 2.0 start-ups but are completely lost in the world of Chinese or Iranian politics, cyber-realists would defy any such attempts at centralization, placing as much responsibility for Internet policy on the shoulders of those who are tasked with crafting and executing regional policy. Instead of asking the highly general, abstract, and timeless question of"How do we think the Internet changes closed societies?" they would ask "How do we think the Internet is affecting our existing policies on country X?" Instead of operating in the realm of the utopian and the ahistorical, impervious to the ways in which developments in domestic and foreign policies intersect, cyber-realists would be constantly searching for highly sensitive points of interaction between the two. They would be able to articulate in concrete rather than abstract terms how specific domestic policies might impede objectives on the foreign policy front. Nor would they have much tolerance for a black-and-white color scheme. As such, while they would understand the limitations of doing politics online, they wouldn't label all Internet activism as either useful or harmful based solely on its outputs, its inputs, or its objectives. Instead, they would evaluate the desirability of promoting such activism in accordance with their existing policy objectives. Cyber-realists wouldn't search for technological solutions to problems that are political in nature, and they wouldn't pretend that such solutions are even possible. Nor would they give the false impression that on the Internet concerns over freedom of expression trump those over energy supplies, when this is clearly not the case. Such acknowledgments would only be factual rather than normative statements-it may well be that concerns over freedom of expression should be more important than concerns over energy supplies-but cyber-realists simply would not accept that any such radical shifts in the value system of the entire policy apparatus could or should happen under the pressure of the Internet alone. Now would cyber-realists search for a silver bullet that could destroy authoritarianism-or even the next-to-silver-bullet, for the utopian dreams that such a bullet can even exist would have no place in their conception of politics. Instead, cyber-realists would focus on optimizing their own decision-malting and learning processes, hoping that the right mix of bureaucratic checks and balances, combined with the appropriate incentive structure, would identify wicked problems before they are misdiagnosed as tame ones, as well as reveal how a particular solution to an Internet problem might disrupt solutions to other, nonInternet problems. Most important, **cyber-realists wouldn't allow themselves to get dragged into the highly abstract and high-pitched debates about whether the Internet undermines or strengthens democracy**. Instead, they would accept that the Internet is poised to produce different policy outcomes in different environments and that a policymaker's chief objective is not to produce a thorough philosophical account of the internet's impact on society at large but, rather, to make the Internet ally in achieving specific policy objectives. Cyber-realists would acknowledge that by continuing to flirt with Internet-centrism and cyber-utopianism, policymakers are playing risky game. Not only do they squander plenty of small-scale opportunities for democratization that the Internet has to offer because look from too distant a perspective, but they also inadvertently bolden dictators and turn everyone who uses the Internet in authoritarian states into unwilling prisoners. Cyber-realists would argue this is a terribly expensive and ineffective way to promote democracy; worse, it threatens to corrupt or crowd out cheaper and more effective alternatives. For them, the promotion of democracy would be too · important an activity to run it out of a Silicon Valley lab with a reputation for exotic experiments. Above all, cyber-realists would believe that world made of bytes may defy the law of gravity but absolutely nothing dictates that it should also defy the law of reason.

AT: Perm

The perm is no different than driving fuel efficient cars to save the environment—it only delays the inevitable—The aff conceals the political and social underpinnings of the problems they try to address—this aggravates the situation and results in infinite technological fixes

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 305-8; kdf)

Perhaps most disturbingly, reframing social problems as a series of technological problems distracts policymakers from tackling problems that are non-technological in nature and cannot be reframed. As the media keep trumping the role that mobile phones have played in fueling economic growth in Africa, policymakers cannot afford to forget that innovation by itself will not rid African nations of the culture of pervasive corruption. Such an achievement will require a great deal of political will. In its absence, even the fanciest technology would go to waste. The funds for the computerization of Sudan would remain unspent, and computers would remain untouched, as long as many of the region's politicians are "more used to carrying AK-47s and staging ambushes than typing on laptops," as a writer for the Financial Times so aptly put it. . On the contrary, when we introduce a multipurpose technology like a mobile phone into such settings, it can often have side effects that only aggravate existing social problems. Who could have predicted that, learning of the multiple money transfer opportunities offered by mobile banking, corrupt Kenyan police officers would demand that drivers now pay their bribes with much-easier-to-conceal transfers of air time rather than cash? In the absence of strong political and social institutions, technology may only precipitate the collapse of state power, but it is easy to lose sight of real-world dynamics when one is so enthralled by the supposed brilliance of a technological fix. Otherwise policymakers risk falling into unthinking admiration of technology as panacea which the British architect Cedric Price once ridiculed by pondering, "Technology is the answer, but what was the question?" When technological fixes fail, their proponents are usually quick to suggest another, more effective technological fix as a remedy-and fight fire with fire. That is, they want to fight technology's problems with even more technology. This explains why we fight climate change by driving cars that are more fuel-efficient and protect ourselves from Internet surveillance by relying on tools that encrypt our messages and conceal our identity. Often this only aggravates the situation, as it precludes a more rational and comprehensive discussion about the root causes of a problem, pushing us to deal with highly visible and inconsequential symptoms that can be cured on the cheap instead. This creates a never-ending and extremely expensive cat-and-mouse game in which, as the problem gets worse, the public is forced to fund even newer, more powerful tools to address it. Thus we avoid the search for a more effective nontechnological solution that, while being more expensive (politically or financially) in the short-term, could end the problem once and for all. We should resist this temptation to fix technology's excesses by applying even more technology to them. How, for example, do most Western governments and foundations choose to fight Internet censorship by authoritarian governments? Usually by funding and promoting technology that helps circumvent it. This may be an appropriate solution for some countries-think, for example, ofNorth Korea, where Western governments have very little diplomatic and political leverage-but this is not necessarily the best approach to handle countries that are nominally Western allies. In such cases, a nearly exclusive focus on fighting censorship with anticensorship tools distracts policymakers from addressing the root causes of censorship, which most often have to do with excessive restrictions that oppressive governments place on free speech. The easy availability of circumvention technology should not preclude policymakers from more ambitious-and ultimately more effective-ways of engagement. Otherwise, both Western and authoritarian governments get a free pass. Democratic leaders pretend that they are once again heroically destroying the Berlin Wall, while their authoritarian counterparts are happy to play along, for they have found other effective ways to control the Internet. In an ideal world, the Western campaign to end Internet censorship in Tunisia or Kazakhstan would primarily revolve around exerting political pressure on their West-friendly authoritarian rulers and would deal with the offline world of newspapers and magazines as well. In many of these countries, muzzling journalists would continue to be the dominant tactic of suppressing dissent until, at least, more of their citizens get online and start using it for more activities than just using email or chatting with their relatives abroad. Allowing a handful of bloggers in Tajikistan to circumvent the government's system of lnternet controls means little when the vast majority of the population get their news from radio and television. Except for his ruminations about hydrogen bombs and war, Weinberg did not discuss how technological fixes might affect foreign policy. Nevertheless, one can still

trace how a tendency to frame foreign policy problems in terms of technological fixes has affected Western thinking about authoritarian rule and the role that the Internet can play in undermining it. One of the most peculiar features of Weinberg's argument was his belief that the easy availability of clear-cut technological solutions can help policymakers better grasp and identify the problems they face. "The [social] problems are, in a way, harder to identify just because their solutions are never clear-cut;' wrote Weinberg. "By contrast, the availability of a crisp and beautiful technological solution often helps focus on the problem to which the new technology is the solution:' In other words, just because policymakers have "a crisp and beautiful technological solution" to break through firewalls, they tend to believe that the problem they need to solve is, indeed, that of breaking firewalls, while often this is not the case at all. Similarly, just because the Internet-that ultimate technological fix-can help mobilize people around certain causes, it is tempting to conceptualize the problem in terms of mobilization as well. This is one of those situations in which the unique features of technological fixes prevent policymakers from discovering the multiple hidden dimensions of the challenge, leading them to identify and solve problems that are easily solvable rather than those that require immediate attention. Many calls to apply technological fixes to complex social problems smack of the promotion of technology for technology's own sake-a technological fetishism of an extreme variety-which policymakers should resist. Otherwise, they run the risk of prescribing their favorite medicine based only on a few common symptoms, without even bothering to offer a diagnosis. But as it is irresponsible to prescribe cough medicine for someone who has cancer, so it is to apply more technology to social and political problems that are not technological in nature.

AT: 2AC answers

The affirmative operates under a flawed epistemology—in order to feel better about themselves and to coopt the alternative and discredit true movements

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; Facebook and Twitter are just places revolutionaries go; http://www.guardian.co.uk/commentisfree/2011/mar/07/facebook-twitter-revolutionaries-cyber-utopians; kdf

Tweets were sent. Dictators were toppled. Internet = democracy. QED. Sadly, this is the level of nuance in most popular accounts of the internet's contribution to the recent unrest in the Middle East. It's been extremely entertaining to watch cyber-utopians – adherents of the view that digital tools of social networking such as Facebook and Twitter can summon up social revolutions out of the ether – trip over one another in an effort to put another nail in the coffin of cyber-realism, the position I've recently advanced in my book The Net Delusion. In my book, I argue that these digital tools are simply, well, tools, and social change continues to involve many painstaking, longer-term efforts to engage with political institutions and reform movements. Since the internet's cheerleaders can't bury cyber-realism any more than they can secede from history, they've had to design their own straw-man interpretation of the cyber-realist position, equating it with a view that the internet doesn't matter. This is a caricature of the cyber-realist worldview that doesn't really square with parts of my book that very explicitly state – here is just one quote – that "the internet is more important and disruptive than [its greatest advocates] have previously theorised". Or take the ongoing persecution of Malcolm Gladwell, who is increasingly painted as some kind of a neo-Luddite. In an online chat that Gladwell did for the New Yorker's website shortly after his infamous attack on the notion of "Twitter Revolution" was published last October, he explicitly stated (no less than three times) that the internet can be an effective tool for political change when used by grassroots organisations (as opposed to atomised individuals). Thus, simply showing that the internet was used to publicise, and even organise protests in the Middle East does nothing to counter his argument (which, by the way, I do not entirely endorse). To refute it, cyber-utopians would need to establish that there was no coordination of these protests by networks of grassroots activists – with leaders and hierarchies – who have forged strong ties (online or offline or both) prior to the protests. What we have seen so far suggests otherwise. True, the principal organisers of Egypt's Facebook movement may not be revolutionary leaders in the conventional understanding of the term. (And how could they be, given the grim track-record that former president Hosni Mubarak compiled – with Washington's complicity – in dispatching such leaders?) However, they did exercise leadership and acted strategically – even going into hiding a few days before the actual protests – just as leaders of a revolutionary

cell would. The collaborations between Tunisian and Egyptian cyber-activists – so widely celebrated in the press – were not virtual, either. In the space of a week in May 2009, I crashed two (independently organised) workshops in Cairo, where bloggers, techies, and activists from both countries were present in person, sharing tips on how to engage in advocacy and circumvent censorship; one of the attendees was the Tunisian blogger Slim Amamou, who went on to become Tunisia's minister of sport and youth. One of these events was funded by the US government and the other by George Soros's Open Society Foundations (with which I'm affiliated). There were many more events like this – not just in Cairo, but also in Beirut and Dubai. Most of them were never publicised, since the security of many participants was at risk, but they effectively belie the idea that the recent protests were organised by random people doing random things online. Those who believe that these networks were purely virtual and spontaneous are ignorant of the recent history of cyber-activism in the Middle East – to say nothing of the support that it's received, sometimes successful but most often not, from western governments, foundations and corporations. In September 2010, to take just one recent example, Google brought a dozen bloggers from the region to the freedom of expression conference the company convened in Budapest. Tracing the evolution of these activist networks would require more than just studying their Facebook profiles; it would demand painstaking investigative work – on the phone and in the archives – that cannot happen overnight. One reason we keep talking about the role of Twitter and Facebook is that the immediate aftermath of the Middle Eastern spring has left us so little else to talk about; thoroughgoing political analysis of the causes of these revolutions won't be available for a few years. This points us to the real reason why so many cyber-utopians got angry with Gladwell: in a follow-up blog post to his article that appeared as the crowds were still occupying Tahrir Square, he dared to suggest that the grievances that pushed protesters into the streets deserve far more attention than the tools by which they chose to organise. This was akin to spitting in the faces of the digerati – or, perhaps worse still, on their iPads – and they reacted accordingly. And yet Gladwell was probably right: today, the role of the telegraph in the 1917 Bolshevik revolution – just like the role of the tape-recorder in the 1979 Iranian revolution and of the fax machine in the 1989 revolutions – is of interest to a handful of academics and virtually no one else. The fetishism of technology is at its strongest immediately after a revolution but tends to subside shortly afterward. In his 1993 bestseller The Magic Lantern, Timothy Garton Ash, one of the most acute observers of the 1989 revolutions, proclaimed that "in Europe at the end of the 20th century, all revolutions are telerevolutions" – but in retrospect, the role of television in those events seems like a very minor point. Will history consign Twitter and Facebook to much the same fate 20 years down the road? In all likelihood, yes. The current fascination with technology-driven accounts of political change in the Middle East is likely to subside, for a number of reasons. First of all, while the recent round of uprisings may seem spontaneous to western observers – and therefore as magically disruptive as a rush-hour flash mob in San Francisco – the actual history of popular regime change tends to diminish the central role commonly ascribed to technology. By emphasising the liberating role of the tools and downplaying the role of human agency, such accounts make Americans feel proud of their own contribution to events in the Middle East. After all, the argument goes, such a spontaneous uprising wouldn't have succeeded before Facebook was around – so Silicon Valley deserves a lion's share of the credit. If, of course, the uprising was not spontaneous and its leaders chose Facebook simply because that's where everybody is, it's a far less glamorous story. Second, social media – by the very virtue of being "social" – lends itself to glib, pundit-style overestimations of its own importance. In 1989, the fax-machine industry didn't employ an army of lobbyists – and fax users didn't feel the same level of attachment to these clunky machines as today's Facebook users feel toward their all-powerful social network. Perhaps the outsize revolutionary claims for social media now circulating throughout the west are only a manifestation of western guilt for wasting so much time on social media: after all, if it helps to spread democracy in the Middle East, it can't be all that bad to while away the hours "poking" your friends and playing FarmVille. But the recent history of technology strongly suggests that today's vogue for Facebook and Twitter will fade as online audiences migrate to new services. Already, tech enthusiasts are blushing at the memory of the serious academic conferences once devoted to the MySpace revolution. Third, the people who serve as our immediate sources about the protests may simply be too excited to provide a balanced view. Could it be that the Google sales executive Wael Ghonim – probably the first revolutionary with an MBA – who has emerged as the public face of Egypt's uprising, vowing to publish his own book about "Revolution 2.0", is slightly overstating the role of technology, while also downplaying his own role in the lead-up to the protests? After all, the world has yet to meet a Soviet dissident who doesn't think it was the fax machine that toppled the Politburo – or a former employee of Radio Free Europe or Voice of America who doesn't think it was western radio broadcasting that brought down the Berlin Wall. This is not to suggest that neither of these communications devices played a role in these decades-old uprisings – but it is to note that the people directly involved may not have the most dispassionate appraisals of how these watershed events occurred. If they don't want to condemn

themselves to a future of tedious bar-room arguments with the grizzled, and somewhat cranky holdouts from the 1989 fax glory days, or the true believers of the Radio Free Europe Revolution, then today's cyber-utopians need to log off their Facebook accounts and try a little harder.

Link: American Propaganda

The affirmative is a rouse to spread American propaganda and to turn activists into passive consumers

Sussman in 2010 (Gerald [Prof of Urban Studies @ Portland State Univ]; Branding Democracy; p. 182; kdf)

In the broader context of a pervasive industrial, commercial, capitalist economy, promotional culture has entered public life as never before. Older notions of propaganda do not suffice to explain the applications of advertising, marketing, public relations, and other forms of selling, because societies, especially in the West, and most particularly in the United States, have never before experienced the current level of promotionalism in social, political, and cultural interaction and the tools that are now available for that purpose. The key to this analysis is that propaganda is no longer simply a tactic employed for specific commercial or state projects but is rather *systemic.* Promotional tasks are now embedded in most aspects of daily life via broadcasting, computer software, Internet, cell phones, iphones, Twitter, . email, chat rooms, and the seemingly unending hybrid technologies and programs that are being sold (or given away) for communicative exchange. Almost all forms of electronic communication are accompanied by some form of advertising, turning citizens into not only consumers but also uncompensated promoters of commodities and services. This systemic basis for promotional culture has deeply penetrated formal politics, public policy, public administration, and foreign policy, usually rationalized as serving the public's informational interests. But politics organized through media-driven "public opinion;' which is typically the way public participation is constructed, is a sacrilege against the ideal of a rational, deliberative, participatory democracy. The energy and ingenuity mobilized in developing a brand campaign in support of a politician and then polling the results are not genuinely about seeking the public's interest in policy outcomes as much as testing the effectiveness of propaganda, creating a momentum for the candidate and using the results of the poll to influence the "voting" outcome. In the United States, and more commonly in other countries, electioneering and other types of campaigns have become a matter of winning by any means necessary. In politics, as in commerce, the United States is a nation of sellers and, with its neoliberal allies, has tutored other nations, with varying degrees of success, to follow in its footsteps

Link: Social Networks

Social networks are not inherently good as the affirmative assumes—they sweep the ill effects under the rug

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 254-6; kdf)

But are social networks really goods to be treasured in themselves? After all, the mafia, prostitution and gambling rings, and youth gangs are social networks, too, but no one would claim that their existence the physical world is a net good or that it shouldn't be regulated. Ever since Mitch Kapor, one of the founding fathers of cyber-utopianism proclaimed that "life in cyberspace seems to be shaping up exactly like Thomas Jefferson would have wanted: founded on the primacy of individual liberty and a commitment to pluralism, diversity, and community" in 1993, many policymakers have been under the impression that the only networks to find homes online would be those

promoting peace and prosperity. But Kapor hasn't read his Jefferson close!~ enough, for the latter was well aware of the antidemocratic spirit many civil associations, writing that "the mobs of the great cities add just so much to the support of pure government as sores do to the strength of the human body." Jefferson, apparently, was not persuaded by the absolute goodness of the "smart mobs;' a fancy term to describe social groups that have been organized spontaneously, usually with the help of technology. As Luke Allnut, an editor with Radio Free Europe, points out " w h ere the techno-utopianists are limited in their vision is that in this great mass of internet users all capable of great things in the name of democracy, they see only a mirror image of themselves: progressive, philanthropic, cosmopolitan. They don't see the neo-Nazis, pedophiles, or genocidal maniacs who have networked, grown, and prospered on the Internet:' The problem of treating all networks as good in themselves is that it allows policymakers to ignore their political and social effects, delaying effective response to their otherwise harmful activities. "Cooperation;' which seems to be the ultimate objective of Clinton's network building, is too ambiguous of a term to build meaningful policy around. A brieflook at history-for example, at the politics of Weimar Germany, where increased civic engagement helped to delegitimize parliamentary democracy-would reveal that an increase in civic activity does not necessarily deepen democracy. American history in the post Tocqueville era offers plenty of similar cues as well. The Ku Klux Klan was also a social network, after all. As Ariel Armony, a political scientist at Colby College in Maine, puts it, "civic involvement may ... be linked to undemocratic outcomes in state and society, the presence of a 'vital society' may fail to prevent outcomes inimical to democracy, or it may contribute to such results:' It's political and economic factors, rather than the ease of forming associations, that primarily set the tone and the vector in which social networks contribute to democratization; one would be naive to believe that such factors would always favor democracy. For example, if online social networking tools end up over-empowering various nationalist elements within China, it is quite obvious that the latter's influence on the direction of China's foreign policy will increase as well. Given the rather peculiar relationship between nationalism, foreign policy, and government legitimacy in China, such developments may not necessarily be particularly conducive to democratization, especially if they lead to more confrontations with Taiwan or Japan. Even Manuel Castells, a prominent Spanish sociologist and one of the most enthusiastic promoters of the information society, has not been sold on the idea of just "letting a thousand networks bloom:' "The Internet is indeed a technology of freedom;' writes Castells, "but it can make the powerful free to oppress the uninformed" and "lead to the exclusion of the devalued by the conquerors of value:' Robert Putnam, the famed American political theorist who lamented the sad state of social capital in America in his best-selling Bowling Alone, also cautioned against the "kumbaja interpretation of social capital:' "Networks and associated norms of reciprocity are generally good for those inside the network;' he wrote, "but the external effects of social capital are by no means always positive:' From the perspective of American foreign policy, social networks may, indeed, be net goods, but only as long as they don't include anyone hiding in the caves of Waziristan. When senator after senator deplores the fact that YouTube has become a second home to Islamic terrorists, they hardly sound like absolute believers in the inherent democratic nature of the networked world. One can't just limit the freedom to connect to the pro-Western nodes of the Web, and everyone-including plenty of anti-Western nodes stands to profit from the complex nature of the Internet. When it comes to democracy promotion, one major problem with a networked society is that it has also suddenly overempowered those who oppose the very process of democratization, be they the church, former communists, . or fringe political movements. As a result, it has become difficult to focus on getting things done, for it's not immediately obvious if the new, networked threats to democracy are more ominous than the ones the West originally thought to fight. Have the non-state enemies of democracy been empowered to a greater degree than the previous enemy (i.e., the monolith authoritarian state) has been disempowered? It certainly seems like a plausible scenario, at least in some cases; to assume anything otherwise is to cling to an outdated conception of power that is incompatible with the networked nature of the modern world "People routinely praise the Internet for its decentralizing tendencies. Decentralization and diffusion of power, however, is not the same thing as less power exercised over human beings. Nor is it the same thing as democracy .... The fact that no one is in charge does not mean that everyone is free," writes Jack Balkin of Yale Law School. The authoritarian lion may be dead, but now there are hundreds of hungry hyenas swirling around the body.

Link: Question Aff Claims

All of the affirmatives claims should be evaluated skeptically

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 268-270; kdf)

For all intents and purposes, navigating tile new "democratized" public spaces created by the Internet is extremely difficult. But it's even more difficult to judge whether the segments that we happen to

see are representative of the entire population. It's never been easier to mistake a few extremely unrepresentative parts for the whole. This in part explains why our expectations about the transformative power of the Internet in authoritarian states are so inflated and skewed toward optimism: The people we usually hear from are those who are already on the frontlines of using new media to push for democratic change in authoritarian societies. Somehow, the Chinese bloggers who cover fashion, music, or pornography-even though those subjects are much more popular in the Chinese blogosphere than human rights or rule of law-never make it to congressional hearings in Washington. The media is not helping either. Assuming they speak good English, those blogging for the Muslim Brotherhood in Egypt may simply have no intention of helping BBC or CNN to produce yet another report about the power of the blogosphere. That's why the only power Western media cover is usually secular, liberal, or pro-Western. Not surprisingly, they tell us what we wanted to hear all along: Bloggers are fighting for secularism, liberalism, and Western-style democracy. This is why so many Western politicians fall under the wrong impression that bloggers are natural allies, even harbingers, of democracy. "If it's true that there are more bloggers per head of population in Iran than any other country in the world, that makes me optimistic about the future of Iran;' said then UK's foreign minister, David Miliband, while visiting Google's headquarters. Why this should be the case-given that Iran's conservative bloggers, who are often more hard-line than the government and are anything but a force for democracy, equality, and justice, are a formidable and rapidly expanding force in the Iranian blogosphere-is unclear. Chances are that Miliband's advisors simply never ventured beyond a handful of pro-Western Iranian blogs that dominate much of the media coverage of the country. It's hard to say what Miliband would make of certain groups of Chinese nationalists who, when they're not making anti-Western or anti-CNN videos, are busy translating books by Western philosophers like Leibniz and Husser!. Things get worse when Western policymakers start listening to bloggers in exile. Such bloggers often have a grudge against their home country and are thus conditioned to portray all domestic politics as an extension of their own struggle. Their livelihoods and careers often depend on important power brokers in Washmgton, London, and Brussels making certain assumptions about the Internet. Many of them have joined various new media NGOs or even created a few of their own should the mainstream assumptions about the power of blogging shift many of these newly created NGOs are likely to go under. Not surprisingly, people who get grants to harness the power of the Internet to fight dictators are not going to tell us that they are not succeeding. It's as if we've produced a few million clones of Ahmed Chalabi, that notoriously misinformed Iraqi exile who gave a highly inaccurate picture of Iraq to those who were willing to listen, and hired them to tell us how to fix their countries. Of course, the influence of exiles on foreign policy is a problem that most governments have had to deal with in the past, but bloggers, perhaps thanks to the inevitable comparisons to Soviet dissidents and the era of samizdat, are often not subjected to the level of scrutiny they deserve.

Impact: Cooption

Providing the internet guarantees that the movement is coopted—even at its best the internet accounts for little change

Sussman in 2010 (Gerald [Prof of Urban Studies @ Portland State Univ]; Branding Democracy; p. 191; kdf)

The availability of the Internet represents a degree of potential support for or even extension of free speech rights. However, it would be naive to assume that present rights of access will necessarily remain intact or that anything close to a majority of people are using the Internet for political education or radical social change. Already, the telecommunications industry is planning to develop tiered access in the way that cable television is delivered, which is being challenged by the demand for "net neutrality" (guaranteeing that the Internet network will continue to function as a public carrier without price discrimination). Another concern that has to be addressed by believers in "electronic democracy" is the reality of government and industry surveillance and the fact that anyone's web use can easily be monitored, which has stifling effects on dissent. With such unfettered opportunities for government spying, would people with connections to radical organizations dare

to post ideas and information online? Does the Web force conformity to structural inequality and permit dissent only within virtual "protest zones" -and confined to what Chomsky calls "the spectrum of thinkable thought"?

Impact: Authoritarianism

The affirmative over simplifies the problem—this only strengthens the current regime

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 310-11; kdf)

The essay contained more than a taxonomy of various planning problems. It also contained a valuable moral prescription: Rittel and Webber thought that the task of the planner was not to abandon the fight in disillusionment but to acknowledge its challenges and find ways to distinguish between tame and wicked problems, not least because it was "morally objectionable for the planner to treat a wicked problem as though it were a tame one:' They argued that the planner, unlike the scientist, has no right to be wrong: "In the world of planning ... the aim is not to find the truth, but to improve some characteristic of the world where people live. Planners are liable for the consequences of the actions they generate:' It's a formidable moral imperative. Even though Rittel and Webber wrote the essay with highly technical domestic policies in mind, anyone concerned with the future of democracy promotion and foreign policy in general would do well to heed their advice. Modern authoritarianism, by its very constitution, is a wicked, not a tame, problem. It cannot be "solved" or "engineered away" by a few lines of genius computer code or a stunning iPhone app. The greatest obstacle that Internet-centric initiatives like Internet freedom pose to this fight is that they misrepresent uber-wicked problems as tame ones. They thus allow policymakers to forget that the very act of choosing one solution over another is pregnant with political repercussions; it is not a mere chess game they are playing. But while it is hard to deny that wicked problems defy easy solutions, it doesn't mean that some solutions wouldn't be more effective (or at least less destructive) than others. From this perspective, a "war on authoritarianism" -or its younger digital sibling, a "war for Internet freedom" -is as misguided as a "war on terror:' Not only does such terminology mask the wicked nature of many problems associated with authoritarianism, concealing a myriad of complex connections between them, it suggests-falsely-that such a war can be won if only enough resources are mobilized. Such aggrandizement is of little help to a policy planner, who instead should be trying to grasp how exactly particular wicked problems relate to their context and what may be done to isolate and tackle them while controlling for side effects. The overall push, thus, is away from the grandiose and the rhetorical-qualities inherent in highly ambiguous terms like "Internet freedom" -and toward the miniscule and the concrete. Assuming that wicked problems lumped under the banner of Internet freedom could be reduced to tame ones won't help either. Western policymakers can certainly work to undermine the information trinity of authoritarianism-propaganda, censorship, and surveillance-but they should not lose sight of the fact that all of them are so tightly interrelated that by fighting one pillar, they may end up strengthening the other two. And even their perception of this trinity may simply be a product of their own cognitive limitations, with their minds portraying the pillars they can fight rather than the pillars they should fight. Furthermore, it's highly doubtful that wicked problems can ever be resolved on a global scale; some local accomplishments-preferably not only of the rhetorical variety-is all a policymaker can hope for. To build on the famous distinction drawn by the Austrian philosopher Karl Popper, policymakers should not, as a general rule, preoccupy themselves with utopian social engineering-ambitious, ambiguous, and often highly abstract attempts to remake the world according to some grand plan-but rather settle for piecemeal social engineering instead. This approach might be less ambitious but often more effective; by operating on a smaller scale, policymakers can still stay aware of the complexity of the real world and can better anticipate and mitigate the unintended consequences.

Impact: No Solvency

The aff operates under half-baked predictions—sweeping future social and political problems under the rug

Morozov 2011 (Evgeny [visiting scholar at Stanford University and a Schwartz fellow at the New America Foundation]; The Net Delusion; p 314-5; kdf)

Hannah Arendt, one of America's most treasured public intellectuals, was aware of this problem back in the 1960s, when the "scientifically minded brain trusters" -Alvin Weinberg was just one of many; another whiz kid with a penchant for computer modeling, Robert McNamara, was put in charge of the Vietnam War-were beginning to penetrate the corridors of power and influence government policy. "The trouble [with such advisers] is not that they are cold-blooded enough to 'think the unthinkable,'" cautioned Arendt in "On Violence," "but that they do not 'think:" "Instead of indulging in such an old-fashioned, uncomputerizable activity," she wrote, "they reckon with the consequences of certain hypothetically assumed constellations without, however, being able to test their hypothesis against actual occurrences:' A cursory glimpse at the overblown and completely unsubstantiated rhetoric that followed Iran's Twitter Revolution is enough to assure us that not much has changed. It was more than just the constant glorification of technical, largely quantitative expertise at the expense of erudition that bothered Arendt. She feared that increased reliance on half-baked predictions uttered by self-interested technological visionaries and the futuristic theories they churn out on an hourly basis would prevent policymakers from facing the highly political nature of the choices in front of them. Arendt worried that "because of their inner consistency ... [such theories J have a hypnotic effect; they put to sleep our common sense:' The ultimate irony of the modern world, which is more dependent on technology than ever, is that, as technology becomes ever more integrated into political and social life, less and less attention is paid to the social and political dimensions of technology itself. Policymakers should resist any effort to take politics out of technology; they simply cannot afford to surrender to the kind of apolitical hypnosis that Arendt feared. The Internet is too important a force to be treated lightly or to be outsourced to know-all consultants. One may not be able to predict its impact on a particular country or social situation, but it would be foolish to deny that some impact is inevitable. Understanding how exactly various stakeholders-citizens, policymakers, foundations, journalists-can influence the way in which technology's political future unfolds is a quintessential question facing any democracy. More than just politics lies beyond the scope of technological analysis; human nature is also outside its grasp. Proclaiming that societies have entered a new age and embraced a new economy does not automatically make human nature any more malleable, nor does it necessarily lead to universal respect for humanist values. People still lust for power and recognition, regardless of whether they accumulate it by running for office or collecting Facebook friends. As James Carey, the Columbia University media scholar, put it: "The 'new' man and woman of the 'new age' strikes one as the same mixture of greed, pride, arrogance and hostility that we encounter in both history and experience:' Technology changes all the time; human nature hardly ever. The fact that do-gooders usually mean well does not mitigate the disastrous consequences that follow from their inability (or just sheer lack of ambition) to engage with broader social and political dimensions of technology. As the German psychologist Dietrich Dorner observed in The Logic of Failure, his masterful account of how decision-makers' ingrained psychological biases could aggravate existing problems and blind them to the far more detrimental consequences of proposed solutions, "it's far from clear whether 'good intentions plus stupidity' or 'evil intentions plus intelligence' have wrought more harm in the world:' In reality, the fact that we mean well should only give us extra reasons for scrupulous self-retrospection, for, according to Dorner, "incompetent people with good intentions rarely suffer the qualms of conscience that sometimes inhibit the doings of competent people with bad intentions:'

Counterplans

Congress CP

1NC

The United States federal government should pass the Driver Privacy Act.

The CP is the only effective way to solve the third-party doctrine

Cover 2015 (Avidan Y [Assistant Professor of Law, Case Western Reserve University School of Law; Director, Institute for Global Security Law and Policy]; Corporate Avatars and the Erosion of the Populist Fourth Amendment; 100 Iowa L. Rev. 1441; kdf)

Courts may be burdened by more litigation brought by individual users over government requests for their data. But statutory clarity through legislation such as the Driver Privacy Act should guide the Executive and Judicial branches in determining what level of protection particular kinds of data require. Increased litigation is, however, the necessary cost of reinserting the individual in the conversation and negotiation with the government over her data. The Fourth Amendment must be first and foremost the people's right against unreasonable searches and seizures, not the right of the corporation. [*1501] VII. Conclusion The viability of corporate avatars as an answer to the third-party doctrine's flaws nears a crossroads. The 2014 term witnessed the Supreme Court's growing recognition of privacy's fragility in the big data era and its continuing expansion of corporations' rights. In Riley v. California, the Court acknowledged big data's encroachment on the Fourth Amendment, holding that a cell phone search required a warrant due to the phone's vast trove of data and the intimate details that information might reveal. n375 In Burwell v. Hobby Lobby Stores, Inc., the Court gave further scope to corporate rights, holding that the government's contraceptive mandate impermissibly burdened a corporation's free exercise of religion. n376 The two lines of cases may ultimately intersect or collide. The Court will have to confront corporate avatars and their legitimacy as guardians of the Fourth Amendment. A more robust corporate Fourth Amendment right might appear to strengthen corporations' ability to resist government requests for user data. The purpose of extending a constitutional right to a corporation is, after all, as the Hobby Lobby majority held, to protect the rights of its people, its members. n377 But the many practical reasons set forth in this Article suggest corporations are unlikely and unable to effectively challenge the government in the majority of requests for their users' data. Moreover, the Bill of Rights' populist origins and the Framers' distrust of corporate power militate against the maintenance of the corporate avatar dynamic. Government surveillance and use of big data will increasingly implicate an individual's Fourth Amendment right, requiring that she be permitted to challenge the government. To achieve the Fourth Amendment's privacy and government oversight objectives, individuals should normally receive notice of government surveillance and acquisition of their data. Notice may be justified on a number of grounds. First, the third-party doctrine should be limited to allow for Fourth Amendment protection of non-content data and data that are now indispensable to participate in society. Second, people should be afforded a proprietary right in much of their data. Congress may extend that right to various data, attaching to that right notice, as well as limits on incentives for corporate acquiescence to government requests for individuals' data. Finally, people may communicate their desired privacy and notice to both corporations and government through machine-to-machine technology, affording some level of ex ante clarity to the government for surveillance and pushing corporations to comport with individuals' preferences. By so [*1502] restoring agency to individuals in their relationship with the government, the Fourth Amendment can become again "the right of the people."

2NC CP Solves

CP Solves the case

Cover 2015 (Avidan Y [Assistant Professor of Law, Case Western Reserve University School of Law; Director, Institute for Global Security Law and Policy]; Corporate Avatars and the Erosion of the Populist Fourth Amendment; 100 Iowa L. Rev. 1441; kdf)

4. Automated Big Data Popular Notice Regime In the big data era, an individual cannot know all the data that private corporations and the government have and what they do with it. Lessig therefore concludes that "architecture must enable machine-to-machine negotiations about privacy so that individuals can instruct their machines about the privacy they want to protect." n371 Building on Lanier's monetization of privacy rights and the privacy preference profiles of the President's Council may better realize the populist, government-limiting objectives of the Fourth Amendment. Rather than attaching a financial component to the data, I propose a regime in which individuals would instead select in advance whether to receive notice when the government requests their data from a third-party company. Instead of setting a price for the data, an individual would choose what forms of data collection and analysis would require notice. The best route toward clarifying what data surveillance requires notice to the individual user is through legislation. As the driver data ownership laws suggest, n372 Congress may decide what data merit a proprietary relationship and, therefore, privacy protection. But any data about which Congress finds that surveillance would implicate privacy concerns should require notice to the individual, a cause of action for the individual, and limits on immunity afforded tech companies. Even with congressional action, however, [*1500] unaddressed instances will arise that call into question whether the government may obtain a person's data. A person's notice profile would permit an individual selection of only corporations' services and devices that provide notice to the user upon government requests for their data. A person might not want notice of every request. An individual may deem inoffensive the collection of telephony metadata for purposes of aggregate analysis and not request notice before such collection. The collection of CSLI, on the other hand, might induce concern and prompt a notice preference. Because, however, there may be forms of data analysis, with resulting revelations about personal behavior or conduct, that have yet to be discovered, general categories of data and analysis should be included within a person's notice profile. Even without judicial or congressional endorsement of notice profiles, the market could precipitate a move toward increased notice to the individual user. As with general privacy preferences concerning the sale of one's data to particular private entities, individual preferences for notice could serve as an adjunct to limiting government surveillance by prompting companies to provide such notice to the users. Notice also might be facilitated through future technological developments such as Lanier's proposed "Nelsonian network" - a two-way system that would record the provenance of all data. n373 The government would know in advance when a person wants notice and the person would receive notice each time the government seeks her data. n374

2NC Courts Bad

Vote neg on presumption, plan wont be enforced

Slobogin 2014 (Christopher [Milton Underwood Prof of Law, Vanderbilt U Law School]; Panvasive Surveillance, Political Process Theory, and the Nondelegation Doctrine; 102 Geo. L.J. 1721; kdf)

Unless the ban on general warrants is violated, the version of political process theory developed in this Article avoids second-guessing legislative decisions about panvasive surveillance that are made by representatives of the groups the surveillance affects and that assure the executive branch will implement legislative intent in an across-the-board manner. Conversely, panvasive surveillance is suspect if it is not authorized legislatively, or it is authorized by a political process that has denied the affected groups an opportunity to participate in the legislative debate, or it is carried out in a discriminatory or standardless fashion. Thus, even if the Fourth Amendment does not apply to panvasive surveillance, political process theory can provide a potent means of regulating it. The legislation, representation, and executive-constraint criteria required by political process theory pose significant obstacles to panvasive surveillance that has not been subject to the democratic process or that is implemented unevenly. Each of the panvasive surveillance programs discussed in this Article might be challengeable on political process theory grounds. Fusion centers are often not legislatively authorized at all. Camera and drone surveillance may be aimed at areas not represented in the legislative body. And all three of these programs, as well as the NSA's metadata surveillance practices, may run afoul of the [*1776] executive-constraint criterion if the legislation fails on intelligible principle or oversight grounds or the implementing regulations fail to meet administrative law's reason-giving, reasonableness, or promulgation-procedure principles. In contrast, under the Supreme Court's jurisprudence, none of the panvasive surveillance programs are subject to judicial regulation because they do not implicate the Fourth Amendment at all. Even if the Court changed direction and redefined "searches" to encompass

these programs, they would likely remain unregulated by the Fourth Amendment because of the Court's highly deferential special needs doctrine. Alternatively, those programs deemed to be aimed at ordinary crime control would be completely prohibited as a constitutional matter given the fact that, by definition, they are not based on individualized probable cause determinations. Thus, political process theory's application to the panvasive-surveillance setting occupies a middle ground between a regime that would essentially prohibit panvasive surveillance of any sort and the current carte blanche approach that either renders the Fourth Amendment irrelevant or permits virtually any panvasive government program meant to accomplish something other than a narrowly defined crime-control objective. Political process theory does not demand as much from the political branches as the Fourth Amendment's general warrant prohibition would require if it applied with full force. But given the Supreme Court's ungenerous construction of the Fourth Amendment, political process theory would ensure that the courts' role in regulating panvasive actions would be much more powerful than it is today.

Despite Supreme Court ruling, the NSA still continues to gather data- Congress is key to solve this issue

Whitney 2007 (Justin Whitney, FISA's Future: An Analysis of Electronic Surveillance in Light of the Special Needs Exception to the Fourth Amendment, 47 Washburn L.J. 127 gcb)

Congress cut off funding for the TIA, but there is no indication that the NSA has given up on data-mining to fight terrorism. n41 In May 2006, the NSA disclosed that it is compiling phone records from the major U.S. telecommunications firms to aid in fighting terrorism. n42 Phone records may not be the extent of the NSA's data-mining. Databases can be comprised of bank transactions, airline ticket purchases, Google internet searches, and credit card purchases. For example, the Department of the Treasury maintains a database called the Financial Crimes Enforcement Network. n43 Unusually suspicious transactions, such as international funds transfers or cash deposits exceeding $ 10,000, are flagged, stored, and shared with multiple law enforcement agencies. n44 Media reports and recent cases have unearthed the details of the TSP. In Hepting v. AT&T Corp., n45 the plaintiffs sought a preliminary injunction of NSA wiretapping alleged to be taking place at AT&T's [*132] San Francisco office. n46 The plaintiffs supported the motion with documents obtained by Mark Klein, a former employee of AT&T. n47 Klein described witnessing workers constructing a new room next to a switch room for wiretapping at the direction of an NSA agent. n48

The Hepting court began its analysis by recognizing admissions from President Bush's radio address on December 17, 2005. n49 In that address, the President admitted that in the weeks after September 11, 2001, he "authorized the National Security Agency ... to intercept the international communications of people with known links to al Qaeda and related terrorist organizations." n50 He also said, "Before we intercept these communications, the government must have information that establishes a clear link to these terrorist networks." n51 President Bush further revealed that the Attorney General reviews the surveillance activities every forty-five days and that leaders in Congress are not updated on the program. n52 The court also took judicial notice of a public statement President Bush made on May 11, 2006. n53 He said that the government's "international activities strictly target al Qaeda and their known affiliates," and that the government is "not mining or trolling through the personal lives of millions of innocent Americans." n54 The court also took notice of Attorney General Alberto Gonzalez's comments on the subject. n55 Gonzalez revealed in a December 19, 2005 press briefing that the surveillance program intercepts

Solves Deference

Use of Congress is key to prevent separation of powers concerns

Whitney 2007 (Justin Whitney, FISA's Future: An Analysis of Electronic Surveillance in Light of the Special Needs Exception to the Fourth Amendment, 47 Washburn L.J. 127 gcb)

If, however, the NSA's controversial Terrorist Surveillance Program (TSP) did play a key role in thwarting the attack, it is now unclear whether the TSP will survive to help deter future attacks. Merely six days after the unraveling of the U.K. terror plot, a federal judge issued an injunction against the TSP and declared it unconstitutional. n11 The constitutionality of the TSP has gained media attention since the New York Times released details of the TSP in December 2005. n12 In response to the court decision and the media controversy, on January 17, 2007, Attorney General Alberto Gonzalez announced that the NSA's warrantless surveillance, generally referred to as the TSP, will cease and the NSA will now conduct future surveillance with court approval under the Foreign Intelligence Surveillance Act of 1978 (FISA). n13 Opponents of warrantless surveillance argue that Congress strictly limited the means for conducting it by enacting FISA. Critics maintain the TSP lacks congressional approval similar to the Supreme Court ruling that the President's military tribunals lacked congressional approval in Hamdan v. Rumsfeld. n14 This article suggests that analyzing warrantless executive surveillance in terms of congressional approval is good because it reduces separation of powers concerns.

Use of the Supreme Court allows for abuse of power by the president

Whitney 2007 (Justin Whitney, FISA's Future: An Analysis of Electronic Surveillance in Light of the Special Needs Exception to the Fourth Amendment, 47 Washburn L.J. 127)

Article II, section 1 of the Constitution imposes a duty on the President to "preserve, protect and defend the Constitution of the United States." n62 Because of that duty, the Supreme Court has stated that the President has implicit authority to protect our system of government from subversion. n63 The Fourth Amendment, however, restricts the President's duty to protect the nation's security and guarantees by protecting U.S. persons from unreasonable searches and seizures absent a warrant based on probable cause. n64 The conflict between national security and the Fourth Amendment unfolded in United States v. U.S. District Court (Keith). n65 In the Keith case, the defendant allegedly bombed the CIA office in Ann Arbor, Michigan with dynamite. n66 The defense sought disclosure of wire-tap evidence obtained against the defendant. n67 The Attorney General admitted to the court that he had approved government agents to conduct warrantless electronic surveillance on the defendant as necessary to guard against "attempts of domestic organizations to attack and subvert" [*134] the government. n68 The Supreme Court set out to define the limits of the Presidential power to protect national security with warrantless domestic wire-tapping, a practice that the Court recognized the executive branch had conducted for at least twenty-five years. n69 The Keith Court recognized the President's implicit constitutional power to conduct surveillance on foreign powers and on domestic powers. n70 The Court, however, held that warrantless surveillance over purely domestic powers violates the Fourth Amendment. n71 The Court made clear that its holding did not limit the President's power to conduct surveillance "with respect to activities of foreign powers or their agents." n72 Thus, the Court limited the holding to the President's constitutional power to conduct surveillance over domestic powers meaning, "composed of citizens of the United States and which has no significant connection with a foreign power, its agents or agencies." n73 Keith's limited holding did not answer whether the President has Article II power to conduct electronic surveillance on citizens possessing a significant connection to a foreign power or its agents. n74

Solves Privacy

The CP is key to preventing further violations of the Fourth Amendment

Whitney 2007 (Justin Whitney, FISA's Future: An Analysis of Electronic Surveillance in Light of the Special Needs Exception to the Fourth Amendment, 47 Washburn L.J. 127 gcb)

Law enforcement can deviate from FISA and remain within constitutional bounds through the special needs exception to the Fourth Amendment. n83 While surveillance related to general crime prevention requires a warrant under the Fourth Amendment, courts relax the warrant requirement if necessary to monitor a specific threat. n84 The special needs exception to the Fourth Amendment constitutionally authorizes the President to conduct warrantless surveillance in response to specific threats from foreign powers. n85In United States v. Truong, n86 the United States Court of Appeals for the Fourth Circuit addressed the President's constitutional authority to monitor the specific threat that foreign powers pose within the U.S. n87 The government monitored David Truong, a Vietnamese citizen, with electronic surveillance upon suspicion that he was transmitting classified information to Vietnam. n88 The government bugged Truong's apartment and phone for almost one year continuously without court authorization. n89 Upon his conviction for espionage, Truong argued that the surveillance violated the Fourth Amendment. n90 The Truong court interpreted Keith to imply that the President can constitutionally conduct warrantless surveillance for foreign intelligence purposes. n91 It held that the need for foreign intelligence information is too great to justify a uniform [*136] warrant requirement. n92 Such a requirement would frustrate the executive's ability to counter foreign threats. n93 The Truong court recognized that countering foreign threats necessitates speed and secrecy. n94 The hurdles of a warrant requirement limit the executive branch's flexibility and increase the time required to respond to a foreign threat. n95 According to the court, a warrant requirement would increase the chance of leaking sensitive executive information. n96 Equally important to the Truong court was recognition that the executive branch has expertise in surveillance decisions that the judiciary lacks. n97 District courts lack the knowledge to assess and weigh the importance of foreign intelligence information relevant to a probable cause determination. n98 This analysis is better left in the hands of the executive branch, comprised of the intelligence community and military, which is better equipped to assess external threats. n99 Putting aside the impracticalities of a warrant requirement for foreign surveillance, the court recognized that the Constitution mandates the executive branch to be the "pre-eminent authority in foreign affairs." n100 In upholding Truong's conviction, the court stated that separation of powers demands that conducting domestic security surveillance is the President's principal responsibility. n101 Truong distinguished between foreign intelligence surveillance and crime investigation surveillance. n102 If the primary purpose of surveillance was to gather foreign intelligence, then the special needs exception was triggered, and the warrant requirement was relaxed. n103 If the primary purpose was criminal prosecution, the surveillance was subject to the usual warrant requirements. n104 The Truong court drew a bright line as to when the purpose of surveillance becomes primarily criminal. n105 Moreover, the Truong court left an impression in law enforcement that the surveillance became primarily criminal at the moment the agency's criminal division assumed the lead role. n106 This framework resulted in the FBI transferring criminal investigations to other government agencies to ensure there was no overlap between criminal and foreign intelligence [*137] purposes that would require a warrant. n107 The Truong test resulted in a compartmentalized approach that erected a wall within the Justice Department. n108 This wall analogy surfaced in testimony before Congress regarding the failure to prevent the 9/11 attack. n109 A New York FBI agent testified that senior FBI officials prohibited agents from initiating a criminal investigation into two of the 9/11 hijackers because they feared a criminal investigation would require a warrant. n110 Out of frustration, one agent infamously predicted in a letter to FBI headquarters: "Someday someone will die - and wall or not - the public will not understand why we were not more effective and throwing every resource we had at certain "problems.' ... The biggest threat to us now, [Usama Bin Laden], is getting the most "protection."' n111 The holding from In re Sealed Case n112 criticized the compartmentalized approach from Truong. n113 Recently, the Supreme Court has indicated that the threat of terrorism might be a valid special needs exception to the Fourth Amendment. In City of Indianapolis v. Edmond, n114 the Court invalidated a suspicionless highway checkpoint created to detect drug transportation. n115 The Court ruled that the primary purpose of drug prosecution was insufficient to justify a suspicionless search. n116 Rather, suspicionless searches require a purpose beyond criminal prosecution such as protecting citizens against special hazards like unsafe drivers. n117 According to the Court, thwarting an imminent terrorist plot would justify a suspicionless search. n118

AT: Perm do Both

The plan and CP are incompatible. Perm do both would include the use of the Supreme Court or the severing of the negative. This is a unique reason to vote neg.

Whitney 2007 (Justin Whitney, FISA's Future: An Analysis of Electronic Surveillance in Light of the Special Needs Exception to the Fourth Amendment, 47 Washburn L.J. 127 gcb)

The [*142] Supreme Court granted certiorari on November 7, 2005. n167 The Hamdan Court carefully ruled that the military commissions exceeded the authority granted by Congress to conduct military commissions without addressing whether the commissions were within the sole constitutional authority of the President. n168 The Court explained that the executive's authority to run military commissions consists of authority found in the Constitution and authority granted to the executive by another branch. n169 The Supreme Court decided Hamdan on the later and left the former unaddressed. **The Constitution expressly states that Congress, not the President, possesses the power to "make Rules concerning Captures on Land and Water."** n170 Pursuant to this authority, Congress has enacted Article 21 of the UCMJ granting the President power to conduct military tribunals but only for offenses that Congress deems may be tried in a military tribunal by statute or by the law of war. n171 Although the Constitution's text reserves this authority for Congress, precedent suggests that the President also possesses this authority in "cases of a controlling necessity." n172 Instead of deciding if the commissions fall within the President's constitutional authority, the Court held that the military commissions exceeded the authority Congress granted the President under the UCMJ. n173 Further, the Court refused to find that the AUMF expanded the President's authorization to conduct military commissions under the UCMJ. n174 This narrow reading of the AUMF conflicts with the Hamdi decision, which held that the detention of enemy combatants was within the scope of the AUMF because it was such a fundamental incident of war. n175

AT: Court override

Congress has authority to enact legislation that eliminates Supreme Court jurisdiction over certain cases - empirics

Dinh 2008 (Viet D; 2008; Threats to judicial independence, real & imagined; Viet D. Dinh is professor of law and codirector of the Asian Law and Policy Studies Program at Georgetown University Law Center; http://www.mitpressjournals.org/doi/pdf/10.1162/daed.2008.137.4.64; 7-10-15; mbc)

Criticism of courts comes in many forms, and recent years have witnessed many if not all of the variations. But if we compare the nature and intensity of today's criticisms with the vitriol direct-ed at judges in years past, it becomes ap-parent that they are not unique. Indeed, public critiques of federal judges have been commonplace throughout Ameri-can history and, when done thoughtfully and honestly, they contribute both to a healthy democracy and to judicial inde¬pendence.7 Congress has attempted to enact legislation that restricts or eliminates the jurisdiction of federal courts to hear certain types of cases. Congress's power to do so derives from the Exceptions Clause,8 which provides that "the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make." The best-known of these limitations concerns review by federal courts of prior adjudications by other bodies, such as administrative agencies or state courts. In the early 1990s, the public (and some members of Congress) grew increasingly frustrated with what was perceived as federal courts' penchant for allowing state convicts to relitigate their cases in the federal system. In re-sponse to these and other concerns (in-cluding fears about terrorism), Congress in 1996 enacted the Anti-Terrorism and Effective Death Penalty Act (AEDPA).9 Among other things, AEDPA limits the ability of federal courts to consider habeas challenges to state-court criminal convictions. Similar concerns led Congress (also in 1996) to enact the Illegal Immigration Reform and Immigrant Responsibility Act (IIRIRA).10 The IIRIRA prevents federal courts from reviewing a final order of the Immigration and Naturalization Service to deport a person with a criminal record, and expands the class of crimes that constitute an aggravated fel-ony, including terrorism. More recently, in December 2005, just months before the Supreme Court was scheduled to hear the Hamdan v. Rumsfeld case, Congress passed and the president signed the Detainee Treatment Act (DTA),11 which purported to remove from the federal courts jurisdiction to hear challenges brought by suspected terrorists to their detention and treatment at Guantánamo Bay. After the Supreme Court held in Hamdan that the DTA did not strip the courts of jurisdiction over habeas petitions pending during the DTA's enactment, Congress and the president tried again. They passed the Military Commissions Act of 2006, which stripped federal courts of jurisdiction over Guantánamo detainees' cases, including those that were pending. The 109th Congress was asked to re-move federal court jurisdiction to re view the constitutionality of hot-button issues, like abortion. The Marriage Pro-tection Act of 2005 intended to strip federal courts of jurisdiction to consider the constitutionality of the Defense of Marriage Act, which declares that no state shall be required to recognize legally same-sex marriages performed in another state.12 Other proposals aimed to deny courts jurisdiction to assess the constitutionality of the Pledge of Alle-giance13 and public displays of the Ten Commandments.14 While all of these measures failed to secure final passage by Congress, they have been reintro-duced in the 110th Congress.

Minimization CP

1NC

The United States federal government should amend the Foreign Intelligence Surveillance Act minimization procedures so that evidence collected on Americans is destroyed, if deemed impertinent

This solves their privacy internal links and avoids the DA

Correia 2014 (Evan RC [JD Candidate, 2015 @ Temple]; PULLING BACK THE VEIL OF SECRECY: STANDING TO CHALLENGE THE GOVERNMENT'S ELECTRONIC SURVEILLANCE ACTIVITIES; 24 Temp. Pol. & Civ. Rts. L. Rev. 185; kdf)

1. The Minimization Process The structural separation within the FISA context is derived from minimization procedures and the preference for immediate, non-supervised destruction, rather than retention of any gathered non-foreign intelligence information. n215 Minimization procedures under the FISA were adopted by the Attorney General and "designed in light of the purpose and technique of the [*206] particular surveillance, to minimize the acquisition and retention, and prohibit the dissemination, of information unavailable to the public concerning non-consenting United States persons consistent with the need of the United States to obtain, produce, and disseminate foreign intelligence information." n216 Borrowed from the concept of minimization in Title III, n217 these procedures attempt to safeguard the privacy rights of American citizens by minimizing the acquisition, retention, and dissemination of information that is not foreign intelligence information. n218 Rather than returning such information to the judge, as is required under Title III, n219 the FISA presumes that the best way to safeguard the privacy of Americans is to destroy the information instead of retaining it. n220 The change from Title III was based upon the belief "that in light of the relatively few cases in which information acquired under this chapter may be used as evidence, the better practice is to allow the destruction of information that is not foreign intelligence information or evidence of criminal activity." n221 However, the question remains as to how the immediate destruction of these communications actually safeguards privacy when minimization procedures require that acquisition be limited to situations where foreign intelligence information is likely to be obtained and dissemination of such communications is strictly prohibited. n222 The invasion of privacy occurs the moment the communication is acquired and sorted. n223 An individual subject to such an invasion would only have [*207] his or her privacy further compromised if the recording were disseminated. Dissemination is prohibited unless it "is necessary to understand foreign intelligence information or assess its importance," n224 or if it is "information that is evidence of a crime which has been, is being, or is about to be committed." n225 The actual effectiveness of these minimization procedures is "significant because it is this immediate destruction that effectively prevents the possibility of serving notice and conducting oversight in cases where something has gone astray in the process." n226 The practical effect of immediate destruction is that Americans whose conversations are unlawfully acquired will never find out about the interception of their communications. n227 As the principal invasion of privacy has already taken place prior to the minimization procedures, the substantial costs that immediate destruction imposes in terms of notice and oversight are not worth incurring. n228 Instead of being immediately destroyed, non-foreign intelligence information should be returned to the FISC in a manner similar to the Title III process. As Adler suggests; "returning the information to the FISC does not significantly compound the invasion of privacy, [and any] minor invasion is justified by the ultimate objectives of the return procedure to provide relief for, and improve oversight of, unlawful electronic surveillance." n229 2. Amending the Minimization Process An amendment altering the minimization procedures could "accomplish the dual objective of achieving greater oversight of the FISA process and enabling the FISC to notify particular individuals who were subjects of unlawful electronic surveillance." n230 Specifically, the statute should require the executive to return non-foreign intelligence information to the FISC in order to determine whether particular individuals should be provided with notice. This is consistent with the statute and the recent practice of allowing the FISC power to monitor surveillance conducted under its authority. n231 It is also consistent with the legislative history of [*208] enabling the FISC to act as the ultimate decision-maker regarding the retention and destruction of information gathered under FISA. n232 Additionally, a notice provision similar to the ones included in Title III and the FISA emergency contexts should be added to the

statute. n233 As Adler proposes, however, "unlike the Title III provision ... not everyone subject to electronic surveillance can or should be notified ... not even everyone subject to unlawful electronic surveillance should be notified." n234 It should be within the discretion of the FISC to determine when it is in the interest of justice to provide notice to those people who were subject to prolonged or particularly intrusive unlawful electronic surveillance. The separation of powers doctrine compels vesting this check on executive power with the FISC, rather than with the executive branch itself. n235 Just as the FISC has the opportunity to decide if an individual is to be notified, the government should be afforded an opportunity "on an ex parte showing of good cause" to have notice delayed or cancelled. n236 However, generalized assertions that "information that is embarrassing to [the federal government] must be kept secret for reasons of national security" n237 should not suffice. n238 Good cause should require a specific showing that notice would inform one of the individuals being monitored or would have the effect of disclosing confidential intelligence methods. n239 A specific demonstration of how serving notice on a particular individual will compromise national security must be made to the FISC. n240 A distinction must be made between disclosures that concretely threaten national security, and those that would merely embarrass the government. n241 The FISC is the ideal body for determining whether notice would actually pose a threat to national security or whether it would merely provide a particular American citizen or citizens with the necessary standing to challenge the intrusion upon their privacy. n242 The attendant safeguards and the limited disclosure of information would ensure that when notice is provided, national security would not be endangered. n243 After the FISC makes its notice determinations, the non-foreign [*209] intelligence information pertaining to those not notified should be destroyed. n244 However, non-foreign intelligence information forming the basis of notice should not be destroyed until after an assessment of damages. n245 When notice is provided, it will be up to the individual to decide whether to take further action. "Although litigants may not often choose to seek relief, it is important, in a civilized society, that the judicial branch of the Nation's government stand ready to afford a remedy in these circumstances." n246

AT: Internet Advantages

Censorship Good – ISIS

1NC

Censorship is key to block ISIS

Bradshaw 2015 (Tom [Senior lecturer in Journalism at I of Gloucestershire]; Why 2015 is gearing up to be the year of censorship; theconversation.com/why-2015-is-gearing-up-to-be-the-year-of-censorship-35693; kdf)

India's government has displeased many internet users by blocking access to some major websites at the start of the new year. A total of 32 sites were blocked, although sanctions have been lifted from the three most famous sites on the list: software development platform GitHub and video sites Vimeo and Dailymotion. The decision to block the sites was reportedly over concerns that they were hosting content by terrorist groups. For many Westerners, democracy and free speech are inextricably connected, so the idea of curtailing freedom of expression in the interests of political stability seems illiberal and even totalitarian. But India is not alone in feeling the need to take some action. Some initial battles took place last year, but it looks as if 2015 will really be the year in which internet censorship will become a war. British prime minister, David Cameron, and other Western leaders have been forced to confront a difficult issue in 2014, as Islamic State showed how deftly it could appropriate social media networks to spread its jihadi manifesto. What happens when terrorists commandeer global media networks and use them to disseminate propaganda aimed at undermining democratic, secular governance? The response from politicians has been to lean heavily on internet service providers, making them do more to remove jihadi material. This approach is regarded as unjustifiable censorship by critics, including the Index on Censorship, which has argued for the right of people to decide for themselves whether they view such content. Corporate censorship For their part, social media companies such as Twitter have been taking down accounts linked to IS, even though employees have been threatened with death for doing so. And YouTube has been working hard to remove jihadi material that glorifies violence. But if you're determined to find a video of an IS beheading, you will find one. One student casually remarked to me during a recent lecture that he'd watched a beheading video only a few nights earlier, in rather the same way as if he might have mentioned that he'd caught up on an episode of The Simpsons. There are some who passionately believe that such videos should remain accessible. The Index on Censorship argues that allowing governments or media corporations to decide who watches what is the start of a process that leads, ultimately, to the muzzling of dissent and difference. Those who believe this content shouldn't be viewed can urge others not to watch it, as Twitter users did in August with the #ISISmediablackout hashtag. Still, while one or more people can choose not to look, the content will still be available unless politicians take action. And as Cameron ponders just how he should do that in 2015 without triggering accusations of censorship, he could consider a lesson in recent British history. The oxygen of publicity The British government formally ended a high-profile dalliance with censorship 20 years ago when it lifted restrictions on how the media could report the Troubles in Northern Ireland. From 1988 to 1994, broadcasters were banned from airing the words spoken directly by the Irish Republican party, Sinn Fein, and by specified paramilitary organisations. As it turned out, broadcasters could use actors and reported speech to convey the content of such organisations. Interviews with Sinn Fein's leader Gerry Adams were televised

and his exact words broadcast, just with the voice of an actor dubbed over the top. This all prompted questions about just how the law was depriving Sinn Fein and other organisations of what Margaret Thatcher termed the "oxygen of publicity". Since then, the digital revolution has transformed the media, enabling terrorists to reach new audiences. By setting up a social media account, jihadis can immediately give themselves a voice with a reach that is potentially global. As a result the UK government is now engaged in a similar battle to that which took place during the Troubles, but the goalposts have been significantly widened. Last month, Cameron announced he wants companies to be more proactive in taking down "harmful material". He also called for stronger filters and an on-screen button to report jihadi material. Talk of filters induces queasiness in the anti-censorship lobby – and for good reason. Censorship of the web is regularly used by repressive regimes to retain control over what is said online. But the trouble for those who oppose such restrictions is that a traditional argument against censorship has been undermined – arguably by Twitter more than any other organisation. Social media often means that debate is conducted via short statements that contain emotional responses. Abbreviated words, images and hashtags often replace reasoned discourse. Almost by design, Twitter is not conducive to the sort of patient argument needed to express a controversial opinion and justify it to your critics. So world leaders have started running out of options. The indicators are that they won't leave it to chance this year and that censorship will continue to be deployed through a combination of government and corporate activity. What started in a panic in 2014, will become something altogether more structured and powerful in the 12 months to come.

ISIS uses the internet as a means of recruiting and financial support

Ajnaili 2014 (Mustapha; How ISIS conquered social media; June 24; english.alarabiya.net/en/media/digital/2014/06/24/How-has-ISIS-conquered-social-media-.html; kdf)

After seizing swathes of land in Iraq and Syria, the Al-Qaeda-inspired Islamic State of Iraq and Syria is expanding its presence on social media, using sophisticated techniques to recruit fighters, spread its propaganda and garner financial support. One of these techniques is a Twitter application called "Fajr al-Bashaer," or "Dawn of Good Tidings" (@Fajr991). The application - flagged by Twitter as "potentially harmful" - requests user data and personal information. After downloading it, the app sends news and updates on ISIS fighting in Syria and Iraq. A recent report estimates that hundreds of users have subscribed to the application on the internet or their Android smart phones using the Google Play store.

ISIS spurs CBW terrorism

Budowsky 14 (LL.M. degree in international financial law from the London School of Economics, aide to former Sen. Lloyd Bentsen and Bill Alexander - chief deputy majority whip of the House Brent Budowsky, Budowsky: ISIS poses nuclear 9/11 threat, http://thehill.com/opinion/brent-budowsky/215603-brent-budowsky-isis-poses-9-11-scope-threat)

I vehemently opposed the misguided Iraq War from the moment it was proposed by former President George W. Bush and have never been a neoconservative, warmonger or super-hawk. But aggressive action against ISIS is urgently needed. ISIS has stated its intention to attack the **U**nited **S**tates and Europe to advance its evil, messianic and genocidal ideology and ambitions. ISIS **has the money** to purchase the most **deadly weapons** in the world, and has recruited American and European traitors with **above-average capability** to execute an attack.

The odds that ISIS can obtain **nuclear, chemical, biological** or other forms of mass destruction weapons are impossible to ascertain but in a world of vast illegal arms trafficking, with so many corrupt officials in nations possessing arsenals of destruction, **the danger is real**. The fact that WMD scares prior to the Iraq War ranged from mistaken to deceitful does not mean that the WMD danger does not exist today. It does. I applaud the recent actions taken by President Obama. Obama's airstrikes saved tens of thousands of Yazidis from genocide, took back the Mosul Dam from ISIS and saved countless Iraqis, Kurds and Syrians from slaughter. The airstrikes inflicted material damage to ISIS. The diplomacy of Obama and Secretary of State John Kerry contributed mightily to the replacement of a disastrous Iraqi government by a government can unite Iraqi Sunnis, Shiites and Kurds. The Obama-Kerry initiatives will lead to the creation of a stable Afghan government and avoid the collapse that was possible after the recent controversial Afghan elections. These are real successes. In the current political climate, Obama seems to get credit for nothing, but he deserves great credit for some important successes in recent weeks. And yet the danger of ISIS pulling off a nuclear, chemical, biological or other mass death 9/11-style attack in a major American or European city is real. Even with dirty or primitive WMD weapons, the casualty totals could be **catastrophic**. ISIS must be defeated and destroyed. This will not be achieved with "boots on the ground" proxies from Iraqi or Kurd forces alone, though Kurdish forces should immediately receive strong military assistance.

Extinction

Mhyrvold 13 (Nathan, Began college at age 14, BS and Masters from UCLA, Masters and PhD, Princeton "Strategic Terrorism: A Call to Action," Working Draft, The Lawfare Research Paper Series Research paper NO . 2 –
2013, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2290382)

A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, terrorists may not have to develop it themselves: some scientist may do so first and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, at some point in the near future, someone may create artificial pathogens that could **drive the human race to extinction**. Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but similar techniques could be directed toward humans.16 When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. Modern biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more. That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate Homo sapiens—will be available to anybody with a solid background in biology, terrorists included.

xt – Yes ISIS uses Internet

FBI Director Comey – crackdown on the internet needed

Hudson 2015 (John; FBI Director: For Would-Be Terrorists, Twitter is the 'Devil on Their Shoulder'; Jul 8; foreignpolicy.com/2015/07/08/fbi-director-for-would-be-terrorists-twitter-is-the-devil-on-their-shoulder/; kdf)

FBI Director James Comey accused Twitter of being the main conduit for Islamic State recruitment on Wednesday and said the social media site amounted to the "devil on their shoulder" for extremist sympathizers around the world. "ISIL is reaching out, primarily through Twitter, to about 21,000 English-language followers," Comey told the Senate Judiciary Committee, using an acronym for the extremist group. "It buzzes in their pocket … a device, almost a devil on their shoulder, all day long saying, **'kill, kill, kill, kill.**'" Comey noted that the Islamic State's recruitment techniques differ from al Qaeda's, which invests more heavily in spectacular attacks against Western landmarks. The ISIS message is "two pronged: come to the so-called Caliphate … and if you can't come, kill somebody where you are." "I cannot see we stopping these indefinitely [sic]," he added. The FBI chief's unusually pointed warning about one of the most successful American social media companies came during congressional testimony about the dangers of encryption technologies that prevent law enforcement from accessing data on Americans' smartphones. In recent months, Silicon Valley and U.S. law enforcement agencies have been at loggerheads over new versions of smartphone operating systems from Google, Apple, and other firms that offer default encryption that the companies themselves can't break. **Privacy advocates have championed the software as an important bulwark against government surveillance and cyber crime**, but law enforcement officials such as Comey worry that forensic data needed to solve crimes or thwart terrorist attacks will "go dark."

ISIS uses the internet as a recruitment

Ryan 2014 (Laura; Al-Qaida and ISIS use Twitter differently. Here's How and Why; Oct 9; www.nationaljournal.com/tech/al-qaida-and-isis-use-twitter-differently-here-s-how-and-why-20141009; kdf)

Al-Qaida has an Internet presence nearly two decades old, using various platforms and—more recently—social media to push its message. But it is ISIS, the relative newcomer, that has escalated its Internet efforts to the point that governments are beginning to see winning the Internet as central to the fight against terrorism. European government officials reportedly met Thursday in Luxembourg with heads of tech companies—including Twitter, Facebook, and Google—to discuss how to combat online extremism. And the U.S. State Department launched its own Center for Strategic Counterterrorism Communications in 2011. Much of ISIS's online strategy stems from lessons learned while its members were still in al-Qaida's fold. But when the groups split apart, their online strategies diverged as well—especially in how they use social media. From 9/11 to the executions of James Foley and Scott Sotloff, there seem to be no limits to the violence the two terrorist groups are willing to carry out. Now both groups use social media to wage their own brand of jihad, but they use it very differently. And their separate techniques not only reveal key divisions between the two terrorist groups, but also illustrate the depths of extremism that ISIS will plumb—and that al-Qaida won't. Here are a few key distinctions: 1. ISIS more successfully uses social media to recruit members. Both groups use social media to target and recruit foreigners, but ISIS is much better at it. The number of Westerners fighting alongside ISIS in Syria and Iraq could number in the thousands, thanks in large part to Twitter and Facebook, and this spooks the West. Social media's public and instantaneous nature is ideal for reaching ISIS's target audience—young, disillusioned Westerners who are ripe for radicalization—and it gives them a sense of community. ISIS showcases its recruiting success via

Twitter and Facebook, where foreign recruits themselves become propaganda tools of the group's digital war, according to Gabriel Weimann, a professor of communication at Haifa University, Israel, who has been tracking terrorists' use of the Internet for nearly 15 years. The Facebook profiles and Twitter handles of Western recruits are distinct because their nationality is usually noted after their new, traditional Muslim names. The American public is most familiar with ISIS's graphic images, but recruits also share messages and images of daily life in Syria as peaceful, purposeful, and orderly. "Even if they recruited them, radicalized them, changed their names, made them legal muslims, they keep calling them by the name of the country they came from," Weimann said. 2. Al-Qaida relies on 'older' Web platforms. Al-Qaida never managed to find this kind of success, according to Weimann. Even though al-Qaida paved the way for ISIS on the Internet, the group has quickly outpaced al-Qaida at exploiting social media to its fullest potential. Al-Qaida certainly has a presence on social media, but the group still relies heavily on "older" platforms, like websites and forums, according to Weimann. And while ISIS focuses on fighting a nearby enemy to defend the Islamic State, al-Qaida focuses on fighting an external enemy, i.e. the United States., and is therefore more focused on stirring "lone-wolf" terrorists to carry out acts of terror on their own.

Internet freedom allows for online terrorist recruitment

UNODC 12
(http://www.unodc.org/documents/frontpage/Use_of_Internet_for_Terrorist_Purposes.pdf, pg. 5)
JKS

The Internet may be used not only as a means to publish extremist rhetoric and videos, but also a way to develop relationships with, and solicit support from, those most responsive to targeted propaganda. Terrorist organizations increasingly use propaganda distributed via platforms such as password-protected websites and restricted access Internet chat groups as a means of clandestine recruitment.5 The reach of the Internet provides terrorist organizations and sympathizers with a global pool of potential recruits. Restricted access cyber forums offer a venue for recruits to learn about, and provide support to, terrorist organizations and to engage in direct actions in the furtherance of terrorist objectives.6 The use of technological barriers to entry to recruitment platforms also increases the complexity of tracking terrorism-related activity by intelligence and law enforcement personnel. 8. Terrorist propaganda is often tailored to appeal to vulnerable and marginalized groups in society. The process of recruitment and radicalization commonly capitalizes on an individual's sentiments of injustice, exclusion or humiliation.7 Propaganda may be adapted to account for demographic factors, such as age or gender, as well as social or economic circumstances. 9. The Internet may be a particularly effective medium for the recruitment of minors, who comprise a high proportion of users. Propaganda disseminated via the Internet with the aim of recruiting minors may take the form of cartoons, popular music videos or computer games. Tactics employed by websites maintained by terrorist organizations or their affiliates to target minors have included mixing cartoons and children's stories with messages promoting and glorifying acts of terrorism, such as suicide attacks. Similarly, some terrorist organizations have designed online video games intended to be used as recruitment and training tools. Such games may promote the use of violence against a State or prominent political figure, rewarding virtual successes, and may be offered in multiple languages to appeal to a broad audience.8

ISIS recruits online now – gives them more power

Hopping 7-8 (http://www.itpro.co.uk/security/24943/fbi-encryption-helps-isis-recruit-new-members) JKS

Universal **encryption will help terrorists spread their creeds through secure messaging services**, according to the FBI. James Comey, director of the agency, claimed in a blog post that worldwide encryption will help groups like ISIS ahead of his appearance at the Senate Intelligence Committee. He wrote that secure messaging services and social media will help ISIS recruit new members online. "When the government's ability—with appropriate predication and court oversight—to see an individual's stuff goes away, it will affect public safety," he wrote on pro surveillance website Lawfare. "That tension is vividly illustrated by the current ISIL threat, which involves ISIL operators in Syria recruiting and tasking dozens of troubled Americans to kill people, a process that increasingly takes part through mobile messaging apps that are end-to-end encrypted, communications that may not be intercepted, despite judicial orders under the Fourth Amendment." While he recognised the personal privacy benefits of secure encryption, he added: "My job is to try to keep people safe. In universal strong encryption, I see something that is with us already and growing every day that will inexorably affect my ability to do that job. "It may be that, as a people, we decide the benefits here outweigh the costs and that there is no sensible, technically feasible way to optimize privacy and safety in this particular context, or that public safety folks will be able to do their job well enough in the world of universal strong encryption." His comments come after Prime Minister David Cameron denounced encrypted messaging services like Whatsapp earlier this year.

xt – Internet recruitment Key

Recruitment via the Internet is critical to ISIS's success

Ajnaili 2014 (Mustapha; How ISIS conquered social media; June 24; english.alarabiya.net/en/media/digital/2014/06/24/How-has-ISIS-conquered-social-media-.html; kdf)

Western Muslims Western Muslims are an important target of ISIS's social media propaganda. The group ensures most of its media productions are translated into as many Western languages as possible. This is done through sophisticated media arms such as Al-Furqan Media, Fursan Al-Balagh Media, Asawirti Media, Al-Ghuraba Media - which appears to be operated in Germany - and Al-Hayat Media Center (http://justpaste.it/ma_asabak). The last one provides the translation of a recent speech by ISIS spokesman Abu Mohammad al-Adnani al-Shami into English, Turkish, Dutch, French, German, Indonesian and Russian. J.M. Berger, editor of INTELWIRE.com and author of "Jihad Joe: Americans Who Go to War in the Name of Islam," wrote: "ISIS does have legitimate support online - but less than it might seem. And it owes a lot of that support to a calculated campaign that would put American social-media-marketing gurus to shame." Peter W. Singer - director of the Center for 21st Century Security and Intelligence, and a senior fellow in the Foreign Policy program - told Al Arabiya News that ISIS's increased activity on social media "in many ways reflects the new nature of media technology's cross with warfare." Singer added: "Just as the Crimea War was the first war reported by telegraph and Vietnam the first TV war, we are now seeing wars in places like Syria and Iraq, just like the broader use of media technology, playing out online."

xt – Yes CBWs: Ebola

ISIS will infect recruits with Ebola, creating a new bubonic plague

Dorminey October 5, 20**14** (Ebola as ISIS BioWeapon?; www.forbes.com/sites/brucedorminey/2014/10/05/ebola-as-isis-bio-weapon/; kdf)

ISIS may already be thinking of using Ebola as a low-tech weapon of bio-terror, says a national security expert, who notes that the "Islamic State of Iraq and Syria" and terror groups like it wouldn't even have to weaponize the virus to attempt to wreak strategic global infection. Such groups could simply use human carriers to intentionally infect themselves in West Africa, then disseminate the deadly virus via the world's air transportation system. Or so says Capt. Al Shimkus, Ret., a Professor of National Security Affairs at the U.S. Naval War College. "The individual exposed to the Ebola Virus would be the carrier," Shimkus told Forbes. "In the context of terrorist activity, it doesn't take much sophistication to go to that next step to use a human being as a carrier." And with a significant portion of West Africa now in an open epidemic, it arguably wouldn't be difficult for a terrorist group to simply waltz in and make off with some infected bodily fluids for use elsewhere at another time. They wouldn't even have to "isolate" it, says Shimkus, who teaches a course in chemical and biological warfare. He says that if ISIS wanted to send half a dozen of its operatives into an Ebola outbreak region and intentionally expose themselves to the virus, they very well could. The idea is then once they had intentionally infected themselves, they would try to interact with as many people in their target city or country of choice. The average fatality rate from Ebola, classified as a hemorrhagic fever, is 50 percent; but without medical treatment, that figure can range as high as 90 percent, reports the U.N. World Health Organization (WHO). The WHO also notes that although there are two potential vaccines undergoing "evaluation," at present none are licensed. The virus was first documented in humans in 1976 during two simultaneous outbreaks, one in Sudan and the other in the Congo, in a village near the Ebola River. The WHO reports that a type of fruit bat is thought to act as the virus' natural host. The virus apparently spreads into the human population via direct contact with infected animals — ranging from chimpanzees, gorillas, monkeys, forest antelope and porcupines; as well as the fruit bat itself — be they found ill or dead in the rain forest. According to the WHO, Ebola can then be spread via contact with the infected's bodily fluids; even bedding and clothing "contaminated" with such fluids. The idea of using human carriers to intentionally spread deadly pathogens has been around for centuries. As Shimkus points out, in the Middle Ages, adversaries threw infected corpses over their enemy's city walls in order to spread the deadly Bubonic Plague.

xt – Yes CBW Extinction

CBW attacks are the most probable existential threat

Burt 2013 (Alistar [member of parliament and parliamentary under-secretary of state at the UK Foreign and Commonwealth Office]; We must wake up to the threats of new chemical weapons; Apr 15; www.newscientist.com/article/mg21829125.900-we-must-wake-up-to-the-threats-of-new-chemical-weapons.html#.VMUUlP7F-AU; kdf)

Most governments now regard such weapons as militarily redundant, as demonstrated by their membership of the Chemical Weapons Convention (CWC), which prohibits the production and

use of chemical weapons, commits them to destroying all existing stocks, and prevents reacquisition. Yet advances in a range of scientific fields – such as neuroscience and nanotechnology – and the growing convergence of chemistry and biology, while offering the hope of benefits to medicine and civil society, also bring the potential for a new era in chemical warfare. There is an intrinsic connection between the military and civilian scientific communities; the military's need for innovation has long been a driving force in research. But the potential for the adaptation and exploitation of scientific discovery for military advantage has rarely been greater. Pursuing legitimate research while minimising the risk of misuse is a challenge for all. In 2011, I wrote in this magazine that the world needed to do more to guard against the growing threat of biological weapons. Now, I want to make the same case with regard to chemical weapons. These issues are being discussed this month at the Third Review Conference of the CWC at The Hague in the Netherlands. The UK was a key player in negotiating agreement for the convention, which came into force in 1997, and although the threats we now face are very different from those that preoccupied the original negotiators, our commitment to it is undiminished. It remains a fundamental part of the international legal framework to tackle the threat of chemical weapons and has resulted in the destruction of four-fifths of the world's declared stockpiles. This is welcome, but we cannot afford to be complacent. The international community must ensure it is equipped to meet new challenges and prevent the re-emergence of chemical weapons. The latest threat comes on several fronts. Consider the rapidly advancing field of neuroscience, in particular neuropharmacology. The potential benefits for treating neurological impairment, disease and psychiatric illness are immense; but so too are potentially harmful applications – specifically the development of a new range of lethal, as well as incapacitating, chemical warfare agents. Nanotech also has the potential to transform medical care, but could be used to bolster chemical weapon capabilities. We should not allow threats to hinder scientific progress. But we should do all we can to minimise the misuse of knowledge, materials, expertise and equipment for hostile purposes. The scientific community must play its part. These issues should be a fundamental element of educational and professional training for scientists and engineers, along with clear guidance on the obligations imposed by the CWC to not develop, produce, acquire, stockpile or retain chemical weapons. Organisations such as the UK's Royal Society are spearheading this work. Significant challenges to the convention are also being addressed. For instance, it focuses on the types and quantities of toxins that armies, not terrorist cells, would need. The components of chemical weapons are readily available: industrial chemicals are sold in bulk, yet unlike their nuclear equivalent, only limited scientific and engineering knowledge is needed to turn them against us. Recent history shows us that extremists entertain no qualms about the acquisition and use of such weapons; and they are willing to use primitive delivery systems. In 1995, terrorists from the Japanese cult Aum Shinrikyo released a nerve agent on the Tokyo subway which led to 13 deaths and left hundreds more suffering ill effects. Preventing and prohibiting misuse without impeding the beneficial development of science and technology is a delicate balancing act but a necessary one. All nations must face up to these challenges and consider the implications for the CWC's verification regime in the short, near and long term. For instance, will the declaration and inspection provisions that apply to the chemical industry still be relevant? We cannot afford to be reactive. If unchecked, this threat has the potential to cause devastation on a vast scale. This is a watershed moment for the convention and for the international community. We must summon the political will to strengthen regulation and ensure relevance in the modern world. The duty to prevent chemical development for weapons must be enforced in all nations, and states must be prepared to take steps nationally to prevent the misuse of toxic chemicals. As the current situation in Syria demonstrates, the danger

posed by these weapons is not an abstract issue. The existence of that country's chemical arsenal is a reminder of the threats we face. Any use of such weapons is abhorrent. Preventing this and holding to account those who use them must remain a priority for the international and scientific communities alike.

AT: ISIS Not a Threat

ISIS is more of a threat than ever

Botelho January 24, 20**15** (Greg; What's happening in the Middle East and why it matters; edition.cnn.com/2015/01/23/middleeast/middle-east-country-breakdown/; kdf)

Already, ISIS has beheaded a number of U.S. and British hostages -- all of them civilians -- and threatened more. There's also the real threat that the group may take its campaign out of the Middle East to strike in the West. That may have happened this month in France. One of the three terrorists there, Amedy Coulibaly, proclaimed his allegiance to ISIS in a video, and investigators discovered ISIS flags along with automatic weapons, detonators and cash in an apartment he rented, France's RTL Radio reported Sunday, citing authorities. The West and some of its Middle Eastern allies are striking back with targeted airstrikes not only in Iraq, where the coalition has a willing partner, but in Syria, where it is not working with al-Assad. (In fact, Obama and others have said they want the Syrian President out of power.) U.S. diplomatic officials said Thursday that estimates are that this coalition has killed more than 6,000 ISIS fighters. Yet their work is far from done. The group boasts upwards of 31,000 fighters, not to mention fresh recruits seemingly coming in regularly.

AT: Plan doesn't get modeled

Facebook censors posts to appease China, plan reverses that

Techdirt 2015 (Is Facebook Censoring posts to please China?; Jan 9; abovethelaw.com/2015/01/is-facebook-censoring-posts-to-please-china/; kdf)

Techdirt has reported before, one troubling consequence of China's widespread online censorship is that users of some services outside that country are also affected. A recent incident suggests that as China's soft power increases, so does its ability to influence even the most powerful of Western online companies. It concerns Tsering Woeser, perhaps the leading Tibetan activist, and certainly the most Net-savvy. As she explains in an article on China Change (NB — post contains some disturbing images of self-immolation): On December 26, 2014, I reposted on my Facebook page a video of Tibetan Buddhist monk Kalsang Yeshe's self-immolation that occurred on December 23 [in Tawu county, Kardze Tibetan Autonomous Prefecture, Sichuan province, China], accompanied by an excerpted report explaining that self-immolation is a tragic, ultimate protest against repression. A few hours later, my post was deleted by the Facebook administrator. I was rather shocked when a Facebook notice of deletion leapt out on screen, which I tweeted right away with the thought, "It's been more than six years since I joined Facebook in 2008, and this is the first time my post was deleted! Does FB also have 'little secretaries?' " "Little secretaries" refers to the censors hired by Chinese online services to remove politically sensitive material. Her article includes Facebook's explanation for its move: Facebook has long been a place where people share things and experiences. Sometimes, those experiences involve violence and graphic videos. We work hard to balance expression and safety. However, since some people object to graphic videos, we are working to give people additional control over the content they see. This may include warning them in advance that the image they are about to see contains graphic content. We do not currently have these tools available and as a result we have removed this content. To which Woeser replies that there seems to be some double standards here: Western democracies have recently resolved to strike ISIS, and the public support for this is largely the result of the Jihadist videos of beheading hostages that have been disseminated online. Facebook defended its inclusion of these beheading videos which it claims do not show the graphic moment of beheading. But I, for one, saw videos of the beheading moment on Facebook. I even saw footage of the executioners putting the severed head on the torso of the dead. Even with a video without the moment of beheading, does it not "involve violence" and is it therefore not "graphic?" Moreover, she points out that there is a key difference between the videos of hostages being beheaded, and the images of self-immolation that she posted: Tibetans who burn themselves to death are not seeking death for their own sake but to call attention to the plight of the Tibetan people. They die so that the Tibetans as a people may live

in dignity. Those who took tremendous risk to videotape the self-immolation and to upload it online know perfectly that such videos will not be able to spread on Chinese websites, and they must be posted on websites in free societies such as Facebook for the world to see. When Facebook decides to delete the video to get rid of "graphic content," it renders the sacrifice of the self-immolator and the risk taken by the videographer as nothing. Is that what Facebook wants to accomplish? She concludes by posing an important question about Facebook's true motives here: On Facebook, videos of Tibetan self-immolations have not been censored before, and my friends argued that we have reason to worry that Facebook founder and CEO Mark Zuckerberg is compromising on defending users' freedom of expression as he seeks China's permission to allow Facebook in China, given that he visited Beijing two months ago and met with high-ranking Chinese officials, and that a couple of weeks ago, Mr. Zuckerberg received Lu Wei, China's Internet czar in Facebook's headquarters where he ingratiated himself to his guest by showing that he and his employees were reading [China's President] Xi Jinping's writings to learn about China. The view that Facebook is selling-out in order to ingratiate itself with the Chinese authorities is lent support by another story involving a Facebook post by a Chinese dissident, reported here by The New York Times: Amid growing censorship pressures around the world, Facebook suspended the account of one of China's most prominent exiled writers after he posted pictures of a streaking anti-government demonstrator. On Tuesday, the exiled writer, Liao Yiwu, said that he had received a notice from Facebook stating that his account had been temporarily suspended, and that it would be blocked permanently if he continued to violate the site's rules against nudity. Once again, the excuse for censorship is that it violated Facebook's rules. But that doesn't stand up to scrutiny: Mr. Liao said the case was not that simple. In an interview at his home in Berlin, the 56-year-old writer said he had covered up the genitalia of the streaker in the photo after people pointed out that it might violate Facebook rules. He cut out a picture of the former Chinese leader Mao Zedong and pasted it over the man's groin in the photo. His account was suspended several days after doing so. Taken together, these two cases certainly seem to indicate a new desire by Facebook to stay on the right side of the Chinese government by removing politically sensitive content, perhaps in the hope that it may be allowed to launch in China at some point. That's bad enough, but the situation is made worse by the company's feeble attempts to pretend otherwise.

China censors ISIS—Aff ends that censorship

Schrock January 21, **2015** (John Richard [Prof at Emporia State University]; Danger, dignity and decent; www.hayspost.com/2015/01/21/danger-dignity-and-decency/; kdf)

Within these last months in the U.S., we have seen Islamic State (ISIS) rebels recruit online. Hundreds of teenagers have left their homes to join the war in Iraq and Syria. The wimpy U.S. response was to produce counter online advertisements. Blocking those recruitment websites was not considered legitimate because it was "free speech." But other countries are willing to take action. Article 19 of the U.N. Universal Declaration of Human Rights recognized in the International Covenant on Civil and Political Rights asserts that "…everyone shall have the right to freedom of expression…" in speech, print, art or other media. However, Article 19 also explains that exercise of these rights may be "…subject to certain restrictions." Those limitations include respecting "…the rights or reputation of others" and "…the protection of national security or of public order, or of public health or morals." Foreign countries recognize the gray areas of free-speech. For instance, some European countries restrict libel of living persons on the Internet. And China has no qualms using their great firewall to block those Internet ISIS calls to come-and-kill. Why do we consider it a crime to threaten to kill another person in the U.S., but not a crime to recruit youngsters to kill people elsewhere?

Plan independently ends censorship

Plan sends a signal for internet freedom—causes a li

Gardner, 10

(Staff Editor & Reporter-Casino Gambling Web, 9/23, Gambling Regulations Will Help Obama's World Internet Freedom Mandate, http://www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html)

Gambling Regulations Will Help Obama's World Internet Freedom Mandate President Obama gave a speech today in front of the United Nations General Assembly, and his message

was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet, so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." **That statement may have been much better received had the US not had their own blocks on** Internet freedom. The **Internet gambling** industry currently is operating as a black market in the US due to the 2006 Unlawful Internet Gambling Enforcement Act. The law is a form of Internet censorship that Representative Barney Frank and other lawmakers have been trying to repeal. In the quest for Internet freedom, the US proclaims themselves as leaders, however, the country must be careful with their plea. **If the US can place Internet bans on certain industries, then little could be done to stop other countries from banning different industries or websites because of their beliefs.** For instance, in countries where religion is unified, there could be bans on any material that the country finds outside the rules of their particular religion. In other countries, bans could be placed on industries that are run largely by foreign operators. President Obama took a strong first step today by promoting Internet freedom. **The next step will be making sure the US leads by example, and one area to start would be by lifting the ban on Internet gambling.** The president has laid down the gauntlet, and **now it is time for him to follow his own lead.**

Internet—Competition

1nc Internet/Bandwidth

If the thesis of their advantage is true – that demand is already too high – companies would be upgrading now. All the aff does is spike a bandwidth crunch in the short term because broadband investments are long term.

No Internet collapse

Dvorak 2007 (John; Will the Internet Collapse?; May 1; www.pcmag.com/article2/0%2c2817%2c2124376%2c00.asp; kdf)

When is the Internet going to collapse? The answer is NEVER. The Internet is amazing for no other reason than that it hasn't simply collapsed, never to be rebooted. Over a decade ago, many pundits were predicting an all-out catastrophic failure, and back then the load was nothing compared with what it is today. So how much more can this network take? Let's look at the basic changes that have occurred since the Net became chat-worthy around 1990. First of all, only a few people were on the Net back in 1990, since it was essentially a carrier for e-mail (spam free!), newsgroups, gopher, and FTP. These

capabilities remain. But the e-mail load has grown to phenomenal proportions and become burdened with megatons of spam. In one year, the amount of spam can exceed a decade's worth, say 1990 to 2000, of all Internet traffic. It's actually the astonishing overall growth of the Internet that is amazing. In 1990, the total U.S. backbone throughput of the Internet was 1 terabyte, and in 1991 it doubled to 2TB. Throughput continued to double until 1996, when it jumped to 1,500TB. After that huge jump, it returned to doubling, reaching 80,000 to 140,000TB in 2002. This ridiculous growth rate has continued as more and more services are added to the burden. The jump in 1996 is attributable to the one-two punch of the universal popularization of the Web and the introduction of the MP3 standard and subsequent music file sharing. More recently, the emergence of inane video clips (YouTube and the rest) as universal entertainment has continued to slam the Net with overhead, as has large video file sharing via BitTorrent and other systems. Then VoIP came along, and IPTV is next. All the while, e-mail numbers are in the trillions of messages, and spam has never been more plentiful and bloated. Add blogging, vlogging, and twittering and it just gets worse. According to some expensive studies, the growth rate has begun to slow down to something like 50 percent per year. But that's growth on top of huge numbers. Petabytes. To date, we have to admit that the structure of the Net is robust, to say the least. This is impressive, considering the fact that experts were predicting a collapse in the 1990s. Robust or not, this Internet is a transportation system. It transports data. All transportation systems eventually need upgrading, repair, basic changes, or reinvention. But what needs to be done here? This, to me, has come to be the big question. Does anything at all need to be done, or do we run it into the ground and then fix it later? Is this like a jalopy leaking oil and water about to blow, or an organic perpetual-motion machine that fixes itself somehow? Many believe that the Net has never collapsed because it does tend to fix itself. A decade ago we were going to run out of IP addresses—remember? It righted itself, with rotating addresses and subnets. Many of the Net's improvements are self-improvements. Only spam, viruses, and spyware represent incurable diseases that could kill the organism. I have to conclude that **the worst-case scenario** for the Net is an outage here or there, if anywhere. After all, the phone system, a more machine-intensive system, never really imploded after years and years of growth, did it? While it has outages, it's actually more reliable than the power grid it sits on. Why should the Internet be any different now that it is essentially run by phone companies who know how to keep networks up? And let's be real here. The Net is being improved daily, with newer routers and better gear being constantly hot-swapped all over the world. This is not the same Internet we had in 1990, nor is it what we had in 2000. While phone companies seem to enjoy nickel-and-diming their customers to death with various petty scams and charges, they could easily charge one flat fee and spend their efforts on quality-of-service issues and improving overall network speed and throughput. That will never happen, and phone companies will forever be loathed. But when all is said and done, it's because of them that the Internet will never collapse. That's the good news. The bad news is they now own the Internet—literally—and they'll continue to play the nickel-and-dime game with us.

Optoelectronics innovation is resilient

NRC 12

National Research Council, principal operating agency of the National Academies, Winter 2012, "Optics and Photonics: Essential Technologies for Our Nation," 7-155

Those firms found that the lowest-cost option was to manufacture the discrete technologies in developing countries and abandon U.S. production of monolithically integrated technologies.49 It is not clear, however, that the apparent declines in monolithic-integration patenting in the firms that have moved production activities offshore **will necessarily lead to** a decline in overall innovation by U.S. firms in monolithic integration. Several start-up firms have emerged in the United States since 2000 that focus on monolithic-integration technologies. It is also possible that established U.S. optoelectronic component manufacturers that have kept fabrication in the United States will increase R&D and patenting in monolithic integration for optoelectronics. Finally, and perhaps most important, **firms outside telecommunications** and data communications, such as computing firms, may find it in their interest to develop monolithic-integration design and fabrication capabilities for communications applications, as evidenced by Intel's recent establishment of a silicon photonics design and fabrication facility at the University of Washington.

The case of optoelectronics components illustrates a strong relationship between the location of production activities by U.S. firms and the direction of these firms' innovative efforts. But the evidence presented in this case suggests that **the movement of optoelectronics-component production to non-U.S. locations has thus far not resulted in the "loss" by the U.S. economy of innovative capabilities** in monolithic integration. Instead, we observe that a different set of U.S. corporations (and universities) now have become active in this technological field.50,51

Aff does nothing to industry structure—Comcast outweighs

Sasso 9/4/14 (Brendan; FCC Chief: Cable Companies Are Wrong About Internet Competition; www.nationaljournal.com/tech/fcc-chief-comcast-is-wrong-about-internet-competition-20140904; kdf)

September 4, 2014 Most Americans lack any real choice in accessing high-speed Internet, the chairman of the Federal Communications Commission said Thursday. Comcast and other cable giants have argued that the industry is already plenty competitive. Consumers in many areas can choose to access the Internet from a DSL provider or on their smartphones, the cable companies argue. While FCC Chairman Tom Wheeler didn't mention Comcast by name, he said those other options don't deliver the speeds that consumers need today. To reliably stream high-definition video, as consumers expect, providers must deliver speeds of at least 25 megabits per second, Wheeler said. In most areas, that means the only option is the local cable company. "At 25 Mbps, there is simply no competitive choice for most Americans," the FCC chief said. "Stop and let that sink in**. Three-quarters of American homes have no competitive choice for the essential infrastructure for 21st century economics and democracy.** Included in that is almost 20 percent who have no service at all." The conclusion doesn't bode well for Comcast's bid to buy Time Warner Cable. The deal would unite the top two cable providers, creating a new behemoth controlling a large portion of the nation's high-speed Internet access. But Comcast frequently notes that its network doesn't overlap with Time Warner Cable, meaning the merger would not actually create fewer choices for any consumers. Comcast didn't respond to a request to comment. The speech could also have implications for the agency's net-neutrality regulations. Wheeler noted that, historically, the absence of competition has "forced the imposition of strict government regulation in telecommunications." But he made it clear that he would prefer a competitive market with light regulation than heavy regulation of monopolies. One of the consequences of past monopoly regulation was the "thwarting of the kind of innovation that competition stimulates," Wheeler said.

Fiber solves bandwidth

Forrest, 14 - Staff Writer for TechRepublic. (Conner, "Google's Fiber lottery: Predicting who's next and how Google picks winners" Tech Republic, http://www.techrepublic.com/article/the-google-fiber-lottery/)

Bandwidth is a serious issue for these kinds of small businesses, as well as entrepreneurs and highly-connected families. Mobile data, streaming video, and advances in cloud services have put tremendous demands on bandwidth, and with internet service providers experimenting with bandwidth throttling and bandwidth caps, it threatens to make internet usage a constrained resource.

Google, of course, wants people and companies to use the internet like it's a unlimited resource, because as the web's largest internet advertising company, it makes more money the more everyone uses the internet.

Google Fiber is tackling this problem by putting a new face on a decades-old technology with the hopes of using it to bring gigabit internet into businesses and homes -- that's **over 10 times the capacity** of most of today's internet connections in US homes and small businesses. No new internet product has generated as much excitement in the technology world as Google Fiber. It has piqued the interest of average consumers and left techies salivating.

When Google Fiber started in Kansas City, Kansas in 2012, it was difficult to determine how serious the search giant was about disrupting the US internet. In 2013, it expanded the experiment to Austin, Texas and Provo, Utah, and the possibility began to emerge that this was going to be a real thing. Google even released a checklist for potential Fiber cities. According to William Hahn, a principal analyst at Gartner, it's hard to tell exactly what Google is up to.

"It's like those murder mysteries. The suspect would act exactly the same way, whatever their motive, up to this point," Hahn said. "If they were trying to take a look at people's data and play in the sandbox, and were willing to subsidize for that reason, it would look a lot like them trying to spur competitive response from the CSPs."

However, in 2014, Google suddenly looked a lot more serious about Fiber when it announced plans to bring Fiber to 34 cities. That sounds a little more ambitious than it really is. It's actually only nine metro areas, but it's still a major expansion of Google's Fiber plans.

The internet's not key to any facet of the international order – their authors inflate the threat

Ortagus '14

[Megan, Master's in International Security from Johns Hopkins. May 2014,"The Internet's Impacts on Power Differentials in Security and Conflict", master's thesis submitted to Johns Hopkins University, https://jscholarship.library.jhu.edu/bitstream/handle/1774.2/37255/ORTAGUS-THESIS-2014.pdf?sequence=1]

It is quite remarkable how ICT has transformed commerce, global communications, and societal interactions so dramatically in only twenty years since the modern Internet became widely accessible to individuals. As a result, all states are presented with unprecedented security vulnerabilities, and their response to shifting power differentials is paramount. This has led many analysts to proclaim that power differentials have fundamentally changed and that cyberspace ultimately will render other forms of warfare irrelevant. However, the Internet has **neither fundamentally altered human nature** nor **the desires and competitions that fuel conflict**; it is transforming the experience of conflict, although not necessarily the outcomes. This thesis has found no conclusive data to support the notion that ICT is concurrently revolutionizing interstate, intrastate or extrastate conflict to the point whereby a weaker adversary can achieve a desired political outcome through the unique use of cyberspace. If this were the case, one would expect to see VNSAs, dissident movements, and fragile states solely using the Internet to prevail against their more powerful adversaries. At present there are **no such cases**. To the contrary, dominant nation states (especially authoritarians) have used ICT in concert with traditional security forces to defeat those who challenge the normal order. The prediction that the fifth domain will make other forms of warfare irrelevant, or that the Internet provides a competitive advantage for dissidents and terrorists, **has not yet come to fruition**. While cyberspace adds a new virtual dimension to conflict, much like airpower added a third dimension to military conflict after World War I, cyber weapons have not yet developed to the point where they can replace weaponry in the physical domains. Some experts argue that they never will. To extend the air power analogy further, aerial systems first provided unparalleled reconnaissance capabilities before evolving into their more famous roles delivering deadly payloads. Today, cyber weapons are **significantly limited and cyber warfare has not proven to be an adequate substitute for an air force, let alone an occupying force**. Although as technology advances, cyber weapons could transform from auxiliary to decisive in combat, much like airpower. Alternatively, cyber warfare could be relegated to a category similar to chemical warfare: it inspires serious concerns,

but has not affected the global balance of power. The latter appears more likely because of the Internet's **inherent limitations in affecting the physical world**.

--XT Squo Solves/Google Fiber

Telecom is answering demand now—fiber will go national no matter what the aff does

Canon, 14 (Scott, "AT&T might challenge Google Fiber with high-speed Internet service in KC" Kansas City Star, 4/21,

Read more here: http://www.kansascity.com/news/business/article346078/ATT-might-challenge-Google-Fiber-with-high-speed-Internet-service-in-KC.html#storylink=cpy)

AT&T Inc. took a swing at Google Inc. on Monday.

The telecommunications behemoth announced it may challenge the Internet search titan on turf that is new to both — the sale of **industrial-strength Internet hookups** to the home.

Both might soon fight over bandwidth-hungry customers in Kansas City. AT&T said the market is one of 24 it is considering for expansion of broadband speeds reaching 1 gigabit per second. That would be nearly 100 times faster than the national average for home consumers.

The two companies had already begun a low-stakes tussle over the fledgling market for high-speed household Internet connections in Austin, Texas.

AT&T's move Monday **signaled a push to nationalize the market**, possibly leapfrogging Google Fiber.

For years, the home Internet business has been the domain of phone and cable TV companies that typically said they saw little evidence that ordinary consumers wanted so much broadband.

Google Fiber was seen as an attempt to goad those companies into offering swifter Internet connections. If AT&T takes such a service nationwide, upgrading its U-verse into a service called GigaPower, the **rest of the industry could follow suit**.

"The scope of this effort simply takes your breath away," said technology industry analyst Jeff Kagan. "This is the most ambitious plan we have seen to date."

Cities that want AT&T, the company suggested, should consider cutting regulatory red tape the way thatKansas City-area communities have for Google Fiber.

Google Fiber boosts innovation in every provider and it's expanding rapidly

Conner, 14 - I am an entrepreneur and communications expert from Salt Lake City, and I am the founder of Snapp Conner PR. I am also a frequent author and speaker on Business Communication (Cheryl ,"Google Fiber Plans Expansion To 34 New Cities (Including Salt Lake)" Forbes, http://www.forbes.com/sites/cherylsnappconner/2014/02/20/google-fiber-plans-expansion-to-34-new-cities-including-salt-lake/)

The race for the Internet gigabit space took another leap forward this week with Google GOOG +0.85% Fiber's announcement that it has targeted 34 more cities in 9 metro areas for access to Google internet services at the increasingly popular 1Gps speed.

Salt Lake City is one of the additional regions Google is considering for network expansion along with additional cities in Arizona, California, Georgia, Tennessee, North Carolina, Oregon and Texas. (Google Fiber's blog announcement includes a comprehensive list of the 34 additional sites in all states.)

Google expects to give final selection decisions to the 34 new candidate locations by the end of the year. Of particular note to cities vying for future expansion, much of Google's choice for current candidates is dependent on cities' ability to conduct their own legwork. Cities with existing infrastructure that is pervasive and documented can gain a leg up in getting their infrastructure maps in order and making it faster and easier for Google to make permit requests, knowing the company can put its fiber on the cities' existing Internet poles.

By targeting cities with existing infrastructure, Google is not only able to move forward more quickly, but is able to minimize the disruption to recipient cities that is caused by digging up streets to establish new conduits, the company said.

Of the selections, Google representative Angie Welling told representatives of Salt Lake City, "Google chose to work with Salt Lake City because of how tech-savvy the area is. Google would love to see what local entrepreneurs would do with a high-speed gig connection."

While Google has previously said that Google Fiber's launch is meant to also spur the growth of competitive platfoms from other providers, the company's fast expansion is making Google itself a bigger competitive force than before. As I have previously reported, Chattanooga Tenn., has built its own ultra high speed fiber network, and AT&T T +1.12% has launched a similar offering in Austin, Texas, after Google's announcement of plans to provide services there.

*It's changing the **entire** industry*

Barr, 14 – staff at WSJ (Alistair, "Google Fiber Is Fast, but Is It Fair?" Wall Street Journal, http://online.wsj.com/articles/google-fuels-internet-access-plus-debate-1408731700)

Frustrated by the hammerlock of U.S. broadband providers, Google Inc. GOOGL +0.92% has searched for ways around them to provide faster Internet speeds at lower cost, via everything from high-speed fiber to satellites.

In the process, **it is changing how next-generation broadband is rolled out.**

Telecom and cable companies generally have been required to blanket entire cities, offering connections to every home. By contrast, Google is building high-speed services as it finds demand, laying new fiber neighborhood by neighborhood.

Others including AT&T Inc. T +1.12% and CenturyLink Inc. CTL +0.59% are copying Google's approach, underscoring a deeper shift in U.S. telecommunications policy, from requiring universal service to letting the marketplace decide.

--XT No Bandwidth Crisis

No total collapse – too decentralized

Jonathan **Strickland**, 10 February 20**10** senior writer for Discovery's How Stuff Works, "What would happen if the Internet collapsed?" . HowStuffWorks.com. <http://computer.howstuffworks.com/internet/basics/internet-collapse.htm>

Here's the good news -- a total collapse of the Internet would be almost impossible. The Internet isn't a magic box with an on/off switch. It's not even a physical thing. It's a collection of physical things and it's constantly changing. The Internet isn't the same entity from one moment to the next -- machines are always joining or leaving the Internet. It's possible for parts of the Internet to go offline. In fact, this happens all the time. Whether it's a particular server that crashes and needs to be rebooted or replaced or a cable under the ocean gets snagged by an anchor, there are events that can disrupt Internet service. But the effects tend to be isolated and temporary. While there is such a thing as the Internet backbone -- a collection of cables and servers that carry the bulk of data across various networks -- it's not centralized. There's no plug you could pull out from a socket or a cable you could cut that would cripple the Internet. For the Internet to experience a global collapse, either the protocols that allow machines to communicate would have to stop working for some reason or the infrastructure itself would have to suffer massive damage. Since the protocols aren't likely to stop working spontaneously, we can rule out that eventuality. As for the massive damage scenario -- that could happen. An asteroid or comet could collide with the Earth with enough force to destroy a significant portion of the Internet's infrastructure. Overwhelming gamma radiation or electromagnetic fluctuations coming from the sun might also do the trick. But in those scenarios, the Earth itself would become a lifeless hulk. At that stage it hardly matters whether or not you can log in to MySpace.

Demand not growing fast enough to cause collapse – consensus

Leslie **Daigle et al** 20**10**; Internet Society Chief Internet Technology Officer; Internet Society briefing paper, Growing Pains: Bandwidth on the Internet http://www.isoc.org/isoc/conferences/bwpanel/docs/bp-growingp-201003-en.pdf

The Internet is continuously evolving. Some of the more profound recent changes have been caused by the impact of broadband access networks. In the last decade, the number of broadband subscribers worldwide has grown over one hundred times. Widespread broadband deployment has led to tremendous innovation in Internet applications and huge increases in the average amount of bandwidth consumed per user. The effects of these changes are now being felt around the globe. Stimulated by a recent panel event organized by the Internet Society, we present the results of several recent studies, which, when combined represent the most detailed and comprehensive picture of the contemporary Internet available today. These studies show a consensus emerging about the gross amount of bandwidth being used on the Internet, and the growth trends. The panel event hosted discussion of the impacts of growth and application innovation on Internet service providers, and some of the actions that the technical community is taking to address these 'growing pains'. We draw a number of conclusions from the data and the discussion: • The growth of Internet bandwidth globally is not about to cause global problems. International and intercarrier links are not, in general, unable to cope with the demands of growing bandwidth consumption.

Your impacts are consistently and hilariously empirically denied – prefer our evidence

Leslie **Daigle et al** 20**10**; Internet Society Chief Internet Technology Officer; Internet Society briefing paper, Growing Pains: Bandwidth on the Internet http://www.isoc.org/isoc/conferences/bwpanel/docs/bp-growingp-201003-en.pdf

It is a truism that the Internet has grown tremendously since its inception, both in the scale of the physical internetwork that underpins it and the scope of activity that it supports. The invention and widespread dissemination of Internet technology marks an inflection point in human civilization arguably as great as that wrought by Johannes Gutenberg. Unsurprisingly, given this sudden, striking, and profound change, doom-laden predictions for the future of the Internet have never been hard to find. In addition to concerns about the impact on human social norms and the implications for economic activity, there have been regular forecasts of impending catastrophe based on fears that the technology itself is simply unable to support the huge growth curve it has experienced and is experiencing.

ISP's exaggerate massive data costs – internet traffic add tiny cost

Barry **Collins** (writer for PC Pro) October **2011** "ISPs "exaggerate the cost of data"" http://www.pcpro.co.uk/news/broadband/370393/isps-exaggerate-the-cost-of-data

SPs are over-egging the costs of meeting the ever-increasing demand for data, according to a new report. Both fixed and mobile providers have claimed that increased internet traffic has resulted in "ballooning" costs for networks. Some ISPs have argued that content providers should pay them to help meet the cost of supplying bandwidth-intensive services such as the BBC iPlayer. However, a new report commissioned by content providers - including the BBC, Channel 4 and Skype - claims the costs of delivering additional internet traffic have been wildly exaggerated by the ISPs. "Traffic-related costs are a small percentage of the total connectivity revenue, and despite traffic growth, this percentage is expected to stay constant or decline," claims the report, written by telecoms experts Plum Consulting. The report claims the cost of delivering additional gigabytes of data are **mere pennies**. "Studies in Canada and in the UK... put the incremental cost of fixed network traffic at around €0.01-0.03 per GB." The report concedes that the cost of adding capacity on mobile networks "are significantly higher than they are for fixed networks" because "the radio-access network is shared by users". However, it claims forthcoming 4G technologies will significantly reduce those costs. "Forward-looking estimates which take account of the transition to LTE [Long Term Evolution], additional spectrum and traffic subscriber growth... puts the cost to the mobile network operators at under €1 per GB," Plum Consulting claims. As the report states, that cost is "well below existing smartphone data tariffs of around €10 per GB". Describing claims of ballooning costs as a "myth", the report concludes that "for fixed networks, traffic-related costs are low, falling on a unit basis and likely to fall overall given declines in traffic growth and on-going cost-reducing technical progress".

Telecoms solve bandwidth crunch now – status quo momentum sufficient

David **Goldman** (writer for CNN Money) February **2012** "4 ways to stave off the cell phone apocalypse" http://money.cnn.com/2012/02/24/technology/spectrum_crunch_solutions/index.htm

It's easy to get frustrated about the effects of the spectrum crunch. Higher bills, fewer choices, and dismal service are enough to make even the casual cell phone customer furious. Making things worse, none of the solutions for easing the spectrum shortage are inexpensive or easy. There's no catch-all fix on the horizon. The good news, though, is that options exist -- and carriers understand that doing nothing would be disastrous. Here are the four primary ways they're going about staving off a spectrum crisis and the resulting cell phone apocalypse. Reusing spectrum: One way to relieve capacity jams is "cell splitting," which involves either adding more cell sites or adding

more radios to existing sites to increase the number of connections that a network can handle. The problem is that it's expensive and tricky. "It would seem to some people that you could infinitely reuse the spectrum you already have," says Dan Hays, a partner at PricewaterhouseCoopers' consultancy. "The reality is a bit more complicated." As the number of bandwidth-hogging smartphones and tablets increases, carriers have to deploy more and more towers. They face practical hurdles: no one wants a new antenna in their backyard. Interference is also a growing problem as more towers get added. There are, however, some **innovative solutions** being developed.

No short-term collapse – and your impacts are unsupported paranoia

Leslie Daigle et al 2010; Internet Society Chief Internet Technology Officer; Internet Society briefing paper, Growing Pains: Bandwidth on the Internet
http://www.isoc.org/isoc/conferences/bwpanel/docs/bp-growingp-201003-en.pdf

At the macro level, bandwidth pressures at the international and intercarrier level would cause regional problems. As described earlier, this does not appear to be on the horizon because **gross traffic growth is not going to exceed the anticipated growth in global network capacity anytime soon**. While the Internet did experience episodes of 'congestion collapse' more than 20 years ago, the mechanisms implemented at that time to address the problem have largely stood the test of time. Despite this, rumours of imminent network meltdown are never far away.

Growth scenarios are exaggerated by the IT industry – be skeptical

Peter Sevcik 2001; President of NetForecast in Andover, MA, and is a leading authority on Internet traffic, performance and technology Internet Bandwidth: It's Time for Accountability Net Forecasts – Peter J. Sevcik BCR Volume 31, Number 1 January 2001
http://www.netforecast.com/Articles/bandwidth%20supply.pdf

The Internet has not been doubling every 3.5 months, despite what you might hear. Figure 1 shows how far off that hyper-growth scenario is. But the myth continues because it's useful -- it helps get money out of investors and keep stock prices inflated. The realistic choices facing planners and investors is reflected in Scenarios A and B in Figure 1. Looking at the evidence and evaluating the chances for those scenarios, I think that Scenario A will prevail in 2001. The industry's in for a tough year; we're more likely to see pessimism doubling every 3.5 months over the prospects for the Internet economy rather than bandwidth doubling. However, long term, I think that Scenario B will emerge as the winning end game. It's ironic that one of the major benefits of the 'Net - information transparency -- manifests itself in many parts of the economy more than in the Internet business itself. The data in Figure 1 is very difficult to gather and compile; it represents the best I could do from the sketchy data available. Most industry players have an incentive to keep this data secret in order to bolster their market positions. Similarly, the market research firms that continually issue glowing reports, seem to place a higher value on loyalty to their clients than to realistic assessment of the situation. If we try to keep Internet planners and investors in the dark, the New Economy will be adopting some of the worst characteristics of the Old Economy. It's time for Internet service providers to supply data about their capacity and demand to an impartial group that will compile and share it with the public. It is time for accountability.

--XT Innovation Inev

University research solves

NRC 12

National Research Council, principal operating agency of the National Academies, Winter 2012, "Optics and Photonics: Essential Technologies for Our Nation," 7-155

In contrast with the pattern of innovation, entry, and early-stage growth of many of these technologies in the 1950s and 1960s, the new technological possibilities are being pursued by start-up firms, often in collaboration with U.S. government laboratories or universities (see Figure 7.5, which shows **the growing role of U.S. universities in optoelectronics** patenting). Moreover, the U.S. defense market often is a less central source of demand for innovative technologies. The new approach to technology development that **relies more heavily on universities** and small and medium-size firms for innovation, in which VC funding plays a more important role, may increase the importance of mechanisms to support cross-industry and cross-institutional coordination in helping the United States to maintain leadership in photonics innovation.

Innovation high and inevitable

Vivek **Wadhwa 14**, fellow at the Rock Center for Corporate Governance at Stanford University, director of research at the Center for Entrepreneurship and Research Commercialization at Duke's engineering school and distinguished scholar at Singularity and Emory universities, "How the United States is reinventing itself yet again", 1/2/14, http://www.washingtonpost.com/blogs/innovations/wp/2014/01/02/how-the-united-states-is-reinventing-itself-yet-again/

And that's not all the pessimists say. They also argue that while the United States continues to dominate in the emergence of new technology powerhouses, the biggest IPO of the decade belongs to Facebook, a social network that is more media company than technology innovator. Stifling red tape and regulations has driven costs of testing new medicines and medical devices so high that many drug companies have shifted testing regimes and market focus to Europe and Asia. Despite mounting evidence that skilled immigrant entrepreneurs have delivered a wildly disproportionate share of the country's technology innovation and technology job growth, the powers that be in Washington, D.C. have, even with broad bipartisan support, not mustered up the votes to reform the country's regressive and punitive immigration policies. Add to all of this an aging populace requiring more and more support from younger workers, ballooning health costs and a tax structure that beggars the young to underwrite benefits for the aged, and the United States looks more and more like a historical footnote than a superpower.¶ Peel back the layers of the onion, and **the reality appears quite different**. In fact, the United States stands on the cusp of a dramatic revival and rejuvenation, propelled by an **amazing wave of technological innovation**. A slew of breakthroughs will deliver the enormous productivity gains and the societal dramatic cost savings needed to sustain economic growth and prosperity. These breakthroughs, mostly digital in nature, will complete the shift begun by the Internet away to a new era where the precepts of Moore's Law can be applied to virtually any field.¶ Computer-assisted design and fabrication will reshape manufacturing forever. These technologies will slash waste and replace nearly all conventional manufacturing with more environmentally friendly and cost-effective additive manufacturing run with robots and computer programs. Complex systems resistant to modeling will succumb to advances in big data that allow mankind to finally make sense and improve upon the most intricate multi-faceted interactions. Where big data fails, ubiquitous crowd sourcing will harness untapped brain cycles to train systems and solve problems, one small activity at a time — on a global scale.¶ In this massively digital world, A/B testing or parallelization of R&D

processes will become commonplace for just about everything from airline design simulations to online advertising to artificial organ construction. This will, in turn, allow for far more rigorous testing of products and processes. Dirt-cheap digital delivery platforms for educational content and improvements in the understanding of the way the brain learns will yield a sea change in how we gain knowledge. This will result in more open, flexible educational systems and structures — and a smarter, more learned, constantly learning populace. While the world will benefit from these changes, the United States is **uniquely positioned to lead** this sea change.

--XT Comcast Thumper

Comcast's monopoly over the internet trumps

Lee 2014 (Timothy B [senior editor at Vox]; Comcast is destroying the principle that makes a competitive internet possible; May 6; www.vox.com/2014/5/6/5678080/voxsplaining-telecom; kdf)

Conservatives love the internet. They don't just love using it, they also love to point to it as an example of the power of free markets. And they're right. The internet has had a remarkable 20-year run of rapid innovation with minimal government regulation. That was possible because the internet has a different structure than other communications networks. Most networks, like the 20th century telephone market, are natural monopolies requiring close government supervision. But the internet is organized in a way that allows markets, rather than monopolists or government regulators, to set prices. That structure has been remarkably durable, but it's not indestructible. And unfortunately, it's now in danger. In recent years, Comcast has waged a campaign to change the internet's structure to make it more like the monopolistic telephone network that came before it, making Comcast more money in the process. Conservatives are naturally and properly skeptical of government regulation. But this is a case where the question isn't whether to regulate, but what kind of regulation is preferable. If federal regulators don't step in now to preserve the structures that make internet competition possible, they will be forced to step in later to prevent the largest ISPs from abusing their growing monopoly power.

Comcast is the biggest internal link to internet competition

Lee 2014 (Timothy B [senior editor at Vox]; Comcast is destroying the principle that makes a competitive internet possible; May 6; www.vox.com/2014/5/6/5678080/voxsplaining-telecom; kdf)

The importance of market share Two factors tend to make the bill-and-keep model stable. One is competition in the consumer ISP market. If customers can easily switch between broadband providers, then it would be foolish for a broadband provider to allow network quality to degrade as a way to force content companies to the bargaining table. The second factor is ISP size. When ISPs are relatively small, payments naturally flow from the edges of the network to the middle because small edge networks need large transit networks to reach the rest of the internet. Imagine, for example, if the Vermont Telephone Company, a tiny telecom company that recently started offering ultra-fast internet services, tried to emulate Comcast. Suppose it began complaining that Netflix was sending it too much traffic and demanding that its transit providers start paying it for the costs of delivering Netflix content to its subscribers. Netflix and the big transit companies that provide it with connectivity would laugh at this kind of demand. It would be obvious to everyone that VTel needs transit service more than transit providers need VTel. But when an ISP's market share gets large enough, the calculus changes. Comcast has 80 times as many subscribers as Vermont has households. So when Comcast

demands payment to deliver content to its own customers, Netflix and its transit suppliers can't afford to laugh it off. The potential costs to Netflix's bottom line are too large. This provides a clear argument against allowing the Comcast/Time Warner merger. Defenders of the merger have argued that it won't reduce competition because Comcast and Time Warner don't serve the same customers. That's true, but it ignores how the merger would affect the interconnection market. A merged cable giant would have even more leverage to demand monopoly rents from companies across the internet. A century ago, the Wilson administration decided not to press its antitrust case against AT&T, allowing the firm to continue the acquisition spree that made it a monopoly. In retrospect, that decision looks like a mistake. Wilson's decision not to intervene in the market led to a telephone monopoly, which in turn led to 70 years of regulation and a messy, 10-year antitrust case. Obviously, the combination of Comcast and Time Warner would not dominate the internet the way AT&T dominated the telephone industry. But **recent events suggest that Comcast is already large enough to threaten competition on the internet**. Preventing the company from getting even larger might avoid the need for a lot more regulation in the years ahead. Comcast declined to comment for this story.

1nc Military Bandwidth

Either tech development in the squo solves because of demand for Netflix, Facebook, etcetera OR the plan makes it worse because it rapidly increases demand on the networks before capacity can be ramped up, turning the aff

New DOD initiatives solve

Slabodkin February 23, 20**15** (Greg; JIE: How DOD is building a bigger network that's alos a smaller target; defensesystems.com/Articles/2015/02/23/Joint-Information-Environment-JRSS-security.aspx?Page=4; kdf)

Dave Cotton, DOD's acting deputy CIO for information enterprise, who is responsible for providing the leadership, strategy, and guidance for JIE, said that the JRSS foundational layer includes network standardization and optimization across DOD networks, such as increasing bandwidth capabilities where necessary and switching upgrades through Multi-Protocol Label Switching (MPLS) technology. MPLS, which enables higher bandwidth/throughput and faster routing capabilities, allows the department to "stop leasing circuits and get away from the legacy-based circuits to a more IP-based infrastructure," he said. "That provides the foundation then to put the security component in place." MPLS routers are an industry-standard for speeding and managing network traffic flow. JRSS is prompting a massive effort to expand capacity and increase throughput across Army and Air Force bases with MPLS upgrades to the network backbone that will increase the bandwidth to 100 gigabytes per second. According to Cotton, MPLS also enables DOD to route and secure network traffic for a specific mission instead of just for a particular location, resulting in more focused and coherent command and control for missions. Unlike the one-size-fits-all networks that DOD currently operates, he says the JIE will provide operational commanders more freedom to take cybersecurity risks with the networks since the risks can be contained to the decision support and systems specifically needed for that mission. **This is a significant change from today's DOD networks** which impose more operational constraints on commanders. The risk containment zones the SSA defines in the server computing and the network will enable joint commanders to better contain cyber risks assumed by a particular mission from spilling over into other missions, while sharing as broadly with external partners as a mission requires, Cotton said. In addition, users and systems will be able to trust their connection with the assurance that the information and systems involved in a mission are correct and working even during a cyberattack. Based on a single DOD-wide IT architecture and key enabling enterprise services, JIE is "a more secure, defendable, responsible, and more command and controllable, integrated network for the Department of Defense information exchange environment," Cotton said. The idea is to bring together all the capabilities that will enable "a more coherent, more secure, interoperable and less costly capability"—efficiencies that will be achieved through economies of scale and eliminating duplication. A big part of that is cloud computing, which is a critical component of the JIE and DOD's IT modernization efforts.

New suitcase internet set up solves

McCaney June 5, 20**14** (Kevin; Army boosts bandwidth with new suitcase-sized satellite terminals; defensesystems.com/articles/2014/06/05/army-t2c2-high-bandwidth-satellite-terminals.aspx; kdf)

Portable network access for soldiers in the field is about to get a lot faster with the Army's latest satellite kit in a suitcase. The Transportable Tactical Command Communications, or T2C2, boosts the bandwidth for small detachments and teams connecting to the Army's battlefield network, thus increasing the situational awareness and functionality of early-entry teams and helping to improve communications throughout the tactical edge, the Army said in a release. T2T2 comes in two flavors: a larger transportable dish that serves company-level operations and the smaller T2C2 Lite, which the Army said is about the size of carry-on luggage and which can be set up and working in about 10 minutes. The small model is similar to the Global Rapid Response Information Package, or GRRIP, which soldiers have been using in Afghanistan, for example, as network infrastructure leaves with the drawdown. But GRIPP uses only the L Band in the satellite communications spectrum, limiting transmission to kilobits per second. T2C2 Lite adds the Ka and X bands, boosting performance to megabits per second and allowing soldiers to use advanced applications. Last month, T2C2 was designated a program of record (GRRIP is not), enabling the Army to institutionalize training on the system. The equipment connects to the Army's battlefield network, the Warfighter Information Network-Tactical, via the military's Wideband Global SATCOM constellation, and will work as a companion to the Enroute Mission Command Capability, a WIN-T program that gives rapid-response forces a view of their drop zones and allows for mission planning while in flight. For the Army, the bigger bandwidth, combined with T2C2's portability, advances the cause of seamless, mobile battlefield communications.

New antennas solve

Hamilton 2015 (Alex; US Army's new high bandwidth inflatable antenna; Jan 11; www.governmentfishbowl.com/2015/01/11/us-armys-new-high-bandwidth-inflatable-antenna/; kdf)

The US Army deployed an inflatable ground satellite antenna that comes in a small package for simple deployment. CHECK OUT: U.S. Naval Ships Now Shoot Lasers The theater of war has shifted from massive armies confronting each other over vast tracts of land to more isolated "surgical" engagements. As much a battleground as land, sea and air, control of the digital spectrum is vital to military dominance. To assist in anywhere access to key networks, enter Project Manager Warfighter Information Network-Tactical (WIN-T), home of the inflatable satellite antenna used by Special Operations, airborne and conventional forces. Blown Into Proportion The communications device is known as Ground Antenna Transmit & Receive (GATR). The inflatable antenna can adjust in size, weight and power, conforming to the needs of military personnel. Leonard Newman, the Army product manager for Satellite Communications said, "The GATR allows you to deploy high-bandwidth communications anywhere in the smallest possible package." It weighs just 25 pounds and inflates into a sphere for resistance of wind up to 60 mph (97 kph). It also boasts a 6 hour backup battery. The setup takes just 30 minutes.

Internet—Freedom

1NC AT: Internet Freedom – terminally impossible

Private companies and algorithms ensure Internet freedom is literally impossible

Maus 2015 (Gregory; Eye in the Skynet; Jul 1; https://www.foreignaffairs.com/articles/china/2015-07-01/eye-skynet; kdf)

Dictators constantly face a dilemma: crushing dissent to terrify (but anger) the populace or tolerating protests and offering reforms to keep the public at bay (but embolden dissidents in the process). Instead of relying on gut instinct, experience, or historical precedent, autocrats now have advances in data analytics and ubiquitous passive data to thank for letting them develop new, scientifically validated methods of repression. By analyzing the dynamics of resistance with a depth previously impossible, autocrats can preemptively crush dissent more reliably and carefully. With machine learning and social network analysis, dictators can identify future troublemakers far more efficiently than through human intuition alone. Predictive technologies have outperformed their human counterparts: a project from Telenor Research and MIT Media Lab used machine-learning techniques to develop an algorithm for targeted marketing, pitting their algorithm against a team of topflight marketers from a large Asian telecom firm. The algorithm used a combination of their targets' social networks and phone metadata, while the human team relied on its tried-and-true methods. Not only was the algorithm almost 13 times more successful at selecting initial purchasers of the cell phone plans, their purchasers were 98 percent more likely to keep their plans after the first month (as opposed to the marketers' 37 percent). Comparable algorithms to target people differently have shown promise somewhat more ominously. For example, advanced social network algorithms developed by the U.S. Navy are already being applied to identify key street gang members in Chicago and municipalities in Massachusetts. Algorithms like these detect, map, and analyze the social networks of people of interest (either the alleged perpetrators or victims of crimes). In Chicago, they have been used to identify those most likely to be involved in violence, allowing police to then reach out to their family and friends in order to socially leverage them against violence. The data for the models can come from a variety of sources, including social media, phone records, arrest records, and anything else to which the police have access. Some software programs along this line also integrate geo-tags from the other data in order to create a geographic map of events. Programs like these have proven effective in evaluating the competence of Syrian opposition groups, in identifying improvised explosive device creation and distribution networks in Iraq, in helping police target gangs, and in helping police better target criminal suspects for investigation. Related breakthroughs in computer algorithms have proven effective in forecasting future civil unrest. Since November 2012, computer scientists have worked on Early Model Based Event Recognition using Surrogates (EMBERS), an algorithm developed with funding from the Intelligence Advanced Research Projects Activity that uses publicly available tweets, blog posts, and other factors to forecast protests and riots in South America. By 2014, it forecasted events at least a week in advance with impressive accuracy. The algorithm learned steadily from its successes and failures, adjusting how it weighed variables and data with each successive attempt. In Russia, the pro-Kremlin Center for Research in Legitimacy and Political Protest think tank claims to have developed a similar software system, called Laplace's Demon, which monitors social media activity for signs of protest. According to the center's head, Yevgeny Venediktov, social scientists, researchers, government officials, and law enforcement agencies that use the system "will be able to learn about the preparation of unsanctioned rallies long before the information will appear in the media." Venediktov considers the tool a vital security measure for curbing protests, stating, "We are now facing a serious cyber threat—the mobilization of protest activists in Russia by forces located abroad," necessitating "active and urgent measures to create a Russian system of monitoring social networks and [develop] software that would warn Russian society in advance about approaching threats." Authoritarian governments, of course, have access to much more data about their citizens than a telecom company, a local police department, or Laplace's Demon could ever hope for, making it all the easier for them to ensure that their people never escape the quiet surveillance web of trouble-spotting algorithms. Classic Orwellian standbys such as wiretapping, collecting communication metadata, watching public areas through cameras (with ever-improving facial recognition), monitoring online activity (especially true in China, which has direct control over network providers and surveillance tools built directly into social media services), tracking purchase records, scanning official government records, and hacking into any computer files that cannot be accessed directly will become only more effective through the use of new technologies and algorithms. There are many new surveillance methods available at the touch of a button. For example, former Ukraine President Viktor Yanukovych sent a passive-oppressive mass text to those near a protest, warning them that they were registered as participants in a mass riot. Governments can monitor their citizens' locations through their phones, and the future of tracking people through wearable computers and smart appliances is still on the way. With a steady stream of data available from nearly every citizen, automated sifters such as EMBERS can steadily learn which data are valuable and prioritize appropriately. Machines have already shown that they are competent in deriving a variety of private traits through Facebook likes, using social media profiles to forecast whether groups will stick together, identifying personality traits through phone data and Twitter activity, determining the stage of one's pregnancy through purchase behavior, or ascertaining how likely one is to take a prescribed medication based on a variety of seemingly unrelated factors. At the same time that mass surveillance is becoming less obtrusive, outright mass censorship, once a standby tool of repressive regimes worldwide, may have a more effective alternative thanks to analytics. Not only can blatant censorship provoke a backlash, it also complicates the

ability of states to monitor their people by encouraging them either to use communication channels that are harder to watch or to figure out how to cleverly evade notice by using coded language or symbols. The Grass-Mud Horse, for example, is an entirely fictional creature popularized on the Chinese Internet because its pronunciation sounds like an incredibly vulgar swear word that the Communist Party's automatic censors would normally catch. However, the text itself seems harmless, so the censors couldn't easily clamp down on it. Indeed, Chinese Internet users have developed very extensive systems of code phrases to evade the automated detection of certain sentiments. Authoritarian regimes have been getting smarter at how they influence the public dialogue. Russia boasts a well-organized army of paid anonymous online commenters. These agents seek to covertly influence opinion both internally and internationally, posting on Russian and English forums and social media outlets that feature news about the nation, items on Ukraine, or criticisms of Russian President Vladimir Putin. Reports also link the group to attempts to manipulate global opinion of U.S. President Barack Obama, as well as the perpetuation of several serious online hoaxes, including false reports in the United States of a chemical plant explosion, an Ebola virus outbreak, and the lethal shooting of an unarmed black woman by police in the wake of the shooting in Ferguson, Mo.

--XT Algorithms t/o solvency

Governments will never cede control

Maus 2015 (Gregory; Eye in the Skynet; Jul 1; https://www.foreignaffairs.com/articles/china/2015-07-01/eye-skynet; kdf)

The ability of autocrats to fend off regime change may be refined further through careful analysis of how news and ideas spread. Academics have been able to track the diffusion of ideas (automatically clustering distinctive words and phrases into unified memes) across millions of news sites since 2009 and have since been creating quantitative models of the diffusion. Since 2012, scholars have developed mathematical models to infer how information flows from one group to another across millions of blogs and news sites, without even having direct intelligence on how it was transmitted. These breakthroughs can be used to turn phone metadata and online activity into complex models that depict how ideas spread. When coupled with psychological profiles of specific subjects made by algorithms, governments can forecast how ideas will spread and also steer them as they see fit. Even a difference as subtle as the order in which a search engine returns results has been found to dramatically impact the formation of political opinions: most Web users will click the first search results and ignore later results, suggesting that a great deal of latitude can be had in influencing beliefs through subtle, calculated nudges. Similarly, even the color of text can impact behavior and attitude, as evidenced in a recent study of online gaming traits. With these advances either at-hand or in the near future, it would seem that regimes will be able to steadily nudge their societies into an ideal of submissive police states, isolating their subjects from any factors that could influence their thoughts towards rebellion. By identifying and removing the "glitches" that cause dissent, these regimes could slowly, but steadily reengineer humanity into the perfect machine-servants. Thanks to advances in computer science, autocracies can be made more secure than ever before.

SQ solves

Squo solves—net neutrality

Garside March 3, 20**15** (Juliette; Net neutrality is like free speech – and the internet needs rules, says FCC boss; www.theguardian.com/technology/2015/mar/03/net-neutrality-free-speech-fcc-tom-wheeler; kdf)

The US's top media regulator hit back at critics of new net neutrality rules voted into law last week, comparing them to the first amendment and saying neither government nor private companies had the right to restrict the openness of the internet. The Federal Communications Commission chairman, Tom Wheeler, was speaking in Barcelona at Mobile World Congress, the world's largest telecoms trade show, just as European governments are meeting to thrash out their own principles for keeping the internet open. "This is no more regulating the internet than the first amendment regulates free speech in our country," Wheeler said. "If the internet is the most powerful and pervasive platform in the history of the planet, can it exist without a referee? There needs to be a referee with a yardstick, and that is the structure we have put in place. A set of rules that say activity should be just and reasonable, and somebody who can raise the flag if they aren't." Telecoms companies across Europe and America have railed against Wheeler's reforms, saying they will discourage investment in better cable and wireless networks and simply benefit bandwidth-hungry services like Netflix and YouTube, which do not normally pay for their content to be carried across the internet. In the US, Verizon and AT&T, the two largest mobile operators, have said they will try to reverse the new rules in the courts. Meanwhile, Wheeler told conference attendees in Barcelona: "Those who were opposed to the open internet rules like to say this is Depression-era monopoly regulation. We built our model for net neutrality on the regulatory model that has been wildly successful in the US for mobile." The FCC rules will treat telecoms companies in a similar way to utilities such as electricity. Internet Service Providers will be explicitly prohibited from blocking, throttling or prioritising internet traffic for commercial reasons. Where complaints are raised, the FCC will decide on a case-by-case basis whether what network owners are doing is "fair and just". The FCC has said it would not intervene areas such as pricing, network unbundling and technical operating requirements. The European parliament is in the midst of negotiations with member states and network operators over final net neutrality rules, which could be published later this spring. A source at one of Europe's largest mobile carriers said the fear was that Europe would introduce similar rules, only to find itself out of step when the FCC is forced to back down by a legal challenge or a change of president.

No backsliding—experts

Berkman, 14—writer for The Daily Dot, an e-magazine focused on key internet issues

Fran, "Tech experts discuss the greatest threats to Internet freedom," July 4, http://www.dailydot.com/politics/threats-to-internet-freedom/

Oh how the Internet has grown. What was once a small village of interconnected networks has grown into a booming digital metropolis with billions of users. Like any prominent place, the Internet is continuously being shaped, for better or worse, by institutional forces. To get a better sense for where this is all leading, **the Pew Research Center asked thousands of Internet experts their thoughts on what the Internet will be like in 2025.** Pew published a report titled "Net Threats," detailing its findings, on Thursday. **The experts' responses were generally optimistic; 65 percent** of the 1,400 experts who responded **said there would not be "significant changes for the worse and hindrances to the ways in which people get and share content online."** Whether they answered with optimism or pessimism, the experts were asked to elaborate on potential risks to Internet freedom. Perhaps unsurprisingly, the experts cited government censorship and surveillance, as well as commercialization, as the greatest threats to the Internet we've come to know and love. "Because of governance issues (and the international implications of the NSA reveals), data sharing will get geographically fragmented in challenging ways," said Microsoft research scientist danah boyd, one of the respondents quoted in the Pew report. "The next few years are going to be about control." boyd is referring to the past 13 months of revelations about the National Security Agency's (NSA) vast digital surveillance capabilities, as revealed through documents leaked by former NSA contractor Edward Snowden. On the topic of censorship, Pew notes that the Internet has shown it has the power to take down governments, as displayed during the Arab Spring. This has caused dictatorial regimes to react by working to censor Internet access. But as one of Pew's experts points out, censorship is not a trend that's limited to just China and Syria. "Governments worldwide are looking for more power over the Net, especially within their own countries," said Dave Burstein, editor of Fast Net News. "Britain, for example, has just determined that ISPs block sites the government considers 'terrorist' or otherwise dangerous." Indeed, a recent report found that British ISP filters are blocking one-fifth of the 100,000 of the country's most popular webpages, including political blogs and medical information sites. As for commercialization, the last of the three threats to Internet freedom detailed by the Pew experts, the respondents highlighted debates about net neutrality and copyright law as key battlegrounds. **It certainly wasn't all doom and gloom for the Internet. Google executive Vint Cerf, one of the Internet's**

founding fathers, responded to Pew **with a bit more optimism**. "**Social norms will change to deal with potential harms in online social interactions**," he said. "**The Internet will become far more accessible than it is today."**

Diplomacy doesn't solve internet freedom

Wagstaff, 14—writer for NBC citing a report by the Pew Research Internet Project

Keith, "These Are the Four Biggest Threats to the Internet: Pew Report," http://www.nbcnews.com/tech/internet/these-are-four-biggest-threats-internet-pew-report-n147391

More people are going online than ever, but **Internet freedom could be seriously at risk**, according to a new report from the Pew Research Internet Project. It identified four main threats. The first is the prospect of **more nations cracking down** on access to the Web and mobile apps, like Turkey's recent Twitter ban and China's long-standing "Great Firewall." The next is a **backlash against government surveillance** programs in the wake of revelations about the U.S. National Security Agency (NSA) and its British equivalent, the Government Communications Headquarters (GCHQ). Also mentioned was the "pressures businesses are under to monetize Internet" — especially when it comes to "net neutrality" and restrictive patent laws that could stifle innovation. The final threat to Internet freedom could be that we share too much information, making us reliant on the algorithms of companies like Google and Facebook to find information, filters that are often set with business considerations in mind.

--XT No Solve Internet Freedom

Silk Road conviction has undermined internet freedom –slippery slope

Maza 2-5-15 [Cristina Maza, Staff writer, What guilty verdict in Silk Road trial might mean for Internet freedom, Christian Science Monitor, http://www.csmonitor.com/USA/USA-Update/2015/0205/What-guilty-verdict-in-Silk-Road-trial-might-mean-for-Internet-freedom]

On Wednesday, a jury decided that Ross Ulbricht is the "Dread Pirate Roberts," the pseudonym used by the architect of the Silk Road underground drug bazaar. Before it was shut down by the federal government in 2013, Silk Road was considered the largest marketplace for finding illegal drugs online. The site was also used to sell fake IDs and other illegal goods using bitcoin, an online currency that operates with no central authority or banks. The prosecution said that Mr. Ulbricht was a "kingpin" who received a portion of every transaction that occurred on the site. Ulbricht will be sentenced in May and faces a minimum of 20 years in prison. He could also be handed a life sentence. The defense has attempted to paint Ulbricht as a naïve kid who was framed after his Frankenstein monster grew out of control. It is expected to appeal the decision. **The case is broadly important, experts say, because it could have implications for Internet freedom**. It explores not only the legal question of whether a website operator can be held accountable for how his site is used by others but also how the government ferrets out illegal Internet activity. Along the way, the proceedings have provided an unvarnished look at the Internet's dark side, perhaps for the first time. "What's most interesting about this case is that it is the first case in its enormity involving the Dark Net and it's going to be a wakeup for anyone using the Dark Net thinking they have anonymity. You cannot remain anonymous on the Internet," Darren Hayes, assistant professor and director of cyber security at Pace University, told CNBC. Ulbricht was arrested after the Federal Bureau of Investigation discovered a server in Iceland that linked him to Silk Road. But how the FBI discovered the server has been a point of contention.

Ulbricht's defenders claim that the government used illegal methods to locate Silk Road, violating his constitutional right to privacy, though a judge denied that line of defense. The anonymity protections provided by the cryptographic software Tor mean that law enforcement would need to obtain a search warrant to discover the the location of Silk Road's servers, Ulbricht's defenders say. The lack of a warrant taints the evidence found in the subsequent investigation, the defense stated in a memo. The FBI stated that it located the server due to a misconfiguration of Silk Road's CAPTCHA system – the string of letters and numbers that helps protect a site from spam. This error inadvertently revealed the server's IP address, the FBI said. But experts claim that it would be impossible to use the CAPTCHA to find the server. Some suggest that the National Security Agency might have had a hand in locating the server. "My guess is that the NSA provided the FBI with this information. We know that the NSA provides surveillance data to the FBI and the DEA, under the condition that they lie about where it came from in court," wrote Bruce Schneier, Chief Technology Officer of Co3 Systems and a fellow at Harvard's Berkman Center, on his blog. Meanwhile, the idea of charging a website's operator with wrongdoing when a user conducts illegal activity raises interesting questions about Internet freedom, says Hanni Fakhoury, an attorney at the Electronic Frontier Foundation. "The main issue, the main **Internet freedom issue is at what point are website operators accountable for what happens on their site?** In Silk Road, it's an easy case because they were catering to illegal activity. But what is interesting is that you start with easy cases and then you start to go towards some of the borderline cases," he said to CNBC. In Ulbricht's case, the jury decided that, as the mastermind behind a site catering to the sale of nefarious content, he should be held accountable. The evidence against Ulbricht, most of which was located on his laptop, was overwhelming and included digital chat records, traced bitcoin transactions, and a diary he kept detailing the tribulations he faced while running the site. The jury deliberated for under four hours before it found Ulbricht guilty on seven counts, including money laundering, drug trafficking, and computer hacking, among others.

Alt cause –Silk Road conviction set a precedent for hypocrisy and violation of interent freedom

Knibbs 2-7-14 [Kate Knibbs, How The Silk Road Trial Set A Dangerous Legal Precedent, Gizmodo, http://www.gizmodo.com.au/2015/02/the-silk-road-trial-set-a-dangerous-legal-precedent/]

The Silk Road trial is over. A jury found Ross Ulbricht guilty on all seven charges, including money laundering, drug trafficking, and the "kingpin" charge. That's not just bad news for Ulbricht, who faces life in prison. His trial has set a dangerous precedent, which could allow law enforcement to gather evidence illegally. While many watching the trial were fascinated by all the ways that Ulbricht's identity was definitively linked to the pseudonymous digital drug bazaar runner Dread Pirate Roberts, they overlooked something crucial. The FBI never had to explain how it located and infiltrated the Silk Road's hidden servers. The fact that the evidence law enforcement provided from those servers was admitted despite the lack of clarity about their sources is troubling. Privacy advocates suspect the government's search and seizure was not entirely above board, arguing the agency hacked into the anonymous site without a warrant. As Adam Clark Estes wrote shortly before the trial: Both sides are clashing over one specific detail regarding how the FBI located the hidden Silk Road server. Put simply, they hacked the site's login page with a (potentially illegal) brute force attack. Or the NSA did it for them — that part's a little bit unclear. Neither of the government agencies had a warrant, of course. The defence says that this sort of intrusion represents a clear violation of the Fourth Amendment. Just imagine if the FBI had broken into and searched Ulbricht's house instead of his server. That's a reasonable concern, though it didn't do the defence any good in court. Judge Katherine Forrest rejected the argument on a technicality during the trial, and so the defence was not allowed to explore this line of questioning. Without a clear answer, there's no proof that the government upheld the Fourth Amendment and obtained the information legally. The defence instead tried to run with the argument that the FBI had initially suspected someone else of running the Silk Road, Mt. Gox CEO Mark Karpeles. But the prosecution shut down this line of questioning, and the defence was pretty much screwed. The prosecution had obtained a damning pile of evidence, from Ulbricht's diaries to a report tracing $US13.4 million Bitcoin from the Silk Road into Ulbricht's personal digital wallet. While defence lawyer Robert Dratel kept arguing about the slipperiness of digital identity, it wasn't enough to sway the jury. What's at stake here is a lot more than Ulbricht's innocence or

guilt. This trial set precedents that will affect future defendants, too. The fact is that law enforcement was allowed to present damning digital evidence without explaining where it came from. That's bad news for our civil liberties. It means that police and other law enforcement officers working digital crime cases may not have to worry as much about obeying the law anymore when it comes to gathering evidence. Corruption would surely follow. Before the verdict came in, I talked to Ryan E. Long, a lawyer affiliated with Stanford's Center on Internet and Society, about the potential **impact of this case on future internet-related trials.** He zeroed in on the importance of authenticating the evidence that the government showed, and making sure it was obtained without violating the Constitution. "How did they get this information, and did they breach the law by getting it? I think that **will set the precedent with future electronic cases about how the government got the information and whether they did it legally**," he said. The issue is, he continued, "whether the government obtained the evidence that they wish to use to prove this narrative, [Ulbricht's guilt] such as the identity of the server, in a lawful way consistent with the Fourth Amendment, among other things." That doesn't mean Ulbricht did not do the things he's now convicted of doing. It doesn't mean the Silk Road kingpin doesn't belong behind bars. But it does mean, unambiguously, that the feds were allowed to present evidence that may have been obtained unlawfully. In the legal world, there's a metaphor called "fruit of the poisonous tree." It's used to describe tainted evidence, evidence that comes from breaking the law. It's not supposed to be admissible in court. But now, thanks to the Silk Road verdict, it is.

--Net Neutrality

Net neutrality now with coming FCC rules

Liebelson, 1/27/15 (Dana, "Stunning Victory Within Reach For Net Neutrality Advocates" Huffington Post, http://www.huffingtonpost.com/2015/01/27/net-neutrality-fcc_n_6555036.html)

Next month, a wonky government agency will rule on the fate of the Internet. The Federal Communications Commission (FCC) is expected to grant a **major victory to net neutrality advocates**, a stunning turnaround following years of conventional wisdom to the contrary.

But advocates aren't celebrating yet. Instead, they're watching to see if the FCC will create rules that are strong and enforceable, or that leave gaping holes for telecom and cable companies to drive through. They are also eyeing a Republican-backed proposal that, they say, will undermine a free and open Internet.

For months, the battle over net neutrality has centered on whether the FCC will reclassify consumer broadband Internet as a utility under Title II of the Telecommunications Act. Reclassification would empower the FCC to block Internet service providers, or ISPs, from charging content providers like Netflix more for reliable Internet access -- thereby hampering, for example, a person's ability to quickly and affordably stream "House of Cards." (ISPs maintain that they won't create a second network for faster service.)

FCC Chairman Tom Wheeler has indicated that he supports Title II -- a proposal backed by President Barack Obama -- and it's widely believed that Wheeler will go that route. Republicans contend that such a move would qualify as government overreach, and they have introduced legislation that would essentially gut the agency's authority. That bill's fate is unclear, given that it's unpopular among many Democrats but still makes big net neutrality concessions that telecom and cable companies might not favor.

Regardless, advocates say that Title II authority won't mean much unless the FCC creates enforceable rules and doesn't allow loopholes.

"Right now, the big carriers are simply looking for a loophole," said Marvin Ammori, a lawyer who advises major tech companies and supports net neutrality. He noted that there are multiple loopholes -- like writing exceptions for mobile or specialized services -- that could undermine the whole FCC rule. "They only need one," he said.

Still, it's not clear how much wiggle room Wheeler's rules will leave. He has said that he favors standards that are "just and reasonable," not simply favorable to the ISPs.

Engstrom told HuffPost that even if the FCC only decides on Title II in this round of rulemaking, and doesn't clarify additional rules until afterward, "that's certainly preferable to the proposals coming out of Congress."

FCC rules will be strong, no loopholes and ISPs hate it

Brodkin, 1/8/15 - Ars Technica's senior IT reporter (Jon, "On net neutrality, Internet providers are betrayed by one of their own" Ars Technica, http://arstechnica.com/business/2015/01/on-net-neutrality-internet-providers-are-betrayed-by-one-of-their-own/)

When President Obama picked Tom Wheeler to lead the Federal Communications Commission in May 2013, our headline was, "Uh-oh: AT&T and Comcast are ecstatic about the FCC's new chairman."

They're not happy anymore, especially not after Wheeler yesterday all but confirmed at the Consumer Electronics Show (CES) that he will propose reclassifying Internet providers as common carriers in order to impose net neutrality rules. This would expose broadband to some of the FCC's strongest powers contained in Title II of the Communications Act, usually reserved for wireline phone service.

Yet it seemed in 2013 that Internet providers had every reason to be pleased: Wheeler formerly led the biggest trade associations representing the cable and wireless industries. Wheeler was CEO of the National Cable Television Association (NCTA) from 1979 to 1984 and CEO of the Cellular Telecommunications & Internet Association (CTIA) from 1992 to 2004.

Wheeler's first stab at net neutrality in May 2014 didn't cause much concern in the industry, which under that proposal would have remained a lightly regulated "information service" and been free to charge Web services for priority access to consumers. But the proposal was widely condemned by consumers and various advocacy groups. Eventually, Obama called on Wheeler to go with Title II for both fixed Internet service and mobile, and it appears Wheeler will do just that.

If he does, Wheeler would show that Washington's revolving door doesn't always guarantee that regulators do the bidding of the regulated. Former FCC Chairman Michael Powell, who made sure that ISPs would face little regulation, now leads the NCTA and has repeatedly called on Wheeler to avoid using Title II. Former FCC Commissioner and current CTIA CEO Meredith Attwell Baker has also lobbied against such a move.

There were signs shortly after Wheeler's swearing-in that he might not hold the same views as the current heads of the cable and wireless trade groups he used to lead. For one thing, he hired prominent consumer advocate Gigi Sohn as his Special Counsel for External Affairs. Wheeler admires Abraham Lincoln's "team of rivals" approach, and for the past year and a half, Sohn has been instrumental in laying groundwork for a likely Title II reclassification, according to an article in The Hill yesterday.

Wheeler has also repeatedly pointed to his past as a venture capitalist and entrepreneur, saying he learned from experience that networks must be open to spur innovation.

Yup, Verizon's mad

Title II's utility-style rules have long been applied to the traditional telephone system, but the rules Internet providers face likely won't be as strict. Obama urged the FCC to forbear from imposing rate regulation and similar restrictions. But the FCC would use Title II to prevent ISPs from blocking or throttling Web services or prioritizing services in exchange for payment.

Wheeler will circulate proposed rules to fellow commissioners on February 5 and hold a vote on February 26, he said yesterday. We contacted the major ISPs and telecommunications industry groups today, and their reactions were predictably negative.

GOP bill dead on arrival

Crawford, 1/28/15 – visiting professor at Harvard (Susan "The Net Neutrality Bait and Switch" https://medium.com/backchannel/the-net-neutrality-bait-and-switch-cedb65f1a1cd

That same shorthand applies to a new "Internet openness" draft bill to amend the Communications Act of 1934, introduced by Sen. John Thune (R-SD) and Rep. Fred Upton (R-MI), the new leaders of the Senate and House committees charged with oversight of the Federal Communications Commission. Although calculated to address concerns about online fairness, its real thrust is to remove or constrain the FCC's authority in a host of areas. The bill will draw a swift presidential veto.

As well it should. The bill is full of problems. It would prevent the FCC from going after any new schemes that position carriers like Comcast or Verizon as gatekeepers online. In cases where carriers are subsidized to provide communications services in hard-to-reach places (like rural areas and tribal land), it would raise barriers to the FCC's ability to ensure that those carriers actually use those funds to offer high-speed Internet access. It would bar the FCC from using its existing statutory authority to protect consumers against privacy abuses and other exploits—like being billed for unauthorized charges. And rather than allowing the FCC to create clear rules that set the terms of engagement in advance, it would put the burden on consumers and businesses to prove problems through prolonged, expensive, case-by-case wrangling after the fact.

The GOP leadership has to know they've lost the PR wars on net neutrality. The bill so transparently shackles the FCC that it doesn't stand a chance in the open air—and even if it does, of course, the President's veto pen will be ready.

AT: Crowe

Squo solves

Crowe 14 (Tyler; The internet of things: our greatest shot at battling climate change; Feb 15; www.fool.com/investing/general/2014/02/15/this-technology-is-our-only-real-shot-at-addressin.aspx; kdf)

The Internet of Things is still very much in its infancy, but it's **taking off fast**. The pending boom in machine-to machine communication helps explain why Google (NASDAQ: GOOGL) shelled out more thah $3.2 billion for smart-thermostat company Nest Labs. Its ability allows customers to better manage heating and cooling in households and instantly provide feedback to utilities in order to better manage energy demand during peak load hours. Sure, estimates put the total number of machine-to-machine capable devices in the billions, but for the Internet of things to be truly effective, everything needs to be connected. Estimates for total connected devices around the globe could reach into the trillions. This could lead to an industry with annual revenues of a whopping $948 billion.

The big players in the technology world, like Google and Intel (NASDAQ: INTL) , will undoubtedly be major players in **this fast-growing market**. Aside from its investment with Nest for smarter home energy use, Google is also getting into the transportation game with its Open Auto Alliance, a group of automakers and technology companies that will establish common practices such that vehicles from different manufacturers can communicate with each other -- the building block for self driving vehicles. With that much money on the line, can you really blame these companies for diving into this market?

What a Fool believes

The Internet of Things trend is approaching ... fast. For investors, it could be an amazing opportunity to get in on the ground floor of a new market with trillion dollar potential, but it is so much more than that. Increased productivity and elimination of wasteful energy consumption through smart devices could be the one and only key to cutting greenhouse gas emission enough to reduce the chances of significant climate change. So go ahead and continue arguing about the use of fossil fuels or alternative energy -- the investors who will really be betting on reducing carbon emissions will be putting their money here.

AT: Eagleman

Eagleman's a hack and internet won't save civilization

Mnookin 12

Seth Mnookin teaches science writing at MIT and blogs at the Public Library of Science, Download the Universe, March 23, 2012, "The Frozen Future of Nonfiction", http://www.downloadtheuniverse.com/dtu/2012/03/why-the-net-matters-how-the-internet-will-save-civilization-by-david-eagleman-canongate-books-2010-for-ipad-by-set.html

At least, that's what I assumed before I read Why The Net Matters, Eagleman's frustrating 2010 e-book about how and why the Internet will save civilization. (I reviewed the $7.99 iPad version, which is the platform it was designed for; a stripped-down, text-based version is available on the Kindle for the portentous price of $6.66.) The problems start with Eagleman's premise, which is so vague and broad as to be **practically meaningless**. There are, he writes, just "a handful of reasons" that civilizations collapse: "disease, poor information flow, natural disasters, political corruption, resource depletion and economic meltdown." Lucky for us (and Eagleman does offer readers "[c]ongratulations on living in a fortuitous moment in history"), the technology that created the web "obviates many of the threats faced by our ancestors. In other words...[t]he advent of the internet represents a watershed moment in history that just might rescue our future."

On the other hand, it just might not: In order to make his point, Eagleman **either ignores or doesn't bother to look** for any evidence that might undercut it. The first of six "random access" chapters that make up the bulk of Why The Net Matters is devoted to "Sidestepping Epidemics," like the smallpox outbreak that helped bring down the Aztec Empire. In the future, Eagleman writes, the "protective net," in the form of telemedicine, telepresence ("the ability to work remotely via computer"), and sophisticated information tracking, will save us from these outbreaks. That all sounds lovely, but what of the fact that we're currently experiencing a resurgence in vaccine-preventable diseases such as measles...a resurgence which is fueled in no small part by misinformation spread over that very same "protective net"?

A few chapters later, in a section celebrating the benefits of the hive mind, Eagleman invokes Soviet pseudoscientist Trofim Lysenko, a famed quack who took over the U.S.S.R.'s wheat production under Stalin. Because the Soviet Union spanned 13 time zones, Eagleman writes, "central rule-setting was disastrous for wheat production. … Part of the downfall of the USSR can be traced to this centralization of agricultural decisions." That sounds nice, and might even be true—but it's not a point that's supported by Lysenko, whose main shortcoming was not that he believed in a one-size-fits-all approach; it was that he was a fraud.

Moving to the present day, Eagleman addresses wildfires that swept through Southern California in 2007, which, he writes, "brought into relief the relationship between natural disasters and the internet."

At the beginning of the outbreak in October, Californians were glued to their television screens, hoping to determine if their own homes were in danger. But at some point they stopped watching the televisions and turned to other sources. A common suspicion arose that the news stations were most concerned with the fate of celebrity homes in Malibu and Hollywood; mansions that were consumed by the flames took up airtime in proportion to their square footage, which made for gripping video but a poor information source about which areas were in danger next. So people be-gan to post on Twitter, upload geotagged cell phone photos to Flickr, and update Facebook.

I had been fairly obsessed with the wildfires, and since I didn't remember this "common suspicion," I decided to check the article Eagleman cites as the source of this info, which was a Wired blog post titled "Firsthand Reports from California Wildfires Pour Through Twitter." It contained no references to a celebrity-obsessed news media; instead, the piece described how "the local media [was] overwhelmed." It also talked about a San Diego resident who was "[a]cting as an ad hoc news aggregator of sorts" by "watching broadcast television news, listening to local radio reports and monitoring streaming video on the web" and then posting information, along with info gleaned from IMs, text messages, and e-mails, to his Twitter account.

AT: Genachowski

Genachowski was the worst—reject their ev

Gustin 13 [Sam Gustin, reporter at TIME focused on business, technology, and public policy, FCC Chairman Julius Genachowski Stepping Down After Contentious Term, TIME, http://business.time.com/2013/03/22/fcc-chairman-julius-genachowski-stepping-down-after-contentious-term-reports/]

Federal Communications Commission Chairman Julius Genachowski is stepping down, he announced Friday. Genachowski, who became chairman in 2009, has presided over an agency that has grappled with contentious issues like U.S. broadband policy, cable and telecom industry competition, and media consolidation. In seeking to strike a centrist balance, Genachowski managed to alienate both public interest groups that have pushed for a more activist FCC on issues like media ownership and Internet openness, as well as industry giants, particularly AT&T, which had proposed buying T-Mobile before the FCC objected. Verizon Wireless is currently suing the FCC in federal court over the agency's "network neutrality" rules. Genachowski's announcement, which was expected, comes just days after another FCC commissioner, Robert McDowell, announced his plan to leave the agency. Their departures create two vacancies on the commission, which will be filled by candidates nominated by President Obama. The job of FCC chairman is particularly important, because the position wields significant power in shaping U.S. telecom regulatory policy. A spokesman for the FCC's office of the chairman declined to comment on the reports of Genachowski's impending departure, but Reuters reported that he informed his staff of his decision on Thursday. Genachowski, a former Internet executive at media mogul Barry Diller's IAC conglomerate, attended Harvard Law School with President Obama and later raised money for Obama. When he was appointed, public interest groups were optimistic that he would champion the open Internet principles at the heart of "network neutrality," the idea that Internet providers shouldn't discriminate against rival services. But public interest groups were dismayed when Genachowski ultimately settled on a compromise originally crafted by Google and Verizon Wireless, which ensured net neutrality on wired networks, but did not extend the principle to wireless networks. "When Julius Genachowski took office, there were high hopes that he would use his powerful position to promote the public interest," Craig Aaron, president and CEO of public interest group Free Press, said in a statement. "But instead of acting as the people's champion, he's catered to corporate interests. He claimed to be a staunch defender of the open Internet, but his Net Neutrality policies are full of loopholes and offer no guarantee that the FCC will be able to protect consumers from corporate abuse in the future." It's easy to take the idea of net neutrality for granted, but all Web users and companies have equal access to the Internet, in the same way that all Americans have the right to travel anywhere in the 50 states without a passport. Companies and institutions have closed networks, but the main public internet is accessible by all. Without this open access, net neutrality advocates argue, startups like Google, Facebook, Twitter, and thousands of others could never have emerged to become the commercial and communications powerhouses they are today.

Genachowski also infuriated public interest groups with his decision to approve Comcast's purchase of NBCUniversal, which critics said concentrated too much power with one company. "Though President Obama promised his FCC chairman would not continue the Bush administration's failed media ownership policies, Genachowski offered the exact same broken ideas that Bush's two chairmen pushed," Aaron said. "He never faced the public and ignored the overwhelming opposition to his plans."

AT: McDowell

McDowell is all rhetoric—but he does say appointments and lack of platform outweigh

McDowell, 13

(Chair-FCC, 2/15, "Commissioner McDowell Congressional Testimony," http://www.fcc.gov/document/commissioner-mcdowell-congressional-testimony)

Thank you Chairman Upton, Ranking Member Waxman, Chairman Royce, Ranking Member Engel, Chairman Walden, Ranking Member Eshoo, Chairman Poe, Ranking Member Sherman, Chairman Smith and Ranking Member Bass. It is an honor to be before you during this rare joint hearing. Thank you for inviting me. It is a privilege to testify before such a rare meeting of three subcommittees and beside such a distinguished group on this panel. Ladies and gentlemen, **the Internet is under assault. As a result, freedom, prosperity and the potential to improve the human condition across the globe are at risk**. Any questions regarding these assertions are now settled. Last year's allegations that these claims are exaggerated no longer have credibility. In my testimony today, I will make five fundamental points: 1) Proponents of multilateral intergovernmental control of the Internet are patient and persistent incrementalists who will never relent until their ends are achieved; 2) The recently concluded World Conference on International Telecommunications ("WCIT") ended the era of an international consensus to keep intergovernmental hands off of the Internet in dramatic fashion, thus radically twisting the one-way ratchet of even more government regulation in this space; 3) Those who cherish Internet freedom **must immediately redouble their efforts** to prevent further expansions of government control of the Internet as the **pivotal 2014 Plenipotentiary** meeting of the International Telecommunication Union ("ITU")1 quickly draws nearer; 4) Merely saying "no" to any changes is – quite obviously – a losing proposition; therefore we should work to offer alternate proposals such as improving the longstanding and highly successful, non-governmental, multi-stakeholder model of Internet governance to include those who may feel disenfranchised; and 5) Last year's bipartisan and unanimous Congressional resolutions clearly opposing expansions of international powers over the Internet reverberated throughout the world and had a positive and constructive effect. I. Proponents of multilateral intergovernmental control of the Internet are patient and persistent incrementalists who will never relent until their ends are achieved. First, it is important to note that as far back as 2003 during the U.N.'s Summit on the Information Society ("WSIS"), the U.S. found itself in the lonely position of fending off efforts by other countries to exert U.N. and other multilateral control over the Internet. In both 2003 and 2005, due to the highly effective leadership of my friend Ambassador David Gross – and his stellar team at the Department of State – champions of Internet freedom were able to avert this crisis by enhancing the private sector multi-stakeholder governance model through the creation of entities such as the Internet Governance Forum ("IGF") where all stakeholders, including governments, could meet to resolve challenges. Solutions should be found through consensus rather than regulation, as had always been the case with the Internet's affairs since it was opened up for public use in the early 1990's.2 Nonetheless, countries such as China, Russia, Iran, Saudi Arabia and scores of their allies never gave up their regulatory quest. They continued to push the ITU, and the U.N. itself, to regulate both the operations, economics and content of the Net. Some proposals were obvious and specific while others were insidious and initially appeared innocuous or insignificant. Many defenders of Internet freedom did not take these proposals seriously at first, even though some plans explicitly called for: • Changing basic definitions contained in treaty text so the ITU would have unrestricted jurisdiction over the Internet;3 • Allowing foreign phone companies to charge global content and application providers internationally mandated fees (ultimately to be paid by all Internet consumers) with the goal of generating revenue for foreign government treasuries;4 • Subjecting cyber security and data privacy to international control, including the creation of an international "registry" of Internet addresses that could track every Internet-connected device in the world;5 • Imposing unprecedented economic regulations of rates, terms and conditions for currently unregulated Internet traffic swapping agreements known as "peering;"6 • Establishing ITU dominion over important non-profit, private sector, multistakeholder functions, such as administering domain names like the .org and .com Web addresses of the world;7 • Subsuming into the ITU the functions of multi-stakeholder Internet engineering groups that set technical standards to allow the Net to work;8 • Centralizing under international regulation Internet content under the guise of controlling "congestion," or other false pretexts; and many more.9 Despite these repeated efforts, the unanimously adopted 1988 treaty text that helped insulate the Internet from international regulation, and make it the greatest deregulatory success story of all time, remained in place. Starting in 2006, however, the ITU's member states (including the U.S.) laid the groundwork for convening the WCIT.10 The purpose of the WCIT was to renegotiate the 1988 treaty. As such, it became the perfect opportunity for proponents of expanded regulation to extend the ITU's reach into the Internet's affairs. In fact, in 2011, thenRussian Prime Minister Vladimir Putin summed it up best when he declared that his goal, and that of his allies, was to establish "international control over the Internet" through the ITU.11 Last month in Dubai, Mr. Putin largely achieved his goal. II. December's WCIT ended the era of international consensus to keep intergovernmental hands off of the Internet in dramatic fashion. Before the WCIT, ITU leadership made three key promises: 1) No votes would be taken at the WCIT; 2) A new treaty would be adopted only through "unanimous consensus;" and 3) Any new treaty would not touch the Internet.12 All three promises were resoundingly broken.13 As a result of an 89-55 vote, the ITU now has unprecedented authority over the economics and content of key aspects of the Internet.14 Although the U.S. was ultimately joined by 54 other countries in opposition to the new treaty language, that figure is misleading. Many countries, including otherwise close allies in Europe, were willing to vote to ensnare the Internet in the tangle of intergovernmental control until Iran complicated the picture with an unacceptable amendment. In short, the U.S. experienced a rude awakening regarding the stark reality of the situation: when push comes to shove, even countries that purport to cherish Internet freedom are willing to surrender. Our

experience in Dubai is a chilling foreshadow of how international Internet regulatory policy could expand at an accelerating pace. Specifically, the explicit terms of the new treaty language give the ITU policing powers over "SPAM," and attempt to legitimize under international law foreign government inspections of the content of Internet communications to assess whether they should be censored by governments under flimsy pretexts such as network congestion.15 The bottom line is, countries have given the ITU jurisdiction over the Internet's operations and content. Many more were close to joining them. More broadly, pro-regulation forces succeeded in upending decades of consensus on the meaning of crucial treaty definitions that were universally understood to insulate Internet service providers, as well as Internet content and application providers, from intergovernmental control by changing the treaty's definitions.16 Many of the same countries, as well as the ITU itself,17 brazenly argued that the old treaty text from 1988 gave the ITU broad jurisdiction over the Internet.18 If these regulatory expansionists are willing to conjure ITU authority where clearly none existed, their control-hungry imaginations will see no limits to the ITU's authority over the Internet's affairs under the new treaty language. Their appetite for regulatory expansionism is insatiable as they envision the omniscience of regulators able to replace the billions of daily decisions that allow the Internet to blossom and transform the human condition like no other technology in human history. At the same time, worldwide consumer demand is driving technological convergence. As a result, companies such as Verizon, Google, AT&T, Amazon, Microsoft, Netflix, and many more in the U.S. and in other countries, are building across borders thousands of miles of fiber optics to connect sophisticated routers that bring voice, video and data services more quickly to consumers tucked into every corner of the globe. From an engineering perspective, the technical architecture and service offerings of these companies look the same. Despite this wonderful convergence, an international movement is growing to foist 19th Century regulations designed for railroads, telegraphs and vanishing analog voice phone monopolies onto new market players that are much different from the monoliths of yore. To be blunt, these dynamic new wonders of the early 21st Century are inches away from being smothered by innovation-crushing old rules designed for a different time. The practical effect of expanded rules would be to politicize engineering and business decisions inside sclerotic intergovernmental bureaucracies. If this trend continues, Internet growth would be most severely impaired in the developing world. But even here, as brilliant and daring technologists work to transform the world, they could be forced to seek bureaucratic permission to innovate and invest. In sum, **the dramatic encroachments on Internet freedom secured in Dubai will serve as a stepping stone to more international regulation of the Internet in the very near future.** The result will be devastating even if the United States does not ratify these toxic new treaties. **We must waste no time fighting to prevent further governmental expansion into the Internet's affairs at the upcoming ITU Plenipotentiary** in 2014. Time is of the essence. While we debate what to do next, Internet freedom's foes around the globe are working hard to exploit a treaty negotiation that dwarfs the importance of the WCIT by orders of magnitude. In 2014, the ITU will conduct what is literally a constitutional convention, called a "plenipotentiary" meeting, which will define the ITU's mission for years to come. Its constitution will be rewritten and a new Secretary General will be elected. This scenario poses both a threat and an opportunity for Internet freedom. The outcome of this massive treaty negotiation is uncertain, but the momentum favors those pushing for more Internet regulation. More immediately, the World Telecommunications Policy/ICT Forum ("WTPF"), which convenes in Geneva this May, will focus squarely on Internet governance and will shape the 2014 Plenipotentiary. Accordingly, the highest levels of the U.S. Government must make this cause a top priority and recruit allies in civil society, the private sector and diplomatic circles around the world. The effort should start with the President immediately making appointments to fill crucial vacancies in our diplomatic ranks. The recent departures of my distinguished friend, Ambassador Phil Verveer, his legendary deputy Dick Beaird, as well as WCIT Ambassador Terry Kramer, have left a hole in the United States' ability to advocate for a constructive – rather than destructive – Plenipot. America and Internet freedom's allies simply cannot dither again. If we do, we will fail, and global freedom and prosperity will suffer. We should work to offer constructive alternative proposals, such as improving the highly successful multi-stakeholder model of Internet governance to include those who feel disenfranchised. As I warned a year ago, merely saying "no" to any changes to the multi-stakeholder Internet governance model has recently proven to be a losing proposition.19 Ambassador

Gross can speak to this approach far better than can I, but using the creation of the IGF as a model, we should immediately engage with all countries to encourage a dialogue among all interested parties, including governments, civil society, the private sector, non-profits and the ITU, to broaden the multi-stakeholder umbrella to provide those who feel disenfranchised from the current structure with a meaningful role in shaping the evolution of the Internet. Primarily due to **economic and logistical reasons,** many developing world countries are not able to play a role in the multi-stakeholder process. This is unacceptable and should change immediately. Developing nations stand to gain the most from unfettered Internet connectivity, and they will be injured the most by centralized multilateral control of its operations and content. V. Last year's bipartisan and unanimous Congressional resolutions clearly opposing expansions of international powers over the Internet reverberated around the world and had a positive and constructive effect, but Congress must do more. In my nearly seven years of service on the FCC, I have been amazed by how closely **every government and communications provider on the globe studies the latest developments in American communications policy**. In fact, we can be confident that this hearing is streaming live in some countries, and is being blocked by government censors in others. Every detail of our actions is scrutinized. It is truly humbling to learn that even my statements have been read in Thailand and Taiwan, as well as translated into Polish and Italian. And when Congress speaks, especially when it speaks with one loud and clear voice, as it did last year with the unanimous and bipartisan resolutions concerning the WCIT, an uncountable number of global policymakers pause to think. Time and again, I have been told by international legislators, ministers, regulators and business leaders that last year's resolutions had a positive effect on the outcome of the WCIT. Although Internet freedom suffered as a result of the WCIT, many even more corrosive proposals did not become international law in part due to your actions.20 IV. Conclusion. And so, I ask you in the strongest terms possible, to take action and take action now. Two years hence, let us not look back at this moment and lament how we did not do enough. We have but one chance. Let us tell the world that we will be resolute and stand strong for Internet freedom. All nations should join us. Thank you for having me appear before you today. I look forward to your questions.

AT: Minton

Minton is writing for Breitbart which is some bullshit

Source Watch no date – accessed 10/12 (Center for Media and Democracy, http://www.sourcewatch.org/index.php?title=Andrew_Breitbart#Sourcewatch_resources)

Race baiting

Breitbart was behind the July 2010 attempt to smear Department of Agriculture employee Shirley Sherrod by heavily editing a video of a speech she gave to make it appear she was confessing to being racist. The story she told, in its entirety, was exactly the opposite -- it was a story of redemption in which Sherrod explained how she had overcome feelings of racism to realize everyone needed to be treated equally.

Media Matters described the episode this way:

In a July 19 BigGovernment.com post -- headlined "Video Proof: The NAACP Awards Racism -- 2010" -- Breitbart purported to provide "video evidence of racism coming from a federal appointee and NAACP award recipient." The heavily edited video clip Breitbart posted shows Shirley Sherrod, then the USDA Georgia Director of Rural Development, speaking at an NAACP Freedom Fund dinner in Georgia, and stating that she didn't give a "white farmer" the "full force of what I could do" because "I was struggling with the fact that so many black people have lost their farmland, and here I was faced with having to help a white person save their land." Breitbart characterized Sherrod's comments as her "describ[ing] how she racially discriminates against a white farmer."

Full video vindicates Sherrod, destroys Breitbart's accusations of racism. On July 20, the NAACP posted the full video of Sherrod's remarks, exposing how the clip Breitbart posted had taken Sherrod out of context. The heavily edited clip included her statements that she initially did not help the farmer, but removed her statements indicating that she ultimately did help him save his farm and learned that "it's not just about black people, it's about poor people."

Immediately prior to the portion of Sherrod's speech included in Breitbart's clip, Sherrod says that she originally made a "commitment" "to black people only," but that "God will show you things and he'll put things in your path so that you realize that the struggle is really about poor people." Immediately following the portion of the video included in the clip, Sherrod detailed her extensive work to help the farmer save his farm. She then said, "working with him made me see that it's really about those who have versus those who don't," adding "they could be black, and they could be white, they could be Hispanic. And it made me realize then that I needed to work to help poor people -- those who don't have access the way others have." She later added, "I couldn't say 45 years ago, I couldn't stand here and say what I'm saying -- what I will say to you tonight. Like I told, God helped me to see that its not just about black people, it's about poor people. And I've come a long way."

Breitbart portrayed Sherrod as a member of the Obama administration when she made the comments, which wasn't the case. The video of her speech was made in 1986, many years prior to the Obama Administration.[3][4]

Distortion

Breitbart was also behind the coordinated release of heavily edited undercover videos that misrepresented the activities of the community group ACORN. Media Matters writes,

On September 10, 2009, conservative activist and videographer James O'Keefe posted an entry to BigGovernment.com in which he revealed that he and fellow activist Hannah Giles had posed as a pimp and prostitute at a Baltimore ACORN Housing office and secretly filmed their meetings with ACORN staffers. As O'Keefe wrote, their intention was to take "advantage of ACORN's regard for thug criminality by posing the most ridiculous criminal scenario we could think of and seeing if they would comply -- which they did without hesitation," the "scenario" being the "trafficking of young helpless girls and tax evasion." O'Keefe would later release similar recordings of their interactions with ACORN and ACORN Housing employees at several other ACORN offices nationwide. Breitbart authored a separate September 10 BigGovernment.com post "introducing" O'Keefe and making it clear that he and BigGovernment.com would play a central role in the distribution of O'Keefe and Giles' videos. But as Breitbart, O'Keefe, and Giles released and promoted the "heavily edited" videos, their allegations about ACORN and its employees were undermined by numerous falsehoods and distortions. Subsequent investigations revealed no pattern of intentional, illegal misconduct by ACORN, and no criminality by ACORN personnel. It did, however, find the videos had been heavily edited to cast ACORN in a negative light. [5]

AT: Democracy

Their internal links are anecdotal

Bailard 2014 (Catie [Assist Prof of Media and Pubic Affairs @ George Washington; Catie received her doctorate in political science from UCLA with concentrations in American Politics, Formal and Quantitative Methods, and International Relations]; The other Facebook Revolution; www.foreignaffairs.com/articles/142351/catie-bailard/the-other-facebook-revolution?cid=rss-rss_xml-the_other_facebook_revolution-000000; kdf)

Empirical testing confirms that the Internet has clear and consistent influence on how citizens feel about their governments. As one might expect, the mirror-holding and window-opening mechanisms boost public satisfaction with government in advanced democracies and public dissatisfaction in nations with weak democratic practices. However, research also demonstrates that the Internet's effect is neither automatic nor uniform—one democratic gain, such as more critical evaluations of poor-performing governments, does not automatically set off a domino effect of entirely pro-democratic gains in citizens' attitudes and behaviors. Take Tanzania, for example, where I conducted a randomized field experiment to test the effect of Internet use on evaluations of the 2010 general election. Although the Internet offered plentiful information about the questionable integrity of a then-upcoming national election, the results of the experiment revealed that Tanzanians with access to that information also **became less likely to vote.** After all, the belief that an election would not be fair can produce two very divergent responses—although some people may feel inclined to respond by taking to the streets, others may simply throw up their hands and stay home. Meanwhile, another randomized field experiment that I conducted in Bosnia and Herzegovina revealed that Internet users there who became more dissatisfied with the quality of democratic practices in their

country also became more likely to consider alternative forms of government as preferable for their country. Taken as a whole, then, this research reveals that the Internet's influence is complex, and that in some instances it will have ambiguous effects for democracy and democratization. The effects of Internet use on political evaluations tend to be particularly profound in hybrid regimes—governments that, despite being firmly authoritarian, allow some form of so-called elections for various offices. In many cases, such elections are exercises in futility, the outcome already determined by the ruling party regardless of what the ballots say. Although outsiders may take for granted that these elections are largely shams, however, citizens living in these countries often invest significant value in them. This was demonstrated in the build-up to the Egyptian Revolution of 2011, during which a segment of the public that was originally angered by police brutality became further incensed by ostensibly rigged parliamentary elections, eyewitness accounts of which were amplified by videos uploaded and distributed online. It wasn't long before citizens began expressing their discontent by protesting in the streets and demanding a change in the regime. Moreover, even in instances that do not result in tangible political activity, the effects of Internet use on political evaluations and satisfaction have important implications for the day-to-day business of governance. Quite simply, governments—democratic, democratizing, and nondemocratic alike—are aware that they have lost some degree of control over information compared to what they enjoyed in the era of traditional media. As a result, they know that there is greater potential for their decisions and actions to be broadcast on the national, and even international, stage, a venue and context that they have diminished control over. Thus, leaders are forced, to varying degrees, to consider the potential activation of latent public opinion when making political decisions in ways that they never had to previously. It is regrettable, if not entirely surprising, that, aside from a handful of notable exceptions, scholars and other political observers mostly failed to anticipate the Arab Spring. Many tried to make up for it by focusing renewed effort on the role played by the Internet in the wave of political upheaval that subsequently swept across the Middle East and North Africa. But they would be wise to focus on what has largely remained a blind spot in scholarly research: the effects of Internet use on the very political evaluations that can, and sometimes do, precipitate political action and organization.

--xt No Democracy

Bush family proves that democracy is non-existent

Sanders 2015 (Bernie; Email to Kurt Fifelski -- This is not democracy; Jul 10)

Kurt - Yesterday afternoon, Jeb Bush announced that a relatively small number of wealthy donors have contributed over one hundred million dollars to his Super PAC. **This is not a democracy. This is oligarchy.** Unfortunately, Jeb Bush is not alone. Almost all of our opponents have embraced this model of fundraising — begging billionaire benefactors who have bought up the private sector to try their hand at buying a presidential election. One of those Super PACs is already running ads against our campaign. Let me be clear: I am more than aware our opponents will outspend us, but we are going to win this election. They have the money, but we have the people. Add your $3 contribution to our campaign today and help fuel the political revolution this moment requires. The economic and political systems of this country are stacked against ordinary Americans. The rich get richer and use their wealth to buy elections. It's up to us to change the course for our country. Thank you for answering the call. Bernie Sanders

AT: Economy

Internet not key to growth

Lowrey 2011 (Annie; Freaks, geeks, and the GDP; Mar 8; www.slate.com/articles/business/moneybox/2011/03/freaks_geeks_and_gdp.html; kdf)

If you have attended any economists' cocktail parties in the past month or so—lucky you!—then you have probably heard chatter about Tyler Cowen's e-book, The Great Stagnation. The book seeks to explain why in the United States median wages have grown only slowly since the 1970s and have actually declined in the past decade. Cowen points to an innovation problem: Through the 1970s, the country had plenty of "low-hanging fruit" to juice GDP growth. In the past 40 years, coming up with whiz-bang, life-changing innovations—penicillin, free universal kindergarten, toilets, planes, cars—has proved harder, pulling down growth rates across the industrialized world. But wait! you might say. In the 1970s, American businesses started pumping out amazing, life-changing computing technologies. We got graphing calculators, data-processing systems, modern finance, GPS, silicon chips, ATMs, cell phones, and a host of other innovations. Has the Internet, the most revolutionary communications technology advance since Gutenberg

rolled out the printing press, done nothing for GDP growth? The answer, economists broadly agree, is: Sorry, but no—at least, not nearly as much as you would expect. A quarter century ago, with new technologies starting to saturate American homes and businesses, economists looked around and expected to find computer-fueled growth everywhere. But signs of increased productivity or bolstered growth were few and far between. Sure, computers and the Web transformed thousands of businesses and hundreds of industries. But overall, things looked much the same. The GDP growth rate did not tick up significantly, **nor did productivity**. As economist Robert Solow put it in 1987: "You can see the computer age everywhere but in the productivity statistics." An overlapping set of theories emerged to explain the phenomenon, often termed the "productivity paradox." Perhaps the new technologies advantaged some firms and industries and disadvantaged others, leaving little net gain. Perhaps computer systems were not yet easy enough to use to reduce the amount of effort workers need to exert to perform a given task. Economists also wondered whether it might just take some time—perhaps a lot of time—for the gains to show up. In the past, information technologies tended to need to incubate before they produced gains in economic growth. Consider the case of Gutenberg's printing press. Though the technology radically transformed how people recorded and transmitted news and information, economists have failed to find evidence it sped up per-capita income or GDP growth in the 15th and 16th centuries. At one point, some economists thought that an Internet-driven golden age might have finally arrived in the late 1990s. Between 1995 and 1999, productivity growth rates actually exceeded those during the boom from 1913 to 1972—perhaps meaning the Web and computing had finally brought about a "New Economy." But that high-growth period faded quickly. And some studies found the gains during those years were not as impressive or widespread as initially thought. Robert Gordon, a professor of economics at Northwestern, for instance, has found that computers and the Internet mostly helped boost productivity in durable goods manufacturing—that is, the production of things like computers and semiconductors. "Our central theme is that computers and the Internet do not measure up to the Great Inventions of the late nineteenth and early twentieth century, and in this do not merit the label of Industrial Revolution," he wrote. Gordon's work leads to another theory, one espoused by Cowen himself. Perhaps the Internet is just not as revolutionary as we think it is. Sure, people might derive endless pleasure from it—its tendency to improve people's quality of life is undeniable. And sure, it might have revolutionized how we find, buy, and sell goods and services. But that still does not necessarily mean it is as transformative of an economy as, say, railroads were. That is in part because the Internet and computers tend to push costs toward zero, and have the capacity to reduce the need for labor. You are, of course, currently reading this article for free on a Web site supported not by subscriptions, but by advertising. You probably read a lot of news articles online, every day, and you probably pay nothing for them. Because of the decline in subscriptions, increased competition for advertising dollars, and other Web-driven dynamics, journalism profits and employment have dwindled in the past decade. (That Cowen writes a freely distributed blog and published his ideas in a $4 e-book rather than a $25 glossy airport hardcover should not go unnoted here.) Moreover, the Web- and computer-dependent technology sector itself does not employ that many people. And it does not look set to add workers: The Bureau of Labor Statistics estimates that employment in information technology, for instance, will be lower in 2018 than it was in 1998. That the Internet has not produced an economic boom might be hard to believe, Cowen admits. "We have a collective historical memory that technological progress brings a big and predictable stream of revenue growth across most of the economy," he writes. "When it comes to the web, those assumptions are turning out to be wrong or misleading. The revenue-intensive sectors of our economy have been slowing down and the big technological gains are coming in revenue-deficient sectors." But revenue is not always the end-all, be-all—even in economics. That brings us to a final explanation: Maybe it is not the growth that is deficient. Maybe it is the yardstick that is deficient. MIT professor Erik Brynjolfsson * explains the idea using the example of the music industry. "Because you and I stopped buying CDs, the music industry has shrunk, according to revenues and GDP. But we're not listening to less music. There's more music consumed than before." The improved choice and variety and availability of music must be worth something to us—even if it is not easy to put into numbers. "On paper, the way GDP is calculated, the music industry is disappearing, but in reality it's not disappearing. It is disappearing in revenue. It is not disappearing in terms of what you should care about, which is music." As more of our lives are lived online, he wonders whether this might become a bigger problem. "If everybody focuses on the part of the economy that produces dollars, they would be increasingly missing what people actually consume and enjoy. The disconnect becomes bigger and bigger." But providing an alternative measure of what we produce or consume based on the value people derive from Wikipedia or Pandora proves an extraordinary challenge—indeed, no economist has ever really done it. Brynjolfsson says it is possible, perhaps, by adding up various "consumer surpluses," measures of how much consumers would be willing to pay for a given good or service, versus how much they do pay. (You might pony up $10 for a CD, but why would you if it is free?) That might give a rough sense of the dollar value of what the Internet tends to provide for nothing—and give us an alternative sense of the value of our technologies to us, if not their ability to produce growth or revenue for us. Of course, if our most radical and life-altering technologies are not improving incomes or productivity or growth, then we still have problems. Quality-of-life improvements do not put dinner on the table or pay for Social Security benefits. Still, even Cowen does not see all doom and gloom ahead, with incomes stagnating endlessly as we do more and more online and bleed more and more jobs and money. Who knows what awesome technologies might be just around the bend?

AT: Telemedicine

Telemedicine booming now

Hixon 10/22 (Todd; Why is Telemedicine Suddenly Hot; www.forbes.com/sites/toddhixon/2014/10/22/why-is-telemedicine-suddenly-hot/; kdf)

Google's GOOGL +1.49% recent announcement that it will provide telemedicine services was the crescendo to a swelling volume of recent interest: e.g., articles in VentureBeat, U.S. News, and The Economist. Telemedicine has been around for a generation. Why is this happening now? Rising use of telemedicine takes different forms. Traditionally telemedicine has played the biggest role in rural areas where visits to doctors are difficult and in consultations with specialists like radiologists and oncologists where value is created by connecting a patient to the best expert. This is expanding because broadband network coverage is improving, patients and doctors are more comfortable with computers, pressure for cost savings is increasing, and an emerging policy consensus favors telemedicine. This all makes sense. But, these forces have been at play for a decade or more and hence don't account for the current inflection point (1) of interest in telemedicine. **The new driving force is the rebirth of relationship medicine**. By "relationship medicine" I mean a paradigm of medical practice that puts the relationship between the patient and the doctor at the center. The most important relationship is with the primary care doctor, because that relationship is life-long, and the primary care doctor is most concerned with the patient's total health status and long term prospects. This is how much of medicine was done in the 1950s, but it declined as Medicare and health insurers "industrialized" medicine, slicing doctors' time finer and finer and putting patients on a medical assembly line that moves them past doctors for ever-shorter office visits. This echoes Henry Ford's industrializion of car assembly. In the relationship medicine paradigm, care is based on a long-term conversation between patient and physician about both long term health maximization and acute issues. That conversation occurs through a variety of encounters. Some encounters are typical office visits. Once the relationship is established, many of these encounters can be remote. Telepresence (e.g., Skype) can be very powerful, but remote encounters do not need to be high-tech: often a phone call, email, or even a text can do the job. Remote encounters are usually more efficient and convenient for both patient and physician. For example, I had a serious toe infection earlier this year, went in for an office visit, and came home with antibiotics which I took as prescribed. The next week I had to go traveling and the toe was still swollen. I took a picture with my phone and sent it to the doctor. He wrote back, "Don't worry, your toe is mending", and I went on with my trip. [I'm resisting the temptation to jazz up this post with the picture of my swollen toe.] This got the job done and avoided a second office visit. Medicare and states such as Massachusetts are holding hospitals responsible for readmission rates. As one hospitalist doctor put it [paraphrase], "we used to think we were responsible for patients' condition while they were in the hospital, and now we realize we are responsible for their condition all the time!" In other words, the doctor and the patient need an ongoing relationship and conversation, and telemedicine helps. Incentives play a big role, as the prior paragraph suggests. But the true driving force here is better health and better use of medical resources. The VA medical system has embraced telemedicine, although its doctors are salaried. My primary care doctor is not supposed to give me his email address and he does not get paid for looking at the picture of my toe, but he did both gladly on request. It is fair to say, however, that aligning incentives correctly will accelerate the growth of relationship medicine. The direct primary care movement (e.g, www.dpcare.org) advocates moving primary care doctors from the pay-for-procedure compensation system created by Medicare and health insurers to payments that are fixed per patient or outcome-based. This encourages doctors to design encounters and use their resources in the manner that creates the best outcomes with the best efficiency. Direct primary care is growing very fast now as both plan sponsors and doctors come to believe that it offers major advantage in both quality of care and overall healthcare cost.

Their author is writing about net-neutrality

Trotter, healthcare specialist, '14

Fred, founder of the DocGraph Journal, a healthcare data journalist and author, the founder of CareSet Systems and DocGraph journal, testified in the original hearings on the definition of Meaningful Use—the standard in the Affordable Care Act for the effective use of electronic medical records "Reply Comments of Fred Trotter, of the DocGraph Journal," 8/5/14, http://engine.is/wp-content/uploads/Reply-Comments-of-Fred-Trotter-of-the-DocGraph-Journal.pdf

Why? We all know healthcare costs are crippling this country. The costs for healthcare under Medicare (mostly for old people, some of whom can no longer drive) and Medicaid (mostly for poor people, some of whom cannot afford a car) are crippling our economy. A central tenet of healthcare reform is to enable treatment of patients in their homes, using broadband Internet to allow for remote monitoring. Pretty ironic, isn't it? Telemedicine is the solution to our current real-world fast lane/slow lane problem. Using telemedicine, we can get the same high levels of

treatment to people no matter if they own a car or not. But all of these programs, presume an Internet built with net neutrality. If we abandon net neutrality, someone is going to have to pay the fast lane tax for patients who want telemedicine solutions to really work. That means either patients are going to pay, or doctors are going to have to pay. Having an Internet slow lane will ensure that poor patients will not be able to have video telemedicine appointments (which operate just like streaming video) because their doctors do not have the technical expertise or budget to afford the Internet fast lane. Think I am kidding? Already the Office of the National Coordinator of Health IT(ONC) has seen that hospitals and practices that serve in minority communities are late adopters of healthcare technology.4

AT: War

Internet doesn't solve conflict

Elias 12

Phillip Elias, board member of the New Media Foundation, 20 January 2012, "Will humanity perish without the internet?," http://www.mercatornet.com/articles/view/will_humanity_perish_without_the_internet

The new Encyclopaedists make the opposite mistake about the future. Inherent in their worldview is the idea that setting up a system where information can be shared quickly, widely, and freely will somehow eliminate corruption, greed and violence from the world. It is almost as though human foibles were glitches in the software of society. But **human vices can never be reduced to social viruses**. They come from deep within us and can find their way **into the most scientific settings**.

Do Wikipedians think themselves immune from the temptation to wield their power towards their own ends?

Free access to information for everyone could be said to be the Wikipedian creed. It encapsulates the Enlightenment values of liberty and equality. But, like the French terror of the 1790s, it neglects that other ideal needed to give them gumption -- a genuine concern for other human beings.

But fraternité is not achieved by giving everyone more information, more freedom and more equality. And it is what is so often lacking on the internet, on blogs, and in other forms of web communication. **Online interaction is so often vitriolic it is unreadable**, and it is at its worst **when the tech-savvy confront each other**. I have seen very few geeks who try to love their enemies.

Fraternité comes from empathising with others. This is difficult to learn online. But without it, how can we understand the point of view of those who have different concepts of freedom or equality, or of troglodytes who don't blog, or of nematodes **who don't have access to the internet**. Believe it or not, there is a life offline and wisdom is wider than the web.

Internet--Governance

No Governance – Alt cause

US has officially backed out of its internet governance role

Hyman 2015 (Leonard [former Google Public Policy Fellow]; U.S. To Scale Back Its Role In Internet Governance; techcrunch.com/2015/02/19/1120736/; kdf)

Even though the Internet has long been an international community, the United States has always been at its center. However, that all may be about to change as the U.S. Department of Commerce scales back its role in Internet governance. The transition is a gradual one, but by the end of the year, the DOC is expected to give up its oversight of the Internet Corporation for Assigned Names and Numbers (ICANN) to the international community. The concept of "Internet governance" may seem like a bizarre one since it often seems like the Wild West out there. The most tangible example of ICANN's impact on Internet governance is management of the Internet Assigned Numbers Authority (IANA) functions: When you type a domain name in your browser (e.g. TechCrunch.com), it connects you with the long, multi-digit IP address that would otherwise be impossible to remember. On its face, it may not seem like a big deal who manages this process. As long as TechCrunch.com actually gets you to TechCrunch.com, does it really matter if it's the U.S., ICANN, or some random guy who's behind it? But that question assumes that your URL actually gets you to your destination. If a foreign government doesn't want you accessing a certain URL, why not redirect you into a dead end? After all, naysayers argue, some countries already have robust firewalls, so why give them more control? The Department of Commerce claims that by scaling back its role, it will be promoting "innovation and inclusion." After all, if the Internet supposedly belongs to the world, shouldn't it actually belong to the world? Further, they maintain that it won't relinquish control until safeguards are in place to prevent that from happening. (Will it live up to that promise? We'll see!) At the same time, U.S. leadership in this area was called into question — perhaps justifiably — after Snowden's NSA surveillance leaks. This is one of the factors that has nudged the U.S. toward giving up its contract. Maybe the international community would do a better job than we have. As unfortunate as censorship would be for foreign countries, the bigger challenge for the average American may be managing the domains themselves. Over 1,000 generic Top Level Domains (e.g. dot-search, dot-eco, dot-docs, etc.) are slated to go live in the coming months. It could easily be a headache for corporations to buy the thousands of domains related to their brand. (Imagine if amazon.buy took you to the wrong site.) Of course, it could be an even bigger hassle for the budding startup, not to mention ICANN itself overseeing this entire process without the support of the U.S. government. The Department of Commerce's process of fully handing over the reins won't be complete until later this year; its contract with ICANN expires in September. In the meantime, ICANN is slated to begin its next round of sessions in Buenos Aires in June. And because it's a multi-stakeholder process, public participation is welcomed. If you're concerned about the impact ICANN's increasing independence could have on a free and open Internet — and you fancy a trip to South America — I hear Argentina is lovely that time of year.

No impact – Cyber war

Cyber war not existential

Healey 2013 (Jason [director of the Cyber Statecraft Initiative at the Atlantic Council]; No, Cyberwarfare Isn't as Dangerous as Nuclear War; March 20, 2013; www.usnews.com/opinion/blogs/world-report/2013/03/20/cyber-attacks-not-yet-an-existential-threat-to-the-us; jw)

America does not face an existential cyberthreat today, despite recent warnings. Our cybervulnerabilities are undoubtedly grave and the threats we face are severe but far from comparable to nuclear war. The most recent alarms come in a Defense Science Board report on how to make military cybersystems more resilient against advanced threats (in short, Russia or China). It warned that the "cyber threat is serious, with potential consequences similar in some ways to the nuclear threat of the Cold War." Such fears were also expressed by Adm. Mike Mullen, then chairman of the Joint Chiefs of Staff, in 2011. He called cyber "The single biggest existential threat that's out there" because "cyber actually more than theoretically, can attack our infrastructure, our financial systems." While it is true that cyber attacks might do these things, it is also true they have not only never happened but are far more difficult to accomplish than mainstream thinking believes. The consequences from cyber threats may be similar in some ways to nuclear, as the Science Board concluded, but

mostly, they are incredibly dissimilar. Eighty years ago, the generals of the U.S. Army Air Corps were sure that their bombers would easily topple other countries and cause their populations to panic, claims which did not stand up to reality. A study of the 25-year history of cyber conflict, by the Atlantic Council and Cyber Conflict Studies Association, has shown a similar dynamic where the impact of disruptive cyberattacks has been consistently overestimated. Rather than theorizing about future cyberwars or extrapolating from today's concerns, the history of cyberconflict that have actually been fought, shows that cyber incidents have so far tended to have effects that are either widespread but fleeting or persistent but narrowly focused. No attacks, so far, have been both widespread and persistent. There have been no authenticated cases of anyone dying from a cyber attack. Any widespread disruptions, even the 2007 disruption against Estonia, have been short-lived causing no significant GDP loss. Moreover, as with conflict in other domains, cyberattacks can take down many targets but keeping them down over time in the face of determined defenses has so far been out of the range of all but the most dangerous adversaries such as Russia and China. Of course, if the United States is in a conflict with those nations, cyber will be the least important of the existential threats policymakers should be worrying about. **Plutonium trumps bytes in a** shooting **war.**

Cyber war not real – their rhetoric leads to less security

Mirani 2014 (Leo [reporter for Quartz]; Worrying about cyberwar is making countries less safe; December 3, 2014; qz.com/305598/worrying-about-cyberwar-is-making-countries-less-safe/; jw)

Ten days ago, on Nov. 24, online security firms revealed the existence of a powerful computer virus called Regin. A tool of espionage (pdf), the bug displayed all the hallmarks of nation-state backing, researchers said. Suspicion immediately fell on the US and Israel. The following day came news of a massive intrusion into the systems of Sony Pictures Entertainment. Several pre-release films were leaked, along with detailed personal records and communications of employees. An estimated 100 terabytes of data were stolen, and some 40 gigabytes have so far been leaked. Investigators pointed the finger at North Korea (paywall). Unsurprisingly, there has since been much hand-wringing about cyberwarfare, with one prominent right-wing American website declaring that "The first cyber war is under way." It is precisely this sort of hype that Thomas Rid, a professor of security studies at King's College London, and Robert M. Lee, an active-duty US Air Force cyber-warfare operations officer, warn against in their paper "OMG Cyber!" (pdf), published in the most recent issue of RUSI Journal, a well-regarded peer-reviewed academic journal of defense and security topics. Cyber-riches Rid and Lee argue that hype makes for bad policy. As defense budgets have shrunk, cyber is one area where funding has grown. That leads to perverse incentives, encouraging worry in order to gain and preserve funding. Since cyber is where the money is, all threats are re-labelled cyber-something. That means "it is ever harder to say when something clearly is not cyber-related," the authors write. "What we are seeing is espionage and practices and techniques that are easy to understand both technically and politically," says Lee. "By hyping them into something they are not we fail to respond appropriately. Our policies, our technologies, our education, [and] our military's readiness are being focused on a classification and understanding of the problem that does not align with the reality." Such reinterpretation of traditional threats can escalate conflict. A NATO official said earlier this year a cyber-attack would be covered by Article 5 of the treaty, which calls upon all member states to come to the defense of any member under attack. However, the official did not say what would count as an attack and what the response would be, suggesting it is meant as a deterrent. But that creates confusion. Does intrusion count? Espionage? From the paper: [T]he vast majority of cyber-attacks also do not fall into NATO's remit in the first place: espionage and cyber-crime are problems for intelligence agencies and law enforcement, not for a military alliance. For militants and the Kremlin, the subtext is clear: cyber matters; better up your game. NATO—among others—is escalating a problem that someone else will have to solve. More than the usual suspects The cyberwarfare hype does not arise solely from defense officials attempting to protect their turf and budgets. Security vendors have a vested interest in making cyber-threats seem pervasive in order to sell their products. And some of the responsibility for creating the hype falls on privacy activists and journalists who have helped give GCHQ, Britain's signals intelligence agency, a profile and mystique matched only by James Bond, says Rid. "[Edward] Snowden and the journalists covering this in a rather naïve way helped created the image that GCHQ and NSA [the US National Security Agency] are all-powerful, perfectly efficient surveillance machines that can see everything, penetrate everything, and know everything they want," says Rid. "And that's just laughable."

AT: Solvency/Oversight

AT: Oversight

AT: Aff = Oversight

Aff oversight doesn't cause transparency, zero reason they solve

Correia 2014 (Evan RC [JD Candidate, 2015 @ Temple]; PULLING BACK THE VEIL OF SECRECY: STANDING TO CHALLENGE THE GOVERNMENT'S ELECTRONIC SURVEILLANCE ACTIVITIES; 24 Temp. Pol. & Civ. Rts. L. Rev. 185; kdf)

There is growing concern regarding the secrecy that surrounds the FISC and its proceedings. n281 The sensitive nature of the FISC is the result of balancing the need to protect national security with the need to provide notice to the individual targeted by the proceeding at an appropriate time. n282 Currently, the FISC is only required to report on the number of orders it issues and denies. n283 No other [*212] information accompanies the annual report, and the public receives no additional information about the cases that come before the court each year. n284 The public should not have to rely on the disclosure of classified orders, such as the Snowden leak, for important information regarding invasions of their privacy by government surveillance. As currently implemented, the FAA lacks transparency and fails to provide any assurance that the FISC can conduct sufficient oversight of the government's surveillance activities. n285 Improvements in such areas could include public reporting procedures for FISC opinions, published statistics for FISC orders, and a provision for an increased web presence or other source of data that can easily be accessed. n286 It is important to provide the public with information about the FISC without compromising the government's security and intelligence gathering interests. n287 Providing the public with information such as an overview of the FISC's docket and the identity of the judge assigned to each case is one possibility. n288 **The most effective way to increase public understanding of the FISC would be to publish past orders and opinions**. n289 Publishing opinions with redacted sensitive material would provide increased accountability for an important executive branch function. n290

AT: Deference

The Zivotofsky decision crushes presidential powers

Glennon 2015 (Michael J [Prof of International Law at the Fletcher School of Law and Diplomacy, Tufts University]; Recognizable power: The Supreme Court Deals a Blow to Executive Authority; Jun 23; https://www.foreignaffairs.com/articles/united-states/2015-06-23/recognizable-power; kdf)

On its face, the Supreme Court's landmark decision this month in Zivotofsky v. Kerry looks like an ode to presidential power. In it, the Court, for the first time, struck down an act of Congress in the field of foreign affairs. The law had required the State Department to designate Israel as the nation of birth of certain Americans born in Jerusalem. For 60 years, though, the United States has recognized no country as having sovereignty over Jerusalem. When the Court invalidated the act, it affirmed that it is the exclusive power of the president to recognize foreign governments, stressing the need for the nation to speak with one voice. It is easy to think that, with this decision, the Supreme Court handed the president an epic victory in its perpetual struggle with Congress to control the nation's foreign policy. That conclusion would be tempting but wrong. In fact, the Court's opinion took nothing from Congress—and may actually have enhanced its power. That the Court affirmed the president's exclusive power to recognize foreign governments is unsurprising. Since President George Washington recognized the revolutionary government of France by receiving Citizen Genet as its representative, few have seriously believed that Congress could ever second-guess a president's decision to recognize a foreign government. During the dispute following President Jimmy Carter's recognition of the

People's Republic of China in 1979, congressional opponents challenged his authority to unilaterally terminate the United States' mutual security treaty with Taiwan, but no one doubted that he had sole power to decide whether to derecognize Taiwan or recognize the PRC. It is true that the Court's opinion rests in part on the need for the United States to "speak with one voice." The Court lifted the so-called one-voice doctrine from recent federalism cases in which it found states to have interfered impermissibly in the federal government's foreign policy prerogatives. In one, for example, it struck down a Massachusetts law barring state entities from buying goods or services from any person doing business with Myanmar (also called Burma). In another, it struck down a California law that required any insurer doing business in that state to disclose information about all policies it sold in Europe between 1920 and 1945. But the Court's references to the doctrine in Zivotofsky relate only to the president's recognition power. Nothing in the opinion implies that the one-voice doctrine narrows any of the long-established powers that Congress exercises in other areas. The Court referred to the one-voice doctrine as a "functional consideration"—a practical concern relating to a branch's particular institutional advantages in exercising a given power. "Unlike Congress," the Court noted, "the President is … capable of engaging in the delicate and often secret diplomatic contacts that may lead to a recognition decision." Some suggest that this approach could be a formula for justifying across-the-boards presidential unilateralism. But functionalism cuts both ways. In future disputes, institutional attributes could easily point toward predominant congressional power. Unlike the executive, Congress can ask pointed questions, bring diverse viewpoints to bear, build a consensus, and sell a policy to the public. Absent a national emergency, such decisive functional advantages would counsel in favor of including the legislative branch in a decision to introduce troops into combat, impose economic sanctions, or enter into a mutual security commitment. The opinion's greatest significance lies in its treatment of two earlier, conflicting precedents. The Court deflated the executive's perennial favorite, the 1936 Curtiss-Wright case, and resurrected an all-but-forgotten opinion of Chief Justice John Marshall that tightly circumscribed presidential power, Little v. Barreme (1804). For its part, Curtiss-Wright implied that the president, as the "sole organ of the nation in its external relations," has exclusive authority over foreign policy generally; no wonder, then, that the Obama administration cited Curtiss-Wright no fewer than ten times in its Zivotofsky pleadings, claiming broad, undefined foreign affairs powers. But Curtiss-Wright's sweeping language, the Court said in Zivotofsky, was merely dicta—it was not necessitated by the facts of that case, in which President Franklin Roosevelt initiated an arms embargo that Congress had authorized, not prohibited. The Court proceeded to reject the Obama administration's claim of "unbounded power" in relying upon Curtiss-Wright. "It is Congress that makes laws," the Court said, "and in countless ways its laws will and should shape the Nation's course." The more important precedent, the Zivotofsky Court suggested, is Little v. Barreme. The 1804 case is significant because it involved the exercise of the president's commander-in-chief powers during the undeclared naval war with France in the 1790s. In it, the Marshall Court held that an act of Congress prohibiting the seizure of a certain ship trumped a military order requiring it. "The Executive is not free from the ordinary controls and checks of Congress merely because foreign affairs are at issue," the Zivotofsky Court said, citing Little. "It is not for the President alone to determine the whole content of the Nation's foreign policy." These are not words, or citations, in which an imperial president could take much comfort. It remains to be seen how much Little will influence the resolution of future foreign affairs controversies, such as the constitutionality of the War Powers Resolution or the validity of a nuclear deal with Iran. Judicial decisions resolving foreign policy disputes are heavily fact-dependent. Precedents inevitably are elastic. But beyond the narrow confines of recognition, nothing in Zivotofsky makes a future presidential victory more likely.

No modelling

No judicial modelling – foreign policy overwhelms the plan

Liptak 2008 (Adam; US Courts is now guiding fewer nations; Sep 17; www.nytimes.com/2008/09/18/us/18legal.html?pagewanted=all)

WASHINGTON — Judges around the world have long looked to the decisions of the United States Supreme Court for guidance, citing and often following them in hundreds of their own rulings since the Second World War. But now American legal influence is waning. Even as a debate continues in the court over whether its decisions should ever cite foreign law, a diminishing number of foreign courts seem to pay attention to the writings of American justices. "One of our great exports used to be constitutional law," said Anne-Marie Slaughter, the dean of the Woodrow Wilson School of Public and International Affairs at Princeton. "We are losing one of the greatest bully pulpits we have ever had." From 1990 through 2002, for instance, the Canadian Supreme Court cited decisions of the United States Supreme Court about a dozen times a year, an analysis by The New York Times found. In the six years since, the annual citation rate

has fallen by more than half, to about five. Australian state supreme courts cited American decisions 208 times in 1995, according to a recent study by Russell Smyth, an Australian economist. By 2005, the number had fallen to 72. The story is similar around the globe, legal experts say, particularly in cases involving human rights. These days, foreign courts in developed democracies often cite the rulings of the European Court of Human Rights in cases concerning equality, liberty and prohibitions against cruel treatment, said Harold Hongju Koh, the dean of the Yale Law School. In those areas, Dean Koh said, "they tend not to look to the rulings of the U.S. Supreme Court." The rise of new and sophisticated constitutional courts elsewhere is one reason for the Supreme Court's fading influence, legal experts said. The new courts are, moreover, generally more liberal that the Rehnquist and Roberts courts and for that reason more inclined to cite one another. Another reason is the diminished reputation of the United States in some parts of the world, which experts here and abroad said is in part a consequence of the Bush administration's unpopularity abroad. Foreign courts are less apt to justify their decisions with citations to cases from a nation unpopular with their domestic audience. "It's not surprising, given our foreign policy in the last decade or so, that American influence should be declining," said Thomas Ginsburg, who teaches comparative and international law at the University of Chicago.

No oversight

The court lacks credibility because of its cherry picking of i-law

Schwarzschild '10 (Maimon; October 2010; Legal Studies Research Paper Series Research Paper No. 10-043 Judicial Independence vs. Judicial Independence; http://www.researchgate.net/publication/228128343_Judicial_Independence_vs._Judicial_Independence; Schwarzschild was an accredited journalist at the United Nations for five years, had White House press credentials during the Nixon administration, and served in the U.S. Department of Justice in Washington, D.C, JD, 1976, Columbia University BA, 1973, Columbia University; 7-10-15; mbc)

One troubling model is the growing power of judges in European Union countries to make public policy under the banner of European norms and treaties which are often vague and open-ended, and which therefore seem to invite judicial over-reaching. A euphemism for this is "teleological" adjudication, which can mean interpreting or pushing, not to say twisting, the law in a particular direction or towards a particular goal. Often, the goal in question is more power for the European Union and its institutions - "deeper union" - at the expense of the democratic institutions of the constituent nation states. This is a goal, in many cases at least, that the public 19 in European countries would not vote for: a goal that the electorates would reject not merely in the heat of passion, but upon sober reflection. It may be especially troubling for the broader judicial culture that this power to use or abuse European norms is not restricted to a handful of specifically European tribunals, but is devolved - in the name of subsidiarity - to ordinary national judges as well. This tends to enlist the judges in the teleological project and vests them with new, broad, and nebulously accountable powers.20 The citation of foreign law by American courts, at least in some contexts, is open to similar criticism. If judicial interpretation of the Constitution or of domestic law is guided by the law of other countries, that tends to circumvent domestic democratic processes. Moreover, on many debatable questions, foreign law is liable to differ from country to country. This creates an obvious risk of arbitrary selectivity about which foreign law to cite, or rather, of tendentious selectivity: that the judge will "pick and choose" whichever bits of foreign law suit the result the judge favours, especially where the result might not be straightforwardly justified under duly enacted domestic law.21 More broadly, international legal

institutions sometimes seem to promote, and even to embody, judicial independence in a dubious rather than in a desirable or defensible sense. Judges appointed to international tribunals from countries ruled by dictatorships, for example, are unlikely to enjoy much judicial independence in the positive sense. Coming from countries with little or no tradition of the rule of law, where the judge has family members who can be implicitly or explicitly threatened, where the judge himself or herself might hope to retire or to pursue a later career, where an independent-minded person is in any event unlikely to have reached a professional position from which appointment to an international tribunal would be plausible, the foundations for judicial independence are scarcely promising. For international jurists, however, there is often a kind of judicial independence in the dubious sense of being unmoored from a developed legal system, and unaccountable to a democratic citizenry. The body of international law, to put it charitably, is less than fully evolved: it embraces uncertain "custom", treaties sometimes drafted broadly, highly arguable "general principles", and so forth. Members of international tribunals are often appointed in a none-too-transparent process of horse trading among governments, international organisations, and sometimes activist pressure groups. There is no global hierarchy of international courts or 22 a responsible body of supervising jurists. Few if any international jurists are known to the public, much less are they politically removable or otherwise answerable to democratic scrutiny.

The fluid, and inevitable nature of judicial independence makes impartiality in court impossible

Dinh '8 (Viet D; 2008; Threats to judicial independence, real & imagined; Viet D. Dinh is professor of law and codirector of the Asian Law and Policy Studies Program at Georgetown University Law Center; http://www.mitpressjournals.org/doi/pdf/10.1162/daed.2008.137.4.64; 7-10-15; mbc)

Public criticism of the federal courts is nothing new.1 Since the beginning of the republic to the present day, pol-iticians and populace have attacked ju-dicial opinions and decried judicial ac-tivism. For example, the response to the landmark Supreme Court decisions of the 1950s, in particular those involving desegregation and church-state rela-tions, was a nationwide movement to remove Chief Justice Warren from the bench.2 Billboards around the country proclaimed their aim: "Impeach Earl Warren."3 Petitions circulated, and over one million Americans signed their names in support of the impeachment effort.4 Some even proposed that War-ren be hanged. For as long as there has been a federal judiciary, federal judges have been blasted for purportedly overstepping their bounds. Yet by and large the judges have not abdicated their duty to invalidate laws that they believe offend the Constitution. Public criticism of judicial decisions does not, by itself, necessarily threaten the independence of the judiciary; in fact, under some cir-cumstances, such critiques paradoxically can help bring about a more robust form of judicial independence. Under our constitutional system, the federal judiciary wields carefully circumscribed powers, but within its prop-er sphere judicial authority is final and therefore absolute. Among other limitations, federal judges may not issue advisory opinions and have no authority to engage in policy-making. But while the Constitution rules certain functions out of bounds for the courts, it also insulates federal judges from the pressures that can be brought to bear in response to an unpopular, but legally required, decision. Article III guarantees that federal judges shall hold their offices for life with continued "good Behaviour." By setting up an independent judiciary, the framers intended to prevent the other branches of government, or the people themselves, from undermining the judiciary's decisional impartiality. It is "essential to the preservation of the rights of every individual, his life, property, and character, that there be an impartial interpretation of the laws, and administration of justice."5 The insulation of judges from popular pressures ensures that all citizens receive equal justice under the law, and prevents judges from being influenced by

the whims of the public (or a powerful faction) when they decide cases. In The Federalist No. 78, Alexander Hamilton emphasized: This independence of the judges is equally requisite to guard the Constitution and the rights of individuals from the effects of those ill humors, which the arts of designing men, or the influence of particular conjectures, sometimes disseminate among the people themselves, and which, though they speedily give place to better information and more deliberate reflection, have a tendency, in the meantime, to occasion dangerous innovations in the government, and serious oppressions of the minor party in the community. 5 Peter D. Webster, "Who Needs an Independent Judiciary?" Florida Bar Journal 78 (2004): 24–25, which discusses the creation of and need for an independent judiciary. The way to achieve this impartiality– to free judges to decide cases based on what the law actually requires, and on nothing else–is to ensure that the judiciary is independent, or, put differently, not subject to reprisals for decisions on the bench. But judicial independence is not an absolute or singular value defining our courts. The principle of judicial restraint is equally important–and it is inextricably linked to judicial independence. At one level, the tension between the two seems inescapable. But there is an important sense in which an independent judiciary and judicial restraint are flip sides of the same coin. Both aim to minimize the influence of extraneous factors on judicial decision-making. A judge must not decide a case with an eye toward public approbation, because whether a particular result is popular is irrelevant to whether it is legally sound. In the same way, a judge must not consult his own policy preferences (or those of whatever moral philosopher happens to be au courant at the time) when construing the Constitution or a statute, because those personal views are immaterial to what the law, fairly construed, actually provides. Judicial independence and judicial restraint thus work together hand-in-glove to channel judges' attention to the factors that are actually relevant to the proper resolution of cases. Much is at stake if the judiciary becomes too independent or too restrained, namely individual rights and the proper functioning of the government. Those who criticize courts advocate more restraint to ensure that judges do not exceed the scope of their powers. But at the same time, it must be stressed, as Justice Sandra Day O'Connor did in a recent speech, that a court's ability to be effective depends "on the notion that we won't be subject to retaliation for our ju- dicial acts."6 The upside of judicial independence, then, is that it insulates judges who faithfully apply the law (albeit in unpopular ways); the downside is that judicial independence insulates judges who use their lack of accountability to shape the law in favor of their own preferred policies.

AT: Third Part Doctrine

1NC – No solve

Plan isn't sufficient to solve their internal link

Ohm 2012 (Paul [Associate Professor, University of Colorado Law School]; The Future of Digital Evidence Searches and Seizures: THE FOURTH AMENDMENT IN A WORLD WITHOUT PRIVACY; 81 Miss. L.J. 1309; kdf)

Some critics contend that the third-party rule is a mistake in every context and should be overturned. n81 Others would restrict it to its original contexts--bank records and telephone numbers dialed--but prevent it from spreading to other network services like electronic mail, cloud computing, and mobile location. n82 What remains consistent throughout this literature is the idea that the third-party doctrine deserves to be our central focus, that if only we could rein it in, we could right the balance between police power and privacy. Fixing the third-party doctrine, in short, is both necessary and sufficient to

fixing the problem of police surveillance of private behavior. In a world without privacy, however, getting rid of the third-party doctrine is necessary but not nearly sufficient to ensure the appropriate protection of the Fourth Amendment. The third-party [*1332] doctrine and, more broadly, the Fourth Amendment have traditionally evolved to focus attention almost entirely on the requirement that a search warrant be issued only with probable cause and particularity. In a world without privacy, probable cause and a warrant by themselves will not do enough to give effect to the full protection of the amendment. Although judges will be able to squelch fishing expeditions, fishing expeditions will no longer be necessary. n83 This is the power of a widespread surveillance society. It produces interconnected databases that track the behavior of millions in excruciating detail, gives companies (and the police agencies they assist) detailed records of what every one has done, and produces chains of evidence that can connect criminals to crime with no breaks and no ambiguous midway points. n84 The result is that even if we increase probable cause and warrant requirements, we still will be subject to far too much arbitrary surveillance. If the police are tracking a person knowing only the time and place of the crime and a general description of the perpetrator, they will be able to access cell phone location databases or video surveillance log files (with probable cause) to make the match. If they know that a particular e-mail address was used, then they will be able to search the login databases for the e-mail provider. Reversing or narrowing the third-party doctrine will help stem official arbitrariness, but it will not do enough to reverse the unprecedented increase in police power that the surveillance society has created. The problem with the surveillance society is not simply how it empowers the bored police officer on a fishing expedition; it is a broader problem with an increase in the power of the state to watch, listen, and follow every one of us.

Alt causes

Other doctrines undermine the world post-plan

Strandburg ’11 (Katherine, Alfred B. Engelberg Professor of Law at NYU School of Law, J.D., University of Chicago, with high honors, “HOME, HOME ON THE WEB AND OTHER FOURTH AMENDMENT IMPLICATIONS OF TECHNOSOCIAL CHANGE”, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3460&context=mlr, 2011)//HW

Determining that a social media site is the technosocial extension of a home or office, and therefore concluding that the Fourth Amendment would generally require a government agent to obtain a warrant in order to gain access to the site through the platform providers, **is only the very beginning of the inquiry.** Once the overly aggressive interpretation of the third party doctrine is jettisoned, we are left to confront the same kinds of questions that have occupied courts for years with regard to privacy in the home or office. There are many such questions: issues of exigency, particularity of warrants and scope of search, third party consent, the plain view doctrine, and the activities of undercover police or in-formants. Full treatment of these issues is well beyond the ambitions of this Article, but in this Section, I will briefly tackle two of them: the plain view doctrine and undercover policing.

Third Party Doctrine in check

There is already transparency within the 3rd party doctrine

Sullum 15 - Sullum won the Keystone Press Award for investigative reporting, and in 1991 he received First Prize in the Felix Morley Memorial Journalism Competition (Jacob, 5/6/15, "how the 11th circuit's 'wooden application of the third-party doctrine' threatens privacy" reason.com/blog/2015/05/06/how-the-11th-circuits-wooden-application)

As Scott Shackford noted earlier today, the U.S. Court of Appeals for the 11th Circuit yesterday overturned a 2014 panel decision requiring a probable-cause warrant to obtain cellphone location records. Last year, in a case involving an armed robber named Quartavius Davis who was linked to the scenes of various crimes by cellphone data, a three-judge 11th Circuit panel concluded that people have a reasonable expectation of privacy in such information, which can reveal where you are throughout the day, every day. The full court disagreed, saying that claim is foreclosed by the Supreme Court's "third-party doctrine," which holds that "a person has no legitimate expectation of privacy in information he voluntarily turns over to third parties." The Court also has said "the Fourth Amendment does not prohibit the obtaining of information revealed to a third party and conveyed by him to Government authorities, even if the information is revealed on the assumption that it will be used only for a limited purpose and the confidence placed in the third party will not be betrayed." Given the sweeping language of those precedents, you can see why the 11th Circuit ruled the way it did, joining two other circuits (the 5th and 6th) that have reached the same conclusion. The three judges who signed last year's decision and the two dissenters from yesterday's ruling tried to avoid that result by arguing that cellphone users do not voluntarily disclose their locations when they make and receive calls and may not even realize their service providers collect and store that information. Nonsense, says the full court: Cell users know that they must transmit signals to cell towers within range, that the cell tower functions as the equipment that connects the calls, that users when making or receiving calls are necessarily conveying or exposing to their service provider their general location within that cell tower's range, and that cell phone companies make records of cell-tower usage. Users are aware that cell phones do not work when they are outside the range of the provider company's cell tower network. Indeed, the fact that Davis registered his cell phone under a fictitious alias tends to demonstrate his understanding that such cell tower location information is collected by MetroPCS and may be used to incriminate him.

AT: Judicial Independence -> Peace

No empirical proof of their internal link

Madden 2012 (Ryan J [political science major at the State University of New York at Binghamton, with a concentration in international relations and global affairs]; Judicial Independence and Peace Duration: An Assessment of Political Institutions in the Post-Conflict Environment; eaglefeather.honors.unt.edu/2012/article/19#conclusion; kdf)

The aim of this paper was to research a previously unexplored area of political institution building in post-conflict societies. The existing literature on post-conflict environments has suggested that mitigating security dilemmas is at the foundation of ensuring durable peace and that the presence of political institutions that safeguard against security dilemmas are necessary in guaranteeing this stability. The primary argument I set forth was that the presence of an independent judiciary would contribute to longer durations of peace in the aftermath of civil war. I argued that an independent judiciary was endowed with the security-assuring attributes that previous literature claimed to be necessary for political institutions to have in order to facilitate peace in post-conflict environments. I argued that independent judiciaries could alleviate security dilemmas by ending conditions of dual sovereignty in the post-conflict environment, increasing public access to political participation, encouraging conditions conducive to economic growth, and monitoring the fair enactment of settlement agreements. I proposed that an independent judiciary, serving as a neutral arbiter between warring factions, could function as a dependable political entity in ensuring the rule of law in the aftermath of conflict and instilling trust in the political system. **The empirical tests conducted in this paper did not support the theoretical argument I put proposed in terms of the role that independent judiciaries play in maintaining peace**. As noted before, there were possible flaws with my research design and the way some of the variables were operationalized. It is possible that the coding I used to determine judicial independence was imprudent. For future research in this field, it will be important to collect survey data on public perceptions of the independence of judicial systems. The mere presence of an independent judiciary may not be sufficient to ensure durable peace; perhaps there must be public confidence in these institutions as well.

AT Afghanistan – Stable Now – US India RX

US and Indian relations lock in stability

Business Standard 2/19/**2015** (US, India discuss stable Afghanistan; www.business-standard.com/article/news-ians/us-india-discuss-stable-afghanistan-115021900378_1.html; kdf)

India and the US held discussions on regional cooperation in South Asia focusing on a stable and prosperous Afghanistan, a US embassy statement said here Thursday. The discussions were held during the visit of an inter-agency delegation, led by US Deputy Special Representative for Afghanistan and Pakistan Laurel Miller, from Feb 16-18. Miller met government officials, civil society, and political party leaders to continue high-level US-India consultations on Afghanistan, the statement said. "The consultations helped advance our shared commitment to regional cooperation on working towards a stable and prosperous Afghanistan," it said. US President Barack Obama and Prime Minister Narendra Modi in their joint statement during the former's visit to India had shared the commitment for a secure, stable, and prosperous Afghanistan.

AT Afghanistan – Stable Now – Regional governments/ New Silk Road

Regional initiatives and the new Silk Road guarantee stability

Astana Times 3/11/2015 (Afghanistan Should Not Be Left Alone; www.astanatimes.com/2015/03/afghanistan-left-alone/; kdf)

Kazakhstan, together with its neighbours and the international community all share a common objective to ensure that Afghanistan never again becomes a safe haven for international terrorism, nor a threat to regional stability. This gives us a common purpose: to build the capacity of the Afghan government and the Afghan National Security Forces, and to give Afghans the opportunities to build a stable and prosperous future. Over a decade on from the September 11, 2001, terrorist attacks, al Qaeda in Afghanistan and Pakistan has been significantly weakened, and today's Afghanistan is unrecognisable from 10 years ago. However the pull-out of NATO troops means that an enduring international commitment to Afghanistan is required. Unfortunately nearly 4,000 Afghan civilians died in 2014, making it the deadliest year yet in the conflict. This must act as a wakeup call to the world. If the international community turns its back on the country and its long-suffering people, there is a real risk that it could descend again into outright chaos and that instability and violence will spill increasingly over its borders. No nation is immune from this threat. Up to now, extremists have struggled to gain a foothold in Kazakhstan. Despite a very diverse population, we have built a moderate and tolerant society where all can make a contribution. The Kazakh government has been closely monitoring the situation regarding religious extremism and drug trafficking out of Afghanistan, two issues that can hurt our own nation. The Kazakh government has also been working hard, and rightly so, to counter the distorted message of the extremists in our society. And it has also stepped up direct economic and humanitarian aid to Afghanistan. Kazakhstan has allocated $2.38 million for social services projects in Afghanistan, sent more than $17 million worth of emergency food assistance, and implemented a $50 million project to train Afghan students at Kazakh universities. But the challenge requires a concerted and coordinated international effort to help re-establish and reintegrate Afghanistan into the region. It is an effort that Afghanistan's Central Asian neighbours must help shape and lead. After all, we in the region have the most to gain from success and the most to lose from failure. Not surprisingly, regional governments are already discussing how Afghanistan's efforts can do more together to help rebuild it as well as improve regional security against terrorism and the drugs trade. The long-term solution must be to accelerate the growth of the entire regional economy to spread employment and prosperity in Afghanistan and all neighbouring countries. This will deny the extremists the anger and despair required for their divisive message to take root. Consistent efforts in this area are being taken by organisations such as the Shanghai Cooperation Organisation, which brings together four Central Asian nations plus Russia and China. Through other initiatives like the U.S.-proposed 'New Silk Road', which aims to integrate the Central Asian countries of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan with Afghanistan, India, and Pakistan, there is hope to integrate Afghanistan into the wider region. The positive impact, of course, of the 'New Silk Road' will be felt far beyond Afghanistan or Central Asia. Our region is seriously laying claim to be the next economic frontier. Rich in energy and natural wealth and strategically positioned between Europe and the fast-growing economies of the east, improved connections can provide a much-needed boost to global growth. We cannot halt the powerful forces which are changing our world. But through increased co-operation with our partners, they can be channelled for the benefit of all. Afghanistan's people are counting for the world's powers to stop their disputes, and instead unite to battle a common

foe. We have all borne the costs of decades of conflict in Afghanistan and, if we fail to come together and turn good intentions into positive action, we will see the chaos engulfing the Middle East repeated in Afghanistan.

AT Afghanistan – Stable Now – Economic Development

Afghani economic development solves

Times of Oman March 4, 2015 (Security, development projects figure in Indo-Afghan talks; www.timesofoman.com/News/48315/Article-Security-development-projects-figure-in-Indo-Afghan-talks; kdf)

Kabul: Foreign Secretary S. Jaishankar on Wednesday held talks with Afghanistan's top leadership here which mainly focussed on India's development projects and the security situation in the war-torn country. Wrapping up the first leg of his 'Saarc Yatra' aimed at firming up India's ties with members of the grouping while reviewing regional and bilateral cooperation, the Foreign Secretary flew into Kabul from Islamabad and called on Afghan President Ashraf Ghani and CEO Abdullah Abdullah among other leaders. During his meetings, Afghan leaders welcomed India being "partner of choice" for Afghanistan and briefed Jaishankar about their views on India's involvement in furthering the cause of stability and security in the country. According to officials, the main thrust during the meetings was on India's development projects in Afghanistan, ways to improve connectivity and the security situation in the war-ravaged country. Afghanistan leaders also welcomed India being a "partner of choice" for the country during the interactions with Jaishankar, the officials said. The Foreign Secretary also called on Foreign Minister Salahuddin Rabbani besides former president Hamid Karzai. Jaishankar also met Deputy Foreign Minister Hekmat Khalil Karzai and held extensive talks. The Foreign Secretary, who arrived here amid light snow, was received by senior Afghan officials and Indian High Commissioner Amar Sinha at the airport. With Wednesday's trip to Afghanistan, Jaishankar rounded off the first leg of his 'Saarc Yatra' that began on Sunday with Bhutan. He subsequently visited Bangladesh and Pakistan as part of the yatra. Afghanistan was recently hit by a massive avalanche that claimed nearly 250 lives. Following the tragedy, Prime Minister Narendra Modi had written to Afghan President Ghani to condole the loss of lives and offered help in rescue and relief efforts. The South Asian Association for Regional Cooperation (Saarc) — an economic and geopolitical grouping of eight countries located in South Asia — includes Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan, Afghanistan and Sri Lanka as its members.

AT: Economy Advantage

No link – Internet not k2 econ

Internet not key to growth

Lowrey 2011 (Annie; Freaks, geeks, and the GDP; Mar 8; www.slate.com/articles/business/moneybox/2011/03/freaks_geeks_and_gdp.html; kdf)

If you have attended any economists' cocktail parties in the past month or so—lucky you!—then you have probably heard chatter about Tyler Cowen's e-book, The Great Stagnation. The book seeks to explain why in the United States median wages have grown only slowly since the 1970s and have actually declined in the past decade. Cowen points to an innovation problem: Through the 1970s, the country had plenty of "low-hanging fruit" to juice GDP growth. In the past 40 years, coming up with whiz-bang, life-changing innovations—penicillin, free universal kindergarten, toilets, planes, cars—has proved harder, pulling down growth rates across the industrialized world. But wait! you might say. In the 1970s, American businesses started pumping out amazing, life-changing computing technologies. We got graphing calculators, data-processing systems, modern finance, GPS, silicon chips, ATMs, cell phones, and a host of other innovations. Has the Internet, the most revolutionary communications technology advance since Gutenberg rolled out the printing press, done nothing for GDP growth? The answer, economists broadly agree, is: Sorry, but no—at least, not nearly as much as you would expect. A quarter century ago, with new technologies starting to saturate American homes and businesses, economists looked around and expected to find computer-fueled growth everywhere. But signs of increased productivity or bolstered growth were few and far between. Sure, computers and the Web transformed thousands of businesses and hundreds of industries. But overall, things looked much the same. The GDP growth rate did not tick up significantly, **nor did productivity**. As economist Robert Solow put it in 1987: "You can see the computer age everywhere but in the productivity statistics." An overlapping set of theories emerged to explain the phenomenon, often termed the "productivity paradox." Perhaps the new technologies advantaged some firms and industries and disadvantaged others, leaving little net gain. Perhaps computer systems were not yet easy enough to use to reduce the amount of effort workers need to exert to perform a given task. Economists also wondered whether it might just take some time—perhaps a lot of time—for the gains to show up. In the past, information technologies tended to need to incubate before they produced gains in economic growth. Consider the case of Gutenberg's printing press. Though the technology radically transformed how people recorded and transmitted news and information, economists have failed to find evidence it sped up per-capita income or GDP growth in the 15th and 16th centuries. At one point, some economists thought that an Internet-driven golden age might have finally arrived in the late 1990s. Between 1995 and 1999, productivity growth rates actually exceeded those during the boom from 1913 to 1972—perhaps meaning the Web and computing had finally brought about a "New Economy." But that high-growth period faded quickly. And some studies found the gains during those years were not as impressive or widespread as initially thought. Robert Gordon, a professor of economics at Northwestern, for instance, has found that computers and the Internet mostly helped boost productivity in durable goods manufacturing—that is, the production of things like computers and semiconductors. "Our central theme is that computers and the Internet do not measure up to the Great Inventions of the late nineteenth and early twentieth century, and in this do not merit the label of Industrial Revolution," he wrote. Gordon's work leads to another theory, one espoused by Cowen himself. Perhaps the Internet is just not as revolutionary as we think it is. Sure, people might derive endless pleasure from it—its tendency to improve people's quality of life is undeniable. And sure, it might have revolutionized how we find, buy, and sell goods and services. But that still does not necessarily mean it is as transformative of an economy as, say, railroads were. That is in part because the Internet and computers tend to push costs toward zero, and have the capacity to reduce the need for labor. You are, of course, currently reading this article for free on a Web site supported not by subscriptions, but by advertising. You probably read a lot of news articles online, every day, and you probably pay nothing for them. Because of the decline in subscriptions, increased competition for advertising dollars, and other Web-driven dynamics, journalism profits and employment have dwindled in the past decade. (That Cowen writes a freely distributed blog and published his ideas in a $4 e-book rather than a $25 glossy airport hardcover should not go unnoted here.) Moreover, the Web- and computer-dependent technology sector itself does not employ that many people. And it does not look set to add workers: The Bureau of Labor Statistics estimates that employment in information technology, for instance, will be lower in 2018 than it was in 1998. That the Internet has not produced an economic boom might be hard to believe, Cowen admits. "We have a collective historical memory that technological progress brings a big and predictable stream of revenue growth across most of the economy," he writes. "When it comes to the web, those assumptions are turning out to be wrong or misleading. The revenue-intensive sectors of our economy have been slowing down and the big technological gains are coming in revenue-deficient sectors." But revenue is not always the end-all, be-all—even in economics. That brings us to a final explanation: Maybe it is not the growth that is deficient. Maybe it is the yardstick that is deficient. MIT professor Erik Brynjolfsson * explains the idea using the example of the music industry. "Because you and I stopped buying CDs, the music industry has shrunk, according to revenues and GDP. But we're not listening to less music. There's more music consumed than before." The improved choice and variety and availability of music must be worth something to us—even if it is not easy to put into numbers. "On paper, the way GDP is calculated, the music industry is disappearing, but in reality it's not disappearing. It is disappearing in revenue. It is not disappearing in terms of what you should care about, which is music." As more of our lives are lived online, he wonders whether this might become a bigger problem. "If everybody focuses on the part of the economy that produces dollars, they would be increasingly missing what people actually consume and enjoy. The disconnect becomes bigger and bigger." But providing an alternative measure of what we produce or consume based on the value people derive from Wikipedia or Pandora proves an extraordinary challenge—indeed, no economist has ever really done it. Brynjolfsson says it is possible, perhaps, by adding up various "consumer surpluses," measures of how much consumers would be willing to pay for a given good or service, versus how much they

do pay. (You might pony up $10 for a CD, but why would you if it is free?) That might give a rough sense of the dollar value of what the Internet tends to provide for nothing—and give us an alternative sense of the value of our technologies to us, if not their ability to produce growth or revenue for us. Of course, if our most radical and life-altering technologies are not improving incomes or productivity or growth, then we still have problems. Quality-of-life improvements do not put dinner on the table or pay for Social Security benefits. Still, even Cowen does not see all doom and gloom ahead, with incomes stagnating endlessly as we do more and more online and bleed more and more jobs and money. Who knows what awesome technologies might be just around the bend?

No Internal – No US Leadership

No US economic leadership—litany of alt causes

FT 2015 (America's wobbly economic leadership; Apr 23; www.ft.com/cms/s/0/35af0bbe-e8f5-11e4-87fe-00144feab7de.html#axzz3fVSr9rsv; kdf)

That is why so many countries have rushed to join the AIIB and why the World Bank and the Asian Development Bank have welcomed the new arrival. There is more than enough demand to go around. The concern is that the AIIB will not adhere to best practices. At a time when the US is reluctant to fulfil its obligations to Bretton Woods institutions, let alone join any new ones, US companies will find it tough to win a slice of the pie in Asia and elsewhere. Exim's standards are among the best in the world. It serves as a check on the crony capitalism practised by China and others. Closing it would sound another US retreat. The concern is that Congress is too polarised to reverse the trend. Most Republicans disdain global bodies and most Democrats revile trade deals. Congress continues to block the 2010 US-led reforms of the International Monetary Fund. That is one reason China is setting up its own institutions. There are signs Capitol Hill may be preparing to pass the fast track negotiating authority the Obama administration needs to wrap up trade deals in the Pacific and the Atlantic. That would be welcome. But Barack Obama will first need to take on sceptics in his own party. Hillary Clinton, his likely successor, has questioned the merits of another trade deal. Jeb Bush, her likely opponent, said he would close Exim. There was a time when US gridlock imposed a price on others. Now others are imposing a price on the US. **The world is no longer waiting on Washington's prevarications.**

No Internal – US Not Key

The US isn't key to the global economy

Kenny 2015 (Charles; Why the Developing World Won't Catch the U.S. Economy's Cold; May 4; www.bloomberg.com/news/articles/2015-05-04/why-the-developing-world-won-t-catch-the-u-s-economy-s-cold; kdf)

Last week the U.S. Commerce Department announced that first-quarter GDP growth for 2015 was an anemic 0.2 percent. This immediately sparked fears that a U.S. slowdown could lead to a global recession. But the cliché about America sneezing and the rest of the world catching the cold doesn't hold like it used to. The U.S. isn't as contagious as it was, and developing countries in particular are far more robust to economic shocks. That's good news for everyone. It means less volatility in Asia, Africa, and Latin America, which contributes to happier people, greater political stability, and stronger long-term growth—all of which should help lift the U.S. out of its own doldrums. A team of IMF researchers has looked at the long-term record of the world's economies when it comes to growth and recession. They measured how long economies expanded without interruption, as well as the depth and length of downturns. Over the past two decades, low and middle-income economies have spent more time in expansions, while downturns and recoveries have become shallower and shorter. This suggests countries have become more resilient to shocks. In the 1970s and '80s, the median developing economy took more than 10 years after a downturn to recover

to the GDP per capita it had prior to that slump. By the early 2000s, that recovery time had dropped to two years. In the 1970s and '80s, countries of the developing world spent more than a third of their time in downturns, but by the 2000s they spent 80 percent of their time in expansions. The first decade of the 21st century was the first time that developing economies saw more expansion and shorter downturns than did advanced economies: Median growth in the developing world was at its highest since 1950 and volatility at its lowest. Developing countries still face a larger risk of deeper recession when terms of trade turn against them, capital flows dry up, or advanced economies enter recessions themselves. But the scale of that risk has diminished. That's because low and middle-income economies have introduced policy reforms that increase resilience: flexible exchange rates, inflation targeting, and lower debt. Economies with inflation-targeting regimes see recovery periods less than a third as long as economies without targeting, for example. Larger reserves are associated with longer expansions. And median reserves in developing countries more than doubled as a percentage of GDP between the 1990s and 2010. Median external debt has dropped from 60 percent to 35 percent of GDP over that same period. Such policy changes account for two-thirds of the increased recession-resilience of developing countries since the turn of the century, suggest the IMF researchers—leaving external factors, such as positive terms of trade, accounting for just one-third. That's good news for the developing world—not least because volatile growth is particularly bad for poorer people, who are most at risk of falling into malnutrition or being forced to take children out of school, which has long-term consequences for future earnings. That might help explain the relationship between growth volatility, slower reductions in poverty, and rising inequality. Sudden negative income shocks can also be a factor in sparking violence: When rains fail, the risk of civil war in Africa spikes, and when coffee prices in Colombia fall, municipalities cultivating more coffee see increased drug-related conflict. The African analysis suggests that a five percentage-point drop in income growth is associated with a 10 percent increase in the risk of civil conflict in the following year. Finally, because volatility increases the uncertainty attached to investments, it can also be a drag on overall long-term economic performance. Viktoria Hnatkovska and Norman Loayza of the World Bank estimated that moving from a comparatively stable to a relatively volatile growth trajectory is associated with a drop in average annual growth of as much as 2 percent of GDP. Lower volatility in the developing world and its associated long-term growth performance is also good news for the U.S. A strong global economy is still a positive force for growth in every country, including developed nations. And with the developing world accounting for about one-third of trade and GDP at market rates, as well as three-fifths of U.S. exports, its role in supporting American economic performance has never been greater. Those hoping for a recovery in U.S. output should be grateful for stronger economic immune systems in the rest of the world.

—xt no Internal

The global economy determines the US economy, not vice versa

Rasmus 2015 (Jack; US Economy Collapses Again; May 14; www.counterpunch.org/2015/05/14/us-economy-collapses-again/; kdf)

The problem of weak, stop-go, recovery in the U.S. today is further exacerbated by a global economy that continues to slow even more rapidly and, in case after case, slip increasingly into recessions or stagnate at best. Signs of weakness and stress in the global economy are everywhere and growing. Despite massive money injections by its central bank in 2013, and again in 2014, Japan's economy has fallen in 2015, a fourth time, into recession. After having experienced two recessions since 2009, Europe's economy is also trending toward stagnation once more after it too, like Japan, just introduced a US$60 billion a month central bank money injection this past winter. Despite daily hype in the business press, unemployment in the Eurozone is still officially at 11.4 percent, and in countries like Spain and Greece, still at 24 percent. Yet we hear Spain is now the 'poster-boy' of the Eurozone, having returned to robust growth. Growth for whom? Certainly not the 24 percent still jobless, a rate that hasn't changed in years. Euro businesses in Spain are doing better, having imposed severe 'labor market reforms' on workers there, in order to drive down wages to help reduce costs and boost Spanish exports. Meanwhile, Italy remains the economic black sheep of the Eurozone, still in recession for years now, while France officially records no growth, but is likely in recession as well. Elites in both Italy and France hope to copy Spain's 'labor market reforms' (read: cut wages, pensions, and make it easier to layoff full time workers). In order to boost its growth, Italy is considering, or may have already decided, to redefine its way to growth by including the services of prostitutes and drug dealers as part of its GDP. Were the USA to do the same redefinition, it would no doubt mean a record boost to GDP. Across the Eurozone, the greater economy of its 18 countries still hasn't reached levels it had in 2007, before the onset of the last recession. Unlike the U.S.'s 'stop-go', Europe has been 'stop-go-stop'.

Impact inevitable -- Tech Bubble

Tech bubble collapse is inevitable, letting it happen now ensures a soft-landing

Mahmood 2015 (Tallot; The Tech Industry Is In Denial, But The Bubble Is About To Burst; Jun 26; techcrunch.com/2015/06/26/the-tech-industry-is-in-denial-but-the-bubble-is-about-to-burst/; kdf)

In the face of these trends, a small group of well-respected and influential individuals are voicing their concern. They are reflecting on what happened in the last dot-com bust and identifying fallacies in the current unsustainable modus operandi. These relatively lonely voices are difficult to ignore. They include established successful entrepreneurs, respected VC and hedge fund investors, economists and CEOs who are riding their very own unicorns. Mark Cuban is scathing in his personal blog, arguing that this tech bubble is worse than that of 2000, because, he states, that unlike in 2000, this time the "bubble comes from private investors," including angel investors and crowd funders. The problem for these investors is there is no liquidity in their investments, and we're currently in a market with "no valuations and no liquidity." He was one of the fortunate ones who exited his company, Broadcast.com, just before the 2000 boom, netting $5 billion. But he saw others around him not so lucky then, and fears the same this time around. A number of high-profile investors have come out and said what their peers all secretly must know. Responding to concerns raised by Bill Gurley (Benchmark) and Fred Wilson (Union Square Ventures), Marc Andreessen of Andreessen Horowitz expressed his thoughts in an 18-tweet tirade. Andreessen agrees with Gurley and Wilson in that high cash burn in startups is the cause of spiralling valuations and underperformance; the availability of capital is hampering common sense. The tech startup space at the moment resembles the story of the emperor with no clothes. As Wilson emphasizes, "At some point you have to build a real business, generate real profits, sustain the company without the largess of investor's capital, and start producing value the old fashioned way." Gurley, a stalwart investor, puts the discussion into context by saying "We're in a risk bubble … we're taking on … a level of risk that we've never taken on before in the history of Silicon Valley startups." The tech bubble has resulted in unconventional investors, such as hedge funds, in privately owned startups. David Einhorn of Greenlight Capital Inc. stated that although he is bullish on the tech sector, he believes he has identified a number of momentum technology stocks that have reached prices beyond any normal sense of valuation, and that they have shorted many of them in what they call the "bubble basket." Meanwhile, Noble Prize-winning economist Robert Shiller, who previously warned about both the dot-com and housing bubbles, suspects the recent equity valuation increases are more because of fear than exuberance. Shiller believes that "compared with history, US stocks are overvalued." He says, "one way to assess this is by looking at the CAPE (cyclically adjusted P/E) ratio … defined as the real stock price (using the S&P Composite Stock Price Index deflated by CPI) divided by the ten-year average of real earnings per share." Shiller says this has been a "good predictor of subsequent stock market returns, especially over the long run. The CAPE ratio has recently been around 27, which is quite high by US historical standards. The only other times it is has been that high or higher were in 1929, 2000, and 2007 — all moments before market crashes." Perhaps the most surprising contributor to the debate on a looming tech bubble is Evan Spiegel, CEO of Snapchat. Founded in 2011, Spiegel's company is a certified "unicorn," with a valuation in excess of $15 billion. Spiegel believes that years of near-zero interest rates have created an asset bubble that has led people to make "riskier investments" than they otherwise would. He added that a correction was inevitable.

--xt Bubble will collapse

Bubble will collapse

Mahmood 2015 (Tallot; The Tech Industry Is In Denial, But The Bubble Is About To Burst; Jun 26; techcrunch.com/2015/06/26/the-tech-industry-is-in-denial-but-the-bubble-is-about-to-burst/; kdf)

The fact that we are in a tech bubble is in no doubt. The fact that the bubble is about to burst, however, is not something the sector wants to wake up to. The good times the sector is enjoying are becoming increasingly artificial. The tech startup space at the moment resembles the story of

the emperor with no clothes. It remains for a few established, reasoned voices to persist with their concerns so the majority will finally listen.

AT: E-commerce k2 economy

Ecommerce through the roof - Facebook

Adler 1/13/15 (Tim; Ecommerce sales through social media triple in 2013 for biggest US retailers; business-reporter.co.uk/2015/01/13/e-commerce-sales-through-social-media-triple-in-2013-for-biggest-us-retailers/; kdf)

The top 500 retailers in the United States earned $2.69 billion from social shopping in 2013, according to the Internet Retailer's Social Media 500 – up more than 60 per cent over 2012 – while the e-commerce market as a whole grew only by 17 per cent. Growth is sure to accelerate and conversion rates should improve as Twitter and Facebook roll out "Buy" buttons, predicts BI Intelligence. Buy buttons enable social media users to buy by clicking on a retailer's post or tweet. Facebook began testing buy buttons in July, Twitter in September. **Facebook is the clear leader for social-commerce referrals and sales.** This is partly because of the sheer size of its audience – 71 per cent of US adult internet users are on Facebook. A Facebook share of an e-commerce post translates to an average $3.58 in revenue from sales compared to just 85 cents on Twitter. But other social media sites are gaining on Facebook and Twitter. Customers buying through fashion and style platform Polyvore spend on average $66.75 per order, according to Shopify. Pinterest sees $65. Facebook by comparison trails at $55 per average order value (AOV).

Ebay deal

Seetharaman 1/21/15 (Deepa; EBay's breakup plans may open door for e-commerce M&A; www.reuters.com/article/2015/01/22/us-ebay-sale-idUSKBN0KV06Z20150122; kdf)

EBay Inc's plans to break up into three different companies could accommodate would-be suitors, signaling a potential merger fight after the breakup. The company plans to spin off its payments division, PayPal, from its core marketplace division in the second half of the year, making two standalone publicly traded companies that some analysts say could be worth more than the combined entity. On Wednesday, eBay added that it will sell or prepare a public offering of its eBay Enterprise unit, which the company bought for $2.4 billion roughly four years ago. The announced moves are intended to give each business the ability to consider all their alternatives, including a sale, eBay Chief Executive Officer John Donahoe said. "No one knows what's going happen down the road," Donahoe said in an interview on Wednesday, after eBay reported fourth-quarter earnings. "But each business will have the flexibility they need to do what they need to do to win." The moves come as Wall Street analysts question how long eBay and PayPal can withstand growing competition from online rivals such as Amazon.com Inc, Google Inc and Alibaba Group Holding Ltd, as well as retailers such as Wal-Mart Stores Inc which are investing in their own e-commerce and payments platforms. As part of the moves announced on Wednesday, eBay agreed to adopt a number of corporate governance changes championed by activist investor Carl Icahn that would limit PayPal board's ability to prevent a takeover once it splits from eBay. Any investor who owns 20 percent of PayPal will be able to call special meetings of shareholders, Icahn said in a separate statement that coincided with eBay's release. EBay also outlined plans to cut 7 percent of its workforce, or 2,400 positions, in the current quarter. "I don't think that is the primary goal, but in general these moves could make for a cleaner, or more attractive, merger or acquisition," said Baird analyst Colin Sebastian, who has previously said Google could be a suitor for eBay. The eBay Marketplaces unit is now going after so-called "avid" shoppers hungry for a bargain. Its enterprise division, which advises companies on how to grow online, will strengthen its relationships with top retailers and brands. Potential buyers of eBay Enterprise include companies focused on building ties with other

businesses, such as Salesforce.com Inc, IBM Corp, Demandware Inc, Adobe Systems Inc or startup Bigcommerce, some experts said. Salesforce declined to comment, while the other companies were not immediately available for comment.

Cloud Computing

Turn: Warming

The cloud uniquely makes warming worse

Matthews 2013 (Richard; How environmentally sustainable is cloud computing and storage?; Sep 12; globalwarmingisreal.com/2013/09/12/sustainable-cloud-computing/; kdf)

Critique The cloud industry has also been called secretive, slow to change its practices, and overly optimistic in its environmental assessments. The massive energy requirement of cloud computing can create environmental problems. According to a 2012 report in the New York Times, data centers use 30 billion watts of electricity per year globally and the U.S. is responsible for one-third of that amount (10 billion watts). A Gartner report indicated that the IT industry is responsible for as much greenhouse gas generation as the aviation industry (2 percent of the world's carbon emissions). Just one of these massive server farms can consume the energy equivalent of 180 000 homes. According to a McKinsey & Company report commissioned by the Times, between 6 and 12 percent of that energy powers actual computations; the rest keeps servers running in case of a surge or crash**. "This is an industry dirty secret,"** an anonymous executive told the Times. However, cloud supporters counter that this may be better understood as a necessary evil if data companies are to ensure that they are able to provide reliable service at all times. Greenpeace has published a report, "A Clean Energy Road Map for Apple," that follows up on the organization's April "How Clean is Your Cloud?" report. These studies indicate that many cloud providers use energy sources that are neither clean nor sustainable. The Greenpeace analysis showed that tech companies like Akamai and Yahoo! are the most environment-friendly while companies like Amazon, Apple and Microsoft each rely heavily on power from fossil fuels. Cloud computing is almost directly responsible for the carbon intensity increase at Apple, which gets 60 percent of its power from coal. Although Apple is increasing the amount of renewable energy used to power its cloud computing, the company has been criticized by Greenpeace for moving slowly. In May 2013, Apple said that its North Carolina data center will be exclusively reliant on renewable power by year's end, and that all three of its major data centers will be coal-free by the end of this year. Solutions Despite all of this convincing data, it is important to understand that saving energy does not always mean that you are reducing your GHG emissions. **To be environmentally sustainable these centers must draw their power from renewable sources of energy.** The location of cloud servers is the key issue that determines whether this is a truly sustainable option. Ideally, cloud computing centers should be located in places where the grid portfolio is clean. (It would be even better if these data centers generated power themselves from renewable sources.)

Climate Change is a threat magnifier—policy making must focus on finding the best avenue to avert disaster

Pascual and Elkind 2010 (Carlos [US Ambassador to Mexico, Served as VP of foreign policy @ Brookings]; Jonathan [principal dep ass sec for policy and int energy @ DOE]; Energy Security; p 5; kdf)

Climate change is arguably the greatest challenge facing the human race.¶ It poses profound risks to the natural systems that sustain life on Earth and¶ consequently creates great challenges for human lives, national economies,¶ nations' security, and international governance. New scientific reports¶ emerging from one year to the next detail ever more alarming potential¶ impacts and risks.¶ It is increasingly common for analysts and policymakers to refer to¶ climate change as a threat multiplier, a destructive force that will exacerbate¶ existing social, environmental, economic, and humanitarian stresses.¶ The warming climate is predicted to bring about prolonged droughts¶ in already dry regions, flooding along coasts and even inland rivers, an¶ overall increase in severe weather events, rising seas, and the spread of¶ disease, to cite just a few examples. Such impacts may spark conflict in¶ weak states, lead to the displacement of millions of people, create environmental¶ refugees, and intensify competition over increasingly scarce¶ resources.¶ One of the great challenges of climate change is, indeed, the scope of¶ the phenomenon. The ongoing warming of the globe results chiefly from¶ one of the most ubiquitous of human practices, the conversion of fossil fuels¶ into energy through simple combustion. Halting and reversing climate¶ change, however, will require both unproven-perhaps even unimaginedtechnology¶ and sustained political commitment. We must change living¶ habits in all corners of the globe over the course of the next several decades.¶ **We must resist the impulse to leave the problem for those who follow us**¶ or to relax our efforts if we achieve a few years of promising progress. The¶ profound challenge will lie in the need for successive rounds of sustained¶ policymaking, successive waves of technological innovation, and ongoing¶ evolution of the ways in which we live our lives.

Cloud Computing – Bad

Cloud computing capabilities are all hype

Marks 13 - Publisher of six best-selling books on small business management (Gene, 10/21/13, "The Embarrassing Truth about the hybrid cloud" www.forbes.com/sites/quickerbettertech/2013/10/21/the-embarrassing-truth-about-the-hybrid-cloud/)

Why the growth in hybrid cloud technology? Well, that's the embarrassing secret no one wants to admit. Some may say it's validation of the cloud's role in a company's infrastructure. I'm not so sure. In my opinion, it actually represents the limitations of the cloud. The cloud has received a lot of hype over the past few years. But now smarter people are starting to better understand its reality. "IT departments are starting to rationalize the cloud as just part of an infrastructure," says Mike Maples, managing partner at Palo Alto-based FLOODGATE Fund. "You can't just let all the bits of your enterprise go to the cloud. It's not all or nothing. The world is becoming a more hybrid enterprise." Cloud based applications have exploded over the past few years. Collaboration services, mobile apps, customer relationship management systems and document storage offerings have literally changed the lives of consumers and employees at companies, big and small. I am accessing my customers' data from a smartphone on a plane at 30,000 feet. A roofer is creating a work-order for a new job while holding onto a chimney and entering the data into his tablet. A college kid sits on a train from New York to Boston and catches up on the latest episodes of Walking Dead on her iPad. It's glorious. It's mind-blogging. And it's maddening too. Because with all the hype, with all the excitement, with all the money thrown at it,

the cloud has been disappointingly and embarrassingly imperfect. Yes, I am accessing my customers' data from 30,000 feet but the connection is so slow and drops so many times that it takes me ten times as long to retrieve the information I'm looking for. The customer's credit card information that the roofer is entering into his tablet is being snagged by the guy three streets over who has hacked into his connection. That college kid audibly groans as the episode freezes and her screen goes black, time and time again, eventually pulling out a book. The cloud will be wondrous and fast and secure and reliable…one day. Today, it is not. And until that day comes we have the hybrid cloud. Why else would Carbonite, whose model has been built around delivering a cloud based backup service, release an on-premise storage device to complement their online service? Why would VMWare and Microsoft MSFT -0.2% duplicate data delivery to multiple servers? Why would venture capital firms plough millions into a software base service like Egnyte so that users can get the same data that is stored in different locations? It's because the cloud is useless unless we can get to our data fast. The cloud is useless if it's not making us more productive and enabling us to do things quicker than before. It's useless if our data is less secure than when it was stored on our own servers. And without hybrid cloud technologies, many companies are learning that this is very much the case. So over the course of technology history our data has travelled from server to desktop to cloud and now back to the server again. It's not a 360 degree turnaround. It's a partial turnaround. A hybrid solution to make up for the cloud's defects. The cloud is great. But the enormous growth of hybrid cloud technologies only proves that it still has a long way to go before it's fast and secure. "In the end, customers and users don't even care about the cloud," says Maples. "They just have a job to do. It's performance and convenience that an all-or-nothing cloud approach can't deliver." Can't we all admit that embarrassing truth?

Cloud computing bad – no one uses

Cloud computing is unreliable

CCA '15 (Cloud Computing Advices, Cloud Computing advices is the one of the best leading cloud computing blogs, where you can access the tutorials on cloud computing, breaking news, security issues, top cloud computing providers, certifications, training programs and jobs opportunities for freshers and experienced IT Professionals, "Cloud Computing Disadvantages", http://cloudcomputingadvices.com/disadvantages-cloud-computing/, 2/20/2015)//HW

Negative effects and Disadvantages of cloud computing:¶ The Greenpeace NGO announces, in its 2010 report on the ecological impact of the IT industry, the negative impacts of cloud computing.In the below list you can see the 5 disadvantages of cloud computing as per the report.¶ 1.The main drawback is the security issues related to storing of confidential information in the cloud. As all information is available via internet if taken to the cloud, there may be concerns with breach of confidential information.¶ 2.There is a tendency for some firms to lose their control over the piled up information in the cloud.¶ 3.The legal issues including ownership of abstraction on the location data of cloud computing.¶ 4.Cloud computing also poses problems in terms of insurance, especially when a company submits an operating loss due to failure of the supplier. Where one company covering a risk, the insurance company offering the cloud architecture takes more, slowing sharply compensation.¶ 5.The customer service of cloud computing becomes dependent on the quality of the network to access this service. No cloud service provider can guarantee 100% availability.

--xt: People don't use the cloud

Lots of drawbacks to cloud computing – people won't switch over

Ward '11 (Susan, business writer and experienced business person; she and her partner run Cypress Technologies, an IT consulting business, providing services such as software and database development, "5 Disadvantages of Cloud Computing", About Money, http://sbinfocanada.about.com/od/itmanagement/a/Cloud-Computing-Disadvantages.htm, 11/8/2011)//HW

5 Disadvantages of Cloud Computing¶ 1) Possible downtime. Cloud computing makes your small business dependent on the reliability of your Internet connection. When it's offline, you're offline. If your internet service suffers from frequent outages or slow speeds cloud computing may not be suitable for your business. And even the most reliable cloud computing service providers suffer server outages now and again. (See The 10 Biggest Cloud Outages of 2013.)¶ 2) Security issues. How safe is your data? Cloud computing means Internet computing. So you should not be using cloud computing applications that involve using or storing data that you are not comfortable having on the Internet. Established cloud computing vendors have gone to great lengths to promote the idea that they have the latest, most sophisticated data security systems possible as they want your business and realize that data security is a big concern; however, their credibility in this regard has suffered greatly in the wake of the recent NSA snooping scandals.¶Keep in mind also that your cloud data is accessible from anywhere on the internet, meaning that if a data breach occurs via hacking, a disgruntled employee, or careless username/password security, your business data can be compromised.¶ Leaving aside revelations about the NSA, switching to the cloud can actually improve security for a small business, says Michael Redding, managing director of Accenture Technology Labs. "Because large cloud computing companies have more resources, he says, they are often able to offer levels of security an average small business may not be able to afford implementing on its own servers" (Outsource IT Headaches to the Cloud (The Globe and Mail).¶ 3) Cost. At first glance, a cloud computing application may appear to be a lot cheaper than a particular software solution installed and run in-house, but you need to be sure you're comparing apples and apples. Does the cloud application have all the features that the software does and if not, are the missing features important to you?¶ You also need to be sure you are doing a total cost comparison. While many cloud computer vendors present themselves as utility-based providers, claiming that you're only charged for what you use, Gartner says that this isn't true; in most cases, a company must commit to a predetermined contract independent of actual use. To be sure you're saving money, you have to look closely at the pricing plans and details for each application.¶In the same article, Gartner also points out that the cost savings of cloud computing primarily occur when a business first starts using it. SaaS (Software as a Service) applications, Gartner says, will have lower total cost of ownership for the first two years because SaaS applications do not require large capital investment for licenses or support infrastructure. After that, the on-premises option can become the cost-savings winner from an accounting perspective as the capital assets involved depreciate.¶ Cloud computing costs are constantly changing, so check current pricing.¶ 4) Inflexibility. Be careful when you're choosing a cloud computing vendor that you're not locking your business into using their proprietary applications or formats. You can't insert a document created in another application into a Google Docs spreadsheet, for instance. Also make sure that you can add and subtract cloud computing users as necessary as your business grows or contracts.¶ 5) Lack of support. In These Issues Need to be Resolved Before Cloud Computing Becomes Ubiquitous, (OPEN Forum) Anita Campbell writes, "Customer service for Web apps leaves a lot to be desired -- All too many cloud-based apps make it difficult to get customer service promptly – or at all. Sending an email and hoping for a response within 48 hours is not an acceptable way for most of us to run a business".

Disads

Court Clog DA

Brought to you by:

Alex Schein, check out his mixtape -- http://bit.ly/IqT6zt

The aff causes a court-clog

Cover 2015 (Avidan Y [Assistant Professor of Law, Case Western Reserve University School of Law; Director, Institute for Global Security Law and Policy]; Corporate Avatars and the Erosion of the Populist Fourth Amendment; 100 Iowa L. Rev. 1441; kdf)

These sorts of "machine-to-machine" communication of individual preferences would permit the government to decide whether it would fight for the acquisition of that specific individual's data or whether the lack of the information would not impair its investigation. If the government believes the data are necessary, it would have two options: (1) provide notice to the user and, in the event of the user's opposition (or the company's), litigate the data acquisition in court; or (2) seek a warrant from the court authorizing the surveillance without notice. Courts may be burdened by more litigation brought by individual users over government requests for their data. But statutory clarity through legislation such as the Driver Privacy Act should guide the Executive and Judicial branches in determining what level of protection particular kinds of data require. Increased litigation is, however, the necessary cost of reinserting the individual in the conversation and negotiation with the government over her data. The Fourth Amendment must be first and foremost the people's right against unreasonable searches and seizures, not the right of the corporation.

And Lawsuits clog US courts, turns the aff and stalls economy

Post 11(Ashely; InsideCounsel as managing editor ,"Frivolous lawsuits clogging U.S. courts, stalling economic growth", www.insidecounsel.com/2011/07/22/frivolous-lawsuits-clogging-us-courts-stalling-eco?page=1-5, July 22, 2011)//ADS

Americans' litigiousness and thirst for massive damages has been a boon to the legal profession. **But some researchers and litigation experts warn that the abundance of lawsuits—many of them frivolous—flooding U.S. courts is severely weakening the economy.** According to consulting firm Towers Watson, the direct cost of the U.S. tort system in 2009 was approximately $250 billion, which was roughly 2 percent of the gross domestic product. The amount is double the estimated tort expenses in other countries, including the U.K. and Japan. In May, the **House Judiciary Committee held a hearing that explored excessive litigation's effect on the United States' global competitiveness**. During his testimony, Skadden Partner John Beisner explained that **plaintiffs counsel engage in five types of litigation abuse that ultimately undermine economic growth:** improperly recruiting plaintiffs, importing foreign claims, filing suits that piggyback off government investigations and actions, pursuing aggregate litigation and seeking third-party litigation financing. "America's litigious nature has caused serious damage to our country's productivity and innovation. … **The root cause is that we have created incentives to sue—and to invest in litigation—instead of establishing disincentives for invoking judicial process unless absolutely necessary.** Other countries discourage litigation; we nuture it," Beisner said at the hearing. **Many litigation experts resoundingly agree with Beisner's stance on the necessity of tort reform to ameliorate the country's economy.** "The entrepreneurial system that we've developed for litigation in this country has always been an impetus to bringing cases that are close to the line or even over the line," says Dechert Partner Sean Wajert. "When

you have that kind of encouragement, you have a slippery slope, which sometimes people will slide down and get into questionable and even abusive and frivolous claims along the way." **The result is clogged courts and corporate funds that finance defense costs instead of economic investment**. Small businesses and startups with less than $20 million in revenue suffer the most because they pay a higher percentage of their revenues toward tort costs than larger companies do, and therefore they become less able to invest in research and development, create new jobs, and give raises and benefits to employees. One proposed solution to frivolous litigation is the Lawsuit Abuse Reduction Act (LARA), introduced in March in the House as H.R. 966 and Senate as S. 533 by House Judiciary Committee Chairman Lamar Smith, R-Tex., and Senate Judiciary Committee Ranking Member Chuck Grassley, R-Iowa, respectively. The bill would revise and strengthen portions of Rule 11 of the Federal Rules of Civil Procedure, which provides for sanctions against parties that file unwarranted or harassing claims. Proponents say LARA would increase plaintiffs' accountability for meritless lawsuits and deter future frivolous claims. However, the bill faces some opposition and obstacles to becoming law. In 1993, lawmakers made three major changes to Rule 11 in an attempt to reduce the number of motions for sanctions and more quickly conclude federal cases. But critics say the revisions significantly weakened Rule 11 and enabled litigation abuse. LARA essentially would undo the 1993 revisions, which are still in effect today. First, Rule 11 allows judges to use their discretion in imposing sanctions for meritless suits rather than making such sanctions mandatory. Many critics disagree with this optional penalty. "If the case doesn't meet certain standards and shouldn't have been filed in the first place, then there ought to be consequences," Beisner says. Second, Rule 11 grants plaintiffs a 21-day "safe harbor" period to withdraw a claim without incurring any penalties when defendants notify them that they'll be seeking a motion for sanctions. Supreme Court Justice Antonin Scalia said the change would allow parties to file "thoughtless, reckless, and harassing pleadings, secure in the knowledge that they have nothing to lose: If objection is raised, they can retreat without penalty." "The problem [with the safe harbor] is that it just allows certain plaintiffs attorneys to go on a 'fishing expedition' and dare you to file a motion for sanctions," Wajert says. Finally, because the rule is supposed to act as a deterrent for meritless claims, the court collects sanctions as monetary penalties instead of directing the money to defendants as compensation. Without reimbursement for court costs and legal fees, pursuing sanctions is often too costly for small businesses. "The defendant has to spend time and money to hire a lawyer to research and draft the motion for sanctions and present it to the other side, so there is a cost involved even if the plaintiffs end up withdrawing the action," Wajert says. To boost liability for parties that file questionable suits, LARA would make sanctions mandatory for any claims that judges recognize as frivolous. LARA also would eliminate the 21-day safe harbor and award some of the sanction money to defendants. Critics have four main arguments against LARA. Some members of the law community say LARA doesn't provide broad enough reform because it doesn't emphasize lawyers' prelitigation duties. "We might want to look at more accountability for failing to perform due diligence before a lawsuit is filed and for continuing to prosecute a lawsuit after learning the claims that are being asserted are invalid," Beisner says. Other LARA challengers claim the bill takes tort reform too far and "swats a fly with a hammer," Wajert says. He notes that some opponents argue there's not enough empirical evidence to suggest that litigation abuse is a serious problem; however, because frivolous suits often are quickly settled so as to avoid litigation expenses, it is difficult to collect meaningful statistics. "The same applies to the safe harbor," Wajert notes. "If something is withdrawn and it never gets to the judge's attention, and therefore never gets into a published opinion, how are we supposed to collect data on that?" Critics also worry that LARA will lead to satellite litigation—or small trials within big trials—

challenging sanctions issued by the courts. LARA supporters say that although there will likely be some additional litigation when the Act first becomes effective, suits will slow up once courts clarify how they are interpreting LARA. A final contention against LARA is that it will deter valid lawsuits. But the Act's proponents say litigants shouldn't be afraid that judges will liberally issue sanctions. "The Act isn't going to change the definition of a frivolous claim," Wajert explains. "Judges are going to be careful to make sure that when they find frivolous, it really is frivolous. It's unlikely that LARA will impact those that are arguing for a good-faith extension, modification or reversal of existing law." Victor Schwartz, a partner at Shook, Hardy & Bacon who testified at a congressional hearing about LARA in March, agrees. "LARA is not cutting off peoples' rights to sue if they have a legitimate claim," he says. Schwartz says LARA stands a good chance of becoming law if it gets adequate support from Congress and the president. A key factor in LARA's advance is democratic support, which could be difficult because trial lawyers, who don't support the bill, are some of the top funders of the Democratic Party. Additionally, the Senate has a democratic majority. Schwartz estimates that LARA would need the support of at least seven Democratic senators to pass. Even if the bill were to reach the president's desk, Schwartz says it probably wouldn't pass speedily. Another fairly recent tort reform bill, the Class Action Fairness Act of 2005, took about eight years to become law, and Schwartz says that he has personally only been involved in four bills over 25 years that were signed by the president. Nonetheless, Schwartz and other LARA supporters remain optimistic that LARA will succeed. "In the [Jan. 25] State of the Union address, the president said he agreed with the Republicans about [the need to reduce costs associated with] frivolous claims. He never endorsed LARA, but he did mention it in what was a very limited menu of topics. It would be unlikely that he would veto the bill," Schwartz says.

That causes World War 3

James 2014 - Professor of history at Princeton University's Woodrow Wilson School who specializes in European economic history (Harold, "Debate: Is 2014, like 1914, a prelude to world war?" 7/3, http://www.theglobeandmail.com/globe-debate/read-and-vote-is-2014-like-1914-a-prelude-to-world-war/article19325504/)

Some of the dynamics of the pre-1914 financial world are now re-emerging. Then an economically declining power, Britain, wanted to use finance as a weapon against its larger and faster growing competitors, Germany and the United States. Now America is in turn obsessed by being overtaken by China – according to some calculations, set to become the world's largest economy in 2014. In the aftermath of the 2008 financial crisis, financial institutions appear both as dangerous weapons of mass destruction, but also as potential instruments for the application of national power. In managing the 2008 crisis, the dependence of foreign banks on U.S. dollar funding constituted a major weakness, and required the provision of large swap lines by the Federal Reserve. The United States provided that support to some countries, but not others, on the basis of an explicitly political logic, as Eswar Prasad demonstrates in his new book on the "Dollar Trap." Geo-politics is intruding into banking practice elsewhere. Before the Ukraine crisis, Russian banks were trying to acquire assets in Central and Eastern Europe. European and U.S. banks are playing a much reduced role in Asian trade finance. Chinese banks are being pushed to expand their role in global commerce. After the financial crisis, China started to build up the renminbi as a major international currency. Russia and China have just proposed to create a new credit rating agency to avoid what they regard as the political bias of the existing (American-based) agencies. The next stage in this logic is to think about how financial power can be directed to national advantage in the case of a diplomatic tussle. Sanctions are a routine (and not terribly successful) part of the pressure applied to rogue states such as Iran and North Korea. But financial pressure can be much more powerfully applied to countries that are deeply embedded in the world economy. The test is in the Western imposition of sanctions after the Russian annexation of Crimea. President Vladimir Putin's calculation in response is that the European Union and the United States cannot possibly be serious about the financial war. It would turn into a boomerang: Russia would be less affected than the more developed and complex financial markets of Europe and America. The threat of systemic disruption generates a new sort of

uncertainty, one that mirrors the decisive feature of the crisis of the summer of 1914. At that time, no one could really know whether clashes would escalate or not. That feature contrasts remarkably with almost the entirety of the Cold War, especially since the 1960s, when the strategic doctrine of Mutually Assured Destruction left no doubt that any superpower conflict would inevitably escalate. The idea of network disruption relies on the ability to achieve advantage by surprise, and to win at no or low cost. But it is inevitably a gamble, and raises prospect that others might, but also might not be able to, mount the same sort of operation. Just as in 1914, there is an enhanced temptation to roll the dice, even though the game may be fatal.

Court Clog D-Rule

It's a D Rule

New York Times 1860(American daily newspaper, founded and continuously published in New York City since September 18, 1851,"Our Supreme Court Clogged", www.nytimes.com/1860/06/16/news/our-supreme-court-clogged.html, June 16, 1860)//ADS

Some years ago the Supreme Court of this District of the State adopted a rule requiring all contested motions to be put upon a calendar to be called a "Motion Calendar," and heard at Chambers. The reason given by the Judges for this was, that it would enable the modest lawyers to get their motions heard as soon as the more bold and less sensitive upon the practice of etiquette; but it did not seem to work, and was soon abandoned -- the formula of the thing took up too much time. The great increase of Chambers business of this Court induced the Judges at the commencement of last month to restore the "Motion Calendar." This second attempt, after the experience of the four weeks of May and two days in June has proved very disastrous. The most important of its evil effects is found under the proceedings to foreclose mortgages. It is well known that much, doubt exists as to the power of the Superior or Common Pleas Courts to grant actions in foreclosure, it having been held that County Courts do not possess this power -- hence most of these proceedings are brought in the Supreme Court. **The mortgagor, not feeling exactly disposed to pay up the interest on his bond, or even the principal, when it becomes due, has no trouble in being accommodated, so long as the "motion calendar" exists. When the complaint to foreclose is served upon him all he has to do is to retain a lawyer to interpose a simple demurrer, in two lines, "that the complaint does not set forth facts sufficient to constitute a cause of action," and then the attorney for the plaintiff has to move to strike it out as frivolous; this motion takes its place at the foot of the "motion calendar," with at least six hundred motions before it; -- and as the Court frequently exhausted two days during the last month in hearing a single motion, the time for reaching a motion may hereafter be safely set down at three months**. But the delay does not stop here; when the motion is finally reached, argued, and the motion to strike out the demurrer granted, the next proceeding of the defendant is a motion far leave to answer, accompanied by a stay of proceedings on the part of the plaintiff; this goes upon the calendar, and judging from the rapid increase of the calendar, full one thousand motions will be before it, but it is finally reached and the order granted; then comes a sham answer, and then comes another motion to strike it out, and then, indeed, a year passes before this can be reached and stricken out. Thus we go, and a lawyer moderately schooled in the sharp practice of the Judges' chambers, can find points to introduce motions for years upon a case where not a particle of defence exists. Now is not this state of affairs truly alarming? In about three weeks this Court will adjourn over to October, and thus, by

reason of this "Motion Calendar," millions of dollars will be for an indefinite time kept from the rightful owners, besides the waste and destruction of the mortgaged property. HOMER. Swans in Central Park. To the Editor of the New-York Times: In the absence -- so far as I have yet observed -- of any ascertained data in regard to the much-regretted death of the swans in the Central Park, I would venture to suggest, from a long experience as a keeper of various water-fowl, as well of this country as of Europe, what may possibly have caused the death of these beautiful birds. I have frequently remarked when any of the various species of "Anatidae" have been long debarred a resort to water, great mischief to have resulted on their being at once restored to unlimited access to that element, Their plumage during confinement gets into very bad condition, and in their eagerness on readmission to water, they wash and plunge so much that their feathers become quilt saturated, even to the very down upon the skin. Under such circumstances I have known death to en[???]ue, and this probably, should the incident have been as above, may have caused the death of the poor swans. The medical gentlemen who examined the dead birds will know whether "pneumonia" would likely be induced under such conditions. My practice was, upon receiving similar birds from a distance, never to permit free access to water until such a length of time had elapsed as to admit the birds, kept in proper quarters in the open air, and with plenty of fresh water supplied in small tubs or other vessels, to rearrange their plumage and restore it to that condition in which the plumage of all water-birds in a state of nature is, viz: quite impervious to water.

Empirically Civil liberty suits clog courts

Emshwiller 14(John R; senior national correspondent for the Wall Street Journal, "Justice Is Swift as Petty Crimes Clog Courts", www.wsj.com/articles/justice-is-swift-as-petty-crimes-clog-courts-1417404782, Nov. 30, 2014)//ADS

Someone facing jail time “absolutely should be able to get representation,” Mr. Padwa said. In Washington state, the **American Civil Liberties Union and others sued the cities of Mount Vernon and Burlington in 2011 for their treatment of indigent misdemeanor defendants.** Like many municipalities, the cities contract with private lawyers. The **federal judge handling the case said evidence showed individual lawyer caseloads in those towns ran as high as 1,000 annually—more than twice the maximum recommended by the American Bar Association and others**. In a declaration filed in the case, Angela Montague, an Afghanistan war veteran and one of the named plaintiffs, said the lawyers she was provided, Richard Sybrandy and Morgan Witt, didn’t respond to her efforts to discuss the various misdemeanor charges against her, including driving under the influence. “It wasn’t until I became a plaintiff in this class-action lawsuit that Mr. Witt finally contacted me,” Ms. Montague said in her declaration. Messrs. Sybrandy and Witt, through their own lawyer, declined to comment. In court filings, they disputed the plaintiffs’ claims about them. Mr. Sybrandy said in one filing he did what was “necessary to obtain a just and acceptable result for the defendant” and used “every opportunity to speak with” his clients.

Federal court clog collapses the federal judiciary– decimates Supreme Court and rule of law

Oakley 96 (John B.; Distinguished Professor of Law Emeritus US Davis School of Law, 1996 The Myth of Cost-Free Jurisdictional Reallocation)//ADS

Personal effects: The hidden costs of greater workloads. The hallmark of federal justice traditionally has been the searching analysis and thoughtful opinion of a highly competent judge, endowed with the time as well as the intelligence to grasp and resolve the most nuanced issues of fact and law. **Swollen dockets create assembly-line conditions, which threaten the ability of the modern federal judge to meet this high standard of quality in federal adjudication.** No one expects a federal judge to function without an adequate level of available tangible resources: sufficient courtroom and chambers space, competent administrative and research staff, a good library, and a comfortable salary that relieves the judge from personal financial pressure. Although salary levels have lagged--encouraging judges to engage in the limited teaching and publication activities that are their sole means of meeting such newly pressing financial obligations as the historically high mortgage expenses and college tuitions of the present decade-in the main, federal judges have received a generous allocation of tangible resources. It is unlikely that there is any further significant gain to be realized in the productivity of individual federal judges through increased levels of tangible resources,13 other than by redressing the pressure to earn supplemental income.14 On a personal level, **the most important resource available to the federal judge is time."5 Caseload pressures secondary to the indiscriminate federalization of state law are stealing time from federal judges, shrinking the increments available for each case. Federal judges have been forced to compensate by operating more like executives and less like judges. They cannot read their briefs as carefully as they would like, and they are driven to rely unduly on law clerks for research and writing that they would prefer to do themselves.**16 If federal judges need more time to hear and decide each case, an obvious and easy solution is to spread the work by the appointment of more and more federal judges. Congress has been generous in the recent creation of new judgeships,17 and **enlargement of the federal judiciary is likely to continue to be the default response, albeit a more grudging one, to judicial concern over the caseload consequences of jurisdictional reallocation.** Systemic effects: The hidden costs of adding more judges. **Increasing the size of the federal judiciary creates institutional strains that reduce and must ultimately rule out its continued acceptability as a countermeasure to caseload growth.** While the dilution of workload through the addition of judges is always incrementally attractive**, in the long run it will cause the present system to collapse.** I am not persuaded by arguments that the problem lies in the declining quality of the pool of lawyers willing to assume the federal bench18 or in the greater risk that, as the ranks of federal judges expand, there will be more frequent lapses of judgment by the president and the Senate in seating the mediocre on the federal bench.19 In my view, the diminished desirability of federal judicial office is more than offset by the rampant dissatisfaction of modern lawyers with the excessive commercialization of the practice of law. There is no shortage of sound judicial prospects willing and able to serve, and no sign that the selection process-never the perfect meritocracy-is becoming less effective in screening out the unfit or undistinguished. Far more serious are other institutional effects of continuously compounding the number of federal judges. Collegiality among judges, consistency of decision,

and coherence of doctrine across courts are all imperiled by the growth of federal courts to cattle-car proportions. Yet the ability of the system to tolerate proliferation of courts proportional to the proliferation of judges is limited, and while collapse is not imminent, it cannot be postponed indefinitely. **Congress could restructure the federal trial and appellate courts without imperiling the core functions, but the limiting factor is the capacity of the Supreme Court to maintain overall uniformity in the administration and application of federal law. That Court is not only the crown but the crowning jewel of a 200-year-old system of the rule of law within a constitutional democracy, and any tinkering with its size or jurisdiction would raise the most serious questions of the future course of the nation.**

Global democracy is predicated off of US judicial legitimacy

Zoccola '06 (Barbara; President of the Memphis Bar Association, "Voters hold the key for judicial fairness" July 23, The Commercial Appeal)//ADS

It matters because **the health of our American democracy depends on impartial judges who apply the law fairly and without regard to the prevailing political mood or opinion.** More than 200 years ago, the Founders of our nation designed a constitutional democracy based on a system of checks and balances, a form of government that is now the model for the world, especially for new democracies that have emerged in recent years. A **fundamental part of this system is** the existence of an **independent judiciary - judges who are able to act without concern for the day-to-day whims of politics and election-focused politicians, to protect every citizen's individual liberties and to prevent a tyranny of the majority.** Unfortunately, a Harris interactive poll conducted in July 2005 for the American Bar Association found that only 55 percent of the respondents correctly identified the three branches of government and only 64 percent correctly identified the meaning of "checks and balances"

Consolidation solves WMD conflict

Halperin 11 (Morton H.; Senior Advisor – Open Society Institute and Senior Vice President of the Center for American Progress, "Unconventional Wisdom – Democracy is Still Worth Fighting For", Foreign Policy, http://foreignpolicy.com/2011/01/03/unconventional-wisdom, JANUARY 3, 2011)//ADS

As the United States struggles to wind down two wars and recover from a humbling financial crisis, realism is enjoying a renaissance. Afghanistan and Iraq bear scant resemblance to the democracies we were promised. The Treasury is broke. And America has a president, Barack Obama, who once compared his foreign-policy philosophy to the realism of theologian Reinhold Niebuhr: "There's serious evil in the world, and hardship and pain," Obama said during his 2008 campaign. "And we should be humble and modest in our belief we can eliminate those things." But one can take such words of wisdom to the extreme-as realists like former Secretary of State Henry Kissinger and writer Robert Kaplan sometimes do, arguing that the United States can't afford the risks inherent in supporting democracy and human rights around the world. Others, such as cultural historian Jacques Barzun, go even further, saying that America can't export democracy at all, "because it is not an ideology but a wayward historical development." Taken too far, such realist absolutism can be just as dangerous, and wrong, as neoconservative hubris. For there is one thing the neocons get right: As I argue in The Democracy Advantage, **democratic governments are more likely than autocratic regimes to engage in conduct that**

advances U.S. interests and avoids situations that pose a threat to peace and security. Democratic states are more likely to develop and to avoid famines and economic collapse. They are also less likely to become failed states or suffer a civil war. Democratic states are also more likely to cooperate in dealing with security issues, such as terrorism and proliferation of weapons of mass destruction. As the bloody aftermath of the Iraq invasion painfully shows, democracy cannot be imposed from the outside by force or coercion. It must come from the people of a nation working to get on the path of democracy and then adopting the policies necessary to remain on that path. But we should be careful about overlearning the lessons of Iraq. In fact, the outside world can make an enormous difference in whether such efforts succeed. There are numerous examples-starting with Spain and Portugal and spreading to Eastern Europe, Latin America, and Asia-in which the struggle to establish democracy and advance human rights received critical support from multilateral bodies, including the United Nations, as well as from regional organizations, democratic governments, and private groups. **It is very much in America's interest to provide such assistance now to new democracies, such as Indonesia, Liberia, and Nepal, and to stand with those advocating democracy in countries such as Belarus, Burma, and China.** It will still be true that the United States will sometimes need to work with a nondemocratic regime to secure an immediate objective, such as use of a military base to support the U.S. mission in Afghanistan, or in the case of Russia, to sign an arms-control treaty. None of that, however, should come at the expense of speaking out in support of those struggling for their rights. Nor should we doubt that America would be more secure if they succeed.

Independently, US model of judicial federalism is key to prevent civil war and authoritarian consolidation

Kincaid, 1995 (John, Robert B.; Professor of Government and Public Service at Lafayette College, Rutgers Law Journal, 26 Rutgers L. J. 913, Lexis)//ADS

Given that it is increasingly necessary to think globally while acting locally, it is pertinent to suggest that this American experience with the new judicial federalism, however muddled, may have useful implications for an emerging federalist revolution worldwide. n132 This potential utility lies primarily in the concept of independent and adequate state constitutional powers that enable constituent governments to protect rights not available from a national government, thereby providing multiple and potentially competing forums for citizen access. The new judicial federalism shows that rights protection cannot be entrusted to a monopoly guardian, whether it be the national government or each constituent government acting monopolistically and autonomously within its jurisdiction. If the American historical experience has been one of overcoming state tyrannies against individual rights, the historical experience of much of the rest of the world has been one of overcoming central government tyrannies against individual rights. The new judicial federalism, moreover, is situated at a critical intersection between individual rights and local autonomy, a matter of increasing importance and conflict in the post-Cold War era. International rights advocates, influenced by the U.S. Supreme Court model of rights nationalization, have sought to internationalize rights. They have focused almost exclusively on international and [*945] national rights forums, largely ignoring regional and local forums. However, the centrifugal forces of class, race, ethnicity, religion, and language suggest that rights principles must also be lodged securely in regional and local forums where individuals daily experience the benefits and abuses of government. International forums have advanced rights

ideas and provided beacons for oppressed peoples, but they remain legally weak and practically inconsequential for most individuals. The prospect of a world court performing rights functions analogous to the Warren Court for five billion people might make for a good Star Trek episode, but it is not within reach of our pre-warp civilization. Most national courts are better at ignoring or abusing rights than protecting rights. Yet, even where democratization produces demands for judicial protections of rights, unitary democratic systems with a single supreme court erected atop a pluralistic polity are buffeted by countervailing universalistic conceptions of rights and justice held by democratic cosmopolitans and particularistic conceptions of rights and justice held by the diverse communities that make up the polity. Additionally, prevailing American conceptions of individual rights, particularly their individualistic foundation, contradict the communal tenets of many cultures and are regarded in some quarters as Western cultural imperialism, much like American social conservative reactions to Roe v. Wade n133 as liberal cultural imperialism. The advancement of human rights, therefore, entails not only a struggle against reactionary, undemocratic governments, but also a debate among cultures and values in a very pluralistic world. The new judicial federalism can perhaps contribute to this debate by confronting the difficult question of which rights should be treated as fundamental, universal, and uniform, and which rights can be subject legitimately to variation among communities of people holding diverse values. For most Americans, prohibiting racial discrimination in any jurisdiction is a fundamental, uniform rights requirement. But do police searches of citizens' curbside garbage fall into the same category? Also, the new judicial federalism suggests a democratically based process for rights decision-making in which more than one supreme court or legislative forum is available to advance rights under conditions of human diversity. Furthermore, the new judicial federalism allows rights not protected by the national government to be protected at least in [*946] some regional and local jurisdictions. Nationally unprotected rights may also include emerging rights, such as the right to die. Americans, for example, have gradually embraced this general concept, but have not yet formed a legal and ethical consensus around it. n134 Hence, we have state-by-state legislative and judicial efforts to define this right. This may be an important consideration because efforts to achieve, through unitary national institutions, uniform rights protections comparable to contemporary international standards may generate so much conflict in some emerging pluralistic democracies as to produce violence, political paralysis, and uniform non-rights protection. The violence generated by Roe v. Wade n135 in the United States, for example, is mild compared to the violence generated by socially sensitive rights issues in many other nations where social fissures are cultural chasms. Democratic nation-building is, in part, a consensus-building process because sovereign citizens have diverse and conflicting conceptions of rights and justice. It is unrealistic, and perhaps counterproductive, therefore, to expect every emerging pluralistic democracy to begin this process with levels of national rights protections that were achieved by Americans and some other Western democracies only after two or more centuries of conflicting and periodically violent consensus-building. Many emerging democracies have adopted grandiose bills of rights based on Western democratic models, but judicial interpretations and actual government protections of those rights often remain distant from the daily lives of most citizens. The new judicial federalism, however, suggests a model that would enable rights advocates to continue pressing for vigorous national and even international rights protections, while also embedding in regional constitutions and local charters rights that cannot be embedded in the national constitution, effectively enforced by the national government, or enforced only at minimal levels. Such an arrangement would produce peaks and valleys of rights protection within a nation, but this rugged rights terrain is surely preferable to a flat land of minimal or ineffectual national rights protection. The peak jurisdictions can function, under

democratic conditions, as rights leaders for a leveling-up process. In an emerging democracy culturally hostile to women's [*947] rights, for example, such an arrangement could embolden at least one subnational jurisdiction to institutionalize women's rights, thus establishing a rights peak visible to the entire society without plunging the nation into civil war or back into reactionary authoritarianism. As a corollary to this principle, it would seem advisable to press hard for freedom of travel and interjurisdictional migration as fundamental national rights, because even a single peak jurisdiction protecting women's rights in an otherwise hostile environment could become a refuge for women fleeing a country's rights deserts. The competitive pressures produced by interjurisdictional migration can have powerful leveling-up effects on rights protection. Individual and family mobility can also loosen the bonds of communal cultures that suppress individual rights by compelling communal elites to respond to their constituents' exit behavior. Under conditions of federalism, or perhaps subsidiarity, such accommodations can be made in regional and local government forums having cultural legitimacy as opposed to national institutions perceived as being dominated by alien elites. At the very least, examining state-equivalent constitutional documents where they exist and developing case materials on rights rulings by regional courts n136 in different political and cultural contexts could considerably enhance our understanding of how to go about protecting individual rights in a highly pluralistic and violence-prone world.

Escalates and goes nuclear

Gottlieb 93 (Gidon; Professor of International Law and Diplomacy University of Chicago Law School, Nation Against State, p. 26-27)//ADS

Self-determination unleashes and unchecked by balancing principles constitutes a menace to the society of states. There is simply no way in which all hundreds of people who aspire to sovereign independence can be granted a state of their own without loosening fearful anarchy and disorder on a planetary scale. **The proliferation of territorial entities poses exponentially greater problems for the control of weapons of mass destruction and multiple situations in which external intervention could threaten the peace. It increases problems for the management of all global issues, including terrorism, AIDS, the environment, and population growth.** It creates conditions in which **domestic strife in remote territories can drag powerful neighbors into local hostilities, creating ever widening circles of conflict**. Events in the aftermath of the breakup of the Soviet Union drove this point home. Like Russian dolls, ever smaller ethnic groups dwelling into larger units emerged to secede and to demand independence. Georgia, for example, has to contend with the claims of South Ossetians and Abkhazians for independence, just as Russian Federation is confronted with the separatism of Tartaristan. **An international system made up of several hundred independent territorial states cannot be the basis of global security and prosperity.**

AT: Patent Trolls Thump

Patent trolls won't clog courts after Obama signs reform legislation

Watkins 7/5 (William J; received his B.A. in history and German summa cum laude from Clemson University and his J.D. cum laude from the University of South Carolina School of

Law., "Congress considers taking a bite out of the patent trolls",thehill.com/blogs/congress-blog/246704-congress-considers-taking-a-bite-out-of-the-patent-trolls, July 5, 2015)//ADS

Patent trolls — those nefarious entities who clog the courts with frivolous patent lawsuits — are sweating. Patent litigation bills are advancing in both the House and the Senate, and President Obama has vowed to sign reform legislation before leaving office. If the reformers win, the patent trolls will have to scavenge elsewhere, and a broken system that has encouraged litigation rather innovation will finally get fixed. The House Judiciary Committee has approved the Innovation Act (H.R. 9) by a 24-8 vote. **This bipartisan bill would curb abusive patent litigation by requiring plaintiffs to cite specific harms caused by the alleged infringement, shortening the discovery period, and making it easier for interested parties to join the litigation.** It would also shift litigation costs to the losing party if the underlying claim were deemed questionable and require disclosure to the United States Patent and Trademark Office of individuals having an interest in the patent. The bill also allows an innocent customer of an alleged infringing manufacturer to avoid getting entangled in protracted and expensive litigation. Last session, an almost the identical bill passed the full House but died in the Senate, when then-Majority Leader Harry Reid (D-Nev.) torpedoed it after trial lawyers complained that it might cost their firms money. The Senate is considering a bill similar to the one in the House, the Protecting American Talent and Entrepreneurship Act of 2015 (PATENT) Act. This legislation tackles many of the same issues as the Innovation Act, but does not go quite as far. For example, it does not presumptively award fees and expenses to the winning party. Instead, the trial judge must determine whether the losing party was not "objectively reasonable" before granting a fee award. It is good news that both Republicans and Democrats agree patent trolling is a danger to our economy. Trolls take a toll because they obtain seek patents not for the purpose of producing an invention or a technology, but in order to license and enforce dubious patents. They seek broad patents likely to be infringed in a particular industry — especially software and other computer-related products, and older technologies that might still be used in various modern products. Then they start to shake down their prey by sending demand letters and filing legal actions. While both the Innovation Act and PATENT Act highlight real problems in patent litigation, both bills ignore the central problem: a one-size-fits-all patent system. Right now, the standard period of patent protection is 20 years. This uniform duration treats vastly different industries the same. It is ludicrous to treat software like pharmaceuticals because their manufacturing and development costs and product lifecycles are so very different. Five years would be a gracious plenty for software. It would allow inventors to reap profits from their work but would effectively deny trolls the use of an older patent to threaten new inventors. Here's another idea that is absent from the bills under consideration: patent law could follow the lead of trademark law and require that a plaintiff prove an intention to make use of the patent. This would address the essence of the trolling problem: patent trolls have no intention to use an idea or invention and just want the right to sue. Under trademark law, a person or entity may file a trademark application based on the intent to use the mark in commerce — that is, to sell products to the public with the mark attached. The rights to a trademark can be lost if the holder abandons or stops using the mark. Likewise, patent holders who never show any intention of using the technologies covered would lose their right to sue. Trolls would undoubtedly try to devise nominal uses of the technology to meet the use requirement, but the courts could evaluate the alleged use and determine if it represents a good-faith attempt to practice the invention or is merely a minimal effort meant to secure an open courthouse door. We should applaud the House and Senate for tackling the problem of patent trolls even though neither addresses the one-size-fits-all patent system or dares

to consider a use requirement. Let's hope that the compromise legislation that will likely emerge from Congress will have real teeth to deal with the trolling crisis.

AT: Immigration Thumps

Obama not taking immigration fight to Supreme Court

Gerstein and Min Kim 5/27(Josh; White House reporter for POLITICO, specializing in legal and national security issues, Seung; assistant editor who covers Congress for POLITICO,"Obama not taking immigration fight to Supreme Court, yet", www.politico.com/story/2015/05/obama-not-taking-immigration-fight-to-supreme-court-yet-118342.html, May 27, 15)//ADS

The Obama administration has decided not to ask the Supreme Court for an emergency stay on a judge's injunction blocking President Barack Obama's newest executive actions on immigration, opting to instead focus on the larger underlying legal battle. **The decision announced by the Justice Department on Wednesday came one day after a three-judge panel of a federal appeals court, in a 2-1 ruling, turned down the administration's request to proceed with Obama's programs to grant quasilegal status and work permits to millions more illegal immigrants.** Story Continued Below A Justice Department spokesman said forgoing an emergency application to the Supreme Court would allow federal government lawyers to focus on an ongoing court fight about the legal merits of Obama's actions rather than on the issue of whether they should or should not remain on hold. "**The Department of Justice is committed to taking steps that will resolve the immigration litigation as quickly as possible in order to bring greater accountability to our immigration system by prioritizing deporting the worst offenders, not people who have long ties to the United States and who are raising American children,"** spokesman Patrick Rodenbush said. "The Department believes the best way to achieve this goal is to focus on the ongoing appeal on the merits of the preliminary injunction itself. … Although the Department continues to disagree with the Fifth Circuit's refusal to stay the district court's preliminary injunction, the Department has determined that it will not seek a stay from the Supreme Court." The 5th Circuit U.S. Court of Appeals has tentatively scheduled arguments on the broader issues in the case for the week of July 6. That appeal is expected to be heard by a different panel than the one that voted Tuesday to deny the Obama administration's stay request.

Terrorism

Terror DA Link

Third-party data collection is necessary to fight terrorism

Ombres 2015 (Devon [J.D. 2006 from Stetson University College of Law; L.L.M. 2013 from American University Washington College of Law; admitted in Florida, District of Columbia, United States Court of Appeals for the 11th Circuit, and United States District Court for the

Middle District of Florida]; NSA DOMESTIC SURVEILLANCE FROM THE PATRIOT ACT TO THE FREEDOM ACT: THE UNDERLYING HISTORY, CONSTITUTIONAL BASIS, AND THE EFFORTS AT REFORM; 39 Seton Hall Legis. J. 27; kdf)

To paraphrase the common understanding of Benjamin Franklin's quote, those who would give up an essential liberty for safety deserve neither liberty nor safety. n154 However, it seems we have already crossed [*56] that Rubicon as a nation. The American public shares immeasurable amounts of information, both knowingly and unknowingly, with each other; corporations; and now the government, through our everyday acts on social media, online purchasing, and use of cell phones. We have reached a point where the public has few qualms with this proposition, save for the overreach of the government in collecting metadata on all communications, not including their content. Most Americans, too, are likely torn by the collections of communications metadata impinging on their privacy and the necessity to conduct global surveillance on increasingly tech savvy terrorist groups to prevent future attacks on American soil. This concern is highlighted by the discovery of westerners, including persons from the United States, attempting to join ranks with extremist groups, such as the Islamic State of Iraq and Syria. n155 While it would be wonderful to return to the FISA scheme in place pre-9/11, that is no longer feasible from a technological, national security, sociopolitical, or even infrastructure-based standpoint, given current geopolitics, international terrorist threats, and the billions invested in surveillance and data storage infrastructure. As such, we appear to be relegated to imperfect reforms, the best of these being the USA FREEDOM legislation, which could still further be strengthened by amending it to include portions of the bills noted above and by creating a non-partisan joint committee within Congress, although the potential for the latter has not garnered much support. n156 Although President Obama has taken action to reform the NSA's collection of domestic communication data, the FREEDOM Act should be enacted, regardless of any redundancies with administration policy. The Act will aid in providing greater transparency and oversight to the NSA surveillance programs currently in place and stem perceived violations of the Fourth Amendment. n157

Stored Communications Act HSS

Uniqueness

Squo Solves

Companies resolve perception link in the status quo

Kendrick 15 (Katharine Kendrick is a policy associate for Internet communications technologies at the NYU Stern Center for Business and Human Rights., 2.19.15, "Risky Business: Data Localization" http://www.forbes.com/sites/realspin/2015/02/19/risky-business-data-localization/, ekr)

U.S. companies' eagerness to please the EU affects their leverage in a place like Russia or China, and undermines their principled calls for a global Internet. Just as we've seen the emergence of company best practices to minimize how information is censored, we need best practices to minimize risks in where it is stored. Companies should take the following steps: Avoid localizing in a repressive country whenever possible. When Yahoo! entered Vietnam, to meet performance needs without enabling the government's Internet repression, it based its servers in Singapore. Explore global solutions. Companies like Apple and Google have started encrypting more data by default to minimize inappropriate access by any government. This doesn't solve everything, but it's a step forward for user privacy. Minimize exposure. If you must have an in-country presence, take steps to minimize risk by being strategic in what staff and services you locate there. Embrace transparency. A growing number of companies have increased transparency by issuing reports on the number of government requests they receive. They should also publish legal requirements like localization, so that people understand the underlying risks to their data. Work together. Companies should coordinate advocacy in difficult markets through organizations like the Global Network Initiative. Tech companies can take a proactive, collective approach, rather than responding reactively when their case hits the headlines. We can only expect localization demands to increase—and business pressures to pull in the opposite direction. While the political dynamics have shifted, companies should still have respect for human rights—and the strength of the global Internet—at the forefront of decisions over where to store their data.

Freedom Act Solves

Status Quo Freedom Act sufficient

CEA 15 (June 2, 2015, "Washington: CEA Praises Senate Passage of USA FREEDOM Act" http://www.ce.org/News/News-Releases/Press-Releases/2015-Press-Releases/CEA-Praises-Senate-Passage-of-USA-FREEDOM-Act.aspx, ekr)

The Consumer Electronics Association has issued the following news release: The following statement is attributed to Michael Petricone, senior vice president of government and regulatory affairs, Consumer Electronics Association (CEA)®, regarding the U.S. Senate's passage of H.R. 2048, the Uniting and Strengthening America by Fulfilling Rights and Ensuring Effective Discipline Over Monitoring (USA FREEDOM) Act of 2015: "We welcome this important reform to U.S. intelligence gathering which takes **critical steps to increase transparency and restore trust in American businesses**, all while maintaining our commitment to preserving our national security. The bipartisan USA FREEDOM Act is common-sense reform to our nation's intelligence gathering programs, which will preserve American businesses' competitiveness worldwide, while continuing to protect our national security. "Following the Senate passage, the legislation now heads to the White House, where we anticipate swift action by President Obama to sign this legislation into law."

New Freedom Act is sufficient to solve US's global credibility gap.

HRW '15

Human Rights Watch is an independent, international organization that works as part of a vibrant movement to uphold human dignity and advance the cause of human rights for all. “Strengthen the USA Freedom Act” - May 19, 2015 - http://www.hrw.org/news/2015/05/19/strengthen-usa-freedom-act

As the Senate considers the USA Freedom Act this week, policymakers should strengthen it by limiting large-scale collection of records and reinforcing transparency and carrying court reforms further. The Senate should also take care not to weaken the bill, and should reject any amendments that would require companies to retain personal data for longer than is necessary for business purposes. It has been two years since the National Security Agency (NSA) whistleblower Edward Snowden unleashed a steady stream of documents that exposed the intention by the United States and the United Kingdom to “collect it all” in the digital age. These revelations demonstrate how unchecked surveillance can metastasize and undermine democratic institutions if intelligence agencies are allowed to operate in the shadows, without robust legal limits and oversight. **On May 13,** the US House of Representatives approved the USA Freedom Act of 2015 by a substantial margin. The bill represents the latest attempt by Congress to rein in one of the surveillance programs Snowden disclosed—the NSA’s domestic bulk phone metadata collection under Section 215 of the USA Patriot Act. The House vote followed a major rebuke to the US government by the US Court of Appeals for the Second Circuit, which ruled on May 7 that the NSA’s potentially nationwide dragnet collection of phone records under Section 215 was unlawful. Section 215 is set to expire on June 1 unless Congress acts to extend it or to preserve specific powers authorized under the provision, which go beyond collection of phone records. Surveillance reforms are long overdue and can be accomplished while protecting US citizens from serious security threats. Congress and the Obama administration should end all mass surveillance programs, which unnecessarily and disproportionately intrude on the privacy of hundreds of millions of people who are not linked to wrongdoing. But reforming US laws and reversing an increasingly global tide of mass surveillance will not be easy. Many of the programs Snowden revealed are already deeply entrenched, with billions of dollars of infrastructure, contracts, and personnel invested. Technological capacity to vacuum up the world’s communications has outpaced existing legal frameworks meant to protect privacy. The Second Circuit opinion represents an improvement over current law because it establishes that domestic bulk collection of phone metadata under Section 215 of the Patriot Act cannot continue. Section 215 allows the government to collect business records, including phone records, that are “relevant” to an authorized investigation. The court ruled that the notion of “relevance” could not be stretched to allow intelligence agencies to gather all phone records in the US. However, the opinion could be overturned and two other appeals courts are also considering the legality of the NSA’s bulk phone records program. The opinion also does not address US surveillance of people not in the US. Nor does it question the underlying assumption that the US owes no privacy obligations to people outside its territory, which makes no sense in the digital age and is inconsistent with human rights law requirements. Even if the Second Circuit opinion remains good law, congressional action will be necessary to address surveillance programs other than Section 215—both domestic and those affecting people outside the US—and to create more robust institutional safeguards to prevent future abuses. The courts cannot bring about reforms to increase oversight and improve institutional oversight on their own. Human Rights Watch has supported the USA Freedom Act because it is a modest, if incomplete, first step down the long road to reining in the NSA excesses. Beyond ending bulk records collection, the bill would begin to reform the secret Foreign Intelligence Surveillance Act (FISA) Court, which oversees NSA surveillance, and would introduce new transparency measures to improve oversight. In passing the bill, the House of Representatives also clarified that it intends the bill to be consistent with the Second Circuit’s ruling, so as to not weaken its findings. The bill is no panacea and, as detailed below, would not ensure comprehensive reform. It still leaves open the possibility of large-scale data collection practices in the US under the Patriot Act. It does not constrain surveillance under Section 702 of the FISA Amendments Act nor Executive Order 12333, the primary legal authorities the government has used to justify mass surveillance of people outside US borders. And the bill does not address many modern surveillance capabilities, from mass cable tapping to use of malware, intercepting all mobile calls in a country, and compromising the security of mobile SIM cards and other equipment and services. **Nonetheless,** passing a strong USA Freedom Act would be a long-overdue step in the right direction. It would show that Congress is willing and able to act to protect privacy and impose oversight over intelligence agencies in an age when technology makes ubiquitous surveillance possible. Passing this bill **would** also help **shift the debate in the US and globally** and would distance the United States from other countries that seek to make mass surveillance the norm. On a global level, other governments may already be emulating the NSA’s approach, fueling an environment of impunity for mass violations of privacy. In the last year, France, Turkey, Russia, and other countries have passed legislation to facilitate or expand large-scale surveillance. If the USA Freedom Act passes, it would be the first time Congress has affirmatively restrained NSA activities since the attacks of September 11. Key supporters of the bill have vowed to take up reforms to other laws next, including Section 702 of the FISA Amendments Act.

Cloud Growth Now

Cloud computing growing now, multiple projections and predictive evidence prove

Columbus ’15 – Louis Columbus, Forbes journalist specializing in CRM, Cloud Computing, ERP and Enterprise Software, Vice President Worldwide Marketing at iBASEt, Adjunct Professor Webster University, (“Roundup Of

Cloud Computing Forecasts And Market Estimates, 2015" Jan 24 2015, Forbes, Available Online at http://www.forbes.com/sites/louiscolumbus/2015/01/24/roundup-of-cloud-computing-forecasts-and-market-estimates-2015/**) N.H**

Global SaaS software revenues are forecasted to reach $106B in 2016, increasing 21% over projected 2015 spending levels. A Goldman Sachs study published this month projects that spending on cloud computing infrastructure and platforms will grow at a 30% CAGR from 2013 through 2018 compared with 5% growth for the overall enterprise IT.

Centaur Partners and other firms mentioned in this roundup are seeing more enterprise-size deals for cloud computing infrastructure and applications. While each of these consultancies and research firms have varying forecasts for the next few years, all agree that cloud computing adoption is accelerating in enterprises on a global scale.

Key take-aways from the roundup are provided below:

By 2018, 59% of the total cloud workloads will be Software-as-a-Service (SaaS) workloads, up from 41% in 2013. Cisco is predicting that by 2018, 28% of the total cloud workloads will be Infrastructure-as-a-Service (IaaS) workloads down from 44% in 2013. 13% of the total cloud workloads will be Platform-as-a-Service (PaaS) workloads in 2018, down from 15% in 2013. The following graphic provides a comparative analysis of IaaS, PaaS and SaaS forecasts from 2013 to 2018. Source: Cisco Global Cloud Index: Forecast and Methodology, 2013–2018. (PDF, free, no opt-in).

Centaur Partners' analysis of SaaS & cloud-based business application services revenue forecasts the market growing from $13.5B in 2011 to $32.8B in 2016, attaining a 19.5% CAGR. Centaur provides a useful overview of current market conditions including M&A activity in their latest market overview published this month, Introduction to Centaur Partners: SaaS Market Overview, (PDF, free, no opt-in). 42% of IT decision makers are planning to increase spending on cloud computing in 2015, with the greatest growth in enterprises with over 1,000 employees (52%). The top five tech spending increases in 2015 are shown in the following graphic. Source: Computerworld's 2015 Forecast Predicts Security, Cloud Computing And Analytics Will Lead IT Spending.

Global SaaS software revenues are forecasted to reach $106B in 2016, increasing 21% over projected 2015 spending levels. Spending on integration, storage management, and database management systems are projected to experience the greatest growth in 2015. These and other key insights are from Forrester's SaaS software subscription revenue by category show below. Source: Enterprise software spend to reach $620 billion in 2015: Forrester.

$78.43B in SaaS revenue will be generated in 2015, increasing to $132.57 in 2020, attaining a compound annual growth rate (CAGR) of 9.14%. The following graphic and table provides an overview of Forrester's Global Public Cloud Computing market size analysis and forecast for the years 2011 to 2020. Source: Institut Sage.

Spending on cloud computing infrastructure and platforms is expected to grow at a 30% CAGR from 2013 through 2018 compared with 5% growth for the overall enterprise IT. Goldman Sachs estimates that Amazon has taken in $4B in revenue, or 26% of the IaaS and PaaS markets, in the past 12 months. These and other insights and the graphics below are from an analysis of the recent Goldman Sachs cloud computing report. Thank you Michael Coté, Research Director, Infrastructure Software at 451 Research for freely sharing your latest presentation, Cloud State of the Union, 2015. Additional interesting links regarding Goldman Sachs' recent cloud computing study include Battle Of Cloud Titans Has Just Begun, Goldman Says and Red Hat: Goldman Cuts to Sell Amidst Bullish Cloud View.

Security (36%), cloud computing (31%) and mobile devices (28%) are the top 3 initiatives IT executives are planning to have their organizations focus on over the next 12 months. Source: 2015 State of the Network Study, Technology Adoption Trends & Their Impact on the Network (free PDF, no opt in). A summary of the study can be found here: State of the Network 2015.

IDC predicts that by 2016, there will be an 11% shift of IT budget away from traditional in-house IT delivery, toward various versions of cloud computing as a new delivery model. By 2017, 35% of new applications will use cloud-enabled, continuous delivery and enabled by faster DevOps life cycles to streamline rollout of new features and business innovation. Source: 2015-2017 Forecast: Cloud Computing to Skyrocket, Rule IT Delivery.

By 2018, IDC forecasts that public cloud spending will more than double to $127.5 billion. This forecast is broken down as follows: $82.7 billion in SaaS spending, $24.6 billion for IaaS and $20.3 billion in PaaS expenditures. Source: Forecasts Call For Cloud Burst Through 2018.

27.8% of the worldwide enterprise applications market will be SaaS-based, generating $50.8B in revenue up from $22.6B or 16.6% of the market in 2013. IDC also estimates the overall enterprise applications market in 2013 was $135.9B. Source: IDC Predicts SaaS Enterprise Applications Will Be A $50.8B Market By 2018.

By 2016 over 80% of enterprises globally will using IaaS, with investments in private cloud computing showing the greater growth. Ovum forecasts that by 2016, 75% of EMEA-based enterprises will be using IaaS. These and other insights are from the presentation, The Role of Cloud in IT Modernisation: The DevOps Challenge (free PDF, no opt in). The graphic below provides an analysis of cloud computing adoption in EMEA and globally.

Cloud computing growing in squo

McCue 14 –[TJ McCue, Forbes Technology contributor/journalist, ("Cloud Computing: United States Businesses Will Spend $13 Billion On It" JAN 29, 2014, Forbes Tech, Available Online at

http://www.forbes.com/sites/tjmccue/2014/01/29/cloud-computing-united-states-businesses-will-spend-13-billion-on-it/**) N.H**

Instead of a slow-moving fluffy white cloud image, the cloud computing industry should use a tornado – that might be a better way to visualize how fast cloud computing is growing today. Amazon is dominating, but is followed by the usual suspects: IBM IBM +2.40%, Apple AAPL +2.44%, Cisco, Google GOOG +1.80%, Microsoft MSFT +0.00%, Salesforce, and Rackspace, to name a few. (Disclosure: I am on the paid blogger team for IBM Midsize Insider, which covers technology pertinent to midsize companies, including the cloud, among other topics.)

"The cloud" is frequently in the news, but there is also a fair amount of confusion, outside of technology teams. What is cloud computing and why do businesses need to care? IBM published this handy infographic: 5 Reasons Businesses Use The Cloud. Among the reasons: Collaboration, better access to analytics, increasing productivity, reducing costs, and speeding up development cycles.

By 2015, end-user spending on cloud services could be more than $180 billion.

It is predicted that the global market for cloud equipment will reach $79.1 billion by 2018

If given the choice of only being able to move one application to the cloud, 25% of respondents would choose storage

By 2014, businesses in the United States will spend more than $13 billion on cloud computing and managed hosting services.

According to Jack Woods at Silicon Angle, there's some serious growth forecasted and he lists 20 recent cloud computing statistics you can use to make your case for why you need the cloud or to understand why you should consider it for your business. The above bullet points come from his post.

Massive growth of cloud computing in squo- especially true in the American context

Woods 14 – Jack Woods, cloud market contributor and journalist at siliconeangle, ("20 cloud computing statistics every CIO should know" Jan 27 14, available online at http://siliconangle.com/blog/2014/01/27/20-cloud-computing-statistics-tc0114/**) N.H**

Big Data Doesn't Solve HC

Big data doesn't solve disease—predictions are too difficult and the bar for entry is too low

White 15 - Michael White is a systems biologist at the Department of Genetics and the Center for Genome Sciences and Systems Biology at the Washington University School of Medicine in St. Louis, where he studies how DNA encodes information for gene regulation. ("The Ethical Risks of Detecting Disease Outbreaks With Big Data," http://www.psmag.com/health-and-behavior/ethical-risks-of-detecting-disease-outbreaks-with-big-data 2/24/2015) STRYKER

One of the most urgent ethical issues that the researchers identify lies at what they call "the nexus of ethics and methodology." The ethical issue can be reduced to one question: **Do these methods actually work**? Ensuring that the methods work "is an ethical, not just a scientific, requirement," the researchers note. Unlike some other social media experiments, a flawed public health monitoring program can cause serious physical and economic harm to large numbers of people. Digital disease detection programs are relatively easy to set up compared to traditional disease monitoring systems, which means **there is a risk that the bar for entering this field might be dangerously low**. An **under-prediction** of a disease outbreak can result in complacency and lack of preparedness by health officials or the public. An **over-prediction** could cause panic, misallocation of limited supplies of vaccines or medical resources, and, as some reactions to the recent Ebola outbreak demonstrated, damaging stigmatization of people or communities who don't pose a risk. As the physicist Niels Bohr once noted, **prediction is hard**—especially about the future. Big data programs and algorithms often perform well when they're used to "predict" the existing data that was used to help build them, but then do poorly when confronted with new data. That's where digital disease detection tools that use social media data often run into trouble. **Google Flu Trends** looked impressive in its initial report in 2009, where it was used to retroactively predict flu activity of previous years. But it **largely missed the two waves of H1N1 swine flu that hit** later **in 2009**. As the Google Flu researchers wrote, "Internet search behavior changed during pH1N1, particularly in the categories 'influenza complications' and 'term for influenza'"—two search terms that are particularly important in the algorithm. The program also **over-predicted the severity of the 2011-12 flu season by 50 percent**.

Big data doesn't solve healthcare – multiple barriers and empirics prove

**predictive analytics/comparative data are referring to the same idea of large databases with patient information i.e. big data in general

Crockett 14 (David, Ph.D. from University of Colorado in medicine, Senior Director of Research and Predictive Analytics at Health Catalyst, "3 Reasons Why Comparative Analytics, Predictive Analytics, and NLP Won't Solve Healthcare's Problems", https://www.healthcatalyst.com/3-reasons-why-comparative-analytics-predictive-analytics-and-nlp-wont-solve-healthcares-problems/)

Comparative **Data Doesn't Drive Improvement** We've had comparative data for **years** in the U.S. healthcare system and it hasn't moved the needle towards better, at all. In fact, the latest OECD data ranks the U.S. even **worse than we've ever been** on healthcare quality and cost. Comparative data, like the OECD, is interesting and certainly worth looking at, but it's far from enough to drive improvements in an organization down to the individual patient. To drive that sort of change, you have to get your head and hands dirty in your own data ecosystem, not somebody else's that is at best a rough facsimile of your organization. There are too many variables and variations in healthcare delivery right now that add **too much noise** to the

data to make comparative analytics as valuable as some pundits advocate. We don't even have an industry standard and clinically precise definition of patients that should be included (and excluded from routine management) in a diabetes registry, much less the other 15 chronic diseases and syndromes we should be managing. Predictive Analytics Fails to Include Outcomes We've also had predictive analytics supporting risk stratification for years in healthcare, particularly in case management, **but without outcomes data, what are we left to predict**? Readmissions. That's a sad state of affairs. Before we start believing that predictive analytics is going to change the healthcare world, we need to understand how it works, technically and programmatically. Without protocol and patient-specific outcomes data, **predictive analytics is largely vendor smoke and mirrors** in all but a very small number of use cases.

Big data doesn't work for disease—only works as well as actual data collection

Swift 14 - Janet Swift is a spreadsheets and statistics specialist for I-Programmer. ("Google Flu Trends Adopts New Model," http://www.i-programmer.info/news/197-data-mining/7939-google-flu-trends-new-model.html 11/3/2014) STRYKER
Google Flu Trends is launching a new model in the United States for the coming 2014/2015 flu season. The important difference is that it is going to incorporate CDC flu data - which rather ruins its original idea. Google Flu Trends (GFT) was launched in 2008 to predict how many cases of flu are likely to occur based on "aggregate search data". The premise used by the model was that there is a correlation between the number of cases of flu and the number of searches on the topic of flu. So rather than collect data from doctors and hospitals about people showing symptoms you can instead look for searches using terms associated with flu such as "cough" or "fever". Initially the model worked well. Not only did it provide accurate estimates of the number of cases of flu, it did so ahead of those from the CDC (Centers for Disease Control and Prevention). But over time Google's model **started to overpredict** the incidence of flu, due to what could be interpreted as a **positive feedback effect**. Heightened media attention to flu when the incidence of flu rises leads to more people googling flu related terms. For the 2012/2013 flu season the GFT prediction exceeded the number of "real" flu cases by 95%. Responding to the research that revealed this anomaly Google adjusted the model for the 2013/2014 flu season (see the details in Google Updates Flu Model but **it continued to overpredict.** So a more drastic remedy was sought. According to Christian Stefansen, Senior Software Engineer, in a post on the Google Research blog announcing "brand new engine" for GFT, for the coming flu season in the US, Google is substituting a: "more robust model that learns continuously from official flu data". While this may well improve the model's accuracy, **the fact that it uses actual data defeats the idea** that flu could be predicted solely on the basis of Internet users search behavior. If the new model works well, it won't be nearly as interesting a finding as the success of the old model.

Big data analysis is ineffective—

A. Selection bias

Hoffman and Podgurski 13 - Sharona Hoffman is a Edgar A. Hahn Professor of Law and Professor of Bioethics and Co-Director of Law-Medicine Center at Case Western Reserve University School of Law. Andy Podgurski is a Professor of Electrical Engineering and Computer Science at Case Western Reserve University. ("The Use and Misuse of Biomedical Data: Is Bigger Really Better?" *American Journal of Law & Medicine*, 39 Am. J. L. and Med. 497, 2013) STRYKER
If data subjects have the opportunity to opt out of inclusion in a database or if certain individuals' records are otherwise excluded, a class of problems often called [*522] **"selection bias"** may arise. n227 Selection bias may occur when **the subset of individuals studied is not representative of the patient population of interest**. n228 This kind of selection bias could manifest, for example, if a disproportionate number of people of one ancestry or economic class opt out of participating in a database. n229 It can likewise exist if individuals with certain behavior traits that might be important in some studies--such as diet, exercise, smoking status, and alcohol or drug consumption--choose not to participate or cannot access medical facilities in which studies take place. n230 Selection bias can **distort assessments** of measures such as disease

prevalence or exposure risk because study estimates will differ systematically from the true values of these measures for the target population. n231 That is, the estimates will not be generalizable from the research subjects to the larger population about which analysts wish to draw conclusions. n232 Another, more subtle kind of selection bias, which is also called "**collider-stratification bias**," n233 "collider-bias," n234 or "M-bias," n235 is specific to causal-effect studies. n236 These studies typically seek to measure the average beneficial effect on patients of a particular treatment or the average harmful effect on individuals of a particular exposure. n237 Collider-stratification bias occurs in analyzing study data when the analysis is conditioned on (e.g., stratified by) one or more levels of a variable that is a common effect (a "collider") of both the treatment/exposure variable and the outcome variable or that is a common effect of a cause of the treatment/exposure and a cause of the outcome. n238 Consider the following classic example. Commonly, **some patients are lost to follow-up**, and thus outcome measurements that would be essential for research purposes are unavailable. The data from these patients cannot be included in studies. Both the treatment and outcome at issue may influence which patients stop seeking medical care. Patients may fail to return for follow-up both because the treatment is unpleasant (treatment factor) and because they actually feel better and don't see a need to return to their doctors (an outcome factor). The loss of these study subjects can create a **spurious statistical association between the treatment/exposure variable and the outcome variable** that becomes mixed with and distorts the true causal effect of the former on the latter. n239 Because collider-stratification bias is associated with [*523] the exclusion of some patients from a study, it is categorized as a type of selection bias. n240

B. Confounding bias

Hoffman and Podgurski 13 - Sharona Hoffman is a Edgar A. Hahn Professor of Law and Professor of Bioethics and Co-Director of Law-Medicine Center at Case Western Reserve University School of Law. Andy Podgurski is a Professor of Electrical Engineering and Computer Science at Case Western Reserve University. ("The Use and Misuse of Biomedical Data: Is Bigger Really Better?" *American Journal of Law & Medicine*, 39 Am. J. L. and Med. 497, 2013) STRYKER

In observational causal-effect studies, confounding bias (confounding) **may be an even greater concern than selection bias**. n241 "Classical" confounding occurs because of the presence of a common cause of the treatment/exposure variable and the outcome variable. n242 Confounding is different from collider-stratification bias because it involves a common cause of the treatment/exposure and outcome variables rather than a common effect of the variables. n243 The following hypothetical illustrates classical confounding. Suppose a physician's treatment choices are influenced by the severity or duration of a patient's disease, which also influence the outcome of treatment. n244 Thus, patients at a later stage of a disease may receive one treatment (treatment A) and those who are at an earlier stage may receive a different therapy (treatment B). At the same time, sicker patients may have worse treatment outcomes than healthier individuals. Unless such a common cause, which is called a "confounding variable" or "confounder," is adjusted for appropriately during statistical data analysis, it may induce a spurious association between the treatment variable and the outcome variable, which distorts estimation of the true causal effects of treatments. n245 In other words, **researchers may reach incorrect conclusions** regarding the efficacy of the two treatments because of the confounding variable: **the degree of sickness** suffered by patients receiving the different therapies. Treatment A may appear to be less effective than treatment B not because it is in fact an inferior therapy but because so many of the patients receiving treatment A are in a late stage of the disease and would not do well no matter what treatment they received. This particular form of confounding, called "confounding by indication," is especially challenging to adjust for, because it may involve multiple factors that influence physicians' treatment decisions. n246 **Socioeconomic factors and patient lifestyle choices** may also be confounders. Those who lack financial resources or adequate health coverage may select less expensive treatments not because those are the best choices for them but because those are the only affordable options. n247 Low income may also separately lead to poor health for reasons such as poor nutrition or financial stress. In the case of preventive care, a treatment's perceived benefits may be amplified because health-oriented individuals interested in the intervention also pursue exercise, low-fat diets, and other health-promoting behaviors. These patients' impressive outcomes thus would not be associated solely with the preventive measure. n248

C. Measurement bias

Hoffman and Podgurski 13 - Sharona Hoffman is a Edgar A. Hahn Professor of Law and Professor of Bioethics and Co-Director of Law-Medicine Center at Case Western Reserve University School of Law. Andy Podgurski is a Professor of Electrical Engineering and Computer Science at Case Western Reserve University. ("The Use and Misuse of Biomedical Data: Is Bigger Really Better?" *American Journal of Law & Medicine*, 39 Am. J. L. and Med. 497, 2013) STRYKER

Measurement biases arise from **errors in measurement and data collection**. n262 Observational study results may be compromised if the biomedical records that are analyzed contain such errors. Measurement errors occur for a variety of reasons. Measurement instruments might not be calibrated properly or might lack sufficient sensitivity to detect differences in relevant variables. n263 Storage time or conditions for biological samples might be different and might affect study results. n264 To the extent that researchers solicit and record patients' own accounts and memories, the subjects' **ability to recall** details may be influenced by the questioner's competence, patience, and apparent sympathy or by the degree to which the patient perceives the topic to be important and relevant to her life. n265 In addition, patients may have **impaired memories** or may **lie** in response to questions if they are embarrassed about the truth. n266 Accurate measurement may be further hindered by **incomplete, erroneous, or miscoded EHR data that obfuscates true values**. n267 In causal-effect studies, errors in measurement of the treatment/exposure and the outcome are most problematic when they are associated (dependent) and when they are differential, that is, when the treatment affects the measurement error for the outcome or the outcome affects the measurement error for the treatment. n268 For example, differential measurement error could occur in a study of the effect of treatment A on dementia, if the use of A was determined only by interviewing study participants, because dementia affects subjects' ability to recall whether and how they were treated. n269 **Mismeasurement of confounding variables** also impedes adjustments intended to eliminate confounding bias. n270

Healthcare prediction can't be scaled up – no motivation and structural problems

Crockett 13 (David, Ph.D. from University of Colorado in medicine, Senior Director of Research and Predictive Analytics at Health Catalyst, "Using Predictive Analytics in Healthcare: Technology Hype vs. Reality", https://www.healthcatalyst.com/predictive-analytics-healthcare-technology)

The **buzzword fever** around predictive analytics will likely continue to rise and fall. Unfortunately, lacking the proper infrastructure, staffing and resource to act when something is predicted with high certainty to happen, we fall short of the full potential of harnessing historic trends and **patterns in patient data**. In other words, without the **willpower** for clinical intervention, any predictor – no matter how good – is not fully utilized.

Skepticism

You should be generally skeptical of their evidence – it overstates the value of big data – studies prove data is mostly irrelevant now

Aslett 13 (Matt, research director for 451 research, formerly the Deputy Editor of monthly magazine Computer Business Review and ComputerWire's daily news service, "Big data reconsidered: it's the economics, stupid", https://451research.com/report-short?entityId=79479&referrer=marketing)

For the past few years the data management industry has been in the grip of a fever related to 'big data' – a loosely defined term that has been used to describe analysis of large volumes of data, or analysis of unstructured data, or high-

velocity data, or social data, or predictive analytics, or exploratory analytics or all of the above – and more besides. The expectations for the potential of big data to revolutionize the data management and analytics industry are **great and inflated**, to the extent that it is easy to become disillusioned. A quick check of recent news **headlines suggests** that big data has the potential to solve world hunger, defeat terrorism, close the gender gap, bring about world peace, cure cancer and identify life on Mars. We don't doubt that data management and analytics will have a critical role to play in efforts related to all those issues, but there is clearly a gap between the potential of big data and the extent to which related technologies have been adopted to date. For example, interviews from TheInfoPro, a service of 451 Research, with storage professionals indicate that big data accounted for just 3% of the total data storage footprint in 2012 – **and the exact same percentage in 2013**. While we believe that the big data trend has the potential to revolutionize the IT industry by enabling new business insight based on previously ignored and underutilized data, it is clear that **big data is also massively over-hyped**.

Impact Defense

Disease Defense

No zoonotic disease impact – multiple warrants

Empirics Prove

Ridley 12 (Matt Ridley, columnist for The Wall Street Journal and author of The Rational Optimist: How Prosperity Evolves, "Apocalypse Not: Here's Why You Shouldn't Worry About End Times," http://www.wired.com/wiredscience/2012/08/ff_apocalypsenot/all/)

The emergence of AIDS led to a theory that other viruses would spring from tropical rain forests to wreak revenge on humankind for its ecological sins. That, at least, was the implication of Laurie Garrett's 1994 book, The Coming Plague: Newly Emerging Diseases in a World Out of Balance. The most prominent candidate was Ebola, the hemorrhagic fever that starred in Richard Preston's The Hot Zone, published the same year. Writer Stephen King called the book "one of the most horrifying things I've ever read." Right on cue, Ebola appeared again in the Congo in 1995, but it soon disappeared. Far from being a harbinger, HIV was the only new tropical virus to go pandemic in 50 years.¶ In the 1980s British cattle began dying from **mad cow** disease, caused by an infectious agent in feed that was derived from the remains of other cows. When people, too, began to catch this disease, predictions of the scale of the epidemic quickly turned terrifying: Up to 136,000 would die, according to one study. A pathologist warned that the British "have to prepare for perhaps thousands, tens of thousands, hundreds of thousands, of cases of vCJD [new variant Creutzfeldt-Jakob disease, the human manifestation of mad cow] coming down the line." Yet the total number of deaths so far in the UK **has been 176**, with just five occurring in 2011 and none so far in 2012.¶ **In 2003 it was SARS**, a virus from civet cats, that ineffectively but inconveniently led to quarantines in Beijing and Toronto amid predictions of global Armageddon. **SARS subsided within a year**, after killing just 774 people. In 2005 it was bird flu, described at the time by a United Nations official as being "like a combination of global warming and HIV/AIDS 10 times faster than it's running at the moment." The World Health Organization's official forecast was 2 million to 7.4 million dead. In fact, by late 2007, when the disease petered out, the death toll was roughly 200. In 2009 it was Mexican swine flu. WHO director general Margaret Chan said: "It really is all of humanity that is under threat during a pandemic." The outbreak proved to be a normal flu episode.¶The truth is, a new global pandemic is growing less likely, not more. Mass migration to cities means the opportunity for viruses to jump from wildlife to the human species has not risen and has possibly even declined, despite media hype to the contrary. Water- and insect-borne infections—generally the most lethal—**are declining** as living standards slowly improve. It's true that casual-contact infections such as colds are thriving—but **only by being mild**

enough that their victims can soldier on with work and social engagements, thereby allowing the virus to spread. Even if a lethal virus does go global, the ability of medical science to sequence its genome and devise a vaccine or cure **is getting better** all the time.

Burnout and variation check

York 14 (Ian, head of the Influenza Molecular Virology and Vaccines team in the Immunology and Pathogenesis Branch of the Influenza Division at the CDC, PhD in Molecular Virology and Immunology from McMaster University, M.Sc. in Veterinary Microbiology and Immunology from the University of Guelph, former Assistant Prof of Microbiology & Molecular Genetics at Michigan State, "Why Don't Diseases Completely Wipe Out Species?" 6/4/2014, http://www.quora.com/Why-dont-diseases-completely-wipe-out-species)

But mostly **diseases don't drive species extinct.** There are **several reasons** for that. For one, the most dangerous diseases are those that spread from one individual to another. If the disease is **highly lethal**, then the population drops, and it becomes **less likely that individuals will contact each other** during the infectious phase. Highly contagious diseases tend to **burn** themselves **out** that way.¶ Probably the main reason is variation. Within the host and the pathogen population there will be a wide range of variants. Some hosts may be **naturally resistant.** Some pathogens will be **less virulent**. And either alone or in combination, you end up with infected individuals who **survive**.¶ We see this in HIV, for example. There is a small fraction of humans who are naturally resistant or altogether immune to HIV, either because of their CCR5 allele or their MHC Class I type. And there are a handful of people who were infected with defective versions of HIV that didn't progress to disease. ¶ We can see indications of this sort of thing happening in the past, because our genomes contain many instances of **pathogen resistance genes** that have **spread through the whole population.** Those all started off as rare mutations that conferred a **strong selection advantage to the carriers,** meaning that the specific infectious diseases were serious threats to the species.

Innovation Defense

Innovation high and inevitable

Vivek **Wadhwa 14**, fellow at the Rock Center for Corporate Governance at Stanford University, director of research at the Center for Entrepreneurship and Research Commercialization at Duke's engineering school and distinguished scholar at Singularity and Emory universities, "How the United States is reinventing itself yet again", 1/2/14, http://www.washingtonpost.com/blogs/innovations/wp/2014/01/02/how-the-united-states-is-reinventing-itself-yet-again/

And that's not all the pessimists say. They also argue that while the United States continues to dominate in the emergence of new technology powerhouses, the biggest IPO of the decade belongs to Facebook, a social network that is more media company than technology innovator. Stifling red tape and regulations has driven costs of testing new medicines and medical devices so high that many drug companies have shifted testing regimes and market focus to Europe and Asia. Despite mounting evidence that skilled immigrant entrepreneurs have delivered a wildly disproportionate share of the country's technology innovation and technology job growth, the powers that be in Washington, D.C. have, even with broad bipartisan support, not mustered up the votes to reform the country's regressive and punitive immigration policies. Add to all of this an aging populace requiring more and more support from younger workers, ballooning health costs and a tax structure that beggars the young to underwrite benefits for the aged, and the United States looks more and more like a historical footnote than a superpower.¶ Peel back the layers of the onion, and **the reality appears quite different.** In fact, the United States stands on the cusp of a dramatic revival and rejuvenation, propelled by an **amazing wave of technological innovation**. A slew of breakthroughs will deliver the enormous productivity gains and the societal dramatic cost savings needed to sustain economic growth and prosperity. These breakthroughs, mostly digital in nature, will complete the shift begun by the Internet away to a

new era where the precepts of Moore's Law can be applied to virtually any field.¶ Computer-assisted design and fabrication will reshape manufacturing forever. These technologies will slash waste and replace nearly all conventional manufacturing with more environmentally friendly and cost-effective additive manufacturing run with robots and computer programs. Complex systems resistant to modeling will succumb to advances in big data that allow mankind to finally make sense and improve upon the most intricate multi-faceted interactions. Where big data fails, ubiquitous crowd sourcing will harness untapped brain cycles to train systems and solve problems, one small activity at a time — on a global scale.¶ In this massively digital world, A/B testing or parallelization of R&D processes will become commonplace for just about everything from airline design simulations to online advertising to artificial organ construction. This will, in turn, allow for far more rigorous testing of products and processes. Dirt-cheap digital delivery platforms for educational content and improvements in the understanding of the way the brain learns will yield a sea change in how we gain knowledge. This will result in more open, flexible educational systems and structures — and a smarter, more learned, constantly learning populace. While the world will benefit from these changes, the United States **is uniquely positioned to lead** this sea change.

A2: Addons

Ebola

Containment solves

Katie **Jennings 14**, Business Insider, citing Dr. Amesh Adalja, an infectious disease specialist from the University of Pittsburgh Medical Center and the Center for Health Security, Aug 4 2014, "Here's Why Your Panic Over Ebola Patients In The US Is Overblown," http://www.businessinsider.com/why-ebola-panic-is-overblown-2014-8

A quick scan of recent headlines — "Ebola outbreak moving faster than efforts to contain it" or "Nigeria death shows Ebola can spread by air travel "— makes it easy to jump to the conclusion that bringing Ebola patients to the United States is risky and could cause a similar outbreak here. However, U.S. government officials and health experts say **this is simply not true**: Ebola will not spread through the **U**nited **S**tates like it has in West Africa. "[T]he plain truth is that we can stop Ebola," Dr. Tom Frieden, director of the U.S. Centers for Disease Control and Prevention told ABC's "This Week." "We know how to control it." Don't Believe Everything You See In The Movies Part of the fear about an Ebola outbreak in the U.S. stems from how the virus has been treated by Hollywood and the media. "Ebola has a mystique about it because the way that it has been treated in fiction," Dr. Amesh Adalja, an infectious disease specialist from the University of Pittsburgh Medical Center and the Center for Health Security, told Business Insider. He specifically referenced the 1995 movie "Outbreak," starring Cuba Gooding, Jr., which features a fictional Ebola-like virus. Richard Preston's book The Hot Zone, a terrifying nonfiction thriller that inspired the movie, is another well-known reference. While fictional stories just aren't true-to-life, there are a few legitimately scary things about Ebola. The symptoms are viscerally horrifying, and treatments and vaccines against the disease don't exist at this time. And because scientists aren't totally sure how the virus outbreaks jump to humans, there is also the fear of the unknown. "The outbreaks are mysterious, they appear out of nowhere, they're explosive and then they disappear," says Adalja. All of these factors work to fuel a panic mentality. **But in the United States, Canada, Europe, and most countries with well-developed health care systems, Ebola poses almost no real risk, because patients can be isolated and treated without spreading the virus.** Don't Panic: The Virus Doesn't Spread Very Efficiently Ebola "doesn't spread very efficiently through humans," says Adalja. While the virus is deadly, **it's not very contagious**. Unlike the common cold or the flu, which spreads through airborne droplets, Ebola can only spread through contact with bodily fluids, like blood, vomit, and diarrhea. Adalja also points out that Ebola is less contagious than Middle East Respiratory Syndrome, or MERS, which recently arrived in the **U**nited **S**tates **but was contained**. No secondary cases, meaning new cases spread by the individuals who had arrived to the country already infected, were reported. "Ebola is a very rare disease that **infects a very small number of people**," says Adalja. "It doesn't have that same type of burden of illness of other diseases like malaria, tuberculosis, HIV."

No risk and alt cause — bodily fluids are necessary and poor living condition increase the risk.

Forbes 14 — Robert Glatter, 2014 ("Could Ebola Virus Become A Threat In The U.S.?," July 29th, Available Online at http://www.forbes.com/sites/robertglatter/2014/07/29/could-ebola-virus-become-a-threat-in-the-u-s/, Accessed on 07-10-15)

Media reports on the death of a Liberian traveler in Lagos, Nigeria, due to the deadly Ebola virus have caught the world's attention–and for good reason. As we live in an interconnected world we have to come to grips with the fact that hopping on a plane may potentially spread any virus–not just Ebola–to another country. Thus, the importance of enforcing proper infectious screening procedures of departing air travelers in an endemic area such as West Africa becomes critical to containing the spread of the Ebola virus. Enforcing a "Do Not Board List" is critical to preventing the spread of such a virus. While the Ebola virus could potentially be transported by travelers to another country by a plane ride, according to officials at the CDC, the actual chance of it developing into a serious public health risk in the U.S. is small. Poor and crowded living conditions, along with improper sanitation, seem to be an important element in the spread of the virus. These are not the living conditions, in general, throughout most modernized countries in the Western world. Ebola, comprised of 5 strains, was first identified in 1976 in the Western Democratic Congo along the Ebola river. Four of the strains can be spread to humans. The fifth resides only in primates. The fruit bat, considered a delicacy in West Africa, is typically considered a natural reservoir of the Ebola virus. Ebola is spread directly, human-to-human, by secretions such as saliva and sweat, but also by blood and feces. It can be spread directly by a break in the skin or mucous membranes or indirectly after touching your nose, mouth or eyes after having contact with the virus. It is not transmitted by coughing or sneezing (droplet spread), as would be the case for someone with influenza or measles.

No extinction or epidemic

Science Alert 10/9/**2014**, citing Lauren Anciel Meyers, Professor of Integrative Biology at The University of Texas at Austin, PhD in Biological Sciences from Stanford, and Tom Frieden, Director of the CDC, "How infectious is Ebola?," http://www.sciencealert.com.au/news/20140910-26305.html

So there's a case of Ebola in the US, and the disease has already killed 70 percent of those it infected in West Africa. Is this the beginning of the end for humanity**? Not even close**, and here's why.¶ The US case of Ebola is the first to be identified outside of Africa. The patient, who has now died from the disease, didn't know that he was infected straight away, so wasn't quarantined by the Texas Health Presbyterian Hospital in Dallas for four days. This sounds like a long time to be walking around being contagious, but medical authorities have assured the public not to panic.¶ In fact, officials seem pretty sure that this particular case **would not lead to an outbreak in the US.** "I have no doubt that we will control this importation, or case, of Ebola so that it **does not spread widely in this country**," director of the Centers for Disease Control and Prevention (CDC) Tom Frieden told the press earlier this week. ¶ Professor of integrative biology Lauren Ancel Meyers from the University of Texas agreed, telling The Huffington Post science editor David Freeman, "I think they are striking a good note in saying that most of you out there don't have to worry. **There doesn't seem to be a real threat of a large epidemic** in the United States."¶ The reason for Frieden's and Meyers's confidence is a simple mathematical term known as R0. This is a 'reproduction number' used by epidemiologists to indicate how infectious a specific disease is. It tells you how many people, on average, will be infected by one patient. ¶ "The reproduction number provides a lot of information," Meyers told The Huffington Post. "It gives us a baseline for projecting the growth of outbreaks in the absence of intervention, and it tells us how hard and how effective do our interventions have to be in order to stop an epidemic."¶ Measles, for example, is the most contagious disease we have, and its R0 is about 18. This means that if no one is vaccinated, an incredible 18 people can be infected by every one person who has the disease. Of course, this number drops to zero if everyone is vaccinated. For HIV/AIDS and SARS, the R0 number is between 2 and 5, and for Ebola, **it's just 2**. ¶ According to Michaeleen Doucleff at NPR, while many factors influence a disease's reproduction number, the fact that Ebola's is transmitted via bodily fluids, rather than the air, is probably why it's rated so low. And because Ebola isn't contagious until the patient starts showing symptoms - at which point the Dallas patient had

checked himself in to the hospital - all that needed to be done to contain the spread of the disease in the US **is to isolate anyone at the hospital who might have been infected**.¶ CNBC reports that as of yesterday, none of the 48 people who potentially came in contact with Dallas patient have developed any definite symptoms.¶ "Then **R0 drops to zero**. And Texas is free of Ebola," says Doucleff.

Ebola doesn't cause extinction — too hard to catch and it's danger is ramped up by fearmongering.

The Washington Post 14 — Abby Ohlheiser, writer for the Post, 2014 ("It's highly unlikely that you'll become infected with Ebola. So what are you so afraid of?," October 5th, Available Online at http://www.washingtonpost.com/news/to-your-health/wp/2014/10/05/nothing-to-fear-but-ebola-itself/, Accessed on 07-10-15)

This is how to get Ebola: Come into direct contact with the bodily fluids of a person who is infected with the virus and already symptomatic. Ebola doesn't travel through the air. A person in Washington, D.C., can't catch Ebola from an Ebola-infected person in Dallas without going there and coming into direct contact with the patient's bodily fluids. Still, amid the deadliest Ebola outbreak in history, in West Africa, the news of the first case diagnosed in the United States has prompted people to act as if they're a half-breath away from catching the virus anyway. America's Patient Zero is in Texas. He's in isolation, and the people who were in an apartment with him when he became sick are under quarantine. None of the people who potentially came into contact with the man while he was symptomatic have yet become sick with Ebola. Multiple potential U.S. cases elsewhere — from New York to Washington — have come up negative. The virus has not ravaged the United States. But the word — Ebola! — is ubiquitous, and so is the fear that comes with it. As The Post noted today in a front-page story about the global health disaster: "This is both a biological plague and a psychological one, and fear can spread even faster than the virus." An example, from Wednesday: Mehmet Oz — aka Dr. Oz — went on television to pronounce that the epidemic could alter the world "as much as any plague in history." Dr. Oz's apocalyptic statement depended not on the realities of the disease as it exists now, but, he said, on "the question no one wants to ask, but everyone fears": Will the Ebola virus mutate and go airborne? Cue a terrifying segment during which little blips on a spinning globe turned the world red with disease. The doomsday potential is "a question that keeps [experts] up at night," Dr. Oz said, adding: "It should keep you up as well." But should it? "People are feeling out of control. They had no control about whether Ebola comes to the United States," David Kaplan of the American Counseling Association said last week. For Americans, Kaplan said, there's a cultural imperative to gain and maintain control of one's own health and safety — an imperative that something like Ebola confounds. "We always like to feel in control of what we do," he said. "That's why people are often much more afraid of flying than of driving, even though it is much safer." Even if the threat of something like Ebola is minuscule or remote, hysterical media coverage, Kaplan argued, can lead us to "develop a cognitive bias that things occur more frequently than they actually do."

No Impact to an Ebola outbreak — we're more prepared, it's dying down, and it's very difficult to transmit.

Walsh 14 — Bryan Walsh, foreign editor at TIME, 2014 ("Why Ebola Isn't Really a Threat to the U.S.," *Time Magazine*, October 21st, Available Online at http://time.com/3525385/ebola-threat-us-cdc/, Accessed on 07-10-15)

Give us this—when Americans overreact, we do it all the way. Over the past week, in response to fears of Ebola, parents in Mississippi pulled their children out of a middle school after finding out that its principal had traveled to Zambia—a nation that is in Africa, but one that hasn't recorded a single Ebola case. A college sent rejection notices to some applicants from Nigeria because the school wouldn't accept "international students from countries with confirmed Ebola cases"—even though Nigeria has had less than 20 confirmed cases and the outbreak is effectively over. The American public is following its leaders, who've come down with a bad case of Ebola hysteria. That's how you get even-tempered politicians like New York Governor Andrew Cuomo musing that the U.S. should "seriously consider" a travel ban on West African countries hit by Ebola, while some of his less restrained colleagues raise the incredibly far-fetched possibility of a terrorist group intentionally sending Ebola-infected refugees into the U.S. It's little surprise that a Washington Post/ABC News poll found that two-thirds of Americans are concerned about an Ebola outbreak in the U.S. They shouldn't be—and two events that happened on Monday show why. WHO officials declared Nigeria officially "Ebola-free." And in Dallas, the first wave of people being monitored because they had direct contact with Thomas Eric Duncan, the first Ebola patient diagnosed in the U.S., were declared free of the diseases. Nigeria matters because the nation's is Africa's most populous, with 160 million people. Its main city, Lagos, is a sprawling, densely populated metropolis of more than 20 million. Nigeria's public health system is far from the best in the world. Epidemiologists have nightmares about Ebola spreading unchecked in a city like Lagos, where there's enough human tinder to burn indefinitely. Yet after a few cases connected to Sawyer, Nigeria managed to stop Ebola's spread thanks to solid preparation before the first case, a quick move to declare an emergency, and good management of public anxiety. A country with a per-capita GDP of $2,700—19 times less than the U.S.—proved it could handle Ebola. As Dr. Faisal Shuaib of Nigeria's Ebola Emergency Operation Center told TIME: "**There is no alternative to preparedness**." But Nigeria's success was also a reminder of this basic fact: If caught in time, **Ebola is not that difficult to control**, largely because it remains **very difficult to transmit outside a hospital**. For all the panic in the U.S. over Ebola, there has yet to be a case transmitted in the community. The fact that two health workers who cared for Duncan contracted the disease demonstrates that something was wrong with the treatment protocol put out by the Centers for Disease Control and Prevention (CDC)—something CDC Director Dr. Tom Frieden has essentially admitted—and may indicate that the way an Ebola patient is cared for in a developed world hospital may actually put doctors and nurses at greater risk.

Small Business

Cloud computing is inefficient hurts small business.

Wilson 14 — Dean Wilson, writer for TechRadar, 2014 ("Cloud 'sprawl' causing business inefficiencies," March 18th, Available Online at http://www.techradar.com/us/news/internet/cloud-services/cloud-sprawl-causing-business-inefficiencies-1234913, Accessed on 07-10-15)

The growing use of a wide variety of unsanctioned cloud services, the so-called "cloud sprawl," is causing significant problems for businesses, according to a new survey. Avanade, an Accenture and Microsoft joint IT consultancy firm, released a report that shows 61 per cent of companies across the globe blame cloud sprawl for causing inefficiencies in their business. That number falls

to 52 per cent in the UK, but it rises to 71 per cent among those using both public and private clouds. The survey involved 750 IT decision makers in United States, United Kingdom, Germany, China, France, Sweden, Brazil, Japan and Australia. The problem is that employees are signing up to cloud services that are different to the ones provided by their own IT department, so instead of homogenisation there is growing disparity between what each individual employee is using. 66 per cent of IT decision markers across the globe have noticed this problem. The number climbs to 69 per cent in the UK. "The study reinforces what we're seeing in the UK market about the challenges of cloud computing. Whilst the cloud can deliver significant benefits, some of its advantages also introduce risk. Unmanaged cloud sprawl in Shadow IT (Dark Cloud) is introducing risk with threats from unmanaged sources," said Mark Corley, CTO at Avanade UK. "Cloud services are becoming available in increasing variety and ease of access, and many IT departments simply can't keep up."

Warming

Cloud computing isn't fast enough to solve for climate change

Foster 11, (Pete, "Cloud computing – a green opportunity or climate change risk?", Guardian, 8-1-2011, http://www.theguardian.com/sustainable-business/cloud-computing-climate-change)

But **cloud computing comes with its own issues of security and reliability. Companies are often reluctant to trust their data and computing to a remote supplier and climate change itself may make cloud computing less attractive.** The Foresight Programme from the UK's Government Office for Science produces in-depth studies looking at major issues 20-80 years in the future. It recently published a report on the International Dimensions of Climate Change that identifies a significant vulnerability from cloud computing. **As more data centres are needed, and with the UK a relatively expensive location, more will be going offshore, but that makes them potentially more vulnerable to climate change impacts.** The report points out that **data storage facilities have already suffered from flooding** and cites the Vodafone data centre in Ikitelli, Turkey, which was affected by flash flooding in 2009, **putting a quarter of the local network at risk**. Similarly, in August 2009 the rainfall from Typhoon Morakot caused rivers to flood in Taiwan flushing large volumes of sediment into the ocean. This led to several submarine landslides which broke at least nine communications cables 4000m down. It disrupted the Internet and telecommunications between Taiwan, China, Hong Kong and other parts of Southeast Asia. The study also makes the point that over 95% of global communications traffic is handled by just one million kilometres of undersea fibre-optic cable. Rising sea levels increase the risk of flooding of coastal cable facilities and may also affect the stability of the seabed, making cables more vulnerable. It makes worrying reading. **While we are all fighting to try and minimise climate change, we're already too far down the road to stop some of the inevitable impacts**. It's ironic that one IT trend that could help reduce greenhouse gas emissions – cloud computing – may well itself be a victim of the impact.

Warming doesn't cause extinction

Bjørn **Lomborg**, an adjunct professor at the Copenhagen Business School, founded and directs the Copenhagen Consensus Center, Project Syndicate, February 14, 20**14**, "The Davos Apocalypse", http://www.project-syndicate.org/commentary/bj-rn-lomborg-criticizes-global-leaders-for-creating-an-atmosphere-of-panic-about-climate-change

The apocalyptic bombast is even more disturbing. According to Angel Gurría, Secretary-General of the OECD, "our planet is warming dangerously," and we need to act now "to avoid catastrophe"; the United Nations climate chief, Christiana Figueres, maintains that global warming means that "the world economy is at risk." Former UN Secretary-General Kofi Annan takes the prize for the **most extreme rhetoric**, claiming that not curbing global warming is "a terrible gamble with the future of the planet and with life itself." Yet, **the rhetoric is unconvincing**. Yes, global warming is real and man-made. But creating panic and proposing unrealistic policies **will not help in tackling the problem.** Both Annan and Gurría cited Typhoon Haiyan in the Philippines last November as evidence of increased climate-change-related damage. Never mind that the latest report by the UN Intergovernmental Panel on Climate Change (IPCC) found that "current datasets indicate no significant observed trends in global tropical cyclone frequency over the past century" and reported "low confidence" that any changes in hurricanes in recent (or future) decades had **anything to do with global warming**. Annan and Gurría also neglected to note that global Accumulated Cyclone Energy, an index for total hurricane activity, is hovering at the lowest values seen since the 1970's. Indeed, the trend for strong hurricanes around the Philippines has declined since 1951. Similarly, Gurría tells us that Hurricane Sandy, which slammed into New York City in 2012, is an example of inaction on climate change, costing the United States "the equivalent of 0.5% of its GDP" each year. In fact, the US currently is experiencing the longest absence of intense landfall hurricanes **since records began** in 1900, while the adjusted damage cost for the US during this period, including Hurricane Sandy, has fallen slightly. Figueres claims "that current annual losses worldwide due to extreme weather and disasters could be a staggering 12% of annual global GDP." But the study she cites shows only a possible loss of 1-12% of GDP in the future, and this is estimated not globally but within just eight carefully selected, climate-vulnerable regions or cities. By contrast, according to the IPCC, "long-term trends in economic disaster losses adjusted for wealth and population increases **have not been attributed to climate change**." On the contrary, the bulk of peer-reviewed economic evidence indicates that, up to around 2050-2070, the net global economic impact of rising temperatures is **likely to be positive**. Although global warming will create costs stemming from more heat-related deaths and water stress**,** they will be **outweighed by the benefits** from many fewer cold-related deaths and higher agricultural productivity from higher levels of CO2. Global warming is a long-term problem. Most models indicate that the cost toward the end of the century will be 1-5% of world GDP. This is not a trivial loss; but nor does it put "the world economy at risk." For comparison, the IPCC expects that by the end of the century, the average person in the developing world will be 1,400-1,800% richer than today. Such incorrect statements by leading officials reinforce **wasteful policies** based on **wishful thinking**. Figueres sees "momentum growing toward" climate policies as countries like China "reduce coal use." In the real world, China accounts for almost 60% of the global increase in coal consumption from 2012 to 2014, according to the International Energy Agency. While Figueres lauds China for dramatically increasing its solar-power capacity in 2013, the increase in China's reliance on coal power was 27 times greater. Figueres's weak grasp on the facts has led her not only to conclude that China is "doing it right" on climate change, but also to speculate that China has succeeded because its "political system avoids some of the legislative hurdles seen in countries including the US." In

other words, the UN's top climate official seems to be suggesting that an authoritarian political system is better for the planet. The fact remains that global wind and solar power usage in 2012 cut, at most, 275 million tons of CO2, while soaking up $60 billion in subsidies. With the electricity worth possibly $10 billion, the average cost of cutting a ton of CO2 is about $180. The biggest peer-reviewed estimate of the damage cost of CO2 is about $5 per ton. This means that solar and wind power avoid about $0.03 of climate damage for every dollar spent. Compare this to smarter technological solutions. In the short run, the US shale-energy revolution has replaced high-polluting coal with cheaper, cleaner natural gas. This has cut about 300 million tons of US emissions – more than all the world's solar and wind power combined – and at the same time has profited Americans by saving them $100 billion in energy costs. In the long run, current investment in green research and development will help drive the price of future renewable energy below that of fossil fuels, enabling a choice that is both environmentally and economically sound. In the meantime, even dramatic cuts in CO2 emissions will have **very little impact** on hurricanes 50-100 years from now. Lifting billions of people out of poverty, however, would not only be intrinsically good; it would also make societies much more resilient in the face of extreme weather, whether caused by global warming or not.

No impact to warming—recent studies

Condie 4/23, (Bill, editor, journalist for more than 30 years, working as a writer and editor in Europe, Asia and Australia for newspapers including The Guardian, The Observer and The Times, "Warming 'slowdown' has no impact on longer term climate trends", Cosmos Newsblog, 4-23-2015, http://blog.cosmosmagazine.com/blog/2015/4/23/warming-slowdown-has-no-impact-on-longer-term-climate-trends)

The recent slowdown in the rise of global average air temperatures will make no difference to how much the planet will warm by 2100, a new study has found. "**The slowdown in global warming has no bearing on long-term projections – it is simply due to decadal variability. Greenhouse gases will eventually overwhelm this natural fluctuation," said** lead author and Chief Investigator with the ARC Centre of Excellence for Climate System Science, Prof Matthew England. **The study**, published today in Nature Climate Change, **compared climate models that capture the current slowdown in warming to those that do not. The study found that long-term warming projections up to 2100 were effectively unchanged across the two groups of models.** "Our research shows that while **there may be short-term fluctuations in global average temperatures, long-term warming of the planet is an inevitable consequence of increasing greenhouse gas concentrations," Prof England said. "This much hyped global warming slowdown is just a distraction to the task at hand".** The models were analysed using one of two IPCC carbon emission projections. The first was a scenario where greenhouse gas concentrations continue to rise unabated through the 21st Century. The second assumes emissions are reduced to address global warming, peaking by 2040 before declining sharply. **Under the high emissions scenario, the difference in average projected end-of-century warming between the two groups of models is less than 0.1°C**. **Warming of this magnitude is well beyond the 2°C threshold that is considered a target by the** Australian Government and a safe limit by the **IPCC.** Some lobby groups have tried to argue that the recent slowdown in the rise of global average temperatures is a reason to abandon international and national efforts to curb carbon emissions. Cosmos has reported on several reasons for the apparent slowdown, including the behaviour of winds in the Pacific Ocean. See Has global warming paused.

6 degree warming inevitable---massively outweighs aff solvency

AP 9 (Associated Press, Six Degree Temperature Rise by 2100 is Inevitable: UNEP, September 24, http://www.speedy-fit.co.uk/index2.php?option=com_content&do_pdf=1&id=168)

Earth's temperature is likely to jump six degrees between now and the end of the century even if every country cuts greenhouse gas emissions as proposed, according to a United Nations update. Scientists looked at emission plans from 192 nations and calculated what would happen to global warming. The projections take into account 80 percent emission cuts from the U.S. and Europe by 2050, which are not sure things. The U.S. figure is based on a bill that passed the House of Representatives but is running into resistance in the Senate, where debate has been delayed by health care reform efforts. Carbon dioxide, mostly from the burning of fossil fuels such as coal and oil, is the main cause of global warming, trapping the sun's energy in the atmosphere. The world's average temperature has already risen 1.4 degrees since the 19th century. Much of projected rise in temperature is because of developing nations, which aren't talking much about cutting their emissions, scientists said at a United Nations press conference Thursday. China alone adds nearly 2 degrees to the projections. "We are headed toward very serious changes in our planet," said Achim Steiner, head of the U.N.'s environment program, which issued the update on Thursday. The review looked at some 400 peer-reviewed papers on climate over the last three years. Even if the developed world cuts its emissions by 80 percent and the developing world cuts theirs in half by 2050, as some experts propose, the world is still facing a 3-degree increase by the end of the century, said Robert Corell, a prominent U.S. climate scientist who helped oversee the update. Corell said the most likely agreement out of the international climate negotiations in Copenhagen in December still translates into a nearly 5-degree increase in world temperature by the end of the century. European leaders and the Obama White House have set a goal to limit warming to just a couple degrees. The U.N.'s environment program unveiled the update on peer-reviewed climate change science to tell diplomats how hot the planet is getting. The last big report from the Nobel Prize-winning Intergovernmental Panel on Climate Change came out more than two years ago and is based on science that is at least three to four years old, Steiner said. Global warming is speeding up, especially in the Arctic, and that means that some top-level science projections from 2007 are already out of date and overly optimistic. Corell, who headed an assessment of warming in the Arctic, said global warming "is accelerating in ways that we are not anticipating." Because Greenland and West Antarctic ice sheets are melting far faster than thought, it looks like the seas will rise twice as fast as projected just three years ago, Corell said. He said seas should rise about a foot every 20 to 25 years.

Mosaic Theory Advantage

Counter-bias – their epistemology's more flawed. Excess fear of surveillance means Aff scholarship's MORE of an exaggeration than ours.

McDonough '15 (Shannon McDonough – Instructor in Social Sciences at Allen University. The author holds a B.A. in Sociology from Miami University, Ohio and an M.A. Sociology from The University of South Carolina. This article is co-authored by Mathieu Deflem – a Professor at the University of South Carolina in the Department of Sociology. His research areas include law, policing, terrorism, popular culture, and sociological theory. "The Fear of Counterterrorism: Surveillance and Civil Liberties Since 9/11" – From the Journal: Society - February 2015, Volume 52, Issue 1, pp 70-79 – obtained via the Springer database collection).

Civil liberties organizations as well as a number of academic scholars have routinely criticized post-9/11 counterterrorism initiatives as unconstitutional and major threats to civil liberties and privacy. Harmonizing with the claims from civil liberties groups are contributions in the popular and scholarly discourse on surveillance and counterterrorism that lament the purported negative impact of **government**al policies and related **surveillance** and intelligence activities on personal rights and liberties. The revelations by former security contractor Edward Snowden in June 2013 concerning alleged spying practices by the National Security Agency (NSA) greatly reinvigorated these debates. We investigate here if there is any counter-evidence to the **alarmist statements** that are often made in the popular and scholarly discourse on civil liberties and **surveillance.** Against the background of academic scholarship on surveillance and criticisms from civil liberty and privacy groups, we rely on **archival sources,** government documents, and media reports to examine a variety of claims made concerning civil liberties violations by security agencies. Our analysis reveals that at least **a sizeable number of claims** raised against counterterrorism practices **are without objective foundation** in terms of **any actual violations.** As an explanation for this marked discrepancy, we suggest that, as various survey data show, there is a relatively **distinct**, albeit it uneven and not entirely stable, **culture of privacy** and civil liberties in contemporary American society which independently contributes to a **fear of counterterror**ism, **rather than of terrorism**. These specific cultural sensitivities bring about an increase in the amount of civil rights allegations independent of actual violations thereof.

Rights can't be absolute – as they sometimes conflict with other "rights". If some rights were absolute, privacy wouldn't be one of them.

Himma '7 (Kenneth - Associate Professor of Philosophy, Seattle Pacific University. The author holds JD and PhD and was formerly a Lecturer at the University of Washington in Department of Philosophy, the Information School, and the Law School. "Privacy vs. Security: Why Privacy is Not an Absolute Value or Right". San Diego Law Review, Vol. 44, p. 859, 2007. Available at SSRN: http://ssrn.com/abstract=994458)

It is perhaps worth noting that absolutist conceptions are not limited to privacy rights. Some people take the position that the moral right to life is absolute; on an absolutist conception of the right to life, it is never justified to take the life of a person—and this rules out not only the death penalty, but the use of deadly force in defense of the lives of innocent others from a culpable attack. Many people take an absolutist view

with respect to something they call a "right to information," holding that there should be no restrictions of any kind, including legal protection of intellectual property rights, on the free flow of information. As this view has most famously, and idiosyncratically, been put by John Perry Barlow, "information wants to be free."5 When it comes to rights, absolutist talk among theorists, lawyers, and ordinary folk is not at all uncommon these days. Indeed, some people seem to think that rights are, by nature, absolute and hence that it is a conceptual truth that all rights are absolute. Consider the following quote from Patrick Murphy, a Democrat who ran for Congress in 2006: I am also very concerned about the erosion of constitutional rights and civil liberties over the past few years. I taught Constitutional Law at West Point, and it makes me so angry to see our elected leaders in Washington—specifically the White House and the Republican leadership in Congress—pushing policies that erode the foundation of this country. The equal protection clause of the constitution is absolute. The right to privacy is absolute. The right to assemble is absolute. Yet time and time again, the administration has supported, and the Congressional leadership has supported nominees and policies that do not follow the constitution. With my background, I can add to this debate. And I'm not afraid to take a stand for what's right.6 As Murphy explains it, every right in the Constitution is absolute and hence utterly without exception. As there is nothing in the Constitution or any legal instrument or norm that suggests or entails that constitutional rights are absolute, it is reasonable to think that Murphy believes, as many people do, that it is part of the very meaning of having a right that it can never justifiably be infringed. This is why debates about political issues are frequently framed in terms of whether there is some right that protects the relevant interests; rights provide the strongest level of moral or legal protection of the relevant interests. It is certainly true that rights provide a higher level of protection than any other considerations that are morally relevant, but it is not because rights are, by nature, absolute. Rights provide robust protection of the relevant interests because it is a conceptual truth that the infringement of any right cannot be justified by an appeal of the desirable consequences of doing so. No matter how many people it might make happy, it would be wrong to intentionally kill an innocent person because her right to life takes precedence over the interests of other people in their own happiness. As Ronald Dworkin famously puts this conceptual point, rights trump consequences.7 But this conceptual truth about rights does not imply rights are, by nature, absolute. The claim that rights trump consequences implies only that some stronger consideration than the desirable consequences of infringing a right can justify doing so. This latter claim leaves open the possibility that there is some such consideration that would justify infringing some rights. One such candidate, of course, is the existence of other more important rights. It is commonly thought that at least some rights are commensurable and can be ranked in a hierarchy that expresses the relative weight each right in the hierarchy has with respect to other rights. For example, one might think that the right to life is at the top of the hierarchy of commensurable rights, and that property rights are in this hierarchy also. This would explain the common intuition that one may use deadly force when necessary to defend innocent lives from culpable attack, but not when necessary only to defend property rights from violation. If, as seems clear from this example, it is possible for two rights to conflict and for one to outweigh the other, it follows that rights are not, by nature, absolute. What may explain the mistaken view that rights are necessarily absolute is confusion about the relationship of various terms that flesh out the status, origin, and contours of moral rights and obligations. For example, rights are frequently described as "inviolable," meaning that a right can never be justifiably violated. This, of course, is a conceptual truth; to say that a right is violated is to say that its infringement is without justification. But this does not imply that rights can never be justifiably infringed; a person's right to life can be justifiably infringed if he (they) culpably shoots at an innocent person and there is no other way to save that person's life except through use of lethal force in defense of his life. Rights are also thought, by nature, to be supreme, relative to some system of norms—moral, social, or legal—in the sense that they cannot be defeated by other kinds of protections; moral rights are thought to be supreme over all other kinds of considerations, including social and legal rights. But this does not imply that rights are absolute because it says nothing about the relative importance of one right to another; it simply asserts that, by nature, rights outweigh all other relevant considerations. Supremacy and inviolability are part of the very nature of a right, but these properties do not entail that rights are, by nature, absolute. Of course, the negation of the claim that all rights are absolute does not imply that no rights are absolute. The possibility of conflicts between any two rights does not preclude there being one right that wins every conflict because it is absolute, and hence, without exception. A moral pacifist, for example, takes this view of the moral right to life and holds that intentional killing of a human being is always wrong. Moreover, if there are two rights that do not come into conflict with each other and win in conflicts with all other rights, those two rights might be absolute. One might think, for example, that the rights to privacy and life can never conflict and that both are absolute. I am somewhat skeptical that any right is absolute in this strong sense, but if there are any, **it will not be privacy.** As we will see in more detail, privacy is commensurable with other rights, like the right to life, which figures into the right to security. It seems clear that privacy rights and the right to life can come into conflict. For example, a psychologist might be justified in protecting a patient's privacy interests even though doing so includes information that might prevent that person from committing a minor property crime of some kind, but she would not be justified in protecting that information if the psychologist knows its disclosure is necessary to prevent a murder. In any event, I will discuss these kinds of examples in more detail below.

Why does the Debate community treat security interests as callous or mean ?Security interests <u>are</u> *competing rights claims that impact serous moral questions.*

Himma '7 (Kenneth - Associate Professor of Philosophy, Seattle Pacific University. The author holds JD and PhD and was formerly a Lecturer at the University of Washington in Department of Philosophy, the Information School, and the Law School. "Privacy vs. Security: Why Privacy is Not an Absolute Value or Right". San Diego Law Review, Vol. 44, p. 859, 2007. Available at SSRN: http://ssrn.com/abstract=994458)

At the outset, it is important to stress that security interests do not embrace interests not immediately related to the survival and minimal physiological well-being of the individual. My interest in security encompasses my interest in continuing life, my interest in being free from the kind of physical injury that threatens my ability to provide for myself, my interest in being free from the kind of financial injury that puts me in conditions of health- or life-threatening poverty, and my interest in being free from psychological trauma inflicted by others that renders me unable to care for myself. My interest in security is a negative one in the sense that it is protected by a moral right constituted, in part, by moral obligations owed to me by other people to refrain from committing acts of violence or theft capable of causing serious threats to my health, well-being, and life. While it is difficult to draw the line between a serious harm and a nonserious harm, it will have to suffice for my purposes to say that a serious harm is one that interferes significantly with the daily activities that not only give my life meaning, but make it possible for me to continue to survive. Significant trauma to the brain not only interferes with many activities that constitute what Don Marquis calls the "goodness of life,"19 but also interferes with my ability to make a living teaching and writing philosophy—while a mildly bruised arm does not. Where exactly to draw the line is not entirely clear, but for my purposes I do not think much turns on it as long as it is understood that security interests do not include minor injuries of any kind. I imagine the boundaries of the relevant notion of seriousness are likely to be contested in any event, but all would agree that the interest in security, by nature, protects only against threats of serious injuries. **It should be abundantly clear that morality protects these interests in the strongest terms available to it.** Unless one is a complete skeptic about morality and moral objectivity, little argument is needed to show that we have a moral right to be free from acts that pose a high risk of causing either our death or grievous injuries to our bodies. Moreover, I would hazard that non-skeptics about morality would also accept that the moral right to physical security is sufficiently important that a state is, as a matter of political morality, obligated to protect it, by criminalizing attacks on it, as a condition of its legitimacy. No state authority that failed to protect this right could be morally legitimate; at the very least no state authority that failed to do so could be justified in claiming a legitimate monopoly over the use of force. Security interests are not, however, **just** about our own well-being; they encompass the well-being of **other persons** whose activities conduce to our own physical security. We are social beings who live in societies in which there is a pronounced division of labor that makes the security of one person dependent upon the security of other persons in a variety of ways—some more abstract, some less abstract.

Assessing Utilitarian consequences are good. Putting ethics in a vacuum is morally irresponsible.

Issac, '2 (Jeffery, Professor of Political Science at Indiana University, Dissent, Vol. 49 No. 2, Spring)

Politics, in large part, involves contests over the distribution and use of power. To accomplish anything in the political world one must attend to the means that are necessary to bring it about. And to develop such means is to develop, and to exercise, power. To say this is not to say that power is beyond morality. It is to say that power is not reducible to morality. As writers such as Niccolo Machiavelli, Max Weber, Reinhold Niebuhr, Hannah Arendt have taught, an unyielding concern with moral goodness undercuts political responsibility. The concern may be morally laudable, reflecting a kind of personal integrity, but it suffers from three fatal flaws: (1) It fails to see that the purity of one's intentions does not ensure the achievement of what one intends**.** Abjuring violence or refusing to make common cause with morally comprised parties may seem like the right thing, but if such tactics entail impotence, then it is hard to view them as serving any moral good beyond the clean conscience of their supporters; (2) it fails to see that in a world of real violence and injustice, moral purity is not simply a form of powerlessness, it is often a form of complicity in injustice**.** This is why, from the standpoint of politics-as opposed to religion-pacifism is always a potentially immoral stand. In categorically repudiating violence, it refuses in principle to oppose certain violent injustices with any effect; and (3) it fails to see that politics is as much about unintended consequences as it is about intentions; it is the effects of action, rather than the motives of action, that is most significant. Just as the alignment with "good" may engender impotence, it is often the pursuit of "good" that generates evil. This is the lesson of communism in the twentieth century: it is not enough that one's goals be sincere or idealistic; it is equally important, **always**, to ask about the effects of pursuing these goals and to judge these effects in pragmatic and historically contextualized ways. Moral absolutism inhibits this judgment. It alienates those who are not true believers. It promotes arrogance. And it undermines political effectiveness.

Alt cause – corporate privacy infringements are far worse and the public readily accepts it.

Lewis '14 (James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy. Before joining CSIS, he worked at the US Departments of State and Commerce as a Foreign Service officer and as a member of the Senior Executive Service. His diplomatic experience included negotiations on military basing in Asia, the Cambodia peace process, and the five-power talks on arms transfer restraint. Lewis received his Ph.D. from the University of Chicago. "Underestimating Risk in the Surveillance Debate" - CENTER FOR STRATEGIC & INTERNATIONAL STUDIES - STRATEGIC TECHNOLOGIES PROGRAM – December - http://csis.org/publication/underestimating-risk-surveillance-debate)

Some of the unhappiness created by the Edward Snowden leaks reflects the unspoken recognition that online privacy has changed irrevocably. The precipitous decline in privacy since the Internet was commercialized **is the elephant in the room** we ignore in the surveillance debate. America's privacy laws are both limited in scope and out of date. Although a majority of Americans believe privacy laws are inadequate, the surveillance debate has not led to a useful discussion of privacy in the context of changed technologies and consumer preferences. Technology is more intrusive as companies pursue revenue growth by harvesting user data. Tracking online behavior is a preferred business model. On average, there are 16 hidden tracking programs on every website. The growing market for "big data" to predict consumer behavior and target advertising will further change privacy. Judging by their behavior, **Internet users are willing to exchange private data for online services.** A survey in a major European country found a majority of Internet users disapproved of Google out of privacy concerns, but more than 80 percent used Google as their search engine. The disconnect between consumer statements and behavior reduces the chances of legislating better protections.

Solvency

Congress Can't Solve

Congress can't keep up with speed of technology

Gatewood, 2014 (Jace C., Associate Professor of Law at Atlanta's John Marshall Law School, "District of Columbia Jones and the Mosaic Theory - In Search of a Public Right of Privacy: The Equilibrium Effect of the Mosaic Theory" Nebraska Law Review Lexis)

Nevertheless, the question that still remains is why the onus should be on the government, rather than the courts or legislature, to determine the scope of the mosaic theory's reach. In other words, why should not the courts or legislature provide specific guidance to law enforcement on the degree of permissible intrusion that will be permitted by the use of specific technology? The simple answer is that the courts and legislature cannot keep up with the speed of technology.

n223 There is no fix-all law that will address all current and future technological advances. By not articulating specific standards in terms of how much information is too much or how long is too long to conduct surveillance, the courts are free to address each new technological advance on a case-by-case basis to determine if the necessary mosaic has been created. Law enforcement and privacy will best be served and preserved if the government is forced to make critical decisions regarding the use and abuse of advanced technology.

Expansion of Mosaic Theory Bad DA

Uniqueness – Court against Mosaic Now

Courts are not ruling on the Mosaic theory now

Bellovin et al, 2014 (Steven M., Prof of Computer Science @ Columbia, Renee M. Hutchins, Associate Prof. of Law @ Maryland Francis King Carey School of Law, Tony Jebara, Associate Prof. of Computer Science @ Columbia, and Sebastian Zimmeck, Ph D. Candidate in Computer Science @ Columbia, "When Enough is Enough: Location Tracking, Mosaic Theory, and Machine Learning" New York University Journal of Law & Liberty Lexis)

In the context of location tracking, the Court has previously suggested that the Fourth Amendment may (at some theoretical threshold) be concerned with the accumulated information revealed by surveillance.3 Similarly, in the Court's recent decision in United States v. Jones, a majority of concurring justices indicated willingness to explore such an approach.4 However, in general, the Court has rejected any notion that technological enhancement matters to the constitutional treatment of location tracking.5 Rather, it has decided that such surveillance in public spaces, which does not require physical trespass, is equivalent to a human tail and thus not regu-lated by the Fourth Amendment. In this way, the Court has avoided a quantitative analysis of the amendment's protections. The Court's reticence is built on the enticingly direct assertion that objectivity under the mosaic theory is impossible. This is true in large part because there has been no rationale yet offered to objectively distinguish relatively short-term monitoring from its counterpart of greater duration.6 This article suggests that by combining the lessons of machine learning with the mosaic theory and apply-ing the pairing to the Fourth Amendment we can see the contours of a response. Machine learning makes clear that mosaics can be created. Moreover, there are important lessons to be learned on when this is the case.c

Uniqueness – Sequential Approach

There is a sequential approach to the Fourth Amendment now

Kerr, 2012 (Orin S., Professor of Law @ George Washington University Law School "THE MOSAIC THEORY OF THE FOURTH AMENDMENT" Michigan Law Review Lexis)

The five votes in favor of a mosaic approach in United States v. Jones do not establish the theory as a matter of law. The majority opinion in Jones failed to adopt the mosaic approach, and it only touched on the mosaic method in passing to express skepticism of it.187 Even if five votes of the current court are ready to embrace the theory, lower courts

must adhere to Supreme Court holdings even when subsequent developments suggest that the Supreme Court would reject those holdings if it reviewed them.188 For now, then, the sequential approach remains good law. At the same time, the concurring opinions in Jones invite lower courts to consider embracing some form of the mosaic approach. Our attention therefore must turn to the normative question: Should courts embrace the mosaic theory? Is the mosaic approach a promising new method of Fourth Amendment interpretation, or is it a mistake that should be avoided? This section argues that courts should reject the mosaic theory. The better course is to retain the traditional sequential approach to Fourth Amendment analysis. The mosaic theory aims at a reasonable goal. Changing technology can outpace the assumptions of existing precedents, and courts may need to tweak prior doctrine to restore the balance of privacy protection from an earlier age. I have called this process "equilibrium adjustment,"189 and it is a longstanding method of interpreting the Fourth Amendment. But the mosaic theory aims to achieve this goal in a very peculiar way.

Hurts Police (General)

Expansion of the Mosaic theory kills investigations – there are no limits, retroactivity, and ensures court clog.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

Maynard left little guidance as to what durational threshold must to be crossed in order for the use of pattern-detecting technology to be sufficiently prolonged as to render it a search.93 Without a clearly demarcated **line,** law enforcement agents, judges, and individuals cannot know when an aggregate of information will receive Fourth Amendment protection. Law enforcement agents are left to speculate as to how much is too much.94 **This lack of clarity will deter law enforcement agents from utilizing the full extent of their investigatory power**. This is even more problematic with respect to the "mosaic theory's" creation of retroactive unconstitutionality.95 As soon as a pattern is created, previously permissible individual law enforcement steps become unconstitutional. Because the "mosaic theory" retroactively renders the entire mosaic unconstitutional and subject to suppression, law enforcement agents will be even more hesitant in exercising the full extent of their investigatory power. Further, if the "mosaic theory" in the Fourth Amendment is premised on the idea that "prolonged GPS monitoring reveals an intimate picture of the subject's life that he expects no one to have— short perhaps of his spouse,"96 who has the burden of proof with respect to whether the prolonged surveillance has in fact revealed an intimate picture of an individual's life and thus created a mosaic? Unless the location of a "stash-house" is an intimate detail, Maynard can be read to stand for the proposition that warrantless prolonged GPS surveillance is per se unconstitutional. Such an approach would be over-inclusive in that prolonged location monitoring that does not result in a pattern, or a pattern that does not reveal intimate details, would be rendered a search within the meaning of the Fourth Amendment and therefore subject to suppression. Once the mosaic threshold is crossed and a mosaic is created, the question that arises is to how to define the scope of the mosaic. If law enforcement officials engage in a number of sustained investigatory techniques—as they often do—it is likely that whole investigations will be called into question. That is, if a pattern is detected only through the use of multiple investigatory techniques, and the theory is applied consistently, the investigation in its entirety will be rendered a search.97 In this respect, the retroactive effect of the "mosaic theory" takes on greater significance. Rather than having the entire investigation held inadmissible and subject to suppression, law enforcement agents will be overly cautious as to the amount of surveillance conducted. The lack of clarity as to how prolonged the surveillance must be to render it a search, whether intimate details need in fact emerge, and what the proper scope of the **mosaic is will provide defendants with an arsenal to attack every police investigation.**

Mosaic theory kills effective law enforcement.

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

The most troubling part of adopting the mosaic theory is that it requires the abandonment of, or dramatic alterations to, the Doctrines. The basic problem is the inherent conflict between the first and second models of reasonable expectation. While the Doctrines embrace a per se rule focusing solely on disclosure and why this vitiates privacy, the mosaic theory rests on society's opinion and what it deems reasonable.223 Consider the Public Disclosure Doctrine. The fact that public movements are not protected under the Fourth Amendment is **critical to law enforcement investigations**.224 Visual warrantless surveillance remains a central part of police surveillance.225 It is not clear to what extent these practices will remain constitutional with the introduction of the mosaic theory. For instance, it is common for officers to track vehicles and aggregate information from various sources over a period of time.226 As Gray and Citron point out, the "mosaic theory puts these practices and the line of doctrine endorsing them in obvious jeopardy, particularly when officers are too successful and their investigations produce too much information."227 This danger is compounded by the fact that law enforcement may use a combination of visual and technology-based surveillance (a la Knotts) when investigating a suspect. "How, after all," ask Gray and Citron, "are we to distinguish 'between the supposed invasion of aggregation of data between GPS-augmented surveillance and a purely visual surveillance of substantial length'?"228 It won't do here to simply say that a specific duration of technology-dependent surveillance violates the expectation of privacy. The problem is that the Public Disclosure Doctrine treats all public movements the same, regardless of how much information is disclosed or how long it is observed.229 To carve out exceptions based on what society thinks is unreasonable leaves vulnerable investigative techniques that are **essential to effective law enforcement.**

Using the mosaic theory hampers numerous investigative techniques.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

One of the most serious implications of the "mosaic theory" in Fourth Amendment law is that it calls into question the validity of previously accepted forms of surveillance. GPS surveillance is not the only form of surveillance that provides law enforcement with a comprehensive and detailed record of someone's movements or affairs when it is sustained on a prolonged basis. Thus, the "mosaic theory," which focuses on the resulting patterns created by individual law enforcement acts that in and of themselves are not searches, naturally calls into question other accepted investigative techniques that are performed on a sufficiently prolonged basis.98 For instance, the "mosaic theory" calls into question the use of pen registers99 and trap and trace devices,100 which have been held to not implicate the Fourth Amendment.101 The "mosaic theory" would also seemingly implicate the prolonged use of a mail cover 102 as an investigatory technique. 103 Although the Supreme Court has yet to address the issue, courts have held that the warrantless use of a mail cover does not violate the Fourth Amendment.104 Another accepted investigatory technique that can reveal very intimate details of an individual's life— particularly if sustained for a prolonged basis—is garbage inspections. 105 It could plausibly be argued that the patterns that result from the prolonged use of garbage inspections are much more intrusive than any pattern resulting from the use of a GPS device.106 The same could be said about prolonged video surveillance.107 It is well settled that video surveillance in public areas does not give rise to a Fourth Amendment issue.108 Thus, video cameras may be placed outside of an individual's residence, and so long as the cameras are incapable of viewing the interior of the residence, no Fourth Amendment right is infringed upon.109 Since Maynard, the "mosaic theory" has in fact been used as the basis for holding a previously accepted investigatory technique a search. In In re Application of the United States of America for an Order Authorizing the Release of Historical

Cell-Site Information,110 Magistrate Judge Orenstein denied the government's application for an order under the Stored Communications Act111 directing a service provider to disclose two months worth of historical cell-site location information. 112 According to Magistrate Judge Orenstein: The Maynard court's concern with sustained GPS tracking over the course of a month was not its formally continuous nature, but rather the fact that it results in a vast collection of specific data points that, viewed together, convey the "intimate picture" of a subject's life. It is the ability to amass a collection of such points, and not the ability to trace the route from each one to the next, that carries with it the ability to resolve those points into a comprehensible picture.113 Applying the "mosaic theory" to historical cell-site information, Magistrate Judge Orenstein concluded that the Fourth Amendment required the government to obtain a warrant based on a showing of probable cause.114 The most significant implication of the "mosaic theory," however, is that it calls into question the governmental use of prolonged visual surveillance in criminal investigations.115 In Maynard, the court addressed the issue of the possible extension of the "mosaic theory" to prolonged visual surveillance.116 Although the court ultimately declined to decide whether such a situation would constitute a search under the new theory, it suggested that visual surveillance would not be implicated.117 The court noted that practically, law enforcement agents do not have the capability to sustain visual monitoring for a duration that exposes information not revealed to the public.118 This argument is unpersuasive to the extent that it suggests that a mosaic is only created if the whole of one's movements is captured. A pattern can be created, and thus intimate details revealed, by the aggregation of individual law enforcement steps not necessarily constituting the whole of the investigatory techniques employed. The court implicitly recognizes this, as even continuous GPS tracking of a vehicle does not reveal the entirety of one's movements, but rather only the movements of a particular vehicle. Further, the dismissal of the implication of visual surveillance is problematic to the extent that it relies on the probability of law enforcement success. Such probability, however, must be viewed in relation to the factual context in which the investigation is conducted, and not in the abstract. To be sure, it is not beyond the realm of possibility that a properly equipped and resourced law enforcement unit would be capable of monitoring an unsuspecting individual for a continuous period of time sufficient to create a mosaic. As a theoretical matter, the court reasoned that in contrast to prolonged GPS monitoring, the extension of the "mosaic theory" to visual surveillance would fail as the means used to uncover private information would not defeat one's expectation of privacy.119 The court's analogy to the distinction between the placement of undercover agents and wiretapping120 overlooks the fact that here, warrantless GPS tracking and visual surveillance are constitutional in the first instance. In fact, the "**mosaic theory" focuses on the nature of the information revealed**—a pattern exposing intimate details—**and does not focus on the investigatory method** used to attain such information. Beyond prolonged visual and video surveillance, Maynard does not express a view as to whether other investigatory techniques would be called into question by the "mosaic theory." This analysis suggests that the "mosaic theory," if consistently applied, would implicate the cumulative effect of previously accepted surveillance methods.121 It is in this capacity that the "mosaic theory" has the potential to revolutionize the Fourth Amendment.

Court application of the mosaic theory is impractical and hurts police investigations.

Ostrander, 2011 (Benjamin M. Candidate for JD @ Notre Dame Law School, "THE "MOSAIC THEORY" AND FOURTH AMENDMENT LAW" Notre Dame Law Review Lexis)

The use of emerging and existing intrusive technologies in criminal investigations certainly has the potential to have a substantial effect on privacy. In an effort to combat the threat of such use, Maynard introduced the "mosaic theory" into Fourth Amendment law. The "mosaic theory" holds that individual law enforcement acts that are not "searches" become a "search" when aggregated, as the whole reveals more than the individual acts it comprises. This Note suggests that despite the intuitive appeal of a "mosaic theory," the use of the theory in Fourth Amendment law is misguided. The "mosaic theory" is inconsistent with the Supreme Court's voluntary exposure analysis, which has often classified theoretical or limited disclosures of information as complete exposures warranting no Fourth Amendment protection. 176 It is also inconsistent with the Supreme Court's implicit rejection of the proposition that the Fourth Amendment analysis is altered when an investigatory technique is prolonged to the point where information may be accumulated.177 Not only is the theory inconsistent with existing Fourth Amendment jurisprudence, it is also impractical in application.

A problematic question arises as to what durational threshold must be crossed in order for the use of a pattern-detecting technology to be sufficiently prolonged as to render it a search. Once this illusive threshold is crossed and a mosaic is created, the question that then arises is how to define the scope of the mosaic. If a pattern is created only through the use of multiple investigatory techniques, the entire investigation will be rendered a search. Also left unanswered is the appropriate standard of review for the use of pattern-detecting investigatory techniques in criminal investigations. The most serious implication of the theory, however, is that it calls into question a number of previously accepted investigatory techniques.

Removal of the third party doctrine hurts law enforcement's ability to investigate

Thompson 14 – Richard M Thompson II, is a Legislative Attorney for —— 2014. ("The Fourth Amendment Third-Party Doctrine," Congressional Research Service, June 5, 2014. Available at https://www.fas.org/sgp/crs/misc/R43586.pdf, Accessed on 07-06-2015)

As a more practical matter, assistance from third parties is utilized by law enforcement in almost every investigation. When investigating a murder, robbery, or any other crime committed in the real world, police officers will usually interview witnesses to obtain facts about the crime. To conduct these interviews, the officers generally need not obtain a warrant, and witnesses who refuse to cooperate can be compelled to testify with a grand jury subpoena.119 It could be argued that this process of fact finding is very similar to requesting documentary evidence held by third parties and the same standard should be applied to each.

In this same vein, Professor Orin Kerr has defended the third-party doctrine on the ground that it maintains the appropriate balance of privacy and security in the face of technological change.120 Without the ability to use third parties such as telephone or Internet companies, Kerr posits, the criminal would traditionally have to go out into the public to commit his crime where the Fourth Amendment offers more limited protection. He argues that a criminal can use the services of these third parties to commit crimes without having to expose these activities to areas open to public surveillance.121 This, he posits, upsets the privacy-security balance that undergirds the Fourth Amendment because it would require police to have probable cause to obtain any evidence of the crime: "The effect would be a Catch-22: The police would need probable cause to observe evidence of the crime, but they would need to observe evidence of the crime first to get probable cause."122 Kerr contends that the third-party doctrine responds to this imbalance by providing the same amount of protection regardless of whether the defendant commits the crime on his own or through the use of a third-party service.

Hurts Undercover Informants

Mosaic theory undermines the ability of undercover agents to work in law enforcement.

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

Scholars have questioned the viability of the mosaic theory, particularly as it relates to the status of government investigative practices.11 Accepting this theory puts routine government surveillance in jeopardy of

Fourth Amendment restrictions.12 It seems that even the brief surveillance of an individual could reveal private information. For instance, a single trip to a particular religious gathering or political function could reveal compromising or otherwise personal information that an individual would like to keep secret. More generally, people may disagree as to what society thinks is reasonable or unreasonable surveillance.13 Perhaps even short-term monitoring of a person's public movements in a remote area where police are not likely to find themselves would also qualify as an unreasonable intrusion.14 To make matters worse, this theory also severely curtails the application of the Third Party Doctrine, the corollary to the Public Disclosure Doctrine (collectively the "Doctrines").15 The Third Party Doctrine states that any information disclosed to another person or entity—much like the public generally—loses any Fourth Amendment protection.16 This doctrine allows law enforcement to use undercover agents and surreptitiously gather information without a warrant.17 However, under the mosaic approach, one could also argue that these communications, taken in the aggregate, can reveal private information about this person (e.g., disclosures about religious or privately held beliefs) and thus should be protected, particularly if the agent goes to great lengths in gaining the confidence of the suspect.1

Hurts Third Party Doctrine

Mosaic theory kills the third party doctrine and law enforcement

Bedi, 2014 (Monu, Assistant Professor, DePaul University College of Law, "SOCIAL NETWORKS, GOVERNMENT SURVEILLANCE, AND THE FOURTH AMENDMENT MOSAIC THEORY" Boston University Law Review Lexis)

The Third Party Doctrine would also be on shaky ground. Here, too, the mosaic theory would upset the voluntary disclosure principle that stands at the heart of this doctrine.230 Shifting the focus to what society or an individual deems reasonable (the first model of reasonable expectation of privacy) would surely frustrate the use of undercover informants or other surreptitious data collection techniques that do not require a warrant. Imagine a scenario where an informant is deep undercover for a significant period of time gaining the trust of a Or imagine an informant who dupes a suspect into allowing her into her home and disclosing private and incriminating information. suspect. Or perhaps the government simply acquires a wealth of financial records from a suspect's bank. Currently, all of these types of law enforcement tools do not trigger Fourth Amendment protection because the individual voluntarily discloses the information to another person or entity.231 However, under the mosaic theory, none of these tactics are secure.232 Societal expectations may find that these methods, too, impinge on Fourth Amendment rights as they involve unreasonable duplicity and reveal private information. Police would thus find themselves in the new position of having to secure a warrant based on probable cause before engaging in these practices. For some, this conclusion may be welcomed, particularly in today's technological world where disclosures to various entities and individuals have become ubiquitous.233 Justice Sotomayor, in fact, raises this possibility in her concurrence.234 This Article does not take such a drastic approach, nor would such a course be desirable. Any such rejection would come at the cost of jettisoning or severely curtailing essential law enforcement investigative techniques that have historically not been subject to warrant and probable cause requirements.235

Child Porn Impact

Police effectiveness and internet surveillance strategies are key to stopping atrocities such as child pornography

Wortley and Smallbone 12 – Richard Wortley has a PhD in psychology, and worked as a prison psychologist for ten years, and is a past national Chair of the Australian Psychological

Society's College of Forensic Psychologists; Stephen Smallbone is a psychologist and Professor in the School of Criminology and Criminal Justice and an Australian Research Council 'Future' Fellow, 2012 ("Child Pornography on the Internet," Problem-Oriented Guides for Police Problem-Specific Guides Series No. 41, 5/2012, Avaliable Online at http://www.hawaii.edu/hivandaids/Child_Pornography_on_the_Internet.pdf, accessed on 7/3/15)//CM

General Considerations for an Effective Response Strategy As noted, Internet child pornography presents some unique challenges for law enforcement agencies. However, despite the difficulties involved in controlling the problem, local police have an important role to play. To maximize their contribution, local police departments need to: Acquire technical knowledge and expertise in Internet pornography. If your department does not have a specialized Internet crime unit, then find out where you can obtain assistance or training. Appendix B lists online resources that can provide information on national and international initiatives, tips and leads, technical assistance, and staff training. Establish links with other agencies and jurisdictions. It is important that local police departments share information and coordinate their activities with other jurisdictions. Appendix B also lists agencies that have specific programs or sections designed to provide a coordinated response to Internet child pornography. Establish links with ISPs. ISPs can be crucial partners for police. As has been noted, there is often a lack of specific legislation setting out ISPs' obligations. This makes it especially important for police to establish good working relations with ISPs to elicit their cooperation in the fight against Internet child pornography. Prioritize their efforts. Because of the volume of Internet child pornography crime, police forces need to prioritize their efforts and concentrate on the most serious offenders, particularly those actually involved in abusing children and producing pornographic images.60 For example, one strategy may be to cross reference lists of Internet child pornography users with sex offender registries to increase the chance of targeting hands-on offenders (see Appendix B). It has been noted that success in combating child pornography is too often judged in terms of the number of images recovered, rather than by the more significant criterion of whether the crimes the images portray have been prevented. Specific Responses to Reduce Internet Child Pornography It is generally acknowledged that it is impossible to totally eliminate child pornography from the Internet. However, it is possible to reduce the volume of child pornography on the Internet, to make it more difficult or risky to access, and to identify and arrest the more serious perpetrators. Since 1996, ISPs have removed some 20,000 pornographic images of children from the web.62 Around 1,000 people are arrested annually in the United States for Internet child pornography offenses.63 The following strategies have been used or suggested to reduce the problem of child pornography on the Internet. Computer Industry Self Regulation ISPs have a central role to play in combating Internet child pornography. The more responsibility ISPs take in tackling the availability of child pornography images on the Internet, the more resources police can devote to addressing the production side of the problem. However, there are two competing commercial forces acting on ISPs with respect to self regulation. On the one hand, if an ISP restricts access to child pornography on its server, it may lose out financially to other ISPs who do not. Therefore, it will always be possible for offenders to find ISPs who will store or provide access to child pornography sites. On the other hand, ISPs also have their commercial reputation to protect, and it is often in their best interests to cooperate with law enforcement agencies. Most major ISPs have shown a commitment to tackling the problem of child pornography. By establishing working relationships with ISPs, and publicizing those ISPs who take self regulation seriously, police may be able to encourage greater levels of self regulation. Current self-regulatory strategies include:1. Removing illegal sites. A number of ISP associations have drafted formal codes of practice that explicitly bind members to not knowingly accept illegal content on their sites, and to removing such sites when they become aware of their existence. Service agreement contracts with clients will often set out expected standards that apply to site content. Large ISPs may have active cyber patrols that search for illegal sites.64 2. Establishing complaint sites/hotlines. Some ISP associations have set up Internet sites or hotlines that allow users to report illegal practices.65 These associations either deal directly with the complaint (e.g., by contacting the webmaster, the relevant ISP, or the police) or refer the complainant to the appropriate authorities. 3. Filtering browsers/search engines. ISPs can apply filters to the browsers and search engines their customers use to locate websites. There are numerous filtering methods. For example, filters can effectively treat certain key words as if they do not exist, so that using these words in a search will be fruitless.66 Software that can identify pornographic images is also being developed. Legislative Regulation Not everyone is satisfied with the current reliance on self regulation, and there have been calls for increased legislation to compel the computer

industry to play a greater role in controlling Internet child pornography. Police may be an important force in lobbying for tighter restrictions. Among the proposals for tighter regulation are: 4. Making ISPs legally responsible for site content. ISPs' legal responsibilities to report child pornography vary among jurisdictions. In the United States, ISPs are legally required to report known illegal activity on their sites, but they are not required to actively search for such sites.68 It has been argued that ISPs' legal responsibilities should be strengthened to require a more proactive role in blocking illegal sites.69 5. Requiring the preservation of ISP records. Police may apply for a court order to seize ISP accounts.70 However, to assist in the prosecution of offenders, ISPs need to maintain good records of IP logging, caller ID, web hostings, and so forth.71 6. Requiring user verification. ISPs often exercise little control over verifying the identities of people who open Internet accounts. Accounts may be opened using false names and addresses, making it difficult to trace individuals who engage in illegal Internet activity. In addition, without verifying users' ages, there is no way of knowing if children are operating Internet accounts without adult supervision. This problem of Internet anonymity is likely to increase as the potential to access the Internet via mobile phones becomes more common. It has been argued that both ISPs and mobile phone networks need to strengthen procedures for user verification.72 7. Regulating anonymous remailers. Remailers are servers that forward emails after stripping them of sender identification. It has been argued that much tighter regulation of remailers is necessary. Some have advocated making remailer administrators legally responsible for knowingly forwarding illegal material, while others have called for a complete ban on remailers.73 8. Using key escrowed encryption. Encryption of pornographic images is shaping to be the biggest technological problem facing law enforcement agencies. Key escrowed encryption would require anyone selling encryption software to supply a trusted third party with a key to the code.74 This has been strongly resisted by the computer industry. In the meantime, work continues on developing code-breaking software.

Surv. Key To Solve

Law enforcement responses to child pornographers rely on effectiveness and surveillance

Wortley and Smallbone 12 – Richard Wortley has a PhD in psychology, and worked as a prison psychologist for ten years, and is a past national Chair of the Australian Psychological Society's College of Forensic Psychologists; Stephen Smallbone is a psychologist and Professor in the School of Criminology and Criminal Justice and an Australian Research Council 'Future' Fellow, 2012 ("Child Pornography on the Internet," Problem-Oriented Guides for Police Problem-Specific Guides Series No. 41, 5/2012, Avaliable Online at http://www.hawaii.edu/hivandaids/Child_Pornography_on_the_Internet.pdf, accessed on 7/3/15)//CM

Law Enforcement Responses In the strategies discussed so far the police role has largely involved working in cooperation with other groups or acting as educators. A number of strategies are the primary responsibility of police. As a rule, local police will not carry out major operations. Most major operations require specialized expertise and inter-agency and inter-jurisdictional cooperation. (See Appendix C for a summary of major coordinated law enforcement operations in recent years.) However, local police will almost certainly encounter cases of Internet child pornography in the course of their daily policing activities. Law enforcement responses include: 19. Locating child pornography sites. Police agencies may scan the Internet to locate and remove illegal child pornography sites. Many areas of the Internet are not accessible via the usual commercial search engines, and investigators need to be skilled at conducting sophisticated searches of the 'hidden net.' Police may issue warnings to ISPs that are carrying illegal content.

20. Conducting undercover sting operations. Law enforcement agents may enter pedophile newsgroups, chat rooms, or P2P networks posing as pedophiles and request emailed child pornography images from others in the group.82 Alternatively, they may enter child or teen groups posing as children and engage predatory pedophiles lurking in the group who may send pornography or suggest a meeting. A variation of the sting operation is to place ads on the Internet offering child pornography for sale and wait for replies.83 Recently, Microsoft announced the development of the Child Exploitation Tracking System to help link information such as credit card purchases, Internet chat room messages, and conviction histories.84 21. Setting up honey trap sites. These sites purport to contain child pornography but in fact are designed to capture the IP or credit card details of visitors trying to download images. These can be considered a type of sting operation and have resulted in numerous arrests. However, their primary purpose is to create uncertainty in the minds of those seeking child pornography on the Internet, and, therefore, reduce the sense of freedom and anonymity they feel (see Operation Pin in Appendix C). 22. Publicizing crackdowns. Many police departments have learned to use the media to good effect to publicize crackdowns on Internet child pornography.85 Coverage of crackdowns in the mass media increases the perception among potential offenders that the Internet is an unsafe environment in which to access child pornography. 23. Conducting traditional criminal investigations. Although most media attention is often given to technological aspects of controlling Internet child pornography, in fact many arrests in this area arise from traditional investigative police work. Investigations may involve information from: The public: The public may contact police directly, or information may be received on one of the various child pornography hotlines. Computer repairers/technicians: Some states mandate computer personnel to report illegal images.86 There are cases where computer repairers have found child pornography images on an offender's hard drive and notified police.87 Police may establish relationships with local computer repairers/ technicians to encourage reporting. Victims: A point of vulnerability for producers of child pornography is the child who appears in the pornographic image. If the child informs others of his/her victimization, then the offender's activities may be exposed.88 Known traders: The arrest of one offender can lead to the arrest of other offenders with whom he has had dealings, producing a cascading effect. In some cases the arrested offender's computer and Internet logs may provide evidence of associates. (See Operation Cathedral in Appendix C.) Unrelated investigations: There is increasing evidence that many sex offenders are criminally versatile and may commit a variety of other offenses.89 Police may find evidence of Internet child pornography while investigating unrelated crimes such as drug offenses.

Cyber Harassment Impact

Cyberharassment is a growing problem - mosaic theory hinders apprehension.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of

Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

Cyberharassment is a widespread and growing challenge for law enforcement in the United States. These online attacks feature threats of violence, privacy invasions, reputation-harming falsehoods, impersonation, computer hacking, and extortion. They often appear in e-mails, instant messages, blog entries, message boards, or sites devoted to tormenting individuals. As the executive director of the National Center for Victims of Crime explained in her congressional testimony supporting the 2006 cyberstalking amendment to the Violence Against Women Act: Stalkers are using very sophisticated technology ... - installing spyware on your computer so that they can track all of your interactions on the Internet, your purchases, your e-mails and so forth, and then using that against you, forwarding e-mails to people at your job, broadcasting your whereabouts, your purchases, your reading habits and so on, or installing GPS in your car so that you will show up at the grocery store, at your local church, wherever and there is the stalker and you can't imagine how the stalker knew that you were going to be there... . I am happy that this legislation amends the statute so that prosecutors have more effective tools, I think, to address technology through VAWA 2005. n257 Although some attackers confine their harassment to networked technologies, others use all available tools to harass victims, including real-space contact. Offline harassment or stalking often includes abusive phone calls, vandalism, threatening mail, and physical assault. n258 According to the Bureau of Justice Statistics, 850,000 adults experienced stalking with an online component in 2006, including threats in e-mails, text messages, chat rooms, and blogs. n259 Young people are even more likely to experience some form of cyberharassment. The National Center for Education Statistics reports that, during the 2008-2009 school year, 1.5 million young people in the United States were victims of some form of cyberharassment. n260 Already a significant problem, [*789] cyberharassment is on the rise. College students now report more sexually harassing speech in online interactions than in face-to-face ones. As the National Institute of Justice explains, the "ubiquity of the Internet and the ease with which it allows others unusual access to personal information" make individuals more accessible and vulnerable to online abuse. n261 Harassing someone online is far cheaper and less personally risky than confronting them in space. n262 Cyberharassment and the identity of its victims follow the well-worn pathways of bias crimes. The most recent Bureau of Justice Statistics findings report that 74% of online stalking victims are female. n263 Perpetrators are far more likely to be men. n264 Unsurprisingly, the content of these attacks are often sexually explicit and demeaning, drawing predominantly on gender stereotypes. As one blogger observed, "the fact is, to be a woman online is to **eventually be threatened with rape and death**. On a long enough timeline, **the chances of this not occurring** drop to [*790] zero." n265 Cyberharassment also follows racial lines. A study conducted in 2009 asked 992 undergraduate students about their experience with cyberharassment. According to this study, nonwhite females faced cyberharassment more than any other group, with 53% reporting having been harassed online. Next were white females, with 45% reporting having been targeted online, with nonwhite males right behind them at 40%. The group least likely to have been harassed was white males, at 31%. n266 Across race, being lesbian, transgender, or bisexual also raised the risk of being harassed. real n267 Another disturbing feature of cyberharassment is that it tends to be perpetrated by groups rather than individuals. Those who engage in abusive online conduct often move in packs. n268 Cyberharassers frequently engage proxies to help torment their victims. n269 These group attacks bear all of the hallmarks of violent mob behavior. So much so, in fact, that one of us has dubbed them "cyber mobs." n270 As with sole practitioners, online mob harassment is more likely to be perpetrated by members of dominant demographics, and to draw on popular stigmas for the purpose of shaming and degrading their targets. n271 Of course, cold statistics and general description tell at best part of the story of legitimate government and law enforcement interests in preventing, detecting, and prosecuting cyberharassment. Recent efforts to highlight the privacy interests that compel recognition of the mosaic theory of Fourth Amendment privacy make liberal use of individual stories, in part to pluck [*791] empathetic strings in the audience. n272 In weighing the competing interests at stake in regulating access to and use of digital surveillance technologies, it is therefore fair to consider the impact of crimes like cyberharassment in individual cases. Take the publicly reported case of D.C. v. R.R. n273 D.C. was a high school student who was actively pursuing a career in the entertainment industry as a singer and actor. n274 He used a pseudonym in his professional career, n275 under which he maintained a

fan site that, among other features, allowed visitors to post comments to a "guestbook." Several students at D.C.'s school, who were later identified in a civil suit, engaged in a pattern of targeted harassment of D.C. by posting comments to his website. Some were simply offensive - one student told D.C. that he was "the biggest fag in the [high school] class." n276 Others, however, went much further, threatening physical and sexual violence in graphic detail. One person posted on D.C.'s website, "I want to rip out your fucking heart and feed it to you... . If I ever see you I'm ... going to pound your head in with an ice pick. Fuck you, you dick-riding penis lover. I hope you burn in hell." n277 Another post told D.C. that he was "now officially wanted dead or alive," and a third promised to "unleash my manseed in those golden brown eyes." n278 According to a California appellate court, the contents of these posts suggested that "the students ... sought to destroy D.C.'s life, threatened to murder him, and wanted to drive him out of [his high school] and the community in which he lived." n279 In that goal they were successful. On [*792] advice of law enforcement, who consulted the Federal Bureau of Investigation, D.C. withdrew from his school and moved with his family to the other end of the state. n280 Despite these efforts, the student newspaper at his former school reported his new location and the name of his new institution. n281 As a consequence of this harassment, D.C. developed a persistent anxiety disorder. n282 Cyberharassment has also spawned a new brand of extortion labeled "sextortion." n283 This is a form of blackmail in which the extortionist threatens to publicize images or information that his target might find embarrassing unless the victim provides sexually explicit pictures and videos or agrees to participate in live sex shows via Skype or other direct video communications. n284 One infamous perpetrator of sextortion schemes invaded his targets' computers using malicious software that allowed him to mine his victims' hard drives for compromising images or to capture images using their own computer cameras. n285 He then used those images and access to his targets' computers and e-mail accounts to terrorize them until they agreed to produce sexually explicit pictures or videos for him. Young people are particularly vulnerable. n286 Teenagers who are extorted into engaging in explicit sex acts under threat and at such a formative stage of their development are also more likely to suffer scarring emotional and psychological harm. n287 As United States Attorney Joseph Hogsett put the [*793] point when commenting on a successful prosecution, "This defendant may not remember his alleged victims, but the true tragedy is that not one of them will ever forget." n288 Cyberharassers engage in telephone harassment as well. For example, in September 2010, Daniel Leonard pleaded guilty to a pattern of harassment that involved over 4,000 threatening and sexually explicit phone calls made to over 1,200 phone numbers using an Internet "spoofing" service that masked his phone number from the call recipients. n289 Others go further still by using the Internet to incite others to rape and stalk victims. Federal prosecutors recently brought a cyberstalking indictment against a man who impersonated his ex-girlfriend online over a four-year period, inciting others to stalk her in person. The man posted online advertisements with the victim's contact information and her alleged desire for sex with strangers. On porn sites, he uploaded videos of her having sex (which he filmed while they were dating) alongside her contact information. n290 Because strange men began appearing at her home demanding sex, the woman changed her name and moved to another state. Her ex-boyfriend discovered her new personal information and again posted her name, address, and an invitation to have sex on pornography sites next to her picture. The cycle repeated itself, with strange men coming to her house at night demanding sex. Although this victim was never physically assaulted, others are not so lucky. In December 2009, Ty McDowell broke into the home of a woman in Casper, Wyoming, tied her up, and raped her. During the course of the [*794] attack, he told her: "You want an aggressive man, bitch, I'll show you aggressive." n291 Although McDowell did not know his victim, his crime was not random. Rather, he had responded to an online advertisement posted on Craigslist that purported to be from a woman seeking to fulfill her own rape fantasies. After a lengthy correspondence with the ad's poster, McDowell believed that he was fulfilling his victim's desires. n292 He was not. As a subsequent investigation would reveal, McDowell was in communication with Jebediah Stipe, who posted the ad and arranged the attack on his ex-girlfriend. n293 Stipe and McDowell were sentenced to sixty-year prison terms after pleading guilty to charges of aggravated kidnapping, rape, and burglary. n294 Cyberharassment can also be more general. Sites that encourage sexualized online abuse are all too common. The website IsAnyoneUp.com provides a notorious example. For a time, it was one of the most popular forums on the Internet for "revenge porn," which entails spurned former lovers posting sexualized pictures of their ex-wives and ex-girlfriends on a public forum so that others can leer at and demean them. n295 Although IsAnyoneUp.com eventually shut down amidst protests and outcry, its operator, Hunter Moore, started a similar site under a different name, HunterMoore.TV, which may eventually include not only pictures of women, but also an overlaid map to the homes of those featured in the pictures. n296 Consider too "Violentacrez," a notorious Reddit administrator [*795] who oversaw forums like "Jailbait," "Creepshots," "Rapebait," "Incest," "Beatingwomen," and "Picsofdeadjailbait," each of which featured pictures and commentary from his followers that celebrated the interests described by the forums' titles. n297 There is, of course, much more to be written about the incidents and dynamics of cyberharassment crimes. For present purposes, however, the foregoing is sufficient to show that there are significant and legitimate governmental interests at stake in preventing, detecting, and prosecuting various forms of cyberharassment. Although cyberharassment is relatively new, executives and legislatures have manifested these interests by setting up dedicated enforcement units and passing tailored criminal statutes. n298 As we argue in the next section, **adopting a mosaic theory of the Fourth Amendment likely will implicate**

these law enforcement concerns by limiting access to both existing and future digital surveillance techniques and technologies. n299

Online harassment and the lack of response from institutions allows for threats, violence, and discrimination against women to continue unabated

Hess 14 – Amanda Hess is a Slate staff writer and popular Gender & Sexuality reporter, 2014 ("Why Women Aren't Welcome on the Internet," Pacific Standard, 1/6/14, http://www.psmag.com/health-and-behavior/women-arent-welcome-internet-72170, 7/3/15)//CM

A woman doesn't even need to occupy a professional writing perch at a prominent platform to become a target. According to a 2005 report by the Pew Research Center, which has been tracking the online lives of Americans for more than a decade, women and men have been logging on in equal numbers since 2000, but the vilest communications are still disproportionately lobbed at women. We are more likely to report being stalked and harassed on the Internet—of the 3,787 people who reported harassing incidents from 2000 to 2012 to the volunteer organization Working to Halt Online Abuse, 72.5 percent were female. Sometimes, the abuse can get physical: A Pew survey reported that five percent of women who used the Internet said "something happened online" that led them into "physical danger." And it starts young: Teenage girls are significantly more likely to be cyberbullied than boys. Just appearing as a woman online, it seems, can be enough to inspire abuse. In 2006, researchers from the University of Maryland set up a bunch of fake online accounts and then dispatched them into chat rooms. Accounts with feminine usernames incurred an average of 100 sexually explicit or threatening messages a day. Masculine names received 3.7. There are three federal laws that apply to cyberstalking cases; the first was passed in 1934 to address harassment through the mail, via telegram, and over the telephone, six decades after Alexander Graham Bell's invention. Since the initial passage of the Violence Against Women Act, in 1994, amendments to the law have gradually updated it to apply to new technologies and to stiffen penalties against those who use them to abuse. Thirty-four states have cyberstalking laws on the books; most have expanded long-standing laws against stalking and criminal threats to prosecute crimes carried out online. But making quick and sick threats has become so easy that many say the abuse has proliferated to the point of meaninglessness, and that expressing alarm is foolish. Reporters who take death threats seriously "often give the impression that this is some kind of shocking event for which we should pity the 'victims,'" my colleague Jim Pagels wrote in Slate this fall, "but anyone who's spent 10 minutes online knows that these assertions are entirely toothless." On Twitter, he added, "When there's no precedent for physical harm, it's only baseless fear mongering." My friend Jen Doll wrote, at The Atlantic Wire, "It seems like that old 'ignoring' tactic your mom taught you could work out to everyone's benefit.... These people are bullying, or hope to bully. Which means we shouldn't take the bait." In the epilogue to her book The End of Men, Hanna Rosin—an editor at Slate—argued that harassment of women online could be seen as a cause for celebration. It shows just how far we've come. Many women on the Internet "are in positions of influence, widely published and widely read; if they sniff out misogyny, I have no doubt they will gleefully skewer the responsible sexist in one of many available online outlets, and get results." "Twitter is the place where I laugh, whine, work, schmooze, procrastinate, and flirt. It sits in my back pocket wherever I go and lies next to me when I fall asleep. And since I first started writing in 2007, it's become just one of the many online spaces where men come to tell me to get out." So women who are harassed online are expected to either get over ourselves or feel flattered in response to the threats made against us. We have the choice to keep quiet or respond "gleefully." But no matter how hard we attempt to ignore it, this type of gendered harassment—and the sheer volume of it—has severe implications for women's status on the Internet. Threats of rape, death, and stalking can overpower our emotional bandwidth, take up our time, and cost us money through legal fees, online protection services, and missed wages. I've spent countless hours over the past four years logging the online activity of one particularly committed cyberstalker, just in case. And as the Internet becomes increasingly central to the human experience, the ability of women to live and work freely online will be shaped, and too often limited, by the technology companies that host these threats, the constellation of local and federal law enforcement officers who investigate them, and the popular commentators who dismiss them—all arenas that remain dominated by men, many of whom have little personal understanding of what women face online every day. This Summer, Caroline Criado-Perez became the English-speaking Internet's most famous recipient of online threats after she petitioned the British government to put more female faces on its bank notes. (When the Bank of England announced its intentions to replace social reformer Elizabeth Fry with Winston Churchill on the £5 note, Criado-Perez made the modest suggestion that the bank make an effort to feature at least one woman who is not the Queen on any of its currency.) Rape and death threats amassed on her Twitter feed too quickly to count, bearing messages like "I will rape you tomorrow at 9 p.m ...

Shall we meet near your house?" Then, something interesting happened. Instead of logging off, Criado-Perez retweeted the threats, blasting them out to her Twitter followers. She called up police and hounded Twitter for a response. Journalists around the world started writing about the threats. As more and more people heard the story, Criado-Perez's follower count skyrocketed to near 25,000. Her supporters joined in urging British police and Twitter executives to respond. Under the glare of international criticism, the police and the company spent the next few weeks passing the buck back and forth. Andy Trotter, a communications adviser for the British police, announced that it was Twitter's responsibility to crack down on the messages. Though Britain criminalizes a broader category of offensive speech than the U.S. does, the sheer volume of threats would be too difficult for "a hard-pressed police service" to investigate, Trotter said. Police "don't want to be in this arena." It diverts their attention from "dealing with something else." Feminine usernames incurred an average of 100 sexually explicit or threatening messages a day. Masculine names received 3.7. Meanwhile, Twitter issued a blanket statement saying that victims like Criado-Perez could fill out an online form for each abusive tweet; when Criado-Perez supporters hounded Mark Luckie, the company's manager of journalism and news, for a response, he briefly shielded his account, saying that the attention had become "abusive." Twitter's official recommendation to victims of abuse puts the ball squarely in law enforcement's court: "If an interaction has gone beyond the point of name calling and you feel as though you may be in danger," it says, "contact your local authorities so they can accurately assess the validity of the threat and help you resolve the issue offline." In the weeks after the flare-up, Scotland Yard confirmed the arrest of three men. Twitter—in response to several online petitions calling for action—hastened the rollout of a "report abuse" button that allows users to flag offensive material. And Criado-Perez went on receiving threats. Some real person out there—or rather, hundreds of them—still liked the idea of seeing her raped and killed. The Internet is a global network, but when you pick up the phone to report an online threat, whether you are in London or Palm Springs, you end up face-to-face with a cop who patrols a comparatively puny jurisdiction. And your cop will probably be a man: According to the U.S. Bureau of Justice Statistics, in 2008, only 6.5 percent of state police officers and 19 percent of FBI agents were women. The numbers get smaller in smaller agencies. And in many locales, police work is still a largely analog affair: 911 calls are immediately routed to the local police force; the closest officer is dispatched to respond; he takes notes with pen and paper. After Criado-Perez received her hundreds of threats, she says she got conflicting instructions from police on how to report the crimes, and was forced to repeatedly "trawl" through the vile messages to preserve the evidence. "I can just about cope with threats," she wrote on Twitter. "What I can't cope with after that is the victim-blaming, the patronising, and the police record-keeping." Last year, the American atheist blogger Rebecca Watson wrote about her experience calling a series of local and national law enforcement agencies after a man launched a website threatening to kill her. "Because I knew what town [he] lived in, I called his local police department. They told me there was nothing they could do and that I'd have to make a report with my local police department," Watson wrote later. "[I] finally got through to someone who told me that there was nothing they could do but take a report in case one day [he] followed through on his threats, at which point they'd have a pretty good lead." The first time I reported an online rape threat to police, in 2009, the officer dispatched to my home asked, "Why would anyone bother to do something like that?" and declined to file a report. In Palm Springs, the officer who came to my room said, "This guy could be sitting in a basement in Nebraska for all we know." That my stalker had said that he lived in my state, and had plans to seek me out at home, was dismissed as just another online ruse. Of course, some people are investigated and prosecuted for cyberstalking. In 2009, a Florida college student named Patrick Macchione met a girl at school, then threatened to kill her on Twitter, terrorized her with lewd videos posted to YouTube, and made hundreds of calls to her phone. Though his victim filed a restraining order, cops only sprung into action after a county sheriff stopped him for loitering, then reportedly found a video camera in his backpack containing disturbing recordings about his victim. The sheriff's department later worked with the state attorney's office to convict Macchione on 19 counts, one of which was cyberstalking (he successfully appealed that count on grounds that the law hadn't been enacted when he was arrested); Macchione was sentenced to four years in prison. Consider also a recent high-profile case of cyberstalking investigated by the FBI. In the midst of her affair with General David Petraeus, biographer Paula Broadwell allegedly created an anonymous email account for the purpose of sending harassing notes to Florida socialite Jill Kelley. Kelley reported them to the FBI, which sniffed out Broadwell's identity via the account's location-based metadata and obtained a warrant to monitor her email activity. In theory, appealing to a higher jurisdiction can yield better results. "Local law enforcement will often look the other way," says Dr. Sameer Hinduja, a criminology professor at Florida Atlantic University and co-director of the Cyberbullying Research Center. "They don't have the resources or the personnel to investigate those crimes." County, state, or federal agencies at least have the support to be more responsive: "Usually they have a computer crimes unit, savvy personnel who are familiar with these cases, and established relationships with social media companies so they can quickly send a subpoena to help with the investigation," Hinduja says. But in my experience and those of my colleagues, these larger law enforcement agencies have little capacity or drive to investigate threats as well. Despite his pattern of abusive online behavior, Macchione was ultimately arrested for an unrelated physical crime. When I called the FBI over headlessfemalepig's threats, a representative told me an agent would get in touch if the bureau was interested in pursuing the case; nobody did. And when Rebecca Watson reported the threats targeted at her to the FBI, she initially connected with a sympathetic agent—but the agent later expressed trouble opening Watson's file of screenshots of the threats, and soon stopped replying to her emails. The Broadwell investigation was an uncommon, and possibly unprecedented, exercise for the agency. As University of Wisconsin-Eau Claire criminal justice professor Justin Patchin told Wired at the time: "I'm not aware of any case when the FBI has gotten involved in a case of online harassment." After I received my most recent round of threats, I asked Jessica Valenti, a prominent feminist writer (and the founder of the blog Feministing), who's been repeatedly targeted with online threats, for her advice, and then I asked her to share her story. "It's not really one story. This has happened a number of times over the past seven years," she told me. When rape and death threats first started pouring into her inbox, she vacated her apartment for a week, changed her bank accounts, and got a new cell number. When the next wave of threats

came, she got in touch with law enforcement officials, who warned her that though the men emailing her were unlikely to follow through on their threats, the level of vitriol indicated that she should be vigilant for a far less identifiable threat: silent "hunters" who lurk behind the tweeting "hollerers." The FBI advised Valenti to leave her home until the threats blew over, to never walk outside of her apartment alone, and to keep aware of any cars or men who might show up repeatedly outside her door. "It was totally impossible advice," she says. "You have to be paranoid about everything. You can't just not be in a public place." And we can't simply be offline either. When Time journalist Catherine Mayer reported the bomb threat lodged against her, the officers she spoke to—who thought usernames were secret codes and didn't seem to know what an IP address was—advised her to unplug. "Not one of the officers I've encountered uses Twitter or understands why anyone would wish to do so," she later wrote. "The officers were unanimous in advising me to take a break from Twitter, assuming, as many people do, that Twitter is at best a time-wasting narcotic." All of these online offenses are enough to make a woman want to click away from Twitter, shut her laptop, and power down her phone. Sometimes, we do withdraw: Pew found that from 2000 to 2005, the percentage of Internet users who participate in online chats and discussion groups dropped from 28 percent to 17 percent, "entirely because of women's fall off in participation." But for many women, steering clear of the Internet isn't an option. We use our devices to find supportive communities, make a living, and construct safety nets. For a woman like me, who lives alone, the Internet isn't a fun diversion—it is a necessary resource for work and interfacing with friends, family, and, sometimes, law enforcement officers in an effort to feel safer from both online and offline violence. The Internet is a global network, but when you pick up the phone to report an online threat, you end up face-to-face with a cop who patrols a comparatively puny jurisdiction. The Polish sociologist Zygmunt Bauman draws a distinction between "tourists" and "vagabonds" in the modern economy. Privileged tourists move about the world "on purpose," to seek "new experience" as "the joys of the familiar wear off." Disempowered vagabonds relocate because they have to, pushed and pulled through mean streets where they could never hope to settle down. On the Internet, men are tourists and women are vagabonds. "Telling a woman to shut her laptop is like saying, 'Eh! Just stop seeing your family,'" says Nathan Jurgenson, a social media sociologist (and a friend) at the University of Maryland. What does a tourist look like? In 2012, Gawker unmasked "Violentacrez," an anonymous member of the online community Reddit who was infamous for posting creepy photographs of underage women and creating or moderating subcommunities on the site with names like "chokeabitch" and "rapebait." Violentacrez turned out to be a Texas computer programmer named Michael Brusch, who displayed an exceedingly casual attitude toward his online hobbies. "I do my job, go home, watch TV, and go on the Internet. I just like riling people up in my spare time," he told Adrian Chen, the Gawker reporter who outed him. "People take things way too seriously around here." Abusers tend to operate anonymously, or under pseudonyms. But the women they target often write on professional platforms, under their given names, and in the context of their real lives. Victims don't have the luxury of separating themselves from the crime. When it comes to online threats, "one person is feeling the reality of the Internet very viscerally: the person who is being threatened," says Jurgenson. "It's a lot easier for the person who made the threat—and the person who is investigating the threat—to believe that what's happening on the Internet isn't real." When authorities treat the Internet as a fantasyland, it has profound effects on the investigation and prosecution of online threats. Criminal threat laws largely require that victims feel tangible, immediate, and sustained fear. In my home state of California, a threat must be "unequivocal, unconditional, immediate, and specific" and convey a "gravity of purpose and an immediate prospect of execution of the threat" to be considered a crime. If police don't know whether the harasser lives next door or out in Nebraska, it's easier for them to categorize the threat as non-immediate. When they treat a threat as a boyish hoax, the implication is that the threat ceases to be a criminal offense. So the victim faces a psychological dilemma: How should she understand her own fear? Should she, as many advise, dismiss an online threat as a silly game, and not bother to inform the cops that someone may want to—ha, ha—rape and kill her? Or should she dutifully report every threat to police, who may well dismiss her concerns? When I received my most recent rape and death threats, one friend told me that I should rest assured that the anonymous tweeter was unlikely to take any physical action against me in real life; another noted that my stalker seemed like the type of person who would fashion a coat from my skin, and urged me to take any action necessary to land the stalker in jail. Danielle Citron, a University of Maryland law professor who focuses on Internet threats, charted the popular response to Internet death and rape threats in a 2009 paper published in the Michigan Law Review. She found that Internet harassment is routinely dismissed as "harmless locker-room talk," perpetrators as "juvenile pranksters," and victims as "overly sensitive complainers." Weighing in on one online harassment case, in an interview on National Public Radio, journalist David Margolick called the threats "juvenile, immature, and obnoxious, but that is all they are ... frivolous frat-boy rants." When police treat a threat as a boyish hoax, the implication is that the threat ceases to be a criminal offense. Of course, the frat house has never been a particularly safe space for women. I've been threatened online, but I have also been harassed on the street, groped on the subway, followed home from the 7-Eleven, pinned

down on a bed by a drunk boyfriend, and raped on a date. Even if I sign off Twitter, a threat could still be waiting on my stoop. Today, a legion of anonymous harassers are free to play their "games" and "pranks" under pseudonymous screen names, but for the women they target, the attacks only compound the real fear, discomfort, and stress we experience in our daily lives.

Ext. MT Hurts CH

Adopting the mosaic theory limits investigators ability to solve cyber harassment.

Gray, Keats Citron, and Rinehart, 2013 (David, Associate Professor, University of Maryland Francis King Carey School of Law, Danielle, Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law, and Liz Clark, University of Maryland Francis King Carey School of Law, "SYMPOSIUM ON CYBERCRIME: FIGHTING CYBERCRIME AFTER UNITED STATES V. JONES" Journal of Criminal Law & Criminology Lexis)

Despite these complications, tracing an IP address is a common and effective way for authorities to identify perpetrators of cyberharassment crimes. At present, the public-observation and third-party doctrines grant law enforcement unfettered discretion to track IP addresses across the Internet. Most cyberharassment is, to one degree or another, public. Furthermore, the third-party doctrine means that law enforcement officers need a subpoena, at most, to secure user information associated with an IP address from ISPs and other third parties, including social-networking sites. n307 A mosaic theory of Fourth Amendment privacy might well change [*798] all of this. Tracking someone's online activities using an IP address over a period of time is akin to tracking a person through physical space using GPS-enabled tracking devices. By aggregating information about a user and his online activities, law enforcement officers using these fairly basic digital surveillance techniques can therefore assemble precisely the sorts of revealing informational mosaics that worried the concurring Justices in Jones. Digital surveillance technology that offends mosaic sensibilities promises even more benefits than IP traces to law enforcement officers interested in detecting cybercrimes. Take, for example, forums such as those organized and moderated by Violentacrez. n308 v c Although under current law and free speech doctrine it is perfectly legal to view and comment on pictures of young women in public, law enforcement officers might have reason to worry that habitues of forums like "Jailbait" and "Creepshots" are more likely than most to produce or possess actual child pornography. It is, of course, impossible to conduct even cursory investigations of the tens and hundreds of thousands of those who visit these sites, much less to distinguish between casual curiosity seekers and practicing pedophiles. Here, broad-scale aggregation technology, in combination with ever more sophisticated data analytics designed to identify and track those patterns of online conduct that correlate with higher risks of illegal on- and offline activities, would be tremendously valuable to law enforcement. Once officers have identified a smaller universe of potential offenders, they can then further narrow their investigative fields by using passive techniques like online honey traps to more definitively identify those who are trafficking in or actively seeking to possess child pornography. n309 Again, although these digital surveillance techniques and technologies are not presently subject to Fourth Amendment review, either **individually or in the aggregate, the situation would likely change under a mosaic theory**. In fact, officers might find themselves assembling informational mosaics sufficient to trigger Fourth Amendment concerns quite by accident. n310 Regardless, law enforcement's legitimate interests in using digital surveillance technology would be affected. n311

Fusion centers also hold significant potential for law enforcement's efforts to detect and prosecute cyberharassment. The Department of Justice, in conjunction with the National Center for Missing and Exploited [*799] Children, maintains a substantial database of known images of child pornography, each of which has a unique digital fingerprint called a "hash value." n312 Fusion centers, which have access to most Internet traffic, provide a unique - although as yet unexploited - resource that law enforcement agents can use to screen for the transmission of known images of child exploitation. Outside the relatively narrow field of child pornography cases, those who engage in cyberharassment and cyberstalking still tend to use a fairly predictable pattern of words, phrases, and images. The software used by most malicious stalkers also tends to come from a stable of online resources, which again bear an identifiable digital signature. Although the true technical capacities of fusion centers are largely unknown to the public, they appear to have the ability to monitor Internet and communications traffic for precisely these sorts of markers. That same capacity is, of course, precisely what raises concerns about fusion centers from a mosaic theory point of view. Here again, the prospect of adopting a mosaic theory of Fourth Amendment privacy raises serious concerns that the legitimate and important law enforcement goals of detecting and prosecuting cybercrimes may be compromised.

Harassment Turns Privacy

Cyberharrassment leads to violations of privacy and violence in the name of "Free Speech" – this is especially true for oppressed groups

Schroder 13 - Jared C. Schroeder, doctoral candidate at the Gaylord College of Journalism & Mass Communication at the University of Oklahoma. His research focuses on free speech and free press issues as they apply to the emerging network society. Before moving to academia, he was a professional journalist for several years, 2013 ("Electronically Transmitted Threats and Higher Education: Oppression, Free Speech, and Jake Baker," Review of Higher Education 36.3, Spring 2013, Project Muse, 7/3/15)//CM

Numerous conflicts arise when the theories of the First Amendment and concepts regarding oppression are placed beside one another. This article does not seek to condemn one area of literature or the other. Instead, this section seeks to illuminate areas of conflict between the two theoretical approaches. The Baker case is particularly relevant because it captures the challenges involved in the network society, the higher education setting, and conflicts between oppression and freedom of speech. It is not the only incident that raises questions regarding the impact of emerging online technology on providing a safe learning atmosphere. Rutgers University student Tyler Clementi committed suicide after his roommate filmed him having sex with another man and posted the video online (Starkman, 2010). The roommate and another student face criminal charges for invasion of privacy. Clearly, Clementi's privacy was invaded in an insensitive and, likely, ignorant way. In other words, the technological abilities of his tormentors outpaced their ethical understanding of the power of the new media. The scenario, though even more tragic, is similar to the Baker case. New technologies allowed a person to be oppressed and tormented, and the universities were left wondering what they could have done differently. Using Young's (2010) definition, the young woman who was named and described in Baker's story, as well as others on campus, can be viewed as oppressed. While oppression does not automatically cross the Supreme Court's threshold of true threats, it certainly raises questions about the safety and viability of the learning environment. In the Baker case, oppression comes in the form of structural norms and values; his actions can be seen as structurally accepted, to some extent, because he followed the rules created by the dominant culture. This rule-following can be seen in the court's reasoning for siding with Baker. While his behavior was viewed as deviant (United States v. Alkhabaz, 1997), the structural protections for free speech shielded him, while leaving the young woman vulnerable. This section addresses these ideas by examining the case through the violence and cultural imperialism concepts discussed by Young (2010). No physical violence occurred toward the female classmate Baker described in his story; but Young (2010) noted that oppressive violence includes [End Page 305] harassment, humiliation, and intimidation. Young (2010) explained: "The oppression of violence consists

not only in direct victimization, but in the daily knowledge shared by all members of oppressed groups that they are liable to violation, solely on account of their group identitiy" (p. 43). After hearing about the violent, explicit, and deadly story she was cast in by one of her classmates, the young woman felt the effects of violent oppression. In his dissent, Judge Krupansky wrote: "Jane Doe's reaction to those threats when brought to her attention evinces a contrary conclusion of a shattering traumatic reaction that resulted in recommended psychological counseling" (United States v. Alkhabaz, 1997, p. 1507). Other women students chose not to attend class when they heard about the story. Their fear-based response is also evidence of oppressive violence. Members of the oppressed group were forced to alter the way they live because they felt vulnerable to violence. Finally, the violence was made possible and somewhat acceptable by the decision of the court. Baker did not have to stop writing and communicating his stories about the young woman. He did not have to take down his posts. The court said what he did was legal. The structures in place made the oppression possible.

A2 No Impact to CH

The timeframe is now. The damage that the aff does to cyber harassment has lasting implications for future abusers and victims

Citron 09 Danielle Keats Citron is the Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law; Affiliate Scholar, Stanford Center on Internet and Society; Affiliate Fellow, Yale Information Society Project. 2009. ("Law's Expressive Value in Combating Cyber Gender Harassment" Michigan Law Review, December. Available via LexisNexis. Accessed on 07-08-2015)

Due to the internet's relative youth, this is an auspicious time to combat the trivialization of cyber gender harassment before it becomes too entrenched. If it continues unabated, cyber harassment could very well be the central front of struggles against sexual harassment in the coming decades given our increasing dependence on the net. More people make friends, apply for jobs, and discuss policy online than ever before, shifting their social and professional interactions to the net and with it the risk of sexual harassment. n18 As the market leans toward more realistic sensory experiences in virtual worlds and as these sites become more popular, cyber gender harassment may more closely approximate conventional notions of sexual violence. For instance, Second Life users' avatars have reportedly been forced to perform sexually explicit acts after being given malicious code. n19 These developments, and others like them, would further threaten gender equality in our digital age.

Wrestling with the marginalization of cyber sexual harassment is a crucial step in combating its gender-specific harms. Law has a crucial role to play in this effort. Law serves different functions here. It can deter online [*377] harassment's harms by raising the costs of noncompliance beyond its expected benefits. Law can also remedy such harm with monetary damages, injunctions, and criminal convictions. My article Cyber Civil Rights explored antidiscrimination, criminal, and tort law's role in preventing, punishing, and redressing cyber harassment. n20 In this piece, I explore law's other crucial role: educating the public about women's unique suffering in the wake of cyber harassment and potentially changing societal responses to it. Because law is expressive, it constructs our understanding of harms that are not trivial. The application of a cyber civil rights legal agenda would reveal online harassment for what it truly is - harmful gender discrimination. It would recognize the distinct suffering of women, suffering that men ordinarily do not experience or appreciate as harmful.

Don't let them lesson the blow to cyber harassment. The impact is real and should be acknowledged

Citron 09 Danielle Keats Citron is the Lois K. Macht Research Professor of Law, University of Maryland Francis King Carey School of Law; Affiliate Scholar, Stanford Center on Internet and Society; Affiliate Fellow, Yale Information Society Project. 2009. ("Law's Expressive Value in Combating Cyber Gender Harassment" Michigan Law Review, December. Available via LexisNexis. Accessed on 07-08-2015)

Such harassment has a profound effect on targeted women. It discourages them from writing and earning a living online. n5 It interferes with their professional lives. It raises their vulnerability to offline sexual violence. It brands them as incompetent workers and inferior sexual objects. The harassment causes considerable emotional distress. n6 Some women have committed suicide. n7

To avoid future abuse, women assume gender-neutral pseudonyms or go offline, even if it costs them work opportunities. n8 Others curtail their online activities. n9 For the "digital native" n10 generation, forsaking aspects of the internet means missing innumerable social connections. Although online harassment inflicts the most direct costs on targeted individuals, it harms society as well by entrenching male hierarchy online.

But no matter how serious the harm that cyber gender harassment inflicts, the public tends to trivialize it. Commentators dismiss it as harmless locker-room talk, characterizing perpetrators as juvenile pranksters and targeted individuals as overly sensitive complainers. n11 Others consider cyber gender harassment as an inconvenience that victims can ignore or defeat with counterspeech. n12 Some argue that women who benefit from the internet have assumed the risks of its Wild West norms. n13 Although the arguments [*376] differ, their message is the same - women need to tolerate these cyber "pranks" or opt out of life online. This message has the unfortunate consequence of discouraging women from reporting cyber gender harassment and preventing law enforcement from pursuing cyber-harassment complaints. n14

Terrorism Impact

A strong law enforcement is key to preventing terrorist attacks

Kris 11 David S. Kris, Assistant Attorney General for National Security at the U.S. Department of Justice from March 2009 to March 2011. 2011. ("Law enforcement as a Counterterrorism Tool," Journal of National Security Law & Policy

Today, law enforcement efforts against terrorism continue. In 2009, as outside observers have remarked, the DOJ charged more individuals with significant terrorism-related offenses than in any year since 9/11. n49 That trend continued in 2010. Here are a few examples of recent terrorism charges or convictions: In June and August 2009, Syed Ahmed Harris and Ehsanul Islam Sadequee were each convicted in the Northern District of Georgia for providing material support to al Qaeda, including videotaping potential U.S. targets. They were sentenced to 13 and 17 years in prison, respectively. In September 2009, Michael C. Finton was arrested and charged with terrorism offenses after he attempted to detonate an explosive device outside a federal building in Springfield, Illinois. That same month, Hosam Maher Husein Smadi was arrested and charged with attempting to detonate an explosive device outside an office building in Dallas, Texas. Smadi pleaded guilty in May 2010 to attempting to use a weapon of mass destruction, and he was sentenced in October 2010 to 24 years in prison. Finton is awaiting trial. Also in September 2009, Najibullah Zazi was arrested just before carrying

out a very serious plot to bomb the New York subway system; he pleaded guilty in February 2010 and is awaiting sentencing in the Eastern District of New York. In October and December 2009, David Coleman Headley and Tahawwur Hussain Rana were charged in the Northern District of Illinois with conspiracy to attack a Dutch cartoonist overseas, and with assisting the terror attack in Mumbai, India that killed 164 people. Headley pleaded guilty in March 2010 to a dozen federal terrorism charges, admitting that he participated in planning both attacks, and he is awaiting sentencing; Rana is awaiting trial. In May 2010, Faisal Shahzad was arrested in the Southern District of New York in connection with an attempted car bombing in Times Square; he pleaded guilty in June 2010 to all counts of the 10-count indictment against him, including conspiring and attempting to use a weapon of mass destruction, conspiring and attempting to commit an act of terrorism transcending national boundaries, attempting to use a destructive device during and in relation to a conspiracy to commit an act of terrorism [*17] transcending national boundaries, and transporting an explosive, among other charges. In October 2010, Shahzad was sentenced to life imprisonment. In October 2010, James Cromitie, David Williams, Onta Williams, and LaGuerre Pen were convicted in the Southern District of New York after a jury trial for their participation in a plot to bomb a synagogue and Jewish community center and to shoot military planes with Stinger surface-to-air guided missiles. Each faces a mandatory minimum sentence of 25 years and maximum of life imprisonment. The examples go on to include Mohammed Warsame, the Minnesota al-Shabaab cases, n50 and Colleen LaRose ("Jihad Jane"), among others. n51 [*18] Not all of these cases made the headlines and not all of the defendants were hard-core terrorists or key terrorist operatives. The results of the cases vary according to several factors. First, as in traditional intelligence or criminal investigations, aggressive and wide-ranging counterterrorism efforts may net many small fish along with the big ones. Those small fish need to be dealt with, but - if they are indeed small fish - the charges will not necessarily yield the heavy penalties that accompany more serious offenses. n52 In some of these cases, moreover, a conviction will support [*19] deportation (and a plea agreement may support rapid deportation), which can mitigate threats posed to the homeland. n53 Alternatively, there are cases in which a seemingly small fish may in fact be a big one, yet it may not be feasible either to prove that he is, or to establish an alternative basis for detaining him, even under the law of war. These cases pose the traditional tension between the intelligence benefit of continued surveillance and the risk to public safety from leaving a suspected terrorist at large (in other words, a tension between the values of short-term disruption and long-term incapacitation). In some of these cases, the risk-benefit equation will demand immediate action, disrupting a terrorist plot through arrest and prosecution for whatever criminal conduct can be established. Sometimes, a sentence of even a few months or years can shatter a terrorist cell and cripple its operational ability. Finally, of course, disruptive arrests may also generate valuable intelligence. Some small fish may be ripe for recruitment precisely because they are not fully radicalized. Such persons may be persuaded to cooperate, either before or after they are released. Moreover, arrests and other disruptive efforts may provoke statements or actions from others that provide an understanding of a terrorist network - such cases effectively "shake the tree" and show how suspects still at large respond to the arrest. Since 2001, in fact, the criminal justice system has collected valuable intelligence about a host of terrorist activities. In effect, it has worked as what the Intelligence Community would call a HUMINT collection platform. n54 I will first explain how the system works as an intelligence collection platform - beginning with pre-arrest activity and ending with sentencing and beyond - and then turn to a few illustrative examples.

Ext. Hurts Terror

The third party doctrine is key to maintaining law enforcement capabilities to combat terrorists

Sales 14 – Nathan Alexander Sales, Associate Professor of Law, Syracuse University College of Law. This Essay is based on testimony presented at a July 9, 2013 hearing of the Privacy and Civil Liberties Oversight Board. 2014. ("NSA SURVEILLANCE: ISSUES OF SECURITY, PRIVACY AND CIVIL LIBERTY: ARTICLE: Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" I/S: A Journal of Law and Policy for the Information Society. Summer. Available via LexisNexis. Accessed on 07-08-2015)

The FISA court repeatedly has upheld the section 215 program on both constitutional grounds (concluding that the acquisition of bulk telephony metadata was not a "search" within the meaning of the Fourth Amendment, largely on the strength of the third-party doctrine recognized in Smith v. Maryland n14 and other cases) and statutory ones (concluding that troves of data sought were tangible things that are relevant to an authorized investigation, as required by section 215). n15 By 2013, 15 different FISA court judges had approved the program in 35 separate rulings since its inception. n16 Other judges are more divided; in a pair of dueling rulings issued late last year, a federal judge in Washington, DC invalidated the program while another in Manhattan affirmed its legality. n17

The second program--known as PRISM or section 702--uses court orders issued under section 702 of FISA n18 to collect the content of certain international communications. In particular, the NSA targets specific non-Americans who are reasonably believed to be located outside the country, and also engages in bulk collection of some foreign-to-foreign communications that happen to be passing through telecommunications infrastructure in the United States. n19 The FISA [*527] court does not approve individual surveillance applications each time the NSA wishes to intercept these communications; instead, it issues once-a-year blanket authorizations. n20 As detailed below, in 2011 the FISA court struck down the program on constitutional and statutory grounds after the government disclosed that it was inadvertently intercepting a significant number of communications involving Americans; n21 the court later upheld the program when the NSA devised a technical solution that prevented such over-collection. n22

Programmatic surveillance initiatives like these differ in simple yet fundamental ways from the traditional forms of monitoring with which many people are familiar--i.e., individualized or particularized surveillance. Individualized surveillance takes place when authorities have some reason to think that a specific, known person is breaking the law. Investigators will then obtain a court order authorizing them to collect information about the target, with the goal of assembling evidence that can be used to establish guilt in subsequent criminal proceedings. Individualized surveillance is common in the world of law enforcement, as under Title III of the Omnibus Crime Control and Safe Streets Act of 1968. n23 It is also used in national security investigations. FISA allows authorities to obtain a court order to engage in wiretapping if they demonstrate, among other things, probable cause to believe that the target is "a foreign power or an agent of a foreign power." n24

By contrast, programmatic surveillance has very different objectives and is conducted in a very different manner. It usually involves the government collecting bulk data and then examining it to identify previously unknown terrorists, spies, and other national security threats. A good example

of the practice is link analysis, in [*528] which authorities compile large amounts of information, use it to map the social networks of known terrorists--has anyone else used the same credit card as Mohamed Atta?--and thus identify associates with whom they may be conspiring. n25 (It is also possible, at least in theory, to subject these large databases to pattern analysis, in which automated systems search for patterns of behavior that are thought to be indicative of terrorist activity, but it's not clear that the NSA is doing so here.) Suspects who have been so identified can then be subjected to further forms of monitoring to determine their intentions and capabilities, such as wiretaps under FISA or other authorities. In a sense, programmatic surveillance is the mirror image of individualized surveillance. With individualized monitoring, authorities begin by identifying a suspect and go on to collect information; with programmatic monitoring, authorities begin by collecting information and go on to identify a suspect.

Programmatic surveillance is a potentially powerful counterterrorism tool. The Ra'ed al-Banna incident is a useful illustration of how the technique, when coupled with old-fashioned police work, can identify possible threats who otherwise might escape detection. Another example comes from a 2002 Markle Foundation study, which found that authorities could have identified the ties among all 19 of the 9/11 hijackers if they had assembled a large database of airline reservation information and subjected it to link analysis. n26 In particular, two of the terrorists--Nawaf al-Hamzi and Khalid al-Mihdhar--were on a government watchlist after attending a January 2000 al-Qaeda summit in Malaysia. So they could have been flagged when they bought their tickets. Querying the database to see if any other passengers had used the pair's mailing addresses would have led investigators to three more hijackers, including Mohamed Atta, the plot's operational leader. Six others could have been found by searching for passengers who used the same frequent-flyer and telephone numbers as these suspects. And so on. Again, the Markle study concerns airline reservation data, not the communications data that are the NSA's focus. But it is still a useful illustration of the technique's potential.

The government claims that programmatic surveillance has been responsible for concrete and actual counterterrorism benefits, not just hypothetical ones. Officials report that PRISM has helped detect and [*529] disrupt about 50 terrorist plots worldwide, including ten in the United States. n27 Those numbers include Najibullah Zazi, who attempted to bomb New York City's subway system in 2009, and Khalid Ouazzani, who plotted to blow up the New York Stock Exchange. n28 Authorities further report that PRISM played an important role in tracking down David Headley, an American who aided the 2008 terrorist atrocities in Bombay, and later planned to attack the offices of a Danish newspaper that printed cartoons of Mohamed. n29 The government also claims at least one success from the telephony metadata program, though it has been coy about the specifics: "The NSA, using the business record FISA, tipped [the FBI] off that [an] individual had indirect contacts with a known terrorist overseas. . . . We were able to reopen this investigation, identify additional individuals through a legal process and were able to disrupt this terrorist activity." n30 Quite apart from foiling attacks, the government also argues that the NSA programs can conserve scarce investigative resources by helping officials quickly spot or rule out any foreign involvement in a domestic plot, as after the 2013 Boston Marathon bombing. n31

SEC DA

Shell

1nc

SEC enforcement works in the squo – it's strong and aggresive

Wiggin and Dana 2014, (A full service law firm -- clients are publicly traded companies, entrepreneurs and emerging growth companies, real estate developers, financial institutions, "TIME TO FOCUS ON COMPLIANCE PROGRAMS AGAIN: SEC ENFORCEMENT ACTIONS AND SANCTIONS ARE ON THE RISE", 10/31/2014, http://www.wiggin.com/15507) BBer

Probably to no one's surprise, given the SEC's much publicized enforcement efforts, the Commission has announced that it filed a record number of enforcement actions over the last three fiscal years and secured record payouts in penalties and disgorgements.[1] Over this period, the SEC has taken aim at a broad spectrum of conduct in the securities markets and targeted a diverse range of market actors. Although **the SEC has divided its focus across a range of different areas, three themes have emerged from its increased enforcement activity**. **First, the SEC has aggressively targeted lapses in regulatory compliance and risk controls over a broad spectrum of conduct and industries. Second, the SEC has increasingly relied on technology to detect such misconduct. And third, the SEC has made substantial awards to whistleblowers for providing information that has led to successful enforcement actions. Considering this increase in enforcement activity, companies and individuals engaged in business relating to the financial industry need to be prepared to meet the SEC's heightened scrutiny.** With this in mind, it is a good time to revisit compliance programs, policies and procedures to assure they are up-to-date and focus on the concerns of the SEC and requirements of the securities laws. According to a recent press release, the Commission reported that it had filed a record high of 755 enforcement actions in Fiscal Year ("FY") 2014. Along with those actions was another high mark: orders for penalties and disgorgement in the amount of $4.16 billion. That reflects a 22% increase in penalties and disgorgement as a result of SEC enforcement actions over last year. In FY 2013, the Commission filed 686 enforcement actions and obtained orders totaling $3.4 billion in disgorgement and penalties. In FY 2012, the Commission filed 734 enforcement actions and obtained orders totaling $3.1 billion in disgorgement and penalties. The SEC continued to crack down on traditional financial fraud, charging more than 135 parties with violations relating to reporting and disclosure. At the same time, it continued its focus on misconduct relating to complex financial instruments such as mortgage-backed securities and collateralized debt obligations, and it brought several novel actions targeting deficient compliance and control practices. For example, the SEC successfully held global investment bank and brokerage firm Jefferies LLC responsible for its failure to properly supervise trading on its mortgage-backed securities desk. The SEC also brought actions, for the first time, under a rule requiring firms to establish adequate risk controls before providing customers with market access. It imposed the largest penalty ever for net capital rule violations in a case against a high frequency trading firm and a former senior executive. And it also filed enforcement actions against the New York Stock Exchange and brokerage subsidiaries for their failure to comply with exchange rules, and Wells Fargo Advisors LLC in the Commission's first case against a broker-dealer for failing to protect a customer's material nonpublic information. The compliance and control practices and procedures of private equity firms, investment advisers and investment companies were also in the SEC's line of sight. According to the Commission, it brought its first-ever action under the investment adviser "pay-to-play" rule. The SEC also filed its first action arising from a focus on fees and expenses charged by private equity firms. It also instituted an action against a private equity firm and its president, alleging

fraud in the allocation of expenses to the firm's funds. Finally, the Commission charged three investment advisory firms with failure to maintain adequate controls on the custody of customer accounts. Accountants, attorneys and compliance professionals also found themselves contending with SEC enforcement actions this past year. In one matter, the SEC filed an action against Ernst & Young LLP relating to auditor independence rules. In another, the SEC filed an action against an audit firm and four of its auditors for their roles in the failed audits of three China-based companies. The Commission charged two Florida-based attorneys, a transfer agent and its CEO for their roles in an offering fraud involving improper distributions of billions of shares of unregistered stock. Finally, in a fraud case, the Commission charged a company's audit committee chair, who learned of the misconduct in question and failed to take meaningful action to investigate it or disclose it to investors. The SEC also touted its success in using new technologies to detect market misconduct over the last three years. SEC Chair Mary Jo White stated that "[t]he innovative use of technology – enhanced use of data and quantitative analysis – was instrumental in detecting misconduct and contributed to the Enforcement Division's success in bringing quality actions that resulted in stiff monetary sanctions." The SEC successfully used quantitative analytics to identify especially high rates of filing deficiencies and brought coordinated charges against 34 individuals and companies for violating laws requiring them to promptly report information about their holdings and transactions in company stock. The SEC pursued wrongdoing by asset managers through proprietary analytics that identify hedge funds with suspicious returns. It also employed "next generation analytical tools to help identify patterns of suspicious trading" in its continued efforts to eliminate trading on the basis of inside information. Over the last three years, the SEC charged 80 people in connection with insider trading and, among those charged are a former hedge fund trader, a portfolio manager, the co-chairman of a board, an investment banker, an investor relations executive, an accountant, husbands who traded on information they learned from their wives, and a group of golf buddies and other friends. There is every reason to expect that the continued use of these techniques will lead to more enforcement actions across a broad spectrum of market conduct. Lastly, **the SEC's record payout of awards to whistleblowers is bound to incentivize whistleblowers to come forward and may lead to more prosecutions of individuals**. In FY 2014, nine whistleblowers received awards totaling approximately $35 million, including one that was more than $30 million for a whistleblower who provided key original information that led to a successful enforcement action. That award was the largest-ever whistleblower award. The Commission also demonstrated its commitment to protect whistleblowers in that it brought its first charges under new authority to bring anti-retaliation enforcement actions. In that case, the SEC charged a hedge fund advisory firm with engaging in prohibited principal transactions and then retaliating against the employee who reported the trading activity to the Commission. It also charged the firm's owner in connection with the principal transactions. In terms of actions against individuals in addition to companies, as U.S. Attorney General Eric Holder recently remarked, cases against individuals are more easily brought when there is a witness who is able to provide evidence of a corporate executive's knowledge of and intent to participate in wrongdoing.[2] Those witnesses are more incentivized to come forward when there is a robust whistleblower program. Undoubtedly, the recent provision of substantial awards to whistleblowers will provide such incentive for people to come forward when they are aware of possible illegal conduct and may lead to increasingly vigorous investigation and enforcement activity against not only companies but also individuals. According to Chair White over the last three years, **"aggressive enforcement against wrongdoers who harm investors and threaten our financial markets remains a top priority, and we brought and will continue to bring creative and important enforcement actions across a broad range of the securities markets.**" As Chair White's and the Commission's statements reflect, **the SEC is committed to using modern data analytics and investigative techniques to monitor the securities markets and enforce the securities laws**. Further, whistleblower awards and legal mechanisms designed to protect whistleblowers from retaliation by their employers have made it more likely that people in possession of information relating to possible wrongdoing will report it to law enforcement authorities and both corporations and individuals will be prosecuted on the basis of that information. Moreover, the SEC continues to hone in on firms' deficient compliance and control practices through bringing novel actions charging companies with violating various laws and rules. Thus, companies and individuals engaged in business relating to the financial industry should expect to encounter even more aggressive enforcement of the securities laws from the SEC. Going forward, a company's compliance programs, policies and procedures will likely be subject to heightened scrutiny by the SEC. With this in mind, now is a good time to re-evaluate compliance programs and internal controls to assure that they are up-to-date, that best practices have been adopted and are being followed, and that, importantly, they adequately address the SEC's concerns.

Requiring a probable cause warrant would obliterate routine investigations — no authority to require a warrant and lack of evidence to receive one.

Baker 11 — James A. Baker, Associate Deputy Attorney General, Statement before the Committee on Judiciary United States Senate, 2011 ("The Electronic Communications Privacy Act: Government Perspectives on Protecting Privacy in the Digital Age," *American Civil*

Liberties Union, April 6th, Available Online at https://www.aclu.org/files/pdfs/email-content-foia/DOJ%20Crim%20Div%20docs/CRM-231.pdf, Accessed on 07-08-15)

Finally, the eighth and last potentially appropriate topic for legislation is the standard for compelling disclosure of the contents of stored communications. As noted above, we appreciate that there are concerns regarding ECPA's treatment of stored communications - in particular, the rule that the government may use lawful process short of a warrant to obtain the content of emails that are stored for more than 180 days. **Indeed**, some have argued recently **in favor** of a probable cause standard for compelling disclosure of all such content under all circumstances. Because communication services are provided in a wide range of situations, any simple rule for compelled disclosure of contents raises a number of serious public safety questions. In considering whether or not there is a need to change existing standards, several issues are worthy of attention. First, current law allows for the acquisition of certain stored communications using a subpoena where the account holder receives prior notice. This procedure is similar to that for paper records. If a person stores documents in her home, the government may use a subpoena to compel production of those documents. Congress should **consider carefully** whether it is appropriate to afford a higher evidentiary standard for compelled production of electronically stored records than paper records. Second, it is important to note that **not all federal agencies have authority to obtain search warrants**. For example, the Securities and Exchange Commission (SEC) and Federal Trade Commission (FTC) conduct investigations in which they need access to information stored as the content of email. Although those entities have authority to issue subpoenas, **they lack the ability to obtain search warrants**. Raising the standard for obtaining stored email or other stored communications to a search warrant **could substantially impair their investigations**. Third, Congress should recognize the collateral consequences to criminal law enforcement and the national security of the United States if ECPA were to provide only one means — a probable cause warrant — for compelling disclosure of all stored content. For example, in order to obtain a search warrant for a particular email account, law enforcement has to establish probable cause to believe that evidence will be found in that particular account. In some cases, this link can be hard to establish. In one recent case, for example, law enforcement officers **knew that a child exploitation** subject had used one account to send and receive child pornography, and officers discovered that he had another email account, but they **lacked evidence about his use of the second account**. Thus, Congress should consider carefully the adverse impact on criminal as well as national security investigations if a probable cause warrant were the only means to obtain such stored communications.

Insider Trading will lead to the collapse of the stock market and SEC regulation prevents that

Dent '12, George W. Dent JR,Professor of Law at Case Western University, 2012 ("Why Legalized Insider Trading Would Be a Disaster", November 2012, Available Online at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2169975,Accessed 07/08/15)

The ban on insider trading probably has something to do with this:100 Stock traders are more sophisticated now than in the 1920s. Most traders then were individuals, many of whom were buying stock for the first time and knew little of the risks, including insider trading, until they were rudely educated by the 1929 stock market crash.102 Today, most trading is done by institutions that are keenly aware of such risks.103 Furthermore, in the 1920s, no foreign stock markets barred insider trading, so investors had no better alternative than the American markets.104 Today, all developed countries ban insider trading.105 If America were to legalize insider trading, investors would simply go elsewhere.106 Legalizing insider trading could effectively destroy public stock markets.107 Defenders of insider trading claim that it does not harm

outsiders.108 Although it is virtually impossible to identify the victims of any particular act of insider trading, it is easy to see that it must hurt outside investors collectively.109 Imagine two publicly traded companies with identical operations. In one there is some significant amount of insider trading; in the other there is none. In the former, insiders siphon off some of the profits from the stock. Accordingly, outsiders must value its stock lower than the stock of the latter company.110 Nonetheless, as long as the level of insider trading stays low, the potential profits to outsiders are still high enough to attract them to purchase the stock at some price.111 This all changes once insider trading is permitted, as it is hard to see how there could be any other trading.112 Insiders will trade whenever no higher returns are attainable from other investments (e.g., real estate).113 Imagine being asked to bid on a bag whose contents you do not know, but that are known to another bidder. The informed bidder will raise her bid unless and until you bid more than the bag's fair value. No reasonable person would enter such a contest.114 It is suggested that insider trading will not scare off outsiders because they "already disregard a large body of evidence indicating that even the most sophisticated institutions have difficulty outperforming the stock market averages. . . . These investors may be convinced that certain stocks will make them money; the occurrence of insider trading may have little effect on investment so motivated."115 Not all "uninformed" traders, however, are so naive.116 Even investors familiar with the efficient market hypothesis buy and sell stock when they want to make additional investments, disinvest, or better diversify their portfolios.117 As already noted, the public market in a stock can survive some level of insider trading.118 To compensate for the gains siphoned off by insiders, the market will discount a stock's price to allow rational trading by outsiders.119 In an efficient market, uninformed investors cannot beat the market, but neither will they underperform other outsiders, "even the most sophisticated institutions."120 They will invest in stocks if the stock market outperforms other available investments.121 In the long run, it does.122 If insider trading becomes rampant, however, the only trades left on the table for outsiders will be those that insiders have spurned because they offer a lower return than is available elsewhere.123 Not even the most sophisticated mutual fund could match the performance of even a minimally skilled insider. In such a world only a fool would utilize anything but an insider trading equity fund to trade stock.124 Not even through examining foreign experience can we adequately tell how stock markets would fare under legalized insider trading because "all countries with developed capital markets limit insider trading to some extent."125 However, the breadth and enforcement of the prohibitions vary, and stricter insider trading bans are associated with wider stock ownership, better stock price accuracy, and deeper market liquidity.126 The corporate cost of equity declines significantly when a country forbids insider trading and actually enforces the law. Countries that more effectively bar insider trading have less volatile stock markets.128 So it is no surprise that whenever the SEC announces enforcement actions involving insider trading, the price of the affected stock declines.129 All this evidence contradicts the market efficiency arguments for insider trading. Although less of the pie remains for outsiders if more of it is taken by inside traders, outsiders might still be better off if insider trading spurs innovation, thereby causing the pie to expand.130 In that case however, companies in markets that allow insider trading should have a lower cost of capital, and revelations of possible insider trading in a company's stock should cause its stock price to rise.131 The evidence just discussed demonstrates that the opposite is true. Outsiders might be able to share in superior profits by investing in insider trading equity funds. However, as already suggested, insiders will probably have little need to create such funds because they will be able to finance most or all of their trading with (cheaper) debt.132 Thus, everyone but insiders would abandon the stock market.133 As an obvious consequence, public trading in stocks would essentially cease.134 Insiders can trade only if there are outsiders (including market makers)135 with whom to trade. If outsiders pull out, that is associated with a reduction in the cost of equity in a country trading , there would be no stock market; there would be no publicly traded companies.136 It would not, however, be tenable to have all the equity of large firms owned by just a few insiders; that is why public ownership originally evolved. If public ownership were destroyed by insider trading, large firms would have to seek investment from private equity companies.137 In most cases, private equity owners demand control.138 As part of that control, they also insist on full disclosure when executives buy or sell the firm's stock.139 In other words, they do not tolerate insider trading. Thus, ironically, legalizing insider trading would lead to the extinction of public stock markets and of insider trading itself. Although unrestricted insider trading would destroy the stock markets and thus preclude insider trading, could market forces somehow react so as to prevent this destruction? It is

true that individual insiders would have no incentive to restrain their trading,140 but, as a response, individual companies could try to curb insider trading.141

Stock Market Key to the Global Economy

Naes '11, Writer for the Journal of Finance, Randi Naes, 2011 ("Stock Market Liquidity and the Business Cycle", Journal of Finance, February 2011, Available Online at http://onlinelibrary.wiley.com/doi/10.1111/j.1540-6261.2010.01628.x/pdf, Accessed 07/10/2015)

IN DISCUSSIONS OF THE CURRENT financial crisis, much is made of the apparent causality between a decline in the liquidity of financial assets and the economic crisis. In this paper we show that such effects are not new; changes in the liquidity of the U.S. stock market have been coinciding with changes in the real economy at least since the Second World War. In fact, stock market liquidity is a very good "leading indicator" of the real economy. Using data for the United States over the period 1947 to 2008, we document that measures of stock market liquidity contain leading information about the real economy, even after controlling for other asset price predictors. Figure 1 provides a time-series plot of one measure of market liquidity, the Amihud (2002) measure, together with the National Bureau of Economic Research (NBER) recession periods (gray bars). This figure illustrates the relationship found between stock market liquidity and the business cycle. As can be seen from the figure, liquidity clearly worsens (illiquidity increases) well ahead of the onset of the NBER recessions. Our results are relevant for several strands of the literature. One important strand is the literature on forecasting economic growth using different asset prices, including interest rates, term spreads, stock returns, and exchange rates. The forward-looking nature of asset markets makes the use ∗Randi Næs is at the Norwegian Ministry of Trade and Industry. Johannes A. Skjeltorp is at Norges Bank (the Central Bank of Norway). Liquidity and the business cycle. The figure shows time-series plots of the detrended Amihud (2002) illiquidity ratio (ILR) for the United States over the period 1947 to 2008. The gray bars indicate the NBER recession periods. ILR is an elasticity (price impact) measure of liquidity and reflects how much prices move in response to trading volume. ILR is first calculated for each stock for each year. Then the equally weighted cross-sectional average for each year is calculated. A more precise definition is found in equation (2) in the paper. Note that ILR reflects illiquidity, so a high value reflects a high price impact of trades (i.e., low liquidity). ILR is detrended using a Hodrick–Prescott filter. of these prices as predictors of the real economy intuitive. If a stock price equals the expected discounted value of future earnings, it seems natural that it should contain information about future earnings growth. Theoretically, a link between asset prices and the real economy can be established from a consumption–smoothing argument. If investors are willing to pay more for an asset that pays off when the economy is thought to be in a bad state than for an asset that pays off when the economy is thought to be in a good state, then current asset prices should contain information about investors' expectations about the future real economy. In their survey article, however, Stock and Watson (2003) conclude that there is considerable instability in the predictive power of asset prices. We shift focus to a different aspect of asset markets: the liquidity of the stock market (i.e., the costs of trading equities). It is a common observation that stock market liquidity tends to dry up during economic downturns. However, we show that the relationship between trading costs and the real economy is much more pervasive than previously thought. A link from trading costs to the real economy is not as intuitive as the link from asset prices, although several possible explanations are suggested in the literature.

Economic decline triggers lash-out and global war---no checks

Harold **James 14**, Professor of history at Princeton University's Woodrow Wilson School who specializes in European economic history, 7/2/14, "Debate: Is 2014, like 1914, a prelude to world war?," http://www.theglobeandmail.com/globe-debate/read-and-vote-is-2014-like-1914-a-prelude-to-world-war/article19325504/

As we get closer to the centenary of Gavrilo Princip's act of terrorism in Sarajevo, there is an ever more vivid fear: it could happen again. The approach of the hundredth anniversary of 1914 has put a spotlight on the fragility of the world's political and economic security systems. At the beginning of 2013, Luxembourg's Prime Minister Jean-Claude Juncker was widely ridiculed for evoking the shades of 1913. By now he is looking like a prophet. By 2014, as the security situation in the South China Sea deteriorated, Japanese Prime Minister Shinzo Abe cast China as the equivalent to Kaiser Wilhelm's Germany; and the fighting in Ukraine and in Iraq is a sharp reminder of the dangers of escalation. Lessons of 1914 are about more than simply the dangers of national and sectarian animosities. The main story of today as then is the precariousness of financial globalization, and the consequences that political leaders draw from it. In the influential view of Norman Angell in his 1910 book The Great Illusion, the interdependency of the increasingly complex global economy made war impossible. But a quite opposite conclusion was possible and equally plausible – and proved to be the case. Given the extent of fragility, a clever twist to the control levers might make war easily winnable by the economic hegemon. In the wake of an epochal financial crisis that almost brought a complete global collapse, in 1907, several countries started to think of finance as primarily an instrument of raw power, one that could and should be turned to national advantage. The 1907 panic emanated from the United States but affected the rest of the world and demonstrated the fragility of the whole international financial order. The aftermath of the 1907 crash drove the then hegemonic power – Great Britain - to reflect on how it could use its financial power. Between 1905 and 1908, the British Admiralty evolved the broad outlines of a plan for financial and economic warfare that would wreck the financial system of its major European rival, Germany, and destroy its fighting capacity. Britain used its extensive networks to gather information about opponents. London banks financed most of the world's trade. Lloyds provided insurance for the shipping not just of Britain, but of the world. Financial networks provided the information that allowed the British government to find the sensitive strategic vulnerabilities of the opposing alliance. What pre-1914 Britain did anticipated the private-public partnership that today links technology giants such as Google, Apple or Verizon to U.S. intelligence gathering. Since last year, the Edward Snowden leaks about the NSA have shed a light on the way that global networks are used as a source of intelligence and power. For Britain's rivals, the financial panic of 1907 showed the necessity of mobilizing financial powers themselves. The United States realized that it needed a central bank analogous to the Bank of England. American financiers thought that New York needed to develop its own commercial trading system that could handle bills of exchange in the same way as the London market. Some of the dynamics of the pre-1914 financial world are now re-emerging. Then an economically declining power, Britain, wanted to use finance as a weapon against its larger and faster growing competitors, Germany and the United States. Now America is in turn obsessed by being overtaken by China – according to some calculations, set to become the world's largest economy in 2014. In the aftermath of the 2008 financial crisis, financial institutions appear both as dangerous weapons of mass destruction, but also as potential instruments for the application of national power. In managing the 2008 crisis, the dependence of foreign banks on U.S. dollar funding constituted a major weakness, and required the provision of large swap lines by the Federal Reserve. The United States provided that support to some countries, but not others, on the basis of an explicitly political logic, as Eswar Prasad demonstrates in his new book on the "Dollar Trap." Geo-politics is intruding into banking practice elsewhere. Before the Ukraine crisis, Russian banks were trying to acquire assets in Central and Eastern Europe. European and U.S. banks are playing a much reduced role in Asian trade finance. Chinese banks are being pushed to expand their role in global commerce. After the financial crisis, China started to build up the renminbi as a major international currency. Russia and China have just proposed to create a new credit rating agency to avoid what they regard as the political bias of the existing (American-based) agencies. The next stage in this logic is to think about how financial power can be directed to national advantage in the case of a diplomatic tussle. Sanctions are a routine (and not terribly successful) part of the pressure applied to rogue states such as Iran and North Korea. But financial pressure can be much more powerfully applied to countries that are deeply embedded in the world economy. The test is in the Western imposition of sanctions after the Russian annexation of Crimea. President Vladimir Putin's calculation in response is that the European Union and the United States cannot possibly be serious about the financial war. It would turn into a boomerang: Russia would be less affected than the more developed and complex financial markets of Europe and America. The threat of systemic disruption generates a new sort of uncertainty, one that mirrors the decisive feature of the crisis of the summer of 1914. At that time, no one could really know whether clashes would escalate or not. That feature contrasts remarkably with almost the entirety of the Cold War, especially since the 1960s, when the strategic doctrine of Mutually Assured Destruction left no doubt that any superpower conflict would inevitably escalate. The idea of network disruption relies on the ability to achieve advantage by surprise, and to win at no or low cost. But it is inevitably a gamble, and raises prospect that others might, but also might not be able to, mount the same sort of operation. Just as in 1914, there is an enhanced temptation to roll the dice, even though the game may be fatal.

Uniqueness

Insider Trading Low

Insider activity low – SEC enforcement

Wiggin and Dana 10/31, (A full service law firm -- clients are publicly traded companies, entrepreneurs and emerging growth companies, real estate developers, financial institutions, "TIME TO FOCUS ON COMPLIANCE PROGRAMS AGAIN: SEC ENFORCEMENT ACTIONS AND SANCTIONS ARE ON THE RISE", 10/31/2014, http://www.wiggin.com/15507) BBer

The SEC successfully used quantitative analytics to identify especially high rates of filing deficiencies and brought coordinated charges against 34 individuals and companies for violating laws requiring them to promptly report information about their holdings and transactions in company stock. The SEC pursued wrongdoing by asset managers through proprietary analytics that identify hedge funds with suspicious returns**. It also employed "next generation analytical tools to help identify patterns of suspicious trading" in its continued efforts to eliminate trading on the basis of inside information.** Over the last three years, the SEC charged 80 people in connection with insider trading and, among those charged are a former hedge fund trader, a portfolio manager, the co-chairman of a board, an investment banker, an investor relations executive, an accountant, husbands who traded on information they learned from their wives, and a group of golf buddies and other friends. There is every reason to expect that the continued use of these techniques will lead to more enforcement actions across a broad spectrum of market conduct. L**astly, the SEC's record payout of awards to whistleblowers is bound to incentivize whistleblowers to come forward and may lead to more prosecutions of individuals.** In FY 2014, nine whistleblowers received awards totaling approximately $35 million, including one that was more than $30 million for a whistleblower who provided key original information that led to a successful enforcement action. That award was the largest-ever whistleblower award

Inside trading is on a decline

Nili 3/18, (Yaron, Co-Editor on the Harvard law school forum on Corporate Governance and Financial Regulation – Went to The Hebrew University: M.B.A., Finance - LL.B., Law --- Activities and Societies: Teaching assistant, "Mishpatim" Law review editor-in-chief, "SEC Enforcement Developments in 2014, and a Look Forward", Harvard Law School, 3-18-2015, http://corpgov.law.harvard.edu/2015/03/18/sec-enforcement-developments-in-2014-and-a-look-forward/) BBer

Substantive Developments Insider Trading Law The year 2014 may have seen the rolling back of the tide of successful insider trading cases brought both by the Manhattan US Attorney's Office and the SEC. **Last year saw the SEC bring 52 insider trading actions, charging 80 people, an increase over the 44 cases brought in 2013.** Already, the US Attorney's Office has filed a brief in another insider trading case, United States v. Durant, arguing that the Second Circuit decision should be construed narrowly. The government argued that, while "[t]he Newman decision dramatically (and, in our view, wrongly) departs from thirty years of

controlling Supreme Court authority," the decision does not apply in Durant. Newman applies to insider trading cases brought under the classical theory of liability the government argued, while Durant was brought under the misappropriation theory.

Insider trading is low – increase in prosecutions and SEC enforcement

Morrison and Foerster 2/21, (Law firm – includes prominent attorneys with decades of experience, former prosecutors, former SEC enforcement attorneys, former senior officials of the CFTC and FINRA, and in-house forensic accounting experts, "2014 Insider Trading: Annual Review", 2/21/2015, http://www.mofo.com/~/media/Files/ClientAlert/2015/02/150211InsiderTradingAnnualReview.pdf) BBer

2014 will be remembered as the year that the Department of Justice's ("DOJ") winning streak in insider trading cases came to an end. **The last few years have been punctuated by the government's aggressive – and highly successful – enforcement of criminal insider trading laws.** Since 2009, **the U.S. Attorney's Office for the Southern District of New York** ("S.D.N.Y.") **had enjoyed a perfect trial record in insider trading cases.** With the high-profile trial conviction of Mathew Martoma, 2014 was poised to be another banner year. However, in July 2014 the perfect record came to an end when a jury acquitted Rajarengan (Rengan) Rajaratnam of insider trading charges. Rengan's acquittal not only ended the government's seemingly endless winning streak, but also signified the end of the longrunning "Perfect Hedge" investigation that initially ensnarled his brother, Raj Rajaratnam, and brought down most of the insider trading defendants over the last few years. To close out 2014, the United States Court of Appeals for the Second Circuit issued the highly anticipated decision overturning the insider trading convictions of Todd Newman and Anthony Chiasson. The blockbuster opinion cast doubt on countless other convictions and guilty pleas secured over the past several years. The early effects of the decision have already been felt in the first few weeks of 2015, with a number of associated guilty pleas by downstream tippees having been vacated. The U.S. Attorney's Office for the S.D.N.Y. is not going quietly; instead, it filed a blistering petition for rehearing and suggestion for rehearing en banc, arguing that the panel not only got it wrong, but also "threaten[ed] the integrity of the securities markets." The viability of the panel opinion and its ripple effects are among the central events to watch in insider trading law in 2015. The consequences of being found liable for insider trading can be severe. Individuals convicted of criminal insider trading can face up to 20 years imprisonment per violation, criminal forfeiture, and fines of up to $5,000,000 or twice the gain from the offense. A successful civil action by the SEC may lead to disgorgement of profits and a penalty not to exceed the greater of $1,000,000, or three times the amount of the profit gained or loss avoided. In addition, individuals can be barred from serving as an officer or director of a public company, acting as a securities broker or investment adviser, or in the case of licensed professionals, such as attorneys and accountants, from serving in their professional capacity before the SEC. **In 2014, the SEC filed insider trading actions against 111 individuals or entities, naming 44 of them in administrative proceedings, while DOJ brought criminal charges involving insider trading against 20 individuals or entities.** Last year in our Review, we included in our tally for the first time administrative proceedings filed by the SEC. With the increasing preference by the SEC Staff to bring actions as administrative proceedings instead of federal court cases, reporting only on the number of SEC enforcement actions would give an incomplete picture of enforcement activity. **As we predicted last year, the trend towards filing administrative proceedings continued in 2014**. **2014 saw DOJ and the SEC continue to aggressively pursue insider trading actions. The total number of actions brought demonstrates that neither agency has lost its interest in enforcing insider trading laws.** While 2014 certainly brought some high-profile victories for the government, 2014 will likely be better remembered for the significant set-backs suffered by both DOJ and the SEC. There are a number of potential explanations for the disparity in sentences inside and outside the S.D.N.Y. In recent years, **prosecutors** in the S.D.N.Y**. compiled an impressive win record**, largely with the benefit of cooperating witnesses in a series of related actions. The success of that approach may have provided additional incentive for prosecutors to encourage cooperation by recommending sentences of probation for cooperators. In addition, because **there are more insider trading cases brought in** the S.D.N.Y. than in all other districts combined, judges in the S.D.N.Y. may be less likely to impose as harsh a sentence on a cooperator as might a judge for which insider trading cases are more novel. **2014 was another big year for insider trading cases.**

Insider trading prosecution on the rise – cooperation

Morrison and Foerster 2/21, (Law firm – includes prominent attorneys with decades of experience, former prosecutors, former SEC enforcement attorneys, former senior officials of the CFTC and FINRA, and in-house forensic accounting experts, "2014 Insider Trading: Annual Review", 2/21/2015, http://www.mofo.com/~/media/Files/ClientAlert/2015/02/150211InsiderTradingAnnualReview.pdf) BBer

The 2014 sentencing data stands out in a number of ways. First, **ten cooperators received prison time in 2014, more than had been sentenced to prison in the prior four years combined, even though the number of cooperators sentenced in 2014 was less than in 2013 and equal to 2012.** Second, **the gap in expected outcomes between cooperators and those who go to trial has narrowed substantially** if one factors in the reversal of the Newman and Chiasson convictions, the doubt that ruling casts upon the Steinberg and Martoma convictions, and DOJ's loss in the Rengan Rajaratnam trial. In short, defendants can now factor in a real chance of acquittal if they go to trial, whereas conviction seemed all but inevitable just one year ago. If the Newman holding remains undisturbed and is followed in other circuits, **we may well see a reduction in the absolute number of insider trading criminal cases (and SEC enforcement actions), as prosecutors forgo hard-to-win remote tippee cases.** Despite these developments, however, it remains true that cooperators receive lower prison sentences (on average 25% of the minimum guidelines in 2014), as compared to settling defendants who do not cooperate (35% of the minimum guidelines in 2014), and those who go to trial (35% of the minimum guideline in 2014). In total over the last five years, the numbers are more stark: cooperators received prison sentences of approximately 11% of the minimum guidelines on average, as compared to 43% for settling non-cooperators, and 45% for those who went to trial. **The benefits of cooperation in 2014 also remained the most pronounced** in the S.D.N.Y. The one cooperator sentenced in the S.D.N.Y. in 2014, Reemah Shah, received no prison time, whereas numerous non-cooperators received substantial prison time. In contrast, seven cooperators outside the S.D.N.Y. were sentenced to prison for more than one year, and non-cooperators' prison sentences were generally not as high outside the S.D.N.Y. **The aggregate sentencing data from 2010 through 2014 shows a clear trend.**

SEC investigations work

SEC investigations successful

Eaglesham 14, (Jean, writes about law enforcement by the Securities and Exchange Commission and other financial agencies, working from the Wall Street Journal's New York bureau, "As SEC Enforcement Cases Rise, Big Actions Are Sparse", WSJ, 9-29-2014, http://www.wsj.com/articles/as-sec-enforcement-cases-rise-big-actions-are-sparse-1412028262) BBer

Mary Jo White will end her first full fiscal year running the Securities and Exchange Commission able to claim an increase in its annual tally of cases, the first year-over-year rise since 2011, according to people close to the agency. It is an important benchmark for the SEC chairman, a former federal prosecutor who promised "aggressive and creative" enforcement soon after taking office last year. But some SEC watchers said the heightened activity masks a scarcity of the blockbuster actions that should be a feature of an effective Wall Street cop. "When the chairman testifies before Congress…she will have nice numbers to cite," said Thomas

Gorman, a partner at law firm Dorsey & Whitney LLP. "But she's not going to have the really good cases that the SEC made its reputation on." Ms. White said **the SEC's enforcement division has been highly successful in the past year, and aggressive enforcement will continue**. "**What is most impressive is that the cases span the spectrum of the securities markets and that we demanded tough remedies**," she said in a statement. The SEC is still completing its official tally of enforcement actions for the fiscal year ending Tuesday. But a recent flurry of activity has boosted total enforcement actions, one of the agency's measures of success, to well over the 686 reached in the previous 12-month period, the people close to the agency said. Ms. White can also point to recent progress on two of her priorities. Her policy of requiring admissions of wrongdoing to settle SEC allegations in some cases has produced 12 such pacts, the most recent last week, according to an analysis by The Wall Street Journal. And her "broken windows" strategy of pursuing even small legal violations led to 54 new cases this month, a handy addition to the annual tally, according to the analysis. Senior SEC officials said **the agency** under Ms. White **is moving on from its effort to punish misconduct related to the financial crisis, which dominated the five years after 2008**. But such actions still accounted for more than half of its biggest-penalties cases in this fiscal year, according to the analysis by the Journal. Four of seven cases with settlements of more than $100 million brought by the SEC in the past 12 months, including the three biggest fines, involve conduct dating back to the financial crisis, the analysis found. Three of these seven $100 million-plus cases included admissions of wrongdoing by the firm involved, reflecting the agency's determination to require admissions in some of its most important cases. But the 12 pacts with admissions reached under the new policy also include alleged misconduct that resulted in much smaller penalties, in which fraud wasn't alleged, such as a computer-coding error that resulted in a discount brokerage giving incorrect data to the SEC. "When you look at the [admissions] cases they've brought so far, it's hard to understand why those have been selected and not others," said Stephen Crimmins, a partner at law firm K&L Gates LLP. Andrew Ceresney, SEC enforcement chief, said all 12 admissions "are important cases that warranted admissions, which enhanced the defendants' acceptance of responsibility for their actions." The SEC has chalked up some notable firsts under Ms. White. This month alone, the agency made a record $30 million payout to a whistleblower and filed its first enforcement action against a high-frequency trading firm, as well as its first case against a brokerage firm for failing to protect customers' nonpublic information. Senior SEC officials said the agency's postcrisis strategy is to pursue wrongdoing on a broad range of fronts, on both Wall Street and Main Street, rather than target any particular area. **"Now that we have completed nearly all of our financial crisis cases, we will increase our focus in a range of different areas,"** said Mr. Ceresney. **The types of cases being targeted include insider trading, market structure, microcap-stock fraud, pyramid schemes, municipal securities, complex financial instruments, and investment-adviser fraud,** he said. Mr. **Ceresney highlighted financial-reporting fraud as another area in which the SEC is ramping up efforts. The numbers of these bread-and-butter, fiddling-the-books cases fell sharply in the aftermath of the crisis. That trend is now reversing: The SEC will this fiscal year be able to report an increase for this type of case for the first time since 2008, said a person close to the agency. Accounting and financial-reporting fraud numbers are up at least 25% on the 68 total for the year** through September 2013, the person said. But these cases are mostly on a fairly modest scale, in terms of the sanctions imposed. "We're not seeing many really big actions; there is nothing to match the accounting fraud cases of the late 1990s," said Thomas Sporkin, a former SEC attorney who is now a partner at law firm BuckleySandler LLP. Some lawyers question the seeming pressure on the SEC to bring ever-bigger cases. Bradley Bondi, a former counsel to two former SEC Republican commissioners, said the agency has touted its enforcement statistics as a gauge of its effectiveness for the past decade. But police chiefs often rate success in terms of falling crime rates, said Mr. Bondi, now a partner at law firm Cadwalader, Wickersham & Taft LLP. The SEC's increasing numbers of cases and "ever-growing penalty amounts" could show a need to re-evaluate how well it is deterring future misconduct, he said. Arthur Levitt, the SEC's chairman from 1993 to 2001, said Ms. White has "got off to a good start" on enforcement. But it is probably too early to judge the effectiveness of her drive to make the SEC a tougher agency. "I don't think we'll really know for a few years," he said.

SEC investigations will continue to be successful – multiple warrants

Nili 3/18, (Yaron, Co-Editor on the Harvard law school forum on Corporate Governance and Financial Regulation – Went to The Hebrew University: M.B.A., Finance - LL.B., Law --- Activities and Societies: Teaching assistant, "Mishpatim" Law review editor-in-chief, "SEC Enforcement Developments in 2014, and a Look Forward", Harvard Law School, 3-18-2015, http://corpgov.law.harvard.edu/2015/03/18/sec-enforcement-developments-in-2014-and-a-look-forward/) BBer

As we noted last year in our memorandum focused on 2013 developments, Securities and Exchange Commission Chair Mary Jo White has called for the SEC to be more aggressive in its enforcement program. By all accounts, **the Enforcement Division has responded to that call**. **The past year saw the SEC continue the trend,** started under Enforcement Director Robert Khuzami in 2009, **of transforming the SEC's civil enforcement arm into an aggressive law enforcement agency modeled on a federal prosecutor's office.** This should not come as a surprise since both Andrew Ceresney, the current Director, and George Cannellos, Ceresney's Co-Director for a brief period of time, like Khuzami, spent many years as federal prosecutors in the Southern District of New York. And the Commission itself is now led for the first time by a former federal prosecutor, Mary Jo White, the US Attorney for the Southern District of New York from 1993 to 2002. Given the events of the past decade involving the Madoff fraud and the fallout from the 2008 financial crisis, we believe both **the aggressive tone and positions the SEC has taken in recent years will continue.** In this post, we outline some of the developments in the SEC's enforcement program and the remedies it has pursued over the past year. We also discuss important developments in areas where we expect to see continued enforcement attention during 2015, including insider trading law, the private equity industry, and accounting and financial reporting matters. **Enforcement Program Focus Adopting a "Broken Windows" Approach to Enforcement** One of the significant and over-arching approaches to the enforcement agenda under Chair White's leadership is the so-called "broken windows" style of enforcement. Emulating tactics introduced by the New York City Police Department in the mid-1990s, **the Commission has pledged to crack down on even minor securities law infractions in an effort to deter more significant violations.** Chair White has explained that **the purpose of the "broken windows" approach is twofold: to ensure that the SEC is punishing "even the smallest infractions" while still pursuing the larger violations, and to make "you feel like we are everywhere."** Extending the policing analogy further, she has said that "[i]t is important because investors in our markets want to know that there is a strong cop on the beat—not just someone sitting in the station house waiting for a call, but patrolling the streets and checking on things." To the extent the approach is designed to make clear that the Commission will attempt to have a presence in virtually every sector of the markets and that it will enforce all of the agency's rules, the program should be neither controversial nor unique. The concern in the corporate sector, however, has focused on the extent to which the "broken windows" policy means that disproportionately harsh sanctions, adverse publicity, and reputational harm will be the consequence of transgressions that may indeed be minor. In announcing the program, Chair White suggested that a group of actions in 2013 relating to violations of Rule 105 of Regulation M (prohibiting certain short sales of a security in advance of a public offering of the same security) were an early example of this approach. Since then, however, the only matter explicitly described as a "broken windows" effort was a group of actions announced in September 2014 against 28 corporate insiders (officers, directors, and major shareholders) for failure to timely and properly file reports of securities ownership. It is noteworthy that these actions do not seem to have been the result of a significant time investment by the Enforcement staff. Rather, as described by the Commission, the actions were an example of the SEC's recent investments in new technology—the deficient filers were identified using sophisticated computer analysis. This may ultimately be a key feature of this initiative—that more powerful computer-based analysis will expose technical violations of filing or other requirements that may previously have gone unnoticed, allowing the Commission to bring such message cases without distracting significantly from other enforcement priorities. The debate over this enforcement policy will continue. Each Chairman and each Enforcement Director over the past several decades has worried about both the breadth and reach of the enforcement program, attempting to have a presence throughout the markets and attempting to identify all manner of violative behavior, whether delinquent filings or even very technical violations. The Chair's public articulation of a policy, analogized to the "broken windows" approach, was perhaps the lightning rod here, and the SEC may now be trying to ratchet back that rhetoric. Enforcement Director Ceresney has recently said that the "broken windows" approach is not about turning every

violation into an enforcement action but, rather, is about targeting rules where "we have seen a pattern of a lack of compliance" and bringing cases that "send a strong message" to the market. **Increasing Use of the Administrative Forum The SEC has said that it will increasingly use the authority it gained** through the Dodd-Frank Act **to bring more actions administratively.** Previously, the Commission was limited in the types of actions it could bring and the relief it could obtain in administrative proceedings. Dodd-Frank significantly expanded the relief the SEC can obtain administratively. The SEC is now authorized to bring actions against non-regulated entities and individuals and to impose significant penalties in administrative actions. The remedies available to the SEC in the different fora are now effectively the same. In preparing to both bring and likely litigate more administrative actions, the SEC recently increased the number of its Administrative Law Judges from three to five and increased the ALJs' staff. The SEC has also expanded the types of cases that it will consider bringing administratively. In June 2014, shortly after two well-publicized trial losses, Director Ceresney noted that, although it had been rare in the past, the SEC would likely bring insider trading cases as administrative proceedings going forward. The SEC has since filed several insider trading cases administratively, and the Staff has said that it expects to bring more FCPA cases in the administrative forum as well. After judicial challenges to a number of negotiated settlements and losses in court over the past several years, many observers have suggested that the increased use of administrative proceedings is an effort by the SEC to secure a "home-court advantage" and avoid the scrutiny of federal judges and juries. In fiscal year 2014, the SEC won all six of its litigated administrative proceedings, but only 11 of its 18 federal court trials. While lauding the agency's trial record on the one hand, Ceresney has not been shy about highlighting the advantageous features of the administrative forum, including prompt decisions, specialized fact-finders, and less stringent rules of evidence. Not surprisingly, the SEC's decision to use its administrative forum in more cases has come under criticism. For example, Judge Rakoff of the Southern District of New York has discussed the dangers of bringing more cases administratively, including concerns about the securities laws being interpreted in a non-judicial forum and the fairness of the administrative proceedings due to the inapplicability of the federal rules of evidence, the lack of a jury trial, and the deference the decisions are entitled to on appellate review. James Cox, a professor at Duke University School of Law, has similarly commented that the SEC must be "sensitive to the benefits" of developing precedent in the federal courts. While there is no basis to believe that the ALJs in these proceedings are not fair and, indeed, that this forum may be more advantageous to respondents in some cases, the process concerns (absence of clear discovery rules, appeal to the Commission itself if one loses) and appearance issues (an in-house forum) should concern the Commission and the Staff. A number of respondents in SEC administrative actions have filed suit in recent months challenging the actions on constitutional and procedural grounds. Thus far, none of these challenges has been successful, though several remain pending. In the first action to be decided, the District Court for the District of Columbia held that it lacked subject matter jurisdiction over the action because no final decision had been rendered by the Commission. Even then, the court noted, the Exchange Act provided for initial judicial review in the Court of Appeals, not the District Court. That case is now on appeal to the DC Circuit. In December, Judge Lewis Kaplan of the SDNY similarly held that the district court lacked jurisdiction to consider an action seeking to enjoin the SEC from proceeding with an administrative action against an investment adviser and his firm. Several other cases remain pending. Recently, a former Standard & Poor's executive filed a pre-emptive declaratory judgment action against the SEC after being notified that the Staff intended to recommend that the Commission bring an administrative proceeding against her. She is asking the court to enjoin the SEC proceeding and to find that, because the SEC's Administrative Law Judges are officers of the executive branch who cannot be removed from office directly by the President, the SEC's adjudicatory system violates Article II of the Constitution. The SEC itself has been dismissive of complaints that its administrative proceedings are unfair. In the face of criticism regarding the Commission's increased use of administrative proceedings and the argument that it is unfair or unconstitutional, Director Ceresney defended the practice, noting that the Commission is still bringing a "significant" number of cases in district court and arguing that the SEC's use of its administrative forum is "eminently proper, appropriate, and fair to respondents." In seeking to impose individual liability, the Staff is also increasingly focused on those in so-called "gatekeeper" roles, including compliance officers, accountants, and attorneys. This focus, which harkens back to the Stanley Sporkin era in the 1970s, was, if anything, sharpened in 2014 with the Commission introducing an initiative it refers to as "Operation Broken Gate." This is an effort to look even more closely at the role of such gatekeepers—those who are "obviously central to our system"—in enforcement actions. **This focus appears designed to achieve at least two goals: (1) sending a message to the public that the SEC is getting tough on individuals in positions of authority within public companies who may have benefited from improper conduct; and (2) incentivizing those in the private sector who can prevent violations because they hold the keys to disclosure and investor protection by pushing them "to actively look for red flags, ask the tough questions, and demand answers." We expect this focus on "gatekeepers" to**

continue into 2015 and beyond. Remedial Developments **Eroding the "No Admit/No Deny" Settlement Model** As we noted in last year's memo, in 2013, the Commission announced a change to its long-standing policy of concluding nearly all settled enforcement cases without an admission from the respondent. Previously, the SEC had required admissions only in cases where the respondent had already pled guilty to criminal charges stemming from the same conduct. SEC settlements generally included language stating that the respondent neither admitted nor denied the factual allegations set forth in the Commission's complaint or order. The policy change comes after the SEC has been subject to significant criticism from federal judges and others for submitting such "no admit/no deny" settlements to the courts for approval. Over the past few years, several proposed SEC settlements have been delayed and scrutinized as a result of concerns raised by the presiding judge. Judge Rakoff started the trend of federal judges refusing to "rubber-stamp" SEC settlements and has been the most vocal critic of the Commission's no admit/no deny settlement policy. He initially refused to approve the Commission's proposed $285 million settlement with Citigroup over its role in structuring and marketing a package of mortgage bonds to investors. Other courts have followed Judge Rakoff's lead. For example, Judge Kane of the District of Colorado issued an opinion rejecting a proposed settlement, stating that "'[l]ike Judge Rakoff, I will not be a mere handmaiden to a settlement negotiated on unknown facts, while the public is deprived of ever knowing the truth in a matter of obvious public importance.'" Although Judge Rakoff's refusal to approve the Citigroup settlement was overturned by the Second Circuit, the Commission has nonetheless said it will continue to demand admissions in certain cases. The new policy reflects the Commission's view that admissions increase accountability and boost investor confidence in the SEC and the markets. The SEC has since sought and obtained admissions in a number of cases. Under the new policy, the SEC will potentially seek admissions where: a large number of investors were harmed or the conduct was "egregious"; the conduct posed "significant risk" of harm to the markets or investors; the admissions would "aid investors deciding whether to deal with a particular party in the future"; and reciting the facts of the case would "send an important message" to the market. Significantly, according to Director Ceresney, admissions are not negotiable. Once the SEC determines there should be an admission in a particular case, there is no room for negotiation. For example, according to Ceresney, the SEC will not accept a larger penalty in lieu of an admission. The respondent must either admit or litigate. **Declining to Relieve Collateral Consequences of Settlements** When public companies or regulated entities settle enforcement actions with government regulators, including the SEC, there are often automatic consequences that apply. These collateral consequences can be quite dramatic and have significant negative impacts on the settling entity. In the SEC context, for example, a public company that settles to violations of the anti-fraud provisions of the securities laws automatically loses its status as a Well-Known Seasoned Issuer, or WKSI. WKSI status allows a company to issue new securities without going through the SEC's typical review process, allowing for faster capital raising. Similarly, Dodd-Frank required the SEC to implement a so-called "bad actor" rule that disqualifies broker-dealers with "a relevant criminal conviction, regulatory or court order, or other disqualifying event" from relying on a Rule 506 exemption to sell certain private investments, like interests in hedge funds and private-equity funds. Challenges to the routine granting of waivers seems likely to continue into 2015. Recently, the Department of Labor, which oversees a similar disqualification regime, took the unusual step of holding an open meeting on a waiver request from Credit Suisse in connection with a disqualification from managing pension funds as a result of its resolution of a tax evasion case with federal prosecutors. Historically, the DOL staff had routinely granted such waivers. In Credit Suisse's case, however, consumer advocates and members of Congress objected to the waiver, prompting the DOL to hold public hearings on the question in early January 2015. Consumer advocate Ralph Nader testified against granting the waiver. While the DOL decision-making process seems to be more protracted than the SEC's, allowing interested parties more opportunity to participate in the process, it seems likely that activists will eventually turn their attention to the SEC waiver process, increasing the political pressure on the Commissioners in considering such requests. **Tying Penalties to the Respondent's Financial Position, Not the Underlying Activity We expect that the SEC will continue to push for ever-larger penalties in 2015,** especially in cases, as with the examples cited above, where the respondent is not a public company and the impact of the penalties will not be passed on to shareholders. Under the discretion the securities laws give the Staff and the Commission to set penalties, and citing "deterrence" as the key consideration, the Commission will continue to take into account the size and financial wherewithal of an individual or an enterprise in setting the amount of any penalties sought or assessed. **Substantive Developments Insider Trading Law** The year 2014 may have seen the rolling back of the tide of successful insider trading cases brought both by the Manhattan US Attorney's Office and the SEC. Last year saw the SEC bring 52 insider trading actions, charging 80 people, an increase over the 44 cases brought in 2013. Already, the US Attorney's Office has filed a brief in another insider trading case, United States v. Durant, arguing that the Second Circuit decision should be construed narrowly. The government argued that, while "[t]he Newman decision dramatically (and, in our view, wrongly) departs from thirty years of controlling Supreme Court authority," the decision does not apply in Durant. Newman applies to insider trading cases brought under the classical theory of liability the government argued, while Durant was brought under the misappropriation theory. On January 23, the US Attorney's Office asked the three-judge panel that

decided the case to reconsider its ruling. If the court elects not to reconsider its decision, the government may request that the entire Second Circuit hear the case en banc or petition the Supreme Court to hear the appeal. That said, the decision is already having an effect. On January 29, Southern District prosecutors indicated that, as a result of Newman, the Office would drop charges against five men who had been indicted on insider trading charges relating to IBM's acquisition of a software company in 2009. **Asset Management Industry The SEC has been focused on the private equity sector for several years.** In 2014, the Office of Compliance Inspections and Examinations began completing a series of "presence exams" it had been conducting of a large number of industry participants since 2012. The results of the exams were sufficiently troubling to the SEC that, in April 2014, the Commission announced that it was launching a new unit within OCIE dedicated to the examination of private equity and hedge funds. In addition to this new unit, two other groups within the SEC continue to focus on private equity: the Asset Management Unit, established in 2010, and the Financial Reporting and Audit Task Force. Andrew Bowden, the Director of OCIE, has said that over half of the private equity advisers that have been examined under the presence exam initiative appear to be violating laws or have material weaknesses around how they assess fees and expenses to clients. The SEC has filed several enforcement actions arising out of those exams. The actions brought include the Commission's first-ever action against a private equity firm for violating the pay-to-play rules. Those rules prohibit investment advisers from providing advisory services to a government entity for two years following a campaign contribution to an elected official of that entity. The SEC also brought an action relating to the fees and expenses charged by a private equity firm. The SEC alleged that the firm and its president violated the anti-fraud and other provisions of the securities laws by misallocating assets from the funds to pay expenses of the management company, including rent, salaries, and other employee benefits. The SEC also alleged that after depleting the funds' assets, the management company made loans to the funds at "excessive" interest rates. Finally, the SEC brought fraud charges against a private equity fund manager for breaching its fiduciary duty by inappropriately allocating expenses between two of its funds. Given the breadth of the presence exams and the establishment of a new unit focused specifically on this industry, we expect to see more actions against private equity firms in 2015. **Accounting and Financial Reporting Another area where we expect to see increased SEC enforcement activity in 2015 is in accounting and financial reporting cases.** Although this has not been much of a focus area since the financial crisis, that is beginning to change. After several years of seeing the number of such actions decline year over year, the number of financial reporting and disclosure cases brought by the SEC shot up 45% in fiscal 2014. The SEC has said it expects to "continue the momentum in pursuing financial reporting and accounting fraud" in 2015. The Financial Reporting and Audit Task Force mentioned above was established by the Commission to identify and develop potential cases that can then be referred to the Enforcement Division for investigation. While the Task Force has begun issuing information requests to public companies, it remains to be seen how active or effective it will be in generating enforcement recommendations. * * * This remains a challenging environment for individuals and enterprises who find themselves involved in regulatory investigations. **The SEC has demonstrated its increasing willingness to push traditional boundaries—including bringing more actions administratively, naming individuals, and seeking admissions in settled matters—suggesting that is not likely to either change course or become less demanding anytime soon.**

Subpoena Key

The SCA impedes federal investigations — they'd need prior approval.

Thompson and Cole 15 — Richard M. Thompson II and Jared P. Cole, Legislative Attorneys for the Congressional Research Service, 2015 ("Stored Communications Act: Reform of the Electronic Communications Privacy Act (ECPA)," *Federation of American Scientists*, May 19th, Available Online at http://fas.org/sgp/crs/misc/R44036.pdf, Accessed on 07-06-15)

While the various ECPA reform bills discussed above appear to enjoy broad support among technology, civil liberty, and government constituencies, some federal agencies have argued that passage of these bills would significantly curtail their ability to conduct investigations. In an apparent effort to assuage these concerns, the Email Privacy Act, the ECPA Amendments Act, and the LEADS Act include a "rule of construction" noting that these agencies could still seek electronic communications directly from the target of their investigation.

Currently, many federal agencies possess subpoena authority which allows them to compel the production of documents from providers **without prior approval** of a court. Pursuant to Section 2703(b), federal agencies have issued subpoenas to service providers to obtain subscriber information about individuals, including their names, telephone numbers, email addresses, and physical addresses, and have indicated that they have used this authority to obtain the content of emails held by service providers for more than 180 days.

The plan would prevent agencies from using subpoenas – requires DOJ intervention.

Thompson and Cole 15 — Richard M. Thompson II and Jared P. Cole, Legislative Attorneys for the Congressional Research Service, 2015 ("Stored Communications Act: Reform of the Electronic Communications Privacy Act (ECPA)," *Federation of American Scientists*, May 19th, Available Online at http://fas.org/sgp/crs/misc/R44036.pdf, Accessed on 07-06-15)

All of the major ECPA reform bills would require a warrant to obtain the contents of electronic communications held by service providers, whether held for more or less than 180 days. One result of this provision would be that administrative subpoenas—subject to a lower standard of proof than warrants—would **no longer be sufficient** to compel service providers to produce the contents of electronic communications. However, because most federal agencies—other than the Department of Justice (DOJ)—do not possess independent authority to seek a warrant from a magistrate judge, such legislation would appear to preclude agencies conducting an investigation to obtain the contents of electronic communications held by service providers directly from the provider itself. Instead, in order to do so, agencies would presumably need to rely on the DOJ to seek a warrant, whose authority is limited to doing so in criminal investigations.

Probable Cause Link

Requiring higher probable cause makes hampers investigations.

Baker 11 — James A. Baker, Associate Deputy Attorney General, Statement before the Committee on Judiciary United States Senate, 2011 ("The Electronic Communications Privacy Act: Government Perspectives on Protecting Privacy in the Digital Age," *American Civil Liberties Union*, April 6th, Available Online at https://www.aclu.org/files/pdfs/email-content-foia/DOJ%20Crim%20Div%20docs/CRM-231.pdf, Accessed on 07-07-15)

A third potentially appropriate topic for legislation is to clarify the standard for issuance of a court order under § 2703(d) of ECPA. ECPA provides that the government can use a court order under § 2703(d) to compel the production of non-content data, such as email addresses, IP addresses, or historical location information stored by providers. These orders can also compel production of some stored content of communications, although compelling content generally requires notice to the subscriber. According to the statute, "[a] court order for disclosure... may be issued by any court that is a court of competent jurisdiction and shall issue only if the governmental entity offers specific and articulable facts showing that there are

reasonable grounds to believe that the contents of a wire or electronic communication, or the records or other information sought, are relevant and material to an ongoing criminal investigation." 18 U.S.C. § 2703(d). Until recently, no court had questioned that the United States was entitled to a 2703(d) order when it made the "specific and articulable facts" showing specified by § 2703(d). However, the Third Circuit recently held that because the statute says that a 2703(d) order "may" be issued if the government makes the necessary showing, judges may choose not to sign an application even if it provides the statutory showing. See In re Application of the United States, 620 F.3d 304 (3d Cir. 2010). The Third Circuit's approach thus makes the issuance of § 2703(d) orders unpredictable and potentially inconsistent; some judges may impose additional requirements, **while others may not**. For example, some judges will issue these orders based on the statutory "reasonable grounds" standard, while others will devise higher burdens. In considering the standard for issuing 2703(d) orders, it is important to consider the role they play in early stages of criminal and national security investigations. In the Wikileaks investigation, for example, this point was recently emphasized by Magistrate Judge Buchanan in the Eastern District of Virginia. In denying a motion to vacate a 2703(d) order directed to Twitter, Judge Buchanan explained that "at an early stage, the requirement of a higher probable cause standard for non-content information voluntarily released to a third party would **needlessly hamper an investigation**."

Kills SEC

The SEC is specifically effected — no guarantee targets will provide their e-mails.

Thompson and Cole 15 — Richard M. Thompson II and Jared P. Cole, Legislative Attorneys for the Congressional Research Service, 2015 ("Stored Communications Act: Reform of the Electronic Communications Privacy Act (ECPA)," *Federation of American Scientists,* May 19th, Available Online at http://fas.org/sgp/crs/misc/R44036.pdf, Accessed on 07-06-15)

Nevertheless, at least one federal agency has claimed that the new warrant requirement contained in the reform bills would **unduly restrict its investigative authority**. The Securities and Exchange Commission (SEC), in a letter to the Senate Judiciary Committee, noted that the targets of agency investigations do not always "retain copies of their incriminating communications or may choose not to provide the e-mails in response to Commission subpoenas."96 Accordingly, the letter argued, the SEC has historically relied on authority under Section 2703(b) to obtain the contents of electronic communications from service providers during its investigations. The legislation would foreclose the SEC from doing so in the future, thereby weakening its investigative authority. The letter argued that if the individuals under investigation knew that the SEC cannot go directly to the service providers to obtain the contents of emails, then those individuals would be less likely to be forthcoming in response to subpoenas issued directly to them. The letter concluded by suggesting that the legislation be amended by inserting a provision that would allow a federal civil agency to seek the contents of electronic communications from service providers subject to a standard similar to that governing the issuance of criminal search warrants.

General Impact to Be Investigated Latter

The ability to access easily access communications data is crucial to law enforcement.

Baker 11 — James A. Baker, Associate Deputy Attorney General, Statement before the Committee on Judiciary United States Senate, 2011 ("The Electronic Communications Privacy Act: Government Perspectives on Protecting Privacy in the Digital Age," *American Civil Liberties Union*, April 6th, Available Online at https://www.aclu.org/files/pdfs/email-content-foia/DOJ%20Crim%20Div%20docs/CRM-231.pdf, Accessed on 07-07-15)

Mr. Chairman, the Department of Justice is charged with the responsibility of enforcing the laws, safeguarding the constitutional rights of Americans, and protecting the national security of the United States. As such, we welcome these hearings on this important topic. We appreciate the concerns that some in Congress, the courts, and the public have expressed about ECPA. We know that some believe that ECPA has not kept pace with technological changes or the way that people today communicate and store records, notwithstanding the fact that ECPA has been amended several times for just that purpose. We respect those concerns, and we appreciate the opportunity to discuss them here today. We also applaud your efforts to undertake a renewed examination of whether the current statutory scheme appropriately accommodates such concerns and adequately protects privacy while at the same time fostering innovation and economic development. It is legitimate to have a discussion about our present conceptions of privacy, about judicially-supervised tools the government needs to conduct **vital law enforcement and national security investigations**, and how **our statutes should accommodate both.** For example, we appreciate that there are concerns regarding ECPA's treatment of stored communications - in particular, the rule that the government may use lawful process short of a warrant to obtain the content of emails that are stored for more than 180 days. We are ready and willing to engage in a robust discussion of these matters to ensure that the law continues to provide appropriate protections for the privacy and civil liberties of Americans as technology develops. As we engage in that discussion, what we must not do - either intentionally or unintentionally - is unnecessarily hinder the government's ability to effectively and efficiently enforce the criminal law and protect national security. The government's ability to access, review, analyze, and act promptly upon the communications of criminals that we acquire lawfully, as well as data pertaining to such communications, is vital to our mission to protect the public from **terrorists**, **spies**, **organized criminals**, **kidnappers**, and other malicious actors. We are prepared to consider reasonable proposals to update the statute - and indeed, as set forth below, we have a few of our own to suggest — provided that they do not compromise our ability to protect the public from the **real threats we face**. Significantly, ECPA protects privacy in another way as well: by authorizing law enforcement officers to obtain evidence from communications providers, ECPA enables the government to **investigate and prosecute hackers**, **identity thieves**, and other online criminals. Pursuant to ECPA, the government obtains evidence critical to prosecuting these privacy-related crimes.

National security investigations are effected by ECPA standards.

Baker 11 — James A. Baker, Associate Deputy Attorney General, Statement before the Committee on Judiciary United States Senate, 2011 ("The Electronic Communications Privacy Act: Government Perspectives on Protecting Privacy in the Digital Age," *American Civil Liberties Union*, April 6th, Available Online at https://www.aclu.org/files/pdfs/email-content-foia/DOJ%20Crim%20Div%20docs/CRM-231.pdf, Accessed on 07-07-15)

ECPA has never been more important than it is now. Because many criminals, terrorists and spies use telephones or the Internet, electronic evidence obtained pursuant to ECPA is now critical in prosecuting cases involving terrorism, espionage, violent crime, drug trafficking, kidnappings, computer hacking, sexual exploitation of children, organized crime, gangs, and **white collar offenses**. In addition, because of the inherent overlap between criminal and national security investigations, ECPA's standards affect critical national security investigations and cyber security programs.

Ext. Stock Market Key

Wall Street key to the Global Economy

Picardo '13 Elvis Picardo, CFA and Portfolio manager at Global Securities Corporation, 2013 ("Why Wall Street Is A Key Player In The World's Economy", Investopedia, No Month Provided, Available Online at http://www.investopedia.com/articles/investing/100814/wall-streets-enduring-impact-economy.asp**, Accessed 07/10/15)**

The most important financial center in the world? A fabled place of silver spoons and golden parachutes? A hub of cut-throat capitalism? Or all of the above. Wall Street is many things to many people, and the perception of what it really is depends on who you ask. Although people's views of Wall Street may differ widely, what is beyond dispute is its enduring impact not just on the American economy, but on the global one. What is Wall Street anyway? Wall Street physically takes up only a few blocks that amount to less than a mile in the borough of Manhattan in New York City; however, its clout extends worldwide. The term "Wall Street" was initially used to refer to the select group of large independent brokerage firms that dominated the U.S. investment industry. But with the lines between investment banks and commercial banks having been blurred since 2008, Wall Street in current financial parlance is the collective term for the numerous parties involved in the U.S. investment and financial industry. This includes the biggest investment banks, commercial banks, hedge funds, mutual funds, asset management firms, insurance companies, broker-dealers, currency and commodity traders, financial institutions and so on. Although many of these entities may have their headquarters in other cities such as Chicago, Boston, and San Francisco, the media still refers to the U.S. investment and financial industry as Wall Street or simply "The Street." Interestingly, the popularity of the term "Wall Street" as a proxy for the U.S. investment industry has led to similar "Streets" in certain cities where the investment industry is clustered being used to refer to that nation's financial sector, such as Bay Street in Canada and Dalal Street in India. Why Wall Street has such an impact The U.S. is the world's biggest economy, with 2013 gross domestic product (GDP) of $16.80 trillion, comprising 22.4% of global economic output. It is almost twice the size of the second-biggest economy, China (2013 GDP = $9.24 trillion). In terms of market capitalization, the U.S. is the world's biggest by some distance, with a market value of $23.6 trillion dollars (as of September 23, 2014) that comprises 36.3% of global market capitalization. Japan's $4.6-trillion market is a distant second, with just over 7% of global market cap. Wall Street has such a significant impact on the economy because it is the trading hub of the biggest financial markets in the world's richest nation. Wall

Street is home to the venerable New York Stock Exchange (now called NYSE Euronext), which is the undisputed leader worldwide in terms of average daily share trading volume and total market capitalization of its listed companies. Nasdaq OMX, the second-largest exchange globally, also has its headquarters on Wall Street. Street firms together control trillions of dollars in financial assets, while New York is the second-largest trading center in the foreign exchange market, where daily trading volumes exceed $5 trillion. How does Wall Street have an impact? Wall Street affects the U.S. economy in a number of ways, the most important of which are – Wealth Effect: Buoyant stock markets induce a "wealth effect" in consumers, although some prominent economists assert that this is more pronounced during a real estate boom than it is during an equity bull market. But it does seem logical that consumers may be more inclined to splurge on big-ticket items when stock markets are hot and their portfolios have racked up sizeable gains. Consumer Confidence: Bull markets generally exist when economic conditions are conducive to growth and consumers and businesses are confident about the outlook for the future. When their confidence is riding high, consumers tend to spend more, which boosts the U.S. economy since consumer spending accounts for an estimated 70% of it. Business investment: During bull markets, companies can use their pricey stock to raise capital, which can then be deployed to acquire assets or competitors. Increased business investment leads to higher economic output and generates more employment. Global bellwether The stock market and the economy have a symbiotic relationship, and during good times, one drives the other in a positive feedback loop. But during uncertain times, the interdependence of the stock market and the broad economy can have a severely negative effect. A substantial downturn in the stock market is regarded as a harbinger of a recession, but this is by no means an infallible indicator. For example, the Wall Street crash of 1929 led to the Great Depression of the 1930s, but the crash of 1987 did not trigger a recession. This inconsistency led Nobel laureate Paul Samuelson to famously remark that the stock market had predicted nine of the last four recessions. Wall Street drives the U.S. equity market, which in turn is a bellwether for the global economy. The 2000-02 and 2008-09 global recessions both had their genesis in the U.S., with the bursting of the technology bubble and housing collapse respectively. But Wall Street can also be the catalyst for a global expansion, as is evident from two examples in the current millennium. The 2003-07 global economic expansion commenced with a huge rally on Wall Street in March 2003. Six years later, amid the biggest recession since the 1930s depression, the climb back from the economic abyss started with a massive Wall Street rally in March 2009. Why Wall Street reacts to economic indicators Prices of stocks and other financial assets are based on current information, which is used to make certain assumptions about the future that in turn form the basis for estimating an asset's fair value. When an economic indicator is released, it would usually have little impact on Wall Street if it comes in as per expectations (or what's called the "consensus forecast" or "analysts' average estimate"). But if it comes in much better than expected, it could have a positive impact on Wall Street; conversely, if it is worse than expectations, it would have a negative impact on Wall Street. This positive or negative impact can be measured by changes in equity indices like the Dow Jones Industrial Average or S&P 500, for instance. For example, let's say that the U.S. economy is coasting along and payroll numbers to be released on the first Friday of next month are expected to show that the economy created 250,000 jobs. But when the payrolls report is released, it shows that the economy only created 100,000 jobs. Although one data point does not make a trend, the weak payroll numbers may lead some economists and market-watchers on Wall Street to rethink their assumptions about U.S. economic growth going forward. Some Street firms may lower their forecasts for U.S. growth, and strategists at these firms may also reduce their targets for the S&P 500. Large institutional investors who are clients of these Street firms may choose to exit some long positions upon receiving their lowered forecasts. This cascade of selling on Wall Street may result in equity indices closing significantly lower on the day. Why Wall Street reacts to company results Most medium to large-sized companies are covered by several research analysts who are employed by Wall Street firms. These analysts have in-depth knowledge of the companies they cover, and are sought after by institutional "buy side" investors (pension funds, mutual funds etc.) for their analysis and insights. Part of analysts' research efforts are devoted to developing financial models of the companies they cover, and using these models to generate quarterly (and annual) revenue and earnings per share forecasts for each company. The average of analysts' quarterly revenue and EPS forecasts for a specific company is called the "Street estimate" or "Street expectations." Thus, when a company reports its quarterly results, if its reported revenue and EPS numbers match the Street estimate, the company is said to have met Street estimates or expectations. But if the company exceeds or misses Street expectations, the reaction in its stock price can be substantial. A company that exceeds Street expectations will generally see its stock price rise, and one that disappoints may see its stock price plunge.

Insider Trading Enforcement Solves

SEC's management of Insider trading is effective and evolving

Hohenstein, ’06 -- Kurt Hohenstein, Ph D in History from the University of Virginia, 2006 (“Old Debate and New Rules: SEC Regulation of Insider Trading in the Global Marketplace”, SEC Historical, November 1, Available online at http://www.sechistorical.org/museum/galleries/it/index.php, Accessed 07/08/15)

Part of the reason for the SEC's success in enforcing its rules against insider trading is how the SEC, which in its early years battled with the stock exchanges, developed a cooperative relationship with the stock exchanges, particularly on disclosure and investor confidence issues. Officials of the New York Stock Exchange tightened their own rules in response to the major insider trading scandals, designed to monitor and flag suspicious trading. While there is still disagreement on how far the stock exchanges must go to regulate their own traders, SEC officials and NYSE officers have worked together to create a more transparent system to identify and disclose transactions that appear to violate the law. Both organizations have agreed that wide-spread investor confidence is a priority.(55) The SEC's ability to adapt played a prominent role in the agency's success in regulating insider trading. In 2000, the SEC adopted Rules 10b5-1 and 10b5-2 to deal with new devices for automatic and computer- programmed securities purchases and sales. In addition, Rule 10b5-2 was intended to provide a guide to investors as to what constituted the kinds of duties which would make the misappropriation theory applicable. Regulation FD was yet another response by the SEC to concerns by investment managers, who often shared confidential information with clients, as to how they might avoid insider trading liability yet continue to perform their duties. The Sarbanes-Oxley Act of 2002 extended the SEC concerns about insider trading by requiring "real time disclosure", increasing penalties and lengthening the statute of limitations for fraud, requiring prompter reporting for trades by insiders, and prohibiting trading by insiders during a pension fund blackout.(56) The SEC continues to respond to new situations with rules meant to provide additional instruction to investors and securities professionals as to how the SEC would apply the misappropriation theory to new and changing securities practices. Even as the 21st century revealed new insider trading scandals involving Enron, Martha Stewart and Imclone, the SEC has continued its steady push for more disclosure, more fiscal transparency, and more regularity in financial reporting and accounting in order to ensure that every investor has access to equal information about regulated companies.(57) But the path of insider trading enforcement becomes increasingly complicated as SEC regulations are applied to the global market. The story of insider trading regulation to the present has involved the SEC's use of administrative and common law and institutional competence to react to challenges, and to reshape legal theories in order to promote fair markets and investor confidence. Whether those methods can successfully work to regulate insider trading in the global marketplace will prove to be the challenge for SEC officials as the future history of insider trading unfolds.

SEC regulation deters Insider Trading; multiple warrants

Del Guercio, Odders-White, and Ready ’13 **Diane Del Guercio, Professor at University of Oregon, Elizabeth R. Odders-White, Professor at Wisconsion School of Business, and Mark J. Ready, Professor at Wisconsin School of Business, 2013 (“The Deterrence Effect of SEC Enforcement Intensity on Illegal Insider Trading”, September 2013, Availabe Online at**
http://poseidon01.ssrn.com/delivery.php?ID=218125068102112120114082024088108010103082061020005063086101094127013119113102119078123118100120050104112113075084126017002104020059005039077090125097102122080023037012093070115112090008001068023085114068127031075113003122068092021073100110003&EXT=pdf&TYPE=2**, Accessed 07/08/15)**

The effects of enforcing insider trading laws have been debated in the law, economics, and finance literature for decades. Early arguments proposed by Manne (1966) and Carlton and Fischel (1983) predict that price efficiency improves when trading by insiders with superior information quickly and accurately impounds information into stock prices. An opposing view is that price efficiency is harmed when investors believe that privileged insiders have an unfair informational advantage because it reduces the incentive of outside investors to gather information or even participate in the stock market (Fishman and Hagerty (1992) and Khanna, Slezak, and Bradley (1994)). Under this view, unchecked insider trading crowds out trading by other potential participants, such as institutional investors, who would otherwise compete for profits under a more level playing field. Although we do not attempt to settle this debate, we recognize that both arguments assume that enforcement deters insider trading, a largely untested premise, at least in the United States. We fill this gap by providing direct evidence of the link between resource-based measures of the U.S. Securities and

Exchange Commission's (SEC's) enforcement intensity and the level of insider trading. Despite the fact that the U.S. has a longer history of insider trading enforcement and devotes more resources toward it than any other country, we have limited empirical evidence of whether these efforts deter insider trading or affect price efficiency.1 Previous studies have measured the effect of U.S. enforcement by comparing days on which prosecuted insider trades took place with days when they did not. Most studies in this strand of the literature analyze detailed transaction-level data from a single court case (Cornell and Sirri (1992), Chakravarty and McConnell (1999), and Fishe and Robe (2004)), and not surprisingly find mixed evidence. Only Meulbroek (1992) examines a comprehensive sample of Insider trading laws were first enforced in the U.S. in 1961. In 2012, the SEC dedicated $467 million and 1300 staff to the Enforcement Division. This does not count resources devoted to other divisions within the SEC or to enforcement by the U. S. Attorney's Offices of the Department of Justice. See Bhattacharya and Daouk (2002), Beny (2007), and Coffee (2007) for cross-country comparisons. all prosecuted insider trading cases, although her sample ends over two decades ago in 1989. In addition, studies of prosecuted trades suffer from the well-known concern that the results may not generalize if successfully prosecuted trades systematically differ from the population of all illegally informed trades. Most empirical evidence on the effects of enforcement comes from cross-country analysis either comparing countries with different enforcement regimes (Bhattacharya et al. (2000) and Griffin et al. (2011)), or testing for the impact of the first-time enactment or enforcement of insider trading laws (Bhattacharya and Daouk (2002), Bushman et al. (2005), DeFond et al. (2007), Fernandes and Ferreira (2009)). The consensus in this literature is that the enforcement of insider trading laws matters, rather than just the law on the books, and that more aggressive enforcement is associated with improvements in liquidity and stock price informativeness, and lower costs of capital, generally supporting the crowding out view. In this paper, we argue that dramatic changes in insider trading enforcement since the 1980s enable us to empirically identify the effects of more aggressive enforcement on trader behavior and stock price discovery. First, the types of trades that expose individuals to legal liability has broadened in scope since the 1980s, extending far beyond the original principles of those with a fiduciary duty to the stock traded (Nagy, 2009; Bainbridge, 2012). Second, punishments for successfully prosecuted traders have become more severe, while at the same time the amount of resources devoted to enforcement has increased dramatically. For example, the SEC's budget in real terms is over four-times larger today than it was in the 1980s. Finally, high-profile insider trading cases (e.g., Galleon) and recent developments in SEC enforcement have both received extensive press coverage, suggesting that regulators have been actively signaling their increased enforcement aggressiveness. We posit that traders are aware of these developments and test whether more aggressive SEC enforcement effort deters illegal insider trading and affects price discovery. To measure variation in the intensity of SEC enforcement over time, we follow recent studies that use resource-based measures to test for the effects of enforcement on capital market outcomes. For example, Christensen, Hail, and Leuz (2011) show that stock market liquidity increases by 15% after European reforms to enforce insider trading and market manipulation laws, but only in the countries with the highest regulatory staff and the highest growth in staff from before to after the reforms. In the spirit of Jackson and Roe (2009), we argue that both the level of the SEC's budget in constant 2011 dollars and the number of staff positions available in SEC annual reports are useful proxies for investors' perceived enforcement intensity of insider trading laws. We show that SEC resources vary substantially over time, and more importantly, that annual increases and decreases are often driven by the idiosyncrasies of the federal budgeting process and are arguably exogenous to the level of illegal insider trading. We also show that the years following the high-profile Galleon insider trading case in October 2009 represent a structural break in SEC enforcement, and an opportunity for further identification of the effect of enforcement. This date marks the beginning of a transformative restructuring of the SEC's Enforcement Division, including the introduction of more effective detection technologies, new legal tools (e.g., cooperation agreements), and a commitment to target more sophisticated serial Wall Street offenders. Most legal experts agree that the SEC's aggressiveness in detecting and prosecuting insider trading in the post-Galleon era is unprecedented. For example, former SEC Commissioner and current Stanford Law Professor Joseph Grundfest stated in the Wall Street Journal that the SEC has "declared war on insider trading" and is taking "a zero-tolerance approach."2 We use data on a comprehensive sample of SEC prosecuted cases from fiscal years 2003 through 2007 and 2010 through 2011 to document that the typical prosecuted trader is more likely to be a sophisticated Wall Street professional in the post-Galleon era, consistent with a structural break. Recent data on SEC prosecuted cases also allow for a comparison to Meulbroek's (1992) results from the 1980s, a period with both fewer enforcement budget and staff resources and less effective tools for detecting and prosecuting insider trading. Under more aggressive enforcement, traders with access to inside information before its public announcement should fear detection and punishment, and thus less illegal trading will occur. As long recognized in the literature, deterrence should also manifest in the pattern of price discovery around news events. With less illegally-informed trading, the stock price reaction to news should be more concentrated at the public announcement, with less anticipatory run-up of prices in the pre-announcement period.3 Market makers and other liquidity providers would also view trading by insiders as a less serious threat under aggressive enforcement,

suggesting that insiders' trades would result in smaller price changes. We find that the price impact on days with prosecuted insider trades is in fact much smaller in the last decade than in the 1980s, consistent with a deterrent effect. Meulbroek reports an average abnormal return of 3.1% on insider trading days, whereas the average from our more recent sample is 0.5%. Moreover, inflation-adjusted insider dollar volume is surprisingly similar in the two sample periods despite a roughly eight-fold increase in total trading volume, suggesting that insiders did not scale up their volume in the later period, perhaps reflective of an increased fear of prosecution. The pronounced decrease in relative insider trading volume is only partially responsible for the smaller price impacts. In a subsample representing the top quintile of insider volume, the abnormal insider trading day return is still only about 1.5%, significantly different from 3.1% at the 1% level, consistent with more muted reactions to informed trading by liquidity providers. To tie these findings more directly to enforcement intensity, we show that variation in insider volume is significantly related to variation in SEC enforcement intensity. Specifically, we show that while illegal insiders trade more in higher-volume stocks, this sensitivity to stock volume is smaller when SEC budgets and staffing are higher and during the post-Galleon period. This is consistent with the predictions of a modified Kyle model in which insiders facing greater fear of prosecution scale up their trading less aggressively in response to increases in uninformed volume. In light of the potential lack of generalizability of results obtained from any sample of only prosecuted cases, we also test whether pre-announcement run-up is negatively related to our proxies for SEC enforcement intensity using two additional samples that are free of selection bias. Specifically, we analyze patterns of price discovery for all annual earnings announcements and all takeover bid announcements for publicly-traded target firms from the early 1980s through 2011. Earnings and takeover news are especially relevant because they represent the most common type of information on which prosecuted insiders trade. For general samples of both types of informational events, we find significant negative relations between the pre-announcement price run-ups and both resource-based measures of SEC enforcement intensity after controlling for a time trend and other factors related to the information content of the announcement. This suggests that increased SEC effort reduces insider trading in advance of these events. Even after controlling for these continuous measures, we find that pre-announcement price runups are significantly lower for earnings announcements during the 2010 and 2011 fiscal years, indicating that the change in SEC tools and increased severity of punishment had an additional dampening effect on insider trading, beyond what would have been expected given the level of SEC budget or staff. Our resource-based, U.S. enforcement intensity measures allow us to exploit thirty years of time-series variation to explain patterns of price discovery and pre-announcement price run-up, and improve our understanding of the deterrence effects of public enforcement.

Insider Trading Hurts Econ

Insider trading erodes the economy

Stefano 11 — Theodore F. di Stefano is a founder and managing partner at Capital Source Partners, which provides a wide range of investment banking services to the small and medium-sized business and is also a frequent speaker to business groups on financial and corporate governance matters, 2011 ("Who's Hurt by Insider Trading", 11/4/11, available at http://www.ecommercetimes.com/story/73674.html date accessed 7/10/15 // K.K)

What's Wrong With Insider Trading? I have no doubt that there are still people who wonder what the big deal is about insider trading. It seems to be a victimless crime, right? The fact is that such trading erodes our very economic foundation. Why is that? Because such trading creates a trading field that is not level -- meaning only certain "special" people on this trading field possess valuable information about specific securities. Such information has the effect of oversized gains for a certain few and losses to the masses. This is patently unfair on its face. Our economic system and stock exchanges need to be efficient and honest. This means that everyone involved in trading securities has access to the same information as everyone else. It doesn't necessarily mean

that someone involved in the stock market will take advantage of the available information. It does mean, however, that no information is hidden from any participants in our markets. Rajaratnam has paid dearly for his moral lapses. Besides being sentenced to 11 years in prison, he must pay a US$10 million fine and forfeit $53.8 million of his illegal profits from insider trading. The interesting (and wonderful) thing about this sentence is that the profits Rajaratnam made from information that wasn't available to the entire market must be returned. This sentence specifically quantifies the illegal gains derived by a person who had information that the general market did not. It clearly shows that nature abhors a vacuum -- the vacuum created by all of the information possessed by Rajaratnam and not possessed by the rest of the market.

Insider Trading causes economic decline and prevents growth

Beny 2 — Laura Nyantung Beny is a John M. Olin Fellow in Law and Economics, Harvard Law School, 2000-2001; Assistant Professor of Law, University of Michigan Law School, beginning 2003, 2002, ("The Political Economy of Insider Trading Legislation and Enforcement: International Evidence", Harvard Law Review, 01/2, available at http://www.law.harvard.edu/programs/olin_center/papers/pdf/348.pdf date accessed 7/10/15 // K.K)

1. Price Informativeness and Capital Allocation Arbitrage (informed) traders play a positive role in price formation, both in the extent and kind of information that is impounded in stock prices (Morck, Yeung and Yu, 2000; Goshen and Parchomovsky, 2000). Risk arbitrageurs invest resources in discovering firm-specific information. Their reward is the profit that they earn by trading with their superior information against less informed investors. Risk arbitrageurs gather proprietary information about firms until the marginal cost of doing so is greater than the marginal benefit. The collective trading of many risk arbitrageurs leads to more efficient capitalization of information into stock prices (Grossman, 1976; Shleifer and Vishny, 1997). In particular, more firm-specific arbitrage by informed traders leads to more firmspecific price variation, making stock prices more informative (French and Roll, 1986; Roll, 1988). Wurgler (2000) shows that capital is more efficiently allocated in the economy the greater the amount of firm-specific information that is capitalized into stock prices. Therefore, if insider trading discourages informed/arbritrage traders, it imposes a negative externality on the economy by reducing the informativeness of stock prices. 2. Capital Constraints and the Cost of Capital Capital constraints limit the range of feasible investments in the economy, in turn limiting economic growth (Bekaert, Harvey, and Lundblad, 2001). A lower cost of capital makes investments more profitable and encourages the entry of new entrepreneurs into the capital market. Using international time series data, Bhattacharya and Daouk (2001) demonstrate that enforcing insider trading legislation is followed by a 5% decrease in the cost of capital (measured by stock returns relative to an international benchmark).18 Their finding suggests that the market's perception of unregulated insider trading makes capital more expensive, while serious enforcement of insider trading laws significantly relaxes capital constraints. Hence enforcing an insider trading ban could lead ultimately to increased economic growth. 3. Transaction Costs and Liquidity Liquid markets are socially valuable because greater liquidity makes purchasing and disposing of shares on short notice, at the appropriate price, easier for investors. The more liquid the market, the more willing investors are to participate in it. This is true for both primary and secondary markets. Amihud and Mendelson (1986) confirm that investors value liquidity by

showing that companies whose shares are more liquid must pay investors a lower expected rate of return than companies with less liquid shares. That is, companies whose shares are more liquid have a lower cost of equity capital. Liquid markets might also mitigate agency costs, by lowering the opportunity cost of monitoring and facilitating the market for corporate control (Maug, 2000; Berndt, 2000).19 As noted above, however, insider trading increases transaction costs and thus reduces stock market liquidity.

Insider trading kills the economy.

Breslow and Yglesias 14 – Jason M. Breslow, degree in communication from American University, Political and Economic reporter. Matthew Yglesias, business and economics correspondent for Slate and the author of The Rent Is Too Damn High, ("Should Insider Trading Be Legal?" Jan 7 2014, PBS, Available online at http://www.pbs.org/wgbh/pages/frontline/business-economy-financial-crisis/to-catch-a-trader/should-insider-trading-be-legal/**) N.H**

On the other hand, I don't think the argument that allowing insider trading would improve market efficiency by putting more information to work makes much sense. As Jie Hue and Thomas Noe write in their analysis of the issue for the Atlanta Federal Reserve, the existence of a sophisticated securities analysis industry in the United States means we don't really face the problem of a major informational gap. Just look at this year's Nobel Prize winners in economics. Eugene Fama has shown that U.S. equities markets are essentially "efficient" in an informational sense as is. His co-winner, Robert Shiller, has done an enormous amount to demonstrate that this kind of efficiency hardly precludes periodic manias and panics and that asset prices fluctuate much more dramatically than the fundamentals. But the substantial holes poked in the theory of the stock market as efficient point to herd psychology as the key flaw, not hidden information that insider trading would reveal.

The real impact of legalizing insider trading, in this instance, would be twofold. On the one hand, firms that don't want their insiders to trade on inside information would need to invest in their own monitoring and enforcement mechanisms of firm-level rules. On the other hand, firms that didn't bother to invest in halting insider trading could construe permissive insider trading rules as a form of additional compensation to employees.

The first impact hardly seems desirable. Since firms couldn't level the same kind of sanctions as the government, the monitoring would need to be much more intensive and expensive to produce equivalent deterrence, leading to a huge waste of social resources. And **the second impact seems potentially disastrous. The last thing the American economy needs is a dynamic in which managers of major corporations have even more financial incentive to spend their time thinking about ways to game the stock market rather than manage their enterprises for the long term.**

There are some good questions to be asked about the overall role of surveillance in American law enforcement that would, of course, have important implications for insider trading cases as well as other kinds of criminal activity. But the fundamental social goal of securities law is to have

well-managed, well-capitalized enterprises and the ban on insider trading serves those goals perfectly well as it stands.

Trillions of dollars are at stake enforcing insider trading rules are key.

Breslow and Yglesias 14 – Jason M. Breslow, degree in communication from American University, Political and Economic reporter. Matthew Yglesias, business and economics correspondent for Slate and the author of The Rent Is Too Damn High, ("Should Insider Trading Be Legal?" Jan 7 2014, PBS, Available online at http://www.pbs.org/wgbh/pages/frontline/business-economy-financial-crisis/to-catch-a-trader/should-insider-trading-be-legal/**) N.H**

This is perhaps a good way of thinking about the fundamental issue that divides us. When I look at the contemporary United States, I'm much more inclined to worry that we are seeing systematically too little capital investment than to worry that owners of corporate stock have too little cash in their pockets. Business investment could create jobs and raise productivity, while stock ownership is overwhelmingly concentrated in the hands of the most prosperous Americans.

Weakening insider trading protections will shift us into a lower-trust equilibrium in corporate governance where we see less investment and more cash flushing out to people who don't really need it. A bad recipe.

Your suggestion that vigorous enforcement of insider trading laws is crowding out more worthy investigations is an intriguing one. Certainly even in my role as designated basher of insider trading, I wouldn't try to make the case that this should be our absolute top priority. That said, there are an awful lot of questions one can raise about priority-setting in the federal law enforcement context. We have federal resources dedicated to hassling medical marijuana dispensaries in California, to policing the size of shampoo bottles that people bring onto airplanes, and into deporting otherwise law-abiding people for the "crime" of moving here from Mexico to roll burritos at Chipotle. Obviously, to debate marijuana legalization or airport security or immigration reform would take us far outside the scope of this exercise.

But my point is that to the extent that we're really worried about resource constraints here, insider trading enforcement is hardly the only place to look. More broadly, when you look at the scale of the economic losses associated with the financial crisis and the ensuing recession — literally trillions of dollars in unrecoverable lost output — it's obvious that any genuinely useful regulatory efforts would more than "pay for themselves." Where I think we can agree is that as a purely political matter the Obama administration has developed a bad habit of acting as if vigorous insider trading enforcement is a way of striking at the heart of the issues that led to the crisis. That's at best political theater aimed at garnering a little undeserved populist credibility. It's bad, and the press shouldn't let them get away with it. But it's not a reason to legalize insider trading any more than the existence of unsolved murders would be a reason for a state to legalize car theft. America's market regulators and federal prosecutors likewise need to be able to walk and chew gum at the same time.

Impacts

War

Economic decline triggers multiple impacts such as war and terrorism

Royal 10 - Jedediah Royal, Director of Cooperative Threat Reduction at the U.S. Department of Defense, ("Economics of War and Peace: Economic, Legal and Political Perspectives" 2010 pg 213-215 Accessed 7/6/15)

Less intuitive is how periods of economic decline may increase the likelihood of external conflict. Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behavior of interdependent states. Research in this vein has been considered at systemic, dyadic and national levels. Several notable contributions follow. First, on the systemic level, Pollins (2008) advances Modelski and Thompson's (1996) work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of a pre-eminent power and the often bloody transition from one pre-eminent leader to the next. As such, exogenous shocks such as economic crises could usher in a redistribution of relative power (see also Gilpin, 1981) that leads to uncertainty about power balances, increasing the risk of miscalculation (Fearon, 1995). Alternatively, even a relatively certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power (Werner, 1999). Separately, Pollins (1996) also shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among major, medium and small powers, although he suggests that the causes and connections between global economic conditions and security conditions remain unknown. Second, on a dyadic level, Copeland's (1996, 2000) theory of trade expectations suggests that 'future expectations of trade' is a significant variable in understanding economic conditions and security behavior of states. He argues that interdependent states are likely to gain pacific benefits from trade so long as they have an optimistic view of future trade relations. However, if the expectations of future trade decline, particularly for difficult to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by interdependent states. Third, others have considered the link between economic decline and external armed conflict at a national level. Blomberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write, the linkages between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the flavor. Moreover, the presence of a recession tends to amplify the extent to which international and external conflicts self-reinforce each other. (Blomberg & Hess, 2002, p. 89) Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapana, 2004), which has the capacity to spill across borders and lead to external tensions. Furthermore, crises generally reduce the popularity of a sitting government . 'Diversionary theory' suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect. Wang (1996), DeRouen (1995), and Blomberg, Hess, and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997), Miller

(1999), and Kisangani and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak Presidential popularity, are statistically linked to an increase in the use of force. In summary, recent economic scholarship positively correlates economic integration with an increase in the frequency of economic crises, whereas political science scholarship links economic decline with external conflict at systemic, dyadic and national levels. This implied connection between integration, crises, and armed conflict has not featured prominently in the economic-security debate and deserves more attention.

Economic decline causes conflict, resource competition, terrorism and war

Kemp, 10 - Director of Regional Strategic Programs at The Nixon Center, served in the White House under Ronald Reagan, special assistant to the president for national security affairs and senior director for Near East and South Asian affairs on the National Security Council Staff, Former Director, Middle East Arms Control Project at the Carnegie Endowment for International Peace, Geoffrey The East Moves West: India, China, and Asia's Growing Presence in the Middle East", p. 233-4)

The second scenario, called Mayhem and Chaos, is the opposite of the first scenario; everything that can go wrong does go wrong. The world economic situation weakens rather than strengthens, and India, China, and Japan suffer a major reduction in their growth rates, further weakening the global economy. As a result, energy demand falls and the price of fossil fuels plummets, leading to a financial crisis for the energy-producing states, which are forced to cut back dramatically on expansion programs and social welfare. That in turn leads to political unrest: and nurtures different radical groups, including, but not limited to, Islamic extremists. The internal stability of some countries is challenged, and there are more "failed states." Most serious is the collapse of the democratic government in Pakistan and its takeover by Muslim extremists, who then take possession of a large number of nuclear weapons. The danger of war between India and Pakistan increases significantly. Iran, always worried about an extremist Pakistan, expands and weaponizes its nuclear program. That further enhances nuclear proliferation in the Middle East, with Saudi Arabia, Turkey, and Egypt joining Israel and Iran as nuclear states. Under these circumstances, the potential for nuclear terrorism increases, and the possibility of a nuclear terrorist attack in either the Western world or in the oil-producing states may lead to a further devastating collapse of the world economic market, with a tsunami-like impact on stability. In this scenario, major disruptions can be expected, with dire consequences for two-thirds of the planet's population.

Heg

The economy is key to national security

Flournoy and Fontaine '15 - Michèle Flournoy is chief executive of the Center for a New American Security and former undersecretary of defense for policy in the Obama administration. Mr. Fontaine is president of the center and

former foreign-policy adviser. Richard Fontaine is President of the Center for a New American Security (CNAS). He served as a Senior Advisor and Senior Fellow at CNAS from 2009-2012 and previously as foreign policy advisor. Worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. 2015 ("Economic Growth Is a National Security Issue" Available Online at http://www.wsj.com/articles/economic-growth-is-a-national-security-issue-1432683397**, May 26, 2015, Accessed 7/7/15) N.H**

The truth is that national security and economic strength are inextricably linked, and Washington needs to pursue both. In siloed government agencies, though, they are too often considered in isolation. America's economy is the foundation of its military and political power, and boosting growth helps relieve the downward pressure on defense and foreign-affairs budgets that reduces Washington's ability to shape international events. With the world aflame from Syria to Ukraine, and tensions with China rising, the demand for U.S. power is higher than it has been in decades. The challenge today is supplying it.

Perceptions of American retrenchment in recent years stem partly from Obama administration policies and congressional dysfunction—the sequester cuts, remember, were supposed to be so onerous that lawmakers would never let them take effect. But equally important is that in the wake of the financial crisis, the country turned inward to focus on creating jobs and reducing income inequality at home rather than sending aid and personnel abroad.

Until the rise of Islamic State in the Middle East and aggression from Russia in Ukraine, the percentage of Americans saying that the country should mind its own business internationally was 52%. This figure, from a December 2013 poll, was the highest ever recorded. The sentiment was driven by pervasive war-weariness and the middle class's increased focus on its pocketbook. Indeed, throughout U.S. history, periods of economic strife have coincided with America's trimming its national sails overseas. An internationally engaged U.S. must be an economically prosperous and confident one.

A bright economic outlook is a powerful counter to the narrative of American decline. It boosts perceptions of U.S. leadership and thus Washington's ability to shape and enforce the international rules of the road, in domains as diverse as trade, maritime security and cyberspace.

U.S. security decline triggers a laundry list of impacts and transition wars

1. Transition wars 2. Asian nuclear war 3. Middle East conflicts 4. Nuclear prolif 5. Nuclear miscalc 6. Terrorism 7. Piracy 8. Organized Crime 9. Climate Change 10. Disease

Brooks 13 – Stephen Brooks, Associate Professor of Government at Dartmouth College, John Ikenberry, Albert G. Milbank Professor of Politics and International Affairs at Princeton University and Global Eminence Scholar at Kyung Hee University in Seoul, John Wohlforth, Daniel Webster Professor of Government at Dartmouth College ("Lean Forward" Foreign Affairs, Available Online at https://www.foreignaffairs.com/articles/united-states/2012-11-30/lean-forward, January/February 2013) N.H

Of course, even if it is true that the costs of deep engagement fall far below what advocates of retrenchment claim, they would not be worth bearing unless they yielded greater benefits. In fact,

they do. The most obvious benefit of the current strategy is that it reduces the risk of a dangerous conflict. The United States' security commitments deter states with aspirations to regional hegemony from contemplating expansion and dissuade U.S. partners from trying to solve security problems on their own in ways that would end up threatening other states. Skeptics discount this benefit by arguing that U.S. security guarantees aren't necessary to prevent dangerous rivalries from erupting. They maintain that the high costs of territorial conquest and the many tools countries can use to signal their benign intentions are enough to prevent conflict. In other words, major powers could peacefully manage regional multipolarity without the American pacifier. But that outlook is too sanguine. If Washington got out of East Asia, Japan and South Korea would likely expand their military capabilities and go nuclear, which could provoke a destabilizing reaction from China. It's worth noting that during the Cold War, both South Korea and Taiwan tried to obtain nuclear weapons; the only thing that stopped them was the United States, which used its security commitments to restrain their nuclear temptations. Similarly, were the United States to leave the Middle East, the countries currently backed by Washington--notably, Israel, Egypt, and Saudi Arabia--might act in ways that would intensify the region's security dilemmas. There would even be reason to worry about Europe. Although it's hard to imagine the return of great-power military competition in a post-American Europe, it's not difficult to foresee governments there refusing to pay the budgetary costs of higher military outlays and the political costs of increasing EU defense cooperation. The result might be a continent incapable of securing itself from threats on its periphery, unable to join foreign interventions on which U.S. leaders might want European help, and vulnerable to the influence of outside rising powers. Given how easily a U.S. withdrawal from key regions could lead to dangerous competition, advocates of retrenchment tend to put forth another argument: that such rivalries wouldn't actually hurt the United States. To be sure, few doubt that the United States could survive the return of conflict among powers in Asia or the Middle East--but at what cost? Were states in one or both of these regions to start competing against one another, they would likely boost their military budgets, arm client states, and perhaps even start regional proxy wars, all of which should concern the United States, in part because its lead in military capabilities would narrow. Greater regional insecurity could also produce cascades of nuclear proliferation as powers such as Egypt, Saudi Arabia, Japan, South Korea, and Taiwan built nuclear forces of their own. Those countries' regional competitors might then also seek nuclear arsenals. Although nuclear deterrence can promote stability between two states with the kinds of nuclear forces that the Soviet Union and the United States possessed, things get shakier when there are multiple nuclear rivals with less robust arsenals. As the number of nuclear powers increases, the probability of illicit transfers, irrational decisions, accidents, and unforeseen crises goes up. The case for abandoning the United States' global role misses the underlying security logic of the current approach. By reassuring allies and actively managing regional relations, Washington dampens competition in the world s key areas, thereby preventing the emergence of a hothouse in which countries would grow new military capabilities. For proof that this strategy is working, one need look no further than the defense budgets of the current great powers: on average, since 1991 they have kept their military expenditures as A percentage of GDP to historic lows, and they have not attempted to match the United States' top-end military capabilities. Moreover, all of the world's most modern militaries are U.S. allies, and the United States' military lead over its potential rivals .is by many measures growing. On top of all this, the current grand strategy acts as a hedge against the emergence regional hegemons. Some supporters of retrenchment argue that the U.S. military should keep its forces over the horizon and pass the buck to local powers to do the dangerous work of counterbalancing rising regional powers. Washington, they contend, should deploy forces abroad

only when a truly credible contender for regional hegemony arises, as in the cases of Germany and Japan during World War II and the Soviet Union during the Cold War. Yet there is already a potential contender for regional hegemony--China--and to balance it, the United States will need to maintain its key alliances in Asia and the military capacity to intervene there. The implication is that the United States should get out of Afghanistan and Iraq, reduce its military presence in Europe, and pivot to Asia. Yet that is exactly what the Obama administration is doing. MILITARY DOMINANCE, ECONOMIC PREEMINENCE Preoccupied with security issues, critics of the current grand strategy miss one of its most important benefits: sustaining an open global economy and a favorable place for the United States within it. To be sure, the sheer size of its output would guarantee the United States a major role in the global economy whatever grand strategy it adopted. Yet the country's military dominance undergirds its economic leadership. In addition to protecting the world economy from instability, its military commitments and naval superiority help secure the sea-lanes and other shipping corridors that allow trade to flow freely and cheaply. Were the United States to pull back from the world, the task of securing the global commons would get much harder. Washington would have less leverage with which it could convince countries to cooperate on economic matters and less access to the military bases throughout the world needed to keep the seas open. A global role also lets the United States structure the world economy in ways that serve its particular economic interests. During the Cold War, Washington used its overseas security commitments to get allies to embrace the economic policies it preferred--convincing West Germany in the 1960s, for example, to take costly steps to support the U.S. dollar as a reserve currency. U.S. defense agreements work the same way today. For example, when negotiating the 2011 free-trade agreement with South Korea, U.S. officials took advantage of Seoul's desire to use the agreement as a means of tightening its security relations with Washington. As one diplomat explained to us privately, "We asked for changes in labor and environment clauses, in auto clauses, and the Koreans took it all." Why? Because they feared a failed agreement would be "a setback to the political and security relationship." More broadly, the United States wields its security leverage to shape the overall structure of the global economy. Much of what the United States wants from the economic order is more of the same: for instance, it likes the current structure of the World Trade Organization and the International Monetary Fund and prefers that free trade continue. Washington wins when U.S. allies favor this status quo, and one reason they are inclined to support the existing system is because they value their military alliances. Japan, to name one example, has shown interest in the Trans-Pacific Partnership, the Obama administration's most important free-trade initiative in the region, less because its economic interests compel it to do so than because Prime Minister Yoshihiko Noda believes that his support will strengthen Japan's security ties with the United States. The United States' geopolitical dominance also helps keep the U.S. dollar in place as the world's reserve currency, which confers enormous benefits on the country, such as a greater ability to borrow money. This is perhaps clearest with Europe: the EU'S dependence on the United States for its security precludes the EU from having the kind of political leverage to support the euro that the United States has with the dollar. As with other aspects of the global economy, the United States does not provide its leadership for free: it extracts disproportionate gains. Shirking that responsibility would place those benefits at risk. CREATING COOPERATION What goes for the global economy goes for other forms of international cooperation. Here, too, American leadership benefits many countries but disproportionately helps the United States. In order to counter transnational threats, such as terrorism, piracy, organized crime, climate change, and pandemics, states have to work together and take collective action. But cooperation does not come about effortlessly, especially when national interests diverge. The United States' military

efforts to promote stability and its broader leadership make it easier for Washington to launch joint initiatives and shape them in ways that reflect U.S. interests. After all, cooperation is hard to come by in regions where chaos reigns, and it flourishes where leaders can anticipate lasting stability. U.S. alliances are about security first, but they also provide the political framework and channels of communication for cooperation on nonmilitary issues. NATO, for example, has spawned new institutions, such as the Atlantic Council, a think tank, that make it easier for Americans and Europeans to talk to one another and do business. Likewise, consultations with allies in East Asia spill over into other policy issues; for example, when American diplomats travel to Seoul to manage the military alliance, they also end up discussing the Trans-Pacific Partnership. Thanks to conduits such as this, the United States can use bargaining chips in one issue area to make progress in others. The benefits of these communication channels are especially pronounced when it comes to fighting the kinds of threats that require new forms of cooperation, such as terrorism and pandemics. With its alliance system in place, the United States is in a stronger position than it would otherwise be to advance cooperation and share burdens. For example, the intelligence-sharing network within NATO, which was originally designed to gather information on the Soviet Union, has been adapted to deal with terrorism. Similarly, after a tsunami in the Indian Ocean devastated surrounding countries in 2004, Washington had a much easier time orchestrating a fast humanitarian response with Australia, India, and Japan, since their militaries were already comfortable working with one another. The operation did wonders for the United States' image in the region. The United States' global role also has the more direct effect of facilitating the bargains among governments that get cooperation going in the first place. As the scholar Joseph Nye has written, "The American military role in deterring threats to allies, or of assuring access to a crucial resource such as oil in the Persian Gulf, means that the provision of protective force can be used in bargaining situations. Sometimes the linkage may be direct; more often it is a factor not mentioned openly but present in the back of statesmen's minds." THE DEVIL WE KNOW Should America come home? For many prominent scholars of international relations, the answer is yes--a view that seems even wiser in the wake of the disaster in Iraq and the Great Recession. Yet their arguments simply don't hold up. There is little evidence that the United States would save much money switching to a smaller global posture. Nor is the current strategy self-defeating: it has not provoked the formation of counterbalancing coalitions or caused the country to spend itself into economic decline. Nor will it condemn the United States to foolhardy wars in the future. What the strategy does do is help prevent the outbreak of conflict in the world's most important regions, keep the global economy humming, and make international cooperation easier. Charting a different course would threaten all these benefits. This is not to say that the United States' current foreign policy can't be adapted to new circumstances and challenges. Washington does not need to retain every commitment at all costs, and there is nothing wrong with rejiggering its strategy in response to new opportunities or setbacks. That is what the Nixon administration did by winding down the Vietnam War and increasing the United States' reliance on regional partners to contain Soviet power, and it is what the Obama administration has been doing after the Iraq war by pivoting to Asia. These episodes of rebalancing belie the argument that a powerful and internationally engaged America cannot tailor its policies to a changing world. A grand strategy of actively managing global security and promoting the liberal economic order has served the United States exceptionally well for the past six decades, and there is no reason to give it up now. The country's globe-spanning posture is the devil we know, and a world with a disengaged America is the devil we don't know. Were American leaders to choose retrenchment, they would in essence be running a massive

experiment to test how the world would work without an engaged and liberal leading power. The results could well be disastrous.

No political support for the plan

Robinson, 2010 (William Jeremy, Georgetown Law, J.D., "Free at What Cost?: Cloud Computing Privacy Under the Stored Communications Act" Georgetown Law Journal Vol. 98)

Although Congress has historically favored the enlargement of privacy protections, it is unlikely to lead the fight to expand online privacy. Congressional inertia can be overcome when the right combination of variables intersect, including political momentum and societal demand.239 Two main obstacles currently prevent these variables from aligning for online privacy issues. First, the SCA itself impedes the adoption of new privacy measures by shrinking the gap between the existing and ideal degree of privacy protections that Congress might want. Second, recent congressional actions are reducing the sphere of individual privacy, especially after the September 11, 2001 terrorist attacks, rather than seeking its expansion.240 The SCA limits the political value of tackling online privacy issues and, therefore, obstructs efforts to adopt stronger protections. Congress has a limited capacity to pursue new legislation and it is hard to get its finite attention focused on a particular issue. Consequently, seeking incremental change in a previously legislated subject area is particularly difficult.241 The SCA already provides some quantum of privacy in online communications and content, but as society embraces new technologies, including cloud computing, the balance that the Act struck more than two decades ago may no longer be appropriate. But aligning the SCA's provisions with current mainstream views about online privacy would not require dramatic changes that would generate substantial public attention. Instead, such an effort would likely involve making incremental enhancements to the Act's structure, clarifying issues of judicial dispute, or modernizing statutory language.242 Because of the limited political return such modest changes would offer, politicians have few incentives to advocate for them.

No Turns – impossible to build support for the plan.

Robinson, 2010 (William Jeremy, Georgetown Law, J.D., "Free at What Cost?: Cloud Computing Privacy Under the Stored Communications Act" Georgetown Law Journal Vol. 98)

The SCA also influences societal expectations about online privacy and thus minimizes the political pressure for change. Societal forces can cause both Congress and the courts to revisit privacy protections. Within the judicial realm, the Court held in Katz v. United States that privacy issues under the Fourth Amendment focus on whether society is prepared to recognize an expectation of privacy under certain circumstances as being reasonable.243 This approach makes it difficult for privacy advocates to advance their interests because of the circularity in using societal expectations to define new legal protections for individual privacy when those expectations are influenced by existing legal protections.244 In the same circular manner, the SCA's privacy standards subtly influence societal norms when they are reflected in media reports, judicial decisions, and terms of service agreements.245 In the legislative realm, the lack of a significant disparity between societal privacy expectations and the SCA's existing protections minimizes the political pressure to bring about change. Political action is motivated when constituencies expand and engage their members to generate enough momentum to attract attention.246 Yet, privacy issues attract a limited natural constituency and building a large coalition of interested online users to generate political change is difficult247—particularly when the SCA's existing statutory scheme continues to define and reinforce societal norms about online privacy. Even if there is societal demand for greater online privacy protections, elected officials and judges need to recognize that a shift in expectations has happened. However, the demographics of Congress and

the Judiciary make it unlikely that their members are well-positioned to determine society's expectations, especially about emerging technologies. Younger people are much more likely to embrace cloud computing services,248 but the average age of senators249 and House members250—as well as the Justices251 on the Court—reflects a notable generational gap from this core user population. Advocates for enhanced online privacy measures will have to bridge this divide and ensure that elected officials and judges understand the technology and its implications for individual privacy before they can secure their assistance in changing the status quo.

SEC opposition makes any reform to ECPA a huge fight — empirics prove the SEC can block reform

Fulton 14 — Sandra Fulton, 2014 ("SEC Blocking Update to Electronic Privacy Laws," American Civil Liberties Union, April 11th, Available Online at https://www.aclu.org/blog/sec-blocking-update-electronic-privacy-laws, Accessed 7-16-2015)

During the long, hard fight to bring the outdated Electronic Communications Privacy Act (ECPA) into the 21st century, advocates have run into the most unlikely of opponents: the Securities and Exchange Commission (SEC). Yes, **the SEC**—the agency charged with regulating the securities industry—**has brought the ECPA update to a screeching halt**. Yesterday the ACLU, along with the Heritage Foundation, Americans for Tax Reform and the Center for Democracy and Technology, sent the agency a letter calling them out on their opposition.

ECPA, enacted in 1986, is the main statute protecting our online communications from unauthorized government access. Unfortunately, as our lives have moved online the law has remained stagnant, leaving dangerous loopholes in our privacy protections. A broad coalition including privacy and consumer advocates, civil rights organizations, tech companies, and members of Congress from both parties has been pushing for an update. Strong bipartisan legislation to update the law has over 200 sponsors and is making serious headway in Congress. Even the Department of Justice—the law enforcement agency with arguably the most to lose in such an update—testified that some ECPA loopholes need to be closed.

But the SEC is pushing back—essentially arguing that they should get to keep one of the loopholes that have developed as the law has aged. When ECPA was passed in 1986, Congress developed an elaborate framework aimed at mirroring existing constitutional protections. Newer email, less than 180 days old, was accessible only with a warrant. Based on the technology of the time, older email was assumed to be "abandoned" and was made accessible with a mere subpoena. Similarly, another category of digital records, "remote computing services," was created for information you outsourced to another company for data processing. Seen as similar to business records, it could also be collected with a subpoena under the law.

Fast forward to the 21st Century. Now we keep a decade of email in our inboxes and "remote computing services" has morphed into Facebook keeping all our photos or Microsoft storing our Word documents in their cloud. Suddenly the SEC can access content in way it never could before.

But in 2010 the 6th Circuit, in United States v Warshak, ruled that email was protected by the Fourth Amendment. Since the SEC doesn't have the power to get a search warrant, they lost the benefit of the loophole that they had been exploiting.. Up until now this hasn't seemed like a big deal. They have never legally challenged this prohibition or been able to identify a case, pre- or post-Warshak, where they have really needed this authority; they already have a wide range of tools at their disposal.

So while the SEC is trying to frame the issue as a loss of authority, it is really a power grab—one that would apply not just to the SEC but all federal and state agencies, including the IRS, DEA, and even state health boards.

Even if the plan has some support, the SEC blocks passage — regardless of the truth of the SEC's claims, congress is buying it

Rottman and Mcauliffe 15 — Gabe Rottman and Katie Mcauliffe, 2015 ("How Congress Can Protect Americans' Email Privacy," *Roll Call*, January 27th, Available Online at http://www.rollcall.com/news/how_congress_can_protect_americans_email_privacy_commentary-239611-1.html?pg=1&dczone=opinion, Accessed 7-14-2015)

Congress should have passed the bipartisan ECPA reform bills last year. But one federal agency, the Securities and Exchange Commission, essentially blocked its passage. As a civil regulatory agency, the SEC doesn't have warrant authority. It only has subpoena power. By holding up ECPA reform, it's trying to obtain the power of a warrant with the lower standards of proof required to issue a subpoena. In short, the SEC wants indiscriminate power to investigate American businesses and their employees and customers by gaining access to private records and property stored online, without convincing a judge a crime is likely being committed. That is an unprecedented, unnecessary and unjust power grab, and rather than acquiescing to it, members of Congress should regard it as a cause to rebuke the agency that attempted it.

Terror Links

Even privacy advocates support keeping the SCA to stop threats

Wyden et al. 14 — Ron Wyden, senator from Oregon since 1996, member of Senate Select Committee on Intelligence with access to classified meta-date program information, Mark Udall, Senator from Colorado from 2009 to 2015, also a member of the Senate Select Committee on Intelligence, and Martin Heinrich, senator from New Mexico, 2014 (. "BRIEF FOR AMICI CURIAE SENATOR RON WYDEN, SENATOR MARK UDALL, AND SENATOR MARTIN HEINRICH IN SUPPORT OF PLAINTIFF-APPELLANT, URGING REVERSAL OF THE DISTRICT COURT," *Electronic Frontier Foundation*, submitted to *Smith v. Obama*, September 9th, Available online at https://www.eff.org/document/wyden-udall-heinrich-smith-amicus, Accessed 7-16-15)

For example, the Stored Communications Act permits the government to obtain precisely the same call records that are now acquired through bulk collection under section 215 when they are

"relevant and material to an ongoing criminal investigation." 18 U.S.C. §2703 (d). Individualized orders for phone records, as opposed to orders authorizing bulk collection, can also be obtained under section 215. 50 U.S.C. §1861.7National security letters, which do not require a court order, can also be used by the government to obtain call records for intelligence purposes. See18 U.S.C. §2709. The government can also acquire telephony metadata on a real-time basis by obtaining orders from either regular federal courts or the FISC for the installation of pen registers or trap-and-trace devices. See18 U.S.C. §§3122, 3125; 50 U.S.C. §1842. And the government may also seek call records using standard criminal warrants based on probable cause. See 18 U.S.C. §2703 (c)(A); Fed. R. Crim. P. 17(c). The government can use many of these authorities without any more evidence than what is currently required to use the bulk phone-records database, with less impact on the privacy interests of innocent Americans.

SCA is used for tracking in tens of thousands of cases

Witmer-Rich 14 — Jonathan Witmer-Rich, Assistant Professor of Law at Cleveland-Marshall College of Law of Cleveland State University, JD from University of Michigan School of Law B.A. from Goshen College 2014 ("The Rapid Rise of Delayed Notice Searches, and the Fourth Amendment "Rule Requiring Notice," *Pepperdine Law Review*, Available to subscribing institutions via Lexis-Nexis, Accessed 7-16-15)

The volume of cell phone location tracking is huge, with one federal judge estimating in 2011 that "federal courts alone approve 20,000-30,000 tracking requests annually, and the number is rising." n187 These different cell phone tracking technologies are governed by a variety of different legal regimes, and there is considerable uncertainty about which legal regimes govern which types of tracking. n188 In many cases, investigators have been able to covertly track cell phone locations without using a search warrant, for example through court orders under 18 U.S.C. § 2703(d) (the Stored Communications Act) or pen/trap orders under 18 U.S.C. § 3123. n189

In recent years, a number of federal magistrate judges have begun demanding that police obtain search warrants for various categories of cell phone tracking data, while other courts continue to permit investigators to use less stringent forms of statutory authority. n190 Amidst this uncertainty, it is clear that investigators are increasingly (though not uniformly) using Fourth Amendment search warrants to conduct various kinds of cell phone location tracking, and that those warrants are always delayed notice [*544] warrants. n191 Some courts have been requiring search warrants for at least some types of cell phone location data (such as prospective, real-time tracking) since at least 2005. n192

To the extent investigators engage in covert cell phone location tracking using statutory orders that are not search warrants, that practice will not be reported in the Delayed Notice Reports (which reports on "warrants" issued under § 3103a). But to the extent investigators conduct the exact same covert tracking using search warrants, that tracking will be reported in the Delayed Notice Reports. It is impossible to determine precisely what percentage of the delayed notice search warrants in the covered years (2006-2012) are warrants for cell phone location tracking. Some investigators likely continue to perform this tracking without using reported search warrants. n193 But given the judicial pressure to use search warrants, it is quite likely that investigators are increasingly using reported search warrants to conduct cell phone location tracking. n194 This shift--from conducting covert cell location tracking searches with court

orders, to conducting that same covert tracking with delayed notice search warrants--would result in a steady increase in the reported number of "delayed notice search warrants" in the Delayed Notice Reports. This increase would appear even if the total number of covert cell phone location tracking remained constant.

E-mail messages. A similar trend may be occurring with covert searches of e-mail messages, although the time frame here is somewhat more recent. At least since 2010, however, and arguably since 2007 or earlier, investigators have been under increasing pressure to use delayed notice search warrants (reported in the Delayed Notice Reports) for any [*545] covert searching of e-mail messages, instead of using other (unreported) legal mechanisms to do so. n195

Access to e-mail messages is governed by the Stored Communications Act (SCA), passed by Congress in 1986. n196 Under the SCA, investigators can obtain e-mail messages in several ways, some of which do not require a search warrant. Depending on the circumstances, investigators can obtain e-mail messages by using a subpoena, with a court order under § 2703(d), or with a search warrant. n197 In some cases, investigators want to access e-mail records without notifying the owner of the account, and the SCA expressly authorizes that practice in specified circumstances. n198 Indeed, recall that it is precisely this list, from the SCA, that Congress chose to cross-reference in section 3103a for delayed notice search warrants. n199

In short, investigators in past years have been able to obtain e-mail messages without using search warrants (at least in some circumstances), and often have been able to obtain those e-mails covertly, without giving notice to the account holder until some later date. n200 These covert e-mail searches--if conducted without search warrants--would not have been reported in the annual Delayed Notice Reports

This advantage is just wrong—the number of middle eastern students studying in the US has tripled since 9/11

Haynie 2/18 [Devon, Staff writer for US News. 2/18/15, "More Middle Eastern Students Come to the U.S., Find Surprises" http://www.usnews.com/education/best-colleges/articles/2015/02/18/more-middle-eastern-students-come-to-the-us-find-surprises//jweideman]

Middle Eastern students thinking about studying in the U.S. are in good company. Since 2000, the number of students from the Middle East and North Africa has more than tripled, according to a report released by the Institute of International Education. Saudi Arabia, which has one of the fastest-growing student populations in the U.S., sent nearly 54,000 students to the country during the 2013-2014 school year. That same year, the number of North African and Middle Eastern students coming to the States grew by 20 percent. "There's a very long tradition, going back many generations, of students from the Middle East coming to study in the U.S.," says Erik Love, assistant professor of sociology at Dickinson College. "The United States has an excellent system of higher education that in many ways remains the envy of the world."

The Middle East has the highest growth rate—newest ev

Hua 7/29 [University of Michigan. Forbes Staff. 7/29/15, "U.S. Colleges: The American Dream For International Students" http://www.forbes.com/sites/karenhua/2015/07/29/u-s-colleges-the-american-dream-for-international-students///jweideman]

The world still sees America as the land of opportunity – for higher ed. This is why in 2014, there were some 1 million foreign students enrolled in U.S. colleges and universities, another peak in a string of all-time highs going back to 2000. China and India export the most students, followed by South Korea and Saudi Arabia. Currently, about 5.4% of America's college students hail from outside the country – a 14% increase from last year and an 85% increase from just 10 years ago. The numbers aren't just big, they're valuable: The 1.2 million international students studying in the U.S. contribute about $34.6 billion total in tuition and other spending. Though college costs around the world vary widely, U.S. tuition has the distinction of being one of the costliest and, not coincidentally, one of the least affordable based on median income. In many European countries such as Germany, France and Sweden, the price of college is virtually free. The cost is largely absorbed by taxpayer dollars. College is tuition-free in Brazil, as well, but what's most surprising is that the country has sent over 13,000 students to the U.S. to study – the 10th most of any country and also with the second-highest growth rate of 22%. So, how do international students pay for expensive U.S. colleges? According to 2014 Open Doors Data, 65% of college funding for foreign students comes from personal and family funds, but 78% also say the lure to the States comes from more active university recruitment efforts. In fact, 19% report that their U.S. college covered part of the costs with either pathway programs or foreign government scholarship programs. Currently, about half of all international students hail from China, India and South Korea collectively. Whereas the top places of origin were all Asian at the start of the century, this year sees a mix of Asian, Middle Eastern and Canadian. Though China still boasts the largest number of students at 274,439 (23% of the total), Kuwait has seen the largest growth of students sent to the States at a 43% increase over the past year. Other Middle Eastern countries such as Saudi Arabia and Iran also have some of the highest growth rates, as do South American countries Brazil and Venezuela.

Best reports prove uniqueness goes neg

Ruiz 14 [Neil G. Ruiz is a senior policy analyst and associate fellow at The Brookings Institution Metropolitan Policy Program. August 29 2014. "The Geography of Foreign Students in U.S. Higher Education: Origins and Destinations" http://www.brookings.edu/research/interactives/2014/geography-of-foreign-students#/M10420//jweideman]

This report uses a new database on foreign student visa approvals from 2001 to 2012 to analyze their distribution in the United States, finding that: The number of foreign students on F-1 visas in U.S. colleges and universities grew dramatically from 110,000 in 2001 to 524,000 in 2012. The sharpest increases occurred among students from emerging economies such as China and Saudi Arabia. Foreigners studying for bachelor's and master's degrees and English language training accounted for most of the overall growth. Foreign students are concentrated in U.S. metropolitan areas. From 2008 to 2012, 85 percent of foreign students pursuing a bachelor's degree or above attended colleges and universities in 118 metro areas that collectively accounted for 73 percent of U.S. higher education students. They contributed approximately $21.8 billion in tuition and $12.8 billion in other spending—representing a major services export—to those metropolitan economies over the five-year period.

Its one of the fastest growing regions for incoming students

O'Malley 14 [Brendan, University world news. 11/20/14, "Middle East swells international student growth in US" http://www.universityworldnews.com/article.php?story=20141120215857 41//jweideman]

The number of international students in American universities rose by 8% in 2013-14, with 73% of the growth accounted for by students from China and Saudi Arabia, according to the latest Open Doors report from the Institute of International Education, or IIE. The fastest growing student populations were from Kuwait, Brazil and Saudi Arabia, where governments are investing heavily in scholarships for international studies, to develop a globally competent workforce, the report said. The fastest growing region this year was the Middle East and North Africa, or MENA, with an increase of 20% in students enrolled in US higher education. The number of international students in US universities rose to a record 886,052, according to the Open Doors Report on International Educational Exchange, published by the IIE in partnership with the US Department of State's Bureau of Educational and Cultural Affairs on 17 November. In 2013-14, the number of international students rose by 66,408 compared to the year before. "International education is crucial to building relationships between people and communities in the United States and around the world," said Evan M Ryan, assistant secretary of state for educational and cultural affairs. "It is through these relationships that together we can solve global challenges like climate change, the spread of pandemic disease, and combating violent extremism," she said.

AT: Discrimination

Double bind. Either A. campus culture is an alt cause, or B. The squo solves discrimination

Haynie 2/18 [Devon, Staff writer for US News. 2/18/15, "More Middle Eastern Students Come to the U.S., Find Surprises" http://www.usnews.com/education/best-

colleges/articles/2015/02/18/more-middle-eastern-students-come-to-the-us-find-surprises//jweideman]

Laurie Riggin, an adjunct instructor at Dominican University who runs a course to help international students acclimate, says many of the nearly 70 Saudi students enrolled at the school were primarily worried about safety before coming to the U.S. "Many international students' perception of safety in the U.S. is based on media that isn't entirely accurate," she says. "I would really encourage them to keep an open mind about these experiences because college campuses are safe and supportive environments." Saad Alqurashi, a 21-year-old from Riyadh, Saudi Arabia, is one of those students. The freshman at Dominican blames his initial safety concerns on American films, which are often packed with crime and violence. "It's not like the movies," he says of the U.S. "You have to come here and see everything with your own eyes." With reports of intimidation aimed at Muslims at U.S. colleges and the recent shooting of three Muslims near the University of North Carolina—Chapel Hill, Middle Eastern students may be understandably concerned about how they will be treated at school. While American campuses are generally tolerant and attacks are very unlikely, experts say Middle Eastern students should be prepared to face some level of prejudice or discrimination, even if small. "I think, yes, in this day and age Muslim international students and Arab Muslims in particular experience prejudice both within the student body and in the host community," says Stephen Sheehi, Sultan Qaboos bin Said Chair of Middle East Studies at the College of William and Mary. The good news, says Sheehi, who has written about Islamophobia, is that they can also find a community of like-minded people in Muslim student groups, the local mosque and other organizations. Love, who also studies Islamophobia, agrees. "In general, U.S. campus culture is quite welcoming and supportive of diversity and Muslim life and the idea that there should be space for people of all cultures and religions," he says. Mohammed Abu Dalhoum, who left his home of Amman, Jordan to attend Maryland's Washington College, says he has rarely felt any kind of discrimination or discomfort in the States. Every now and then in a political science class, someone will say something ignorant about the Middle East. That angers him, he says, but then he shakes it off.

AT: Hearts and minds

A/C—ISIS Propaganda

ISIS propaganda is too strong for the plan to overcome

Engel 7/15 [Pamela Engel is a reporter for Business Insider's main page, covering mostly breaking news and crime. She previously worked for the Associated Press in Indianapolis and has also written for The Columbus Dispatch, the Scripps Howard news wire and the New York Observer. Ohio University, bachelor's degree in journalism. 7/15/15, "ISIS is winning hearts and minds in a deceptively simple way" http://www.businessinsider.com/isis-is-winning-hearts-and-minds-in-a-deceptively-simple-way-2015-7//jweideman]

While many Westerners associate Islamic State propaganda with violence and beheadings, the terror group also likes to showcase its deceptively "softer" side to those within its territory in the Middle East, as a Vocativ analysis showed this week. And given that their target audience is disaffected Sunnis living in war-torn Iraq and Syria, the plan is working. Videotaped beheadings and action-packed fighting scenes might be effective recruitment tools for young people who are thinking about traveling to Syria to fight with the militants, but the Islamic State (also known as ISIS, ISIL, and Daesh) knows that winning hearts and minds is just as important to its longevity. Vocativ notes that "in the areas it already controls or is fighting to take over, almost half of what [ISIS] broadcasts has a positive theme to it. 'Come to the Islamic State,' is the message. 'There is fun here, and food, and services.'" ISIS markets itself as an Islamic utopia that can provide happiness and stability its residents. In addition to enforcing a strict interpretation of Sharia law, ISIS sets up

schools and consumer protection bureaus in the areas of Iraq and Syria it holds. And apparently, ISIS also operates a mall and amusement park near Mosul, Iraq: The above propaganda video shows children playing and residents talking about how much better life is now that ISIS has moved in and taken control of Mosul. And it's not just amusement parks — earlier this year, ISIS' media wing announced that the group had re-opened a "luxury" hotel in Mosul. The video makes no mention of the headless bodies that can also be seen in the streets of ISIS' self-proclaimed "caliphate," an aspirational Islamic empire that aims to unite the world's Muslims under a single religious and political entity. With its civil services and positive propaganda, ISIS seeks to build a sense of community within its caliphate. And given that many ISIS members are from disaffected Sunni communities, the group has a natural advantage over Westerners in uniform trying to win hearts and minds. Recruiting with camaraderie ISIS also uses positive propaganda, along with more brutal propaganda, to bring in foreign fighters replenish their ranks on the b+attlefield. In an extensive analysis of ISIS propaganda for the counter-extremism think tank Quilliam Foundation, Charlie Winter noted that the idea of belonging is "one of Islamic State's most powerful draws to new recruits," especially Westerners who are thinking of traveling to the caliphate. "Through their regular publication of, for example, videos and photographic reports depicting istirāḥat al-mujāhidīn — fighters relaxing with tea and singing with each other — the propagandists emphasise the idea of brotherhood in the 'caliphate,'" Winter wrote. "The carefully branded camaraderie that one is absorbed into upon arrival in Islamic State-held territories is, as the propagandists would have their audiences believe, almost overwhelming." ISIS "recognize[s] that offers of friendship, security and a sense of belonging are powerful draws for its supporters abroad," Winter wrote.

XT: ISIS already won

The ISIS narrative is too strong for the plan to overcome

Cottee 15 [SIMON COTTEE is a contributing writer for The Atlantic and a senior lecturer in criminology at the University of Kent. He is the author of the forthcoming book The Apostates: When Muslims Leave Islam. March 2 2015. "Why It's So Hard to Stop ISIS Propaganda" http://www.theatlantic.com/international/archive/2015/03/why-its-so-hard-to-stop-isis-propaganda/386216///jweideman]

ISIS has beheading videos. The CSCC doesn't. Beheading videos are shocking and repugnant. But they are also weirdly fascinating—and they go viral for this reason. The CSCC's videos, by and large, are not shocking or repugnant, still less fascinating—and don't go viral for this reason. ISIS's métier is shock and gore, whereas the CSCC's, to put it unkindly, is more mock and bore, more Fred Flintstone than Freddy Krueger. Shock and gore, needless to say, is where the action is—and hence where the Internet traffic tends to go. "You're never going to be able to match the power of their outrageousness," Fernandez said, conceding this disadvantage. ISIS has a vast network of "fanboys," as its virtual supporters are widely and derisively known, who disseminate the group's online propaganda. (ISIS ennobles them with the title "knights of the uploading.") They are dedicated, self-sufficient, and even, Fernandez said, occasionally funny. And they are everywhere on Twitter, despite the social-media network's efforts to ban them. Fernandez described the group's embrace of social media as "a stroke of genius on their part." The CSCC doesn't have fanboys. More crucially, ISIS has a narrative. This is often described by the group's opponents as "superficial" or "bankrupt." Only it isn't. It is immensely rich. The International Centre for the Study of Radicalisation and Political Violence estimates that of the 20,000 or more foreign jihadists believed to have gone to fight in Syria and Iraq, around 100 are from the United States. These fighters may be naive or stupid, but they didn't sacrifice everything for nothing. John Horgan, director of the Center for Terrorism and Security Studies at University of Massachusetts Lowell, told me that people who join groups like ISIS "are trying to find a path, to answer a call to something, to right some perceived wrong, to do something truly meaningful with their lives." The CSCC doesn't have a narrative—not one, at any rate, remotely comparable in emotional affect and resonance to that of ISIS. No one is more sharply aware of this than Fernandez himself. "ISIS's message," he said, "is that Muslims are being killed and that they're the

solution. ... There is an appeal to violence, obviously, but there is also an appeal to the best in people, to people's aspirations, hopes and dreams, to their deepest yearnings for identity, faith, and self-actualization. We don't have a counter-narrative that speaks to that. What we have is half a message: 'Don't do this.' But we lack the 'do this instead.' That's not very exciting. The positive narrative is always more powerful, especially if it involves dressing in black like a ninja, having a cool flag, being on television, and fighting for your people." In his biography of the philosopher Ludwig Wittgenstein, Ray Monk discussed Wittgenstein's decision to enlist in the Austro-Hungarian army during the First World War. It wasn't really about patriotism, Monk suggested. Rather, Wittgenstein "felt that the experience of facing death would, in some way or other, improve him. ... What Wittgenstein wanted from the war was a transformation of his whole personality, a 'variety of religious experience' that would change his life irrevocably." One of the greatest challenges in counterterrorism today is working out how to create a narrative that directly speaks to a similar kind of longing among potential terrorists—and channels that longing in a nonviolent direction. As Scott Atran argues in Talking to the Enemy, "In the long run, perhaps the most important counterterrorism measure of all is to provide alternative heroes and hopes that are more enticing and empowering than any moderating lessons or material offerings." The more immediate, but no less intractable, challenge is to change the reality on the ground in Syria and Iraq, so that ISIS's narrative of Sunni Muslim persecution at the hands of the Assad regime and Iranian-backed Shiite militias commands less resonance among Sunnis. One problem in countering that narrative is that some of it happens to be true: Sunni Muslims are being persecuted in Syria and Iraq. This blunt empirical fact, just as much as ISIS's success on the battlefield, and the rhetorical amplification and global dissemination of that success via ISIS propaganda, helps explain why ISIS has been so effective in recruiting so many foreign fighters to its cause.

AT: ISIS Impact

AT: Grids—Author indicts

Their grid internal link ev cites Frank Gaffney—he's a crazy right wing islamophobe and conspiracy theorist--- zero quals. Seriously he's super racist.

SPLC 15 [The Southern Poverty Law Center is an American nonprofit legal advocacy organization specializing in civil rights and public interest litigation. 2015. "Frank Gaffney Jr." http://www.splcenter.org/get-informed/intelligence-files/profiles/frank-gaffney-jr//jweideman]

Once a respectable Washington insider, Frank Gaffney Jr. is now one of America's most notorious Islamophobes. Gripped by paranoid fantasies about Muslims destroying the West from within, Gaffney believes that "creeping Shariah," or Islamic religious law, is a dire threat to American democracy. He favors congressional hearings to unmask subversive Muslim conspiracies, and was even banned from far-right Conservative Political Action Conference events after accusing two of its organizers of being agents of the Muslim Brotherhood. In His Own Words: "We're witnessing not just the violent kind of jihad that these Islamists believe God compels them to engage in, but also, where they must for tactical reasons, a more stealthy kind, or civilizational jihad as the Muslim Brotherhood calls it. We're witnessing that playing out, not only in places in the Middle East but also in Europe, in Australia, in Canada and here in the United States as well." —Quoted by Newsmax, October 2011 "So pervasive now is the MB's [Muslim Brotherhood's] 'civilization jihad' within the U.S. government and civil institutions that a serious, sustained and rigorous investigation of the phenomenon by the legislative branch is in order. To that end, we need to establish a new and improved counterpart to the Cold War-era's HUAC [House Un-American Activities Committee] and charge it with examining and rooting

out anti-American – and anti-constitutional – activities that constitute an even more insidious peril than those pursued by communist Fifth Columnists fifty years ago. ” –column, Center for Security Policy, October 2011 “We know for a fact that the Muslim Brotherhood has as its mission the worldwide imposition of Islam's toxic, brutally repressive and anti-constitutional supremacist doctrine known as Shariah. And yes, it means here, too.” – column, FamilySecurityMatters.org, August 2013 Background: If Frank Gaffney Jr. had his way, average hard-working Americans of the Muslim faith would be dragged before Congress to face such questions as, “Are you now, or have you ever been, a member of the Muslim Brotherhood?” In Gaffney’s mind, America is in peril, and bringing back the notorious Cold War-era House Un-American Activities Committee (HUAC) would expose the subversives he imagines are working to implement Shariah religious law throughout the land. Gaffney’s wild-eyed accusations would certainly fit right into the red-baiting HUAC tradition, judging from his long history of smears and innuendo aimed at Muslims. There was his groundless 2011 claim that Huma Abedin — aide to then-Secretary of State Hillary Clinton — was part of a “Muslim Brotherhood conspiracy.” That charge was subsequently trumpeted by U.S. Rep. Michele Bachmann (R-Minn.), prompting even conservative Republican stalwarts such as Sen. John McCain (Ariz.) and House Speaker John Boehner (Ohio) to condemn it. Then there was Gaffney’s 2011 claim that two board members of the Conservative Political Action Committee (CPAC) were secretly aiding the Muslim Brotherhood, proving that even potential right-wing allies are not safe from his vitriol. Gaffney’s evidence was predictably flimsy — board member and anti-tax crusader Grover Norquist’s wife is Palestinian-American, while board member Suhail Khan is a Muslim. Both were political appointees in the George W. Bush administration with long experience in conservative Republican Party affairs. Calling the accusations reprehensible, CPAC banned Gaffney from participating in future events. Following his banishment from CPAC events, Gaffney teamed up with the inflammatory right-wing site Brietbart News to offer an alternative conference, called Homeland Threats. Featured speakers at the March 2014 event included U.S. Rep. Steve King (R-Iowa) and Sen. Ted Cruz (R-Tex.), and panel discussions flogged such tired topics as “Benghazigate: The Ugly Truth and the Cover-Up” and “Amnesty and Open Borders: The End of America.” Naturally, Gaffney also hosted a panel entitled “The Muslim Brotherhood, the Civilization Jihad and Its Enablers” in the March Homeland Threats lineup, not so subtly thumbing his nose at his former CPAC comrades in arms. Among the “enablers” of civilization jihad in America, President Obama is near the top of Gaffney’s list. But Gaffney has tried — and failed — to gather support for baseless suggestions that Obama is a practicing Muslim, or for the accusations he leveled in a series of Washington Times articles in 2009 that the Obama administration is adopting the Muslim Brotherhood’s Middle East plan. “What if it turns out that some of the people the Obama administration has been embracing are actually promoting the same totalitarian ideology and seditious agenda as al Qaeda, only they’re doing it from White House Iftar dinners?” he asked in the Washington Times, referring to the meal served after Ramadan fasts. During an appearance on MSNBC’s “Hardball with Chris Matthews” in 2009, Gaffney made a statement that boggled even veteran Gaffney-watchers: “There is also circumstantial evidence, not proven by any means, but nonetheless some pretty compelling circumstantial evidence, of Saddam Hussein's Iraq being involved with the people who perpetrated both the 1993 attack on the World Trade Center and even the Oklahoma City bombing." But Gaffney wasn’t always such a fringe character. As recently as in 2002, a prominent British newspaper listed him with Iraq invasion cheerleaders Paul Wolfowitz, Douglas Feith, and Richard Perle as one of the men “directing” then-President George W. Bush’s post 9/11 security doctrine. A native of Pittsburgh, Pa., Gaffney graduated from the Edmund A. Walsh School of Foreign Service at Georgetown University in 1975, and subsequently received a graduate degree from Johns Hopkins University's Paul H. Nitze School of Advanced International Studies. After serving as an aide to the late Sen. Henry M. “Scoop” Jackson (D-Wash.) in the 1970s, Gaffney in 1983 was appointed Deputy Assistant Secretary of Defense for Nuclear Forces and Arms Control Policy. In 1987, he was nominated for an Assistant Secretary of Defense post, but the Senate did not confirm him. In 1988, he founded the Center for Security Policy (CSP), a hawkish but initially respectable think tank. Sometime after that, he seemed to go off the rails, becoming increasingly taken with a conspiracy theory about the infiltration of the United States by nefarious Muslim Brotherhood operatives burrowed deep within the infrastructure. This line — amplified via Gaffney’s radio show, his contributions to numerous far-right periodicals, and the CSP website — quickly elevated his stature in hard-line anti-Muslim circles.

Their second source is Peter Pry—he’s super biased—the advantage is paranoid hype

Dykes 14 [Melissa, journalist and cofounder of the Daily Sheeple. Global research center. September 2014. “War on Terror” Fearmongering: ISIS Is Going to Attack America’s Electric Grid” http://www.globalresearch.ca/war-on-terror-fearmongering-isis-is-going-to-attack-americas-electric-grid/5400464//jweideman]

Back in August, it was all about how ISIS is tremendously well-funded and like nothing the Pentagon had ever seen and another 9/11 was on the way. Then we were told an ISIS terror attack on American streets is highly likely; so likely, in fact, that an Imminent Terrorist Attack Warning By Feds on US Border alert was released featuring the possibility that ISIS groups operating out of the Mexican border city of Juarez might attack the U.S. with car bombs, although no specific threats had been received. Then we were told that there are nearly a dozen jets missing from war-torn Libya which could be used to strike 9/11-like targets. The new and latest September-fresh talking point is that ISIS is going to attack America’s ‘frail and vulnerable’ electric grid. Frank Gaffney, founder and president of the Center for Security Policy in Washington, has actually given it the monicker “grid jihad.” Not only that, but they are being VERY specific on exactly how ISIS could commit this act and all the ways it could cripple the country if they did. At

a recent press conference, Dr. Peter Pry, a former CIA officer and head of the task force on National and Homeland Security, went on record that America's power grid faces an "imminent" attack by ISIS — and the media has run with it. "There is an imminent threat from ISIS to the national electric grid and not just to a single U.S. city," Pry warns. He points to a leaked U.S. Federal Energy Regulatory Commission report in March that said a coordinated terrorist attack on just nine of the nation's 55,000 electrical power substations could cause coast-to-coast blackouts for up to 18 months. […] "The Congressional EMP Commission, on which I served, did an extensive study of this," Pry says. "We discovered to our own revulsion that critical systems in this country are distressingly unprotected. We calculated that, based on current realities, in the first year after a full-scale EMP event, we could expect about two-thirds of the national population – 200 million Americans – to perish from starvation and disease, as well as anarchy in the streets." (source) Here are just a few of the headlines now coming off the news wire. Chicago Tribune: "ISIS has changed the game for America" If ISIS gets a nuclear electromagnetic-pulse device and succeeds in setting it off in America, it could shut down our electric grid and plunge America into the Dark Ages. KBOI2: "Experts warn of ISIS attack on US power grid" Washington Examiner: "New ISIS threat: America's electric grid; blackout could kill 9 of 10″ "Inadequate grid security, a porous U.S.-Mexico border, and fragile transmission systems make the electric grid a target for ISIS," said Peter Pry, one of the nation's leading experts on the grid. […] "By one estimate, should the power go out and stay out for over a year, nine out of 10 Americans would likely perish," said Frank Gaffney, founder and president of the Center for Security Policy in Washington. WND: "Expert: 'Imminent' ISIS threat to U.S. power grid" Pry surmised such an attack on the U.S. power grid "wouldn't be difficult for them." "There are … open-source computer models where you can figure out which are those nine critical transformer substations where if attacked would take down the whole national power grid," he said. "So something like that could be arranged. It could happen tomorrow. It could happen next week." So glad he's busy giving out precise instructions on exactly how to accomplish this. Let's continue. International Business Times: "ISIS Will Target the U.S. Power Grid, Former CIA Says; Could Tap Other Fellow Extremist Groups to Do the Job" "All they've got to do is contact the Knights Templar, wire these guys $10 million, I mean they'll do anything for money. And say, 'Hey, go across that open U.S. border and take out the electric grid in Arizona, or New Mexico, or Minnesota or New York. Or the entire nation.'" Oh so knocking out the grid would run them about $10 mil? KGNS.TV: "Security experts warn about possible ISIS targets in the US" "Unfortunately, there's a lot to evidence that enemies of this country have figured out that if you attack that very vulnerable grid, they could cause cataclysmic damage to the American people," Gaffney said. Gaffney says the "domino effect" of an attack on the electric grid could reach all corners of the country and be deadly. "Water requires power, food requires power, transportation requires electricity, finance, telecommunications," explained Gaffney. Peter Pry even showed up on Fox to advertise, er, discuss the ISIS electric grid threat: At this point, all the bases on this scenario have been covered. The only thing they didn't do was give senior ISIS leadership a tour of a major power plant, complete with fake badges and blueprints as take home souvenirs. If these experts and reporters have left any detail to the imagination on exactly how ISIS [a US-Saudi sponsored intelligence asset] could carry this plan out and what precise steps are needed to make it a reality, I'm not sure what that is. The repeated talking point also seems noteworthy, considering that one of the last warnings former Homeland Security Secretary Janet Napolitano gave to her successor in an 'open letter' before heading out the door was that a cyber or physical event that knocks out the power grid will occur – and it was not a question of "if" but "when."

AT: Teaming up with cartels

The ISIS-Mexican cartel connection was completely made up--- reject their random newspapers

Smith 15 [J.R. 21st century Wire. Citing the US state Department. 4/17/15, "Latest 'ISIS Camp in Mexico' Story is Completely FAKE" http://21stcenturywire.com/2015/04/17/latest-isis-camp-in-mexico-story-is-completely-fake///jweideman]

There's good money to be made in fake news. Earlier this week on April 14th, a nameless 'news story' appeared on the "Corruption Chronicles Blog" section of the website Judicial Watch, which claimed "ISIS Camp a Few Miles from Texas, Mexican Authorities Confirm." The website claims that 'an ISIS base' exists approximately 8 miles from the US-Texas border in an area known as 'Anapra' just west of Ciudad Juárez in the Mexican state of Chihuahua.Upon closer inspection, it's clear that this story is fake. The following day, even FOX News distanced itself from the story, reporting that US law enforcement agencies flatly denied there was any truth at all to allegations that ISIS militants had set up a training base in Mexico. El Paso-based local news affiliate ABC-7 also contacted multiple federal border agencies. They all said the same thing: the report is unverified, and there is no ISIS in Anapra, or Juarez. Today, the US State Department also weighed-in, calling the claims "unfounded". This did not stop a number of right-wing, fear mongering and opportunistic media outlets from running with this latest fake ISIS story, with some US-based outlets even producing their own fake ISIS beheading videos designed to hype-up the fear surrounding this fake story (as if

we needed any more fake ISIS videos made to scare the US population into submission). If one actually reads into the original Judicial Watch 'report', it soon becomes apparent that nothing in it is actually real. The blog post cites "sources in the Mexican military", and further alludes to an "unnamed Mexican Army officer" and a Mexican "police inspector". Based on the over-the-top sensationalism and the lack of any substance in the story, most intelligent Americans might write it off as just another fake 'ISIS in Mexico' story, but for cash-obsessed media businesses, a wild story like this, whether true or not, will automatically generate tens of thousands of dollars in online ad revenues overnight. Beyond the obvious financial gains however, the real function of a planted story like this is political. By invoking the ISIS threat, it energizes the far right-wing in America which further polarizes the political spectrum. Here we can see how a planted news story is custom designed to advance a fear-based agenda, where media outlets work hand-in-glove with the US government's military establishment to secure more funding and foreign intervention in the Middle East, as well as more funding for the Department of Homeland Security in the US. The Judicial Watch decoy story cites multiple vague sources including "Mexican intelligence sources". This might be the first mention of "Mexican Intelligence" in US media ever, as it's widely accepted that Mexico is not known for having any 'intelligence' body that is not already co-opted by organized drug cartels. Regardless, Judicial Watch and its media affiliates have no reservations about passing off lines like these to their readers: "Another ISIS cell to the west of Ciudad Juárez, in Puerto Palomas, targets the New Mexico towns of Columbus and Deming for easy access to the United States, the same knowledgeable sources confirm." Notice the phrase, "the same knowledgeable sources confirm." This vague wording is all it takes to fool any reader who is already predisposed to swallowing a certain flavor of either pro-war and Islamophobic propaganda. Unfortunately, the story quickly cascaded through what many would classify as the right-wing tabloid media, led by the highly dubious Washington Times (not to be confused with the real media outlet The Washington Post), The Blaze, Drudge Report, and also by 'alternative' media outlet Infowars. The ad revenues from this story alone across all media have already generated millions of dollars in the aggregate. The Judicial Watch blog post then goes on to build-up an imaginary case stating, "During the course of a joint operation last week, Mexican Army and federal law enforcement officials discovered documents in Arabic and Urdu, as well as "plans" of Fort Bliss – the sprawling military installation that houses the US Army's 1st Armored Division. Muslim prayer rugs were recovered with the documents during the operation." Of course, no such "ISIS documents" or "prayer rugs" were ever presented by the Mexican authorities. So the logical conclusion should be fairly certain to anyone by now: they do not exist. Full-Spectrum Propaganda Not content with the initial fake news story, Judicial Watch doubled-down with a "follow-up" story contrived in order to add credence and reinforce the original fake story planted earlier on Tuesday. Their follow-up, impressively entitled, "FBI Holds "Special" Meeting in Juárez to Address ISIS, DHS Not Invited", and again, claims to have scooped this off of a "high-level intelligence source", who must remain anonymous for "safety reasons". Here they claim that another anonymous source has leaked to Judicial Watch about "a secret FBI meeting to determine who is providing information to Judicial Watch". There are only two possibilities here. Either the editor at Judicial Watch is being fed fake information by his "anonymous intelligence sources", or the editor is simply making it up. Either way, you cannot call it journalism, or even 'reporting'. Perhaps worse, is the fact that so many other alternative media outlets have not even questioned the original blog post, and ran with such a wild fish story. All anonymous, and all secret. This has all the makings of a classic circular media psy-op. Judicial Watch continues, stating that: "To the east of El Paso and Ciudad Juárez, cartel-backed "coyotes" are also smuggling ISIS terrorists through the porous border between Acala and Fort Hancock, Texas." Almost hidden away at the very bottom of the same propaganda article in the Washington Times, a tacit admission is printed confirming that the story is not real, stating that Mexican authorities dispute the Judicial Watch invention: "The government of Mexico dismisses and categorically denies each of the statements made today by the organization Judicial Watch on the alleged presence of ISIS's operating cells throughout the border region, particularly at Ciudad Juárez, Chihuahua – El Paso, Texas," Ariel Moutsatsos-Morales, Mexico's minister for press and public affairs, told The Washington Times. The irony here is almost comical, as this official denial by the Mexican government and Moutsatsos-Morales – is the only real item to be found throughout this whole invented ISIS drama.

AT: ISIS WMD's

ISIS can't get WMDs

Cottee 14 [Matthew **Cottee 14**, research analyst with the Non-Proliferation and Disarmament Programme at the International Institute for Strategic Studies; and Dina Esfandiary, research associate with the Non-Proliferation and Disarmament Programme at the International Institute for Strategic Studies, 10/15/14, "The very small Islamic State WMD threat," http://thebulletin.org/very-small-islamic-state-wmd-threat7729//jweideman]

In short, ISIS does seem interested in acquiring chemical, biological, and nuclear weapons, but **ambitions do not** necessarily **equate with reality.** The complexities of such weapons, combined with the difficulties involved in **obtaining** and **handling** the necessary material, make the likelihood of **its use remote. Let's not exaggerate the threat.**

1nc: Squo solves ISIS

Squo solves ISIS

Beauchamp 2/23 [Zack, world correspondent @ Vox, Editor of TP Ideas (ThinkProgress), MSc in IR from London School of Economics, "ISIS is losing," http://www.vox.com/2015/2/23/8085197/is-isis-losing//jweideman]

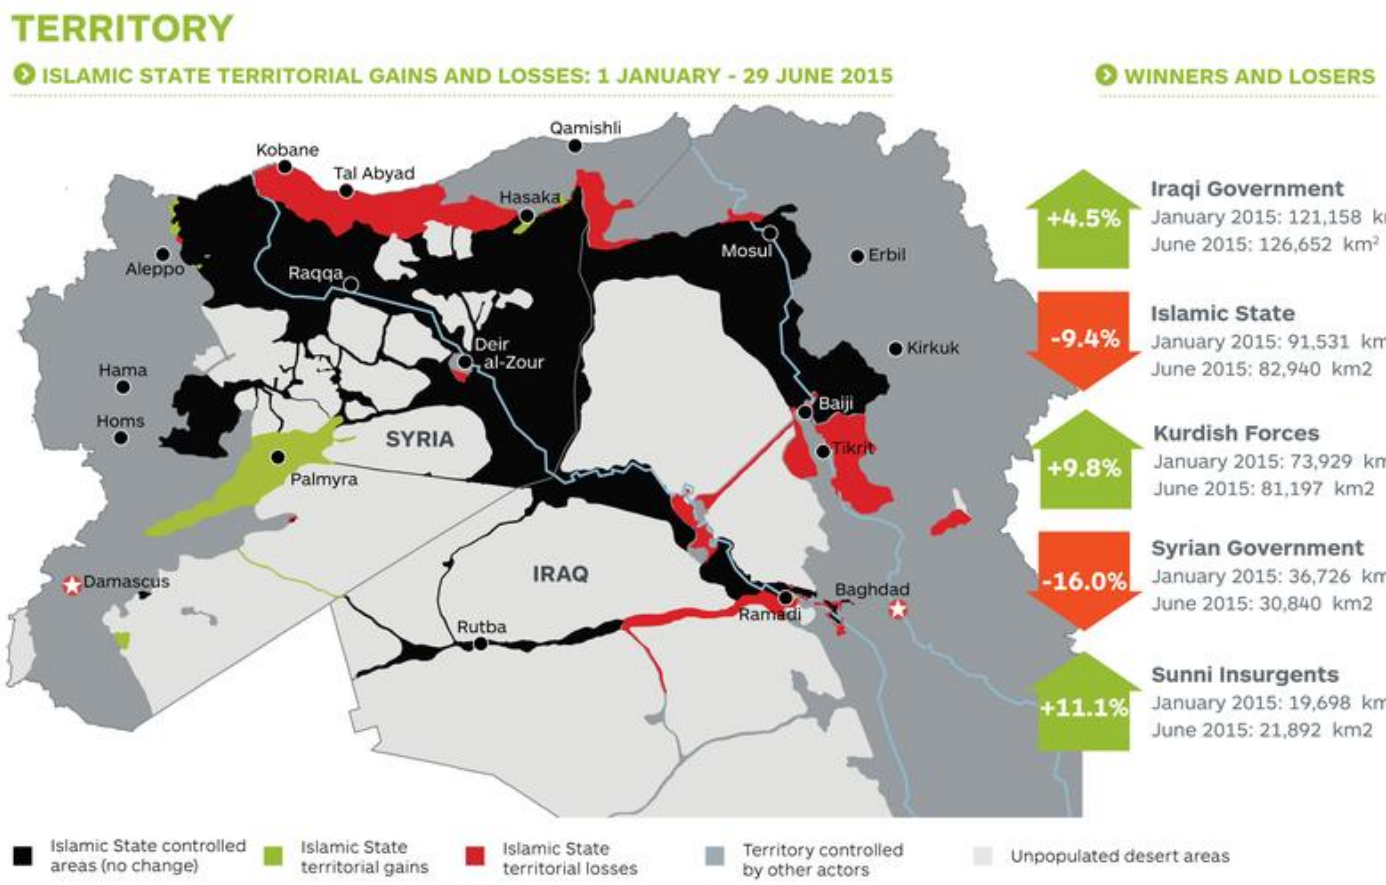
If you want to understand what's happening in the Middle East today, you need to appreciate one fundamental fact: **ISIS is losing its war** for the Middle East. This may seem hard to believe: in Iraq and Syria, the group still holds a stretch of territory larger than the United Kingdom, manned by a steady stream of foreign fighters. Fighters pledging themselves to ISIS recently executed 21 Christians in Libya. It's certainly true that ISIS remains a terrible and urgent threat to the Middle East. The group is not on the verge of defeat, nor is its total destruction guaranteed. But, after months of ISIS expansion and victories, the group is now being beaten back. It is losing territory in the **places that matter.** Coalition airstrikes have **hamstrung** its **ability to wage offensive war**, and it has no friends to turn to for help. Its governance model is unsustainable and risks collapse in the long run. Unless ISIS starts adapting, there's a very good chance its so-called caliphate is going to fall apart. Believe it or not, Iraq is looking better than anyone could have hoped six months ago One year ago, ISIS was soon to launch the offensive in Iraq that, in June, would sweep across northern Iraq and conquer the country's second-largest city, Mosul. Today, the Iraqi government is prepping a **counter-offensive** aimed at seizing Mosul back, which the US believes will launch in April. In that year, the situation has changed dramatically. After ISIS's seemingly unstoppable rampage from June to August of 2014, the Iraqi government and its allies have **turned the tide.** Slowly, unevenly, but surely, ISIS is being pushed back. "**There's really nowhere where [ISIS] has momentum,"** Kirk Sowell, the principal at Uticensis Risk Services and an expert on Iraqi politics, told me in late January. "There are a significant string of [Iraqi] victories all along the northern river valley, up through Diyala and Salahuddin [two central Iraqi provinces]," Doug Ollivant, National Security Council Director for Iraq from 2008-2009 and current managing partner at Mantid International, explained. In northern Iraq, Kurdish forces are threatening to cut off a highway that serves as ISIS's **main supply line** between Iraq and Syria. They took the town of Sinjar, which sits on the highway, in December; by late January, they had taken a longer stretch of the highway near a town called Kiske. Ollivant describes much of the Kurdish progress in the north as a "circling around Mosul." Though the Kurds won't attempt to retake the city on their own, a joint Iraqi-Kurdish force is now poised to do so. Re-taking Mosul would be a **major blow** to ISIS. To be clear, ISIS isn't on the retreat everywhere. "The news in [western province] Anbar is more mixed," Ollivant says. "Things are shifting, but not to anyone's particular advantage. The Iraqi government gains ground here, and loses ground there." In February, an ISIS offensive in Anbar threatened al-Asad airbase, where US troops are training Iraqi soldiers. Still, ISIS is falling back in most places where it's facing a serious push. And Iraq watchers are starting to see ISIS's struggles as **harbingers of a larger collapse.** "The Islamic State ... will lose its battle to hold territory in Iraq," Ollivant writes in War on the Rocks. **"The outcome in Iraq is now clear to most serious analysts."** Sowell agrees. "There is no Islamic 'State' in Iraq. They're basically operating as an insurgency/mafia," he says. "They just don't have the ability, the wherewithal in Iraq to set up Sharia courts, patrol, and really govern a state." ISIS is at a standstill in Syria Syria is a different story. ISIS has a firm hold on the Syrian city Raqqa and its environs; it's stronger there than it is anywhere in Iraq. No faction in Syria is in a position to challenge ISIS's core holdings, at least in the near term. Still, ISIS's months of progress in Syria have stalled. And that bodes poorly for the group's long-term prospects. By the end of January, ISIS had been driven out of Kobane, a Kurdish town in northern Syria that it had spent enormous amounts of manpower and resources trying to seize. Kobane isn't hugely important in strategic terms. But the fact that Kurdish forces pushed ISIS back there, with support from heavy American airstrikes, does matter. "We can take [Kobane], to a limited extent, as a signal that the airstrikes are helping roll back or at least stop [ISIS] progress in Syria," says Sasha Gordon, an associate at the private research and consulting firm Caerus Associates, who tracks developments on the ground at Syria closely. "A lot of [elite ISIS forces] might have been lost at Kobane," adds Yasir Abbas, another Caerus associate on the Syria desk.

2nc: Squo solves ISIS

Territory loss proves—we'll also insert a map

Beauchamp 7/30 [Zack, world correspondent @ Vox, Editor of TP Ideas (ThinkProgress), MSc in IR from London School of Economics, 7/30/15 "Map: ISIS has lost 9.4 percent of its territory this year" http://www.vox.com/2015/7/30/9069705/isis-map-10-percent//jweideman]

ISIS has lost almost 10 percent of its territory so far in 2015, yet another indication that the group, for all the terror it has sown in Syria and Iraq, is losing the war. Defense analysis group IHS Jane's 360 detailed the territorial loss in a report, which includes this map below estimating the change in ISIS's territory between January 1 and June 29 of this year. Green shows territory ISIS has taken in those months, and red shows land that it's lost:



Jane's estimates the total loss at 9.4 percent of what ISIS held when the year began. The year has included gain for ISIS, as well, most notably the Syrian city Palmyra and the Iraqi city Ramadi. But according to Jane's analyst Columb Strack, "Successes in Palmyra and Ramadi came at the expense of significant territorial losses elsewhere." This points to one of ISIS's most fundamental problems: It has too many enemies. You can see this in another thing on the Jane's map, showing who gained territory: the Iraqi government, Syrian rebels (labeled "Sunni insurgents"), and Kurdish forces in both Iraq and Syria. All of those groups are hostile to ISIS, and two of them are backed by US airpower. ISIS's fighters might be skilled, but they can't fight everyone at once. Losing territory is a serious problem for ISIS. The whole idea of ISIS, the thing that makes it really different from al-Qaeda, is that it claims to be the actual state: a caliphate that governs and holds territory. It needs that territory to ideologically

justify itself, to collect the extortionary "taxes" it uses to fund its activities, and to attract ever more foreign recruits. "When they declared the caliphate, their legitimacy came to rest on the continuing viability of their state," Daveed Gartenstein-Ross, a senior fellow at the Foundation for the Defense of Democracies, told me in October. If they keep losing territory, their funding and recruiting pool will slowly dry up. Recent developments have been bad for ISIS. Syrian Kurdish forces advanced dangerously close to ISIS's de facto capital, Raqqa, in late June. Iraqi forces are pressuring ISIS in Anbar province, home to Ramadi and ISIS stronghold Fallujah. None of this means ISIS is going to fall quickly. But it does show that the widely feared terrorist group, for all the terrible suffering it has inflicted, is on the battlefield not as fearsome as it sometimes is perceived to be.

Squo solves foreign students—numbers are increasing

Jordan 15 [Miriam, Staff writer for the wall street journal. Has BA's in international relations and psychology from Stanford University and a master's degree in journalism from Columbia University. 3/24/15 "International Students Stream Into U.S. Colleges" http://www.wsj.com/articles/international-students-stream-into-u-s-colleges-1427248801//jweideman]

American universities are enrolling unprecedented numbers of foreign students, prompted by the rise of an affluent class in China and generous scholarships offered by oil-rich Gulf states such as Saudi Arabia. Cash-strapped public universities also are driving the trend, aggressively recruiting students from abroad, especially undergraduates who pay a premium compared with in-state students. There are 1.13 million foreign students in the U.S., the vast majority in college-degree programs, according to a report to be released Wednesday by the Department of Homeland Security. That represents a 14% increase over last year, nearly 50% more than in 2010 and 85% more than in 2005. Students from China account for the largest share—331,371 of all international students, or 29%. Nearly 81,000 subjects of the Saudi kingdom are studying in the U.S. this school year, up from about 5,000 in 2000-01. Nearly three-quarters of Saudi students are enrolled in bachelor's programs or English-language programs that precede starting undergraduate studies here. Of the top five campuses for international students, two are public universities: Purdue, at No. 2, and the University of Illinois Urbana-Champaign, at No. 4. The No. 1 school is the University of Southern California, with 12,480 students, according to the report. Columbia ranks No. 3. and New York University comes in at No. 5. Amid rising costs, shrinking state support and student resistance to tuition increases, foreign students have become crucial to many public universities. Some hire foreign consultants to recruit students overseas, while others send their own staff on scouting missions. Officials at many state universities say the higher-paying students essentially subsidize in-state students.

2nc- SQ solves

Enrollment is increasing despite competition—and other countries fill in for China

Strauss 14 [Valerie, staff writer for the Washington Post. 11/12/14, "China is sending fewer graduate students to U.S., but more are arriving from India" http://www.washingtonpost.com/blogs/answer-sheet/wp/2014/11/12/china-is-sending-fewer-graduate-students-to-u-s-but-more-are-arriving-from-india///jweideman]

The United States remains a popular destination for international graduate students despite increased competition, according to new data just released showing that China sends the most to U.S. schools, followed by India and South Korea — although the flow of students from China declined for the first time since the data started to be collected a decade ago. According to a new report by the nonprofit Council of Graduate Schools, the total graduate enrollment increased by 8 percent between fall 2013 and fall 2014. It says that 17 percent of all graduate students in U.S. graduate institutions come from other countries — up from 14.5 percent in 2012. Students from China, India and South Korea account for about one-half of all international students attending U.S. graduate schools. But the data show that first-time graduate enrollment of Chinese students decreased 1 percent in 2014, a drop that involves "a relatively large number of students, since Chinese students constitute 33 percent of the total enrollment of international graduate students in the U.S." There were other declines too: The first-time graduate enrollment of South Korean students fell by 7 percent, and of Taiwanese students by 8 percent. But there were increases from other parts of the globe: First-time enrollment of students from India increased 27 percent, marking the second year in a row of double-digit growth in first-time enrollments of students from that country, First-time graduate enrollment of students from

Brazil increased 91 percent in 2014, following a 17 percent increase in 2013 and a 14 percent increase in 2012. It should be noted that these increases concern a relatively small number of students. Changes in first-time graduate enrollment of students from the Middle East were the largest among the three regions followed (8 percent), a trend that has been consistent for the past three years.

AT: China decline

Indian and Iranian students are more likely to enter STEM

Ayres 14 [Alyssa, senior fellow for India, Pakistan, and South Asia at the Council on Foreign Relations. 11/18/14, "India and U.S. Higher Education: Strong Indian Presence In The United States, But Americans Studying In India Still Meager" http://www.forbes.com/sites/alyssaayres/2014/11/18/india-and-u-s-higher-education-strong-indian-presence-in-the-united-states-but-americans-studying-in-india-still-meager///jweideman]

As the Open Doors fact sheet on India shows, India was the number one place of origin for foreign students in the United States for eight years, from the 2001-02 survey year through 2008-09. In 2009-10, however, China surpassed India as a place of origin, with more than 127,000 students in the United States that year compared with India's nearly 105,000. The number of students from India then began to dip slightly, dropping to below 100,000 by 2012-13, although it was still the number two place of origin. By comparison, students from China have been rapidly increasing in numbers such that for the 2013-14 year just released, there were close to 275,000 Chinese students in the United States. An overwhelming number of Indian students in the United States are at the graduate level, 59.5%. Just 12.3% of the Indian students here are undergrads, and 27% are pursuing optional practical training (a year of work preceding or following degree completion). This profile differs substantially from the breakdown of Chinese students in the United States, of whom 40% are undergrads, 42% are graduate level and 12.2% are carrying out optional practical training. More interestingly, 78.6% of the Indian students in the United States are in the "STEM" (Science, Technology, Engineering, Math) fields. The only country sending a higher proportion of its students in the STEM fields is Iran, with 79.6%. I was surprised that the number of Indian students in business is just 11.7%. Every other field of study tracked by Open Doors clocks in at 3% or less for Indian students: the social sciences, just 2.7%; fine arts, 1.4%; humanities, a mere 0.5%, as was education. This means the average Indian student in the United States is highly likely to be in a STEM graduate degree program.

A/C—State regs

State backlash is a massive alt cause

Jordan 15 [Miriam, Staff writer for the wall street journal. Has BA's in international relations and psychology from Stanford University and a master's degree in journalism from Columbia University. 3/24/15 "International Students Stream Into U.S. Colleges" http://www.wsj.com/articles/international-students-stream-into-u-s-colleges-1427248801//jweideman]

But the perception that foreign students, in addition to out-of-state Americans, displace state residents has fueled a backlash in some states. The University of California system recently announced it will cap the

percentage of out-of-state and foreign undergraduate students at the Los Angeles and Berkeley campuses at the current level, 22%. University of Iowa regents last year adopted a plan to tie state funding of public universities to the number of in-state students enrolled. Brenda Nard of Salem, Ore., said she encountered many out-of-state and foreign students during her daughter's recent college search. "You wrestle with it because you want your kids to have the most opportunity," she said. "I understand the state needs the money yet I also wonder if it eliminates opportunities for some Oregonians." Tina Orwall, a Washington state legislator, in 2012 introduced an amendment to a tuition bill that allowed the University of Washington to increase enrollment as long as the number of in-state residents remained at a minimum level. The amendment, prompted by an influx of both foreign and out-of-state students, passed. "I was hearing from constituents that their sons and daughters were being denied admission into our state institutions despite being very strong academic students," she said. The growth in international students also has caused tensions on some campuses. At Michigan State University, where the Chinese undergraduate population has risen eightfold in nine years to nearly 4,000, staff and students have been promoting dialogue since luxury cars owned by Chinese students were vandalized in 2012. "There is a widespread notion that dollars are being spent on foreign students and that they are displacing U.S. students, even if in general that isn't right," said John Bound, a University of Michigan economist who has studied the influx.

Competitiveness

Tech sector strong

The tech sector is strong—solves competitiveness

Delloitte 15 [Outlook firm. 2015, "2015 Technology Industry Outlook" http://www2.deloitte.com/us/en/pages/technology-media-and-telecommunications/articles/2015-technology-outlook.html//jweideman]

Consumer hunger for new technologies has been driving tech sector growth for years. Going forward, enterprises will take the lead as they harness new technologies to improve efficiency and strengthen competitive advantage. Consider the Internet of Things (IoT). It is moving out of the hype phase and landing at the center of enterprise applications in everything from industrial equipment and supply chain management to retail shopping experiences. The rise of enterprise IoT use will drive increased demand for network infrastructure, sensors, software applications, and all technologies needed to operate IoT applications including data analytics. The growth of IoT will also create significant demand for cyber security services. As the proliferation of sensors and smart devices mounts, companies will need to protect data and secure access points between product technology stacks and other company systems. Enterprise needs will also fuel the growth of Artificial Intelligence (AI). Despite futuristic hype, AI is already on the ground in many industries. Banks, for example, use machine learning to identify behaviors that predict fraud. Media companies have coupled natural language technology with analytics to draft content on data-heavy topics such as corporate earnings and sports scoresi. The cloud is also poised for significant growth, especially among enterprises. Between this year and 2017, the enterprise cloud market is expected to grow from $70 billion to more than $250 billion. The growth will be driven to a great extent by enterprises becoming more adept at integrating, aggregating and orchestrating cloud and on premise assets.

Econ UQ

1nc- Econ high

No uniqueness- the economy is poised for growth in every sector

Conerly 15 [Bill, economist with a PHD. Contributes to Forbes. 1/6/15, "Economic Forecast 2015-2017" http://www.forbes.com/sites/billconerly/2015/01/06/economic-forecast-2015-2017/2///jweideman]

The economic outlook if the Fed does not trigger a recession is quite positive and gets better as time goes by. My own forecast is stronger than my colleagues' projections, which I think is due to my greater optimism about housing construction, business capital spending, and reduced energy imports. Consumer spending is likely to grow just in pace with the economy. Few consumers are stretching beyond their incomes, and few are withdrawing from spending. As incomes rise, their spending rises at about the same rate. I see this continuing. Housing starts are poised to grow significantly. Our population growth justifies 1.2 to 1.4 million starts a year, but we're at only one million. We are within a tenth of a percent of working off the excess supply that was constructed in the boom, so it's time to start building. I forecast two years of 10 percent residential construction gains. Non-residential construction, however, won't see much acceleration in the next two years, due to continued soft demand. The lack of new construction now means that eventually landlords will be able to command strong rents with little new competition. Business capital spending will improve. Already it has been strong, but look for even more growth. Manufacturing production has increased five percent over the past 12 months and is well above the pre-recession peak. Look for more companies to add machinery, computers and transportation equipment. Government spending on transfer payments will continue to grow, but federal discretionary spending will be limited due to budget constraints and Republican resistance to higher taxes. Defense spending will probably be protected, but Congress's traditional aversion to cutting existing programs means there isn't much room to increase military budgets. State and local governments will be able to expand their spending by the three-to-five percent revenue gains they reap. Interest rates will rise in this environment. The Federal Reserve will start pushing short-term interest rates up in the spring. The rate hike will be about one percentage point per year, which is one-third their full-blown speed. Long-term interest rates will rise, primarily due to global economic expansion (which pushes global demand for credit up faster than global supply of savings), with additional help from the Fed's tightening. Inflation will remain subdued. The all-items measure will drop with lower oil prices, while core inflation is flat. Businesses plans should be based on expansion—the odds certainly favor growth. However, every company should acknowledge the risk of recession, and also acknowledge their inability to predict when the next recession will come. You can check out my video series, Business Planning With A Risk Of Recession. The stock market should do well in this environment, with the positive effects of economic growth outweighing the negative impact of higher interest rates.

2nc Econ high

GDP is expanding

Backman 7/30 [Melvin, Finance and markets reporter for Quartz. 7/30/15, "The US economy: GDP is growing, but not going gangbusters" http://qz.com/467904/the-us-economy-gdp-is-growing-but-not-going-gangbusters///jweideman]

The American economy grew at an annualized rate of 2.3% in the second quarter, according to the Bureau of Economic Analysis. That's not as a high as analysts were expecting (2.7%). But it is a lot better than the first quarter. Earlier estimates of the first three months of 2015 said the economy shrank. (The most recent report said the economy contracted at a 0.2% rate during the first three months of 2015.) Exports helped growth in the second quarter, which shows that the economic disruption from the West Coast port strike was short-lived. Spending from consumers and local governments also gave growth a lift. On the deficit side of the ledger, inventory building and residential real estate slowed, and federal government spending and business investment contracted. Final sales, a measure of GDP growth when you strip out unsold business inventories swung higher to 2.4% in the second quarter after falling 0.2% in the first.

Growth is strong

Whitefoot 7/8 [John Whitefoot is an editor at Lombardi Financial, specializing in low-priced investment opportunities. He contributes to Lombardi's Profit Confidential and Daily Gains

Letter newsletters. 7/8/15, "U.S. Economic Outlook for 2015: Economy Strong but Markets Unstable" http://www.profitconfidential.com/economic-analysis/u-s-economic-outlook-2015///jweideman]

As 2014 winds down, many investors are wondering what the economic outlook for 2015 will be. If you look at the U.S. economic data that's been trickling in, 2015 looks like it could be a very strong year. The U.S. announced strong third-quarter gross domestic product (GDP) growth of 3.9%. This extends the recent trend of strong quarter-over-quarter GDP growth; in the fourth quarter of 2013, real GDP growth came in at 2.4%; GDP in the first quarter of 2014 contracted 2.9%—though this was primarily seen as a result of the brutal winter; and in the second quarter, real GDP increased 4.6%. Gloss over the winter of 2014, and the U.S. economy is showing signs of sustained growth. Not only is GDP growth up, but the U.S. jobs market is also improving with unemployment at 5.8%, consumer confidence is up, and so, too, is retail spending. The U.S. Census Bureau announced recently that November retail sales increased 0.7% month-over-month to $449.3 billion—the largest monthly gain since March 2014. Economists were expecting November sales to climb just 0.4%. On a year-over-year basis, November retail sales were up a whopping 5.1%.(1) The momentum could continue well into 2015. And it is excellent news for a country that gets 70% of its GDP from consumer spending. This may be why the U.S. economy is forecast to grow by 3.1% in 2015. That would represent the strongest annual GDP growth since 2005, when the economy grew 3.3%. In fact, thanks to an improving job market and falling oil prices, the U.S. could enjoy the fastest economic growth in a decade. The optimism and boost in consumer spending can be attributed, in large part, to slumping oil prices.

Stock market recovery and fed analysis proves

Agrawal 7/30 [Tanya, Journalist for Reuters. 7/30/15, "US STOCKS-Wall St recovers as data points to growing economy" http://www.reuters.com/article/2015/07/30/markets-stocks-usa-idUSL3N10A5YS20150730//jweideman]

The S&P 500 almost recovered the day's losses while the Dow and Nasdaq were higher in afternoon trading on Thursday as investors digested earnings and GDP data showed that the economy grew in the second quarter. Procter & Gamble fell 3.7 percent after the company reported its sixth straight quarter of lower sales while Facebook shares fell 2.6 percent after the social media company's profit decreased. Mondelez International rose 4.9 percent to $45.22 after reporting results that beat expectations. Gross domestic product expanded at a 2.3 percent annual rate in the second quarter, while first-quarter numbers were revised to show that the economy, previously reported to have shrunk, grew at 0.6 percent. The Federal Reserve on Wednesday said the economy was improving and left doors open for a possible rate hike in September. The Fed has maintained near-zero interest rates for nearly a decade, saying it will raise rates only when it sees a sustained recovery in the economy. "Earnings haven't been great and there is much more slack in the economy than the market or the Fed thought while big concerns such as oil and China continue to persist," said John Canally, investment strategist at LPL Financial. "We are in a slow-growth environment and anything that knocks that down further is not a plus for the market." The U.S. dollar continued to strengthen and was up 0.75 percent near a weekly high of $97.70 against a basket of currencies as the Fed readies to raise rates this year. U.S. stocks closed stronger on Wednesday after the Fed statement. The S&P 500 has bounced about 2 percent higher in the past two days following a near-3 percent drop over the preceding week that had been caused in part by a rout in China's stock markets. At 13:15 p.m. ET (1715 GMT) the Dow Jones industrial average was up 3.37 points, or 0.02 percent, at 17,754.76, the S&P 500 was down 0.09 points, or -0 percent, at 2,108.48 and the Nasdaq Composite was up 19.57 points, or 0.38 percent, at 5,131.31. Five of the 10 major S&P sectors were lower with the energy index's 0.6 percent fall leading the decliners. More than halfway through the second-quarter earnings season, analysts expect overall earnings of S&P 500 companies to edge up 0.8 percent and revenue to decline 3.9 percent, according to Thomson Reuters data.

Econ resilient

The economy is resilient to shocks

Kohn 15 [Donald, Senior Fellow, Economic Studies at Brookings. 1/30/15, "U.S. Monetary Policy: Moving Toward the Exit in an Interconnected Global Economy" http://www.brookings.edu/research/speeches/2015/01/30-us-monetary-policy-global-economy-kohn//jweideman]

The global financial authorities have made major strides in making their systems more resilient to unexpected developments, in particular with higher capital and greater liquidity for banks and bank holding companies. In several jurisdictions, banks have been stress tested with scenarios that included rising rates. Moreover, we've seen several episodes in which volatility and risk spreads have risen, including the summer of 2013 during the so-called taper tantrum, and in the past few months amid mounting uncertainty about global economic prospects, plunging oil prices, growing political and economic tensions in the euro area, and strong monetary policy responses. Although there's been some fallout from these financial market developments, none has threatened financial stability.

AT: Stem crisis

1nc- No stem crisis

No STEM crisis—numbers are overblown, don't assume growth, non-STEM majors fill in the gap

Charette 13 [Robert. Writing at IEEE.org, advanced technology organization. August. "The STEM Crisis Is a Myth" http://spectrum.ieee.org/at-work/education/the-stem-crisis-is-a-myth//jweideman]

You must have seen the warning a thousand times: Too few young people study scientific or technical subjects, businesses can't find enough workers in those fields, and the country's competitive edge is threatened. It pretty much doesn't matter what country you're talking about—the United States is facing this crisis, as is Japan, the United Kingdom, Australia, China, Brazil, South Africa, Singapore, India…the list goes on. In many of these countries, the predicted shortfall of STEM (short for science, technology, engineering, and mathematics) workers is supposed to number in the hundreds of thousands or even the millions. A 2012 report by President Obama's Council of Advisors on Science and Technology, for instance, stated that over the next decade, 1 million additional STEM graduates will be needed. In the U.K., the Royal Academy of Engineering reported last year that the nation will have to graduate 100 000 STEM majors every year until 2020 just to stay even with demand. Germany, meanwhile, is said to have a shortage of about 210 000 workers in what's known there as the MINT disciplines—mathematics, computer science, natural sciences, and technology. The situation is so dismal that governments everywhere are now pouring billions of dollars each year into myriad efforts designed to boost the ranks of STEM workers. President Obama has called for government and industry to train 10 000 new U.S. engineers every year as well as 100 000 additional STEM teachers by 2020. And until those new recruits enter the workforce, tech companies like Facebook, IBM, and Microsoft are lobbying to boost the number of H-1B visas—temporary immigration permits for skilled workers—from 65 000 per year to as many as 180 000. The European Union is similarly introducing the new Blue Card visa to bring in skilled workers from outside the EU. The government of India has said it needs to add 800 new universities, in part to avoid a shortfall of 1.6 million university-educated engineers by the end of the decade. And yet, alongside such dire projections, you'll also find reports suggesting just the opposite—that there are more STEM workers than suitable jobs. One study found, for example, that wages for U.S. workers in computer and math fields have largely stagnated since 2000. Even as the Great Recession slowly recedes, STEM workers at every stage of the career pipeline, from freshly minted grads to mid- and late-career Ph.D.s, still

struggle to find employment as many companies, including Boeing, IBM, and Symantec, continue to lay off thousands of STEM workers. To parse the simultaneous claims of both a shortage and a surplus of STEM workers, we'll need to delve into the data behind the debate, how it got going more than a half century ago, and the societal, economic, and nationalistic biases that have perpetuated it. And what that dissection reveals is that there is indeed a STEM crisis—just not the one everyone's been talking about. The real STEM crisis is one of literacy: the fact that today's students are not receiving a solid grounding in science, math, and engineering. In preparing this article, I went through hundreds of reports, articles, and white papers from the past six decades. There were plenty of data, but there was also an extraordinary amount of inconsistency. Who exactly is a STEM worker: somebody with a bachelor's degree or higher in a STEM discipline? Somebody whose job requires use of a STEM subject? What about someone who manages STEM workers? And which disciplines and industries fall under the STEM umbrella? Such definitions obviously affect the counts. For example, in the United States, both the National Science Foundation (NSF) and the Department of Commerce track the number of STEM jobs, but using different metrics. According to Commerce, 7.6 million individuals worked in STEM jobs in 2010, or about 5.5 percent of the U.S. workforce. That number includes professional and technical support occupations in the fields of computer science and mathematics, engineering, and life and physical sciences as well as management. The NSF, by contrast, counts 12.4 million science and engineering jobs in the United States, including a number of areas that the Commerce Department excludes, such as health-care workers (4.3 million) and psychologists and social scientists (518 000). Such inconsistencies don't just create confusion for numbers junkies like me; they also make rational policy discussions difficult. Depending on your point of view, you can easily cherry-pick data to bolster your argument. Another surprise was the apparent mismatch between earning a STEM degree and having a STEM job. Of the 7.6 million STEM workers counted by the Commerce Department, only 3.3 million possess STEM degrees. Viewed another way, about 15 million U.S. residents hold at least a bachelor's degree in a STEM discipline, but three-fourths of them—11.4 million—work outside of STEM. The departure of STEM graduates to other fields starts early. In 2008, the NSF surveyed STEM graduates who'd earned bachelor's and master's degrees in 2006 and 2007. It found that 2 out of 10 were already working in non-STEM fields. And 10 years after receiving a STEM degree, 58 percent of STEM graduates had left the field, according to a 2011 study from Georgetown University. The takeaway? At least in the United States, you don't need a STEM degree to get a STEM job, and if you do get a degree, you won't necessarily work in that field after you graduate. If there is in fact a STEM worker shortage, wouldn't you expect more people with STEM degrees to be filling those jobs? And if many STEM jobs can be filled by people who don't have STEM degrees, then why the big push to get more students to pursue STEM? Now consider the projections that suggest a STEM worker shortfall. One of the most cited in recent U.S. debates comes from the 2011 Georgetown University report mentioned above, by Anthony P. Carnevale, Nicole Smith, and Michelle Melton of the Center on Education and the Workforce. It estimated there will be slightly more than 2.4 million STEM job openings in the United States between 2008 and 2018, with 1.1 million newly created jobs and the rest to replace workers who retire or move to non-STEM fields; they conclude that there will be roughly 277 000 STEM vacancies per year. But the Georgetown study did not fully account for the Great Recession. It projected a downturn in 2009 but then a steady increase in jobs beginning in 2010 and a return to normal by the year 2018. In fact, though, more than 370 000 science and engineering jobs in the United States were lost in 2011, according to the Bureau of Labor Statistics.

2nc- no crisis

Their numbers are inaccurate and the plan can't solve the problems STEM fields do have.

gov data discounts entrepenours and non-stem degree workers

problem is experience no amount of workers

Alphonse 13 [Lylah, Lylah M. Alphonse is the Managing Editor of News for U.S. News & World Report. 2013. “Are We Misinterpreting the STEM Crisis?” http://www.usnews.com/news/stem-solutions/articles/2013/09/09/are-we-misinterpreting-the-stem-crisis//jweideman]

But the severity of the crisis depends on how you crunch the numbers, writes Robert Charette at IEEE Spectrum, the publication of the Institute of Electrical and Electronics Engineers. The president of ITABHI Corporation, a business and technology risk management consultancy, Charette calls the STEM crisis a myth, and says that leaders the world over are focusing on filling jobs and earning specific college degrees when they should be worrying about boosting general STEM literacy instead. The Department of Commerce counted 7.6 million people working at STEM jobs in 2010, Charette writes. But the National Science Foundation's tally was much higher – 12.4 million people. Why the difference? The NSF included jobs held by health-care workers, psychologists, and social scientists, among other fields that the Department of Commerce didn't factor in. Even going by the lower number, "Of the 7.6 million STEM workers counted by the Commerce Department, only 3.3 million possess STEM degrees," he writes. "Viewed another way, about 15 million U.S. residents hold at least a bachelor's degree in a STEM discipline, but three-fourths of them -- 11.4 million -- work outside of STEM." The data indicate that there are far more STEM-qualified workers than there are STEM jobs, Charette points out. "And if many STEM jobs can be filled by people who don't have STEM degrees, then why the big push to get more students to pursue STEM?" he asks. The government data also doesn't take into account STEM jobs created by entrepreneurs in traditionally non-STEM industries, Devin Voorsanger, a New York-based digital strategist to Fortune 100 companies, points out. "For every STEM graduate who becomes an entrepreneur you usually will have several STEM positions that are needed to support his or her endeavor," he tells U.S. News & World Report. Even as the most-recent recession eases, tech companies continue to lay off STEM workers or hire less-expensive (and temporary) foreign workers using H1B visas, Charette writes. Many STEM jobs end up being outsourced or automated. In some industries, NPR reports, we no longer need many highly skilled workers, just many computers and machines -- and maybe a handful of people to maintain them. The way companies hire STEM workers has also changed dramatically in just a generation. "In engineering, for instance, your job is no longer linked to a company but to a funded project," Charette explains. "Long-term employment with a single company has been replaced by a series of de facto temporary positions that can quickly end when a project ends or the market shifts." Workers in STEM fields, however, argue that the crisis does indeed exist -- but they say it's about a lack of skills and experience, not a lack of jobs or candidates with advanced degrees. "There's a shortage of employers willing to hire young people and train them," commenter "Moltenmetal" writes at IEEE. "They call this a 'skills shortage': they can't find sufficient numbers of people with 10 years of experience because they didn't hire fresh grads 10 years ago."

The affs a giant misconception

Leef 14 [worked at the John W. Pope Center for Higher Education Policy. Forbes contributor. 6/6/14, “True Or False: America Desperately Needs More STEM Workers” http://www.forbes.com/sites/georgeleef/2014/06/06/true-or-false-america-desperately-needs-more-stem-workers///jweideman]

“Never let a crisis go to waste,” advised Rahm Emanuel when he served as President Obama’s chief of staff. And the crisis doesn’t have to be real — politicians can take advantage of a perceived crisis just as well as a real one. Many Americans are convinced that the country faces a STEM crisis. That is, we supposedly don’t have enough teachers in Science, Technology, Engineering, and Mathematics, don’t have enough students taking degrees in those fields, and don’t have enough STEM workers to maintain the country’s leadership. In his 2011 State of the Union address, President Obama pledged to create 100,000 new STEM teachers by 2020—a key part of his plan to “win the future.” In February of 2012, his Council of Advisors on Science and Technology released a report stating that the nation needs one million new STEM workers. Naturally, the White House was reacting to widespread beliefs. The groundwork for those beliefs was set in place by influential reports done years earlier. In 2005, the Business Roundtable released a report entitled “Tapping America’s Potential.” The big conclusion of the report: the country needed to double the number of STEM graduates within a decade (by 2015.) Then in 2007, the National Research Council published a much

heftier study bearing the ominous title "Rising Above the Gathering Storm." It too argued that the U.S. needs to increase its training of students in the STEM disciplines. Otherwise, we will suffer from a shortage of American scientists and engineers and thus "reduced ability to compete in a globalizing world." Those reports received serious criticism, but that did very little to damp down the widespread belief that America desperately needs to get more people through college with STEM degrees. That belief, however, is starting to collapse under scrutiny. In his recent book Falling Behind: Boom, Bust & the Global Race for Scientific Talent, Michael Teitelbaum (Senior Research Associate at Harvard Law School) shows that the U.S. has been through at least five STEM-related cycles since World War II. In each instance, alarms about a perceived shortage of STEM workers led to federal action to stimulate STEM research and education. But after the government's stimulus ended, we were left with a surfeit of people with STEM degrees but no work commensurate with their training. Far from "falling behind," Teitelbaum shows that the U.S. currently has a surplus of people with STEM education. After surveying the research, he writes that America "produces far more science and engineering graduates annually than there are S&E job openings—the only disagreement is whether it is 100 percent or 200 percent more." Nevertheless, many Americans instinctively believe that there is something special about science, engineering and technology. They drive progress. We might have too many lawyers or baristas or interior designers, but we can't have too many STEM workers. Furthermore, interest groups that want more STEM education, research funding and workers know how to capitalize on that belief to get politicians to enact the policies they want. Even through there is nothing approaching a crisis, they keep lobbying as if we have a dire one.

Surveillance Samford

Immigration Surveillance Aff + Neg

Resolution

Resolved: The United States federal government should substantially curtail its domestic surveillance.

FYI

General FYI

Here's a rundown of some key acronyms to know on this topic:

DHS= Department of Homeland Security, an agency of the U.S. federal government that was created after September 11th, 2001 to protect the country from terrorist attacks, natural disasters, etc. They are frequently behind border control policies to prevent illegal immigration and criminal smuggling.

ICE= Immigration Customs Enforcement, an enforcement agency under the DHS, which deals with security-related immigration policies. They often conduct raids of immigrants' homes and workplaces for the purposes of deportation and detention.

Here are some other important terms to know for the topic:

TIME '13 [TIME staff, "A Glossary of Government Surveillance," August 1, 2013, http://nation.time.com/2013/08/01/a-glossary-of-government-surveillance/]

The National Security Agency (NSA) is the United States' chief coordinator of signals intelligence—the collection and analysis of communication through radio, radar, and electronic means. It serves the Department of Defense, other government agencies, the Intelligence Community, private sector partners, the armed forces and international allies. Little is known about the NSA because of the sensitive nature of its operations, but the agency's headquarters in Fort Meade, Maryland is home to some of the world's best cryptographers, computer scientists, engineers and mathematicians. General Keith B. Alexander is the current director of the National Security Agency, chief of the Central Security Service and commander of U.S. Cyber Command. John C. Inglis is the agency's deputy director.

The Federal Bureau of Investigation (FBI) is an agency of the US Department of Justice with investigative jurisdiction over 200 categories of federal crime. Its primary duties include

counterterrorism and counterintelligence efforts, cyberwarfare research and defense, the protection of civil rights and the prosecution of violent, organized, and white collar criminal activity. The FBI is headquartered in Washington, DC but maintains hundreds of international field offices. In June 2013, President Barack Obama named James Comey Jr. to succeed Robert Mueller as director of the FBI.

The Foreign Intelligence Surveillance Act (FISA) was a United States law passed in 1978 that outlined procedures for the federal conduction of electronic surveillance, physical searches, and the mining of information for foreign intelligence purposes. FISA established the United States Foreign Intelligence Surveillance Court (FISA Court), a federal counsel that oversees the granting of surveillance warrants to law enforcement and intelligence agencies. The Act also gave the President authority to conduct electronic surveillance without a court order through the Attorney General and the FISA Court. FISA garnered national attention in 2005 after the Bush administration authorized unwarranted wiretapping of US phones by the National Security Agency.

The Protect America Act (PAA) was an amendment to the Foreign Intelligence Surveillance Act that was championed by President George W. Bush and passed by Congress in 2007. In a controversial maneuver later upheld by the FISA Court, the PAA removed the requirement of a warrant for the federal surveillance of foreign intelligence targets reasonably believed to be outside the country and any Americans communicating with them. It also dramatically reduced the power of authorities such as the FISA Court and granted retroactive immunity to telecommunications providers that cooperated with the government's surveillance agencies. The PAA was heavily criticized by civil liberties groups like the American Civil Liberties Union, which called it the "Police America Act."

The Responsible Electronic Surveillance That is Overseen, Reviewed and Effective Act (RESTORE Act) was a 2007 amendment to the Foreign Intelligence Surveillance Act that restored the checks and balances left out of the Protect America Act. Notably, it required an individualized court warrant for the targeting of persons inside the United States, reestablished the power of the FISA Court and mandated regular audits of surveillance programs.

The FISA Amendments Act (FAA) was a law hastily pushed through Congress to establish and clarify intelligence procedure when the Protect America Act expired in 2008. The FAA enhanced protections for Americans overseas but increased the time allowed for warrantless surveillance and allowed eavesdropping in emergency situations. It also granted immunity to the telecommunications companies involved in the Bush administration's wiretapping scandal and renewed the government's authority to monitor electronic communications of foreigners abroad without a warrant. Section 702 of the FAA, which permits the Attorney General and the Director of National Intelligence to target "persons reasonably believed to be located outside the United States to acquire foreign intelligence information," authorizes foreign surveillance programs like PRISM, which in 2008 were no longer protected by George W. Bush's President's Surveillance

Program. The day that the FAA was enacted, the American Civil Liberties Union and other civil rights groups sued James R. Clapper, the Director of National Intelligence, claiming that the FAA violated the first and fourth amendments. The case made its way to the Supreme Court, which decided that the groups could not challenge the FAA because they could not prove that they had personally been targets of surveillance. Congress and President Obama extended the provisions of the FAA for five more years in 2012. The law now applies through the end of 2017.

The Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act (USA PATRIOT Act) was the US government's primary legislative response to the September 11, 2001 attacks. Passed a month after the attacks, it dramatically expanded the investigative powers of the executive branch, broadened the definition of terrorism, increased the budget for counterterrorism and counterintelligence efforts and tightened restrictions on immigration to the United States. Section 215 of the PATRIOT Act modified the Foreign Intelligence Surveillance Act by allowing the FBI to secretly collect records, papers and other documents—domestically or elsewhere—for use in counterterrorism or counterintelligence investigations. Section 215 was condemned by a number of organizations and public figures because it did not require the presence of a defendant or proof of probable cause before the commencement of data collection.

PRISM is an electronic surveillance data mining program operated by the United States National Security Agency under Section 702 of the PATRIOT Act. PRISM commenced operation under the supervision of the Foreign Intelligence Surveillance Court after the passage of the Protect America Act in 2007. Technically, the program cannot "target" Americans because it must operate legally under FISA; however, the information leaked in June by Edward Snowden revealed that NSA analysts can exploit a number of loopholes in surveillance legislation to obtain the private communications of Americans at home. Through the Federal Bureau of Investigation, PRISM collects the broad outlines of communications stored on the servers of nine providers: Microsoft, Yahoo, Google, Facebook, PalTalk, AOL, Skype, Youtube and Apple. The program is believed to be unconstitutional by the American Civil Liberties Union, FreedomWatch USA and other civil rights advocates.

BLARNEY is a data mining program operated by the National Security Agency alongside PRISM. According to the slides leaked by Edward Snowden, BLARNEY is an "upstream" program that collects Internet metadata in the same way that the NSA collects phone data: by sucking up information "on fiber cables and infrastructure as it flows past." The program's summary describes BLARNEY as "an ongoing collection program that leverages IC [intelligence community] and commercial partnerships to gain access and exploit foreign intelligence obtained from global networks." Unlike PRISM, BLARNEY only collects metadata.

Metadata, strictly speaking, is information about data rather than data itself. In the context of the NSA leaks, metadata is information about phone and email messages that does not include their

content. Examples include the time and location of phone calls or the author, date created and file size of an email. US law does not require the procurement of a warrant before obtaining metadata.

1AC

Observation 1 is Inherency:

Immigrant surveillance has skyrocketed- it's a central part of enforcement strategies

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

As these immigration enforcement activities have widely proliferated, and the scale of the enforcement regime's "formidable machinery" has grown and solidified, authorities have deployed a variety of new surveillance, dataveillance, and tracking systems as key components of their enforcement strategies at every stage of the migration process.110 In this Part, I analyze the swift, extensive, and largely unconstrained implementation of these technologies, which have given rise to what I term, adapting from Jack Balkin, the immigration surveillance state: an approach to immigration governance "that features the collection, collation, and analysis of information about populations . . . to identify problems, to head off potential threats, to govern populations, and to deliver valuable social services."111 These systems enable and routinize the collection, storage, aggregation, processing, and dissemination of detailed personal information for immigration control and other purposes on an unprecedented scale and facilitate the involvement of an escalating number of federal, state, local, private, and non-U.S. actors in immigration control activities.

This causes mass deportation and deters immigration, both legal and illegal

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

In recent decades, however, the regulation of immigration after noncitizens have entered the United States has increased dramatically. In part, post-entry enforcement serves as an extension of regulation of the territorial border, intended to apprehend noncitizens who are unlawfully present. Under what Daniel Kanstroom terms an "extended border control" model of enforcement, officials seek to deport not only unlawful entrants but also the many individuals—estimated in recent years to comprise between forty and fifty percent of all unauthorized migrants—who lawfully enter as temporary nonimmigrants and then overstay or otherwise violate their terms of admission.57 But Congress also has fashioned a second model of deportation by expanding the bases upon which individuals who are lawfully present may be "delegalized" and deported for post-entry conduct.58 The trend toward this model of what Kanstroom calls "postentry social control" has been particularly severe for individuals with postentry criminal convictions.59 Until the 1980s, only a limited number of serious crimes rendered noncitizens deportable, and in most instances, those individuals could seek discretionary relief from deportation. Since 1988, however, Congress has steadily (and at times retroactively) expanded the list of criminal deportability grounds to include a broad range of comparatively minor crimes, including a variety of misdemeanors and nonviolent felonies, and has sharply narrowed eligibility for discretionary relief.60 The consequences have been transformative, as federal officials now place unprecedented emphasis on direct post-entry enforcement within the United States. Over half of all individuals removed in recent years have been deported from inside the United States.61 Since 1999, deportation of individuals with criminal convictions has been the government's highest stated interior enforcement priority, and the number of individuals removed on criminal grounds has increased accordingly.62 Of the 391,000 individuals removed in 2011, almost half had a prior conviction, compared to three percent in 1986.63 Moreover, as the U.S. economy has slumped since 2008 and the number of unauthorized migrants has dropped—and as southwestern border enforcement strategies have increasingly emphasized criminal prosecution rather than immediate expulsion—the number of informal, "voluntary" returns without formal removal

orders, which typically occur at or near the territorial border, has plummeted.64 As a result of these shifts, lawfully present noncitizens have become immigration enforcement targets to a greater extent than ever before, and the number of formal removals arising from interior enforcement activities now significantly dwarfs the number of informal returns arising from apprehensions at or near the territorial border.65

Thus the plan:

The United States Federal Government should substantially curtail its domestic surveillance of non-citizens done for the purposes of deportation, detention or raids.

Observation 2 is Solvency:

Federal action is key- it shapes state-level immigration policies

Carcamo '13 [Cindy, covers immigration issues for the Los Angeles Times, "States back off from enacting immigration laws," October 12, http://articles.latimes.com/2013/oct/12/nation/la-na-ff-immigration-laws-20131013]

Utah mirrors a national trend of states holding back on passing immigration laws in hopes that the federal government will act on the issue, according to a study released this fall by the National Conference of State Legislatures. It's a far cry from 2011, when states enacted 162 immigration laws, many following Arizona's controversial SB 1070. By 2012, states had shrunk away from the immigration issue, especially after the U.S. Supreme Court rejected key provisions of the Arizona law that June. This year, 146 immigration laws have been enacted in 43 states and the District of Columbia. California has led the nation in providing benefits to people who are in the country illegally. New laws would allow such immigrants to obtain driver's licenses and practice law, for example. On the other end of the spectrum is Georgia, where officials this year expanded on a sweeping crackdown on illegal immigration. State law now prevents people who are in the country illegally from obtaining public housing, driver's licenses, state grants and loans. Most states have taken a more nuanced approach to immigration law this year. In the Southwest, for instance, Utah enacted legislation that excluded people who are in the country illegally from receiving new state scholarships. At the same time, legislators created a provision in a law regarding abandoned property, allowing former tenants access to a property if they needed to retrieve documents about their immigration status. In Virginia, legislators did not opt for sweeping laws like Georgia, but did ban people who are in the country illegally from obtaining concealed weapons permits. Most noteworthy is that **24 states — double the number from previous years — passed resolutions asking the federal government to step in and take the reins on immigration**, according to the report by the National Conference of State Legislatures.

The plan creates room for effective immigration reform

ACLU '13 [American Civil Liberties Union, a non-partisan organization aimed at protecting civil rights, "A STUDY IN CONTRASTS: HOUSE AND SENATE APPROACHES TO BORDER SECURITY," House Homeland Security Committee Hearing, July 23, 2013 http://www.gpo.gov/fdsys/pkg/CHRG-113hhrg86033/html/CHRG-113hhrg86033.htm]

The ACLU urges the House to reject S. 744's wasteful resource splurge on border security as irrational and damaging to border communities. Instead, Congress must prioritize the reduction of abuses in the currently-oppressive immigration and border enforcement system. That profligate enforcement has cost $219 billion in today's dollars since 1986.\50\ By jettisoning proposals for escalated border security that clash with civil liberties and thereby creating space for genuine immigration reform, Congress can ensure that the roadmap to citizenship for aspiring Americans, which is indispensable to true immigration reform, is a generous one free of unjust obstacles.

Advantage 1 is Agriculture-

Global food crises are coming – stable markets are key to prevent resource wars

Lehane 1-16-15 [Sinéad Lehane, Research Manager at Future Directions International, "Shaping Conflict in the 21st Century—The Future of Food and Water Security," http://www.brinknews.com/shaping-conflict-in-the-21st-century-the-future-of-food-and-water-security/]

Food and water security will shape the 21st century. The interconnection between the availability and access to natural resources, political and economic stability, community wellbeing and the potential for conflict are indisputable. Those who view security through a traditional lens risk overlooking the complexities of conflict triggers as we move further into the 21st century. Over the next 35 years, population growth, reduced access to fresh water and declining arable land will place mounting pressure on global food and water security. The greatest pressure will be on those countries least equipped to deal with these challenges, increasing the risk of both inter- and intra-state conflict. Food and water insecurity is not necessarily about a dearth of resources—we have enough food and water globally to meet demand. But demand for food and water is expected to outpace the supply of globally available resources. The majority of the world's population growth to 2050 is expected to occur in Asia and Sub-Saharan Africa, but both regions are ill-equipped at present to access the required resources and meet the basic needs of their growing populations. Population Growth and Movement By 2050, an increasing number of countries will be unable to feed their people or quench their thirst for water. Land and water won't move, but food and people can—and will—in response to resource scarcity. Consequently, food systems and markets around the world will continue to become progressively interdependent. In the case of food shortages, we can expect increased migration, across states and regions—but this is likely to intensify the potential for conflict.

Surveillance of undocumented workers destroys US agriculture

Devadoss and Luckstead '11 [Stephen Devadoss, PhD in Economics from Iowa State University, is a professor at the Department of Agricultural Economics and Rural Sociology at the University of Idaho, Jeff Luckstead, PhD in economics from Washington State, is an Assistant Professor of Agricultural Economics and Agribusiness at the University of Arkansas, "Implications of immigration policies for the U.S. farm sector and workforce," 7-1-11, http://www.freepatentsonline.com/article/Economic-Inquiry/261386342.html]

Because illegal immigration was not a serious problem in the 1960s and 1970s, legislation addressed only the number of legal immigrants allowed to enter the United States. But in the 1980s, illegal immigration began to emerge as a national problem, and extensive debates entrenched around issues such as preventing the entry of unauthorized workers, providing public services to illegal immigrants, and even legalizing these workers. Consequently, the U.S. Congress attempted to address the immigration problems by enacting the 1986 Immigration Reform and Control Act (IRCA). The goals of IRCA were to eliminate the stock of undocumented workers through amnesty (2) and domestic enforcement of employer sanctions and curb the influx of illegal immigrants by increasing the border surveillance. Amnesty failed to eliminate the stock of illegal immigrants because only about half of the illegal immigrants filed for citizenship, and it created future expectation of amnesty and more illegal unauthorized entry. Furthermore, domestic sanctions on employers of undocumented workers and deportation of these workers were scantly enforced. To stop the influx of immigrants, IRCA focused heavily on tightening border control. The IRCA

also legislated the H-2A program, which allowed agricultural employers to bring in guest workers during seasonal operations (ERS 2007). However, farmers complained that the cumbersome paperwork of H-2A and bureaucratic delay were not conducive to procure seasonal laborers at the time of peak farm operations such as vegetable and fruit picking. (3) In spite of IRCA's amnesty provision and strengthened control measures, illegal immigration continued to rise--about 12 million unauthorized immigrants resided in the United States in 2007 (Martin 2007) which is reaffirmed by many popular press reports--leading to an extended congressional debate that began at the start of this decade to solve the illegal immigration problem. Several bills were proposed by the House of Representatives, the Senate, and the White House, addressing issues related to increased domestic and border enforcements, (4) paths to citizenship, and guest-worker programs (Montgomery 2006). These bills were not passed because of major disagreements among lawmakers over providing citizenship and guest-worker programs. As a result of the failed legislations and the September 11 attack, the government primarily focused on border security. Accordingly, funding for border enforcement has steadily increased, (5) and resources were diverted from domestic to border enforcement. However, Boucher and Taylor (2007) documented that increased funding to secure the border did not deter undocumented workers from crossing the border because determined immigrants eventually find a way to enter the country by repeated attempts. Following September 11, 2001, the U.S. Immigration and Customs Enforcement (ICE) further decreased the number of human hours devoted to worksite inspection because monitoring critical infrastructure took priority (GAO 2005). For example, from 1999 to 2003, the number of human hours for domestic enforcement decreased from 480,000 to 18,000. (6,7) But, by late 2005, the U.S. government started to intensify domestic surveillance. For example, only 25 criminal arrests relating to illegal immigration occurred in 2002, but increased to 716 by 2006 and 1,103 by 2008 (U.S. Department of Homeland Security 2008c). **Domestic surveillance has** further **intensified** under the current administration (Meyer and Gorman 2009). According to Passel (2008), a decreasing trend in the unauthorized immigrant population is recently occurring. (8) This is largely due to worksite and border enforcements and the recent U.S. economic recession. These enforcements have exacerbated U.S. agricultural labor shortages before the 2008/2009 economic crisis. According to the National Agricultural Worker Survey, 80% of the newly hired farm labor force is from Mexico, of which 96% are unauthorized (U.S. Department of Labor 2005). Therefore, as border and domestic enforcements intensified, entry of undocumented immigrants into the U.S. farm labor force was thwarted, which led to an acute labor scarcity. For example, the Wall Street Journal (2007) reported that in 2006, about 20% of agricultural products were not harvested nationwide. Furthermore, the Rural Migration News (2007) provides a detailed and specific list of these shortages and the adverse effect on crucial cultivational operations which resulted in heavy losses. As a result, farm groups are one of the strongest allies of overhauling the current guest-worker program to bring immigrants to legally work in U.S. agriculture. For the last several decades, **immigrants played a crucial role in the development and competitiveness of U.S. agricultural production** (Torok and Huffman 1986). For example, Devadoss and Luckstead (2008) provide evidence of the importance of immigrant farm workers to vegetable production which is highly labor intensive. The United States has a great land endowment and ideal growing conditions; however, without immigrant labor who perform the back-breaking labor-intensive operations that U.S. low-skilled workers are unwilling to perform, agricultural productivity and total production would decline. Consequently, costs to U.S. consumers of agricultural products would increase and net exports would also decrease. In recent years, Mexican immigrant labor contributed significantly to the expansion of U.S. agricultural exports, particularly between the United States and Mexico. For example, between 1994 and 2008, net U.S. exports to the world and to Mexico increased by 82% and 200%, respectively (U.S. Department of Agriculture 2008f). Devoid of these laborers, this dramatic increase would not have been possible. Although domestic and border enforcements address only the symptoms of illegal immigration, they are an important part of the immigration policy and the U.S. government devotes vast resources to prevent illegal entry and the employment of illegal aliens. The specific objectives of this paper are to: (1)analyze theoretically through illegal immigration and trade theory the effects of domestic and border enforcements on the illegal farm wage rate, commodity prices, unauthorized entry, and commodity trade between the United States and Mexico and (2) empirically implement the theoretical model through econometric estimation and simulation analysis and quantify the impacts of immigration policies on farm labor and commodity markets.

Immigrant workers are key to US agriculture, food security and job growth

McDaniel 4-1-15 [Paul, PhD in Geography and Urban Regional Analysis from the University of North Carolina at Charlotte, researcher at the American Immigration Council, "How Inaction on Immigration Impacts the Agricultural Economy," http://immigrationimpact.com/2015/04/01/how-inaction-on-immigration-impacts-the-agricultural-economy/]

Due to its geographic diversity and natural resource abundance, the United States is one of the world's leading agricultural producers and suppliers. Indeed, the $374 billion U.S. agriculture sector is critical to the U.S. economy, but its health depends on a functioning immigration system. From migrant workers on farms, to foreign-born scientists at agribusiness and agricultural research centers, immigrant labor is important for U.S. agriculture, and analysts predict that in the absence of immigration reform, the growth of the entire sector may stall. At an event Tuesday on immigration, agriculture, and the economy, panelists described how the status quo is harmful to employers, workers, the broader economy, and food security. Stephanie Mercier, with the Farm Journal Foundation, and author of Employing Agriculture: How the Midwest Farm Sector Relies on Immigrant Labor, observed that between 2000 and 2012, "U.S. consumption of fresh produce rose by 10.5 percent, while U.S. production rose only 1.4 percent. As a result, imports of fresh fruits and vegetables have increased by 38 percent over that period, with imports in several categories spiking well over 100 percent." And citing a previous study, she notes that labor supply challenges and H-2A visa shortcomings are key factors in a 27 percent decline in market share for U.S. growers, accounting for $3.3 billion in missed GDP growth and $1.4 billion in unrealized farm income for 2012. Another panelist, Craig Regelbrugge, with AmericanHort, observed on AgriTalk radio that immigrants working in the

agriculture sector are helping to create jobs for U.S. workers by enabling us to produce in the United States: "And when we produce here we are generating thousands upon thousands of jobs that are not on the farm necessarily. They're related to inputs that the farmer must buy in order to produce. They're related to things that must happen after the crop or product leaves the farm. The multiplier effect for each farmworker is said to be somewhere between 2 and 3 jobs that are created here…If we become reliant on Canada, Mexico, Central America, and…China to feed us, most of the jobs that exist here in agriculture will go offshore to support us." Describing the perspective of farmworkers, Adrienne DerVartanian, with Farmworker Justice, noted that "when you have a majority undocumented workforce, you have a workforce that's fearful of defending their workplace rights, of seeking improved wages and working conditions." She explained that farmworkers should be presented with an opportunity to have lawful permanent residency and a path to citizenship, which would stabilize the agricultural labor force and result in higher wages and better working conditions. Employers would benefit through higher retention rates and improved productivity, subsequently benefitting our nation through greater food security and food safety. Panelists agreed that **the future of agriculture in this country** and the ability to feed ourselves **is very much connected with immigration**. "Clearly, U.S. agriculture in the Midwest and elsewhere in the country really needs significant reforms to how the current U.S. immigration system works," Mercier said. "The current stalemate is very frustrating to a lot of farmers because it's forcing them to rethink how they operate their farms, what kind of crops they plant, in a way that's very limiting to their ability to run a good business." Regelbrugge explained the adverse effect of delaying immigration reform: "The do-nothing strategy is a net loser because the reality is new folks aren't coming in, and there is over time going to be attrition of the existing workforce…It doesn't take a nuclear physicist or rocket scientist to figure out how to solve agriculture's problem."

The US is key to global food security

DeCapua '12 ["US Drought Impacts Global Food Security," http://www.voanews.com/content/us-drought-food-security-8aug12/1475641.html]

The United States is the leading producer of corn and soybeans – two commodities that developing countries rely on. However, over the past two months, prices have risen sharply as the U.S. experiences its worst drought since the 1950s. A food policy expert says effectively responding to the drought can help prevent another global food crisis More than half the United States is experiencing the dual problems of too little rain and temperatures that are too high. Shenggen Fan, head of the International Food Policy Research Institute, said that's not only driving up prices, but contributing to price volatility as well.¶ "**The U.S. plays a huge role in global food security**. The U.S. is the largest food exporter – soybeans, maize and many other food commodities. So **anything [that] happens in the U.S. will have global significance**," he said.

Food wars go nuclear

FDI '12 [Future Directions International, an Australian-based independent, not-for-profit research institute, "International Conflict Triggers and Potential Conflict Points Resulting from Food and Water Insecurity," http://www.futuredirections.org.au/files/Workshop_Report_-_Intl_Conflict_Triggers_-_May_25.pdf]

There is little dispute that conflict can lead to food and water crises. This paper will consider ¶ parts of the world, however, where **food and water insecurity can be the cause of** conflict ¶ and, at worst, result in **war**. While dealing predominately with food and water issues, the ¶ paper also recognises the nexus that exists between food and water and energy security. ¶ There is a growing appreciation that the conflicts in the next century will most likely be fought over a lack of resources. Yet, in a sense, this is not new. Researchers point to the French and Russian revolutions as conflicts induced by a lack of food. More recently, Germany's World War Two efforts are said to have been inspired, at least in part, by its perceived need to gain access to more food. Yet the general sense among those that attended FDI's recent workshops, was that the scale of the problem in the future could be significantly greater as a result of population pressures, changing weather,

urbanisation, migration, loss of arable land and other farm inputs, and increased affluence in the developing world. In his book, Small Farmers Secure Food, Lindsay Falvey, a participant in FDI's March 2012 ¶ workshop on the issue of food and conflict, clearly expresses the problem and why countries ¶ across the globe are starting to take note. . ¶ He writes (p.36), "…if people are hungry, especially in cities, the state is not stable – riots, ¶ violence, breakdown of law and order and migration result." ¶ "Hunger feeds anarchy." ¶ This view is also shared by Julian Cribb, who in his book, The Coming Famine, writes that if "large regions of the world run short of food, land or water in the decades that lie ahead, then wholesale, bloody wars are liable to follow." ¶ He continues: "An increasingly credible scenario for World War 3 is not so much a ¶ confrontation of super powers and their allies, as a festering, self-perpetuating chain of ¶ resource conflicts." He also says: "The wars of the 21st Century are less likely to be global conflicts with sharply defined sides and huge armies, than a scrappy mass of failed states, rebellions, civil strife, insurgencies, terrorism and genocides, sparked by bloody competition over dwindling resources." ¶ As another workshop participant put it, people do not go to war to kill; they go to war over ¶ resources, either to protect or to gain the resources for themselves. Another observed that hunger results in passivity not conflict. Conflict is over resources, not because people are going hungry. ¶ A study by the International Peace Research Institute indicates that where food security is an issue, it is more likely to result in some form of conflict. Darfur, Rwanda, Eritrea and the Balkans experienced such wars. Governments, especially in developed countries, are increasingly aware of this phenomenon. **The UK Ministry of Defence, the CIA**, the US Center for Strategic and International Studies ¶ and the Oslo Peace Research Institute, **all identify famine as a** potential **trigger for conflicts and** possibly even **nuclear war**.

Food crises collapse civilization- causes disease spread, terrorism, and economic collapse

Brown '09 [Lester, environmental analyst, founder of the Worldwatch Institute, and founder and president of the Earth Policy Institute, a nonprofit research organization, recipient of 26 honorary degrees and a MacArthur Fellowship, has won several prizes and awards, including the United Nations Environment Prize, the World Wide Fund for Nature Gold Medal, and the Blue Planet Prize, "Could Food Shortages Bring Down Civilization?" http://www.scientificamerican.com/article/civilization-food-shortages/]

One of the toughest things for people to do is to anticipate sudden change. Typically we project the future by extrapolating from trends in the past. Much of the time this approach works well. But sometimes it fails spectacularly, and people are simply blindsided by events such as today's economic crisis. For most of us, the idea that civilization itself could disintegrate probably seems preposterous. Who would not find it hard to think seriously about such a complete departure from what we expect of ordinary life? What evidence could make us heed a warning so dire—and how would we go about responding to it? We are so inured to a long list of highly unlikely catastrophes that we are virtually programmed to dismiss them all with a wave of the hand: Sure, our civilization might devolve into chaos—and Earth might collide with an asteroid, too! For many years I have studied global agricultural, population, environmental and economic trends and their interactions. The combined effects of those trends and the political tensions they generate point to the breakdown of governments and societies. Yet I, too, have resisted the idea that **food shortages could bring down** not only individual governments but also our **global civilization**. I can no longer ignore that risk. Our continuing failure to deal with the environmental declines that are undermining the world food economy—most important, falling water tables, eroding soils and rising temperatures—forces me to conclude that such a collapse is possible.¶ The Problem of Failed States¶ Even a cursory look at the vital signs of our current world order lends unwelcome support to my conclusion. And those of us in the environmental field are well into our third decade of charting trends of environmental decline without seeing any significant effort to reverse a single one.¶ In six of the past nine years world grain production has fallen short of consumption, forcing a steady drawdown in stocks. When the 2008 harvest began, world carryover stocks of grain (the amount in the bin when the new harvest begins) were at 62 days of consumption, a near record low. In response, world grain prices in the¶ spring and summer of last year climbed to the¶ highest level ever.¶ As demand for food rises faster than supplies¶ are growing, the resulting food-price inflation puts severe stress on the governments of countries already teetering on the edge of chaos. Unable to buy grain or grow their own, hungry people take to the streets. Indeed, even before the¶ steep climb in grain prices in 2008, the number of failing states was expanding [see sidebar at left]. Many of their problems stem from a failure¶ to slow the growth of their populations. But if the food situation continues to deteriorate, entire nations

will break down at an ever increasing rate. We have entered a new era in geopolitics. In the 20th century **the main threat to international security** was superpower conflict; **today** it **is failing states**. It is not the concentration of¶ power but its absence that puts us at risk. **States fail when** national **governments can no longer provide** personal security, **food security**¶ and basic social services such as education and¶ health care. They often lose control of part or all¶ of their territory. When governments lose their¶ monopoly on power, law and order begin to disintegrate.¶ After a point, countries can become so dangerous that food relief workers are no longer¶ safe and their programs are halted; in Somalia¶ and Afghanistan, deteriorating conditions have¶ already put such programs in jeopardy.¶ Failing states are of international concern because¶ they are a source of terrorists, drugs, weapons¶ and refugees, threatening political stability everywhere. Somalia, number one on the 2008¶ list of failing states, has become a base for piracy.¶ Iraq, number five, is a hotbed for terrorist training.¶ Afghanistan, number seven, is the world's¶ leading supplier of heroin. Following the massive¶ genocide of 1994 in Rwanda, refugees from that¶ troubled state, thousands of armed soldiers among¶ them, helped to destabilize neighboring Democratic¶ Republic of the Congo (number six).¶ Our global civilization depends on a functioning network of politically healthy nationstates to control the spread of infectious disease, to manage the international monetary system, to control international terrorism and to reach¶ scores of other common goals. If the system for¶ controlling infectious diseases—such as polio,¶ SARS or avian flu—breaks down, humanity will be in trouble. Once states fail, no one assumes responsibility for their debt to outside lenders. If enough states disintegrate, their fall will threaten the stability of global civilization itself.

Diseases cause extinction

Guterl '12 [Fred, award-winning journalist and executive editor of Scientific American, worked for ten years at Newsweek, has taught science at Princeton University, *The Fate of the Species: Why the Human Race May Cause Its Own Extinction and How We Can Stop It*, 1-2, Google Books, online]

Over the next few years, the bigger story turned out not to be SARS, which trailed off quickly, bur avian influenza, or bird flu. It had been making the rounds among birds in Southeast Asia for years. An outbreak in 1997 Hong Kong and another in 2003 each called for the culling of thousands of birds and put virologists and health workers into a tizzy. Although the virus wasn't much of a threat to humans, scientists fretted over the possibility of a horrifying pandemic. Relatively few people caught the virus, but more than half of them died. What would happen if this bird flu virus made the jump to humans? What if it mutated in a way that allowed it to spread from one person to another, through tiny droplets of saliva in the air? One bad spin of the genetic roulette wheel and a deadly new human pathogen would spread across the globe in a matter of days. With a kill rate of 60 percent, such a pandemic would be devastating, to say the least.¶ Scientists were worried, all right, but the object of their worry was somewhat theoretical. Nobody knew for certain if such a supervirus was even possible. To cause that kind of damage to the human population, a flu virus has to combine two traits: lethality and transmissibility. The more optimistically minded scientists argued that one trait precluded the other, that if the bird flu acquired the ability to spread like wildfire, it would lose its ability to kill with terrifying efficiency. The virus would spread, cause some fever and sniffles, and take its place among the pantheon of ordinary flu viruses that come and go each season.¶ The optimists, we found out last fall, were wrong. Two groups of scientists working independently managed to create bird flu viruses in the lab that had that killer combination of lethality and transmissibility among humans. They did it for the best reasons, of course—to find vaccines and medicines to treat a pandemic should one occur, and more generally to understand how influenza viruses work. If we're lucky, the scientists will get there before nature manages to come up with the virus herself, or before someone steals the genetic blueprints and turns this knowledge against us. ¶ Influenza is a natural killer, but we have made it our own. We have created the conditions for new viruses to flourish—among pigs in factory farms and live animal markets and a connected world of international trade and travel—and we've gone so far as to fabricate the virus ourselves. Flu is an excellent example of how we have, through our technologies and our dominant presence on the planet, begun to multiply the risks to our own survival.

Advantage 2 is the Economy-

Sustainable immigration is key to the economy- solves workforce shortages

Guilford '13 [Gwynn, economics reporter and editor for Quartz, a news publication, "The US economy needs low-skilled immigrant workers as much as it needs PhDs," http://qz.com/75006/the-us-economy-needs-low-skilled-workers-as-much-as-it-needs-computer-science-phds/]

Immigrants have increasingly been filling low-wage jobs that Americans don't want. And that's not because they're stealing US jobs. As the native workforce has become more educated—and, therefore, moved up the income chain—immigrants have increasingly met the demand for the lowest-skilled jobs (pdf, p.4). By 2012, 24% of foreign workers did not have a high school diploma, compared with just 5% of working natives. Plus, native and immigrant low-skilled workers now tend to compete for different types of jobs (pdf, p.22). And demand for those workers is growing rapidly… The highest-volume and fastest-growing job categories also tend to be low-skilled ones (pdf), according to the Bureau of Labor Statistics. …particularly as the US workforce ages. Growth of the native working population in slowing, as retirees make up an increasing proportion of the overall population. This means there won't be enough native workers to fill many of the 4 million low-skilled jobs that the economy will add by 2020, according to the BLS. Take, for example, home health and personal care aides. If the 2020 workforce breakdown stayed at current levels—around a 25-75 split between foreign-born and native workers (pdf)—the economy would be short some 700,000 of those aides by 2020. That's a lot of sick and old people without help. Immigration of low-skilled workers drives up native wages… Research on what would happen if the US cleared a path to citizenship for its 11 million undocumented immigrants (a workable proxy for low-skilled immigrants) suggests that, as economic security encourages immigrants to consume, overall incomes will rise by $470 billion in a decade (pdf), and the economy would add 121,000 jobs each year. Plus, immigration pushes low-skilled natives up the income chain, helping to close that nagging wage gap. …and boost native productivity… Availability of domestic workers helps free up a highly productive slice of the workforce: ultra-educated women. "Domestic workers…make it possible for [high-skilled] women to enter the labor force and hold full-time jobs because they are home caring for their loves ones and maintaining the household," Haeyoung Yoon, of the National Employment Law Project tells Quartz. "[D]omestic workers make all other work possible." In short, more low-skilled immigrants will help women worried about "having it all," well, have it all. …as well as immigrant productivity. As The Economist discussed in Nov. 2012, the US's superior infrastructure and institutions alone would "supercharge" the productivity of an immigrant worker, regardless of how talented he is. With US worker productivity on the decline, this is much needed. Of course, no one's going to set up a fancy lobbying group for gardeners, nannies and bricklayers. But **they're** just as **crucial to the US's economic outlook**.

Deportation shakes the entire US economy- spills over and depresses wages

Zahniser et al '12 [Steven Zahniser, agricultural economist at the United States Department of Agriculture Economic Research Service, Thomas Hertz, Ph.D. in economics from the University of Massachusetts at Amherst, Peter B. Dixon, Professor in the Centre of Policy Studies at Victoria University, Maureen T. Rimmer, PhD in mathematics and lecturer in the Departments of Mathematics and Economics at La Trobe, "Immigration Policy and Its Possible Effects on U.S. Agriculture," June 5, http://www.ers.usda.gov/amber-waves/2012-june/immigration-policy.aspx#.VWe_189VhBf]

The results from the increased farm labor supply scenario conform to basic economic principles when the supply of one factor or input of production--such as labor, land, or machinery--becomes more plentiful. Greater availability of temporary nonimmigrant foreign-born farmworkers leads to their increased employment at lower wages. This, in turn, results in longrun increases in agricultural output and exports, above and beyond the growth projected by the base forecast. The increases in output and exports are generally larger in labor-intensive sectors such as fruit, tree nuts, vegetables, and nursery products. By Year 15 of the scenario, these four sectors experience a 1.1- to 2.0-percent increase in output and a 1.7- to 3.2-percent increase in exports, relative to the base forecast. Less labor-intensive sectors, such as grains, oilseeds, and livestock production, tend to have smaller increases, ranging from 0.1 to 1.5 percent for output and from 0.2 to 2.6 percent for

exports. Accompanying this additional growth in agricultural output and employment, however, would be a relative decrease of about 5.7 percent in the number of U.S.-born and other permanent residents employed as farmworkers and a 3.4-percent relative decrease in their wage rate. In the model, U.S.-born and foreign-born permanent resident workers are assumed to compete with foreign-born temporary nonimmigrant workers in the labor market. A 3.4-percent relative decrease in the wage rate does not mean that the wage rate is projected to fall by 3.4 percent over the 15-year period of the projection. Instead, it means that the wage rate in Year 15 is projected to be 3.4 percent lower in the increased farm labor supply scenario than in the base forecast. The longrun results from the decreased unauthorized labor supply scenario show a reduction in the labor supply to agriculture with effects on agricultural output and exports that are opposite in sign from the increased farm labor supply scenario and larger in magnitude. Fruit, tree nuts, vegetables, and nursery production are again among the most affected sectors but with longrun relative declines of 2.0 to 5.4 percent in output and 2.5 to 9.3 percent in exports. These effects tend to be smaller in other, less labor-intensive, parts of agriculture--a 1.6- to 4.9-percent decrease in output and a 0.3- to 7.4-percent decrease in exports. As part of the decreased unauthorized labor supply scenario, the number of unauthorized workers employed as farmworkers falls by between 34.1 and 38.8 percent, depending on modeling assumptions, relative to the base forecast for Year 15. At the same time, the number of farmworkers who are either U.S.-born or foreign-born, permanent residents increases by about 2.4 to 4.0 percent in the long run, compared with the base forecast, and their wage rate increases by 3.3 to 7.5 percent. However, the increased farm employment of U.S.-born and other permanent resident workers is not sufficient to offset the decrease in unauthorized farmworkers. As a result, the total number of farmworkers decreases by 3.4 to 5.5 percent. Some observers question whether a reduction in the number of unauthorized workers would benefit or harm U.S.-born and other permanent resident workers. Model results suggest that wages would rise (relative to the base forecast) in some lower paying occupations where unauthorized workers are common, decrease slightly in many higher paying occupations, and decrease on average. Several factors account for the slight decrease in earnings. First, **the decrease in the supply of unauthorized labor leads to a** longrun relative **decrease in production, not just in agriculture but in all sectors of the economy**. This, in turn, reduces incomes to many complementary factors of production, including U.S.-born and foreign-born, permanent resident workers in higher paying occupations. Second, with the departure of so many unauthorized workers, the occupational distribution of U.S.-born and other permanent resident workers necessarily shifts in the direction of more hired farm work and other lower paying occupations, such as food service, child care, and housekeeping, and away from higher paying occupations (a much larger category). The effect of this compositional change is to reduce the average real wage for U.S.-born and foreign-born, permanent resident workers in all sectors of the economy, even as real wages in many lower paying occupations rise. In the long term, overall gross national product accruing to U.S.-born and foreign-born, permanent residents would fall by about 1 percent, compared with the base forecast. This result indicates that the negative economic effects generated by the departure of a significant portion of the labor force outweigh the positive effects on the wages of U.S.-born workers and other permanent residents employed in lower paying occupations. This conclusion, however, might be different in a model that reproduced current levels of unemployment, rather than describing a longrun equilibrium in which the economy is much closer to full employment.

US economic decline causes global great power wars

Duncan '12 [Richard Duncan, former IMF consultant, financial sector specialist for the World Bank, Chief Economist Blackhorse Asset Management, The New Depression: The Breakdown of the Paper Money Economy, Page 12, Ebooks]

The political battle over America's future would be bitter, and quite possibly bloody. It cannot be guaranteed that the U.S. Constitution would survive. Foreign affairs would also confront the United States with enormous challenges. During the Great Depression, the United States did not have a global empire. Now it does. The United States maintains hundreds of military bases across dozens of countries around the world. Added to this is a fleet of 11 aircraft carriers and 18 nuclear-armed submarines. The country spends more than $650 billion a year on its military. If the U.S. economy collapses into a New Great Depression, the United States could not afford to maintain its worldwide military presence or to continue in its role as global peacekeeper. Or, at least, it could not finance its military in the same way it does at present. Therefore, either the United States would have to find an alternative funding method for its global military presence or else it would have to radically scale it back. Historically, empires were financed with plunder and territorial expropriation. The estates of the vanquished ruling classes were given to the conquering generals, while the rest of the population was forced to pay imperial taxes. The U.S. model of empire has been unique. It has financed its global military presence by issuing government debt, thereby taxing future generations of Americans to pay for this generation's global supremacy. That would no longer be possible if the economy collapsed. Cost–benefit analysis would quickly reveal that much of America's global presence was simply no longer affordable. Many—or even most—of the outposts that did not pay for themselves would have to be abandoned. Priority would be given to those places that were of vital economic interests to the United States. The Middle East oil fields would be at the top of that list. The United States would have to maintain control over them whatever the price. In this global depression scenario, the price of oil could collapse to $3 per barrel. Oil consumption would fall by half and there would be no speculators left to manipulate prices higher. Oil at that level would impoverish the oil-producing nations, with extremely destabilizing political consequences. Maintaining control over the Middle East oil fields would become much more difficult for the United States. It would require a much larger military presence than it does now. On the one hand, it might become necessary for the United States to reinstate the draft (which would possibly meet with violent resistance from draftees, as it did during the Vietnam War). On the other hand, America's all-volunteer army might find it had more than enough volunteers with the national unemployment rate in excess of 20 percent. The army might have to be employed to keep order at home, given that mass unemployment would inevitably lead to a sharp spike in crime. Only after the Middle East oil was secured would the country know how much more of its global military presence it could afford to maintain. If international trade had broken down, would there be any reason for the United States to keep a military presence in

Asia when there was no obvious way to finance that presence? In a global depression, the United States' allies in Asia would most likely be unwilling or unable to finance America's military bases there or to pay for the upkeep of the U.S. Pacific fleet. Nor would the United States have the strength to force them to pay for U.S. protection. Retreat from Asia might become unavoidable. And Europe? What would a cost–benefit analysis conclude about the wisdom of the United States maintaining military bases there? What valued added does Europe provide to the United States? Necessity may mean Europe will have to defend itself. Should a New Great Depression put an end to the Pax Americana, the world would become a much more dangerous place. When the Great Depression began, Japan was the rising industrial power in Asia. It invaded Manchuria in 1931 and conquered much of the rest of Asia in the early 1940s. Would China, Asia's new rising power, behave the same way in the event of a new global economic collapse? Possibly. China is the only nuclear power in Asia east of India (other than North Korea, which is largely a Chinese satellite state). However, in this disaster scenario, it is not certain that China would survive in its current configuration. Its economy would be in ruins. Most of its factories and banks would be closed. Unemployment could exceed 30 percent. There would most likely be starvation both in the cities and in the countryside. The Communist Party could lose its grip on power, in which case the country could break apart, as it has numerous times in the past. It was less than 100 years ago that China's provinces, ruled by warlords, were at war with one another. United or divided, China's nuclear arsenal would make it Asia's undisputed superpower if the United States were to withdraw from the region. From Korea and Japan in the North to New Zealand in the South to Burma in the West, all of Asia would be at China's mercy. And hunger among China's population of 1.3 billion people could necessitate territorial expansion into Southeast Asia. In fact, the central government might not be able to prevent mass migration southward, even if it wanted to. In Europe, severe economic hardship would revive the centuries-old struggle between the left and the right. During the 1930s, the Fascists movement arose and imposed a police state on most of Western Europe. In the East, the Soviet Union had become a communist police state even earlier. The far right and the far left of the political spectrum converge in totalitarianism. It is difficult to judge whether Europe's democratic institutions would hold up better this time that they did last time. England had an empire during the Great Depression. Now it only has banks. In a severe worldwide depression, the country—or, at least London—could become ungovernable. Frustration over poverty and a lack of jobs would erupt into anti-immigration riots not only in the United Kingdom but also across most of Europe. The extent to which Russia would menace its European neighbors is unclear. On the one hand, Russia would be impoverished by the collapse in oil prices and might be too preoccupied with internal unrest to threaten anyone. On the other hand, it could provoke a war with the goal of maintaining internal order through emergency wartime powers. Germany is very nearly demilitarized today when compared with the late 1930s. Lacking a nuclear deterrent of its own, it could be subject to Russian intimidation. While Germany could appeal for protection from England and France, who do have nuclear capabilities, it is uncertain that would buy Germany enough time to remilitarize before it became a victim of Eastern aggression. As for the rest of the world, its prospects in this disaster scenario can be summed up in only a couple of sentences. Global economic output could fall by as much as half, from $60 trillion to $30 trillion. Not all of the world's seven billion people would survive in a $30 trillion global economy. Starvation would be widespread. Food riots would provoke political upheaval and myriad big and small conflicts around the world. It would be a humanitarian catastrophe so extreme as to be unimaginable for the current generation, who, at least in the industrialized world, has known only prosperity. Nor would there be reason to hope that the New Great Depression would end quickly. The Great Depression was only ended by an even more calamitous global war that killed approximately 60 million people.

Empirical studies prove economic decline causes wars

Royal '10 [Jedediah, Director of Cooperative Threat Reduction at the U.S. Department of Defense, "Economic Integration, Economic Signaling and the Problem of Economic Crises," Economics of War and Peace: Economic, Legal and Political Perspectives, 213-215, online]

Less intuitive is how periods of economic decline may increase the likelihood of external conflict. Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behaviour of interdependent states. Research in this vein has been considered at systemic, dyadic and national levels. Several notable contributions follow. First, on the systemic level, Pollins (2008) advances Modelski and Thompson's (1996) work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of a pre-eminent power and the often bloody transition from one pre-eminent leader to the next. As such, exogenous shocks such as economic crises could usher in a redistribution of relative power (see also Gilpin. 1981) that leads to uncertainty about power balances, increasing the risk of miscalculation (Feaver, 1995). Alternatively, even a relatively certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power (Werner. 1999). Separately, Pollins (1996) also shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among major, medium and small powers, although he suggests that the causes and connections between global economic conditions and security conditions remain unknown. Second, on a dyadic level, Copeland's (1996, 2000) theory of trade expectations suggests that 'future expectation of trade' is a significant variable in understanding economic conditions and security behaviour of states. He argues that interdependent states are likely to gain pacific benefits from trade so long as they have an optimistic view of future trade relations. However, if the expectations of future trade decline, particularly for difficult to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by

interdependent states.4 Third, others have considered the link between economic decline and external armed conflict at a national level. Blomberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write: The linkages between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the favour. Moreover, the presence of a recession tends to amplify the extent to which international and external conflicts self-reinforce each other. (Blomberg & Hess, 2002. p. 89) Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapana, 2004), which has the capacity to spill across borders and lead to external tensions. Furthermore, crises generally reduce the popularity of a sitting government. "Diversionary theory" suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect. Wang (1996), DeRouen (1995). and Blomberg, Hess, and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997), Miller (1999), and Kisangani and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak Presidential popularity, are statistically linked to an increase in the use of force. In summary, recent economic scholarship positively correlates economic integration with an increase in the frequency of economic crises, whereas political science scholarship links economic decline with external conflict at systemic, dyadic and national levels.5 This implied connection between integration, crises and armed conflict has not featured prominently in the economic-security debate and deserves more attention.

Inherency

Immigration surveillance now

Surveillance of immigrants has substantially increased in recent years

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

This expansion of direct post-entry enforcement consists of several component mechanisms. First, noncitizens have been subject to more extensive, ongoing monitoring and registration requirements while in the United States. While noncitizens have long been required, as a formal matter, to register and be fingerprinted upon arrival, to carry proof of registration at all times within the United States, and to notify immigration officials promptly of changes of address, these provisions went largely unenforced for decades. 66 Even today, these registration requirements largely remain a legal fiction.67 Nevertheless, in the aftermath of the 2001 terrorist attacks, the government did step up both its formal and informal efforts to monitor certain categories of noncitizens within the United States.68 For example, beginning soon after the attacks, the FBI initiated a program of "voluntary" interviews for thousands of Arab and Muslim men with nonimmigrant visas.69 In early 2002, the Justice Department announced plans to aggressively enforce the change of address provision, warning of severe adverse consequences for noncompliance.70 Later in 2002, the Attorney General initiated the National Security Entry-Exit Registration System ("NSEERS"), which imposed registration requirements on nonimmigrant men who were at least sixteen years old and current or former nationals of twenty-five countries, all but one predominantly Arab or Muslim. 71 Congress and DHS also tightened oversight of international students and schools where they are enrolled to ensure compliance with the terms of student visas.72 Second, DHS has devoted substantially more resources to post-entry investigations.73 In 2002, DHS launched an initiative targeting "absconders" or "fugitives," categories that it defines to include (1) individuals with removal orders who have not departed the United States and (2) individuals who have otherwise failed to report to ICE when required.74 Between 2003 and 2010, funding for these programs spiraled from $9 million to over $230 million, increasing the personnel devoted to these programs by more than 1300%. 75 The operations conducted under these programs have involved tactics ranging from undercover investigations to high profile, paramilitary-style home and workplace raids and blanket community sweeps in apartment complexes, grocery stores, laundromats, and parks.76 Third, federal officials have enlisted hundreds of thousands of state and local law enforcement and corrections officials in immigration policing.77 These initiatives, whose particular manifestations have evolved swiftly, seek to identify potentially deportable noncitizens by screening individuals when they are arrested, convicted, and incarcerated to determine their citizenship and immigration status and potential deportability. In addition to these federal initiatives, some states and localities unilaterally have sought to become directly involved in immigration policing. For example, several states and localities—most prominently Arizona, with its controversial and widely-noted Senate Bill 1070—have authorized or required law enforcement to inquire about the immigration status of individuals they encounter and in some instances to convey that information to federal immigration officials.78 While the Supreme Court left open the possibility of as-applied challenges to Section 2 when it reviewed SB 1070, it declined to facially invalidate the provision, and it has previously signaled its willingness to tolerate an active role for state and local police in direct immigration enforcement.79

Surveillance has drastically reduced immigration

Kalhan '14 [Anil, J.D. from Yale Law School, Associate Professor of Law, Drexel University. A.B., Brown University, "Immigration Surveillance," Maryland Law Review, Volume 74, Issue 1, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr]

In this Article, I examine a set of important but underappreciated consequences of this entrenchment of mass immigration enforcement, tracing and analyzing the evolution of immigration governance into an enduring regime of immigration surveillance. 4 By any measure, enforcement levels have soared in recent years. Federal expenditures on border and immigration control have grown fifteen-fold since 1986 and now substantially exceed expenditures on all other federal law enforcement programs combined.5 These activities have been supplemented by a dizzying array of initiatives, often administered by state, local, and private actors, that indirectly enforce immigration law by regulating access to rights, benefits, and services—including employment, social services, driver's licenses, transportation services, and education—based on citizenship or immigration status.6 Increasingly, immigration control objectives also are pursued using criminal prosecutions.7 These initiatives have yielded a staggering, widely noted increase in the number of noncitizens formally removed from the United States.8 Much less widely noted, however, has been the full significance of that growth—including an attendant sea change in the underlying nature of immigration regulation itself, hastened by the implementation of transformative new surveillance and dataveillance technologies. Like many other areas of contemporary governance, immigration control has rapidly become an information-centered and technology-driven enterprise. At virtually every stage of the process of migrating or traveling to, from, and within the United States, both noncitizens and U.S. citizens are now subject to collection and analysis of extensive quantities of personal information for immigration control and other purposes. This information is aggregated and stored by government agencies for long retention periods in networks of interoperable databases and shared among a variety of public and private actors, both inside and outside the United States, with little transparency, oversight, or accountability.9

ICE raids now

ICE is still cracking down on immigrants

Fox 2 Now 6-17-15 [News service based in St. Louis, "Surge in ICE enforcement leads to 44 arrests in St. Louis," http://fox2now.com/2015/06/17/surge-in-ice-enforcement-leads-to-44-arrests-in-st-louis/]

A surge in Midwest enforcement by the U.S. Immigration and Customs Enforcement (ICE) led to 280 arrests, 44 in St.Louis. The initiative was conducted from May 18th to June 13th. The focus was on the arrest and removal of convicted criminal aliens. Officers worked in six states: Illinois, Indiana, Wisconsin, Kentucky, Kansas and Missouri. ICE reports that 40 men and 4 women were arrested in the area. Convicted criminals were from the following countries: Mexico (33), Guatemala (4), Kenya (2), and one each from Honduras, Nigeria, Saudi Arabia, Spain and Vietnam.

Immigration decreasing

Illegal immigration is falling now

Markon 5-27-15 [Jerry, reporter for The Washington Post, "Fewer immigrants are entering the U.S. illegally, and that's changed the border security debate," http://www.washingtonpost.com/politics/flow-of-illegal-immigration-slows-as-us-mexico-border-dynamics-evolve/2015/05/27/c5caf02c-006b-11e5-833c-a2de05b6b2a4_story.html]

As the Department of Homeland Security continues to pour money into border security, evidence is emerging that illegal immigration flows have fallen to their lowest level in at least two decades. The nation's population of illegal immigrants, which more than tripled, to 12.2 million, between 1990 and 2007, has dropped by about 1 million, according to demographers at the Pew Research Center.

Solvency

Federal action key

The federal government should take the lead on immigration policy- states can't undermine the plan

Cannato '12 [Vincent J. Cannato is an associate professor of history at the University of Massachusetts, Boston, "Our Evolving Immigration Policy," National Affairs Issue 13, Fall 2012, http://www.nationalaffairs.com/publications/detail/our-evolving-immigration-policy]

Legitimate though these state concerns may be, however, their solution is not to be found in 50 separate immigration policies. "Arizona may have understandable frustrations with the problems caused by illegal immigration while that process [of discourse] continues," the Court declared, "but the State may not pursue policies that undermine federal law." And though the power to control immigration may not be explicitly granted to the federal government under the Constitution, it is hard to imagine a modern nation-state in the 21st century in which that power does not rest firmly in the central government's hands. Nevertheless, this still means, as the Court noted, that the federal government has a responsibility to act on immigration — to pursue reform that reflects a shared "political will," and to forge that agreement through "searching, thoughtful, rational civic discourse." The history of American immigration suggests that this agreement will be reached only when the national mood and the country's politics more broadly are ready for it — and the signs indicate that now is not that moment. But settling on a sensible immigration policy will be crucial in the coming decades. Without one, it will be impossible to maintain a high standard of living and a dynamic, entrepreneurial economy while also managing the large demographic changes that continue to remake our society. In this sense, the unproductive nature of our immigration debate may be telling us something about the state of the nation more generally. Our decaying institutions have forced us to make enormously consequential decisions about the role of our government, its relationship to the individual, and the direction of the nation. As with immigration policy, our ability to settle these broader disputes satisfactorily is an open question.

Federal action is essential to shape immigration policy- states can't reverse it

Cannato '12 [Vincent J. Cannato is an associate professor of history at the University of Massachusetts, Boston, "Our Evolving Immigration Policy," National Affairs Issue 13, Fall 2012, http://www.nationalaffairs.com/publications/detail/our-evolving-immigration-policy]

For all the debate that surrounds America's immigration policy, just who is responsible for enforcing that policy has rarely been in dispute in recent decades — until Arizona adopted the statute S.B. 1070. Arguing that the federal government had proved incapable of stopping the illegal immigration wreaking havoc in the state, Arizona lawmakers took matters into their own hands, enacting legislation that used state penalties and state police to try to give meaningful force to federal laws already on the books. Washington, for its

part, resisted, claiming that Arizona's approach intruded on federal prerogatives. The federal-state power struggle ultimately landed before the Supreme Court, which, amid a swirl of politicized commentary on both sides of the matter, issued its ruling in June. "The Government of the United States has broad, undoubted power over the subject of immigration and the status of aliens....The federal power to determine immigration policy is well settled," opined Justice Anthony Kennedy, writing for the Court's majority in Arizona v. United States. In a 5-3 decision (Justice Elena Kagan recused herself), the Court struck down most of the Arizona law and limited the permissible range of state activity in the realm of immigration enforcement. To allow each of the 50 states to enact its own immigration-control laws — even if those laws did not conflict with, but instead complemented, federal law — would, in the Court's view, violate the doctrine that "the States are precluded from regulating conduct in a field that Congress, acting within its proper authority, has determined must be regulated by its exclusive governance." In the eyes of the Court's majority, the regulation of immigration has been so thoroughly dominated by the federal government as to leave virtually no room for action by the states. Justice Antonin Scalia disagreed, writing in his dissent that such a ruling "deprives States of what most would consider the defining characteristic of sovereignty: the power to exclude from the sovereign's territory people who have no right to be there." The majority's opinion, he contended, is supported by "neither the Constitution itself nor even any law passed by Congress." Nor is it supported by the history of immigration in the United States. As Scalia noted, "In light of the predominance of federal immigration restrictions in modern times, it is easy to lose sight of the States' traditional role in regulating immigration — and to overlook their sovereign prerogative to do so." He is correct: Federalism and immigration have interacted in complicated ways since our republic was created. In fact, until the late 19th century, immigration was an issue largely left up to individual states to regulate. A look at the history of our immigration system can therefore offer some important clarification of the dispute at the heart of Arizona v. United States. But that history also has a great deal to say about our approach to immigration policy more broadly. After all, Arizona did not resolve the much bigger dilemma facing the nation: how, exactly, we should repair a national immigration system that is quite clearly broken. Designed almost five decades ago, that system has ceased to function effectively, to suit the needs and circumstances of today's society and economy, and to retain the support of the public. It is precisely the failure of that system that has driven Arizona and other states to try to fix the problem themselves, and that has prompted lawmakers at the national level to spend the better part of the past decade in pursuit of "comprehensive immigration reform." That effort has tortured the nation's politics and stoked controversy surrounding questions of race and national identity — and yet has achieved essentially nothing. Why? Here, too, history points to the answer: Our immigration policies, and the role the federal government plays in them, tend to follow American political trends more broadly. Large reforms of immigration laws have coincided with sweeping changes in the public's expectations of the federal government — during the Progressive era, in the wake of World War I, and in the heart of the Great Society period. We may well be in the midst of such a dramatic shift in our approach to government, though it is not yet evident precisely where these changing expectations will lead. We should not be surprised, then, that our immigration debate has, to date, been similarly inconclusive.

Farms declining now

Worker shortages are threatening US food security- immigration is key

Ahrens 4-5-15 [Daniel, Berkeley Political review, "An Agri-Culture of Settlement," http://bpr.berkeley.edu/2015/04/05/an-agri-culture-of-settlement/]

Increasingly serious labor shortages are putting America's conveniently low food prices at risk. Yet, Obama's recent executive action on immigration does little to assuage the agricultural labor crisis and could possibly exacerbate the shortage. The shortage problem is challenging the agriculture industry to adapt and may lead to the establishment of a more efficient food system. According to a report by the National Council for Agricultural Employers, a group that represents the agriculture industry before Congress, farmers are losing 320 million dollars a year due to labor shortages. The shortage has left agriculture unpicked on branches, and fields neglected. While the government does not collect data on labor shortage costs due to the subjective nature of the measurement, the industry's conclusions are backed up by other statistics. First, real wages are rising for agriculture workers, signifying a greater need for work. The National Agricultural Statistics Services's Farm Labor Survey finds that real wages are on the rise at a rate of 0.8% per year. Second, the average age of the workforce is growing, suggesting fewer younger workers are entering the agricultural industry. A 2012 agricultural census from the US Department of Agriculture found that the average age of principal farmers was 58.3, up 1.2 years from 2007, and is still on the rise. Fewer workers

are entering agriculture, and America's food supply is suffering as a result. A quick glance at the US Department of Labor's National Agricultural Workers Survey (NAWS) finds that 75% of farm laborers were born in Mexico. Yet, immigration from Mexico fell from its peak of approximately 7 million immigrants living in the United States in 2009 to 5.8 million in 2012. Many attribute the labor shortage in agriculture to the decline in immigration from Mexico.

US agriculture is declining- profits are low

Bjerga 2-9-15 [Alan, writer for Bloomberg Business, "U.S. Farmers Watch $100 Billion-a-Year Profit Fade Away," http://www.bloomberg.com/news/articles/2015-02-10/u-s-farmers-watch-100-billion-a-year-profit-fade-away]

Farm income this year in the U.S., the world's top agricultural producer and exporter, is heading for a third straight decline and will post its biggest slide since the Great Depression, the government said today. While raising livestock remains profitable, as tight meat supplies keep prices high, growers of corn, soybeans and wheat saw crop and land values fall faster than many of their costs. That's pinching sales for equipment maker Deere & Co. and seed producers including DuPont Co. "The budget picture for corn and soybeans is as negative as we've seen in a long time," said Brent Gloy, an agricultural economist at Purdue University in West Lafayette, Indiana. "You will see some farmers not able to cover their production costs." USDA Forecast Net-cash income from all farm activity will tumble 22 percent to $89.4 billion, the biggest drop since 1932 and the lowest since 2009, the U.S. Department of Agriculture said in a report today in Washington. Last year's slump was 12 percent to $115.1 billion. Net income, including the value of inventory and non-cash income, was forecast to drop 32 percent to $73.6 billion, with expenses at a record $370.4 billion, the government said.

Surveillance hurts agriculture

Surveillance cuts off ag labor supplies and exports- boosts commodity prices

Devadoss and Luckstead '11 [Stephen Devadoss, PhD in Economics from Iowa State University, is a professor at the Department of Agricultural Economics and Rural Sociology at the University of Idaho, Jeff Luckstead, PhD in economics from Washington State, is an Assistant Professor of Agricultural Economics and Agribusiness at the University of Arkansas, "Implications of immigration policies for the U.S. farm sector and workforce," 7-1-11, http://www.freepatentsonline.com/article/Economic-Inquiry/261386342.html]

To examine the effect of an increase in the domestic enforcement in the United States on the illegal labor flow, d[W.sub.I] and d[P.sub.U] from Equations (11a) and (11b) are substituted into Equation (13a). Holding all other exogenous variables, except for domestic enforcement, constant in Equation (13a), the change in illegal labor flow in response to tighter domestic control is stated as: (14a) [MATHEMATICAL EXPRESSION NOT REPRODUCIBLE IN ASCII] The first set of terms shows the wage effect. Because tighter domestic control is likely to reduce the illegal wage rate, the unauthorized entry will contract. The second set of terms demonstrates the price effect. Increased domestic enforcement will make production more expensive, leading to a higher commodity price and increased demand for labor. The net effect of domestic enforcement is to reduce the cross-border migration because the wage effect is likely to dominate the price effect. To study the effect of an increase in the domestic enforcement on commodity trade, d[W.sub.I] and d[P.sub.U] from Equations (11a) and (11b) are substituted into Equation (13b). Holding all other exogenous variables, except for domestic enforcement, constant in Equation (13b), the change in U.S. exports to Mexico is expressed as: (14b)

[MATHEMATICAL EXPRESSION NOT REPRODUCIBLE IN ASCII] The first set of terms illustrates the wage effect. Tighter domestic surveillance forces undocumented workers to return to Mexico, which will increase the Mexican workforce and reduce the Mexican wage rate. This lower wage rate will increase Mexican commodity production, leading to lower imports. The second set of terms demonstrates the price effect. Increased domestic enforcement will cause the U.S. wage rate to rise and make production more expensive, leading to a lower U.S. commodity supply. This will result in a higher commodity price and lower imports by Mexico. Thus, both effects reinforce each other in reducing U.S. exports to Mexico. To analyze the effect of heightened U.S. border enforcement on the illegal labor flow, d[W.sub.I] and d[P.sub.U] from Equations (12a) and (12b) are substituted into Equation (13a). Holding all other exogenous variables, except for border security, constant in Equation (13a), the change in illegal labor flow in response to a change in border control is written as: (15a) [MATHEMATICAL EXPRESSION NOT REPRODUCIBLE IN ASCII] In Equation (15a), the first set of terms shows the wage effect. Strengthened border surveillance reduces the illegal entry and thus raises the illegal wage rate. Even though immigrants apprehended at the border are sent back to Mexico, the higher illegal wage rate in the United States lures them to cross the border repeatedly. The second set of terms illustrates the price effect. As the United States implements additional measures to secure its borders, fewer illegal workers enter the United States, causing the cost of production and commodity price to rise. This also results in a higher Mexican commodity price. The higher Mexican price draws would be immigrant laborers back into Mexican production, which contracts the illegal labor supply. The third set of terms represents the direct effect of an increase in U.S. border security on the illegal labor supply. As a result of the tightened border control, fewer laborers successfully cross the U.S. border, which reduces the supply of unauthorized labor. The combined effect of the three terms should result in fewer illegal laborers entering the U.S. labor market from Mexico. To examine the effect of heightened U.S. border security on the commodity trade, d[W.sub.I] and d[P.sub.U] from Equations (12a) and (12b) are substituted into Equation (13b). Holding all other exogenous variables, except for border surveillance, constant in Equation (13b), the change in commodity trade resulting from tighter border security is expressed as: (15b) [MATHEMATICAL EXPRESSION NOT REPRODUCIBLE IN ASCII] The first set of terms in Equation (15b) demonstrates the wage effect. Increased border surveillance reduces the illegal entry and thus drives up the illegal wage rate in the United States, but augments the Mexican workforce and lowers the Mexican wage rate, which expands Mexican commodity production, leading to lower imports. The second set of terms represents the price effect. An increase in border enforcement curtails the illegal workforce in U.S. agricultural production, leading to an increase in U.S. production cost, reduced supply, and lowers exports to Mexico. The third set of terms conveys the indirect effect of heightened border enforcement on commodity trade through changes in the wage rate. This effect also reduces U.S. exports to Mexico. Thus, the combined effects of all three terms reinforce each other in reducing U.S. exports to Mexico.

Surveillance devastates agriculture- curbs production, trade and labor

Kille '12 [Leighton Walter Kille, degree from the Harvard Kennedy School of Government, where he serves as a Research Editor, "Implications of immigration policies for U.S. farm sector and workforce," June 25, http://journalistsresource.org/studies/government/immigration/implications-immigration-policies-u-s-farm-sector-labor]

In the United States, illegal immigration has long been the subject of public debate as well as political skirmishing. The 1986 Immigration Reform and Control Act (IRCA) attempted to reduce the flow of undocumented immigrants through a mix of amnesty programs, increasing monitoring of employers and tighter border controls; after the 9/11 attacks, policy shifted toward enforcement, even as the collapse of the housing markets in 2007 led to declining rates of immigration. Despite this, immigration is still a key issue in the 2012 presidential contest. A 2011 study published in Economic Inquiry, "Implications of Immigration Policies for U.S. Farm Sector and Workforce," examined the effect of U.S. immigration policy on the flow of unauthorized immigrants from Mexico and the subsequent impact on the nation's economy. The researchers, based at Washington State University and the University of Idaho, modeled the relationship between restrictive policies and the productivity of the U.S. agricultural sector. The findings include: There is a strong relationship between spending on border security and rates of illegal immigration from Mexico. "As the probability of apprehension of illegal immigrants at the border increases, the flow of undocumented workers into the United States lessens." A 10% increase in domestic enforcement spending, primarily worksite surveillance, reduces the wage rate for illegal workers more than 11%; curbs illegal labor use by approximately 9,000 workers to U.S. agriculture; and decreases U.S.-Mexico commodity trade by an average of $180 million. "Heightened border enforcements reduce the employment of undocumented workers and commodity production, which causes U.S. agricultural exports to Mexico to decline by an average of 5%."

Reductions in the immigrant labor force has caused labor shortages in several states and has had "devastating effects on farm production and profitability." These are being felt by consumers through higher costs for fruits and vegetables. "The results of the study show the distinct tradeoffs between reducing illegal immigration into the United States, and the productivity of the agricultural sector, and subsequently the U.S. economy," the researchers state. "U.S. government policies aimed at deporting unauthorized workers — without taking adequate measures to supply farm laborers through guest-worker programs — will adversely affect the supply of farm laborers to crop production."

Immigrants key to agriculture

Lower immigration rates destroy US agriculture

Plumer '14 [Brad, senior editor at Vox.com, where he oversees the site's science, energy, and environmental coverage, "America is running out of farm workers. Will robots step in?" July 2, http://www.vox.com/2014/7/2/5861274/americas-running-out-of-farmworkers-will-robots-help]

What's more, the paper noted, it's unlikely that America will be able to find ready replacements of farmworkers. Most native-born Americans don't seem to have much interest in going back to the farm, even if wages rise significantly. And poorer countries like Guatemala or El Salvador are either too small or urbanizing too rapidly to supplant Mexico in providing low-wage farm labor. Combine that with stricter immigration enforcement in recent years, and America's already starting to see the effects. In 2012, California faced one of its worst agricultural labor shortages ever. This year, Washington is suffering its largest shortage of seasonal farmworkers on record. (Georgia, for its part, has tried to use prison inmates to replace lost farm labor after enacting stricter immigration laws — and it's gone poorly.)

Stable immigration is vital to US agriculture- otherwise labor shortages kill global food supplies

PNAE '13 [The Partnership for a New American Economy brings together more than 500 Republican, Democratic, and Independent mayors and business leaders united in making the economic case for streamlining, modernizing, and rationalizing our immigration system, "Agriculture," http://www.renewoureconomy.org/issues/agriculture/#]

Farmers across the country depend on temporary labor to help grow their crops and their businesses. Immigrants help fill these vital positions, creating an additional 2 to 3 jobs for domestic-born workers in industries such as food packaging, shipping, and farming supplies. For many farms across the country, there are simply not enough native-born workers to work their fields. In North Carolina, the Growers Association had 6,500 agriculture jobs available in 2011, but out of the 500,000 unemployed North Carolinians, only 7 applied and completed the growing season. Without immigrants to staff these openings, North Carolina may have lost a major industry for the state – a trend that is happening across the country. Over 84,000 acres of production and 22,000 jobs in agriculture have been lost to Mexico, and according to a 2014 Partnership study, labor shortages on farms led to $3.3 billion in

missed GDP growth and $1.3 billion in lost farm income in 2012. When America has the workers it needs, farmers can produce the food locally and create a major source of revenue – agricultural exports created 920,000 full-time jobs in 2008, according to a USDA study. The U.S. must act to fix its burdensome immigration system if America's agriculture industry hopes to remain competitive and continue to be the breadbasket for the world.

Brink

Global food security is approaching the brink- strong US exports are key to solve global instability

Kiefer '13 [Captain T. A. "Ike" Kiefer, naval aviator and EA-6B pilot with 7 deployments ¶ to the PACOM and CENTCOM AORs and 21 months on the ground in Iraq. He ¶ has a Bachelor's degree in physics from the US Naval Academy and a Master's ¶ in Strategy from the US Army Command and General Staff College. He has ¶ commanded at the O-5 and O-6 level and was 2005 action officer of the year of the ¶ Joint Staff J-7 Directorate in the Pentagon. He currently teaches strategy at the US ¶ Air Force Air War College as the CJCS Chair, "Twenty-First Century Snake Oil: ¶ Why the United States ¶ Should Reject Biofuels as ¶ Part of a Rational National ¶ Security Energy Strategy," January, http://phe.rockefeller.edu/docs/Kiefer%20-%20Snake%20Oil.pdf]

In 2008, world grain market prices tripled, mirroring and surpassing the spike in ¶ global oil prices, and proving the linkage between food Calories and energy ¶ calories in the modern world. Grain prices to the poorest consumers increased ¶ as much as 50%, driving 8% more of Africa's population toward hunger and raising ¶ the world's undernourished population to approximately 850 million.¶ 151¶ Today's ¶ market prices are still double what they were in 2007. Various studies of the 2008 ¶ food price spike surveyed by the World Bank have attributed as much as 70% of ¶ the increase in corn prices and 100% of the increase in sugar prices to global ¶ diversion of food to biofuels.¶ 152¶ A union of the world's preeminent food and ¶ assistance agencies including the World Food ¶ Program and the Food and Agriculture ¶ Organization of the United Nations has formally ¶ called for all G20 nations to drop their biofuels ¶ subsidies and mandates because of the impact ¶ they are having on driving up food prices ¶ around the world.¶ 153¶ It is a myth to think that ¶ non-food biofuel crops do not compete with ¶ food. Labels such as "Gen2" or "Advanced" can ¶ only serve as Orwellian attempts to hide the ¶ truth and assuage investor consciences. That fact is that every cultivated crop—¶ food or non-food—competes with every other cultivated crop for finite resources ¶ including water, land, agrichemicals, farm equipment, transportation, financing, etc. ¶ Putting more demand on these resources raises prices for everyone. Biofuels are ¶ becoming a huge threat to global food security, and thereby to global stability—a ¶ fact that should shape any military or political energy strategy. Many analysts now ¶ looking at the "Arab Spring" phenomenon recognize that, underlying the very real ¶ political aspirations of movements such as the revolution in Tunisia, there was ¶ outrage at skyrocketing food prices. What first began as riots in Egypt due to the ¶ government no longer being able to afford to subsidize the price of bread became a ¶ hot-blooded revolt and coup.¶ 12.1. The Looming Global Food Crisis ¶ As the global population sprints toward 9 billion by 2050, there are 140,000 ¶ more mouths to feed every day. Food grain consumption is growing at 40 million ¶ tons per year.¶ 154¶ Yet, because of enormous market-distorting subsidies, the United ¶ States today produces more corn for ethanol than for food or cattle feed.¶ 155¶ For ¶ decades past, America had surplus food crop capacity and used it to rescue other ¶ nations from famine. In 1965 President Lyndon Johnson's administration shipped one-fifth of the US wheat crop to India during a devastating drought.¶ 156¶ With slack ¶ land now being consumed by biofuels production, a drought such as the one that ¶ destroyed 40% of Russia's grain crop in 2010 would be devastating to national ¶ security—particularly because both food and fuel would be simultaneously affected. ¶ The negative consequences of biofuels upon food crop production have been ¶ understood by the US government since a blue-ribbon panel of scientists appointed ¶ by the newly formed DoE rejected gasohol for this and other sound reasons in ¶ 1980.¶ 157¶ Twenty-five years

later in 2005, politics trumped science with the ¶ imposition of US ethanol blending mandates and corn ethanol subsidies that even Al ¶ Gore now regrets—and the world is reaping what we have sown.¶ 158¶ If our greater interest is truly global peace and security, US farmers should be out of the fuel business, and instead looking to increase food production to fill commodity and direct export orders with famine-wary nations in the overstressed global food market.

US ag key to global food security

US is key to food stability- prevents destabilizing food crises

Coleman '12 [Isobel Coleman, Senior Fellow and Director of the Civil Society, Markets, and Democracy Initiative; Director of the Women and Foreign Policy Program, "U.S. Drought and Rising Global Food Prices," August 2, http://www.cfr.org/food-security/us-drought-rising-global-food-prices/p28777]

The ongoing drought in the Midwest has affected approximately 80 percent of the U.S. corn crop and more than 11 percent of the soybean crop, triggering a rise in global food prices (RFE/RL) that CFR's Isobel Coleman says may fuel political instability in developing countries. The United States produces approximately 35 percent of the world's corn and soybean supply, commodities that are "crucial in the food chain, because they are used for feed stock for animals," Coleman says. Growing demand for meat and protein from emergent middle classes internationally has made many countries dependent on "relatively inexpensive food stocks" from the United States, she explains. "When you see a crop failure of the magnitude you have seen this summer, it flows through the whole food chain," says Coleman, who recommends reconsidering the U.S. ethanol mandate and building "more resilience into the global food system." How is the U.S. drought affecting commodity crops, food production, and prices? As recently as May, experts were predicting a record crop in the United States--and of course, what the United States does is so important, because the Midwest is the bread basket for the rest of the world. But with severe drought in the Midwest, you've already seen a failure in the soybean and corn crop in the United States. That increased world commodity prices, and it is going to trickle through the whole food chain. This is the hottest summer on record in the United States since 1895, and people are beginning to wonder whether this type of drought that we're experiencing could become a new normal. The United States is a pivotal player in world food production and has the most sophisticated agricultural sector in terms of seeds, technology, irrigation, deep commodity markets, and future markets. If the United States crop is so devastated by drought, what is going to happen to the rest of the world? How do rising U.S. food prices affect global food prices down the world's food supply chain? Which areas of the globe are most at risk? There are many large food producers in the world. China is the largest wheat producer, but it is also the largest wheat consumer. What makes the United States unique is that we are the largest exporter, so we produce about 35 percent of the world's corn and soybean supply. Those two commodities are crucial in the food chain, because they are used for feed stock for animals. Around the world you have rising middle classes, a growing demand for meat and protein in the diet, and countries around the world are becoming increasingly dependent on relatively inexpensive food stocks from the United States. When you see a crop failure of the magnitude you have seen this summer, it flows through the whole food chain. Right now you have American livestock producers taking their pigs and cattle to the slaughter house because they simply don't have the food to be feeding them. So you're going to see meat prices in the short term in the United States go down, but over the longer term you're going to see rising meat prices; [experts] are predicting already 4 to 5 percent price increases in meat for the next year. That flows through the whole food chain. [to] big-population countries that import a lot of food, such as the Philippines, Afghanistan, Egypt. And when you see rapidly rising food prices, of course it leads to instability. We've seen [this] in the last five years across many of those countries, and you see rising food prices translate almost directly into street protests. You're going to see the continuation of [political] instability driven in part by rapidly rising food prices. In 2008, we had food protests across much of the Middle East, so governments are going to be very much on the alert for unrest and very sensitive to it. Egypt is already spending about one-third of its subsidies on food, and it is draining the Egyptian foreign exchange reserve to continue those subsidies. This combination of an already mobilized population out on the streets demanding lots of different changes [in Egypt], and rising food prices is going to create a very unstable atmosphere. What are some policy responses for alleviating the pressures being felt in the United States and other countries because of rising food prices? In the United States, we have to look at our own policies that are part of the problem, [including] our mandated use of ethanol in gasoline. This is something that is a mandated [10] percent that is not flexible, and when you have rising food prices and a problem with the failing crop, you would think that maybe we could lighten up on the ethanol mandate. Because right now so much of our food production is going into ethanol. So you've already seen governors across the United States in some of the hard-hit states saying, "Shouldn't we review our ethanol policies?" That's not a short-term fix, but it is potentially longer-term and something we should be looking at carefully. In terms of policy, we have a rising global population. We have more mouths to feed every year, and food security for the world is a critical issue. We should be looking at how to build in more resilience into the global food system. Africa, which has the highest population growth rates of any continent in the world, used to feed itself and used to export food, but [its] agriculture has suffered tremendously over the last half century. Only 4 percent of the land in Africa is even irrigated, and you've seen a green revolution occur in many parts of the world that has really passed Africa by.

And so building in greater resilience and improving the agricultural capacity of Africa is a critical part of this equation, so that Africa has more of an ability to feed itself and become more a part of the global supply chain and not be so dependent on it. Unfortunately, governments have not made the investments in the agricultural sector that they needed to over the past half century, which is why you have this situation in Africa today.

Specifically, slowdowns in US food production pushes us over the brink

Kennedy '12 [Robert, Al Jazeera, "Food riots predicted over US crop failure," 8-21-12, http://www.aljazeera.com/indepth/features/2012/08/20128218556871733.html]

The world is on the brink of a food "catastrophe" caused by the worst US drought in 50 years, and misguided government biofuel policy will exacerbate the perilous situation, scientists and activists warn.¶ When food prices spike and people go hungry, **violence soon follows**, they say. Riots caused by food shortages - similar to those of 2007-08 in countries like Bangladesh, Haiti, the Philippines and Burkina Faso among others - may be on the horizon, threatening social stability in impoverished nations that rely on US corn imports.¶ This summer's devastating drought has scorched much of the mid-western United States - the world's bread basket.¶ Crops such as corn, wheat, and soy have been decimated by high temperatures and little rain. Grain prices have skyrocketed and concerns abound the resulting higher food prices will hit the world's poor the hardest - sparking violent demonstrations.¶ Early dryness in Russia's wheat growing season, light monsoon rains in India, and drought in Africa's Sahel region, combined with America's lost crop, mean a perfect storm is on the horizon.¶ Surging food prices could kick off food riots similar to those in 2008 and 2010, Professor Yaneer Bar-Yam, president of the New England Complex Systems Institute, told Al Jazeera.¶ "Recent droughts in the mid-western United States threaten to cause global catastrophe," said Bar-Yam, whose institute uses computer models to identify global trends.¶ Hopes were high in May of a bumper corn crop this year, but sizzling temperatures in June and July scuttled those predictions. US corn yields are now expected to be the lowest in 17 years.¶ The United States accounted for 39 per cent of global trade in corn in 2011-12. Stockpiles are now down 48 per cent, according to the US Department of Agriculture. Corn prices have shot up 60 per cent since June 15.¶ Corn is a primary staple in Sub-Saharan Africa, and in much of Central and South America. In South Africa, the cost of maize has increased about 40 per cent in the last year, even before the US drought struck. ¶ Bar-Yam highlighted the food riots of 2007-08 and 2010-11 that were fuelled by sudden and dramatic spikes in food prices. He said his institute recently entered data from the US drought into its computer model, which predicted the outbreak of food-related unrest "in a short period of time".¶ "When people are unable to feed themselves and their families, widespread social disruption occurs," Bar-Yam said. "**We are on the verge of** another crisis, the third in five years, and likely to be **the worst yet**, capable of causing new food riots and turmoil on a par with the Arab Spring."¶ Fighting for food¶ While Americans and other Westerners will largely escape the financial pain spawned by the drought, impoverished people around the globe won't be so fortunate.¶ People in wealthy industrialised countries spend between 10 to 20 per cent of their income on food. Those in the developing world pay up to 80 per cent. According to Oxfam, a one per cent jump in the price of food results in 16 million more people crashing into poverty. ¶ More than 60 food riots occurred worldwide between 2007 and 2009, when rapidly rising commodity prices wreaked havoc on family budgets.¶ The world is not yet in a food crisis, said David Hallam, the UN Food and Agriculture Organisation's director of trade and markets.¶ "We're a long way from that … Some of the elements that we saw in 2007-08 are very much missing at the moment", Hallam told Reuters. He said wheat stocks were currently stable, and a bumper rice crop was still expected later this year. ¶ But he added: "We are in a very vulnerable situation in markets, and any **further supply-side shocks** or any disruptive policy actions that individual countries might take could add further to the problems we have and **create turmoil in markets**."

Yes Resource Wars- Empirics

Empirics go aff

Acemogluy et al '10 [Daron Acemogluy, Ph.D., London School of Economics, named the Charles P. Kindleberger Professor of Applied Economics in 2004, member of the Economic Growth program of the Canadian Institute of Advanced Research. He is also affiliated with the National Bureau of Economic Research, Center for Economic Performance, International Growth Centre, and Centre for Economic Policy Research, Michael Golosovz, professor of economics at Princeton University, Aleh Tsyvinskix, Professor of Economics Co-Director, Macroeconomics Program, Cowles Foundation at Yale, Pierre Yared, Assistant Professor of Finance and Economics at Columbia University's Graduate School of Business, "A Dynamic Theory of Resource Wars," October 12, http://econ.as.nyu.edu/docs/IO/16865/Golosov_20101029.pdf]

Control over natural resources has been one of the key determinants of wars.1 An early study of¶ causes of modern wars by Bakeless (1921) during the 1878 to 1918 period argues that fourteen of the twenty major wars had significant economic causes, often related to the conflict over resources. He emphasizes ì[t]he rise of industrialism has led to the struggle for ... raw materials. For example, in the War of the Pacific (1879-1884), Chile fought against a defensive alliance of¶ Bolivia and Peru for the control of guano mineral deposits. The war was precipitated by the rise¶ in the value of the deposits due to their extensive use in agriculture. Chile's victory increased¶ the size of its treasury by 900 percent.2¶ In another study, Westing (1986) argues that many of the wars in the twentieth century had an important resource dimension. As examples, he cites the Algerian War of Independence¶ (1954-1962), the Six Day War (1967), and the Chaco War (1932-1935).3 More recently, Saddam¶ Hussein's invasion of Kuwait in 1990 was a result of the dispute over the Rumaila oil field. In¶ Resource Wars (2001), Klare argues that following the end of the Cold War control of valuable¶ natural resources has become increasingly important and these resources will become a primary motivation for wars in the future. The famous Carter Doctrine, which states that Any attempt by any outside force to gain control of the Persian Gulf ... will be repelled by any means necessary, including military force.. is just one facet of this perspective.4 This paper develops an economic theory of resource wars and clarifies the conditions under¶ which such wars can be prevented. We consider the interaction between a resource-rich and a¶ resource-poor country. Our model is dynamic in order to capture the effect of the increasing¶ scarcity of finite resources. We construct a theory which combines the classical Hotelling (1931)¶ model of exhaustible resources with a dynamic guns and butter model of armament and war along the lines of Powell (1993). A key friction in our model is the presence of limited commitment,¶ as countries cannot commit to future policies. We use the model to ask three main questions.¶ First, what is the effect of resource scarcity on the likelihood of war? Second, how does the¶ threat of war affect resource extraction and prices? Finally, how are the realization of war and¶ the dynamics of resource extraction affected by market structure?¶ More specifically, in our framework, the resource-poor country (country A) exchanges a nonexhaustible good (a consumption good) for an exhaustible good (oil) with the resource-rich¶ country (country S). At any date, country A can arm and invade country S, where higher¶ armaments result in country A capturing a greater portion of the left-over resources in country¶ S. We consider two different market structures. In the first market structure, the competitive¶ environment, the entire stock of the exhaustible resource in country S is distributed among a set¶ of perfectly competitive price-taking firms which supply the world market. Country A consumers¶ purchase at the world market price, unless there is a war (in which case country A captures part¶ of the endowment and the rest of the stock is destroyed). In the second market structure, the¶ monopolistic environment, the government of country S regulates the price and the level of¶ production of the resource (for example, by setting nonlinear taxes). More specifically, following¶ the armament decision by country A, country S makes a take-it-or-leave-it price-quantity offer¶ to country A, where country A has the option of declaring war if this is preferable to accepting¶ the offer. We characterize the equilibrium in Markovian strategies.¶ A key force which emerges in both of these environments is the elasticity of the demand for¶ oil. More specifically, if the elasticity of demand for oil is below 1, the value of the outstanding¶ stock of oil rises as the resource is depleted. This implies that the incentives for country A to¶ arm and to fight country S rise over time. In contrast, if this elasticity exceeds 1, the value¶ of the outstanding stock of oil declines with time, as do country A's incentives to arm and to¶ fight. As we will see, the elasticity of demand plays a crucial role for the characterization of¶ equilibrium dynamics. Given that empirically relevant estimates of elasticity are below 1, we¶ focus our discussion on the implications of the model for elasticities below 1.5¶ Our first main result is that a novel externality emerges in the competitive environment and¶ this externality can precipitate war. Specifically, firms in country S do not internalize effect¶ of selling decision on country A's war incentives. In the case with inelastic demand, firms do¶ not take into account that their extraction decision increases country A's incentives to invade¶ country S, since these incentives rise with resource scarcity. Moreover, if country A is sufficiently¶ powerful (i.e., it can acquire a large enough portion of the outstanding oil during war), then¶ country A will eventually invade country S once the stock of oil has been sufficiently depleted.¶ Firms anticipate this prospect of future war by increasing their extraction today, which in turn¶ increases country A's incentives to engage in war even earlier, an effect which we refer to as the¶ unraveling of peace.

Impacts- Extinction

Food insecurity causes extinction

Trudell '5 (Robert H., Fall, Trudell, J.D. Candidate 2006, Food Security Emergencies And The Power Of Eminent Domain: A Domestic Legal Tool To Treat A Global Problem, 33 Syracuse J. Int'l L. & Com. 277, Lexis)

2. But, Is It Really an Emergency? In his study on environmental change and security, J.R. McNeill dismisses the scenario where environmental degradation destabilizes an area so much that "security problems and ... resource scarcity may lead to war." 101 McNeill finds such a proposition to be a weak one, largely because history has shown society is always able to stay ahead of widespread calamity due, in part, to the slow pace of any major environmental change. 102 This may be so. However, as the events in Rwanda illustrated, the environment can breakdown quite rapidly - almost before one's eyes - when food insecurity drives people to overextend their cropland and to use outmoded agricultural practices. 103 Furthermore, as Andre and Platteau documented in their study of Rwandan society, overpopulation and land scarcity can contribute to a breakdown of society itself. 104 Mr. McNeill's assertion closely resembles those of many critics of Malthus. 105 The general argument is: whatever issue we face (e.g., environmental change or overpopulation), it will be introduced at such a pace that we can face the problem long before any calamity sets in. 106 This wait-and-see view relies on many factors, not least of which are a functioning society and innovations in agricultural productivity. But, today, with up to 300,000 child soldiers fighting in conflicts or wars, and perpetrating terrorist acts, the very fabric of society is under increasing world-wide pressure. 107 Genocide, anarchy, dictatorships, and war are endemic throughout Africa; it is a troubled continent whose problems threaten global security and challenge all of humanity. 108 As [*292] Juan Somavia, secretary general of the World Social Summit, said: "We've replaced the threat of the nuclear bomb with the threat of a social bomb." 109 Food insecurity is part of the fuse burning to set that bomb off. It is an emergency and we must put that fuse out before it is too late.

Impacts- General

Food insecurity is a conflict multiplier

Brinkman and Hendrix '11 [Henk-Jan Brinkman is Chief, Policy, Planning and Application in the Peacebuilding Support Of ice of the¶ United Nations. Cullen S. Hendrix is Assistant Professor, The College of William & Mary, and Fellow, Robert¶ S. Strauss Center for International Security and Law, University of Texas at Austin, "Food Insecurity and Violent Conflict: Causes, Consequences, and Addressing the Challenges," July, http://documents.wfp.org/stellent/groups/public/documents/newsroom/wfp238358.pdf]

This paper provides an overview of the link between¶ food insecurity and violent conflict, addressing both¶ traditional and emerging threats to security and¶ political stability. It discusses the effects of food¶ insecurity on several types of conflict, and the¶ political, social, and demographic factors that may¶ exacerbate these effects. It then discusses the¶ interventions that can break the link between food¶ security and conflict, focusing on mechanisms that¶ can shield consumers and producers from food price¶ shocks. Finally, it discusses ways in which the¶ international community can assist in breaking this¶ link and build peace.¶ Food insecurity – especially when caused by a rise in¶ food prices – is a threat and impact multiplier for violent conflict. It might not be a direct cause and¶ rarely the only cause, but combined with other¶ factors, for example in the political or economic¶ spheres, it could be the factor that determines¶ whether and when violent conflicts will erupt. Changes in food security, rather than levels of food¶ insecurity, are probably most influential. Food¶

insecurity is neither a necessary nor a sufficient¶condition for violent conflict. Food price stabilization¶measures and safety nets are critical instruments to¶prevent violent conflict. Food assistance can¶contribute to peacebuilding, restore trust in¶governments and rebuild social capital.

Food insecurity makes all impacts inevitable

Trudell '05 [Robert H., J.D. Candidate, Food Security Emergencies And The Power Of Eminent Domain: A Domestic Legal Tool To Treat A Global Problem, 33 Syracuse J. Int'l L. & Com. 277, Lexis]

Today, more than 842 million people - nearly three times the population of the United States - are chronically hungry. 43 "Chronic hunger is a profound, debilitating human experience that affects the ability of individuals to work productively, think clearly, and resist disease. It also has devastating consequences for society: it drains economies, destabilizes governments, and reaches across international boundaries." 44 The enormous number of chronically hungry people conjures up a critical question: how can we feed these people? While the rate of population growth has been leveling off in the developed, wealthy countries of the world, the populations of the poorest countries and regions of the world still grow at an alarming pace. 45 Population statisticians refer to this phenomenon as population momentum. 46 Of the seventeen countries whose women average six or more births in a lifetime, all but two are in Africa. 47 In sub-Saharan Africa, millions are undernourished and millions more live on a dollar a day, making it the most poverty-stricken region in the world today. 48 [*285] Chronic hunger and poverty are the rock-and-a-hard-place in between which the people of sub-Saharan Africa find themselves today. One tragedy endlessly feeds upon and exacerbates the other because a person needs money to buy food, but she (or he) cannot earn money when she is chronically hungry. 49 The food security issues of this region are a global concern. Silvio Berlusconi, Prime Minister of Italy, and Chairperson of the 2002 World Food Summit in Rome said, "Together with terrorism, hunger is one of the greatest problems the international community is facing." 50 Human security is a value which can be broadly defined as both the "freedom from fear" and the "freedom from want." 51 Until recently, security was largely a concern arising out of the conflict among states, i.e. state security, which can be summed up in the phrase "military preparedness." 52 Today, it is recognized that the achievement of freedom from want is as important a goal as the achievement of freedom from fear and countries must arm themselves against such fear by addressing food insecurity. 53 In an editorial in the Economist, Kofi Annan, Secretary General of the United Nations, wrote that today's threats to security - terrorism, food security and poverty - are all interrelated so that no one country can tackle them alone. 54 For example, keeping our food supply secure plays a direct role in achieving freedom from fear. The State Department has been studying the possibilities of food-borne bioterrorism, introducing the national security element to food security concerns. 55 Likewise, in December [*286] 2004, during his resignation announcement, Tommy Thompson, the former Secretary of the Health and Human Services Department, stated: "For the life of me, I cannot understand why the terrorists have not attacked our food supply, because it is so easy to do." 56 Yet it is a mistake to think of global security only in military terms. 57 Food security deserves its place in any long-term calculation regarding global security. Widespread chronic hunger causes widespread instability and debilitating poverty and decreases all of our safety, for example from the increased threat from global terrorism. 58 Widespread instability is an unmistakable characteristic of life in sub-Saharan Africa. 59 Food insecurity, therefore, causes global insecurity because widespread instability in places like sub-Saharan Africa threatens all of our safety. Food insecurity in the unstable regions of the world must be taken on now lest we find ourselves facing some far worse danger in the days to come.

Food insecurity causes escalatory wars

Brinkman and Hendrix '11 [Henk-Jan Brinkman is Chief, Policy, Planning and Application in the Peacebuilding Support Of ice of the¶United Nations. Cullen S. Hendrix is Assistant Professor, The College of William & Mary, and Fellow, Robert¶S. Strauss Center for International Security and Law, University of Texas at Austin, "Food Insecurity and Violent Conflict: Causes, Consequences, and Addressing the Challenges," July, http://documents.wfp.org/stellent/groups/public/documents/newsroom/wfp238358.pdf]

Competition over scarce resources, particularly land¶and water, often causes or exacerbates communal conflict (Homer-Dixon, 1999;Kahl, 2006;Ban,¶ 2007).Communal conflict involves groups with¶ permanent or semi-permanent armed militias but¶ does not involve the government. However, it can¶escalate to include government forces, as in the¶massacres in Darfur, Rwanda and Burundi. These conflicts have the potential to

escalate to civil war¶ when the government is perceived to be supporting,¶ tacitly or otherwise, one communal group at the¶ expense of the other (Kahl, 2006).While the conflict in Darfur began as a communal conflict over land¶ and water, its impact escalated to devastating proportions following the government's support for¶ Janjaweed militias in their fight against the Sudan¶ People's Liberation Army/Movement and Justice¶ and Equality Movement rebels.¶ Communal conflicts are common in the Sahel, the¶ zone of transition between the Sahara desert and the¶ savanna, particularly in years of extremely high and¶ low rainfall(Hendrix and Salehyan, 2010).¶ Recurrent, long-lasting droughts in the Sahel have¶ undermined cooperative relationships between¶ migratory herders and sedentary farmers, leading to¶ food insecurity and increased competition for water¶ and land between farmers and herders, but also¶ within herding and farming groups. As a pastoralist¶ in the Sudan noted: "When there is food, there is no¶ cattle raiding." (quoted in Schomerus and Allen,¶ 2010). Once violence begins, conflict escalates and persists because of security dilemmas (fear of future¶ attacks leads to preemptive attacks – see Posen,¶ 1993) and lack of alternative dispute mechanisms¶ between groups and effective policing within groups¶ (Fearon and Laitin, 1996).¶ These conflicts have been particularly lethal in¶ Kenya, Nigeria, the Sudan and Uganda. Repeated¶ clashes between Fulani herders and Tarok farmers in¶ Nigeria's Plateau State killed 843 people in 2004.¶ Similar clashes between Rizeigat Abbala and Terjam¶ herders in the Sudan killed 382 in 2007.Cattle¶ raiding in the Karamoja Cluster, a cross-border¶ region of Ethiopian, Kenyan and Ugandan territory,¶ resulted in more than 600 deaths and the loss of¶ 40,000 heads of livestock in 2004 alone (Meier,¶ Bond and Bond, 2007). These conflicts tend to occur¶ in politically marginalized territories far from the¶ capital(Raleigh, 2010).

Don't buy their generic impact defense- new ag slowdowns collapse food security and causes extinction

Palm '13 [Justin T., writer for The Real Truth magazine, "Agriculture's Amazing Future!" http://realtruth.org/articles/130125-005.html]

Seventy-four days. That is all that stands between mankind and starvation—the length of time the world's food reserves would feed humanity before disappearing. From 1986 to 2001, the world held an average of 107 days' worth of grain in storage. But from 2002 to 2011, the average dropped to just 74. Not even three months' worth!¶ Shrinking levels of surplus food supplies are signaling that the future of food may not be as secure as most think. The Guardian quoted Lester Brown, president of the Earth Policy Institute and author of Full Planet, Empty Plates: "Ever since agriculture began, carry-over stocks of grain have been the most basic indicator of food security." If mankind missed one harvest, it would begin to starve. For thousands of years, man's existence has been drawn from the soil. Civilizations unable to provide lasting sustenance for their people were invariably lost to history. Healthy, arable land has always been humanity's most precious commodity. As its total area shrinks to dangerous, never-before-seen levels, and man's population explodes, the very future of civilization is at stake. Too little food is being grown on too few acres to provide for the roughly 370,000 human beings born every day.¶ Like millions of American families living "paycheck to paycheck," humanity is living harvest to harvest. Mr. Brown also stated, "An unprecedented period of world food security has come to an end. The world has lost its safety cushions and is living from year to year…" (ibid.).¶ Once-bountiful water sources are drying up. Arable land is dwindling. Now more than ever, mankind must address the issue of food security.

Impacts- Wars

Food insecurity is the greatest risk of great power war- magnifies every impact

Brown '09 [Lester R., United States environmental analyst, founder of the Worldwatch Institute, and founder and president of the Earth Policy Institute, a nonprofit research organization based in Washington, D.C., recipient of 26 honorary degrees and a MacArthur Fellowship, Brown

has been described by the Washington Post as "one of the world's most influential thinkers," has been the recipient of many prizes and awards, including, the 1987 United Nations Environment Prize, the 1989 World Wide Fund for Nature Gold Medal, and the 1994 Blue Planet Prize for his "contributions to solving global environmental problems," "Can Food Shortages Bring Down Civilization?" Scientific American, May]

The biggest threat to global stability is the potential for food crises in poor countries to cause government collapse. Those crises are brought on by ever worsening environmental degradation One of the toughest things for people to do is to anticipate sudden change. Typically we project the future by extrapolating from trends in the past. Much of the time this approach works well. But sometimes it fails spectacularly, and people are simply blindsided by events such as today's economic crisis. For most of us, the idea that civilization itself could disintegrate probably seems preposterous. Who would not find it hard to think seriously about such a complete departure from what we expect of ordinary life? What evidence could make us heed a warning so dire--and how would we go about responding to it? We are so inured to a long list of highly unlikely catastrophes that we are virtually programmed to dismiss them all with a wave of the hand: Sure, our civilization might devolve into chaos--and Earth might collide with an asteroid, too! For many years I have studied global agricultural, population, environmental and economic trends and their interactions. The combined effects of those trends and the political tensions they generate point to the breakdown of governments and societies. Yet I, too, have resisted the idea that food shortages could bring down not only individual governments but also our global civilization. I can no longer ignore that risk. Our continuing failure to deal with the environmental declines that are undermining the world food economy--most important, falling water tables, eroding soils and rising temperatures--forces me to conclude that such a collapse is possible. The Problem of Failed States Even a cursory look at the vital signs of our current world order lends unwelcome support to my conclusion. And those of us in the environmental field are well into our third decade of charting trends of environmental decline without seeing any significant effort to reverse a single one. In six of the past nine years world grain production has fallen short of consumption, forcing a steady drawdown in stocks. When the 2008 harvest began, world carryover stocks of grain (the amount in the bin when the new harvest begins) were at 62 days of consumption, a near record low. In response, world grain prices in the spring and summer of last year climbed to the highest level ever. As demand for food rises faster than supplies are growing, the resulting food-price inflation puts severe stress on the governments of countries already teetering on the edge of chaos. Unable to buy grain or grow their own, hungry people take to the streets. Indeed, even before the steep climb in grain prices in 2008, the number of failing states was expanding [see sidebar at left]. Many of their problem's stem from a failure to slow the growth of their populations. But if the food situation continues to deteriorate, entire nations will break down at an ever increasing rate. We have entered a new era in geopolitics. In the 20th century the main threat to international security was superpower conflict; today it is failing states. It is not the concentration of power but its absence that puts us at risk. States fail when national governments can no longer provide personal security, food security and basic social services such as education and health care. They often lose control of part or all of their territory. When governments lose their monopoly on power, law and order begin to disintegrate. After a point, countries can become so dangerous that food relief workers are no longer safe and their programs are halted; in Somalia and Afghanistan, deteriorating conditions have already put such programs in jeopardy. Failing states are of international concern because they are a source of terrorists, drugs, weapons and refugees, threatening political stability everywhere. Somalia, number one on the 2008 list of failing states, has become a base for piracy. Iraq, number five, is a hotbed for terrorist training. Afghanistan, number seven, is the world's leading supplier of heroin. Following the massive genocide of 1994 in Rwanda, refugees from that troubled state, thousands of armed soldiers among them, helped to destabilize neighboring Democratic Republic of the Congo (number six). Our global civilization depends on a functioning network of politically healthy nation-states to control the spread of infectious disease, to manage the international monetary system, to control international terrorism and to reach scores of other common goals. If the system for controlling infectious diseases--such as polio, SARS or avian flu--breaks down, humanity will be in trouble. Once states fail, no one assumes responsibility for their debt to outside lenders. If enough states disintegrate, their fall will threaten the stability of global civilization itself.

Most qualified research proves resource wars are true

Brinkman and Hendrix '11 [Henk-Jan Brinkman is Chief, Policy, Planning and Application in the Peacebuilding Support Of ice of the¶United Nations. Cullen S. Hendrix is Assistant Professor, The College of William & Mary, and Fellow, Robert¶S. Strauss Center for International Security and Law, University of Texas at Austin, "Food Insecurity and Violent Conflict: Causes,

Consequences, and Addressing the Challenges," July, http://documents.wfp.org/stellent/groups/public/documents/newsroom/wfp238358.pdf]

Rising food prices contribute to food insecurity, which is a clear and serious threat to human security. Interest in food security as a catalyst for political instability and conflict has grown rapidly since 2007–2008, when food protests and riots broke out in 48 countries as a result of record world prices. In February 2011,the food price index of the Food and Agriculture Organization of the United Nations (FAO) reached a new historic peak, and the rise in food prices contributed to the wave of protests across North Africa and the Middle East that toppled Tunisian president Zine El Abidine BenAli and Egyptian president Hosni Mubarak. Among major development organizations, the unchallenged consensus is that war and conflict are development issues: conflict ravages local economies, often leading to forced migration, refugee populations, disease, a collapse of social trust, and acute food insecurity. But is food insecurity itself a cause of conflict? Based on a review of recent research, the answer is a highly qualified yes. Food insecurity, especially when caused by higher food prices, heightens the risk of democratic breakdown, civil conflict, protest, rioting, and communal conflict. The evidence linking food insecurity to interstate conflict is less strong, though there is some historical evidence linking declining agricultural yields to periods of regional conflict tin Europe and Asia.

Food-based conflict is the most probable form of warfare

Brinkman and Hendrix '11 [Henk-Jan Brinkman is Chief, Policy, Planning and Application in the Peacebuilding Support Of ice of the United Nations. Cullen S. Hendrix is Assistant Professor, The College of William & Mary, and Fellow, Robert S. Strauss Center for International Security and Law, University of Texas at Austin, "Food Insecurity and Violent Conflict: Causes, Consequences, and Addressing the Challenges," July, http://documents.wfp.org/stellent/groups/public/documents/newsroom/wfp238358.pdf]

Civil conflict is the prevalent type of armed conflict in the world today (Harbom and Wallersteen, 2010). Itis almost exclusively a phenomenon of countries with low levels of economic development and high levels of food insecurity. Sixty-five percent of the world's food-insecure people live in seven countries: India, China, the Democratic Republic of Congo (DRC),Bangladesh, Indonesia, Pakistan and Ethiopia (FAO, 2010), of which all but China have experienced civil conflict in the past decade, with DRC, Ethiopia, India and Pakistan currently embroiled in civil conflicts. Pinstrup-Andersen and Shimokawa (2008)find that poor health and nutrition are associated with greater probability of civil conflict, though their findings are based on small sample sizes. Countries with lower per capita caloric intake are more prone to experience civil conflict, even accounting for their levels of economic development (Sobek and Boehmer, 2009). This relationship is stronger in those states where primary commodities make up a large proportion of their export profile. Some of the countries most plagued by conflict in the past 20 years are commodity-rich countries characterized by widespread hunger, such as Angola, DRC, Papua New Guinea and Sierra Leone. The mixture of hunger– which creates grievances – and the availability of valuable commodities – which can provide opportunities for rebel funding – is a volatile combination. World commodity prices can trigger conflict, as higher prices, especially for food, increase affected groups' willingness to fight. Timothy Besley and Torsten Persson (2008)find that as a country's import prices increase, thereby eroding real incomes, the risk of conflict increases. Oeindrila Dube and Juan F.Vargas (2008) arrive at similar conclusions when looking at Colombia, where higher export prices for coffee (which is labour intensive and a source of rural income) reduced violence in coffee producing areas while higher export prices for oil (which is capital intensive and a source of income for rebels and paramilitary groups)increased violence in regions with oil reserves and pipelines.

Impacts- Starvation

Food insecurity can cause billions to starve

Brown '5 (Lester Brown, President of the Earth Policy Institute, February 7, 2005, People and the Planet, "Falling water tables 'could hit food supply'," http://www.peopleandplanet.net/doc.php?id=2424

Many Americans see terrorism as the principal threat to security, but for much of humanity, the effect of water shortages and rising temperatures on food security are far more important issues. For the 3 billion people who live on 2 dollars a day or less and who spend up to 70 per cent of their income on food, even a modest rise in food prices can quickly become life-threatening. For them, it is the next meal that is the overriding concern."

Impacts- Democracy

Food insecurity destroys democracy

Brinksman and Hendrix '11 [Henk-Jan Brinkman is Chief, Policy, Planning and Application in the Peacebuilding Support Of ice of the United Nations. Cullen S. Hendrix is Assistant Professor, The College of William & Mary, and Fellow, Robert

S. Strauss Center for International Security and Law, University of Texas at Austin, "Food Insecurity and Violent Conflict: Causes, Consequences, and Addressing the Challenges," July, http://documents.wfp.org/stellent/groups/public/documents/newsroom/wfp238358.pdf]

Food insecurity, proxied by low availability of¶ calories for consumption per capita, makes democratic breakdown more likely, especially in higher-income countries, where people expect there to be larger social surpluses that could be invested to reduce food insecurity (Reenock,Bernhard and¶ Sobek, 2007). Though statistical evidence is lacking, rising food prices have been implicated in the wave of demonstrations and transitions from authoritarian rule to fledgling democracy in some countries across North Africa and the Middle East in 2011. There are some historical precedents for this: a bad harvest in 1788 led to high food prices in France, which caused rioting and contributed to the French revolution in 1789; and the wave of political upheaval that swept Europe in 1848 was at least in part a response to food scarcity, coming after three below-average¶ harvests across the continent(Berger and Spoerer¶ 2001).

Democracy is key to solve extinction

Diamond ’95 [Larry Diamond, Hoover Institution, Stanford University, December, PROMOTING DEMOCRACY IN THE 1990S, 1995, p. http://www.carnegie.org//sub/pubs/deadly/diam_rpt.html]

Nuclear, chemical and biological weapons continue to proliferate. The very source of life on Earth, the global ecosystem, appears increasingly endangered. Most of these new and unconventional threats to security are associated with or aggravated by the weakness or absence of democracy, with its provisions for legality, accountability, popular sovereignty and openness. The experience of this century offers important lessons. Countries that govern themselves in a truly democratic fashion do not go to war with one another. They do not aggress against their neighbors to aggrandize themselves or glorify their leaders. Democratic governments do not ethnically "cleanse" their own populations, and they are much less likely to face ethnic insurgency. Democracies do not sponsor terrorism against one another. They do not build weapons of mass destruction to use on or to threaten one another. Democratic countries form more reliable, open, and enduring trading partnerships. In the long run they offer better and more stable climates for investment. They are more environmentally responsible because they must answer to their own citizens, who organize to protest the destruction of their environments.

Impacts- Protectionism

US food shortages cause protectionism

Pollan ‘8 (BOOKS ARTICLESAPPEARANCESMEDIA PRESS KITNEWSRESOURCES TODAY’S LINK Farmer in Chief By Michael Pollan The New York Times Magazine, October 12, 2008

The impact of the American food system on the rest of the world will have implications for your foreign and trade policies as well. In the past several months more than 30 nations have experienced food riots, and so far one government has fallen. Should high grain prices persist and shortages develop, you can expect to see the pendulum shift decisively away from free trade, at least in food. Nations that opened their markets to the global flood of cheap grain (under pressure from previous administrations as well as the World Bank and the I.M.F.) lost so many farmers that they now find their ability to feed their own populations hinges on decisions made in Washington (like your predecessor’s precipitous embrace of biofuels) and on Wall Street. They will now rush to rebuild their own agricultural sectors and then seek to protect them by erecting trade barriers. Expect to hear the phrases “food sovereignty” and “food security” on the lips of every foreign leader you meet. Not only the Doha round, but the whole cause of free trade in agriculture is probably dead, the casualty of a cheap food policy that a scant two years ago seemed like a boon for everyone. It is one of the larger paradoxes of our time that the very same food policies that have contributed to overnutrition in the first world are now contributing to undernutrition in the third. But it turns out that too much food can be nearly as big a problem as too little — a lesson we should keep in mind as we set about designing a new approach to food policy.

Protectionism causes extinction

Miller and Elwood ’88 (Miller and Elwood, 1988 International Society for Individual Liberty , http://www.free-market.net/resources/lit/free-trade-protectionism.html, gender modified)

TRADE WARS: BOTH SIDES LOSE When the government of Country "A" puts up trade barriers against the goods of Country "B", the government of Country "B" will naturally retaliate by erecting trade barriers against the goods of Country "A". The result? A trade war in which both sides lose. But all too often a depressed economy is not the only negative outcome of a trade war . . . WHEN GOODS DON'T CROSS BORDERS, ARMIES OFTEN DO **History is not lacking in examples of cold trade wars escalating into hot shooting wars**: Europe suffered from almost non-stop wars during the 17th and 18th centuries, when restrictive trade policy (mercantilism) was the rule; rival governments fought each other to expand their empires and to exploit captive markets. British tariffs provoked the American colonists to revolution, and later the Northern-dominated US government imposed restrictions on Southern cotton exports - a major factor leading to the American Civil War. In the late 19th Century, after a half century of general free trade (which brought a half-century of peace), short-sighted politicians throughout Europe again began erecting trade barriers. Hostilities built up until they eventually exploded into World War I. In 1930, facing only a mild recession, US President Hoover ignored warning pleas in a petition by 1028 prominent economists and signed the notorious Smoot-Hawley Act, which raised some tariffs to 100% levels. Within a year, over 25 other governments had retaliated by passing similar laws. The result? **World trade came to a grinding halt, and the entire world was plunged into the "Great Depression**" for the rest of the decade. **The depression in turn led to World War II**. THE #1 DANGER TO WORLD PEACE The world enjoyed its greatest economic growth during the relatively free trade period of 1945-1970, a period that also **saw no major wars**. **Yet we again see trade barriers being raised around the world by short-sighted politicians. Will the world again end up in a shooting war as a result of these economically-deranged policies? Can we afford to allow this to happen in the nuclear age**? "What generates **war** is the economic philosophy of nationalism: embargoes, trade and foreign exchange controls, monetary devaluation, etc. The philosophy of protectionism is a philosophy of war." Ludwig von Mises THE SOLUTION: FREE TRADE A century and a half ago French economist and statesman Frederic Bastiat presented the practical case for free trade: "It is always beneficial," he said, "for a nation to specialize in what it can produce best and then trade with others to acquire goods at costs lower than it would take to produce them at home." In the 20th century, journalist Frank Chodorov made a similar observation: "Society thrives on trade simply because trade makes specialization possible, and specialization increases output, and increased output reduces the cost in toil for the satisfactions men live by. That being so, the market place is a most humane institution." WHAT CAN YOU DO? Silence gives consent, and there should be no consent to the current waves of restrictive trade or capital control legislation being passed. If you agree that free trade is an essential ingredient in maintaining world peace, and that it is important to your future, we suggest that you inform the political leaders in your country of your concern regarding their interference with free trade. Send them a copy of this pamphlet. We also suggest that you write letters to editors in the media and send this pamphlet to them. Discuss this issue with your friends and warn them of the danger of current "protectionist" trends. Check on how the issue is being taught in the schools. Widespread public understanding of this issue, followed by citizen action, is the only solution. Free trade is too important an issue to leave in the hands of politicians. "For thousands of years, the tireless effort of productive men and women has been spent trying to reduce the distance between communities of the world by reducing the costs of commerce and trade. "Over the same span of history, the slothful and incompetent protectionist has endlessly sought to erect barriers in order to prohibit competition - thus, effectively moving communities farther apart. When trade is cut off entirely, the real producers may as well be on different planets. The protectionist represents the worst in humanity: fear of change, fear of challenge, and the jealous envy of genius. The protectionist is not against the use of every kind of force, even warfare, to crush his rival. **If [hu]mankind is to survive**, then these primeval fears must be defeated."

Economy Advantage

Econ declining now

The economy is heading for a recession now

Gula 3-18-15 [Alan, chief income analyst at Wall St. Daily, holds an MBA from New York University, "U.S. Economy Edges Closer to Recession," "http://www.wallstreetdaily.com/2015/05/18/u-s-economy-recession/]

And we may be witnessing the start of a recession right now… In late April, we learned that preliminary U.S. real GDP growth for the first quarter of 2015 was just 0.2% – lower than 82 of the 86 estimates from economists polled by Bloomberg. Interestingly, the Atlanta Fed's GDPNow forecasting model actually nailed the number by predicting 0.1% growth. However, information released in May indicates that growth actually contracted quarter over quarter. Barclays Capital and JPMorgan (JPM) both lowered U.S. Q1 GDP estimates to negative 1.1% after disappointing factory order data revisions last Thursday. Now, it even looks as if the second quarter is imperiled. Retail sales for April were disappointing. Again, economists had expected that a decline in gasoline prices would boost consumption, which hasn't happened. What's truly amazing is that retail sales and food services (excluding motor vehicles and parts dealers) contracted versus the year-ago figure. As can be seen in the chart below, retail sales growth is actually lower than it was at any point during the recession in 2001! On Friday, we learned that industrial production contracted in April. GDPNow's forecast for the second-quarter growth is running at just +0.7%. Granted, some components of GDP – such as net exports (trade) and changes in private inventory levels – are extremely difficult to forecast, so the model isn't going to appear prophetic every quarter. Nonetheless, it's a good approximation. All of this points to a grim conclusion: **The probability of a U.S. recession is increasing**. Ironically, the Federal Reserve is supposed to be raising short-term interest rates sometime this year.

The economy is stumbling now

Samuelson 5-21-15 [Robert, economics reporter for the Washington Post, "The tentative economy," http://www.washingtonpost.com/opinions/our-tentative-economy/2015/05/31/8160fb52-0615-11e5-a428-c984eb077d4e_story.html]

The U.S. economy continues to stumble. It's creating jobs at a goodly clip, but other aspects of growth are less impressive. Business investment has been lackluster. The housing recovery is improving but remains short of where many economists thought it would be. Consumer spending, representing slightly more than two-thirds of total spending, has been soft. The economy has a tentative quality that repeatedly disappoints forecasts of stronger growth. My main explanation for this — as I've argued before — is the hangover from the 2008-2009 financial crisis and the Great Recession. These events changed economic psychology, precisely because they were unanticipated and horrific. They transcended the experience of most Americans (that is, anyone who hadn't lived through the Great Depression). Corporate executives and consumers alike became more defensive; they saved and hoarded a bit more. If a novel calamity struck once, it could strike again. They'd better prepare.

Deportations = economic decline

Mass deportations are the biggest threat to our economy

McDaniel '14 [PhD in Geography and Urban Regional Analysis from the University of North Carolina at Charlotte, researcher at the American Immigration Council, "Increase in Deportations Harms Native-Born Workers and Economy," March 14, http://immigrationimpact.com/2014/03/14/increase-in-deportations-harms-native-born-workers-and-economy/]

More immigrants are being "removed" from the United States than ever before by a deportation system that has grown larger and more aggressive coupled with an agency with misplaced priorities in which most immigrants deported pose no threat to anyone. "For nearly two decades, the federal government has been pursuing an enforcement-first approach to immigration control that favors mandatory detention and deportation

over the traditional discretion of a judge to consider the unique circumstances of every case." Pressure is growing, however. On Thursday, President Obama met with three members of the Congressional Hispanic Caucus (CHC)—Reps. Ruben Hinojosa (TX), Xavier Becerra (CA) and Luis Gutierrez (IL)—about concerns over the administration's deportation policy. The President subsequently ordered a review of immigration policies "to determine ways to make it more humane," the Washington Post reported. Gutierrez later remarked, "It is clear that the pleas from the community got through to the president. The CHC will work with him to keep families together." Amid concerns over a mounting humanitarian disaster, the increasing number of deportations also has economic ramifications. A new study from the National Bureau of Economic Research, by economists Andri Chassamboulli and Giovanni Peri, explores the labor market effects of reducing undocumented immigrants. They find that an increase in deportation results in a negative effect on employment opportunities and wages for native-born workers, while legalization of the undocumented would produce positive labor market effects for the native-born. The major question the paper asks is "how can we reduce undocumented immigration in the least costly way for U.S. firms and workers?" With that question in mind, the paper analyzes four policy scenarios: "reducing the opportunities of illegal immigration (more border enforcement), increasing the costs that undocumented face in looking for a job (hostile environment, no access to any social benefits), increasing the frequency of deportations and, finally, increasing legalization rates." As the report notes, each of these policy proposals would have different effects on the economy, including effects on employment opportunities for native-born workers and job-creation by U.S. firms. What the findings show is that policies increasing deportation rates have a large negative effect on native-born workers' employment opportunities, but legalization could lead to higher wages and a lower unemployment rate for native-born workers. As the authors of the study explain: "policies increasing deportation rates have the largest negative effect on employment opportunities of natives. Legalization, instead has a positive employment effect for natives. This is because repatriations are disruptive of job matches and they reduce job-creation by US firms. Legalization instead stimulates firms' job creation by increasing the total number of immigrants and stimulating firms to post more vacancies some of which are filled by natives." The "most disruptive policy, for the economy and for the wage and labor market opportunities of natives," the report concludes, "is an increase in deportation rates." Unfortunately, the federal immigration system has been taking a similar approach over the past two decades rather than instituting meaningful and systemic reforms. As the number of deportations under the current administration approaches 2 million, spending billions more on an already costly border enforcement and deportation system is not the answer to reducing undocumented immigration. Reforming our byzantine immigration system to meet the needs of a 21st century economy and society is the way forward that benefits everyone. Recent research shows that, on top of the moral and social impetus' for legalization, there is also a clear economic case for a pathway to citizenship. Ultimately, this research adds further evidence to the breadth of analyses finding that enforcement-only policies are economically, socially, and morally ruinous.

Immigrants key to the economy

Sustainable immigration is key to US economic growth

Clemons '14 [Scott Clemons is Chief Investment Strategist in Private Banking at Brown Brothers Harriman, America's oldest private partnership bank, "The Unsung Economics Of Immigration," 9-4-14, http://www.forbes.com/sites/realspin/2014/09/04/the-unsung-economics-of-immigration/]

Lost amidst the national debate on immigration reform is the critical fact that we need to attract workers from abroad to maintain the long term growth of our labor force. U.S. fertility rates are right at population replacement levels, and labor force participation has been in decline since the 1970s. Thus, without immigration, we are headed toward a stagnant or even declining labor force in the not too distant future, with dire implications for economic growth. **Getting immigration right is an economic imperative** for the 21st century. Data from the Population Division of the United Nations paints a stark picture of what the future labor force of the United States would look like without immigration. Using projected fertility rates and current immigration trends, the population of the United States continues to grow throughout the 21st century, topping 460 million inhabitants at the turn of the 22nd century. If we subtract immigration from the data, the population of the United States stops growing in about 2042, with seriously negative implications for economic activity. Why is the labor force so important? In the short run, economic activity is determined by demand: the degree to which people consume, businesses invest and governments tax and spend. In the long run, however, economic activity is driven by the supply of resources, and the most critical resource turns out to be human capital. The capacity of any economy to expand over time is a function of growth in the labor force plus the productivity of that labor force. A few simple dynamics determine growth in the labor force: fertility, mortality, participation, and immigration. We routinely think of these as demographic or social issues, but the economic implications are meaningful. Our economic capacity is defined by how many new people are being born, how long they live, the extent to which they participate in the formal economy, and whether or not we can "borrow" population growth from other countries through immigration. On several of these measures, the United States is in relatively good demographic shape compared to the rest of the world. Our fertility rate of 2.06 births per woman is right in line with population replacement levels, but better than Germany, Japan, France, Brazil and even China. Our health care system, although beset with well-documented challenges, has nevertheless resulted in longer, healthier and more productive lifespans than ever before. Aging workers pose their own challenges to government policy and corporate protocols, but an information or knowledge based economy ought to benefit from retaining experienced workers, whose human capital does not deteriorate over time, but increases. Yet the demographic front has bad news, too. The labor force participation rate in the United States in May stood at 62.8%, a 36-year low. This decline in participation may reflect the leading edge of baby boomer retirements, or lingering effects of the financial crisis, or even a shift in how we define work. But the absence of 29.2% of the working age population from the labor force is an undeniable drag on economic potential. Net immigration helps to offset this drag, and furthermore provides a boost to population and labor force growth if fertility rates continue to decline. A survey of global

economies provides plenty of examples of economies that struggle with stagnant or even negative population or labor force growth, and illustrates how difficult it is to generate sustainable economic growth when human capital is in short supply. Japan – an economy relatively closed to immigration – stands as the clearest example of these challenges.

Crackdowns devastate the economy- undocumented workers are key

CAP Immigration Team '14 [Center for American Progress Immigration Team, research group specializing in immigration studies, "The Facts on Immigration Today," https://www.americanprogress.org/issues/immigration/report/2014/10/23/59040/the-facts-on-immigration-today-3/]

The record on immigrants and the economy Undocumented immigrants pay billions of dollars in taxes annually. Households headed by unauthorized immigrants paid $10.6 billion in state and local taxes in 2010. This includes $1.2 billion in personal income taxes, $1.2 billion in property taxes, and more than $8 billion in sales and excise taxes. Immigrants—even legal immigrants—are barred from most social services, meaning that they pay to support benefits they cannot even receive. Research shows that immigrants complement, rather than compete with, native-born American workers—even less-skilled workers. Research by renowned economists such as David Card, Gianmarco Ottaviano, Giovanni Peri, and Heidi Shierholz shows that American workers are not harmed by—and may even benefit from—immigration. This is because immigrants tend to complement the skillsets of American workers, thus helping them be more productive. Immigration reform will not affect the unemployment rates of native-born Americans. The CBO estimates that during the 10-year period following passage of immigration reform, unemployment will increase by 0.1 percent. This small increase falls entirely upon the undocumented and is the short-term effect of growth in the labor force and of the labor market adjusting to undocumented workers positioning themselves to be productive for decades to come. Taxes paid by legalized immigrants more than offset any use of social programs. The CBO found that increases in costs to social programs are modest and will be more than paid for by the tax contributions of immigrants. The increase in spending in Social Security and Medicare from 2024 through 2033, for example, will be $65 billion—just 4.4 percent of the total increase in tax revenue. As Baby Boomers retire en masse over the next 20 years, immigrants will be crucial to fill these job openings and promote growth in the labor market. More than two-thirds of new entrants into the labor market will replace retiring workers. However, while 58.6 million new workers will be needed to fill these retirements, only 51.3 million native-born people are projected to enter the workforce, meaning that immigrants and their children will be crucial to filling the additional 7.3 million job openings while also furthering growth in the labor market. The price of inaction and the cost of mass deportation Inaction on immigration reform carries a heavy cost. Each day the House of Representatives fails to pass immigration reform costs the United States $37 million in missed tax revenue. As of October 2014, the House's inaction has cost more than $17.7 billion. Maintaining the status quo is not revenue neutral. With only one-third of unauthorized immigrants working in the formal economy and contributing about $12 billion in payroll taxes each year, the United States loses around $20 billion in payroll tax revenue annually. This lost revenue would go a long way toward funding the retirement of Americans across the country. The United States spends more on immigration and border enforcement annually than the annual gross domestic product of 80 countries. In fact, the United States now spends $3.5 billion more on immigration and border enforcement—a total of nearly $18 billion per year—than it does on all other federal law enforcement combined. A self-deportation regime would cost our economy trillions of dollars. If all undocumented immigrants in the country were deported or "self-deported"—meaning they choose to leave the country because life is too difficult—the United States' cumulative GDP would suffer a hit of $2.6 trillion over 10 years. Mass deportation of the undocumented immigrant population would cost billions of dollars. Deporting the entire undocumented population would cost $285 billion over a five-year period, including continued border and interior enforcement efforts. For that price, we could hire more than 1 million new public high school teachers and pay their salaries for five years. It costs taxpayers more than $20,000 to carry out the deportation of a single individual. Apprehending, detaining, processing, and transporting one individual in the deportation process cost $23,482 in fiscal year 2008.

Undocumented workers key

Illegal immigrants are vital to the economy- deportations crush key industries

Goodman '14 [H.A., journalist for The Hill, "Illegal immigrants benefit the U.S. economy," http://thehill.com/blogs/congress-blog/foreign-policy/203984-illegal-immigrants-benefit-the-us-economy]

When analyzed from the vantage point of information derived from reputable, nonpartisan sources (the Pew Research Center, USDA, United States Department of Labor, and leading economists and researchers) then one can obtain a clearer view of this muddled discussion. The truth of the matter is that illegal immigrants are important to the U.S. economy, as well as vital to certain industries like agriculture. According to the Pew Research Hispanic Trends Project, there were 8.4 million unauthorized immigrants employed in the U.S.; representing 5.2 percent of the U.S. labor force (an increase from 3.8 percent in 2000). Their importance was highlighted in a report by Texas Comptroller Susan Combs that stated, "Without the undocumented population, Texas' work force would decrease by 6.3 percent" and Texas' gross state product would decrease by 2.1 percent. Furthermore, certain segments of the U.S. economy, like agriculture, are entirely dependent upon illegal immigrants. The U.S. Department of Agriculture states that, "about half of the hired workers employed in U.S. crop agriculture were unauthorized, with the overwhelming majority of these workers coming from Mexico." The USDA has also warned that, "any potential immigration reform could have significant impacts on the U.S. fruit and vegetable industry." From the perspective of National Milk Producers Federation in 2009, retail milk prices would increase by 61 percent if its immigrant labor force were to be eliminated. Echoing the Department of Labor, the USDA, and the National Milk Producers Federation, agricultural labor economist James S. Holt made the following statement to Congress in 2007: "The reality, however, is that if we deported a substantial number of undocumented farm workers, there would be a tremendous labor shortage." In terms of overall numbers, The Department of Labor reports that of the 2.5 million farm workers in the U.S., over half (53 percent) are illegal immigrants. Growers and labor unions put this figure at 70 percent. But what about the immense strain on social services and money spent on welfare for these law breakers? The Congressional Budget Office in 2007 answered this question in the following manner: "Over the past two decades, most efforts to estimate the fiscal impact of immigration in the United States have concluded that, in aggregate and over the long term, tax revenues of all types generated by immigrants—both legal and unauthorized—exceed the cost of the services they use." According to the New York Times, the chief actuary of the Social Security Administration claims that undocumented workers have contributed close to 10% ($300 billion) of the Social Security Trust Fund. Finally, the aggregate economic impact of illegal immigration is debatable, but any claim that they've ruined the country doesn't correlate to the views of any notable economist. An open letter to President George W. Bush in 2006, signed by around five hundred economists (including five Nobel laureates) stated the following: "While a small percentage of native-born Americans may be harmed by immigration, vastly more Americans benefit from the contributions that immigrants make to our economy, including lower consumer prices." Although Harvard economist Jorge Borjas has stated that illegal immigrants from 1980-2000 have reduced the wages of high school dropouts in the U.S, he also states that the average American's wealth has increased by 1 percent because of illegal immigration. In an op-ed published in the Los Angeles Times, UC Davis economist Giovanni Peri stated that new laws are needed to meet demands within industries like construction, agriculture, and hospitality: "In recent decades, the high demand for these services and the pressure for keeping their cost low and prices competitive have generated incentives to hire undocumented workers."

US k2 global econ

US is key to the global economy

James and Lombardi '13 [Harold James is Professor of History and International Affairs at Princeton University, Professor of History at the European University Institute, Florence, and a senior fellow at the Center for International Governance Innovation, Domenico Lombardi is Director of the Global Economy Program at the Centre for International Governance Innovation, "Who Should Lead the Global Economy?" http://www.project-syndicate.org/commentary/harold-james-and-domenico-lombardiconsider-whether-china-or-the-eurozone-has-what-it-takes-to-replace-the-us-as-the-world-s-economic-leader]

In terms of global economic leadership, the twentieth century was American, just as the nineteenth century was British and the sixteenth century was Spanish. Some Chinese and Europeans think that they are next. Are they? And should they even want to be?¶ The most important prerequisite for global economic leadership is size. The bigger an economy, the greater its systemic importance, and the more leverage its political representatives have in international decision-making. The United States is the world's largest economy, with a GDP of roughly $16.7 trillion. The eurozone's $12.6 trillion output puts it in second place, and China, with a GDP of around $9 trillion, comes in third. In other words, all three economies are conceivably large enough to serve as global economic leaders.¶ But an economy's future prospects are also crucial to its leadership prospects – and serious challenges lie ahead. No one thinks that the eurozone will grow more quickly than the US in the coming years or decades. While China is expected to overtake the US in terms of output by 2020, decades of rigid population-control measures will weaken growth in the longer run, leaving the US economy as the most dynamic of the three.¶ Another key requirement for global economic leadership is systemic importance in commercial, monetary, and financial terms. Unlike China, a large trade power with underdeveloped monetary and financial capabilities, the eurozone meets the requirement of systemic significance in all three areas.¶ There is also a less concrete aspect to leadership. Being a true global leader means

shaping and connecting the global economic structures within which states and markets operate – something the US has been doing for almost 70 years.¶ At the 1944 Bretton Woods conference, the US crafted the post-World War II international monetary and financial order. The basic framework, centered around the US dollar, has survived financial crises, the Soviet Union's dissolution, and several developing countries' integration into the world economy.¶ Today, American leadership in global trade and financial and monetary governance rests on inter-related strengths. The US provides the world's key international currency, serves as the linchpin of global demand, establishes trends in financial regulation, and has a central bank that acts as the world's de facto lender of last resort.¶ Beyond delivering a global public good, supplying the world's central currency carries substantial domestic benefits. Because the US can borrow and pay for imports in its own currency, it does not face a hard balance-of-payments constraint. This has allowed it to run large and sustained current-account deficits fairly consistently since the early 1980's.¶ These deficits raise persistent concerns about the system's viability, with observers (mostly outside the US) having long predicted its imminent demise. But the system survives, because it is based on a functional trade-off, in which the US uses other countries' money to act as the main engine of global demand. In fact, export-oriented economies like Germany, Japan, and China owe much of their success to America's capacity to absorb a massive share of global exports – and they need to keep paying America to play this role.¶ Given this, the big exporters have lately come under intense pressure to "correct" their external surpluses as part of responsible global citizenship. While this has contributed to a sharp contraction of the Chinese and Japanese surpluses, the eurozone's current-account surplus is growing, with the International Monetary Fund expecting it to reach 2.3% of GDP this year (slightly less than the Chinese surplus).¶ A global economy led by a surplus country seems more logical, given that creditors usually dictate terms. At the time of the Bretton Woods conference, the US accounted for more than half of the world's manufactured output. The rest of the world needed dollars that only the US could supply.¶ Chinese or European leadership would probably look more like the pre-World War I Pax Britannica (during which the United Kingdom supplied capital to the rest of the world in anticipation of its own relative economic decline), with the hegemon supplying funds on a long-term basis. But this scenario presupposes a deep and well-functioning financial system to intermediate the funds – something that China and the eurozone have been unable to achieve.¶ Despite the 2008 financial crisis, the US remains the undisputed leader in global finance. Indeed, American financial markets boast unparalleled depth, liquidity, and safety, making them magnets for global capital, especially in times of financial distress. This "pulling power," central to US financial dominance, underpins the dollar's global role, as investors in search of safe, liquid assets pour money into US Treasury securities.

US is key to the global economy

McIntyre 1-15-14 [Douglas, partner at 24/7 Wall St., LLC. former Editor-in-Chief and Publisher of Financial World Magazine, first president of Switchboard.com when it was the 10th most visited website in the world, former CEO of FutureSource, LLC and On2 Technologies, Inc, is a magna cum laude graduate of Harvard, "U.S. Key to Global Recovery, Says World Bank," http://247wallst.com/economy/2014/01/15/u-s-key-to-global-recovery-says-world-bank/]

While the developed economies of the world will stage improvements this year, and the growth of the developing world will accelerate sharply, **the U**nited **S**tates, the largest nation based on gross domestic product (GDP), **is the key to a strong global recovery** in 2014. At the core of the U.S. effect is the activity of Federal Reserve and its efforts to taper its stimulus programs. The recovery, in other words, may come down to the decisions of a single central bank. Economists in America and abroad say that if access to money at extremely low interest rates in the United States begins to disappear, the American economy cannot sustain growth, which has only picked up sharply in the past few quarters, both based on GDP improvement and employment gains. The jobless rate in the United States, at 6.7%, is still well above the average when the economy is in strong recovery. American consumer activity is still about two-thirds of GDP, and the foundations of that activity are still modest.¶ The World Bank reports in its new "Global Economic Prospects" analysis that:¶ Growth prospects for 2014 are, however, sensitive to the tapering of monetary stimulus in the United States, which began earlier this month, and to the structural shifts taking place in China's economy.¶ China likely will continue to step into the limelight as its cements it position as the world's second largest nation as measured by GDP, and one that is growing much faster than the United States.¶ Other World Bank forecasts:¶ The report forecasts growth in developing countries to pick up from 4.8 percent in 2013 to a slower than previously expected 5.3 percent this year, 5.5 percent in 2015 and 5.7 percent in 2016. While the pace is about 2.2 percentage points lower than during the boom period of 2003-07, the slower growth is not a cause for concern. Almost all of the difference reflects a cooling off of the unsustainable turbo-charged pre-crisis growth, with very little due to an easing of growth potential in developing countries. Moreover, even this slower growth represents a substantial (60 percent) improvement compared with growth in the 1980s and early 1990s.¶ Global GDP is projected to grow from 2.4 percent in 2013 to 3.2 percent this year, stabilizing at 3.4 percent and 3.5 percent in 2015 and 2016, respectively, with much of the initial acceleration reflecting a pick-up in

high-income economies.¶ In other words, the consuming economies will help those that produce the goods that are fruits of the recovery in the United States, Europe and Japan.

Impacts- Econ=nuclear wars

Economic decline causes every major impact

Green '09 [Michael J., Senior Advisor and Japan Chair at the Center for Strategic and International Studies (CSIS) and Associate Professor at Georgetown University, Asia Times Online, 3.26.9, http://www.atimes.com/atimes/Asian_Economy/KC26Dk01.html AD 6/30/09]

Facing the worst economic crisis since the Great Depression, analysts at the World Bank and the US Central Intelligence Agency are just beginning to contemplate the ramifications for international stability if there is not a recovery in the next year. For the most part, the focus has been on fragile states such as some in Eastern Europe. However, the Great Depression taught us that a downward global economic spiral can even have jarring impacts on great powers. It is no mere coincidence that the last great global economic downturn was followed by the most destructive war in human history. In the 1930s, economic desperation helped fuel autocratic regimes and protectionism in a downward economic-security death spiral that engulfed the world in conflict. This spiral was aided by the preoccupation of the United States and other leading nations with economic troubles at home and insufficient attention to working with other powers to maintain stability abroad. Today's challenges are different, yet 1933's London Economic Conference, which failed to stop the drift toward deeper depression and world war, should be a cautionary tale for leaders heading to next month's London Group of 20 (G-20) meeting. There is no question the US must urgently act to address banking issues and to restart its economy. But the lessons of the past suggest that we will also have to keep an eye on those fragile threads in the international system that could begin to unravel if the financial crisis is not reversed early in the Barack Obama administration and realize that economics and security are intertwined in most of the critical challenges we face. A disillusioned rising power? Four areas in Asia merit particular attention, although so far the current financial crisis has not changed Asia's fundamental strategic picture. China is not replacing the US as regional hegemon, since the leadership in Beijing is too nervous about the political implications of the financial crisis at home to actually play a leading role in solving it internationally. Predictions that the US will be brought to its knees because China is the leading holder of US debt often miss key points. China's currency controls and full employment/export-oriented growth strategy give Beijing few choices other than buying US Treasury bills or harming its own economy. Rather than creating new rules or institutions in international finance, or reorienting the Chinese economy to generate greater long-term consumer demand at home, Chinese leaders are desperately clinging to the status quo (though Beijing deserves credit for short-term efforts to stimulate economic growth). The greater danger with China is not an eclipsing of US leadership, but instead the kind of shift in strategic orientation that happened to Japan after the Great Depression. Japan was arguably not a revisionist power before 1932 and sought instead to converge with the global economy through open trade and adoption of the gold standard. The worldwide depression and protectionism of the 1930s devastated the newly exposed Japanese economy and contributed directly to militaristic and autarkic policies in Asia as the Japanese people reacted against what counted for globalization at the time. China today is similarly converging with the global economy, and many experts believe China needs at least 8% annual growth to sustain social stability. Realistic growth predictions for 2009 are closer to 5%. Veteran China hands were watching closely when millions of migrant workers returned to work after the Lunar New Year holiday last month to find factories closed and jobs gone. There were pockets of protests, but nationwide unrest seems unlikely this year, and Chinese leaders are working around the clock to ensure that it does not happen next year either. However, the economic slowdown has only just begun and nobody is certain how it will impact the social contract in China between the ruling communist party and the 1.3 billion Chinese who have come to see President Hu Jintao's call for "harmonious society" as inextricably linked to his promise of "peaceful development". If the Japanese example is any precedent, a sustained economic slowdown has the potential to open a dangerous path from economic nationalism to strategic revisionism in China too. Dangerous states It is noteworthy that North Korea, Myanmar and Iran have all intensified their defiance in the wake of the financial crisis, which has distracted the world's leading nations, limited their moral authority and sown potential discord. With Beijing worried about the potential impact of North Korean belligerence or instability on Chinese internal stability, and leaders in Japan and South Korea under siege in parliament because of the collapse of their stock markets, leaders in the North Korean capital of Pyongyang have grown increasingly boisterous about their country's claims to great power status as a nuclear weapons state. The junta in Myanmar has chosen this moment to arrest hundreds of political dissidents and thumb its nose at fellow members of the 10-country Association of Southeast Asian Nations. Iran continues its nuclear program while exploiting differences between the US, UK and France (or the P-3 group) and China and Russia - differences that could become more pronounced if economic friction with Beijing or Russia crowds out cooperation or if Western European governments grow nervous about sanctions as a tool of policy. It is

possible that the economic downturn will make these dangerous states more pliable because of falling fuel prices (Iran) and greater need for foreign aid (North Korea and Myanmar), but that may depend on the extent that authoritarian leaders care about the well-being of their people or face internal political pressures linked to the economy. So far, there is little evidence to suggest either and much evidence to suggest these dangerous states see an opportunity to advance their asymmetrical advantages against the international system.

US economic decline causes WMD wars

Nyquist '05 [J.R. renowned expert in geopolitics and international relations, WorldNetDaily contributing editor, "The Political Consequences of a Financial Crash," February 4, www.financialsense.com/stormw...2005/0204.html]

Should the United States experience a severe economic contraction during the second term of President Bush, the American people will likely support politicians who advocate further restrictions and controls on our market economy – guaranteeing its strangulation and the steady pauperization of the country. In Congress today, Sen. Edward Kennedy supports nearly all the economic dogmas listed above. It is easy to see, therefore, that the coming economic contraction, due in part to a policy of massive credit expansion, will have serious political consequences for the Republican Party (to the benefit of the Democrats). Furthermore, an economic contraction will encourage the formation of anti-capitalist majorities and a turning away from the free market system. The danger here is not merely economic. The political left openly favors the collapse of America's strategic position abroad. The withdrawal of the United States from the Middle East, the Far East and Europe would catastrophically impact an international system that presently allows 6 billion people to live on the earth's surface in relative peace. Should anti-capitalist dogmas overwhelm the global market and trading system that evolved under American leadership, the planet's economy would contract and untold millions would die of starvation. Nationalistic totalitarianism, fueled by a politics of blame, would once again bring war to Asia and Europe. But this time the war would be waged with mass destruction weapons and the United States would be blamed because it is the center of global capitalism. Furthermore, if the anti-capitalist party gains power in Washington, we can expect to see policies of appeasement and unilateral disarmament enacted. American appeasement and disarmament, in this context, would be an admission of guilt before the court of world opinion. Russia and China, above all, would exploit this admission to justify aggressive wars, invasions and mass destruction attacks. A future financial crash, therefore, must be prevented at all costs. But we cannot do this. As one observer recently lamented, "We drank the poison and now we must die."

AT: Past recession disproves

Despite the past recession, it could be much worse if we can't stave off another downturn

Reich '10 [Robert, professor of public policy at the University of California at Berkeley and former secretary of labor during the Clinton administration, "The root of economic fragility and political anger," 7-13-10,

http://www.salon.com/news/great_recession/?story=/news/feature/2010/07/13/reich_economic_anger]

The crash of 2008 didn't turn into another Great Depression because the government learned the importance of flooding the market with cash, thereby temporarily rescuing some stranded consumers and most big bankers. But the financial rescue didn't change the economy's underlying structure — median wages dropping while those at the top are raking in the lion's share of income. That's why America's middle class still doesn't have the purchasing power it needs to reboot the economy, and why the so-called recovery will be so tepid—maybe even leading to a double dip. It's also why America will be vulnerable to even larger speculative booms and deeper busts in the years to come.

Continued worsening of recessions increases likelihood of war

Mead '09 [Walter Russell, Senior Fellow in U.S. Foreign Policy at the Council on Foreign Relations, New Republic, February 4, http://www.tnr.com/politics/story.html?id=571cbbb9-2887-4d81-8542-92e83915f5f8&p=2]

So far, such half-hearted experiments not only have failed to work; they have left the societies that have tried them in a progressively worse position, farther behind the front-runners as time goes by. Argentina has lost ground to Chile; Russian development has fallen farther behind that of the Baltic states and Central Europe. Frequently, the crisis has weakened the power of the merchants, industrialists, financiers, and professionals who want to develop a liberal capitalist society integrated into the world. Crisis can also strengthen the hand of religious extremists, populist radicals, or authoritarian traditionalists who are determined to resist liberal capitalist society for a variety of reasons. Meanwhile, the companies and banks based in these societies are often less established and more vulnerable to the consequences of a financial crisis than more established firms in wealthier societies. As a result, developing countries and countries where capitalism has relatively recent and shallow roots tend to suffer greater economic and political damage when crisis strikes--as, inevitably, it does. And, consequently, financial crises often reinforce rather than challenge the global distribution of power and wealth. This may be happening yet again. None of which means that we can just sit back and enjoy the recession. History may suggest that financial crises actually help capitalist great powers maintain their leads--but it has other, less reassuring messages as well. If financial crises have been a normal part of life during the 300-year rise of the liberal capitalist system under the Anglophone powers, so has war. The wars of the League of Augsburg and the Spanish Succession; the Seven Years War; the American Revolution; the Napoleonic Wars; the two World Wars; the cold war: The list of wars is almost as long as the list of financial crises. Bad economic times can breed wars. Europe was a pretty peaceful place in 1928, but the Depression poisoned German public opinion and helped bring Adolf Hitler to power. If the current crisis turns into a depression, what rough beasts might start slouching toward Moscow, Karachi, Beijing, or New Delhi to be born? The United States may not, yet, decline, but, if we can't get the world economy back on track, we may still have to fight.
