I knew the threat from cyber warfare was serious, but I didn't put it up there on the same level as a nuclear holocaust. Until today. Speaking this morning in Washington, former national security advisor Brent Scowcroft compared the cyber threat to the danger posed by nuclear weapons during the Cold War. He said, "Cyber has the same capabilities," before adding that actually, "in many ways it's more daunting." At a conference hosted by Georgetown University and the Atlantic Council, Scowcroft joined with policy makers and defense experts to debate how the U.S. can better handle security in cyberspace. Texan Congressman Mac Thornberry warned that "our laws, policies and regulations are not keeping up with the challenge" posed by cyber threats, adding, "while we fiddle, our vulnerability continues to grow." "What is the responsibility of the Department of Defense to defend the private sector?" asked Thornberry. "If we have a fleet of bombers coming to bomb the Houston ship channel, it's pretty clear," he said. But what about WikiLeaks attacking Visa and MasterCard? The answer is less clear. Least anyone in the audience failed to grasp just how big - and potentially dangerous - the Internet is, Lieutenant General Charles Croom - former director of the Defense Information Systems Agency - said: "It is the most disruptive thing for our species since European man's discovery of the Western hemisphere." Move over, Columbus. You've been replaced by Facebook. Cyber threats come in all shapes in sizes. There are full-blown attacks, mere disruptions and then your standard data nabbing. A full-on attack could be devastating. The Los Angeles Times delivers this account about how easy it was for one hacker to break-in to the system that controls LA's drinking water. The danger is very real: Terrorist groups such as Al Qaeda don't yet have the capability to mount such attacks, experts say, but potential adversaries such as China and Russia do, as do organized crime and hacker groups that could sell their services to rogue states or terrorists. U.S. officials say China already has laced the U.S. power grid and other systems with hidden malware that could be activated to devastating effect. When it comes to countries - like China - going after the American government's data, former National Security Agency and CIA director, General Michael Hayden said we shouldn't be so outraged. "Adult nations steal information from each other," he said. It's up to us to figure out how to secure our secrets. As if all that wasn't scary enough, the threat is not just that foreigners will e-attack or that homegrown computer-geeks-turned-cyber-warriors will target the American government. Hayden warned that we also have to worry about so-called "cyber patriots," American hackers that take defense policy into their own hands by launching attacks on foreign governments. The conference came up with more questions than answers. So it was fitting that Hayden wrapped up the panel discussion by calling for a national dialogue on cyber security, privacy and how the U.S. government plans to face this ever-changing challenge. The general warned, "The game is on."

Cyber conflicts cause extinction **Adhikari '09**

(Richard,- leading journalist on advanced-IP issues for several major publications, including The Wall Street Journal "Civilization's High Stakes Cyber-Struggle: Q&A With Gen. Wesley Clark (ret.)")

The conflicts in the Middle East and Afghanistan, to name the most prominent, are taking their toll on human life and limb. However, the escalating cyberconflict among nations is far more dangerous, argues retired general Wesley Clark, who spoke with TechNewsWorld in an exclusive interview. That cyberconflict will

take a far greater toll on the world, contends Clark, who last led the NATO forces to end the ethnic cleansing in Albania. There is a pressing need for new institutions to cope with the ongoing conflict, in his view. Clark is a member of the boards of several organizations. He has a degree in philosophy, politics and economics from Oxford University and a master's degree in military science from the U.S. Army's Command and General Staff College. Background: In November 2008, the Center for Strategic and International Studies, a Washington-based bipartisan think tank, presented recommendations on national security to the then-incoming Obama administration. These called for an overhaul of the existing national cybersecurity organization. Since then, the state of national cybersecurity has appeared chaotic. In August, White House cybersecurity adviser Melissa Hathaway resigned for reasons that echoed the departure in 2004 of Amit Yoran, who then held essentially the same post. In an exclusive interview earlier this year, Yoran told TechNewsWorld that national cybersecurity was still a mess. TechNewsWorld: Security experts warn that nations are preparing for a new cyberwar. Is our government doing enough to protect our national cyber-infrastructure? Or is it in the process of protecting the cyber-infrastructure? Gen. Wesley K. Clark: I think we're in the process of trying to get it protected, but unlike conventional security considerations, where one can easily see an attack and take the appropriate response, the cyberstruggle is a daily, ongoing affair. **It's a matter of thousands of probes a day, in and out, against** systems that belong to obvious targets like the United States Department of Defense; not-so-obvious targets like **banks and energy companies; and individual consumers or taxpayers.** It's ongoing, it's undeclared, it's often unreported, and it's very much an ongoing concern at all levels -- business, commerce and individual privacy. TechNewsWorld: The national security infrastructure has repeatedly been reported to be sorely lacking. Is the government moving fast enough? Does it need to do more? Clark: It does need to do more. It's in the process of doing more, and there's a tremendous amount of public and private sector effort going into cybersecurity right now. Whether it's going to be adequate or not is not the issue. There are many approaches to this problem that are mainly based on software, but software is vulnerable. When you open up to communicate with the Web, when you bring in data and programs from another source, when you bring in applications -- all that entails huge risks. It's dealing with those risks and trying to gain the rewards of doing so that make it such a difficult proposition. Online banking was a novelty 20 years ago. Now, everything happens on the Internet. People pay their bills, they do business, they do their work with customers. People don't fax documents any more if they don't have to -- they do webinars and briefings. All of this exposes the opportunity for mischief. You don't know the source of the mischief. You don't know whether it's individuals trying to solve a difficult technical challenge on their own or if they're connected to governments, or if they're cells attached to governments -- and it's very difficult to pin down ... incoming probes to a source. TechNewsWorld: While it's generally agreed that the next war may be a cyberwar, much of our infrastructure is either hooked up to the Internet or in the process of being hooked up to the Internet. Electricity companies, for example, are agitating for the use of smart meters. That being the case, and with hackers increasing the frequency and sophistication of their attacks, does the increasing pace of hooking everything up to the Internet pose a real security threat? Clark: We're going into completely digitized medical records, which could lead to a huge invasion of privacy. It could also lead to things like blackmail and is physically dangerous because people can tamper with records of vital signs, or can alter prescriptions. There's no telling just what could be done. Companies could lose their supply chain management, lose their accounting records, lose their customer lists. Trying to rebuild this on paper when we've all been interconnected on the Internet will cause years of economic decline. **We are, as a civilization, quite vulnerable to disruption,** and this security problem doesn't just affect one nation but the whole global economic infrastructure. You can't conceive of the threats from the point of view of a traditional war. Cyber-efforts are ongoing today; we're in a cyber-struggle today. We don't know who the adversaries are in many cases, but we know what **the stakes are: continued economic vitality and, ultimately, global civilization.**

A2: No Cyber Attackers

Long list of potential state-sponsored cyber-attackers – the NSA is key

Van Cleave 13 -- Michelle Van Cleave served as the head of US counterintelligence under President George W. Bush and is now a principal with the Jack Kemp Foundation. "What It Takes: In Defense of the NSA" <http://www.worldaffairsjournal.org/article/what-it-takes-defense-nsa>

The United States has built a global intelligence apparatus because it has global interests and global responsibilities. We have taken seriously the duties of leader of the free world, as two world wars, Korea, Vietnam, Afghanistan, Iraq, and freedom fighters in many parts of the world can attest. **None of these duties in the last sixty years could have been met without the exceptional resources of NSA.** Successive presidents and Congresses, entrusted with preserving and defending our freedom, have judged these investments to be vital to our nation's security. They have protected the core secrets that enable collection programs to succeed, as have those in US business and industry who have been integral to their success. **The unquestioned qualitative edge of US intelligence has been as essential to defending this country and preserving our freedom** as have the forces we have built to arm and equip our military. But time has not stood still. **China is attacking computer systems throughout the world, stealing information and implanting features to enable future control. China's prominence in IT commercial markets means that they are in the supply chain, and their market share is growing** as part of a purposeful, state-run program for strategic position. **A long roll call of spies from Russia, China, Cuba, and other nations have targeted the essential secrets of US intelligence capabilities in order to be able to defeat them.** And now they have the Snowdens and the WikiLeaks of the world helping them out. **Interconnected global networks of digital data have become the single most important source of intelligence warning of threats, enabling our defense at home and the advancement of freedom abroad. To say "hands off," as some shortsighted privacy advocates have been doing, will not preserve our liberties, it will endanger them.** It should be possible for an enlightened citizenry to empower government action in that sphere without forfeiting the very rights that our government exists to secure. That challenge is, at the very least, a part of the continuing experiment that is our democracy.

A2: No Cyber Threats

Vulnerable to cyber attack now

NY Times 12

New Interest in Hacking as Threat to Security <http://www.nytimes.com/2012/03/14/us/new-interest-in-hacking-as-threat-to-us-security.html>

The increase has prompted a new interest in cybersecurity on Capitol Hill, where lawmakers are being prodded by the Obama administration to advance legislation that could require new standards at facilities where a breach could cause significant casualties or economic damage. It is not clear whether the higher numbers were due to increased reporting amid a wave of high-profile hacking, including the arrest last week of several members of the group Anonymous, or an actual increase in attacks. James A. Lewis, a senior fellow and a specialist in computer security issues at the Center for Strategic and International Studies, a policy group in Washington, said that as hacking awareness had increased, attacks had become more common. He said that the attacks on the nation's infrastructure were particularly jarring. "Some of this is heightened awareness because everyone is babbling about it," he said of the reported rise in computer attacks. "But much of it is because the technology has improved and the hackers have gotten better and people and countries are probing around more like the Russians and Chinese have." He added: "We hit rock bottom on this in 2010. Then we hit rock bottom in 2011. And we are still at rock bottom. We were vulnerable before and now we're just more vulnerable. You can destroy physical infrastructure with a cyberattack just like you could with a bomb."

Consensus of experts agree—threat isn't exaggerated

The Hill 13

System is blinking red': Alarming rhetoric in push for cybersecurity bills, <http://thehill.com/blogs/hilicon-valley/technology/216519-alarming-rhetoric-used-in-push-for-cybersecurity-bills>

But James Lewis, the director of the Technology and Public Policy Program at the Center for Strategic and International Studies, said "**no serious analyst doubts the risk anymore**" of a cyber attack. "There are people who are naturally skeptical about anything the government says and there are the ones who are paid to be skeptical," Lewis said, but he claimed almost everyone else has accepted the seriousness of the situation. He explained that some of the most frightening evidence of the country's vulnerability is likely classified, so it can be difficult to convince the public of the risk. He said in 2007, the Homeland Security Department publicly demonstrated that terrorists could use software to cause machinery to break into pieces. Lewis estimated it would cost a terrorist group between \$100,000 and \$500,000 to acquire the technology to disrupt critical infrastructure. "I don't think it's exaggerated," he said

A2: Cyber Security Now

Cyber security on brink now- number of attacks increased by 650 percent- a serious attack will devastate the economy- recent attacks prove

Wilshusen 11

Gregory, Director Information Security Issues, 3-16, Government Accountability Office, Testimony Before the Subcommittee on Cybersecurity, Infrastructure Protection, and Security Technologies, Committee on Homeland Security, House of Representatives, CYBERSECURITY Continued Attention Needed to Protect Our Nation's Critical Infrastructure and Federal Information Systems, Statement of Gregory C. Wilshusen

Threats to systems supporting critical infrastructure and federal information systems are evolving and growing. Government officials are concerned about attacks from individuals and groups with malicious intent, such as criminals, terrorists, and foreign nations. Federal law enforcement and **intelligence agencies have identified multiple sources of threats to our nation's critical information systems, including foreign nations engaged in espionage and information warfare, criminals, hackers, virus writers, and disgruntled employees and contractors.** **These groups and individuals have a variety of attack techniques at their disposal that can be used to determine vulnerabilities and gain entry into targeted systems.** For example, phishing involves the creation and use of fake e-mails and Web sites to deceive Internet users into disclosing their personal data and other sensitive information. **The connectivity between information systems, the Internet, and other infrastructures also creates opportunities for attackers to disrupt telecommunications, electrical power, and other critical services.** For example, in May 2008, we reported that the Tennessee Valley Authority's (TVA) corporate network contained security weaknesses that could lead to the disruption of control systems networks and devices connected to that network.⁴ We made 19 recommendations to improve the implementation of information security program activities for the control systems governing TVA's critical infrastructures and 73 recommendations to address weaknesses in information security controls. TVA concurred with the recommendations and has taken steps to implement them. **As government, private sector, and personal activities continue to move to networked operations, the threat will continue to grow.** Consistent with the evolving and growing nature of the threats to federal systems, **agencies are reporting an increasing number of security incidents.** These incidents put sensitive information at risk. Personally identifiable information about U.S. citizens has been lost, stolen, or improperly disclosed, thereby potentially exposing those individuals to loss of privacy, identity theft, and financial crimes. Agencies have experienced a wide range of incidents involving data loss or theft, computer intrusions, and privacy breaches, underscoring the need for improved security practices. Further, **reported attacks and unintentional incidents involving critical infrastructure systems demonstrate that a serious attack could be devastating.** When incidents occur, agencies are to notify the federal information security incident center—the United States Computer Emergency Readiness Team (US-CERT). **Over the past 5 years, the number of incidents reported by federal agencies to US-CERT has increased dramatically, from 5,503 incidents reported in fiscal year 2006 to about 41,776 incidents in fiscal year 2010 (a more than 650 percent increase).** The three most prevalent types of incidents and events reported to US-CERT during fiscal year 2010 were: (1) malicious code (software that infects an operating system or application), (2) improper usage (a violation of acceptable computing use policies), and (3) unauthorized access (where an individual gains logical or physical access to a system without permission). Additionally, according to Department of Homeland Security (DHS) officials, US-CERT detects incidents and events through its intrusion detection system, supplemented by agency reports, for investigation (unconfirmed incidents that are potentially malicious or anomalous activity deemed by the reporting entity to warrant further review). **Reports of cyber attacks and information security incidents against federal systems and systems supporting critical infrastructure illustrate the effect that such incidents could have on national and economic security.** • **In July 2010,** the Department of Defense (DOD) launched an investigation to identify how thousands of classified military documents (including Afghanistan and Iraq war operations, as well as field reports on Pakistan) were obtained by the group **WikiLeaks.org.** According to DOD, this investigation was related to an ongoing investigation of an Army private charged with, among

other things, transmitting national defense information to an unauthorized source. • In 2010, the Deputy Secretary of Defense stated that DOD suffered a significant compromise of its classified military computer networks in 2008. It began when a flash drive's malicious computer code, placed there by a foreign intelligence agency, uploaded itself onto a network and spread on both classified and unclassified systems.⁵ • In February 2011, media reports stated that computer hackers broke into and stole proprietary information worth millions of dollars from the networks of six U.S. and European energy companies.

A2: No Infrastructure Attacks

Terrorist Organizations Have the capability to attack our Transportation Infrastructure-SL

Jones 3/12/-14 (Greg G. Director, International security and defense policy center, “The Extremist Threat to the U.S. Homeland”, The Rand Corporation, <http://www.rand.org/pubs/testimonies/CT403z1.html>)

Whether we are one step ahead or one step behind depends, in part, on the issue. According to several documents found in Osama bin Laden’s Abbotabad residence, some senior al Qa’ida leaders were frustrated about the difficulties in smuggling operatives into the United States because of improvements in U.S. border security, intelligence collection and analysis, and data bases such as the No Fly List. However, terrorists – including al Qa’ida and its affiliates – continue to innovate. In Somalia, al Shabaab has explored the possibility of concealing bombs inside consumer electronic items, such as laptop computers, cameras, and tape recorders. And al Qa’ida in the Arabian Peninsula bomb makers continue their efforts to build improvised explosive devices using components that may not be detected by airport screeners. Perhaps most concerning, al Qa’ida is a different organization than it was a decade ago – a development that some officials have not fully appreciated. The broader Salafi-jihadist movement has become more decentralized among four tiers: (1) core al Qa’ida in Pakistan, led by Ayman al-Zawahiri; (2) formal affiliates that have sworn allegiance (or bayat) to core al Qa’ida (located in Syria, Somalia, Yemen, and North Africa); (3) a panoply of Salafi-jihadist groups that have not sworn allegiance to al Qa’ida but are committed to establishing an extremist Islamic emirate; and (4) **inspired individuals and networks. Using the state of core al Qa’ida in Pakistan as a gauge of the group’s strengths (or weaknesses) – as some have done – is increasingly anachronistic. Overall, I am concerned that the United States is one step behind in understanding the nature of the threat from a heterogeneous and decentralized movement.**

! Turns Econ/Heg

Cyber-security key to safeguard against attacks which destroys the economy and heg

Rash 2/18

(Wayne, "Cybersecurity Act Gives Feds Power to Protect Infrastructure", CMR)

The Cybersecurity Act of 2012 would give the Department of Homeland Security power to regulate the kind of company security protections government deems necessary to protect critical infrastructure -- such as power and phone companies, water and treatment plants, wireless providers and other companies based on DHS risk assessments. Details emerged during a formal hearing chaired by Sen. Joe Lieberman, I-Conn., yesterday. Lieberman began the hearing by stating that the proposed law wouldn't tell companies how to meet security requirements, that they could use any hardware or software they chose, and that **all indications were that the law would enhance security innovations. Lieberman also said that despite rumors that have been circling the Internet, there is no Internet "kill switch" in the bill that would allow the President to seize control of the Internet,** and there is nothing in the bill that touches on the balance between intellectual property and free speech. He specifically pointed out that there is nothing related to the ill-fated SOPA and PIPA bills in his legislation. See our security laws, regulations and guidelines directory for a deeper perspective. **Lieberman also said the bill was carefully crafted to protect privacy and ensure that it is aimed specifically at avoiding cyber attacks that could lead to mass casualties, damage to the economy or destruction of infrastructure** necessary for the health and safety of citizens. Lieberman's comments were echoed by Sen. Susan Collins, R-Me., who stressed lessons learned from the terrorist attacks of Sept. 11, 2001, in which much of the blame could be placed on the lack of information sharing between law enforcement and intelligence agencies. Collins said the new law has specific provisions for information sharing that would help head off a cyber-terror attack. Collins noted that the US government is already under daily attack from other nations and from terrorists. "They come from all directions," she said, noting that the urgency was underscored by intrusions that have already occurred at the Department of Defense and other agencies. Noting that cybercrime already exceeds the global drug trade in terms of dollars, she pointed out that the lack of a good cyber defense is a threat to the economic well-being of the United States. "Cyber terrorists have ability to cripple critical infrastructure," Collins said. Referring to recent attacks from China and Russia, she added the threat is being pursued by "global competitors seeking to undermine our leadership." "This bill is urgent," Collins said. "We cannot wait to act. We cannot wait until our country suffers a catastrophic attack." **The bill is a joint effort by several committees, including the Committee on Commerce, Science and Transportation,** with Chairman John D. Rockefeller, D-WV, testifying, and Sen. Dianne Feinstein, D-CA, who also testified. **The bill was introduced by the Committee on Homeland Security and Governmental Affairs Feb. 14 and is expected to be debated** by the full Senate during the next working session, which begins **at the end of February. The bill enjoyed bipartisan support** while it was being developed. However, a group of Republican senators have said they may introduce their own cybersecurity bill.

U.S. hegemonic decline results in global conflict—successors won't fill in and multiple hotspots escalate

Brzezinski 12—Professor of Foreign Policy @ Johns Hopkins

Zbigniew, After America, Foreign Policy, Jan/Dec 2012,
http://www.foreignpolicy.com/articles/2012/01/03/after_america?page=0,0

For **if America falters**, the world is unlikely to be dominated by a single preeminent successor -- not even China. International uncertainty, increased **tension among global competitors, and even outright chaos would be** far more **likely** outcomes. While a sudden, massive crisis of the American system -- for instance, another financial crisis -- would produce a fast-moving chain reaction leading to global political and economic disorder, a steady drift by America into increasingly pervasive decay or endlessly widening

warfare with Islam would be unlikely to produce, even by 2025, an effective global successor. No single power will be ready by then to exercise the role that the world, upon the fall of the Soviet Union in 1991, expected the United States to play: the leader of a new, globally cooperative world order. More probable would be a protracted phase of rather inconclusive realignments of both global and regional power, with no grand winners and many more losers, in a setting of international uncertainty and even of potentially fatal risks to global well-being. Rather than a world where dreams of democracy flourish, a Hobbesian world of enhanced national security based on varying fusions of authoritarianism, nationalism, and religion could ensue. The leaders of the world's second-rank powers, among them India, Japan, Russia, and some European countries, are already assessing the potential impact of U.S. decline on their respective national interests. The Japanese, fearful of an assertive China dominating the Asian mainland, may be thinking of closer links with Europe. Leaders in India and Japan may be considering closer political and even military cooperation in case America falters and China rises. Russia, while perhaps engaging in wishful thinking (even schadenfreude) about America's uncertain prospects, will almost certainly have its eye on the independent states of the former Soviet Union. Europe, not yet cohesive, would likely be pulled in several directions: Germany and Italy toward Russia because of commercial interests, France and insecure Central Europe in favor of a politically tighter European Union, and Britain toward manipulating a balance within the EU while preserving its special relationship with a declining United States. Others may move more rapidly to carve out their own regional spheres: Turkey in the area of the old Ottoman Empire, Brazil in the Southern Hemisphere, and so forth. None of these countries, however, will have the requisite combination of economic, financial, technological, and military power even to consider inheriting America's leading role. China, invariably mentioned as America's prospective successor, has an impressive imperial lineage and a strategic tradition of carefully calibrated patience, both of which have been critical to its overwhelmingly successful, several-thousand-year-long history. China thus prudently accepts the existing international system, even if it does not view the prevailing hierarchy as permanent. It recognizes that success depends not on the system's dramatic collapse but on its evolution toward a gradual redistribution of power. Moreover, the basic reality is that China is not yet ready to assume in full America's role in the world. Beijing's leaders themselves have repeatedly emphasized that on every important measure of development, wealth, and power, China will still be a modernizing and developing state several decades from now, significantly behind not only the United States but also Europe and Japan in the major per capita indices of modernity and national power. Accordingly, Chinese leaders have been restrained in laying any overt claims to global leadership. At some stage, however, a more assertive Chinese nationalism could arise and damage China's international interests. A swaggering, nationalistic Beijing would unintentionally mobilize a powerful regional coalition against itself. None of China's key neighbors -- India, Japan, and Russia -- is ready to acknowledge China's entitlement to America's place on the global totem pole. They might even seek support from a waning America to offset an overly assertive China. The resulting regional scramble could become intense, especially given the similar nationalistic tendencies among China's neighbors. A phase of acute international tension in Asia could ensue. Asia of the 21st century could then begin to resemble Europe of the 20th century -- violent and bloodthirsty. At the same time, the security of a number of weaker states located geographically next to major regional powers also depends on the international status quo reinforced by America's global preeminence -- and would be made significantly more vulnerable in proportion to America's decline. The states in that exposed position -- including Georgia, Taiwan, South Korea, Belarus, Ukraine, Afghanistan, Pakistan, Israel, and the greater Middle East -- are today's geopolitical equivalents of nature's most endangered species. Their fates are closely tied to the nature of the international environment left behind by a waning America, be it ordered and restrained or, much more likely, self-serving and expansionist. A faltering United States could also find its strategic partnership with Mexico in jeopardy. America's economic resilience and political stability have so far mitigated many of the challenges posed by such sensitive neighborhood issues as economic dependence, immigration, and the narcotics trade. A decline in American power, however, would likely undermine the health and good judgment of the U.S. economic and political systems. A waning United States would likely be more nationalistic, more defensive about its national identity, more paranoid about its homeland security, and less willing to sacrifice resources for the sake of others' development. The worsening of relations between a declining America and an internally troubled Mexico could even give rise to a particularly ominous phenomenon: the emergence, as a major issue in

nationalistically aroused Mexican politics, of territorial claims justified by history and ignited by cross-border incidents. Another consequence of American decline could be a corrosion of the generally cooperative management of the global commons -- shared interests such as sea lanes, space, cyberspace, and the environment, whose protection is imperative to the long-term growth of the global economy and the continuation of basic geopolitical stability. In almost every case, the potential absence of a constructive and influential U.S. role would fatally undermine the essential communality of the global commons because the superiority and ubiquity of American power creates order where there would normally be conflict. None of this will necessarily come to pass. Nor is the concern that America's decline would generate global insecurity, endanger some vulnerable states, and produce a more troubled North American neighborhood an argument for U.S. global supremacy. In fact, the strategic complexities of the world in the 21st century make such supremacy unattainable. But those dreaming today of America's collapse would probably come to regret it. And as the world after America would be increasingly complicated and chaotic, it is imperative that the United States pursue a new, timely strategic vision for its foreign policy -- or start bracing itself for a dangerous slide into global turmoil.

Heg Ext.

Cyber attack devastates US hegemony—increases costs Rustici 11-- contract Research Analyst who has worked with the National Defense University's Institute for National Security Studies

Ross, Cyberweapons: Leveling the International Playing Field Parameters. Carlisle Barracks: Autumn 2011. Vol. 41, Iss. 3; pg. 32, 11 pgs

The American global defense posture since the end of World War II has been primarily one of offshore balancer. In the most simplistic of views, the United States spent the Cold War and subsequent decades trying to preserve regional balances of power and prevent any coalition from gaining a disproportionate amount of power. This balancing has ranged from active conflict in Korea, Vietnam, and Iraq to support activities in the Middle East, Africa, and Southeast Asia. Not since World War II has America fought in a conflict or supported an interventionist foreign policy where its adversaries had the military capability to severely harm the United States. Indeed, it has not been since the Spanish-American War that the United States has fought a military with a global reach and military bases within striking distance of the continental United States. Not since the war of 1812 has the continental United States experienced an invading force. This amazing insulation from conflict is eroding quickly as technology progresses. While the United States, due largely to geography, has had the ability to act internationally with impunity, this is no longer the case. Cyber capabilities allow, for the first time in history, small states with minimal defense budgets to inflict serious harm on a vastly stronger foe at extreme ranges. To be clear, cyberweapons merely increase the cost of conflict for adversaries; these weapons are unlikely to dissuade national security policy when core national interests are at stake. With the exception of the United States and the United Kingdom, there are no countries with a demonstrated global power projection capability able to take advantage of the situation created by an effective cyberattack beyond their immediate borders. Cyberattacks on critical infrastructure thus become primarily a defensive weapon. These capabilities have the potential to provide substantial regime security at a fraction of the cost of a nuclear weapons program. While the deterrent value may be less than nuclear weapons attached to intercontinental ballistic missiles (ICBMs), a cyberattack has the potential to inflict enough damage to prevent interventionist foreign policy. The transaction cost for the United States to act as an offshore balancer or a global police force will increase dramatically. This is likely to erode the American public's tolerance to the ramifications of intervention in anything but the most extreme circumstances.

*Nuke Terror 2NC/1NR

NSA Surveillance exposes secret nuclear weapons projects and associated terrorism suspects

Cesca '14 (Bob, “NSA Inadvertently Collected Thousands of Non-Targeted Emails, Uncovered Terrorism and Nuclear Weapons Projects,” July 7, <http://thedailybanter.com/2014/07/nsa-inadvertently-collected-thousands-non-targeted-emails-uncovered-terrorism-nuclear-projects/>, ME)

Finally, while it's obvious that NSA isn't without its problems, the article revealed that **the agency's surveillance operations do, in fact, work**. Beyond the scare-headline and lede, the fifth and sixth paragraphs reported the following: **Among the most valuable contents** – which The Post will not describe in detail, to avoid interfering with ongoing operations – **are fresh revelations about a secret overseas nuclear project, double-dealing by an ostensible ally, a military calamity that befell an unfriendly power, and the identities of aggressive intruders into U.S. computer networks**. Months of tracking communications across more than 50 alias accounts, the files show, led directly to the 2011 capture in Abbottabad Of Muhammad Tahir Shahzad, a Pakistan-based bomb builder, and Umar Patek, a suspect in a 2002 terrorist bombing on the Indonesian island of Bali. At the request of CIA officials, The Post is withholding other examples that officials said would compromise ongoing operations. **This is precisely why there's an NSA: weeding out secret nuclear weapons projects, apprehending terrorism suspects and protecting U.S. computer networks from malicious hackers**. Coincidentally, we learned about the importance and flaws of NSA several days before The Post's article. The Privacy and Civil Liberties Oversight Board (PCLOB) released a report last week (pdf) on this very matter and concluded that **PRISM and FISA Section 702, “has been valuable and effective in protecting the nation's security and producing useful foreign intelligence.”** PCLOB also concluded that “...certain aspects of the program's implementation raise privacy concerns. These include the scope of the incidental collection of U.S. persons' communications and the use of queries to search the information collected under the program for the communications of specific U.S. persons.”

Terrorism goes nuclear---high risk of theft and attacks escalate

Dvorkin 12 (Vladimir Z., Major General (retired), doctor of technical sciences, professor, and senior fellow at the Center for International Security of the Institute of World Economy and International Relations of the Russian Academy of Sciences. The Center participates in the working group of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, 9/21/12, "What Can Destroy Strategic Stability: Nuclear Terrorism is a Real Threat," belfercenter.ksg.harvard.edu/publication/22333/what_can_destroy_strategic_stability.html)

Hundreds of scientific papers and reports have been published on nuclear terrorism. International conferences have been held on this threat with participation of Russian organizations, including IMEMO and the Institute of U.S. and Canadian Studies. Recommendations on how to combat the threat have been issued by the International Luxembourg Forum on Preventing Nuclear Catastrophe, Pugwash Conferences on Science and World Affairs, Russian-American Elbe Group, and other organizations. The UN General Assembly adopted the International Convention for the Suppression of Acts of Nuclear Terrorism in 2005 and cooperation among intelligence services of leading states in this sphere is developing. ¶ At the same time, these efforts fall short for a number of reasons, partly because various **acts of nuclear terrorism are possible**. Dispersal of radioactive material by detonation of conventional explosives (“dirty bombs”) is a method that is most accessible for terrorists. With the wide spread of radioactive sources, raw materials for such attacks have become much more accessible than weapons-useable nuclear material or nuclear weapons. The use of **“dirty bombs”** will not cause many immediate casualties, but it will result into long-term

radioactive contamination, contributing to the spread of **panic and socio-economic destabilization**.[¶] Severe consequences can be caused by sabotaging nuclear power plants, research reactors, and radioactive materials storage facilities. Large cities are especially vulnerable to such attacks. A large city may host dozens of research reactors with a nuclear power plant or a couple of spent nuclear fuel storage facilities and dozens of large radioactive materials storage facilities located nearby. The past few years have seen significant efforts made to enhance organizational and physical aspects of security at facilities, especially at nuclear power plants. Efforts have also been made to improve security culture. But these efforts do not preclude the possibility that **well-trained terrorists may be able to penetrate nuclear facilities**.[¶] Some estimates show that sabotage of a research reactor in a metropolis may expose hundreds of thousands to high doses of radiation. A formidable part of the city would become uninhabitable for a long time.[¶] Of all the scenarios, it is building an improvised nuclear device by terrorists that poses the maximum risk. **There are no engineering problems that cannot be solved if terrorists decide to build a simple “gun-type” nuclear device.** Information on the design of such devices, as well as implosion-type devices, is available in the public domain. It is the acquisition of weapons-grade uranium that presents the sole serious obstacle. Despite numerous preventive measures taken, we cannot rule out the possibility that such materials can be bought on the black market. **Theft of weapons-grade uranium is also possible.** Research reactor fuel is considered to be particularly vulnerable to theft, as it is scattered at sites in dozens of countries. There are about 100 research reactors in the world that run on weapons-grade uranium fuel, according to the International Atomic Energy Agency (IAEA).[¶] **A terrorist “gun-type” uranium bomb can have a yield of least 10-15 kt, which is comparable to the yield of the bomb dropped on Hiroshima.** The explosion of such a bomb in a modern metropolis can kill and wound hundreds of thousands and cause serious economic damage. There will also be long-term sociopsychological and political consequences.[¶] The vast majority of states have introduced unprecedented security and surveillance measures at transportation and other large-scale public facilities after the terrorist attacks in the United States, Great Britain, Italy, and other countries. These measures have proved burdensome for the countries’ populations, but the public has accepted them as necessary. **A nuclear terrorist attack will make the public accept further measures meant to enhance control even if these measures significantly restrict the democratic liberties they are accustomed to.** Authoritarian states could be expected to adopt even more restrictive measures.[¶] If a nuclear terrorist act occurs, nations will delegate tens of thousands of their secret services’ best personnel to investigate and attribute the attack. Radical Islamist groups are among those capable of such an act. We can imagine what would happen if they do so, given the anti-Muslim sentiments and resentment that conventional terrorist attacks by Islamists have generated in developed democratic countries. **Mass deportation of the non-indigenous population and severe sanctions would follow such an attack in what will cause violent protests in the Muslim world. Series of armed clashing terrorist attacks may follow.** The prediction that Samuel Huntington has made in his book “The Clash of Civilizations and the Remaking of World Order” may come true. Huntington’s book clearly demonstrates that it is not Islamic extremists that are the cause of the Western world’s problems. Rather there is a deep, intractable conflict that is rooted in the fault lines that run between Islam and Christianity. **This is especially dangerous for Russia because these fault lines run across its territory.** To sum it up, the political leadership of Russia has every reason to revise its list of factors that could undermine strategic stability. BMD does not deserve to be even last on that list because its effectiveness in repelling massive missile strikes will be extremely low. BMD systems can prove useful only if deployed to defend against launches of individual ballistic missiles or groups of such missiles. Prioritization of other destabilizing factors—that could affect global and regional

stability—merits a separate study or studies. But even without them I can conclude that nuclear terrorism should be placed on top of the list. **The threat of nuclear terrorism is real, and a successful**

nuclear terrorist attack would lead to a radical transformation of the global order

All of the threats on the revised list must become a subject of thorough studies by experts. States need to work hard to forge a common understanding of these threats and develop a strategy to combat them.

Impact causes extinction- retaliation

Ayson 10 - Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington (Robert, July. “After a Terrorist Nuclear Attack: Envisaging Catalytic Effects.” Studies in Conflict & Terrorism, Vol. 33, Issue 7. InformaWorld.)

But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today’s and tomorrow’s terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington’s relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington’s early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country’s armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the “Chechen insurgents’ ... long-standing interest in all things nuclear.”⁴² American pressure on that part of the

world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither "for us or against us") might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability.

A2: Deterrence Checks Retaliation

Nuclear terrorism causes US-Russia nuclear war—only scenario for extinction—deterrence doesn't check

Barrett et al 13 – Anthony has a PhD in Engineering and Public Policy from Carnegie Mellon University, is a Fellow in the RAND Stanton Nuclear Security Fellows Program, and is the Director of Research at Global Catastrophic Risk Institute. Seth Baum has a PhD in Geography from Pennsylvania State University is a Research Scientist at the Blue Marble Space Institute of Science, and is the Executive Director of Global Catastrophic Risk Institute. Kelly Hostetler has a BS in Political Science from Columbia and is a Research Assistant at the Global Catastrophic Risk Institute. (“Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia”, Science and Global Security 21(2), June 28, 2013, http://sethbaum.com/ac/2013_NuclearWar.pdf)

Note: this version of the article is a little different from the one published in the actual journal; I cut this version from the link in the cite above.

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have globally catastrophic effects such as severely reducing food production for years,¹ potentially leading to collapse of modern civilization worldwide and even the extinction of humanity.² Nuclear war between the United States and Russia could occur by various routes, including accidental or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack.³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches.⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, though numerous measures were also taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counterattack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack.⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced.⁶ However, it has also been argued that inadvertent nuclear war between the United States and Russia has continued to present a substantial risk.⁷ While the United States and Russia are not actively threatening each other with war, they have remained ready to launch nuclear missiles in response to indications of attack.⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time.⁹ Second, terrorist groups or other actors might cause attacks on either the United States or Russia that resemble some kind of nuclear attack by the other nation by actions such as exploding a stolen or improvised nuclear bomb,¹⁰ especially if such an event occurs during a crisis between the United States and Russia.¹¹ A variety of nuclear terrorism scenarios are possible.¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States.¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security.¹⁴

Causes extinction – draws in Russia through miscalc

Barrett et al. 13—PhD in Engineering and Public Policy from Carnegie Mellon University, Fellow in the RAND Stanton Nuclear Security Fellows Program, and Director of Research at Global Catastrophic Risk Institute—AND Seth Baum, PhD in Geography from Pennsylvania State University, Research Scientist at the Blue Marble Space Institute of Science, and Executive Director of Global Catastrophic Risk Institute—

AND Kelly Hostetler, BS in Political Science from Columbia and Research Assistant at Global Catastrophic Risk Institute (Anthony, 24 June 2013, "Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia," Science & Global Security: The Technical Basis for Arms Control, Disarmament, and Nonproliferation Initiatives, Volume 21, Issue 2, Taylor & Francis)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have **globally catastrophic effects** such as severely **reducing food production for years**,¹ potentially **leading to collapse of modern civilization** worldwide, and even **the extinction** of humanity.² Nuclear war between the United States and Russia could occur by various routes, including accidental or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack.³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches.⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, and numerous measures also were taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counter-attack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack.⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced.⁶ **However**, it also has been argued that inadvertent nuclear war between the United States and Russia has continued to present a **substantial risk**.⁷ While the United States and Russia are not actively threatening each other with war, they have **remained ready to launch nuclear missiles** in response to indications of attack.⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time.⁹ Second, **terrorist groups or other actors might cause attacks** on either the United States or Russia that **resemble** some kind of **nuclear attack by the other nation** by actions such as exploding a stolen or improvised nuclear bomb,¹⁰ especially if such an event occurs during a crisis between the United States and Russia.¹¹ A variety of nuclear terrorism scenarios are possible.¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States.¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security.¹⁴ It has long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.–Russian crisis conditions,¹⁵ with the Cuban Missile Crisis being a prime historical example. It is possible that U.S.–Russian relations will significantly deteriorate in the future, increasing nuclear tensions. There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks.¹⁶

It's the only scenario – deterrence solves all their impacts

Gable 11 (William, US Army War College, "An Era of Persistent Conflict?,"

<http://www.dtic.mil/cgi-bin/GetTRDoc?AD=ADA560155>)

Exceptional individuals are key contributors to the turmoil the U.S. experienced in the last decade through the present, and their objectives could portend continued conflict. While the existence of these exceptional individuals alone does not necessarily assure conflict, the ideologies they espouse are underpinned by religion adding a **nondeterrable dimension** to their struggle. The actual or **perceived preponderance** of U.S. power will not diminish the likelihood of future attacks. In fact, such attacks will only serve to enhance these organizations' status and power, fueling every aspect of their operations from recruiting to financing operations. Consequently, threats from non-state actors will continue. Depending on the potential destruction inflicted by any terrorist attack, the attacker's sanctuary, and the threat posed to the aforementioned governments, the U.S. may be compelled to fight wars similar to the war in Afghanistan. Conflict with another state is possible, though **less likely**. Although the relative decline of U.S. economic power in relation to China appears to constitute a potential —windowl or **threat** to peace, both governments are aware of the **risks** and are **working to mitigate** them. Moreover, the U.S., China, and Russia represent **deterrable nuclear powers**, states dissuaded from conflict with each other due to the potential costs of a nuclear exchange. Conflict between these states appears unlikely. However, existing theory suggests **problems with nondeterrable states** that are not responsive to punishment or are willing to take risks that prompt conflict. North Korea and Iran seem to fit this description. Their efforts to develop, acquire, and possibly proliferate nuclear weapons, combined with the potential threat posed by a **non-state actor** acquiring such weapons, form conditions that indicate a strong possibility of war. In particular, Iran's nuclear program presents a potentially ominous window. Should diplomacy, sanctions, and cyber attacks fail to sidetrack Iran's nuclear program, the U.S. will be presented with an ever-narrowing window to act with force to deny Iran this capability. This could result in conflict with Iran. While false optimism is a potent and pervasive cause of war, recent experience with war and the nature of these and likely future conflicts will diminish leaders support for initiating war. Similarly, the current economic conditions and concern over the national debt will dampen leaders' enthusiasm for wars. But existing theories that discuss these factors fail to consider the impact of non-state actors. Thus, **conflict is still possible despite them**. Overall, the combination of factors seems to indicate continuing conflict with nonstate actors and potential conflict with states over development and **proliferation** of nuclear weapons. These factors identify specific circumstances where U.S. involvement in war is likely, and represent the **primary drivers** for concluding that the current era will be one **of** persistent **conflict**. The U.S. government should use all of the elements of power to focus on these factors to prevent what history and theory suggest the inevitability of war.

A2: Other Impacts Outweigh (LONG)

Mutually assured destruction has made war obsolete, a nuclear terror attack would break the nuclear taboo causing a massive and rapid nuclear US retaliation

Caplow, '7 (Theodore- commonwealth professor of sociology emeritus at the univ. of virginia, Forbidden Wars, University Press of America, p.97-98, ME)

Nuclear weapons, which are only useful if never used, have created a geopolitical world that looks much more dangerous than it is. With the disintegration of the Soviet Union, the threat of a nuclear war went from orange (with tinges of red) to bright green, or whatever color signifies safety, and there it remains today. But the American public, which lived quite comfortably with a plausible threat of nuclear war for forty years, now quakes at the thought of nuclear weapons in the hands of North Koreans or Iranians. **During the cold war, both superpowers deployed thousands of nuclear warheads on hair trigger alert. Washington and Moscow took for granted the unrelenting hostility between them and the real possibility of having to absorb the first strike. Each understood that the first strike might be launched by accident or with deadly purpose, with equally catastrophic results. Nothing like that looms over us today. The Russian federation is a "strategic partner" of the United States although not always a comfortable one. The nuclear rules guarantee the immunity of nuclear-armed states from hostile national forces. The nuclear taboo remains unbroken and has just now, in the summer of 2006, survived a major test as the Bush administration backed away from a plan to use nuclear blockbusters in an attack on irans nuclear installations. The five major nuclear weapon states- the U.S., Russia, Britain, France, China- have no serious quarrels among themselves. The five proliferators or would be proliferators – Israel, India, Pakistan, North Korea, Iran – show not the slightest disposition to attack any of the major nuclear-weapons states. The classic problem of abolishing international wars is nearly solved, although nobody seems to notice.** What formerly seemed to call either for a world government or for a peacekeeping federation much more powerful than the United Nations, has yielded to the nuclear rules. **For the first time in history, major geopolitical goals are being reached by international consensus with no application or threat of force. A striking example is the European Union, which has effectively abolished international war on the European Continent, the historic theater of so many wars. Another is the voluntary adherence of nearly all the world governments to the non-proliferation regime, along with the voluntary abandonment of nuclear weapons programs by Libya, South Africa, Brazil, Argentina, Ukraine, Kazakstan, and Belarus. Compliance with the limited test ban treaty has been nearly perfect, and the only resistance of the United States and a handful of other holdouts have so far prevented its more comprehensive successor from coming into effect. What all this signifies is that nuclear weapons have changed the normal relationships of sovereign states in a fundamental way. The nuclear weapons states, being militarily invulnerable, have little to gain by going to war.** Under the Nuclear Rules, they may not fight each other and **their security is not enhanced by warring with non-nuclear states. Only the United States has chosen to do so,** ostensibly, it must be remembered, **to prevent Iraq from acquiring nuclear weapons** and as of this writing, the United States government is threatening war against Iran for the same reason, although with less precipitation and more limited military resources. **If nuclear weapons could be wielded only by national governments, the present condition of the commonwealth of nations might well be celebrated as approaching the fulfillment of an age-old utopian dream, the abolition of**

international war. True, there are two kinds of international war that the nuclear rules permit: a conflict between non-nuclear states that have no nuclear guarantors and an attack on a non-nuclear state that lacks a nuclear guarantor by a nuclear state. There are only a handful of potential conflicts in the former category while the latter category contains only the United States and its axis-of-evil targets. **Of course, as the incidence of international war has declined toward extinction, the focus of fear has shifted to the possible use of nuclear weapons by terrorists** and insurgents. Indeed, the U.S. invasion of Iraq was promoted as a precautionary measure against the possible transfer of nuclear weapons to terrorists by Saddam Hussein. Never mind that the Baathists and Jihadists had very different programs or that any such transaction might have invited a nuclear reprisal against the donor. The same concern is raised, with possibly more justification with regard to North Korea. Pakistan, which has many more nuclear warheads than North Korea and with many Jihadists in official positions, is seldom mentioned in this context, but the thought is there. **It would be foolish to deny the plausibility of the nightmare scenario in which a nuclear device transferred from a proliferator to a terrorist group is used to attack an American city. That would, of course, break the nuclear taboo and it would also unleash the full fury of an American nuclear reprisal against the suspected donor.** So it may not happen. Another scenario would involve the transfer of a nuclear device to an insurgent group in Latin America or Africa. That too would break the nuclear taboo but would be less likely to provoke a nuclear response.

A Nuclear terrorist attack would be so emotionally and psychologically devastating. In an age of instant communication it would literally destroy the fabric that holds society together, This makes all makes all conflict irrational and turns deterrence theory

Bostrom, Ackerman and Potter, '8

(Nick-Director of the future of humanity institute at Oxford University, specializes in probability theory, scientific method, and risk analysis- former expert consultant for European Commission in Brussels and the CIA, Gary- research director of the national consortium for START and Director of the center for terrorism and intelligence studies, and William- Institute professor and director of the center for nonproliferation studies on numerous committees of the national academy of science, "Global Catastrophic Risks", Oxford University Press, p.430-31, ME)

Unlike the more tangible physical and economic effects of nuclear terrorism, it is almost impossible to model the possible psychological, social, and political consequences of nuclear terrorism, especially in the long term and following multiple incidents. One is therefore forced to rely on proxy data from the effects of previous cases of large-scale terrorism, a variety of natural disasters and past nuclear accidents such as the Chernobyl meltdown. The psychological, social and political effects of nuclear terrorism are likely to extend far beyond the areas affected by blast or radiation, although many of these effects are likely to be more severe closer to ground zero. **It can be expected that the initial event will induce a number of psychological symptoms in victims, responders, and onlookers. In an age of instantaneous global communication, the last category might rapidly encompass most of the planet.** The constellation of possible symptoms might include anxiety, grief, helplessness, initial denial, anger, confusion, impaired memory, sleep disturbance and withdrawal (Alexander and Klein, 2006). Based on past experience with terrorism and natural disasters, these symptoms will resolve naturally in the majority of people, with only a fraction going on to develop persistent psychiatric illness such as post-traumatic stress disorder. However, **the intangible, potentially irreversible, contaminating, invasive and doubt provoking nature**

of radiation brings with it a singular aura of dread and high levels of stress and anxiety. Indeed, this fear factor is one of the key reasons why some terrorists might select weapons emitting radiation. In addition to significant physical casualties, **a nuclear terrorism event would most likely result in substantially greater numbers of unexposed individuals seeking treatment, thereby complicating medical responses.** **In the 1987, radiological incident in Goiania, Brazil, up to 140,000 unexposed people flooded the health care system seeking treatment** (department of homeland security, 2003, p.26). Although genuine panic – in the sense of maladaptive responses such as freezing – is extremely rare (Jones, 1995), **a nuclear terrorism incident might provoke a mass exodus from cities as individuals make subjective decisions to minimize their anxiety.** **Following the three mile island nuclear accident** in the United States in 1979, 150,000 people took to the highways – **45 people evacuated for every person advised to leave** (Becker, 2003). Were nuclear terrorism to become a repeating occurrence, the question would arise regarding whether people would eventually be able to habituate to such events, much as the Israeli public currently manages to maintain a functional society despite continual terrorist attacks. While desensitization to extremely high levels of violence is possible, **multiple cases of nuclear terrorism over an extended period of time might prove to be beyond the threshold of human tolerance. Even a single incidence of nuclear terrorism could augur negative social changes.** While greater social cohesion is likely in the immediate aftermath of an attack (department of homeland security, 2003, p.38), **over time feelings of fear, anger and frustration could lead to widespread anti-social behavior, including the stigmatization of those exposed to radiation and the scapegoating of population groups associated with the perceived perpetrators of the attack. This reaction could reach the level of large-scale xenophobia and vigilantism. Repeated attacks on major cities might even lead to behaviors encouraging social reversion and the general deterioration of civil society.** For example, if many people adopt a survivalist attitude and abandon populated areas. There is, of course, also the possibility that higher mortality salience might lead to positive social effects, including more constructive approaches to problem-solving (Calhoun and Tedeschi, 1998). Yet higher morality could just as easily lead to more pathological behaviors. For instance, **during outbreaks of the black death plague in the middle ages, some groups lost all hope and descended into a self-destructive epicureanism. A nuclear terrorist attack, or series of attacks, would almost certainly alter the fabric of politics** (Becker, 2003). **The use of a nuclear weapon might trigger a backlash against current political or scientific establishments for creating and failing to prevent the threat. Such attacks might paralyze an open or free society by causing the government to adopt draconian methods** (Stern, 1999, pp.2-3), **or massively restrict movement and trade until all nuclear material can be accounted for, an effort that would take years and which could never be totally complete. The concomitant loss of faith in governing authorities might eventually culminate in** the fulfillment of John Herz's initial vision of the atomic age, resulting in **the demise of the nation-state as we know it** (1957).

The world is rapidly becoming more peaceful eliminating the possibility for power wars- mutually assured destruction ensures cooperation to avoid conflict, our knowledge is best

Goldstein, 9/10- **'11** (Joshua- professor emeritus of international relations at American University and author of the forthcoming book "winning the war on war", "Think Again: War", Foreign Affairs, ME)
So far they haven't even been close. In fact, **the last decade has seen fewer war deaths than any decade in the past 100 years, based on data compiled by**

researchers Bethany Lacina and Nils Petter Gleditsch of the Peace Research Institute Oslo. Worldwide, deaths caused directly by war-related violence in the new century have averaged about 55,000 per year, just over half of what they were in the 1990s (100,000 a year), a third of what they were during the Cold War (180,000 a year from 1950 to 1989), and a hundredth of what they were in World War II. If you factor in the growing global population, which has nearly quadrupled in the last century, the decrease is even sharper. Far from being an age of killer anarchy, **the 20 years since the Cold War ended have been an era of rapid progress toward peace.** Armed conflict has declined **in large part because armed conflict has fundamentally changed. Wars between big national armies all but disappeared along with the Cold War, taking with them the most horrific kinds of mass destruction. Today's asymmetrical guerrilla wars may be intractable and nasty, but they will never produce anything like the siege of Leningrad. The last conflict between two great powers, the Korean War, effectively ended nearly 60 years ago. The last sustained territorial war between two regular armies, Ethiopia and Eritrea, ended a decade ago. Even civil wars, though a persistent evil, are less common than in the past; there were about a quarter fewer in 2007 than in 1990. If the world feels like a more violent place than it actually is, that's because there's more information about wars -- not more wars themselves. Once-remote battles and war crimes now regularly make it onto our TV and computer screens, and in more or less real time. Cell-phone cameras have turned citizens into reporters in many war zones. Societal norms about what to make of this information have also changed. As Harvard University psychologist Steven Pinker has noted, "The decline of violent behavior has been paralleled by a decline in attitudes that tolerate or glorify violence," so that we see today's atrocities -- though mild by historical standards -- as "signs of how low our behavior can sink, not of how high our standards have risen."**

There is an almost zero probability for great power shoot out-our evidence indicts all of the negatives impact scenarios

Fettweis, '8 (Christopher J.- PoliSci Proff @ Tulan University and Former Proff of U.S. foreign policy and Grand strategy @ naval war college, "Losing Hurts Twice as Bad", W.W. Norton & Company, p.190-94, ME)
One can be fairly confident in making such an assertion in part because of what might be the single most significant yet under-reported trend in world politics: **The world is significantly more peaceful at the beginning of the twenty-first century than at any time in recorded history. Although conflict and chaos may dominate the headlines, the incidence of warfare has dropped to remarkably low levels.** A far greater percentage of the worlds people live in societies at peace than at any other time in history. **Not only is the current era markedly better in most measurable categories of international security than ever before, but it is growing more stable as time goes by. At the very least, to a growing number of experts, a major clash of arms does not seem plausible. Major war may well have become obsolete. Rather than a "clash of civilizations" a "coming anarchy," or a step "back to the future" toward multipolarity and instability, the new century may well prove to be far more peaceful than any previous one. The number and intensity of all kinds of conflict, including interstate wars, civil wars, and ethnic conflicts, declined steadily throughout the 1990s and into the new decade. This period of peace may be due to** some combination of nuclear weapons, complex economic interdependence, the spread of democracy, or , as many scholars believe, **a simple change in ideas about what is worth fighting for. These days, not much may be left.** This rather bold and perhaps counterintuitive claim may seem a bit utopian to those familiar with the long, dismal history of warfare. **Is not war an innate part of**

human nature, an outgrowth of our passions and imperfections, like murder? **Not necessarily, say many of the scholars. After all, murder is an act of the individual, often of passion rather than reason: war is a rational act of state, a symptom of the broader practices of the international system of states. War is an institution, a tradition of dispute resolution, a method countries have chosen to employ when their interests diverge.** Granted, it has been with us since the beginning of time, but as political scientists John Mueller has noted, “unlike breathing, eating or sex, war is **not something that is somehow required by the human psyche, by the human condition, or by the forces of history.**” **The eminent military historian John Keegan reports being “impressed by the evidence that mankind, wherever it has the option, is distancing itself from the institution of warfare.”** If Keegan is impressed, then maybe we should be, too. Overall, as the table below shows, international and internal conflicts have steadily declined since the end of the cold war. Despite perceptions that the current wars “on terror” and in Iraq may have created, the world is a much safer place than it was in prior generations. **There remains a human (and perhaps particularly American) tendency to replace one threat with another, to see international politics as an arena of dangerous competition, but this perception simply no longer matches the facts. The evidence is apparent on every continent.** At the beginning of 2008, the only conflict raging in the entire western hemisphere was the ongoing civil war in Colombia, but even that was far less severe than it was a decade ago. **Europe, which of course has been the most war-prone continent for most of human history, was entirely calm,** without even the threat of interstate conflict. The situations in Bosnia and Kosovo were not settled, but they were at least stable for the moment. And in contrast to 1914, **the great powers have shown no eagerness to fill Balkan power vacuums-** to the contrary, throughout the 1990’s they had to be shamed into intervention, and were on the same side when they did. The entire Pacific Rim was currently experiencing no armed conflict. Even in the Middle East, where Iraq continued to burn, a tenuous peace was holding between Arabs and Israelis, terrorism notwithstanding, and no other wars seemed imminent. **This trend was even visible in Africa** where, despite a variety of ongoing serious challenges, levels of conflict were the lowest they have ever been in the centuries of written history we have about the continent. Darfur and the Congo were the only real extended tragedies still underway; the intensity of the internal conflicts simmering in Algeria, Somalia, Senegal, and a couple of other places is in all cases lower than a decade ago. This can all change quite rapidly – Ethiopia and Eritrea might soon decide to renew their pointless fighting over uninhabitable land, for instance, or Kenya could melt down into chaos – but right now, the continent seems more stable than it has ever been. **West Africa is quiet,** at least for the moment, as is all of Southern Africa, despite the criminally negligent governance of Robert Mugabe in Zimbabwe. None of this is to suggest that these places are without problems, of course. But given the rapid increase in the world population and number of countries (the League of Nations had 63 members at its peak between the wars, while the United Nations currently has 192), one might expect a great deal more warfare than there currently is. **We also are witnessing record low levels of the secondary symptoms of insecurity, such as arms races, military rivalry, and “cold” wars.** Either we are merely experiencing another of the world’s occasional peaceful periods (and it would be by far the most remarkable such period ever), or **something about the nature of international politics has changed, and for the better. The twentieth century witnessed an unprecedented pace of evolution in all areas of human endeavor,** in science and medicine, transportation and communication, and even in religion. **In such an atmosphere, perhaps it is not difficult to imagine that attitudes toward the venerable institution of warfare may also have experienced similarly rapid evolution, to the point where its obsolescence could become plausible,** even probable, in spite of thousands of years of violent precedent. Perhaps **the burden of proof should be on those who say that our rules of governing war cannot change, and that it will someday return with a vengeance. Overall, although the idea that war is becoming obsolete is gaining ground in academic circles, it has yet to make much headway in those**

of policymaking. One need not be convinced of its wisdom, however, to believe that the United States is an extremely safe country, or at the very least that its basic existence does not depend on an active presence abroad. **No matter what happens in the far corners of the globe, it would seem, America is going to survive the coming century quite well. Even those who actively support internationalism have a hard time demonstrating that there foreign adventures are truly necessary to assume the basic security of the United States.** The benefits of activist strategies must therefore manifestly outweigh the costs, since **the United States could easily survive inaction, no matter how dire any future situation appears.**

A2: Mueller/No Terrorist Attack

It's likely

Bunn et al 13 – Matthew Bunn is a Professor of the Practice of Public Policy at Harvard Kennedy School and Co-Principal Investigator of Project on Managing the Atom at Harvard University's Belfer Center for Science and International Affairs. Vice Admiral Valentin Kuznetsov (retired Russian Navy) is a senior research fellow at the Institute for U.S. and Canadian Studies of the Russian Academy of Sciences and a Senior Military Representative of the Russian Ministry of Defense to NATO from 2002 to 2008. Martin Malin is the Executive Director of the Project on Managing the Atom at the Belfer Center for Science and International Affairs. Colonel Yuri Morozov (retired Russian Armed Forces) is a professor of the Russian Academy of Military Sciences, senior research fellow at the Institute for U.S. and Canadian Studies of the Russian Academy of Sciences, and chief of department at the Center for Military-Strategic Studies at the General Staff of the Russian Armed Forces from 1995 to 2000. ("Steps to Prevent Nuclear Terrorism: Recommendations Based on the U.S.-Russia Joint Threat Assessment", September 2013, <http://belfercenter.ksg.harvard.edu/files/JTA%20eng%20web2.pdf>)

In 2011, Harvard's Belfer Center for Science and International Affairs and the Russian Academy of Sciences' Institute for U.S. and Canadian Studies published "The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism." The assessment **analyzed the means, motives, and access of would-be nuclear terrorists, and concluded that the threat of nuclear terrorism is urgent and real.**

The Washington and Seoul Nuclear Security Summits in 2010 and 2012 established and demonstrated a consensus among political leaders from around the world that nuclear terrorism poses a serious threat to the peace, security, and prosperity of our planet. For any country, a terrorist attack with a nuclear device would be an immediate and catastrophic disaster, and the negative effects would reverberate around the world far beyond the location and moment of the detonation.

Preventing a nuclear terrorist attack requires international cooperation to secure nuclear materials, especially among those states producing nuclear materials and weapons. As the world's two greatest nuclear powers, the United States and Russia have the greatest experience and capabilities in securing nuclear materials and plants and, therefore, share a special responsibility to lead international efforts to prevent terrorists from seizing such materials and plants.

The depth of convergence between U.S. and Russian vital national interests on the issue of nuclear security is best illustrated by the fact that bilateral cooperation on this issue has continued uninterrupted for more than two decades, even when relations between the two countries occasionally became frosty, as in the aftermath of the August 2008 war in Georgia.

Russia and the United States have strong incentives to forge a close and trusting partnership to prevent nuclear terrorism and have made enormous progress in securing fissile material both at home and in partnership with other countries. However, to meet the evolving threat posed by those individuals intent upon using nuclear weapons for terrorist purposes, the United States and Russia need to deepen and broaden their cooperation.

The 2011 "U.S. - Russia Joint Threat Assessment" offered both specific conclusions about the nature of the threat and general observations about how it might be addressed. This report builds on that foundation and analyzes the existing framework for action, cites gaps and deficiencies, and makes specific recommendations for improvement.

"The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism" (The 2011 report executive summary):

Nuclear terrorism is a real and urgent threat. Urgent actions are required to reduce the risk. **The risk is driven by the rise of terrorists who seek to inflict unlimited damage**, many of whom have sought justification for their plans in radical interpretations of Islam; **by the spread of information about the decades-old technology of nuclear weapons; by the increased availability of weapons-usable nuclear materials; and by globalization**, which makes it easier to move people, technologies, and materials across the world.

Making a crude nuclear bomb would not be easy, but **is potentially within the capabilities of a technically sophisticated terrorist group**, as numerous government studies have confirmed. Detonating a stolen nuclear weapon would likely be difficult for terrorists to accomplish, if the weapon was equipped with modern technical safeguards (such as the electronic locks known as Permissive Action Links, or PALs). **Terrorists could,**

however, cut open a stolen nuclear weapon and make use of its nuclear material for a bomb of their own.

The nuclear material for a bomb is small and difficult to detect, making it a major challenge to stop nuclear smuggling or to recover nuclear material after it has been stolen. Hence, a primary focus in reducing the risk must be to keep nuclear material and nuclear weapons from being stolen by continually improving their security, as agreed at the Nuclear Security Summit in Washington in April 2010.

Al-Qaeda has sought nuclear weapons for almost two decades. The group has repeatedly attempted to purchase stolen nuclear material or nuclear weapons, and has repeatedly attempted to recruit nuclear expertise. Al-Qaeda reportedly conducted tests of conventional explosives for its nuclear program in the desert in Afghanistan. The group's nuclear ambitions continued after its dispersal following the fall of the Taliban regime in Afghanistan. Recent writings from top al-Qaeda leadership are focused on justifying the mass slaughter of civilians, including the use of weapons of mass destruction, and are in all likelihood intended to provide a formal religious justification for nuclear use.

While there are significant gaps in coverage of the group's activities, al-Qaeda appears to have been frustrated thus far in acquiring a nuclear capability; it is unclear whether the the group has acquired weapons-usable nuclear material or the expertise needed to make such material into a bomb. Furthermore, pressure from a broad range of counter-terrorist actions probably has reduced the group's ability to manage large, complex projects, but has not eliminated the danger.

However, there is no sign the group has abandoned its nuclear ambitions. On the contrary, leadership statements as recently as 2008 indicate that the intention to acquire and use nuclear weapons is as strong as ever.

There are materials, expertise, and motives

Jaspal 12 – Zafar is a professor of international relations at Quaid-i-Azam. (“Nuclear/Radiological Terrorism: Myth or Reality?” Journal of Political Studies, Vol. 19, Issue - 1, 2012, http://pu.edu.pk/images/journal/pols/pdf-files/Nuclear%20Radiological%20terrorism%20Jaspa_Vol_19_Issue_1_2012.pdf)

The misperception, miscalculation and above all ignorance of the ruling elite about security puzzles are perilous for the national security of a state. Indeed, in an age of transnational terrorism and unprecedented dissemination of dual-use nuclear technology, ignoring nuclear terrorism threat is an imprudent policy choice. The incapability of terrorist organizations to engineer fissile material does not eliminate completely the possibility of nuclear terrorism. At the same time, the absence of an example or precedent of a nuclear/ radiological terrorism does not qualify the assertion that the nuclear/radiological terrorism ought to be remained a myth.

Farsighted rationality obligates that one should not miscalculate transnational terrorist groups – whose behavior suggests that they have a death wish – of acquiring nuclear, radiological, chemical and biological material producing capabilities. In addition, one could be sensible about the published information that huge amount of nuclear material is spread around the globe. According to estimate it is enough to build more than 120,000 Hiroshima-sized nuclear bombs (Fissile Material Working Group, 2010, April 1). The alarming fact is that a few storage sites of nuclear/radiological materials are inadequately secured and continue to be accumulated in unstable regions (Sambaiew, 2010, February). Attempts at stealing fissile material had already been discovered (Din & Zhiwei, 2003: 18).

Numerous evidences confirm that terrorist groups had aspired to acquire fissile material for their terrorist acts. Late Osama bin Laden, the founder of al Qaeda stated that acquiring nuclear weapons was a “religious duty” (Yusufzai, 1999, January 11). The IAEA also reported that “al-Qaeda was actively seeking an atomic bomb.” Jamal Ahmad al-Fadl, a dissenter of Al Qaeda, in his trial testimony had “revealed his extensive but unsuccessful efforts to acquire enriched uranium for al-Qaeda” (Allison, 2010, January: 11). On November 9, 2001, Osama bin Laden claimed that “we have chemical and nuclear weapons as a deterrent and if America used them against us we reserve the right to use them (Mir, 2001, November 10).” On May 28, 2010, Sultan Bashiruddin Mahmood, a Pakistani nuclear scientist confessed that he met Osama bin Laden. He claimed that “I met Osama bin Laden before 9/11 not to give him nuclear know-how, but to seek funds for establishing a technical college in Kabul (Syed, 2010, May 29).” He was arrested in 2003 and after extensive interrogation by American and Pakistani intelligence agencies he was released (Syed, 2010, May 29). Agreed, Mr. Mahmood did not share nuclear know-how with Al Qaeda, but his meeting with Osama establishes the fact that the

terrorist organization was in contact with nuclear scientists. Second, the terrorist group has sympathizers in the nuclear scientific bureaucracies. It also authenticates bin Laden's Deputy Ayman Zawahiri's claim which he made in December 2001: "If you have \$30 million, go to the black market in the central Asia, contact any disgruntled Soviet scientist and a lot of dozens of smart briefcase bombs are available" (Allison, 2010, January: 2).

The covert meetings between nuclear scientists and al Qaeda members could not be interpreted as idle threats and thereby the threat of nuclear/radiological terrorism is real. The 33rd Defense Secretary Robert Gates admitted in 2008 that "what keeps every senior government leader awake at night is the thought of a terrorist ending up with a weapon of mass destruction, especially nuclear (Mueller, 2011, August 2)." Indeed, the nuclear deterrence strategy cannot deter the transnational terrorist syndicate from nuclear/radiological terrorist attacks. Daniel Whiteneck pointed out:

"Evidence suggests, for example, that al Qaeda might not only use WMD simply to demonstrate the magnitude of its capability but that it might actually welcome the escalation of a strong U.S. response, especially if it included catalytic effects on governments and societies in the Muslim world. An adversary that prefers escalation regardless of the consequences cannot be deterred" (Whiteneck, 2005, Summer: 187)

Terrorist Attacks are homegrown and destroy Policy Infrastructure-Preventable through NSA-SL

Carafano 6/10/-15 (James Jay Ph.D., Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow, "Islamist Plots Are On The Rise; Should Our Concern Be Rising As Well?", Heritage Foundation, <http://www.heritage.org/about/staff/c/james-carafano>)

Islamist terrorists are busier than ever trying to kill us. That's a fact. Two years ago, The Heritage Foundation conducted an exhaustive review of publicly available U.S. court and federal and state government records. The researchers documented at least 60 terrorist plots related to Islamist extremism following the 9/11 attacks—all aimed at the U.S. And the pace of plotting has only quickened. There have been nine additional plots since that report came out in 2013. Seven occurred this calendar year, six since April. Plot number 69 was thwarted just a few days ago. On June 2, federal law enforcement officers killed Usaamah Abdullah in Boston. Dawud Sharif Abdul Khaliq, an alleged accomplice, was arrested later. It is suspected they intended to behead anti-Islamist activist Pamela Geller. So, **yes, Islamist terrorism in America is on the rise**. The numbers don't lie. Still, there is a ferocious debate over what they mean. No one has paid more attention to terrorist trends in the United States than **Cato Institute Senior Fellow John Mueller**. In 2011, he co-authored Terror, Security and Money: Balancing the Risks, Benefits and Costs of Homeland Security for Oxford University Press. Mueller conducted an exhaustive study of terrorism threats in relation to other risks faced by everyday Americans. He concluded Washington obsessions with combating terrorism were overblown. Other dangers killed and maimed many more citizens than terrorists. "The rise of terrorism is a hazard to human life," Mueller wrote in an updated 2014 risk assessment, "and it should be dealt with in a manner similar to that applied to other hazards—albeit with an appreciation for the fact that terrorism often evokes extraordinary fear and anxiety." Since other risks are greater he argues, counterterrorism efforts ought to be scaled back. Mueller's latest study was published right before ISIS started to make headlines gobbling up territory in Syria and Iraq and beating the drum for more attacks on the U.S. homeland. Still, Mueller would be unimpressed. After all, of the 69 post-9/11 plots, only five came to fruition. (The most recent of these came last year, when Zale Thompson attacked and injured two New York City police officers with an axe.) And, all together, they resulted in a very limited loss of life. These numbers seem to reinforce Mueller's conclusions. If Mueller provided

the right context for evaluating the domestic terrorist threat he might be right. But he is wrong. According to Mueller, the distinguishing feature of terrorism is that it sparks obsessive fear. On that score there is social science research to back him up. People-generated disasters (such as terrorist attacks and riots) evoke more anxiety and apprehension than acts of nature. But, "fear" is not what uniquely distinguishes terrorism as a human hazard. Terrorism is an act of "political" violence. Terrorists are not just trying to kill people and destroy property. They are trying to undermine the political order and civil society. Thus, they represent a fundamental threat to the system that provides security, protects liberty and promotes prosperity. Terrorism is a danger to all members of the community, not just the specific victims. As a public policy problem, it does represent an outsize concern beyond just counting the number killed. Getting beyond the body count, there are a number of reasons to be concerned about the recent up-tick. Plots are increasingly homegrown. That means they are hatched here by individuals who are self-radicalized and operating without formal ties or instructions to overseas terrorist organizations. Finding and upending these threats requires scrupulous, persistent and effective domestic intelligence and law enforcement operations. While the terrorists are here, however, their inspiration is abroad. Increasingly, radicalized individuals are found to be inspired or in dialogue with extremists entities overseas. ISIS successes in the field, its sophisticated social network activities and its ability to recruit fighters globally are all real cause for concern. What the U.S. faces now is a transnational terrorist threat more complex than the enemy that confronted America on 9/11. Terrorists are linking social networks and human webs, and that creates unprecedented opportunities to operationalize violence. Defeating this threat will require both continuing to disrupt plots here at home and defeating the overseas terrorists who inspire them. That will require an expenditure of resources far outsized to the formula suggested by Dr. Mueller's risk assessment.

Mueller is a hack

Graham **Allison 9**, Douglas Dillon Professor of Government and Director of the Belfer Center for Science and International Affairs at Harvard University's Kennedy School of Government, "A Response to Nuclear Terrorism Skeptics" Brown Journal of World Affairs, Hein Online

What drives Mueller and other skeptics to arrive at such different conclusions? They make four major claims that merit serious examination and reflection. ¶ CLAIM 1: No ONE IS SERIOUSLY MOTIVATED TO CONDUCT A NUCLEAR TERRORIST ATTACK ¶ More than a decade ago, no one could have imagined that a Japanese doomsday cult would be sufficiently motivated to disseminate sarin gas on the Tokyo subway. ^{Indeed,} at the time ^{of that attack,} the consensus among terrorism experts was that terrorists wanted an audience and sympathy-not casualties. ^{The leading American student of terrorism, Brian Jenkins, summarized the consensus judgment in 1975: "terrorists seem 34 to be more interested in having a lot of people watching, not a lot of people dead."} ¶ As intelligence officials later testified, an inability to recognize the shifting modus operandi of some terrorist groups was part of the reason why members of Aum Shinrikyo "were simply not on anybody's radar screen." ¶ This, despite the fact that the group owned a 12-acre chemical weapons factory in Tokyo, had \$1 billion in its bank account, and had a history of serious nuclear ambitions. ¶ Similarly, before the 9/11 attacks on the World Trade Center and Pentagon that extinguished 3,000 lives, few imagined that terrorists could mount an attack upon the American homeland that would kill more Americans than the Japanese attack at Pearl Harbor. ^{As Secretary Rice testified to the 9/11 Commission, "No one could have imagined them taking a plane, slamming it into the Pentagon and into the World Trade Center, using planes as a missile."} ¶ For most Americans, the idea of international terrorists mounting an attack on our homeland and killing thousands of citizens was not just unlikely, but inconceivable. But assertions about what is "imaginable" or "conceivable" are propositions about individuals' mental capacities, not about what is objectively possible. ¶ In fact, Al Qaeda's actions in the decade prior to the 9/11 attacks provided clear evidence both of intent and capability. While its 1993 attack on the World Trade Center succeeded in killing only six people, Ramzi Yousef, the key operative in this case, had planned to collapse one tower onto the second, killing 40,000. In the summer of 1996, Osama bin Laden issued a fatwa declaring war upon the United States. Two years later, Al Qaeda attacked the U.S. embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, killing more than 200 people. In October 2000, Al Qaeda attacked the warship USS Cole. Throughout this period, Al Qaeda's leadership was running thousands of people through training camps, preparing them for mega-terrorist attacks. ¶ Notwithstanding Aum Shinrikyo's brazen attack, Al Qaeda's audacious 9/11 attack, and the recent attacks in Mumbai that killed 179 people, Mueller maintains that "terrorists groups seem to have exhibited only limited desire... they have discovered that the tremendous effort required is scarcely likely to be successful." He asserts that the evidence about Al Qaeda's nuclear intentions ranges from the "ludicrous to the merely dubious," and that those who take Al Qaeda's nuclear aspiration seriously border on "full-on fantasyland." ¶ Even scholars who would have been inclined to

agree with this point of view have revised their judgment as new facts have accumulated. In 2006, for example, Jenkins reversed the basic proposition that he had set forth three decades earlier. In his summary: "In the 1970s the bloodiest incidents caused fatalities in the tens. In the 1980s, fatalities from the worst incidents were in the hundreds; by the 1990s, attacks on this scale had become more frequent. On 9/11 there were thousands of fatalities, and there could have been far more. We now contemplate plausible scenarios in which tens of 35 thousands might die." Underlining the contrast with his own 1975 assessment, Jenkins now says: "Jihadists seem ready to murder millions, if necessary. Many of today's terrorists want a lot of people watching and a lot of people dead."²² (Emphasis added.)¶ Al Qaeda has been deadly clear about its ambitions. In 1998, Osama bin Laden declared that he considered obtaining weapons of mass destruction "a religious duty."²³ In December 2001, he urged his supporters to trump the 9/11 attacks: "America is in retreat by the grace of God Almighty...but it needs further blows."²⁴ A few months later, Al Qaeda announced its goal to "kill four million Americans."²⁵ It even managed to gain religious sanction from a radical Saudi cleric in 2003 to kill "ten million Americans" with a nuclear or biological weapon.²⁶¶ We also now know that Al Qaeda has been seriously seeking a nuclear bomb. According to the Report of the 9/11 Commission, "Al Qaeda has tried to acquire or make nuclear weapons for at least ten years... and continues to pursue its strategic goal of obtaining a nuclear capability." It further reveals "bin Laden had reportedly been heard to speak of wanting a 'Hiroshima'. The Commission provides evidence of Al Qaedas effort to recruit nuclear expertise-including evidence about the meeting between two Pakistani nuclear weapon scientists, bin Laden, and his deputy Ayman al-Zawahiri in Afghanistan to discuss nuclear weapons.²⁷ These scientists were founding members of Ummah Tamer-e-Nau (UTN), a so-called charitable agency to support projects in Afghanistan. The foundation's board included a fellow nuclear scientist knowledgeable about weapons construction, two Pakistani Air Force generals, one Army general, and an industrialist who owned Pakistan's largest foundry.²⁸¶ In his memoir, former CIA Director George Tenet offers his own conclusion that "the most senior leaders of Al Qaeda are still singularly focused on acquiring WMD" and that "the main threat is the nuclear one." In Tenet's view, Al Qaedas strategic goal is to obtain a nuclear capability. He concludes as follows: "I am convinced that this is where Osama bin Laden and his operatives desperately want to go."²⁹¶ CLAIM 2: IT IS IMPOSSIBLE FOR TERRORISTS TO ACQUIRE FISSILE MATERIAL.¶ Assuming that terrorists have the intent-could they acquire the necessary materials for a Hiroshima-model bomb? Tenet reports that after 9/11, President Bush showed President Putin his briefing on UTN. In Tenet's account of the meeting, Bush "asked Putin point blank if Russia could account for all of its material." Putin responded that he could guarantee it was secure during his watch, underlying his inability to provide assurance about events under his predecessor, Boris Yeltsin.³⁰¶ When testifying to the Senate Intelligence Committee in February 2005, Commit- 36 tee Vice-Chairman John Rockefeller (D-WV) asked CIA Director Porter Goss whether the amount of nuclear material known to be missing from Russian nuclear facilities was sufficient to construct a nuclear weapon. Goss replied, "There is sufficient material unaccounted for that it would be possible for those with know-how to construct a weapon...I can't account for some of the material so I can't make the assurance about its whereabouts."³¹¶ Mueller sidesteps these inconvenient facts to assert a contrary claim. According to his telling, over the last 10 years, there have been only 10 known thefts of highly enriched uranium (HEU), totaling less than 16 pounds, far less than required for an atomic explosion. He acknowledges, however, that "There may have been additional thefts that went undiscovered."³²¶ Yet, as Matthew Bunn testified to the Senate in April 2008, "Theft of HEU and plutonium is not a hypothetical worry, it is an ongoing reality." He notes that "nearly all of the stolen HEU and plutonium that has been seized over the years had never been missed before it was seized." The IAEA Illicit Nuclear Trafficking Database notes 1,266 incidents reported by 99 countries over the last 12 years, including 18 incidents involving HEU or plutonium trafficking, 130 research reactors around the world in 40 developing and transitional countries still hold the essential ingredient for nuclear weapons. As Bunn explains, "The world stockpiles of HEU and separated plutonium are enough to make roughly 200,000 nuclear weapons; a tiny fraction of one percent of these stockpiles going missing could cause a global catastrophe."³³¶ Consider the story of Russian citizen Oleg Khinsagov. Arrested in February 2006 in Georgia, he was carrying 100 grams of 89-percent enriched HEU as a sample and attempting to find a buyer for what he claimed were many additional kilograms. Mueller asserts that "although there is a legitimate concern that some material, particularly in Russia, may be somewhat inadequately secured, it is under lock and key, and even sleepy, drunken guards, will react with hostility (and noise) to a raiding party."³⁴¶ CLAIM 3: IT IS EXTREMELY DIFFICULT TO CONSTRUCT A NUCLEAR DEVICE THAT WORKS.¶ Rolf Mowatt-Larssen, former director of the Department of Energy's Office of Intelligence and Counterintelligence, testified that, "The 21st century will be defined first by the desire and then by the ability of non-state actors to procure or develop crude nuclear weapons."³⁵ In contrast, Mueller contends that "Making a bomb is an extraordinarily difficult task... the odds, indeed, are stacked against the terrorists, perhaps massively so."³⁷¶ Mueller argues that his conclusion follows from an analysis of 20 steps an atomic terrorist would have to accomplish in what he judges to be the most likely nuclear terrorism scenario. On the basis of this list, he claims that there is "worse than one in a 37 million" chance of success.³⁸¶ His approach, however, misunderstands probabilistic risk assessment. For example, some of the steps on the list would have to be completed before an attempt to acquire material could begin (therefore, the success rate for any of those steps during the path would, by definition, be 100 percent). Other steps are unnecessary, such as having a technically sophisticated team pre-deployed in the target country. Although he assumes that stolen materials will be missed, in none of the 18 documented cases mentioned earlier had the seized material been reported missing.³⁹¶ At U.S. weapons labs and among the U.S. intelligence community, experts who have examined this issue largely agree. John Foster, a leading American bomb maker and former director of the Lawrence Livermore National Laboratories, wrote a quarter century ago, "If the essential nuclear materials are at hand, it is possible to make an atomic bomb using information that is available in the open literature."⁴⁰ Similarly, Theodore Taylor, the nuclear physicist who designed America's smallest and largest atomic bombs, has repeatedly stated that, given fissile material, building a bomb is "very easy". Double underline. Very Easy."⁴¹¶ Inquiring into such claims, then-Senator Joe Biden (D-DE) asked the major nuclear weapons laboratories whether they could make such a device if they had nuclear materials. All three laboratories answered affirmatively. The laboratories built a gun-type device using only components that were commercially available and without breaking a single U.S. law.¶ The Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, known as the Silberman-Robb Commission, reported in 2005 that the intelligence community believed Al Qaeda "probably had access to nuclear expertise and facilities and that there was a real possibility of the group developing a crude nuclear device." It went on to say that "fabrication of at least a 'crude' nuclear device was within Al Qaedas capabilities, if it could obtain fissile material."⁴³¶ Skeptics argue that terrorists cannot replicate the effort of a multi-billion dollar nuclear program of a state. This claim does not distinguish between the difficulty of producing nuclear materials for a bomb (the most difficult threshold) and the difficulty of making a bomb once the material has been acquired. The latter is much easier. In the Iraq case, for

example, the CIA noted that if Saddam Hussein had stolen or purchased nuclear materials from abroad, this would have cut the time Iraq needed to make a bomb from years to months.¹ Moreover, terrorists do not require a state-of-the-art weapon and delivery system, since for blowing up a single city a crude nuclear device would suffice.⁴

The grim reality of globalization's dark underbelly is that non-state actors are 38 increasingly capable of enacting the kind of lethal destruction heretofore the sole reserve of states.
CLAIM 4: IT IS TOO DIFFICULT TO DELIVER A NUCLEAR DEVICE TO THE UNITED STATES.⁴

⁴In the spring of 1946, J. Robert Oppenheimer was asked whether units of the atom bomb could be smuggled into New York and then detonated. He answered, "Of course it could be done, and people could destroy New York." As for how such a weapon smuggled in a crate or a suitcase might be detected, Oppenheimer opined, "with a screwdriver." He went on to explain that because the HEU in a nuclear weapon emits so few radioactive signals, a bomb disguised with readily available shielding would not be detected when inspectors opened the crates and examined the cargo.⁴¹ The nuclear weapon that terrorists would use in the first attack on the United States is far more likely to arrive in a cargo container than on the tip of a missile. In his appearance before a Senate subcommittee in March 2001, six months before 9/11, National Intelligence Officer Robert Walpole testified that "non-missile delivery means are less costly, easier to acquire, and more reliable and accurate."⁶ Citing the 1999-2003 U.S. Congressional Advisory Panel to Assess Domestic Response Capabilities for Terrorism Involving Weapons of Mass Destruction (the Gilmore

Commission), **Mueller states that transporting an improvised nuclear device would require overcoming "Herculean challenges."**⁴ **He does not explain, however, why bringing a crude nuclear weapon into an American city would be materially different than the challenge faced by drug smugglers or human traffickers.** According to the Government Accountability Organization, an average of 275 metric tons of cocaine have arrived in Mexico each year for transshipment to the United States since 2000. Reported seizures averaged about 36 tons a year, a 13 percent success rate for the intelligence and law enforcement community. Three million illegal immigrants enter the country each year, and only one in three gets caught."

A2: Deterrence Solves Terrorism

Deterrence theory fails when dealing with terrorists- guarantees irrational response

Preston 7 (Thomas, Associate Prof. IR – Washington State U and Faculty Research Associate – Moynihan Institute of Global Affairs, “From Lambs to Lions: Future Security Relationships in a World of Biological and Nuclear Weapons”, page 170-171, ME) Unfortunately, **for nonstate actors (like terror groups, millennial cults, fanatical religious sects, etc.), these considerations are far less valid. These groups are unlikely to be worried about political legitimacy, and often see the infliction of mass casualties and destruction upon opponents as supported by either their religious or political beliefs.** As Hoffman (1998,94) warns, religions can serve as a “legitimizing force” that lowers the inhibitions a terrorist group might normally have against inflicting indiscriminate, mass casualties on an opponent. Moreover, terror groups like Al Qaeda do not have “return mailing addresses” and therefore are unlikely to be overly concerned about the threat of retaliation from victims. Unlike states, it is difficult to target nonstate actors for direct retaliation since they lack the kind of “fixed targets of high value” possessed by states (e.g., cities, monuments, industries, economic assets controlled by the ruling elites. Etc.). Although economic assets and fundraising efforts can be targeted for disruption – as the U.S. has sought to do since 9/11 – it will never be possible to eliminate half of a population and a third of an economy with the push of a button as it is for state opponents. Indeed, **since deterrence requires the ability of a victim to retaliate and inflict unacceptable levels of damage against an attacker's valued assets, the amorphous nature of nonstate actors make such deterrence efforts by states impossible. Because of these difficulties, state actors seldom (if ever) enter into deterrent security relationships with nonstate actors. Instead, they face the kind of “irrational” opponent long feared by pessimists** – one uninterested in negotiation, **unconcerned about consequences or, in many cases survival, who seeks only to inflict as much harm as possible upon the victim whenever possible.** And, unlike state opponents, who are viewed as less threatening when only their peripheral interests are at stake or they possess only rudimentary WMD capabilities, **nonstate actors can credibly threaten WMD use regardless of their level of capability and they do not have interests easily decompiled into central vs. peripheral areas. As a result, the state vs. nonstate actor security relationship is the most unstable, most prone to conflict, and least susceptible to notions of deterrence of any that exists.** As noted terrorism expert Jessica Stern observes: It is difficult to preempt or deter adversaries whose identities, motivations, and likely responses are unknown. It is also difficult to preempt or deter adversaries whose responses are not rational... for ad hoc groups seeking revenge, acts of violence are likely to be expressive rather than instrumental. They do not measure success by political changes but by horrified and hurt audiences and a humiliated target government. Ad hoc groups have little to lose and are therefore hard to deter. Religious extremists, similarly, may be actively aiming for chaos or, in some cases, for martyrdom... state sponsors, in contrast, may be possible to deter.

A2: Nuke Terror Attack Not That Bad

A nuclear terror attack would kill billions, collapse the global economy, and cause escalation

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 1-2; kdf)

IN AN OTHERWISE CALM AND UNEVENTFUL MORNING, A small nuclear weapon explodes in downtown Washington, DC. The device generates a yield of fifteen kilotons, roughly the same force unleashed by the bomb Little Boy over Hiroshima. The casualty count rises to over a hundred thousand, and the destruction is measured in hundreds of billions of dollars. The blast's electromagnetic pulse burns out electrical components across the metropolitan area. Radiation leaves the center of the city uninhabitable for the first time since it was declared America's capital in 1790, and the scientific community predicts that it will remain so for a decade. The stock market plunges as investors anticipate draconian customs regimes that will choke global trade. Fear of further attacks paralyzes America and much of the Western world. Hours after the explosion, a little unknown terrorist group claims responsibility. It is the first time the president, who was not in Washington at the time of the blast, and his surviving cabinet members, including the director of national intelligence, have heard of the group. After searching intelligence databases, analysts report that the group is linked to three hostile governments, all of which have issued statements condemning the attack and denying involvement. It will take weeks for the remnants of the US intelligence community to assess that one of these three governments is probably lying, but even then the US government won't have irrefutable evidence of complicity. Unlike a ballistic missile or bomb delivered by enemy land-, air-, or seacraft, the origin of what analysts will call a "container-based improvised nuclear device" is difficult to determine and impossible to prove. Nuclear forensics will ultimately provide strong evidence that the fissile material used in the device originated from the country under suspicion. Signals intelligence will record celebrations and praise of the attack by midlevel officials in that country's military and intelligence establishment. However, the intelligence reporting taken as a whole will suggest that negligence within that country's weapons industry and at its nuclear complexes is at least as plausible a scenario as a deliberate transfer by government officials to the terrorist group. Yet there is no conclusive reporting that points to either willful negligence or human error. Either way, there is no way to know if the transfer occurred through official policy, the machinations of a venal or ideologically motivated individual, or simple incompetence. There is almost nothing about the origins of the attack that the president of the United States knows for certain.

Hiroshima and Nagasaki were different nuclear incidents, in the age of mass communication one attack would destroy society

Dodgen Et A., '11 (Daniel- Phd, Office of the Assistant Secretary for Preparedness and Response, Department of Health and Human Services; "Social, Psychological, and Behavioral Responses to a Nuclear Detonation in a US City: Implications for Health Care Planning and Delivery", Vol 5-1, American Medical Association, ME)
Although the Bombings of Hiroshima and Nagasaki Were Nuclear Incidents, They Are of Limited Usefulness in Gauging What the Public Reaction Would Be to a Modern Nuclear Detonation

The only actual experience with individual and group behavior after nuclear explosions comes from the World War II bombings of Hiroshima and Nagasaki in 1945; however, there are severe limitations in applying the lessons learned from those events to contemporary times. Although there was recognition early on that **the devastation in Hiroshima was caused by a new type of weapon, it was not immediately recognized that the incident involved radiation.** Therefore, people's responses in

the early days were not affected by perceptions of the danger of radiation per se, although many people feared some sort of residual hazard. Similarly, the clinical presentations associated with acute radiation syndrome were puzzling and were initially attributed by some to be a consequence of poisoning or secondary infectious diseases.

How might things unfold if there were a nuclear detonation in a US city today?

How long would it take people to comprehend what had happened? **There would be a blinding flash of light followed by a huge explosion. Intense heat, pressure waves, and wind would herald the detonation.** However, a 10-kT nuclear groundburst may not be recognized initially as being nuclear in origin, especially by those closest to the epicenter. Moreover, the characteristic mushroom shaped cloud may not form due to urban canyon effects.²⁰ Not long after, however, **people would likely begin to speculate that a nuclear blast had occurred, and formal and informal news media around the world would begin around-the-clock coverage. As in past events such as the September 11, 2001, terror attacks, some information initially reported would be speculative or wrong, and that could contribute to public confusion. It is unclear precisely when survivors in areas near the detonation point would learn of the radiation hazard, but it would likely be within the early aftermath of the detonation.** While the electromagnetic pulse effect would probably not extend far, there is concern that the **nearby electrical grid and nearby communication equipment may be affected.** Similarly, **it is unclear how quickly emergency management personnel could begin disseminating guidance to people in specific areas to shelter in place or evacuate to minimize exposure to dangerous fallout.** Nevertheless, it would certainly not take long for neighboring communities to learn that a nuclear device had been detonated in their region. Information about how people can best protect themselves from fallout would need to be disseminated as quickly as possible.

The world has changed dramatically since 1945. **Information about radiation, including some that is inaccurate and some that can best be described as myth, is widespread. An act of terror using a nuclear device would now have manifold levels of meaning and associated fear that would significantly affect the way people and systems respond. Instant national and international communications, Web-based social media, knowledge of previous radiation incidents, and the anticipation that terrorists could detonate additional nuclear devices in other locations are just a few of the variables involved in this new calculus of behavioral response.**

A2: No Retaliation

9/11 proves, attacks invite counter-attacks

Myhrvold 2014 (Nathan P [chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft]; Strategic Terrorism: A Call to Action; cco.dodlive.mil/files/2014/04/Strategic_Terrorism_corrected_II.pdf; kdf)

Failing nation-states—like North Korea—which possess nuclear weapons potentially pose a nuclear threat. Each new entrant to the nuclear club increases the possibility this will happen, but this problem is an old one, and one that existing diplomatic and military structures aim to manage. The newer and less understood danger arises from the increasing likelihood that stateless groups, bent on terrorism, will gain access to nuclear weapons, most likely by theft from a nation-state. Should this happen, the danger we now perceive to be coming from rogue states will pale in comparison. The ultimate response to a nuclear attack is a nuclear counterattack. Nation states have an address, and they know that we will retaliate in kind. Stateless groups are much more difficult to find which makes a nuclear counterattack virtually impossible. As a result, they can strike without fear of overwhelming retaliation, and thus they wield much more effective destructive power. Indeed, in many cases the fundamental equation of retaliation has become reversed. Terrorists often hope to provoke reprisal attacks on their own people, swaying popular opinion in their favor. The aftermath of 9/11 is a case in point. While it seems likely that Osama bin Laden and his henchmen hoped for a massive overreaction from the United States, it is unlikely his Taliban hosts anticipated the U.S. would go so far as to invade Afghanistan. Yes, al-Qaeda lost its host state and some personnel. The damage slowed the organization down but did not destroy it. Instead, the stateless al-Qaeda survived and adapted. The United States can claim some success against al-Qaeda in the years since 9/11, but it has hardly delivered a deathblow. Eventually, the world will recognize that stateless groups are more powerful than nation-states because terrorists can wield weapons and mount assaults that no nationstate would dare to attempt. So far, they have limited themselves to dramatic tactical terrorism: events such as 9/11, the butchering of Russian schoolchildren, decapitations broadcast over the internet, and bombings in major cities. Strategic objectives cannot be far behind.

Terrorism changes the psyche of policy makers and the public against rationality

Pinker, 8-7- '11 (Steven- professor of psychology at Harvard University, "Terrorism", <http://chronicle.com/article/Era-in-Ideas-Terrorism/128490/>, ME) The discrepancy between the panic generated by terrorism and the deaths generated by terrorism is no accident. **Panic is the whole point of terrorism, as the root of the word makes clear: "Terror" refers to a psychological state, not an enemy or an event. The effects of terrorism depend completely on the psychology of the audience. Terrorists are communicators, seeking publicity and attention, which they manufacture through fear.** They may want to extort a government into capitulating to a demand, to sap people's confidence in their government's ability to protect them, or to provoke repression that will turn people against their government or bring about chaos in which the terrorist faction hopes to prevail. **Cognitive psychologists such as Amos Tversky, Daniel Kahneman, Gerd Gigerenzer, and Paul Slovic have shown that the perceived danger of a risk depends on two factors: fathomability and dread. People are terrified of risks that are novel, undetectable, delayed in their effects, and poorly understood. And they are terrified about worst-case scenarios, the ones that are uncontrollable, catastrophic, involuntary, and inequitable** (that is, the people exposed to the risk are not the ones who benefit from it). **These psychologists suggest that cognitive illusions are a legacy of ancient brain circuitry that evolved to protect us against natural risks such as**

predators, poisons, storms, and especially enemies. Large-scale terrorist plots are **novel, undetectable, catastrophic, and inequitable, and thus maximize both unfathomability and dread. They give the terrorists a large psychological payoff for a small investment in damage.**

US would respond

Caplow, '7 (Theodore- commonwealth professor of sociology emeritus at the univ. of virginia, Forbidden Wars, University Press of America, p.56, ME)

There is also some question as to whether the critics of extended deterrence were correct in assuming that the response to a nuclear attack on a client state or the crossing of a tripwire would not be automatic. **Although some details are classified, it appears that during the cold war, an American second strike would have been forthcoming even if the U.S. government had been decapitated by a soviet first strike.** For many years an airplane code-named Looking glass flew random patterns above the Midwest carrying an Air Force general with the necessary communications equipment to launch a nuclear second strike if higher national authorities were put out of action. Other arrangements were in place to assure that a soviet nuclear attack on any of the third-party states under U.S. protection would evoke a virtually automatic response . **Even today,** as previously noted, **the American responses to a hostile nuclear attack,** whether **directed at the homeland** or at a Nato ally or at a tripwire, **would probably be immediate and overwhelming.**

A2: Terrorism Defense

The probability of a nuclear terror attack is at unprecedented levels – amplifies the magnitude

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 23-25; kdf)

Is the scenario above simply the product of an overactive imagination and a penchant for alarmism? This is a reasonable question to ask. And it is worth answering before embarking on an exploration of potential responses to nuclear terrorism. Those who assert that there is a genuine threat of nuclear terrorism should acknowledge at the outset that there are legitimate reasons for skepticism. In fact, those who have paid closest attention to the issue over the years may be most conditioned to be incredulous. They have heard public officials repeatedly issue dire warnings of impending terrorist attacks, watched and seen that no attack materializes, and then have been presented with little or no evidence to support the initial alert. It is also perfectly understandable that reasonable people question the competence and/or trustworthiness of US national security officials, particularly those responsible for nuclear issues. This is especially so in light of the second American-led invasion of Iraq—a war justified to the public largely on the basis of nonexistent nuclear weapons. Moreover, warnings of impending doom didn't originate with then vice president Dick Cheney. "I think we have to live with the expectation," remarked a Los Alamos atomic engineer in 1973, "that once every four or five years a nuclear explosion will take place and kill a lot of people." This statement is cited in John McPhee's *The Curve of Binding Energy*, which detailed concerns about the proliferation of nuclear weapons to nonstate actors over forty years ago.³ In the context of this history, accusations of Chicken Little-like behavior aren't flippant reactions. While exaggeration may mislead the credulous and offend the perceptive, neither the absence of a precedent for nuclear terrorism nor the intelligence failure regarding Saddam Hussein's WMD program change the growing threat. Many of these conditions aren't new; they have existed since the dawn of the nuclear age, and the world has been very fortunate that the danger has been effectively managed for so long. Other conditions are truly unprecedented. The world crossed from Graham Allison's "Three No's" into three Yeses with a whimper rather than a bang, but we have nevertheless entered an environment of extraordinary risk. Allison's contention that "[t]he detonation of a terrorist nuclear device in an American city is inevitable if the U.S. continues on its present course" is certainly debatable.⁴ Yet an objective assessment of the current nuclear security situation and its future trajectory leads to an unavoidable conclusion: We are more vulnerable to nuclear terrorism than at any time since the dawn of the nuclear age.

Terrorists can easily build and detonate a nuclear weapon on US soil

Preston 7

(Thomas, Associate Prof. IR – Washington State U and Faculty Research Associate – Moynihan Institute of Global Affairs, "From Lambs to Lions: Future Security Relationships in a World of Biological and Nuclear Weapons", page 172, ME)

A device need not be transportable: an easier option would be to build it in a rented garage or apartment near the center of the target city, to be set off by a timer allowing ample time for the perpetrators to get away. It would be easy to smuggle to such a destination a half dozen or so half-liter parcels of highly enriched uranium. A Hiroshima type nuclear explosive device weapons could then be manufactured rather easily, using openly available information. All the other materials necessary to complete the project could be brought in place without difficulty, presumably **without any need to use black market suppliers** (except, possibly, to purchase some conventional explosives). Even a small weapon of only one-kiloton yield could cause immense casualties in a major city if detonated by terrorists.

Based on a computer simulation of a one-kiloton explosion in Times Square, New York, during a normal work day, Matthew Mckinzie, a staff scientist at the Natural Resources Defense Council, **found over 20,000 people would be killed instantly, and that up to a quarter-mile away, all those exposed to a direct view of the fireball would receive fatal doses of radiation. Up to a quarter-million workers would be affected** by the attack to some degree, **and radioactive fallout would spread at least five to ten miles from ground zero** (Keller 2002, 57). As spiers (2000,80) observes: The potential effects of nuclear terrorism have always been formidable: **if a group with sufficient skills was able to obtain about 30 pounds of highly enriched uranium, which is easily carried in a briefcase, or a small amount of plutonium** (baseball size), **and then spent some \$200,000 acquiring readily available materials and equipment , it could build a nuclear device within a couple of months.** **Had such a nuclear device been in the mini van placed at the World Trade Center, it is estimated that “the lower part of Manhattan would have disappeared up to Gramercy Park, all of Wall Street.”** Of course, **the construction of a nuclear device by terror groups – either outside the U.S. of with components smuggles into the country - would be no simple task. But could be easily accomplished, there is little question a group like Al Qaeda would seek to use it against a target to produce a maximum level of casualties.** And, as former UN weapons inspector David Albright observes, while the technical difficulties in assembling a working weapons should not be underestimated, **it is also a mistake to overestimate the hurdles – especially is you are dealing with a well-organized terror group that has no interest in maintain a reliable, safe arsenal and is willing to take the risk its jury rigged weapon will either not achieve its full yield** (or fail to explode at all). As Albright suggests, **“as you get smarter, you realize you can get by with less... you can do it in facilities that look like barns, garages, with simple machine tools. You can do it with 10-15 people, not all PhD’s, but some engineers, technicians. Our judgment is that a gun-type device is well within the capability of a terrorist organization.**

A2: US Fighting More Wars

Wars are decreasing and when they do occur they are less violent

Goldstein, 9/10- **'11** (Joshua- professor emeritus of international relations at American University, "Think Again: War", Foreign Affairs, ME)
But **though the conflicts of the post-9/11 era may be longer than those of past generations, they are also far smaller and less lethal. America's decade of war since 2001 has killed about 6,000** U.S. service members, **compared with 58,000 in Vietnam and 300,000 in World War II.** Every life lost to war is one too many, but these deaths have to be seen in context: **Last year more Americans died from falling out of bed than in all U.S. wars combined.** And the fighting in Iraq and Afghanistan has taken place against a backdrop of base closures and personnel drawdowns elsewhere in the world. **The temporary rise in U.S. troop numbers in South Asia and the Middle East, from 18,000 to 212,000 since 2000, contrasts with the permanent withdrawal of almost 40,000 troops from Europe, 34,000 from Japan and South Korea, and 10,000 from Latin America in that period. When U.S. forces come home from the current wars -- and they will in large numbers in the near future, starting with 40,000 troops from Iraq and 33,000 from Afghanistan by 2012 -- there will be fewer U.S. troops deployed around the world than at any time since the 1930s.** President Barack Obama was telling the truth in June when he said, **"The tide of war is receding."**

A2: War is more Brutal

There are less civilian casualties now and more humanitarian responses in times of war

Goldstein, 9/10- '11 (Joshua- professor emeritus of international relations at American University, "Think Again: War", Foreign Affairs, ME)
In February 2010, a NATO airstrike hit a house in Afghanistan's Marja district, killing at least nine civilians inside. The tragedy drew condemnation and made the news, **leading the top NATO commander in the country to apologize** to Afghan President Hamid Karzai. **The response underscored just how much has changed in war.** During World War II, Allied bombers killed hundreds of thousands of civilians in Dresden and Tokyo not by accident, but as a matter of tactics; Germany, of course, murdered civilians by the millions. And **when today's civilians do end up in harm's way, more people are looking out for them. The humanitarian dollars spent per displaced person rose in real terms from \$150 in the early 1990s to \$300 in 2006. Total international humanitarian assistance has grown** from \$2 billion in 1990 **to \$6 billion in 2000 and (according to donor countries' claims) \$18 billion in 2008. For those caught in the crossfire, war has actually gotten more humane.** Yet many people insist that the situation is otherwise. For example, authoritative works on peacekeeping in civil wars (Roland Paris's award-winning *At War's End* and Michael Doyle and Nicholas Sambanis's *Making War and Building Peace*), as well as gold-standard reports on conflict from the World Bank and the Carnegie Commission on Preventing Deadly Conflict, tell us that 90 percent of today's war deaths are civilian while just 10 percent are military -- the reverse of a century ago and "a grim indicator of the transformation of armed conflict" in the late 20th century, as political scientist Kalevi Holsti put it. Grim indeed -- but, fortunately, untrue. The myth originates with the 1994 U.N. Human Development Report, which misread work that Swedish researcher Christer Ahlström had done in 1991 and accidentally conflated war fatalities in the early 20th century with the much larger number of dead, wounded, and displaced people in the late 20th century. **A more careful analysis done in 1989 by peace researcher William Eckhardt shows that the ratio of military to civilian war deaths remains about 50-50, as it has for centuries** (though it varies considerably from one war to the next). **If you are unlucky enough to be a civilian in a war zone, of course, these statistics are little comfort. But on a worldwide scale, we are making progress in helping civilians afflicted by war.**

War deaths are decreasing

Goldstein, 9/10- '11 (Joshua- professor emeritus of international relations at American University, "Think Again: War", Foreign Affairs, ME)
Recent technological changes are making war less brutal, not more so. **Armed drones now attack targets that in the past would have required an invasion with thousands of heavily armed troops, displacing huge numbers of civilians and destroying valuable property along the way. And improvements in battlefield medicine have made combat less lethal** for participants. In the U.S. Army, the chances of dying from a combat injury fell from 30 percent in World War II to 10 percent in Iraq and Afghanistan -- though this also means the United States is now seeing a higher proportion of injured veterans who need continuing support and care.

! Turns Human Rights

Terrorism turns civil liberties and human rights

Gorman 6 (Lindsey Gorman; “The Terrorist Threat: Its Impact on American Civil Liberties and Democracy”; Atlantic International Studies Organization; Volume 3, Spring 2006; <http://atlismta.org/online-journals/0607-journal-development-challenges/the-terrorist-threat/>)

Within the international system, terrorist attacks threaten the security of their target states. Terrorism can be defined “as the threat or use of violence to spread fear to lead to political change.”^[1] However, state responses to terrorist threats differ according to its political system. For authoritarian regimes, the responses are virtually limitless. Appropriate responses become inherently more complex for a liberal democracy that guarantees its citizens a certain level of civil and human rights. **In fact, the strategy used by terrorists “is to force the liberal government to reveal its true, authoritarian nature...through restrictions on civil liberties as would be imposed in a crisis or state of siege.”**^[2] A paradox ensues, in which a state can clamp down on civil liberties and human rights in order to defeat and capture terrorists, ending the democratic regime. Alternatively, states that do not react in this manner ensure civil liberties are protected but leave their citizens vulnerable to security threats.^[3] As Michael Ignatieff points out, “A terrorist emergency is precisely a case where allowing individual liberty – to plan, to plot, to evade detection—may threaten a vital majority interest that is national security.”^[4] This is the “catch-22” of the liberal democratic state response to terrorism.

! Turns Tech Leadership

Terrorism guts tech leadership and competitiveness

Koh 7 (Winston T.H., Professor of Economics and Associate Dean – Singapore Management University, “Terrorism and its Impact on Economic Growth and Technological Innovation”, *Technological Forecasting and Social Change*, 74(2), February, ScienceDirect)

3. Terrorism's impact on R&D and innovation

How will the war against global terrorism affect the trajectory of R&D and the pace of innovation? In the past, wartime tends to stimulate innovation of all kinds. **Military conflict engenders innovation**, and is changed by it [16]. During World War II, technologies that were developed include the radar, jet engines, radio electronics and nuclear power. As a result, World War II turned out to be a different war compared with World War I; airpower, which played a minor role in World War I, played a decisive role in winning World War II for the Allies. Spurred by the current war on terrorism, innovations in intelligence gathering and decision support, sensors, monitoring are generating greater interest. Since the 9-11 attacks, there is an increase in demand for inspection technologies to screen individuals, packages, vehicles, and containers for weapons, explosives, chemical agents, and nuclear materials. There is also demand for advanced bomb resistant waste receptacles to increase public safety as well as a variety of fully confined containment containers for safely storing, transporting, or detonating detected contraband. 3.1. New technologies in the war on terrorism Clearly, the development of the homeland security industry going forward will be shaped by the changing attitudes and perception of people towards the threat of terrorism. In the United Kingdom, a pilot scheme was announced in 2004 to launch 10,000 identity cards on a volunteer basis, incorporating biometric features. In Singapore, all passports would eventually incorporate biometric features. By scanning personal characteristics such as fingerprints and iris features onto a computer chip that can only be read by a high-tech reader, these biometric passports make it difficult to forge documents to enter a country illegally. Many countries are also spending on technology to link the land, sea and air checkpoints electronically, thereby tightening the first-line defense against the entry of terrorist elements into their homeland. Looking into the future, new technologies that allow us to generate forward-looking intelligence would be critical in the war against terrorism. The greatest value of intelligence is to anticipate terrorist actions and to translate that information into an effective response. Improvements in technology will provide us with improved computer-based data fusion capabilities, modeling and simulation to better understand possible scenarios and responses. Advanced language translation software will be developed to better track terrorist communication as a source of intelligence. Besides intelligence, detection is another area which would spur innovations in the fight against terrorism. The future of sensors lies in biomimetics—biological and chemical sensors. For instance, technologies that are being developed include those that mimic the sniffing capabilities of a dog or the heat-seeking abilities of a viper to detect concealed bombs or weapons. In addition, technologies that allow for more accurate and timely detection of viral and bacterial pathogens will drive advancements in sensors—with the ultimate goal of combining chemical and biological threat detection into a suite of sensors. Sensors of the future will be deployed by highly mobile, reliable and affordable robotics. 3.2. Competition for R&D talents and resources Between the end of World War II and the current war on terrorism, the principal focus of technological innovation was the commercial markets. For instance, in the late 1960s, computer technology was being applied to offices as well as the manufacturing shopfloor. In the 1970s, the market for handheld calculators, electronic watches and clocks was driving development in the semiconductor technology. By the 1990s, it was the Internet, the cell phone, the DVD player, the PDA, and the personal computer and other commercial and consumer items that governed developments. Besides military usage, global positioning satellite systems were sold to consumers for hunting expeditions or for mapping or keeping track of the fleet of trucks for shipping and courier companies. **While the war on terrorism may spur innovation**, as was the case during the Second World War, **there could be an opposite effect**. There are concerns that **the war on terrorism may draw talented engineers and scientists to work on terrorism-related initiatives, and draw a high proportion of the research talent away from the industrial sector to work on** what are essentially **non-economic projects**. It was suggested that **the huge scientific effort** in the 1960s **to put a man on the moon during the Cold War** of the 1960s **was one of the contributing causes to the decline in US competitiveness in the 1970s and 1980s**, relative to Japan and other European countries. Moreover, when the Cold War was in full bloom, advanced fighter planes, better radar systems, smarter tanks and artillery were all in development in addition to the race to space. The United States was beaten in launching first orbiting satellite, but they were not going to lose the race to the moon. Some commentators have argued that **the civilian spin offs** of the space exploration **were** in fact **quite modest**, and in any event **vastly less than** those that **would have been generated if the people involved had been working in private industry**. Except for products aimed at the consumer electronics market—principally television—virtually all new products were produced with the military and aerospace industry customer in mind. Moreover, performing standards were set to meet the demanding requirements of these military and aerospace customers. It is feared that the current war on terrorism may result in similar effects on the United States global economy. **Even if there is no crowding out effect on private sector R&D, several effects on the rate and scope of technological innovation can be discerned as attention has focused on the fight against terrorism**. Firstly, the development of some types of technologies will be stimulated, or greatly speeded up as resources are invested [17]. As we discussed earlier in this section, the obvious examples are those related to surveillance, satellite imaging, security recognition systems, interception of radio and telephone signals, disaster recovery, etc. However, there is some concern although there is some commercialization potential in the technologies that are being developed in the wake of the 9-11 attacks, the spin off effect into the civilian economy may turn out to be not as much. There will be some civilian uses for these technologies (better security systems in large office buildings, and improved satellite imaging for oil exploration, for example) but much of the new technology will be highly specialized, and in any event may be kept secret to avoid tipping off potential adversaries. 3.3. Government funding of venture capital Another interesting effect of the war on terrorism is that governments are working more closely with venture capitalists since the late 1990s. A good example of such collaboration was the establishment by the CIA of In-Q-Tel in 1999 [18]. This small US\$30 million fund operates in the Silicon Valley to co-invest with other venture partners in technologies (particularly information technologies) that have potential application to governmental projects, particularly in the area of intelligence. The fund will not be an exclusive founder of a startup but will seek to make the companies in which it is invested aware of markets for their products and technology that are parallel to their commercial applications. In other countries, such as Singapore, government recognizes the need to develop new technologies systems that respond to terrorist threats and is taking the lead to set up venture capital funding for technologies have applications to the war on terrorism. Many countries have set up similar government-funded venture funds that offer early-stage venture capital funding and introductions to capabilities that will serve to address terrorist activities. 4. The future What does the future hold? **Attacks on an even broader scale than the 9-11 attacks may occur**. For instance, the risk of **a nuclear device** bearing explosive force of 20 000 tons of TNT denoting over Manhattan is real. Such a device

would destroy everything within three square miles (see Stern [19]). The whole Wall Street and financial district would be destroyed and hundreds of thousands of lives would be lost. It would leave most of the metropolitan area uninhabitable for years, and would reduce the country's production potential substantially, with the brunt borne by the financial industry, which represents the bulk of New York City's economy. Wall Street would be closed for a long period of time and the recovery of financial transactions would depend on the availability of back-up facilities and data duplication. There would be severe disruption to the transportation system, including the port and airports. It is not only New York that faces such as threat. Other financial centers such as London, Tokyo, and Singapore are potential targets as well. Another possible scenario is that terrorists could attempt to explode a nuclear device or release contagious viruses in a populous metropolitan area [19]. In fact, within weeks of the 9-11 attacks, lethal anthrax spores were found to have contaminated mail in the United States. There are also concerns that terrorists could use the SARS virus, avian flu virus, and even the eradicated smallpox virus for future biological terrorist acts. In light of these potential future scenarios, technology will play a far greater role in preventing future terrorist acts. On balance, the development of a number of technologies relating to surveillance and related areas will be speeded up. However, as we noted in the paper, there is also the risk that the diversion of resources to develop anti-terror technologies may slow down innovation in society as a whole, by drawing talented people from more economically productive areas, by crowding out investment dollars, and by creating a climate of intolerance that will impede innovation. That, in turn, may well play a role in reducing economic growth in the long term.

! Turns Economy

Nuke Terror Would Kill Hundreds of Thousands, Collapse the Global Economy, Cause Poverty, and Intensify Conflicts in the Developing World

Kenneth C. **Brill** is a former U.S. ambassador to the I.A.E.A. **AND** Kenneth N.

Luongo is president of the Partnership for Global Security. 3/17 **2012** Both are members of the Fissile Material Working Group, a nonpartisan nongovernmental organization NYTimes.com Nuclear Terrorism: A Clear Danger, ME

A terrorist nuclear explosion could kill hundreds of thousands, create billions of dollars in damages and undermine the global economy. Former Secretary General Kofi Annan of the United Nations said that an act of nuclear terrorism “would thrust tens of millions of people into dire poverty” and create “a second death toll throughout the developing world.” Surely after such an event, global leaders would produce a strong global system to ensure nuclear security. There is no reason to wait for a catastrophe to build such a system.

Large-scale terror attack collapses the U.S. and global economies

Rogoff 4 (Kenneth, Professor of Economics and Public Policy – Harvard University, “The Cost of Living Dangerously: Can the Global Economy Absorb the Expenses of Fighting Terrorism?; Argument”, Foreign Policy, 11-1, Lexis)

As this article is being written, the threat of a horrific prelection terrorist assault against the United States has yet to materialize. Unfortunately, the news this summer that al Qaeda operatives have painstakingly targeted major U.S. and international financial institutions only underscores the likelihood of more attacks.

Politicians, economists, and ordinary citizens rightfully worry that terrorism--beyond the tragic human costs--could derail economic growth in the United States and around the

world. What also worries me, however, is the potential economic impact of antiterrorism efforts. Forget the long lines at airports. The global economy has become so dependent on the free flow of goods and people across borders that even a little additional security can have a greater impact than most might think. Consider, for example, the likely consequence of enhanced security at shipping ports worldwide to monitor for biological or nuclear weapons material, a precaution many experts consider inevitable. Currently, only about 2 percent of all cargo reaching U.S. shores is subject to inspection. The July 2004 report of the U.S. 9/11 Commission noted that, until better technologies become available, authorities should improve methods of “identifying and tracking the high-risk containers, operators, and facilities that require added scrutiny.” But what if such added scrutiny means that the level of cargo inspected jumps to, say, 50 percent? Today’s slowest customs lines--in countries such as Japan that already use port delays as veiled forms of trade protectionism--would start to seem like express lanes, and the costs of many consumer goods would skyrocket. Worse yet, as trade in goods and the flow of people slows, so too will the breathless pace of product innovation that many individuals now take for granted. Any abatement of the competitive pressures of globalization or any reduction in the free movement of people and ideas would surely undercut growth--not to mention raise prices sharply at your local Wal-Mart. Think about what is happening already. Despite introducing relatively limited antiterrorist restrictions thus far, the United States will likely register slower economic growth in a few years due to post-9/11 visa restrictions alone. Few Americans appreciate the extent to which scientists, engineers, and businesspeople from other countries contribute to U.S. economic growth. Historically, the United States has attracted legions of enterprising foreign-born workers; today about 2.5 million foreigners with advanced degrees work in the United States, and many hold leading positions in science and industry and serve as key transnational links for the increasingly globalized U.S. economy. More than 30 percent of all Ph.D. recipients in U.S. science and mathematics programs are foreigners on student visas. In engineering, almost half of all graduates have come to the United States on foreign visas; many of them stay in the country upon completing their degrees. The U.S. economy grows in no small part by skimming the cream off the rest of the world’s workforce.

Unfortunately, U.S. companies today often shy away from hiring U.S.-educated foreigners. The price tag on the visa application process has soared, and companies never know if and when work permits will be approved or precisely when a new foreign employee can come on board. And yes, workers from Muslim countries are particularly hard hit, but the difficulties have worsened for everyone. Even obtaining visas to attend academic or policy conferences in the United States is now an ordeal. Little surprise that international applications to U.S. graduate programs have declined by roughly a third in the last year. Added security won’t come cheap, either, and raising the necessary taxes will prove painful, especially with the United States and Europe facing the costs of aging populations and shrinking workforces. The United States estimates its 2005 homeland security budget at about \$40 billion, a sum that could easily double in a few years. But these direct costs of increased security reveal only a limited picture. Perhaps the greatest danger is that increased security will distort and accentuate government taxation and regulation. Orwellian 1984 scenarios aside, suppose governments were able to keep much closer tabs on citizens? Just like individuals, economies need a bit of privacy to function efficiently. Idiotic government rules and regulations abound, and citizens must have ways to evade the worse of them. The reason why roughly one fifth of Italy’s economy is “underground” is not just high tax rates or the Sicilian Mafia. The real explanation is more prosaic: Ordinary people need to hire painters, plumbers, and carpenters

to fix their houses, or nannies to care for their children, without wasting endless hours tangled in red tape. Germany--hardly famous for its mafia--has an underground economy approaching one sixth of its national income. More severe security measures are probably necessary and inevitable, even from a narrow economic perspective. Another atrocity on the scale of September 11 would wreak havoc on energy prices, stock markets, and consumer confidence, slamming the brakes on today's global economic recovery. But just like other desirable government initiatives (such as environmental regulations or workplace safety laws), antiterrorism measures can work at far less cost when they are flexible and market-friendly. For example, just as some countries provide fast-track airport security lines to high-paying business travelers, shippers should be able to pay higher fees to move more quickly to the head of the customs queue. Similarly, higher fees should help accelerate visa applications. No doubt, such measures may offend some people's sense of egalitarianism, but these policies and others like them are essential. The benefits of today's interconnected market economies won't survive under a vast and inflexible command-and-control security arrangement.

! Turns Warming

Cross-apply Ayson—nuclear and cyber terror are both internal links to miscalc with Russia—that triggers warming way faster

Robock '10 (Oman, “Nuclear Winter Revisited with a Modern Climate Model and Current Nuclear Arsenals: Still Catastrophic Consequences,” Journal of Geophysical Research, Vol. 112, no. D13107, available online at <http://www.nucleardarkness.org/warconsequences/globalwarmingversuscoolingfromnuclearwar/>, ME)

Climatic changes resulting from nuclear conflict would occur many thousands of times faster – and thus would likely be far more catastrophic – than the climatic changes predicted as a result of global warming.¹ **The rapidity of the war-induced changes, appearing in a matter of days and weeks, would allow human populations and the whole plant and animal kingdoms no time to adapt.** It is worth noting that **the same methods and climate models used to predict global warming were used in these studies to predict global cooling resulting from nuclear war. These climate models have proved highly successful in describing the cooling effects of volcanic clouds during extensive U.S. evaluations and in international intercomparisons** performed as part of the Fourth Assessment of the Intergovernmental Panel on Climate Change.² Predicted drops in average surface temperatures in the Northern Hemisphere caused by small, moderate and large nuclear conflicts are contrasted with the effects of global warming during the last century in Figure 1 and with average surface air temperatures during the last 1000 years in Figure 2. Observed Global Warming during the period 1880 through 2006 contrasted with predicted temperature drops from a range of nuclear wars. **The India-Pakistan war detonated only one half of 1% of the explosive power of the currently deployed and operational U.S. and Russian nuclear arsenals.**³ Northern Hemisphere average surface air temperatures during the last 1000 years contrasted with forecast temperature drops from a range of nuclear conflicts.⁴ **There are, of course, other important considerations which must be made when estimating the overall environmental and ecological impacts of nuclear war. These must include the release of enormous amounts of radioactive fallout, pyrotoxins (poisonous gases produced in large fires) and toxic industrial chemicals into the ecosystems. There will also be massive increases in the amount of deadly ultraviolet light which will reach the surface of the Earth as a result of ozone depletion** (no calculations on ozone depletion from a large nuclear war have been done using modern climate models, but **recent calculations predict massive depletion from nuclear conflict using only a tiny fraction of the current global nuclear arsenal**). All **these by-products of nuclear war must be taken into account when comparing the danger of nuclear conflict to other potential dangers now confronting humanity and life on Earth.**

! Turns Court Advantages

Terror turns the Court advantage – causes judicial conservatism and deference to political branches

Epstein 5 (Lee **Epstein** et. al., law at Washington University, April **2005** (80 N.Y.U.L. Rev. 1, lexis))

In addition, because concerns over institutional legitimacy are constant, the Court must follow precedent established during wartime even after the crisis dissipates. If it does not, it once again may risk undermining its fundamental efficacy. That is so for several reasons, not the least of which is that members of legal and political communities base their future expectations on the belief that others will follow existing rules. Should the Court make a radical change in those rules, the communities may be unable to adapt, resulting in a decision that does not produce a (new) efficacious rule. If a sufficient number of such decisions accumulate over time, the Court will undermine its legitimacy. Hence, the norm of stare decisis can constrain the decisions of all justices, even those who do not believe they should be constrained by past decisions or who dislike extant legal principles.¹³³ From this logic, advocates of the crisis thesis assert that one of two possibilities relating to precedent established during wartime results: (a) “statist ratchets,” sometimes termed “lingering effects,”¹³⁴ or (b) “dosages.”¹³⁵ The first seems to follow from Justice Jackson’s dissent in *Korematsu*, which warns that: [O]nce a judicial opinion rationalizes [a government] order to show that it conforms to the Constitution, or rather rationalizes the Constitution to show that the Constitution sanctions such an order, **the Court for all time has validated [a] principle** . . . [that] then lies about like a loaded weapon ready for the hand of any authority that can bring forward a plausible claim of an urgent need. Every repetition imbeds that principle more deeply in our law and thinking and expands it to new purposes.¹³⁶ In other words, **once justices articulate doctrine “accommodating” the crisis, that doctrine “become[s] entrenched over time and thus normalized and made routine.”**¹³⁷ Future justices will stick to it, regardless of whether a war is ongoing and regardless of whether they agree with it. This follows from the norm of stare decisis and its role in helping the Court to establish and maintain its legitimacy. Dosages too flow from the norm but take a slightly different form. The idea here—in direct contradistinction to “libertarian ratchets”—is that with every passing war or other international crisis, the government responds with ever-increasing “dosages” necessary to fend off the threat. Or, as Gross puts it: What might have been seen as sufficient ‘emergency’ measures in the past (judged against the ordinary situation) may not be deemed enough for further crises as they arise. Much like the need to gradually increase the dosage of a heavily used medication in order to experience the same level of relief, so too with respect to emergency powers . . .¹³⁸ **Given the extreme deference the Court must show to the government to retain its legitimacy, it will approve of its ever-extreme measures** and thereby generate even more extreme doctrine that future Courts must follow.

! Turns Internet

Large scale terror causes sealed borders and hyper-nationalization – turns their Internet advantage

Ignatieff 4 (Michael, Professor of Human Rights – Harvard University, *The Lesser Evil: Political Ethics in an Age of Terror*, p. 153-154)

It is a commonplace of presidential and prime ministerial rhetoric to insist that their democracies cannot lose in a war on terror. My own analysis thus far has confirmed that no democracy has ever been toppled by a terrorist campaign, unless other factors, like economic collapse or military defeat, were present too. But faced with terrorism that deploys weapons of mass destruction, we cannot be as certain that the historical pattern, argued for in this book, would prevail in the future. In other words, we could lose. What would defeat look like? It would not be like invasion, conquest, or occupation, of course, but rather would entail the disintegration of our institutions and way of life. **A succession of mass casualty attacks, using weapons of mass destruction, would leave** behind zones of devastation sealed off for years and **a pall of mourning, anger, and fear hanging over** our public and private lives. Such attacks would destroy the existential security on which democracy depends. Recurrent attacks with weapons of mass destruction might not just kill hundreds of thousands of people. **We might find ourselves living with a national security state on permanent alert, with sealed borders, constant identity checks, and permanent detention camps for suspicious aliens** and recalcitrant citizens. **A successful attack would poison the wellsprings of trust among strangers that make the relative liberty of liberal democracy possible.** Our police forces might descend to torturing suspects in order to prevent future attacks, and our secret security forces might engage in direct assassination of perpetrators or mere suspects as well. Our military might itself use weapons of mass destruction against terrorist enemies. If our institutions were unable to stop the attacks, the state's monopoly of force might even break down, as citizens took the law into their own hands seeking to defend themselves against would-be perpetrators. Vigilantes would patrol blighted and deserted streets. This is what the face of defeat might look like. We would survive, but we would no longer recognize ourselves or our institutions. We would exist but lose our identity as free people.

Terrorism –MSDI

1NC

The Syrian Civil War has Dramatically Increased The Risk of Terror Attacks Of all kinds in the U.S.

David Francis, February 25, 2015, Foreign Policy, Islamic State Threat Comes to American Shores, <http://foreignpolicy.com/2015/02/25/islamic-state-threat-comes-to-american-shores/>
DOA: 3-1-15

US. law enforcement authorities nabbed three terrorism suspects Wednesday for conspiring to travel to Syria to fight for the Islamic State and conduct attacks here at home, including a potential attempt on President Barack Obama's life and a hoped-for bomb attack at New York's Coney Island. The arrests are likely to raise concerns about the Islamic State's presence on American shores. No one claiming allegiance to the group has yet to strike in the United States but the militants running a self-proclaimed caliphate in parts of Syria and Iraq have inspired attacks in Canada, Denmark, France, and Australia. In the last year, U.S. law enforcement personnel have arrested more than 20 people for trying to travel to the Middle East to fight for the Islamic State or other terrorist groups. One suspect, Akhror Saidakhmetov, was arrested at New York's Kennedy Airport while trying to board a plane to Istanbul. A second suspect, Abdurasul Hasanovich Juraboev, traveled to Turkey last month and was picked up in Brooklyn. Abror Habibov was arrested up in Florida and stands accused of funding Saidakhmetov's attempts to travel to the Middle East. Each faces a maximum sentence of 15 years in federal prison. "The flow of foreign fighters to Syria represents an evolving threat to our country and to our allies," United States Attorney Loretta Lynch, who is also Obama's nominee as attorney general, said in a statement announcing the arrests. "As alleged in the complaint, two of the defendants in this case sought to travel to Syria to join [the Islamic State] but were also prepared to wage violent jihad here in the United States." Their arrests serve as a reminder of the international reach of the group. Saidakhmetov lives in Brooklyn but is a citizen of Kazakhstan. Juraboev and Habibov are from Uzbekistan.

Intensive Domestic Surveillance is Empirically Key to Prevent Nuclear, Chemical and Bio Terror Attacks

Yohn **Yoo**, Summer 2014, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS, <http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 929-30

The real problem with FISA, and even the Patriot Act, as they existed before the 2008 Amendments, is that they remained rooted in a law enforcement approach to electronic surveillance. They tied the government's counterterrorism efforts to individualized suspicion. Searches and wiretaps had to target a specific individual already believed to be involved in harmful activity. But detecting al Qaeda members who have no previous criminal record in the United States, and who are undeterred by the possibility of criminal sanctions, requires the use of more sweeping methods. To prevent attacks successfully, the government

has to devote surveillance resources where there is a reasonable chance that terrorists will appear or communicate, even if their specific identities remain unknown. What if the government knew that there was a fifty percent chance that terrorists would use a certain communications pipeline, such as e-mail provided by a popular Pakistani ISP, but that most of the communications on that channel would not be linked to terrorism? An approach based on individualized suspicion would prevent computers from searching through that channel for the keywords or names that might suggest terrorist communications because there are no specific al Qaeda suspects and thus no probable cause. Searching for terrorists depends on playing the probabilities rather than individualized suspicion, just as roadblocks or airport screenings do. The private owner of any website has detailed access to information about the individuals who visit the site that he can exploit for his own commercial purposes, such as selling lists of names to spammers or gathering market data on individuals or groups. Is the government's effort to find violent terrorists a less legitimate use of such data? Individualized suspicion dictates the focus of law enforcement, but war demands that our armed forces defend the country with a broader perspective. Armies do not meet a "probable cause" requirement when they attack a position, fire on enemy troops, or intercept enemy communications. The purpose of the criminal justice system is to hold a specific person responsible for a discrete crime that has already happened. But focusing on individualized suspicion does not make sense when the purpose of intelligence is to take action, such as killing or capturing members of an enemy group, to prevent future harm to the nation from a foreign threat. FISA should be regarded as a safe harbor that allows the fruits of an authorized search to be used for prosecution. Using FISA sacrifices speed and breadth of information in favor of individualized suspicion, but it provides a path for using evidence in a civilian criminal prosecution. If the President chooses to rely on his constitutional authority alone to conduct warrantless searches, then he should generally use the information only for military purposes. The primary objective of the NSA program is to "detect and prevent" possible al Qaeda attacks on the United States, whether another attack like September 11; a bomb in apartment buildings, bridges, or transportation hubs such as airports; or a nuclear, biological, or chemical attack. These are not hypotheticals; they are all al Qaeda plots, some of which U.S. intelligence and law enforcement agencies have already stopped. A President will want to use information gathered by the NSA to deploy military, intelligence, and law enforcement personnel to stop the next attack. The price to pay for speed, however, is foregoing any future criminal prosecution. If the President wants to use the NSA to engage in warrantless searches, he cannot use its fruits in an ordinary criminal prosecution. Al Qaeda has launched a variety of efforts to attack the United States, and it intends to continue them. The primary way to stop those attacks is to find and stop al Qaeda operatives, and the best way to find them is to intercept their electronic communications. Properly understood, the Constitution does not subject the government to unreasonable burdens in carrying out its highest duty of protecting the nation from attack.

The First impact is a global nuclear exchange

Robert **Ayson 10** Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand @ The Victoria University of Wellington, July 2010, "After a Terrorist

Nuclear Attack: Envisaging Catalytic Effects," Studies in Conflict and Terrorism, Vol. 33 Issue 7)

But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be "spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important . . . some indication of where the nuclear material came from."⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear

aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the "Chechen insurgents' . . . long-standing interest in all things nuclear."⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide.

Additionally, Bioterror Leads to Extinction

Nathan **Mhyrvold** 2013 "Strategic Terrorism: A Call to Action"

http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2290382 Lawfare Research Paper No. 2-2013 He attended Mirman School and began college at age 14. He studied mathematics, geophysics, and space physics at UCLA. He was awarded a Hertz Foundation Fellowship for graduate study and studied at Princeton University, where he earned a master's degree in mathematical economics and completed a PhD in theoretical and mathematical physics. He also attended Santa Monica College. For one year, he held a postdoctoral fellowship at the University of Cambridge working under Stephen Hawking.

As horrible as this would be, such a pandemic is by no means the worst attack one can imagine, for several reasons. First, most of the classic bioweapons are based on 1960s and 1970s technology because the 1972 treaty halted bioweapons development efforts in the United States and most other Western countries. Second, the Russians, although solidly committed to biological weapons long after the treaty deadline, were never on the cutting edge of biological research. Third and most important, the science and technology of molecular biology have made enormous advances, utterly transforming the field in the last few decades. High school biology students routinely perform molecular-biology manipulations that would have been impossible even for the best superpower-funded program back in the heyday of biological-weapons research. The biowarfare methods of the 1960s and 1970s are now as antiquated as the lumbering mainframe computers of that era. Tomorrow's terrorists will have vastly more deadly bugs to choose from. Consider this sobering development: in 2001, Australian researchers working on mousepox, a nonlethal virus that infects mice (as chickenpox does in humans), accidentally discovered that a simple genetic modification transformed the virus.^{10, 11} Instead of producing mild symptoms, the new virus killed 60% of even those mice already immune to

the naturally occurring strains of mousepox. The new virus, moreover, was unaffected by any existing vaccine or antiviral drug. A team of researchers at Saint Louis University led by Mark Buller picked up on that work and, by late 2003, found a way to improve on it: Buller's variation on mousepox was 100% lethal, although his team of investigators also devised combination vaccine and antiviral therapies that were partially effective in protecting animals from the engineered strain.^{12, 13} Another saving grace is that the genetically altered virus is no longer contagious. Of course, it is quite possible that future tinkering with the virus will change that property, too. Strong reasons exist to believe that the genetic modifications Buller made to mousepox would work for other poxviruses and possibly for other classes of viruses as well. Might the same techniques allow chickenpox or another poxvirus that infects humans to be turned into a 100% lethal bioweapon, perhaps one that is resistant to any known antiviral therapy? I've asked this question of experts many times, and no one has yet replied that such a manipulation couldn't be done. This case is just one example. Many more are pouring out of scientific journals and conferences every year. Just last year, the journal Nature published a controversial study done at the University of Wisconsin–Madison in which virologists enumerated the changes one would need to make to a highly lethal strain of bird flu to make it easily transmitted from one mammal to another.¹⁴ Biotechnology is advancing so rapidly that it is hard to keep track of all the new potential threats. Nor is it clear that anyone is even trying. In addition to lethality and drug resistance, many other parameters can be played with, given that the infectious power of an epidemic depends on many properties, including the length of the latency period during which a person is contagious but asymptomatic. Delaying the onset of serious symptoms allows each new case to spread to more people and thus makes the virus harder to stop. This dynamic is perhaps best illustrated by HIV, which is very difficult to transmit compared with smallpox and many other viruses. Intimate contact is needed, and even then, the infection rate is low. The balancing factor is that HIV can take years to progress to AIDS, which can then take many more years to kill the victim. What makes HIV so dangerous is that infected people have lots of opportunities to infect others. This property has allowed HIV to claim more than 30 million lives so far, and *approximately 34 million people are now living with this virus and facing a highly uncertain future.¹⁵ A virus genetically engineered to infect its host quickly, to generate symptoms slowly—say, only after weeks or months—and to spread easily through the air or by casual contact would be vastly more devastating than HIV. It could silently penetrate the population to unleash its deadly effects suddenly. This type of epidemic would be almost impossible to combat because most of the infections would occur before the epidemic became obvious. A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, terrorists may not have to develop it themselves: some scientist may do so first and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, at some point in the near future, someone may create artificial pathogens that could drive the human race to extinction. Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but similar techniques could be directed toward humans.¹⁶ When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. Modern

biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more. That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate Homo sapiens—will be available to anybody with a solid background in biology, terrorists included.

General Domestic Surveillance

Surveillance is a critical tool needed to defeat terrorism

Alan **Dershowitz**, Harvard Law School, May 5, 2014, The Atlantic, "No one opposes all surveillance; false equivalence on the NSA," <http://www.theatlantic.com/politics/archive/2014/05/false-equivalence-on-surveillance-from-alan-dershowitz/361694/> DOA: 2-22-15

Our enemies, especially those who target civilians, have one major advantage over us. They are not constrained by morality or legality. We have an advantage over them. In addition to operating under the rule of law, we have developed through hard work and extensive research technological tools that allow us to monitor and prevent their unlawful and lethal actions. Such technological tools helped us break the German and the Japanese code during the Second World War. They helped us defeat fascism. They helped us in the Cold War. And they are helping us now in the hot war against terrorists who would bomb this theater if they had the capacity to do so. You're going to hear again that there are only excuses that are being offered, that terrorism is really not a serious problem, or that American policy is as terroristic as the policy of al-Qaeda. I don't think you're going to accept that argument. We must not surrender our technological advantage.

Surveillance critical to the war on terror

Jessica **Zuckerman et al**, 2013, 60 Terrorist Plots Since 9-11: Continued Lessons in Domestic Counterterrorism, <http://www.heritage.org/research/reports/2013/07/60-terrorist-plots-since-911-continued-lessons-in-domestic-counterterrorism> DOA: 5-24-15
Zuckerman is a Policy Analyst @ Heritage, Steven Bucci Phd, Director, Douglas and Sarah Allison Center for Foreign and National Security Policy, James Carafano, Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow

Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains. Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should: Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in

danger. Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sun setting provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping "lone wolf" actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.

Surveillance needed to defeat terrorism

Glenn **Sulmassy**, 2013, CNN, "Feds start building case against NSA leaker,"
<http://www.cnn.com/2013/06/10/opinion/sulmasy-nsa-snowden/> DOA: 4-1-15

The current threat by al Qaeda and jihadists is one that requires aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways. This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence. However, the move toward "home-grown" terror will necessarily require, by accident or purposefully, collections of U.S. citizens' conversations with potential overseas persons of interest. An open society, such as the United States, ironically needs to use this technology to protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting "unreasonable searches and seizures." American historical resistance towards such activities is a bedrock of our laws, policies and police procedures. But what might have been reasonable 10 years ago is not the same any longer. The constant armed struggle against the

jihadists has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens. However, when we hear of programs such PRISM, or the Department of Justice getting phone records of scores of citizens without any signs of suspicious activities nor indications of probable cause that they might be involved in terrorist related activities, the American demand for privacy naturally emerges to challenge such "trolling" measures or data-mining. The executive branch, although particularly powerful in this arena, must ensure the Congress is kept abreast of activities such as these surveillance programs. The need for enhanced intelligence activities is a necessary part of the war on al Qaeda, but abuse can occur without ensuring the legislative branch has awareness of aggressive tactics such as these. Our Founding Fathers, aware of the need to have an energetic, vibrant executive branch in foreign affairs, still anticipated checks upon the presidency by the legislature. Working together, the two branches can ensure that both legally, and by policy, this is what the citizens desire of their government -- and that leaks such as Snowden's won't have the impact and damage that his leaks are likely to cause.

Surveillance Key

Britain **Eakin**, June 19, 20**13**, Al Arabia, "NSA: Secret Surveillance Helped Prevent 50-plus terror attacks," <http://english.alarabiya.net/en/News/world/2013/06/19/NSA-Secret-U-S-surveillance-helped-prevent-50-plus-terror-attacks.html> DOA: 4-25-15

Secret surveillance programs helped prevent more than 50 potential terror attacks worldwide, including plots to target the New York Stock Exchange and the city's subway, the director of the National Security Agency testified on Tuesday. Ten of the 50 potential threats were domestic, said Army General Keith B. Alexander. A hearing before the House Intelligence Committee sought to calm fears among the American public that the U.S. government spies on them unconstitutionally, and repeated assurances that none of the NSA surveillance programs can target U.S. citizens at home or abroad without a court order. "These programs are limited, focused and subject to rigorous oversight," Alexander said. Because of that, the civil liberties and privacy of Americans are not at stake, he added. However, Bruce Fein, a specialist in constitutional law, said the NSA surveillance programs are unconstitutional because there is no demonstration of individualized suspicion, as required by the Fourth Amendment. "The government has a burden to show some reasonable suspicion that someone being spied on is engaged in some wrongdoing before privacy can be invaded," said Fein. Nonetheless, the witnesses defended the NSA programs as legal and necessary because of the nature of the threat of terrorism. "If you're looking for a needle in a haystack, you have to get the haystack first," testified Deputy Attorney General James Cole. Alexander and other senior U.S. intelligence officials testified in response to details leaked by former NSA contractor Edward Snowden about how the agency gathers data. The hearing reviewed NSA surveillance programs 215 and 702. Testimony said program 215 gathers data in bulk from various providers, such as Verizon, but does not look at content or names, while program 702 applies only to foreign citizens. The leak has sparked a debate among the American public over what information the government should be able to collect to safeguard national security, and how it should be allowed to gather it. A recent Pew poll shows that a slight majority of Americans think the NSA surveillance programs are acceptable. Meanwhile, U.S. President Barack Obama's approval ratings have dropped over the past month. Alexander

linked the relative safety Americans have enjoyed since the 9/11 attacks directly to the NSA surveillance programs, but Fein said people's fears are being exploited. "Most people are risk-averse. They're easily frightened, and told they need to surrender their liberties in order to be safe, even if it's not true," Fein said. The government has not provided any evidence that these programs are effective, he added. "It's just their say-so." When questioned about whether the NSA surveillance programs previously collected any other information, Alexander said what they have and have not collected remains classified and cannot be discussed. However, some details about how the programs have stopped potential terror attacks would be presented as early as Wednesday to U.S. lawmakers, he said. The largely docile Congress expressed overall support for the NSA programs, with Rep. Michele Bachmann framing Snowden as a traitor. "It seems to me that the problem here is that of an individual who worked within the system, who broke laws and who chose to declassify highly sensitive classified information," Bachmann said. Alexander said they are investigating where security broke down, and how to provide better oversight for nearly 1,000 system administrators that can access classified information. The leaks were viewed across the board as a threat to national security. "These are egregious leaks... and now here we are talking about this in front of the world, so I think those leaks affect us," said Sean Joyce, deputy director of the FBI. Only one member of the House Committee, Rep. Jim Himes, said he was troubled by what he called the historically unprecedented revelations revealed in the leaks. "We know that when a capability exists, there's a potential for abuse... From time to time, it'll be abused."

Surveillance has prevented more than 50 terror plots

Kimberly Dozier, 6-18-2013, "NSA: 50 Terrorist Plots Were Foiled Thanks To Surveillance Program," Huffington Post, http://www.huffingtonpost.com/2013/06/18/nsa-surveillance_n_3460106.html

The director of the National SECURITY Agency insisted on Tuesday that the government's sweeping surveillance programs have foiled some 50 terrorist plots worldwide in a forceful defense echoed by the leaders of the House Intelligence Committee. Army Gen. Keith Alexander said the two recently disclosed PROGRAMS – one that gathers U.S. phone records and another that is designed to track the use of U.S.-based Internet servers by foreigners with possible links to terrorism – are critical in the terrorism fight. Intelligence officials have disclosed some details on two thwarted attacks, and Alexander promised additional information to the panel on thwarted attacks that the PROGRAMS helped stop. He provided few additional details. The PROGRAMS "assist the intelligence community to connect the dots," Alexander told the committee in a rare, open Capitol Hill hearing. Alexander got no disagreement from the leaders of the panel, who have been outspoken in backing the PROGRAMS since Edward Snowden, a 29-year-old former contractor with Booz Allen Hamilton, disclosed information to The Washington Post and the Guardian newspapers. Rep. Mike Rogers, R-Mich., chairman of the committee, and Rep. C.A. Dutch Ruppersberger of Maryland, the panel's top Democrat, said the programs were vital to the intelligence community and assailed Snowden's actions as criminal. "It is at times like these where our enemies within become almost as damaging as our enemies on the outside," Rogers said. Ruppersberger said the "brazen disclosures" put the United States and its allies at

risk. The general counsel for the intelligence community said the NSA cannot TARGET phone conversations between callers inside the U.S. – even if one of those callers was someone they were targeting for surveillance when outside the country. The director of national intelligence's legal chief, Robert S. Litt, said that if the NSA finds it has accidentally gathered a phone call by a target who had traveled into the U.S. without their knowledge, they have to "purge" that from their system. The same goes for an accidental collection of any conversation because of an ERROR. Litt said those incidents are then reported to the Foreign Intelligence Surveillance Court, which "pushes back" and asks how it happened, and what the NSA is doing to fix the problem so it doesn't happen again. Rogers previewed the latest public airing of the NSA controversy the morning after President Barack Obama, who is attending the G-8 summit in Ireland, vigorously defended the surveillance programs in a lengthy interview Monday, calling them transparent – even though they are authorized in secret. "It is transparent," Obama told PBS' Charlie Rose in an interview. "That's why we set up the FISA court," the president added, referring to the secret court set up by the Foreign Intelligence Surveillance Act that authorizes two recently disclosed programs: one that gathers U.S. phone records and another that is designed to track the use of U.S.-based Internet servers by foreigners with possible links to terrorism. Obama said he has named representatives to a privacy and civil liberties oversight board to help in the debate over just how far government data gathering should be allowed to go – a discussion that is complicated by the secrecy surrounding the FISA court, with hearings held at undisclosed locations and with only government lawyers present. The ORDERS that result are all highly classified. "We're going to have to find ways where the public has an assurance that there are checks and BALANCES in place ... that their phone calls aren't being listened into; their text messages aren't being monitored, their emails are not being read by some big brother somewhere," the president said. A senior administration official said Obama had asked Director of National Intelligence James Clapper to determine what more information about the two PROGRAMS could be made public, to help better explain them. The official spoke on condition of anonymity because the official was not authorized to speak publicly. Snowden accused members of Congress and administration officials Monday of exaggerating their claims about the success of the data gathering PROGRAMS, including pointing to the arrest of the would-be New York subway bomber, Najibullah Zazi, in 2009. In an online interview with The Guardian in which he posted answers to questions Monday, Snowden said that Zazi could have been caught with narrower, targeted surveillance PROGRAMS – a point Obama conceded in his interview without mentioning Snowden. "We might have caught him some other way," Obama said. "We might have disrupted it because a New York cop saw he was suspicious. Maybe he turned out to be incompetent and the bomb didn't go off. But, at the margins, we are increasing our chances of preventing a catastrophe like that through these PROGRAMS," he said. Obama repeated earlier assertions that the NSA programs were a legitimate counterterror tool and that they were completely noninvasive to people with no terror ties – something he hoped to discuss with the privacy and civil liberties board he'd formed. The senior administration official said the president would be meeting with the new privacy board in the coming days.

Video Surveillance

Video surveillance essential to defeat terrorism

St. Louis Dispatch, August 13, 2013, "The Role of Surveillance Cameras in the War on Terror," <http://www.gopusa.com/news/2013/04/22/the-role-of-surveillance-cameras-in-crime-or-terror/> DOA: 5-1-15

Mere hours after the public release of grainy surveillance camera images in the Boston Marathon bombings, law enforcement officials had pinpointed suspects in one of the nation's most horrific terrorist acts. It was a stunning and swift break in the case, one that illustrates the potency surveillance photos have for the public and police in solving crime. For Howard Richards, the images captured in Boston are validation of a three-year project in St. Louis to link 150 surveillance cameras into a single security system throughout the city's central corridor, from the riverfront to Forest Park. "Without those images, they would not have been able to solve this thing as quickly, there are no two ways about it," Richards said of the Boston case. "You can't overestimate the value of this technology." Richards is head of security at Harris-Stowe State University and chairs monthly meetings of the Central Corridor Security Group, formed about three years ago to address security issues. The group eventually brought on United for a Better St. Louis, a nonprofit organization formed in 2011 to enhance public safety efforts, to lead a fundraising campaign. The St. Louis project would form a common network out of cameras owned and operated by a host of entities, such as the city's port authority and street department, the Partnership for Downtown St. Louis, the Locust Business District and the Central West End. The security system, which organizers hope to have in place in about three months, would equip police with tablet computers and software allowing officers to look through any of the cameras on the network. With newer cameras, police would be able to zoom, pan and tilt to get a better view. "It's going to make us cutting-edge and on board with other big cities in the country," said Michael Gerdine, a chiropractor and chairman of United for a Better St. Louis. Cities such as Baltimore, Chicago, Atlanta and Dallas use the technology, and their systems have been reviewed for the St. Louis project. New York operates a "Ring of Steel" that trains an estimated 3,000 cameras in Lower Manhattan. Boston has a network of cameras throughout its city and transit system. London -- known for its ubiquitous security cameras -- has also seen how surveillance images can lead to a swift resolution to terrorism investigations. In 2005, terrorism suspects were quickly identified with such images. Weeks later, a failed group of bombers was also caught, thanks to the cameras. In Baltimore, the cameras have been a valuable tool in prosecuting crimes, and have been successful in reducing crime in trouble spots, said Baltimore police spokesman Anthony Guglielmi. "We love them. It's a really great system," Guglielmi said. Still, he said, "they are in no way designed to replace those on patrol." Research further backs up the value that surveillance cameras have in solving crime. In St. Louis, the project grew out of meetings between members of the Locust Business District and the Downtown Partnership over security concerns. Expanding and linking camera systems was proposed as a way to not only help solve crime, but prevent it. From those early discussions, the Central Corridor Security Group was formed. The group's board includes representatives of the Downtown Partnership, Grand Center Inc., St. Louis

University and Barnes-Jewish Hospital. Two St. Louis police captains are on the board. Representatives of Metro, Sigma-Aldrich and Wells Fargo also attend meetings. Maggie Campbell, president of the Partnership for Downtown St. Louis, said live monitoring of cameras has been happening downtown for about five years. "But if we can grow it and leverage it with our neighboring business districts, then we can make it work better for everyone," she said. "It's all about multiplying the eyes that are watching." No public funds are being sought in the startup of the program, and the cameras would be limited to public areas. "We all decided it would be a good idea to basically look out for each other," Richards said. But increasing cameras and the number of people allowed to monitor them concerns privacy advocates.

Surveillance cameras critical to defeat terrorism

Farhad **Manjo**, April 18, 2013, Slate, We Need More Cameras and We Need them Now," http://www.slate.com/articles/technology/technology/2013/04/boston_bomber_photos_the_marathon_bombing_shows_that_we_need_more_security.html DOA: 4-5-15

Though DesLauriers did not indicate the source of the images, the [Boston Globe](#) reported earlier that authorities were focusing on video "from surveillance cameras on the same side of Boylston Street as the explosions." If it turns out that the people in the FBI's photos are the guys who did it, they shouldn't be surprised that surveillance cameras turned out to be their undoing. Neither should you. We should see this potential break in the case as a sign of the virtues of video surveillance. More than that, we should think about how cameras could help prevent crimes, not just solve them once they've already happened. Cities under the threat of terrorist attack should install networks of cameras to monitor everything that happens at vulnerable urban installations. Yes, you don't like to be watched. Neither do I. But of all the measures we might consider to improve security in an age of terrorism, installing surveillance cameras everywhere may be the best choice. They're cheap, less intrusive than many physical security systems, and—as will hopefully be the case with the Boston bombing—they can be extremely effective at solving crimes. Surveillance cameras aren't just the bane of hardcore civil libertarians. The idea of submitting to constant monitoring feels wrong, nearly un-American, to most of us. Cameras in the sky are the ultimate manifestation of Big Brother—a way for the government to watch you all the time, everywhere. In addition to normalizing surveillance—turning every public place into a venue for criminal investigation—there's also the potential for abuse. Once a city is routinely surveilled, the government can turn every indiscretion into a criminal matter. You used to be able to speed down the street when you were in a hurry. Now, in many places around the world, a speed camera will record your behavior and send you a ticket in the mail. Combine cameras with facial-recognition technology and you've got a recipe for governmental intrusion. Did you just roll a joint or jaywalk or spray-paint a bus stop? Do you owe taxes or child support? Well, prepare to be investigated—if not hassled, fined, or arrested. These aren't trivial fears. The costs of ubiquitous surveillance are real. But these are not intractable problems. Such abuses and slippery-slope fears could be contained by regulations that circumscribe how the government can use footage obtained from security cameras. In general, we need to be thinking about ways to make cameras work for us, not reasons to abolish them. When you

weigh cameras against other security measures, they emerge as the least costly and most effective choice. In the aftermath of 9/11, we've turned most public spaces into fortresses—now, it's impossible for you to get into tall buildings, airports, many museums, concerts, and even public celebrations without being subjected to pat-downs and metal detectors. When combined with competent law enforcement, surveillance cameras are more effective, less intrusive, less psychologically draining, and much more pleasant than these alternatives. As several studies have found, a network of well-monitored cameras can help investigators solve crimes quickly, and there's even evidence that cameras can help deter and predict criminal acts, too.

Surveillance cameras necessary to counter terrorism

Charlie **Savage**, August 12, 2007, "US doles out millions for street cameras, local efforts raise privacy concerns," Boston Globe,
http://www.boston.com/news/nation/articles/2007/08/12/us_doles_out_millions_for_street_cameras/?page=full DOA: 5-1-15

The Department of Homeland Security is funneling millions of dollars to local governments nationwide for purchasing high-tech video camera networks, accelerating the rise of a "surveillance society" in which the sense of freedom that stems from being anonymous in public will be lost, privacy rights advocates warn. Since 2003, the department has handed out some \$23 billion in federal grants to local governments for equipment and training to help combat terrorism. Most of the money paid for emergency drills and upgrades to basic items, from radios to fences. But the department also has doled out millions on surveillance cameras, transforming city streets and parks into places under constant observation. The department will not say how much of its taxpayer-funded grants have gone to cameras. But a Globe search of local newspapers and congressional press releases shows that a large number of new surveillance systems, costing at least tens and probably hundreds of millions of dollars, are being simultaneously installed around the country as part of homeland security grants. In the last month, cities that have moved forward on plans for surveillance networks financed by the Homeland Security Department include St. Paul, which got a \$1.2 million grant for 60 cameras for downtown; Madison, Wis., which is buying a 32-camera network with a \$388,000 grant; and Pittsburgh, which is adding 83 cameras to its downtown with a \$2.58 million grant. Small towns are also getting their share of the federal money for surveillance to thwart crime and terrorism. Recent examples include Liberty, Kan. (population 95), which accepted a federal grant to install a \$5,000 G2 Sentinel camera in its park, and Scottsbluff, Neb. (population 14,000), where police used a \$180,000 Homeland Security Department grant to purchase four closed-circuit digital cameras and two monitors, a system originally designed for Times Square in New York City. "We certainly wouldn't have been able to purchase this system without those funds," police Captain Brian Wasson told the

Scottsbluff Star-Herald. Other large cities and small towns have also joined in since 2003. Federal money is helping New York, Baltimore, and Chicago build massive surveillance systems that may also link thousands of privately owned security cameras. Boston has installed about 500 cameras in the MBTA system, funded in part with homeland security funds. Marc Rotenberg, director of the Electronic Privacy Information Center, said Homeland Security Department is the primary driver in spreading surveillance cameras, making their adoption more attractive by offering federal money to city and state leaders. Homeland Security Department spokesman Russ Knocke said that it is difficult to say how much money has been spent on surveillance cameras because many grants awarded to states or cities contained money for cameras and other equipment. Knocke defended the funding of video networks as a valuable tool for protecting the nation. "We will encourage their use in the future," he added. But privacy rights advocates say that the technology is putting at risk something that is hard to define but is core to personal autonomy. The proliferation of cameras could mean that Americans will feel less free because legal public behavior -- attending a political rally, entering a doctor's office, or even joking with friends in a park -- will leave a permanent record, retrievable by authorities at any time. Businesses and government buildings have used closed-circuit cameras for decades, so it is nothing new to be videotaped at an ATM machine. But technology specialists say the growing surveillance networks are potentially more powerful than anything the public has experienced. Until recently, most surveillance cameras produced only grainy analog feeds and had to be stored on bulky videotape cassettes. But the new, cutting-edge cameras produce clearer, more detailed images. Moreover, because these videos are digital, they can be easily transmitted, copied, and stored indefinitely on ever-cheaper hard-drive space. In addition, police officers cannot be everywhere at once, and in the past someone had to watch a monitor, limiting how large or powerful a surveillance network could be. But technicians are developing ways to use computers to process real-time and stored digital video, including license-plate readers, face-recognition scanners, and software that detects "anomalous behavior." Although still primitive, these technologies are improving, some with help from research grants by the Homeland Security Department's Science and Technology Directorate. "Being able to collect this much data on people is going to be very powerful, and it opens people up for abuses of power," said Jennifer King, a professor at the University of California at Berkeley who studies privacy and technology. "The problem with explaining this scenario is that today it's a little futuristic. [A major loss of privacy] is a low risk today, but five years from now it will present a higher risk." As this technological capacity evolves, it will be far easier for individuals to attract police suspicion simply for acting differently and far easier for police to track that person's movement closely, including retracing their steps backwards in time. It will also create a greater risk that the officials who control the cameras could use them for personal or political gain, specialists said. The expanded use of surveillance in the name of fighting terrorism has proved controversial in

other arenas, as with the recent debate over President Bush's programs for eavesdropping on Americans' international phone calls and e-mails without a warrant. But public support for installing more surveillance cameras in public places, both as a means of fighting terrorism and other crime, appears to be strong. Last month, an ABC News/Washington Post poll found that 71 percent of Americans favored increased use of surveillance cameras, while 25 percent opposed it.

Video surveillance necessary to defeat terrorism

Steven **Simon, 2015** , adjunct senior fellow in Middle Eastern Studies at the Council on Foreign Relations and the co-author of "The Age of Sacred Terror" and "The Next Attack.", Times Square, Bombs, and Big Crowds, New York Times, http://roomfordebate.blogs.nytimes.com/2010/05/03/times-square-bombs-and-big-crowds/?_r=0#steven DOA: 5-5-15

Video surveillance would not have stopped the Times Square attack. Does this mean that it would be useless? Not necessarily. Swift and accurate analysis of video surveillance information might prevent the next attack, even if it is powerless to stop the last one. Imagery can be used to assist in the identification and location of individuals at the scene of the crime. It can also be used to track the progress of the bomb-laden vehicle from the its point of origin, or the point at which the truck was weaponized, to the place the terrorists have targeted. In combination with physical evidence acquired from the vehicle — fingerprints, hair, cloth fibers, soil, trash, forgotten personal items or a host of other bits of evidence — video surveillance can lead to the arrest of the bombers and to the unraveling of cells or networks and, if the attackers are foreign, the ratlines they exploited to enter the country. At this point, the U.S. does not have the kind of pervasive surveillance systems in place that, say, the British have deployed. In the U.K., there is about one surveillance camera for every thousand residents. It took British authorities years to reach this level of intensive surveillance. The U.S., as anyone who follows the debate over privacy loss in this country knows, is studded with cameras, but most of these are in stores to track consumption habits to facilitate marketing or deter shoplifters. They're not where they're needed, which is on the street. The two smallest jurisdictions in the U.K., very rural areas indeed, together deploy more surveillance cameras than the San Francisco police department. The U.S., of course, does not have to match Britain camera for camera. Surveillance can be enhanced in areas that are assessed to be likely targets, a category that can be inferred, at least in a general sense, from targeting patterns and what the terrorists actually have said about the desirability of attacking this or that; and they do discuss this in their literature and on their Web sites. More problematic, is the need to organize our law enforcement capabilities in ways that enable this visual information to be exploited effectively, while protecting the rapidly fading privacy available to ordinary citizens. Therein lies the real challenge.

Warrantless Surveillance

Warrant requirement for national security decisions undermines executive power needed for effective surveillance

Yohn **Yoo**, Summer 20**14**, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS, <http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 904

This approach applies to national security activity that occurs within the United States as well as outside it. In 1972, the Supreme Court refused to subject surveillance for national security purposes to the Fourth Amendment warrant requirement. But it has extended this protection to purely domestic terrorist groups, out of concern that the government might use its powers to suppress political liberties. Lower courts, however, have found that when the government conducts a search of a foreign power or its agents, it need not meet the requirements that apply to criminal law enforcement. In a leading 1980 case, the Fourth Circuit held that "the needs of the executive are so compelling in the area of foreign intelligence, unlike the area of domestic security, that a uniform warrant requirement would . . . unduly frustrate the President in carrying out his foreign affairs responsibilities." A warrant requirement for national security searches would reduce the flexibility of the executive branch, which possesses "unparalleled expertise to make the decision whether to conduct foreign intelligence surveillance" and is "constitutionally designated as the pre-eminent authority in foreign affairs." A warrant requirement would place national security decisions in the hands of the judiciary, which "is largely inexperienced in making the delicate and complex decisions that lie behind foreign intelligence surveillance." Under this framework, Presidents conducted national security surveillance using their executive authority for decades. President Nixon's abuses, however, led Congress to enact the Foreign Intelligence Surveillance Act (FISA) in 1978. FISA replaced presidentially-ordered monitoring of national security threats with a system similar to that used by law enforcement to conduct electronic surveillance of criminal suspects, but with important differences to protect classified information. FISA requires the government to show "probable cause" that a target is "an agent of a foreign power," which includes terrorist groups. A special court of federal district judges, the Foreign Intelligence Surveillance Court (FISC), examines classified information in a closed, ex parte hearing before issuing the warrant.

Warrantless surveillance necessary to combat Al Qaeda

Yohn **Yoo**, Summer 20**14**, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS,

<http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 903-4

It is al Qaeda's nature as a decentralized network that stresses the normal division between military and intelligence surveillance and the warrant-based approach of the criminal justice system. The Constitution vests the President with the executive power and designates him Commander-in-Chief. The Framers understood these powers to invest the executive with the duty to protect the nation from foreign attack and the right to control the conduct of military hostilities. To exercise those powers effectively, the President must have the ability to engage in electronic surveillance that gathers intelligence on the enemy. Regular military intelligence need not follow standards of probable cause for a warrant or reasonableness for a search, just as the use of force against the enemy does not have to comply with the Fourth Amendment. During war, military signals intelligence might throw out a broad net to capture all communications within a certain area or by an enemy nation. Unlike the criminal justice system, which seeks to detain criminals, protection of national security need not rest on particularized suspicion of a specific individual.

Business records

Signal Intelligence Necessary to Prevent Terrorism

Signal intelligence necessary because human intelligence on the decline

Stuart **Taylor**, April 29, 20**14**, The Big Snoop: Life, Liberty, and the Pursuit of Terrorists, <http://www.brookings.edu/research/essays/2014/the-big-snoop-print> (is an author, a freelance journalist, and a Brookings nonresident senior fellow. Taylor has covered the Supreme Court for a variety of national publications, including The New York Times, Newsweek, and National Journal, where he is also a contributing editor. His published books include Mismatch: How Affirmative Action Hurts Students It's Intended to Help, and Why Universities Won't Admit It. In addition to his work as a journalist and scholar, he is a graduate of Harvard Law School and practiced law in a D.C. firm.)

Over the five years that she has been chairman of the Intelligence Committee, Feinstein has seen more inside information on NSA activities than most of her fellow lawmakers. She is convinced that, since the FISA reforms of the seventies put safeguards and multiple layers of oversight in place, there has been no evidence of the NSA's seriously violating those strictures. She is also convinced that signals intelligence is, if anything, more indispensable than ever at a time when human intelligence—that is, information from undercover U.S. operatives operating abroad or inside hostile organizations like al Qaeda—is so hard to come by. That leads her to worry that curbs on the phone records program might increase the exposure of Americans to danger from terrorists and other enemies, perhaps including mass-casualty cyber, biological, or even nuclear attacks.

Signals intelligence necessary to combat terrorism and weapons proliferation

Report and Recommendations of the President's Review Group on Intelligence, December 20**13**, Liberty and Security in a Changing World, December 12, http://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf

Protecting The Nation Against Threats to Our National Security. The ability of the United States to combat threats from state rivals, terrorists, and weapons proliferators depends on the acquisition of foreign intelligence information from a broad range of sources and through a variety of methods. In an era increasingly dominated by technological advances in communications technologies, the United States must continue to collect signals intelligence globally in order to assure the safety of our citizens at home and abroad and to help protect the safety of our friends, our allies, and the many nations with whom we have cooperative relationships.

Section 702 and Section 215 programs have prevented terror attacks

Sean M. **Joyce**, Deputy Director, Federal Bureau of Investigation (FBI), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs"
<https://www.hsdl.org/?view&did=741931> (First joined the Department of Justice in 1979. He served for 13 years in the Criminal Division, later becoming the deputy chief of the division's public integrity section, went in private practice, sworn in as deputy attorney general on January 3rd, 2011)

SEN. FEINSTEIN: Good. Now, the NSA has produced and declassified a chart, which I'd like to make available to all members. It has the 54 total events. It includes a Section 702 authority and Section 215 authority, which essentially work together. And it shows the events disrupted based on a combination of these two programs, 13 in the homeland, 25 in Europe, five in Africa and 11 in Asia. Now, I remember I was on the Intelligence Committee before 9/11, and I remember how little information we have and the great criticism of the government because of those stovepipes, the inability to share intelligence, the inability to collect intelligence. We had no program that could've possibly caught two people in San Diego before the event took place. I support this program. I think, based on what I know, they will come after us. And I think we need to prevent an attack wherever we can from happening. That doesn't mean that we can't make some changes.

Signals intelligence from business records needed to stop WMD attacks

Stuart **Taylor**, April 29, 20**14**, The Big Snoop: Life, Liberty, and the Pursuit of Terrorists, <http://www.brookings.edu/research/essays/2014/the-big-snoop-print> (is an author, a freelance journalist, and a Brookings nonresident senior fellow. Taylor has covered the Supreme Court for a variety of national publications, including The New York Times, Newsweek, and National Journal, where he is also a contributing editor. His published books include Mismatch: How Affirmative Action Hurts Students It's Intended to Help, and Why Universities Won't Admit It. In addition to his work as a journalist and scholar, he is a graduate of Harvard Law School and practiced law in a D.C. firm.) DOA: 2-25-15

Over the five years that she has been chairman of the Intelligence Committee, Feinstein has seen more inside information on NSA activities than most of her fellow lawmakers. She is convinced that, since the FISA reforms of the seventies put safeguards and multiple layers of oversight in place, there has been no evidence of the NSA's seriously violating those strictures. She is also convinced that signals intelligence is, if anything, more indispensable than ever at a time when human intelligence—that is, information from undercover U.S. operatives operating abroad or inside hostile organizations like al Qaeda—is so hard to come by. That leads her to worry that curbs on the phone records program might increase the exposure of Americans to danger from terrorists and other enemies, perhaps including mass-casualty cyber, biological, or even nuclear attacks.

Business record 215 program has been used to stop a terror attack

Sean M. **Joyce**, Deputy Director, Federal Bureau of Investigation (FBI), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs" <https://www.hsdl.org/?view&did=741931> (First joined the Department of Justice in 1979. He served for 13 years in the Criminal Division, later becoming the deputy chief of the division's public integrity section, went in private practice, sworn in as deputy attorney general on January 3rd, 2011)

As you mentioned another instance when we used the business record 215 program, as Chairman Leahy mentioned, Basaaly Moalin. So initially the FBI opened a case in 2003 based on a tip. We investigated that tip. We found no nexus to terrorism and closed the case. In 2007 the NSA advised us, through the business record 215 program, that a number in San Diego was in contact with an al-Shabab and east -- al-Qaida east -- al-Qaida East Africa member in Somalia. We served legal process to identify that unidentified phone number. We identified Basaaly Moalin. Through further investigation, we identified additional co-conspirators, and Moalin and three other individuals have been convicted -- and some pled guilty -- to material support to terrorism.

Business records closes holes in intelligence in order to defeat terrorism

Sean M. **Joyce**, Deputy Director, Federal Bureau of Investigation (FBI), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs" <https://www.hsdl.org/?view&did=741931> (First joined the Department of Justice in 1979. He served for 13 years in the Criminal Division, later becoming the deputy chief of the division's public integrity section, went in private practice, sworn in as deputy attorney general on January 3rd, 2011)

SEN. GRASSLEY: OK. Mr. Joyce, one part of the balance that we have to strike, protecting privacy of Americans -- the other part, national security. Thankfully, until the Boston bombing, we had prevented large-scale terrorist attacks on American soil. I have a few questions about how valuable the role of Section 215 and 702 programs have played in predicting (sic) our national security. Two questions, and then I'll have to stop and go to our colleagues. Can you describe any specific situations where Section 215 and Section 702 authorities helped disrupt a terrorist attack or identify individuals planning to attack, the number of times? And then secondly, if you didn't have the authority to collect phone records in bulk the way that they are now under Section 215, how would you have affected those investigations? MR. JOYCE: So to your first question, Senator, as far as a specific example of when we have utilized both of these programs is the one I had first mentioned, the first al-Qaida-directed plot since 9/11, in September of 2009, when Najibullah Zazi and others conspired plot to bomb the New York subway system. We initially found out about Zazi through an NSA 702 coverage, and he was actually talking to an al-Qaida courier who was -- he was

asking for his help to perfect an explosives recipe. So but for that, we would not have known about the plot. We followed that up with legal process and then had FISA coverage on him and others as we fully investigated the plot. Business records 215 was also involved, as I had previously mentioned, where we also through legal process were submitting legal process for telephone numbers and other email addresses, other selectors. But NSA also provided another number we are unaware of of a co-conspirator, Adis Medunjanin. So that is an instance where a very serious plot to attack America on U.S. soil that we used both these programs. But I say, as Chairman Leahy mentioned, there is a difference in the utility of the programs. But what I say to you is that each and every program and tool is valuable. There were gaps prior to 9/11. And what we have collectively tried to do, the members of the committee, other members of the other oversight committees, the executive branch and the intelligence community, is we have tried to close those gaps and close those seams. And the business record 215 is one of those programs that we have closed those seams. So I respectfully say to the chairman that the utility of that specific program initially is not as valuable. I say you are right. But what I say is it plays a crucial role in closing the gaps and seams that we fought hard to gain after the 9/11 attacks.

Section 702 and Section 215 programs have prevented terror attacks

Sean M. **Joyce**, Deputy Director, Federal Bureau of Investigation (FBI), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs" <https://www.hsdl.org/?view&did=741931> (First joined the Department of Justice in 1979. He served for 13 years in the Criminal Division, later becoming the deputy chief of the division's public integrity section, went in private practice, sworn in as deputy attorney general on January 3rd, 2011)

SEN. FEINSTEIN: Good. Now, the NSA has produced and declassified a chart, which I'd like to make available to all members. It has the 54 total events. It includes a Section 702 authority and Section 215 authority, which essentially work together. And it shows the events disrupted based on a combination of these two programs, 13 in the homeland, 25 in Europe, five in Africa and 11 in Asia. Now, I remember I was on the Intelligence Committee before 9/11, and I remember how little information we have and the great criticism of the government because of those stovepipes, the inability to share intelligence, the inability to collect intelligence. We had no program that could've possibly caught two people in San Diego before the event took place. I support this program. I think, based on what I know, they will come after us. And I think we need to prevent an attack wherever we can from happening. That doesn't mean that we can't make some changes.

Business records program has stopped many attacks

Rep. Mike **Rogers**, Miami Times (Florida), June 18, 20**13**, (Rep. Mike Rogers, R-Mich., is chairman of the House Permanent Select Committee on Intelligence,

<http://www.usatoday.com/story/opinion/2013/06/18/nsa-mike-rogers-house-intelligence-committee-editorials-debates/2436541/> , DOA: 2-24-15

The gross distortion of two vital National Security Agency [NSA] programs is dangerous and unfortunate. Neither program authorizes NSA to read e-mails or listen to phone calls of American citizens. Both are constitutional with numerous checks and balances by all three branches of government. They have been authorized and overseen by Congress and presidents of both parties. And they have produced vital intelligence, preventing dozens of terrorist attacks around the world, including plots against New York City subways and the New York Stock Exchange. The first program allows NSA to preserve a limited category of business records. It preserves only phone numbers and the date, time and duration of calls. It doesn't include any names or the content of calls. These records can only be accessed when NSA is investigating a foreign terrorist. If a foreign terrorist is found linked to an American, the tip is passed to the FBI and requires a court order before additional action can be taken. This is a critical tool for connecting the dots between foreign terrorists plotting attacks in the U.S. The second program allows the NSA to target foreigners overseas to collect certain foreign intelligence with court approval. It doesn't create a "back door" to any company's server, and doesn't authorize monitoring of U.S. citizens. No U.S. person anywhere in the world can be intentionally monitored without a specific order. Any comparison to government abuses in decades past is highly misleading. Today's programs are authorized in law, with a thorough system of oversight and checks and balances in place, and a court review not present in the past. Now each of the agencies has an inspector general and general counsels who ensure that these authorities are exercised in accordance with the law. The House and Senate each have Intelligence Committees charged with overseeing these authorities. Additionally, electronic surveillance for foreign intelligence purposes occurs with approval of the Foreign Intelligence Surveillance Court. None of these structures and protections was in place in the 1950s, '60s or '70s. These narrowly targeted programs are legal, do not invade Americans' privacy, and are essential to detecting and disrupting future terrorist attacks.

Section 215 necessary to defeat terrorism

James **Carafano**, May 21, 2015, Section 215 of the PATRIOT Act and Metadata Collection: Responsible Options for the Way Forward, Dr. Carafano is

Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow, Charles Stimson is Manager, National Security Law Program and Senior Legal Fellow, Dr. Steven Bucci is Director, Douglas and Sarah Allison Center for Foreign and National Security Policy, John Malcolm is Director, Edwin Meese III Center for Legal and Judicial Studies, and the Ed Gilbertson and Sherry Lindberg Gilbertson Senior Legal Fellow,

<http://www.heritage.org/research/reports/2015/05/section-215-of-the-patriot-act-and-metadata-collection-responsible-options-for-the-way-forward> DOA: 5-24-15

The United States is in a state of armed conflict against al-Qaeda, the Afghan Taliban, ISIS, and associated forces. It must therefore rely on all lawful tools of national security, including but not limited to robust signals intelligence. As the 9/11 Commission Report made crystal clear, one of the key failures of the United States before the 9/11 attacks was the government's inability to "connect the dots" between known or suspected terrorists. The artificial "wall"

between domestic law enforcement and U.S. intelligence agencies, enacted during the 1990s, proved to be America's Achilles' heel. Some analysts believe that had America had a Section 215-type program in place before 9/11, U.S. intelligence, along with domestic law enforcement, would have been able to connect the dots and prevent at least some of the hijackers from launching their devastating attack. In fact, according to a report by the House Permanent Select Committee on Intelligence, using the authorities under Section 215 and 702 of the PATRIOT Act has contributed to thwarting 54 total international terrorist plots in 20 countries. Thirteen of those plots were directed inside the United States.

Bulk Data

Mass records collection is needed to catch terrorists because they are not all in one place

Joshua **Kapstein**, May 16, 20**14**, "The NSA Can 'Collect it All,'" but what would it do with the data?, <http://www.thedailybeast.com/articles/2014/05/16/the-nsa-can-collect-it-all-but-what-will-it-do-with-our-data-next.html> DOA: 2-23-15

The NSA and its allies are staunch defenders of these "haystacks," even though multiple studies concluded the database containing millions of Americans' phone records played little or no role in preventing terrorist attacks. They've countered that it's foolish to assume all terrorists hang out in one isolated section of the Internet, therefore mass-collection becomes a necessary obsession to find that ever-elusive needle.

Database needs to be broad to find terrorist cells

Yohn **Yoo**, Summer 20**14**, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS, <http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 911-12

A critic, however, might argue that billions of innocent calling records are not "relevant" to a terrorism investigation. Even if terrorist communications take place over the phone, that cannot justify the collection of all phone call records in the United States, the vast majority of which have nothing to do with the grounds for the search. The FISC rejected this argument because, to be useful, a database has to be broad enough to find terrorist calls. "Because known and unknown international terrorist operatives are using telephone communications, and because it is necessary to obtain the bulk collection of a telephone company's metadata to determine those connections between known and unknown international terrorist operatives as part of authorized investigations," the Court observed, "the production of the information sought meets the standard for relevance under Section 215." Aggregating calling records into a database, the court found, was necessary to find the terrorist communications and the links between terrorists. It may not even be possible to detect the links unless such a database is created. If a database is not comprehensive, in other words, then the government will only be able to glimpse incomplete patterns of terrorist activity, if it can glimpse any at all.

Broad-based records approaches are often used in national security cases

Yohn **Yoo**, Summer 20**14**, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS,

<http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, P 911-12

Relevance is a slippery concept, but it cannot require that every piece of information obtained by subpoena must contain information related to guilt. Even when grand juries subpoena the business records or communications of a criminal suspect, it is likely that the large majority of the items will not have any relationship to the crime. Nonetheless, a grand jury may subpoena all of a suspect's financial records to find those that pertain to a criminal conspiracy. A different way to view the NSA's telephone calling record program is that the "relevant" tangible "thing" is the database itself, rather than any individual calling record. Of course, the NSA program differs from a subpoena to a financial institution for the records of a known criminal suspect. The amount of data collected by the NSA program is many orders of magnitude greater, and hence the percentage of directly involved communications much smaller. Also, unlike a regular subpoena, it is important to have as large a searchable database as possible because the breadth will bring into the sharpest contrast the possible patterns of terrorist activity. On the other hand, the magnitude of harm that the government seeks to prevent exceeds by several orders that of regular crime. The magnitude of the harm should be taken into account in judging relevance as well as the unprecedented difficulties of locating al Qaeda operatives disguised within the United States.

Data mining critical to defeat terrorism

Dr. James **Carafano**, June 6, 2005, The Future of Antiterrorism Technologies, <http://www.heritage.org/research/lecture/the-future-of-anti-terrorism-technologies> DOA: 5-1-15

Data Mining and Link Analysis Technologies. We live in a world that is becoming increasingly awash in commercial and government information. The trail of the terrorist, however, is often indistinguishable from a mass of bills, license applications, visa forms, census records, and telephone lists. Traditional law enforcement investigation techniques often begin with the identification of a suspected individual, followed by the laborious process of seeking out information related to that individual. As more and more information becomes available, this task becomes more and more problematic. Technology, however, now has the potential to turn this challenge into an advantage. Rather than trying to narrow the scope of information that has to be looked at, data mining and link analysis technologies work best by exploiting larger and larger amounts of information. Data mining is a "technology for analyzing historical and current online data to support informed decision making."^[5] It involves identifying patterns and anomalies from the observation of vast datasets. The primary goals of data mining are prediction and description. Prediction involves using some variables or fields in the database to predict unknown or future values of other variables of interest, and description focuses on finding human-interpretable patterns describing the data. Description concerns increasing knowledge about a variable or dataset by finding related information. [This second characteristic of data mining- description-is often referred to as link analysis. Whereas data mining attempts to identify anomalies in vast amounts of information, link analysis technologies sift through databases to find commonalties. Link analysis is a slightly different twist on data mining. In preventing a terrorist attack, it is critical that one understands the relationships among individuals, organizations, and other entities which

could be security threats. Link analysis is the process of analyzing the data surrounding the suspect relationships to determine how they are connected-what links them together. While the technology to conduct data mining is rapidly maturing, it is currently limited by its capacity to handle non-structured formats; i.e., those that are a mix of text, image, video, and sensor information. In addition, future algorithms will also need to incorporate the knowledge of human experts into their derivation of patterns. "Breakthrough" Technologies My final two candidate technologies definitely fit into the last category of an aggressive technology acquisition program. They offer two potential breakthroughs which could significantly reshape the nature of competition between terrorism and counterterrorism. Nanotechnology. As a counterterrorism tool, nanotechnologies are in their infancies. Nanotechnology involves developing or working with materials and complete systems at the atomic, molecular, or macromolecular levels where at least one dimension falls within the range of 1-100 nanometers.[7] Working at such a small scale offers unique capabilities, such as being able to control how nanodevices interact with other systems at the atomic or molecular level. Current research areas include materials, sensors, biomedical nanostructures, electronics, optics, and fabrication. Materials which have been modified at the nanoscale can have specific properties incorporated into them. For instance, materials can have coatings that make them water-repellant or stain-resistant. According to a study by Daniel Ratner and Mark A. Ratner: Nanoscale sensors are generally designed to form a weak chemical bond to the substance of whatever is to be sensed, and then to change their properties in response (that might be a color change or a change in conductivity, fluorescence, or weight).[8] Biomedical nanostructures, by design, interact with people at the molecular level, allowing for targeted drug delivery, adhesive materials for skin grafts or bandages, etc. Nanoscale electronics can help to shrink computer circuits even further and to make them more efficient. Nanoscale optics allow once again for materials that fluoresce to be tuned at the nanoscale to change specific properties under certain conditions. Fabrication at the nanoscale offers the potential of creating devices from the atom up, as opposed to having to shrink materials down to the needed size. According to a RAND report, there are numerous future applications for nanotechnology, though most face at least some technical hurdles. They include nanofabricated computational devices like nanoscale semiconductor chips, biomolecular devices, and molecular electronics. If one includes integrated microsystems and micro-electrical-mechanical systems (MEMS) in the discussion, and one probably should, there are additional uses for nanotechnology, including smart systems-on-a-chip and micro- and nanoscale instrumentation and measurement technologies. While there are counterterrorism applications for all of the research areas, sensors are the most promising. Nanodevices offer the opportunity for fast, cheap, and accurate sensors and detectors, and markers that can be used for a wide range of forensic activities.

Metadata collection needed to cast a wide net

Yohn **Yoo**, Summer 2014, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS, <http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 907-8

A. Phone Call Metadata Collection Like business records, phone call metadata falls within Section 215's definition of tangible items. Collection of such metadata relates to an authorized investigation to protect against international terrorism. Several investigations into al Qaeda plots remain open, as shown by the repeated indictments against bomb plotters in the last five years. The examination of records also helps protect the nation against terrorist attacks. According to the NSA, only the information contained in the billing records is collected; the content of calls is not. There can be no First Amendment violation if the content of the calls remains untouched. A critic might argue that the terms of the search are too broad because ninety-nine percent of the calls are unconnected to terrorism. But an intelligence search, as Judge Richard Posner has described it, "is a search for the needle in a haystack." Rather than focus on foreign agents who are already known, counterterrorism agencies must search for clues among millions of potentially innocent connections, communications, and links. "The intelligence services," Posner writes, "must cast a wide net with a fine mesh to catch the clues that may enable the next attack to be prevented." For this reason, the FISC approved the NSA program in 2006 and has continued to renew it since.

The wider the surveillance net, the more effective the surveillance

Report and Recommendations of the President's Review Group on Intelligence, December 2013, Liberty and Security in a Changing World, December 12, http://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf
DOA: 1-1-14

When public officials acquire information, they seek to reduce risks, above all risks to national security. If the government is able to obtain access to a great deal of information, it should be in a better position to mitigate serious threats of violence. And if the goal is to reduce such threats, a wide net seems far better than a narrow one, even if the government ends up acquiring a great deal of information that it does not need or want. As technologies evolve, it is becoming increasingly feasible to cast that wide net. In the future, the feasibility of pervasive surveillance will increase dramatically. From the standpoint of risk reduction, that prospect has real advantages.

PRISM/ Section 702

Authority for PRISM is in section 702

James **Carafano**, 8-6, **13** Heritage Foundation, The Examiner (Washington, DC) August 6, 2013, PRISM is essential to U.S. security in war against terrorism (Vice President for Defense and Foreign Policy Studies at The Heritage Foundation, PRISM is Essential to US Security in the War on Terrorism, <http://www.heritage.org/research/commentary/2013/8/prism-is-essential-to-us-security-in-war-against-terrorism> DOA: 2-1-13

"Our intelligence professionals must be able to find out who the terrorists are talking to, what they are saying, and what they're planning," said the president. "The lives of countless Americans depend on our ability to monitor these communications." He added that he would cancel his planned trip to Africa unless assured Congress would support the counterterrorism surveillance program. The president was not, Barack Obama. It was George W. Bush, in 2008, pressing Congress to extend and update reforms to the Foreign Intelligence Surveillance Act (FISA). He was speaking directly to the American public, in an address broadcast live from the Oval Office. How times have changed. Back then, the President of the United States willingly led the fight for the programs he thought necessary to keep the nation safe. Now, our president sends underlings to make the case. In distancing himself from the debate over PRISM (the foreign intelligence surveillance program made famous by the world-travelling leaker, Edward Snowden), President Obama followed the precedent he established in May at the National Defense University. There, he spoke disdainfully of drone strikes, the authorization to use military force against terrorists, and the detention facilities at Guantanamo Bay. All three are essential components of his counterterrorism strategy. In distancing himself from his own strategy, Obama hoped to leave the impression that he is somehow above it all. He has dealt with the Snowden case the same way. When asked while traveling in Africa if he would take a role in going after the leaker, the president replied "I shouldn't have to." The White House's above-it-all attitude sends seriously mixed messages to the American people, who are trying to figure if the government's surveillance programs are legal and appropriate. Congress has not been much better. The authority for PRISM is in FISA Section 702. Congress debated these authorities in 2007 and again when the program was reauthorized in 2008. Senate Majority Leader Harry Reid, D-Nev., surely remembers the controversy. He wrote President Bush: "There is no crisis that should lead you to cancel your trip to Africa. But whether or not you cancel your trip, Democrats stand ready to negotiate a final bill, and we remain willing to extend existing law for as short a time or as long a time as is needed to complete work on such a bill." Evidently, Reid must have felt the authorities granted under Section 702 received a full and sufficient hearing. Most current members of Congress were seated under the dome during the 2008 debates. They had every opportunity not just to read the law, but to be briefed on the program by intelligence officials before voting on the bill. For them to act shocked at the scope of the program today rings about as hollow as Obama's expressed disdain for the operations he oversees. The reality is that Congress and the administration share responsibility for these programs. If they want to change or modify them, who's stopping them? If changes are made, however, they should to be made for the right reason. Leaders must never compromise our security for political expediency. At least 60 Islamist-

inspired terrorist plots have been aimed at the U.S. since the 9/11 attacks. The overwhelming majority have been thwarted thanks to timely, operational intelligence about the threats. Congress should not go back to a pre-/11 set of rules just to appeal to populist sentiment. Congress and the White House have an obligation to protect our liberties and to safeguard our security -- in equal measure. Meeting that mission is more important than winning popularity polls.

PRISM necessary to get to emails to counter threats

Michael **Hayden**, former director of the NSA and the CIA, May 5, 2014, "Michael Hayden's Unwitting Case Against Secret Surveillance,"
<http://www.theatlantic.com/politics/archive/2014/05/michael-haydens-unwitting-case-against-secret-surveillance/361689/> DOA: 2-19-15

Actually, you need to go back and look at the whole movie. You need to see what went on before. Because if you know what went on before you may have a different interpretation of what you think the butler is guilty of. There are three or four things that happen that NSA and all these organizations have tried to solve. Enormous volume. How do you conduct signals intelligence to keep you safe in a tsunami of global communications? Well, the answer to that is bulk collection of metadata. Another issue that's out there prominently is NSA is mucking about in those global telecommunication grids that have your emails. No one complained when NSA was doing Soviet strategic microwave rocket signals. Well, the equivalent of those Soviet microwave signals are proliferator, terrorist, narco-trafficker, money-launderer emails, coexisting with yours and mine, out there in Gmail. And if you want NSA to continue to do what it was doing, or CSEC to continue to do what it's doing, what it had been doing to keep you safe, it's got to be in the stream where your data is. There's a couple other things too. After 9/11, the enemy was inside my country. That's the 215 program, metadata. Who might be affiliated with terrorists inside the United States? And finally, when the enemy wasn't in my country his communications were. It's an accident of history, but it's a fact, most emails reside on servers in the United States. They should not deserve constitutional protection if the email's from a bad man in Pakistan communicating to a bad man in Yemen. And the Prism program is what allowed us to get those emails to keep everyone safe. There's a lot more to talk about but you're going to start clapping in about nine seconds. So I'm going to go back to the podium.

PRISM has contributed to actionable intelligence in the fight against terrorism

Stuart **Taylor**, April 29, 2014, The Big Snoop: Life, Liberty, and the Pursuit of Terrorists, <http://www.brookings.edu/research/essays/2014/the-big-snoop-print> (is an author, a freelance journalist, and a Brookings nonresident senior fellow. Taylor has covered the Supreme Court for a variety of national publications, including The New York Times, Newsweek, and National Journal, where he is also a contributing editor. His published books include Mismatch: How Affirmative Action Hurts Students It's Intended to Help, and Why

Universities Won't Admit It. In addition to his work as a journalist and scholar, he is a graduate of Harvard Law School and practiced law in a D.C. firm.)

The PRISM program poses an even trickier version of the cost/benefit question: it is easier to justify its efficacy, but because it goes after the contents of messages, not just their origin and destination, it is more intrusive on the liberties of the people whose communications it scoops up. Moreover, while PRISM is more restrictive in its formal mandate (i.e., it is targeted only at foreign bad actors), in practice it does pry "incidentally" into the Internet traffic of many law-abiding U.S. citizens. Yet there's no denying that PRISM's mining of emails and other Internet messages has produced a mother lode of useful information. An internal NSA document leaked by Snowden described the program as "the most prolific contributor to the President's Daily Brief" and the NSA's "leading source of raw material, accounting for nearly one in seven [of all the intelligence community's secret] reports." More to the point, PRISM has often contributed to the collection of actionable intelligence used in the fight against terrorism. Even Wyden, the NSA's strongest congressional critic, acknowledges as much. He and his ally on the surveillance issue, Senator Mark Udall (D-Colo.), said in a joint statement last summer that "multiple terrorist plots have been disrupted at least in part because of information obtained under Section 702."

Section 702 programs necessary to defeat terrorism

Sean M. **Joyce**, Deputy Director, Federal Bureau of Investigation (FBI), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs"
<https://www.hsdl.org/?view&did=741931> (First joined the Department of Justice in 1979. He served for 13 years in the Criminal Division, later becoming the deputy chief of the division's public integrity section, went in private practice, sworn in as deputy attorney general on January 3rd, 2011)

SEN. GRASSLEY: OK. Mr. Joyce, one part of the balance that we have to strike, protecting privacy of Americans -- the other part, national security. Thankfully, until the Boston bombing, we had prevented large-scale terrorist attacks on American soil. I have a few questions about how valuable the role of Section 215 and 702 programs have played in predicting (sic) our national security. Two questions, and then I'll have to stop and go to our colleagues. Can you describe any specific situations where Section 215 and Section 702 authorities helped disrupt a terrorist attack or identify individuals planning to attack, the number of times? And then secondly, if you didn't have the authority to collect phone records in bulk the way that they are now under Section 215, how would you have affected those investigations? MR. JOYCE: So to your first question, Senator, as far as a specific example of when we have utilized both of these programs is the one I had first mentioned, the first al-Qaida-directed plot since 9/11, in September of 2009, when Najibullah Zazi and others conspired plot to bomb the New York subway system. We initially found out about Zazi through an NSA 702 coverage, and he was actually talking to an al-Qaida courier who was -- he was asking for his help to perfect an explosives recipe. So but for that, we would not have known about the plot. We followed that up with legal process and then had FISA coverage on him

and others as we fully investigated the plot. Business records 215 was also involved, as I had previously mentioned, where we also through legal process were submitting legal process for telephone numbers and other email addresses, other selectors. But NSA also provided another number we are unaware of of a co-conspirator, Adis Medunjanin. So that is an instance where a very serious plot to attack America on U.S. soil that we used both these programs. But I say, as Chairman Leahy mentioned, there is a difference in the utility of the programs. But what I say to you is that each and every program and tool is valuable. There were gaps prior to 9/11. And what we have collectively tried to do, the members of the committee, other members of the other oversight committees, the executive branch and the intelligence community, is we have tried to close those gaps and close those seams. And the business record 215 is one of those programs that we have closed those seams. So I respectfully say to the chairman that the utility of that specific program initially is not as valuable. I say you are right. But what I say is it plays a crucial role in closing the gaps and seams that we fought hard to gain after the 9/11 attacks.

Section 702 critical to fight terrorism

Washington Post, June 20, 2013, Reprinted in South China Morning Post, US Defends Surveillance Tactics in War on Terrorism, <http://www.scmp.com/news/world/article/1264602/us-defends-surveillance-tactics-war-terrorism> DOA: 4-1-15

In November 2008, Abid Naseer, a Pakistani student living in Manchester, England, began to e-mail a Yahoo account ultimately traced to his home country. The young man's e-mails appeared to be about four women - Nadia, Huma, Gulnaz and Fozia - and which one would make a "faithful and loving wife". British investigators later determined that the four names were code for types of explosives. And they ascertained that a final April 2009 e-mail announcing a "marriage to Nadia" between the 15th and the 20th was a signal that a terrorist attack was imminent, according to British court documents. It is unclear exactly how British intelligence linked the Pakistani e-mail address to a senior al-Qaeda operative who communicated in a kind of code to his distant allies. But the intelligence helped stop the plot in England, and the address made its way to the US National Security Agency (NSA). A few months later, the NSA was monitoring the Yahoo user in Pakistan when a peculiar message arrived from a man named Najibullah Zazi, an Afghan American living in Colorado. He asked about "mixing of [flavour and ghee oil] and I do not know the amount, plz right away." Soon after, on September 9, 2009, a second message arrived that echoed the code used in the British plot: "The marriage is ready," Zazi wrote. The e-mails led the NSA to alert the FBI, which obtained a court order to place Zazi under more extensive surveillance. Officials learned that he had visited Pakistan in 2008, the same time as one of the British plotters. In the end, the e-mails and additional surveillance foiled a plot by Zazi and two others to conduct suicide bombings in the New York subway system just days after he sent the "marriage is ready" e-mail. In recent days, US intelligence and law enforcement officials, as well as congressional officials, have pointed to the authority that allowed them to target the Yahoo account - Section 702 of the Foreign Intelligence Surveillance Act (FISA) - as a critical tool in identifying and disrupting terrorist plots in the US and abroad. But some critics of NSA

surveillance suggested that the collection of data under a programme called Prism was not essential to Zazi's capture because the British first obtained the critical e-mail address. Still, the case study provides a rare glimpse of how the broad surveillance practices of the United States, often in concert with allies, are deployed. "The 702 programme has been enormously useful in a large number of terrorist cases," said a US official who has access to classified records on NSA programmes. "It's beyond dispute that it is highly effective. It operates exactly as anyone paying attention would have expected it to operate based on floor debate and plain reading of law." Passage of Section 702 as an amendment to FISA in 2008 gave the government the authority to request information from US telecommunications companies on foreign targets located overseas without a court order for each individual case. The broad authority is reviewed and renewed annually by the FISA court, although the law does not preclude making a specific request for surveillance. "It appears the NSA did not need any of the expanded authorities conferred by Section 702 to monitor the communications at issue," said Elizabeth Goitein, co-director of the Brennan Centre for Justice's Liberty and National Security Programme. "The government easily could have met this standard if it certified that the targets were al-Qaeda terrorists in Pakistan." But US officials argue that, given the flood of leads in today's interconnected world, the system would get bogged down and they could miss plots if they had to go before the court every time they got information about potential foreign suspects. The officials said they used material from multiple sources - allies, agents, informants and other investigations - to provide rolling targeting information for the Prism program. They also said if the Yahoo address had not been included, Zazi might not have been identified just days before the attacks were set to occur. In testimony before Congress on Tuesday, senior intelligence and law enforcement officials said that recently revealed surveillance programmes have disrupted more than 50 "potential terrorist events", including at least 10 plots with a connection in the US. The Zazi case was one of four that officials used in recent days to defend the effectiveness of the surveillance programmes. One of the others was a planned attack on a Danish newspaper that involved a Pakistani American, David Headley. Sean Joyce, the deputy director of the FBI, described the other two potential attacks on Tuesday in testimony before the House Intelligence Committee. In one, Joyce said, the NSA was monitoring "a known extremist in Yemen" when it learned that the individual was in contact with a man in Kansas City, Missouri. Joyce said Khalid Ouazzani and two co-conspirators were plotting to bomb the New York Stock Exchange. Ouazzani pleaded guilty in 2010 to supporting a terrorist organisation, bank fraud and overseas money laundering. His co-conspirators also pleaded guilty to terrorism charges. In the other incident, phone records helped identify a San Diego man who was financing a terrorist group overseas, apparently al-Shabab in Somalia. "Investigating terrorism is not an exact science. It's like a mosaic," Joyce said. "We try to take these disparate pieces and bring them together to form a picture. There are many different pieces of intelligence. "We have assets. We have physical surveillance. We have electronic surveillance through a legal process, phone records through additional legal process, financial records. "Also, these programmes that we're talking about here today, they're all valuable pieces to bring that mosaic together." General Keith Alexander, head of the National Security Agency, said details of the two programmes disclosed by Snowden were not closely held within the secretive agency. Alexander said after the hearing that most of the documents accessed by Snowden, a former systems analyst on contract to the NSA, were on a web forum available to NSA employees. Others were on a site that required a special credential to access.

Alexander said investigators were studying how Snowden did that. He told lawmakers Snowden's leaks had caused "irreversible and significant damage to this nation". He also said the internet programme had helped stop 90 per cent of the 50-plus plots he cited. He said more than 10 of the plots thwarted had a link inside the US. Still, little was offered to substantiate claims that the programmes had been successful in stopping acts of terrorism that would not have been caught with narrower surveillance. In the New York subway bombing case, Barack Obama conceded the would-be bomber might have been caught with less sweeping surveillance. Committee chairman Congressman Mike Rogers said the programmes were vital to the intelligence community and blasted Snowden's actions as criminal. "It is at times like these where our enemies within become almost as damaging as our enemies on the outside," Rogers said. Officials acknowledged that intelligence collected from US phone records under a programme authorised by the USA Patriot Act is less compelling and the case for that extensive surveillance is harder to make. The NSA's ability to intercept "the contents of e-mail communications of bad guys overseas provides a more lucrative set of information" about terrorist activity than its access to phone records of millions of Americans, one US official said.

Section 702 critical to defeat terrorism

Benjamin **Wittes**, Brookings, 20**14**, Senior Fellow in Governance Studies at the Brookings Institution. I co-founded and am Editor in Chief of *Lawfare*, a website devoted to sober and serious discussion of "Hard National Security Choices." I am the author or editor of several books on subjects related to law and national security: *Detention and Denial: The Case for Candor After Guantánamo* (2011), *Law and the Long War: The Future of Justice in the Age of Terror* (2008), and *Legislating the War on Terror: An Agenda for Reform* (2009). I have written extensively both on the AUMF and on NSA collection under various provisions of the Foreign Intelligence Surveillance Act (FISA).³ The views I am expressing here are my own, April 8, Prepared Statement, Is Al Qaeda Winning the Administration's Counterterrorism Policy," <http://docs.house.gov/meetings/FA/FA18/20140408/102109/HHRG-113-FA18-Wstate-WittesB-20140408.pdf> DOA: 5-1-15

President Obama has announced that he wants to end the AUMF conflict, raising profound questions both about the plausibility and timeframe of that objective and about what legal instrument—if any—will replace the AUMF. Meanwhile, serial leaks have generated enormous political anxiety about NSA programs and persistent calls for reform in the press, in the general public, among allies, and in this body. Section 702 will sunset in 2017 absent action by Congress to renew this important collection authority.⁴ So major pillars of the legal architecture of America's conflict with Al Qaeda have been placed—in different ways and for very different reasons—on the table. This body thus cannot avoid the question of how much, if at all, it wants to alter the most fundamental architecture of the conflict. In my view, as I will lay out, the critical task facing the Congress is different with respect to these two laws. With respect to the AUMF, the Congress should legislate to clearly authorize, and establish proper oversight of, the conflict the United States is likely to continue fighting after its withdrawal from Afghanistan. With respect to Section 702, the task is simpler: to maintain the intelligence community's capacity to support both the broad national security objectives of the United States and the conflict's prosecution under whatever legal authorities may succeed the AUMF. CONTINUES

As I said at the outset of this statement, the question of intelligence collection under Section 702 of the FAA may seem connected to the AUMF's future in only the most distant fashion. In fact, the connection between intelligence collection authorities and the underlying regime authorizing the conflict itself is a critical one. Good intelligence is key to any armed conflict and good technical intelligence is a huge U.S. strength in the fight against Al Qaeda. Yet ironically, the more one attempts to narrow the conflict, the more important technical intelligence becomes. The fewer boots on the ground we have in Afghanistan, for example, the greater our reliance will become on technical collection. The more we rely on drone strikes, rather than large troop movements, in areas where we lack large human networks, the more we rely on technical intelligence. Particularly if one imagines staying on offense against a metastasizing Al Qaeda in the context of a withdrawal from Afghanistan and a narrowing—or a formal end—of the AUMF conflict, the burden on technical intelligence collection to keep us in the game will be huge even ignoring the many other foreign intelligence and national security interests Section 702 surveillance supports. Section 702 is a complicated statute, and it is only one part of a far more complicated, larger statutory arrangement. But broadly speaking, it permits the NSA to acquire without an individualized warrant the communications of non-US persons reasonably believed to be overseas when those communications are transiting the United States or stored in the United States. Under these circumstances, the NSA can order production of such communications from telecommunications carriers and internet companies under broad programmatic orders issued by the Foreign Intelligence Surveillance Court (FISC), which reviews both targeting and minimization procedures under which the collection then takes place. Oversight is thick, both within the executive branch, and in reporting requirements to the congressional intelligence committees. Make no mistake: Section 702 is a very big deal in America's counterterrorism arsenal. It is far more important than the much debated bulk metadata program, which involves a few hundred queries a year. Section 702 collection, by contrast, is vast, a hugely significant component not only of contemporary counterterrorism but of foreign intelligence collection more generally. In 2012, the Senate Select Committee on Intelligence wrote that "[T]he authorities provided [under section 702] have greatly increased the government's ability to collect information and act quickly against important foreign intelligence targets. . . . [The] failure to reauthorize [section 702] would 'result in a loss of significant intelligence and impede the ability of the Intelligence Community to respond quickly to new threats and intelligence opportunities.'"⁸ The President's Review Group on Intelligence and Communications Technologies, after quoting this language, wrote that "Our own review is not inconsistent with this assessment. . . . [W]e are persuaded that section 702 does in fact play an important role in the nation's effort to prevent terrorist attacks across the globe."⁹ The Washington Post has reported that 702 was in 2012 the single most prolific contributor to the President's Daily Brief.¹⁰ Yet we have seen enormous anxiety about Section 702 collection, along with its close cousin, collection overseas against non-US person targets under Executive Order 12333. Sometimes, these anxieties have been rooted in the supposed effects of this collection on U.S. persons.¹¹ Sometimes, however, the complaints have stemmed from broader concerns about infringement of privacy worldwide. Europeans have expressed shock, for example, that a U.S. spy agency would presume to collect against an allied foreign leader like German Chancellor Angela Merkel¹²—surveillance that now seems forward-thinking and reasonable given later reports that Merkel has been on the phone frequently during the Crimea crisis with Vladimir

Putin.¹³ Major news organizations have considered it front-page news that NSA has pursued intelligence targets on online gaming platforms and smartphone apps,¹⁴ that NSA has collected contact lists in large numbers around the world,¹⁵ even that foreign countries *spy on one another*, collect attorney-client communications involving U.S. lawyers along the way, and may share that material with NSA subject to U.S. law and minimization requirements.¹⁶ Whether one considers these stories important journalism or reckless blowing of valuable surveillance activities, they both reflect and further stoke a deep concern about the scope of U.S. surveillance practices. And that concern is creating inexorable pressures for reforms we may regret in the counterterrorism space. The legal regime here is one that this body knowingly and deliberately created in an iterative set of interactions with the intelligence community and the courts. It requires no apology. Rather, it requires an active defense. And while there are certainly areas in which the regime could benefit from reform, the big risk here is that overreaction and panic in the face of exposure will lead to a burdening of the core signals intelligence capacity of the United States with legal processes designed to protect civil liberties domestically. This could happen either because reform efforts go too far or because Congress fails to reauthorize 702 and thus applies the terms of core FISA—which require an individualized warrant based on probable cause— to a wide swath of overseas collection. Broadly then, the legislative task with respect to Section 702 is something of the opposite of the task with respect to the AUMF. To the extent that members of this committee continue to believe, as I do, in the essential integrity and value of the existing legal authorities for intelligence collection and oversight, the task in the current political environment is to defend that architecture—publicly and energetically—rather than to race to correct imagined deficiencies, or even real structural deficiencies that, however real they may be, bear little relation to the outcomes that disquiet us.

Cyber Provisions

Encryption cracking necessary to prevent terrorism

Network World, September 19, 2013, NSA wants even closer partnership with tech industry; NSA's Debora Plunkett says NSA's now is real-time automated information sharing on a large scale, <http://www.networkworld.com/news/2013/091913-nsa-tech-industry-274011.html>
DOA: 2-1-15

The National Security Agency's director of information assurance today said the "way to achieve confidence in cyberspace" is to increase collaboration between the government and the high-tech industry -- remarks that rang ironic given former NSA contractor Edward Snowden's revelations about how NSA works with industry. NSA documents leaked by Snowden showed that the NSA's goal is to build backdoors into commercial products and weaken encryption to make it easier for surveillance, allegations that the U.S. government has not even tried to refute. When asked about that today, NSA director of information assurance Debora Plunkett, who gave the keynote address at the New York Institute of Technology Cyber Security Conference here, flatly refused to discuss the topic. But her keynote address was intended to get hardware and software vendors to work in ever-closer partnership with the NSA. Cyberattacks that could take electricity grids offline and disrupt transportation systems are possible, Plunkett said in her keynote, pointing out the destructive attack that hit Saudi Aramco last year and impacted data systems there. [RELATED: Reported NSA actions raise serious questions about tech industry partnerships MORE: Black Hat: Top 20 hack-attack tools] It's a simple matter to hire hacking services to carry out attacks such as denial-of-service, she said, and the fear now is of "integrity attacks" that would destroy or alter critical data. These are all "cyber security challenges," she noted, and the government today is largely dependent on commercial hardware and software for which the NSA itself cannot "provide indemnification." NSA's needs industry's help, she said. Plunkett said "we have to have a community come together" to collaborate on security in mobility and the cloud especially. The NSA expects that the future of network security lies in "more automated cyber defense" based on "large-scale automation" that would reduce the need for manpower where there would be more real-time sharing of findings. She said there's a need for collaboration with ISPs and hardware companies to achieve all of this. "We have to build a close partnership," she said, adding, there can be "confidence in cyberspace" if "we stay the course." Plunkett is a 29-year veteran of the NSA who worked her way up through the ranks to have a hand in guiding strategic direction for the agency, which carries out surveillance to help defend the country against cyberthreats. But NSA documents recently leaked by Snowden show that the NSA views its partnership with industry in part as a way to subvert security in commercial products and services to make cyber-spying easier. This revelation casts NSA's call for industry partnership and its insistence that there can be "confidence in cyberspace" in a questionable light.

Domestic Anti-Terrorism Key

Domestic terror solvency spills over to international solvency

Michael **Massing**, Journalist, 20**01** [The American Prospect, " Home-Court Advantage: What the War on Drugs Teaches Us about the War on Terrorism, 12/3, 12: 21, <http://prospect.org/article/home-court-advantage>]

Might not the same be true with terrorism? There is no treatment analogy, of course. But if our main goal is to prevent future terrorist attacks, wouldn't it be more effective to concentrate our enforcement efforts here, in the United States, instead of operating on the hostile terrain of the Middle East? In all the talk about unleashing the CIA, it's often overlooked that the perpetrators of September 11 had been living in this country for years. In detecting and rooting out terrorists, shouldn't we tend primarily to our own backyard? The Home Team Emphasizing prevention at home would offer a number of advantages. First, it's much easier to carry out undercover work here than abroad. Agents face fewer hazards in San Diego, Trenton, and Boca Raton than they do in Beirut, Cairo, or Peshawar. And we have many more resources here. In addition to the FBI and other federal agencies, thousands of local police officers are working on terrorism in cities across the country. In the drug war, the local police have led the way in dismantling drug gangs, and they could make a similar contribution toward uprooting terrorist networks. Furthermore, when it comes to obtaining "HUMINT"--the critical "human intelligence" collected by investigative agencies--the millions of loyal American Muslims living in this country would seem a far more fruitful source than Islamic fundamentalists in the Middle East. Finally, concentrating on domestic law enforcement would avoid the types of covert actions that have proved so costly and embarrassing in the past.

Intelligence Necessary to Prevent Genocide

Intelligence necessary to prevent human trafficking and mass atrocities

Report and Recommendations of the President's Review Group on Intelligence, December 2013, Liberty and Security in a Changing World, December 12, http://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf

Intelligence is designed not only to protect against threats but also to safeguard a wide range of national security and foreign policy interests, including counterintelligence, counteracting the international elements of organized crime, and preventing drug trafficking, human trafficking, and mass atrocities.

A2: Terrorists No Longer Use Email

Terrorists still communicate via email

Alastair **Stevenson** , Computer Reseller News UK, June 24, 20**14**, NSA and GCHQ mass surveillance a waste of time, says Edward Snowden

"The top spy in the US - the director of National Intelligence James Clapper - stated in a private meeting that was later reported in the press, that regardless of their fears, terrorists and criminals have to communicate. And when they do, they will always make mistakes and give us ways to find them," he said. "For example, we've all known about telephone wire taps for years now, but criminals still use them. We know about internet surveillance, but we still use email because it's critical to our lives. We have ways to monitor them."

Government Transparency

Increasing transparency increases terrorism risks because terrorists can take advantage of the information

SENATOR CHARLES **GRASSLEY** (R-IA), July 31, 20**13**, Hearing of the Senate Judiciary Committee Subject: "Strengthening Privacy Rights and National Security: Oversight of FISA (Foreign Intelligence Surveillance Act) Surveillance Programs"
<https://www.hsdl.org/?view&did=741931>

Finally, increased transparency is a worthy goal in general. And as I suggested before, whenever we can talk about these programs, I think there's less questions out there in the minds of people, and we probably created some public relations problems for us and for this program and for our national security community because maybe we haven't made enough information available. I say that understanding that we can't tell our enemies what we -- what tools we use. But if we consider any reform that may bring more transparency to the FISA process, we should keep in mind, then, that every piece of information we make available to the public will be read by a determined adversary, and that adversary has already demonstrated the capacity to kill thousands of Americans, even on our own soil.

RFID

RFID technology defeats terrorism

Gene **Kaprowski**, August 13, 20**14**, UPI, "Wireless World: RFID to Thwart Terrorism," http://www.upi.com/Science_News/2004/08/13/Wireless-World-RFID-to-thwart-terrorism/88291092413872/ DOA: 5-1-15

An associate of Osama bin Laden crawls into a container -- along with some new luxury cars -- in a shipyard in Hamburg, Germany. The goal -- shipping himself to the United States and evading the Department of Homeland Security, with its high-tech officers on the ground at major airports, armed with databases of suspects' photos. He is foiled, however, when a silent alarm is triggered, and an alert is sent to security over the airwaves, as he lifts the lid of the container in the warehouse. A wireless radio frequency identification or RFID security tag on the container sent the signal, silently, without alerting the intruder. This scenario is one the government, major shippers and transportation companies are envisioning as possible for the near future. "The security of American ports continues to be a critical issue for homeland security," Robert Jackson, an attorney with Reed Smith LLP, located in the firm's Washington, D.C., office, told United Press International. RFID technology, long touted as in-store anti-theft devices for retailers, is evolving and now is "the answer for homeland defense at our ports," Ben Quinones, a partner in the technology law practice of Pillsbury Winthrop in California's Silicon Valley, told UPI. The technology, developed by private sector research and development labs -- at companies like Avery Dennison, among others -- goes by several names, but one well-known product is called the "security strap," a spokesman for the company told UPI. Once goods are sealed inside a box, a longshoreman or another worker affixes the security strap. That enables shippers to track the cargo containers through their entire overseas trip. Tampering with the seal brings a security check. Companies like SAMSys are moving forward with second-generation RFID security technologies that may be even more effective. Sun Microsystems Inc. recently opened a test center in Dallas, giving customers a location to test an array of RFID scenarios, a spokesman told UPI. Even food and drug companies are eyeing the technology, fearful that rogues may tamper with or, worse yet, counterfeit the nation's pharmaceutical supplies. The technology also is garnering funds at government research laboratories, as scientists are anxious to improve the state of the art for RFID. Last month, the U.S. Department of Energy's Oak Ridge National Laboratory reached a development deal with Spectrum Signal Processing Inc. for a RFID platform, endorsed by the Pentagon, for an array of applications, a spokesman told UPI. RFID security technology currently comes in many forms, experts said. "Tags on containers, for rail cars, are fairly large and are active," John Parkinson, chief technologist, North American Region, with the consulting firm Capgemini in suburban Chicago, told UPI. "They contain a power source and can broadcast a signal that can be tracked by a satellite. Load the tag with a manifest of what's in the container, and you can track it as it moves along the

global supply chain." Other kinds of tags operate passively but still are good for catching stowaways, Parkinson said. "Pass the tag through a broadcast RF (radio frequency) from a reader and the tag gets enough energy to squawk out a short code so it can be used to look up what's on the pallet or in the carton," he said. "If the passive tag IDs point to data that specifies size and weight, a quick calculation and weighbridge datum tells you if the container is full and over or under weight. Stowaways or added materials would show up." Some technology companies, like RAE Systems Inc. and a wireless semiconductor maker called Ember Corp., don't think RFID tags provide enough information or security. They believe wireless sensor technology will be more effective at monitoring shipping containers. Around Christmas last year, the companies demonstrated a prototype wireless security monitoring system, designed to help carriers of cargo comply with federal regulations seeking to prevent terrorists from smuggling nuclear weapons and other weapons of mass destruction into the United States. The Department of Homeland Security last Nov. 18 declared it wanted cargo companies that ship to American ports to equip their containers to prevent terrorist threats. The prototype technology developed by RAE Systems and Ember uses embedded RF chips and networking software to wrap cargo in a virtual Web network, which can detect weapons grade materials, as well as detail when containers have been opened. "It's easier to detect potential terrorists in American ports when we know what's happening inside the container at all times," RAE Systems Chief Executive Officer Robert Chen said in a statement. More than 7 million shipping containers pass through U.S. ports each year, experts said. "The sheer volume of cargo entering our country every day makes it too easy for terrorists to smuggle dangerous cargo," Ember CEO Jeff Grammer said in a statement. The movement for wireless technology to track potential terrorist threats also is creating some consumer spin-offs, experts said. The Airport IT Trends Survey, sponsored by the airline information technology industry, reported 8 percent of responding airports already offer RFID tracking for passenger baggage. This is expected to increase to 25 percent of airports during the next two years. That could, one day, mean no more irretrievable luggage, lost forever in some cargo bin. Long-term, RFID also could speed up the process for importers to bring legitimate goods into the United States. The Department of Homeland Security has started using RFID tags to identify freight-carrying trucks as they cross the border with Canada and, by the end of the year, the technology is expected to be deployed to other land entry points into the United States. Another use is RFID cards for those people who frequently cross the border into the U.S. Congress is eyeing these technology developments, especially now that the Pentagon and Homeland Security are pushing RFID projects, and views them as replacing less-effective video surveillance methods. "RFID chips are more powerful than today's video surveillance technology," said Sen. Patrick Leahy, D-Vt., during a conference this spring at the Georgetown University Law Center. "RFIDs are more reliable, they are 100 percent automatic, and they are likely to become pervasive, because they are significantly less expensive."

RFID technology provides security against terrorism

Laura **Wiegler**, 2014, June 20, RFID Insider, "Securing Entry: RFID is Making us Safer," DOA: 5-2-15

In 2001, the database the Department of Homeland Security (DHS) uses to check visa and passport applicants held about 7 million visa records and over 2 million passport records, according to the DHS. Further, they said that, "if a visa applicant turned out to be a possible match for a terrorism-related CLASS record, the consular officer requested a Security Advisory Opinion (SAO) from the Visa Office in Washington. Such requests were sent via cables, as were the Department's responses. This multi-step cable process to communicate with posts and to coordinate with other government agencies resulted in long wait times for both the consular officers and the applicants." A simpler, more efficient way By 2005, though, those long wait times were going to change – at least in theory – as RFID was introduced to the average American passenger traveling internationally. Today, the State Department issues both passport cards and passport books that are "smart" enough to read our information, the former at a distance and the latter at close range. The U.S. employs biometrics, which can be obtained through facial recognition, fingerprints, or the scanning of irises, but apparently requirements can vary. Michael Holly, Senior Advisor for International Affairs, Passport Services in the U.S. Department of State Bureau of Consular Affairs told RFIDinsider that "We use both fingerprints and facial recognition [for visas]. We've also studied the use of iris images." He did not elaborate further, but it's widely speculated that scanning iris images is not as reliable, and thus less popular, than scanning fingerprints and recognizing faces. For passports, moreover, a digitized and readable photo is used, forgoing fingerprints on its contactless chip. Insofar as the Government's rationale behind RFID's use, Holly claims the history far precedes 9-11, a common barometer for measuring the nation's security practices. Indeed, according to the U.S. Government, RFID has been used along the nation's land borders with Canada and Mexico since 1995. While Holly didn't spell this out, the new passports have been designed to better protect the public from terrorism, even though it's arguable whether or not they are also easing hassles at airports. Toward that end, there are bells and whistles attached to modern-day passports, and depending on whether one has the "card" or the "book", the technology differs. "What we provide to a U.S. traveling citizen bearing a passport card is a protective sleeve with that document," Holly says. "But with a passport we do a number of things – these are two different technologies: proximity and vicinity." He says with a passport card "vicinity technology" is employed; and a number of things are done to protect it "from the possibility of skimming data from the chip, and eavesdropping. We use anti-attenuation tape, a skimming sleeve that blocks the possibility of someone trying to skim data from the chip if the book is closed," he says. The borders agent can thus obtain information discreetly, and in real time, according to Holly. "They're [the passport issuers] using PKI (public key infrastructure) and in association with the RFID chip we can ...confirm data that

appears on the passport's data page and [which one] can authenticate using the digital signatures," he says. Obviously, in an era when a plane can go missing for weeks or months, and two passengers can board with stolen passports, security at least worldwide is hardly foolproof. Nevertheless, Holly believes that over about the past decade, the American traveler's experience is far more secure than it was in the halcyon days of early air travel. "We use a security protocol known as the "basic access control" that requires, in order for the chip to communicate with a reader, that [the passport owner's] book must be open, that the machine- readable zone be read." He says this "zone" is two lines of OCR code at bottom of the passport page, and from which "a number of pins are derived, and then once that happens, the chip will communicate with the reader, releasing the data on the chip." In the case of passport books, the readers are at the customs booths for use upon entry to the foreign country. But in the case of cards, which he explains are commonly used when U.S. citizens travel by car from the northernmost and southernmost parts of the country, the data is read from a greater distance. (See article on toll booth RFID use.) Both [the card type and book type] are passports but the book uses RFID proximity technology, he explains. "The chip in the passport book is a microprocessor. It stores data on it. ...The passport card does not store any data. It simply points [via a recognized serial number] to a record stored in a secure database." The Netherlands-based Gemalto, a global digital security firm, has been working with the U.S. Government for several years on rolling out RFID for use on or with passports. Gemalto says on its website that in August of 2012, the Government Printing Office (GPO) awarded the company with a second consecutive five-year contract. "Gemalto first partnered with [the] GPO in 2006 following stringent evaluations to meet agency requirements," the company says on its site

Biometrics

Biometrics essential to counter terrorism

Patrick **Tucker**, February 27, 2015, Defense One, Jihadi John and the Future of the Biometrics Terror Hunt, <http://www.defenseone.com/technology/2015/02/jihadi-john-and-future-biometrics-terror-hunt/106263/> DOA: 5-7-15

On Thursday, the *Washington Post* and *BBC* publicly identified Mohammed Emwazi, a British-educated, Kuwaiti-born man in his mid 20s, as “Jihadi John,” the Islamic State frontman who executed several hostages on camera, to the world’s horror. “We will not comment on ongoing investigations and therefore are not in a position to confirm or deny the identity of this individual,” the FBI said Thursday. Denials aside, FBI director James Comey said months ago that they knew John’s identity. If the FBI has in fact identified Jihadi John, the victory was, in part, a product of the FBI’s growing collaboration with the Department of Defense — a relationship that will grow much more cozy in the coming years, in the black cherry tree dotted hills of Clarksburg, West Virginia. About four hours away from Washington D.C. sits the headquarters of the FBI’s Criminal Justice Information Services Division, or CJIS, which houses the bureau’s Biometric Center of Excellence. The center is not a place so much as a program begun in 2007 that plays a key role in making use of all the biometric data that comes into the FBI’s possession. That’s every fingerprint, every image, and every phone message that anyone sends to the FBI. “Bottom line for us ... if any of our divisions, whether it be our counterterrorism division, our criminal division, if at any time during their investigations they develop biometrics ... they submit it through our system,” Stephen L. Morris, assistant director of the CJIS, told *Defense One* at a recent conference in Washington. In terms of identifying John, he said, “I’m not going to tell you how we did it,” but added, “You have to have something to search ... you can have images with faces but if you’re not capturing it in the right way, if there’s not data in that image to make a comparison, it’s just not useful.” This, in part, is why the biometric center plays a role in bringing parties, and their biometric databases, together. The FBI’s system is called the Next Generation Identification, or NGI. It includes photos, aliases, physical characteristics and, of course, fingerprints. Today, it’s completely interoperable with the military’s Automated Biometric Identification System, or ABIS, and the Department of Homeland Security’s Automated Biometric Identification System, or IDENT. The center also works with the State Department and allied law enforcement agencies around the world. The FBI and Britain’s MI5 have been working together to identify John. Obtaining a biometric record on a suspect to match against a terrorist video of a masked jihadi is not something done easily or robotically. It requires old school investigation, either sifting through lots of hours of collected video footage and comparing that to crime videos (such as beheadings), or going out into the field to find voice samples on suspects to match against crime videos, or both. This is where the Defense Department’s extensive library of biometric signatures, gathered on the field in places like Iraq and Afghanistan, can play a role in future investigations. The department’s biometrically enabled watch list, or BEWL, houses more than 200,000 records.” I can’t speak enough about our relationship with the Department of Defense. After

9/11, our mission in life changed. It was all about national security, our partnership with DHS and DOD — to say it expanded is an understatement,” Morris said at a recent biometrics conference in Washington, D.C. “Their ABIS system was connected with our system, so they have a small group of folks who are out there [in West Virginia] in charge of their system. Having them co-locate with us has been very important.” That important relationship is about to get a lot more intimate. Later this year, the FBI is going to open a \$328 million, 360,000-square foot Biometric Technology Center next to the current CJIS campus. The Defense Department will get about 40,000 square feet in the building, which will also consolidate the FBI’s biometric workers and operations. “Anything and everything we do will be run out of that building,” said Morris. In September of last year, the FBI announced that the \$1.2 billion dollar NGI system was fully operational (it was rolled out in increments over a period of years). If it works according to plan, it will provide law enforcement with a very fast and reliable sense of exactly who they are talking to, what threat that individual may pose, and what records they’ve left — fingerprints, voiceprints, etc. — in what places. But fingerprints don’t help you catch everyone. Voice recognition played a key role in the identification of Jihadi John, according to published reports. The FBI’s biometric center site lists voice recognition as one of its key modalities, or areas of study, along with DNA and others, but fingerprints and more traditional biometric signatures make up a bulk of the records it manages.

Biometrics needed to prevent terrorism

John **Woodward**, RAND, 2002, Biometrics: Facing Up Terrorism, <http://www.rand.org/content/dam/rand/www/external/congress/terrorism/phase1/biometrics.pdf> DOA: 5-3-15

As the nation recovers from the attacks of September 11, 2001, we must rededicate our efforts to preventing any such terrorist acts in the future. While there is no easy, foolproof technical fix to counter terrorism, the use of biometric technologies might help make America a safer place. Biometrics refers to the use of a person’s physical characteristics or personal traits to identify, or verify the claimed identity, of that individual. Fingerprints, faces, voices, and handwritten signatures are all examples of characteristics that have been used to identify us in this way. Biometric based systems provide automatic, nearly instantaneous identification of a person by converting the biometric, for example a fingerprint, into digital form and then comparing it against a computerized database. This RAND Issue Paper discusses how biometric technologies could be used to impede terrorism in three critical areas: 1. Controlling access to sensitive facilities at airports, 2. Preventing identity theft and fraud in the use of travel documents, and, 3. Identifying known or suspected terrorists with a proposed counterterrorist application known as FaceCheck.

UQ

General

Surveillance Programs Now

Surveillance is first step to prevent terror

General Keith Alexander, retired after 8 years as director of the NSA, May 15, 2014, New Yorker,

<http://www.newyorker.com/online/blogs/newsdesk/2014/05/were-at-greater-risk-q-a-with-general-keith-alexander.html> DOA: 2-20-15

In January, President Obama claimed that the N.S.A. bulk-metadata program has disrupted fifty-four terrorist plots. Senator Patrick Leahy said the real number is zero. There's a big difference between fifty-four and zero. Those [fifty-four events] were plots, funding, and giving money—like the Basaaly Moalin case, where the guy is giving money to someone to go and do an attack. [Note: Moalin's case is awaiting appeal.] It's fifty-four different events like that, where two programs—the metadata program and the 702 program—had some play. I was trying to think of the best way to illustrate what the intelligence people are trying to do. You know “Wheel of Fortune”? Here's the deal: I'm going to give you a set of big, long words to put on there. Then I'm going to give you some tools to guess the words. You get to pick a vowel or a consonant—one letter. There's a hundred letters up there. You'll say, I don't have a clue. O.K., so you've used your first tool in analysis. What the intelligence analysts are doing is using those tools to build the letters, to help understand what the plot is. This is one of those tools. It's not the only tool. And, at times, it may not be the best tool. It evolved from 9/11, when we didn't have a tool that helped us connect the dots between foreign and domestic. Around 9/11, we intercepted some of [the hijackers'] calls, but we couldn't see where they came from. So guys like [Khalid al-Mihdhar, [one of the 9/11 hijackers who was living] in California—we knew he was calling people connected to Al Qaeda in Yemen. But we thought he was in the Middle East. We had no way to connect the dots. If you rewound 9/11, what you would have done is tipped the F.B.I. that a guy who is planning a terrorist attack is in San Diego. You may have found the other three groups that were with him.

We must keep all intelligence tools to fight terror

John **McLaughlin** teaches at the Johns Hopkins School of Advanced International Studies. He was deputy director and acting director of the CIA from 2000 to 2004, January 2, 2014, Washington Post, “NSA Intelligence-Gathering Programs Keep us Safe,” http://www.washingtonpost.com/opinions/nsa-intelligence-gathering-programs-keep-us-safe/2014/01/02/0fd51b22-7173-11e3-8b3f-b1666705ca3b_story.html

As our debate continues, the terrorist threat is not receding but transforming. The core leadership of al-Qaeda has been degraded and remains under pressure, but robust al-Qaeda affiliates have multiplied. With the decline of central government authority in the Middle East and North Africa in the wake of the Arab Spring and the war in Syria, terrorists have the largest havens and areas for operational planning in a decade. If anything, the atomization of the movement has made the job of intelligence more labor-intensive, more detail-oriented and more demanding. Now is not the time to give up any tool in the counterterrorism arsenal.

Intelligence gathering critical to defeat terrorism

Paul **Rosenzweig**, Heritage Senior Legal Research Fellow, 2004 ["The Patriot Act Reader," w/ Alane Kochems & James Jay Carafano, 9/20, [http://www.heritage.org/Research/HomelandDefense/loader.cfm?url=/commonspot/security/getfile.cfm&PageID=69895](http://www.heritage.org/Research/HomelandDefense/loader.cfm?url=/commonsspot/security/getfile.cfm&PageID=69895)]

As should be clear from the outline of the scope of the problem, the suppression of terrorism will not be accomplished by military means alone. Rather, effective law enforcement and/or intelligence gathering activity are the key to avoiding new terrorist acts. Recent history supports this conclusion. In fact, police have arrested more terrorists than military operations have captured or killed. Police in more than 100 countries have arrested more than 3,000 al-Qaeda-linked suspects, while the military captured some 650 enemy combatants. Equally important, it is policing of a different form—preventative rather than reactive, since there is less value in punishing terrorists after the fact when, in some instances, they are willing to perish in the attack. The foregoing understanding of the nature of the threat from terrorism helps to explain why the traditional law enforcement paradigm needs to be modified (or, in some instances, discarded) in the context of terrorism investigations. The traditional law enforcement model is highly protective of civil liberty in preference to physical security. All lawyers have heard one or another form of the maxim that “it is better that 10 guilty go free than that one innocent be mistakenly punished.” This embodies a fundamentally moral judgment that when it comes to enforcing criminal law, American society, in effect, prefers to have many more Type II errors (false negatives) than it does Type I errors (false positives). That preference arises from two interrelated grounds. One is the historical distrust of government that, as already noted, animates many critics of the Patriot Act. But the other is, at least implicitly, a comparative valuation of the social costs attending the two types of error. We value liberty sufficiently highly that we see a great cost in any Type I error. And though we realize that Type II errors free the guilty to return to the general population, thereby imposing additional social costs on society, we have a common-sense understanding that those costs, while significant, are not so substantial that they threaten large numbers of citizens or core structural aspects of the American polity. The post-September 11th world changes this calculus in two ways. First, and most obviously, it changes the cost of the Type II errors. Whatever the cost of freeing mob boss John Gotti or sniper John Muhammad might be, they are substantially less than the potentially horrific costs of failing to stop the next al-Qaeda assault. Thus, the theoretical rights-protective construct under which our law enforcement system operates must, of necessity, be modified to meet the new reality. We simply cannot afford a rule that “better 10 terrorists go free than that one innocent be mistakenly punished.” Second, and less obviously, it changes the nature of the Type I errors that must be considered. In the traditional law enforcement paradigm, the liberty interest at stake is personal liberty—that is, freedom from the unjustified application of governmental force. We have as a model the concept of an arrest, the seizure of physical evidence, or the search of a tangible place. As we move into the Information Age, and deploy new technology to assist in tracking terrorists, that model is no longer wholly valid.

NSA surveillance has disrupted more than 50 terror plots

USA Today, JUN 07, 2013,

<http://www.usatoday.com/story/news/nation/2013/06/18/nsa-surveillance-secret-programs-terror-plots/2434193/> NSA: Surveillance foiled 50 terror plots By: Kevin Johnson, DOA: 1-1-14 Director says NYSE was among targets Section: News, Pg. 05a

National Security Agency Director Keith Alexander told a House committee Tuesday that more than 50 terror threats throughout the world have been disrupted with the assistance of two secret surveillance programs that were recently disclosed by former defense contractor Edward Snowden. More than 10 of the plots targeted the U.S. homeland, Alexander told the House Intelligence Committee, including a plan to attack the New York Stock Exchange. "I would much rather be here today debating this," Alexander said, "than explaining why we were unable to prevent another 9/11" attack. At the rare open committee hearing, Alexander and Deputy Attorney General Jim Cole told lawmakers that both surveillance operations -- a domestic telephone tracking system that collects records of millions of Americans and an Internet monitoring program targeting non-citizens outside the U.S. -- have been subject to rigorous oversight to guard against privacy abuses. "This isn't some rogue operation that some guys at the NSA are operating," Alexander said. Deputy FBI Director Sean Joyce told the committee about a threat that was neutralized by the programs: Investigators used the phone-tracking system to identify an operative in San Diego who was providing support to terrorists in Somalia. Joyce also referred to two disrupted plots that were disclosed last week as having been thwarted by the surveillance operations, including a 2009 plan to bomb the New York subway system. In that case, authorities used NSA's Internet monitoring program to identify overseas communications involving Najibullah Zazi in Colorado, who was later convicted in connection with the subway attack plan. "This is not a program that is off the books," Cole said, outlining the executive, legislative and judicial controls. In the plot against the stock exchange, Joyce said investigators identified a former New York accountant working with contacts in Yemen who were in the early stages of planning an assault. Joyce did not name the man. In court documents, however, he is identified as Sabirhan Hasanoff, 37, who pleaded guilty last year to providing support to al-Qaeda. Hasanoff was not charged in a plot against the stock exchange, but prosecutors, while arguing for a harsh prison sentence, alleged in court documents that he "cased the New York Stock Exchange" at the direction of a terror leader in Yemen. Hasanoff's attorney was not immediately available for comment. Lawmakers raised few questions about the intelligence officials' authority to conduct the operations, despite the heated national privacy debate that was prompted by Snowden's disclosures. Rep. Mike Rogers, R-Mich., the panel's chairman, said the programs were "designed" to protect Americans. Maryland Rep. Dutch Ruppersberger, the committee's ranking Democrat, said Snowden's unauthorized disclosures "put our country and allies in danger."

Surveillance critical to disrupt clandestine terrorist operations

Report and Recommendations of the President's Review Group on Intelligence, December 2013, Liberty and Security in a Changing World, December 12,

http://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf
DOA: 1-1-14

In the American tradition, the word "security" has had multiple meanings. In contemporary parlance, it often refers to national security or homeland security. Thus understood, it signals the immense importance of counteracting threats that come from those who seek to do the nation and its citizens harm. One of the government's most fundamental responsibilities is to protect this form of security, broadly understood. Appropriately conducted and properly disciplined, surveillance can help to eliminate important national security risks. It has helped to save lives in the past. It will help to do so in the future. In the aftermath of the terrorist attacks of September 11, 2001, it should not be necessary to belabor this point. By their very nature, terrorist attacks tend to involve covert, decentralized actors who participate in plots that may not be easy to identify or disrupt. Surveillance can protect, and has protected, against such plots.

Any Restrictions on intel gathering increase terror risk

Ambassador L. Paul **Bremer**, National Commission on Terrorism Chair, 2000 ["New Terrorist Threats and How to Counter Them," 7/31, <http://www.heritage.org/Research/HomelandDefense/hl678.cfm>]

It is obvious that there is no substitute for good intelligence if you are going to have an effective counterterrorist policy. I have worked in and around government for 35 years now, and I have never seen a field in which intelligence is more central to good policy and intelligence is more difficult to get than in the field of terrorism. If you don't have good intelligence on terrorists, you simply don't have an effective counterterrorist policy and, most of all, you cannot prevent attacks. After all, the basic objective of counterterrorism is to stop the attacks before they happen.

Intel Key to solve terror

Fernando **Reinares**, Department of Politics and Sociology, Universidad Nacional de Education a Distancia, Madrid, War on Terrorism, ed. Alan O'Day, 2004, p. 226-7

Given the clandestine and unpredictable nature of terrorism, however, all these resources may not be effective unless they are accompanied by mechanisms for detecting and preventing future threats. Reliable intelligence is an essential tool. Experience shows that, as long as the other components function as they should, success in the state's counter-terrorism campaign is directly proportional to the emphasis placed on the gathering and analyzing of reliable information. On the contrary, when intelligence is insufficient or inadequate, the terrorist group may sense the window of opportunity they are being offered and will not hesitate to exploit this advantage by escalating its campaign of insurgent violence. In 1976, for reasons that have never been sufficiently clarified, the Italian Government decided to dismantle the special anti-terrorist units it had created only a few years earlier and ordered far-reaching reorganization of its secret services. Terrorist attacks, which until then had been diminishing in frequency, immediately began to pick up and did not ease again until the early 1980s. Not coincidentally, by that time, revamped intelligence services put under greater supervisory control of the legislative and executive branches, had begun to produce results.

Internal Terror Prevention Strong Now

Intelligence necessary to protect against WMD proliferation and terrorism

Report and Recommendations of the President's Review Group on Intelligence, December 2013, Liberty and Security in a Changing World, December 12, http://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf

The national security threats facing the United States and our allies are numerous and significant, and they will remain so well into the future. These threats include international terrorism, the proliferation of weapons of mass destruction, and cyber espionage and warfare. A robust foreign intelligence collection capability is essential if we are to protect ourselves against such threats. Because our adversaries operate through the use of complex communications technologies, the National Security Agency, with its impressive capabilities and talented officers, is indispensable to keeping our country and our allies safe and secure.

Efforts to track-down and arrest terrorists are effective

Heritage Foundation, August 2011, Homeland Security 2010, [http://www.heritage.org/Events/2011/08/Terror-](http://www.heritage.org/Events/2011/08/Terror-Trends?query=Terrorism+by+the+Numbers:+Understanding+U.S.+and+Global+Trends)

[Trends?query=Terrorism+by+the+Numbers:+Understanding+U.S.+and+Global+Trends](http://www.heritage.org/Events/2011/08/Terror-Trends?query=Terrorism+by+the+Numbers:+Understanding+U.S.+and+Global+Trends)

A decade after the 9/11 terrorist attacks and after the demise of Osama bin Laden, looking back is as important as looking forward, in order to learn from the past and to examine the current and future threats facing the United States. Domestically, since the terrorist attacks of September 11, 2001, at least 40 terror plots against the U.S. have been foiled thanks to domestic and international cooperation, as well as efforts to track down terror leads in local communities. Likewise, on a global scale, from 1969 to 2009, there were a staggering 38,345 terrorist incidents around the world, with nearly 3,000 targeted at the United States alone. These numbers serve as a reminder that terrorists have not relented in their desire to harm the United States and its people – America needs to remain vigilant. Join us as our panelists discuss the nature of the terrorist threat to the United States and U.S. counterterrorism policy since 9/11.

Existing US counterterrorism efforts effective

Bergen, et al, September 2013, Jihadist Terrorism: A Threat Assessment,

[http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf)

[A%20Threat%20Assesment_0.pdf](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf) Peter Bergen is the author of four books about al-Qaeda, three of which were New York Times best sellers. The books have been translated into 20 languages. He is the director of the National Security Program at the New America Foundation in Washington, D.C.; a fellow at Fordham University's Center on National Security; and CNN's national security analyst.

As detailed above, al-Qaeda has weakened considerably over the past few years, while U.S. defenses have been strengthened. Just consider the following changes since the 9/11 attacks:

On 9/11, there were 16 people on the “no fly” list. Now there are more than 20,000. In 2001, there were 32 Joint Terrorism Task Force “fusion centers” where multiple law enforcement agencies work together to chase down leads to build terrorism cases. Now there are 103. A decade ago, the Department of Homeland Security, National Counterterrorism Center, Transportation Security Administration, U.S. Northern Command, and U.S. Cyber Command didn’t exist. All of these new institutions currently make it much harder for terrorists to operate in the United States. Before 9/11, Special Operations Forces were rarely deployed against al-Qaeda and allied groups. Now they perform nearly a dozen operations every day in Afghanistan, as well as missions in other countries such as Yemen and Somalia. At the beginning of the 21st century, the American public didn’t comprehend the threat posed by jihadist terrorists, but that changed dramatically after 9/11. In December 2001, it was passengers who disabled Richard Reid, “the shoe bomber.” Similarly, it was fellow passengers who tackled Umar Farouk Abdulmutallab, the “underwear bomber,” eight years later. And the following year, it was a street vendor who spotted the bomb-laden SUV Faisal Shahzad had parked in Times Square. Before 9/11, the CIA and the FBI barely communicated about their respective investigations of terrorist groups. Now they work together quite closely. The U.S. intelligence budget grew dramatically after 9/11, giving the government large resources with which to improve its counterterrorism capabilities. In 2010, the United States spent more than \$80 billion on intelligence collection and other covert activities, a total more than three times what it spent in 1998.

General Terror Risk

Up now

Number of terror attacks increasing

General Clapper, Director of National Intelligence, February 26, 2015, Full Committee Hearing on "Worldwide Threats", <http://www.armed-services.senate.gov/hearings/15-02-26-worldwide-threats>

Moving onto terrorism, in 2013, just over 11,500 terrorist attacks worldwide killed approximately 22,000 people. Preliminary data for the first nine months of 2014 reflects nearly 13,000 attacks, which killed 31,000 people. When the final counting is done, 2014 will have been the most lethal year for global terrorism in the 45 years such data has been compiled.

Terror threat increasing

General Clapper, Director of National Intelligence, February 26, 2015, Full Committee Hearing on "Worldwide Threats", <http://www.armed-services.senate.gov/hearings/15-02-26-worldwide-threats>

I'm drawing this data -- ISIL conducting more attacks than any other terrorist group in the first nine months of 2014. And credit where credit's due, I'm drawing this data from the National Consortium of the Study of Terrorism and Responses to Terrorism, or START, at the University of Maryland. The recent terrorist attacks in Europe emphasized the threat posed by small numbers of extremists radicalized by the conflicts in Syria and Iraq. The global media attention and widespread support in extremist circles for these attacks probably will inspire additional extremists to conduct similar attacks. In ISIL, Al Qaida and Al Qaida in the Arabian Peninsula and most recently, Al Shabaab are calling on their supporters to conduct loan- wolf attacks against the United States and other Western countries. Of the 13 attacks in the West since last May, 12 were conducted by individual extremists. Since the conflict began, more than 20,000 Sunni foreign fighters have travelled to Syria from more than 90 countries to fight the Assad regime. Of that number, at least 13,600 have extremist ties. More than 3,400 Western fighters have gone to Syria and Iraq. Hundreds have returned home to Europe. About 180 Americans or so have been involved in various stages of travel to Syria. I should point out, this is those who've attempted to go, didn't get there, those who got there and were killed, those who got there who fought and went to another country and -- and some number have come back. A relatively small number have returned, and we've not identified any of them engaged in attack plotting. Nevertheless, the home-grown violent extremists continue to pose the most likely threat to the homeland. Loan actors or (inaudible) groups who act autonomously will -- will likely gravitate to simpler plots that don't require advanced skills, outside training or communication with others. A small but persistent number of Sunni terrorist remain intent on striking the U.S. and the West, some of whom still see commercial aviation as -- as an appealing target.

Al Qaeda UQ

General

Al-Qaeda's strength and geographic reach increasing

Dr. **Hegghammer**, 7-18, 13, Dr. Thomas Hegghammer is the Zukerman Fellow at Stanford University Center for International Security and Cooperation and a senior research fellow at the Norwegian Defense Research Establishment in Oslo, Hearing of the Terrorism, Nonproliferation and Trade Subcommittee of the House Foreign Affairs Committee Subject: "Global al-Qaida: Affiliates, Objectives and Future Challenges" <https://www.hsdl.org/?view&did=740859>

I would first point out that I think the growth of al-Qaida's affiliate in Syria and other recent developments make this hearing particularly timely and important. In reviewing al-Qaida's evolution since 1988, I'm going to make three arguments in my opening remarks. First, contrary to some interpretations of the weakness of al-Qaida today, I would respond that it is actually quite resilient. As I look at both al-Qaida as it stood, reflected in part in your map, Mr. Chairman, there has been a net expansion in the number and the geographic scope of al-Qaida affiliates and allies over the past decade, indicating that al-Qaida, at least in my view, is -- and the movement are far from defeated. I'll explain in a moment what I mean by al-Qaida. This growth, in my view, is caused by at least two factors. One is the Arab uprisings, which have weakened regimes across North Africa and the Middle East and created an opportunity for al-Qaida to -- and its allies to establish or attempt to establish a foothold or a safe haven. I would submit that the developments in Egypt are of particular concern. It is where the head of -- current head of al-Qaida is from, and it is another potential avenue for a foothold, depending on how that situation develops over the next several weeks and months. In addition, the growing sectarian struggle across the Middle East between Sunni and Shia, which has been funded by, on the Sunni side, both states and nonstate actors, has increased the resources available to militant groups, including to al-Qaida and its affiliates. So the first point is that I think there's been a slight net expansion in al-Qaida's geographic scope and its number. Second, however, this expansion has, along with the weakness of central al-Qaida in Pakistan -- recently, anyway -- has created a more diffuse and decentralized movement. And I do think this is important, because I think what we see as we look at Syria, Jabhat al-Nusra, Iraq, al-Qaida in Iraq, Somalia, Al-Shabaab, Yemen, the al-Qaida in the Arabian Peninsula, and al-Qaida in the Islamic Maghreb in North Africa, the main affiliates, they largely, as I interpret it, run their operations somewhat autonomously, though they still communicate with the core and still may take some strategic advice. And I would note that, what's interesting in the Syrian front is the attempt from the core in Pakistan to adjudicate a dispute between al-Qaida in Iraq and Jabhat al-Nusra in Syria, and then to have the affiliate in Syria essentially break away from Iraq, the al-Qaida in Iraq segment, and swear allegiance directly to the core element in Pakistan, which to me symbolizes that there is still some importance to that leadership. Now, the way I would -- if pressed, would define al-Qaida today, it would include the core in Pakistan, and I would say, even if Zawahiri were killed, there are at least three potential replacements that sit in Iran today, all of whom are quite well-esteemed and are members of what was called the

management council, and one that potentially sits in -- or that sits in Yemen. So even with the death of Zawahiri, I still think you would get a movement that would continue.

Egypt Warrant

Egyptian coup strengthened Al Qaeda

Gartenstein-Ross 14 (Daveed, Senior Fellow at the Foundation for Defense of Democracies, adjunct assistant professor in Georgetown University's security studies program, "The Arab Spring and Al-Qaeda's Resurgence," Congressional Testimony before the House Armed Services Committee, 2/4/14, <http://docs.house.gov/meetings/AS/AS00/20140204/101698/HHRG-113-AS00-Wstate-Gartenstein-RossD-20140204.pdf>)

But al-Qaeda's biggest gain last year was perhaps the July military coup that deposed Egyptian president Mohamed Morsi, and the often-brutal crackdown on protesters that followed. After the coup, jihadist groups in the Sinai went on an immediate offensive, with targets including security officers and Christians. That offensive has both extended beyond the Sinai region and continued into this year, with a series of four January 24 bombings in Greater Cairo, including an explosion at the security directorate. Egypt's coup also bolstered al-Qaeda's narrative. Many Western observers had hoped the Arab uprisings would weaken al-Qaeda by providing a democratic alternative to the region's dictators. These hopes rested on an inexorable march toward democracy that would prompt increasing numbers of citizens to participate in the new political systems. But the coup showed that democracy is reversible—perhaps particularly so if political Islamist groups are in power. Al-Qaeda emir Ayman al-Zawahiri had been saying exactly this since the revolutions began—claiming in March 2011 that Egypt's new regime, even if nominally democratic, would "preserve and maintain the old policies that fight Islam and marginalize the sharia." Though it's too early to say whether more people are gravitating toward al-Qaeda's argument as a result, Zawahiri and other leading jihadist thinkers have already claimed vindication after the coup, and we can expect more full-throated rhetoric on this point in the coming year. Al-Qaeda also continues to be a force in its traditional strongholds. For example, it has spearheaded an assassination campaign in Yemen that has, for more than two years, targeted the country's military officers. Bearing in mind the manner in which prisoner releases gave new life to jihadism in North Africa, a final concern is a series of jailbreaks in July. The most significant was a July 21 jailbreak at Iraq's notorious Abu Ghraib prison that freed about 500 prisoners from a facility boasting a high concentration of skilled jihadists. On July 28, prison riots coupled with an external attack freed 1,117 inmates from Benghazi's Kuafiya prison. And a sophisticated July 30 prison break in Pakistan, where almost 250 prisoners escaped, was claimed by the militant group Tehrik-i-Taliban Pakistan.⁴⁵ Some of the least surprising news of the year was that U.S. officials came to suspect that these incidents, all occurring around the same time, might "be part of an al Qaeda- coordinated 'Great Escape'-like plot."⁴⁶

Arab Spring Warrant

The Arab Spring strengthened Al Qaeda – three reasons

Gartenstein-Ross 14 (Daveed, Senior Fellow at the Foundation for Defense of Democracies, adjunct assistant professor in Georgetown University's security studies program, "The Arab Spring and Al-Qaeda's Resurgence," Congressional Testimony before the House Armed Services Committee, 2/4/14, <http://docs.house.gov/meetings/AS/AS00/20140204/101698/HHRG-113-AS00-Wstate-Gartenstein-RossD-20140204.pdf>)

Factors Strengthening al-Qaeda and Jihadism Three primary factors have strengthened al-Qaeda and jihadism in the Arab Spring environment, two of which fundamentally relate to the jihadist strategy previously outlined: prisoner releases, dawa opportunities, and the resurgence of jihadist-aligned charity networks. Prisoner releases. The Senate Select Committee on Intelligence report on the notorious September 2012 attack on the U.S. consulate in Benghazi notes that a number of individuals affiliated with terrorist groups were involved, including those affiliated with the Muhammad Jamal Network. Jamal himself is notable as one of many jihadist figures to have been released from Egyptian prison. This makes Jamal part of the aforementioned trend that began with the Arab Spring uprisings, in which prisons in affected countries have been emptied. In many cases, it is a good thing that prisoners have gone free: the Arab dictatorships were notorious for unjustly incarcerating and abusing their political prisoners. But jihadists were part of this wave of releases. Prisoners went free for a variety of reasons. In Libya, Qaddafi's government initially used releases as an offensive tactic early after the uprisings, setting prisoners free in rebellious areas in order to create strife.²⁸ As the rebellion continued, some prison governors decided to empty prisons they were charged with guarding, including as a means of defection.²⁹ Chaos also allowed prison escapes, and gunmen attacked prisons in order to free inmates. Regimes that experienced less chaotic transitions, including Tunisia and Egypt, were hesitant to continue imprisoning virtually anybody jailed by the old regime, including violent Islamists with blood on their hands. Moving beyond Muhammad Jamal, other prominent figures from Egypt's jihadist movement were also freed from prison. The most notorious is Muhammad al-Zawahiri, the brother of al-Qaeda's emir and a former member of Egyptian Islamic Jihad. Zawahiri played a prominent role in encouraging jihadists to join the September 2012 attack on the U.S. embassy in Cairo, and American officials told The Wall Street Journal that he has also helped Muhammad Jamal connect with his brother, the al-Qaeda chief. Other released Egyptian inmates returned to operational and media roles, including Murjan Salim, who has been directing jihadists to training camps in Libya. Figures like Jalal al-Din Abu al-Fatuh and Ahmad 'Ashush, among others, helped loosely reorganize networks through media outlets al-Bayyan and al-Faruq. Prisoner releases helped regenerate jihadist networks in the Sinai that have been able to cause a great deal of bloodshed since the country's July coup. Ansar al-Sharia in Tunisia's striking growth was also attributable to prisoner releases. AST leader Abu Iyadh al-Tunisi had been imprisoned since 2003 for involvement in terrorism abroad, but was released in the general amnesty of March 2011. In fact, prominent AST members have claimed that the organization was born during periods of imprisonment, when "communal prayer time served as a forum for discussion and refining ideas that would be put into practice on release." In Libya, many former prisoners, including some leaders of the Libyan Islamic Fighting Group, said they would forsake armed struggle and join the political process. But other released prisoners returned to jihadist violence. Mohammed al-Zahawi and Shaykh

Nasir al-Tarshani of Katibat Ansar al-Sharia in Benghazi both spent years in Qaddafi's notorious Abu Salim prison.³¹ Abu Sufyan bin Qumu, another Ansar al-Sharia leader based in Derna, was formerly imprisoned in both Guantánamo Bay and Abu Salim. Dawa opportunities. Newfound opportunities to undertake dawa allowed the spread of salafi jihadist ideology in places like Egypt and Tunisia. In Egypt, members of the salafi jihadist current such as Muhammad al-Zawahiri and Ahmad 'Ashush were able to personally advocate for the movement on television for the first time. In Tunisia, AST developed a sophisticated dawa strategy. It continues to undertake dawa even after the Tunisian government banned it, but AST youth leader Youssef Mazouz said the group now carries out "less than half the work it used to before August when it could plan events openly and post details on Facebook."³² Some of AST's dawa efforts have been rather traditional: holding dawa events at markets or universities, holding public protests, and dominating physical spaces, such as cafés, near places of worship. But AST also used innovative approaches to dawa, including provision of social services (something other militant Islamic groups like Hizballah and Hamas have also done) and its use of social media. As noted, AST's ban now impedes its ability to leverage social media. AST's social services activity has included distribution of food, clothing, and basic supplies, as well as sponsorship of convoys that provide both medical care and medicine. These efforts concentrated on areas of Tunisia that are typically neglected by the government, such as rural and impoverished areas, and AST also provided emergency humanitarian assistance in the wake of such natural disasters as flooding. AST's social services are typically accompanied by distribution of literature designed to propagate its ideology. But even at its height, AST's distribution of social services didn't reach the same areas consistently: it isn't clear any communities saw AST as a services provider week after week. This is where AST's savvy use of social media was particularly relevant. Almost immediately after it undertook humanitarian efforts, AST would post information about its latest venture, including photographs, to its Facebook page and other websites. Social media served as a force multiplier: while AST didn't provide consistent services to a single area, its social media activity illustrated a rapid pace of humanitarian assistance, and thus helped the group achieve its goal of visibility. The context in which this dawa work was undertaken is important, as the country's economy suffered and much of its revolutionary hopes had faded. AST positioned itself as a critic of the status quo and a champion of those whom the system neglected. This helped AST develop into a growing movement by the last time I did field research there, in April 2013. Whether the new Tunisian constitution will rekindle revolutionary hopes remains to be seen. Resurgence of jihadist-aligned charity networks. Prior to the 9/11 attacks, al-Qaeda received significant funding from a well-financed network of Islamist charity organizations. As a monograph produced for the 9/11 Commission noted, prior to those attacks "al-Qaeda was funded, to the tune of approximately \$30 million per year, by diversions of money from Islamic charities and the use of well-placed financial facilitators who gathered money from both witting and unwitting donors."³³ Despite the efforts made to shut down such groups, Islamist-leaning international charities and other NGOs have been reemerging as sponsors of jihadist activity. In Tunisia, the pictures, videos, and information that AST posted on its Facebook page suggest that AST received support from jihadist charity networks. In at least one case, it received medical supplies from the Kuwaiti charity RIHS (the Revival of Islamic Heritage Society). The fact that RIHS supported a jihadist-oriented group in Tunisia will come as no surprise to seasoned watchers of terrorist financing. The U.S. Treasury Department

designated RIHS in 2008 “for providing financial and material support to al-Qaeda and al-Qaeda affiliates, including Lashkar e-Tayyiba, Jemaah Islamiyah, and Al-Itihaad al-Islamiya.”³⁴ The Treasury designation also charges that RIHS provided financial support specifically for terrorist acts. And that’s not AST’s only connection to sympathetic foreign organizations. The literature it passes out at dawa events can be traced to at least three book publishing houses in Saudi Arabia: Dar al-Qassem, based in Riyadh; Dar al-Tarafan, based in Taif; and the Cooperative Office for the Call and Guidance and Education Communities, based in Dammam. It’s likely that AST, which has distributed a significant amount of these publishers’ literature, either has a direct relationship with the publishers or else a designated intermediary. The most significant theater for jihadist charities’ rebound, though, will likely be Syria. A recent comprehensive report published by the Brookings Institution notes the role of “individual donors in the Gulf,” who “encouraged the founding of armed groups, helped to shape the ideological and at times extremist agendas of rebel brigades, and contributed to the fracturing of the military opposition.”³⁵ The report singles out Kuwaiti donors and charities in particular—including the aforementioned RIHS—in part because Kuwait has had fewer controls than other Gulf countries. Further, the Syrian Islamic Front (SIF)—an umbrella group of six organizations that is considered one of the key jihadist elements within the Syrian opposition—has clearly expressed ties to Turkish and Qatari government-linked NGOs. The video proclaiming the creation of this new group in December 2012 showed SIF members providing aid to Syrian civilians with boxes and flags bearing the logos of the Turkish Humanitarian Relief Foundation (IHH). In January 2013, SIF posted a video to YouTube depicting its members picking up aid from IHH in Yayladagi, Turkey, that was to be distributed in Syria. Other boxes and flags in SIF’s December 2012 video belonged to Qatar Charity, which used to go by the name Qatar Charitable Society. Evidence submitted by the U.S. government in a criminal trial noted that in 1993 Osama bin Laden named the society as one of several charities that were used to fund al-Qaeda’s overseas operations. Other charities that in the past supported al-Qaeda and jihadist causes may also be on the rebound. For example, when the U.S. Treasury Department designated the Al Haramain Islamic Foundation (AHIF), a Saudi charity that provided significant support to al-Qaeda internationally, it noted that AHIF’s leadership “has attempted to reconstitute the operations of the organization, and parts of the organization have continued to operate.”³⁶ Further, the U.N.’s Office of the Ombudsperson overseeing sanctions of al-Qaeda-linked individuals has produced a delisting in 38 different cases as of the time of this testimony.³⁷ The delisting of al-Qaeda supporters at the United Nations could further re-energize al-Qaeda charity networks.

Arab Spring led to AQ expansion

Gartenstein-Ross 14 (Daveed, Senior Fellow at the Foundation for Defense of Democracies, adjunct assistant professor in Georgetown University’s security studies program, “The Arab Spring and Al-Qaeda’s Resurgence,” Congressional Testimony before the House Armed Services Committee, 2/4/14, <http://docs.house.gov/meetings/AS/AS00/20140204/101698/HHRG-113-AS00-Wstate-Gartenstein-RossD-20140204.pdf>)

Chairman McKeon, Ranking Member Smith, distinguished members of the committee, it is an honor to appear before you to discuss the state of al-Qaeda, its affiliates, and associated groups. My testimony will focus on how the Arab Spring environment presented new opportunities for al-Qaeda, altered its focus in discernible ways, and allowed it to experience significant geographic expansion. Not only is the expansion of al-Qaeda's recognized affiliates clear, but also a large number of new organizations have cropped up in the Middle East and North Africa that profess an allegiance to al-Qaeda's ideology, salafi jihadism, yet claim they are organizationally independent from its network. These claims cannot necessarily be taken at face value. Indeed, two central questions that analysts of jihadist militancy debate today are: 1) to what extent are these new jihadist groups connected to the al-Qaeda network, and 2) to what extent is al-Qaeda's senior leadership (AQSL) able to set priorities and strategy for its affiliates, and thus either control or influence their activities? Uncertainties surrounding both questions somewhat complicate the U.S.'s policy response. This testimony begins by examining the question of what al-Qaeda is, and what its goals are. Thereafter, it turns to the perceptions that al-Qaeda and other salafi jihadists had of the Arab Spring, and their ideas about how the movement could benefit. The testimony then calls into question the notion that al-Qaeda's senior leadership has been decimated—which, if true, means that intentions aside, the group would be unable to execute strategy in the new environment. I then turn to factors that did in fact strengthen al-Qaeda and jihadism during the Arab Spring, before giving an overview of al-Qaeda's current position. I conclude by discussing what kinds of policy responses are appropriate for the United States to adopt to address this challenge.

AQAP Warrant

AQAP is likely to attempt transnational attacks.

Clapper 12 (James, Director of National Intelligence, "Unclassified Statement for the Record on the Worldwide Threat Assessment of the US Intelligence Community for the Senate Select Committee on Intelligence," http://www.fas.org/irp/congress/2012_hr/013112clapper.pdf)

Despite the death in September of AQAP transnational operations chief and US person Anwar al-Aulaqi, we judge AQAP remains the node most likely to attempt transnational attacks. His death probably reduces, at least temporarily, AQAP's ability to plan transnational attacks, but many of those responsible for implementing plots, including bombmakers, financiers, and facilitators, remain and could advance plots. We assess that AQI will remain focused on overthrowing the Shia-led government in Baghdad in favor of a Sunni-led Islamic caliphate. It probably will attempt attacks primarily on local Iraqi targets, including government institutions, Iraqi Security Forces personnel, Shia civilians, and recalcitrant Sunnis, such as members of the Sons of Iraq, and will seek to re-build support among the Sunni population. In its public statements, the group also supports the goals of the global jihad, and we are watchful for indications that AQI aspires to conduct attacks in the West.

ISIS UQ

General Strong Now

ISIS strength increasing

The Malone Telegram, February 28, 2015 Saturday, Obama's reasoned request, P. 4

ISIL is a serious and growing threat, with reports that it is looking to gain footholds in even more nations in its quest to establish a caliphate. If the Middle East seems chaotic now, imagine it with ISIL ruling an oil-rich nation from which to export its violent doctrine. It must be stopped.

ISIS a threat to regional and international security

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

This impressively managed, almost obsessively bureaucratic organization has become a serious threat to regional and international security. In fundamentally challenging al-Qaeda's place as the recognized leader of transnational jihadism, it continues to attract recruits from across the globe. The scale of this threat has been demonstrated by the initiation of airstrikes by a broad international coalition in Iraq and Syria in recent months. While IS has shifted underground, it continues operations in Syria and Iraq. Moreover, its beheading of foreign hostages has presented a concerning element of leverage over the international community's ability to counter its influence.

Attacks Increasing Warrent

ISIS conducts mass casualty urban attacks

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

IS military operations can generally be divided into two categories. The first is mass casualty urban attacks, normally targeting Shia, Alawi Muslims, and other minority groups, often in civilian areas. These attacks, which have been more common in Iraq, see IS operate as a typical terrorist organization, managing small, covert, largely urban cells linked to a larger militant infrastructure capable of providing funding and equipment. These operations can continue amid favorable or unfavorable operating environments and are the key to sustaining offensive momentum against adversaries.

Military Capacity Warrent

ISIL's influence and threat in the Middle East is increasing

General Clapper, Director of National Intelligence, February 26, 2015, Full Committee Hearing on "Worldwide Threats", <http://www.armed-services.senate.gov/hearings/15-02-26-worldwide-threats> DOA: 3-1-15

Moving into the Mid East, ISIL is increasing its influence outside of Iraq and Syria, seeking to expand its self-declared caliphate into the Arabian Peninsula, North Africa and South Asia and planning terrorist attacks against Western and Shia interests. ISIL's rise represents the greatest shift in the Sunni violent extremist landscape since Al Qaida affiliates first began forming, and it is the first to assume at least some characteristics of a nation state. Spillover from the Syrian conflict is raising the prospect of instability in Lebanon, Jordan and Saudi Arabia. In Iraq, sectarian conflict in mixed Shia-Sunni areas is growing and if not blunted, will undermine progress against ISIL. Although Prime Abadi has begun to alter the etho-sectarian tone in Iraq, resistance from his Shia political allies and persistent distrust among Iraqi leaders will limit progress toward a stable, inclusive political environment. ISIL's ability to conduct large-scale offensive operations in Iraq has been degraded by coalition airstrikes, the provision of weapons and munitions by the U.S. and other allies, and stiffened defenses by the Iraqi security forces, Kurdish Peshmerga, Shia militants and tribal allies, not to mention the Iranians. However, ISIL remains, as we've seen, a formidable and brutal threat.

ISIS has a professional military organization

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

At the top, Baghdadi brings a crucial image of Islamic legitimacy, justified by his apparent Ph.D. in Islamic Studies from the Islamic University of Baghdad and his history as an imam and preacher in Samarra. Though not a graduate of al-Azhar or Dar al-Ifta' al-Masriyyah, this clerical background puts Baghdadi on a qualitatively higher religious level than Osama bin Laden or Ayman al-Zawahiri. More significant, however, is the military and intelligence experience held by many of Baghdadi's deputies, which has brought a level of professionalism to IS's ability to operate as an efficient and capable organization. For example, both of Baghdadi's deputies were former ranking officers in the Iraqi military. Abu Ali al-Anbari, the chief of Syria operations, was a major general in the Iraqi Army and Fadl Ahmad Abdullah al-Hiyali (Abu Muslim al-Turkmani), the chief of operations in Iraq, was a lieutenant colonel in Iraqi Military Intelligence and a former officer in the Iraqi Special Forces.⁵⁰ Moreover, according to data seized from the safe-house of former IS General Military Council leader Adnan Ismail Najem Bilawi (Abu Abd al-Rahman al-Bilawi) in early June 2014, the group maintained roughly 1,000 "medium and top level field commanders, who all have technical, military, and security experience."

ISIS creates power vacuums that it enters and takes over

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

Independent of specific local dynamics, IS has proven capable of designing and implementing a multi-stage strategy aimed at engendering a chaotic power vacuum into which it can enter. Combining a typical insurgent strategy of attrition with extreme brutality (such as the execution of approximately 200 men captured at Tabaqa Airbase in late August), IS is able to acquire the leverage necessary to become locally dominant. At that point, IS units assume a central role in all local affairs, as Abu Usama, a British fighter based in Homs explained in May 2014: “Our average day here is now normally much of the same—manning checkpoints, going on patrol in the area, settling disputes between locals and between tribes, and a lot of meetings with village elders and their chiefs, so we can discuss their concerns and complaints.”⁴

Returning Fighters Warrent

ISIS fighters are security threats when they return home

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

Realistically, however, the chance that a foreign fighter might choose to return home to carry out an attack is quite unpredictable and should be treated as plausible. Judging by data from 1990-2010, approximately 11 percent of foreign fighters have become active security threats after returning home—not a small number.¹⁰⁹ For Western Europe, from which there are approximately 3,000 fighters in Syria, that would amount to 330 potential terrorists. Notably, the last three prominent terrorist attacks in the Western world involved individuals with travel experience in foreign conflict zones—Syria, Dagestan, Kenya, and Somalia. Moreover, there is already a precedent for fighters with experience in Syria returning to their home countries or for individuals influenced by IS commanders plotting or successfully carrying out attacks. The cases of Mehdi Nemmouche in Brussels and Ibrahim Boudina in France suggest such fears are already being realized.

ISIS is well resourced and plans on attacking the US

James Kittfield, 8-20, The National Journal, August 20, 2014 Why Washington Should Declare War on ISIS

Most importantly, ISIS today represents a direct and growing threat to the United States. It has attracted an estimated 12,000 foreign fighters to its black banner flying over Syrian and Iraqi territory, including hundreds of Europeans and Americans who can travel freely with Western passports. It has a bigger sanctuary, far more money, and is more indiscriminately murderous than al-Qaida was on Sept. 10, 2001. ISIS leader Abu Bakr al-Baghdadi has assured anyone who will listen that he eventually intends to direct his jihad at the United States, telling the U.S. soldiers who released him from prison in 2009, "I'll see you in New York."

Al-Shabaab UQ

General

Al-Shabaab is also recovering

Gartenstein-Ross 14 (Daveed, Senior Fellow at the Foundation for Defense of Democracies, adjunct assistant professor in Georgetown University's security studies program, "The Arab Spring and Al-Qaeda's Resurgence," Congressional Testimony before the House Armed Services Committee, 2/4/14, <http://docs.house.gov/meetings/AS/AS00/20140204/101698/HHRG-113-AS00-Wstate-Gartenstein-RossD-20140204.pdf>)

Another al-Qaeda franchise that is seemingly recovering its capabilities, based on the attacks it was able to execute, is the Somali militant group al-Shabaab. Shabaab once controlled more territory in southern Somalia than did the country's U.N.-recognized government, but it lost its last major urban stronghold of Kismayo to advancing African Union forces in October 2012. However, Shabaab's capabilities have recovered since then. The group captured worldwide attention on September 21, 2013, when terrorists associated with the group launched a spectacular assault on Nairobi's Westgate Mall. The attack dragged on for four days, killing 67 and injuring at least 175. But even before that, there were signs that a complex operation like Westgate was possible, as Shabaab carried out increasingly sophisticated attacks throughout the year. These included an April 2013 attack on a Mogadishu courthouse that killed 29, and a June 2013 twin suicide bombing at Mogadishu's U.N. compound that claimed 22 lives. Over the course of 2013, Shabaab was able to kill between 515 and 664 people, according to a database that I maintain.

I/L

Al Qaeda Specific

Surveillance Solves

Al Qaeda activity can be detected with email and phone record surveillance

Yohn **Yoo**, Summer **2014**, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute, Harvard Journal of Law & Public Policy, THE LEGALITY OF THE NATIONAL SECURITY AGENCY'S BULK DATA SURVEILLANCE PROGRAMS, <http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Yoo1.pdf>, DOA: 1-1-15, p. 908-9

Members of the al Qaeda network can be detected, with good intelligence work or luck, by examining phone and e-mail communications, as well as evidence of joint travel, shared assets, common histories or families, meetings, and so on. As the time for an attack nears, "chatter" on this network will increase as operatives communicate to coordinate plans, move and position assets, and conduct reconnaissance of targets. When our intelligence agents successfully locate or capture an al Qaeda member, they must be able to move quickly to follow new information to other operatives before news of the capture causes them to disappear. The NSA database is particularly important because it will point the way to al Qaeda agents within the United States, where they are closest to their targets and able to inflict the most harm on civilians. The September 11 hijackers themselves provide an example of the way that the NSA could use business record information to locate an al Qaeda cell. Links suggested by commercially available data might have turned up ties between every single one of the al Qaeda plotters and Khalid al Mihdhar and Nawar al Hazmi, the two hijackers known to the CIA to have been in the country in the summer of 2001. Mihdhar and Hazmi had rented apartments in their own names and were listed in the San Diego phone book. Both Mohammad Atta, the leader of the September 11 al Qaeda cell, and Marwan al-Shehi, who piloted one of the planes into the World Trade Center, had lived there with them. Hijacker Majed Moqed used the same frequent flier number as Mihdhar; five hijackers used the same phone number as Atta when booking their flights; the remaining hijackers shared addresses or phone numbers with one of those hijackers, Ahmed Alghamdi, who was in the United States in violation of his visa at the time. Our intelligence agents, in fact, had strong leads that could conceivably have led them to all of the hijackers before 9/11. CIA agents had identified Mihdhar as a likely al Qaeda operative because he was spotted at a meeting in Kuala Lumpur and mentioned in Middle East intercepts as part of an al Qaeda "cadre." Hazmi too was known as likely to be al Qaeda. But in neither case was there enough evidence for a criminal arrest because they had not violated any American laws. If our intelligence services had been able to track immediately their cell phone calls and e-mail, it is possible that enough of the hijacking team could have been rounded up to avert 9/11. Our task is much more difficult today, because we might not have even this slender information in hand when the next al Qaeda plot moves toward execution.

Intelligence collection key to defeating Al Qaeda

Benjamin **Wittes**, Brookings, 20**14**, Senior Fellow in Governance Studies at the Brookings Institution. I co-founded and am Editor in Chief of *Lawfare*, a website devoted to sober and

serious discussion of “Hard National Security Choices.” I am the author or editor of several books on subjects related to law and national security: *Detention and Denial: The Case for Candor After Guantánamo* (2011), *Law and the Long War: The Future of Justice in the Age of Terror* (2008), and *Legislating the War on Terror: An Agenda for Reform* (2009). I have written extensively both on the AUMF and on NSA collection under various provisions of the Foreign Intelligence Surveillance Act (FISA).³ The views I am expressing here are my own, April 8, Prepared Statement, Is Al Qaeda Winning the Administration’s Counterterrorism Policy,” <http://docs.house.gov/meetings/FA/FA18/20140408/102109/HHRG-113-FA18-Wstate-WittesB-20140408.pdf> DOA: 5-1-15

Yet in considering the question of the state of the U.S. confrontation with Al Qaeda, there is something to be said for considering these questions in conjunction with one another. These are, after all, two of the most important legal instruments in the struggle this committee is endeavoring to assess. One is the key legal authority for virtually every military action the United States undertakes in its military battle against Al Qaeda, its offshoots, and its affiliates. The other is the single most important legal authority the intelligence community has for collecting intelligence against the Al Qaeda target—not to mention other foreign targets of great national security significance. This intelligence is key to arrests and the thwarting of terrorist plots against the United States and its allies. It is also key to accurate and precise targeting judgments in lethal force operations.

ISIS Specific

Surveillance Solves ISIS

Surveillance necessary to prevent ISIS attacks

Guardian, June 22, 2014 , Isis threat justifies greater surveillance powers in UK, says Liam Fox

Former defence secretary says first duty of state is to protect citizens and public will accept greater monitoring powers Britain's security services may need to be given greater powers of surveillance to monitor extremists from Isis when they return home to Britain from Iraq and Syria, the former defence secretary Liam Fox has said. A majority of people will accept that an "ideological battle" means that the authorities will need greater powers to intercept the communications of extremists, Fox said. The former defence secretary, who was speaking on the Andrew Marr Show on BBC1, said that Britain should offer to put its airbases at the disposal of the US to avoid "horrendous" situation in Iraq as Isis forces pose a threat to Baghdad. Fox said: "There are those who say if we don't get involved, if we hunker down then we will be fine. There will be no backlash. That is utterly, utterly wrong because the jihadists don't hate us because of what we do. They hate us because of who we are. We can't change that. It is our values and our history that they detest more than anything else." Fox said that the authorities could deprive British citizens returning from Syria and Iraq of their passports. But he said that the greatest effort should go towards increasing the power of the state to monitor the communications of extremists. He said: "We have the security services to ensure that they [extremists] are watched and that they don't pose a greater threat." Asked whether the powers of the security services were insufficient, the former defence secretary said: "That is a real question that we are going to have to ask - whether the security services have adequate resources for an increased threat. "That is a question politicians will have to take into account in judgments on spending allocations but also do the powers they have reflect the increasing [threat]? You've got people in the light of Snowden saying that the state has too many powers and we have to restrict the powers of the state." Asked which powers the state should be given, Fox said: "The whole areas of intercept that need to be looked at. We have got a real debate, and it is a genuine debate in a democracy, between the libertarians who say the state must not get too powerful and pretty much the rest of us who say the state must protect itself." Asked whether this meant more surveillance and increasing the manpower of the security services, he said: "If required is the first duty of the state to protect its citizens ... it is a real worry and it is a problem that is going to be with us for a very long time. At heart it is an ideological battle and we have to realise that we have to win the ideological battle as well." The remarks by Fox suggests that some figures, particularly on the right, will use the success of extremists in Iraq to challenge the claim by Edward Snowden that the state has amassed too many powers of surveillance. Snowden leaked a series of NSA files to the former Guardian journalist Glenn Greenwald last year.

ISIS Nuclear Terrorism

ISIS created the world's largest terrorist safe haven – it's the largest risk of nuclear terrorism

Bunn, 7/11/14 - Matthew Bunn, a professor of practice at the Harvard Kennedy School's Belfer Center for Science and International Affairs, is a former adviser on nonproliferation in the White House Office of Science and Technology Policy, where he focused on control of nuclear weapons and materials (Matthew, "ISIS Seizes Nuclear Material—but That's Not the Reason to Worry" 7/11, <http://nationalinterest.org/feature/isis-seizes-nuclear-material%E2%80%94that%E2%80%99s-not-the-reason-worry-10849>)

But while this particular uranium is not much of a worry, the larger picture is starting to make me bite my nails a bit. The Islamic State now controls a big chunk of territory, hundreds of millions of dollars, and thousands of armed troops – and it has made clear that its ambitions are global. Its statement declaring itself the caliphate promised by Allah was an explicit invitation to violent Islamic extremists from all over the world to join them. Like the Taliban's Afghanistan before 9/11, the Islamic State may become a safe haven for people from other groups and countries to train and plot complex attacks. Having such a haven where the government is not going to interfere makes a huge difference in terrorists' ability to put together a really complicated plot – from something like 9/11 to a plot to make a nuclear bomb. Let's not forget that al Qaeda has repeatedly sought to get the kind of nuclear material that really could be put together into a nuclear bomb, and the expertise to do that job. The Islamic State or others taking advantage of its territory may well renew that effort. That's all the more reason to accelerate the effort to ensure that all the world's potential nuclear bomb material is effectively secured – and to be grateful that past efforts eliminated such material from Iraq long before the Islamic State came on the scene.

ISIS Is the Biggest Nuclear Threat

Brent **Budowsky 8/22/14**, LL.M. degree in international financial law from the London School of Economics, former aide to former Sen. Lloyd Bentsen and Bill Alexander, then chief deputy majority whip of the House, "ISIS poses nuclear 9/11 threat", 2014, http://www.opednews.com/articles/ISIS-poses-nuclear-9-11-th-by-Brent-Budowsky-ISI_Military_Nuclear_insanity_Threat-To-World-Peace-140822-911.html

After the latest grotesque atrocity by the Islamic State in Iraq and Syria (ISIS), the beheading of an American journalist, American and European policymakers must clearly understand the near certainty that unless it is defeated and destroyed, ISIS will launch a major terror attack on American or European soil. Analysts estimate that ISIS has amassed a cash hoard of between \$400 million and \$2 billion. It is highly probable that ISIS will attempt to use some of this money to obtain nuclear, chemical, biological or other weapons of mass death on the international black market or from corrupt officials in nations such as Russia, China, Pakistan or North Korea to use in attacks against New York, Washington, London, Paris, Berlin, Rome, Brussels or other nations it considers infidel enemies. This danger is magnified by the fact that ISIS has recruited nationals of the United States and Europe, who possess American and European passports and are physically indistinguishable from local populations in America and Europe. It is extraordinary

that the mass murdering butchery of ISIS is so demented than even al Qaeda is offended. It is alarming that the CIA, which launched intelligence operations even against the United States Senate, and the NSA, which launched massive and unprecedented eavesdropping operations, and intelligence services of leading European nations were blind to the magnitude of the ISIS threat until the most barbaric terrorists in modern history had taken over almost a third of Iraq and are on the brink of creating a terrorist super-state that dwarfs al Qaeda's efforts prior to 9/11. I vehemently opposed the misguided Iraq War from the moment it was proposed by former President George W. Bush and have never been a neoconservative, warmonger or super-hawk. But aggressive action against ISIS is urgently needed. ISIS has stated its intention to attack the United States and Europe to advance its evil, messianic and genocidal ideology and ambitions. ISIS has the money to purchase the most deadly weapons in the world, and has recruited American and European traitors with above-average capability to execute an attack. The odds that ISIS can obtain nuclear, chemical, biological or other forms of mass destruction weapons are impossible to ascertain but in a world of vast illegal arms trafficking, with so many corrupt officials in nations possessing arsenals of destruction, the danger is real. The fact that WMD scares prior to the Iraq War ranged from mistaken to deceitful does not mean that the WMD danger does not exist today. It does. I applaud the recent actions taken by President Obama. Obama's airstrikes saved tens of thousands of Yazidis from genocide, took back the Mosul Dam from ISIS and saved countless Iraqis, Kurds and Syrians from slaughter. The airstrikes inflicted material damage to ISIS. The diplomacy of Obama and Secretary of State John Kerry contributed mightily to the replacement of a disastrous Iraqi government by a government can unite Iraqi Sunnis, Shiites and Kurds. The Obama-Kerry initiatives will lead to the creation of a stable Afghan government and avoid the collapse that was possible after the recent controversial Afghan elections. These are real successes. In the current political climate, Obama seems to get credit for nothing, but he deserves great credit for some important successes in recent weeks. And yet the danger of ISIS pulling off a nuclear, chemical, biological or other mass death 9/11-style attack in a major American or European city is real. Even with dirty or primitive WMD weapons, the casualty totals could be catastrophic. ISIS must be defeated and destroyed. This will not be achieved with "boots on the ground" proxies from Iraqi or Kurd forces alone, though Kurdish forces should immediately receive strong military assistance. America should not initiate another massive Iraq ground war. What is needed is a multinational special ops strike force made up of 10,000 troops from NATO nations and possibly Arab League nations.

ANY WMD attack on U.S. Soil Would Escalate – Miscalculation and Command Confusion

Hellman 8 (Martin E. Hellman, emeritus prof of engineering @ Stanford, "Risk Analysis of Nuclear Deterrence" SPRING 2008 THE BENT OF TAU BETA PI, <http://www.nuclearrisk.org/paper.pdf>)

The threat of nuclear terrorism looms much larger in the public's mind than the threat of a full-scale nuclear war, yet this article focuses primarily on the latter. An explanation is therefore in order before proceeding. A terrorist attack involving a nuclear weapon would be a catastrophe of immense proportions: "A 10-kiloton bomb detonated at Grand Central Station on a typical

work day would likely kill some half a million people, and inflict over a trillion dollars in direct economic damage. America and its way of life would be changed forever.” [Bunn 2003, pages viii-ix]. The likelihood of such an attack is also significant. Former Secretary of Defense William Perry has estimated the chance of a nuclear terrorist incident within the next decade to be roughly 50 percent [Bunn 2007, page 15]. David Albright, a former weapons inspector in Iraq, estimates those odds at less than one percent, but notes, “We would never accept a situation where the chance of a major nuclear accident like Chernobyl would be anywhere near 1% A nuclear terrorism attack is a low-probability event, but we can’t live in a world where it’s anything but extremely low-probability.” [Hegland 2005]. In a survey of 85 national security experts, Senator Richard Lugar found a median estimate of 20 percent for the “probability of an attack involving a nuclear explosion occurring somewhere in the world in the next 10 years,” with 79 percent of the respondents believing “it more likely to be carried out by terrorists” than by a government [Lugar 2005, pp. 14-15]. I support increased efforts to reduce the threat of nuclear terrorism, but that is not inconsistent with the approach of this article. Because terrorism is one of the potential trigger mechanisms for a full-scale nuclear war, the risk analyses proposed herein will include estimating the risk of nuclear terrorism as one component of the overall risk. If that risk, the overall risk, or both are found to be unacceptable, then the proposed remedies would be directed to reduce whichever risk(s) warrant attention. Similar remarks apply to a number of other threats (e.g., nuclear war between the U.S. and China over Taiwan). his article would be incomplete if it only dealt with the threat of nuclear terrorism and neglected the threat of full- scale nuclear war. If both risks are unacceptable, an effort to reduce only the terrorist component would leave humanity in great peril. In fact, society’s almost total neglect of the threat of full-scale nuclear war makes studying that risk all the more important.

The cost of World War iii The danger associated with nuclear deterrence depends on both the cost of a failure and the failure rate.³ This section explores the cost of a failure of nuclear deterrence, and the next section is concerned with the failure rate. While other definitions are possible, this article defines a failure of deterrence to mean a full-scale exchange of all nuclear weapons available to the U.S. and Russia, an event that will be termed World War III. Approximately 20 million people died as a result of the first World War. World War II’s fatalities were double or triple that number—chaos prevented a more precise determination. In both cases humanity recovered, and the world today bears few scars that attest to the horror of those two wars. Many people therefore implicitly believe that a third World War would be horrible but survivable, an extrapolation of the effects of the first two global wars. In that view, World War III, while horrible, is something that humanity may just have to face and from which it will then have to recover. In contrast, some of those most qualified to assess the situation hold a very different view. In a 1961 speech to a joint session of the Philippine Congress, General Douglas MacArthur, stated, “Global war has become a Frankenstein to destroy both sides. ... If you lose, you are annihilated. If you win, you stand only to lose. No longer does it possess even the chance of the winner of a duel. It contains now only the germs of double suicide.” Former Secretary of Defense Robert McNamara expressed a similar view: “If deterrence fails and conflict develops, the present U.S. and NATO strategy carries with it a high risk that Western civilization will be destroyed” [McNamara 1986, page 6]. More recently, George Shultz, William Perry, Henry Kissinger, and Sam Nunn⁴ echoed those concerns when they quoted President Reagan’s belief that nuclear weapons were “totally irrational, totally

inhuman, good for nothing but killing, possibly destructive of life on earth and civilization.” [Shultz 2007] Official studies, while couched in less emotional terms, still convey the horrendous toll that World War III would exact: “The resulting deaths would be far beyond any precedent. Executive branch calculations show a range of U.S. deaths from 35 to 77 percent (i.e., 79-160 million dead) ... a change in targeting could kill somewhere between 20 million and 30 million additional people on each side These calculations reflect only deaths during the first 30 days. Additional millions would be injured, and many would eventually die from lack of adequate medical care ... millions of people might starve or freeze during the following winter, but it is not possible to estimate how many. ... further millions ... might eventually die of latent radiation effects.” [OTA 1979, page 8] This OTA report also noted the possibility of serious ecological damage [OTA 1979, page 9], a concern that assumed a new potentiality when the TTAPS report [TTAPS 1983] proposed that the ash and dust from so many nearly simultaneous nuclear explosions and their resultant firestorms could usher in a nuclear winter that might erase homo sapiens from the face of the earth, much as many scientists now believe the K-T Extinction that wiped out the dinosaurs resulted from an impact winter caused by ash and dust from a large asteroid or comet striking Earth. The TTAPS report produced a heated debate, and there is still no scientific consensus on whether a nuclear winter would follow a full-scale nuclear war. Recent work [Robock 2007, Toon 2007] suggests that even a limited nuclear exchange or one between newer nuclear-weapon states, such as India and Pakistan, could have devastating long-lasting climatic consequences due to the large volumes of smoke that would be generated by fires in modern megacities. While it is uncertain how destructive World War III would be, prudence dictates that we apply the same engineering conservatism that saved the Golden Gate Bridge from collapsing on its 50th anniversary and assume that preventing World War III is a necessity—not an option.

Impacts

Nuke Terror

Dirty Bomb Risk High

Dirty bomb risks increasing, insecure nuclear material world-wide

Bunn & Tobey, 5-20-15, The Hill, “Don’t weaken our defenses against nuclear smuggling,” <http://thehill.com/blogs/congress-blog/homeland-security/242566-dont-weaken-our-defenses-against-nuclear-smuggling> DOA: 5-25-15 Bunn is a professor at Harvard Kennedy School and co-principal investigator for the Kennedy School’s Project on Managing the Atom. Tobey is a senior fellow at Harvard Kennedy School’s Belfer Center and former deputy administrator for Defense Nuclear Nonproliferation at the National Nuclear Security Administration. Roth is research associate with the Belfer Center’s Project on Managing the Atom.

The possibility of a terrorist detonating a “dirty bomb” or even a crude nuclear bomb is one of the gravest threats facing the United States today. Yet the House Armed Services Committee is pushing a bill that would prohibit funding for fixed radiation detectors to catch nuclear smugglers – both for installing new ones and even for maintaining the ones U.S. taxpayers have already paid billions to install. Radiation detection is a highly imperfect line of defense. Once nuclear material has left the facility where it is supposed to be, it could be anywhere, and recovering it poses an enormous challenge. The immense length of national borders, the huge scale of legitimate traffic, the myriad pathways across these borders, and the small size and sometimes weak radiation signal of the nuclear and radiological materials terrorists might be seeking combine to make nuclear smuggling extraordinarily difficult to stop. But that hardly justifies giving up. From airports to bridges across major waterways to the loading stations at container ports, there are many locations where fixed radiation detectors make sense. A balanced program to defeat nuclear smugglers must include strong security to keep material from being stolen in the first place, effective law enforcement and intelligence work, and interdiction efforts and border controls backed by both fixed and mobile radiation detectors. These elements work together, reinforcing each other’s effectiveness. In addition to detecting stolen radioactive and nuclear material, fixed radiation detectors deter smugglers from using official borders, limiting their options and making them easier to catch. As a military leader in Azerbaijan—which shares borders with Russia—recently argued, “to leave an unequipped border crossing is like leaving the window open.” For nearly twenty years, both Republicans and Democrats in Congress and the White House have invested billions in putting in place a network of thousands of fixed radiation detectors in more than fifty countries. Cutting off funding now would mean abandoning partners across the world, after years of painstaking diplomacy – and would undermine the investment already made, reducing the chance that existing detectors would continue to be used effectively. As much of the nuclear and radiological material smuggled to date has come from Russia—a country with hundreds of tons of nuclear weapons material spread across dozens of facilities—detecting smuggling from Russia is vital. It became even more important last year, when Russia halted nearly all work with the United States on improving the security of its nuclear stockpiles, increasing the risk of nuclear

theft and smuggling. The good news is that before the recent crisis in U.S.-Russian relations, Russia and the United States worked together to install a ring of detectors at all of Russia's official border crossings. The bad news is that the conflict in Ukraine has effectively erased some of those borders, and Russia's customs union with Belarus and Kazakhstan means goods flow across those borders unchecked. Hence, there is a clear need to install more fixed radiation detectors to patch the holes in the system already put in place. Beyond Russia, there is radiological material located at thousands of inadequately protected sites in more than a hundred countries. These vulnerabilities, combined with the rise of groups like the Islamic State who are bent on mass violence and terror, make deliberately weakening defenses against nuclear smugglers recklessly negligent.

General High Risk

Risk of nuclear terror is high and likely

Ogilvie-White 2014

Dr Tanya Ogilvie-White, former senior analyst at the Australian Strategic Policy Institute; Stanton nuclear security fellow at the International Institute for Strategic Studies, senior lecturer in international relations at the University of Canterbury, Preventing Nuclear Terrorism, Australia's Leadership Role, https://www.aspi.org.au/publications/preventing-nuclear-terrorism-australias-leadership-role/SR63_prevent_nuclear_terrorism.pdf

The main worry about the theft and trafficking of nuclear and radiological materials is that they will end up in the hands of terrorist groups, who will use them in INDs or RDDs. Even in the case of an RDD, which is a more likely scenario but would be much less lethal than an IND, radioactive contamination in a densely populated area could have serious economic and social consequences. Although a successful RDD attack has never been perpetrated, there's evidence that terrorists have invested in such devices: Chechen separatists were involved in two incidents involving radioactive materials in November 1995 and December 1998, and more recently intelligence agencies in mainland Europe, Thailand, the UK and the US have managed to foil RDD plots before they reached fruition. In 2012, the International Atomic Energy Agency (IAEA) Incident and Trafficking Database reported 160 incidents involving the illegal trade and movement of nuclear or other radioactive material across national borders. Of those, 17 involved possession and related criminal activities, 24 involved theft or loss and 119 involved other unauthorised activities. Two incidents involved highly enriched uranium (HEU) in unauthorised activities. There were also three incidents involving dangerous Category 1–3 radioactive sources, two of which were thefts. Information reported to the database demonstrates that:

- the availability of unsecured nuclear and other radioactive material persists
- although effective border control measures help to detect illicit trafficking, effective controls aren't uniformly implemented at all international border points
- individuals and groups are prepared to engage in trafficking this material. The possibility of RDD or, worse, IND detonation is real and, while the risks need to be kept in perspective, they need to be taken seriously. One of the most worrying recent cases of illicit trafficking involving HEU occurred in June 2011 in Moldova, where officials arrested six people with a quantity of weapon-grade material. The group claimed to have access to plutonium and up to 9 kilograms of HEU, which they were willing to sell for \$31 million. A serious buyer, reportedly of North African origin, appears to have been involved and remains at large. Research reactors are considered vulnerable to thefts of nuclear and radiological materials because they're often located on university campuses or in larger scientific research centres, which are relatively open to the public or have many users and visitors. Moreover, other than the amended Convention on the Physical Protection of Nuclear Material, which has yet to enter into force, there's no internationally binding requirement for securing these facilities. Since 2003, however, the US and the IAEA have been working with various countries to reduce the risks associated with research reactors. Many countries with HEU-fuelled research reactors, including some in Australia's near neighbourhood, have taken part in securing HEU and converting the reactors to use low-enriched uranium (LEU). In particular, HEU has been removed and secured from

Indonesia, the Philippines, Thailand and, most recently, Vietnam. Of course, LEU-fuelled research reactors remain a target for terrorists who wish to spread ionising radiation or damage a symbolic facility representing technological progress, and most research reactors have substantial quantities of sealed sources that are potentially vulnerable to theft.

Al Qaeda Risk High

Al Qaeda likely to use WMDs – extreme ideology, no fear of counterattack, ambitious goals and they are likely to attack the US homeland

Nathan **Myhrvold, 13**, July 2013, Myhrvold is chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft. “Strategic Terrorism: A Call to Action,” <http://www.lawfareblog.com/wp-content/uploads/2013/07/Strategic-Terrorism-Myhrvold-7-3-2013.pdf>

The risk that al Qaeda or some future group will use equally terrible weapons seems higher on every level. its geopolitical goals are, if anything, more ambitious than the soviets’ were. al Qaeda’s ideology is more extreme. The group’s vulnerability to counterattack or reprisal is far lower than anything the soviets faced—it has already survived the worst our nation can throw at it. The terrorists have demonstrated a shocking degree of ruthlessness. Under any theory of risk, these foes must be considered more likely to act than the soviets ever were. Another reason terrorists would attack is the oldest justification in the world—because we’re trying to get them. it’s no secret that the United states aims to exterminate al Qaeda and similar terrorist groups—and rightly so. With revenge and self-preservation on their minds, our primary adversaries are not likely to show us unnecessary mercy. A more mundane reason to worry is that the information cascade that empowers stateless groups will ultimately demand more numerous and spectacular demonstrations of power to feed popular interest. terrorism survives by making a big impact, and when the world gets desensitized to beheadings, the temptation to one-up the last attack increases. Similarly, the arc of terrorism in iraq—which spiked dramatically from 2004 through 2007 and then leveled off, only to resurge somewhat recently—may foreshadow an increasing risk to the United states. terrorists quite rationally sought to destabilize iraq and afghanistan as a way to humble the United states and influence its policy by forcing a pullout. That strategy focused terrorists’ attention more on these countries and possibly distracted some groups from directly attacking U.s. territory. as U.s. forces withdraw from the region, these targets become less interesting. What next? al Qaeda and other stateless groups will seek to build on their previous successes. They have successfully carved out a safe haven for themselves in the lawless frontiers of Pakistan. dramatic attacks on the american homeland would be a natural next step. The decentralized nature of stateless organizations raises another set of concerns. once mass death becomes accessible to small groups, it is unclear who would be in control. This lack of direction has already been seen in various al Qaeda attacks in saudi arabia and europe, some of which clearly hurt the cause of islamic terrorists. They took place because no single chain of command exists in the overall movement—it is, at best, a loose confederacy. an additional issue might be called the “craziness factor.” small groups can have crazy goals. The smaller the group, the crazier they may be. The apocalyptic death cult aum shinrikyo is a case in point. Kaczynski is another example. The belief that terror groups will not use terrible weapons if they get them seems foolish in the extreme.

to borrow a phrase from *A Streetcar Named Desire*, to hold this belief is, in effect, to rely “on the kindness of” terrorists. any rational analysis must assign a substantial amount of the terror risk to large-scale, high-magnitude events. yet that is not how our defenses are organized and not how we are spending our resources. instead, we focus most of our counterterrorism efforts on thwarting small-scale attacks— by, for example, confiscating grandma’s four-ounce bottle of hand lotion at the airport.

Terrorists attempting to gain access to WMDs

Bergen, et al, September 2013, Jihadist Terrorism: A Threat Assessment,

[http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf)

[A%20Threat%20Assesment_0.pdf](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf) Peter Bergen is the author of four books about al-Qaeda, three of which were *New York Times* best sellers. The books have been translated into 20 languages. He is the director of the National Security Program at the New America Foundation in Washington, D.C.; a fellow at Fordham University’s Center on National Security; and CNN’s national security analyst.

However, the fact that jihadist extremists in the United States have shown no interest in CBRN weapons does not eliminate the need for securing potential sources of chemical, biological, and radiological agents. According to a count by the New America Foundation, since 2001, 13 extremists motivated by right-wing ideologies, one left-wing militant, and two individuals with idiosyncratic motives have deployed, acquired, or tried to acquire chemical, biological, or radiological weapons. For example, William Krar and Judith Bruey, two anti-government extremists, possessed precursor chemicals for hydrogen cyanide gas, which they discussed deploying through a building’s ventilation system.¹⁰ They were arrested in 2003. Zawahiri’s new goal is acquisition of a nuclear bomb – risk of al Qaeda nuclear attack is high Kanani, Editor of *World Affairs Commentary*, 6-29-’11 (Rahim, “New al-Qaeda Chief Zawahiri Has Strong Nuclear Intent” *Forbes*, <http://www.forbes.com/sites/rahimkanani/2011/06/29/new-al-qaeda-chief-zawahiri-has-strong-nuclear-intent/>) We should be especially worried about the threat of nuclear terrorism under Zawahiri’s leadership. In a recent report titled “Islam and the Bomb: Religious Justification For and Against Nuclear Weapons”, which I researched for and contributed to, lead author Rolf Mowatt-Larsen, former director of intelligence and counterintelligence at the U.S. Department of Energy, argues that al-Qaeda’s WMD ambitions are stronger than ever. And that “this intent no longer feels theoretical, but operational. “I believe al-Qaeda is laying the groundwork for a large scale attack on the United States, possibly in the next year or two,” continues Mowatt-Larsen in the opening of the report issued earlier this year by the Belfer Center for Science and International Affairs at Harvard Kennedy School. “The attack may or may not involve the use of WMD, but there are signs that al-Qaeda is working on an event on a larger scale than the 9/11 attack. Most will readily dismiss such claims as implausible and unlikely, and we hope they are right, but after spending months with Mowatt-Larsen, who also served as the former head of the Central Intelligence Agency’s WMD and terrorism efforts, scrutinizing and cross-referencing Zawahiri’s 268-page treatise published in 2008 titled “Exoneration”, the analytics steered us towards something far more remarkable than expected.

ISIS Risk High

ISIS Can Buy, Build or Steal Nuclear Weapons – Just a Matter of Time

Russ **Wellen**, 10-21-2014, "Is the Islamic State Capable of Nuclear Terrorism?," Foreign Policy In Focus, <http://fpif.org/islamic-state-capable-nuclear-terrorism/>

After 9/11, many feared that Al Qaeda would get its hands on nuclear weapons. Such fears were stoked by the far right, especially the books of journalist Paul Williams with their provocative titles: *Osama's Revenge: The Next 9/11* and *The Al Qaeda Connection: International Terrorism, Organized Crime, And the Coming Apocalypse*. (Yes, I read them at the time; ate them up even.) In fact, Al Qaeda had made attempts to obtain nuclear materials. In 2007 at the New Yorker, Steve Coll asked: Can the United States be made safe from nuclear terrorism? Even the Belfer Center of the Harvard Kennedy School issued a report in 2010. Key excerpt: Al Qaeda's patient, decade-long effort to steal or construct an improvised nuclear device (IND) flows from their perception of the benefits of producing the image of a mushroom cloud rising over a US city, just as the 9/11 attacks have altered the course of history. This lofty aim helps explain why Al Qaeda has consistently sought a bomb capable of producing a nuclear yield, as opposed to settling for the more expedient and realistic course of devising a "dirty bomb," or a radiological dispersal device. Now such fears are beginning to be transferred to the Islamic State.

Ploughshares Fund President Joseph Cirincione: [The Islamic State, or ISIS's] seizure of banks and oil fields gave it more than \$2 billion in assets. If ISIS could make the right connection to corrupt officials in Russia or Pakistan, the group might be able to buy enough highly enriched uranium (about 50 pounds) and the technical help to build a crude nuclear device. Militants recruited from Europe or America could help smuggle it into their home nations. Or ISIS could try to build a "dirty bomb," conventional explosives like dynamite laced with highly radioactive materials. The blast would not kill many directly, but it would force the evacuation of tens of square blocks contaminated with radioactive particles. The terror and economic consequences of a bomb detonated in the financial districts of London or New York would be enormous. [Also] ISIS could also try to get chemical weapons, such as deadly nerve gases or mustard gas. Fortunately, the most likely source of these terror weapons was just eliminated. How would it pull that off? The Times of India reported on one fanciful idea the Islamic State had, as explained in a "manifesto believed to have been written by Abdullah Ahmed al-Meshedani, a member of the group's highly secretive six-man war cabinet." The document, typed on perforated sheets, was seized by Iraqi special forces during a raid in March on the home of one of the commanders of ISIS, The Sunday Times reported today. And from whom does the Islamic State propose to obtain nuclear know-how, material, or actual weapons? In the document, which has been examined by western security officials — who believe it to be authentic — Meshedani wrote that ISIS aims to get hold of nuclear weapons with the help of Russia, to whom it would offer access to gas fields it controls in Iraq's Anbar province. And as long as you're sharing nuclear weapons with us, Russia, one more little thing: Also, the documents said, Kremlin will have to give up "Iran and its nuclear programme and hands over its secrets." Russia would also have to abandon support for Syrian President Bashar al-Assad and back the Gulf States against Iran. It may not be much of a problem now, but it could be some day. On October 1 the New York Daily News reported on a statement by British Home Secretary Theresa May (emphasis added): "If (ISIS) succeeds in firmly consolidating their grip on the land they occupy in Syria and Iraq, we will see the world's first

truly terrorist state established within a few hours flying time of our country," ... Britain and the West cannot cede ISIS "the space to plot attacks against us, train their men and women, and devise new methods to kill indiscriminately," she said. "We will see the risk, often prophesied, but thank God not yet fulfilled, that with the capability of a state behind them, the terrorists will acquire chemical, biological or even nuclear weapons to attack us."

ISIS Thumps General Nuke Terror Defense – It has Massive Resources and International Connections

Budowsky, Budowsky was an aide to former Sen. Lloyd Bentsen and Bill Alexander, then chief deputy majority whip of the House. He holds an LL.M. degree in international financial law from the London School of Economics., 8-20-**2014**, "Budowsky: ISIS poses nuclear 9/11 threat," TheHill, <http://thehill.com/opinion/brent-budowsky/215603-brent-budowsky-isis-poses-9-11-scope-threat>

Analysts estimate that ISIS has amassed a cash hoard of between \$400 million and \$2 billion. It is highly probable that ISIS will attempt to use some of this money to obtain nuclear, chemical, biological or other weapons of mass death on the international black market or from corrupt officials in nations such as Russia, China, Pakistan or North Korea to use in attacks against New York, Washington, London, Paris, Berlin, Rome, Brussels or other nations it considers infidel enemies. This danger is magnified by the fact that ISIS has recruited nationals of the United States and Europe, who possess American and European passports and are physically indistinguishable from local populations in America and Europe. It is extraordinary that the mass murdering butchery of ISIS is so demented than even al Qaeda is offended. It is alarming that the CIA, which launched intelligence operations even against the United States Senate, and the NSA, which launched massive and unprecedented eavesdropping operations, and intelligence services of leading European nations were blind to the magnitude of the ISIS threat until the most barbaric terrorists in modern history had taken over almost a third of Iraq and are on the brink of creating a terrorist super-state that dwarfs al Qaeda's efforts prior to 9/11. I vehemently opposed the misguided Iraq War from the moment it was proposed by former President George W. Bush and have never been a neoconservative, warmonger or super-hawk. But aggressive action against ISIS is urgently needed. ISIS has stated its intention to attack the United States and Europe to advance its evil, messianic and genocidal ideology and ambitions. ISIS has the money to purchase the most deadly weapons in the world, and has recruited American and European traitors with above-average capability to execute an attack. The odds that ISIS can obtain nuclear, chemical, biological or other forms of mass destruction weapons are impossible to ascertain but in a world of vast illegal arms trafficking, with so many corrupt officials in nations possessing arsenals of destruction, the danger is real. The fact that WMD scares prior to the Iraq War ranged from mistaken to deceitful does not mean that the WMD danger does not exist today. It does.

Yes Extinction

Nuke Taboo

An attack breaks the nuclear taboo – leads to nuclear war.

Li Bin 2009 "An Investigation of China – U.S. Strategic Stability" Prof. Li Bin is a leading Chinese expert on arms control and is currently the director of Arms Control Program at the Institute of International Studies, Tsinghua University. He received his Bachelor and Master Degrees in Physics from Peking University before joining China Academy of Engineering Physics (CAEP) to pursue a doctorate in the technical aspects of arms control. He served as a part-time assistant on arms control for the Committee of Science, Technology and Industry for National Defense (COSTIND). Upon graduation Dr. Li entered the Institute of Applied Physics and Computational Mathematics (IAPCM) as a research fellow and joined the COSTIND technical group supporting Chinese negotiation team on Comprehensive Test Ban Treaty (CTBT). He attended the final round of CTBT negotiations as a technical advisor to the Chinese negotiating team. Nie Hongyi is an officer in the People's Liberation Army with an MA from China's National Defense University and a Ph.D. in International Studies from Tsinghua University, which he completed in 2009 under Prof. Li Bin.

The nuclear taboo is a kind of international norm and this type of norm is supported by the promotion of the norm through international social exchange. But at present the increased threat of nuclear terrorism has lowered people's confidence that nuclear weapons will not be used. China and the United States have a broad common interest in combating nuclear terrorism. Using technical and institutional measures to break the foundation of nuclear terrorism and lessen the possibility of a nuclear terrorist attack can not only weaken the danger of nuclear terrorism itself but also strengthen people's confidence in the nuclear taboo, and in this way preserve an international environment beneficial to both China and the United States. In this way even if there is crisis in China-U.S. relations caused by conflict, the nuclear taboo can also help both countries reduce suspicions about the nuclear weapons problem, avoid miscalculation and thereby reduce the danger of a nuclear war.

Miscalculation

Causes accidental US-Russia nuclear war.

Barrett et al. 13 – (6/28, Anthony, PhD, Engineering and Public Policy from Carnegie Mellon University, Director of Research, Global Catastrophic Risk Institute, Fellow in the RAND Stanton Nuclear Security Fellows Program, Seth Baum, PhD, Geography, Pennsylvania State University, Executive Director, GCRI, Research Scientist at the Blue Marble Space Institute of Science, former Visiting Scholar position at the Center for Research on Environmental Decisions at Columbia University, and Kelly Hostetler, Research Assistant, GCRI, “Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia,” Science and Global Security 21(2): 106-133, pre-print, available online)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have globally catastrophic effects such as severely reducing food production for years,¹ potentially leading to collapse of modern civilization worldwide and even the extinction of humanity.² Nuclear war between the United States and Russia could occur by various routes, including accidental or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack.³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches.⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, though numerous measures were also taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counterattack. However, concerns about the extreme disruptions that a first attack would cause in the other side’s forces and command-and-control capabilities led to both sides’ development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack.⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced.⁶ However, it has also been argued that inadvertent nuclear war between the United States and Russia has continued to present a substantial risk.⁷ While the United States and Russia are not actively threatening each other with war, they have remained ready to launch nuclear missiles in response to indications of attack.⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time.⁹ Second, terrorist groups or other actors might cause attacks on either the United States or Russia that resemble

some kind of nuclear attack by the other nation by actions such as exploding a stolen or improvised nuclear bomb,¹⁰ especially if such an event occurs during a crisis between the United States and Russia.¹¹ A variety of nuclear terrorism scenarios are possible.¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States.¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security.¹⁴ It has long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.-Russian crisis conditions,¹⁵ with the Cuban Missile Crisis being a prime historical example. It is possible that U.S.-Russian relations will significantly deteriorate in the future, increasing nuclear tensions. There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks.

U.S. Lash out

A new WMD terrorist attack will Cause the U.S. to Lash out

Greg **Easterbrook**, senior editor with THE NEW REPUBLIC, November 2001, p.

www.cnn.com/TRANSCRIPTS/0111/01/gal.00.html. (UNDRG/C324)

Terrorists may not be held by this, especially suicidal terrorists, of the kind that al Qaeda is attempting to cultivate. But I think, if I could leave you with one message, it would be this: that the search for terrorist atomic weapons would be of great benefit to the Muslim peoples of the world in addition to members, to people of the United States and Western Europe, because if an atomic warhead goes off in Washington, say, in the current environment or anything like it, in the 24 hours that followed, a hundred million Muslims would die as U.S. nuclear bombs rained down on every conceivable military target in a dozen Muslim countries.

That Domino's into Global Nuclear War

Mohamed **Sid-Ahmed**, Al-Ahram Weekly political analyst, 2004 [Al-Ahram Weekly,

"Extinction!" 8/26, no. 705, <http://weekly.ahram.org.eg/2004/705/op5.htm>]

What would be the consequences of a nuclear attack by terrorists? Even if it fails, it would further exacerbate the negative features of the new and frightening world in which we are now living. Societies would close in on themselves, police measures would be stepped up at the expense of human rights, tensions between civilisations and religions would rise and ethnic conflicts would proliferate. It would also speed up the arms race and develop the awareness that a different type of world order is imperative if humankind is to survive. But the still more critical scenario is if the attack succeeds. This could lead to a third world war, from which no one will emerge victorious. Unlike a conventional war which ends when one side triumphs over another, this war will be without winners and losers. When nuclear pollution infects the whole planet, we will all be losers.

Econ Collapse

A nuclear terror attack in the U.S. will collapse the global financial markets

William J. **Perry** is the Michael and Barbara Berberian Professor at Stanford University. He is a senior fellow at Freeman Spogli Institute for International Studies and serves as codirector of the Preventive Defense Project, ANNALS OF THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE, September 2006, p. 86

Of course, terrorists setting off a nuclear bomb on U.S. soil would not be equivalent to the nuclear holocaust threatened during the cold war. But it would be the single worst catastrophe this country has ever suffered. Just one bomb could result in more than one hundred thousand deaths, and there could be more than one attack. The direct economic losses from the blast would be hundreds of billions of dollars, but the indirect economic impact would be even greater, as worldwide financial markets would collapse in a way that would make the market setback after 9/11 seem mild. And the social and political effects are incalculable, especially if the weapon were detonated in Washington or Moscow or London, crippling the government of that nation.

Global economic crisis causes war---strong statistical support

Royal 10 – Jedediah Royal, Director of Cooperative Threat Reduction at the U.S. Department of Defense, 2010, “Economic Integration, Economic Signaling and the Problem of Economic Crises,” in Economics of War and Peace: Economic, Legal and Political Perspectives, ed. Goldsmith and Brauer, p. 213-214

Less intuitive is how periods of economic decline may increase the likelihood of external conflict. Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behaviour of interdependent states. Research in this vein has been considered at systemic, dyadic and national levels. Several notable contributions follow. First, on the systemic level, Pollins (2008) advances Modelski and Thompson’s (1996) work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of pre-eminent power and the often bloody transition from one pre-eminent leader to the next. As such, exogenous shocks such as economic crises could usher in a redistribution of relative power (see also Gilpin, 10981) that leads to uncertainty about power balances, increasing the risk of miscalculation (Fearon, 1995). Alternatively, even a relatively certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power (Werner, 1999). Separately, Pollins (1996) also shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among major, medium, and small powers, although he suggests that the causes and connections between global economic conditions and security conditions remain unknown. Second, on a dyadic level, Copeland’s (1996,2000) theory of trade expectations suggests that ‘future expectation of trade’ is a significant variable in understanding economic conditions and security behavior of states. He argues that interdependent states are likely to gain pacific benefits

from trade so long as they have an optimistic view of future trade relations. However, if the expectation of future trade decline, particularly for difficult to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by interdependent states. Third, others have considered the link between economic decline and external armed conflict at a national level. Blomberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write, The linkages between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the favour. Moreover, the presence of a recession tends to amplify the extent to which international and external conflicts self-reinforce each other. (Blomberg & Hess, 2002, p.89). Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapana, 2004), which has the capacity to spill across borders and lead to external tensions. Furthermore, crises generally reduce the popularity of a sitting government. 'Diversionary theory' suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to create a 'rally round the flag' effect. Wang (1996), DeRouen (1995), and Blomberg, Hess and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997) Miller (1999) and Kisanganie and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak presidential popularity, are statistically linked to an increase in the use of force.

Middle East Escalation

Instability in The Middle East ensures that Nuclear Terror Would cause a Surge in Extremism against a pre-occupied U.S. and it's allies – Iran, Pakistan, Israel and Independent Nuclear Terror Attacks are all likely to cause War

Freilich 10 – (2010, Chuck, PhD, Senior Fellow at the International Security Program, Harvard Kennedy School, Adjunct Professor at New York University, former Deputy National Security Adviser in Israel, “The Armageddon Scenario: Israel and the Threat of Nuclear Terrorism,” THE BEGIN-SADAT CENTER FOR STRATEGIC STUDIES BAR-ILAN UNIVERSITY, Mideast Security and Policy Studies No. 84, <http://www.biu.ac.il/SOC/besa/MSPS84.pdf>)

The Middle East is a demographic, socio-economic, political, and military time bomb waiting to explode. Even before the recent global economic crisis, unemployment in Arab countries was the highest in the world, including among young people. Economic growth in the Middle East is likely to remain stagnant, with the region falling further behind the rest of the world. When combined with the highly combustible winds of religious fundamentalism, the danger of nuclear terrorism is particularly acute in this region.²³ There is little reason to believe that regional governments will permit political reform and greater self-expression, and political grievances will likely continue to be expressed in extremist and fundamentalist terms which render them inviolate and non-negotiable. For example, there is no assurance that Egyptian President Hosni Mubarak will be succeeded by a moderate and peaceful leader, or that Egypt will not become a radical Islamic state. The long anticipated regime change in Iran may give rise to a more moderate government, but may also result in an even more radical one. Saudi Arabia's future is also questionable. Even the future of Turkey, heretofore held out as a beacon of democracy and secularism within the Muslim world, is unclear. Hatred of Israel, the US, and the West is likely to continue and possibly intensify. Progress towards peace with Israel and improvements in Arab-Western relations are unlikely to be sufficient to reduce the evolving socio-economic, political, and demographic pressures. The Middle East faces another explosion today – of potential nuclear capabilities. Not only Israel, but also the Sunni Arab regimes, are deeply afraid of Iran's nuclear capabilities. In response, over a dozen Arab countries have announced civil military programs. Arab “civil” nuclear programs, as seen from past experience, have a nasty tendency to morph into military ones. The danger of nuclear terrorism, further abetted by the spread of nuclear technology and materials in the region, will be greatly exacerbated by the rise of a multi-polar nuclear Middle East. Nuclear terrorism could give rise to a broader war in the Middle East and even lead to nuclear war. Nuclear war could give rise to more nuclear terrorism.²⁴

Escalates and Leads to extinctions

Russell 09 (James A. Russell, senior lecturer in the Department of National Security Affairs at the Naval Postgraduate School, “Strategic Stability Reconsidered: Prosepects for Nuclear War

and Escalation in the Middle East,” in collaboration with the Atomic Energy Commission, http://www.nps.edu/academics/sigs/ccc/people/biolinks/russell/PP26_Russell_2009.pdf)

Strategic stability in the region is thus undermined by various factors: (1) asymmetric interests in the bargaining framework that can introduce unpredictable behavior from actors; (2) the presence of non-state actors that introduce unpredictability into relationships between the antagonists; (3) incompatible assumptions about the structure of the deterrent relationship that makes the bargaining framework strategically unstable; (4) perceptions by Israel and the United States that its window of opportunity for military action is closing, which could prompt a preventive attack; (5) the prospect that Iran’s response to pre-emptive attacks could involve unconventional weapons, which could prompt escalation by Israel and/or the United States; (6) the lack of a communications framework to build trust and cooperation among framework participants. These systemic weaknesses in the coercive bargaining framework all suggest that escalation by any the parties could happen either on purpose or as a result of miscalculation or the pressures of wartime circumstance. Given these factors, it is disturbingly easy to imagine scenarios under which a conflict could quickly escalate in which the regional antagonists would consider the use of chemical, biological, or nuclear weapons. It would be a mistake to believe the nuclear taboo can somehow magically keep nuclear weapons from being used in the context of an unstable strategic framework. Systemic asymmetries between actors in fact suggest a certain increase in the probability of war – a war in which escalation could happen quickly and from a variety of participants. Once such a war starts, events would likely develop a momentum all their own and decision-making would consequently be shaped in unpredictable ways. The international community must take this possibility seriously, and muster every tool at its disposal to prevent such an outcome, which would be an unprecedented disaster for the peoples of the region, with substantial risk for the entire world.

AT: Can't Get the Bomb Here

Their Evidence is just complacency – U.S. Security measures are not Resilient Enough Absent Strong Domestic Surveillance

Bunn 13 – (2013, Matthew, PhD, Professor of Practice; Co-Principal Investigator, Project on Managing the Atom, Belfer Center for Science and International Affairs, Harvard, “Beyond Crises: The Unending Challenge of Controlling Nuclear Weapons and Materials,” in Nuclear Weapons Security Crises: What Does History Teach? Ed. Henry D. Sokolski. Strategic Studies Institute, U.S. Army War College, 253-278)

In short, the threats are out there. In a world that includes terrorists with global reach, effective nuclear security and accounting measures are needed wherever nuclear weapons, plutonium, or HEU exist. All countries with such stockpiles on their soil should ensure that they are at least protected against a modest group of well-armed, well-trained outsiders; a well-placed insider; and both outsiders and an insider working together, using a broad range of tactics. Countries that face more substantial adversary threats—Pakistan being an obvious example—need to provide even higher levels of protection.⁹ Unfortunately, in many countries around the world, the security measures in place today are demonstrably not sufficient to protect against the kinds of threats terrorists and thieves have already shown they can pose. For example, a U.S. team visiting a foreign site with a Category I quantity of HEU from 2005 to 2010 found that there were no fences around the perimeter, no sensors to detect intrusions, no video surveillance systems to help guards assess the cause of alarms generated by sensors, and no vehicle barriers.¹⁰ (It is a reasonable bet that this facility also did not have an on-site armed response team to protect it from armed attackers.) The U.S. team recommended that all of these basic security measures be put in place, which the country agreed to do. But when a team of congressional auditors visited in 2010-11, some of the improvements were still under way. The fact that such glaring weaknesses still existed at a site with Category I materials years after the September 11, 2001 (9/11), attacks speaks volumes about the urgent work still ahead to plug nuclear security weak points around the world. Indeed, I would argue that every country with nuclear weapons or weapons-usable nuclear materials—including the United States—has more to do to ensure that these items are effectively protected. PUNCTUATING COMPLACENT EQUILIBRIUM: THE U.S. CASE If political turmoil is not the most important driver of nuclear security problems, what is? In a word, complacency—the belief that nuclear terrorism is not a serious threat, and that whatever security measures are in place today are already sufficient. The history of nuclear security is a story of punctuated equilibrium, with long stretches of complacency and little change punctuated by moments when something—typically, a major incident of some kind—made it possible to move the system to a higher-security state, from which it would then begin to drift slowly into complacency again. The results of incidents and other events are mediated by the different political cultures and institutions in different countries, so that one country might react to an incident by establishing substantial new security rules, while another might react by having participants in the system offer explanations why it could never happen again.

AT: Can't Build Them

Russian Materials Make Construction Relatively Easy

Zimmerman 09 – (2009, Peter, PhD, experimental nuclear and elementary particle physics, Emeritus Professor of Science and Security at King's College London, former Chief Scientist of the Senate Foreign Relations Committee, "Do We Really Need to Worry? Some Reflections on the Threat of Nuclear Terrorism," Defence Against Terrorism Review Vol. 2, No. 2, Fall 2009, 1-14)

Abstract: This paper considers the case for and against there being a substantial risk that a sub-state adversary might be able to carry the construction of a nuclear device to completion and delivery. It discusses works both for and against the proposition that the detonation of an improvised nuclear device (IND) or a stolen nuclear weapon is sufficiently probable that strong measures to prevent the act must be considered. Contrarian articles and books have appeared suggesting that the possibility of nuclear terrorism has been greatly exaggerated. They argue that building an IND is too difficult for even well-financed terrorists, that obtaining sufficient fissile materials is nearly impossible, and that no intact weapons will be stolen. But an examination of these works finds some to be simplistic and ridden with basic mistakes in risk analysis or misconceptions, while others are better informed but still flawed. The principal barrier to entry for either a new nuclear weapons possessor state or a sub-state group, namely acquiring fissile material, plutonium or highly enriched uranium (HEU), became less imposing with the collapse of the Soviet Union. There is a gap in our knowledge of Russian fissile inventories, which have not always been well guarded, and in this circumstance one cannot reassure the world that there has been no theft of fissile material, or that any attempt will be detected quickly enough to prevent its being made into a nuclear device. The probability of a nuclear terrorist attack in any given year remains significant. Significant investment to deter, prevent, detect, and destroy a nuclear terror plot is required.

AT: Empirically Denied

High risk of nuclear terrorism, empirically denied arguments are bunk, and terrorists can steal materials

Simon **Sturdee**, 7-1, 13, "UN Atomic Energy Agency Sounds Warning on 'Nuclear Terrorism,'" <http://www.foxnews.com/world/2013/07/01/un-atomic-agency-sounds-warning-on-nuclear-terrorism/>

The head of the UN atomic agency warned Monday against complacency in preventing "nuclear terrorism", saying progress in recent years should not lull the world into a false sense of security.¶ "Much has been achieved in the past decade," Yukiya Amano of the International Atomic Energy Agency told a gathering in Vienna of some 1,200 delegates from around 110 states including 35 ministers to review progress on the issue.¶ "Many countries have taken effective measures to prevent theft, sabotage, unauthorised access, illegal transfer, or other malicious acts involving nuclear or other radioactive material. Security has been improved at many facilities containing such material."¶ Partly as a result, he said, "there has not been a terrorist attack involving nuclear or other radioactive material."¶ "But this must not lull us into a false sense of security. If a 'dirty bomb' is detonated in a major city, or sabotage occurs at a nuclear facility, the consequences could be devastating.¶ "Nuclear terrorism" comprises three main risks: an atomic bomb, a "dirty bomb" -- conventional explosion spreading radioactive material -- and an attack on a nuclear plant.¶ The first, using weapons-grade uranium or plutonium, is generally seen as "low probability, high consequence" -- very difficult to pull off but for a determined group of extremists, not impossible.¶ There are hundreds of tonnes of weapons-usable plutonium and uranium -- a grapefruit-sized amount is enough for a crude nuclear weapon that would fit in a van -- around the world.¶ A "dirty bomb" -- a "radiological dispersal device" or RDD -- is much easier but would be hugely less lethal. But it might still cause mass panic.¶ "If the Boston marathon bombing (in April this year) had been an RDD, the trauma would be lasting a whole lot longer," Sharon Squassoni from the Center for Strategic and International Studies (CSIS) told AFP.¶ Last year alone, the IAEA recorded 17 cases of illegal possession and attempts to sell nuclear materials and 24 incidents of theft or loss. And it says this is the "tip of the iceberg".¶ Many cases have involved former parts of the Soviet Union, for example Chechnya, Georgia and Moldova -- where in 2011 several people were arrested trying to sell weapons-grade uranium -- but not only.¶ Nuclear materials that could be used in a "dirty bomb" are also used in hospitals, factories and university campuses and are therefore seen as easy to steal.¶ Major international efforts have been made since the end of the Soviet Union in 1991 and the September 11, 2001 attacks in the United States to prevent nuclear material falling into the wrong hands.¶ US President Barack Obama hosted a summit in 2010 on the subject which was followed by another one in Seoul last year. A third is planned in The Hague in March.¶ A report issued in Vienna on Monday to coincide with the start of the meeting by the Arms Control Association and the Partnership for Global Security said decent progress had been made but that "significant" work remained.¶ Ten countries have eliminated their entire stockpiles of weapons-grade uranium, many reactors producing nuclear medicines were using less risky materials and smuggling nuclear materials across borders, for example from Pakistan, is harder, it said.¶ But some countries still do not have armed guards at nuclear power plants,

security surrounding nuclear materials in civilian settings is often inadequate and there is a woeful lack of international cooperation and binding global rules.¶ "We are still a long way from having a unified regime, a unified understanding of the threat and a way to address it," Michelle Cann, co-author of the report, told AFP.

AT: No Expertise

Terrorists Could Build a Dirty bomb without Expertise

Michael **Clark, 2013**, Michael Clarke (m.clarke@griffith.edu.au) is an Australian Research Council (ARC) Research Fellow at the Griffith Asia Institute, June 2013, Comparative Strategy, "Pakistan and Nuclear Terrorism: How Real is the Threat?," pp. 98-114

The threat of terrorist use of an RDD or "dirty bomb" has increased since September 11, 2001, and is perceived as the most likely act of nuclear terrorism. An RDD is not a nuclear weapon but a bomb that uses conventional explosives to spread radiological material over a wide area. The damage caused by the detonation of an RDD would not necessarily stem from the effects of the radiological material itself but instead from the amount of conventional explosives used.³⁵ Nonetheless, the detonation of a dirty bomb would have a major psychological impact due to the widespread fear of radiation in the public imagination.³⁶ The effectiveness of an RDD would also depend on a number of variables including the radiological material used, the amount of conventional explosive, and the weather conditions. While there are hundreds of radioactive isotopes, only a small number are considered to be effective in an RDD, notably cesium-137 and cobalt-60, both of which are produced in nuclear reactors and are widely used for medical/industrial purposes. As these materials are found in hospitals, universities, and research facilities, they are perceived by some analysts as a "soft target" for potential terrorists seeking materials for an RDD.³⁷ Spent fuel from nuclear power reactors has also been identified as a potential source of radioactive materials for an RDD.

Bioterror Impacts

General Risk High

Bio and Nuclear Weapon Acquisition Risk is High – Lone Wolves Can Deliver

Gary A. **Ackerman 14** & Lauren E. Pinson, Gary is Director of the Center for Terrorism and Intelligence Studies, Lauren is Senior Researcher and Project Manager for the National Consortium for the Study of Terrorism and Responses of Terrorism, *An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells*, *Terrorism and Political Violence*, Volume 26, Issue 1

The first question to answer is whence the concerns about the nexus between CBRN weapons and isolated actors come and whether these are overblown. The general threat of mass violence posed by lone wolves and small autonomous cells has been detailed in accompanying issue contributions, but the potential use of CBRN weapons by such perpetrators presents some singular features that either amplify or supplement the attributes of the more general case and so are deserving of particular attention. Chief among these is the impact of rapid technological development. Recent and emerging advances in a variety of areas, from synthetic biology 3 to nanoscale engineering, 4 have opened doors not only to new medicines and materials, but also to new possibilities for malefactors to inflict harm on others. What is most relevant in the context of lone actors and small autonomous cells is not so much the pace of new invention, but rather the commercialization and consumerization of CBRN weapons-relevant technologies. This process often entails an increase in the availability and safety of the technology, with a concurrent diminution in the cost, volume, and technical knowledge required to operate it. Thus, for example, whereas fifty years ago producing large quantities of certain chemical weapons might have been a dangerous and inefficient affair requiring a large plant, expensive equipment, and several chemical engineers, with the advent of chemical microreactors, 5 the same processes might be accomplished far more cheaply and safely on a desktop assemblage, purchased commercially and monitored by a single chemistry graduate student.¶ The rapid global spread and increased user-friendliness of many technologies thus represents a potentially radical shift from the relatively small scale of harm a single individual or small autonomous group could historically cause. 6 From the limited reach and killing power of the sword, spear, and bow, to the introduction of dynamite and eventually the use of our own infrastructures against us (as on September 11), the number of people that an individual who was unsupported by a broader political entity could kill with a single action has increased from single digits to thousands. Indeed, it has even been asserted that “over time ... as the leverage provided by technology increases, this threshold will finally reach its culmination—with the ability of one man to declare war on the world and win.” 7 Nowhere is this trend more perceptible in the current age than in the area of unconventional weapons.¶ These new technologies do not simply empower users on a purely technical level. Globalization and the expansion of information networks provide new opportunities for disaffected individuals in the farthest corners of the globe to become familiar with core weapon concepts and to purchase equipment—online technical courses and eBay are undoubtedly a boon to would-be purveyors of violence. Furthermore, even the most solipsistic misanthropes, people who would never be able to function socially as part of an operational terrorist group, can find radicalizing influences or legitimation for their beliefs in the maelstrom of virtual identities on the Internet.¶ All of this can spawn, it is feared, a more deleterious breed of lone actors, what have been referred to in

some quarters as “super-empowered individuals.”⁸ Conceptually, super-empowered individuals are atomistic game-changers, i.e., they constitute a single (and often singular) individual who can shock the entire system (whether national, regional, or global) by relying only on their own resources. Their core characteristics are that they have superior intelligence, the capacity to use complex communications or technology systems, and act as an individual or a “lone-wolf.”⁹ The end result, according to the pessimists, is that if one of these individuals chooses to attack the system, “the unprecedented nature of his attack ensures that no counter-measures are in place to prevent it. And when he strikes, his attack will not only kill massive amounts of people, but also profoundly change the financial, political, and social systems that govern modern life.”¹⁰ It almost goes without saying that the same concerns attach to small autonomous cells, whose members' capabilities and resources can be combined without appreciably increasing the operational footprint presented to intelligence and law enforcement agencies seeking to detect such behavior.[¶] With the exception of the largest truck or aircraft bombs, the most likely means by which to accomplish this level of system perturbation is through the use of CBRN agents as WMD. On the motivational side, therefore, lone actors and small autonomous cells may ironically be more likely to select CBRN weapons than more established terrorist groups—who are usually more conservative in their tactical orientation—because the extreme asymmetry of these weapons may provide the only subjectively feasible option for such actors to achieve their grandiose aims of deeply affecting the system. The inherent technical challenges presented by CBRN weapons may also make them attractive to self-assured individuals who may have a very different risk tolerance than larger, traditional terrorist organizations that might have to be concerned with a variety of constituencies, from state patrons to prospective recruits.¹¹ Many other factors beyond a “perceived potential to achieve mass casualties” might play into the decision to pursue CBRN weapons in lieu of conventional explosives,¹² including a fetishistic fascination with these weapons or the perception of direct referents in the would-be perpetrator's belief system.[¶] Others are far more sanguine about the capabilities of lone actors (or indeed non-state actors in general) with respect to their potential for using CBRN agents to cause mass fatalities, arguing that the barriers to a successful large-scale CBRN attack remain high, even in today's networked, tech-savvy environment.¹³ Dolnik, for example, argues that even though homegrown cells are “less constrained” in motivations, more challenging plots generally have an inverse relationship with capability,¹⁴ while Michael Kenney cautions against making presumptions about the ease with which individuals can learn to produce viable weapons using only the Internet.¹⁵ However, even most of these pundits concede that low-level CBR attacks emanating from this quarter will probably lead to political, social, and economic disruption that extends well beyond the areas immediately affected by the attack. This raises an essential point with respect to CBRN terrorism: irrespective of the harm potential of CBRN weapons or an actor's capability (or lack thereof) to successfully employ them on a catastrophic scale, these weapons invariably exert a stronger psychological impact on audiences—the essence of terrorism—than the traditional gun and bomb. This is surely not lost on those lone actors or autonomous cells who are as interested in getting noticed as in causing casualties.[¶] Proven Capability and Intent[¶] While legitimate debate can be had as to the level of potential threat posed by lone actors or small autonomous cells wielding CBRN weapons, possibly the best argument for engaging in a substantive examination of the issue is the most concrete one of all—that these actors have already demonstrated the motivation and capability

to pursue and use CBRN weapons, in some cases even close to the point of constituting a genuine WMD threat. In the context of bioterrorism, perhaps the most cogent illustration of this is the case of Dr. Bruce Ivins, the perpetrator behind one of the most serious episodes of bioterrorism in living memory, the 2001 “anthrax letters,” which employed a highly virulent and sophisticated form of the agent and not only killed five and seriously sickened 17 people, but led to widespread disruption of the U.S. postal services and key government facilities. 16¶ Other historical cases of CBRN pursuit and use by lone actors and small autonomous cells highlight the need for further exploration. Among the many extant examples: 17¶ Thomas Lavy was caught at the Alaska-Canada border in 1993 with 130 grams of 7% pure ricin. It is unclear how Lavy obtained the ricin, what he planned to do with it, and what motivated him.¶ In 1996, Diane Thompson deliberately infected twelve coworkers with shigella dysenteriae type 2. Her motives were unclear.¶ In 1998, Larry Wayne Harris, a white supremacist, was charged with producing and stockpiling a biological agent—bacillus anthracis, the causative agent of anthrax.¶ In 1999, the Justice Department (an autonomous cell sympathetic to the Animal Liberation Front) mailed over 100 razor blades dipped in rat poison to individuals involved in the fur industry.¶ In 2000, Tsiugio Uchinshi was arrested for mailing samples of the mineral monazite with trace amounts of radioactive thorium to several Japanese government agencies to persuade authorities to look into potential uranium being smuggled to North Korea.¶ In 2002, Chen Zhengping put rat poison in a rival snack shop's products and killed 42 people.¶ In 2005, 10 letters containing a radioactive substance were mailed to major organizations in Belgium including the Royal Palace, NATO headquarters, and the U.S. embassy in Brussels. No injuries were reported.¶ In 2011, federal agents arrested four elderly men in Georgia who were plotting to use ricin and explosives to target federal buildings, Justice Department officials, federal judges, and Internal Revenue Service agents.¶ Two recent events may signal an even greater interest in CBRN by lone malefactors. First, based on one assessment of Norway's Anders Breivik's treatise, his references to CBRN weapons a) suggest that CBRN weapons could be used on a tactical level and b) reveal (to perhaps previously uninformed audiences) that even low-level CBRN weapons could achieve far-reaching impacts driven by fear. 18 Whether or not Breivik would actually have sought or been able to pursue CBRN, he has garnered a following in several (often far-right) extremist circles and his treatise might inspire other lone actors. Second, Al-Qaeda in the Arabian Peninsula (AQAP) released two issues of Inspire magazine in 2012. Articles, on the one hand, call for lone wolf jihad attacks to target non-combatant populations and, on the other, permit the use of chemical and biological weapons. The combination of such directives may very well influence the weapon selection of lone actor jihadists in Western nations. 19

Bioterror is Easier than Most Experts Let on

Allison, IR Director @ Harvard, **12** (Graham, Director, Belfer Center for Science and International Affairs; Douglas Dillon Professor of Government, Harvard Kennedy School, "Living in the Era of Megaterror", Sept 7, http://belfercenter.ksg.harvard.edu/publication/22302/living_in_the_era_of_megaterror.html)

Forty years ago this week at the Munich Olympics of 1972, Palestinian terrorists conducted one of the most dramatic terrorist attacks of the 20th century. The kidnapping and massacre of 11 Israeli athletes attracted days of around-the-clock global news coverage of Black September's anti-Israel message. Three decades later, on 9/11, Al Qaeda killed nearly 3,000 individuals at the

World Trade Center and the Pentagon, announcing a new era of megaterror. In an act that killed more people than Japan's attack on Pearl Harbor, a band of terrorists headquartered in ungoverned Afghanistan demonstrated that individuals and small groups can kill on a scale previously the exclusive preserve of states. Today, how many people can a small group of terrorists kill in a single blow? Had Bruce Ivins, the U.S. government microbiologist responsible for the 2001 anthrax attacks, distributed his deadly agent with sprayers he could have purchased off the shelf, tens of thousands of Americans would have died. Had the 2001 "Dragonfire" report that Al Qaeda had a small nuclear weapon (from the former Soviet arsenal) in New York City proved correct, and not a false alarm, detonation of that bomb in Times Square could have incinerated a half million Americans. In this electoral season, President Obama is claiming credit, rightly, for actions he and U.S. Special Forces took in killing Osama bin Laden. Similarly, at last week's Republican convention in Tampa, Jeb Bush praised his brother for making the United States safer after 9/11. There can be no doubt that the thousands of actions taken at federal, state and local levels have made people safer from terrorist attacks. Many are therefore attracted to the chorus of officials and experts claiming that the "strategic defeat" of Al Qaeda means the end of this chapter of history. But we should remember a deeper and more profound truth. While applauding actions that have made us safer from future terrorist attacks, we must recognize that they have not reversed an inescapable reality: The relentless advance of science and technology is making it possible for smaller and smaller groups to kill larger and larger numbers of people. If a Qaeda affiliate, or some terrorist group in Pakistan whose name readers have never heard, acquires highly enriched uranium or plutonium made by a state, they can construct an elementary nuclear bomb capable of killing hundreds of thousands of people. At biotech labs across the United States and around the world, research scientists making medicines that advance human well-being are also capable of making pathogens, like anthrax, that can produce massive casualties. What to do? Sherlock Holmes examined crime scenes using a method he called M.M.O.: motive, means and opportunity. In a society where citizens gather in unprotected movie theaters, churches, shopping centers and stadiums, opportunities for attack abound. Free societies are inherently "target rich." Motive to commit such atrocities poses a more difficult challenge. In all societies, a percentage of the population will be homicidal. No one can examine the mounting number of cases of mass murder in schools, movie theaters and elsewhere without worrying about a society's mental health. Additionally, actions we take abroad unquestionably impact others' motivation to attack us. As Faisal Shahzad, the 2010 would-be "Times Square bomber," testified at his trial: "Until the hour the U.S. ... stops the occupation of Muslim lands, and stops killing the Muslims ... we will be attacking U.S., and I plead guilty to that." Fortunately, it is more difficult for a terrorist to acquire the "means" to cause mass casualties. Producing highly enriched uranium or plutonium requires expensive industrial-scale investments that only states will make. If all fissile material can be secured to a gold standard beyond the reach of thieves or terrorists, aspirations to become the world's first nuclear terrorist can be thwarted. Capabilities for producing bioterrorist agents are not so easily secured or policed. While more has been done, and much more could be done to further raise the technological barrier, as knowledge advances and technological capabilities to make pathogens become more accessible, the means for bioterrorism will come within the reach of terrorists. One of the hardest truths about modern life is that the same advances in science and technology that enrich our lives also empower potential killers to achieve their deadliest

ambitions. To imagine that we can escape this reality and return to a world in which we are invulnerable to future 9/11s or worse is an illusion. For as far as the eye can see, we will live in an era of megaterror.

Al Qaeda Risk High

Best Evidence – Al Qaeda Specifically Wants To Use bio weapons

Hellmich and Redig 07 – (2007, Christina, PhD, Reader in International Relations and Middle East Studies, and Amanda, MD, PhD, Clinical Fellow in Medicine, Harvard Catalyst Clinical and Translational Science Center, “The Question is When: The Ideology of Al Qaeda and the Reality of Bioterrorism,” Studies in Conflict & Terrorism Volume 30, Issue 5, 2007)

The fictional scenario presented at the beginning of this article is not meant to be a scientifically valid primer in the production or distribution of a biological agent. Rather, it is intended to illustrate the ease with which biological agents can be adapted to more conventional and well-documented historical examples of terrorism. In this setting, the question du jour is not if it can be done, but rather, is there someone willing to do it. It is thus the aim of the remainder of this commentary to provide a missing piece of analysis in what has become a topic of international concern with a budget of billions of dollars. Current evaluations of bioterrorism do not adequately consider either the unique and often unrecognized ideological position of Al Qaeda or the relevance of the organization's historical and contextual setting. Furthermore, in what is a dangerous oversight, the scientific and technical aspects of creating and using biological weapons have only been assessed from a now invalid historical paradigm that does not accurately reflect the decision-making structure and operations of the present-day organization most likely to use such weapons. As counterterrorism measures are only as accurate as the analysis on which they are based, it is a matter of grave importance that the threat of bioterror be philosophically and scientifically reevaluated through the only lens that matters: Al Qaeda's.

Loose Soviet Anthrax Presents Biggest Risk

Hellmich and Redig 07 – (2007, Christina, PhD, Reader in International Relations and Middle East Studies, and Amanda, MD, PhD, Clinical Fellow in Medicine, Harvard Catalyst Clinical and Translational Science Center, “The Question is When: The Ideology of Al Qaeda and the Reality of Bioterrorism,” Studies in Conflict & Terrorism Volume 30, Issue 5, 2007)

Although the ability to effectively weaponize a microbe such as anthrax, smallpox, or Yersinia pestis is admittedly a challenge, it has already been accomplished by at least one state entity, namely the former Soviet Union. 64 This raises concerns at two levels: in the dissolution of an entire society, what happened to the reagent stocks of bioweapons and what happened to the scientists who created them? Ironically, the world was probably more secure from the threat of biowarfare during the years in which some of the world's most talented molecular biologists were actively creating superstrains of bacteria and determining how to effectively deliver them than it is today. For even as research accelerated the development of extremely sophisticated bioweapons, the political checks and constraints of a bipolar world made the likelihood of their eventual use very low. In addition, the not inconsiderable resources of a superpower with an established Gulag and NKVD were fully deployed to prevent the unauthorized use, transport, or discussion of such weapons. However, the politics that prevented a nuclear holocaust triggered by the opposition of two superpowers during the Cold War simply do not apply to the political or strategic decision-making process of an organization like Al Qaeda. And although Al Qaeda itself may not have the resources to create a weapons-grade strain of anthrax or smallpox,

Biopreparat did. In the collapse of any social safety net, and in the wake of rampant inflation, unemployment, and poverty following the end of the Soviet Union, it is not hard to imagine that some of the estimated 50,000 scientists employed by Biopreparat may have been tempted to trade what resources were left—information or materials—to stave off starvation, secure medical care for an ill child, or provide the means to relocate to a more stable society. In short, Al Qaeda is poised to benefit from resources it could never hope to match while organizing an operation a state actor could never conceivably order. Bioterror attacks are unlikely as long as the means and the will to orchestrate them remain separated. Quite simply, the Western world can no longer assume that is the case.

ISIS Specific

ISIS Is Developing Bioweapons – Recovered Raid Data Proves

Harald Doornbosjenan **Moussa**, 8-28-2014, Harald Doornbos is a reporter based in Pakistan covering the greater Middle East. "Found: The Islamic State's Terror Laptop of Doom," Foreign Policy, <http://foreignpolicy.com/2014/08/28/found-the-islamic-states-terror-laptop-of-doom/>

AKYA, Turkey — Abu Ali, a commander of a moderate Syrian rebel group in northern Syria, proudly shows a black laptop partly covered in dust. "We took it this year from an ISIS hideout," he says. Abu Ali says the fighters from the Islamic State of Iraq and al-Sham (ISIS), which have since rebranded themselves as the Islamic State, all fled before he and his men attacked the building. The attack occurred in January in a village in the Syrian province of Idlib, close to the border with Turkey, as part of a larger anti-ISIS offensive occurring at the time. "We found the laptop and the power cord in a room," he continued, "I took it with me. But I have no clue if it still works or if it contains anything interesting." The Complex: Is the ISIS laptop of doom an operational threat? Meet Lady al Qaeda: Why does every jihadi group want the U.S. to free Aafia Siddiqui? Inside the Bureaucracy of Evil: From electricity to sewage, U.S. intel warns the Islamic State has gotten pretty good at running a country. As we switched on the Dell laptop, it indeed still worked. Nor was it password-protected. But then came a huge disappointment: After we clicked on "My Computer," all the drives appeared empty. Appearances, however, can be deceiving. Upon closer inspection, the ISIS laptop wasn't empty at all: Buried in the "hidden files" section of the computer were 146 gigabytes of material, containing a total of 35,347 files in 2,367 folders. Abu Ali allowed us to copy all these files — which included documents in French, English, and Arabic — onto an external hard drive. A screenshot of material found on the computer. The files appear to be videos of speeches by jihadist clerics. (Click to enlarge.) The laptop's contents turn out to be a treasure trove of documents that provide ideological justifications for jihadi organizations — and practical training on how to carry out the Islamic State's deadly campaigns. They include videos of Osama bin Laden, manuals on how to make bombs, instructions for stealing cars, and lessons on how to use disguises in order to avoid getting arrested while traveling from one jihadi hot spot to another. But after hours upon hours of scrolling through the documents, it became clear that the ISIS laptop contains more than the typical propaganda and instruction manuals used by jihadists. The documents also suggest that the laptop's owner was teaching himself about the use of biological weaponry, in preparation for a potential attack that would have shocked the world. The information on the laptop makes clear that its owner is a Tunisian national named Muhammed S. who joined ISIS in Syria and who studied chemistry and physics at two universities in Tunisia's northeast. Even more disturbing is how he planned to use that education: The ISIS laptop contains a 19-page document in Arabic on how to develop biological weapons and how to weaponize the bubonic plague from infected animals. The ISIS laptop contains a 19-page document in Arabic on how to develop biological weapons and how to weaponize the bubonic plague from infected animals. "The advantage of biological weapons is that they do not cost a lot of money, while the human casualties can be huge," the document states. The document includes instructions for how to test the weaponized disease safely, before it is used in a terrorist attack. "When the microbe is injected in small mice, the symptoms of the disease should start to appear within 24 hours," the document says. The laptop also includes a 26-page fatwa, or Islamic ruling, on the usage of weapons of mass

destruction. “If Muslims cannot defeat the kafir [unbelievers] in a different way, it is permissible to use weapons of mass destruction,” states the fatwa by Saudi jihadi cleric Nasir al-Fahd, who is currently imprisoned in Saudi Arabia. “Even if it kills all of them and wipes them and their descendants off the face of the Earth.” When contacted by phone, a staff member at a Tunisian university listed on Muhammed’s exam papers confirmed that he indeed studied chemistry and physics there. She said the university lost track of him after 2011, however. Out of the blue, she asked: “Did you find his papers inside Syria?” Asked why she would think that Muhammed’s belongings would have ended up in Syria, she answered, “For further questions about him, you better ask state security.” An astonishing number of Tunisians have flocked to the Syrian battlefield since the revolt began. In June, Tunisia’s interior minister A photo of Muhammed S. found on his laptop. This image has been digitally altered. Out of the blue, she asked: “Did you find his papers inside Syria?” Asked why she would think that Muhammed’s belongings would have ended up in Syria, she answered, “For further questions about him, you better ask state security.” An astonishing number of Tunisians have flocked to the Syrian battlefield since the revolt began. In June, Tunisia’s interior minister estimated that at least 2,400 Tunisians were fighting in the country, mostly as members of the Islamic State. This isn’t the first time that jihadists have attempted to acquire weapons of mass destruction. Even before the 9/11 attacks, al Qaeda had experimented with a chemical weapons program in Afghanistan. In 2002, CNN obtained a tape showing al Qaeda members testing poison gas on three dogs, all of which died. Nothing on the ISIS laptop, of course, suggests that the jihadists already possess these dangerous weapons. And any jihadi organization contemplating a bioterrorist attack will face many difficulties: Al Qaeda tried unsuccessfully for years to get its hands on such weapons, and the United States has devoted massive resources to preventing terrorists from making just this sort of breakthrough. The material on this laptop, however, is a reminder that jihadists are also hard at work at acquiring the weapons that could allow them to kill thousands of people with one blow. “The real difficulty in all of these weapons ... [is] to actually have a workable distribution system that will kill a lot of people,” said Magnus Ranstorp, research director of the Center for Asymmetric Threat Studies at the Swedish National Defence College. “But to produce quite scary weapons is certainly within [the Islamic State’s] capabilities.” The Islamic State’s sweeping gains in recent months may have provided it with the capacity to develop such new and dangerous weapons. Members of the jihadi group are not solely fighting on the front lines these days — they also control substantial parts of Syria and Iraq. The fear now is that men like Muhammed could be quietly working behind the front lines — for instance, in the Islamic State-controlled University of Mosul or in some laboratory in the Syrian city of Raqqa, the group’s de facto capital — to develop chemical or biological weapons. In short, the longer the caliphate exists, the more likely it is that members with a science background will come up with something horrible. The documents found on the laptop of the Tunisian jihadist, meanwhile, leave no room for doubt about the group’s deadly ambitions. “Use small grenades with the virus, and throw them in closed areas like metros, soccer stadiums, or entertainment centers,” the 19-page document on biological weapons advises. “Best to do it next to the air-conditioning. It also can be used during suicide operations.”

The WHO Concludes that ISIS Has the Capability to Develop a Bio Weapon

Ryan **Wallace**, 6-25-2015, ScienceTimes.com Writer "Biological Warfare on the Horizon? ISIS Soldiers May Be Infected With Ebola," Science Times, <http://www.sciencetimes.com/articles/2395/20150105/biological-warfare-on-the-horizon-isis-soldiers-may-be-infected-with-ebola.htm>

It's what national security organizations have feared since day one-the World Health Organization (WHO) announced last week that they are evaluating jihadist militants associated with ISIS, who may have contracted the virus responsible for Ebola. While the WHO has yet to confirm whether or not the fighters are exhibiting symptoms, the current evaluations of a Mosul hospital 250 miles north of Baghdad are prompting concerns that the fringe extremist group ISIS may in fact be able to obtain a biological weapon unlike anything the world has seen before. Though Mosul has been under ISIS control since late last June, the Iraqi health ministry has issued a press release denying reports from Iraqi news outlets that claim the soldier are definitively infected and seeking treatment in Mosul. "The Ebola virus could be in any area in the world, including Mosul, where they don't have the measures or techniques to diagnose the virus" spokesperson for the health ministry Ahmed Rudaini says. "They are incapable to detect it." Over the past several months, the world has watched as threats from extremist group ISIS have come true, from the beheadings of captured prisoners of war to the mass murder of children's schools. And with the possibility of a global pandemic looming over our heads, many are demanding action be taken to isolate the potential vectors as a worst case scenario. Yet, as conflicting reports abound, international health organizations and the WHO are unable to assess the health concern on site, and treat the patients as their own. WHO director Christy Feig told reporters early this weekend that " We [the WHO] have no official notification from the Iraqi government that it is Ebola." While that may be true, the possibility that the militants may have contracted the virus causes a problematic situation for the WHO, in that ISIS does not believe in modern medicine and an outbreak in an ISIS-controlled area like Mosul could be a breeding ground for the ever-mutating virus. But worst of all, aside from the possibility of possible infection of Iraq, should ISIS isolate the virus for themselves, the entire western world may find soon enough that the Ebola virus could be the worst weapon known to man. "U.N. workers have thus far been prohibited from entering ISIS-controlled territory in both Iraq and Syria," intelligence analyst for Levantine Group, Benjamin T. Decker says. "In this context, the lack of medical infrastructure, supplies and practitioners in the city suggests that the outbreak could quickly lead to further infection of both ISIS fighters and residents of Mosul."

Yes Extinction

Lashout

Lack of security measures ensures US pre-emption and lashout.

Koblentz, 4, Gregory Koblentz is a doctoral candidate in Political Science at the Massachusetts Institute of Technology, "Pathogens as Weapons: The International Security Implications of Biological Warfare", *International Security*, Vol. 28 No. 3 Winter 2003/04, pp. 84-122, <http://belfercenter.ksg.harvard.edu/files/koblentz.pdf>

prevention and preemption. States may adopt preventive or preemptive strategies to neutralize perceived threats posed by the prospect of anonymous biological attacks or the acquisition of biological weapons by nondeterrable actors.¹¹⁸ After the September 11 terrorist attacks, preventive and preemptive strategies became central to U.S. national security planning.¹¹⁹ These strategies, however, arst emerged during President Bill Clinton's administration in response to the threat of mass casualty terrorism. In 1995, the White House is- sued a presidential decision directive stating that the acquisition of nuclear, biological, or chemical weapons by terrorists was "unacceptable." According to the directive, "There is no higher priority than preventing the acquisition of this capability or removing this capability from terrorist groups potentially op- posed to the U.S."¹²⁰ This policy was arst implemented on August 20, 1998, when the United States launched cruise missiles at the al-Shifa pharmaceutical plant in Sudan, which ofacials believed was linked to the development of chemical weapons for al-Qaeda.¹²¹ Despite concerns within the administration about the legal and intelligence justiciations for the attack, "the perception of imminent danger was powerful enough to overcome these concerns. At the Principals meeting, [National Security Adviser] Sandy Berger asked, 'What if we do not hit it [al-Shifa] and then, after an attack, nerve gas is released in the New York City subway? What will we say then?'"¹²² Although this incident in- volved terrorist acquisition of chemical (not biological) weapons, it indicates how states may respond to the specter of terrorist acquisition of even more le- thal weapons. Preventive and preemptive attacks against suspected biological weapons facilities present signiacant intelligence, military, and diplomatic challenges. The potential consequences of a biological attack and the limita- tions of defensive and deterrent strategies, however, may inouence a decision- maker's calculation that the risks of inaction outweigh the costs of action.

Pandemic Extinction

Bioweapons independently cause extinction

Richard **Ochs**: 7-9-02, has published articles in the Baltimore Sun, Baltimore Chronicle, Science magazine, past president of the Aberdeen Proving Ground Superfund Citizens Coalition, member of the Depleted Uranium Task force of the Military Toxics Project and a member of the Chemical Weapons Working Group, "Biological Weapons must be abolished immediately," http://www.freefromterror.net/other_articles/abolish.html

Of all the weapons of mass destruction, the genetically engineered biological weapons, many without a known cure or vaccine, are an extreme danger to the continued survival of life on earth. Any perceived military value or deterrence pales in comparison to the great risk these weapons pose just sitting in vials in laboratories. While a "nuclear winter," resulting from a massive exchange of nuclear weapons, could also kill off most of life on earth and severely compromise the health of future generations, they are easier to control. Biological weapons, on the other hand, can get out of control very easily, as the recent anthrax attacks has demonstrated. There is no way to guarantee the security of these doomsday weapons because very tiny amounts can be stolen or accidentally released and then grow or be grown to horrendous proportions. The Black Death of the Middle Ages would be small in comparison to the potential damage bioweapons could cause. Abolition of chemical weapons is less of a priority because, while they can also kill millions of people outright, their persistence in the environment would be less than nuclear or biological agents or more localized. Hence, chemical weapons would have a lesser effect on future generations of innocent people and the natural environment. Like the Holocaust, once a localized chemical extermination is over, it is over. With nuclear and biological weapons, the killing will probably never end. Radioactive elements last tens of thousands of years and will keep causing cancers virtually forever. Potentially worse than that, bio-engineered agents by the hundreds with no known cure could wreck even greater calamity on the human race than could persistent radiation. AIDS and ebola viruses are just a small example of recently emerging plagues with no known cure or vaccine. Can we imagine hundreds of such plagues? HUMAN EXTINCTION IS NOW POSSIBLE.

Engineered diseases cause extinction.

Sandberg et al 8, Anders Sandberg is a James Martin Research Fellow at the Future of Humanity Institute at Oxford University. He received a PhD in computational neuroscience from Stockholm University and is a postdoctoral research assistant for the EU Enhance project. Jason G. Matheny is a PhD candidate in Health Policy and Management at Johns Hopkins Bloomberg School of Public Health. He is also a special consultant to the Center for Biosecurity at the University of Pittsburgh Medical Center. Milan M. Ćirković is senior research associate at the Astronomical Observatory of Belgrade. He is also an assistant professor of physics at the University of Novi Sad in Serbia and Montenegro. "How Can We Reduce The Risk of Human Extinction?" <http://www.thebulletin.org/web-edition/features/how-can-we-reduce-the-risk-of-human-extinction>

The risks from anthropogenic hazards appear at present larger than those from natural ones. Although great progress has been made in reducing the number of nuclear weapons in the world, humanity is still threatened by the possibility of a global thermonuclear war and a resulting nuclear winter. We may face even greater risks from emerging technologies. Advances in synthetic biology might make it possible to engineer pathogens capable of extinction-level pandemics. The knowledge, equipment,

and materials needed to engineer pathogens are more accessible than those needed to build nuclear weapons. And unlike other weapons, pathogens are self-replicating, allowing a small arsenal to become exponentially destructive. Pathogens have been implicated in the extinctions of many wild species. Although most pandemics "fade out" by reducing the density of susceptible populations, pathogens with wide host ranges in multiple species can reach even isolated individuals. The intentional or unintentional release of engineered pathogens with high transmissibility, latency, and lethality might be capable of causing human extinction. While such an event seems unlikely today, the likelihood may increase as biotechnologies continue to improve at a rate rivaling Moore's Law.

AT: Deterrence/Terrorists Won't use WMD's

Terrorists will use WMDs when they get them.

Bucci, 8-25, Steve Bucci, previous Deputy Assistant Secretary for Homeland Security at the Department of Defense, "Weapons of Mass Destruction – A Dangerous and Uncertain Future", <http://securitydebrief.com/2011/08/25/weapons-of-mass-destruction-a-dangerous-and-uncertain-future/>

Clearly our enemies, extremists in the main, but also rouge states, continue to seek the full gamut of Chem, Bio, Rad, Nuke, and HYE devices. They have few if any scruples that would deter them from deploying such devices against any vulnerable target – Gov't, Military, or civilian, including complete innocents. One imagines that using such a terror-producing device against the most innocent of targets would actually be a more desirable outcome for many of these groups.

AT: No bioweapon access

Bioweapons availability is increasing- cheap option for mass destruction

CSIS, 6 ("STRATEGIC STUDY ON BIOTERRORISM,

http://csis.org/files/media/csis/pubs/061016_bioterrorism.pdf)

Bio-agents are readily available in the modern world and are relatively inexpensive to produce, store and transport from one country to another. At the same time, they can be toxic, transmissible and lethal. Some have a long period of incubation, and many items involved in biotechnology are dual use, thus difficult to ban. The physical security of biological agents is very poor in a number of facilities, with dangerous pathogens stored in unlocked kitchen refrigerators and simple fences without alarm systems surrounding the facilities. Lax border controls make illicit trafficking of drugs, arms and materials of weapons of mass destruction a possibility in regions such as Central Asia and the Caucasus, which is an area also traveled by terrorist groups. This report focuses on bio agents that may be available to terrorists rather than terrorism in general. How can we secure, collect or destroy strains that may pose a serious threat and prevent them from falling into the hands of terrorists? How can we channel the knowledge and experience of unemployed former Soviet bioscientists into benefits for the international community? It is almost impossible to detect and deter the movement and/or transfer of a small quantity of dangerous infectious agents. It is very difficult to forecast consequences of a bioterrorist attack. For example, in the case of a sudden appearance of an epidemic type of avian flu H5N1, the epidemic will travel the globe quickly, while the development, testing and production of the necessary quantities of a vaccine against the avian flu will take at least 4 to 5 months; this will provide protection for 50% of the world population. Therefore, the protection of the population from epidemics and pandemics of dangerous diseases caused by natural outbreaks, man-made accidents or bioterrorist attacks is an issue of national and international concern. Given their proximity, Russia and other European countries are well placed to cooperate on improving communications and surveillance systems to reach hospitals and doctors, including in isolated areas. There is no common definition of bioterrorism. A modified FBI definition refers to it as the "unlawful use of viruses, bacteria, fungi, toxins or other pathogenic material against a government, the civilian population, livestock, crops or any segment thereof, in furtherance of political, social and/or economic objectives."¹³ An unofficial Russian definition states, "Bioterrorism is the use of dangerous biological agents for inflicting damage to the life and health of people in order to reach goals of a political and materialistic nature." The possibilities for bioterrorism exist in water, land, food, air, and the human being itself. Much has been written about possible scenarios of pathogens in the major water reserves, the food supply, animal husbandry, the subway, sport arenas, railway stations, and places where large numbers of people congregate. The sources of water supplies are generally considered protected in the cities, though they are not failsafe. Certain safeguards are in place for food protection, though a number of experts have expressed concern in particular about possible contamination of milk.¹⁴ The experts in this Study agreed that the highest risk was that of air contamination, and they recognized that it is close to impossible to protect the population from being contaminated. The method of dissemination of bio agents depends on the kinds of diseases. Non-contagious diseases require complex dissemination equipment such as a spray system or an explosive device to create a large-scale effect. The

anthrax letters delivered in the United States Senate Office Building showed that widespread psychological effects could be inflicted via a simple means of delivery and a small number of actual victims. Various organizations have compiled lists of agents that are based on parameters such as lethality, toxicity, morbidity, and mortality. The United States Centers for Disease Control and Prevention has defined three categories of bioterrorism agents/diseases. Category A comprises high priority agents that “include organisms that pose a risk to national security because they can be easily disseminated or transmitted from person to person; result in high mortality rates and have the potential for major public health impact; might cause public panic and social disruption; and require special action for public health preparedness.” The CDC lists the following under Category A: Anthrax (*Bacillus anthracis*), Botulism (*Clostridium botulinum* toxin), plague (*Yersinia pestis*), Smallpox (*variola major*), Tularemia (*Francisella tularensis*) and Viral hemorrhagic fevers (filoviruses [e.g. Ebola, Marburg] and arenaviruses [e.g. Lassa, Machupo]). Category B diseases/agents are defined as those that “are moderately easy to disseminate; result in moderate morbidity rates and low mortality rates; and require specific enhancements of CDC’s diagnostic capacity and enhanced disease surveillance.” Category B includes: Brucellosis (*Brucella* species); Epsilon toxin of *Clostridium perfringens*; Food safety threats (e.g. *Salmonella* species, *Escherichia coli* O157:H7, *Shigella*); Glanders (*Burkholderia mallei*); Melioidosis (*Burkholderia pseudomallei*); Psittacosis (*Chlamydia psittaci*); Q fever (*Coxiella burnetii*); Ricin toxin from *Ricinus communis* (castor beans); Staphylococcal enterotoxin B; Typhus fever (*Rickettsia prowazekii*); Viral encephalitis (alphaviruses [e.g. Venezuelan equine encephalitis, eastern equine encephalitis, western equine encephalitis]); Water safety threats (e.g. *Vibrio cholerae*, *Cryptosporidium parvum*). The third highest priority agents, Category C, are defined as “emerging pathogens that could be engineered for mass dissemination in the future because of availability; ease of production and dissemination; and potential for high morbidity and mortality rates and major health impact.” The CDC list mentions emerging infectious diseases such as Nipah virus and hanta virus.¹⁵ Similar lists of pathogens exist for plants and animals. Recent examples of diseases that have caused economic as well as psychological distress include foot and mouth disease in the United Kingdom in 2001, which cost an estimated \$12 billion, SARS, which cost Canadian tourism almost \$1 billion in lost revenue,¹⁶ and avian flu. Even the process of finding a disease capable of causing bioterrorism costs a great deal in research and development, money that could be spent on other activities such as treating tuberculosis, dengue fever or other severe diseases. During the Soviet era the country had very strong scientific and engineering capabilities, with a high level of university training. President Yeltsin acknowledged in 1992 that the Soviet Union had violated the Biological Weapons Convention, which entered into force in 1975. The legacy of suspicion and mistrust between the former Soviet Union and the United States that persisted during the cold war has continued to this day. The economic decline that set in after the Soviet era resulted in poor physical security systems in facilities housing large collections of dangerous pathogens and a drop in salaries for an estimated 10,000 former Soviet biological scientists possessing relevant bioweapons expertise.¹⁷ Many either changed careers or sought work in other countries, causing concern over the possibility of terrorists acquiring knowledge from them. Many Russian officials now talk about the “lost generation” of scientists: at the Russian Academy of Medical Sciences, for example, more than half the researchers are older than 45, and only 15 percent are between the age of 30 and 45.

AT: No BW Delivery

Delivery is possibly- ingenuity and motivation for use ensures capabilities

Carafano 3, Phd, Deputy Director, Institute for International Studies and Director, Center for Foreign Policy Studies, (James, "Improving Federal Response to Catastrophic Bioterrorist Attacks: The Next Steps," Heritage Foundation, November 13, <http://www.heritage.org/Research/Reports/2003/11/Improving-Federal-Response-to-Catastrophic-Bioterrorist-Attacks-The-Next-Steps#pgfId-1083840>)

Equally troubling, the difficulties in effectively delivering biotoxins can be overcome with some forethought and ingenuity. For example, cruise missiles, unmanned aerial vehicles, or aircraft could perform sprayer attacks, but only if specialized spraying equipment was employed that ensured proper dispersal and prevented particle clumping. Clumping of agents can degrade the effectiveness of an attack. Large particles quickly drop to the ground or, if inhaled, do not easily pass into lung tissue, significantly lessening the potential for infection. Mechanical stresses in the spraying system might also kill or inactivate a large percentage of particles--by some estimates up to 99 percent.⁹ However, if an enemy had a large supply (e.g., 50 kilograms of a virulent bioweapon) or was not terribly concerned about achieving maximum effects, crude dispensers might be adequate. In creating bioweapons, terrorists might be limited only by their imagination. For example, a low-tech version of a bio-cruise missile attack could be attempted with a system like the Autonomous Helicopter, a 14-foot-long, pilotless, remote-controlled helicopter built by Yamaha for crop dusting in Japan. The \$100,000 aircraft uses a GPS system and video camera to allow its flight route to be preprogrammed and monitored. Intentional contamination of food and water is another possible form of biological attack. Product tampering or contaminating food supplies is an ever-present danger.¹⁰ For instance, in 1984, the Rajneeshee cult contaminated local salad bars in an Oregon town with salmonella, demonstrating the ease of conducting small-scale, indiscriminate terrorist attacks.¹¹ Another means of bioattack is to spread infectious diseases through humans, animals, or insects. Infectious diseases are already the third leading cause of death in the United States, and battling them is an ongoing health issue. Foreign animal diseases also present a serious risk. Many diseases can infect multiple hosts. Three-quarters of emerging human pathogens are zoonotic-- in other words, readily transmitted back and forth among humans, domesticated animals, and wildlife.

AT: Containment Solves BW

Diversity of pathogens means response is key, drugs don't check.

Koblentz, 4, Gregory Koblentz is a doctoral candidate in Political Science at the Massachusetts Institute of Technology, "Pathogens as Weapons: The International Security Implications of Biological Warfare", *International Security*, Vol. 28 No. 3 Winter 2003/04, pp. 84-122, <http://belfercenter.ksg.harvard.edu/files/koblentz.pdf>

Biological warfare agents are characterized by a relatively high degree of diversity, which provides terrorists and military planners with significant flexibility. The open literature discusses some thirty pathogens as having the physical and biological characteristics needed for a mass casualty-producing biological weapon. Most national biological warfare programs have focused on ten to fifteen agents.²⁶ Even this short list of biological warfare agents, however, offers a range of possibilities from the lethal B. anthracis to incapacitating agents such as *Coxiella burnetii* (which causes Q fever) and Venezuelan equine encephalitis. Pathogens that cause contagious diseases that have been developed as biological weapons include variola major (the causative agent of smallpox) and *Yersinia pestis* (the cause of plague). This list of agents, however, reflects only known threats. Unexpected or novel pathogens may also emerge as threats. U.S. experts were surprised to learn of some of the agents that Iraq and the former Soviet Union had chosen to produce and weaponize.²⁷ Because biological terrorism is generally less sophisticated and less demanding than the military use of biological weapons, the range of possible agents for terrorists is even larger and more varied.²⁸ The application of molecular biology to the development of advanced biological weapons could significantly increase the diversity of biological warfare agents, but efforts along these lines are believed not to have advanced beyond the research stage.²⁹ As a result, because of the difficulty in assessing threat agents in a timely manner, defensive programs tend to lag behind offensive programs.³⁰

Other Scenarios

Cyber Scenario

Core

Domestic Cyber Terror Risk is High now

General Clapper, Director of National Intelligence, February 26, 2015, Full Committee Hearing on "Worldwide Threats", <http://www.armed-services.senate.gov/hearings/15-02-26-worldwide-threats>

Again this year, I'll start with some cyber threats. Attacks against us are increasing in frequency, scale, sophistication, and severity of impact. Although we must be prepared for a catastrophic large scale strike, a so called -- cyber Armageddon, the reality is that we've been living with a constant and expanding barrage of cyber attacks for some time. This insidious trends, I believe, will continue. Cyber poses a very complex set of threats, because profit-motivated criminals, ideologically-motivated hackers or extremists, and variously capable nation states like Russia, China, North Korea, and Iran are all potential adversaries who, if they choose, can do great harm. CLAPPER: Additionally, the methods of attacks, the systems targeted and the victims are also expanding in diversity and intensity on a daily basis. 2014 saw, for the first time, destructive cyber attacks carried out on U.S. soil by nation-state entities, marked first by the Iranian attack against the Las Vegas Sands Casino Corporation a year ago this month and the North Korean attack against Sony in November. While both of these nations have lesser technical capabilities in comparison to Russia and China, these destructive attacks demonstrate that Iran and North Korea are motivated and unpredictable cyber actors. Russia and China continue to develop very sophisticated cyber programs. While I can't go into detail, the Russian cyber threat is more severe than we have previously assessed, and Chinese economic espionage against U.S. companies remains a major threat, despite detailed private-sector reports, scathing public indictments and stern U.S. (inaudible). With respect to non-nation-state entities, some ideologically motivated cyber actors expressing support for ISIL have demonstrated their capabilities by hacking several social-media accounts. The so-called cyber caliphate successfully hacked CENTCOM's Twitter account and YouTube page in January and two weeks ago hacked Newsweek Magazine's Twitter handle. The most pervasive cyber threat to the U.S. financial sector is from cyber criminals. Criminals were responsible for cyber intrusions in 2014 in the JPMorgan, Home Depot, Target, Neiman Marcus, Anthem and other U.S. companies. And in the future, we'll probably see cyber operations that change or manipulate electronic information to compromise its integrity instead of simply deleting or disrupting access to it

Domestic Surveillance Key to Prevent Cyber Terror

Jack **Goldsmith**, contributing editor, teaches at Harvard Law School and is a member of the Hoover Institution Task Force on National Security and Law., 10-10-2013, "We Need an Invasive NSA," New Republic, <http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks>

Ever since stories about the National Security Agency's (NSA) electronic intelligence-gathering capabilities began tumbling out last June, The New York Times has published more than a dozen editorials excoriating the "national surveillance state." It wants the NSA to end the "mass warehousing of everyone's data" and the use of "back doors" to break encrypted communications. A major element of the Times' critique is that the NSA's

domestic sweeps are not justified by the terrorist threat they aim to prevent. At the end of August, in the midst of the Times' assault on the NSA, the newspaper suffered what it described as a "malicious external attack" on its domain name registrar at the hands of the Syrian Electronic Army, a group of hackers who support Syrian President Bashar Al Assad. The paper's website was down for several hours and, for some people, much longer. "In terms of the sophistication of the attack, this is a big deal," said Marc Frons, the Times' chief information officer. Ten months earlier, hackers stole the corporate passwords for every employee at the Times, accessed the computers of 53 employees, and breached the e-mail accounts of two reporters who cover China. "We brought in the FBI, and the FBI said this had all the hallmarks of hacking by the Chinese military," Frons said at the time. He also acknowledged that the hackers were in the Times system on election night in 2012 and could have "wreaked havoc" on its coverage if they wanted. Illustration by Harry Campbell

Such cyber-intrusions threaten corporate America and the U.S. government every day. "Relentless assaults on America's computer networks by China and other foreign governments, hackers and criminals have created an urgent need for safeguards to protect these vital systems," the Times editorial page noted last year while supporting legislation encouraging the private sector to share cybersecurity information with the government. It cited General Keith Alexander, the director of the NSA, who had noted a 17-fold increase in cyber-intrusions on critical infrastructure from 2009 to 2011 and who described the losses in the United States from cyber-theft as "the greatest transfer of wealth in history." If a "catastrophic cyber-attack occurs," the Times concluded, "Americans will be justified in asking why their lawmakers ... failed to protect them." When catastrophe strikes, the public will adjust its tolerance for intrusive government measures. The Times editorial board is quite right about the seriousness of the cyber- threat and the federal government's responsibility to redress it. What it does not appear to realize is the connection between the domestic NSA surveillance it detests and the governmental assistance with cybersecurity it cherishes. To keep our computer and telecommunication networks secure, the government will eventually need to monitor and collect intelligence on those networks using techniques similar to ones the Times and many others find reprehensible when done for counterterrorism ends. The fate of domestic surveillance is today being fought around the topic of whether it is needed to stop Al Qaeda from blowing things up. But the fight tomorrow, and the more important fight, will be about whether it is necessary to protect our ways of life embedded in computer networks. Anyone anywhere with a connection to the Internet can engage in cyber-operations within the United States. Most truly harmful cyber-operations, however, require group effort and significant skill. The attacking group or nation must have clever hackers, significant computing power, and the sophisticated software—known as "malware"—that enables the monitoring, exfiltration, or destruction of information inside a computer. The supply of all of these resources has been growing fast for many years—in governmental labs devoted to developing these tools and on sprawling black markets on the Internet. Telecommunication networks are the channels through which malware typically travels, often anonymized or encrypted, and buried in the billions of communications that traverse the globe each day. The targets are the communications networks themselves as well as the computers they connect—things like the Times' servers, the computer systems that monitor nuclear plants, classified documents on computers in the Pentagon, the nasdaq exchange, your local bank, and your social-network providers. To keep these computers and networks secure, the government needs powerful intelligence

capabilities abroad so that it can learn about planned cyber-intrusions. It also needs to raise defenses at home. An important first step is to correct the market failures that plague cybersecurity. Through law or regulation, the government must improve incentives for individuals to use security software, for private firms to harden their defenses and share information with one another, and for Internet service providers to crack down on the botnets—networks of compromised zombie computers—that underlie many cyber-attacks. More, too, must be done to prevent insider threats like Edward Snowden's, and to control the stealth introduction of vulnerabilities during the manufacture of computer components—vulnerabilities that can later be used as windows for cyber-attacks.

Blackouts Module

Two Impacts, First is Blackouts

Cetron 09, Dr. Marvin J. Cetron, President of Forecasting International, “55 Trends for Cyberwar”, Presented at Future of Information Warfare and Information Operations Sponsored by JIOP (Joint Information Operations Program Office), CIA, DIA (Defense Intelligence Agency) & NSA (National Security Agency), 3-18-09, http://davidleffler.com/55-Trends-for-Cyberwar.html#_Toc224031549

“Cyber Security is the soft underbelly of this country.” outgoing National Intelligence Director Mike McConnell declared in a valedictory address to reporters in mid-January 2009. He rated this problem equal in significance to the potential development of atomic weapons by Iran. With this concern in mind, Forecasting International (FI) undertook a study of factors likely to influence the future development of information warfare. This work was based on a list of 55 trends FI believes will shape the world in the years ahead. In the first stage of research, FI’s staff analyzed the probable effects of trends in fields such as economics, demographics, and technology on the course of cyberwar. In the second, we presented this work to 31 leading forecasters, intelligence professionals, and military thinkers and requested their views. This report presents the results. Director McConnell does not worry so much that hackers or spies will steal classified information from computers owned by government or the military, or by contractors working for them on secret projects. He is afraid they will erase it and thereby deprive the United States of critical data. “It could have a debilitating effect on the country,” he said. Real-world attacks over the Internet also are possible. In March 2007, the Department of Energy’s Idaho Lab conducted an experiment to determine whether a power plant could be compromised by hacking alone. The result was a diesel generator smoking and on fire as a result of some malicious data that could easily have been sent to it over the Internet from anywhere in the world. In January 2008, a CIA analyst told American utilities that hackers had infiltrated electric companies in several locations outside the U.S. In at least one case, they had managed to shut off power to multiple cities. Information attacks have been used in practical conflicts as well. In April and May 2008, Russian hackers believed not to be directly employed by the Moscow government subjected Estonia to a nationwide denial-of-service (DoS) attack that effectively shut down the country’s access to the Internet, with substantial economic impact. They began the same sort of attack on Georgia in the run-up to the August 2008 clash between Moscow and T’blisi. Similarly, the military dictatorships of Myanmar and Mauritania both reportedly have hired operators of botnets—networks of illegally commandeered PCs—to smother several opposition websites with DoS attacks. We conclude that information warfare will be a significant component in most future conflicts. This position is in line with both U.S. military doctrine and white papers published by the Chinese People’s Army. One study affirms that as

many as 120 governments already are pursuing information warfare programs. Repeated reports that Chinese computer specialists have hacked into government networks in Germany, the United States, and other countries show that the threat is not limited to relatively unsophisticated lands.

A 2007 estimate suggested that hackers sponsored by the Chinese government had downloaded more than 3.5 terabytes of information from NIPRNet, a U.S. government network that handles mostly unclassified material. More disturbingly, The Joint Operating Environment 2008: Challenges and Implications for the Future Joint Force ("the JOE") comments that "our adversaries have often taken advantage of computer networks and the power of information technology not only to directly influence the perceptions and will of the United States, its decision-makers, and population, but also to plan and execute savage acts of terrorism." In a 2008 magazine article, attached as Appendix C, Forecasting International examined possible targets of future terrorist attack. At that time, we were considering vulnerabilities to relatively conventional weapons, such as bombs and toxins. However, many of the targets we identified lend themselves to cyber assaults as well. Consider these examples: Detonate EMP Bombs in the Internet-Critical Region of Northern Virginia Probability: Medium Impact: High EMP means "electromagnetic pulse," a blast of radio energy so strong it fries electronic equipment. (Set off an atomic bomb at an altitude of 30,000 feet, and there won't be a computer working for miles around.) The terrorists who strike Northern Virginia on 9/11 in 2010 do not need a nuclear weapon to shut down the region's computers. Instead, they use homemade EMP generator-bombs that any good engineering student can build with \$400 and information found on the Internet. They detonate nine of the bombs within a triangle stretching from McLean west to Dulles International Airport and south to Chantilly. The EMP blasts take down communications and navigation equipment at Dulles, some of the less critical computers at CIA headquarters in Langley, and data centers that carry some 40 percent of the world's Internet traffic. With police unable to use radios, computers, and cellphones, the terrorists escape. It is eight months before they are identified. Only one of the six-member team will be captured in the next two years. A similar bomb, detonated near Wall Street, acts as a "weapon of mass disruption," sowing chaos and fear. Casualties: None directly. In Northern Virginia-area hospitals, 17 patients die in part because their computerized monitors no longer operate properly. Another 14 may have died when their pacemakers delivered massive shocks to the heart and then ceased working. Consequences: Dulles-bound aircraft are diverted for three days until replacement gear can be brought in. Some 40 percent of the world's Internet traffic flowed through this part of Northern Virginia. Losing that capacity slows the Internet to a crawl, which further complicates emergency response. Most of the 175,000 people employed in this IT-intensive region will be out of work for at least a year. Repairing the electronic infrastructure will cost an estimated \$40 billion. Businesses across the United

States lose an additional \$2 billion per month owing to the loss of efficient Internet service. The Dow plummets 1,000 points and trading is suspended for three days. This attack is, of course, a cyber assault even as originally imagined. The same weapon could be used to destroy computer systems in Manhattan's financial district, at financial wire-system centers, or in the government offices of Washington, D.C. According to the best estimates we have been able to find, a good engineer could produce an EMP bomb from widely available parts for \$5,000.

Attack on U.S. Oil Refineries Probability: High Impact: High Four terrorists driving minivans approach the gates of four oil refineries: the Royal Dutch Shell installation at Port Arthur, Texas; the Valero Energy refinery at Corpus Christi, Texas; the Chalmette refinery east of New Orleans; and the Chevron refinery at Pascagoula, Miss. They crash through the gates and aim for the key catalytic units used to refine petroleum. The crashes set off more than 500 pounds of dynamite in the back of each van. Eleven workers die in the initial attacks and six more perish in the infernos that send plumes of dark smoke miles into the sky. Even before the flames can be extinguished, the price of oil skyrockets to more than \$200 a barrel. The president declares a state of emergency and dispatches National Guard units to protect key infrastructure. Casualties: Seventeen dead, 34 wounded (several critically burned). Consequences: In a single day, America loses 15 percent of its crude-oil processing capability for more than a year. The Federal Reserve slashes the prime rate by a full point in a desperate attempt to avert a recession, as gas jumps to \$4 a gallon. Critics bemoan the fact that, for decades, the United States neglected development of its "dirty" oil-processing infrastructure—and now it's too late. Total economic cost: \$1.2 trillion. Like many other facilities, oil refineries are almost completely automated. Manipulating their computers to push operating temperatures and pressures out of tolerance could disrupt nation's petroleum supplies as effectively as bombs, with little risk to the attackers. With sufficient preparation, many more than four refineries could be brought down at once. Similar attacks might release toxins from chemical plants or destroy manufacturing facilities.

Bring Down Four High-Tension Wires Across the West Probability: High Impact: High **The North American power grid has a dark secret: Of the 10,000 power substations, a loss of only 4 percent will disconnect almost two-thirds of the entire grid. But with proper planning and timing, only 2 percent need be disrupted—downing just a few power lines can have widespread consequences.** Some attacks are as easy as starting forest or grass fires under transmission lines, to ionize the air and cause the lines to fail. Others require suicide car bombs. In 12 hours, by downing just four lines, more than 60 percent of North America is without power. Power is lost from Knoxville, Tenn., to Nevada, and north to the Canadian border. Casualties: Other than the suicide bombers, there are no direct casualties. But patients in hospitals, nursing homes, and even on respirators and other life-saving devices in private homes begin to expire. The indirect death toll starts to climb rapidly. Based on prior blackouts, 100 to 300 deaths are likely. Stop lights don't work, gas

stations can't pump fuel, and civil disturbances occur as crowds waiting in lines to receive ice grow restless. The president considers requesting help from the National Guard to maintain order. Consequences: Nearly 200 million people are affected, and infrastructure damage could take several months to repair. Even the most optimistic projections show the economic impact could easily top \$100 billion. Again, the power grid is governed by computers that could be manipulated to bring down the system. Oil and gas pipelines, subway systems, and rail lines appear to be equally vulnerable to cyber attack.

That Leads to Nuclear Meltdowns.

Public Citizen, 3, "The Big Blackout and Amnesia in Congress: Lawmakers Turn a Blind Eye to the Danger of Nuclear Power and the Failure of Electricity Deregulation", <http://www.citizen.org/documents/bigblackout.pdf>

Unfortunately, many policymakers and politicians have misidentified the cause of the blackout, ignored one of its most serious effects, and offered as a solution massive legislation that would only make the situation worse. Although there are problems with many facets of the nation's energy system, many of the deficiencies that have been highlighted since the blackout are either non-existent (such as the alleged shortage of electricity capacity) or have been mischaracterized. In this report, Public Citizen analyzes one of the most serious and immediately dangerous effects of the blackout: the unreliability and heightened vulnerability of nuclear power reactors. Furthermore, we trace the cause of the blackout to the chaotic effects of electricity deregulation. Finally, we consider the folly of the pending omnibus energy legislation in Congress, which completely fails to provide the most appropriate legislative prescription for the problem: the strengthening of electricity regulations and consumer protections, coupled with investment in safe, renewable and reliable electricity generation and distribution systems. THE BLACKOUT DEMONSTRATES THE UNRELIABILITY, VULNERABILITY, AND DANGER OF NUCLEAR POWER REACTORS

Unfortunately, some nuclear industry cheerleaders are opportunistically exploiting the blackout to promote further reliance on the inherently unsafe, unreliable and polluting technology of nuclear power. As usual, they espouse nuclear "solutions" to nearly every problem, while turning a blind eye to the myriad problems caused by the nuclear industry itself. Sen. Pete Domenici (R-N.M.), chairman of the Energy and Commerce committee, and a staunch supporter of nuclear power, issued a statement after the blackout in which he claimed: This outage clearly demonstrates how close the nation is to its energy production and distribution limit. [...] Ensuring the proper level of power to the country demands that we make trade-offs, including...greater use of such sources as nuclear energy... [Emphasis added] In the aftermath of the recent blackout, it is important to consider the enormous risks and reliability deficiencies of nuclear power. The unique dangers of nuclear power

were exacerbated by the huge power outage: 21 nuclear reactors—which are, ironically, dependent upon off-site power—were forced to shut down in the U.S. and Canada. Power loss from the grid forces nuclear power stations to resort to emergency generators for basic safety operations while in shutdown mode—a contingency operation that presents a whole host of new risks for the plant. Power outages, especially on a grand scale, put already-vulnerable nuclear facilities at an even greater risk of serious accident.

Extinction

Wasserman 2, Harvey Wasserman, Greenpeace USA, Nuclear Information & Resource Service, “America’s Terrorist Nuclear Threat To Itself”, <http://www.greens.org/s-r/27/27-13.html>

A jet crash like the one on 9/11 or other forms of terrorist assault at Indian Point could yield three infernal fireballs of radioactive lava burning through the earth and into the aquifer and the river. Striking water they would blast gigantic billows of radioactive steam into the atmosphere. Prevailing winds from the north and west might initially drive these clouds of mass death downriver into New York City and east into Westchester and Long Island. But at Three Mile Island and Chernobyl, winds ultimately shifted around the compass to irradiate all surrounding areas. At Indian Point, thousands of square miles would have been saturated with the most lethal clouds ever created, depositing genetic poisons that would kill forever. In nearby communities like Buchanan, Nyack, Monsey and scores more, infants and small children would quickly die en masse. Virtually all pregnant women would spontaneously abort, or ultimately give birth to deformed offspring. Sores, rashes, ulcerations and burns would afflict the skin of millions. Emphysema, heart attacks, stroke, multiple organ failure, hair loss, nausea, inability to eat or drink or swallow, diarrhea and incontinence, sterility and impotence, asthma, blindness, and more would kill thousands on the spot, and doom hundreds of thousands if not millions. A metallic taste would afflict virtually everyone downwind in New York, New Jersey and New England, a ghoulish curse similar to that endured by the fliers who dropped the atomic bombs on Hiroshima and Nagasaki, by those living downwind from nuclear bomb tests in the south seas and Nevada, and by victims caught in the downdrafts from Three Mile Island and Chernobyl. Then comes the wave of cancers, leukemias, lymphomas and tumors. Evacuation would be impossible, but thousands would die trying. Bridges and highways would become killing fields for those attempting to escape to destinations that would soon enough become equally deadly as the winds shifted. The assault would not require a large jet. Attempts to quench the fires would be futile. At Chernobyl, pilots flying helicopters that dropped boron on the fiery core died in droves. At Indian Point, such missions would be a sure ticket to death. Their utility would be doubtful as the molten cores rage uncontrolled for days, weeks and years, spewing ever more devastation into the eco-sphere. More than 800,000 Soviet draftees were forced through

Chernobyl's seething remains in a futile attempt to clean it up. They are dying in droves. Who would now volunteer for such an American task force? The radioactive cloud from Chernobyl blanketed the vast Ukraine and Belarus landscape, then carried over Europe and into the jetstream, surging through the west coast of the United States within 10 days, carrying across our northern tier, circling the globe, then coming back again. The radioactive clouds from Indian Point would enshroud New York, New Jersey, New England, and carry deep into the Atlantic and up into Canada and across to Europe and around the globe again and again. The immediate damage would render thousands of the world's most populous and expensive square miles permanently uninhabitable. All five boroughs of New York City would be an apocalyptic wasteland. The World Trade Center site would be rendered as unusable and even more lethal by a jet crash at Indian Point than it was by the direct hits of 9/11. All real estate and economic value would be poisonously radioactive throughout the entire region. Irreplaceable trillions in human capital would be forever lost. As at Three Mile Island, where thousands of farm and wild animals died in heaps, and as at Chernobyl, where soil, water and plant life have been hopelessly irradiated, natural eco-systems on which human and all other life depends would be permanently and irrevocably destroyed. Spiritually, psychologically, financially, ecologically, our nation would never recover. This is what we missed by a mere 40 miles near New York City on September 11. Now that we are at war, this is what could be happening as you read this. There are 103 of these potential Bombs of the Apocalypse now operating in the United States. They generate just 18% of America's electricity, just 8% of our total energy. As with reactors elsewhere, the two at Indian Point have both been off-line for long periods of time with no appreciable impact on life in New York. Already an extremely expensive source of electricity, the cost of attempting to defend these reactors will put nuclear energy even further off the competitive scale. Since its deregulation crisis, California—already the nation's second-most efficient state—cut further into its electric consumption by some 15%. Within a year the US could cheaply replace with increased efficiency all the reactors now so much more expensive to operate and protect. Yet, as the bombs fall and the terror escalates, Congress is fast-tracking a form of legal immunity to protect the operators of reactors like Indian Point from liability in case of a meltdown or terrorist attack. Why is our nation handing its proclaimed enemies the weapons of our own mass destruction, and then shielding from liability the companies that insist on continuing to operate them? Do we take this war seriously? Are we committed to the survival of our nation? If so, the ticking reactor bombs that could obliterate the very core of our life and of all future generations must be shut down.

Oil Shocks Module

Second is Oil Shocks – Cyber Terror Would Target Commodities Exchanges and Spike Oil Prices

Cetron 09, Dr. Marvin J. Cetron, President of Forecasting International, “55 Trends for Cyberwar”, Presented at Future of Information Warfare and Information Operations Sponsored by JIOPO (Joint Information Operations Program Office), CIA, DIA (Defense Intelligence Agency) & NSA (National Security Agency), 3-18-09, http://davidleffler.com/55-Trends-for-Cyberwar.html#_Toc224031549

“Cyber Security is the soft underbelly of this country,” outgoing National Intelligence Director Mike McConnell declared in a valedictory address to reporters in mid-January 2009. He rated this problem equal in significance to the potential development of atomic weapons by Iran. With this concern in mind, Forecasting International (FI) undertook a study of factors likely to influence the future development of information warfare. In January 2008, a CIA analyst told American utilities that hackers had infiltrated electric companies in several locations outside the U.S. In at least one case, they had managed to shut off power to multiple cities. Information attacks have been used in practical conflicts as well. In April and May 2008, Russian hackers believed not to be directly employed by the Moscow government subjected Estonia to a nationwide denial-of-service (DoS) attack that effectively shut down the country’s access to the Internet, with substantial economic impact. They began the same sort of attack on Georgia in the run-up to the August 2008 clash between Moscow and T’blisi. Similarly, the military dictatorships of Myanmar and Mauritania both reportedly have hired operators of botnets—networks of illegally commandeered PCs—to smother several opposition websites with DoS attacks. We conclude that information warfare will be a significant component in most future conflicts. This position is in line with both U.S. military doctrine and white papers published by the Chinese People’s Army. One study affirms

that as many as 120 governments already are pursuing information warfare programs. Repeated reports that Chinese computer specialists have hacked into government networks in Germany, the United States, and other countries show that the threat is not limited to relatively unsophisticated lands. A 2007 estimate suggested that hackers sponsored by the Chinese government had downloaded more than 3.5 terabytes of information from NIPRNet, a U.S. government network that handles mostly unclassified material. More disturbingly, The Joint Operating Environment 2008: Challenges and Implications for the Future Joint Force (“the JOE”) comments that “our adversaries have often taken advantage of computer networks and the power of information technology not only to directly influence the perceptions and will of the United States, its decision-makers, and population, but also to plan and execute savage acts of terrorism.” In a 2008 magazine article, attached as Appendix C, Forecasting International examined possible targets of future terrorist attack. At that time, we were considering vulnerabilities to relatively conventional weapons, such as bombs and toxins. However, many of the targets we identified lend themselves to cyber assaults as well. Consider these examples: Detonate EMP Bombs in the Internet-Critical Region of Northern Virginia Probability: Medium Impact: High EMP means “electromagnetic pulse,” a blast of radio energy so strong it fries electronic equipment. (Set off an atomic bomb at an altitude of 30,000 feet, and there won’t be a computer working for miles around.) The terrorists who strike Northern Virginia on 9/11 in 2010 do not need a nuclear weapon to shut down the region’s computers. Instead, they use homemade EMP generator-bombs that any good engineering student can build with \$400 and information found on the Internet. They detonate nine of the bombs within a triangle stretching from McLean west to Dulles International Airport and south to Chantilly. The EMP blasts take down communications and navigation equipment at Dulles, some of the less critical computers at CIA headquarters in Langley, and data centers that carry some 40 percent of the world’s Internet traffic. With police unable to use radios, computers, and cellphones, the terrorists escape. It is eight months before they are identified. Only one of the six-member team will be captured in the next two years. A similar bomb, detonated near Wall Street, acts as a “weapon of mass disruption,” sowing chaos and fear. Casualties: None directly. In Northern Virginia-area hospitals, 17 patients die in part because their computerized monitors no longer operate properly. Another 14 may have died when their pacemakers delivered massive shocks to the heart and then ceased working. Consequences: Dulles-bound aircraft are diverted for three days until replacement gear can be brought in. Some 40 percent of the world’s Internet traffic flowed through this part of Northern Virginia. Losing that capacity slows the Internet to a crawl, which further complicates emergency response. Most of the 175,000 people employed in this IT-intensive region will be out of work for at least a year. Repairing the electronic infrastructure will cost an estimated \$40 billion. Businesses across the United States lose an additional \$2 billion per month owing to the loss of efficient Internet

service. The Dow plummets 1,000 points and trading is suspended for three days. This attack is, of course, a cyber assault even as originally imagined. The same weapon could be used to destroy computer systems in Manhattan's financial district, at financial wire-system centers, or in the government offices of Washington, D.C. According to the best estimates we have been able to find, a good engineer could produce an EMP bomb from widely available parts for \$5,000. Attack on U.S. Oil Refineries Probability: High Impact: High Four terrorists driving minivans approach the gates of four oil refineries: the Royal Dutch Shell installation at Port Arthur, Texas; the Valero Energy refinery at Corpus Christi, Texas; the Chalmette refinery east of New Orleans; and the Chevron refinery at Pascagoula, Miss. They crash through the gates and aim for the key catalytic units used to refine petroleum. The crashes set off more than 500 pounds of dynamite in the back of each van. Eleven workers die in the initial attacks and six more perish in the infernos that send plumes of dark smoke miles into the sky. Even before the flames can be extinguished, the price of oil skyrockets to more than \$200 a barrel. The president declares a state of emergency and dispatches National Guard units to protect key infrastructure. Casualties: Seventeen dead, 34 wounded (several critically burned). Consequences: In a single day, America loses 15 percent of its crude-oil processing capability for more than a year. The Federal Reserve slashes the prime rate by a full point in a desperate attempt to avert a recession, as gas jumps to \$4 a gallon. Critics bemoan the fact that, for decades, the United States neglected development of its "dirty" oil-processing infrastructure—and now it's too late. Total economic cost: \$1.2 trillion. Like many other facilities, oil refineries are almost completely automated. Manipulating their computers to push operating temperatures and pressures out of tolerance could disrupt nation's petroleum supplies as effectively as bombs, with little risk to the attackers. With sufficient preparation, many more than four refineries could be brought down at once. Similar attacks might release toxins from chemical plants or destroy manufacturing facilities.

Instability in oil prices causes worldwide recession and resource wars.

Roberts 2004 (Paul, The end of Oil: on the edge of a perilous new world, p13)

The last three times oil production dropped off a cliff- the Arab oil embargo of 1974, the Iranian revolution in 1979, and the 1991 Persian Gulf War- the resulting price spikes pushed the world into recession. And these disruptions were temporary. Presumably, the effects of a long-term permanent disruption would be far more gruesome. As prices rose, consumers would quickly shift to other fuels, such as natural gas or coal, but soon enough, those supplies would also tighten and their prices would rise. An inflationary ripple effect would set in. As energy became more expensive, so would such energy-dependent activities as manufacturing and transportation. Commercial activity would slow, and segments of the global economy especially

dependent on rapid growth- which is to say, pretty much everything these days- would tip into recession. The cost of goods and services would rise, ultimately depressing economic demand and throwing the entire economy into an enduring depression that would make 1929 look like a dress rehearsal and could touch of a desperate and probably violent contest for whatever oil supplies remained.

Conflicts over natural resources are the most probable scenario for global war – Escalates and Makes all other Impacts More likely

Klare 2006 (Michael- professor of peace and world security studies at Hampshire College, March 7, <http://www.energybulletin.net/13605.html>)

It's official: the era of resource wars is upon us. In a major London address, British Defense Secretary John Reid warned that global climate change and dwindling natural resources are combining to increase the likelihood of violent conflict over land, water and energy. Climate change, he indicated, "will make scarce resources, clean water, viable agricultural land even scarcer"—and this will "make the emergence of violent conflict more rather than less likely." Lthough not unprecedented, Reid's prediction of an upsurge in resource conflict is significant both because of his senior rank and the vehemence of his remarks. "The blunt truth is that the lack of water and agricultural land is a significant contributory factor to the tragic conflict we see unfolding in Darfur," he declared. "We should see this as a warning sign." Resource conflicts of this type are most likely to arise in the developing world, Reid indicated, but the more advanced and affluent countries are not likely to be spared the damaging and destabilizing effects of global climate change. With sea levels rising, water and energy becoming increasingly scarce and prime agricultural lands turning into deserts, internecine warfare over access to vital resources will become a global phenomenon. Reid's speech, delivered at the prestigious Chatham House in London (Britain's equivalent of the Council on Foreign Relations), is but the most recent expression of a growing trend in strategic circles to view environmental and resource effects—rather than political orientation and ideology—as the most potent source of armed conflict in the decades to come. With the world population rising, global consumption rates soaring, energy supplies rapidly disappearing and climate change eradicating valuable farmland, the stage is being set for persistent and worldwide struggles over vital resources. Religious and political strife will not disappear in this scenario, but rather will be channeled into contests over valuable sources of water, food and energy. Prior to Reid's address, the most significant expression of this outlook was a report prepared for the U.S. Department of Defense by a California-based consulting firm in October 2003. Entitled "An Abrupt Climate Change

Scenario and Its Implications for United States National Security,” the report warned that global climate change is more likely to result in sudden, cataclysmic environmental events than a gradual (and therefore manageable) rise in average temperatures. Such events could include a substantial increase in global sea levels, intense storms and hurricanes and continent-wide “dust bowl” effects. This would trigger pitched battles between the survivors of these effects for access to food, water, habitable land and energy supplies. “Violence and disruption stemming from the stresses created by abrupt changes in the climate pose a different type of threat to national security than we are accustomed to today,” the 2003 report noted. “Military confrontation may be triggered by a desperate need for natural resources such as energy, food and water rather than by conflicts over ideology, religion or national honor.” Until now, this mode of analysis has failed to command the attention of top American and British policymakers. For the most part, they insist that ideological and religious differences— notably, the clash between values of tolerance and democracy on one hand and extremist forms of Islam on the other—remain the main drivers of international conflict. But Reid’s speech at Chatham House suggests that a major shift in strategic thinking may be under way. Environmental perils may soon dominate the world security agenda. This shift is due in part to the growing weight of evidence pointing to a significant human role in altering the planet’s basic climate systems. Recent studies showing the rapid shrinkage of the polar ice caps, the accelerated melting of North American glaciers, the increased frequency of severe hurricanes and a number of other such effects all suggest that dramatic and potentially harmful changes to the global climate have begun to occur. More importantly, they conclude that human behavior—most importantly, the burning of fossil fuels in factories, power plants, and motor vehicles—is the most likely cause of these changes. This assessment may not have yet penetrated the White House and other bastions of head-in-the-sand thinking, but it is clearly gaining ground among scientists and thoughtful analysts around the world. For the most part, public discussion of global climate change has tended to describe its effects as an environmental problem—as a threat to safe water, arable soil, temperate forests, certain species and so on. And, of course, climate change is a potent threat to the environment; in fact, the greatest threat imaginable. But viewing climate change as an environmental problem fails to do justice to the magnitude of the peril it poses. As Reid’s speech and the 2003 Pentagon study make clear, the greatest danger posed by global climate change is not the degradation of ecosystems per se, but rather the disintegration of entire human societies, producing wholesale starvation, mass migrations and recurring conflict over resources. “As famine, disease, and weather-related disasters strike due to abrupt climate change,” the Pentagon report notes, “many countries’ needs will exceed their carrying capacity”—that is, their ability to provide the minimum requirements for human survival. This “will create a sense of desperation, which is likely to lead to offensive aggression” against countries with a greater stock of vital resources. “Imagine eastern European countries, struggling to feed their

populations with a falling supply of food, water, and energy, eyeing Russia, whose population is already in decline, for access to its grain, minerals, and energy supply.” Similar scenarios will be replicated all across the planet, as those without the means to survival invade or migrate to those with greater abundance—producing endless struggles between resource “haves” and “have-nots.” It is this prospect, more than anything, that worries John Reid. In particular, he expressed concern over the inadequate capacity of poor and unstable countries to cope with the effects of climate change, and the resulting risk of state collapse, civil war and mass migration. “More than 300 million people in Africa currently lack access to safe water,” he observed, and “climate change will worsen this dire situation”—provoking more wars like Darfur. And even if these social disasters will occur primarily in the developing world, the wealthier countries will also be caught up in them, whether by participating in peacekeeping and humanitarian aid operations, by fending off unwanted migrants or by fighting for access to overseas supplies of food, oil, and minerals. When reading of these nightmarish scenarios, it is easy to conjure up images of desperate, starving people killing one another with knives, staves and clubs—as was certainly often the case in the past, and could easily prove to be so again. But these scenarios also envision the use of more deadly weapons. “In this world of warring states,” the 2003 Pentagon report predicted, “nuclear arms proliferation is inevitable.” As oil and natural gas disappears, more and more countries will rely on nuclear power to meet their energy needs—and this “will accelerate nuclear proliferation as countries develop enrichment and reprocessing capabilities to ensure their national security.”

Nuke Power Scenario

Core

US nuclear power sites not protected, risk of terror attack

Laura **Muth**, 9-2, 13 graduated in 2012 from Johns Hopkins University with a degree in political science, Policy Mic, The Unexpected Threat to America's Nuclear Power Sites, <http://www.policymic.com/articles/61611/the-unexpected-threat-to-america-s-nuclear-sites>

Decades after the end of the Cold War, the U.S. is dealing with a different nuclear threat: the security of its own nuclear sites. But the problem is more complicated than you might think.¶ The University of Texas, Austin Nuclear Proliferation Prevention Project (NPPP) recently released a report stating that none of the 104 commercial nuclear reactors or three research reactors in the U.S. is adequately protected against terrorist threats. The report cites two "credible threats: the theft of bomb-grade material to make a nuclear weapon, and sabotage attacks intended to cause a reactor meltdown."¶

Domestic Intelligence is Key to Check Insiders that could attack plants

Laura **Kirkman**, Allan **Kuperman**, 8-15, 13, Nonproliferation Prevention Project, "Protecting US Nuclear Facilities from Terrorist Attack: Reassessing the Current 'Design Basis Threat' Approach," <http://blogs.utexas.edu/nppp/files/2013/08/NPPP-working-paper-1-2013-Aug-15.pdf>

Implicit in the four threats described above is the possibility of an active or passive insider using knowledge of facilities to assist terrorists in their actions. Passive insiders could provide information about weaknesses in the plant or operations, allowing terrorists to magnify their impact. 49 An active insider could deactivate alarm and emergency safety systems or deliver explosives to sensitive areas of the nuclear facility.50¶ A recent incident highlights the immediacy of the insider threat problem. An American citizen, suspected of al Qaeda membership, worked for five different US nuclear power plants from 2002 to 2008 after passing federal background checks.51 This incident is particularly disturbing because nuclear power plants depend heavily on their employee screening processes to combat the insider threat.52 Another incident that allegedly involved insider information was the break-in at the Pelindaba nuclear reactor and research center in South Africa. In November 2007, four gunmen spent 45 minutes inside the heavily guarded facility, eventually breaking into the emergency control center at the middle of the facility. They fled when an alarm was triggered. At the same time, another four men tried but failed to break-in from the other side of the facility, suggesting a coordinated attack. The ease with which the attackers disabled multiple layers of security strongly suggests the use of insider information.53

Attack on a reactor means a massive release of radioactivity

Michael **Clark, 2013**, Michael Clarke (m.clarke@griffith.edu.au) is an Australian Research Council (ARC) Research Fellow at the Griffith Asia Institute, June 2013, Comparative Strategy, "Pakistan and Nuclear Terrorism: How Real is the Threat?," pp. 98-114

Commercial power reactors are arguably more attractive for a terrorist attack aimed at dispersing radioactive material than research reactors due to the fact that they are more numerous (approximately 440 commercial power reactors in 31 countries), are larger, contain more radioactive spent fuel in cooling ponds, and contain much higher levels of radioactivity in their core. ³³ Ferguson and Potter conclude that while a terrorist attack targeting a reactor or spent fuel pond "could not ignite an explosive chain reaction—that is a nuclear bomb-type explosion," the "worst plausible scenario is that terrorists would be able to cause a massive off-site release of radioactivity and substantial damage to the nuclear facility."

Extinction

Wasserman 2, Harvey Wasserman, Greenpeace USA, Nuclear Information & Resource Service, "America's Terrorist Nuclear Threat To Itself", <http://www.greens.org/s-r/27/27-13.html>

A jet crash like the one on 9/11 or other forms of terrorist assault at Indian Point could yield three infernal fireballs of radioactive lava burning through the earth and into the aquifer and the river. Striking water they would blast gigantic billows of radioactive steam into the atmosphere. Prevailing winds from the north and west might initially drive these clouds of mass death downriver into New York City and east into Westchester and Long Island. But at Three Mile Island and Chernobyl, winds ultimately shifted around the compass to irradiate all surrounding areas. At Indian Point, thousands of square miles would have been saturated with the most lethal clouds ever created, depositing genetic poisons that would kill forever. In nearby communities like Buchanan, Nyack, Monsey and scores more, infants and small children would quickly die en masse. Virtually all pregnant women would spontaneously abort, or ultimately give birth to deformed offspring. Sores, rashes, ulcerations and burns would afflict the skin of millions. Emphysema, heart attacks, stroke, multiple organ failure, hair loss, nausea, inability to eat or drink or swallow, diarrhea and incontinence, sterility and impotence, asthma, blindness, and more would kill thousands on the spot, and doom hundreds of thousands if not millions. A metallic taste would afflict virtually everyone downwind in New York, New Jersey and New England, a ghoulish curse similar to that endured by the fliers who dropped the atomic bombs on Hiroshima and Nagasaki, by those living downwind from nuclear bomb tests in the south seas and Nevada, and by victims caught in the downdrafts from Three Mile Island and Chernobyl. Then comes the wave of cancers, leukemias, lymphomas and tumors. Evacuation would be impossible, but thousands would die trying. Bridges and highways would become killing fields for those attempting to escape to destinations that would soon enough become equally deadly as the winds shifted. The assault would not require a large jet. Attempts to quench the fires would be futile. At Chernobyl, pilots flying helicopters that dropped boron on the fiery core died in droves. At Indian Point, such missions would be a sure ticket to

death. Their utility would be doubtful as the molten cores rage uncontrolled for days, weeks and years, spewing ever more devastation into the eco-sphere. More than 800,000 Soviet draftees were forced through Chernobyl's seething remains in a futile attempt to clean it up. They are dying in droves. Who would now volunteer for such an American task force? The radioactive cloud from Chernobyl blanketed the vast Ukraine and Belarus landscape, then carried over Europe and into the jetstream, surging through the west coast of the United States within 10 days, carrying across our northern tier, circling the globe, then coming back again. The radioactive clouds from Indian Point would enshroud New York, New Jersey, New England, and carry deep into the Atlantic and up into Canada and across to Europe and around the globe again and again. The immediate damage would render thousands of the world's most populous and expensive square miles permanently uninhabitable. All five boroughs of New York City would be an apocalyptic wasteland. The World Trade Center site would be rendered as unusable and even more lethal by a jet crash at Indian Point than it was by the direct hits of 9/11. All real estate and economic value would be poisonously radioactive throughout the entire region. Irreplaceable trillions in human capital would be forever lost. As at Three Mile Island, where thousands of farm and wild animals died in heaps, and as at Chernobyl, where soil, water and plant life have been hopelessly irradiated, natural eco-systems on which human and all other life depends would be permanently and irrevocably destroyed. Spiritually, psychologically, financially, ecologically, our nation would never recover. This is what we missed by a mere 40 miles near New York City on September 11. Now that we are at war, this is what could be happening as you read this. There are 103 of these potential Bombs of the Apocalypse now operating in the United States. They generate just 18% of America's electricity, just 8% of our total energy. As with reactors elsewhere, the two at Indian Point have both been off-line for long periods of time with no appreciable impact on life in New York. Already an extremely expensive source of electricity, the cost of attempting to defend these reactors will put nuclear energy even further off the competitive scale. Since its deregulation crisis, California—already the nation's second-most efficient state—cut further into its electric consumption by some 15%. Within a year the US could cheaply replace with increased efficiency all the reactors now so much more expensive to operate and protect. Yet, as the bombs fall and the terror escalates, Congress is fast-tracking a form of legal immunity to protect the operators of reactors like Indian Point from liability in case of a meltdown or terrorist attack. Why is our nation handing its proclaimed enemies the weapons of our own mass destruction, and then shielding from liability the companies that insist on continuing to operate them? Do we take this war seriously? Are we committed to the survival of our nation? If so, the ticking reactor bombs that could obliterate the very core of our life and of all future generations must be shut down.

Fuel Rod Internal

Terrorists can attack spent fuel rods

Laura **Kirkman**, Allan **Kuperman**, 8-15, 13, Nonproliferation Prevention Project, "Protecting US Nuclear Facilities from Terrorist Attack: Reassessing the Current 'Design Basis Threat' Approach," <http://blogs.utexas.edu/nppp/files/2013/08/NPPP-working-paper-1-2013-Aug-15.pdf>

Sabotage of spent fuel pools is related to sabotage of nuclear power plants, which typically store their spent fuel in facilities located on their grounds. Unlike fresh fuel, spent nuclear fuel is highly radioactive but unable to sustain as efficient a nuclear chain reaction. This spent fuel is removed from the reactor and stored in pools of cooling water, and sometimes is subsequently transferred to more permanent dry-cask storage on-site. The pools often lack the shielding and structural protections that the containment provides to the reactor itself, leaving the spent fuel also more vulnerable to sabotage by terrorists.⁴³ A 2006 report by the National Academy of Sciences concluded that a successful terrorist attack on spent fuel pools would be difficult, but possible.⁴⁴ In the absence of a centralized national storage facility for spent fuel, nuclear power plants often maintain their spent fuel pool inventories at amounts beyond the original design limits of the pool.⁴⁵ A terrorist with enough technical knowledge and means could drain a spent fuel pool, triggering a cladding fire that could result in the release of large amounts of radioactive material.⁴⁶ This is similar to what occurred in 2011 in Fukushima, Japan, when an earthquake's effects drained the spent fuel pools. According to Beyea, Lyman, and von Hippel, a terrorist attack on a spent fuel pool could cause thousands of deaths from cancer, and economic damages in the hundreds of billions of dollars.⁴⁷ In the wake of the NAS report, U.S. utilities reportedly have taken some measures that may somewhat mitigate this risk, but not eliminate it.⁴⁸ An attack on dry cask storage would also result in the release of radioactive material, although in smaller amounts due to design differences.

Blackout Scenario

Core

ISIS will shut down the U.S. national grid – it'll independently kill 9 out of 10 Americans

Bedard 9/3/14 – Paul, columnist at the Washington Examiner, “New ISIS threat: America's electric grid; blackout could kill 9 of 10” <http://washingtonexaminer.com/new-isis-threat-americas-electric-grid-blackout-could-kill-9-of-10/article/2552766>

Former top government officials who have been warning Washington about the vulnerability of the nation's largely unprotected electric grid are raising new fears that troops from the jihadist Islamic State are poised to attack the system, leading to a power crisis that could kill millions. “Inadequate grid security, a porous U.S.-Mexico border, and fragile transmission systems make the electric grid a target for ISIS,” said Peter Pry, one of the nation's leading experts on the grid. Others joining Pry at a press conference later Wednesday to draw attention to the potential threat said that if just a handful of the nation's high voltage transformers were knocked out, blackouts would occur across the country. “By one estimate, should the power go out and stay out for over a year, nine out of 10 Americans would likely perish,” said Frank Gaffney, founder and president of the Center for Security Policy in Washington. At the afternoon press conference, Gaffney dubbed the potential crisis the “grid jihad.” A lack of electricity would shut off water systems, impact city transportation services and shutdown hospitals and other big facilities. Fresh and frozen foods also would be impacted as would banks, financial institutions and utilities. Pry provided details of recent attacks on electricity systems and said that ISIS could easily team with Mexican drug cartels to ravage America. He told Secrets, for example, that the Knights Templar drug gang blacked out the electric grid of the Mexican state of Michoacan in 2013 to provide cover for killing those fighting the drug trade. “The Knights Templars and other criminal gangs in Mexico will do anything for money, and ISIS, the richest terrorist organization in history, has hundreds of millions of dollars at its disposal,” said Pry. “ISIS could hire one of the Mexican cartels, or one of their criminal gangs already in the U.S., or activate jihadist terror cells already in the U.S., and inflict a multi-state blackout immediately, within days or weeks. Perhaps even a nationwide blackout,” Pry explained to Secrets. “I am not saying it is likely they will do so. But given the capabilities and objectives of ISIS and our obvious vulnerabilities, it would be foolish to ignore the threat to the grid, to regard the threat as unlikely. Our planning should be based on imminent asymmetrical threats, and not assume that another 9/11 large-scale attack is years away,” he added.

Surveillance necessary to prevent ISIS attacks

Guardian, June 22, 2014 , Isis threat justifies greater surveillance powers in UK, says Liam Fox

Former defence secretary says first duty of state is to protect citizens and public will accept greater monitoring powers Britain's security services may need to be given greater powers of surveillance to monitor extremists from Isis when they return home to Britain from Iraq and Syria, the former defence secretary Liam Fox has said. A majority of people will accept that an "ideological battle" means that the authorities will need greater powers to intercept the

communications of extremists, Fox said. The former defence secretary, who was speaking on the Andrew Marr Show on BBC1, said that Britain should offer to put its airbases at the disposal of the US to avoid "horrendous" situation in Iraq as Isis forces pose a threat to Baghdad. Fox said: "There are those who say if we don't get involved, if we hunker down then we will be fine. There will be no backlash. That is utterly, utterly wrong because the jihadists don't hate us because of what we do. They hate us because of who we are. We can't change that. It is our values and our history that they detest more than anything else." Fox said that the authorities could deprive British citizens returning from Syria and Iraq of their passports. But he said that the greatest effort should go towards increasing the power of the state to monitor the communications of extremists. He said: "We have the security services to ensure that they [extremists] are watched and that they don't pose a greater threat." Asked whether the powers of the security services were insufficient, the former defence secretary said: "That is a real question that we are going to have to ask - whether the security services have adequate resources for an increased threat. "That is a question politicians will have to take into account in judgments on spending allocations but also do the powers they have reflect the increasing [threat]? You've got people in the light of Snowden saying that the state has too many powers and we have to restrict the powers of the state." Asked which powers the state should be given, Fox said: "The whole areas of intercept that need to be looked at. We have got a real debate, and it is a genuine debate in a democracy, between the libertarians who say the state must not get too powerful and pretty much the rest of us who say the state must protect itself." Asked whether this meant more surveillance and increasing the manpower of the security services, he said: "If required is the first duty of the state to protect its citizens ... it is a real worry and it is a problem that is going to be with us for a very long time. At heart it is an ideological battle and we have to realise that we have to win the ideological battle as well." The remarks by Fox suggests that some figures, particularly on the right, will use the success of extremists in Iraq to challenge the claim by Edward Snowden that the state has amassed too many powers of surveillance. Snowden leaked a series of NSA files to the former Guardian journalist Glenn Greenwald last year.

Attack on the grid risks nuclear war.

Andres and Breetz 11 (Richard Andres, Professor of National Security Strategy at the National War College and a Senior Fellow and Energy and Environmental Security and Policy Chair in the Center for Strategic Research, Institute for National Strategic Studies, at the National Defense University, and Hanna Breetz, doctoral candidate in the Department of Political Science at The Massachusetts Institute of Technology, Small Nuclear Reactors for Military Installations: Capabilities, Costs, and Technological Implications, www.ndu.edu/press/lib/pdf/StrForum/SF-262.pdf)

Grid Vulnerability. DOD is unable to provide its bases with electricity when the civilian electrical grid is offline for an extended period of time. Currently, domestic military installations receive 99 percent of their electricity from the civilian power grid. As explained in a recent study from the Defense Science Board: DOD's key problem with electricity is that critical missions, such as national strategic awareness and national command authorities, are almost entirely dependent on the national transmission grid . . . [which] is fragile, vulnerable, near its capacity limit, and outside of DOD control. In most cases, neither the

grid nor on-base backup power provides www.ndu.edu/inss SF No. 262 3 sufficient reliability to ensure continuity of critical national priority functions and oversight of strategic missions in the face of a long term (several months) outage. 7 The grid's fragility was demonstrated during the 2003 Northeast blackout in which 50 million people in the United States and Canada lost power, some for up to a week, when one Ohio utility failed to properly trim trees. The blackout created cascading disruptions in sewage systems, gas station pumping, cellular communications, border check systems, and so forth, and demonstrated the interdependence of modern infrastructural systems. 8 More recently, awareness has been growing that the grid is also vulnerable to purposive attacks. A report sponsored by the Department of Homeland Security suggests that a coordinated cyberattack on the grid could result in a third of the country losing power for a period of weeks or months. 9 Cyberattacks on critical infrastructure are not well understood. It is not clear, for instance, whether existing terrorist groups might be able to develop the capability to conduct this type of attack. It is likely, however, that some nation-states either have or are working on developing the ability to take down the U.S. grid. In the event of a war with one of these states, it is possible, if not likely, that parts of the civilian grid would cease to function, taking with them military bases located in affected regions. Government and private organizations are currently working to secure the grid against attacks; however, it is not clear that they will be successful. Most military bases currently have backup power that allows them to function for a period of hours or, at most, a few days on their own. If power were not restored after this amount of time, the results could be disastrous. First, military assets taken offline by the crisis would not be available to help with disaster relief. Second, during an extended blackout, global military operations could be seriously compromised; this disruption would be particularly serious if the blackout was induced during major combat operations. During the Cold War, this type of event was far less likely because the making bases more resilient to civilian power outages would reduce the incentive for an opponent to attack the grid. United States and Soviet Union shared the common understanding that blinding an opponent with a grid blackout could escalate to nuclear war. America's current opponents, however, may not share this fear or be deterred by this possibility.

A2: Drone Strikes Solve

Al Qaeda dead in Pakistan but operating elsewhere

Bergen, et al, September 2013, Jihadist Terrorism: A Threat Assessment,

[http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf)

[A%20Threat%20Assesment_0.pdf](http://bipartisanpolicy.org/sites/default/files/Jihadist%20Terrorism-A%20Threat%20Assesment_0.pdf) Peter Bergen is the author of four books about al-Qaeda, three of which were *New York Times* best sellers. The books have been translated into 20 languages. He is the director of the National Security Program at the New America Foundation in Washington, D.C.; a fellow at Fordham University's Center on National Security; and CNN's national security analyst. He has held teaching positions at the Kennedy School of Government at Harvard University and at the School of Advanced International Studies at Johns Hopkins University.¶ Bruce Hoffman is a professor at Georgetown University's Edmund A. Walsh School of Foreign Service, where he is also the director of both the Center for Security Studies and the Security Studies Program. He previously held the corporate chair in counterterrorism and counterinsurgency at the RAND Corporation and was the scholar-in-residence for counterterrorism at the CIA between 2004 and 2006.¶ Michael Hurley is the president of Team 3i LLC, an international strategy company, and advises the Bipartisan Policy Center's Homeland Security Project. He led the 9/11 Commission's counterterrorism policy investigation, as well as CIA personnel in Afghanistan immediately after the 9/11 attacks. He retired from the CIA following a 25-year career and has served as director on the National Security Council staff.¶ Erroll Southers is the associate director of research transition at the Department of Homeland Security's National Center for Risk and Economic Analysis of Terrorism Events (CREATE) at the University of Southern California, where he is an adjunct professor in the Sol Price School of Public Policy. He is a former FBI special agent and was President Barack Obama's nominee for the Transportation Security Administration, as well as Governor Arnold Schwarzenegger's deputy director for the California Office of Homeland Security and the chief of homeland security and intelligence for the LAX Police Department. He is the author of *Homegrown Violent Extremism*.) Core al-Qaeda has been decimated by drone strikes and arrests in Pakistan, but continues to find some sanctuary in the country's ungoverned tribal regions, and is potentially ready to move back into Afghanistan, should that country experience significant instability after NATO combat troops withdraw at the end of 2014.¶ CIA drone strikes have killed 33 al-Qaeda leaders or senior operatives in Pakistan since 2008.³ As a result, there are only around four al-Qaeda leaders in Pakistan today. The group's overall leader, Ayman al-Zawahiri, has proved to be more capable than some analysts initially thought, officially bringing Somalia's al-Shabaab group and Syria's Jabhat al-Nusra organization into al-Qaeda's fold. Zawahiri also had no problem transferring already existing al-Qaeda affiliates' allegiances from Osama bin Laden to himself. In the three months following bin Laden's death in May 2011, the leaders of al-Qaeda in Iraq (AQI), al-Qaeda in the Arabian Peninsula (AQAP), and al-Qaeda in the Islamic Maghreb (AQIM) all pledged their allegiance to Zawahiri as their new overall commander.^{4,5}

Drone strikes won't solve US-citizen terrorists

Brian **Ross**, 9-11, **13**, ABC News, <http://gma.yahoo.com/officials-dozens-u-under-surveillance-potential-terror-threats-234106742--abc-news-topstories.html>

Twelve years after al Qaeda slaughtered nearly 3,000 Americans on U.S. soil, the FBI has under watch as many as 100 people inside the homeland suspected of being linked to or inspired by the terror group, intelligence and law enforcement officials told ABC News. ¶ Additionally, intelligence and law enforcement officials had anticipated -- even before April's Boston Marathon bombings -- that this approximate number of terror cases wouldn't change in the years ahead, even with arrests made, because of new cases expected to surface. ¶ Despite years of losses from drone strikes overseas and counter-terrorism operations inside the American homeland, the al Qaeda network still survives thanks in part to its American recruits. ¶ "I think that is the most disturbing thing, to see Americans switching sides and going over to the enemy," Rep. Michael McCaul, R-Texas, Chairman of the House Committee on Homeland Security, told ABC News. ¶ Some of the Americans that have gone over to al Qaeda have risen far enough in the ranks that in the years after the Twin Towers fell, often the public voice of the perpetrators of that horrible attack speak with an American accent. ¶ "America is absolutely awash with easily obtainable firearms," said Adam Yahiyeh Gadahn, a California Muslim convert, in a 2011 Al Qaeda video urging individual violent jihad. "So what are you waiting for?" ¶ Gadahn, who once tore up his U.S. passport on camera, is now in Al Qaeda's leadership in Pakistan, regularly producing videos in English and Arabic. He is the first American since the 1950's to be charged with treason, indicted in 2006. ¶ Gadahn is one of five Americans the U.S. has offered a total of \$21 million in rewards to help capture because they served under Osama Bin Laden or his henchmen. The five, however, are only a fraction of the number of Americans believed to be fighting for al Qaeda or one of its affiliates. ¶ Americans taunting their own countrymen -- or luring them into the fight -- is a new and troubling reality about the resilience of al Qaeda even after the killings of Osama bin Laden and Yemeni-American al Qaeda cleric and leader Anwar al-Awlaki two years ago. ¶ The accused American terrorists come from small towns and big cities, law enforcement officials told ABC News. They include a man who grew up on Monte Vista Road in Phoenix, 30-year-old U.S. Army veteran Eric Harroun. ¶ This year he became one of about a dozen Americans who authorities say are fighting in Syria with a group that has sworn allegiance to al Qaeda, called Jabhat al-Nusra. ¶ Harroun, who was lured out of the region by the FBI and charged with terrorism in a Virginia federal court, allegedly posted videos on Facebook of his adventures in Syria with fellow fighters, including one where he addressed Syria's president Bashar al-Assad, saying, "Where you go we will find out and kill you. Do you understand?" ¶ Eric Harroun's father says his son just fell in with the wrong people. ¶ "He's not any terrorist, not any more than I am," Darryl Harroun said in an interview today with ABC News from Phoenix. ¶ The younger Harroun is expected to go to trial in two months on terror charges. ¶ American recruits to al Qaeda are also showing up in other hot spots across the Middle East and Africa, intelligence sources said. ¶ "As an American citizen, I'm shocked. I'm amazed that something like that occurs," Shawn Henry, who retired last year as a senior FBI official, told ABC News. ¶ Henry, now an executive at the cyber security firm CrowdStrike, said Americans or "U.S. Persons" -- non-citizens who have lived here and have certain legal rights -- radicalized to violent Islamist extremism are "a minority," but the FBI's highest counterterrorism

priority.¶ "Once they get that into their blood, it's a threat," Henry said.¶ At least 50 young American men have been tracked to the al Qaeda group fighting in Somalia, al-Shabaab, where a young man from the small town of Daphne, Alabama, Omar Hammami, became a top commander.¶ "Our main objective, one of the things we seek for in this life of ours, is to die as martyrs," Hammami explained in one video, among numerous he made to help al-Shabaab draw Westerners into the fight.¶ More than 15 U.S. citizens have been killed fighting with al-Shabaab, and at least 20 remain unaccounted for in Somalia.¶ A new American voice in the Somali terror organization, the as yet unidentified "Abu Ahmed al-Amriki," appeared in a February video, said his countrymen should fight Western governments in Afghanistan, Somalia and Mali.¶ "America is going down and the Caliphate is rising," he said, brandishing an AK-47.¶ Hammami -- who remains committed to violent jihad despite a falling out with al-Shabaab leaders -- is now one of the five Americans with U.S. rewards ranging from \$1 to \$5 million on their head because of their alleged Al Qaeda leadership positions. Others are men from Waukesha, Wisconsin, Brooklyn, New York and Buffalo, New York.¶ For security reasons, the details of those 100 or so individuals under surveillance inside the U.S. are closely guarded, and both U.S. and European officials say they're focused on Westerners joining al Qaeda in places such as Syria, which is relatively easy to enter.¶ Asked via Twitter last March about those like him, who turn against America by joining al Qaeda affiliates such as al-Shabaab in Somalia, Hammami did not deny the threat they pose.¶ Somalia has "many muhajirs from U.S. And dangerous. True," tweeted @abumamerican, an account believed by U.S. officials to be Hammami's.

AT: Domestic Terrorism Decline

Bergen is wrong – domestic terrorism threat is not decreasing

Gartenstein-Ross 13 (Daveed, Senior Fellow at the Foundation for Defense of Democracies, adjunct assistant professor in Georgetown University's security studies program, and the author of Bin Laden's Legacy, "Is The Terrorist Threat Declining? The Use And Abuse Of Statistics," 12/16/13, <http://warontherocks.com/2013/12/is-the-terrorist-threat-declining-the-use-and-abuse-of-statistics/>)

Earlier this month, terrorism analyst Peter Bergen wrote at CNN that the declining number of jihadists indicted in the United States demonstrates that the domestic terrorist threat has "markedly declined over the past couple of years." His view is a counterpoint to the proclamations of Senate and House intelligence committee heads Sen. Dianne Feinstein (D.-Calif.) and Rep. Mike Rogers (R.-Mich.), who have claimed that the U.S. is no safer than it was in 2011. Who is right? Bergen, the head of the National Security Program at the New America Foundation (NAF), contends that though Feinstein and Rogers might be on firm ground in arguing that al-Qaeda is resurgent in the Middle East, a NAF study of jihadist militants shows a substantial decline in the number of indicted extremists since 2010. Bergen contends that this establishes a declining domestic threat: "The total number of such indicted extremists has declined substantially from 33 in 2010 to nine in 2013. And the number of individuals indicted for plotting attacks within the United States, as opposed to being indicted for traveling to join a terrorist group overseas or for sending money to a foreign terrorist group, also declined from 12 in 2011 to only three in 2013. Of course, a declining number of indictments doesn't mean that the militant threat has disappeared. One of the militants indicted in 2013 was Dzhokhar Tsarnaev, who is one of the brothers alleged to be responsible for the Boston Marathon bombings in April. But a sharply declining number of indictments does suggest that fewer and fewer militants are targeting the United States.... In short, the data on al-Qaeda-linked or -influenced militants indicted in the United States suggests that the threat of terrorism has actually markedly declined over the past couple of years." Here's the interesting thing, to me, about Bergen's analysis: it depends almost entirely on how one reads a sudden spike in homegrown terrorist cases that occurred in 2009-10. Exactly four years ago, in December 2009, Bergen's view of the homegrown terrorist threat, based on the sudden rise in cases we were then experiencing, was that "there is no denying it is increasing." He explained that a trend toward more homegrown jihadism "is just a fact," since the phenomenon had "sort of grown exponentially in the last two years." In other words, Bergen assessed at the time that the rising cases weren't aberrant, but rather part of a trend of increased homegrown jihadist violence that would continue. At the time, I disagreed in print with Bergen's confidence that we were seeing a definite trend toward a persistently higher number of homegrown terrorism cases. Now that the 2009-10 spike in cases has receded, Bergen argues just as confidently that we are safer. I disagree with this conclusion, too. Much of our disagreement boils down to differences between my methodology of interpreting statistics and Bergen's. In turn, this discussion has implications for broader efforts to assess U.S. counterterrorism policies: are we drawing the right lessons from the statistics and evidence that we gather, or are we being fooled by our own numbers?

The 2009-10 Spike in Homegrown Terrorist Cases 2009 saw almost twice as many people in the U.S. indicted for illegally supporting the jihadist cause as any previous year. According to NAF's database of homegrown terrorism cases, there were 43 such cases in 2009, when the highest number in any other year since the 9/11 attacks had been 23, in 2003. The following year, in 2010, the number of homegrown jihadist terrorism cases declined to 34, but that still represented more such cases than any year but 2009. As previously noted, Bergen viewed this sudden spike in homegrown terrorist cases at the time as an undeniable increase in the threat. I wasn't so sure. In an article I published in the summer of 2010, I concluded that it wasn't "clear that homegrown terrorism is increasing," for two reasons. The first was that the perceived spike could be based on changes in policing strategies and tactics. If authorities started making arrests at a different point relative to a suspect undertaking illegal activities, that could artificially trigger perceptions of a major increase in homegrown terrorists; and so too could an increase in the number of sting operations. Second, I raised the possibility that this could be a statistical aberration: "Another possibility is that the current rash of homegrown terror cases is an aberration. In a statistical sequence measured over the course of years (such as weather patterns or a baseball player's career), aberrant sequences will frequently arise. A spike or precipitous decline in numbers does not mean the numerical trajectory will extend indefinitely. For example, an unusually cold May does not mean that July will also be unusually cold. While in the middle of an unusual statistical sequence, it can be hard to have perspective; and in five years, 2009-2010 may seem exceptional in terms of the level of homegrown terrorist activity, rather than the beginning of a new trend." Now that five years have passed since the onset of that spike in cases, it appears to have been just that, an aberrational sequence. And we can pinpoint the precise development that drove the 2009-10 rise in cases: the Somalia war. In December 2008, the U.S. media first reported authorities' discovery that more than a dozen young Somali men from Minnesota's Twin Cities area (which has the U.S.'s largest Somali community) had disappeared, going abroad to join jihadist groups in Somalia. They decided to fight there after Ethiopia's U.S.-backed invasion of Somalia in 2006, which was designed to shore up the country's U.N.-recognized transitional federal government and push back its main adversary, the Islamic Courts Union. In addition to the young men being driven by nationalist sentiments, jihadist recruiters focused their efforts on the Twin Cities area—a somewhat unique dynamic for domestic terrorist cases, the vast majority of which do not feature recruiters from any established militant organization. Thereafter, domestic law enforcement made apprehension of the young men who went to fight abroad, and the networks encouraging and supporting them, a top priority. Terrorism-related indictments increased as a result: the NAF dataset suggests that 14 indictments in 2009 and 16 in 2010 were related to the Somalia conflict. If you subtract these figures from the number of total indictments for both years, the numerical spike becomes less extreme, with only 29 indictments in 2009 and 18 in 2010 that were unrelated to the Somalia war. Though 2009 still would have a higher number of indictments than any year preceding it even with the adjusted figures, 2010 would be more in line with the numbers from previous years, featuring fewer terrorism indictments than either 2003 or 2006. As recruiting for the Somalia conflict has declined, the number of indictments has also gone down. So the question remains: how do we interpret the lower numbers we are seeing now? Has the threat of homegrown terrorism "markedly declined," as Bergen insists, or is there a better way to understand the number of homegrown jihadist cases that we have seen

in 2012-13? The Longer View Fortunately, there has always been a relatively small number of homegrown jihadist terrorism cases in the United States. The fact that these numbers are small should make us hesitant to infer too much from numerical fluctuations. Take a look at the number of homegrown jihadists who have been indicted or killed by year, per the NAF database: 2002: 16 2003: 23 2004: 8 2005: 12 2006: 19 2007: 16 2008: 6 2009: 43 2010: 34 2011: 22 2012: 7 2013: 10 Bergen asserted that there had been nine indictments this year, but his article came out before Terry Loewen's arrest, which pushes the number to ten. Looking at the full data by year, it's not clear that there is a declining threat. Ten indictments in 2013 is three more than there were last year; it's also a higher number than we saw in either 2004 or 2008. Indeed, there were only six such cases in 2008—the year *before* we saw the sudden jump to forty-three indictments. In fact, rather than basing our assessment on indictments, there's an entirely different statistic for measuring whether we face a declining threat: the number of people killed or injured by homegrown terrorists in the U.S. in any given year. That number was zero in 2011, while in 2013 three people were killed and 264 injured (in the Boston bombings). The bottom line is that it's perilous to infer too much from the data when the numbers in question are rather small, because small numbers makes it extraordinarily difficult to measure trends reliably. All it takes is one unusual development—such as the outbreak of war in Somalia, and its resulting impact on Minneapolis-St. Paul—to make it appear that everything has changed from a numerical perspective. There is thus little proof that “the threat of terrorism has actually markedly declined over the past couple of years.” The core problem with Bergen's use of statistics is evident when you compare his analysis in 2009 with his assessment today: his methodology is prone to perceiving a significant change in the level of threat based upon the direction that the numerical trend line is pointing at any given time. If the number of indictments doubled to twenty next year, by Bergen's established methodology the threat would seem to be increasing again—even though the absolute numbers would still be lower than 2003, 2009, 2010, or 2011. In attempting to determine whether we are grappling with an increasing or declining threat, it's important to view the most recent data in as broad a context as possible. We should be wary of any method of statistical interpretation wherein temporary fluctuations in one direction or another can be mistaken for massive shifts in the threat we confront.

AT: State Sponsorship of Terrorism Decreasing

Terrorists don't need state sponsors

Stephen D. Collins, 2014 is an associate professor of political science and international affairs at Kennesaw State University. His research focuses on terrorism, economic statecraft, democracy and human rights, conflict resolution, and nuclear proliferation. He is the author of, *inter alia*, "Dissuading State Support of Terrorism: Strikes or Sanctions? An Analysis of Dissuasion Measures Employed Against Libya," *Studies in Conflict and Terrorism* 27 (1): 2014. Stephen D. Politics & Policy. Feb2014, Vol. 42 Issue 1, p131-159

State sponsorship of terrorism is today in an attenuated position—weaker than at any point in modern history. Furthermore, the terrorist organizations that currently represent the greatest threat to civilian populations are far less reliant on state support than terrorist groups in the earlier phases. Indeed, al Qaeda and its affiliated jihadist groups operate essentially independent from any state support. A variety of factors explain why terrorist groups have been able to remain operationally effective without the aid of state patrons. First, the communications revolution of the late twentieth century has permitted terrorist networks to reduce their previous reliance on the geographic proximity of members. Just as the Internet, e-mail, and inexpensive telephony have enabled myriad businesses to situate their employees in globally disparate locations, these technological agents of globalization have also enabled terrorist leaders to operate sophisticated terrorist organizations with agents dispersed across thousands of miles. Thus there is a diminished need today for a physical base of operations for training, planning, and collaboration. Second, terrorists groups such as al Qaeda have developed their own streams of revenue by engaging in smuggling and other forms of illicit commerce—including the trade in drugs and conflict resources—and have also generated large sums through fraudulent charity schemes. Third, the relaxation of border controls has facilitated the flow of terrorist operatives among their home countries, the headquarters of terrorist organizations, and target countries.

State sponsorship has played a significant role in supporting terrorism

Stephen D. Collins, 2014 is an associate professor of political science and international affairs at Kennesaw State University. His research focuses on terrorism, economic statecraft, democracy and human rights, conflict resolution, and nuclear proliferation. He is the author of, *inter alia*, "Dissuading State Support of Terrorism: Strikes or Sanctions? An Analysis of Dissuasion Measures Employed Against Libya," *Studies in Conflict and Terrorism* 27 (1): 2004. Stephen D. Politics & Policy. Feb2014, Vol. 42 Issue 1, p131-159

While generally not the ultimate cause of terrorism, state sponsorship of terrorist organizations has played a significant role in facilitating the terrorist violence witnessed in the international system over the past half century (Council on Foreign Relations 2013). State sponsorship encompasses a variety of assistance measures including, *inter alia*, arms, safe haven, financing, training, intelligence, and diplomatic cover. The succor provided by state sponsors facilitates

terrorist groups' planning, training, communications, transit, and logistics in support of specific attacks. These benefits allow for increased sophistication in terror plots, which lead to more lethal attacks. State sponsorship, therefore, can represent a significant facilitating variable with respect to international terrorism, and it can amplify the frequency and lethality of attacks.

A2: Al Qaeda Threat Decreasing

Affiliates as strong as ever

Noah **Rotham**, Mediaite, May 19, 2014

FBI Director: More, Stronger Al Qaeda Affiliates 'Than I Appreciated' <http://rt.com/usa/160004-fbi-comey-al-qaeda/> DOA: 3-5-15

Al Qaeda's affiliates are both stronger and more prolific than previously anticipated, FBI director James Comey told the New York Times[1] on Monday. While the Times noted that some expected Comey to be the first post-9/11 FBI director to redirect his focus away from terrorism, he clarified that Islamic radicalism is as potent a force as ever. 'I didn't have anywhere near the appreciation I got after I came into this job just how virulent those affiliates had become,' Comey told the Times when asked if he thought the threat of al Qaeda-related terrorism had diminished. Referring to the terror group's affiliates in Africa and the Middle East, Comey said that the threat of terrorism against American interest sis as present as ever. 'There are both many more than I appreciated, and they are stronger than I appreciated,' he confessed.

Al Qaeda has adapted and decentralized

MATTHEW OLSEN, Director, National Counterterrorism Center, March 6, 2014, Hearing of the Senate Foreign Relations Committee Subject: "Syria Spillover: The Growing Threat of Terrorism and Sectarianism in the Middle East" Thank you very much, Chairman, and members of the committee. I think it was about a year ago I was here to talk about threats in North Africa. So I appreciate the opportunity to be here again to represent NCTC and to talk a little bit about the threats we face in the Levant. And I'm particularly pleased to be here with two of our key partners, Deputy Secretary of State Burns and Assistant Secretary of Defense Chollet. So as you are aware, we continue to face terrorist threats to the United States and to our interests overseas, particularly in parts of South Asia and the Middle East and Africa. But it's the current conflict in Syria and the regional instability in the Levant that stand out for me as areas of particular concern. I do think it's important to consider Syria in the context of the global terrorist movement. In the face of what's been sustained counterterrorism pressure, core al-Qaida has adapted. They've adapted by becoming more decentralized and shifting away from the large-scale plotting that was exemplified in the attacks of September 11th. al-Qaida has modified its tactics and looked to conduct simpler attacks that don't require the same degree of resources and training and command and control. So today, we're facing a wider -- a wider array of threats in a greater variety of locations across the Middle East and around the world. In comparison to the al-Qaida plots that emanated from the tribal areas of Pakistan a few years ago, these smaller and these less sophisticated plots are often more difficult for us to detect and disrupt and that's put even greater pressure on us to work closely with our partners here at the table, across the federal government and around the world. So turning to Syria, Syria has become the preeminent location for al-Qaida-aligned groups to recruit and to train and to equip what is now a growing number of extremists, some of whom seek to conduct external attacks. In addition, Iran and Hezbollah, as you pointed out, are committed to defending the Assad regime

including sending billions of dollars in military and economic aid, training pro-regime and Iraqi Shia militants and deploying their own personnel into the country. Now, from a terrorism perspective, the most concerning development is that al-Qaida has declared Syria its most critical front and has called for extremists to fight against the regime in Syria. So what we've seen is that thousands of fighters from around the world, including hundreds from the West have traveled to Syria and many of them have joined with established terrorist groups in Syria. This raises our concern that radicalized individuals with extremist contacts and battlefield experience could return to their home countries to commit violence at their own initiative or participate in al-Qaida-directed plots aimed at Western targets outside of Syria. What we've seen is a coalescence in Syria of al-Qaida veterans from Afghanistan and Pakistan as well as extremists from other hotspots such as Libya and Iraq. These extremists bring a wide range of contacts and skills as well as battlefield experience and they're able to exploit what has become a permissive environment from which to plot and train. Shifting briefly to Lebanon, one of the continuing effects of the Syrian conflict will be the instability in Lebanon in the upcoming year. I recently traveled to Lebanon and Jordan and the impacts of the continuing conflict in Syria continue to be of great concern to officials in the region. Hezbollah publicly admitted last spring that it is fighting for the Syrian regime and has framed the war as an act of self-defense against Western-backed Sunni extremists. The group is sending capable fighters for pro-regime operations and support for a pro-regime militia. In addition, Iran and Hezbollah are using allied Iraqi Shia groups to participate in counter-opposition operations. And this active support to the Assad regime is of course driving increased Sunni extremist attacks and sectarian violence. In short, the various factors contributing to instability in Lebanon are only exacerbated by the protracted conflict in Syria.

Groups associated with Al Qaeda have increased activity

Central Asia General Newswire, April 9, 2014 Radical Islam followers from Europe, Central Asia fight for Syrian militants - Bortnikov

Federal Security Service Director Alexander Bortnikov has reaffirmed the global nature of terrorism threats. "The terrorism threat became global a rather long time ago. Although the core of Al Qaeda has reduced its activity, associated militant groups demonstrate the capacity for autonomous and aggressive actions," Bortnikov said on Wednesday in Krasnaya Polyana, Sochi, at the 13th conference of chiefs of foreign security services and law enforcement agencies - partners of the Federal Security Service. The armed conflict in Syria has galvanized into action destructive forces throughout the Middle East, the Russian counterintelligence chief stated. "Local rings are being joined by radical Islam followers from Europe, Central Asia, the South Caucasus and Russia. They are trained in special camps and engage in the hostilities. The return of persons experienced in sabotage and the creation of covert organizations to their countries of origin leads to the spread and actualization of the terrorism threat," Bortnikov said. A complex situation is taking shape in the Afghan-Pakistani zone where terrorist groups, primarily the Taliban, the Turkestan Islamic Party and the Pakistani Taliban, have lately bolstered their combat potential, he noted. The forthcoming partial pullout of coalition forces from Afghanistan builds up the threat of destabilization in neighboring countries, Bortnikov said

Al Qaeda spillover from Syria

SENATOR ROBERT **MENENDEZ** (D-NJ), March 6, 2014, Hearing of the Senate Foreign Relations Committee Subject: "Syria Spillover: The Growing Threat of Terrorism and Sectarianism in the Middle East"

As we enter the year three of the Syria crisis, headlines coming out of the region are no longer limited to the violence within Syria, but to the increasing spread of violence across Syria's borders, especially into Lebanon and Iraq. Of great concern is the proliferation of al-Qaida affiliates and splinter groups and the increasing sectarian rhetoric fueling the increase of violence that offers new opportunities for al-Qaida to gain footholds in local communities. It opens the door for an Iranian-sponsored terrorist network to justify their presence as the protector of the region's Shias while bolstering the Assad regime and antagonizing Arab states. The spillover from Syria is dangerous and troubling. In Lebanon, there's been an alarming uptick in high-profile bombings, many claimed by the al-Qaida-affiliated Abdullah Azzam Brigades. And at the same time, Hezbollah, purportedly protecting the Lebanese Shia community, has now extended into Syria, protecting the Assad regime.

Threat from affiliates still strong

China Today, April 15, 2014, Cooperate to counter terrorism challenges

The recent terrorist attacks in Afghanistan, Pakistan, China and elsewhere have demonstrated that the global fight against terrorism is far from over, and it still faces many challenges. After the death of Osama bin Laden, the threat posed by al-Qaida as a global terrorist organization has declined. However, the threat posed by its affiliates still persists. The al-Qaida threat continues to diversify, with numerous loosely linked affiliates and associated radical individuals and cells innovating with regard to their targets, tactics and technology. Terrorism is still around. For example, the risk of attacks by al-Qaida affiliates across the Sahel persists. Al-Qaida in the Arabian Peninsula continues to be a strong factor affecting the security situation in Yemen. Al-Shabaab remains a serious threat to the security of the region. In Syria, an affiliate of al-Qaida in Iraq has gained influence and recruits from it are fighting in the civil war. With the deadline for the withdrawal of US troops from Afghanistan in 2014 approaching, it is hard to tell whether the situation in Afghanistan will be better or worse. Al-Qaida and the Taliban, taking refuge in the mountainous areas along the border between Afghanistan and Pakistan, may take advantage of the United States' withdrawal to launch attacks. Afghan troops and law enforcement forces still lack the capability to keep the situation under full control. The shutdown of US embassies last year in many parts of the world is a demonstration of the severe threat of terrorism. The Boston Bombing incident also showed that individuals can pose a serious threat to peace and security. Recent terrorist attacks in China alerted people once again to the threat of terrorism. All these have shown that terrorism is still one of the most serious threats to peace and security. Terrorist attacks are spreading, becoming more isolated and hi-tech. The international community should work together to prevent and combat terrorism in all its forms and manifestations. Any acts of terrorism are criminal acts and unjustifiable regardless of their motivations, whenever and by whomsoever committed.

A2: Al Qaeda Leaders Killed

Al Qaeda has lots of talent and leaders easily replaceable

Thomas **Joscelyn**, May 20, 2014, Al Qaeda in Afghanistan and Pakistan: An Enduring Threat, Testimony,

http://www.longwarjournal.org/archives/2014/05/al_qaeda_in_afghanis.php# (Thomas Joscelyn is the Senior Editor of The Long War Journal. Thomas is a senior fellow at the Foundation for Defense of Democracies (FDD). He is also the executive director of the Center for Law and Counterterrorism at FDD. He is a terrorism analyst, economist, and writer living in New York. Most of Thomas's research and writing has focused on how al Qaeda and its affiliates operate around the world. He is a regular contributor to the Weekly Standard and its online publications, the Daily Standard and Worldwide Standard. His work has also been published by National Review Online, the New York Post, and other media outlets. Thomas is the author of Iran's Proxy War Against America, a short book published by the Claremont Institute that details Iran's decades-long sponsorship of America's terrorist enemies. He makes regular appearances on radio programs around the country and has appeared on MSNBC and FOX News. In 2006 he was named one of the Claremont Institute's Lincoln Fellows. Thomas served as the senior terrorism adviser for Mayor Rudolph Giuliani's 2008 presidential campaign. He holds a Bachelor of Arts degree in Economics from the University of Chicago.) Al Qaeda is, at its heart, a clandestine organization, but careful analysis reveals that it has a deep bench of talent from which it draws. Since its founding in 1988, the organization has attempted to conceal its operations. This has made it difficult to assess some very basic aspects of al Qaeda. The group does not, for instance, publish an organizational chart or make its total roster known. If you watch al Qaeda carefully enough, however, you can see that the group has consistently replaced top leaders lost in the 9/11 wars. In some cases these replacements are not as competent, while in other cases they may even surpass their fallen comrades. Nasir al Wuhayshi, the aforementioned general manager of al Qaeda, is a seasoned veteran who replaced others in that role after they were killed or captured. Wuhayshi is, by all appearances, an all too competent leader. Still, the American-led counterterrorism effort has certainly disrupted al Qaeda's international network, delivering severe setbacks in some areas. Al Qaeda's problems with ISIS stem, to a large degree, from the fact that the U.S. and its allies took out its predecessor organization's top leadership in 2010. The leaders of the Islamic State of Iraq (ISI) were loyal to al Qaeda's "general command" but were replaced with leaders who had not been vetted by al Qaeda's senior leaders. One of the interesting things about the infighting between the ISIS and Al Nusra is that it has led al Qaeda to identify several leaders who were previously unknown to the public. The leaders were identified because they were called as witnesses against ISIS, relying on their established jihadist pedigrees to give them credibility. Some of these leaders have dossiers that stretch back decades, but no one was talking about them until they appeared on screen. This same phenomenon happens all the time. Al Qaeda leaders who were previously unknown are identified in either the "general command" or the regional branches. This dynamic leads to a significant epistemological problem. U.S. officials, under both the Bush and Obama administrations, have repeatedly claimed to have decimated al Qaeda after a certain number of leaders of the

organization were either killed or captured. Part of the reason these assessments have been flawed is that al Qaeda has a "deep bench" to draw from, both from within its own organization and allied groups. Al Qaeda is constantly in the process of recruiting new talent as well. In Pakistan and Afghanistan today, al Qaeda likely has a significant cadre of leaders who have not been publicly identified. The roles played by other, publicly identified operatives are not widely understood either. For instance, a cursory review of *Vanguards of Khorasan*, an al Qaeda publication, reveals numerous leaders who are not regularly discussed.

A2: ISIS Can't Succeed/No Positive Mission

Support for ISIS in Iraq

Lee Ferran, February 25, 2015, ABC News, "ISIS Trail of Terror,"

<http://abcnews.go.com/WN/fullpage/isis-trail-terror-isis-threat-us-25053190> DOA: 3-1-15

ISIS saw a series of successes as it has cut its way from Syria into Iraq and towards Baghdad using a combination of military expertise and unimaginable brutality. Social media accounts associated with ISIS have published disturbing videos purportedly showing ISIS fighters taunting, torturing and executing scores of unarmed prisoners. In addition, former senior U.S. military officials who served in Iraq and helped train the Iraqi security forces said that ISIS has been able to take advantage of government forces who lack the motivation to put up a good fight against ISIS in some areas. The Iraqi government and much of its military officer corps are mostly made up of Shi'a Muslims, whereas much of the areas ISIS has retained in Iraq are predominantly Sunni, like ISIS — meaning the Iraqi military forces are often operating in areas where the local population may be more willing to tolerate, or even support ISIS. ISIS has also built relations of convenience with disgruntled local Sunni tribes and ex-Baathists who have felt marginalized and disenfranchised by the government in Baghdad, which has been accused of favoring Shi'as.

A2 ISIS No means

ISIS is worth \$2 billion

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

ISIS likely retained assets of at least \$875 million prior to seizing Mosul.² Judging by the scale of American-made Iraqi military equipment captured in June and that IS was assessed to be earning \$2 million per day by smuggling oil from Iraq and Syria by September, IS represents a formidable militant organization likely worth close to \$2 billion.

ISIS financially self-sufficient

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

One aspect of IS's internal structure and policymaking mechanisms that has proven decisive in enabling expansion is its generation of income. IS has been almost entirely self-financed since at least 2005 and according to the U.S. Department of Defense database, external funding to AQI, MSM, and ISI between 2005 and 2010 amounted to no more than five percent of its total "income."⁵⁴ After assuming ISI leadership in 2010, Baghdadi established a financial command council and Mosul cemented its role as a principal source of income.⁵⁵ By 2014, a complex extortion network there was generating \$12 million per month. Notwithstanding a potential increase in private financial support following IS's increased public prominence, the simultaneous expansion in income-earning capacity makes it likely that the group has continued to be financially self-sufficient.

Terrorism –Michigan

1NC

Terror threats are mounting

Bolton 2015 (John R [served as the US Permanent Representative to the UN and as Under Secretary of State for Arms Control and International Security]; NSA activities key to terrorism fight; Apr 28; www.aei.org/publication/nsa-activities-key-to-terrorism-fight/; kdf)

After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces. In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016. This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Government surveillance critical to prevent terror attacks

Sulmasy, 13 --- Professor of Law and Governmental Affairs Officer at Coast Guard Academy (6/10/2013, Glenn, "Why we need government surveillance," <http://www.cnn.com/2013/06/10/opinion/sulmasy-nsa-snowden/>, JMP)

The current threat by al Qaeda and jihadists is one that requires

aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways.

This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence. However, the move toward "home-grown" terror will necessarily require, by accident or purposefully, collections of U.S. citizens' conversations with potential overseas persons of interest.

An open society, such as the United States, ironically needs to use this technology to protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting "unreasonable searches and seizures." American historical resistance towards such activities is a bedrock of our laws, policies and police procedures.

But what might have been reasonable 10 years ago is not the same any longer. **The constant armed struggle against the jihadists** has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens.

Terrorist attacks escalate – killing billions

Myhrvold 2014 (Nathan P [chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft]; Strategic Terrorism: A Call to Action; cco.dodlive.mil/files/2014/04/Strategic_Terrorism_corrected_II.pdf; kdf)

Technology contains no inherent moral directive—it empowers people, whatever their intent, good or evil. This has always been true: when bronze implements supplanted those made of stone, the ancient world got scythes and awls, but also swords and battle-axes. The novelty of our present situation is that modern technology can provide small groups of people with much greater lethality than ever before. We now have to worry that private parties might gain access to weapons that are as destructive as—or possibly even more destructive than— those held by any nation-state. A handful of people, perhaps even a single individual, could have the ability to kill millions or even billions. Indeed, it is possible, from a technological standpoint, to kill every man, woman, and child on earth. The gravity of the situation is so extreme that getting the concept across without seeming silly or alarmist is challenging. Just thinking about the subject with any degree of seriousness numbs the mind. The goal of this essay is to present the case for making the needed changes before such a catastrophe occurs. The issues described here are too important to ignore. Failing nation-states—like North Korea—which possess nuclear weapons potentially pose a nuclear threat. Each new entrant to the nuclear club increases the possibility this will happen, but this problem is an old one, and one that existing diplomatic and military structures aim to manage. The newer and less understood danger arises from the increasing likelihood that stateless groups, bent on terrorism, will gain access to nuclear weapons, most likely by theft from a nation-state. Should this happen, the danger we now perceive to be coming from rogue states will pale in comparison. The ultimate response to a nuclear attack is a nuclear counterattack. Nation states have an address, and they know that we will retaliate in kind. Stateless groups are much more difficult to find which makes a nuclear counterattack virtually impossible. As a result, they can strike without fear of overwhelming retaliation, and thus they wield much more effective destructive power. Indeed, in many cases the fundamental equation of retaliation has become reversed. Terrorists often hope to provoke reprisal attacks on their own people, swaying popular opinion in their favor. The aftermath of 9/11 is a case in point. While it seems likely that Osama bin Laden and his henchmen hoped for a massive overreaction from the United States, it is unlikely his Taliban hosts anticipated the U.S. would go so far as to invade Afghanistan. Yes, al-Qaeda lost its host state and some personnel. The damage slowed the organization down but did not destroy it. Instead, the stateless al-Qaeda survived and adapted. The United States can claim some success against al-Qaeda in the years since 9/11, but it has hardly delivered a deathblow. Eventually, the world will recognize that stateless groups are more powerful than nation-states because terrorists can wield weapons and mount assaults that no nationstate would dare to attempt. So far, they have limited themselves to dramatic tactical terrorism: events such as 9/11, the butchering of Russian schoolchildren, decapitations broadcast over the internet, and bombings in major cities. Strategic objectives cannot be far behind.

2NC must read

Threats are real and our scholarship is sound – surveillance is the key tool in preventing attacks

-AT: Terror Talk- the risk of a terrorist attack is enough that we need to have discussions about particular groups

-AT: No Threats- Al Qaeda, Hamas, Hezbollah, and ISIS disagree, as they splinter they become more difficult to stop

-Surveillance Key- “The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems”

Lewis 2014 (James Andrew [senior fellow and director of the Strategic Technologies Program at CSIS]; Underestimating Risk in the Surveillance Debate; Dec; http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; kdf)

The phrase “terrorism” is overused, and the threat of terrorist attack is easily exaggerated, **but that does not mean this threat is nonexistent.** Groups and individuals still plan to attack American citizens and the citizens of allied countries. The dilemma in assessing risk is that it is discontinuous. There can be long periods where no activity is apparent, only to have the apparent calm explode in an attack. The constant, low-level activity in planning and preparation in Western countries is not apparent to the public, nor is it easy to identify the moment that discontent turns into action. There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences. A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia. Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces. **The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems,** nationally and in cooperation with others, including the United States, **to detect and prevent potential attacks.** Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new “front” for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets. ²⁷ The incidence of attacks in the United States or Europe is very low,

but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. **these attacks are the threat that mass surveillance was created to prevent.** The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

2NC Perception Trick

Independently, the perception of widespread surveillance is crucial to deter effective terrorist communication --- the plan emboldens effective regrouping

Rascoff 14 [Samuel J. Rascoff, Associate Professor of Law, Faculty Director, Center on Law and Security, New York University School of Law, "COUNTERTERRORISM AND NEW DETERRENCE," 2014]

An open question - an answer to which requires more empirical data - is whether the government's prosecution of relatively amateur would-be terrorists based on stings is likely to be effective in deterring better-trained terrorists. n109 But it bears remembering that the viability [*855] of the deterrence-based account of stings does not depend on who is prosecuted. The mere fact of prosecution can alter terrorists' perceptions of future success by implying a pervasive surveillance network n110 facilitated by technology. n111 As Alex Wilner observed of Canadian counterterrorism, the fact that the country's "intelligence community clearly has the means and the tools to uncover plots expeditiously" creates an "overwhelming perception ... that terrorists are unlikely to evade Canada's watchful eye." n112 In sum, the meaning of a sting operation and subsequent trial must include the strategic benefits of revealing the fact of undercover surveillance as well as the normative costs implied by widespread surveillance. n113 This in turn illustrates the [*856] complicated relationship between transparency and secrecy entailed by new deterrence. C. Psychology and Strikes New deterrence also enriches understanding of the role of fear and emotion in counterterrorism. Terrorism aims at communicating vulnerability and sowing distrust; violent attacks are, in a sense, means to bring about these more intangible objectives. n114 (Thus, building sufficient social resiliency to withstand terrorist attacks, as new deterrence counsels, deprives terrorists of an important goal, even when an attack succeeds. n115) But fear n116 and distrust are also part of the counterterrorism repertoire. n117 Inevitably this fact raises serious [*857] normative issues. First is the foundational question of what it means for the state to manage terrorist risk through the potentially widespread, deliberate employment of fear. n118 Rich sociological and historical literature attest to the emotional costs of aggressive national security tactics. n119 Second is a concern about the distribution of fear and whether the government considers race and religion when employing it. n120 My central point here, however, is not normative so much as conceptual: Whereas policymakers, lawyers, and the general public often define counterterrorism as the sum of so many violent interventions, new deterrence reminds us that counterterrorism also operates in a psychological register. Unlike traditional deterrence, which conveys its message through fear of being caught and punished, new deterrence relies on a wider and subtler range of official modalities that go to the likelihood of terrorist success. For example, the government may aim to demoralize an adversary by telegraphing the state's overwhelming might. The state might do so by "spreading false or exaggerated rumors of the [*858] existence of sting operations," n121 sowing a sense of distrust within a cell by implying that one among them is on an official payroll, or even conveying an image of officials as irrational and prone to unmeasured violence. n122

Surveillance is the only method to stop terrorist attacks

Sanger and Shanker 2013 (David E and Thom; NSA Director firmly defends surveillance efforts; Oct 12; www.nytimes.com/2013/10/13/us/nsa-director-gives-firm-and-broad-defense-of-surveillance-efforts.html; kdf)

FORT MEADE, Md. — The director of the National Security Agency, Gen. Keith B. Alexander, said in an interview that to prevent terrorist attacks he saw no effective alternative to the N.S.A.'s bulk collection of telephone and other electronic metadata from Americans. But he acknowledged that his agency now faced an entirely new reality, and the possibility of Congressional restrictions, after revelations about its operations at home and abroad. While offering a detailed defense of his agency's work, General Alexander said the broader lesson of the controversy over disclosures of secret N.S.A. surveillance missions was that he and other top officials have to be more open in explaining the agency's role, especially as it expands its mission into cyberoffense and cyberdefense. Gen. Keith Alexander, the director of the National Security Agency, testified on Thursday before the Senate Intelligence Committee. N.S.A. Gathers Data on Social Connections of U.S. Citizens SEPT. 28, 2013 "Given where we are and all the issues that are on the table, I do feel it's important to have a public, transparent discussion on cyber so that the American people know what's going on," General Alexander said. "And in order to have that, they need to understand the truth about what's going on." General Alexander, a career Army intelligence officer who also serves as head of the military's Cyber Command, has become the public face of the secret — and, to many, unwarranted — government collection of records about personal communications in the name of national security. He has given a number of speeches in recent weeks to counter a highly negative portrayal of the N.S.A.'s work, but the 90-minute interview was his most extensive personal statement on the issue to date. Speaking at the agency's heavily guarded headquarters, General Alexander acknowledged that his agency had stumbled in responding to the revelations by Edward J. Snowden, the contractor who stole thousands of documents about the N.S.A.'s most secret programs. But General Alexander insisted that the chief problem was a public misunderstanding about what information the agency collects — and what it does not — not the programs themselves. "The way we've explained it to the American people," he said, "has gotten them so riled up that nobody told them the facts of the program and the controls that go around it." But he was firm in saying that the disclosures had allowed adversaries, whether foreign governments or terrorist organizations, to learn how to avoid detection by American intelligence and had caused "significant and irreversible damage" to national security. General Alexander said that he was extremely sensitive to the power of the software tools and electronic weapons being developed by the United States for surveillance and computer-network warfare, and that he set a very high bar for when the nation should use them for offensive purposes. "I see no reason to use offensive tools unless you're defending the country or in a state of war, or you want to achieve some really important thing for the good of the nation and others," he said. Those comments were prompted by a document in the Snowden trove that said the United States conducted more than 200 offensive cyberattacks in 2011 alone. But American officials say that in reality only a handful of attacks have been carried out. They say the erroneous estimate reflected an inaccurate grouping of other electronic missions. But General Alexander would not discuss any specific cases in which the United States had used those weapons, including the best-known example: its years-long attack on Iran's nuclear enrichment facility at Natanz. To critics of President Obama's administration, that decision made it easier for China, Iran and other nations to justify their own use of cyberweapons. General Alexander, who became the N.S.A. director in 2005, will retire early next year. The timing of his departure was set in March when his tour was extended for a third time, according to officials, who said it had nothing to do with the surveillance controversy spawned by the leaks. The appointment of his successor is likely to be a focal point of Congressional debate over whether the huge infrastructure that was built during his tenure will remain or begin to be restricted. Senator Patrick J. Leahy, a Vermont Democrat who leads the Senate Judiciary Committee, has already drafted legislation to eliminate the N.S.A.'s ability to systematically obtain Americans' calling records. And Representative Jim Sensenbrenner, a Wisconsin Republican and co-author of the Patriot Act, is drafting a bill that would cut back on domestic surveillance programs. General Alexander was by turns folksy and firm in the interview. But he was unapologetic about the agency's strict culture of secrecy and unabashed in describing its importance to defending the nation. He insisted that it would have been impossible to have made public, in advance of the revelations by Mr. Snowden, the fact that the agency collected what it calls the "business records" of all telephone calls, and many other electronic communications, made in the United States. The agency is under rules preventing it from investigating that so-called haystack of data unless it has a "reasonable, articulable" justification, involving communications with terrorists abroad, he added. But he said the agency had not told its story well. As an example, he said, the agency itself killed a program in 2011 that collected the metadata of about 1 percent of all of the e-mails sent in the United States. "We terminated it," he said. "It was not operationally relevant to what we needed." However, until it was killed, the N.S.A. had repeatedly defended that program as vital in reports to Congress. Senior officials also said that one document in the Snowden revelations, an agreement with Israel, had been misinterpreted by those who believed that it meant the N.S.A. was sharing raw intelligence data on Americans, including the metadata on phone calls. Officials said the probability of American content in the

shared data was extremely small. General Alexander said that confronting what he called the two biggest threats facing the United States — terrorism and cyberattacks — would require the application of expanded computer monitoring. In both cases, he said, he was open to much of that work being done by private industry, which he said could be more efficient than government. In fact, he said, a direct government role in filtering Internet traffic into the United States, in an effort to stop destructive attacks on Wall Street, American banks and the theft of intellectual property, would be inefficient and ineffective. “I think it leads people to the wrong conclusion, that we’re reading their e-mails and trying to listen to their phone calls,” he said. Although he acknowledged that the N.S.A. must change its dialogue with the public, General Alexander was adamant that the agency adhered to the law. “We followed the law, we follow our policies, we self-report, we identify problems, we fix them,” he said. “And I think we do a great job, and we do, I think, more to protect people’s civil liberties and privacy than they’ll ever know.”

Link: Congressional Oversight

Oversight has zero chance of working but still substantially undermines executive secrecy

Posner and Vermeule 10 [Eric, professor of law at the University of Chicago AND Adrian, professor of law at Harvard, The Executive Unbound, p. 25-29]

Many institutional factors hamper effective legislative monitoring of executive discretion for legal compliance. Consider the following problems. Information Asymmetries Monitoring the executive requires expertise in the area being monitored. In many cases, Congress lacks the information necessary to monitor discretionary policy choices by the executive. Although the committee system has the effect, among others, of generating legislative information and expertise,¹⁸ and although Congress has a large internal staff, there are domains in which no amount of legislative expertise suffices for effective oversight. Prime among these are areas of foreign policy and national security. Here the relative lack of legislative expertise is only part of the problem; what makes it worse is that the legislature lacks the raw information that experts need to make assessments. The problem would disappear if legislators could cheaply acquire information from the president, but they cannot. One obstacle is a suite of legal doctrines protecting executive secrecy and creating deliberative privileges— doctrines that may or may not be justified from some higher-order systemic point of view as means for producing optimal deliberation within the executive branch. Although such privileges are waivable, the executive often fears to set a bad institutional precedent. Another obstacle is the standard executive claim that Congress leaks like a sieve, so that sharing secret information with legislators will result in public disclosure. The problem becomes most acute when, as in the recent controversy over surveillance by the National Security Agency, the executive claims that the very scope or rationale of a program cannot be discussed with Congress, because to do so would violate the very secrecy that makes the program possible and beneficial. In any particular case the claim might be right or wrong; legislators have no real way to judge, and they know that the claim might be made either by a well-motivated executive or by an ill-motivated executive, albeit for very different reasons. Collective Action Problems Part of what drives executive reluctance to share information is that, even on select intelligence committees, some legislator or staffer is bound to leak and it will be difficult to pinpoint the source. Aware of the relative safety that the numbers give them, legislative leakers are all the more bold. This is an example of a larger problem, arising from the fact that there are many more legislators than top-level executive officials. Compared to the executive branch, Congress finds it more costly to coordinate and to undertake collective action (such as the detection and punishment of leakers). To be sure, the executive too is a “they,” not an “it.” Much of what presidents do is arbitrate internal conflicts among executive departments and try to aggregate competing views into coherent policy over time. As a strictly comparative matter, however, the contrast is striking: the executive can act with much greater unity, force, and dispatch than can Congress, which is chronically hampered by the need for debate and consensus among large numbers. This comparative advantage is a principal reason why Congress enacts broad delegating statutes in the first place, especially in domains touching on foreign policy and national security. In these domains, and elsewhere, the very conditions that make delegation attractive also hamper congressional monitoring of executive discretion under the delegation. There may or may not be offsetting advantages to Congress’s large numbers. Perhaps the very size and heterogeneity of Congress make it a superior deliberator, whereas the executive branch is prone to suffer from various forms of groupthink. But there are clear disadvantages to large numbers, insofar as monitoring executive discretion is at issue. From the standpoint of individual legislators, monitoring is a collective good. If rational and self-interested, each legislator will attempt to free ride on the production of this good, and monitoring will be inefficiently underproduced. More broadly, the institutional prerogatives of Congress are also a collective good. Individual legislators may or may not be interested in protecting the institution of Congress or the separation of legislative from executive power; much depends on legislators’ time horizons or discount rate, the expected longevity of a legislative career, and so forth. But it is clear that protection of legislative prerogatives will be much less emphasized in an institution composed of hundreds of legislators coming and going than if Congress were a single person. “Separation of Parties, not Powers” Congress is, among other things, a partisan institution.¹⁹ Political

scientists debate whether it is principally a partisan institution, or even exclusively so. But Madison arguably did not envision partisanship in anything like its modern sense. **Partisanship undermines the separation of powers during periods of unified government. When the same party controls both the executive branch and Congress, real monitoring of executive discretion rarely occurs,** at any rate far less than in an ideal Madisonian system. **This appears to have a marked effect in the domain of war powers and foreign affairs,** where a recent study by political scientists William Howell and Jon Pevehouse shows that congressional oversight of presidential war powers differs markedly depending upon the partisan composition of Congress.²⁰ When Congress is a co-partisan of the president, oversight is minimal; when parties differ across branches, oversight is more vigorous. Partisanship can enhance monitoring during periods of divided government,²¹ but this is cold comfort for liberal legalists. From the standpoint of liberal legalism, monitoring is most necessary during periods of unified government, because Congress is most likely to enact broad delegations when the president holds similar views; and in such periods monitoring is least likely to occur. The Congress of one period may partially compensate by creating institutions to ensure bipartisan oversight in future periods— consider the statute that gives a minority of certain congressional committees power to subpoena documents from the executive²²—but these are palliatives. Under unified government, **congressional leaders of the same party as the president have tremendous power to frustrate effective oversight by the minority party.** The Limits of Congressional Organization Congress as a collective body has attempted, in part, to overcome these problems through internal institutional arrangements. Committees and subcommittees specialize in a portion of the policy space, such as the armed forces or homeland security, thereby relieving members of the costs of acquiring and processing information (at least if the committee itself maintains a reputation for credibility). Intelligence committees hold closed sessions and police their members to deter leaks (although the sanctions that members of Congress can apply to one another are not as strong as the sanctions a president can apply to a leaker in the executive branch). Large staffs, both for committees and members, add expertise and monitoring capacity. And interest groups can sometimes be counted upon to sound an alarm when the executive harms their interests. Overall, however, these arrangements are not fully adequate, especially in domains of foreign policy and national security, where the scale of executive operations is orders of magnitude larger than the scale of congressional operations. **Congress's whole staff, which must** (with the help of interest groups) **monitor all issues, runs to some 30,000 persons.**²³ **The executive branch has some 2 million civilian employees,** in addition to almost 1.4 million in the active armed forces.²⁴ **The sheer mismatch between the scale of executive operations and the congressional capacity for oversight, even aided by interest groups or by leakers within the bureaucracy, is daunting.** Probably **Congress is already at or near the limits of its monitoring capacity** at its current size and budget.

Link: Constitution Free Zones/Borders

Surveillance by TSA, Border and Customs agents key to security --- internal safe guards will protect civil rights

Horwitz, 14 --- covers the Justice Department and criminal justice issues nationwide for The Washington Post (12/8/2014, Sari, "Justice Dept. announces new rules to curb racial profiling by federal law enforcement," http://www.washingtonpost.com/world/national-security/justice-dept-to-announce-new-rules-to-curb-racial-profiling-by-federal-law-enforcement/2014/12/07/e00eca18-7e79-11e4-9f38-95a187e4c1f7_story.html, JMP)

A fact sheet on the policy said that some DHS activity is not covered by the policy because of the "unique nature of DHS's mission." "This does not mean that officers and agents are free to profile," according to the DHS fact sheet. "To the contrary, **DHS's existing policies make it categorically clear that profiling is prohibited, while articulating limited circumstances where it is permissible to rely in part on these characteristics, because of the unique nature of border and transportation security as compared to traditional law enforcement.**" President George W. Bush banned racial profiling in 2003, but the prohibition did not apply to national security investigations and covered only race — not religion, national origin, gender or sexual orientation and gender identity. Civil rights groups and Democratic lawmakers have pushed for expanded anti-profiling protections since President Obama was elected in 2008. Holder began the process to revamp the rules in 2009 and considers the new policy one of the signature accomplishments of his tenure. About six months ago, the Justice Department delivered the rules to the White House. But they applied only to the department, and White House officials wanted the polices to cover additional agencies. The rules have been delayed in part because DHS officials pushed the White House and the Justice Department to allow major exclusions for agencies such as the Transportation Security Administration, Immigration and Customs Enforcement, and Customs and Border Protection. In several high-level meetings, DHS Secretary Jeh Johnson argued that immigration and customs agents and airport screeners needed to consider a variety of factors to keep the nation safe, according to officials familiar with his personal efforts. TSA officials argued that the rules should not apply to them because the TSA is not a law enforcement agency. In its fact sheet, DHS officials said that they will review activities not directly covered by the guidance to ensure that "we are including every appropriate safeguard and civil rights protection in the execution of those important security activities, and to enhance our policies where necessary."

Link: Domestic Spying

Surveillance is critical to thwart domestic right-wing terror attacks

Perez and Bruner 2015 (Evan and Wes; DHS intelligence report warns of domestic right-wing terror threat; Feb 20; www.cnn.com/2015/02/19/politics/terror-threat-homeland-security/; kdf)

Washington (CNN) They're carrying out sporadic terror attacks on police, have threatened attacks on government buildings and reject government authority. A new intelligence assessment, circulated by the Department of Homeland Security this month and reviewed by CNN, focuses on the domestic terror threat from right-wing sovereign citizen extremists and comes as the Obama administration holds a White House conference to focus efforts to fight violent extremism. Some federal and local law enforcement groups view the domestic terror threat from sovereign citizen groups as equal to -- and in some cases greater than -- the threat from foreign Islamic terror groups, such as ISIS, that garner more public attention. The Homeland Security report, produced in coordination with the FBI, counts 24 violent sovereign citizen-related attacks across the U.S. since 2010. The government says these are extremists who believe that they can ignore laws and that their individual rights are under attack in routine daily instances such as a traffic stop or being required to obey a court order. They've lashed out against authority in incidents such as one in 2012, in which a father and son were accused of engaging in a shootout with police in Louisiana, in a confrontation that began with an officer pulling them over for a traffic violation. Two officers were killed and several others wounded in the confrontation. The men were sovereign citizen extremists who claimed police had no authority over them. Among the findings from the Homeland Security intelligence assessment: "(Sovereign citizen) violence during 2015 will occur most frequently during routine law enforcement encounters at a suspect's home, during enforcement stops and at government offices." The report adds that "law enforcement officers will remain the primary target of (sovereign citizen) violence over the next year due to their role in physically enforcing laws and regulations." The White House has fended off criticism in recent days for its reluctance to say the words "Islamist extremism," even as the conference this week almost entirely focused on helping imams and community groups to counteract the lure of groups like ISIS. Absent from the White House conference is any focus on the domestic terror threat posed by sovereign citizens, militias and other anti-government terrorists that have carried out multiple attacks in recent years. An administration official says the White House is focused on the threat from all terrorists, including from sovereign citizen and other domestic groups. "I don't think it's fair to say the (White House) conference didn't address this at all," the official said, adding that President Barack Obama addressed the need to combat "violent ideologies" of all types. An official at the Justice Department, which is leading the administration's counter-radicalization effort, says many of the tactics aimed at thwarting radical Islamic recruitment of young people can also be used to fight anti-government extremist groups. While groups like ISIS and al Qaeda garner the most attention, for many local cops, the danger is closer to home. A survey last year of state and local law enforcement officers listed sovereign citizen terrorists, ahead of foreign Islamists, and domestic militia groups as the top domestic terror threat. The survey was part of a study produced by the University of Maryland's National Consortium for the Study of Terrorism and Responses to Terrorism. In 2013, a man who held anti-government views carried out a shooting attack on three Transportation Security Administration employees at Los Angeles International Airport, killing one TSA officer. Last year, a couple killed two police officers and a bystander at a Las Vegas Walmart store. Mark Potok, senior fellow at the Southern Poverty Law Center, said that by some estimates, there are as many as 300,000 people involved in some way with sovereign citizen extremism. Perhaps 100,000 people form a core of the movement, he said. The federal government's focus on the domestic groups waxes and wanes, Potok said, in part because the threat from foreign groups like al Qaeda and its affiliates. Potok says sovereign citizen groups have attracted support because of poor economic conditions. Some groups travel the country pitching their ideology as a way to help homeowners escape foreclosure or get out of debt, by simply ignoring the courts and bankruptcy law. The Homeland Security report's focus on right-wing terrorists is a subject that garnered political controversy for the Obama administration in the past. In 2009, a Homeland Security report on possible recruitment of military veterans by right-wing militia groups prompted an outcry from veterans groups. The report was produced by staff members during the Bush administration but wasn't published until then Homeland Security Janet Napolitano had taken office. Napolitano criticized her own agency for the report.

Link: Drone warrants

The plan grounds drones – blocking preventive measures

McNeal 2014 (Gregory [prof at Pepperdine University]; Drones and Aerial surveillance: Considerations for Legislators; Nov; www.brookings.edu/research/reports2/2014/11/drones-and-aerial-surveillance; kdf)

To counter the threat of surveillance, privacy advocates have focused solely on requiring warrants before the use of drones by law enforcement. Such a mandate oftentimes will result in the grounding of drone technology in circumstances where law enforcement use of drones would be beneficial and largely non-controversial. For example, in light of the Boston Marathon bombing, police may want to fly a drone above a marathon to ensure the safety of the public. Under many bills, police would not be allowed to use a drone unless they had a warrant, premised upon probable cause to believe a crime had been or was about to be committed. This requirement exceeds current Fourth Amendment protections with regard to the reasonableness of observing activities in public places. What this means is that the police would need to put together a warrant application with sufficient facts to prove to a judge that they had probable cause. That application would need to define with particularity the place to be searched or the persons to be surveilled. All of this would be required to observe people gathered in a public place, merely because the observation was taking place from a drone, rather than from an officer on a rooftop or in a helicopter. In a circumstance like a marathon, this probable cause showing will be difficult for the police to satisfy. After all, if the police knew who in the crowd was a potential bomber, they would arrest those individuals. Rather, a marathon is the type of event where the police would want to use a drone to monitor for unknown attackers, and in the unfortunate event of an attack, use the footage to identify the perpetrators. This is precisely the type of circumstance where the use of drone could be helpful, but unfortunately it has been outlawed in many states. To make matters worse, this type of drone surveillance would pose little to no harms to privacy. A marathon is a highly public event, the event is televised, it takes place on streets where there are surveillance cameras and spectators are photographing the event. Moreover, in the states where drones have been banned (unless accompanied by a warrant), the police have not been prohibited from using any other type of surveillance equipment --- just drones. This technology centric approach has done little to protect privacy, but will certainly harm public safety, depriving law enforcement of a tool that they could use to protect people.

Link: Drones

Drones are critical to combat bio- and chemical-terror

Koerner 2015 (Matthew R [Duke University School of Law, J.D. expected 2015]; DRONES AND THE FOURTH AMENDMENT: REDEFINING EXPECTATIONS OF PRIVACY; 64 Duke L.J. 1129; kdf)

Senator Dianne Feinstein, a staunch advocate of governmental surveillance n1 and Chairman of the 113th Congress's Senate Intelligence Committee, n2 recently found herself, rather ironically, as the target of surveillance. n3 One day at her home, Senator Feinstein walked to the window to check on a protest that was taking place outside. n4 Much to her surprise, a small drone n5 hovered on the other side of the window, only inches away, spying on her. n6 The drone immediately flew away. n7 Senator Feinstein's experience is just one example of drones being used for surveillance within the United States. But her story and others like it n8 have sparked significant controversy over the use of drones for domestic surveillance, which falls within a broader debate [*1131] on privacy and governmental surveillance programs. n9 Advocates of robust federal surveillance policies champion governmental surveillance as the only way to prevent terrorist and cyber attacks against the United States. n10 President Barack Obama defended these surveillance programs as ""modest encroachments on privacy"" that "strike the "right balance' between national security and civil liberties." n11 In comparison, privacy advocates envision these surveillance programs leading to a dystopian, totalitarian government watching over its citizenry - undetected but omnipresent. n12 References to George Orwell's Nineteen Eighty-Four n13 abound. n14 [*1132] Apart from the surrounding privacy-concerns debate, drones currently provide many practical benefits and their projected applications seem limitless. n15 Based on their obvious advantage of being unmanned, drones have the capability to conduct missions previously considered too risky, dangerous, or impracticable. These applications are also provided at continuously decreasing costs and with the latest technological sophistication, such as the capability to see through physical obstructions, to detect various chemical and biological agents in the air, to recognize human faces and license plates, and to fly in strategic, coordinated formations. n16

Link: Drone Sales

Drone sales key to crush ISIS

Tucker and Weisgerber 2015 (Patrick and Marcus; Obama to Sell Armed Drones to More Countries; Feb 17; www.defenseone.com/technology/2015/02/obama-sell-armed-drones-more-countries/105495/; kdf)

The State Department on Tuesday announced that the United States would be expanding the sale of armed unmanned aerial vehicles, or UAVs, to carefully selected allied countries. The announcement suggests that strategic partners – especially in the Middle East – could acquire American-made armed drones before the year is out. Some of those could go toward the international campaign against the Islamic State, or ISIS. Battlefield commanders and the intelligence community are hungry for large, armed drones as they could loiter over targets for hours. The footage captured by high-powered cameras attached to these unmanned aircraft has been critical in determining the locations for airstrikes against Islamic State militants in Iraq and Syria, U.S. officials say. State Department officials maintained that every export request would meet “a strong presumption of denial,” according to Tuesday’s release, but U.S. officials will allow exports on “‘rare occasions’ that are justified in terms of the nonproliferation and export control factors specified in the [Missile Technology Control Regime Guidelines.]” The Missile Technology Control Regime, or MTCR, is a voluntary partnership that the United States and 33 other countries established in 1987 to curb the proliferation of weapons of mass destruction. Officials who spoke to the Washington Post said that new export applications would be approved or denied within months of receipt, clearing the way for armed drones and armed drone technology to potentially arrive in other countries by year’s end. The new policy affects drones that are capable of flying a distance of 300 kilometers and carrying a payload of 500 kilograms. Those specifications come from the MTCR but apply to drones like the Reaper, which are capable of carrying laser-guided bombs and Hellfire missiles. Exporting more drones— either armed or outfitted with laser targeting systems for smart bombs—to key allies and partners in the Middle East like Jordan would help them strike Islamic State, according to experts. “Transferring drones, particularly those that had laser designators so they could designate targets for strikes from manned fighter aircraft, to coalition partners such as Jordan participating in strikes against ISIL could be a significant advantage to them,” Paul Scharre, fellow and director of the 20YY Warfare Initiative at the Center for a New American Security, told Defense One. Earlier this year, a member of the House Armed Services Committee disclosed to the Washington Times that the Obama administration had denied a request from Jordan for unarmed Predator spy drones. But that was before Jordan stepped up its F-16-led air assault to retaliate against Islamic State for the brutal burning alive of First Lt. Moaz al-Kasasbeh, the Jordanian pilot captured by the terrorist group. “Given our mutual interests, and our strong relationship, it’s absolutely critical that we provide Jordan the support needed to defeat the Islamic State,” Rep. Duncan Hunter, R-Calif., wrote to President Obama in a Feb. 5 letter. The loosened export rules do not mean that every ally in a pinch will be fast-tracked for the most lethal drones that America produces. Ukraine is reportedly seeking unarmed drones to bolster its campaign against Russian-supported separatists. “I find it hard to imagine that this would lead to transferring large-scale armed drones to Ukraine, not to mention the fact that they would likely have difficulty operating them effectively. This might help pave the way for transferring small, tactical drones to Ukrainian forces, which wouldn’t be a game-changer, but would help them with tactical reconnaissance and would be a sensible move,” said Scharre. “The new drone export policy is unlikely to lead to the transfer of armed drones to Ukraine,” Michael Horowitz, associate professor of political science at the University of Pennsylvania, told Defense One. Horowitz and other experts argue that the policy change could allow the U.S. to regain some control if not over armed proliferation at least over how proliferation occurs. Last May, the Chinese Times reported that China would be selling their Wing Loong armed UAV, sometime called a Predator knockoff, to U.S. ally Saudi Arabia.

Link: Telephone Metadata

Telephone metadata doesn't infringe on privacy, but does prevent terrorism

Praast 2014 (Linda Renee [J.D., Magna Cum Laude, California Western School of Law, 2013; LL.M., National Security and U.S. Foreign Relations Law, George Washington University, 2014]; This Isn't Your Founding Fathers' Fourth Amendment: Analyzing the Constitutionality of Warrantless Metadata Collection under the Foreign Intelligence Surveillance Act; 51 Cal. W. L. Rev. 7; kdf)

Conclusion The events of September 11, 2001 demonstrated America's vulnerability to terrorist attacks at home. The government responded with legislation creating new agencies, new protections, and new methods of gathering intelligence designed to predict and prevent future similar catastrophes. **The cost of this enhanced protection is unavoidable pressures on privacy.** The NSA's telephony metadata collection program is one such program designed to predict and prevent terrorist attacks. Congress impliedly approved the program as it currently functions through its reauthorization of section 215 of the Patriot Act. Therefore, the program is statutorily allowed. Addressing the larger issue, the program does not represent an impermissible search under the Fourth Amendment. The only data collected is information voluntarily provided by telephone users to their third-party telephone providers. While the scope of the data collection is vast, the data itself is not protected by the Fourth Amendment. So long as the data analysis is limited to queries concerning suspected foreign agents or terrorists, and so long as the data collected does not expand to include substantive content of the telephone calls, the program is a permissible, legal national security tool.

Link: Foreign intelligence requirement

Valid terrorism concerns justify the collection of data

Praast 2014 (Linda Renee [J.D., Magna Cum Laude, California Western School of Law, 2013; LL.M., National Security and U.S. Foreign Relations Law, George Washington University, 2014]; This Isn't Your Founding Fathers' Fourth Amendment: Analyzing the Constitutionality of Warrantless Metadata Collection under the Foreign Intelligence Surveillance Act; 51 Cal. W. L. Rev. 7; kdf)

The statutory authority cited by the government for the metadata collection is the FISA business records provision, added by section 215 of the Patriot Act and codified at 50 U.S.C. § 1861. n43 Titled "Access to Certain Business Records for Foreign Intelligence and International Terrorism Investigations," section 215 allows the FBI to apply to a FISA court for an order "requesting production of any tangible things," including telephony metadata. n44 The provision allows such requests for information relevant to "an investigation to obtain foreign intelligence information not concerning a United States person or to protect against international terrorism or clandestine intelligence activities." n45 The statute expressly limits the investigations to those concerning foreign governments and their agents and individuals in contact with, or known to, a suspected agent of a foreign power who is the subject of such authorized investigation. n46 The NSA surveillance program disclosed by the Guardian clearly encompasses telephony metadata for individuals who are not involved with foreign governments or terrorist activities. However, while the metadata is collected without regard to the foreign intelligence requirement, the FISA Court orders allowing metadata collection "strictly limit access to, analysis of, and dissemination of information derived from the metadata to valid counter-terrorism purposes." n47 To accomplish this, the stored metadata is only accessible through search queries by a very limited number of NSA officials, resulting in a very small percentage of the metadata actually being analyzed. n48 These searches are only approved based on "facts giving rise to a reasonable, [*16] articulable suspicion that the selection term to be queried is associated with one or more of the specified foreign terrorist organizations." n49 The Government argues that Congress permits the collection scheme used by the NSA under section 215. n50 As evidence, the Government points to congressional reauthorization of section 215 in 2010. n51 This reauthorization occurred after all members of Congress had received a report on the telephony metadata program. n52 This reauthorization, made with full knowledge of how the statute was being implemented, shows congressional approval and provides statutory authority for the metadata program under section 215.

Link: FISC

FISC imposes slow and cumbersome procedures --- that disrupts effective counter-terror

Yoo 14 [John, Emanuel S. Heller Professor of Law, University of California, Berkeley Law School; Visiting Scholar, American Enterprise Institute. "The Legality of the National Security Agency's Bulk Data Surveillance Programs," Summer, 2014, I/S: A Journal of Law and Policy for the Information Society, 10 ISJLP 301, lexis]

FISA, and the law enforcement mentality it embodies, creates several problems. FISA requires "probable cause" to believe that someone is an agent of a foreign power before one can get a warrant to collect phone calls and e-mails. n35 An al Qaeda leader could have a cell [*309] phone with 100 numbers in its memory, ten of which are in the United States and thus require a warrant. Would a FISA judge have found probable cause to think the users of those ten numbers are al Qaeda too? Probably not. Would our intelligence agencies even immediately know who was using those numbers at the time of captured al Qaeda leader's calls? The same is true of his e-mail, as to which it will not be immediately obvious what addresses are held by U.S. residents. In our world of rapidly shifting e-mail addresses, multiple cell phone numbers, and Internet communications, FISA imposes slow and cumbersome procedures on our intelligence and law enforcement officers. n36 These laborious checks are based on the assumption that we remain within the criminal justice system, and look backwards at crimes in order to conduct prosecutions, rather than within the national security system, which looks forward in order to prevent attacks on the American people. n37 FISA requires a lengthy review process, in which special FBI and DOJ lawyers prepare an extensive package of facts and law to present to the FISC. n38 The Attorney General must personally sign the application, and another highranking national security officer, such as the President's National Security Advisor or the Director of the FBI, must certify that the information sought is for foreign intelligence. n39 Creating an existing database of numbers that can be quickly searched can allow the government to take advantage of captured al Qaeda numbers abroad, before the cells within the United States break their contacts. A critic, however, might argue that billions of innocent calling records are not "relevant" to a terrorism investigation. Even if terrorist communications take place over the phone, that cannot justify the collection of all phone call records in the United States, the vast [*310] majority of which have nothing to do with the grounds for the search. The FISC rejected this argument because, to be useful, a database has to be broad enough to find terrorist calls. "Because known and unknown international terrorist operatives are using telephone communications, and because it is necessary to obtain the bulk collection of a telephone company's metadata to determine those connections between known and unknown international terrorist operatives as part of authorized investigations," the court observed, "the production of the information sought meets the standard for relevance under Section 215." n40 Aggregating calling records into a database, the court found, was necessary to find the terrorist communications and the links between terrorists. n41 It may not even be possible to detect the links before such a database is created. If a database is not comprehensive, in other words, then the government will only be able to glimpse incomplete patterns of terrorist activity, if it can glimpse any at all. Relevance is a slippery concept, but it cannot require that every piece of information obtained by subpoena must contain information related to guilt. Even when grand juries subpoena the business records or communications of a criminal suspect, it is likely that the large majority of the items will not have any relationship to the crime. Nonetheless, a grand jury may subpoena all of a suspect's financial records to find those that pertain to a criminal conspiracy. A different way to view the NSA's telephone calling record program is that the "relevant" tangible "thing" is the database itself, rather than any individual calling record.

Link: FISC -- Disclosing decisions

Disclosing FISC decisions destroys strategic ambiguity – precludes effective deterrence

Rascoff 14 [Samuel J. Rascoff, Associate Professor of Law, Faculty Director, Center on Law and Security, New York University School of Law, "COUNTERTERRORISM AND NEW DETERRENCE," 2014]

Finally, it bears mentioning that the complicated relationship between secrecy and revelation demanded by new deterrence plays out in the legal arena as well. n96 On one level, public laws are exercises in revelation. For example, while reports of the details of the NSA Prism program created a sensation, the FISA Amendments Act of 2008 (hardly a secret document) seems to have authorized the collection in question. n97 On the other hand, legal interpretations that are [*852] crucial to the oversight of national security programs - such as opinions of the Foreign Intelligence Surveillance Court (FISC) n98 or the Justice Department's memorandum authorizing a lethal strike against American citizen Anwar al-Aulaqi n99 - have been withheld. Part of the reasoning is that these legal analyses themselves contain secrets or that in a world in which government is expected to operate at the outer limits of legal authority, n100 to disclose those limits publicly is, in effect, to reveal national security secrets. On this view, **to maintain strategic ambiguity, it is necessary to be vague about legal interpretation.** n101 In sum, new deterrence subtly refocuses the debate [*853] away from a zero-sum contest between secrecy and transparency and toward a more nuanced account.

Link: Logfren Amendment

Lofgren amendment fails – destroys effective response to terrorism

Margulies 14 [Peter, Professor of Law, Roger Williams University School of Law, B.A. 1978, Colgate University; J.D. 1981, Columbia Law School, “Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden,” December, 2014, Hastings Law Journal, 66 Hastings L.J. 1, lexis]

The Lofgren Amendment paints with an unduly broad brush. It does not allow queries based on U.S. persons who are involved with hostage situations. Even though this query does not readily fit with the NSA's current criteria, barring it altogether would be counterproductive. In exigent cases, the NSA should have the ability to frame queries that may save lives. The Constitution presents no bar since courts have [*72] regularly approved searches under exigent circumstances. n422 Nor does the use of U.S. person queries in hostage situations clash with section 702's bar on targeting U.S. persons, since the queries concern evidence already acquired through the targeting of persons reasonably believed to be outside the United States. n423 Moreover, the government may well have the need to seek other information regarding U.S. persons that could be included in lawful collection under section 702 and might be difficult to acquire through other means. For example, the government might intercept communications sent or received by an ISIS operative in Syria or Iraq, and might wish to know if the ISIS operative mentioned any U.S. persons who are currently abroad fighting on ISIS's behalf or might wish to go abroad for this purpose. It is true that the government might be able to secure a traditional FISA warrant once it determined that someone had taken concrete steps to join ISIS's fighting force, since that would make that individual an "agent of a foreign power" who could be targeted under the statute. n424 However, in a particular case, such as one in which a U.S. person who had fought with ISIS was about to board a plane to return to the United States, time might be of the essence. In such a case, the government may not have received sufficient notice of that individual's ISIS involvement to allow for the completion of a traditional FISA application. Under these circumstances, it would be appropriate to authorize a query of a section 702 database. The Lofgren Amendment also fails to address this situation.

Link: PCLOB

Destroys effective intel sharing

Margulies 14 [Peter, Professor of Law, Roger Williams University School of Law, B.A. 1978, Colgate University; J.D. 1981, Columbia Law School, "Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden," December, 2014, Hastings Law Journal, 66 Hastings L.J. 1, lexis]

Another flawed fix is the proposal by Chairman Medine and Judge Wald of the PCLOB. That proposal requires ex ante judicial review of NSA queries to ensure that they are "reasonably likely to return foreign intelligence information." n425 This proposal is superior to the Lofgren Amendment because it has an appropriately deferential substantive standard. Moreover, a larger FISC role is useful. n426 In addition, Medine and Wald outlined an intriguing alternative, entailing FISC appointment of a special master who could review a "representative sample of query results" and make recommendations to the court. n427 The major flaw in the Medine and Wald proposal is its differential standard for the NSA and the FBI. Under the proposal, the test for the FBI, as assessed ex ante by [*73] the FISC in all but exigent circumstances, would be whether the U.S. person query is "reasonably likely to return information relevant to an assessment or investigation of a crime." n428 The NSA's test is whether the query is "reasonably likely to return foreign intelligence information." n429 The differing criteria for FBI and NSA queries could hamper intelligence sharing between the two agencies, replicating the failures of the "wall" that existed between agencies prior to September 11. n430

Link: PRISM

PRISM decimates Al Qaeda's ability to conduct mass attacks

Etzioni 15 [Amitai Etzioni, Director of the Institute for Communitarian Policy Studies at George Washington University, former President of the American Sociological Association, former Professor at Harvard Business School, former Senior Adviser to the White House, “

NSA: National Security vs. Individual Rights,” *Intelligence and National Security*, Volume 30, Issue 1, 2015, pages 100-136]

One telling piece of evidence regarding the effectiveness of the electronic surveillance programs is the way they **hobbled bin Laden**. He found out that he was unable to use any modern communication device to run his terror organizations that had branches in three continents.⁵⁴ He was reduced to using the same means of communication employed 5000 years ago – a messenger, a very slow, low-volume, cumbersome, and unreliable way of communication and command; in effect, preventing bin Laden from serving as an effective commander-in-chief of Al Qaeda. Moreover, once the CIA deduced that using a messenger was the only way left for him to communicate – tracking the messenger led to bin Laden's downfall.⁵⁵ Additional evidence publically available that the NSA programs forced terrorists to limit their communications is gleaned from reports that following the revelation that the United States intercepted the communications of Ayman al-Zawahiri, there was a sharp decline in Al Qaeda's electronic communications.⁵⁶ In short, we have seen that **there continues to be a serious threat of terrorism** to national security; that **terrorists cannot be handled like other criminals** and to counter them distinct measures are best employed; and that **surveillance programs like PRISM** and the phone surveillance programs **make a significant contribution to curbing terrorism**. In short these programs do enhance one core element of the liberal communitarian balance. The next question the article addresses is the extent they undermine the other core element.

PRISM roadblocks terrorists – guts them of the tools necessary to pull off an attack

Arquilla 2013 (John [Professor and Chair Department of Defense Analysis @ Naval postgrad school]; In Defense of PRISM; Jun 7; foreignpolicy.com/2013/06/07/in-defense-of-prism/; kdf)

Prior to TIA, and well before 9/11, there were other ancestors of our current big data efforts. At the National Security Agency, and in other parts of the extensive American intelligence community, search systems known by such evocative names as "Echelon" and "Semantic Forests," among others, were in use, striving relentlessly to detect patterns of communication that might open up golden seams of information from the most secret caches of the world's various malefactors. Often enough, these and other tracking tools did distinguish the pattern from the noise, and national security was well served. And in the early days of the war against al Qaeda, the enemy was still using means of communication that American intelligence had the ability to monitor — including satellite phones and such — leading to several counterterror coups and high-level captures. But the network learned quickly and adjusted, becoming far more elusive, more dispersed, its cells increasingly attuned to operating independently, its nodes and links ever less visible. It was against this shift that something like PRISM had to be mobilized to improve our ability to find the foe whose best, and only real defense against us is his capacity for concealment. Thus, the tantalizing prospect of PRISM, and of the whole "finding effort," is to deny the terrorists the virtual haven that they enjoy throughout the world's telecommunications spaces — indeed, throughout the whole of the "infosphere," which includes cyberspace. The piercing of this veil would mark a true turning point in the war on terror, for al Qaeda and other networks simply cannot function with any kind of cohesion, or at any sort of reasonable operational tempo if their communications become insecure. Cells and

nodes would be ripped up, operatives killed or captured, and each loss would no doubt yield information that imperiled the network further. Even if al Qaeda resorted to the drastic measure of moving messages, training, and financial information by courier, operations would be so slowed as to cripple the organization. And even couriers can be flagged on "no fly" lists or caught boarding tramp steamers and such. So for all the furor caused by the PRISM revelations, my simple recommendation is to take a deep breath before crying out in protest. Think first about how the hider/finder dynamic in the war on terror has driven those responsible for our security to bring to bear the big guns of big data on the problem at hand. Think also about whether a willingness to allow some incursions into our privacy might lead to an improved ability to provide for our security, and where that equilibrium point between privacy and security might be. And last, think about the world as it might be without such a sustained effort to find the hidden — to detect, track, and disrupt the terrorists. That would be a world in which they stay on their feet and fighting, and in which they remain secure enough, for long enough, to acquire true weapons of mass destruction. Those of us in the national security business, who know that networks so armed will be far harder to deter than nations ever were, believe that big data approaches like PRISM and its forebears, have been and remain essential elements in the unrelenting and increasingly urgent effort to find the hidden.

Link: Profiling – FBI

New profiling rules preserves FBI flexibility to fight terrorism --- broader restrictions will wreck mission effectiveness

Apuzzo, 14 (4/9/2014, Matt, **“Profiling Rules Said to Give F.B.I. Tactical Leeway,”**

http://www.nytimes.com/2014/04/10/us/profiling-rules-said-to-give-fbi-tactical-leeway.html?_r=0, JMP)

WASHINGTON — Attorney General Eric H. Holder Jr.’s long-awaited revisions to the Justice Department’s racial profiling rules would allow the F.B.I. to continue many, if not all, of the tactics opposed by civil rights groups, such as mapping ethnic populations and using that data to recruit informants and open investigations. The new rules, which are in draft form, expand the definition of prohibited profiling to include not just race, but religion, national origin, gender and sexual orientation. And they increase the standards that agents must meet before considering those factors. But they **do not change the way the F.B.I. uses nationality to map neighborhoods, recruit informants, or look for foreign spies**, according to several current and former United States officials either involved in the policy revisions or briefed on them. While the draft rules allow F.B.I. mapping to continue, they would eliminate the broad national security exemption that former Attorney General John Ashcroft put in place. For Mr. Holder, who has made civil rights a central issue of his five years in office, the draft rules represent a compromise between his desire to protect the rights of minorities and the concern of career national security officials that they would be hindered in their efforts to combat terrorism. The Justice Department has been reworking the policy for nearly five years, and civil rights groups hope it will curtail some of the authority granted to the F.B.I. in the aftermath of the 9/11 terrorist attacks. Muslims, in particular, say federal agents have unfairly singled them out for investigation. The officials who described the draft rules did so on the condition of anonymity because they were not authorized to discuss them. Mr. Holder, who officials say has been the driving force behind the rule change, gave a personal account of racial profiling on Wednesday before the National Action Network, the civil rights group founded by the Rev. Al Sharpton. “Decades ago, the reality of racial profiling drove my father to sit down and talk with me about how, as a young black man, I should interact with the police if I was ever stopped or confronted in a way I felt was unwarranted,” he said. Throughout the review process, however, the attorney general and his civil rights lawyers ran up against a reality: Making the F.B.I. entirely blind to nationality would fundamentally change the government’s approach to national security. The Bush administration banned racial profiling in 2003, but that did not apply to national security investigations. Since then, the F.B.I. adopted internal rules that prohibited agents from making race or religion and nationality the “sole factor” for its investigative decisions. Civil rights groups see that as a loophole that allows the government to collect information about Muslims without evidence of wrongdoing. Intelligence officials see it as an essential tool. They say, for example, that an F.B.I. agent investigating the Shabab, a Somali militant group, must be able to find out whether a state has a large Somali population and, if so, where it is. As written, the new rules are unlikely to satisfy civil rights groups and some of the administration’s liberal allies in Congress. Senator Richard J. Durbin, Democrat of Illinois, has said the existing rules “are a license to profile.” The Justice Department rules would also apply to the Drug Enforcement Administration, and the Bureau of Alcohol, Tobacco, Firearms and Explosives, but it is the F.B.I. that takes the lead on most national security investigations. Farhana Khera, the president of Muslim Advocates, said expanding the rules to cover nationality and religion would be a significant step forward. But she opposed any rule that allowed the F.B.I. to continue what it calls “domain mapping” — using census data, public records and law enforcement data to build maps of ethnic communities. Agents use this data to help assess threats and locate informants. “It would certainly mean we have work to do,” said Ms. Khera, who was one of several rights advocates who met with Mr. Holder about the profiling rules last week. “We want an effective ban on all forms of profiling.” Before federal agents could consider religion or other factors in their investigations under the new rules, they would need to justify it based on the urgency and totality of the threat and “the nature of the harm to be averted,” according to an official who has seen the draft. That would not prevent agents from considering religion or nationality, but officials said the goal was to establish clear rules that made doing so rare. Department officials were prepared to announce the new rules soon and had told Congress to expect them imminently. But recently, the White House intervened and told Mr. Holder to coordinate a larger review of racial profiling that includes the Department of Homeland Security, officials said. That is significant because the Bush-era racial profiling rules also contained an exception for border investigations, which are overseen by the department. Hispanic

advocacy groups are as opposed to that caveat as Muslims are to the exception for national security investigations. Mr. Holder cannot tell Homeland Security what rules to follow. But he has told colleagues that he believes border agents can conduct their investigations without profiling and by following the same rules as the Justice Department, one law enforcement official said. It is not clear how long this broader review will take, but for now it has delayed release of the Justice Department rules. Relations between the F.B.I. and Muslims have at times been strained since the weeks after 9/11, when agents arrested dozens of Muslim men who had no ties to terrorism. Since then, the F.B.I. has adopted new policies and invested heavily to explain them to Muslim populations. Senior agents speak at mosques and meet regularly with imams and leaders of Muslim nonprofit groups, but suspicions remain. Internal F.B.I. documents revealed that agents used their relationship-building visits at mosques as a way to gather intelligence. Leaked training materials, which the F.B.I. quickly disavowed, described the Prophet Muhammad as a cult leader and warned that mainstream Muslims shared the same "strategic themes" as terrorists. The draft rules would establish a program to track profiling complaints. The current process is less organized, making it difficult to track patterns in complaints or how they are resolved.

xt – FBI Link UQ

Recent DOJ guidelines won't result in any changes to FBI practices and still permits surveillance in critical areas

Phelps, 14 (12/9/2014, Timothy M., "Comey says new profiling guidelines will have no effect on the FBI," <http://www.latimes.com/nation/la-na-fbi-comey-profiling-20141209-story.html>, JMP)

The new Justice Department guidelines governing profiling by federal law enforcement officers will have no effect on FBI practices, its director, James B. Comey, said Tuesday.

On Monday, Comey's boss, Atty. Gen. Eric H. Holder Jr., said the new guidelines were "a major and important step forward to ensure effective policing by federal law enforcement officials."

But at a press briefing Tuesday, Comey said that the FBI, the lead federal law enforcement agency, is already in compliance with the new guidelines and strongly asserted that no changes were required.

The guidelines "don't have any effect on the FBI," he said

Asked whether the new guidance would change anything to FBI does now, Comey said, "No, nothing. It doesn't require any change to our policies or procedures."

He said the FBI field manual for agents would not be changed because it was already in compliance with the guidelines, which expand restrictions on racial and ethnic profiling to cover religion, national origin, sexual orientation and gender identity.

He defended the FBI practice of "mapping" communities to identify neighborhoods by race, religion or national origin. Civil rights leaders were critical Monday of the failure of the Justice Department to curtail the practice.

"We need to be able to understand the communities we serve and protect," Comey said. "When there is a threat from outside the country, it makes sense to know who inside the country might be able to help law enforcement."

"It is about knowing the neighborhoods: what's it like, where's the industry, where are the businesses, are there particular groups of folks who live in a particular area?"

Despite shortcomings, recent review demonstrates FBI's effectiveness because of unfettered surveillance

Ackerman, American national security reporter and blogger, national security editor for the Guardian, **and Yuhas, 15** (3/25/2015, Spencer & Alan, The Guardian, "FBI told its cyber surveillance programs have actually not gone far enough; In-house 9/11 Review Commission calls for further expansion of informant and cyber surveillance networks but largely ignores domestic intelligence gathering," Lexis, JMP)

An in-house review of the FBI has found the agency failing to go far enough in its expansion of physical and cyber surveillance programs, urging the bureau to recruit deeper networks of informants and bring its technological abilities up to pace with other intelligence agencies.

While billed as a damning critique of the FBI, the in-house assessment known as the 9/11 Review Commission primarily attacks the bureau for not moving fast enough to become a domestic intelligence agency, precisely the direction in which the FBI has pivoted since the 2001 terror attacks.

The majority of the panel's findings recommend bureaucratic changes - such as expanded training for FBI intelligence analysts or expanding cooperation with local and state law enforcement through the agency's Joint Terrorism Task Force - or otherwise urge Director James Comey onward in the long-set course he and predecessor Robert Mueller have set, such as bolstering the FBI's "human intelligence" (Humint) network of informants.

In particular, the report found that the agency fails to support analysts and linguists who interpret intelligence behind the scenes. The "imbalance" between support for field agents and analysts "needs urgently to be addressed to meet growing and increasingly complex national security threats, from adaptive and increasingly tech-savvy terrorists, more brazen computer hackers, and more technically capable, global cyber syndicates", the report's authors wrote.

Yet the "Review Commission cannot say that with better JTTF collaboration, Humint or even intelligence analysis that the FBI would have detected those plots beforehand", the panel concedes, offering only that FBI counterterrorism "might have benefited" with an acceleration of what the agency has already been doing.

Much of the report remarked approvingly on the FBI's activities of the past decade, **praising the way it shares information with government agencies and the new rules that allow it to surveil a target without a warrant.**

"With the new and almost entirely unclassified AG Guidelines, special agents working on national security issues could now at the assessment stage 'recruit and task sources, engage in interviews of members of the public without a requirement to identify themselves as FBI agents and disclose the precise purpose of the interview, and engage in physical surveillance not requiring a court order' just as special agents working on organized crime investigations could do," the authors wrote.

Link: Profiling – Mosques

Surveillance of particular communities key to prevent terrorism

Lengell, 15 (1/7/2015, Sean, "Peter King: Surveillance of Muslim community vital for national security," <http://www.washingtonexaminer.com/peter-king-surveillance-of-muslim-community-vital-for-national-security/article/2558311>, JMP)

Rep. Peter King said Wednesday's attack on a Paris newspaper that killed a dozen people highlights the need for enhanced police surveillance in Muslim communities to help combat terrorism. "It shows us that we should put political correctness aside and realize that it is important to have police in the communities to be using sources, to be using informers," the conservative New York Republican told Fox News on Wednesday. "Let's face it. The threat is coming from — for the most part, it's coming out of the Muslim community. It's a small percentage, but that's where it's coming from." King said law enforcement spying of certain ethnic communities is nothing new, saying that police for decades have used such tactics to combat the Italian-American Mafia and the Westies, a gang that sprang from New York City's Irish-American community in the 1960s. "We have to be able to go in there and find out what's happening so we can be tipped off and not stand back and treat all communities as if they're the same," he said. "If it's Islamist terrorism, we have to have more surveillance in those communities." The Associated Press reported that three masked gunmen shouting "Allahu akbar!" stormed the Paris offices of the satirical weekly newspaper Charlie Hebdo, killing 12 people, including its editor, before escaping in a car. The publication's caricatures of the Prophet Muhammad have frequently drawn condemnation from Muslims. King said that while it's uncertain if enhanced surveillance could have stopped the Paris shooting, "it shows the absolute necessity" of "on-the-ground intelligence. "You can't provide security for every soft target in a major city. But if you have surveillance, if you're in the community, if you have informers, that shows how essential this [is], like the NYPD's been doing over the years," he said.

AT: Link Turn-“Too Much Hay”

The turn makes no sense – programs are effective now

Lewis 2014 (James Andrew [senior fellow and director of the Strategic Technologies Program at CSIS]; Underestimating Risk in the Surveillance Debate; Dec; http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; kdf)

If the risk of attack is increasing, it is not the right time to change the measures the United States has put in place to deter another 9/11. If risk is decreasing, surveillance programs can be safely reduced or eliminated. A more complicated analysis would ask if the United States went too far after 9/11 and the measures it put in place can be reduced to a reasonable level without increasing risk. Unfortunately, precise metrics on risk and effectiveness do not exist, ¹² and we are left with the conflicting opinions of intelligence officials and civil libertarians as to what makes effective intelligence or counterterrorism programs. There are biases on both sides, with intelligence officials usually preferring more information to less and civil libertarians can be prone to wishful thinking about terrorism and opponent intentions.¹³ Interviews with current and former intelligence officials give us some guidance in deciding this. The consensus among these individuals is that 215 is useful in preventing attacks, but the least useful of the programs available to the intelligence community. **If there was one surveillance program they had to give up, it would be 215 before any other**s, but ending 215 would not come without some increase in risk.

Technology and algorithms check

Marritz 2013 (Ilya; Verizon Call Logs Controversy: No Such Thing As Too Much Information; June 6; www.wnyc.org/story/297513-verizon-call-logs-controversy-no-such-thing-too-much-information/; kdf)

The news that Verizon is providing the government with data about its customers on a daily basis has reignited the debate between balancing individual privacy and national security. Barry Steinhardt of the group Friends of Privacy USA said the surveillance itself is not so surprising, but the volume of material gathered is. “The government seems to think the way to find the needle in the haystack is to pour more hay on the stack,” Steinhardt said. That idea might seem counter-intuitive. **But too much information is increasingly a thing of the past,** as powerful computer programs tease patterns out of bigger and bigger pools of data.

****Impact Debate - Generic**

Impact: Turns the Aff -> Increase Surveillance

Empirically - a terror attack leads to greater surveillance, turns the aff

Tuccille 2015 (J.D. [Managing Editor, Reason.com]; What's a terrorist attack if not an excuse for domestic spying?; Jan 14; reason.com/blog/2015/01/14/whats-a-terrorist-attack-if-not-an-excuse; kdf)

Following on last week's terrorist attacks in France, the British government has dusted off a long-sought "snooper's charter"—better known as the Data Communications Bill—to ease the power of officials to track people's private communications. "It is too soon to say for certain, but it is highly probable that communications data was used in the Paris attacks to locate the suspects and establish the links between the two attacks," Home Secretary Theresa May told Parliament. "Quite simply, if we want the police and the security services to protect the public and save lives, they need this capability. You get that? There's no evidence that the bill would have prevented the Charlie Hebdo attack, but that incident is why you should pass the bill. Prime Minister David Cameron even says that messaging services that can't be intercepted should be banned. Using the latest outrage to inject new life into old security-state legislation isn't a British specialty. When the Patriot Act was introduced in 2001, then-Senator Joseph Biden boasted, "I drafted a terrorism bill after the Oklahoma City bombing. And the bill John Ashcroft sent up was my bill." This is a game in which politicians everywhere can participate. Never mind that, as Reason's Ron Bailey pointed out in November, "there is very little evidence that the Internet is making terrorism easier to do." But pretending otherwise, and passing legislation that empowers security services, lets government officials accumulate power and give the appearance of doing something when the public is frightened. Added Bailey: As [David Benson, a political scientist at the University of Chicago] argues, exaggerating the Internet's usefulness to terrorism has "egregious costs." Some officials, for example, have been calling for a "kill switch" that would allow the government to shut down the Internet in an emergency. Noting how much Americans depend upon the Net for commerce, communication, medical care, and so forth, Benson points out that "It is difficult to imagine a terrorist attack being as costly as turning off the Internet would be." Terrorism also gives officials an excuse to tighten censorship—especially in jurisdictions, including many democratic countries in Europe, where the whole free speech thing has relatively shallow roots. So get ready for the ride. Driven by a need to appear proactive, and a preexisting taste for accumulating power, government officials once again exploit a murderous incident to increase their authority over us. Which escalates the ongoing cold war between people who want to be left alone, and the governments that seek to control them.

Impact: Turns the Aff -> Racism

Terror attacks incite racism domestically, regardless of who attacks

Akrahm and Johnson 2002 (Susan M [Associate Clinical Prof @ Boston U School of Law] and Kevin R [Associate Dean for Academic Affairs@ UC Davis, Prof of Law and Chicana/o Studies]; RACE, CIVIL RIGHTS, AND IMMIGRATION LAW AFTER SEPTEMBER 11, 2001: THE TARGETING OF ARABS AND MUSLIMS; Nov 2; www.privacysos.org/sites/all/files/akram.pdf; kdf)

Times of crisis are often accompanied by hostility toward minorities in the United States. For Arabs and Muslims, this may be even more problematic, as perpetrators of hate crimes against Arabs and Muslims frequently fail to differentiate among persons based on religion or ethnic origin, from Pakistanis, Indians, Iranians, and Japanese to Muslims, Sikhs and Christian Arabs.⁸⁹ The widespread perception in the United States is that Arabs and Muslims are identical and eager to wage a holy war against the United States.⁹⁰ In fact, according to a 1993 report, only 12% of the Muslims in the United States at that time were Arab,⁹¹ and Arab Muslims are even a minority in the Arab-American community.⁹² Although there are Muslim “extremists,” the majority of Muslims are “decent, law-abiding, productive citizens.”⁹³ Because of the lack of differentiation between different types of Arabs and Muslims, terrorist acts by small groups of Arabs and Muslims often have been followed by generalized hostility toward entire communities of Arabs and Muslims in the United States. For example, after Lebanese Shi’a gunmen in 1985 hijacked TWA Flight 847 to Beirut, beat an American on the plane to death, and held the remaining passengers hostage for over two weeks,⁹⁴ violent attacks against persons of Arab and Muslim origin occurred across the United States.⁹⁵ Islamic centers and Arab-American organizations were vandalized and threatened. A Houston mosque was firebombed. A bomb exploded in the American-Arab Anti-Discrimination Committee office in Boston, severely injuring two policemen.⁹⁶ Later that same year, after terrorists hijacked the Achille Lauro cruise liner and murdered a passenger, a wave of anti-Arab violence swept the country, including the bombing of an American Arab Anti-Discrimination Committee office that killed its regional executive director.⁹⁷ In 1986, in apparent response to the Reagan Administration’s “war on terrorism” directed at Libya,⁹⁸ another episode of anti-Arab harassment and violence broke out. The same night of a U.S. bombing raid on Libya, the American-Arab Anti-Discrimination Committee national office in Washington received threats. Shortly thereafter, the Detroit American-Arab Anti-Discrimination Committee office, the Dearborn Arab community center, and the Detroit Arab-American newspaper received bomb threats.⁹⁹ Threats, beatings and other violent attacks on Arabs were reported across the United States.¹⁰⁰ At this time, someone broke into a Palestinian family’s home, set off a smoke bomb inside the house, and painted slogans such as “Go Back to Libya” on the walls.¹⁰¹ The Gulf War intensified anti-Arab hostility in the United States. The American-Arab Anti-Discrimination Committee reported four anti-Arab hate crimes for 1990 before the invasion of Kuwait in August.¹⁰² Between the invasion and February 1991, the Committee reported 175 incidents.¹⁰³ When U.S. intervention commenced in January 1991, Arab and Muslim businesses and community organizations were bombed, vandalized, and subjected to harassment.¹⁰⁴

Impact: Terror Bad

Even a small attack pulled off by 1 person could kill billions

Myhrvold 2014 (Nathan P [chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft]; Strategic Terrorism: A Call to Action; cco.dodlive.mil/files/2014/04/Strategic_Terrorism_corrected_II.pdf; kdf)

Technology contains no inherent moral directive—it empowers people, whatever their intent, good or evil. This has always been true: when bronze implements supplanted those made of stone, the ancient world got scythes and awls, but also swords and battle-axes. The novelty of our present situation is that modern technology can provide small groups of people with much greater lethality than ever before. We now have to worry that private parties might gain access to weapons that are as destructive as—or possibly even more destructive than— those held by any nation-state. A handful of people, perhaps even a single individual, could have the ability to kill millions or even billions. Indeed, it is possible, from a technological standpoint, to kill every man, woman, and child on earth. The gravity of the situation is so extreme that getting the concept across without seeming silly or alarmist is challenging. Just thinking about the subject with any degree of seriousness numbs the mind. The goal of this essay is to present the case for making the needed changes before such a catastrophe occurs. The issues described here are too important to ignore.

Impact: Escalation

9/11 proves, attacks invite counter-attacks

Myhrvold 2014 (Nathan P [chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft]; Strategic Terrorism: A Call to Action; cco.dodlive.mil/files/2014/04/Strategic_Terrorism_corrected_II.pdf; kdf)

Failing nation-states—like North Korea—which possess nuclear weapons potentially pose a nuclear threat. Each new entrant to the nuclear club increases the possibility this will happen, but this problem is an old one, and one that existing diplomatic and military structures aim to manage. The newer and less understood danger arises from the increasing likelihood that stateless groups, bent on terrorism, will gain access to nuclear weapons, most likely by theft from a nation-state. Should this happen, the danger we now perceive to be coming from rogue states will pale in comparison. The ultimate response to a nuclear attack is a nuclear counterattack. Nation states have an address, and they know that we will retaliate in kind. Stateless groups are much more difficult to find which makes a nuclear counterattack virtually impossible. As a result, they can strike without fear of overwhelming retaliation, and thus they wield much more effective destructive power. Indeed, in many cases the fundamental equation of retaliation has become reversed. Terrorists often hope to provoke reprisal attacks on their own people, swaying popular opinion in their favor. The aftermath of 9/11 is a case in point. While it seems likely that Osama bin Laden and his henchmen hoped for a massive overreaction from the United States, it is unlikely his Taliban hosts anticipated the U.S. would go so far as to invade Afghanistan. Yes, al-Qaeda lost its host state and some personnel. The damage slowed the organization down but did not destroy it. Instead, the stateless al-Qaeda survived and adapted. The United States can claim some success against al-Qaeda in the years since 9/11, but it has hardly delivered a deathblow. Eventually, the world will recognize that stateless groups are more powerful than nation-states because terrorists can wield weapons and mount assaults that no nationstate would dare to attempt. So far, they have limited themselves to dramatic tactical terrorism: events such as 9/11, the butchering of Russian schoolchildren, decapitations broadcast over the internet, and bombings in major cities. Strategic objectives cannot be far behind.

Threats real - Lone Wolf

Lone wolf threats are mounting

Wall Street Journal 2015 (The Anti-Surveillance Rush; 20 May 2015: A.12; ProQuest; kdf)

Among the GOP presidential field, Marco Rubio has come out in favor of metadata, while Chris Christie gave a thoughtful speech Monday on intelligence and foreign affairs in Portsmouth, New Hampshire. The New Jersey Governor speaks with some authority as a former antiterror prosecutor who worked in the greater New York region that is a principal target of global jihad. "If we want to manage events -- and not have events manage us -- then we need superior knowledge of the world around us," Mr. Christie said. "Instead, Washington is debating the wrong question entirely -- which intelligence capabilities should we get rid of?" He is flattering the legislative rush by calling it a debate. Mr. Christie was especially sharp on the distinction between the practical realities of protecting the country and "the intellectual purists worried about theoretical abuses that haven't occurred -- instead of the real threats that we've already seen from Garland, Texas, to Fort Dix, New Jersey." The growing world disorder may mean metadata is more critical than ever. A rush to the exits is no way to conduct U.S. intelligence, or the affairs of Congress. If a majority of Senators really do want to disarm in the terror war, then they should defend their positions, listen to the other side, and be accountable for the results. Cramping such a major policy into law before a holiday weekend is a failure to treat national security with the seriousness it deserves.

AT: Mueller

Mueller is a hack

Graham **Allison 9**, Douglas Dillon Professor of Government and Director of the Belfer Center for Science and International Affairs at Harvard University's Kennedy School of Government, "A Response to Nuclear Terrorism Skeptics" Brown Journal of World Affairs, Hein Online

What drives Mueller and other skeptics to arrive at such different conclusions? They make four major claims that merit serious examination and reflection. CLAIM 1: No ONE IS SERIOUSLY MOTIVATED TO CONDUCT A NUCLEAR TERRORIST ATTACK. More than a decade ago, no one could have imagined that a Japanese doomsday cult would be sufficiently motivated to disseminate sarin gas on the Tokyo subway. Indeed, at the time of that attack, the consensus among terrorism experts was that terrorists wanted an audience and sympathy-not casualties. The leading American student of terrorism, Brian Jenkins, summarized the consensus judgment in 1975: "terrorists seem to be more interested in having a lot of people watching, not a lot of people dead." As intelligence officials later testified, an inability to recognize the shifting modus operandi of some terrorist groups was part of the reason why members of Aum Shinrikyo "were simply not on anybody's radar screen" This, despite the fact that the group owned a 12-acre chemical weapons factory in Tokyo, had \$1 billion in its bank account, and had a history of serious nuclear ambitions.⁹ Similarly, before the 9/11 attacks on the World Trade Center and Pentagon that extinguished 3,000 lives, few imagined that terrorists could mount an attack upon the American homeland that would kill more Americans than the Japanese attack at Pearl Harbor. As Secretary Rice testified to the 9/11 Commission, "No one could have imagined them taking a plane, slamming it into the Pentagon and into the World Trade Center, using planes as a missile." ²⁰ For most Americans, the idea of international terrorists mounting an attack on our homeland and killing thousands of citizens was not just unlikely, but inconceivable. But assertions about what is "imaginable" or "conceivable" are propositions about individuals' mental capacities, not about what is objectively possible. In fact, Al Qaeda's actions in the decade prior to the 9/11 attacks provided clear evidence both of intent and capability. While its 1993 attack on the World Trade Center succeeded in killing only six people, Ramzi Yousef, the key operative in this case, had planned to collapse one tower onto the second, killing 40,000. In the summer of 1996, Osama bin Laden issued a fatwa declaring war upon the United States. Two years later, Al Qaeda attacked the U.S. embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, killing more than 200 people. In October 2000, Al Qaeda attacked the warship USS Cole. Throughout this period, Al Qaeda's leadership was running thousands of people through training camps, preparing them for mega-terrorist attacks. Notwithstanding Aum Shinrikyo's brazen attack, Al Qaeda's audacious 9/11 attack, and the recent attacks in Mumbai that killed 179 people, Mueller maintains that "terrorists groups seem to have exhibited only limited desire... they have discovered that the tremendous effort required is scarcely likely to be successful." He asserts that the evidence about Al Qaeda's nuclear intentions ranges from the "ludicrous to the merely dubious," and that those who take Al Qaeda's nuclear aspiration seriously border on "full-on fantasyland."¹ Even scholars who would have been inclined to agree with this point of view have revised their judgment as new facts have accumulated. In 2006, for example, Jenkins reversed the basic proposition that he had set forth three decades earlier. In his summary: "In the 1970s the bloodiest incidents caused fatalities in the tens. In the 1980s, fatalities from the worst incidents were in the hundreds; by the 1990s, attacks on this scale had become more frequent. On 9/11 there were thousands of fatalities, and there could have been far more. We now contemplate plausible scenarios in which tens of 35 thousands might die." Underlining the contrast with his own 1975 assessment, Jenkins now says: Jihadists seem ready to murder millions, if necessary. Many of today's terrorists want a lot of people watching and a lot of people dead.²² (Emphasis added.) Al Qaeda has been deadly clear about its ambitions. In 1998, Osama bin Laden declared that he considered obtaining weapons of mass destruction "a religious duty." In December 2001, he urged his supporters to trump the 9/11 attacks: "America is in retreat by the grace of God Almighty...but it needs further blows." A few months later, Al Qaeda announced its goal to "kill four million Americans."⁵ It even managed to gain religious sanction from a radical Saudi cleric in 2003 to kill "ten million Americans" with a nuclear or biological weapon.²⁶ We also now know that Al Qaeda has been seriously seeking a nuclear bomb. According to the Report of the 9/11 Commission, "Al Qaeda has tried to acquire or make nuclear weapons for at least ten years... and continues to pursue its strategic goal of obtaining a nuclear capability." It further reveals bin Laden had reportedly been heard to speak of wanting a 'Hiroshima.' The Commission provides evidence of Al Qaeda's effort to recruit nuclear expertise-including evidence about the meeting between two Pakistani nuclear weapon scientists, bin Laden, and his deputy Ayman al-Zawahiri in Afghanistan to discuss nuclear weapons.² These scientists were founding members of Ummah Tamer-e-Nau (UTN), a so-called charitable agency to support projects in Afghanistan. The foundation's board included a fellow nuclear scientist knowledgeable about weapons construction, two Pakistani Air Force generals, one Army general, and an industrialist who owned Pakistan's largest foundry.²⁸ In his memoir, former CIA Director George Tenet offers his own conclusion that "the most senior leaders of Al Qaeda are still singularly focused on acquiring WMD" and that "the main threat is the nuclear one." In Tenet's view, Al Qaeda's strategic goal is to obtain a nuclear capability. He concludes as follows: "I am convinced that this is where Osama bin Laden and his operatives desperately want to go."²⁹ **CLAIM 2: IT IS IMPOSSIBLE FOR TERRORISTS TO ACQUIRE FISSILE MATERIAL.** Assuming that terrorists have the intent-could they acquire the necessary materials for a Hiroshima-model bomb? Tenet reports that after 9/11, President Bush showed President Putin his briefing on UTN. In Tenet's account of the meeting, Bush "asked Putin point blank if Russia could account for all of its material." Putin responded that he could guarantee it was secure during his watch, underlying his inability to provide assurance about events under his predecessor, Boris Yeltsin.³⁰ When testifying to the Senate Intelligence Committee in February 2005, Committee Vice-Chairman John Rockefeller (D-WV) asked CIA Director Porter Goss whether the amount of nuclear material known to be missing from Russian nuclear facilities was sufficient to construct a nuclear weapon. Goss replied, "There is sufficient material unaccounted for that it would be possible for those with know-how to construct a weapon." I can't account for some of the material so I can't make the assurance about its whereabouts."³¹ Mueller sidesteps these inconvenient facts to assert a contrary claim. According to his telling, over the last 10 years, there have been only 10 known thefts of highly enriched uranium (HEU), totaling less

than 16 pounds, far less than required for an atomic explosion. He acknowledges, however, that "There may have been additional thefts that went undiscovered."³² ¶ Yet, as Matthew Bunn testified to the Senate in April 2008, "Theft of HEU and plutonium is not a hypothetical worry, it is an ongoing reality." He notes that "nearly all of the stolen HEU and plutonium that has been seized over the years had never been missed before it was seized." The IAEA Illicit Nuclear Trafficking Database notes 1,266 incidents reported by 99 countries over the last 12 years, including 18 incidents involving HEU or plutonium trafficking. 130 research reactors around the world in 40 developing and transitional countries still hold the essential ingredient for nuclear weapons. As Bunn explains, "The world stockpiles of HEU and separated plutonium are enough to make roughly 200,000 nuclear weapons; a tiny fraction of one percent of these stockpiles going missing could cause a global catastrophe." ¶ Consider the story of Russian citizen Oleg Khinsagov. Arrested in February 2006 in Georgia, he was carrying 100 grams of 89-percent enriched HEU as a sample and attempting to find a buyer for what he claimed were many additional kilograms. Mueller asserts that "although there is a legitimate concern that some material, particularly in Russia, may be somewhat inadequately secured, it is under lock and key, and even sleepy, drunken guards, will react with hostility (and noise) to a raiding party."³¹ ¶

CLAIM 3: IT IS EXTREMELY DIFFICULT TO CONSTRUCT A NUCLEAR DEVICE THAT

WORKS. ¶ Rolf Mowatt-Larssen, former director of the Department of Energy's Office of Intelligence and Counterintelligence, testified that, "The 21st century will be defined first by the desire and then by the ability of non-state actors to procure or develop crude nuclear weapons."⁶ In contrast, Mueller contends that, "Making a bomb is an extraordinarily difficult task... the odds, indeed, are stacked against the terrorists, perhaps massively so."³⁷ ¶ Mueller argues that his conclusion follows from an analysis of 20 steps an atomic terrorist would have to accomplish in what he judges to be the most likely nuclear terrorism scenario. On the basis of this list, he claims that there is "worse than one in a 37 million" chance of success.³⁸ ¶ His approach

however, misunderstands probabilistic risk assessment. For example, some of the steps on the list would have to be completed before an attempt to acquire material could begin (therefore, the success rate for any of those steps during the path would, by definition, be 100 percent). Other steps are unnecessary, such as having a technically sophisticated team pre-deployed in the target country. Although he assumes that stolen materials will be missed, in none of the 18 documented cases mentioned earlier had the seized material been reported missing.³⁹ ¶ At U.S. weapons labs and among the U.S. intelligence community, experts who

have examined this issue largely agree. John Foster, a leading American bomb maker and former director of the Lawrence Livermore National Laboratories, wrote a quarter century ago, "If the essential nuclear materials are at hand, it is possible to make an atomic bomb using information that is available in the open literature."⁴ Similarly, Theodore Taylor, the nuclear physicist who designed America's smallest and largest atomic bombs, has repeatedly stated that, given fissile material, building a bomb is "very easy." Double underline. Very Easy.⁴⁰ ¶

Inquiring into such claims, then-Senator Joe Biden (D-DE) asked the major nuclear weapons laboratories whether they could make such a device if they had nuclear materials. All three laboratories answered affirmatively. The laboratories built a gun-type device using only components that were commercially available and without breaking a single U.S. law. ¶ The Commission on the Intelligence Capabilities of the United States Regarding Weapons of Mass Destruction, known as the Silberman-Robb Commission, reported in 2005 that the intelligence community believed Al Qaeda "probably had access to nuclear expertise and facilities and that there was a real possibility of the group developing a crude nuclear device." It went on to say that "fabrication of at least a 'crude' nuclear device was

within Al Qaeda's capabilities, if it could obtain fissile material."⁴³ ¶ Skeptics argue that terrorists cannot replicate the effort of a multi-billion dollar nuclear program of a state. This claim does not distinguish between the difficulty of producing nuclear materials for a bomb (the most difficult threshold) and the difficulty of making a bomb once the material has been acquired. The latter is much easier. In the Iraq case, for example, the CIA noted that if Saddam Hussein had stolen or purchased nuclear materials from abroad, this would have cut the time Iraq needed to make a bomb from years to months.¹ Moreover, terrorists do not require a state-of-the-art

weapon and delivery system, since for blowing up a single city a crude nuclear device would suffice. ¶ The grim reality of globalization's dark underbelly is that non-state actors are 38 increasingly capable of enacting the kind of lethal destruction heretofore the sole reserve of states. ¶ CLAIM 4: IT IS TOO DIFFICULT TO

DELIVER A NUCLEAR DEVICE TO THE UNITED STATES. ¶ In the spring of 1946, J. Robert Oppenheimer was asked whether units of the atom bomb could be smuggled into New York and then detonated. He answered, "Of course it could be done, and people could destroy New York." As for how such a weapon smuggled in a crate or a suitcase might be detected, Oppenheimer opined, "with a screwdriver." He went on to explain that because the HEU in a nuclear weapon emits so few radioactive signals, a bomb disguised with readily available shielding would not be detected when inspectors opened the crates and examined the cargo.⁴¹ ¶ The nuclear weapon that terrorists would use in the first attack on the United States is far more likely to arrive in a cargo container than on the tip of a missile. In his appearance before a Senate subcommittee in March 2001, six months before 9/11, National Intelligence Officer Robert Walpole testified that "non-missile delivery means are less costly, easier to acquire, and more reliable and accurate."⁶ ¶ Citing the 1999-2003 U.S. Congressional Advisory Panel to Assess Domestic Response

Capabilities for Terrorism Involving Weapons of Mass Destruction (the Gilmore Commission), Mueller states that transporting an improvised nuclear device would require overcoming "Herculean challenges." ¶ He does not explain, however, why bringing a crude nuclear weapon into an American city would be materially different than the challenge faced by drug smugglers or human traffickers. According to the Government Accountability Organization, an average of 275 metric tons of cocaine have arrived in Mexico each year for transshipment to the United States since 2000. Reported seizures averaged about 36 tons a year, a 13 percent success rate for the intelligence and law enforcement community. Three million illegal immigrants enter the country each year, and only one in three gets caught.⁴² ¶

Impact – Right Wing Nuts

Uniqueness – Threats Real

Right-wing fanatics are the biggest threat to the US

Kruzman and Schanzer June 16, 2015 (Charles and David; The Growing Right-Wing Terror Threat; www.nytimes.com/2015/06/16/opinion/the-other-terror-threat.html?_r=0)

THIS month, the headlines were about a Muslim man in Boston who was accused of threatening police officers with a knife. Last month, two Muslims attacked an anti-Islamic conference in Garland, Tex. The month before, a Muslim man was charged with plotting to drive a truck bomb onto a military installation in Kansas. If you keep up with the news, you know that a small but steady stream of American Muslims, radicalized by overseas extremists, are engaging in violence here in the United States. But headlines can mislead. **The main terrorist threat in the United States is not from violent Muslim extremists, but from right-wing extremists.** Just ask the police. In a survey we conducted with the Police Executive Research Forum last year of 382 law enforcement agencies, 74 percent reported anti-government extremism as one of the top three terrorist threats in their jurisdiction; 39 percent listed extremism connected with Al Qaeda or like-minded terrorist organizations. And only 3 percent identified the threat from Muslim extremists as severe, compared with 7 percent for anti-government and other forms of extremism. The self-proclaimed Islamic State's efforts to radicalize American Muslims, which began just after the survey ended, may have increased threat perceptions somewhat, but not by much, as we found in follow-up interviews over the past year with counterterrorism specialists at 19 law enforcement agencies. These officers, selected from urban and rural areas around the country, said that radicalization from the Middle East was a concern, but not as dangerous as radicalization among right-wing extremists. An officer from a large metropolitan area said that "militias, neo-Nazis and sovereign citizens" are the biggest threat we face in regard to extremism. One officer explained that he ranked the right-wing threat higher because "it is an emerging threat that we don't have as good of a grip on, even with our intelligence unit, as we do with the Al Shabab/Al Qaeda issue, which we have been dealing with for some time." An officer on the West Coast explained that the "sovereign citizen" anti-government threat has "really taken off," whereas terrorism by American Muslim is something "we just haven't experienced yet." Last year, for example, a man who identified with the sovereign citizen movement — which claims not to recognize the authority of federal or local government — attacked a courthouse in Forsyth County, Ga., firing an assault rifle at police officers and trying to cover his approach with tear gas and smoke grenades. The suspect was killed by the police, who returned fire. In Nevada, anti-government militants reportedly walked up to and shot two police officers at a restaurant, then placed a "Don't tread on me" flag on their bodies. An anti-government extremist in Pennsylvania was arrested on suspicion of shooting two state troopers, killing one of them, before leading authorities on a 48-day manhunt. A right-wing militant in Texas declared a "revolution" and was arrested on suspicion of attempting to rob an armored car in order to buy weapons and explosives and attack law enforcement. These individuals on the fringes of right-wing politics increasingly worry law enforcement officials. Law enforcement agencies around the country are training their officers to recognize signs of anti-government extremism and to exercise caution during routine traffic stops, criminal investigations and other interactions with potential extremists. **"The threat is real,"** says the handout from one training program sponsored by the Department of Justice. Since 2000, the handout notes, 25 law enforcement officers have been killed by right-wing extremists, who share a "fear that government will confiscate firearms" and a "belief in the approaching collapse of government and the economy." Despite public anxiety about extremists inspired by Al Qaeda and the Islamic State, the number of violent plots by such individuals has remained very low. Since 9/11, an average of nine American Muslims per year have been involved in an average of six terrorism-related plots against targets in the United States. Most were disrupted, but the 20 plots that were carried out accounted for 50 fatalities over the past 13 and a half years. In contrast, right-wing extremists averaged 337 attacks per year in the decade after 9/11, causing a total of 254 fatalities, according to a study by Arie Perliger, a professor at the United States Military Academy's Combating Terrorism Center. The toll has increased since the study was released in 2012. Other data sets, using different definitions of political violence, tell comparable stories. The Global Terrorism Database maintained by the Start Center at the University of Maryland includes 65 attacks in the United States associated with right-wing ideologies and 24 by Muslim extremists since 9/11. The International Security Program at the New America Foundation identifies 39 fatalities from "non-jihadist" homegrown extremists and 26 fatalities from "jihadist" extremists. Meanwhile, terrorism of all forms has accounted for a tiny proportion of violence in America. There have been more than 215,000

murders in the United States since 9/11. For every person killed by Muslim extremists, there have been 4,300 homicides from other threats. Public debates on terrorism focus intensely on Muslims. But this focus does not square with the low number of plots in the United States by Muslims, and it does a disservice to a minority group that suffers from increasingly hostile public opinion. As state and local police agencies remind us, right-wing, anti-government extremism is the leading source of ideological violence in America.

Link – Surveillance

All surveillance measures are useful to prevent fanatics from pulling off attacks & Ohio is evil

Sewell 2015 (Dan; New FBI official: Terror threat in Ohio is surprising; May 30; www.bucyrustelegraphforum.com/story/news/state/2015/05/30/new-fbi-official-terror-threat-ohio-surprising/28217115/; kdf)

CINCINNATI – The new head of the FBI's wide-ranging Cincinnati division says the threat of homegrown terrorists in her native state is surprising and scary. Angela Byers became special agent in charge of the office that covers 48 of Ohio's 88 counties in late February, just after back-to-back arrests of young men in Cincinnati and Columbus in separate cases alleging they were plotting attacks in the United States. Both have pleaded not guilty to all charges. Byers told The Associated Press in an interview she was surprised at the threat level in Ohio, and she suspects many people in the Midwest don't realize that "violent extremists" can pop up anywhere. "It's scary. And it's scary to us. I'm not sure the general public quite gets the gravity of it," she said. She said counterterrorism efforts are ongoing in her office, although she couldn't comment on any possible other cases. "It seems like once we get one guy, another guy pops up high on the radar," she said. "We just keep moving from one to the next." The cases that broke this year in her division were the arrests of Christopher Lee Cornell, of suburban Cincinnati, on charges he planned to attack the U.S. Capitol, and Abdirahman Sheik Mohamud, 23, of Columbus, accused of planning to attack a military base or prison after returning from terrorist training in Syria. Mark Ensalaco, the director of human rights research at the University of Dayton, who has written about Middle East terrorism and the Sept. 11 attacks, said trying to detect homegrown "lone wolves" before they act is "a nightmare for national security." But he said use of confidential informants and federal electronic surveillance can raise concerns about protecting citizens' rights.

Impact – Racism

Right-wing terrorism accesses the internal-link more than the aff

Iyer 6/19/2015 (Deepa; Charleston Shooting is domestic terrorism;

america.aljazeera.com/opinions/2015/6/charleston-shooting-is-domestic-terrorism.html; kdf)

A gun rampage. A hate crime. An act of domestic terrorism. The shooting deaths of nine people in the historic Emanuel African Methodist Episcopal Church in downtown Charleston, South Carolina, on Wednesday night must be characterized as all three. While we await further information about the suspect, Dylann Roof, and as we mourn with the families of the victims, it is important that we categorize this tragedy accurately. Roof, apprehended by police on Thursday, is a 21-year-old white man. Before he opened fire on a group of adults and children who had gathered for Bible study, Roof apparently told the congregation, "You rape our women and you're taking over our country. And you have got to go." According to his roommate Dalton Tyler, he had planned something like this attack for six months. "He was big into segregation and other stuff," Tyler told ABC News. "He said he wanted to start a civil war. He said he was going to do something like that and then kill himself." **The Charleston shooting is a violent act of racial hatred, intended to terrorize and intimidate black people.** It exists on the alarming spectrum of other acts of hate in places of worship, including the bombing of the 16th Street Baptist Church in Birmingham, Alabama, in 1963; the spate of arsons against African-American churches in the late 1990s in the South; the anti-Semitic graffiti regularly sprawled on the walls of synagogues and murders at Jewish community centers; the burning of Korans and throwing of Molotov cocktails at mosques; the vandalism of Hindu temples; and the 2012 shooting of six Sikh worshippers at a gurdwara in Oak Creek, Wisconsin, by a white supremacist. Indeed, acts of violence are perpetrated regularly in this country, on the streets and in places of worship, and on the basis of racial bias, sexual orientation, religious bias, ethnicity, disability, gender bias and gender identity. Annual reports from the Federal Bureau of Investigation (FBI) and the Bureau of Justice Statistics (BJS) sketch a national landscape filled with hate crimes against people, including assaults and homicides, and property, including vandalism to places of worship or cross-burnings. The BJS reports that the percentage of hate crimes involving violence increased from 78 percent in 2004 to 90 percent in 2011 and 2012. Meanwhile, the Southern Poverty Law Center has been tracking the organized activities of anti-immigrant, anti-gay, anti-Muslim and anti-government "patriot" groups, many of which are forming in response to changing American racial demographics, immigration patterns and the election of a black president. They are motivated by the belief that the balance of power will shift away from white Americans — a sentiment apparently voiced by Roof when he said "you are taking over," before opening fire at the church. These domestic right-wing hate groups should not be taken lightly. Their ideologies of white supremacy and white nationalism are seeping into mainstream political activity and rhetoric, and influencing "lone wolves" who are committing the majority of hate violence in the country.

AT: Terror K

No link – the disad focus on actual threats: right wing fanatics

Iyer 6/19/2015 (Deepa; Charleston Shooting is domestic terrorism;

america.aljazeera.com/opinions/2015/6/charleston-shooting-is-domestic-terrorism.html; kdf)

We can start by calling the Mother Emanuel Church shooting a hate crime, as Charleston police chief Greg Mullen has already done. But we should also call it domestic terrorism. Doing so will help us understand the gravity of such acts and ensure that we characterize acts of hate in similar ways, regardless of the race or faith of the perpetrator. Typically, the media and lawmakers label an act of mass violence motivated by hatred or bigotry as terrorism when the perpetrator is Muslim or is of Arab, Middle Eastern, North African or South Asian descent in order to trigger a sense of national insecurity related to the 9/11 attacks. On the other hand, white perpetrators of similar crimes are given the benefit of the doubt, treated as innocent until proven guilty or characterized as mentally unfit. These disparate narratives in turn influence policy and legal decisions as well as public opinion towards people from marginalized backgrounds. Categorizing mass violence motivated by bigotry as domestic terrorism will also compel the federal government to study, monitor, track, prosecute and ultimately prevent the hateful actions of radical right groups motivated by notions of white supremacy. Currently, the government's programs to combat violent extremism almost exclusively focus on the threat of Muslim radicalization. Notwithstanding the negative perceptions of Muslims fueled by these programs, it is vital that the federal government allocate resources towards countering violent extremism by hate groups that target communities of color and faith. But a label is only a start. In order to address the roots of hate violence perpetrated by individuals, we must come to terms with the structural inequities in America. The cycles of economic, education, incarceration and housing policies that abandon, criminalize and disenfranchise black and brown people foster an environment in which hateful individuals feel empowered to violently target already marginalized communities. We must disrupt these cycles through policy and culture shifts that include dismantling the narratives, propelled by xenophobia, Islamophobia and racism, that are constructed about black and brown communities — as people who are undeserving of benefits and rights.

Impact – Al Qaeda

Uniqueness - Al Qaeda

Al Qaeda is expanding and plotting attacks against the West

Hubbard 6/9/2015 (Ben; Al Qaeda Tries a New Tactic to Keep Power: Sharing It;

www.nytimes.com/2015/06/10/world/middleeast/qaeda-yemen-syria-houthis.html; kdf)

BEIRUT, Lebanon — After they routed the army in southern Yemen, fighters from Al Qaeda stormed into the city of Al Mukalla, seizing government buildings, releasing jihadists from prison and stealing millions of dollars from the central bank. Then they surprised everyone. Instead of raising their flags and imposing Islamic law, they passed control to a civilian council and gave it a budget to pay salaries, import fuel and hire teams to clean up garbage. The fighters receded into the background, maintaining only a single police station to arbitrate disputes. Al Qaeda's takeover of Yemen's fifth-largest city in April was the most direct indication yet that the group's most potent regional affiliates are evolving after years of American drone strikes killing their leaders and changing to meet the challenge posed by the Islamic State's competing and land-grabbing model of jihad. While the image of Al Qaeda has long been one of shadowy operatives plotting international attacks from remote hide-outs, its branches in Yemen and Syria are now increasingly making common cause with local groups on the battlefield. In doing so, they are distancing themselves from one of Osama bin Laden's central precepts: That fighters should focus on the "far enemy" in the West and not get bogged down in local insurgencies. In recent weeks, the Qaeda affiliate in Yemen has allied with armed tribes to fight Iranian-backed Houthi rebels, putting that alliance on the same side of the country's civil war as the United States and Saudi Arabia. In Syria, Qaeda-allied fighters are important members of a rebel coalition against President Bashar al-Assad that includes groups supported by the West. This strategy has clear benefits for a group that has long been near the top of the United States's list of enemies by allowing it to build local support while providing some cover against the threat of foreign military action. But despite Al Qaeda's increased involvement in local battles, American officials say the group remains committed to attacking the West, a goal that could be easier to plot from sanctuaries where it enjoys local support. Cooperating with others could also give Al Qaeda a long-term advantage in its competition with the extremists of the Islamic State, analysts said. Since its public break with Al Qaeda last year, the Islamic State, also known as ISIS or ISIL, has stolen the jihadist limelight by seizing cities in Syria and Iraq and declaring a caliphate in the territory it controls. This has won it the allegiances of other militant cells from Libya to Afghanistan. The Islamic State has insisted that other groups join it or be considered enemies, a tactic that has alienated many in areas it controls. And its public celebration of violence, including the beheading of Western hostages, helped spur the formation of a United States-led military coalition that is bombing the group. Al Qaeda's branches in Syria and Yemen have taken a different route, building ties with local groups and refraining from the strict application of Shariah, the legal code of Islam, when faced with local resistance, according to residents of areas where Al Qaeda holds sway. When Al Qaeda took over Al Mukalla in April, it seized government buildings and used trucks to cart off more than \$120 million from the central bank, according to the bank's director, Abdul-Qader Foulihan. That sum could not be independently verified. But it soon passed control to a civilian council, giving it a budget of more than \$4 million to provide services, an arrangement that made sense to local officials seeking to serve their people during wartime. "We are not Qaeda stooges," said Abdul-Hakeem bin Mahfood, the council's secretary general, in a telephone interview. "We formed the council to avoid the destruction of the city." While the council pays salaries and distributes fuel, Al Qaeda maintains a police station to settle disputes, residents said. It has so far made no effort to ban smoking or regulate how women dress. Nor has it called itself Al Qaeda, instead using the name the Sons of Hadhramaut to emphasize its ties to the surrounding province. One self-described Qaeda member said that the choice of name was deliberate, recalling that after the group seized territory in southern Yemen in 2011, the country's military had mobilized to push it out with support from the United States. "We were in control for a year and six months, we applied God's law, we created a small state and the whole world saw it, but they did not leave us alone," the man said in an interview with a Yemeni television station. "So we came here with the name the Sons of Hadhramaut, but the people here know who we are." American officials have long considered the terrorist group's Yemeni branch, known as Al Qaeda in the Arabian Peninsula, the most dangerous to the West. It has sought to carry out attacks against the United States, and it retains sophisticated bomb-making expertise. Now, Yemen's civil war has given the group an opportunity to expand, analysts said.

--AT: al-Wuhayshi killed

Al-Wuhayshi's death galvanized AQAP

Johnson 6/16/2015 (Bridget; AQAP Confirms Leader Killed, Vows to Make U.S. 'Taste the Bitterness of Defeat'; pjmedia.com/tatler/2015/06/16/aqap-confirms-leader-killed-vows-to-make-u-s-taste-the-bitterness-of-defeat/; kdf)

Al-Qaeda in the Arabian Peninsula confirmed in a statement released through its media arm, Al-Malahem, that leader Nasir al-Wuhayshi was killed in an American airstrike in Yemen. "We in al-Qaeda in the Arabian Peninsula mourn to our Muslim nation ... that Abu Baseer Nasser bin Abdul Karim al-Wuhayshi, God rest his soul, passed away in an American strike which targeted him along with two of his mujahideen brothers, may God rest their souls," Khaled Batarfi, a senior member of the group, read in the group's nearly 10-minute statement. "Let it be known to the enemies of God that their battle is not only with one person or figure, no matter how important," Batarfi stressed. "To the infidel America: God has kept alive those who will trouble your life and make you taste the bitterness of defeat." AQAP's commander of military operations, Qassim al-Raimi, has moved into the top spot.

Al Qaeda Gets Nukes

Al-Qaeda's regrouping across the world – they're searching for nukes

Etzioni 15 [Amitai Etzioni, Director of the Institute for Communitarian Policy Studies at George Washington University, former President of the American Sociological Association, former Professor at Harvard Business School, former Senior Adviser to the White House, “

NSA: National Security vs. Individual Rights,” *Intelligence and National Security*, Volume 30, Issue 1, Winter 2015, pages 100-136]

Those who hold that terrorism has much subsided can draw on President Obama's statements. The President announced in May 2013 that ‘the core of Al Qaeda in Afghanistan and Pakistan is on the path to defeat. Their remaining operatives spend more time thinking about their own safety than plotting against us’,²¹ and echoing this sentiment in August when he stated that ‘core Al Qaeda is on its heels, has been decimated’.²² Administration officials have been similarly optimistic regarding the diminished terror threat.²³ And he ‘pivoted’ US foreign policy away from a focus on the Middle East in favor of a focus on East Asia.²⁴ However, since then there has been a steady stream of reports that suggest that much remains to be done in facing terrorism, indeed that Al Qaeda is rebuilding its strength and that the pivot to the Far East may well have been premature. Core Al Qaeda is regrouping under the banner of ‘Al Qaeda in the Arabian Peninsula’ (**AQAP**). Ayman al-Zawahiri has taken over Osama bin Laden's vacated position. It has expanded from 200–300 members in 2009 to over 1000 today.²⁵ This group was behind the ‘most specific and credible threat’ since the attacks on 9/11, which led to the closure of dozens of American embassies across the Middle East.²⁶ And it managed to capture and control significant territory in Yemen.²⁷ **Al Qaeda affiliates are growing in strength and spreading into additional nations**.²⁸ Al Qaeda increasingly is relying on a decentralized network of collaborating terrorist affiliates.²⁹ Affiliates include groups in Africa (a network that spans Algeria, Mali, Niger, Mauritania, and Libya),³⁰ the Caucasus, Syria, and Somalia.³¹ Taken together, ‘Al Qaeda franchises and fellow travelers now control more territory and can call on more fighters, than at any time since Osama bin Laden created the organization 25 years ago’.³² Al Qaeda in Iraq has recently started a bombing campaign that killed over 1000 people. The group has transformed Iraq into a staging point for incursions into the Syrian civil war.³³ At the same time, Syria is turning into a haven and breeding ground for terrorists: ‘an even more powerful variant of what Afghanistan was more than 30 years ago’.³⁴ It is estimated that there are as many as 17,000 foreign fighters in the country, most from Saudi Arabia and Tunisia.³⁵ Western intelligence officials worry that Syria is ‘developing into one of the biggest terrorist threats in the world today.’³⁶ Al Qaeda and its subsidiaries have shown that they are agile and able to adapt as revealed in their use of ink cartridges as a bomb and ‘implanted’ explosives undetectable by airport scanners. Finally, terrorists have been trying to get nuclear weapons. Both Russia and Pakistan have less-than-fully-secured nuclear arms within their borders,³⁷ and Pakistan has experienced at least six serious terrorist attempts to penetrate its nuclear facilities.³⁸

Impact - ISIS

Uniqueness: ISIS in the US

ISIS has infiltrated the US -- only strong surveillance can prevent escalation

Perez and Prokupecz May 30 (Evan and Shimon; FBI struggling with surge in homegrown terror cases; www.cnn.com/2015/05/28/politics/fbi-isis-local-law-enforcement/; kdf)

The New York Police Department and other law enforcement agencies around the nation are increasing their surveillance of ISIS supporters in the U.S., in part to aid the FBI which is struggling to keep up with a surge in the number of possible terror suspects, according to law enforcement officials. The change is part of the fallout from the terrorist attack in Garland, Texas earlier this month. The FBI says two ISIS supporters attempted a gun attack on a Prophet Mohammad cartoon contest but were killed by police. One of the attackers, Elton Simpson, was already under investigation by the FBI but managed to elude surveillance to attempt the foiled attack. FBI Director James Comey told a group of police officials around the country in a secure conference call this month that the FBI needs help to keep tabs on hundreds of suspects. As a result, some police agencies are adding surveillance teams to help the FBI monitor suspects. Teams of NYPD officers trained in surveillance are now helping the FBI's surveillance teams to better keep track of suspects, law enforcement officials say. Why ISIS is winning, and how to stop it NYPD Commissioner William Bratton has said he wants to add 450 officers to the force's counterterrorism unit, partly to counter the increasing domestic threat posed by ISIS sympathizers. The same is happening with other police departments around the country. The Los Angeles Police Department's counterterrorism unit is also beefing up its surveillance squads at the request of the FBI, law enforcement officials say. Comey said at an unrelated news conference Wednesday that he has less confidence now that the FBI can keep up with the task. "It's an extraordinarily difficult challenge task to find -- that's the first challenge -- and then assess those who may be on a journey from talking to doing and to find and assess in an environment where increasingly, as the attorney general said, their communications are unavailable to us even with court orders," Comey said. "They're on encrypted platforms, so it is an incredibly difficult task that we are enlisting all of our state, local and federal partners in and we're working on it every single day, but I can't stand here with any high confidence when I confront the world that is increasingly dark to me and tell you that I've got it all covered," he said. "We are working very, very hard on it but it is an enormous task." On Saturday, an FBI spokesman said the bureau doesn't have a shortage of resources and the Garland attack wasn't the result of lack of surveillance personnel. If agents had any indication that Simpson was moving toward an attack, they would have done everything to stop it, the spokesman said. The appeal for local help isn't intended to seek more surveillance, but more broadly to encourage local law enforcement to increase vigilance given the heightened threat, the FBI said. The Garland attack prompted a reassessment for FBI officials. Simpson's social media and other communications with known ISIS recruiters drew the FBI's interest earlier this year. The Americans linked to ISIS FBI agents in Phoenix began regular surveillance of Simpson, though it was not round-the-clock monitoring, according to a U.S. official. The agents watching Simpson noticed he disappeared for a few days. Investigators looked into his communications and found social media postings making reference to the Garland cartoon contest. That discovery is what prompted the FBI to send a bulletin to the joint terrorism task force that was monitoring the Garland event. The bulletin arrived about three hours before the attack. Comey told reporters this month the FBI had no idea Simpson planned to attack the event or even that he had traveled from his home in Phoenix to Texas.

Uniqueness: ISIS coming

ISIS is growing in power – all tools are necessary to mitigate their strength

Rojas June 19, 2015 (Nicole; US State Department: Isis knocks off al-Qaeda as leading terrorist organisation; www.ibtimes.co.uk/us-state-department-isis-knocks-off-al-qaeda-leading-terrorist-organisation-1507091; kdf)

The Country Reports on Terrorism by the US State Department, released on 19 June, reveals Isis has beaten al-Qaeda as the world's leading terrorist organisation. The new report found that the Islamic State in the Middle East, as well as its partner Boko Haram in Africa, has led to the decline of al-Qaeda's power. It reported that al-Qaeda leadership "appeared to lose momentum as the self-styled leader of a global movement in the face of Isil's [Isis] rapid expansion." However, the report noted that al-Qaeda continued to have an impact on terrorism. "Though AQ central leadership was weakened, the organisation continued to serve as a focal point of 'inspiration' for a worldwide network of affiliated groups, including al-Qa'ida in the Arabian Peninsula—a long-standing threat to Yemen, the region, and the United States; al-Qa'ida in the Islamic Maghreb; a;-Nusrah Front; and al-Shabaab," the report said. The report also found that nearly 33,000 people were killed and another 34,700 were injured in about 13,500 terrorist attacks around the world last year. According to NBC News, that equates to a 35% increase in terrorist attacks and an 81% rise in fatalities since 2013. CNN reported that 24 Americans died last year in terrorist attacks, specifically in Afghanistan, Jerusalem and Somalia. The attacks, which were dominate in Iraq, Pakistan, Afghanistan, India, Nigeria and Syria, happened in 95 countries total. More aggressive and ruthless attacks Terrorist groups were conducting more aggressive attacks, which included "ruthless methods of violence such as beheadings and crucifixions intended to terrify opponents". Isis and Boko Haram also employed tactics such as "stoning, indiscriminate mass casualty attacks, and kidnapping children for enslavement".

Threats real – attacks on the homeland

ISIS is unique – intercepting communication early is key to prevent attacks in the US

Temple-Raston 2015 (Dina; For Next President, the fight against extremism will hit closer to home; May 27; wlrn.org/post/next-president-fight-against-extremism-will-hit-closer-home; kdf)

This week, the FBI arrested a 20-year-old Texas man named Asher Abid Khan on allegations that he intended to join the self-proclaimed Islamic State. He joins more than 60 young American men and women who have been lured to Syria by the group, also known as ISIS. What makes Khan's case a little different, though, is the way in which he was arrested by authorities. He had been in Australia and then traveled to Turkey and was about to cross into Syria when his parents sent him a frantic message. They claimed his mother was in the hospital and was desperate to see him. The ruse worked. He left Turkey, flew to Texas and was finally arrested Tuesday, nearly a year after his return. It is unclear whether his parents' participation in convincing him to come home will have some bearing on any eventual sentence — he has been charged with material support to a terrorist organization and faces up to 15 years in prison. Khan's case is important because it is an indication of the creativity law enforcement officials are starting to employ to stem the flow of American Muslims to ISIS; and it foreshadows the scope of the problem facing the next president from his or her first day in office. In the past two years, nearly 200 Americans have either tried to travel to Syria and were stopped, are actively considering going, or have actually made it to the ISIS battlefields there. Al-Qaida has never had that kind of attraction and appeal in the U.S. The threat of prison clearly isn't solving the problem. So law enforcement officials are starting to entertain alternatives, and that means the next president will likely have to do so as well. The one thing everyone seems to agree with in regard to ISIS is that it is fundamentally different from al-Qaida. Its leader, Abu Bakr al-Baghdadi, sees himself as a religious figure, a descendant of the prophet who has been chosen to create a homeland, or caliphate, for the world's Muslims. Osama bin Laden, the founder of al-Qaida, fancied himself a warrior, locking horns with the West. A caliphate, he said, could come later. Similarly, ISIS' goals — at least at this point — are different. While bin Laden and his successor Ayman al-Zawahiri are focused on attacking the U.S.; ISIS is endlessly creative in trying to get young men and women to leave home to create a state in Syria and Iraq. If you don't want to fight, its recruitment videos say, not to worry, you can be a plumber or an electrician or a traffic cop in the new caliphate. ISIS doesn't lure young men and women from around the world with the long audio diatribes bin Laden and al-Zawahiri have always favored, instead the group has been more creative. For example, it re-created its own version of the popular video game Grand Theft Auto. Download the game and you can shoot up Syrian troops, or local police, and get a dose of ISIS propaganda at the same time. "I don't think al-Qaida ever had that kind of talent," says Tony Sgro, the CEO of a San Francisco company called EdVenture Partners which, among other things, markets to exactly the kind of people who are attracted by ISIS' sales pitch. "I personally don't remember them being such a world-class employment, branding and recruiting agency. But ISIL is."

ISIS is a threat – surveillance is uniquely key in preventing an attack

Bidgood and Phillips 6/3 (Jess and Dave; Boston Terror Suspect's Shooting Highlights Concerns over reach of ISIS; www.nytimes.com/2015/06/04/us/usaama-rahim-boston-terrorism-suspect-planned-beheading-authorities-say.html?partner=rss&emc=rss; kdf)

BOSTON — Investigators had been watching Usaamah Abdullah Rahim long enough to know about his avid interest in Islamic State militants, but when they overheard him talking on a cellphone about beheading Massachusetts police officers, they moved in, leading to a confrontation Tuesday morning outside a pharmacy here that left Mr. Rahim dead and once again raised alarms about the influence of foreign extremists on homegrown radicals. The shooting occurred in the fairly quiet neighborhood of Roslindale on a routine weekday morning, when officials said an F.B.I. agent and a Boston police officer fired on Mr. Rahim after he threatened them with a knife. The shooting quickly and suddenly revealed what officials described as a lengthy terrorism investigation, with several law enforcement agencies looking into a suspected murder plot that involved at least two other people, including a relative of Mr. Rahim's who was charged Wednesday with conspiracy. The knife confiscated from Usaama Rahim. Officers Kill Suspect Who Wielded

Knife in Boston Here in a city that had just finished with the trial of Dzhokhar Tsarnaev, who was sentenced to death a few weeks ago for his role in the 2013 Boston Marathon bombings, the episode prompted another round of outrage and scrutiny. Coming just a month after two Muslim men with ties to the Islamic State were shot and killed while trying to attack an anti-Islamic gathering in Garland, Tex., the case has also renewed concerns in Washington about the long reach of the Islamic State and other radical groups that have seized on Internet recruitment. “These cases are a reminder of the dangers posed by individuals radicalized through social media,” said the chairman of the House Homeland Security Committee, Representative Michael McCaul, Republican of Texas, at a hearing on Wednesday. He added that Mr. Rahim had been under investigation because he was “communicating with and spreading ISIS propaganda online.”

Impact: ISIS

ISIS will get nuclear and chemical weapons

Cirincione 2014 (Joe [president of Ploughshares Fund, a global security foundation]; ISIS will be in position to get nuclear weapons if allowed to consolidate power, resources, says expert; www.nydailynews.com/news/world/isis-nukes-allowed-consolidate-expert-article-1.1958855; kdf)

The risk of a terrorist attack using nuclear or chemical weapons has just gone up. ISIS is willing to kill large numbers of innocents, and it has added three capabilities that catapult the threat beyond anything seen before: control of large, urban territories, huge amounts of cash, and a global network of recruits. British Home Secretary Theresa May warned that if ISIS consolidates its control over the land it occupies, “We will see the world’s first truly terrorist state” with “the space to plot attacks against us.” Its seizure of banks and oil fields gave it more than \$2 billion in assets. If ISIS could make the right connection to corrupt officials in Russia or Pakistan, the group might be able to buy enough highly enriched uranium (about 50 pounds) and the technical help to build a crude nuclear device. Militants recruited from Europe or America could help smuggle it into their home nations. Or ISIS could try to build a “dirty bomb,” conventional explosives like dynamite laced with highly radioactive materials. The blast would not kill many directly, but it would force the evacuation of tens of square blocks contaminated with radioactive particles. The terror and economic consequences of a bomb detonated in the financial districts of London or New York would be enormous. ISIS could also try to get chemical weapons, such as deadly nerve gases or mustard gas. Fortunately, the most likely source of these terror weapons was just eliminated. The Obama administration struck a deal with Syrian President Bashar Assad that has now destroyed the 1,300 tons of chemical bombs Assad built. Without this deal, ISIS would likely already have these weapons. There are two good answers to these threats. First, drain the swamp: Secure or eliminate the materials ISIS would need to build terror bombs. Second, deter any attack by making sure ISIS knows our retribution would be swift, certain and devastating.

Impact - Cyber-attacks

Uniqueness: Cyber-attack

A massive Iranian cyber-attack is coming

Kagan and Stiansen 2015 (Frederick [Director of AEI's Critical Threats Project and a former professor of military history at the U.S. Military Academy at West Point] and Tommy [Chief technology officer of Norse]; The Growing Cyberthreat from Iran; www.aei.org/publication/growing-cyberthreat-from-iran/)

Iran is emerging as a significant cyberthreat to the US and its allies. The size and sophistication of the nation's hacking capabilities have grown markedly over the last few years, and Iran has already penetrated well-defended networks in the US and Saudi Arabia and seized and destroyed sensitive data. The lifting of economic sanctions as a result of the recently announced framework for a nuclear deal with Iran will dramatically increase the resources Iran can put toward expanding its cyberattack infrastructure. We must anticipate that the Iranian cyberthreat may well begin to grow much more rapidly. Yet we must also avoid overreacting to this threat, which is not yet unmanageable. The first requirement of developing a sound response is understanding the nature of the problem, which is the aim of this report. Pistachio Harvest is a collaborative project between Norse Corporation and the Critical Threats Project at the American Enterprise Institute to describe Iran's footprint in cyberspace and identify important trends in Iranian cyberattacks. It draws on data from the Norse Intelligence Network, which consists of several million advanced sensors distributed around the globe. A sensor is basically a computer emulation designed to look like an actual website, email login portal, or some other kind of Internet-based system for a bank, university, power plant, electrical switching station, or other public or private computer systems that might interest a hacker. Sensors are designed to appear poorly secured, including known and zero-day vulnerabilities to lure hackers into trying to break into them. The odds of accidentally connecting to a Norse sensor are low. They do not belong to real companies or show up on search engines. Data from Norse systems combined with open-source information collected by the analysts of the Critical Threats Project have allowed us to see and outline for the first time the real nature and extent of the Iranian cyberthreat. A particular challenge is that the Islamic Republic has two sets of information technology infrastructure— the one it is building in Iran and the one it is renting and buying in the West. Both are attacking the computer systems of America and its allies, and both are influenced to different degrees by the regime and its security services. We cannot think of the Iranian cyberfootprint as confined to Iranian soil. That fact creates great dangers for the West, but also offers opportunities. Iranian companies, including some under international sanctions and some affiliated with the Islamic Revolutionary Guard Corps (IRGC) and global terrorist organizations like Hezbollah, are hosting websites, mail servers, and other IT systems in the United States, Canada, Germany, the United Kingdom, and elsewhere. Simply by registering and paying a fee, Iranian security services and ordinary citizens can gain access to advanced computer systems and software that the West has been trying to prevent them from getting at all. The bad news is that they are getting them anyway, and in one of the most efficient ways possible—by renting what they need from us without having to go to the trouble of building or stealing it themselves.

xt-Iran funds terror

Iran is massively invested in terror plots – surveillance is critical to monitor the spread

Lee and Klapper June 19, 2015 (Matthew and Bradley; US report finds Iran threat undiminished as nuke deadline nears; global terror killings soar; www.usnews.com/news/politics/articles/2015/06/19/us-35-percent-spike-in-global-terror-attacks-in-2014; kdf)

WASHINGTON (AP) — Iran's support for international terrorist groups remained undiminished last year and even expanded in some respects, the Obama administration said Friday, less than two weeks before the deadline for completing a nuclear deal that could provide Tehran with billions of dollars in relief from economic sanctions. The assessment offered a worrying sign of even worse terror-related violence to come after a year in which extremists in the Middle East, Africa and Asia committed 35 percent more terrorist acts, killed nearly twice as many people and almost tripled the number of kidnappings worldwide. Statistics released by the State Department on Friday also pointed to a tenfold surge in the most lethal kinds of attacks. Yet even as the Islamic State and the Taliban were blamed for most of the death and destruction in 2014, the department's annual terrorism report underscored the ongoing threat posed by Iran and its proxies across the Islamic world and beyond. Tehran increased its assistance to Shiite militias fighting in Iraq and continued its long-standing military, intelligence and financial aid to Lebanon's Hezbollah, Syrian President Bashar Assad's embattled government and Palestinian groups Hamas and Islamic Jihad. While the 388-page study said Iran has lived up to interim nuclear deals with world powers thus far, it gave no prediction about how an Iran flush with cash from a final agreement would behave. World powers and Iran are trying to conclude an accord by the end of the month, setting 15 years of restrictions on Iran's nuclear program in exchange for significant relief from the international sanctions that have crippled the Iranian economy. The negotiations don't involve Iran's support for militant groups beyond its border. But Israel and the Sunni monarchies of the Persian Gulf, Iran's regional rivals, fear a fresh wave of terrorism as a result of any pact. President Barack Obama, hoping to ease their fears, has said most of the money would go to Iran's economic development. America's "grave concern about Iran's support for terrorism remains unabated," White House spokesman Eric Shultz said. "That is all the more reason that we need to make sure they don't obtain a nuclear weapon." In total last year, nearly 33,000 people were killed in almost 13,500 terrorist attacks around the world, according to the figures that were compiled for the State Department by the National Consortium for the Study of Terrorism and Responses to Terrorism at the University of Maryland. That's up from just over 18,000 deaths in nearly 10,000 attacks in 2013. Twenty-four Americans were killed by extremists in 2014, the report said. And abductions soared to 9,428 in the calendar year from 3,137 in 2013. The report attributes the rise in attacks to increased terror activity in Iraq, Afghanistan and Nigeria and the sharp spike in deaths to a growth in exceptionally lethal attacks in those countries and elsewhere. There were 20 attacks that killed more than 100 people each in 2014, compared to just two a year earlier, the report said. Among those were December's attack by the Pakistani Taliban on a school in Peshawar that killed at least 150 people and the June attack by Islamic State militants on a prison in Mosul, Iraq, in which 670 Shiite prisoners died. At the end of 2014, the prison attack was the deadliest terrorist operation in the world since Sept. 11, 2001, according to the report. Despite all indications pointing toward increased violence, the State Department's counterterrorism coordinator said the numbers didn't reflect improvements by the U.S. and its partners in stamping out terrorism financing, improving information sharing, impeding foreign fighters and forming a coalition to fight the Islamic State. "We have made progress," Ambassador Tina Kaidanow said.

Impact: Cybercrime

Cybercrime poses the most probable existential threat

Paikowsky and Baram 2015 (Deganit [post-doctoral fellow at the Davis Institute for International Relations at Hebrew University in Jerusalem and a senior researcher at the Yuval Nee'man Workshop for Science, Technology, and Security at Tel-Aviv University, also a research associate at the Space Policy Institute at George Washington University and a consultant to the space committee of Israel's National Council for Research and Development] and Gil [Ph.D. candidate in the department of political science at Tel-Aviv University, and a researcher at the Yuval Nee'man workshop for Science, Technology, and Security at Tel-Aviv University]; Space Wars; Jan 7; www.foreignaffairs.com/articles/142690/deganit-paikowsky-and-gil-baram/space-wars?cid=rss-rss_xml-space_wars-000000; kdf)

In September 2014, hackers from China broke into the U.S. National Oceanic and Atmospheric Administration (NOAA) network in an attempt to disrupt data related to disaster planning, aviation, and much more coming from U.S. satellites. This breach was the latest in a series of cyberattacks on space systems, exposing the Achilles' heel of such technology: the vulnerability of its computers and the information it creates and transmits. Cyberattacks, which are on the rise in every industry, pose particularly significant threats to space systems as they are used so ubiquitously in corporate and military operations, making them increasingly attractive targets for hackers. Although only about a dozen countries have the capability to launch a satellite into space, billions of people around the world rely on space systems for nearly every aspect of modern life. Satellites are used to support phones, the Internet, and banking systems. They are also used to monitor land, air, and maritime traffic; facilitate global communications; monitor the earth for climate change or severe weather threats and natural disasters; gather intelligence; and send early warnings of incoming ballistic missiles. It is no wonder, then, that the global economy depends on communication satellites, navigation systems, and earth-observation satellites. The backbone of all these services consists of 1,200 operational satellites currently orbiting the earth, which have the potential to cause significant tangible damage by attacking national or global space systems across countries and continents. Even a small glitch can wreak havoc. For example, in April 2014, the Glonass System, the Russian equivalent of the American-designed GPS, malfunctioned due to two small mathematical mistakes in the software. Significantly, fixing the system took more than 13 hours, and the half-day breakdown led to severe disruption of Glonass receivers, which affected iPhone5 users. While the disruption was not caused by ambitious hackers, it is easy to see why space systems are the brass ring of cybercrimes: They are low effort and high return. Therefore, a relatively simple hack can inflict considerable damage. It is easy to see why space systems are the brass ring of cybercrimes: They are low effort and high return. Therefore, a relatively simple hack can inflict considerable damage. EASY PREY Although a space system is composed of three connected segments—satellites and spacecraft that orbit the earth, ground stations, and the communication systems that link the two—cybercriminals only need to find the vulnerabilities in one of these segments. For example, for a few hundred dollars, a hacker can buy a small jamming device on the Internet to interfere with satellite signals. "We have to make it (satellite navigation systems) more robust," warned Colonel Bradford Parkinson, who led the creation of the GPS. "Our cellphone towers are timed with GPS. If they lose that time, they lose sync and pretty soon they don't operate. Our power grid is synchronized with GPS [and] so is our banking system." Space systems have become the target of hacking. In July of last year, the United States identified a 28-year-old British citizen who hacked a number of government networks, including NASA. He attempted to grab highly sensitive data and claimed he would "do some hilarious stuff with it." Four months later, in November 2013, viruses infected the computers used by the International Space Station. Japan's space agency also discovered a computer virus inside a few of its computers in January 2012 and Germany's space center recently suffered an espionage attack, with several of its computers getting hit with spyware. Since 2009, the BBC has complained of disruptions to its Persian-language radio and television programs and has accused Tehran of interfering with international satellite broadcasts beamed into Iran. Only after the EU made a diplomatic complaint to pressure Iran to cease and desist did the attacks stop. When North Korea jammed South Korea's GPS signals in May 2012, it affected the navigation of over 250 flights. The list goes on. One of the reasons space systems, especially commercial ones, are such easy prey is that they often operate with outdated software. Developing a space system is generally a long process that, depending on the complexity of the system, takes several years to complete. And once the system is operational, it is expected to last for at least several years—sometimes even more than a decade. This process makes it difficult to update the system's security software. Moreover, in many cases, the information systems that are being used to manage space systems are mostly based on commercial "off-the-shelf" products, with known vulnerabilities and low levels of protection, especially compared to supposedly better-protected military systems. In 2014, a number of think-tanks, from the Council on Foreign Relations to London-based Chatham House, as well as the information-security firm IOActive, sounded the alarm on how vulnerable space systems are to cyberattacks. These reports warned of the ease with which backdoors in software—an undetected remote access to a computer—can be exploited, and of the prevalence of unsecured software, non-protected protocols, and unencrypted channels. One of the studies' recommendations was to immediately remove software updates from the public websites of various companies that provide satellite services and equipment, in order to prevent hackers from reverse-engineering the source code. However, despite these warnings, the space industry is barely aware of these risks and its responses are slow. Herein lies a challenge: to produce and put into practice standards and regulations regarding multinational and commercial activities in space technology and exploration. MOVING FORWARD In the past year, several space-faring nations have begun to tackle the issue. Three months ago, the U.S. Air Force announced that it hopes to develop technologies that would prevent hackers from jamming its satellites. Russia intends to significantly update the

robustness and security of its military and government satellite communication system by 2025. Despite these positive steps, national governments and international bodies have more ground to cover. First, governments need to increase their efforts to raise awareness regarding the growing threat of cyberattacks against both government and commercial space systems. Second, in order to provide better protection, governments and corporations should take a holistic rather than piecemeal approach regarding the protection of all segments of their systems, and work toward solutions that will ensure the performance of the systems and their services, rather than protecting a specific asset. For example, satellites are and will continue to be damaged by cyberattacks; but the ability of an entire system to operate smoothly and recover rapidly is more crucial than the security and safety of a single satellite. Third, military, civil, and commercial actors should engage in more dialogue in order to strengthen overall protection. They can do so by sharing information and working jointly toward better standards and regulations. Fourth, governments and international bodies should try to standardize protocols for protecting space systems. For example, when NOAA was breached in September, the Inspector General for the Commerce Department, which oversees the network, had just criticized it for an array of "high-risk vulnerabilities" in the security of its satellite information and weather service systems. It took nearly a month for NOAA to admit it had been hacked. Hiding such information hampers meaningful and timely discussion about the issue and delays the development of preventive measures. Enforcing a standard protocol could help alleviate this problem. And finally, protecting space systems must be an international effort. Space-faring nations should work together to achieve international cooperation on all of the areas mentioned above: raising awareness, sharing information, and developing much-needed standards. The potential for colossal damage and the relative ease of launching a cyberattack on space systems make them tantalizing targets for cybercriminals. The threat is already at our doorstep, and it will only get bigger. It is time for the international space community to muster the political will to rise to this growing challenge.

xt-- Cyber attacks escalate

Cyber war escalates

Tilford 12 (27 July 2012, Robert, Writer for The Examiner, <http://www.examiner.com/article/cyber-attackers-could-easily-shut-down-the-electric-grid-for-the-entire-east-coa>)

“Cyber attackers could all too easily shut down the electric grid for the entire east coast, the west coast, and the middle part of our country”, said Senator Grassley on July 26, 2012. “Any one attack could leave dozens of major cities and tens of millions of Americans without power. We know, because we were shown in a room here in the Capitol, how an attack could take place and what damage it would do, so we know this is not just make believe”, he said. So what would a cyber attack look like anyway? The Senator explained: “Without ATMs or debit card readers, commerce would immediately grind to a halt. My daughter, who lives here in the DC area, lost power when the storm hit. They waited for a number of hours, and then they took all the food out of their freezer, they gave away what they could, and they threw the rest away. And that was the way it was all over. Their power was out for about a week, and it made it very difficult. They are fortunate enough to have a basement, and the heat wasn’t oppressive down there. Without refrigeration, food would rot on the shelves, the freezers would have to be emptied, and people could actually go hungry. Without gas pumps, transportation arteries would clog with abandoned vehicles. Without cell phones or computers, whole regions of the country would be cut off from communication and families would be unable to reach each other. Without air conditioning and without lifesaving technology and the service of hospitals and nursing homes, the elderly and sick would become much sicker and die. Most major hospitals have backup power, but it is only for a limited amount of time. It depends on how much fuel they can store, and that is very limited”, Senator Grassley said. The devastation that the Senator describes is truly unimaginable. To make matters worse a cyber attack that can take out a civilian power grid, for example could also cripple harm the U.S. military. The senator notes that is that the same power grids that supply cities and towns, stores and gas stations, cell towers and heart monitors also power “every military base in our country.” “Although bases would be prepared to weather a short power outage with backup diesel generators, within hours, not days, fuel supplies would run out”, he said. Which means military command and control centers could go dark. Radar systems that detect air threats to our country would shut Down completely. “Communication between commanders and their troops would also go silent. And many weapons systems would be left without either fuel or electric power”, said Senator Grassley. “So in a few short hours or days, the mightiest military in the world would be left scrambling to maintain base functions”, he said. We contacted the Pentagon and officials confirmed the threat of a cyber attack is something very real. Top national security officials—including the Chairman of the Joint Chiefs, the Director of the National Security Agency, the Secretary of Defense, and the CIA Director— have said, “preventing a cyber attack and improving the nation’s electric grids is among the most urgent priorities of our country” (source: Congressional Record). So how serious is the Pentagon taking all this? Enough to start, or end a war over it, for sure (see video: Pentagon declares war on cyber attacks http://www.youtube.com/watch?v=_kVQrp_D0kY&feature=relmfu). A cyber attack today against the US could very well be seen as an “Act of War” and could be met with a “full scale” US military response. That could include the use of “nuclear weapons”, if authorized by the President.

--AT: No Cyber Terror

Leading security firms prove – cyber terror threats are areal and ramping up

Sanger and Perlroth 2015 (David E Sanger and Nicole; Iran is raising sophistication and

frequency of cyberattacks, study says; Apr 15;

www.nytimes.com/2015/04/16/world/middleeast/iran-is-raising-sophistication-and-frequency-of-cyberattacks-study-says.html?ref=topics; kdf)

WASHINGTON — In February, a year after the Las Vegas Sands was hit by a devastating cyberattack that ruined many of the computers running its casino and hotel operations, the director of national intelligence, James R. Clapper Jr., publicly told Congress what seemed obvious: Iranian hackers were behind the attack. Sheldon G. Adelson, the billionaire chief executive of Sands, who is a major supporter of Israel and an ardent opponent of negotiating with Tehran, had suggested an approach to the Iran problem a few months before the attack that no public figure had ever uttered in front of cameras. “What I would say is: ‘Listen. You see that desert out there? I want to show you something,’ ” Mr. Adelson said at Yeshiva University in Manhattan in October 2013. He then argued for detonating an American nuclear weapon where it would not “hurt a soul,” except “rattlesnakes and scorpions or whatever,” before adding, “Then you say, ‘See, the next one is in the middle of Tehran.’ ” Instead, Tehran directed an attack at the desert of Nevada. Now a new study of Iran’s cyberactivities, to be released by Norse, a cybersecurity firm, and the American Enterprise Institute, concludes that beyond the Sands attack, Iran has greatly increased the frequency and skill of its cyberattacks, even while negotiating with world powers over limits on its nuclear capabilities. “Cyber gives them a usable weapon, in ways nuclear technology does not,” said Frederick W. Kagan, who directs the institute’s Critical Threats Project and is beginning a larger effort to track Iranian cyberactivity. “And it has a degree of plausible deniability that is attractive to many countries.” Mr. Kagan argues that if sanctions against Iran are suspended under the proposed nuclear accord, Iran will be able to devote the revenue from improved oil exports to cyberweapons. But it is far from clear that that is what Iran would do. When Mr. Clapper named Iran in the Sands attack, it was one of the few instances in which American intelligence agencies had identified a specific country that it believed was using such attacks for political purposes. The first came in December, when President Obama accused North Korea of launching a cyberattack on Sony Pictures. Other United States officials have said that Iran attacked American banks in retaliation for sanctions and that it destroyed computers at the oil giant Saudi Aramco in retaliation for the close Saudi ties with the United States. The evidence from the Norse report, along with analyses by American intelligence agencies, strongly suggests that Iran has made much greater use of cyberweapons over the past year, despite international sanctions. The attacks have mostly involved espionage, but a few, like the Sands attack, have been for destructive purposes. In the report, to be released Friday, Norse — which, like other cybersecurity firms, has an interest in portraying a world of cyberthreats but presumably little incentive in linking them to any particular country — traced thousands of attacks against American targets to hackers inside Iran. The report, and a similar one from Cylance, another cybersecurity firm, make clear that Iranian hackers are moving from ostentatious cyberattacks in which they deface websites or simply knock them offline to much quieter reconnaissance. In some cases, they appear to be probing for critical infrastructure systems that could provide opportunities for more dangerous and destructive attacks. But Norse and Cylance differ on the question of whether the Iranian attacks have accelerated in recent months, or whether Tehran may be pulling back during a critical point in the nuclear negotiations. Norse, which says it maintains thousands of sensors across the Internet to collect intelligence on attackers’ methods, insists that Iranian hackers have shown no signs of letting up. Between January 2014 and last month, the Norse report said, its sensors picked up a 115 percent increase in attacks launched from Iranian Internet protocol, or I.P., addresses. Norse said that its sensors had detected more than 900 attacks, on average, every day in the first half of March. Cylance came to a different conclusion, at least for Iran’s activities in the past few months, as negotiations have come to a head. Stuart McClure, the chief executive and founder of Cylance, which has been tracking Iranian hacking groups, said that there had been a notable drop in activity over the past few months, and that the groups were now largely quiet. American intelligence agencies also monitor the groups, but they do not publicly publish assessments of the activity. Classified National Intelligence Estimates over the past five years have identified Russia and China as the United States’ most sophisticated, and prolific, adversaries in cyberspace. However, American officials have said that Iran and North Korea concern them the most, not for their sophistication, but because their attacks are aimed more at destruction, as was the case with the attack on Sony Pictures. In addition to the Sands attack last year — about which Mr. Clapper gave no detail in public — Iran has been identified as the source of the 2012 attack on Saudi Aramco, in which hackers wiped out data on 30,000 computers, replacing it with an image of a burning American flag.

Impact - Nuclear Terror

Impact: Nuclear Terror

A nuclear terror attack would kill billions, collapse the global economy, and cause escalation

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 1-2; kdf)

IN AN OTHERWISE CALM AND UNEVENTFUL MORNING, A small nuclear weapon explodes in downtown Washington, DC. The device generates a yield of fifteen kilotons, roughly the same force unleashed by the bomb Little Boy over Hiroshima. The casualty count rises to over a hundred thousand, and the destruction is measured in hundreds of billions of dollars. The blast's electromagnetic pulse burns out electrical components across the metropolitan area. Radiation leaves the center of the city uninhabitable for the first time since it was declared America's capital in 1790, and the scientific community predicts that it will remain so for a decade. The stock market plunges as investors anticipate draconian customs regimes that will choke global trade. Fear of further attacks paralyzes America and much of the Western world. Hours after the explosion, a little known terrorist group claims responsibility. It is the first time the president, who was not in Washington at the time of the blast, and his surviving cabinet members, including the director of national intelligence, have heard of the group. After searching intelligence databases, analysts report that the group is linked to three hostile governments, all of which have issued statements condemning the attack and denying involvement. It will take weeks for the remnants of the US intelligence community to assess that one of these three governments is probably lying, but even then the US government won't have irrefutable evidence of complicity. Unlike a ballistic missile or bomb delivered by enemy land-, air-, or seacraft, the origin of what analysts will call a "container-based improvised nuclear device" is difficult to determine and impossible to prove. Nuclear forensics will ultimately provide strong evidence that the fissile material used in the device originated from the country under suspicion. Signals intelligence will record celebrations and praise of the attack by midlevel officials in that country's military and intelligence establishment. However, the intelligence reporting taken as a whole will suggest that negligence within that country's weapons industry and at its nuclear complexes is at least as plausible a scenario as a deliberate transfer by government officials to the terrorist group. Yet there is no conclusive reporting that points to either willful negligence or human error. Either way, there is no way to know if the transfer occurred through official policy, the machinations of a venal or ideologically motivated individual, or simple incompetence. There is almost nothing about the origins of the attack that the president of the United States knows for certain.

Yes Nuclear Terror- Pakistan

Pakistani nukes pose an existential risk – myriad of reasons

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 66-78; kdf)

The breakup of the Soviet Union presented an entirely unprecedented challenge: the redeployment of thousands of nuclear weapons and the dismantlement of hundreds of nuclear installations. It was this challenge that focused a great deal of attention on the danger of "loose nukes," another of Allison's "Three No's." In 1991, it also spurred Sam Nunn and Richard Lugar to launch the Cooperative Threat Reduction program, which has since provided a half billion dollars each year to improve the safety and security of Russia's unconventional arms. These funds allowed the United States to remove nuclear weapons from Belarus, Kazakhstan and Ukraine and financed the demolition of thousands of Soviet weapons, including missiles, submarines, bombers, and warheads. The Nunn-Lugar CTR program also paid the salaries of tens of thousands of Soviet weapons scientists, engineers, and technicians who were impoverished by the economic crises of the early 1990s and helped discourage them from working for American adversaries and governments of proliferation concern. 20 The growth of CTR efforts corresponded with a significant decline in seizures of illicit highly enriched uranium, partially enriched uranium, and plutonium sales on the black market. Between 1992 and 2002 there were at least eleven cases of HEU seizures and two plutonium seizures reported to the IAEA. In contrast, only four seizures occurred during nearly a decade between 2002 and 2012, and they were all associated with a single country- Georgia. While correlation certainly doesn't prove causation, these statistics are a strong indication of CTR's effectiveness and suggest that the threat of loose Soviet nukes and fissile materials has been largely contained. 21 Unfortunately, the threat of "loose nukes" has shifted rather than declined. Few have had greater access to information on this threat, and experience combating it, than Rolf Mowatt-Larssen. A twenty-three year veteran of the CIA's Clandestine Service, Mowatt-Larssen served multiple tours as a chief of station and rose to the agency's most powerful positions: chief of the European Division, chief of the Weapons of Mass Destruction Department, and chief of the Counterterrorism Center. After the September 11, 2001 attacks George Tenet, the director of the CIA, tapped Mowatt-Larssen to be at the point of the spear in America's response to the threat of nuclear terrorism. Mowatt-Larssen fulfilled this role first within the CIA and then from the basement of the Energy Department's headquarters as the director of its Office of Intelligence and Counterintelligence. 22 The centrality of Mowatt-Larssen's efforts is documented, among other places, in Tenet's memoir. After leaving government, Mowatt-Larssen articulated the problem in no uncertain terms: "The greatest threat of a loose nuke scenario stems from insiders in the nuclear establishment working with outsiders, people seeking a bomb or material to make a bomb. Nowhere in the world is this threat greater than in Pakistan." 23 Pakistan is distinguished by an extraordinary combination of malevolent ingredients. It is the only country ever to have both the founding father of the nation's nuclear weapons program and a lead nuclear weapons scientist independently develop clandestine networks to proliferate atomic weapons for profit. The latter, and better known of the two, Abdul Qadeer Khan, stole uranium enrichment technology while working at a centrifuge manufacturing company in the Netherlands during the 1970s, went on to develop Pakistan's uranium enrichment pathway to the bomb, and then proceeded to go into business for himself. His clients included Iran, Libya, and North Korea. This became apparent to the world in dramatic fashion in January 2003 when US agents intercepted a German ship named the BBC China that was transporting a large stash of nuclear weapons components to Libya. Libyan officials later admitted to having reached an agreement with Khan Research Laboratories to provide \$100 million in exchange for a "complete store-bought nuclear weapons program." 24 Khan also built upon Pakistan's long-standing relationship with North Korea in the field of missile technology to provide that country with dozens of centrifuges. 25 As early as 1987, Khan also sold to the Iranians and eventually provided them P-1 centrifuges, schematics of advanced P-2 designs, and hundreds of sensitive nuclear components. 26 Despite his public confession in 2004, Khan remains a hero to the vast majority of Pakistanis, a political reality that compelled president Pervez Musharraf to pardon Khan for his crimes. Pakistan's other premier proliferator, Bashiruddin Mahmood, is less well known but was also a stalwart of the nuclear program during the 1970s; he occupies the singular position of being the most senior scientist to liaison directly with al-Qaeda. The chief designer and director of Pakistan's Khushab Plutonium Production Reactor, Mahmood retired from government service in 1999 and founded a nongovernmental organization called Umma Tameer-e-Nau (UTN; Reconstruction for the Islamic Community). The leadership of UTN was made up of retired Pakistani nuclear scientists, military officers, engineers, and technicians, including Chaudhry Abdul Majid, who had been a nuclear fuel expert at the Pakistan Institute of Nuclear Science and Technology. In the summer of 2001, Mahmood and Majid traveled to Afghanistan under the cover of the UTN in order to discuss nuclear weapons with mullah Mohammed Omar and Osama bin Laden. According to former director of the Central Intelligence Agency George Tenet, Mahmood was thought of as something of a madman by many of his former colleagues in the Pakistan nuclear establishment. In 1987 he published a book called "Doomsday and Life After Death: the Ultimate Faith of the Universe as Seen by the Holy Quran." It was a disturbing tribute to his skewed view of the role of science in jihad. The book's basic message from the leader of a group that has offered WMD capabilities to AQ [al-Qaeda] -was that the world would end one day

soon in the fire of nuclear holocaust that would usher in judgment day and thus fulfill the prophecies of the Quran ... Mahmood and Majid were detained after a tip from a foreign intelligence service prompted the CIA to inform the Pakistani government of their actions. The two scientists admitted to the meetings, noted that bin Laden was interested in nuclear weapons and that Majid had drawn a rough sketch of an improvised nuclear device for him, but denied that they assisted al-Qaeda. Despite failing several polygraph tests and a statement from Libya's head of intelligence claiming that the UTN had tried to sell Libya a nuclear bomb, the two scientists were soon released.²⁷ According to Tenet, the United States "knew that UTN enjoyed some measure of support from Pakistani military officers ... notably the former director of Pakistani intelligence service, Gen. Hamid Gul."²⁸ A second factor that makes the nuclear terrorism threat from Pakistan especially acute is its track record as a sanctuary and a patron of terrorist organizations. Even before Pakistan became a state after the partition of British India, its advocates decided that securing an Islamic polity required an investment in asymmetric proxies. India was destined to have conventional military superiority, so the Muslims of the subcontinent from the start invested in unconventional warfare. From the bloody battles of partition through the present day, the Pakistani military cultivated radicals, which for the first few decades were overwhelmingly Pathans/Pashtuns, but in recent time have come to include Punjabis as well. This isn't a temporary fad; it is an embedded component of Pakistan's national security system. The ability of Osama bin Laden to enjoy approximately a decade of hospitality just miles from Pakistan's premier military university likely had more to do with the sympathies of a handful of people than official policy, but his presence was entirely consistent with Pakistani support for radical jihadist groups such as Lashkar-e-Jhangvi, Lashkar-e-Taiba, the Haqqani Network, and the Afghan Taliban, among others.²⁹ Third, and likely related, Pakistani public opinion polls consistently show widespread antipathy toward the United States and sympathy for jihadist organizations. As of June 2012, 75 percent considered the United States "an enemy."³⁰ Significant segments of the public not only hold anti-American views but also subscribe to radical militant ideology that is manifest in violence against Christians, Shi'ites (of which 375 were killed in 2012 alone), symbols of secularism, and even the Pakistani government. The assassination in 2011 of Pakistan's only Christian minister, Shahbaz Bhatti, was indicative of this trend, but even more alarming than the murder was the subsequent outburst of public support for the assassin. Thousands of demonstrators celebrated the "execution," which they claimed was justified by Bhatti's efforts to reform Pakistan's blasphemy laws, which impose the death penalty for insulting Islam. Before former prime minister Benazir Bhutto was murdered in 2007, she expressed a belief that al-Qaeda would march on Islamabad in a matter of years.³¹ These attitudes are worth bearing in mind in the context of another statistic: the approximately nine thousand civilian scientists, including two thousand who reportedly possess "critical knowledge" of weapons manufacturing and maintenance who work in Pakistan's nuclear complexes.³² There is arguably no published figure more qualified to comment on Pakistan's nuclear weapons program than Feroz Khan, who served for thirty years in the Pakistani military and occupied senior positions at Pakistan's Strategic Plans Division, the country's nuclear decision-making and command-and-control apparatus. Regarding the insider threat Khan has said, "Pakistan faces two fundamental challenges in establishing its personnel reliability requirements. First, religious extremism is increasing in Pakistani society as a whole Second, because Pakistan does not have sophisticated technological controls over personnel, it has to rely on the rationality and loyalty of individuals"³³ These words don't inspire a great deal of confidence. A fourth development of serious concern is that radical ideology and radical organizations inevitably have spawned radical violence in Pakistan. According to Bruce Reidel, a CIA veteran and former lead Pakistan analyst for the Obama administration, government insiders have facilitated multiple terrorist attacks against the Pakistani state, including suicide bombings at air force bases that house nuclear weapons storage sites.³⁴ In 2011, Jeffrey Goldberg reported in the Atlantic that at least six facilities widely believed to be associated with Pakistan's nuclear program had already been targeted by militants. The Pakistani military's inability to protect its own assets was demonstrably apparent in early 2011 when it took forces over fifteen hours to regain control of a major Pakistani naval base near Karachi after militants overran it, destroyed two P-3C Orion surveillance planes and killed ten people.³⁵ These events, alongside a variety of other negative economic indicators, led Stephen Cohen, a leading expert on the country, to conclude, "The fundamentals of the state are either failing or questionable, and this applies to both the idea of Pakistan, the ideology of the state, the purpose of the state, and also to the coherence of the state itself. I wouldn't predict a comprehensive failure soon, but clearly that's the direction in which Pakistan is moving."³⁶ Fifth and most alarming, Pakistan's nuclear arsenal and its nuclear doctrine are undergoing changes that exponentially expand the risk of terrorist acquisition of a nuclear weapon. With respect to sheer size, Pakistan was on track to displace France as the world's fourth largest nuclear weapons power.³⁷ This is a dangerous development in itself, but is accompanied by even more troubling indications of how those weapons will be managed. Feroz Khan has confirmed these facts, and his access to senior Pakistani officials, including former president Musharraf, lend great credibility to his account of the nuclear security situation in Pakistan. While a Pakistani patriot and strong supporter of the country's nuclear weapons program, Khan's account reveals a

number of issues of grave concern from a proliferation perspective. Khan cites two specific events as catalysts that pushed Pakistan to undertake unprecedented risks with respect to its nuclear arsenal. The first was instigated by India on January 25, 2000, when India's defense minister, George Fernandes, formally announced a new doctrine of "limited war under the nuclear umbrella"-a doctrine that would become known as Cold Start. The central idea of the Cold Start doctrine is that India could take conventional military action against Pakistan in a limited manner that would prevent escalation to nuclear war. This would allow India a viable response to Pakistani-sponsored terrorist attacks. Following Lashkar-e-Taiba's attack on the Indian Parliament in December 2001, India demonstrated that this doctrine was more than words by mobilizing 500,000 troops for the first time since the 1971 war. The subsequent ten-month standoff between the two countries convinced the Pakistan military that it needed to up its nuclear ante. In Khan's words, the standoff demonstrated that "Pakistan would lack the resources to begin major mobilizations whenever terrorists attacked India and instead would be forced to rely even more on nuclear deterrence."³⁸ A second catalytic event was the US-led invasion of Afghanistan after 9/11, which placed US military assets in striking distance of Pakistan. As early as the 1960s, Americans had expressed alarm about nuclear security in Pakistan. None other than the famous Henry De Wolf Smyth of the Smyth Report once stated, "What I am concerned about internationally is power reactors in countries that have unstable governments. The Pakistani reactor, for example, builds up a stockpile of plutonium. Suppose there's a revolution. A totally new and crazy government comes in, and here's the plutonium just sitting there asking to be made into a bomb."³⁹ Islamabad has long been aware of these concerns, and when it conceded to Washington's demand for access to Pakistani airspace to support US military operations in Afghanistan its "decades-long fear of preventive strikes sent it to high alert." India's Cold Start doctrine and the US-led invasion of Afghanistan spurred Pakistan to make changes in its nuclear posture that are entirely rational within a framework that assumes the Indian military to be an existential threat; but these changes are also extremely destabilizing when placed in the context of Pakistan's domestic instability. The first change is a massive expansion of Pakistan's plutonium production capacity. The Pakistan Atomic Energy Commission is constructing three additional heavy water reactors at the same site as its fiftymegawatt Khushab reactor. To reprocess the higher quantities of plutonium, Islamabad is also doubling the capacity of the reprocessing plant at the Pakistan Institute of Nuclear Science and Technology as well as completing a much larger commercial-scale reprocessing facility at Chashma that was abandoned by the French in 1978.⁴¹ This is consistent with Pakistan's position with respect to the Fissile Material Cutoff Treaty, which Pakistani diplomats have worked for years to block; these diplomats declare that in order to maintain their country's minimal critical deterrent, Pakistan cannot be expected to accept any cap in fissile material production. Expansion of plutonium production is also reportedly being accompanied by greater HEU enrichment. According to Feroz Khan, the Khan Research Laboratories continue to produce at least one hundred kilograms of HEU annually and are expanding their capability by introducing and installing a new generation of P-3 and P-4 gas centrifuges that have a significantly higher separative work unit. A second development, which is closely related to the first, is Pakistan's decision to build small tactical nuclear warheads. Plutonium-based nuclear weapons designs, which can require only four to six kilograms of plutonium, allow for substantial miniaturization.⁴¹ This trend is consistent with the April 2011 test of the Hatf IX INASR missile system, which is a rocket launcher capable of being tipped with a nuclear warhead. According to Khan, "The implication of this system is that Pakistan has acquired the capability to build a miniaturized nuclear warhead . . . plutonium-based system that requires an implosion device with a diameter of less than twelve inches-quite a technological achievement."⁴² From a proliferation prospective this is also quite a problem. A third development of grave concern is the implication of the fielding of such a system. To be most effective, it would have to be "pre-deployed and combat ready."⁴³ Khan suggests that given the current trajectory of the program, "at some point nuclear weapons would be mated with delivery systems in peacetime."⁴⁴ This is the same allegation that Goldberg made in his 2011 article in the Atlantic asserting that Pakistan is using civilian-style vehicles without noticeable defense to transport not merely the "demated" components of nuclear parts but "mated" nuclear weapons.⁴⁵ The Congressional Research Service has also cited lieutenant general Khalid Kidwai, the head of Pakistan's Strategic Plans Division in 2008, who made the same allegation.⁴⁶ This contention is conjecture rather than a sure fact, but the military dynamics of the conflict between Pakistan and India do encourage the predeployment of combat ready nuclear weapons and therefore make these assertions plausible. Fourth, Khan confirms that Pakistan has prioritized preventing Indian or American disablement of Pakistan's nuclear arsenal above the danger of theft. As the United States prepared to launch an attack on the Afghan Taliban after September 11, 2001, President Musharraf reportedly ordered the dispersal of Pakistan's nuclear arsenal to "at least six secret new locations."⁴⁷ The dispersal of the arsenal apparently is also consistent with Khan's allegation that Pakistan is expanding its nuclear weapons delivery systems. Initially, Pakistan only had the capability to deliver atomic weapons by aircraft, but with assistance from North Korea and China, solid and liquid fueled ballistic missiles became an option. However, Pakistan interpreted India's bid for an Arrow antiballistic missile system and Patriot PAC-3 system to back up its S-300 system as a threat that could blunt Pakistan's offensive systems. Pakistan responded by developing the Babur cruise missile and, according to Khan, is also actively pursuing a sea-based deterrent that would "complete the third leg of the [nuclear] triad."⁴⁸ When considering the potential for a maritime nuclear capability, it is worth keeping in mind a statement that a retired Pakistani general made to Goldberg: "Different aspects of the military and security services have different levels of sympathy for the extremists. The navy is high in sympathy."⁴⁹

Yes Nuclear Terror - Loose Nukes

Pakistani nukes will get loose

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 15-16; kdf)

With respect to "loose nukes," the threat faced today is unprecedented. The good news is that the danger that Allison focused on-fissile material leaking out of the former Soviet republics-has been substantially curtailed, though not eliminated. When Allison served in government he was confronted by a slew of nuclear smuggling cases. Between 1992 and 2002, eleven cases of attempted sales of highly enriched uranium and two cases of attempted plutonium sales occurred. In contrast, between 2002 and 2012 there have been only four cases-all but one of which was linked to a single country, Georgia. This is a good news story, which is probably due in no small measure to the efforts of the United States to provide rapid security upgrades as part of the Nunn-Lugar Cooperative Threat Reduction program.⁶ Unfortunately, this good news has been accompanied by extremely dangerous developments in Pakistan. The country is in the midst of a massive expansion of its nuclear weapons complex at a time when radicalization is on the rise and its military is under frequent attack from insurgents. Moreover, the size of the nuclear complex is not only expanding but, according to Feroz Khan, a thirty-year veteran of the Pakistani program, the military is also planning to produce miniaturized tactical nuclear weapons, deploy them in a ready-to-launch state, and mate them with new delivery vehicles. From a proliferation perspective this is a frightening prospect, particularly considering that Pakistan has an unparalleled history of proliferation. This is all occurring in a country that hosted Osama bin Laden and the senior leadership of al-Qaeda for over a decade and where the military intelligence service continues to court, coopt, and coordinate with a wide array of terrorists groups.⁷

Yes Nuclear Terror – AT: Safeguards

The safeguards highlighted by their ev will fail – only intelligence can solve

Myhrvold 2014 (Nathan P [chief executive and founder of Intellectual Ventures and a former chief technology officer at Microsoft]; Strategic Terrorism: A Call to Action; cco.dodlive.mil/files/2014/04/Strategic_Terrorism_corrected_II.pdf; kdf)

Preventing nuclear war and fighting common crime are similar in some ways. Both efforts typically exploit the principle of deterrence by inflicting punishment after the fact. This approach works well when the deterrence is real—when it is clear that the probability of punishment or retaliation is high. With strategic terrorism, we already know we cannot retaliate effectively. Besides deterrence, the other main approach to security is guarding: preventing crime by having forces on the scene that stop criminals or attackers in their tracks. Guarding is used quite a bit in counterterrorism—air marshals on flights, security screeners in airports, and bomb-sniffing dogs at large events. **Unfortunately, guarding does not prevent strategic terrorism.** If the goal of a terrorist is to spread an infectious disease in the United States, it is simple to put a few infected volunteers on a plane headed into our country. It would be difficult for security to notice anything amiss. The terrorists wouldn't be obviously sick or carrying suspicious items. Even if a way existed to detect such attackers, by the time someone found them in the United States, it would already be too late. Even with nuclear, chemical, or noncontagious bio warfare, guarding the country is of limited use. Intercepting a nuclear bomb in a shipping container works only if you stop it in a place you don't mind losing if the weapon detonates. Having a nuclear bomb explode in a Port Authority facility in New Jersey may be marginally better than having it explode in midtown Manhattan, but it would be a Pyrrhic victory. **The only way to beat strategic terrorists is to go after them,** either in their home territory or, if they are already here, before they have built a sufficiently dangerous weapon. We need to strike preemptively. The Iraq War, however, has given preemption a bad name. Destroying Saddam Hussein's weapons of mass destruction was the goal, yet investigators ultimately found that he didn't have any. This not only discredits the intelligence process that led us into Iraq, it discredits preemption itself. Both the country and the world will be highly skeptical of any rush to a preemptive attack. Most preemptive action will not be at the level of a full-scale war and thus will require lower thresholds of certainty. Nevertheless, any sort of preemptive attack places tremendous demands on intelligence gathering—demands that our intelligence community, in its current form, cannot meet. The need to battle strategic terrorists preemptively sets the bar for 21st-century intelligence services: they must provide information of sufficient quality and timeliness to enable policy makers to decide whether or not to act. The intelligence community needs a complete bottom-up review to determine whether its structure and methodologies match present and future needs. The new approach will require large and unpopular budget increases. Existing program budgets will need to be redistributed. Congress will vigorously defend current projects affecting their constituents and contractors will howl. **Action is nevertheless imperative.**

AT: Nuclear Terror doesn't escalate

It's impossible to know if nuclear terror would escalate, best to side with caution

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 3-5; kdf)

Yet there are very few authors, academics, or entertainers who have really thought through the scenario described above or examined in detail the question of what happens in the days, weeks, and months after such an attack. Presumably, part of the reason for this is that the US government's response to nuclear terrorism is unknowable. Ask anyone who has spent time at the White House on the National Security Council staff and they will tell you that decisions of war and peace are in no small part the product of fickle factors like the personality of the president and the people who surround him. Thoughtful national security practitioners also know that happenstance and dumb luck have a prominent role in shaping discussions in the White House Situation Room. These conditions make realistic speculation difficult to formulate. The wide range of possible scenarios and the salience of unknowable factors make it difficult to anticipate hypothetical policy prescriptions. Another reason that this question hasn't demanded an answer is that most people understandably consider it to be far less relevant than "How can nuclear terrorism be prevented?" Speculating on responses to a nuclear attack is a bit like contemplating the day after any number of disasters that involve an unprecedented scale of devastation. Does the national security community focus on the US government's potential response to an asteroid striking the planet or the aftermath of a war between China and the United States? It does not, because these types of scenarios fall into the realm of the surreal or at a minimum envision a situation in which there is such massive social disruption and such a severe diminution of US government capacity that it is difficult to even know where to begin. Admitting the limits of American power, particularly the "hard power" of the US military and intelligence community, is also not a popular pastime. A politician would need to be unusually brave to publicly focus on the day after an act of nuclear terrorism instead of the days before. Accepting nuclear terrorism is an unacceptable position, his opponents would surely retort. There are also no precedents, history, or cases of nuclear terrorism to provide context or demand consideration. People -particularly pundits and politicians-who have not studied much history often use the term unprecedented to describe the unfamiliar, but the scenario laid out above is truly something new under the sun. Since a successful nuclear terrorism event has not happened before, and it is not happening now, there is less appetite for thinking deeply about it than there is for considering more traditional security issues. From the sinking of the Lusitania by a German U-boat, to the Japanese empire's attack on Pearl Harbor, to al-Qaeda's attacks that culminated in the events of 9/11, Americans are conditioned to contemplate surprise attacks and expect that the US government can respond swiftly and severely, to manifest the prediction made by Japanese admiral Isoroky Yamamoto that a surprise attack against America would "awaken a sleeping giant."

AT: Low Probability

The probability of a nuclear terror attack is at unprecedented levels – amplifies the magnitude

Schwartz 2015 (Benjamin [Worked at the Departments of State, Defense and Energy]; Right of Boom: The Aftermath of Nuclear Terrorism; The Overlook Press; p. 23-25; kdf)

Is the scenario above simply the product of an overactive imagination and a penchant for alarmism? This is a reasonable question to ask. And it is worth answering before embarking on an exploration of potential responses to nuclear terrorism. Those who assert that there is a genuine threat of nuclear terrorism should acknowledge at the outset that there are legitimate reasons for skepticism. In fact, those who have paid closest attention to the issue over the years may be most conditioned to be incredulous.

They have heard public officials repeatedly issue dire warnings of impending terrorist attacks, watched and seen that no attack materializes, and then have been presented with little or no evidence to support the initial alert. It is also perfectly understandable that reasonable people question the competence and/or trustworthiness of US national security officials, particularly those responsible for nuclear issues. This is especially so in light of the second American-led invasion of Iraq—a war justified to the public largely on the basis of nonexistent nuclear weapons. Moreover, warnings of impending doom didn't originate with then vice president Dick Cheney. "I think we have to live with the expectation," remarked a Los Alamos atomic engineer in 1973, "that once every four or five years a nuclear explosion will take place and kill a lot of people." This statement is cited in John McPhee's *The Curve of Binding Energy*, which detailed concerns about the proliferation of nuclear weapons to nonstate actors over forty years ago.³ In the context of this history, accusations of Chicken Little-like behavior aren't flippant reactions. While exaggeration may mislead the credulous and offend the perceptive, neither the absence of a precedent for nuclear terrorism nor the intelligence failure regarding Saddam Hussein's WMD program change the growing threat. Many of these conditions aren't new; they have existed since the dawn of the nuclear age, and the world has been very fortunate that the danger has been effectively managed for so long. Other conditions are truly unprecedented. The world crossed from Graham Allison's "Three No's" into three Yeses with a whimper rather than a bang, but we have nevertheless entered an environment of extraordinary risk. Allison's contention that "[t]he detonation of a terrorist nuclear device in an American city is inevitable if the U.S. continues on its present course" is certainly debatable.⁴ Yet an objective assessment of the current nuclear security situation and its future trajectory leads to an unavoidable conclusion: We are more vulnerable to nuclear terrorism than at any time since the dawn of the nuclear age.

AT: Schwartz Indicts

Criticism of Schwartz is that his magnitude is too small – experts agree that he is awesome

Boot 2015 (Max [senior fellow at the Council on Foreign Relations]; 'Right of Boom,' by Benjamin E Schwartz; Feb 6; www.nytimes.com/2015/02/08/books/review/right-of-boom-by-benjamin-e-schwartz.html; kdf)

Nuclear terrorism has long been a staple of movies and television shows. But typically, Hollywood productions end with the bomb being defused. What would happen if heroes didn't save the day and the United States experienced the worst 24 hours in its history? That is the important question Benjamin E. Schwartz, a career government official who has worked at the Departments of State, Defense and Energy, sets out to answer in his clunkily titled first book, "Right of Boom." ("Right of boom" is -government-speak for "after an explosion.") His analysis begins with a fictional narrative that unfolds in a flat, matter-of-fact tone: "On an otherwise calm and uneventful morning, a small nuclear weapon explodes in downtown Washington, D.C. . . . The casualty count rises to over a hundred thousand, and the destruction is measured in hundreds of billions of dollars." Schwartz rather arbitrarily assumes that the president is out of town at the time of the explosion, along with other key officials. They must then figure out what to do when a "little-known terrorist group" (no ideology specified) claims responsibility. Experts suggest the group is "linked to three hostile governments, all of which have issued statements condemning the attack and denying involvement." Eventually, in Schwartz's story line, intelligence concludes that the nuclear material most likely came from one nation (unnamed) but that "negligence within that country's weapons industry and at its nuclear complexes is at least as plausible a scenario as a deliberate transfer by government officials to the terrorist group." What, then, should the president do? Schwartz notes that "people may assume that the answer to nuclear terrorism is tragic but quite straightforward: retaliation with nuclear weapons." But it may not be so simple. It is far from certain that the president would be willing to incinerate the people of, say, North Korea, Iran or Pakistan. And, as Schwartz notes, "American maneuver room would be severely curtailed if the nuclear threat network emanated from Russian or Chinese territory." Only Dr. Strangelove would suggest starting World War III with a state that possesses hundreds if not thousands of nuclear weapons. What's more, taking out the nuclear weapons even of a smaller state like Pakistan or North Korea would not be easy. It would be necessary to wipe out the entire arsenal, but of course all states camouflage and disperse their nuclear stockpiles. If American strikes left some nukes intact, the danger of a further nuclear attack on the American homeland would be very real. What about using boots on the ground? "U.S. military forces could invade a country and forcefully take control over -nuclear-related sites and facilities," Schwartz says. He may go too far in suggesting that such an action would have "limited prospects of eliminating the threat," but he is right that it would be a "high-risk venture" whose downside could include many of the problems the United States encountered in Afghanistan and Iraq. While Schwartz believes (rightly) that airstrikes against suspected nuclear proliferators would be the most likely initial response, he argues that dealing with an act of nuclear terrorism in the long term would require a much more complex series of actions designed to blunt "global nuclear threat networks." Washington would need "capabilities to conduct missions ranging from halting the sale of dual-use components through legal and diplomatic processes, to freezing funds of weapons proliferators, to isolating and immobilizing terrorist groups, to improving security practices at nuclear materials storage sites, to coercive interdictions on the high seas, to seizing and securing -nuclear weapons sites and even to -destroying nuclear weapons arsenals." Schwartz's most intriguing suggestion is that an act of nuclear terrorism could revive an idea briefly entertained by the Truman administration to establish "an international structure to control nuclear energy" — an International Atomic Energy Agency on steroids. Countries that failed to comply with its edicts could face more than sanctions or strong rhetoric — they could be "presumed guilty" and -declared "a legitimate target for retaliation following nuclear terrorism even in the absence of proof of complicity." Whatever happens, there is little doubt that we would be entering a brave new world whose contours can be glimpsed only dimly. Schwartz is to be commended for thinking about the unthinkable. It's a shame he has not produced a better book. Schwartz is, to put it mildly, no thriller writer. His nuclear-attack plot is presented with a minimum of drama, and it's hard not to roll your eyes when he sketches an imaginary conversation on an unnamed television show between experts from nonexistent think tanks chatting in language no human being would actually use. "As the late Irving Kristol noted many years ago," one of his pundits declaims, "international law is a fiction abused callously, or ignored ruthlessly, by those nations that, unlike the Western democracies, never took it seriously in the first place." Back to you, Bret. Schwartz also takes long detours into historical case studies of limited relevance. For example, he compares possible responses to terrorism with America's campaigns against the Comanches and Britain's against the Pashtuns in the 19th century. He even suggests that "war against Al Qaeda waged through unmanned aerial vehicles and informants on the ground" is similar to the "punitive" expeditions undertaken by the British Raj in what is now Pakistan. The analogy doesn't hold up. British forces routinely burned villages in retaliation for Pashtun raids. Winston Churchill, who as a young army officer participated in one such campaign, left a memorable description of how the Tirah Valley "was filled with the smoke," which "hung like a cloud over the scene of destruction." If Washington were engaged in such a policy today, our armed forces would be bombing villages in Pakistan. But they're not. Current policy is actually "leadership

targeting” — trying with great discrimination to eliminate the key players in Al Qaeda and other terrorist organizations. This approach also has a long history, dating back to the Roman assassination, in 139 B.C., of a rebel leader in Hispania (Spain) named Viriathus, but it goes entirely unmentioned here. And more disturbing than Schwartz’s failure to cite the relevant historical examples is his conceptual error in failing to differentiate between decapitation strikes and punitive expeditions. “Right of Boom” is marred by other problems as well, like Schwartz’s unwillingness to consider the possible impact of the nation’s entire political leadership being wiped out. Another curious omission is neglecting to think about what would happen if more than one nuclear bomb went off, or if more nuclear attacks were threatened. That possibility was raised in Andrew Krepinevich’s “7 Deadly Scenarios,” a more compelling look at this same issue that also goes unmentioned here. Finally Schwartz does not explain what steps policy makers should take to stop nuclear terrorism before it occurs. What, for example, should we be doing to prevent Iran from getting the bomb? Schwartz never says. Nonetheless, even if “Right of Boom” is not the book we need on nuclear terrorism, it can still do some good if it spurs greater study of and conversation about what is arguably our most important and least-understood national security threat.

****AT: Aff args**

AT: FREEDOM Act Thumps

Either A) Freedom act solves and takes out inherency means vote neg on presumption OR B) it's just a drop in the bucket

Straeley 2015 (Steve; Congress' NSA Bulk Surveillance Reform Bill: Much Ado about Little; May 4; www.allgov.com/news/top-stories/congress-nsa-bulk-surveillance-reform-bill-much-ado-about-little-150504?news=856395; kdf)

The USA Freedom Act, a bill passed out of committee last week which would limit the government's ability to spy on Americans' communications, would hardly put a crimp in the National Security Agency's (NSA) surveillance practices. The Freedom Act would stop most government collection of domestic calling metadata. The government would be limited to requesting from telecommunications companies information when there is a "reasonable, articulable suspicion" that a "specific selection term" is connected to international terrorism, according to an analysis by the Electronic Frontier Foundation. But the bill doesn't address data collection under Section 702 of the FISA Amendments Act, which allows the collection of the actual content of some communications, including that of Americans, and the collection of information from overseas calls. "If this bill passes, the NSA will continue unaddressed surveillance programs and will secretly torture the English language to devise novel justifications for spying on Americans," David Segal, executive director of Demand Progress, a group that has fought for more civil liberties, told The New York Times. "We won't even know the details until a new whistleblower comes forward a decade or two from now." An amendment which would strengthen protections against backdoor surveillance such as that allowed under Section 702 has drawn significant support (pdf), but has been rejected, along with others. House Judiciary Committee Chair Rep. Bob Goodlatte (R-Virginia) and ranking member Rep. John Conyers (D-Michigan) have said the Freedom Act has been carefully crafted as a compromise and if it's amended, it has no chance of getting a vote on the House floor. Its chance for success hinges on the expiration next month of authority for bulk data collection and those in the intelligence community want to ensure they still have some ability to spy on Americans.

And—It wasn't key

Lewis 2014 (James Andrew [senior fellow and director of the Strategic Technologies Program at CSIS]; Underestimating Risk in the Surveillance Debate; Dec; http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; kdf)

If the risk of attack is increasing, it is not the right time to change the measures the United States has put in place to deter another 9/11. If risk is decreasing, surveillance programs can be safely reduced or eliminated. A more complicated analysis would ask if the United States went too far after 9/11 and the measures it put in place can be reduced to a reasonable level without increasing risk. Unfortunately, precise metrics on risk and effectiveness do not exist, 12 and we are left with the conflicting opinions of intelligence officials and civil libertarians as to what makes effective intelligence or counterterrorism programs. There are biases on both sides, with intelligence officials usually preferring more information to less and civil libertarians can be prone to wishful thinking about terrorism and opponent intentions.¹³ Interviews with current and former intelligence officials give us some guidance in deciding this. The consensus among these individuals is that 215 is useful in preventing attacks, but the least useful of the programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215 before any others, but ending 215 would not come without some increase in risk.

AT: Privacy outweighs

Their impacts are about the perception the public has about intrusion of privacy – overwhelmingly the public enjoys it

Sherfinski June 4 (David; NSA surveillance prevented terrorist attacks, most voters say: poll; www.washingtontimes.com/news/2015/jun/4/nsa-surveillance-prevented-terrorist-attacks-poll/; kdf)

Nearly two-thirds of U.S. voters say the National Security Agency's bulk data collection program has thwarted terrorist attacks in the United States, but a majority also think it's likely that the program has violated Americans' civil liberties. Sixty-five percent say they believe the NSA program has helped prevent terrorist attacks in the United States, compared to 28 percent who don't believe it has, according to a Fox News poll. Meanwhile, 57 percent say they believe the surveillance program has led to civil liberties of law-abiding Americans being violated, compared to 36 percent who don't believe that it has. But a plurality of voters, 49 percent to 42 percent, said the government's surveillance of U.S. citizens is more likely to help catch terrorists and protect Americans from additional attacks, as opposed to hurting law-abiding Americans by using private information improperly. Backers of the program have said there aren't any documented abuses, while opponents have pointed to a recent report from the Justice Department's inspector general saying the program hasn't been responsible for a big break in a terrorism case, either.

AT: Fear mongering

Their authors are just as guilty of fear mongering

Bolton 2015 (John R [served as the US Permanent Representative to the UN and as Under Secretary of State for Arms Control and International Security]; NSA activities key to terrorism fight; Apr 28; www.aei.org/publication/nsa-activities-key-to-terrorism-fight/; kdf)

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, have played a vital role in protecting America and our citizens around the world from the still-metastasizing terrorist threat. The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens. Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail." The ill-informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts.

AT: No recent terror

They say no recent terror, but that's because the programs are working

AT: Doesn't solve terrorism

These programs have stopped over 50 terror attacks

Dozier 2013 (Kimberly; NSA: Surveillance Programs Foiled Some 50 Terrorist Plots Worldwide; Jun 18; www.huffingtonpost.com/2013/06/18/nsa-surveillance_n_3460106.html; kdf)

The director of the National Security Agency insisted on Tuesday that the government's sweeping surveillance programs have foiled some 50 terrorist plots worldwide in a forceful defense echoed by the leaders of the House Intelligence Committee. Army Gen. Keith Alexander said the two recently disclosed programs – one that gathers U.S. phone records and another that is designed to track the use of U.S.-based Internet servers by foreigners with possible links to terrorism – are critical in the terrorism fight. Intelligence officials have disclosed some details on two thwarted attacks, and Alexander promised additional information to the panel on thwarted attacks that the programs helped stop. He provided few additional details. The programs "assist the intelligence community to connect the dots," Alexander told the committee in a rare, open Capitol Hill hearing. Alexander got no disagreement from the leaders of the panel, who have been outspoken in backing the programs since Edward Snowden, a 29-year-old former contractor with Booz Allen Hamilton, disclosed information to The Washington Post and the Guardian newspapers. Rep. Mike Rogers, R-Mich., chairman of the committee, and Rep. C.A. Dutch Ruppersberger of Maryland, the panel's top Democrat, said the programs were vital to the intelligence community and assailed Snowden's actions as criminal. "It is at times like these where our enemies within become almost as damaging as our enemies on the outside," Rogers said. Ruppersberger said the "brazen disclosures" put the United States and its allies at risk. The general counsel for the intelligence community said the NSA cannot target phone conversations between callers inside the U.S. – even if one of those callers was someone they were targeting for surveillance when outside the country. The director of national intelligence's legal chief, Robert S. Litt, said that if the NSA finds it has accidentally gathered a phone call by a target who had traveled into the U.S. without their knowledge, they have to "purge" that from their system. The same goes for an accidental collection of any conversation because of an error. Litt said those incidents are then reported to the Foreign Intelligence Surveillance Court, which "pushes back" and asks how it happened, and what the NSA is doing to fix the problem so it doesn't happen again. Rogers previewed the latest public airing of the NSA controversy the morning after President Barack Obama, who is attending the G-8 summit in Ireland, vigorously defended the surveillance programs in a lengthy interview Monday, calling them transparent – even though they are authorized in secret. "It is transparent," Obama told PBS' Charlie Rose in an interview. "That's why we set up the FISA court," the president added, referring to the secret court set up by the Foreign Intelligence Surveillance Act that authorizes two recently disclosed programs: one that gathers U.S. phone records and another that is designed to track the use of U.S.-based Internet servers by foreigners with possible links to terrorism. Obama said he has named representatives to a privacy and civil liberties oversight board to help in the debate over just how far government data gathering should be allowed to go – a discussion that is complicated by the secrecy surrounding the FISA court, with hearings held at undisclosed locations and with only government lawyers present. The orders that result are all highly classified. "We're going to have to find ways where the public has an assurance that there are checks and balances in place ... that their phone calls aren't being listened into; their text messages aren't being monitored, their emails are not being read by some big brother somewhere," the president said. A senior administration official said Obama had asked Director of National Intelligence James Clapper to determine what more information about the two programs could be made public, to help better explain them. The official spoke on condition of anonymity because the official was not authorized to speak publicly. Snowden accused members of Congress and administration officials Monday of exaggerating their claims about the success of the data gathering programs, including pointing to the arrest of the would-be New York subway bomber, Najibullah Zazi, in 2009. In an online interview with The Guardian in which he posted answers to questions Monday, Snowden said that Zazi could have been caught with narrower, targeted surveillance programs – a point Obama conceded in his interview without mentioning Snowden. "We might have caught him some other way," Obama said. "We might have disrupted it because a New York cop saw he was suspicious. Maybe he turned out to be incompetent and the bomb didn't go off. But, at the margins, we are increasing our chances of preventing a catastrophe like that through these programs," he said. Obama repeated earlier assertions that the NSA programs were a legitimate counterterror tool and that they were completely noninvasive to people with no terror ties – something he hoped to discuss with the privacy and civil liberties board he'd formed. The senior administration official said the president would be meeting with the new privacy board in the coming days.

Surveillance isn't foolproof, but has solved attacks - empirics

Williams and Winter 2015 (Pete and Tom; Man Under Surveillance by Joint Terrorism Task Force Shot Dead in Boston; www.nbcnews.com/news/us-news/man-under-surveillance-joint-terrorism-task-force-shot-dead-boston-n368376; kdf)

A man wielding a large, military-style knife came at police and FBI agents as they attempted to interview him in Boston early Tuesday, and was fatally shot only after he refused to drop the weapon, officials said. Usaamah Abdullah Rahim had been under 24-hour surveillance by the Boston Joint Terrorism Task Force, and a senior official told NBC News they were investigating whether the 26-year-old Boston man had become radicalized by ISIS-inspired social media messages and feared a terror plot was in the works. A second man from the Boston suburb of Everett was later taken into custody as officials conducted a related terrorism investigation, Boston police said Tuesday night. His name was not released. Rahim was stopped around 7 a.m. ET at a CVS parking lot in Boston's Roslindale neighborhood, FBI Special Agent in Charge Vincent Lisi said at an afternoon news conference. The officers wanted to interview him at the scene, but had no warrant for his arrest. The officers did not have their guns drawn, and Rahim pulled a knife out first, Boston Police Commissioner William Evans told reporters. "We have video depicting the individual coming at officers while the officers were retreating," Evans said. Officers and agents ordered Rahim to drop his weapon, and then took out their firearms and shot at him when he refused, Evans added. He was struck twice — in the abdomen and torso — and was later pronounced dead at the hospital, police said. Officials are reviewing whether the shooting was justified, but early surveillance video and witness statements indicate the officers' "lives were in danger," Evans said. After the shooting, authorities began searching a home in Everett and another address in Warwick, Rhode Island, in connection to the incident, senior law enforcement sources in New England told NBC News. A source earlier said the occupants in the Everett home might also be of interest in the investigation. Law enforcement sources say Rahim had been under investigation and surveillance for several weeks by the Boston Joint Terrorism Task Force. In recent months, ISIS messages worldwide have called for attacks using whatever weapons are at hand, including guns and knives.

AT: Terrorism Kritiks

Even if they win the K – it is just impact mitigation, not a reason to vote Aff

*This is also the 2NC must read

Lewis 2014 (James Andrew [senior fellow and director of the Strategic Technologies Program at CSIS]; Underestimating Risk in the Surveillance Debate; Dec; http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; kdf)

The phrase “terrorism” is overused, and the threat of terrorist attack is easily exaggerated, **but that does not mean this threat is nonexistent.** Groups and individuals still plan to attack American citizens and the citizens of allied countries. The dilemma in assessing risk is that it is discontinuous. There can be long periods where no activity is apparent, only to have the apparent calm explode in an attack. The constant, low-level activity in planning and preparation in Western countries is not apparent to the public, nor is it easy to identify the moment that discontent turns into action. There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences. A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia. Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces. The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new “front” for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets. ²⁷ The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. these attacks are the threat that mass surveillance was created to prevent. The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent

upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

Terrorism studies are epistemologically and methodologically valid---our authors are self-reflexive

Michael J. **Boyle 8**, School of International Relations, University of St. Andrews, and John Horgan, International Center for the Study of Terrorism, Department of Psychology, Pennsylvania State University, April 2008, "A Case Against Critical Terrorism Studies," *Critical Studies On Terrorism*, Vol. 1, No. 1, p. 51-64

Jackson (2007c) calls for the development of an explicitly CTS on the basis of what he argues preceded it, dubbed 'Orthodox Terrorism Studies'. The latter, he suggests, is characterized by: (1) its poor methods and theories, (2) its state centrism, (3) its problemsolving orientation, and (4) its institutional and intellectual links to state security projects. Jackson argues that the major defining characteristic of CTS, on the other hand, should be 'a skeptical attitude towards accepted terrorism "knowledge"'. **An implicit presumption from this is that terrorism scholars have laboured for all of these years without being aware that their area of study has an implicit bias, as well as definitional and methodological problems.** In fact, **terrorism scholars are not only well aware of these problems, but also have provided their own searching critiques** of the field at various points during the last few decades (e.g. Silke 1996, Crenshaw 1998, Gordon 1999, Horgan 2005, esp. ch. 2, 'Understanding Terrorism'). **Some of those scholars** most associated with the critique of empiricism implied in 'Orthodox Terrorism Studies' **have also engaged in deeply critical examinations of the nature of sources, methods, and data in the study of terrorism.** For example, Jackson (2007a) regularly cites the handbook produced by **Schmid and Jongman** (1988) to support his claims that theoretical progress has been limited. But this fact was well recognized by the authors; indeed, in the introduction of the second edition they **point out** that they have not revised their chapter on theories of terrorism from the first edition, because the **failure to address** persistent conceptual and **data problems** has undermined progress in the field. The point of their handbook was to sharpen and make more comprehensive the result of research on terrorism, not to glide over its methodological and definitional failings (Schmid and Jongman 1988, p. xiv). Similarly, **Silke's** (2004) **volume on the state of the field of terrorism research performed a similar function**, highlighting the shortcomings of the field, in particular the lack of rigorous primary data collection. **A non-reflective community of scholars does not produce such scathing indictments of its own work.**

Terror is a real threat driven by forces the aff can't resolve---we should reform the war on terror, not surrender---any terror attack turns the entire case

Peter **Beinart 8**, associate professor of journalism and political science at CUNY, *The Good Fight; Why Liberals – and only Liberals – Can Win the War on Terror and Make America Great Again*, vii-viii

APPLYING THAT TRADITION today is not easy. Cold war liberals developed their narrative of national greatness in the shadow of a totalitarian superpower. **Today, the United States faces** no such unified threat. Rather, it faces **a web of dangers**—from disease to environmental degradation to weapons of mass destruction—all **fueled by globalization, which leaves America increasingly vulnerable to pathologies bred in distant corners of the world.** And **at the center of this nexus sits jihadist terrorism**, a new totalitarian movement that lacks state power but harnesses the power of globalization instead. Recognizing that the United States again faces a totalitarian foe does not provide simple policy prescriptions, because today's totalitarianism takes such radically different form. But **it reminds us** of something more basic, **that liberalism does not find its enemies only on the right—a lesson sometimes forgotten in the age of George W. Bush.** Indeed, it is because liberals so despise this president that they increasingly reject his trademark phrase, the "war on terror." Were this just a semantic dispute, it would hardly matter; **better alternatives to war on terror abound.** But the rejection signifies something deeper: a turn away from the very idea that anti-totalitarianism should sit

at the heart of the liberal project. For too many liberals today, George W. Bush's war on terror is the only one they can imagine. This alienation may be understandable, but that does not make it any less disastrous, for it is liberalism's principles—even more than George W. Bush's—that jihadism threatens. If today's liberals cannot rouse as much passion for fighting a movement that flings acid at unveiled women as they do for taking back the Senate in 2006, they have strayed far from liberalism's best traditions. And if they believe it is only George W. Bush who threatens America's freedoms, they should ponder what will happen if the United States is hit with a nuclear or contagious biological attack. **No matter who is president,** Republican or Democrat, **the reaction will make John Ashcroft look like the head of the ACLU.**

Ethical rebellion does not require rejecting all resort to lethal force---killing is conditionally justified in cases where the target is culpable for injustice. This distinction will win us the debate---ethical rebellion can allow killing, so long as we recognize that it is simultaneously necessary, but cannot be truly ethically justified. Recognizing our own conduct as ethically unjustifiable despite its necessity in preserving innocent life sets up killing as truly exceptional

Matt Hartman 13, MA, Philosophy, University of Chicago, 6/5/13, "The Rebel or the Militant: Universality and Political Violence,"

<http://lucian.uchicago.edu/blogs/colloquium/2013/06/05/the-rebel-or-the-militant-universality-and-political-violence/>

I begin with rebellion, Camus' analogue to Badiou's event. For him, rebellion means something restricted, something that respects its own limits.

The rebels who [...] wanted to construct [...] a savage immortality are terrified at the prospect of being obliged to kill in their turn. Nevertheless, if they retreat they must accept death; if they advance they must accept murder. Rebellion, cut off from its origins and cynically travestied, oscillates, on all levels, between sacrifice and murder.[24]

In other words, rebellion is characterized by a recognition that the status quo is structurally unjust and must be opposed—hence the rebel's inability to retreat—and a simultaneous recognition that the means of opposition themselves imply a crime.[25] The 'savage immortality' that appears to arise from rebellion—the point where rebellion's initial impetus appears to no longer to govern the sequence—cannot be, and yet the rebel must act. This conflict forms the paradoxical, logical structure of rebellion that creates an inherent limit upon what can be (ethically) done. As we will see, that limit is marked by murder.

Moreover, that limit is dependent upon the beginnings of the rebellion. "I rebel—therefore we exist," says Camus (R 22). This formulation is variously suggestive, but the two most important implications for our purposes are the axiomatic claims to universality and equality. Similar to Badiou's claim that all are 'virtual militants' of the event, Camus argues that a rebellion reaches for universality (by transforming the 'I' into a 'We'). Its virtues must apply to all. And for this reason, it must aim at equality, as all must be equal in their ability to make the same declaration.

Rebellion is the assertion of an axiom of equality between one and all. "In assigning oppression a limit within which begins the dignity[26] common to all men, rebellion defined a primary value" (R 281). Camus' formulation necessitates an understanding—an ethical principle—of equality that rebels must recognize. Rebellion is the very process of the assertion of this egalitarianism. We can already begin to see, then, how Camus' axiom is an ethical principle.

But this point further implies that the claim of rebellion—a claim to act from principle, not simply to take power—must recognize universality as a claim concerning the situation. The principle now instituted refers to a governing logic, not to an individual. Again,

this claim parallels Badiou's rethinking of the State's logic of ordering. The structure of thought, not the identity of the master, is the problem. Thus, one claims a wrong against the situation: if the slave merely takes his master's place, there is no rebellion but a coup. The logic must change. The 'we exist' half of Camus' formulation necessitates as much: if the rebellion's axiom does not apply to all, the rebellion has no coherent ground or claim. It would be a mere simulacrum. Rebels must act towards all—they have a limit on what they can not do.

But, against Badiou, they also have a limit on what they can do. The result of the 'universal value' defined by the axiom/principle in Camus' formulation is a limit placed upon rebels. This limit is murder:

[M]urder is thus a desperate exception or it is nothing. It is the limit that can be reached but once, after which one must die. The rebel [...] kills and dies so that it shall be clear that murder is impossible. He demonstrates that, in reality, he prefers the 'We are' to the 'We shall be.' [...] Beyond the farthest frontier, contradiction and nihilism begin. (R 282)

This passage contains the core of The Rebel. Camus condemns any logic that justifies murder on the grounds of a history—either because it helps bring about a desired future state or because it is part of a larger, necessary historical epoch. He denies any logic that determinatively ties ethical action to a historical context, subsuming particular situations under history.

To justify an act by history is to implicitly de-value the present. It is to imply that a present claim to justice—to the axiomatic principles of rebellion—are not to be met. It is to deny the 'we are' to the 'we shall be,' as Camus says above. The axiomatic structure of the statement 'I rebel, therefore we exist,' demands the present be equal to the future. If not, the very structure of politics is denied and rebellion's logic is made incoherent. The situatedness of the rebellion—the fact that the axiom is declared now—implies that as a universal, logical claim it is definitively tied to the present. Because it is universal, the present cannot be devalued to the future, otherwise it would be a mere instrument. By not separating history into pre- and post-event with an ontologically uncontainable state between them, Camus is providing a framework to make historical change sensible even as it is ongoing.

The axiomatic aspect of rebellion's principles conditions this thought. Camus does not claim that rebellion's ends should exist, or that they will exist, or that it would be morally right if they existed: "Nothing justifies the assertion that these principles have existed eternally; it is of no use to declare that they will one day exist" (R 283). Rather, the axiom is a demand for equality (or justice or freedom) against the State. Because the axiom acts as an ethical principle for the rebels during the course of their rebellion, the coherence between the rebels' actions and their axiom is the justification of their logic. Every (legitimate) rebellion has this form.

And as a result, for Camus, universality is not a matter of Badiou's virtuality, but of actuality. Because "[rebellion's] reasons—the mutual recognition of a common destiny and the communication of men between themselves—are always valid" at the same time they are axiomatic, Camus is demanding concrete coherence between the rebellion's actions and its axiom (R 283). The axiomatic principles are merely actualized by their declaration. But this is possible only because Camus does not posit an axiom that is (materially, historically) transformed into an ethical principle. As a result, though Camus may have supported all of the Libyan rebels' actions, he has built the framework to sensibly ask the ethical question of them, even though it is based in particularity.

This is because the actual universality Camus posits provides a substantial ethics: murder is the limit of rebellion and cannot be justified. "Logically," he says, "one should reply that murder and rebellion are contradictory. If a single master should, in fact, be killed, the rebel, in a certain way, is no longer justified in using the term community of men from which he derived his justification" (R 281). The claim is drastic: to murder anyone, even the source of injustice, is unjustifiable. It denies all egalitarian maxims by denying the victim the chance to meet rebellion's demand—and it does so because Camus' concern is actuality: Badiou's universality in principle holds whether acted upon or not. But Camus shows in the first three sections of *The Rebel* that rebellions that have accepted murder became incoherent.[27]

However, Camus did not forswear murder—he claimed that it was a limit that could be met exactly once. On the one hand, it is simply utopian to refuse the use of violence in politics: Assad must be overthrown for the sake of creating a democracy. But Camus has already denied historical justification as nihilistic and incoherent. And yet inaction would implicitly accept the unjust status quo. So, then, murder is necessary but unjustifiable; the rebel "kills and dies so that it shall be clear that murder is impossible."

Camus navigates this paradox by insisting on murder's exceptional status. One should rebel, even by murder, but simultaneously recognize murder as contrary to one's own principles. An act of murder, we can say, will be legitimate but not just: legitimate in battling the unjust present, but unjust itself because legitimacy cannot clear the rebel of guilt. This claim—which is the core of Camus' argument against Robespierre and Lenin, as well as his defense of the Russian terrorist Kaliayev—asserts that history cannot enter into politics' logic. This time, this point in history may legitimize an act, but it cannot justify that act because ethical principles are eternal. Their universality must be protected in the material actions throughout the rebellion.

For this reason, even the legitimacy of murder is conditional. [28] First, the victim must be a cause of the present injustices—e.g., the master of the slaves or the Ba'athist dictator. The murder of innocents can only be legitimated by historicist arguments unavailable to the coherent rebel. Second, the rebel's act must be recognized as a crime by her own standards. She must recognize her own guilt as a failure to cohere with her axiom: only this recognition ensures murder remains exceptional. protecting a practical manifestation of the rebellion's logic. The crime of Saint-Just and Robespierre was allowing the Terror to become an institution that altered the rebellion's logic.

****Counter-terror Debate**

AT: Counter-terror ineffective/ AT: Losing WOT

It's not a question of "have we defeated all the terrorists" but instead, "how do we most effectively combat terrorism?" – the plan robs intelligence agencies of the tools needed to prevent large scale attacks—that's all of our link ev

And – counter-terrorism is working now

Zenko 2015 (Micah; CIA Director: We're Winning the War on Terror, But It Will Never End; Apr 8; blogs.cfr.org/zenko/2015/04/08/cia-director-were-winning-the-war-on-terror-but-it-will-never-end/; kdf)

Last night, Director of Central Intelligence John Brennan participated in a question-and-answer session at Harvard Kennedy School's Institute of Politics. The first thirty-seven minutes consisted of an unusually probing exchange between Brennan and Harvard professor Graham Allison (full disclosure: Graham is a former boss of mine). Most notably, between 19:07 and 29:25 in the video, Allison pressed Brennan repeatedly about whether the United States is winning the war on terrorism and why the number of al-Qaeda-affiliated groups has only increased since 9/11: "There seem to be more of them than when we started...How are we doing?" Brennan replied: If I look across the board in terms of since 9/11 at terrorist organizations, and if the United States in all of its various forms. In intelligence, military, homeland security, law enforcement, diplomacy. If we were not as engaged against the terrorists, I think we would be facing a horrendous, horrendous environment. Because they would have taken full advantage of the opportunities that they have had across the region... We have worked collectively as a government but also with our international partners very hard to try and root many of them out. Might some of these actions be stimulants to others joining their ranks? Sure, that's a possibility. I think, though it has taken off of the battlefield a lot more terrorists, than it has put on. This statement is impossible to evaluate or measure because the U.S. government has consistently refused to state publicly which terrorist organizations are deemed combatants, and can therefore be "taken out on the battlefield." However, relying upon the State Department's annual Country Reports on Terrorism, the estimated strength of all al-Qaeda-affiliated groups has grown or stayed the same since President Obama came into office. Of course, non-al-Qaeda-affiliated groups have arisen since 9/11, including the self-proclaimed Islamic State, which the Central Intelligence Agency estimated last September to contain up to 31,500 fighters, and Boko Haram, which has perhaps 10,000 committed members. However, the most interesting question posed to Brennan came at the very end from a Harvard freshman who identified himself as Julian: "We've been fighting the war on terror since 2001. Is there an end in sight, or should we get used to this new state of existence? Brennan replied: It's a long war, unfortunately. But it's been a war that has been in existence for millennia, at the same time—the use of violence for political purposes against noncombatants by either a state actor or a subnational group. Terrorism has taken many forms over the years. What is more challenging now is, again, the technology that is available to terrorists, the great devastation that can be created by even a handful of folks, and also mass communication that just proliferates all of this activity and incitement and encouragement. So you have an environment now that's very conducive to that type of propaganda and recruitment efforts, as well as the ability to get materials that are going to kill people. And so this is going to be something, I think, that we're always going to have to be vigilant about. There is evil in the world and some people just want to kill for the sake of killing...This is something that, whether it's from this group right now or another group, I think the ability to cause damage and violence and kill will be with us for many years to come. We just have to not kill our way out of this because that's not going to address it. We need to stop those attacks that are in train but we also have to address some of those underlying factors and conditions. I'm not saying that poverty causes somebody to become a terrorist, or a lack of governance, but they certainly do allow these terrorist organizations to grow and they take full advantage of those opportunities. To summarize, the war on terrorism is working, compared to inaction or other policies. But, the American people should expect it to continue for millennia, or as long as lethal technologies and mass communication remain available to evil people.

xt - Counter-terror effective

American counter-terrorism measures are effective

Bonn 6/17/2015 (Steve [producer of the Rachel Maddow Show]; The scope of Obawww.msnbc.com/rachel-maddow-show/the-scope-obamas-counter-terrorism-successes; kdf)

Whenever the political world's attention turns to matters of national security and terrorism, Republican criticisms of President Obama feature familiar talking points. The president isn't "aggressive" enough, they say. His approach must be "tougher," like the policies adopted by the Bush/Cheney administration. Obama's counter-terrorism policies are so ineffective, the right insists, that the White House won't even use the specific words – "radical Islamic terrorism" – that Republicans demand to hear. But the gap between GOP rhetoric and national-security reality continues to grow. We learned yesterday, for example, that a U.S. airstrike killed Nasir al-Wuhaysh, al Qaeda's No. 2 official – and the top guy in al Qaeda in the Arabian Peninsula. As Rachel noted on the show last night, his death is a "huge deal," especially given the terrorist plots al-Wuhaysh has helped oversee. NBC News had a helpful report yesterday on the frequency with which U.S. strikes have successfully targeted al Qaeda's top leaders. Since Navy SEALs killed [Osama bin Laden] in 2011, American drone strikes have taken out seven potential candidates to succeed him as the leader of what was once the most-feared terror gang. The targeted attacks started within weeks of bin Laden's death. Three al Qaeda higher-ups were killed in June, August and September of 2011, followed by another three in late 2012 and early 2013.... Now, the death of 38-year-old Wuhayshi – killed in a strike on Friday – is seen by American intelligence officials as a major blow to al Qaeda, which is struggling with decimated ranks and ideological competition from the Islamic State. I'm reminded of this piece in The Atlantic last fall, when Jeffrey Goldberg, hardly a liberal, wrote, "Obama has become the greatest terrorist hunter in the history of the presidency." It's a detail Republicans simply don't know what to do with, so they ignore it and pretend the president is indifferent to matters of national security, all evidence to the contrary notwithstanding. While GOP officials and candidates continue to insist that what really matters is word-choice, Obama's counter-terrorism strategy includes so many successes, they no longer generate much attention. Notice, for example, just how little chatter al-Wuhaysh's death garnered yesterday. There is, of course, an entirely different side of the debate. Yes, Republican rhetoric is divorced from reality. Yes, Obama has successfully targeted a wide variety of prominent terrorist leaders. But there are all kinds of related questions that often go overlooked: do U.S. strikes deter or prevent future terrorist threats? Is the U.S. policy entirely consistent with the law? What are the implications of a policy reliant on drones? Should Americans expect the current national-security policy to remain in place indefinitely? What happens when one terrorist leader is killed, but he's replaced by someone worse?

xt - Terror attacks down

Even if they don't solve all attacks, counter-terror measures are reducing the frequency and severity – the plan throws the baby out with the bathwater

Gutierrez et al 6/20/2015 (ARES P. GUTIERREZ, CATHERINE S. VALENTE AND AFP; US notes 24% drop in terror attacks in PH; www.manilatimes.net/us-notes-24-drop-in-terror-attacks-in-ph/193594/; kdf)

According to the Country Reports on Terrorism 2014 prepared by the State Department's Bureau of Counterterrorism, the drop in the number of attacks was attributed to the improved cooperation between Manila and Washington. "Terrorist groups, including the Abu Sayyaf Group (ASG), Jemaah Islamiya (JI), and the Communist People's Party/New People's Army (CPP/NPA), were unable to conduct major attacks compared to previous years due to continuous pressure from Philippine counterterrorism and law enforcement efforts. Terrorist groups' acts included criminal activities designed to generate revenue for self-sustainment, such as kidnapping for ransom, extortion, and bombings for hire," the report which was posted on the State Department's website said. The report however said that despite "sustained pressure on terrorist organizations," terrorist and rebel groups in Mindanao managed to retained its capability to make improvised bombs and engage in small-scale attacks. The State Department likewise gave credit to the progress in the implementation of the country's Internal Peace and Security Plan which calls for the transition of internal security operations from the military to the Philippine National Police. It however branded the transition as "slow and ineffective". "Continued violent extremist activity, as well as counterterrorism gaps between the AFP and the PNP, slowed this transition and forced the AFP to continue playing the lead counterterrorism role in the Philippines," the report said. The State Department also took note of the government's push to enact the proposed Bangsamoro Basic Law and efforts to curb the potential threat posed by radical supporters of the Islamic State in Iraq and the Levant (ISIL) and the risk of ISIL elements traveling to the Philippines to promote violent extremism in the country or seek safe haven as among the situations to watch out for in the Philippines. Commenting on the State Department's report, Communications Secretary Herminio Coloma said the Philippines is "firmly determined to address these challenges". "Government is firmly determined to address these challenges through intensified security measures and pursuit of peace-building initiatives," he said in a text message. The State Department report mentioned the Aquino administration's move to prioritize having the 2007 Human Security Act amended to enable it to conform to international standards; ease the strict monetary penalties and prison terms against law enforcement officials involved in cases where individuals are wrongly accused and later acquitted; and remove barriers to support investigations. "The (Anti-Terrorism Council) Project Management Center, in coordination with the Anti-Money Laundering Council (AMLC) Secretariat and the Presidential Legislative Liaison Office, ensured the final version of the HSA was fully in line with the Terrorism Financing Prevention Act and other Anti-Money Laundering Act and Philippine government initiatives prior to submission to the House of Representatives," the report said. While the report criticizes the limited capabilities and "mixed record of accountability and respect for human rights of specialized counterterrorism units like the National Bureau of Investigation and the PNP Special Action Force, it gave credit to the continued improvement in the security of Philippine passports. It also mentioned the country's commitment to improve transportation and port security by increasing security capabilities at its airports, seaports, and bus terminals. The State Department report moreover said an "under-resourced and understaffed law enforcement and judicial system, coupled with widespread official corruption" led to "limited domestic investigations, unexecuted arrest warrants, few prosecutions, and lengthy trials of cases." "Philippine investigators and prosecutors lacked necessary tools to build strong cases, including a lack of clear processes for requesting judicially-authorized interception of terrorist communications, entering into plea bargains with key witnesses, and seizing assets of those suspected in benefiting from terrorism," it said. The full State Department report said there were 13,463 attacks in 95 countries in 2014 — up by a third from the year before — with Iraq, Pakistan and Afghanistan bearing the brunt of extremist violence, the State Department said in a report. The largest number of attacks were carried out by Islamic State (IS) militants, who unleashed 1,083 assaults last year as part of a deadly march across Iraq and Syria. The Taliban were the next most lethal group, with 894 attacks. There was also a sharp rise in violence in Nigeria, where Boko Haram's Islamist militants have been spreading terror in the north. Some 7,512 people were killed in 662 attacks. The report also highlighted a rise in "lone offender violent extremists in the West" such as the Charlie Hebdo attacks in January in Paris. "The terrorism challenges that we face continue to evolve at a rapid pace and we cannot predict with precision what the landscape will look like one decade or even really a year from now," said top US counterterrorism envoy Tina Kaidanow, unveiling the 2014 Country Reports on Terrorism. "We must do more to address the cycle of violent extremism and transform the very environment from which these terrorist movements emerge." Acknowledging that most of the recorded attacks were in war zones, Kaidanow denounced the "savagery" seen last year which had spurred the high death toll. Kidnappings also jumped by a third, with more than 9,400 people taken hostage, three times as many as in 2013.

Ransoms have been used by both IS and Al-Qaeda as an effective way to raise money. But Kaidanow said the numbers did not tell the whole story, saying the US has been effective over the past year in building up a coalition to help fight militant groups, choke off funding and stem the flow of foreign fighters.

Terrorism –Samford

Shell

1NC Terrorism DA

Terror threats are real- flexible surveillance is key to prevent major attacks

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, “Underestimating Risk in the Surveillance Debate,”

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

Americans are reluctant to accept terrorism is part of their daily lives, but **attacks have been planned or attempted against American targets** (usually airliners or urban areas) **almost every year since 9/11**. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia's then-attorney general said in August 2013 that communications surveillance had stopped four “mass casualty events” since 2008. The constant planning and preparation for attack by terrorist groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications **surveillance is an essential law enforcement and intelligence tool. There is no replacement for it**. Some suggestions for **alternative approaches** to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, **reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm**. The Evolution of Privacy Some of the unhappiness created by the Edward Snowden leaks reflects the unspoken recognition that online privacy has changed irrevocably. The precipitous decline in privacy since the Internet was commercialized is the elephant in the room we ignore in the surveillance debate. America's privacy laws are both limited in scope and out of date. Although a majority of Americans believe privacy laws are inadequate, the surveillance debate has not led to a useful discussion of privacy in the context of changed technologies and consumer preferences. Technology is more intrusive as companies pursue revenue growth by harvesting user data. Tracking online behavior is a preferred business model. On average, there are 16 hidden tracking programs on every website. The growing market for “big data” to predict consumer behavior and target advertising will further change privacy. Judging by their behavior, Internet users are willing to exchange private data for online services. A survey in a major European country found a majority of Internet users disapproved of Google out of privacy concerns, but more than 80 percent used Google as their search engine. The disconnect between consumer statements and behavior reduces the chances of legislating better protections. We have global rules for finance and air travel, and it is time to create rules for privacy, but governments alone cannot set these rules, nor can a single region impose them. Rules also need to be reciprocal. NSA bears the brunt of criticism, but its actions are far from unique. All nations conduct some kind of communications surveillance on their own populations, and many collect against foreign targets. Getting this consensus will be difficult. There is no international consensus on privacy and data protection. EU efforts to legislate for the entire world ignore broad cultural differences in attitudes toward privacy, and previous EU privacy rules likely harmed European companies' ability to innovate. Finding a balance between privacy, security, and innovation will not be easy since unconstrained collection creates serious concerns while a too-restrictive approach threatens real economic harm. Espionage and Counterterrorism NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but **assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence**. **Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of** the efforts of teams of dedicated individuals from many **agencies, using many tools and techniques**, working together **to assemble** fragments of **data from many sources into a coherent picture**.

Border terrorism is especially likely- strict laws are key to prevent attacks

Leonard and Katz '14 [Tom Leonard is a retired Army officer and War College graduate; Joshua Katz is a former Army Ranger and CIA operations officer. Both served as senior policy advisors to the Chairman of the House Committee on Homeland Security, “IT'S TIME FOR A NATIONAL BORDER SECURITY STRATEGY,” 9-17-14,

<http://warontherocks.com/2014/09/its-time-for-a-national-border-security-strategy/>]

The threats facing the United States within the international border environment are real, dynamic, and multi-dimensional; those who wish us harm – terrorists, criminal organizations, and nation states – **remain flexible** and act without regard to our laws. **These adversaries are** not only **able to exploit the gaps in our laws, border security infrastructure**, and response capabilities, but also in our policies **and our own failure to implement existing law**. In short, our adversaries are quicker to adapt to the changing border security environment than we are at identifying and correcting our own security shortfalls. Although there are potential threats present at each border, the danger posed by the accumulation of those threats (TCOs, terrorists, adversarial nation states) is particularly acute along the Southwest border. Competing drug cartels are engaged in an unprecedented inter-

organizational conflict over smuggling routes into the United States. Furthermore, with billions of dollars in operating capital, TCOs are capable of buying, corrupting, building, and/or coercing the necessary freedom of action to counter and respond to law enforcement efforts to curtail their activities. TCOs have spent decades refining the **transportation routes to bring illicit material** (drugs) **into the country** and to engage in human trafficking. TCOs have also realized that these routes are more valuable than for just transporting drugs, that others will pay high sums to use these routes for their own purposes. The additional funds from transporting people and other material do not impact the transportation of their main product, meaning any revenues received are pure profit. On this basis, there is little downside to transporting people or dangerous materials into the United States (product is product), and it thus **provides a proven conduit for terrorist organizations to enter the United States undetected**. There is speculation that the TCO risk/reward analysis would prevent them from partnering with a terrorist organization, as such a relationship would heighten the pressure they might face from the United States government. However, at least one publicly acknowledged incident—the attempted assassination of the Saudi Arabian ambassador to the United States by a suspected agent of the government of Iran—seems to contradict this argument. This case suggests the possibility of a worrying, if ad hoc, relationship between the Iranian government (or, more specifically its intelligence service) and a Mexican cartel to manage the transportation of the Iranian operative into the United States. **It also highlights the need for heightened awareness of the narco-terrorist nexus** within the Mexican cartels and the possibility that these relationships are growing stronger as the development of a true border security strategy continues to be delayed.

Terrorism causes extinction through CBW, nuclear, and cyber attacks- threats are constantly advancing

Alexander '10 [Yonah, Director of the International Center for Terrorism Studies at the Potomac Institute for Policy Sciences, “Maghreb & Sahel Terrorism: Addressing the Rising Threat from al-Qaeda & other Terrorists in North & West/Central Africa,” January, http://www.potomac institute.org/attachments/524_Maghreb%20Terrorism%20report.pdf]

Current and future perpetrators include the following: “freelance” and sub-state terrorist groups; individual terrorists; mentally deranged “crusaders” or “martyrs”; single-issue political extremists; ideological-based groups; ethnic, racial, and religious movements; nationalist and separatist actors; criminal and political mercenaries; and international networks, particularly **al-Qaeda and its affiliates in Africa, Asia, and the Middle East**. Terrorists’ impulses cover a broad range of motivations. These consist of political discontent— ideological (anarchism, ambitions, radicalism) and nationalistic (resistance, separatism, irredentism)— economic discontent (low living standards, lack of opportunity, unfulfilled expectations, loss or squandered resources); and cultural discontent (class constraints, ethnic discrimination, religious intolerance, technological and environmental irritants). **There is also a long record of governments that provide terror groups both direct and indirect support** (e.g., financing, training, intelligence, operations, and weaponry). **A rogue nation utilizes terrorist proxies to further its own country’s interests**. As formal, open, and direct malevolent actions undertaken by a government would call immediate attention to state sponsors, using terrorist groups to carry out operations such as assassinations and bombings enables the government sponsor to deny any claim. The roles played by Iran, Sudan, Cuba, previously Libya, and North Korea in such events come to mind. Currently, Iran and North Korea are of particular concern to the international community because of their nuclear ambitions. In addition, **the latest focus of concern is so-called “failed states” wherein there are no effective government institutions to intercede and prevent the spread of terrorist facilities within a country**. These lawless zones are increasingly becoming target-rich opportunities for the **consolidation of terrorist assets and ventures**. Current Trends Modern terrorism is characterized by an ideological and theological fanaticism, an education in hatred toward one’s enemy, which has coupled with rapid technological advancements in communications (e.g., the internet), transportation (e.g., modern international air travel), as well as conventional and unconventional weaponry to create a truly lethal threat. Indeed, this threat has become much more decentralized as it now emanates not only from established terrorist organizations but also from freelance individuals with the motives, means, and opportunity to visit harm upon civil society. Because of these developments, contemporary terrorism presents a multitude of threats to all nations, large and small. One measurement of evaluating the terrorist threat is to calculate the enormous cost to all societies in terms of the number of incidents, the human toll, and the economic damage. Indeed, since the 1960s, **modern society has suffered dearly from the global disease of terrorism, a reality that grows in scope and brutality with every passing year**. For example, in the 1970s, a total of 300 domestic and international terrorist attacks were recorded worldwide. Today, almost 40 years later, the count totals more than 80,000 incidents. Clearly, no community, country, or region is immune from the impact of terrorism. In the 9/11 attacks in New York City, citizens from 78 countries were killed. That year alone, 3,537 people died. During the period between 2002-2008, more than 113,000 persons perished and hundreds of thousands were wounded in terrorist attacks throughout the world. The economic, political, psychological, and strategic costs must also be considered in this assessment. Criminal-Terrorist Nexus Globalization and the information revolution have enabled criminals and organized crime to do business and engage in a broad

range of criminal activities. For instance, “white collar” crimes are expanding. These crimes target sectors such as antitrust law, securities, commodities futures, environmental activities, maritime business, gaming, the internet, intellectual property, and tax customs. Trafficking in human beings (e.g., buying and selling of women and children, usually for sexual exploitation) represents another “new,” substantive, and transnational offense. In addition, serious organized criminal threats facing the international community (e.g., the Maghreb and Sahel regions) consist of current and emerging challenges to law enforcement, including drug trafficking (particularly in heroin, both powder and crack cocaine, and ecstasy), organized immigration crime, fraud (particularly in revenue fraud), money laundering, counterfeiting, illicit weapons possession and sales, and high-tech criminal activity (e.g., the Abdul Qadeer Khan nuclear smuggling network). Legitimate companies support terrorists and criminals—directly and unwittingly—to initiate their illicit activities. Numerous identifiable forums of these relationships include the following interfaces: funding and money laundering; employment and accessibility of personnel and equipment; generic tools (e.g., trucks); instruments of terror (e.g., dynamite or explosives); information about local landmarks and prospective targets (e.g., highlighting vulnerabilities and access to targets); communications, resources, and contacts; work permits (particularly for immigration-related criminal activity); and sponsorship (e.g., employment and resources). Terrorist groups and criminals also use front companies, which combine both legitimate and illicit sources of revenue, and shell companies, opaque firms used to hide a legitimate owner’s interests, to finance unlawful operations. In addition to the foregoing, terrorists and criminals feed off each other in a wide variety of criminal activities, including counterfeiting currency, credit card theft, misappropriating and using credit card information, forging documents, identity theft, money laundering, drug trafficking, corruption, and commercial espionage. Terrorist groups use a variety of means—from the simple to the complex—to secure funding for their activities. The initial sources of terrorist funding include both legal (e.g., personal savings and legitimate business revenue) and illicit avenues (e.g., criminal activity such as drug trafficking, kidnapping, and financial fraud). Once the funds are raised, they are distributed to various factions of terrorist groups through a variety of means. These include the use of traditional and alternative financial services entities (e.g., banks and hawalas—informal money-transfers systems firmly established in Asia and the Middle East), nonprofit organizations trading in commodities (e.g., “conflict diamonds” and gold), bogus financial instruments, smuggling of currency and products, wire transfers, drug trafficking, extortion, money laundering, securities fraud, and other scams. Future Outlook: Super Terrorism What is of particular concern is that unconventional weapons—biological, chemical, radiological, and nuclear—are slowly emerging upon the contemporary terrorist scene. That is, as technological developments offer new capabilities for terrorist groups, the modus operandi of these groups may subsequently alter most drastically. Reportedly, at least a dozen terrorist groups, in addition to al-Qaeda’s network, have shown an interest in acquiring or actively attempting to obtain nuclear weapons, which is a significant threat throughout the world. Thus, while the probability of nuclear terrorism remains low in comparison to the use of other weapons of mass destruction, the consequences of “super” terrorism could be enormous. If a nuclear bomb is stolen (or built by a terrorist group with reasonable resources and talent), it could result in massive devastation. For example, an explosion of about one kiloton (one-twentieth the power of the Hiroshima attack) in any major city has the potential to cause more than 100,000 fatalities and result in damage totaling billions of dollars. Another dangerous emerging trend of contemporary international life is the growing threat of cyberterrorism. The expanding concern is that not only criminal hackers but also terrorists will intensify the utilization of this form of electronic warfare as an equalizer weapon. It is evident that the threat of “non-explosive” terrorist assaults is growing with every passing day. Three contributing factors account for the reality. First, the “globalization” of the internet makes government and industry efforts to control cyber attacks much more challenging than ever before. Second, there are now tens of thousands of hacker-oriented sites on the internet resulting in “democratization” of the tools used for disruption and destruction. With their systematic cyber “cookbooks,” the exploitation of Trojan horses, logic bombs, and other electric modus operandi alternatives are becoming a permanent fixture of international life. Third, terrorist organizations have broken away from their place within the formerly bipolar world and have become multidirectional, causing further complications to our technologically vulnerable societies. These new developments have enhanced the threats and capabilities of terrorist groups to the degree in which they could forever alter our planet’s existence.

Uniqueness

UQ- Surveillance strong now

The government still has plenty of surveillance powers

Cohn and Crocker 6-2-15 [Cindy Cohn, Executive Director of the Electronic Frontier Foundation, Andrew Crocker is staff attorney on the Electronic Frontier Foundation's civil liberties team, "Gov't Still Have Plenty Of Surveillance Power Without Sec. 215," <https://www.popularresistance.org/govt-still-have-plenty-of-surveillance-power-without-sec-215/>]

And then there's the matter of targeted investigations. The ACLU's Jameel Jaffer has explained that this too is scaremongering, because "the sunset of Section 215 wouldn't affect the government's ability to conduct targeted investigations of terrorist threats." That's because **even without Section 215, the government still has broad powers to collect information during its national security investigations**. EFF believes that many of these laws can be scaled back and made more transparent as well, but given the current situation, these are the tools in the national security investigators' toolbox: Pen Registers: These allow the government to collect "dialing, routing, addressing, or signaling information" including telephone numbers dialed and Internet metadata such as IP addresses and email headers. There are two pen register statutes, one for foreign intelligence surveillance and one for law enforcement. Both rely only that the pen register be likely to obtain information relevant to a national security or criminal investigation respectively. Until the end of 2011, the NSA used the Foreign Intelligence Surveillance Act (FISA) pen register statute to conduct mass surveillance of Internet metadata, much as it still uses Section 215 for mass collection of telephone records. The Pre-Patriot Act Business Records Provision: Before the passage of the Patriot Act in 2001, **FISA contained a provision allowing the government to obtain business records from transportation carriers and storage facilities**. Harley Geiger of the Center for Democracy and Technology has pointed out that under a June 1 sunset, FISA would simply revert to this provision. An ECPA "D Order": Under Section 2703(d) of the Electronic Communications Privacy Act (ECPA), the government can get a court order for information from ISPs or other communications providers about their customers, including the sorts of metadata the government gets with Section 215. To get a D Order, the government must provide "specific and articulable facts showing that there are reasonable grounds to believe that . . . the records or other information sought, are relevant and material to an ongoing criminal investigation." Grand Jury Subpoenas: Given that Section 215 explicitly says that the FISA Court (FISC) "may only require the production of a tangible thing if such thing can be obtained" with a grand jury subpoena, it's apparent that a grand jury subpoena is a reasonable substitute, at least where a grand jury can be convened. **National Security Letters** (NSLs): Similar to subpoenas, NSLs **allow intelligence agencies to collect records from a range of entities including telecommunications providers, financial institutions, credit reporting bureaus, travel agencies and others**. Nearly all NSLs include self-certified gag orders, which EFF has successfully challenged as unconstitutional. Nevertheless, the FBI and other agencies can use NSLs to collect much the same information as Section 215, although the government has also misused NSLs to obtain communication records not authorized by the NSL statute. Administrative Subpoenas: Many federal agencies have the authority to issue subpoenas for customer records in their normal course of business. These authorities are extremely widespread, comprising 335 different statutes by one count. FISA Warrants: **Under FISA, the government can get warrants from the FISC for electronic surveillance and physical searches in the context of national security investigations**. Although these require a higher showing—probable cause—statistics compiled by EPIC show **the FISC routinely issues them**, and has done so since FISA was passed in 1978. Some of these laws involve different legal standards than Section 215, and not all of them apply in all contexts, although exactly how the government thinks it can use many of them remains unclear. Moreover, mapping these to the government's actual use of 215 is imprecise because the government also continues to say that the types of information it obtains with Section 215 are classified. FBI Director James Comey claims the loss of Section 215 would be a "problem" because at least some of this information can't be obtained with a subpoena or an NSL but hasn't given any examples. And taken together **the government's tools are formidable**, making it difficult to see legitimate, targeted national security information that the government cannot get even without the current version of Section 215, a conclusion confirmed by the Inspector General report that as of 2009 it could not "identify any major case developments from the records obtained in response to Section 215 orders."

UQ- Terror threat is real

Terror threats are imminent- surveillance is key to stop attacks

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

The phrase "terrorism" is overused, and the threat of terrorist attack is easily exaggerated, but that does not mean this threat is nonexistent. **Groups and individuals still plan to attack American citizens** and the citizens of allied countries. The dilemma in assessing risk is that it is discontinuous. There can be long periods where no activity is apparent, only to have the apparent calm explode in an attack. The constant, low-level activity in planning and preparation in Western countries is not apparent to the public, nor is it easy to identify the moment that discontent turns into action. There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences. A simple **assessment of the risk of attack** by jihadis **would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and** the appearance of a powerful new force, the Islamic State in Iraq and Syria (**ISIS**). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia. Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces. The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new "front" for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets. ²⁷ The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. **These attacks are the threat that mass surveillance was created to prevent.** The needed reduction in public **anti-terror measures** without increasing the chances of successful attack **is contingent upon maintaining** the capability provided by communications **surveillance to detect, predict, and prevent attacks.** Our opponents have not given up; neither should we.

Terrorist threats are growing- surveillance is the best solution

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

The echoes of September 11 have faded and the fear of attack has diminished. We are reluctant to accept terrorism as a facet of our daily lives, but **major attacks**—roughly one a year in the last five years—**are regularly planned against U.S. targets**, particularly passenger aircraft and cities. **America's failures in the Middle East have spawned new, aggressive terrorist groups**. These groups include radicalized recruits from the West—one estimate puts the number at over 3,000—who will return home embittered and hardened by combat. Particularly in Europe, **the next few years will see an influx of jihadis joining the existing population of homegrown radicals, but the United States itself remains a target. America's size and population make it is easy to disappear into the seams of this sprawling society. Government surveillance is**, with one exception and contrary to cinematic fantasy, limited and disconnected. That exception is communications surveillance, which provides **the best and perhaps the only national-level solution to find and prevent attacks against Americans and their allies**. Some of the suggestions for **alternative approaches** to surveillance, such as the recommendation that NSA only track "known or suspected terrorists," **reflect both deep ignorance** and wishful thinking. **It is the unknown terrorist who will inflict the greatest harm**.

Surveillance checks terror attacks

Medine et al '14 [David Medine, Chairman of the Privacy and Civil Liberties Oversight Board, Rachel Brand, Elisabeth Collins Cook, James Dempsey, Patricia Wald also contributed to the report, "Report on the Surveillance Program Operated Pursuant to Section 702 of the Foreign Intelligence Surveillance Act," <https://www.pclob.gov/library/702-Report.pdf>]

The efficacy of any particular counterterrorism program is difficult to assess. Even when focusing only on programs of **surveillance**, such programs **can serve a variety of functions that contribute to the prevention of terrorism**. Most obviously, a **surveillance** program **may reveal the existence of a planned terrorist attack, enabling the government to disrupt the attack**. But the number of "plots thwarted" in this way is only one measure of success. Counterterrorism **surveillance** programs **can enable the government to learn about the identities and activities of the individuals who make up terrorist networks. They can help the government to understand the goals and intentions** of those organizations, as well as the ways in which the organizations fund their pursuits and coordinate the activities of their members. **All of this knowledge can aid the government in taking steps to frustrate the efforts of these terrorist organizations**—potentially **stymieing their endeavors long before they coalesce** around the plotting and implementation of **a specific attack**. Because the nature of counterterrorism efforts can vary, measures of success may vary as well.

Lean on the side of caution- surveillance is crucial even if it solves one attack

Morrell '13 [Michael Morell is the former acting director and deputy director of the Central Intelligence Agency and a member of President Obama's Review Group on Intelligence and Communications Technologies, "Michael Morell: Correcting the record on the NSA recommendations," December 27, <http://www.washingtonpost.com/opinions/michael-morell->

correcting-the-record-on-the-nsa-recommendations/2013/12/27/54846538-6e45-11e3-aecc-85cb037b7236_story.html]

Take, for example, **the** Section 215 telephony **metadata program**. It gives the National Security Agency (NSA) the ability to hold the metadata of Americans' phone calls and to search the database containing that information, under a broad court order, to determine whether terrorists overseas have connections to any individuals in the United States. Several news outlets have reported that the review group had called for an end to the program, but we did not do that. We called for a change in approach rather than a wholesale rejection. To better protect the privacy and civil liberties of Americans — key values of our republic — we recommended that the government no longer hold the data and that it be required to obtain an individual court order for each search. But make no mistake: The review group reaffirmed that **the program should remain a tool of our government in the fight against terrorism**. Another misperception involved the review group's view of the efficacy of the Section 215 program; many commentators said it found no value in the program. **The report accurately said that the program has not been "essential to preventing attacks" since its creation. But that is not the same thing as saying the program is not important to national security,** which is why we did not recommend its elimination. **Had the program been in place more than a decade ago, it would likely have prevented 9/11. And it has the potential to prevent the next 9/11. It needs to be successful only once to be invaluable. It also provides some confidence that overseas terrorist activity does not have a U.S. nexus.** The metadata program did exactly that during my last days at the CIA this summer, in the midst of significant threat reports emanating from Yemen. By examining the metadata, we were able to determine that certain known terrorists were most likely not in phone contact with anyone in the United States during this specific period of concern.

US surveillance is key to global counter-terror efforts

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

The United States had unique advantages for counterterrorism on a global level. These include its relationships with a range of foreign intelligence partners, its technical resources, and the information it obtained from its operations in Iraq and Afghanistan. A captured cell phone can provide names and numbers that allow for more precise targeting. Using sophisticated software and combined with information from other intelligence services, NSA was able to take the billions of calls and emails sent each day and winnow them down to a few thousand messages to which an intelligence analyst actually listened. The nature of mass surveillance has been misrepresented, although this point is politically irrelevant. The chief error lies in the difference between collecting and exploitation. Millions of records were collected, very few were exploited. Sophisticated software programs sort through the records to find conversations linked to terrorism, or in some cases, to proliferation or espionage. Most conversations are boring. NSA devoted almost two decades to develop technologies that would let it sort automatically through millions of records to find those few conversations or messages of interest. The actual number of messages is staggering. One report estimates that there were more than 100 trillion messages on the Internet in 2010—more than 30 billion every day (if we discount "spam"). There are more than 3 billion email accounts globally.¹⁶ There are more than 6 billion mobile phone users.¹⁷ The idea that NSA and its partner services in Europe and Asia listened to each message or phone is ludicrous, even if firmly embedded in the public consciousness. We do not know the full scope of success for these programs. The traditional explanation is that the failures of intelligence services will be on every front page but their successes will never be known. We do know that **ending NSA's role in mass surveillance** will not end mass surveillance in Europe or other parts of the world. What it **will** do is **reduce cooperation among allied and friendly services** and the United States and restrict access to extraregional counterterrorism data. **Cooperation** will not end, but **will be less effective at a time when jihadi fighters are beginning to return from Syria. There will be an increase in the risk that a plot will go undetected,** but how much risk will increase is difficult to estimate.

Ending surveillance causes worse strategies to fill the void- backfires and increases terror threats

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Broad surveillance of communications is the least intrusive method and most effective means for discovering terrorist activity. The alternatives to mass surveillance are straightforward. Countries can replace communications surveillance by increasing the number of security service personnel responsible for monitoring terrorism or they can decrease surveillance and accept some increase in the level of risk of a successful attack. The dilemma with choosing this course of action is that the number of agents required to replace communications surveillance is expensive and overtly intrusive in a way the communications surveillance is not. Hundreds of thousands of additional agents would be required to provide national coverage, may lack sufficient global reach to detect activity being planned or undertaken outside U.S. territory, and the creation of such a large force risks creating a much greater chilling effect on liberties. The other risk is political. A vocal minority in the U.S. audience asserts that surveillance has a chilling effect on free speech (although there is no evidence that either the quantity or volume of speech has been in any way affected). European audiences—in part because of a different sense of privacy that we must respect, in part because they lacked familiarity with the role and work of their own intelligence agencies, and in part because of anti-American sentiments—are also disturbed, creating real damage in the transatlantic partnership. Some of this can be discounted—the European left asserting their disapproval of the United States is nothing particularly new. Saying that this disapproval by both U.S. and European audiences is unfair or undeserved, mistaken, or even driven by a larger anti-American agenda misses the point. The political reality is that surveillance programs have created serious concerns and these must be addressed, by beginning an honest discussion of risk, by putting surveillance in the larger context of resurgent authoritarianism and continuing jihad, and by examining whether existing mechanisms for public oversight of surveillance programs are adequate in the United States and in Europe. The only conclusion that can be drawn from the debate over political risk to democracies from surveillance is that adequate oversight is sadly lacking. There are legitimate concerns about surveillance and espionage, but the way to address these concerns is not to end surveillance—that would create unacceptable risk—or to create layers of rules and bureaucracy that return us to pre-9/11 gridlock or try to recreate pre-Internet standards of privacy. Change is essential, and the United States could consider several modifications to its existing practices: increased transparency, strengthened oversight, a greater role for courts, modernizing federal privacy laws, and gaining international agreement on principles for data protection.

Links- Surveillance solves terror

Surveillance is the best counter-terror strategy

Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

Broad surveillance of communications **is the least intrusive and most effective method for discovering terrorist and espionage activity.** Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often **in cooperation with other countries, including the United States.** Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. **Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing.** Any legislative change should be viewed through this lens.

Counter-terror surveillance is effective and key to global cooperation against terrorism

Rotella '13 [Sebastian Rotella worked at the Los Angeles Times, where he was named a Pulitzer Prize finalist in 2006 for his coverage of terrorism and Muslim communities in Europe, "How the NSA's High-Tech Surveillance Helped Europeans Catch Terrorists," June 19, <http://www.propublica.org/article/how-the-nsas-high-tech-surveillance-helped-europeans-catch-terrorists>]

In 2007, Belgian police were keeping close watch on Malika el-Aroud, a fierce al-Qaida ideologue whose dark eyes smoldered above her veil. The Moroccan-born Aroud had met Osama bin Laden while living in al-Qaida's stronghold in Afghanistan. She gained exalted status when her husband posed as a journalist to blow up the renowned Ahmed Shah Massoud, the chief of the anti-Taliban Northern Alliance, just two days before the Sept. 11 attacks. Aroud later returned to Europe, remarried and started an Islamist website that attracted a group of **French and Belgian extremists.** Led by her second husband, Moez Garsallaoui, half-a-dozen of them went to Waziristan, where they **joined several thousand al-Qaida fighters,** including a Latino convert from Long Island, learned to make bombs and plotted against the West with terrorist kingpins. The authorities — American, Belgian, French, Swiss, Italian, Turkish — were all over them. **U.S. surveillance had tracked their radicalization,** their emails from Pakistan, even calls made to their mothers before they trudged through snowy Iranian mountains. An intercepted photo that Garsallaoui sent his wife showed him holding a grenade launcher. He claimed to have killed U.S. soldiers in Afghanistan and described his escape from a missile strike: "I came close to dying." The militants took precautions, changing laptops and using Internet cafes. But **they were no match for top-secret, real-time NSA intercepts.** Some of the monitoring was approved by the Foreign Intelligence Surveillance Act. "We were inside their computers," a source said. As debate rages in the United States about the National Security Agency's sweeping data-mining programs, I've been on a reporting trip overseas, where I've been talking to sources about the controversy and how differing U.S. and European approaches to counterterrorism can complement each other. On Tuesday, NSA Director Gen. Keith **Alexander, told a congressional committee that** his agency's **surveillance programs helped stop more than 50 terror plots in the U.S. and abroad.** Five years ago, I was based in Europe covering terrorism, running from one attack or aborted plot to another. As the Brussels investigation shows, **these cases frequently combined the high-tech reach of the U.S. counterterror apparatus with the street skills of foreign agencies.** In November 2008, Pakistani and U.S. agents swooped into Kandahar and nabbed Bryant Neal Vianas, the convert from Long Island and al-Qaida militant. He cooperated with the FBI, admitting that he discussed an attack on the Long Island Rail Road with top al-Qaida figures. Days later, a drone strike killed Rashid Rauf, a Pakistani-British operative who helped plan the London transport bombings and the "liquid bomb" plot to blow up planes in 2006. Three Belgian and French militants returned home, where police arrested them after intercepts picked up menacing chatter. Vianas pleaded guilty. Aroud went to prison, and investigators believe her second husband Garsallaoui died in the land of jihad. Other cases benefited from close cooperation. In Germany in 2007, U.S. monitoring detected a suspect checking the draft file of an email box at an Internet cafe in Stuttgart. Armed with that lead, German security services deployed surveillance at numerous Internet cafes in the city. The investigation resulted in the dismantling of a Pakistan-trained group plotting to attack U.S. military targets in Germany. As several European sources told me, if an extremist in Marseilles was talking about nefarious activities with an extremist in Geneva over the Internet, chances were good that U.S. intelligence agencies would find out and inform the French and Swiss. Not because of sources on the ground, but because U.S. agencies could detect the communications through computer servers in the United States. The reaction here to the U.S. debate has been bemused. **European terrorist hunters seem surprised that** the revelation of the NSA data-**monitoring programs is big**

news. The technological capacities of U.S. agencies have been an integral component of dramatically improved teamwork against terrorism during the past decade. “In the fight against terrorism, intelligence-sharing is essential.” said Jean-Louis Bruguère, who served for more than two decades as a top French antiterror magistrate before retiring in 2007. (He declined to discuss the NSA’s role in investigations.) “Cooperation with American services has always been trusting and excellent.”

Intel-gathering is crucial to preventing terror attacks

Sulmasy ‘13 [Glenn Sulmasy is professor of law and chairman of the department of humanities at the U.S. Coast Guard Academy. He is the homeland and national security law fellow at the Center for National Policy in Washington, “Why We Need Government Surveillance,” 6-10-13, <http://trumanproject.org/doctrine-blog/why-we-need-government-surveillance/>]

The current threat by al Qaeda and jihadists is one that requires aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways. This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence However, the move toward “home-grown” terror will necessarily require, by accident or purposefully, collections of U.S. citizens’ conversations with potential overseas persons of interest. An open society, such as the United States, ironically needs to use this technology to protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting “unreasonable searches and seizures.” American historical resistance towards such activities is a bedrock of our laws, policies and police procedures. But what might have been reasonable 10 years ago is not the same any longer. The constant armed struggle against the jihadists has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens.

Links- Immigrant surveillance

Surveillance of immigrants is key to prevent terrorist attacks

Carafano '07 [James Carafano, PhD, is The Heritage Foundation's Vice President, Foreign and Defense Policy Studies, E. W. Richardson Fellow, and Director of the Kathryn and Shelby Cullom Davis Institute for International Studies, "Immigration, Security, and All That," October 27, <http://www.cfr.org/immigration/immigrants-homeland-security-risk/p14660>]

There is a serious, immediate, and persistent **border security threat**—the transnational criminal cartels fighting over control of the smuggling corridor that runs through 2,000 miles of border with Mexico. They make gaining operational control of the border nearly impossible. Criminal gangs have money, resources, smarts, and every reason to want make life easy for businesses running drugs, people, and other contraband north, and sending lucrative illicit arms south. Until this border war is under control, a safe southern border is not an option. That said, **dealing with illegal immigration has to be part of the solution.**

Serious criminals hide in the 500,000 individuals who illegally cross from Mexico each year. A significant drop in illegal crossings would allow law enforcement to focus resources on criminals victimizing people on both sides of the border. **The unlawful presence of millions of undocumented workers in the U_{nited} S_{tates} fuels more illegal border crossings and makes the task of making the border safe that much more difficult**. Understanding Terrorism Travel Terrorists have tried every conceivable means possible, both legal and illegal, to travel to and remain undetected inside the United States. The overwhelming number of documented cases involve coming to the United States through a legal point of entry. Terrorists have resided here lawfully and unlawfully. They include aliens and U.S. citizens. Taken all together they comprise a minuscule percentage of any group one could imagine—other than other terrorists: a minuscule percentage of international travelers, individuals from any foreign country, or any group living in America. Focusing on any particular group is like looking for a needle in a needle stack. **The best way to combat terrorism and other transnational security threats is effective intelligence, surveillance, and counterterrorism investigations based on legitimate concerns**.

Links- Global terror

The plan hurts global counter-terror cooperation- US surveillance is key Lewis '14 [James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy, “Underestimating Risk in the Surveillance Debate,”

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf]

The United States had unique advantages for counterterrorism on a global level. These include its relationships with a range of foreign intelligence partners, its technical resources, and the information it obtained from its operations in Iraq and Afghanistan. A captured cell phone can provide names and numbers that allow for more precise targeting. Using sophisticated software and combined with information from other intelligence services, NSA was able to take the billions of calls and emails sent each day and winnow them down to a few thousand messages to which an intelligence analyst actually listened. The nature of mass surveillance has been misrepresented, although this point is politically irrelevant. The chief error lies in the difference between collecting and exploitation. Millions of records were collected, very few were exploited. The traditional explanation is that the failures of intelligence services will be on every front page but their successes will never be known. We do know that ending NSA’s role in mass surveillance will not end mass surveillance in Europe or other parts of the world. What it will do is reduce cooperation among allied and friendly services and the United States and restrict access to extraregional counterterrorism data. Cooperation will not end, but will be less effective at a time when jihadi fighters are beginning to return from Syria. There will be an increase in the risk that a plot will go undetected. but how much risk will increase is difficult to estimate.

Impacts

Impacts- Nuclear war

Terrorism causes nuclear miscalc with Russia and China

Ayson '10 [Robert, Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington, "After a Terrorist Nuclear Attack: Envisaging Catalytic Effects," Studies in Conflict & Terrorism, Volume 33, Issue 7, July, Available Online to Subscribing Institutions via InformaWorld]

But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive interstate nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be "spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important . . . some indication of where the nuclear material came from."⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the "Chechen insurgents' . . . long-standing interest in all things nuclear."⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other

nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither “for us or against us”) might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability

Impacts- Extinction

Terrorism causes extinction- several reasons

Wright '07 [Robert, New America Foundation senior fellow, 4-28-07, "Planet Of The Apes," <http://select.nytimes.com/2007/04/28/opinion/28wright.html>]

(3) **Terrorism**. Alas, the negative-feedback loop — bad outcomes lead to smart policies — may not apply here. We reacted to 9/11 by freaking out and invading one too many countries, creating more terrorists. With the ranks of terrorists growing — amid evolving biotechnology and loose nukes — we could within a decade see terrorism on a scale that would make us forget any restraint we had learned from the Iraq war's outcome. If 3,000 deaths led to two wars, how many wars would 300,000 deaths yield? And how many new terrorists? Terrorism alone won't wipe out humanity. But with our unwitting help, it could strengthen other lethal forces. It could give weight to the initially fanciful "clash of civilizations" thesis. Muslim states could fall under the control of radicals and opt out of what might otherwise have become a global civilization. Armed with nukes (Pakistan already is), they would revive the nuclear Armageddon scenario. A fissure between civilizations would also sabotage the solution of environmental problems, and the ensuing eco-calamity could make people on both sides of the fissure receptive to radical messages. The worse things got, the worse they'd get. So while no one of the Big Three doomsday dynamics is likely to bring the apocalypse, they could well combine to form a positive-feedback loop, a k a the planetary death spiral. And the catalyst would be terrorism, along with our mishandling of it.

Terrorism causes extinction

Morgan '09 [Dennis Ray, Hankuk University of Foreign Studies, Yongin Campus - South Korea, Futures, Volume 41, Issue 10, December 2009, Pages 683-693]

Years later, in 1982, at the height of the Cold War, Jonathon Schell, in a very stark and horrific portrait, depicted sweeping, bleak global scenarios of total nuclear destruction. Schell's work, *The Fate of the Earth* [8] represents one of the gravest warnings to humankind ever given. The possibility of complete annihilation of humankind is not out of the question as long as these death bombs exist as symbols of national power. As Schell relates, the power of destruction is now not just thousands of times as that of Hiroshima and Nagasaki; now it stands at more than one and a half million times as powerful, more than fifty times enough to wipe out all of human civilization and much of the rest of life along with it [8]. In *Crucial Questions about the Future*, Allen Tough cites that Schell's monumental work, which "eradicated the ignorance and denial in many of us," was confirmed by "subsequent scientific work on nuclear winter and other possible effects: humans really could be completely devastated. Our human species really could become extinct." [9]. Tough estimated the chance of human self-destruction due to nuclear war as one in ten. He comments that few daredevils or high rollers would take such a risk with so much at stake, and yet "human civilization is remarkably casual about its high risk of dying out completely if it continues on its present path for another 40 years" [9]. What a precarious foundation of power the world rests upon. The basis of much of the military power in the developed world is nuclear. It is the reigning symbol of global power, the basis, — albeit, unspoken or else barely whispered — by which powerful countries subtly assert aggressive intentions and ambitions for hegemony, though masked by "diplomacy" and "negotiations," and yet this basis is not as stable as most believe it to be. In a remarkable website on nuclear war, Carol Moore asks the question "Is Nuclear War Inevitable?"

[10].4 In Section 1, Moore points out what most **terrorists** obviously already **know about the nuclear tensions between powerful countries. No doubt, they've figured out that the best way to escalate these tensions into nuclear war is to set off a nuclear exchange.** As Moore points out, **all that militant terrorists would have to do is get their hands on one small nuclear bomb** and explode it on either Moscow or Israel. Because of the Russian "dead hand" system, "where regional nuclear commanders would be given full powers should Moscow be destroyed," it is likely that **any attack would be blamed on the United States**" [10]. Israeli leaders and Zionist supporters have, **likewise**, stated for years that **if Israel were to suffer a nuclear attack, whether from terrorists or a nation state, it would retaliate with the suicidal "Samson option" against all major Muslim cities in the Middle East.** Furthermore, **the Israeli Samson option would also include attacks on Russia and even "anti-Semitic" European cities** [10]. In that case, of course, **Russia would retaliate, and the U.S. would then retaliate against Russia. China would probably be involved as well, as thousands, if not tens of thousands, of nuclear warheads, many of them much more powerful than those used at Hiroshima and Nagasaki, would rain upon most of the major cities in the Northern Hemisphere.** Afterwards, for years to come, **massive radioactive clouds would drift throughout the Earth in the nuclear fallout, bringing death or else radiation disease that would be genetically transmitted to future generations in a nuclear winter that could last as long as a 100 years, taking a savage toll upon the environment and fragile ecosphere** as well. And **what many people fail to realize is what a precarious, hair-trigger basis the nuclear web rests on. Any accident, mistaken communication, false signal or "lone wolf" act of sabotage or treason could, in a matter of a few minutes, unleash the use of nuclear weapons, and once a weapon is used, then the likelihood of a rapid escalation of nuclear attacks is quite high** while the likelihood of a limited nuclear war is actually less probable since **each country would act under the "use them or lose them" strategy and psychology; restraint by one power would be interpreted as a weakness by the other, which could be exploited as a window of opportunity to "win" the war.** In other words, **once Pandora's Box is opened, it will spread quickly**, as it will be the signal for permission for anyone to use them. Moore compares swift nuclear escalation to a room full of people embarrassed to cough. Once one does, however, "everyone else feels free to do so. The bottom line is that as long as large nation states use internal and external war to keep their disparate factions glued together and to satisfy elites' needs for power and plunder, these nations will attempt to obtain, keep, and inevitably use nuclear weapons. And as long as large nations oppress groups who seek selfdetermination, some of those groups will look for any means to fight their oppressors" [10]. In other words, as long as war and aggression are backed up by the implicit threat of nuclear arms, it is only a matter of time before the escalation of violent conflict leads to the actual use of nuclear weapons, and once even just one is used, it is very likely that many, if not all, will be used, **leading to** horrific scenarios of global death and **the destruction of** much of human **civilization** while condemning a mutant human remnant, if there is such a remnant, to a life of unimaginable misery and suffering in a nuclear winter.

The impact is extinction

Sid-Ahmed '04 [Mohamed, Managing Editor for Al-Ahali, "Extinction!" August 26-September 1, Issue no. 705, <http://weekly.ahram.org.eg/2004/705/op5.htm>]

A nuclear attack by terrorists will be much more critical than Hiroshima and Nagasaki, even if -- and this is far from certain -- the weapons used are less harmful than those used then, Japan, at the time, with no knowledge of nuclear technology, had no choice but to capitulate. Today, the technology is a secret for nobody. So far, except for the two

bombs dropped on Japan, nuclear weapons have been used only to threaten. Now we are at a stage where they can be detonated. This completely changes the rules of the game. We have reached a point where anticipatory measures can determine the course of events. Allegations of a terrorist connection can be used to justify anticipatory measures, including the invasion of a sovereign state like Iraq. As it turned out, these allegations, as well as the allegation that Saddam was harbouring WMD, proved to be unfounded. What would be the consequences of a nuclear attack by terrorists? Even if it fails, it would further exacerbate the negative features of the new and frightening world in which we are now living. Societies would close in on themselves, police measures would be stepped up at the expense of human rights, tensions between civilisations and religions would rise and ethnic conflicts would proliferate. It would also speed up the arms race and develop the awareness that a different type of world order is imperative if humankind is to survive. But the still more critical scenario is if the attack succeeds. This could lead to a third world war, from which no one will emerge victorious. Unlike a conventional war which ends when one side triumphs over another, this war will be without winners and losers. When nuclear pollution infects the whole planet, we will all be losers.

Impacts- CBWs

Bioweapons are comparatively the biggest risk of extinction- our author is the most qualified

Matheny '07 [Jason, research associate with the Future of Humanity Institute at Oxford University, where his work focuses on technology forecasting and risk assessment - particularly of global catastrophic risks and existential risks.[1] He previously worked for the World Bank, the Center for Biosecurity, the Center for Global Development, and on national security projects for the US government. He is a Sommer Scholar and PhD candidate in Applied Economics at Johns Hopkins University. He holds an MPH from Johns Hopkins, an MBA from Duke University, and a BA from the University of Chicago, Department of Health Policy and Management, Bloomberg School of Public Health, Johns Hopkins University, "Reducing the Risk of Human Extinction,"

http://www.physics.harvard.edu/~wilson/pmpmta/Mahoney_extinction.pdf

Of current extinction risks, the most severe may be bioterrorism. The knowledge needed to engineer a virus is modest compared to that needed to build a nuclear weapon; the necessary equipment and materials are increasingly accessible and because biological agents are self-replicating, a weapon can have an exponential effect on a population (Warrick, 2006; Williams, 2006). 5 Current U.S. biodefense efforts are funded at \$5 billion per year to develop and stockpile new drugs and vaccines, monitor biological agents and emerging diseases, and strengthen the capacities of local health systems to respond to pandemics (Lam, Franco, & Shuler, 2006). There is currently no independent body assessing the risks of high-energy physics experiments. Posner (2004) has recommended withdrawing federal support for such experiments because the benefits do not seem to be worth the risks.

CBW attacks ensure multiple scenarios for extinction

Kellman '8 (Barry Kellman is the director of the International Weapons Control Center, "Bioviolence: A Growing Threat", The Futurist, May-June 2008, http://www.wfs.org/March-April09/MJ2008_Kellman.pdf)

A looming danger confronts the world—the threat of bioviolence. It is a danger that will only grow in the future, yet we are increasingly failing to confront it. With every passing day, committing a biocatastrophe becomes a bit easier, and this condition will perpetuate for as long as science progresses. Biological warfare is as old as conflict, of course, but in terms of the objectives of traditional warfare—gaining territory or resources, compelling the surrender of an opposing army—biological weapons weren't very effective. If the objective is to inflict mass death and panic on a mixed population, however, emerging bioweapons offer remarkable potential. We would be irresponsible to presume that radical jihadists like al Qaeda have ignored said potential. What's New in Bioviolence? Bioviolence refers to the many ways to inflict disease as well as the many people who might choose to do so, whether heads of states, criminals, or fanatics. Fortunately, doing bioviolence is technically far more difficult than using conventional explosives. Natural pathogens like anthrax are difficult to weaponize. Smallpox remains unavailable (presumably); plague is readily treatable; Ebola kills too quickly to ignore it e a pandemic. But emerging scientific disciplines—notably genomics, nanotechnology, and other microsciences—could alter these pathogens for use as weapons. These scientific disciplines offer profound benefits for humanity, yet there is an ominous security challenge in minimizing the danger of their hostile application. For example, highly dangerous agents can be made resistant to vaccines or antibiotics. In Australia, scientists introduced a gene into mousepox (a cousin of smallpox) to reduce pest populations—it worked so well that it wiped out 100% of affected mice, even those that had immunity against the disease. Various bacterial agents, such as plague or tularemia (rabbit fever), could be altered to increase their lethality or to evade antibiotic treatment. Diseases once thought to be eradicated can now be resynthesized, enabling them to spread in regions where there is no

natural immunity. The polio virus has been synthesized from scratch; its creators called it an “animate chemical.” Soon, it may be resynthesized into a form that is contagious even among vaccinated populations. Recreation of long eradicated livestock diseases could ravage herds severely lacking in genetic diversity, damage food supplies, and cause devastating economic losses. Perhaps the greatest biothreat is the manipulation of the flu and other highly contagious viruses, such as Ebola. Today, scientists can change parts of a virus’s genetic material so that it can perform specific functions. The genomic sequence of the Spanish flu virus that killed upwards of 40 million people nearly a century ago has been widely published; any savvy scientist could reconstruct it. The avian flu is even more lethal, albeit not readily contagious via casual aerosol delivery. A malevolent bioscientist might augment its contagiousness. The Ebola virus might be manipulated so that it kills more slowly, allowing it to be spread farther before its debilitating effects altogether consume its carrier. A bit further off is genetic manipulation of the measles virus—one of the great killers in human history—rendering useless the immunizations that most of us receive in early childhood. Soon, laboratory resynthesis of smallpox may be possible. Advanced drug delivery systems can be used to disseminate lethal agents to broad populations. Bioregulators—small organic compounds that modify body systems—could enhance targeted delivery technologies. Some experts are concerned that new weapons could be aimed at the immune, neurological, and neuroendocrine systems. Nanotechnology that lends itself to mechanisms for advanced disease detection and drug delivery—such as gold nanotubes that can administer drugs directly into a tumor—could also deliver weaponized agents deep into the body, substantially raising the weapon’s effectiveness. Altogether, techniques that were on the frontiers of science only a decade or two ago are rapidly mutating as progress in the biological sciences enables new ways to produce lethal catastrophe. Today, they are on the horizon. Within a decade, they will be pedestrian. According to the National Academies of Science, “The threat spectrum is broad and evolving—in some ways predictably, in other ways unexpectedly. In the future, genetic engineering and other technologies may lead to the development of pathogenic organisms with unique, unpredictable characteristics.” For as far into the future as we can possibly see, every passing day it becomes slightly easier to commit a violent catastrophe than it was the day before. Indeed, the rapid pace of advancing science helps explain why policies to prevent such a catastrophe are so complicated. Bioviolence Jihad? **Some experts argue that terrorists and fanatics are not interested in bioviolence** and that the danger might therefore be overblown. Since there have been no catastrophic bioviolence attacks, these experts argue, terrorists lack the intention to make bioweapons. Hopefully, they are correct. But **an enormous amount of evidence suggests they are wrong**. From the dawn of biology’s ability to isolate pathogens, people have pursued hostile applications of biological agents. It is perilous to ignore this extensive history by presuming that today’s villains are not fervent about weaponizing disease. Not a single state admits to having a bioweapons program, but U.S. intelligence officials assert that as many as 10 states might have active programs, including North Korea, Iran, and Syria. Moreover, many terrorist organizations have expressed interest in acquiring biological weapons. Whatever weight the **taboo against inflicting disease** might have for nation-states, it **is obviously irrelevant to terrorists**, criminals, and lunatics. **Deterrence by threat of retaliation is essentially meaningless for groups with suicidal inclinations** who are likely to intermingle with innocent civilians. **Al-Qaeda** and affiliated Islamic fundamentalist organizations **have overtly proclaimed their intention to develop and use bioweapons**. The 11th volume of al-Qaeda’s Encyclopedia of Jihad is devoted to chemical and biological weapons. Indeed, al-Qaeda has acknowledged that “biological weapons are considered the least complicated and easiest to manufacture of all weapons of mass destruction.” **Al-Qaeda is widely reported to have acquired legal pathogens via publicly available scientific sources**. Before 9/11, **al-Qaeda operatives** reportedly purchased anthrax and plague from arms dealers in Kazakhstan, and the group **has repeatedly urged followers to recruit microbiology and biotechnology experts**. Following the Taliban’s fall, **five al-Qaeda biological weapons labs in Afghanistan tested positive for anthrax**. **Documents calculating aerial dispersal methods of anthrax via balloon were discovered** in Kabul, along with anthrax spore concentrate at a nearby vaccine laboratory. According to a lengthy fatwa commissioned by Osama bin Laden, jihadists are entitled to use weapons of mass destruction against the infidels, even if it means killing innocent women, children, and Muslims. No matter that these weapons cannot be specifically targeted. “[N]othing is a greater duty, after faith itself, than repelling an enemy attacker who sows corruption to religion and the world.” According to the fatwa, “No conditions limit this: one repels the enemy however one can.” The sentiment might be reprehensible, but it is certainly not irrational. Even the most passionate terrorists must realize that conventional attacks are not bringing the West to its knees. The 9/11 strikes, the bombing of the Madrid and London subways, and numerous smaller attacks have all put civilization on edge, but history marches inexorably forward. A few thousand people can be killed, yet Western armies still traverse the world, and Western economies still determine winners and losers. From this perspective, the stakes must be raised. Bioviolence is perhaps the most dire, easiest means to execute existential danger. What Might Bioviolence Accomplish? Envision a series of attacks against capitals of developing states that have close diplomatic linkages with the United States. The attacks would carry a well-publicized yet simple warning: “If you are a friend of the United States, receive its officials, or support its policies, thou and so of your people will get sick.” How many attacks in how many cities would it take before international diplomacy, to say nothing of international transit, comes to a crashing halt? In comparison to use of conventional or chemical weapons, the potential death toll of a bioattack could be huge. Although the number of victims would depend on where an attack takes place, the type of pathogen, and the sophistication of the weapons maker, there is widespread consensus among experts that a heightened attack would inflict casualties exceedable only by nuclear weapons. In comparison to nuclear weapons, **bioweapons are far easier and cheaper to make and transport, and they can be made in facilities that are far more difficult to detect**. **The truly unique characteristic of certain**

bioweapons that distinguishes them from every other type of weapon **is contagion**. **No other type of weapon can replicate itself and spread**. Any other type of attack, no matter how severe, **occurs at a certain moment in time at an identifiable place**. If you aren't there, you are angry and upset but not physically injured by the attack. **An attack with a contagious agent can uniquely spread, potentially imperiling target populations far from where the agents are released**. A bio-offender could infect his minions with a disease and send them across borders before symptoms are obvious. Carriers will then spread it to other unsuspecting victims who would themselves become extended bioweapons, carrying the disease indiscriminately. There are challenges in executing such an attack, but fanatical terrorist organizations seem to have an endless supply of willing suicide attackers. All this leads to the most important characteristic of bioviolence: It raises incomparable levels of panic. Contagious bioviolence means that planes fly empty or perhaps don't fly at all. People cancel vacation and travel plans and refuse to interact with each other for fear of unseen affliction. Public entertainment events are canceled; even going to a movie becomes too dangerous. Ultimately, bioviolence is about hiding our children as everyone becomes vulnerable to our most fundamental terror: the fear of disease. **For people who seek to rattle the pillars of modern civilization and perhaps cause it to collapse, effective use of disease would set in motion political, economic, and health consequences so severe as to call into question the ability of existing governments to maintain their citizens' security**. In an attack's wake, no one would know when it is over, and no government could credibly tell an anxious population where and when it is safe to resume normal life. While it is difficult to specify when this danger will strike, there should be no doubt that we are vulnerable to a rupture. Just as planes flying into the Twin Towers on September 11, 2001, instantly became a historical marker dividing strategic perspectives before from after, the day that disease is effectively used as an instrument of hate will profoundly change everything. If you want to stop modern civilization in its tracks, bioviolence is the way to go. The notion that no one will ever commit catastrophic bioviolence is simply untenable. What Can We Do? How can we confront these growing dangers? First, we must appreciate the global nature of the problem. Perpetrators from anywhere can get pathogens from virtually everywhere. Bio research labs that once were concentrated in about two dozen developed states are proliferating, expanding the risk that lethal agents could be diverted and misused. The knowledge needed to weaponize pathogens is available on the Internet. An attack can be prepared through a system of transnational communication. Once a bioweapon is prepared, terrorists or other perpetrators from anywhere can slide across national boundaries and release disease anonymously. Once released, a contagious agent would spread without regard for boundaries, race, religion, or nationality. Public health responses would have to be internationally coordinated. New modes of international legal cooperation would immediately be needed to investigate the crime. Thus, bioviolence dangers shrink the planet into an interdependent neighborhood. It makes no sense for any particular country to try to insulate its homeland from these dangers. No missile defense system will protect us from bioviolence. Improved border security will not keep disease at bay. National efforts to enhance medical capabilities have virtues, but these defenses can be readily circumvented. To prevent bioviolence requires policies that focus on humanity as a species and that are implemented everywhere with centralized governance. Antibioviolence policies must be global. Yet, advancing anti-bioviolence policies is what the international community does worst. Bioviolence dangers are unnecessarily high because national and international antibioviolence strategies are gap-ridden, often incoherent, and not globally observed. As a result, we are all virtually naked in the face of unacceptable dangers. No other threat presents such a stark contrast between severity of harm and a failure of leadership to reduce risks. Most important, existing institutional arrangements are inadequate. In sharp contrast to most other global security challenges, there is no responsible international authority that defines relevant prohibitions and responsibilities, implements policies over time, or evaluates whether obligations are being fulfilled. With regard to global bioviolence prevention policies, there's nobody in charge. No one is responsible; no one is accountable. The absence of authority is profoundly dangerous. Bioviolence prevention and preparedness requires a sizable orchestra, made up of various instruments, to play complicated music in harmony. Today, there is not a bad "conductor", there is no conductor at all. The result is cacophony. Simply stated, bioviolence is the dark side of globalization, yet international alarms of bioviolence ring nowhere! We need a comprehensive national and international strategy for bioviolence prevention. [See box: "Five Strategies for Preventing Bioviolence," page 30.] Policies should be pursued within an integrated approach that enables each policy to gain strength from all the others. Such policies are potentially available and effective, but they demand progressive changes in our global order. The Security Mission Global bioviolence prevention and preparedness policies are imperative, but also imperative is recognition that the world faces natural disease horrors. Where mass public health challenges are daily phenomena, the risks of terrorists using pathogens must be weighed against more tangible natural threats. Simply stated, it is illegitimate to insist that every nation adopt policies for preventing human-inflicted disease without acknowledging the silent genocide of natural disease that is responsible for millions of deaths. But neither is it legitimate to view bioviolence dangers as distractions from efforts to combat natural disease and therefore to put off beneficial measures until those afflictions are defeated. To do so frustrates forward movement on cost-effective initiatives that could help build an international security architecture for advancing science and health. Thus, bioviolence prevention must be a facet of a broad international commitment to: 1. Prevent the spread of disease (e.g., through public health measures). 2. Enhance protection against and cures for disease (e.g., through vaccination and drug therapies). 3. Supervise the conduct of biological science. 4. Criminalize unauthorized or improper use of pathogens. From this foundation should flow a policy commitment to the growth of bioscience as a global public good. Policies to encourage its worldwide spread deserve vigorous support. This governance mission should, therefore, be conceived as a global covenant. As bioscience goes forward as a fundamental pillar of human progress, all nations must undertake common responsibilities to prevent bioviolence even as the burdens associated with those responsibilities are differentiated according to wealth and capability. From everyone according to their abilities—to all for the benefit of all. The United Nations' Importance The United Nations represents the best venue for a new governance platform that can accommodate the need for an integrated global strategy

against bioviolence. Only the United Nations has the necessary international legitimacy, and only the United Nations can integrate the many sectors—health, law enforcement, science, military, emergency preparedness—that must devote expertise and resources. A primary consideration here is to minimize any bureaucratic reshuffling. There is certainly no need to modify or replicate existing capabilities. Many relevant governance tasks are already addressed by one or more international organizations. For example, the World Health Organization should continue to be responsible for addressing the health implications of a pandemic, whether natural or malevolent. Interpol should continue to be responsible for addressing bioviolence's law enforcement implications. Indeed, the UN's role should be only to coordinate the performance of these tasks. Broadly viewed, the United Nations should be able to undertake three functions: First, a specific UN agency should stimulate bioscience development by incorporating security concerns into the fabric of scientific undertakings and by assisting countries in using bioscience in ways that are consistent with policies for preventing bioviolence. Because science, development, and security can and must be mutually reinforcing, this agency's primary responsibilities would be to promote and distribute knowledge and build capacity to fulfill obligations, especially in developing nations. Second, a UN office should coordinate activities among the relevant international/regional organizations, professional networks, and expert bodies. For example, three major international organizations focus on health (World Health Organization, Animal Health Organization, and the Food and Agriculture Organization); Interpol and Europol both focus on law enforcement; a large array of organizations focus on conveyance of dangerous items (e.g., International Maritime Organization, International Civil Aviation Organization). This UN office should be a steering mechanism to engage each of these organizations' specialized expertise and to identify synergies. Third, a Security Council Committee should be authorized to investigate bioviolence preparations as well as respond and coordinate assistance to a bioviolence attack. Situations that call for investigation or response arise rarely, but they carry disproportionate significance for international peace and security. The Security Council Committee should not advance programmatic agendas, but it should be able to wield expertise and political muscle in volatile situations. Its primary mission would be to enable the international community to sustain global order in the face of a bioviolence challenge. Ever since someone harnessed a new technology to create a weapon with more devastating effects, there has been a link—a double helix—between the progress of science and the pursuit of security. This is inevitable. These dangers of bioviolence do not argue for relinquishing scientific progress, but they disprove notions that new challenges can be effectively addressed with yesterday's policies. At bottom is a condition unique to this historical era: Scientific progress is intertwined with escalating malevolence threatening human security. **Progressing capabilities** improve our lives and yet, inextricably, **enable truly harmful weapons against humanity**. Here are the challenges to international peace and security at the beginning of the third millennium. **Failing to do the right thing in response to these challenges could have dire consequences for all humanity.**

Bio-weapons represent the single greatest risk of extinction

Ochs, 2

[Richard, BS in Natural Resource Management from Rutgers University, with honors, BIOLOGICAL WEAPONS MUST BE IMMEDIATELY ABOLISHED, http://www.freefromterror.net/other_articles/abolish.html

Of all the weapons of mass destruction, **the genetically engineered biological weapons, many without a known cure or vaccine, are an extreme danger to the continued survival of life on earth.** Any perceived military value or deterrence pales in comparison to the great risk these weapons pose just sitting in vials in laboratories. **While a "nuclear winter," resulting from a massive exchange of nuclear weapons, could also kill off most of life on earth and severely compromise the health of future generations, they are easier to control. Biological weapons, on the other hand, can get out of control very easily, as the recent anthrax attacks has demonstrated.** **There is no way to guarantee the security of these doomsday weapons because very tiny amounts can be stolen or accidentally released and then grow or be grown to horrendous proportions. The Black Death of the Middle Ages would be small in comparison to the potential damage bioweapons could cause.** Abolition of chemical weapons is less of a priority because, while they can also kill millions of people outright, their persistence in the environment would be less than nuclear or biological agents or more localized. Hence, chemical weapons would have a lesser effect on future generations of innocent people and the natural environment. Like the Holocaust, once a localized chemical extermination is over, it is over. **With nuclear and biological weapons, the killing will probably never end.** Radioactive elements last tens of thousands of years and will keep causing cancers virtually forever. **Potentially worse than that, bio-engineered agents by the hundreds with no known cure could wreck even greater calamity on the human race than could persistent radiation. AIDS and ebola viruses are just a small example of recently emerging plagues with no known cure or vaccine.** Can we imagine hundreds of such plagues? **HUMAN EXTINCTION IS NOW POSSIBLE.**

Impacts- Retaliation

Retaliation causes nuclear war among world powers

Corsi '05 [Jerome, PhD in political science from Harvard, excerpt from Atomic Iran, http://911review.org/Wget/worldnetdaily.com/NYC_hit_by_terrorist_nuke.html]

The combination of **horror and outrage** that **will surge** upon **the nation will demand that the president retaliate** for the incomprehensible damage done by the attack. The problem will be that **the president will not immediately know how to respond or against whom**. The perpetrators will have been incinerated by the explosion that destroyed New York City. Unlike 9-11, there will have been no interval during the attack when those hijacked could make phone calls to loved ones telling them before they died that the hijackers were radical Islamic extremists. There will be no such phone calls when the attack will not have been anticipated until the instant the terrorists detonate their improvised nuclear device inside the truck parked on a curb at the Empire State Building. Nor will there be any possibility of finding any clues, which either were vaporized instantly or are now lying physically inaccessible under tons of radioactive rubble. Still, the president, members of Congress, the military, and the public at large will suspect another attack by our known enemy – Islamic terrorists. **The first impulse will be to launch a nuclear strike on Mecca**, to destroy the whole religion of Islam. Medina could possibly be added to the target list just to make the point with crystal clarity. Yet what would we gain? The moment Mecca and Medina were wiped off the map, **the Islamic world** – more than 1 billion human beings in countless different nations – **would feel attacked. Nothing would emerge intact after a war between the United States and Islam. The apocalypse would be upon us**. Then, too, we would face an immediate threat from our long-term enemy, the former Soviet Union. Many in the Kremlin would see this as an opportunity to grasp the victory that had been snatched from them by Ronald Reagan when the Berlin Wall came down. A missile strike by the Russians on a score of American cities could possibly be pre-emptive. Would the U.S. strategic defense system be so in shock that immediate retaliation would not be possible? **Hardliners in Moscow might argue that there was never a better opportunity to destroy America**. In China, our newer Communist enemies might not care if we could retaliate. With a population already over 1.3 billion people and with their population not concentrated in a few major cities, **the Chinese might calculate to initiate a nuclear blow** on the United States. What if the United States retaliated with a nuclear counterattack upon China? The Chinese might be able to absorb the blow and recover. **The North Koreans might calculate even more recklessly**. Why not launch upon America the few missiles they have that could reach our soil? More confusion and chaos might only advance their position. If Russia, China, and the United States could be drawn into attacking one another, North Korea might emerge stronger just because it was overlooked while the great nations focus on attacking one another.

AT

AT: Surveillance fails

Plenty of examples prove surveillance solves terrorism

Gellman et al '14 [Barton Gellman, Julie Tate and Ashkan Soltani, writers for The Washington Post citing data released by Edward Snowden, "In NSA-intercepted data, those not targeted far outnumber the foreigners who are," July 5, http://www.washingtonpost.com/world/national-security/in-nsa-intercepted-data-those-not-targeted-far-outnumber-the-foreigners-who-are/2014/07/05/8139adf8-045a-11e4-8572-4b1b969b6322_story.html]

The surveillance files highlight a policy dilemma that has been aired only abstractly in public. **There are discoveries of considerable intelligence value in the intercepted messages** — and collateral harm to privacy on a scale that the Obama administration has not been willing to address. **Among the most valuable contents** — which The Post will not describe in detail, to avoid interfering with ongoing operations — **are fresh revelations about a secret overseas nuclear project, double-dealing by an ostensible ally, a military calamity that befell an unfriendly power, and the identities of aggressive intruders into U.S. computer networks. Months of tracking** communications across more than 50 alias accounts, the files show, **led directly to the 2011 capture** in Abbottabad **of** Muhammad Tahir **Shahzad, a Pakistan-based bomb builder, and** Umar **Patek, a suspect in a 2002 terrorist bombing** on the Indonesian island of Bali. At the request of CIA officials, The Post is withholding other examples that officials said would compromise ongoing operations.

Top officials prove that surveillance solves- their evidence doesn't account for classified examples

Savage '13 [Charlie, Pulitzer Prize-winning Washington correspondent for The New York Times, "N.S.A. Chief Says Surveillance Has Stopped Dozens of Plots," http://www.nytimes.com/2013/06/19/us/politics/nsa-chief-says-surveillance-has-stopped-dozens-of-plots.html?_r=0]

Top national security officials on Tuesday **promoted two newly declassified examples of what they portrayed as "potential terrorist events" disrupted by government surveillance.** The cases were made public as Congress and the Obama administration stepped up a campaign to explain and defend programs unveiled by recent leaks from a former intelligence contractor. **One case involved** a group of **men** in San Diego **convicted of sending money to an extremist group** in Somalia. **The other was** presented **as a nascent plan to bomb the New York Stock Exchange,** although its participants were not charged with any such plot. Both were described by Sean Joyce, deputy director of the Federal Bureau of Investigation, at a rare public oversight hearing by the House Intelligence Committee. At the same hearing, **Gen. Keith B. Alexander,** the head of the National Security Agency, **said that American surveillance had helped prevent "potential terrorist events over 50 times since 9/11,"** including at least 10 "homeland-based threats." **But** he said that **a vast majority of the others must remain secret.** "In the 12 years since the attacks on Sept. 11, **we have lived in relative** safety and **security** as a nation," General Alexander said. **That security is a direct result of the intelligence community's quiet efforts to better connect the dots** and learn from the mistakes that permitted those attacks to occur on 9/11."

AT: No nuke terror

Nuclear terrorism is likely- they have the means and motive

Plame '14 [Valerie, former career covert CIA operations officer, “Nuclear terrorism: Most immediate and extreme threat to global security,” 9-26-14, <http://thehill.com/opinion/oped/218959-nuclear-terrorism-most-immediate-and-extreme-threat-to-global-security>]

Achieving the elimination of nuclear weapons is one of the U.N.'s longstanding objectives, one it has failed to prioritize. It's no surprise that the security discussions this year were overshadowed by the plans of 10 member states to dismantle and defeat the Islamic State group, especially as their assault on radical Sunni resistance and aggression toward U.S. and British journalists continues to grow. Yet this mounting violence and instability pales in comparison to what could be wrought by nuclear-armed terrorists. We know that the Islamic State group has the means and motive to attain weapons of mass destruction. They have an appetite for shocking demonstrations and indiscriminate killing, and have already seized low-grade nuclear material from a facility in Mosul. They are acquiring the ability to build radioactive dirty bombs that could cause major health and economic damage. With reports of escalating funding and recruitment of citizens from every continent, and ties to radicals in nuclear weapons-states such as Pakistan, it is increasingly conceivable that weapons-grade materials - or even a ready-made nuclear device - could fall into their hands. If that happens, they would not hesitate to use them - possibly at a cost of hundreds of thousands of lives.

AT: No CBW terror

Terrorists can and will use CBWs against the US

Vincinanzo 4-23-15 [Amanda, senior editor at Homeland Security Today, “Biological Terrorist Attack On US An 'Urgent And Serious Threat',” <http://www.hstoday.us/briefings/daily-news-analysis/single-article/biological-terrorist-attack-on-us-an-urgent-and-serious-threat/0ce6ebf3524d83c537b1f4f0cc578547.html>]

In her opening statement, **McSally expressed concern over the possibility that** the Islamic State of Iraq and the Levant (ISIL) and other **jihadi terrorist organizations could conduct a biological attack on American soil. “ISIL is better resourced, more brutal, and more organized than any terrorist group to date.”** McSally said. “We know that they have an interest in using chemical and biological weapons.” Last year, Director of National Intelligence James Clapper warned the Syrian government might have advanced beyond the research and development stage and may have a restricted capacity to manufacture weaponized disease agents. Counterterrorism officials have worried for years since the conflict in Syria began that ISIL may be able to get a hold of these biological weapons. Moreover, last year, a laptop belonging to a Tunisian jihadist reportedly recovered from an ISIL hideout in Syria contained a hidden trove of secret plans, including instructions for weaponizing the bubonic plague and a document discussing the advantages of a biological attack. “The advantage of **biological weapons** is that they **do not cost a lot of money**, while the human casualties can be huge,” stated a document found on the laptop. **In October, jihadists and supporters of ISIL stepped up discussions on jihadist social media websites about the possibility and ease of using** Ebola, as well as other **virulent pathogens and poisons, as weapons against the US and the West**, according to reports by the Middle East Media Research Institute. Jim Talent, former Senator from Missouri and former vice-chair of The Commission on the Prevention of Weapons of Mass Destruction Proliferation and Terrorism, testified that the threat of a bioattack is “one of the greatest and gravest” facing the nation. Talent said that at the end of 2008, the 9/11 Commission issued the report, World at Risk, which addressed the threat posed by nuclear and biological weapons. Talent and former Sen. Bob Graham (D-Fla.) gave the biothreat greater emphasis, knowing that terrorists have acquired bio-weapons in the past, and that it’s likely easier for them to secure a bio-weapon than a nuclear weapon. The report stated, “We accept the validity of current intelligence estimates about the current rudimentary nature of terrorist capabilities in the area of biological weapons but caution that the terrorists are trying to upgrade their capabilities and could do so by recruiting skilled scientists. In this regard, the biological threat is greater than the nuclear; the acquisition of deadly pathogens, and their weaponization and dissemination in aerosol form, would entail fewer technical hurdles than the theft of production of weapons-grade uranium or plutonium and its assembly into an improvised nuclear device.” In addition, **bio-weapons can be easily transported, stockpiled, can cause more deaths than a tactical nuclear weapon**, and, depending on the biological agent used, the terrorists could launch an attack and escape the area before the authorities even knew that an attack had occurred, according to Talent. And he’s not alone. **Seasoned and veteran counterterrorism officials agree that jihadi organizations appear to have a greater interest in acquiring and using biological and radiological weapons**, and that Al Qaeda is known to have experimented with trying to weaponize a number of highly virulent pathogens.

ISIS will use chemical and biological weapons

Leone ’14 [Katie, ABC 10 News, citing Kevin Mellott, terrorism expert and CEO of ERASE Enterprises, “On 9/11 anniversary, terrorism expert warns about ISIS,” <http://www.10news.com/news/on-911-anniversary-terrorism-expert-warns-about-isis>]

Thirteen years after the first plane crashed into the World Trade Center Twin Towers in New York City, killing thousands and crippling the nation’s economy and sense of safety, **the U.S. is pushing forward in the ongoing battle against terrorism, and facing it on many fronts.** Scripps National Desk spoke in an exclusive interview with Kevin Mellott, terrorism expert and CEO of ERASE Enterprises, about the anniversary of Sept. 11 and the imminent threat posed by ISIS. Should the United States be worried about a repeat attack on Sept. 11? According to Mellott, it’s a possibility. “The whole concept of terrorism is to surprise people, and to attack innocents and noncombatants,” Mellott said. “Would an attack on September 11 be a surprise? No, it’s an anniversary. But keep in mind, for the desired effect of an attack, a terrorist group needs media coverage. So right up front, that motivation, that media coverage is there.” When terrorists chose 9/11 to attack the U.S., they may have chosen that date for a specific reason, and if so, might choose that date again. Mellott substantiates this by stating the period of Sept. 10-13 was identified by U.S. intelligence to be a specific date of concern as early as the mid-1990s. On Sept. 13, 1993, Yasser Arafat, then-Chairman of the Palestine Liberation Organization, and Israeli Prime Minister and Defense Minister Yitzhak Rabin signed the Oslo Accord at the White House, in an attempt to set up a framework to lead to the resolution of the Palestinian-Israeli conflict. The accords were developed during the Madrid Conference of 1991. Arafat and Rabin were famously photographed shaking hands in front of Bill Clinton at the White House on Sept. 13. Fanatics in the Middle East were very bent out of shape at the perceived photo op of the U.S. President forcing sworn enemies to shake hands, according to Mellott, who was training Saudi military in the Middle East at the time. Both men would die in the next 11 years, perhaps as a result of this accord: Rabin was assassinated after a public event in 1995, and Arafat fell ill and died in 2004. Many believe he was poisoned. Domestic targets for terrorist attacks If ISIS strikes in the U.S. soon, one target favorable to them would be against the U.S. military, as an ultimate show of what it can do, Mellott said. “It could also be a shopping mall in Texas, Tennessee, California; a movie theater, sporting event, anything that is a public group that would cause maximum impact psychologically across the U.S.,” Mellott said. “What was so terribly impactful in New York was the feeling of

"That could've been me in my office building." Targets that other people can relate to have more PR value for the terrorists. And **terrorists are aware of how easy it is to enter the country through its south border**, Mellott said. **One of the most frightening aspects of the ISIS organization is it has done exactly what it said it would do, so far. "They're not afraid of carrying out threats."** Mellott said. "They've already given us a warning: If you don't stop attacking, we're going to kill. And they kept their word when they beheaded Sotloff." ISIS kicked out of Al-Qaeda It's common knowledge the fundamentalist group ISIS was formerly Al-Qaeda in Iraq. It renamed and rebranded, as any smart corporation would. What's less-widely known, according to Mellott, is the reason it was kicked out: Members will kill anybody, including fellow Muslims. ISIS is willing to look back at the time before Saladin, before the Islamic armies were united and began to fight Christian armies during the Crusades, back to when Arab tribes were fighting each other and killing each other, and they justify it in that way, he said. "They've got a history of killing each other off- they don't care about killing Sunnis," Mellott said. "How long is the fight? As long as it needs to be." This is where the differences between ISIS and Al-Qaeda become critical for Western countries, Mellott said. **Because ISIS will kill anyone, it could use a chemical or biological weapon anywhere, on any day, without warning** With Al-Qaeda, according to Mellott, they would likely try to avoid killing faithful Muslims -- so if it was going to release a weapon in a stadium, it would be on a Muslim holy day, when no good faithful would be present. For ISIS, because members will kill anyone, they could use a chemical weapon on any day. But **the real threat**, according to Mellott, **is that of a biological weapon**. "A chemical weapon released at ground zero kills 100 percent at the site. As you move farther away from the location, the impact is diluted. **With a biological weapon**, the effect is the opposite. **You infect one person, who spreads contamination to 50 more people, who each spread to even more** people. Since you can't control it, Al-Qaeda would never use it," Mellott said. "ISIS would use it, because they don't care."

AT: No ISIS threat

ISIS plans to attack the US- threats are growing rapidly

Morell 5-14-15 [Michael Morell is the former deputy director of the CIA and has twice served as acting director, “ISIS Is a Danger on U.S. Soil,” <http://time.com/3858354/isis-is-a-danger-on-u-s-soil/>]

What ISIS has that al-Qaeda doesn't is a Madison Avenue level of sophisticated messaging and social media. ISIS has a multilingual propaganda arm known as al-Hayat, which uses GoPros and cameras mounted on drones to make videos that appeal to its followers. And ISIS uses just about every tool in the platform box—from Twitter to YouTube to Instagram—to great effect, attracting fighters and funding. Digital media are one of the group's most significant strengths; they have helped **ISIS** become an organization that **poses** four **significant threats to the U.S.** First, **it is a threat to the stability of the entire Middle East.** ISIS is putting the territorial integrity of both Iraq and Syria at risk. And a further collapse of either or both of these states could easily spread throughout the region, bringing with it sectarian and religious strife, humanitarian crises and the violent redrawing of borders, all in a part of the world that remains critical to U.S. national interests. ISIS now controls more territory—in Iraq and Syria—than any other terrorist group anywhere in the world. When al-Qaeda in Iraq joined the fight in Syria, the group changed its name to ISIS. ISIS added Syrians and foreign fighters to its ranks, built its supply of arms and money and gained significant battlefield experience fighting Bashar Assad's regime. Together with the security vacuum in Iraq and Nouri al-Maliki's alienation of the Sunnis, this culminated in ISIS's successful blitzkrieg across western Iraq in the spring and summer of 2014, when it seized large amounts of territory. ISIS is not the first extremist group to take and hold territory. Al-Shabab in Somalia did so a number of years ago and still holds territory there, al-Qaeda in the Islamic Maghreb did so in Mali in 2012, and al-Qaeda in Yemen did so there at roughly the same time. I fully expect extremist groups to attempt to take—and sometimes be successful in taking—territory in the years ahead. But **no other group has taken so much territory so quickly as ISIS** has. Second, ISIS is attracting young men and women to travel to Syria and Iraq to join its cause. At this writing, **at least 20,000 foreign nationals** from roughly 90 countries **have gone to Syria and Iraq to join the fight. Most have joined ISIS.** This flow of foreigners has outstripped the flow of such fighters into Iraq during the war there a decade ago. And there are more foreign fighters in Syria and Iraq today than there were in Afghanistan in the 1980s working to drive the Soviet Union out of that country. These foreign nationals are getting experience on the battlefield, and they are becoming increasingly radicalized to ISIS's cause. There is a particular subset of these fighters to worry about. Somewhere between 3,500 and 5,000 jihadist wannabes have traveled to Syria and Iraq from Western Europe, Canada, Australia and the U.S. They all have easy access to the U.S. homeland, which presents two major concerns: that these fighters will leave the Middle East and either conduct an attack on their own or conduct an attack at the direction of the ISIS leadership. The former has already happened in Europe. It has not happened yet in the U.S.—but it will. In spring 2014, Mehdi Nemmouche, a young Frenchman who went to fight in Syria, returned to Europe and shot three people at the Jewish Museum of Belgium in Brussels. The third threat is that **ISIS is building a following among other extremist groups around the world.** The allied exaltation is happening at a faster pace than al-Qaeda ever enjoyed. It has occurred in Algeria, Libya, Egypt and Afghanistan. More will follow. These groups, which are already dangerous, will become even more so. They will increasingly target ISIS's enemies (including us), and they will increasingly take on ISIS's brutality. We saw the targeting play out in early 2015 when an ISIS-associated group in Libya killed an American in an attack on a hotel in Tripoli frequented by diplomats and international businesspeople. And we saw the extreme violence play out just a few weeks after that when another ISIS-affiliated group in Libya beheaded 21 Egyptian Coptic Christians. And fourth, perhaps most insidiously, ISIS's message is radicalizing young men and women around the globe who have never traveled to Syria or Iraq but who want to commit an attack to demonstrate their solidarity with ISIS. These are the so-called lone wolves. Even before May 4, such an ISIS-inspired attack had already occurred in the U.S.: an individual with sympathies for ISIS attacked two New York City police officers with a hatchet. Al-Qaeda has inspired such U.S. attacks—the Fort Hood shootings in late 2009 that killed 13 and the Boston Marathon bombing in spring 2013 that killed five and injured nearly 300. The attempted attack in Texas is just the latest of these. **We can expect** more of these kinds of **attacks in the U. S.** Attacks by ISIS-inspired individuals are occurring at a rapid pace around the world—roughly 10 since ISIS took control of so much territory. Two such attacks have occurred in Canada, including the October 2014 attack on the Parliament building. And another occurred in Sydney, in December 2014. Many planning such attacks—in Australia, Western Europe and the U.S.—have been arrested before they could carry out their terrorist plans. Today an ISIS-directed attack in the U. S. would be relatively unsophisticated (small-scale), but over time **ISIS's capabilities will grow.** This is what a long-term safe haven in Iraq and Syria would give ISIS, and it is exactly what the group is planning to do. **They have announced their intentions—just like bin Laden** did in the years **prior to 9/11.**

ISIS border attacks are coming

Stoltzfoos '14 [Rachel, “Report: ISIS Planning Imminent Terror Attack At U.S. Border,” 8-29-14, <http://dailycaller.com/2014/08/29/report-isis-planning-imminent-terror-attack-at-u-s-border/>]

The **I**slamic **S**tate of **I**raq and **S**yria **is reportedly working with al-Qaida to carry out a terror attack on the U.S.-Mexico border in the very near future, according to a government watchdog.** Sources told Judicial Watch the **I**slamic **S**tate of **I**raq and **S**yria **is** definitely **operating along the Mexican border in Ciudad Juarez alongside al-Qaida, and one source said officials have picked up radio chatter about an imminent “attack on the border.”** “It's coming soon,” the source told Judicial Watch. **High-level federal enforcement** and other sources **confirmed** to Judicial Watch **that a bulletin was sent out** to a number of Homeland Security, Justice and Defense agencies

warning that ISIS and other terrorists are operating in Juarez, where they are planning an imminent attack on the U.S. with car bombs and other vehicle born improvised explosives.

AT: No Al Qaeda threat

Al-Qaeda is growing stronger- planning to attack the US

Joscelyn 2-4-15 [Thomas, The Long War Journal, a publication covering issues regarding the War on Terror, "High-ranking US intelligence official: Al Qaeda will make gains in Syria and Afghanistan in 2015," <http://www.businessinsider.com/high-ranking-us-intelligence-official-al-qaeda-will-make-gains-in-syria-and-afghanistan-in-2015-2015-2>]

The director of the Defense Intelligence Agency (DIA), Lieutenant General Vincent R. Stewart, warned during congressional testimony yesterday that the "security challenges" the US faces are "more diverse and complex than those we have experienced in our lifetimes." Stewart delivered his remarks to the House Armed Services Committee during a hearing devoted to assessing worldwide threats. While Stewart addressed diverse national security issues, much of his written testimony was focused on what was once called the global war on terror. Al Qaeda in Syria may "expand its territory," while threatening the West. The Islamic State's advances in Iraq and Syria have understandably garnered most of the headlines since the middle of last year. But the Islamic State's rivals in the Al Nusrah Front, an official branch of al Qaeda, have been gaining ground over the past several months. And the DIA is concerned that Al Nusrah will continue to advance inside Syria and elsewhere, while also enabling senior al Qaeda operatives to plan attacks against the West. The DIA expects Al Nusrah "will try to expand its territory in 2015" beyond its Syrian operating areas and enhance its operational capabilities in Lebanon, where it already conducts operations. "As part of the larger al Qaeda network," Stewart writes, "we are concerned about the support Al Nusrah Front provides to transnational terrorist attack plotting against US and Western interests." In particular, he highlighted the threat posed by the so-called Khorasan Group, "a cadre of experienced al Qaeda operatives that works closely with and relies upon al Nusrah Front to provide personnel and space for training facilities in northwestern Syria." The Khorasan Group "is primarily focused on transnational terrorist attack plotting."

Al-Qaeda is becoming more powerful

Rothman '14 [Noah, holds a master's degree in international relations with a focus on security policy in Eastern Europe and the Former Soviet Republics in 2010, "Al-Qaeda 'decimated?' Study shows terror groups, attacks on the rise," June 25, <http://hotair.com/archives/2014/06/25/al-qaeda-on-the-run-study-shows-terror-groups-attacks-on-the-rise/>]

George W. Bush had one politically devastating "mission accomplished" moment. Obama has had over 30 of them. During the 2012 presidential campaign, the president regularly touted his administration's successful execution of the war against Islamic terrorism. Obama and his allies often described al-Qaeda as "decimated" and "on the run," but a new report suggests that the terror group and its affiliates were growing in numbers and operational capacity even then. According to a RAND corporation study, there has been a 58 percent increase in the number of jihadist groups since 2010 as well as a "doubling" of Islamic fundamentalist fighters and a "tripling" of the number of attacks carried out by al-Qaeda affiliates.

DHS attention has refocused on lone wolf now – the threat is growing

Fobbs 14 – Kevin Fobbs began writing professionally in 1975 and has been published in the "New York Times," and written for the "Detroit News," "Michigan Chronicle," "GOPUSA", "Soul Source" magazine and "Writers Digest" magazine. As the former Community Concerns columnist for 12 years with The Detroit News, "Is America ready – U.S. officials fear radicalized lone-wolf terrorist plots maybe soon!" <http://buzzpo.com/america-ready-u-s-officials-fear-radicalized-lone-wolf-terrorist-plots-maybe-soon/>

How prepared do you believe America is if ISIS or Al Qaeda terrorism crept into your neighborhood and attacked? Are you as afraid as many U.S. intelligence community officials are who fear radicalized citizens will carry out lone-wolf terrorist plots? Maybe you and your family should be. Because, according to PBS News, Obama administration officials are suggesting a far ranging list of threat assessments to America's national security. But chief among them are the lone-wolf terrorist plots because, "they don't require large conspiracies of people whose emails or phone calls can be intercepted." Unlike the September 11th 2001 terrorist attacks on America's homeland, these breed of terrorists are not only well trained but they have joined or are affiliated with ISIS; a well financed terrorist organizational network. This extremist group has established a highly efficient caliphate, or Islamic state, in eastern Syrian and northern and western Iraq; it is also the group that is responsible for the beheading of American journalist James Foley. Although Obama and his administration officials appear to be discounting the seriousness of terrorist attacks on America by lone-wolf operators to the same degree as Britain, they should. On Friday, England raised its terror threat to its second highest level from "substantial" to "severe". They have based this reaction to intelligence community information in Britain that cites that an "a foreign fighter danger that made a terrorist attack "highly likely," reported PBS News. America does not have to wonder if this type of terrorism can happen, because it did with the 2013 Boston Marathon bombings. Several people were killed and dozens of innocent citizens were injured. By apparent self-radicalized American brothers Dzhokhar and Tamerlan Tsarnaev. Then of course there was the New York Times bomb attempt in 2010 by Faisal Shahzad. Shahzad had received training and instructions while in Pakistan. Is America ready for this threat, even though the White House refuses to declare the jihadists and ISIS declared terrorist intentions real? This should definitely concern the nation because it only take approximately 90 seconds of period of violence to harm hundred if not thousands of Americans, from the alleged 200 plus citizens who have gone to fight for extremist terrorists in Iraq and Syria. The real pressing urgent matter lies in the terrorist trained Americans that return to American soil. Rutgers University professor John Cohen who recently left as Homeland Security Department's counterterrorism coordinator stressed that the officials worked very hard, "to detect Westerners who have gone to Syria, no one knows for sure whether there are those who have gone there undetected," reported PBS News. As the 9/11 terrorist attack anniversary approaches it is probably wise for all Americans to be aware of not just the possibility that a terrorist act could occur, but to report anything suspicious to law enforcement. Remember, America does not get a second chance to get it right.

Preparedness is increasing – local law enforcement are ramping up vigilance

Perez and Prokupecz 15 -- Evan Perez joined CNN as a justice reporter in 2013. In his current role, he regularly writes for CNN.com and appears across the network's programs to report on his findings. Shimon Prokupecz covers law enforcement for CNN and is based in New York City. "FBI struggling with surge in homegrown terror cases"

<http://www.cnn.com/2015/05/28/politics/fbi-isis-local-law-enforcement/>

New York (CNN) **The New York Police Department and other law enforcement agencies** around the nation **are increasing their surveillance of ISIS supporters in the U.S., in part to aid the FBI which is struggling** to keep up with a surge in the number of possible terror suspects, according to law enforcement officials. The change is part of the fallout from the terrorist attack in Garland, Texas earlier this month. The FBI says two ISIS supporters attempted a gun attack on a Prophet Mohammad cartoon contest but were killed by police. One of the attackers, Elton Simpson, was already under investigation by the FBI but managed to elude surveillance to attempt the foiled attack. FBI Director James Comey told a group of police officials around the country in a secure conference call this month that **the FBI needs help to keep tabs on hundreds of suspects. As a result, some police agencies are adding surveillance teams to help the FBI monitor suspects. Teams of NYPD officers trained in surveillance are now helping the FBI's surveillance teams to better keep track of suspects, law enforcement officials say.** NYPD Commissioner William Bratton has said he wants to add 450 officers to the force's counterterrorism unit, partly to counter the increasing domestic threat posed by ISIS sympathizers. **The same is happening with other police departments around the country.** The Los Angeles Police Department's counterterrorism unit is also beefing up its surveillance squads at the request of the FBI, law enforcement officials say. Comey said at an unrelated news conference Wednesday that he has less confidence now that the FBI can keep up with the task. "It's an extraordinarily difficult challenge task to find -- that's the first challenge -- and then assess those who may be on a journey from talking to doing and to find and assess in an environment where increasingly, as the attorney general said, their communications are unavailable to us even with court orders," Comey said. "They're on encrypted platforms, so it is an incredibly difficult task that we are enlisting all of our state, local and federal partners in and we're working on it every single day, but I can't stand here with any high confidence when I confront the world that is increasingly dark to me and tell you that I've got it all covered," he said. **"We are working very, very hard on it but it is an enormous task."** On Saturday, **an FBI spokesman said the bureau doesn't have a shortage of resources** and the Garland attack wasn't the result of lack of surveillance personnel. If agents had any indication that Simpson was moving toward an attack, they would have done everything to stop it, the spokesman said. **The appeal for local help isn't intended to seek more surveillance, but more broadly to encourage local law enforcement to increase vigilance given the heightened threat,** the FBI said. The Garland attack prompted a reassessment for FBI officials. Simpson's social media and other communications with known ISIS recruiters drew the FBI's interest earlier this year. FBI agents in Phoenix began regular surveillance of Simpson, though it was not round-the-clock monitoring, according to a U.S. official. The agents watching Simpson noticed he disappeared for a few days. Investigators looked into his communications and found social media postings making reference to the Garland cartoon contest. That discovery is what prompted the FBI to send a bulletin to the joint terrorism task force that was monitoring the Garland event. The bulletin arrived about three hours before the attack. Comey told reporters this month the FBI had no idea Simpson planned to attack the event or even that he had traveled from his home in Phoenix to Texas.

We're winning the war on terrorism now -- Continued vigilance is key

Zenko 4/8/15 – Zenko covers the U.S. national security debate and offers insight on developments in international security and conflict prevention. “CIA Director: We’re Winning the War on Terror, But It Will Never End”
<http://blogs.cfr.org/zenko/2015/04/08/cia-director-were-winning-the-war-on-terror-but-it-will-never-end/>

Last night, **Director of Central Intelligence John Brennan participated** in a question-and-answer session at Harvard Kennedy School’s Institute of Politics. The first thirty-seven minutes consisted of an unusually probing exchange between Brennan and Harvard professor Graham Allison (full disclosure: Graham is a former boss of mine). Most notably, between 19:07 and 29:25 in the video, Allison pressed Brennan repeatedly about whether the United States is winning the war on terrorism and why the number of al-Qaeda-affiliated groups has only increased since 9/11: “There seem to be more of them than when we started...How are we doing?” Brennan replied: If I look across the board in terms of since 9/11 at terrorist organizations, and if the United States in all of its various forms. **In intelligence, military, homeland security, law enforcement, diplomacy. If we were not as engaged against the terrorists, I think we would be facing a horrendous, horrendous environment.** Because **they would have taken full advantage of the opportunities that they have had across the region.** We have worked collectively as a government but also with our international partners very hard to try and root many of them out. Might some of these actions be stimulants to others joining their ranks? Sure, that’s a possibility. I think, though **it has taken off of the battlefield a lot more terrorists, than it has put on. This statement is impossible to evaluate or measure because the U.S. government has consistently refused to state publicly which terrorist organizations are deemed combatants,** and can therefore be “taken out on the battlefield.” However, **relying upon the State Department’s annual Country Reports on Terrorism, the estimated strength of all al-Qaeda-affiliated groups has grown or stayed the same since President Obama came into office.** Of course, **non-al-Qaeda-affiliated groups have arisen** since 9/11, including the self-proclaimed **Islamic State**, which the Central Intelligence Agency estimated last September to contain up to 31,500 fighters, **and Boko Haram**, which has perhaps 10,000 committed members. However, the most interesting question posed to Brennan came at the very end from a Harvard freshman who identified himself as Julian: “We’ve been fighting the war on terror since 2001. Is there an end in sight, or should we get used to this new state of existence? Brennan replied: **It’s a long war** unfortunately. **But it’s been a war that has been in existence for millennia,** at the same time—the use of violence for political purposes against noncombatants by either a state actor or a subnational group. **Terrorism has taken many forms** over the years. **What is more challenging now is** again, **the technology that is available to terrorists, the great devastation that can be created** by even a handful of folks, **and also mass communication that just proliferates** all of this activity and incitement and **encouragement.** So you have an environment now that’s very conducive to that type of propaganda and recruitment efforts, as well as the ability to get materials that are going to kill people. And so this is going to be something, I think, that **we’re always going to have to be vigilant** about. There is evil in the world and some people just want to kill for the sake of killing...This is something that, whether it’s from this group right now or another group, I think the ability to cause damage and violence and kill will be with us for many years to come. We just have to not kill our way out of this because that’s not going to address it. **We need to stop those attacks that are in train** but we also have to address some of those underlying factors and conditions. I’m not saying that poverty causes somebody to become a terrorist, or a lack of governance, but they certainly do allow these terrorist organizations to grow and they take full advantage of those opportunities. To summarize, **the war on terrorism is working, compared to inaction or other policies. But, the American people should expect it to continue** for millennia, or as long as lethal technologies and mass communication remain available to evil people.

2NC – Generic

Current strategies prevent attacks – groups can still rebound – intel key

Pomerleau 4/24/15 — Mark, bachelor's degree in Political Science from Westfield State University. a freelance journalist in Washington covering politics and policy. "Is the US Winning the War on Terror?" <http://www.theepochtimes.com/n3/blog/is-the-us-winning-the-war-on-terror/>

The War on Terror, or described differently, the global struggle to curb violent extremism, can be boiled down to optics and rhetoric. While military operations play a small role, the larger conflict encompasses so much more. The United States has struggled both on and off the battlefield to win this conflict but victory can be, and in this case, is subjective. Successes: **The United States deposed the Taliban regime that ruled Afghanistan in the 1990s and early 2000s, that provided al-Qaeda safe-haven. The uprooting of these sanctuaries put both organizations on the run, which disrupted their long-term planning** against the U.S. homeland. **Drone strikes and raids have allowed the U.S. to take out several key leaders** of these terrorist entities, dealing a blow to operational planning. Documents and correspondence between Osama bin Laden and his associates unveiled in the trial of an al-Qaeda member in February that the robust aerial drone campaign expanded by the Obama administration had a profound impact in limiting the movements of terrorist groups hiding out in Pakistan. The ability of drones to loiter 24/7 combined with Special Operations Forces raids allowed the United States to gain intrusive access to and vital intelligence about the inner workings of terrorist organizations. **There has not been a successful attack on the homeland since 9/11, due in part to changes made to the intelligence community after 9/11 and counterterrorism operations.** **Additionally, the U.S. has made great strides in monitoring would-be domestic terror suspects and prosecuted them with the full extent of the law. Failures: While the U.S. was successful in degrading terrorist entities, it was unsuccessful in destroying them.** Consider the Islamic State group's predecessor organization, al-Qaeda in Iraq/Islamic State of Iraq (AQI/ISI). The group was severely weakened as a result of the Iraqi Tribal Awakening Movement when Iraqi tribes joined the U.S. surge to dispel the violent insurgents. AQI/ISI was, however, never officially destroyed and its survivors were able to regroup and rebuild. Despite the demise of several key leaders of al-Qaeda, the Taliban and associated groups, the strategy of leadership decapitation has not worked in dismantling these organizations. The Obama administration has made the mistake of thinking that "if you sort of lop off the top of the pyramid, the whole thing crumbles," Tom Joscelyn, Senior Fellow at the Foundation for Defense of Democracies told lawmakers regarding the idea of destroying these terrorist groups by taking out their leadership. Al-Qaeda is not organized that way Joscelyn stated. However, it is also entirely possible that the U.S. is simply just trying to eliminate as many terrorists as possible in a sort-of whack-a-mole campaign, which would be equally ineffective, though the president has maintained he does not wish this as counterterrorism strategy. The drone campaign has been highly criticized by human rights groups for its collateral civilian damage. This collateral damage is also being touted as a recruiting device, which incites more people to join terrorist groups so they can retaliate against the United States. By some estimates, in confirmed strikes that have taken place in Pakistan, Yemen, and Somalia, the number of civilians killed ranges from 237-308. A recent figure released by the Syrian Observatory for Human Rights, considered one of the premier sources for on-the-ground reporting in Syria's volatile civil war, 66 civilians have been killed in coalition air strikes. Though, collateral damage is expected in wars, the nature of drone strikes (e.g. zero risk to soldiers as well as controversial signature strikes that target a specific area based on behavioral patterns without knowing exactly who the targets are) obfuscates this reality. Civilians in nations where U.S. drones prominently operate have long feared succumbing to death. This reality hit home for Americans as the U.S. officially acknowledged yesterday that an American hostage and an Italian aid worker were killed in a strike that targeted a suspected militant compound. The government asserts that it was not aware the American was being held at that location. Similarly, U.S. raids by Special Operations Forces have also rendered tragic results. A U.S. raid in Yemen to rescue a U.S. hostage failed when the militants were alerted to the presence of U.S. soldiers and killed the American and a South African being held by the group, whom the U.S. did not know was present. Many of these failures boil down to intelligence and a willingness to pull the trigger. They contribute to a broader narrative of negative optics. The al-Qaeda "vanguard" movement was started by Osama bin Laden partially due to an undesired American presence in Muslim lands. Several groups have continued this narrative calling for lone wolf actors to incite violence inside western nations. The fact that the U.S. continues operations in these nations despite widespread reporting of collateral damage, that could be preventable, only feeds this narrative. The U.S. has had great success in fighting terrorism over the last 14 years, especially in the military context. While the Islamic State group is marginally losing ground on the battlefield, governments are still struggling to figure out how to curb radical messaging and recruitment online. The U.S. battlefield successes to oust the Taliban could be for naught if, as suspected, the Afghan forces will not be able to stand up on their own against a formidable Taliban insurgency that is certain to continue to fight to reestablish their Islamic Emirate. With the online propaganda success of the Islamic State group, **there has been a greater need for the non-military counterterror metrics. Many have questioned if U.S. counterterror policies (military and non-military such as controversial sting operations in American communities thought to drive non-violent individuals to commit crimes) are creating more terrorists than killing them. Despite the great successes, however, it is not overtly clear that the U.S. is winning the War on Terror.**

Intel Key

We'll win the WOT – intel gathering is key

McDONOUGH 2/28/15 – Doug, Citing American spy, James Olson “**U.S. winning the war on terror**”
http://www.myplainview.com/news/article_c1881ec4-bf9b-11e4-a9b1-b342ff9491d6.html

After spending 31 years as an American spy, James Olson is blunt in his assessment. "Make no mistake, **our country is at war,**" he said Thursday while keynoting the annual Plainview Chamber of Commerce banquet. "**It's a war on terror,** and it will be long, bloody and deadly. But **America will win this war because our best young people today are stepping forward in droves.**" While many of those are putting on uniforms and joining the ranks of the nation's combat forces on the front lines, still more are going in harm's way behind the scenes as counterintelligence operatives. "We are on the front lines in the war on terror," Olson warns. "And **we will be hit again, inside our own borders. It will be a weapon of mass destruction, and no region or sector is immune from this attack. The best way to combat this threat is through good intelligence.**" Olson was in his final year as a law student at the University of Iowa on the fast track to fulfill his dream of practicing law in a rural town when he received a phone call one Friday afternoon.

The United States federal government should

- Streamline funding for fusion centers
- Require the FBI to share relevant information with state and local law enforcement
- Establish an office within the Department of Homeland Security to coordinate efforts countering violent extremism

That fills the holes in counterterrorism -- Perm can't solve

Inserra 15 -- David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy, of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation. "68th Terrorist Plot Calls for Major Counterterrorism Reforms" <http://www.heritage.org/research/reports/2015/05/68th-terrorist-plot-calls-for-major-counterterrorism-reforms>

Strengthening the Counterterrorism Enterprise In light of these warnings, the U.S. cannot be passive. Heritage has recommended numerous counterterrorism policies for Congress to address, including: Streamlining U.S. fusion centers. Congress should limit fusion centers to the approximately 30 areas with the greatest level of risk as identified by the Urban Area Security Initiative (UASI). Some exceptions might exist, such as certain fusion centers that are leading cybersecurity or other important topical efforts. The remaining centers should then be fully funded and resourced by UASI. Pushing the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working to integrate intelligence and law enforcement activities. This will require overcoming cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Ensuring that the FBI shares information more readily and regularly with state and local law enforcement and treats state and local partners as critical actors in the fight against terrorism. State, local, and private-sector partners must send and receive timely information from the FBI. The Department of Homeland Security (DHS) should play a role in supporting these partners' efforts by acting as a source or conduit for information to partners and coordinating information sharing between the FBI and its partners. Designating an office in DHS to coordinate countering violent extremism (CVE) efforts. CVE efforts are spread across all levels of government and society. DHS is uniquely situated to lead the federal government's efforts to empower local partners. Currently, DHS's CVE working group coordinates efforts across DHS components, but a more substantial office will be necessary to manage this broader task. Supporting state, local, and civil society partners. Congress and the Administration should not lose sight of the fact that all of the federal government's efforts must be focused on empowering local partners. The federal government is not the tip of the spear for CVE efforts; it exists to support local partners who are in the best position to recognize and counter radicalization in their own communities. Maintaining essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations, however, does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Ensuring Security In the midst of this surge in terrorist activity, the U.S. must recommit itself to counterterrorism efforts. Improving intelligence tools, information sharing with state and local law enforcement, and local civil society outreach to counter radicalization should be a priority for Congress.

2NC -- Fusion Centers

Fusion centers are crucial to support investigations into potential threats

Vicinanzo 15 -- HSToday, Amanda Vicinanzo, Senior Editor "Gaps In Info Sharing Continue To Hinder Counterterrorism Efforts"

<http://www.hstoday.us/briefings/daily-news-analysis/single-article/gaps-in-info-sharing-continue-to-hinder-counterterrorism-efforts/b365f132d73fa2a44e1966dfbee3340a.html>

The September 11, 2001 attacks demonstrated the importance of information sharing between local, state, tribal and federal law enforcement and homeland security partners in the wake of a devastating terrorist attacks. However, while progress has been made, significant challenges continue to hinder state and local law enforcement from sharing information on threats to the homeland. To address remaining gaps in federal, state and local information sharing, the House Committee on Homeland Security's Subcommittee on Counterterrorism and Intelligence recently convened a hearing to examine areas where information sharing can be improved. "A common trend in these different reviews is the need for federal departments and agencies to view state and local law enforcement as partners in national security and counterterrorism, the need for leadership within organizations to ensure accountability for information sharing, wider access to necessary databases, and the professionalization of analysis and information sharing," said subcommittee chairman Peter King (R-NY). Chief Richard Beary, president of the International Association of Chiefs of Police (IACP), testified that the 9/11 Commission rightly asserted that ineffective information sharing severely handicapped our nation's homeland security efforts. Since then, Beary explained there has been "substantial movement" in the right direction, but "our work is not done." Beary stated IACP strongly agrees with the recommendations laid out in the report of the Business Executives for National Security (BENS), particularly the recommendation that ownership and management of the integrated fusion centers should continue to be managed by state and local stakeholders with the support of federal entities. Mike Sena, president of the National Fusion Center Association (NFCA), testified that fusion centers have played a significant role in the dramatic progress law enforcement, public safety and intelligence communities have made over the past decade in analyzing and sharing threat information. The Majority Staff Report on the National Network of Fusion Centers issued by the Subcommittee on Counterterrorism and Intelligence in July 2015 recognized the direct impact of fusion center information sharing on terrorism investigations. According to information provided by the FBI and Department of Justice, between December 2008 and December 2012, "176 SARs [suspicious activity reports] entered by fusion centers into the eGuardian or Shared Spaces SAR databases [...] resulted in the FBI opening new terrorism investigations." In addition, "289 Terrorist Watchlist encounters reported by fusion centers enhanced existing FBI cases." Sena also agreed with many of the recommendations included in the BENS report, particularly the recommendation to establish a domestic threat framework for assessing and prioritizing threats and information needs. However, Sena disagreed with some of the assumptions made by the report. For example, the BENS report recommended establishment of regional fusion centers on top of what is already in existence today. Sena believes this recommendation is unnecessary and could have a negative impact on the ability of fusion centers in those areas to accomplish their core missions. Sena asserted fusion centers are increasingly contributing analytical and information sharing efforts to address cyber threats. For example, in late November and early December 2014 during the events in Ferguson, Missouri, the NFCA Cyber Intelligence Network hosted a virtual situational awareness room (referred to as CINAWARE) on the Homeland Security Information Network. The CINAWARE room facilitated information sharing across agencies, with more than 350 individuals from fusion centers and other federal, state and local agencies around the country participated in the CINAWARE room between mid-November and early December. "That level of threat information sharing was impossible only a few years ago, yet it is becoming essential," Sena said.

2NC -- FBI Plank

Info-sharing is crucial to preventing domestic lone-wolf terror – decentralizes information and allows for specialization

Downing 13 -- "Preventing the Next "Lone Wolf" Terrorist Attack Requires Stronger Federal–State–Local Capabilities" Michael P. Downing is Deputy Chief, Commanding Officer, Counter-Terrorism and Special Operations Bureau, Los Angeles Police Department. Matt A. Mayer is a Visiting Fellow at The Heritage Foundation and author of Homeland Security and Federalism: Protecting America from Outside the Beltway. <http://www.heritage.org/research/reports/2013/06/preventing-the-next-lone-wolf-terrorist-attack-requires-stronger-federal-state-local-capabilities>

Fortunately, state and local organizations recognize that outreach and engagement strategies build trust and solve community problems at the grassroots level. Indeed, state and local law enforcement have spent years developing a relationship of trust with local leaders. No one knows this landscape better than the "boots on the ground." The integration of these sometimes-isolated communities into the greater fold of society has never been more important—and is not the job of federal authorities. It is, of course, impossible to know whether all of these puzzle pieces—or even some of them—would have been pieced together by the BPD and/or the FBI. Yet the goal of the U.S. domestic counterterrorism enterprise is not to provide an impenetrable defense against terrorism; rather, the objective is to give federal, state, and local law enforcement the greatest possible number of constitutionally grounded opportunities to detect and stop potential terrorists. Rather than again debate the dangerous proposal of a domestic intelligence agency, the counter-terrorism conversation should focus on how legally and ethically to take advantage of the decentralized, community-focused, and well-positioned nature of state and local law enforcement. Without question, had the FBI shared its interview actions with the BPD, local law enforcement would have had a much greater chance of detecting Tsarnaev's extremism. Federal law enforcement is not designed to fight against this kind of threat; it is built to battle against cells, against groups, and against organizations, but not against individuals. As a consequence, U.S. national strategy reinforces the community policing, outreach, and engagement model of state and local enforcement. Why do we continue to underutilize these resources? Four Key Reforms Still Needed The FBI must share more broadly with state and local law enforcement. Despite the lessons of 9/11 and other terrorist plots, the culture of the FBI continues to resist sharing information with state and local law enforcement. This culture must change, and it must change rapidly. As large-scale, complicated terrorist attacks become harder to execute, the "lone wolf" scenario becomes more of a threat. America therefore has to leverage the experience, capabilities, authorities, and relationships found in local law enforcement to detect budding terrorists before they strike. If the FBI believes it could not effectively share the information related to Tsarnaev because of advice provided by the United States Attorney's Office, then one of two things needs to happen: Either Congress should pass legislation allowing such information to be shared or accountability for decision making needs to be assessed. Local cyber capabilities must be a priority. Building cyber investigation capabilities in the higher-risk urban areas must become a primary focus of the U.S. Department of Homeland Security grants. With so much terrorism-related activity occurring on the Internet, local law enforcement must have the ability to constitutionally monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Community outreach remains a vital tool. Federal grant funds should also be used to create robust community outreach capabilities in higher-risk urban areas. Such capabilities are key to building trust in local communities, and if the United States is to thwart "lone wolf" terrorist attacks successfully, it must do so by putting effective community outreach operations at the tip of the spear. Re-examine the FBI's "lead agency" function. The "lone wolf" attack in Boston was first a crime and then a terrorist act. The responsibility for public safety and the investigation of crimes at the local level rests with the local police agency, except in those cases in which the FBI determines that it will assume control of the investigation. With regard to public safety information and intelligence flow, such a policy relegates both the police department and the state sovereign to a subordinate—and potentially isolated—position. Therefore, this policy should be re-examined both in terms of best practice and in terms of its legal framework. Additionally, federal entities are often reluctant to release information that may prove embarrassing—a practice that may arise during an investigation in local public safety matters. Information that comes first to the entity that "leads" an investigation is always subject to restriction by those in charge. The decision to censor or withhold any information related to local public safety should always be in the hands of those who have the sovereign duty and obligation for public safety at the local level. Decisions related to the criminal investigations should belong to the local police department rather than the federal government.

NSA

1NC

Plan allows effective cyberterrorism -- Continued NSA metadata surveillance is key-- the NSA will fill current gaps but the plan curtails that

Goldsmith 13 -- Jack Goldsmith, a contributing editor, teaches at Harvard Law School and is a member of the Hoover Institution Task Force on National Security and Law. "We Need an Invasive NSA" <http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks>

Ever since stories about the National Security Agency's (NSA) electronic intelligence-gathering capabilities began tumbling out last June, **The New York Times** has published more than a dozen editorials excoriating the "national surveillance state." It **wants the NSA to end the "mass warehousing of everyone's data"** and the use of "back doors" to break encrypted communications. **A major element of the Times' critique is that the NSA's domestic sweeps are not justified** by the terrorist threat they aim to prevent. At the end of August, in the midst of the Times' assault on the NSA, **the newspaper suffered** what it described as a "malicious external attack" on its domain name registrar **at the hands of the Syrian Electronic Army**, a group of hackers who support Syrian President Bashar Al Assad. The paper's website was down for several hours and, for some people, much longer. "In terms of the sophistication of the attack, this is a big deal," said Marc Frons, the Times' chief information officer. **Ten months earlier, hackers stole the corporate passwords for every employee at the Times, accessed the computers of 53 employees, and breached the e-mail accounts of two reporters who cover China.** "We brought in the FBI, and the FBI said this had all the hallmarks of hacking by the Chinese military," Frons said at the time. He also acknowledged that the hackers were in the Times system on election night in 2012 and could have "wreaked havoc" on its coverage if they wanted. Illustration by Harry Campbell Such cyber-intrusions threaten corporate America and the U.S. government every day. **Relentless assaults on America's computer networks by China and other foreign governments, hackers and criminals have created an urgent need for safeguards** to protect these vital systems," the Times editorial page noted last year while supporting legislation encouraging the private sector to share cybersecurity information with the government. It cited General Keith Alexander, the director of the NSA, who had noted a 17-fold increase in cyber-intrusions on critical infrastructure from 2009 to 2011 and who described the losses in the United States from cyber-theft as "the greatest transfer of wealth in history." **If a "catastrophic cyber-attack occurs," the Times concluded, "Americans will be justified in asking why their lawmakers ... failed to protect them."** **When catastrophe strikes, the public will adjust its tolerance** for intrusive government measures. **The Times** editorial board **is quite right about the seriousness of the cyber-threat** and the federal government's responsibility to redress it. **What it does not appear to realize is the connection between the domestic NSA surveillance it detests and the governmental assistance with cybersecurity it cherishes.** **To keep our computer and telecommunication networks secure, the government will eventually need to monitor and collect intelligence on those networks** using techniques similar to ones the Times and many others find reprehensible when done for counterterrorism ends. **The fate of domestic surveillance is today being fought around the topic of whether it is needed to stop Al Qaeda from blowing things up.** **But the fight tomorrow, and the more important fight, will be about whether it is necessary to protect our ways of life embedded in computer networks.** Anyone anywhere with a connection to the Internet can engage in cyber-operations within the United States. **Most truly harmful cyber-operations, however, require group effort and significant skill.** The attacking group or nation must have clever hackers, significant computing power, and the sophisticated software—known as "malware"—that enables the monitoring, exfiltration, or destruction of information inside a computer. The supply of all of these resources has been growing fast for many years—in governmental labs devoted to developing these tools and on sprawling black markets on the Internet. **Telecommunication networks are the channels** through which malware typically travels, often anonymized or encrypted, and buried in the billions of communications that traverse the globe each day. **The targets are the communications networks** themselves as well as the computers they connect—things like the Times' servers, the **computer systems that monitor nuclear plants** classified **documents** on computers **in the Pentagon, the nasdaq exchange,** your local bank, and your social-network providers. To keep these computers and networks secure, **the government needs powerful intelligence capabilities abroad so that it can learn about planned cyber-intrusions.** It also needs to raise defenses at home. An important first step is to correct the market failures that plague

cybersecurity. Through law or regulation, the government must improve incentives for individuals to use security software, for private firms to harden their defenses and share information with one another, and for Internet service providers to crack down on the botnets—networks of compromised zombie computers—that underlie many cyber-attacks. More, too, must be done to prevent insider threats like Edward Snowden's, and to control the stealth introduction of vulnerabilities during the manufacture of computer components—vulnerabilities that can later be used as windows for cyber-attacks. And yet that's still not enough. The U.S. government can fully monitor air, space, and sea for potential attacks from abroad. But it has limited access to the channels of cyber-attack and cyber-theft, because they are owned by private telecommunication firms, and because Congress strictly limits government access to private communications. "I can't defend the country until I'm into all the networks," General Alexander reportedly told senior government officials a few months ago. For Alexander, being in the network means having government computers scan the content and metadata of Internet

communications in the United States and store some of these communications for extended periods. Such access, he thinks, will give the government a fighting chance to find the needle of known malware in the haystack of communications so that it can block or degrade the attack or exploitation. It will also allow it to discern patterns of malicious activity in the swarm of communications, even when it doesn't possess the malware's signature. And it will better enable the government to trace back an attack's trajectory so that it can discover the identity and geographical origin of the threat.

Alexander's domestic cybersecurity plans look like pumped-up versions of the NSA's

counterterrorism-related homeland surveillance that has sparked so much controversy in recent months. That is why so many people in Washington think that Alexander's vision has "virtually no chance of moving forward," as the Times recently reported. "Whatever trust was there is now gone," a senior intelligence official told Times. There are two reasons to think that these predictions are wrong and that the government, with extensive assistance from the NSA, will one day intimately monitor private networks. The first is that the cybersecurity threat is more pervasive and severe than the terrorism threat and is somewhat easier to see. If the Times' website goes down a few more times and for longer periods, and if the next penetration of its computer systems causes large intellectual property losses or a compromise in its reporting, even the editorial page would rethink the proper balance of privacy and security. The point generalizes: As cyber-

theft and cyber-attacks continue to spread (and they will), and especially when they result in a catastrophic disaster (like a banking compromise that destroys market confidence, or a successful attack on an electrical grid), the public will demand government action to remedy the problem and will adjust its tolerance for intrusive government measures. At that point, the nation's willingness to adopt some version of

Alexander's vision will depend on the possibility of credible restraints on the NSA's activities and credible ways for the public to monitor, debate, and approve what the NSA is doing over time. Which leads to the second reason why skeptics about enhanced government involvement in the network might be wrong. The public mistrusts the NSA not just because of what it does, but also because of its extraordinary secrecy. To obtain the credibility it needs to secure permission from the American people to protect our networks, the NSA and the intelligence community must fundamentally recalibrate their attitude toward disclosure and scrutiny. There are signs that this is happening—and that, despite the undoubted damage he inflicted on our national security in other respects, we have Edward Snowden to thank. "Before the unauthorized disclosures, we were always conservative about discussing specifics of our collection programs, based on the truism that the more adversaries know about what we're doing, the more they can avoid our surveillance," testified Director of National Intelligence James Clapper last month. "But the disclosures, for better or worse, have lowered the threshold for discussing these matters in public." In the last few weeks, the NSA has done the unthinkable in releasing dozens of documents that implicitly confirm general elements of its collection capabilities. These revelations are bewildering to most people in the intelligence community and no doubt hurt some elements of collection. But they are justified by the countervailing need for public debate about, and public confidence in, NSA activities that had run ahead of what the public expected. And they suggest that secrecy about collection capacities is one value, but not the only or even the most important one. They also show that not all revelations of NSA capabilities are equally harmful. Disclosure that it sweeps up metadata is less damaging to its mission than disclosure of the fine-grained details about how it collects and analyzes that metadata. It is unclear whether the government's new attitude toward secrecy is merely a somewhat panicked reaction to Snowden, or if it's also part of a larger rethinking about the need for greater tactical openness to secure strategic political legitimacy. Let us hope, for the sake of our cybersecurity, that it is the latter.

Cyber war causes nuclear lashout

Fritz '9 (Jason - former Captain of the U.S. Army, July, Hacking Nuclear Command and Control)

The US uses the two-man rule to achieve a higher level of security in nuclear affairs. Under this rule two authorized personnel must be present and in agreement during critical stages of nuclear command and control. The President must jointly issue a launch order with the Secretary of Defense; Minuteman missile operators must agree that the launch order is valid; and on a submarine, both the commanding officer and executive officer must agree that the order to launch is valid. In the US, in order to execute a nuclear launch, an Emergency Action Message (EAM) is needed. This is a preformatted message that directs nuclear forces to execute a specific attack. The contents of an EAM change daily and consist of a complex code read by a human voice. Regular monitoring by shortwave listeners and videos posted to YouTube provide insight into how these work. These are issued from the NMCC, or in the event of destruction, from the designated hierarchy of command and control centres. Once a command centre has confirmed the EAM, using the two-man rule, the Permissive Action Link (PAL) codes are entered to arm the weapons and the message is sent out. These messages are sent in digital format via the secure Automatic Digital Network and then relayed to aircraft via single-sideband radio transmitters of the High Frequency Global Communications System, and, at least in the past, sent to nuclear capable submarines via Very Low Frequency (Greenemeier 2008, Hardisty 1985). The technical details of VLF submarine communication methods can be found online, including PC-based VLF reception. Some reports have noted a Pentagon review, which showed a potential "electronic back door into the US Navy's system for broadcasting nuclear launch orders to Trident submarines" (Peterson 2004). The investigation showed that cyber terrorists could potentially infiltrate this network and insert false orders for launch. The investigation led to "elaborate new instructions for validating launch orders" (Blair 2003). Adding further to the concern of cyber terrorists seizing

control over submarine launched nuclear missiles; The Royal Navy announced in 2008 that it would be installing a Microsoft Windows operating system on its nuclear submarines (Page 2008). The choice of operating system, apparently based on Windows XP, is not as alarming as the advertising of such a system is. **This may attract hackers and narrow the necessary reconnaissance to learning its details and potential exploits.** It is unlikely that the operating system would play a direct role in the signal to launch, although this is far from certain. **Knowledge of the operating system may lead to the insertion of malicious code, which could be used to gain accelerating privileges, tracking, valuable information, and deception that could subsequently be used to initiate a launch.** Remember from Chapter 2 that the UK's nuclear submarines have the authority to launch if they believe the central command has been destroyed. **Attempts by cyber terrorists to create the illusion of a decapitating strike could also be used to engage fail-deadly systems.** Open source knowledge is scarce as to whether Russia continues to operate such a system. However evidence suggests that they have in the past. Perimetr, also known as Dead Hand, was an automated system set to launch a mass scale nuclear attack in the event of a decapitation strike against Soviet leadership and military. In a crisis, military officials would send a coded message to the bunkers, switching on the dead hand. If nearby ground-level sensors detected a nuclear attack on Moscow, and if a break was detected in communications links with top military commanders, the system would send low-frequency signals over underground antennas to special rockets. Flying high over missile fields and other military sites, these rockets in turn would broadcast attack orders to missiles, bombers and, via radio relays, submarines at sea. Contrary to some Western beliefs, Dr. Blair says, many of Russia's nuclear-armed missiles in underground silos and on mobile launchers can be fired automatically. (Broad 1993) Assuming such a system is still active, cyber terrorists would need to create a crisis situation in order to activate Perimetr, and then fool it into believing a decapitating strike had taken place. While this is not an easy task, the information age makes it easier. Cyber reconnaissance could help locate the machine and learn its inner workings. This could be done by targeting the computers high of level official's—anyone who has reportedly worked on such a project, or individuals involved in military operations at underground facilities, such as those reported to be located at Yamantau and Kosvinsky mountains in the central southern Urals (Rosenbaum 2007, Blair 2008) Indirect Control of Launch **Cyber terrorists could cause incorrect information to be transmitted, received, or displayed at nuclear command and control centres, or shut down these centres' computer networks completely.** In 1995, a Norwegian scientific sounding rocket was mistaken by Russian early warning systems as a nuclear missile launched from a US submarine. A radar operator used Krokus to notify a general on duty who decided to alert the highest levels. Kavkaz was implemented, all three chegets activated, and the countdown for a nuclear decision began. It took eight minutes before the missile was properly identified—a considerable amount of time considering the speed with which a nuclear response must be decided upon (Aftergood 2000). **Creating a false signal** in these early warning systems **would be relatively easy using** computer network operations. The real difficulty would be gaining access to these systems as they are most likely on a closed network. However, **if they are transmitting wirelessly, that may provide an entry point,** and information gained through **the internet may reveal** the details, such as **passwords and software, for gaining entrance to the closed network.** If access was obtained, **a false alarm could be followed by** something like a DDoS attack, **so the operators believe an attack may be imminent,** yet they can no longer verify it. **This could add pressure to the decision making process,** and if coordinated precisely, could appear as a first round EMP burst. Terrorist **groups could** also **attempt to launch a non-nuclear missile,** such as the one used by Norway, **in an attempt to fool the system.** The number of states who possess such technology is far greater than the number of states who possess nuclear weapons. Obtaining them would be considerably easier, especially when enhancing operations through computer network operations. Combining traditional terrorist methods with cyber techniques opens opportunities neither could accomplish on their own. For example, **radar stations might be more vulnerable to a computer attack,** while satellites are more vulnerable to jamming from a laser beam, thus together they deny dual phenomenology. Mapping communications networks through cyber reconnaissance may expose weaknesses, and automated scanning devices created by more experienced hackers can be readily found on the internet. Intercepting or spoofing communications is a highly complex science. These systems are designed to protect against the world's most powerful and well funded militaries. Yet, there are recurring gaffes, and **the very nature of asymmetric warfare is to bypass complexities by finding simple loopholes.** For example, **commercially available software for voice-morphing could be used to capture voice commands within the command and control structure, cut these sound bytes into phonemes, and splice it back together in order to issue false voice commands** (Andersen 2001, Chapter 16). **Spoofing could also be used to escalate a volatile situation in the hopes of starting a nuclear war.** "In June 1998, a group of international hackers calling themselves Milw0rm hacked the web site of India's Bhabha Atomic Research Center (BARC) and put up a spoofed web page showing a mushroom cloud and the text "If a nuclear war does start, you will be the first to scream" (Denning 1999). Hacker web-page defacements like these are often derided by critics of cyber terrorism as simply being a nuisance which causes no significant harm. However, web-page defacements are becoming more common, and they point towards alarming possibilities in subversion. During the 2007 cyber attacks against Estonia, a counterfeit letter of apology from Prime Minister Andrus Ansip was planted on his political party website (Grant 2007). This took place amid the confusion of mass DDoS attacks, real world protests, and accusations between governments.

Goldsmith Impact Overview

1). Cyberterror causes nuclear war – terrorists use spoofing to fool radars and make it look like an attack is taking place – causes miscalc and escalation – that's Fritz

2). Turns econ – terrorist attacks wreck market confidence and deter investment -- that's Goldsmith -- Best studies prove growth solves conflict

Jedidiah **Royal 10**, Director of Cooperative Threat Reduction at the U.S. Department of Defense, "Economic Integration, Economic Signalling And The Problem Of Economic Crises", in *Economics of War and Peace: Economic, Legal and Political Perspectives*, ed. Goldsmith and Brauer, p. 213-215

Second, on a dyadic level. Copeland's (1996, 2000) theory of trade expectations suggests that 'future expectation of trade' is a significant variable in understanding economic conditions and security behaviour of states. He argues that interdependent states are likely to gain pacific benefits from trade so long as they have an optimistic view of future trade relations. However, if the expectations of future trade decline, particularly for difficult to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by interdependent states.⁴ Third, others have considered the link between economic decline and external armed conflict at a national level. Blomberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write, The linkages between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the favour. Moreover, the presence of a recession lends to amplify the extent to which international and external conflicts self-reinforce each other. (Blomberg & Hess, 2002, p. 89) Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapana, 2004), which has the capacity to spill across borders and lead to external tensions. Furthermore, crises generally reduce the popularity of a sitting government. "Diversionary theory" suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect. Wang (1996), DeRouen (1995), and Blomberg, Mess, and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997), Miller (1999), and Kisangani and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak Presidential popularity, are statistically linked to an increase in the use of force.

3). Terrorists could target the grid – that's goldsmith – causes extinction

WND 9/4 (WND, WorldNetDaily News Company, "ISIS THREAT LOOMS OVER U.S. HOMELAND", <http://mobile.wnd.com/2014/09/isis-threat-looms-over-u-s-homeland/>, September 9, 2014)

*edited for language

'Militants expressing increased interest in notion they could infiltrate' ISIS bluster that threatens the U.S. Long-known al-Qaida links to south-of-the-border drug cartels. A porous U.S-Mexico

border. Gunshots at a California power plant. The individual reports may not cause immediate alarm, but **a panel of experts** who have **connected the dots on threats** against the U.S. is warning that **the nation needs to be looking at the big picture** – and preparing its defenses appropriately. Now. **The** warnings come from a **panel** set up by the **Secure the Grid Coalition at the Washington-based Center for Security Policy**. At a National Press Club news conference this week were **Frank Gaffney, former assistant secretary of defense for international security affairs and now president of the CSP; threat expert Dr. Peter Vincent Pry; Ambassador Henry F. Cooper; actress and activist Kelly Carson; and F. Michael Maloof, a former senior security policy analyst in the office of the secretary of defense and now a senior writer with WND.** He's authored **"A Nation Forsaken" on the dangers to the U.S. from an attack on its power grid, especially from electromagnetic pulse. There have been multiple reports of ISIS** terrorists in Iraq and Syria **making statements threatening an attack** on the U.S. homeland. And it's well-documented that al-Qaida, the Muslim terror world's bad boy before **ISIS** arrived, **is linked closely with drug cartels, many of which have a presence inside** some 1,200 of **America's large cities**. Further, **the U.S. southern border** now easily **can be crossed** illegally. And **there already** may have **been a "dry run" attack on the U.S. power grid, which, in a collapse, would leave America's defense capabilities severely handicapped.** Such concerns have been underscored in recent days by an interview Judicial Watch had with U.S. intelligence officials and the Texas Department Safety. **It confirmed that ISIS is present across the Texas border in Juarez, Mexico,** where an intelligence unit has picked up increased "chatter" in recent days. While Mexican authorities have denied **ISIS' presence in Mexico** and its ability to illegally enter the U.S., **Maloo** pointed out that three hardened Ukrainian criminals walked into the U.S. from Mexico undetected and have yet to be apprehended. Similarly, there has been evidence uncovered that various nationalities from Pakistan and various Arab countries have entered the U.S. undetected, **taking advantage of the porous southern border.** Put it all together, panel members said at a news conference in Washington on Wednesday, and the threat the U.S. is facing should be considered immediate and substantial. "It's all related," **Maloo** said. "One thing leads to another ... It's the domino effect." He noted a series of incidents at a Metcalf power plant in San Jose, California, that suggest someone – still unknown – **has been exploring what it takes to bring down a major component of the nation's grid.** Former Rep. Allen West bluntly called the situation a "'dry run' for something bigger." WND reported the utility company, whose operation was disabled in the attack, has offered a \$250,000 reward for the arrest and conviction of the perpetrators. West explained, "On April 16, 2013, snipers waged a 52-minute attack on a central California electrical substation. According to reports by Fox News and the Wall Street Journal, the sniper attack started when at least one person entered an underground vault to cut telephone cables, and attackers fired more than 100 shots into Pacific Gas & Electric's Metcalf transmission substation, knocking out 17 transformers. Electric officials were able to avert a blackout, but it took 27 days to repair the damage," he wrote. "My concern is that this may have been a dry run for something far bigger. We should be demanding an update on the investigation as to the perpetrators of this attack who escaped without detection," he said. **WB248Pry** pointed out that **ihadists already are aware of the vulnerability of a country's grid system by having knocked out completely the entire grid of the country of Yemen last June.** Read the book that's documenting the worry about the EMP threat, "A Nation Forsaken." The Metcalf attack came one day after the Boston Marathon bombing that killed three people and wounded 264 others. The Boston Marathon suspects are from the Russian North Caucasus, which prompted the Federal Bureau of Investigation to get involved in the investigation of the sniper attack on the transformers. There is a large community of Chechen and North Caucasus immigrants in the San Jose area. Chechenihadists also have been very prominent in Syria where it is battling to overthrow the government of Syrian President Bashar al-Assad. There also were reports only days after the California sniper attack of a shoot-out when a security guard at the TVA Watts Bar Nuclear Plant in Spring City, Tennessee, was confronted by a suspect at 2 a.m. "TVA spokesperson Jim Hopson said the subject traveled up to the plant on a boat and walked onto the property. When the officer questioned the suspect, the individual fired multiple shots at the officer. The officer shot back, and when he called for backup, the suspect sped away on his boat," reports said. **And just a few days ago, the California** plant, after spending millions of dollars on heightened security, again **was targeted** by a break-in attempt, authorities have reported. **Maloo** explained after the news conference **that the big picture "underscores the potential for an ISIS threat on the grid."** He pointed out how al-Qaida, which is known to have drug cartel links and likely sleeper agents in the United States through those organizations, has been

morphing into ISIS, and the belligerent threats made against the U.S. by that group. And he noted that the U.S. grid remains vulnerable and taking it down in any significant way could cause calamities for the U.S., since the nation's food, fuel, energy, banking and communications industries all are dependent on electricity. "Whenever you start tampering with the grid, you're affecting the life-sustaining critical infrastructures," Maloof said. "Our entire survival is based on technology and electronics that, in turn, are based on the electrical flow. If that's interrupted for any period of time, there are catastrophes over a wide geographic area." Reports just this week revealed social media chatter shows Islamic State militants "are keenly aware of the porous U.S.-Mexico border, and are 'expressing an increased interest' in crossing over to carry out a terrorist attack." A law enforcement advisory said, "A review of ISIS social media messaging during the week ending August 26 shows that militants are expressing an increased interest in the notion that they could clandestinely infiltrate the southwest border of U.S., for [a] terror attack." Maloof explained at the news conference that America's enemies know "the vulnerabilities of our grid ... they will at some point try" to attack. "The threat is there," he said. "ISIS operatives can easily come through the [southern] border. And because they [ISIS] have proxies in the U.S.," the potential for a catastrophe exists. "The president could take his pen and make [the problem] a priority," he said. "At the federal level they don't have a plan, so the state and local level won't have a plan."

4). Could also target nuclear plants – that's goldsmith – causes extinction

Wasserman 2, Harvey Wasserman, Senior Editor – The Free Press, "America's Self-Imposed Terror Threat", The Earth Island Journal, Spring 2002, <http://www.earthisland.org/eijournal...7&journalID=63>

As US bombs and missiles began to rain on Afghanistan, the certainty of terror retaliation inside the US has turned our 103 nuclear powerplants into potential weapons of apocalyptic destruction, just waiting to be used against us. One or both planes that crashed into the World Trade Center on September 11 could have easily obliterated the two atomic reactors now operating at Indian Point, about 40 miles up the Hudson River. Indian Point Unit One was shut long ago by public outcry. But Units 2 and 3 have operated since the 1970s. Reactor containment domes were built to withstand a jetliner crash but today's jumbo jets are far larger than the planes that were flying in the 1970s. Had one of those hijacked jets hit one of the operating reactors at Indian Point, the ensuing cloud of radiation would have dwarfed the ones at Hiroshima and Nagasaki, Three Mile Island and Chernobyl. The intense radioactive heat within today's operating reactors is the hottest anywhere on the planet. Because Indian Point has operated so long, its accumulated radioactive burden far exceeds that of Chernobyl. The safety systems are extremely complex and virtually indefensible. One or more could be wiped out with a small aircraft, ground-based weapons, truck bombs or even chemical/biological assaults aimed at the work force. A terrorist assault at Indian Point could yield three infernal fireballs of molten radioactive lava burning through the earth and into the aquifer and the river. Striking water, they would blast gigantic billows of horribly radioactive steam into the atmosphere. Thousands of square miles would be saturated with the most lethal clouds ever created, depositing relentless genetic poisons that would kill forever. Infants and small children would quickly die en masse. Pregnant women would spontaneously abort or give birth to horribly deformed offspring. Ghastly sores, rashes, ulcerations and burns would afflict the skin of millions. Heart attacks, stroke and multiple organ failure would kill thousands on the spot. Emphysema, hair loss, nausea, inability to eat or drink or swallow, diarrhea and incontinence, sterility and impotence, asthma and blindness would afflict hundreds of thousands, if not millions. Then comes the wave of cancers, leukemias, lymphomas, tumors and hellish diseases for which new names will have to be invented. Evacuation would be impossible, but thousands would die trying. Attempts to quench the fires would be futile. More than 800,000 Soviet draftees forced through Chernobyl's seething remains in a futile attempt to clean it up are still dying from their exposure. At Indian Point, the molten cores would burn uncontrolled for days, weeks and years. Who would volunteer for such an American task force? The immediate damage from an Indian Point attack (or a domestic accident) would render all five boroughs of New York City an apocalyptic wasteland. As at Three Mile Island, where thousands of farm and wild animals died in heaps, natural ecosystems would be permanently and irrevocably destroyed. Spiritually, psychologically, financially and ecologically, our nation would never recover. This is what we missed by a mere 40 miles on September 11. Now that we are at war, this is what could be happening as you read this. There are 103 of these potential Bombs of the Apocalypse operating in the US. They generate a mere 8 percent of our total energy. Since its deregulation crisis, California cut its electric consumption by some 15 percent. Within a year, the US could cheaply replace virtually all the reactors with increased efficiency. Yet, as the terror escalates, Congress is fast-tracking the extension of the Price-Anderson Act, a form of legal immunity that protects reactor operators from liability in case of a meltdown or terrorist attack. Do we take this war seriously? Are we committed to the survival of our nation? If so, the ticking reactor bombs that could obliterate the very core of our life and of all future generations must be shut down.

Domestic surveillance is key to intel gathering – allows effective executive decision-making

Bolton 13 -- John Bolton, a senior fellow at the American Enterprise Institute, served as US ambassador to the United Nations in 2005-06. "3 views on NSA reform after Snowden leaks" <http://www.csmonitor.com/Commentary/One-Minute-Debate-3-Views/2013/0926/3-views-on-NSA-reform-after-Snowden-leaks/Don-t-overreact-Anger-over-abuses-must-not-harm-NSA-capabilities-secrecy>

For years, **America's enemies have yearned to cripple its foreign electronic intelligence-gathering capabilities.** Now, **the ongoing furor over the** National Security Agency (NSA), **gives them the chance** Outright **falsehoods, distortions, and hysteria** **have** unfortunately **been fueled by actual abuses and mistakes. We face a** general **debate about whether** vital electronic **surveillance programs should be** substantially **curtailed. We must prevent** hype and anger over specific abuses **from harming the NSA's actual capabilities** and the secrecy needed to protect them. **Intelligence exists** not for its own sake but **to support executive decisionmaking.** Accordingly, President Obama is principally responsible for explaining and advocating clandestine activities. This, he appallingly failed to do. Mr. Obama must act like a president, leading the defense of our embattled capabilities. The inevitable congressional **proceedings must not repeat the** irreparable **damage that the 1970s-era congressional investigative committees caused the CIA.** Deficiencies there were, but **our enemies were the principal beneficiaries of the committees' destructive investigations.** Most important, **whatever fixes are made** today **must not deny America the tools to protect itself from terrorists, their state sponsors, and foreign adversaries many of which are developing** massive **cyberwarfare** programs. Moreover, the largely preventable or imaginary invasions of privacy pale before security breakdowns that have allowed serious intelligence leaks. The NSA's opponents should be put on notice: **If you** materially **restrict surveillance capabilities, you risk having American blood on your hands.** Yes, stop the abuses, increase constitutional oversight, tighten NSA security, and demand accountability. But do not render America deaf and blind.

That's key – the president is the cornerstone of national security

Berman 13 -- Emily Berman, Assistant Professor, Brooklyn Law School. New York University School of Law, LL.M. 2011, J.D. 2005. "THE PARADOX OF COUNTERTERRORISM SUNSET PROVISIONS" <http://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?article=4863&context=flr>

One crucial element of any discussion of counterterrorism powers goes unaddressed in the accounts of legislators and commentators who favor sunsets: **the President dominates** the formulation of **national security and foreign affairs policy** in ways that he does not in any other policy area. **This** domination **arises from** many sources, including the drastic **expansion of presidential power** in the post-war era, which is most **highly pronounced in the national security context**; the advantage that accompanies the President's position as first mover in responding to crises; **the ability to act quickly and secretly;** **the President's role as the "sole organ" of U.S. foreign affairs**; the executive's information monopoly; **substantive expertise in military and security matters;** **and a norm of executive primacy** that fosters expectations that the President will take the lead in national security. 228 229 230

Domestic Surveillance is necessary to stop terror and foreign espionage – the NSA has found a happy medium between privacy and security now

Honorof 13 – Marshall "How the NSA's Spying Keeps You Safe" <http://www.tomsguide.com/us/nsa-spying-keeps-safe,review-1899.html>

The U.S. National Security Agency (NSA) **may have taken** some fairly **extreme liberties when it comes to collecting user data,** **but the organization hasn't acted on a whim.** Call **the NSA's** surveillance unethical or unconstitutional or dangerous, but it **has a responsibility to protect the United States** with every tool at its disposal. If you haven't been keeping up with the issue, Americans and Britons are very angry with their governments right now. Reports from The Guardian and The New York Times indicate that the NSA and its British counterpart, Government Communications Headquarters (GCHQ), have the capacity to intercept just about everything their citizens do online, from social media information to encrypted emails. While this anger is both understandable and justifiable, relatively few people have stopped to consider the other side of the coin. **You can have total privacy or total national security,** **but you cannot have both.** A modern democratic **society requires a compromise** between the two extremes. The most important thing to keep in mind is that **there is, at present, absolutely no**

indication that the NSA has done anything illegal or outside the parameters of its mission statement. The NSA monitors external threats to the U.S., and, in theory, does not turn its attention to American citizens without probable cause. There is no evidence to the contrary among the documents that Edward Snowden leaked. "How do we protect our nation? How do we defend it?" asked Gen. Keith Alexander, the NSA's director, at the Black Hat 2013 security conference, held in Las Vegas in July. "[This information] is not classified to keep it from you: a good person. It's classified because sitting among you are people who wish us harm." While the thought of the NSA controlling every bit of information that the average American citizen posts online is disconcerting, Alexander maintained that a terrorist attack is even worse for a country's basic freedoms. "What we're talking about is future terrorist attacks," Alexander said, discussing a number of planned attacks that the NSA foiled over the last 10 years. It is worth considering what would have happened in the world if those attacks — 42 of those 54 were terrorist plots — if they were successfully executed. What would that mean to our civil liberties and privacy?" James Lewis, a researcher at the Center for Strategic and International Studies, agrees. "The NSA said there were 54 cases where they were able to detect plans and stop them, and 50 of them led to arrests." Lewis told Tom's Guide. "Fifty doesn't sound like a lot compared to the number of records [the NSA collected], but would you have preferred to have 50 more Boston bombings?" Counterterrorism is not the only function of the NSA's widespread surveillance. Although it cannot report exact numbers, Lewis theorizes that the data-mining has allowed the NSA to put a stop to a number of international espionage plots. "The original intent of all these programs was to find foreign spies," he said. "They haven't talked about that, but presumably there have been some successes there, too. A lot of times when you see things and there doesn't appear to be any explanation of how we seemed to magically know about it, it might very well be espionage." As an example of how domestic surveillance can unearth international plots, Lewis pointed to the North Korean ship stopped in Panama in August 2013. The vessel turned out to be smuggling illegal arms from Cuba. "The Panamanians just woke up one day and decided to look in their ship? I think not," Lewis said. The NSA is not the only government in the world that runs surveillance programs. In fact, if the NSA is keeping tabs on you, there's a good chance that other countries are as well. If you're lucky, they'll be Germany and Australia; if not, then Russia and China may have you under the microscope. Robert David Graham, founder and chief executive officer of Errata Security, spoke with Tom's Guide about how countries leverage surveillance data. "There are two parts to the information," he said. "Information about foreigners and information about your own citizens. The information you get about your own citizens affects political processes within your own country." He went on to explain that if you stir up negative sentiment about Germany, for example, the Germans can hoard your emails just the same as the NSA. Just like the NSA, though, they are unlikely to do anything with those emails unless you represent some kind of clear threat. "The Russians and the Chinese don't have anything to learn about how to do surveillance from us," Lewis said. He explained that the Scandinavian countries and Australia have programs that rival the NSA's as well. It's just par for the course everywhere in the world. Lewis believes that the NSA's surveillance is much less problematic than its transparency on the issue. "[Security and privacy] have to be balanced, and the debate has largely been 'they should stop doing this,'" he said. "It's weird seeing Rand Paul and the ACLU getting together [to condemn the NSA]. If Rand Paul is for it, it's probably a bad idea." The NSA is also taking the lion's share of the blame for a problem that began at the dawn of the consumer Internet age, got worse after 9/11, and still continues to this day: Internet privacy, or more accurately, the almost total lack thereof. There really isn't any privacy anymore, and I don't think Americans have realized that, Lewis said. Credit card companies, for example, know just about everything about you, right down to what street you've lived on every year of your life. "This was commercial ... The NSA just happens to be the poster child for this at the moment." There's one thing on which both staunch critics like Graham and fierce proponents like Lewis agree: The U.S. government must be clear and open with its citizens regarding the need for security, even when that security becomes invasive. Total security means zero privacy. Total privacy means zero security. Graham said. The extremes are what we have to fear ... The NSA should be monitoring people. It's just the issue of monitoring Americans without probable cause that really bothers the heck out of me. "If you have the right rules, if you have the right laws, if you have the right amount of transparency, you can feel comfortable with this," Lewis said. "Comfortable" is a very strong word, but if the choice is between invasive surveillance and the very real threats of terrorism and espionage, it's not so easy to write the NSA off entirely.

Even altering metadata policy would eviscerate counterterrorism efforts

Wiser 15 – Daniel Wiser is a staff writer for the Washington Free Beacon. "U.S. Surveillance Programs Could Expire, Despite Terror Threat" <http://freebeacon.com/national-security/u-s-surveillance-programs-could-expire-despite-terror-threat/>

The decreased authorities for counterterrorism agents would come as the FBI is reportedly scrambling to cope with a proliferation of terror suspects inspired by the Islamic State (IS). Two IS sympathizers—including one who was monitored by the FBI—were killed by police in Garland, Texas, earlier this month before they could attack a Prophet Muhammad cartoon contest. James Comey, director of the FBI, said at a press conference on Wednesday that terror suspects are increasingly using "encrypted platforms" to evade U.S. surveillance. "I can't stand here with any high confidence when I confront the world that is increasingly dark to me and tell you that I've got it all covered," he said. "We are working very, very hard on it but it is an enormous task." The House-passed USA Freedom Act—which has the backing of the Obama administration and would transfer metadata storage

from the government to telephone companies—appears to have the best chance of passage before the deadline. But it is not without critics. Sen. Richard Burr (R., N.C.), chairman of the Senate Intelligence Committee, said earlier this month that the House bill provided “illusory protection” because it did not require telecommunications companies to retain data. He has since introduced a bill that would gradually shift the storage of metadata to corporations but require them to inform the government before they alter their data retention policies. Sen. Dan Coats (R., Ind.), another member of the Senate Intelligence Committee, wrote in a recent op-ed that the transfer of data to phone companies “would require an expansive regulatory system” and might be “operationally useless.” “I am deeply concerned that ending the current program would render our counterterrorism tools less agile and unreliable.” he said. The remaining capability would be less responsive, if not operationally useless. The Patriot Act fight is likely to last right until the deadline, as proponents of the surveillance programs try to corral supporters during a congressional recess. “It’s all very up in the air right now,” said one Senate aide tracking the debate.

Terrorists are paying attention to metadata collection – if it stops they’ll exploit holes

Newsmax 15 – Citing CIA Chief John Brennan “CIA Chief: Ending NSA Spying Would Boost Terror Threat”
<http://www.newsmax.com/Newsfront/john-brennan-patriot-act-terrorism/2015/05/31/id/647804/>

CIA chief John Brennan warned Sunday that allowing vital surveillance programs to expire could increase terror threats, as the US Senate convened for a crunch debate on whether to renew the controversial provisions. With key counterterrorism programs set to expire at midnight Sunday, the top intelligence official made a final pitch to senators, arguing that the bulk data collection of telephone records of millions of Americans unconnected to terrorism has not abused civil liberties and only serves to safeguard citizens. “This is something that we can’t afford to do right now,” Brennan said of allowing the expiration of counterterrorism provisions, which “sunset” at the end of May 31. “Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,” he said CBS’ “Face the Nation” talk show. Brennan added that groups like Islamic State have followed the developments “very carefully” and are “looking for the seams to operate.” The House has already passed a reform bill, the USA Freedom Act, that would end the telephone data dragnet by the National Security Agency and require a court order for the NSA to access specific records from the vast data base retained by telecommunications companies. If no action is taken by the Senate Sunday, authorities will be forced to shut down the bulk collection program and two other provisions, which allow roving wiretaps of terror suspects who change their mobile phone numbers and the tracking of lone-wolf suspects. Senator Rand Paul, a Republican 2016 presidential candidate adamantly opposed to reauthorizing the surveillance, is threatening to delay votes on the reform bill or an extension of the original USA Patriot Act. That would force the counterterrorism provisions to lapse until at least Wednesday. Former NSA chief Michael Hayden, who is also a former CIA director, equated such a temporary lapse as “giving up threads” in a broader protective fabric. “It may not make a difference for a while. Then again, it might,” he told CNN’s State of the Union. “Over the longer term, I’m willing to wager, it will indeed make a difference.”

Domestic surveillance is a key link – informs troops on the ground

McLaughlin 14 -- John McLaughlin teaches at the Johns Hopkins School of Advanced International Studies. He was deputy director and acting director of the CIA from 2000 to 2004.”
NSA intelligence-gathering programs keep us safe
http://www.washingtonpost.com/opinions/nsa-intelligence-gathering-programs-keep-us-safe/2014/01/02/0fd51b22-7173-11e3-8b3f-b1666705ca3b_story.html

It’s time we all came to our senses about the National Security Agency (NSA). If it is true, as many allege, that the United States went a little nuts in its all-out pursuit of al-Qaeda after the Sept. 11, 2001, attacks, it is equally true that we are going a little nuts again in our dogged pursuit of the post-Snowden NSA. Those who advocate sharply limiting the agency’s activities ought to consider that its work is the very foundation of U.S. intelligence. I don’t mean to diminish the role of other intelligence agencies, and I say this as a 30-year veteran of the Central Intelligence Agency who is “CIA” through and through. But in most cases, the NSA is the starting point for determining what holes need to be filled through other means of intelligence-collection. That’s because its information on foreign developments is so comprehensive and generally so reliable. It is the core of intelligence support to U.S. troops in battle. Any efforts to “rein in” the agency must allow for the possibility that change risks serious damage to U.S. security and the country’s ability to navigate in an

increasingly uncertain world. The presumption that the NSA “spies” on Americans should also be challenged. In my experience, NSA analysts err on the side of caution before touching any data having to do with U.S. citizens. In 2010, at the request of then-Director of National Intelligence Dennis Blair, I chaired a panel investigating the intelligence community’s failure to be aware of Umar Farouk Abdulmutallab, the “underwear bomber” who tried to blow up a commercial plane over Detroit on Dec. 25, 2009. The overall report remains classified, but I can say that the government lost vital time because of the extraordinary care the NSA and others took in handling any data involving a “U.S. person.” (Abdulmutallab, a Nigerian, was recruited and trained by the late Anwar al-Awlaki, a U.S. citizen based in Yemen.) Regarding outrage over the NSA’s collection of telephone calling records, or metadata, I don’t know why anyone would have greater confidence in this information being held by private companies. And given the perceived threat to privacy, it’s astonishing how little attention has been paid to the Senate commerce committee’s recent report on companies that gather personal information on hundreds of millions of Americans and sell it to marketers, often highlighting people with financial vulnerability. Some companies group the data into categories including “rural and barely making it,” “retiring on empty” and “credit crunched: city families.” The aim is often to sell financially risky products to transient consumers with low incomes, the report found. That’s a real scandal — and a universe away from the NSA’s ethical standards and congressional oversight. The NSA, of course, is not perfect. But it is less a victim of its actions — theindependent commission appointed by President Obama found no illegality or abuses — than of the broad distrust of government that has taken root in the United States in recent decades. Studies by Pew and others show distrust of government around 80 percent, an all-time high. This distrust is the only logical explanation I see for fear of data being held by “the government” — and it’s not a circumstance the NSA created. Although our society lauds, in almost “Stepford Wives”-like fashion, the merits of “transparency,” it lacks a collective, mature understanding of how intelligence works, how it integrates with foreign policy and how it contributes to the national welfare. Meanwhile, prurient interest in the details of leaked intelligence skyrockets, and people devour material that is not evidence of abuse but merely fascinating — and even more fascinating to U.S. adversaries. So what makes sense going forward? Clearly, the widespread perception that there is at least the “potential for abuse” when the government holds information even as limited as telephone call metadata must be addressed. The recent presidential commission recommended adding a public privacy advocate to the deliberation process of courts that approve warrants — one proposal that would do no harm. But as the administration contemplates reform, it must reject any ideas that add time and process between the moment the NSA picks up a lead overseas and the time it can cross-check records to determine whether there is a domestic dimension to overseas plotting. As our debate continues, the terrorist threat is not receding but transforming. The core leadership of al-Qaeda has been degraded and remains under pressure, but robust al-Qaeda affiliates have multiplied. With the decline of central government authority in the Middle East and North Africa in the wake of the Arab Spring and the war in Syria, terrorists have the largest havens and areas for operational planning in a decade. If anything, the atomization of the movement has made the job of intelligence more labor-intensive, more detail-oriented and more demanding. Now is not the time to give up any tool in the counterterrorism arsenal.

--Cyber

Long list of potential state-sponsored cyber-attackers – the NSA is key

Van Cleave 13 -- Michelle Van Cleave served as the head of US counterintelligence under President George W. Bush and is now a principal with the Jack Kemp Foundation. "What It Takes: In Defense of the NSA" <http://www.worldaffairsjournal.org/article/what-it-takes-defense-nsa>

The United States has **built a global intelligence apparatus because it has global interests** and global responsibilities. We have taken seriously the duties of leader of the free world, as two world wars, Korea, Vietnam, Afghanistan, Iraq, and freedom fighters in many parts of the world can attest. **None of these duties** in the last sixty years **could have been met without the exceptional resources of NSA.** Successive presidents and Congresses, entrusted with preserving and defending our freedom, have judged these investments to be vital to our nation's security. They have protected the core secrets that enable collection programs to succeed, as have those in US business and industry who have been integral to their success. **The unquestioned qualitative edge of US intelligence has been** as **essential to defending this country** and preserving our freedom as have the forces we have built to arm and equip our military. But time has not stood still. **China is attacking computer systems** throughout the world, **stealing information** and implanting features to enable future control. China's prominence in IT commercial markets **means that they are in the supply chain** and their market share is growing as part of a purposeful, state-run program for strategic position. **A long roll call of spies from Russia, China, Cuba, and other nations have targeted** the essential secrets of **US intelligence capabilities** in order to be able to **defeat them**. And now they have the Snowdens and the WikiLeaksers of the world helping them out. **Interconnected global networks of digital data have become the single most important source of intelligence** warning of threats, **enabling our defense at home** and the advancement of freedom abroad. To say "hands off," as some shortsighted privacy advocates have been doing, **will not preserve our liberties, it will endanger them**. It should be possible for an enlightened citizenry to empower government action in that sphere without forfeiting the very rights that our government exists to secure. That challenge is, at the very least, a part of the continuing experiment that is our democracy.

Ratchet Effect

Aggressive anti-terrorism creates a new security paradigm – hardens the public to government intrusions – scaling back surveillance eliminates that paradigm and creates vulnerability

Givens 13 -- Austen D. Givens is a PhD student in the Department of Political Economy at King's College London. His forthcoming book with Nathan E. Busch, *The Business of Counterterrorism: Public-Private Partnerships in Homeland Security*, will be published by Peter Lang. "The NSA Surveillance Controversy: How the Ratchet Effect Can Impact Anti-Terrorism Laws" <http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/>

The ratchet effect can occur because anti-terrorism laws create a new security paradigm. An aggressive anti-terrorism law can fundamentally alter societal approaches to terrorism. Surveillance may increase. Police powers can expand. Intelligence efforts may grow. Public expectations of privacy can diminish. In the aggregate, these types of changes can represent a drastic change in a government's approach to terrorism, and effectively create a "new normal" level of security. Because this "new normal" is linked to the law itself, reversing the law begins to dismantle the new security paradigm. From the public's perspective, this might be an unacceptable option because it may increase societal vulnerability to terrorism. Government agencies also risk losing resources—personnel, money, and political support—by returning to the status quo ante.

Link helper

Be skeptical of Aff ev – the necessity of NSA secrecy makes the literature asymmetric

(AKA if we ACTUALLY explain our link arguments, the terrorists might hear us.)

Bolton 15 – John R. Bolton, a diplomat and a lawyer, has spent many years in public service. From August 2005 to December 2006, he served as the U.S. permanent representative to the United Nations. From 2001 to 2005, he was under secretary of state for arms control and international security. At AEI, Ambassador Bolton's area of research is U.S. foreign and national security policy. "NSA activities key to terrorism fight" <http://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>

Congress is poised to decide whether to re-authorize **programs** run by the National Security Agency **that assess patterns of domestic** and international **telephone calls and emails to uncover linkages with known terrorists**. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, **have played a vital role in protecting America** and our citizens around the world **from the still-metastasizing terrorist threat**. The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens. Nonetheless, **critics from the right and left have attacked the NSA** for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. **Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics**, hoping **to score political points** with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail." **The ill-informed nature of the debate has facilitated scare-mongering**, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And **there is an important asymmetry at work** here as well. **Critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond**. By definition, the programs' **success rests on the secrecy** fundamental to all intelligence activities. Frequently, therefore, **explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists** and others, in turn, **could use to stymie future detection efforts**. After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces. In fact, just in the year since Congress last considered the NSA programs, **the global terrorist threat has dramatically increased**. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. **Boko Haram is expanding** beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016. **This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat**. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Impact Work

Nuclear

It's Possible

It's likely

Bunn et al 13 – Matthew Bunn is a Professor of the Practice of Public Policy at Harvard Kennedy School and Co-Principal Investigator of Project on Managing the Atom at Harvard University's Belfer Center for Science and International Affairs. Vice Admiral Valentin Kuznetsov (retired Russian Navy) is a senior research fellow at the Institute for U.S. and Canadian Studies of the Russian Academy of Sciences and a Senior Military Representative of the Russian Ministry of Defense to NATO from 2002 to 2008. Martin Malin is the Executive Director of the Project on Managing the Atom at the Belfer Center for Science and International Affairs. Colonel Yuri Morozov (retired Russian Armed Forces) is a professor of the Russian Academy of Military Sciences, senior research fellow at the Institute for U.S. and Canadian Studies of the Russian Academy of Sciences, and chief of department at the Center for Military-Strategic Studies at the General Staff of the Russian Armed Forces from 1995 to 2000. ("Steps to Prevent Nuclear Terrorism: Recommendations Based on the U.S.-Russia Joint Threat Assessment", September 2013, <http://belfercenter.ksg.harvard.edu/files/JTA%20eng%20web2.pdf>)

In 2011, **Harvard's Belfer Center** for Science and International Affairs and the Russian Academy of Sciences' Institute for U.S. and Canadian Studies published "The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism." The assessment **analyzed the means, motives, and access of would-be nuclear terrorists**, and concluded that **the threat of nuclear terrorism is urgent and real**.

The Washington and Seoul Nuclear Security **Summits in 2010 and 2012 established and demonstrated a consensus among political leaders** from around the world **that nuclear terrorism poses a serious threat** to the peace, security, and prosperity of our planet. For any country, a terrorist attack with a nuclear device would be an immediate and catastrophic disaster, and the negative effects would reverberate around the world far beyond the location and moment of the detonation.

Preventing a nuclear terrorist attack requires international cooperation to secure nuclear materials, especially among those states producing nuclear materials and weapons. As the world's two greatest nuclear powers, the United States and Russia have the greatest experience and capabilities in securing nuclear materials and plants and, therefore, share a special responsibility to lead international efforts to prevent terrorists from seizing such materials and plants.

The depth of convergence between U.S. and Russian vital national interests on the issue of nuclear security is best illustrated by the fact that bilateral cooperation on this issue has continued uninterrupted for more than two decades, even when relations between the two countries occasionally became frosty, as in the aftermath of the August 2008 war in Georgia.

Russia and the United States have strong incentives to forge a close and trusting partnership to prevent nuclear terrorism and have made enormous progress in securing fissile material both at home and in partnership with other countries. However, to meet the evolving threat posed by those individuals intent upon using nuclear weapons for terrorist purposes, the United States and Russia need to deepen and broaden their cooperation.

The 2011 "U.S. - Russia Joint Threat Assessment" offered both specific conclusions about the nature of the threat and general observations about how it might be addressed. This report builds on that foundation and analyzes the existing framework for action, cites gaps and deficiencies, and makes specific recommendations for improvement.

"The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism" (The 2011 report executive summary):

Nuclear terrorism is a real and urgent threat. Urgent actions are required to reduce the risk. **The risk is driven by the rise of terrorists who seek to inflict unlimited damage**, many of whom have sought justification for their plans in radical interpretations of Islam; **by the spread of information about the decades-old technology** of nuclear weapons; **by the increased availability of weapons-usable nuclear materials**; and by **globalization, which makes it easier to move people, technologies, and materials across the world**.

Making a crude nuclear bomb would not be easy, but **is potentially within the capabilities of a technically sophisticated terrorist group**, as numerous government studies have confirmed. Detonating a stolen nuclear weapon would likely be difficult for terrorists to accomplish, if the weapon was equipped with modern technical safeguards (such as the electronic locks known as Permissive Action Links, or PALs). **Terrorists could, however, cut open a stolen nuclear weapon and make use of its nuclear material** for a bomb of their own.

The nuclear material for a bomb is small and difficult to detect, making it a major challenge to stop nuclear smuggling or to recover nuclear material after it has been stolen. Hence, a primary focus in reducing the risk must be to keep nuclear material and nuclear weapons from being stolen by continually improving their security, as agreed at the Nuclear Security Summit in Washington in April 2010.

Al-Qaeda has sought nuclear weapons for almost two decades. The group has repeatedly attempted to purchase stolen nuclear material or nuclear weapons, and has repeatedly attempted to recruit nuclear expertise. Al-Qaeda reportedly conducted tests of conventional explosives for its nuclear program in the desert in Afghanistan. The group's nuclear ambitions continued after its dispersal following the fall of the Taliban regime in Afghanistan. Recent writings from top al-Qaeda leadership are focused on justifying the mass slaughter of civilians, including the use of weapons of mass destruction, and are in all likelihood intended to provide a formal religious justification for nuclear use.

While there are significant gaps in coverage of the group's activities, al-Qaeda appears to have been frustrated thus far in acquiring a nuclear capability; it is unclear whether the group has acquired weapons-usable nuclear material or the expertise needed to make such material into a bomb. Furthermore, pressure from a broad range of counter-terrorist actions probably has reduced the group's ability to manage large, complex projects, but has not eliminated the danger. However, there is no sign the group has abandoned its nuclear ambitions. On the contrary, leadership statements as recently as 2008 indicate that the intention to acquire and use nuclear weapons is as strong as ever.

There are materials, expertise, and motives

Jaspal 12 – Zafar is a professor of international relations at Quaid-i-Azam. ("Nuclear/Radiological Terrorism: Myth or Reality?" Journal of Political Studies, Vol. 19, Issue - 1, 2012, http://pu.edu.pk/images/journal/pols/pdf-files/Nuclear%20Radiological%20terrorism%20Jaspa_Vol_19_Issue_1_2012.pdf)

The misperception, miscalculation and above all ignorance of the ruling elite about security puzzles are perilous for the national security of a state. Indeed, in an age of transnational terrorism and unprecedented dissemination of dual-use nuclear technology, ignoring nuclear terrorism threat is an imprudent policy choice. The incapability of terrorist organizations to engineer fissile material does not eliminate completely the possibility of nuclear terrorism. At the same time, the absence of an example or precedent of a nuclear/ radiological terrorism does not qualify the assertion that the nuclear/radiological terrorism ought to be remained a myth.

Farsighted rationality obligates that one should not miscalculate transnational terrorist groups — whose behavior suggests that they have a death wish — of acquiring nuclear, radiological, chemical and biological material producing capabilities. In addition, one could be sensible about the published information that huge amount of nuclear material is spread around the globe. According to estimate it is enough to build more than 120,000 Hiroshima-sized nuclear bombs (Fissile Material Working Group, 2010, April 1). The alarming fact is that a few storage sites of nuclear/radiological materials are inadequately secured and continue to be accumulated in unstable regions (Sambaiew, 2010, February). Attempts at stealing fissile material had already been discovered (Din & Zhiwei, 2003: 18).

Numerous evidences confirm that terrorist groups had aspired to acquire fissile material for their terrorist acts. Late Osama bin Laden, the founder of al Qaeda stated that acquiring nuclear weapons was a "religious duty" (Yusufzai, 1999, January 11). The IAEA also reported that "al-Qaeda was actively seeking an atomic bomb." Jamal Ahmad al-Fadl, a dissenter of Al Qaeda, in his trial testimony had "revealed his extensive but unsuccessful efforts to acquire enriched uranium for al-Qaeda" (Allison, 2010, January: 11). On November 9, 2001, Osama bin Laden claimed that "we have chemical and nuclear weapons as a deterrent and if America used them against us we reserve the right to use them (Mir, 2001, November 10)." On May 28, 2010, Sultan Bashiruddin Mahmood, a Pakistani nuclear scientist confessed that he met Osama bin Laden. He claimed that "I met Osama bin Laden before 9/11 not to give him nuclear know-how, but to seek funds for establishing a technical college in Kabul (Syed, 2010, May 29)." He was arrested in 2003 and after extensive interrogation by American and Pakistani intelligence agencies he was released (Syed, 2010, May 29). Agreed, Mr. Mahmood did not share nuclear know-how with Al Qaeda, but his meeting with Osama establishes the fact that the terrorist organization was in contact with nuclear scientists. Second, the terrorist group has sympathizers

in the nuclear scientific bureaucracies. It also authenticates bin Laden's Deputy Ayman Zawahiri's claim which he made in December 2001: "If you have \$30 million, go to the black market in the central Asia, contact any disgruntled Soviet scientist and a lot of dozens of smart briefcase bombs are available" (Allison, 2010, January: 2).

The covert meetings between nuclear scientists and al Qaeda members could not be interpreted as idle threats and thereby the threat of nuclear/radiological terrorism is real. The 33Defense Secretary Robert Gates admitted in 2008 that "what keeps every senior government leader awake at night is the thought of a terrorist ending up with a weapon of mass destruction, especially nuclear (Mueller, 2011, August 2)." Indeed, the nuclear deterrence strategy cannot deter the transnational terrorist syndicate from nuclear/radiological terrorist attacks. Daniel Whiteneck pointed out:

"Evidence suggests, for example, that al Qaeda might not only use WMD simply to demonstrate the magnitude of its capability but that it might actually welcome the escalation of a strong U.S. response, especially if it included catalytic effects on governments and societies in the Muslim world. An adversary that prefers escalation regardless of the consequences cannot be deterred" (Whiteneck, 2005, Summer: 187)

Retaliation -- Ayson

Terrorism causes extinction- retaliation

Ayson 10 - Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington (Robert, July. "After a Terrorist Nuclear Attack: Envisaging Catalytic Effects." *Studies in Conflict & Terrorism*, Vol. 33, Issue 7. InformaWorld.)

But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that **some sort of terrorist attack**, and especially an act of nuclear terrorism, **could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more** of the **states** that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as **raising the risks of a catalytic nuclear war between the superpowers started by third parties**. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be "spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from."⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But **at what stage would Russia and China be definitely ruled out** in this high stakes game of nuclear Cluedo? In particular, **if the act of nuclear terrorism occurred against a backdrop of existing tension** in Washington's relations **with Russia and/or China**, and at a time when threats had already been traded between these major powers, **would officials and political leaders not be tempted to assume the worst?** Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? **Washington's early response** to a terrorist nuclear attack on its own soil **might also raise the possibility of an unwanted (and nuclear aided) confrontation** with Russia and/or China. For example, **in the noise and confusion during the immediate aftermath** of the terrorist nuclear attack, **the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert**. In such a tense environment, when careful planning runs up against the friction of reality, **it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force** (and possibly nuclear force) against them. In that situation, the **temptations to preempt** such actions might **grow**, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the "Chechen insurgents' ... long-standing interest in all things nuclear."⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither "for us or against us") might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability.

--Not Ayson

Nuclear terrorism causes US-Russia nuclear war—only scenario for extinction—deterrence doesn't check

Barrett et al 13 – Anthony has a PhD in Engineering and Public Policy from Carnegie Mellon University, is a Fellow in the RAND Stanton Nuclear Security Fellows Program, and is the Director of Research at Global Catastrophic Risk Institute. Seth Baum has a PhD in Geography from Pennsylvania State University is a Research Scientist at the Blue Marble Space Institute of Science, and is the Executive Director of Global Catastrophic Risk Institute. Kelly Hostetler has a BS in Political Science from Columbia and is a Research Assistant at the Global Catastrophic Risk Institute. (“Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia”, Science and Global Security 21(2), June 28, 2013, http://sethbaum.com/ac/2013_NuclearWar.pdf)

Note: this version of the article is a little different from the one published in the actual journal; I cut this version from the link in the cite above.

War involving significant fractions of **the U.S. and Russian nuclear arsenals, which are** by far **the largest of any nations, could have globally catastrophic effects** such as severely **reducing food production for years**¹ potentially leading to collapse of modern civilization worldwide **and** even **the extinction of humanity**.² Nuclear war between the United States and Russia could occur by various routes, including accidental or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack.³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches.⁴) **Over the years, nuclear strategy was aimed** primarily **at** minimizing risks of intentional attack through development of **deterrence capabilities**, though numerous measures were also taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counterattack. However, **concerns about** the extreme disruptions that **a first attack** would cause in the other side's forces and command-and-control capabilities **led to** both sides' **development of capabilities to detect a first attack and launch a counter-attack before suffering damage** from the first attack.⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced.⁶ However, it has also been argued that **inadvertent nuclear war** between the United States and Russia **has continued to present a substantial risk**.⁷ While **the United States and Russia** are not actively threatening each other with war, they **have remained ready to launch nuclear missiles in response to indications of attack**.⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time.⁹ Second, **terrorist groups** or other actors **might cause attacks on** either **the United States or Russia that resemble some kind of nuclear attack** by the other nation by actions **such as exploding a stolen or improvised nuclear bomb**,¹⁰ especially if such an event occurs during a crisis between the United States and Russia.¹¹ **A variety of nuclear terrorism scenarios are possible**.¹² **Al Qaeda has sought** to obtain or construct **nuclear weapons and to use them against the United States**.¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security.¹⁴

C3I vulnerability makes rapid US-Russia escalation inevitable

Ford 10 [Christopher, Senior Fellow at Hudson Institute in Washington, D.C., former U.S. Special Representative for Nuclear Nonproliferation and Principal Deputy Assistant Secretary of State, reserve intelligence officer in the U.S. Navy, “Playing for Time on the Edge of the Apocalypse: Maximizing Decision Time for Nuclear Leaders,” <http://www.hudson.org/files/publications/Decision%20Time%20Final%20for%20Print.pdf>]

Yet this is not the end of the story, for sophisticated advocates of de-alerting measures do not necessarily contend that LOW is actually official policy. Rather, scholars such as Blair suggest that **no matter what official policy is, U.S. and**

Russian decision-makers face formidable incentives to launch on warning anyway – as long as that option is technically available – because force and command-system vulnerabilities leave them with no alternative to LOW if they are to inflict the desired level of retaliatory damage on the enemy. Because both sides effectively lack a genuine “ride-out” option, the argument goes, they would be left, in practice, with little choice but to adopt a de facto LOW policy, which is indeed just as dangerously destabilizing and prone to accident as the more hawkish Wohlstetters and Kahns always believed. (Indeed, it is perhaps worse, insofar as the critics allege that the nuclear superpowers’ command-and-control systems are very likely at some point to give rise to an uncaught false alarm or some other accident likely to trip their de facto LOW postures into catastrophic motion.) Through this prism, de-alerting is said to become necessary as a means to prevent vulnerabilities from giving rise to launch-on-warning decisions by making it technically impossible to launch during the very brief span of time between detection of what looks like an enemy attack and its presumed time of impact.

Let us examine this argument in more detail, for it lies at the heart of the de-alerting debate – and perhaps our way out of it. As indicated, the most sophisticated and articulate critiques of current nuclear force postures, in which at least some forces are set up for extremely rapid launch, are Bruce Blair and Scott Sagan, who offer different but complimentary arguments. Blair’s account revolves around the incentives for a launch-on-warning posture, he says, are created by the vulnerability not just (or even principally) of nuclear forces themselves (e.g., missile silos) but of the command, control, communications, and intelligence (C3I) architectures upon which their employment in actual nuclear warfighting depends. In his view, in effect, both nuclear superpowers’ longstanding investments in survivable second-strike nuclear weapons to some extent missed the point – or at least proved radically incomplete – insofar as they failed to provide Washington and Moscow with a genuine ability to mount and manage a retaliatory strike because national C3I systems would be too damaged by a massive nuclear exchange to handle the demands of second-strike battle management.³² Both countries are thus said to have faced tremendous incentives for launch-on-warning – in practice, at least, whether or not this was official policy – because it was presumably clear to their nuclear planners that C3I degradation and outright force attrition (e.g., high losses of silo-based ballistic missiles and non-alerted bomber forces) from an enemy attack would prevent its recipient from mounting the kind of retaliatory strike it deemed necessary.³³

Cyber

Exts – Escalation

Escalates to global war

Lawson '9 (Sean, Assistant professor in the Department of Communication at the University of Utah, Cross-Domain Response to Cyber Attacks and the Threat of Conflict, p. <http://www.seanlawson.net/?p=477>, June 13, 2009)

At a time when it seems impossible to avoid the seemingly growing hysteria over the threat of cyber war, [1] network security expert Marcus Ranum delivered a refreshing talk recently, "The Problem with Cyber War," that took a critical look at a number of the assumptions underlying contemporary cybersecurity discourse in the United States. He addressed one issue in particular that I would like to riff on here, the issue of conflict escalation—i.e. the possibility that offensive use of **cyber attacks could escalate to the use of physical force**. As I will show, his concerns are entirely legitimate as current U.S. military cyber doctrine assumes the possibility of what I call "cross-domain responses" to cyberattacks. Backing Your Adversary (Mentally) into a Corner Based on the premise that completely blinding a potential adversary is a good indicator to that adversary that an attack is imminent, Ranum has argued that "**The best thing that you could possibly do if you want to start World War III is launch a cyber attack**." [...] When people talk about cyber war like it's a practical thing, what they're really doing is messing with the OK button for starting World War III. We need to get them to sit the f-k down and shut the f-k up." [2] He is making a point similar to one that I have made in the past: **Taking away an adversary's ability to make rational decisions could backfire**. [3] For example, Gregory Witold cautions that "attacking the decision maker's ability to perform rational calculations may cause more problems than it hopes to resolve." [4] **Removing the capacity for rational action may result in completely unforeseen consequences**, including longer and bloodier battles than may otherwise have been." [4] **Cross-Domain Response** So, from a theoretical standpoint, I think his concerns are well founded. But the current state of U.S. policy may be cause for even greater concern. It's not just worrisome that a hypothetical blinding attack via cyberspace could send a signal of imminent attack and therefore trigger an irrational response from the adversary. What is also cause for concern is that **current U.S. policy indicates that "kinetic attacks" (i.e. physical use of force) are seen as potentially legitimate responses to cyber attacks**. Most worrisome is that **current U.S. policy implies that a nuclear response is possible**, something that policy makers have not denied in recent press reports. The reason, in part, is that the U.S. defense community has increasingly come to see cyberspace as a "domain of warfare" equivalent to air, land, sea, and space. The definition of cyberspace as its own domain of warfare helps in its own right to blur the online/offline, physical-space/cyberspace boundary. But thinking logically about the potential consequences of this framing leads to some disconcerting conclusions. If cyberspace is a domain of warfare, then it becomes possible to define "cyber attacks" (whatever those may be said to entail) as acts of war. But **what happens if the U.S. is attacked** in any of the other domains? **It retaliates**. But it usually does not respond only within the domain in which it was attacked. Rather, responses are typically "cross-domain responses"—i.e. a massive bombing on U.S. soil or vital U.S. interests abroad (e.g. think 9/11 or Pearl Harbor) might lead to air strikes against the attacker. Even more likely given a U.S. military "way of warfare" that emphasizes multidimensional, "joint" operations is a massive conventional (i.e. non-nuclear) response against the attacker in all domains (air, land, sea, space), simultaneously. The possibility of "kinetic action" in response to cyber attack, or as part of offensive U.S. cyber operations, is part of the current (2006) National Military Strategy for Cyberspace Operations [5]: (U) Kinetic Actions. DOD will conduct kinetic missions to preserve freedom of action and strategic advantage in cyberspace. Kinetic actions can be either offensive or defensive and used in conjunction with other mission areas to achieve optimal military effects. Of course, **the possibility that a cyber attack on the U.S. could lead to a U.S. nuclear reply** constitutes possibly the ultimate in "cross-domain response." And while this may seem far fetched, it **has not been ruled out by U.S. defense policy makers** and is, in fact, implied in current U.S. defense policy documents. From the National Military Strategy of the United States (2004): "The term WMD/E relates to a broad range of adversary capabilities that pose potentially devastating impacts. WMD/E includes chemical, biological, radiological, nuclear, and enhanced high explosive weapons as well as other, more asymmetrical 'weapons'. They may rely more on disruptive impact than destructive kinetic effects. For example, cyber attacks on US commercial information systems or attacks against transportation networks may have a greater economic or psychological effect than a relatively small release of a lethal agent." [6] The authors of a 2009 National Academies of Science report on cyberwarfare respond to this by saying, "**Coupled with the declaratory policy on nuclear weapons** described earlier, **this statement implies that the United States will regard certain kinds of cyberattacks against the United States as being in the same category as nuclear, biological, and chemical weapons, and thus that a nuclear response to certain kinds of cyberattacks (namely, cyberattacks with devastating impacts) may be possible**. It also sets a relevant scale—a cyberattack that has an impact larger than that associated with a relatively small release of a lethal agent is regarded with the same or greater seriousness." [7]

Independently – Cyber-attacks breaks down command and control – causes nuclear response. The bureaucratic decision to react without information is a result of situating offensive cyber ops with the president

Cimbala 11 (Stephen J. Cimbala 2011. Professor of Political Science at Penn State. "Nuclear Crisis Management and "Cyberwar" Phishing for Trouble?" Strategic Studies Quarterly Spring 2011)

This section discusses how **cyberwar might adversely affect nuclear crisis management**. Readers are advised, however, that history is indeterminate. It might turn out that, in some fortuitous cases, the United States could use nuclear deterrence and cyberwar as joint multipliers toward a successful outcome in crisis or war. For example, **in facing down an opponent with a comparatively small or no nuclear arsenal and inferior conventional strike capabilities, the United States or another power could employ information warfare aggressively "up front" while forgoing explicit mention of its**

available nuclear capability. Russia's five-day war against Georgia in August 2008 involved obvious cyber attacks as well as land and air operations, but no explicit nuclear threats. On the other hand, had Georgia already been taken into membership by NATO prior to August 2008 or had Russo-Georgian fighting spread into NATO member-state territory, the visibility of Russia's nuclear arsenal as a latent and potentially explicit threat would have been much greater. Notwithstanding the preceding disclaimers, **information warfare has the potential to attack or disrupt successful crisis management on each of four dimensions.** First, it **can muddy the signals being sent** from one side to the other **in a crisis.** This can be done deliberately or inadvertently. Suppose one side plants a virus or worm in the other's communications networks.¹⁹ The virus or worm becomes activated during the crisis and destroys or alters information. The missing or altered information may make it more difficult for the cyber victim to arrange a military attack. But destroyed or altered information may mislead either side into thinking that its signal has been correctly interpreted when it has not. Thus, side A may intend to signal "resolve" instead of "yield" to its opponent on a particular issue. Side B, misperceiving a "yield" message, may decide to continue its aggression, meeting unexpected resistance and causing a much more dangerous situation to develop. **Infowar can also destroy or disrupt communication channels necessary for successful crisis management.** One way it can do this is to **disrupt communication links between policymakers and military commanders during a period of high threat and severe time pressure.** Two kinds of unanticipated problems, from the standpoint of civil-military relations, are possible under these conditions. **First, political leaders may have pre-delegated limited authority for nuclear release or launch under restrictive conditions; only when these few conditions obtain, according to the protocols of predelegation, would military commanders be authorized to employ nuclear weapons distributed within their command. Clogged, destroyed, or disrupted communications could prevent top leaders from knowing that military commanders perceived a situation to be far more desperate, and thus permissive of nuclear initiative,** than it really was. During the Cold War, for example, disrupted communications between the US National Command Authority and ballistic missile submarines, once the latter came under attack, could have resulted in a joint decision by submarine officers to launch in the absence of contrary instructions. Second, information warfare during a crisis will almost certainly increase the time pressure under which political leaders operate. It may do this literally, or it may affect the perceived timelines within which the policymaking process can make its decisions. Once either side sees parts of its command, control, and communications (C3) system being subverted by phony information or extraneous cyber noise, its sense of panic at the possible loss of military options will be enormous. In the case of US Cold War nuclear war plans, for example, disruption of even portions of the strategic C3 system could have prevented competent execution of parts of the SIOF (the strategic nuclear war plan). The SIOF depended upon finely orchestrated time-on-target estimates and precise damage expectations against various classes of targets. Partially misinformed or disinforming networks and communications centers would have led to redundant attacks against the same target sets and, quite possibly, unplanned attacks on friendly military or civilian installations. A third potentially disruptive effect of infowar on nuclear crisis management is that it may reduce the search for available alternatives to the few and desperate. Policymakers searching for escapes from crisis denouements need flexible options and creative problem solving. Victims of information warfare may have a diminished ability to solve problems routinely, let alone creatively, once information networks are filled with flotsam and jetsam. Questions to operators will be poorly posed, and responses (if available at all) will be driven toward the least common denominator of previously programmed standard operating procedures. **Retaliatory systems that depend on launch-on-warning instead of survival after riding out an attack are especially vulnerable to reduced time cycles and restricted alternatives:** **A well-designed warning system cannot save commanders from misjudging the situation under the constraints of time and information imposed by a posture of launch on warning.** Such a posture **truncates the decision process** too early for iterative estimates to converge on reality. **Rapid reaction is inherently unstable** because it cuts short the learning time needed to match perception with reality.²⁰ The propensity to search for the first available alternative that meets minimum satisfactory conditions of goal attainment is strong enough under normal conditions in nonmilitary bureaucratic organizations.²¹ **In civil-military command and control systems under the stress of nuclear crisis decision making, the first available alternative may quite literally be the last;** or so policymakers and their military advisors may persuade themselves. Accordingly, **the bias toward prompt and adequate solutions is strong.** During the Cuban missile crisis, a number of members of the presidential advisory group continued to propound an air strike and invasion of Cuba during the entire 13 days of crisis deliberation. Had less time been available for debate and had President Kennedy not deliberately structured the discussion in a way that forced alternatives to the surface, the air strike and invasion might well have been the chosen alternative.²² Fourth and finally on the issue of crisis management, infowar can cause flawed images of each side's intentions and capabilities to be conveyed to the other, with potentially disastrous results. Another example from the Cuban crisis demonstrates the possible side effects of simple misunderstanding and noncommunication on US crisis management. At the most tense period of the crisis, a U-2 reconnaissance aircraft got off course and strayed into Soviet airspace. US and Soviet fighters scrambled, and a possible Arctic confrontation of air forces loomed. Khrushchev later told Kennedy that Soviet air defenses might have interpreted the U-2 flight as a prestrike reconnaissance mission or as a bomber, calling for a compensatory response by Moscow.²³ Fortunately Moscow chose to give the United States the benefit of the doubt in this instance and to permit US fighters to escort the wayward U-2 back to Alaska. Why this scheduled U-2 mission was not scrubbed once the crisis began has never been fully revealed: **the answer may be as simple as bureaucratic inertia compounded by noncommunication down the chain of command by policymakers who failed to appreciate the risk of "normal" reconnaissance under these extra-ordinary conditions.**

Threat Real

The threat is real

Habiger '10 (Eugue, Retired Air Force General, Cyberwarfare and Cyberterrorism, The Cyber Security Institute, p. 11-19, February 1, 2010)

However, there are reasons to believe that what is going on now amounts to a fundamental shift as opposed to business as usual. Today's network exploitation or information operation trespasses possess a number of characteristics that suggest that the line between espionage and conflict has been, or is close to being, crossed. (What that suggests for the proper response is a different matter.) First, **the number of cyberattacks we are facing is growing significantly.**

Andrew **Palowitch, a former CIA official now consulting with** the US Strategic Command

STRATCOM, which oversees the Defense Department's Joint Task Force-Global Network Operations, recently **told a meeting** of experts that **the Defense Department has experienced almost 80,000 computer attacks, and** some number of **these assaults have actually "reduced" the military's "operational capabilities."**²⁰ Second, **the nature of these attacks is starting to shift** from penetration attempts aimed

at gathering intelligence (cyber spying) **to offensive efforts** aimed at taking down systems (cyberattacks). Palowitch put this in stark terms last November, "We are currently in a cyberwar and war is going on today."²¹ Third, these recent attacks need to be taken in a broader strategic context. Both **Russia and China have stepped up their offensive efforts and taken a much more aggressive cyberwarfare posture**

The Chinese have developed an openly discussed cyberwar strategy aimed at achieving electronic dominance over the U.S. and its allies by 2050. In 2007 the Department of Defense reported that for the first time **China has developed first strike viruses, marking a major shift**

from prior investments in defensive measures.²² And in the intervening period China has launched a series of offensive cyber operations against U.S. government and private sector networks and infrastructure. In 2007, Gen. James Cartwright, the former head of STRATCOM and now the Vice Chairman of the Joint Chiefs of Staff, told the US-China Economic and Security Review Commission that China's ability to launch "denial of service" attacks to overwhelm an IT system is of particular concern. ²³ **Russia also has already begun to wage offensive cyberwar.** At the outset of the recent hostilities with Georgia,

Russian assets launched a series of cyberattacks against the Georgian government and its critical infrastructure systems, including media, banking and transportation sites.²⁴ In 2007, **cyberattacks that many experts attribute, directly or indirectly, to Russia shut down the Estonia government's IT systems.** Fourth, the current geopolitical context must also be factored into any effort to gauge

the degree of threat of cyberwar. The start of the new Obama Administration has begun to help reduce tensions between the United States and other nations. And, the new administration has taken initial steps to improve bilateral relations specifically with both China and Russia. However, it must be said that over the last few years **the posture of both the Chinese and Russian governments toward America has clearly become more assertive, and** at times even **aggressive. Some** commentators **have talked about** the prospects of **a cyber Pearl Harbor, and the pattern of Chinese and Russian behavior** to date **gives reason for concern** along these lines:

both nations have offensive cyberwarfare strategies in place; both nations **have taken the cyber equivalent of building up their forces**; both nations now **regularly probe our cyber defenses** looking for gaps to be

exploited; both nations **have begun** taking actions that cross the line from cyberespionage to **cyberaggression; and, our** bilateral **relations** with both nations **are increasingly fractious** and complicated by areas of marked, direct **competition.** Clearly, there a sharp differences between current U.S. relations with these two nations and relations between the US and Japan just prior to World War II. However, from a strategic defense perspective, there are enough warning signs to warrant preparation. In addition to the threat of cyberwar, **the limited resources required** to carry out even a large scale cyberattack also **makes likely the potential for a significant cyberterror attack** against the United States.

However, the lack of a long list of specific incidences of cyberterrorism should provide no comfort. **There is strong evidence to suggest that al Qaeda has the ability to conduct cyberterror attacks** against the United States and its allies. Al Qaeda and other terrorist

organizations are extremely active in cyberspace, using these technologies to communicate among themselves and others, carry out logistics, recruit members, and wage information warfare. For example, al Qaeda leaders used email to communicate with the 9-11 terrorists and the 9-11 terrorists used the Internet to make travel plans and book flights. Osama bin Laden and other al Qaeda members routinely post videos and other messages to online sites to communicate. Moreover, **there is evidence of**

efforts that al Qaeda and other terrorist organizations are actively developing cyberterrorism capabilities and seeking to carry out cyberterrorist attacks. For example, the Washington Post has reported that **"U.S. investigators have found evidence** in the logs that mark a browser's path through the Internet **that al Qaeda operators spent time on** sites that offer software and

programming instructions for the **digital switches that run power, water, transport and communications grids.** In some interrogations . . . al Qaeda prisoners have described intentions, in general terms, to use those tools."²⁵ Similarly, a 2002 CIA report on the cyberterror threat to a member of the Senate stated that al Qaeda and Hezbollah have become "more adept at using the internet and computer technologies."²⁶ The FBI has issued bulletins stating that, "U. S.

law enforcement and intelligence agencies have received indications that Al Qaeda members have sought information on Supervisory Control And Data Acquisition (SCADA) systems available on multiple SCADA-related web sites.”²⁷ In addition a number of jihadist websites, such as 7hj.7hj.com, teach computer attack and hacking skills in the service of Islam.²⁸ While al Qaeda may lack the cyber-attack capability of nations like Russia and China, there is every reason to believe its operatives, and those of its ilk, are as capable as the cyber criminals and hackers who routinely effect great harm on the world’s digital infrastructure generally and American assets specifically. In fact, perhaps, the most troubling indication of the level of the cyberterrorist threat is the countless, serious non-terrorist cyberattacks routinely carried out by criminals, hackers, disgruntled insiders, crime syndicates and the like. **If run-of-the-mill criminals and hackers can threaten powergrids, hack vital military networks, steal vast sums of money, take down a city’s of traffic lights, compromise the Federal Aviation Administration’s air traffic control systems, among other attacks, it is overwhelmingly likely that terrorists can carry out similar, if not more malicious attacks.** Moreover, even if the world’s terrorists are unable to breed these skills, they can certainly buy them. There are untold numbers of cybermercenaries around the world—sophisticated hackers with advanced training who would be willing to offer their services for the right price. Finally, given the nature of our understanding of cyber threats, there is always the possibility that we have already been the victim or a cyberterrorist attack, or such an attack has already been set but not yet effectuated, and we don’t know it yet. Instead, **a well-designed cyberattack has the capacity cause widespread chaos,** sow societal unrest, undermine national governments, **spread paralyzing fear and anxiety, and create a state of utter turmoil,** all without taking a single life. **A sophisticated cyberattack could throw a nation’s banking and finance system into chaos causing markets to crash, prompting runs on banks, degrading confidence in markets, perhaps even putting the nation’s currency in play and making the government look helpless and hapless. In today’s difficult economy, imagine how Americans would react if vast sums of money were taken** from their accounts and their supporting financial records were destroyed. A truly nefarious cyberattacker could carry out an attack in such a way (akin to Robin Hood) as to engender populist support and deepen rifts within our society, thereby making efforts to restore the system all the more difficult. **A modestly advanced enemy could use a cyberattack to shut down** (if not physically damage) one or more regional **power grids.** An entire region could be cast into total darkness, power-dependent systems could be shutdown. **An attack on one or more regional power grids could also cause cascading effects that could jeopardize our entire national grid.** When word leaks that the blackout was caused by a cyberattack, **the specter of a foreign enemy capable of sending the entire nation into darkness would only increase the fear, turmoil and unrest.** While the finance and energy sectors are considered prime targets for a cyberattack, an attack on any of the 17 delineated critical infrastructure sectors could have a major impact on the United States. For example, our healthcare system is already technologically driven and the Obama Administration’s e-health efforts will only increase that dependency. A cyberattack on the U.S. e-health infrastructure could send our healthcare system into chaos and put countless of lives at risk. Imagine if emergency room physicians and surgeons were suddenly no longer able to access vital patient information. **A cyberattack on our nation’s water systems could likewise cause widespread disruption. An attack** on the control systems for one or more dams could put entire communities at risk of being inundated, and **could create ripple effects across the water, agriculture, and energy sectors.** Similar **water control system attacks could** be used to at least temporarily **deny water to** otherwise **arid regions, impacting** everything from the quality of life in these areas to **agriculture.** In 2007, the U.S. Cyber Consequences Unit determined that the destruction from a single wave of cyberattacks on critical infrastructures could exceed \$700 billion, which would be the rough equivalent of 50 Katrina-esque hurricanes hitting the United States all at the same time.²⁹ Similarly, one IT security source has estimated that the impact of a single day cyberwar attack that focused on and disrupted U.S. credit and debit card transactions would be approximately \$35 billion.³⁰ Another way to gauge the potential for harm is in comparison to other similar noncyberattack infrastructure failures. For example, the August 2003 regional power grid blackout is estimated to have cost the U.S. economy up to \$10 billion, or roughly .1 percent of the nation’s GDP. ³¹ That said, a cyberattack of the exact same magnitude would most certainly have a much larger impact. The origin of the 2003 blackout was almost immediately disclosed as an atypical system failure having nothing to do with terrorism. This made the event both less threatening and likely a single time occurrence. Had it been disclosed that the event was the result of an attack that could readily be repeated the impacts would likely have grown substantially, if not exponentially. Additionally, **a cyberattack could also be used to disrupt our nation’s defenses or distract our national leaders** in advance of a more traditional conventional or strategic attack. Many military leaders actually believe that such a disruptive cyber pre-offensive is the most effective use of offensive cyber capabilities. This is, in fact, the way Russia utilized cyberattackers—whether government assets, governmentdirected/ coordinated assets, or allied cyber irregulars—in advance of the invasion of Georgia. **Widespread distributed denial of service (DDoS) attacks were launched** on the Georgian governments IT systems. **Roughly a day later Russian armor rolled into Georgian territory.** The cyberattacks were used to prepare the battlefield; **they denied** the Georgian government **a critical communications tool** isolating it from its citizens and degrading its command and control capabilities precisely at the time of attack. In this way, these attacks were the functional equivalent of conventional air and/or missile strikes on a nation’s communications infrastructure.³² One interesting element of the Georgian cyberattacks has been generally overlooked: On July 20th, weeks before the August cyberattack, the website of Georgian President Mikheil Saakashvili was overwhelmed by a more narrowly focused, but technologically similar DDoS attack.³³ This should be particularly chilling to American national security experts as our systems undergo the same sorts of focused, probing attacks on a constant basis. **The ability of an enemy to use a cyberattack to counter our offensive capabilities or soften our defenses for a wider offensive** against the United States **is much more than mere speculation.** In fact, in Iraq it is already happening. Iraq insurgents are now using off-the-shelf software (costing just \$26) to hack U.S. drones (costing \$4.5 million each), allowing them to intercept the video feed from these drones.³⁴ **By hacking these drones the insurgents have succeeded in greatly reducing one of our most valuable sources of real-time intelligence** and situational awareness. If our enemies in Iraq are capable of such an effective cyberattack against one of our more sophisticated systems, consider what a more technologically advanced enemy could do. At the strategic level, in 2008, as the United States Central Command was leading wars in both Iraq and Afghanistan, a cyber intruder compromised the security of the Command and sat within its IT systems, monitoring everything the Command was doing. ³⁵ This time the attacker simply gathered vast amounts of

intelligence. However, it is clear that **the attacker could** have used this access to wage cyberwar—**altering information, disrupting the flow of information, destroying information, taking down systems**—against the United States forces already at war. Similarly, during 2003 as the United States prepared for and began the War in Iraq, the IT networks of the Department of Defense were hacked 294 times.³⁶ By August of 2004, with America at war, **these ongoing attacks compelled** then-Deputy Secretary of Defense Paul Wolfowitz to write in a memo that, **“Recent exploits have reduced operational capabilities on our networks.”**³⁷ This wasn’t the first time that our national security IT infrastructure was penetrated immediately in advance of a U.S. military option.³⁸ In February of 1998 the Solar Sunrise attacks systematically compromised a series of Department of Defense networks. What is often overlooked is that these attacks occurred during the ramp up period ahead of potential military action against Iraq. The attackers were able to obtain vast amounts of sensitive information—information that would have certainly been of value to an enemy’s military leaders. There is no way to prove that these actions were purposefully launched with the specific intent to distract American military assets or degrade our capabilities. However, such ambiguities—the inability to specifically attribute actions and motives to actors—are the very nature of cyberspace. Perhaps, these repeated patterns of behavior were mere coincidence, or perhaps they weren’t. The potential that an enemy might use a cyberattack to soften physical defenses, increase the gravity of harms from kinetic attacks, or both, significantly increases the potential harms from a cyberattack. Consider the gravity of the threat and risk if an enemy, rightly or wrongly, believed that it could use a cyberattack to degrade our strategic weapons capabilities. **Such an enemy might be convinced that it could win a war—**conventional or **even nuclear—**against the **U**nited **S**tates. **The effect of this would be to undermine our deterrence—**based defenses, **making us significantly more at risk of a major war.**

Domestic Terror

Lone Wolf Impact

Lone wolves use WMDs

Gary A. **ACKERMAN**, Director of the Special Projects Division at the National Consortium for the Study of Terrorism and Responses to Terrorism (START), University of Maryland, **AND** Lauren E. **PINSON**, Senior Research/Project Manager at START and PhD student at Yale University, **14** ["An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

The first question to answer is whence the concerns about the nexus between CBRN weapons and isolated actors come and whether these are overblown. The general threat of mass violence posed by lone wolves and small autonomous cells has been detailed in accompanying issue contributions, but the potential use of CBRN weapons by such perpetrators presents some singular features that either amplify or supplement the attributes of the more general case and so are deserving of particular attention. Chief among these is the impact of rapid technological development. Recent and emerging advances in a variety of areas, from synthetic biology³ to nanoscale engineering,⁴ have opened doors not only to new medicines and materials, but also to new possibilities for malefactors to inflict harm on others. What is most relevant in the context of lone actors and small autonomous cells is not so much the pace of new invention, but rather the commercialization and consumerization of CBRN weapons-relevant technologies. This process often entails an increase in the availability and safety of the technology, with a concurrent diminution in the cost, volume, and technical knowledge required to operate it. Thus, for example, whereas fifty years ago producing large quantities of certain chemical weapons might have been a dangerous and inefficient affair requiring a large plant, expensive equipment, and several chemical engineers, with the advent of chemical microreactors,⁵ the same processes might be accomplished far more cheaply and safely on a desktop assemblage, purchased commercially and monitored by a single chemistry graduate student. The rapid global spread and increased user-friendliness of many technologies thus represents a potentially radical shift from the relatively small scale of harm a single individual or small autonomous group could historically cause.⁶ From the limited reach and killing power of the sword, spear, and bow, to the introduction of dynamite and eventually the use of our own infrastructures against us (as on September 11), the number of people that an individual who was unsupported by a broader political entity could kill with a single action has increased from single digits to thousands. Indeed, it has even been asserted that "over time ... as the leverage provided by technology increases, this threshold will finally reach its culmination—with the ability of one man to declare war on the world and win."⁷ Nowhere is this trend more perceptible in the current age than in the area of unconventional weapons. These new technologies do not simply empower users on a purely technical level. Globalization and the expansion of information networks provide new opportunities for disaffected individuals in the farthest corners of the globe to become familiar with core weapon concepts and to purchase equipment—online technical courses and eBay are undoubtedly a boon to would-be purveyors of violence. Furthermore, even the most solipsistic misanthropes, people who would never be able to function socially as part of an operational terrorist group, can find radicalizing influences or legitimation for their beliefs in the maelstrom of virtual identities on the Internet. All of this can spawn, it is feared, a more deleterious breed of lone actors, what have been referred to in some quarters as "super-empowered individuals."⁸ Conceptually, super-empowered individuals are atomistic game-changers, i.e., they constitute a single (and often singular) individual who can shock the entire system (whether national, regional, or global) by relying only on their own resources. Their core characteristics are that they have superior intelligence, the capacity to use complex communications or technology systems, and act as an individual or a "lone-wolf."⁹ The end result, according to the pessimists, is that if one of these individuals chooses to attack the system, "the unprecedented nature of his attack ensures that

no counter-measures are in place to prevent it. And when he strikes, his attack will not only kill massive amounts of people, but also profoundly change the financial, political, and social systems that govern modern life." 10 It almost goes without saying that the same concerns attach to small autonomous cells, whose members' capabilities and resources can be combined without appreciably increasing the operational footprint presented to intelligence and law enforcement agencies seeking to detect such behavior. With the exception of the largest truck or aircraft bombs, the most likely means by which to accomplish this level of system perturbation is through the use of CBRN agents as WMD. On the motivational side, therefore, lone actors and small autonomous cells may ironically be more likely to select CBRN weapons than more established terrorist groups—who are usually more conservative in their tactical orientation—because the extreme asymmetry of these weapons may provide the only subjectively feasible option for such actors to achieve their grandiose aims of deeply affecting the system. The inherent technical challenges presented by CBRN weapons may also make them attractive to self-assured individuals who may have a very different risk tolerance than larger, traditional terrorist organizations that might have to be concerned with a variety of constituencies, from state patrons to prospective recruits. 11 Many other factors beyond a "perceived potential to achieve mass casualties" might play into the decision to pursue CBRN weapons in lieu of conventional explosives, 12 including a fetishistic fascination with these weapons or the perception of direct referents in the would-be perpetrator's belief system. Others are far more sanguine about the capabilities of lone actors (or indeed non-state actors in general) with respect to their potential for using CBRN agents to cause mass fatalities, arguing that the barriers to a successful large-scale CBRN attack remain high, even in today's networked, tech-savvy environment. 13 Dolnik, for example, argues that even though homegrown cells are "less constrained" in motivations, more challenging plots generally have an inverse relationship with capability, 14 while Michael Kenney cautions against making presumptions about the ease with which individuals can learn to produce viable weapons using only the Internet. 15 However, even most of these pundits concede that low-level CBR attacks emanating from this quarter will probably lead to political, social, and economic disruption that extends well beyond the areas immediately affected by the attack. This raises an essential point with respect to CBRN terrorism: irrespective of the harm potential of CBRN weapons or an actor's capability (or lack thereof) to successfully employ them on a catastrophic scale, these weapons invariably exert a stronger psychological impact on audiences—the essence of terrorism—than the traditional gun and bomb. This is surely not lost on those lone actors or autonomous cells who are as interested in getting noticed as in causing casualties. Proven Capability and Intent While legitimate debate can be had as to the level of potential threat posed by lone actors or small autonomous cells wielding CBRN weapons, possibly the best argument for engaging in a substantive examination of the issue is the most concrete one of all—that these actors have already demonstrated the motivation and capability to pursue and use CBRN weapons, in some cases even close to the point of constituting a genuine WMD threat. In the context of bioterrorism, perhaps the most cogent illustration of this is the case of Dr. Bruce Ivins, the perpetrator behind one of the most serious episodes of bioterrorism in living memory, the 2001 "anthrax letters," which employed a highly virulent and sophisticated form of the agent and not only killed five and seriously sickened 17 people, but led to widespread disruption of the U.S. postal services and key government facilities. 16 Other historical cases of CBRN pursuit and use by lone actors and small autonomous cells highlight the need for further exploration. Among the many extant examples: 17 Thomas Lavy was caught at the Alaska-Canada border in 1993 with 130 grams of 7% pure ricin. It is unclear how Lavy obtained the ricin, what he planned to do with it, and what motivated him. In 1996, Diane Thompson deliberately infected twelve coworkers with shigella dysenteriae type 2. Her motives were unclear. In 1998, Larry Wayne Harris, a white supremacist, was charged with producing and stockpiling a biological agent—bacillus anthracis, the causative agent of anthrax. In 1999, the Justice Department (an autonomous cell sympathetic to the Animal Liberation Front) mailed over 100 razor blades dipped in rat poison to individuals involved in the fur industry. In 2000, Tsiugio Uchinshi was arrested for mailing samples of the mineral monazite with trace amounts of radioactive thorium to several Japanese government agencies to persuade authorities to look into potential uranium being smuggled to North Korea. In 2002, Chen Zhengping put rat poison in a rival snack shop's products and killed 42 people. In 2005, 10 letters containing a radioactive substance were mailed to major organizations in Belgium including the Royal Palace, NATO headquarters, and the U.S. embassy in Brussels. No injuries were reported. In 2011, federal agents arrested four elderly men in Georgia who were plotting to use ricin and explosives to target federal buildings, Justice Department officials, federal judges, and Internal Revenue Service agents. Two recent events may signal an even greater interest in CBRN by lone malefactors. First, based on one assessment of Norway's Anders Breivik's treatise, his references to CBRN weapons a) suggest that CBRN weapons could be used on a tactical

level and b) reveal (to perhaps previously uninformed audiences) that even low-level CBRN weapons could achieve far-reaching impacts driven by fear. 18 Whether or not Breivik would actually have sought or been able to pursue CBRN, he has garnered a following in several (often far-right) extremist circles and his treatise might inspire other lone actors. Second, Al-Qaeda in the Arabian Peninsula (AQAP) released two issues of Inspire magazine in 2012. Articles, on the one hand, call for lone wolf jihad attacks to target non-combatant populations and, on the other, permit the use of chemical and biological weapons. The combination of such directives may very well influence the weapon selection of lone actor jihadists in Western nations. 19

Extinction

Nathan **MYHRVOLD**, PhD in theoretical and mathematical physics from Princeton, former chief technology officer of Microsoft, **13** [July 2013, "Strategic Terrorism: A Call to Action," The Lawfare Research Paper Series No.2, <http://www.lawfareblog.com/wp-content/uploads/2013/07/Strategic-Terrorism-Myhrvold-7-3-2013.pdf>]

Several powerful trends have aligned to profoundly change the way that the world works. Technology now allows stateless groups to organize, recruit, and fund themselves in an unprecedented fashion. That, coupled with the extreme difficulty of finding and punishing a stateless group, means that stateless groups are positioned to be lead players on the world stage. They may act on their own, or they may act as proxies for nation-states that wish to duck responsibility. Either way, stateless groups are forces to be reckoned with. At the same time, a different set of technology trends means that small numbers of people can obtain incredibly lethal power. Now, for the first time in human history, a small group can be as lethal as the largest superpower. Such a group could execute an attack that could kill millions of people. It is technically feasible for such a group to kill billions of people, to end modern civilization—perhaps even to drive the human race to extinction. Our defense establishment was shaped over decades to address what was, for a long time, the only strategic threat our nation faced: Soviet or Chinese missiles. More recently, it has started retooling to address tactical terror attacks like those launched on the morning of 9/11, but the reform process is incomplete and inconsistent. A real defense will require rebuilding our military and intelligence capabilities from the ground up. Yet, so far, strategic terrorism has received relatively little attention in defense agencies, and the efforts that have been launched to combat this existential threat seem fragmented. History suggests what will happen. The only thing that shakes America out of complacency is a direct threat from a determined adversary that confronts us with our shortcomings by repeatedly attacking us or hectoring us for decades.

Econ

Crushes the economy

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooiti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. <http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

modified for ableist language

New technology has lowered transportation costs and increased trade and capital flows across nations. But the same technology that has fostered international economic growth has also allowed terrorism to spread easily among countries whose interests are tightly interwoven. Terrorism is no longer solely a local issue. Terrorists can strike from thousands of miles away and cause vast destruction. The effects of terrorism can be terrifyingly direct. People are kidnapped or killed. Pipelines are sabotaged. Bombers strike markets, buses, and restaurants with devastating effect. But terrorism inflicts more than human casualties and material losses. It can also cause serious indirect harm to countries and economies by increasing the costs of economic transactions—for example, because of enhanced security measures to ensure the safety of employees and customers or higher insurance premiums. Terrorist attacks in Yemen on the USS Cole in 2000 and on the French tanker Limburg in 2002 seriously damaged that country's shipping industry. These attacks contributed to a 300 percent rise in insurance premiums for ships using that route and led ships to bypass Yemen entirely (Enders and Sandler, 2012). In this article we explore the economic burden of terrorism. It can take myriad forms, but we focus on three: national income losses and growth-retarding effects, dampened foreign direct investment, and disparate effects on international trade.

Domestic Terrorism deters FDI – even small attacks crush investor confidence

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooiti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. "The Toll of Terrorism"
<http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

Scaring off investors increased terrorism in a particular area tends to depress the expected return on capital invested there, which shifts investment elsewhere. This reduces the stock of productive capital and the flow of productivity-enhancing technology to the affected nation. For example, from the mid-1970s through 1991, terrorist incidents reduced net foreign direct investment in Spain by 13.5 percent and in Greece by 11.9 percent (Enders and Sandler, 1996). In fact, the initial loss of productive resources as a result of terrorism may increase manyfold because potential foreign investors shift their investments to other, presumably safer, destinations. Abadie and Gardeazabal (2008) showed that a relatively small increase in the perceived risk of terrorism can cause an outsized reduction in a country's net stock of foreign direct investment and inflict significant damage on its economy. We analyzed 78 developing economies over the period 1984–2008 (Bandyopadhyay, Sandler, and Younasis, 2014) and found that on average a relatively small increase in a country's domestic terrorist incidents per 100,000 persons sharply reduced net foreign direct investment. There was a similarly large reduction in net investment if the terrorist incidents originated abroad or involved foreigners or foreign assets in the attacked country. We also found that greater official aid flows can substantially offset the damage to foreign direct investment—perhaps in part because the increased aid allows recipient nations to invest in more effective counterterrorism efforts. Most countries that experienced above-average domestic or transnational terrorist incidents during 1970–2011 received less foreign direct investment or foreign aid than the average among the 122 in the sample (see table). It is difficult to assess causation, but the table suggests a troubling association between terrorism and depressed aid and foreign direct investment, both of which are crucial for developing economies. It is generally believed that there are higher risks in trading with a nation afflicted by terrorism, which cause an increase in transaction costs and tend to reduce trade. For example, after the September 11 attacks on New York City and the Washington, D.C., area, the U.S. border was temporarily closed, holding up truck traffic between the United States and Canada for an extended time. Nitsch and Schumacher (2004) analyzed a sample of 200 countries over the period 1960–93 and found that when terrorism incidents in a pair of trading countries

double in one year, trade between them falls by about 4 percent that same year. They also found that **when one of two trading partners suffers at least one terrorist attack, it reduces trade between them to 91 percent of what it would be in the absence of terrorism.** Blomberg and Hess (2006) estimated that terrorism and other internal and external conflicts retard trade as much as a 30 percent tariff. More specifically, they found that any trading partner that experienced terrorism experienced close to a 4 percent reduction in bilateral trade. But Egger and Gassebner (2015) found more modest trade effects. Terrorism had few to no short-term effects; it was significant over the medium term, which they defined as "more than one and a half years after an attack/incident." Abstracting from the impact of transaction costs from terrorism, Bandyopadhyay and Sandler (2014b) found that terrorism may not necessarily reduce trade, because resources can be reallocated. If terrorism disproportionately harmed one productive resource (say land) relative to another (say labor), then resources would flow to the labor-intensive sector. If a country exported labor-intensive goods, such as textiles, terrorism could actually lead to increased production and exportation. In other words, although terrorism may reduce trade in a particular product because it increases transaction costs, its ultimate impact may be either to raise or reduce overall trade. These apparently contradictory empirical and theoretical findings present rich prospects for future study. Of course terrorism has repercussions beyond human and material destruction and the economic effects discussed in this article. Terrorism also influences immigration and immigration policy. The traditional gains and losses from the international movement of labor may be magnified by national security considerations rooted in a terrorism response. For example, a recent study by Bandyopadhyay and Sandler (2014a) focused on a terrorist organization based in a developing country. It showed that the immigration policy of the developed country targeted by the terrorist group can be critical to containing transnational terrorism. Transnational terrorism targeted at well-protected developed countries tends to be more skill intensive: it takes a relatively sophisticated terrorist to plan and successfully execute such an attack. Immigration policies that attract highly skilled people to developed countries can drain the pool of highly skilled terrorist recruits and may cut down on transnational terrorism. ■

FDI competitiveness is vital to sustained economic recovery

Kornecki '13 [L. PhD in Economics, Prof Embry-Riddle Aeronautical University's College of Business. "Inward FDI in the United States and its policy context" Columbia FDI Profiles, 2/4/13 http://www.vcc.columbia.edu/files/vale/documents/US_IFDI_-_FINAL_-_REVISED_Feb_4_2013.pdf]

Inward foreign direct investment (IFDI) **represents an integral part of the** United States (U.S.) **economy, with** its stock growing from US\$ 83 billion in 1980 to US\$ **3.5 trillion** in 2011. **The United States**, which had earlier been primarily a home for multinational enterprises (MNEs) rather than a host for affiliates of foreign MNEs, has become a preferred host country for FDI since the 1980s. Foreign **MNEs have contributed robust flows of FDI into diverse industries** of the U.S. economy, and total FDI inflows reached US\$ 227 billion in 2011, **equivalent to 15% of global inflows**, the single largest share of any economy. Inflows of **FDI**, with a peak of US\$ 314 billion in 2000 and another of US\$ 306 billion in 2008, **have been an important factor contributing to sustained economic growth** in the United States. The recent financial and economic crises negatively impacted FDI flows to the United States and opened a period of major uncertainty. **The effectiveness of government policy responses at both the national and international levels** in addressing the financial crisis and its economic consequences **will play a crucial role** for creating favorable conditions for a rebound in FDI inflows. **Inward foreign direct investment is an essential component of the U.S. economy, contributing to production, exports and high-paying jobs for the country's workers.** As the world's largest economy, **the United States is well positioned to participate in the increasingly competitive international environment** for FDI that has emerged as both advanced and developing economies have recognized the value of such investment. **The U.S. hosts the largest stock of IFDI among the world's economies and continues to be at the top as a destination for inward FDI flows.**

Threat real

Homegrown terrorism is the most likely scenario for an attack

Zenko 15 -- Zenko covers the U.S. national security debate and offers insight on developments in international security and conflict prevention. "Is US Foreign Policy Ignoring Homegrown Terrorists" <http://www.defenseone.com/threats/2015/05/us-foreign-policy-ignoring-homegrown-terrorists/113197/>

Senior U.S. intelligence and counterterrorism officials increasingly warn of the threat of "lone wolf" individuals attempting terror attacks within the United States. These potential perpetrators are characterized as externally motivated, but predominantly self-directed in plotting and attempting acts of politically and/or ideologically motivated violence. They need not travel to purported foreign "safe havens" to receive training or guidance, nor be in direct contact with terrorist organizations based abroad. Rather, their inspiration, in large part, appears to stem from the principles and narratives promoted by Islamist jihadist groups. On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence: "We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy." On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned: "Home-grown violent extremists continue to pose the most likely threat to the homeland." Last Friday, Secretary of

Homeland Security Jeh Johnson stated on MSNBC: "We're in a new phase...in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..." Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically: "Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways: people coming to fight for them, and people coming to stand up and attack coalition nations in their home." In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world. Remarkably, these two observations have had virtually no impact on U.S. foreign policy discourse. In Washington, there is an agreed-upon, bipartisan understanding that under no circumstances will officials or politicians acknowledge, or even explore, the concept that foreign policy activities might play a role in compelling U.S. residents, who would not otherwise consider terrorism, to plot and attempt attacks. This is somewhat understandable given that there are many different backgrounds, experiences, and precursors that lead people to become violent extremists. Yet, whereas there are constant hearings and debates—even White House summits—about how to "counter violent extremism," there is rarely any consideration of which U.S. foreign policy activities might themselves be precursors to U.S. terrorism. In fact, the only foreign policy decisions that the Obama administration admits might inspire terrorism are those made by Obama's predecessor. The first is one that the White House has tried to reverse since January 2009: detaining terror suspects at Guantanamo Bay, Cuba. Most recently, at a House Armed Services Committee hearing on March 18, Secretary of Defense Ashton Carter endorsed closing the military prison because, "It still provides a rallying point for Jihadi recruiting." The other decision is the 2003 invasion of Iraq; as President Obama stated on March 17, "ISIL is a direct outgrowth of al-Qaeda in Iraq that grew out of our invasion, which is an example of unintended consequences." Of course, another unintended consequence emerged from the U.S.-led airwar in 2011 that ensured the toppling of Muammar al-Qaddafi in Libya. As a U.S. military official told The Wall Street Journal today, "ISIL now has an operational presence in Libya, and they have aspirations to make Libya their African hub. Libya is part of their terror map now." Compare this recent warning to how the State Department described Libya on the eve of the 2011 airwar: "The Libyan government continued to demonstrate a strong and active commitment to combating terrorist organizations and violent extremism through bilateral and regional counterterrorism and security cooperation, particularly on the issue of foreign fighter flow to Iraq." Now, foreign fighters are flowing from Iraq and Syria to establish a stronghold in Libya. This is clearly an unintended, though not at all unsurprising, consequence, but not one that the Obama administration will acknowledge because it happened under its watch. (See also: Are We Downplaying the Risks of Homegrown Terrorism?) More critically, what foreign policy activities are bolstering the narrative of Islamic jihadist groups today? Is it really just the 122 terror suspects still in Guantanamo? What about drone strikes, which themselves are universally hated? Or, what of the support for President Abdel Fattah el-Sisi in Egypt, whose government sentenced that country's first elected leader to death this week? Finally, is the U.S.-led airwar against IS fueling that narrative and making the likelihood of lone wolf attacks within the United States more likely? What else is the United States doing abroad that could be making Americans less safe from lone wolf terrorism at home? Why is this never asked or considered when officials and politicians discuss how the thirteen-and-a-half-year war on terrorism is progressing?

ISIS

ISIS is in the US

Piccoli 15 – Sean, [Ex-DHS, NSA Official: ISIS Terror Cells in US 'Probable'](#)

<http://www.newsmax.com/Newsmax-Tv/Stewart-ABaker-United-States-cells-ISIS/2015/02/12/id/624453/>

It's safe to assume that [there are people with terrorist ambitions](#) and instructions [from the Islamic State](#) operating [inside the United States](#) today, [says a former Department of Homeland Security official](#), agreeing with a similar claim made by [the agency's current chief](#). While hesitating to use the phrase " sleeper cells " to describe these attackers in waiting, former DHS assistant secretary Stewart A. Baker told "MidPoint" host Ed Berliner on Newsmax TV Thursday that [it is "more probable than not" that they are here](#), "and [we](#) certainly [should be acting as though that's likely](#) ." "It is quite possible that [there were foreign fighters](#) from the United States or from other countries [whose names we never got and whose travel to Syria we never flagged](#)," said Baker, "and that [those folks have come back to the United States with instructions to](#) try to [carry out an attack](#) if that's possible." Homeland Security Secretary Jeh Johnson said as much on Sunday, telling CNN's "State of the Union" that [a number of individuals living in the U.S. are in touch with](#) the Islamic State [ISIS](#) and other [terror groups that share "a desire to conduct an attack" against America](#). Johnson said the problem of homegrown or reimported terrorists is worse in Europe than in the U.S., but that on both continents, [social media make it easier for an ISIS or an al-Qaida to recruit fighters from afar or groom lone-wolf terrorists](#) within the targeted countries. It's against that backdrop that President Barack Obama is grudgingly seeking a new congressional authorization for military force against ISIS in Iraq and Syria, said Baker. "It's obvious he would very much like not to be fighting this war," said Baker, a lawyer and former general counsel to the National Security Agency. Obama "came into office thinking he would put an end to the use of force abroad and to unilateral executive decision-making about what force could be used," said Baker, "and he's found himself actually being more Bush than Bush on that topic, taking existing authorities and stretching them far. " His written request to Congress for a war authorization lasting three years is an attempt to "thread a needle," said Baker, "to say, 'Give me a lot of authority but not as much authority as you've given the president in the past,' because he is genuinely ambivalent about whether this is a good idea. "He's written it in a way that authorizes ground troops, just not for very long or in any large numbers," said Baker. "He is visibly uncomfortable doing what he feels he must do, both politically and militarily, and any limits he can come up with, he's glad to embrace, especially if those limitations will mostly be felt by his successor," said Baker. Baker also discussed the new cease-fire in Ukraine agreed to by Russia, which has been hit with international sanctions for backing separatist rebels in Ukraine and annexing Ukrainian territory. German and French leaders Angela Merkel and François Hollande helped broker the truce, but Baker was doubtful that it will last any longer than Russian President Vladimir Putin wants it to. "He is playing, especially, Europe, but he's playing us as well," said Baker. "He's managed to increase the [Ukrainian] territory that is largely under the control of his Special Forces and the rebels, and now the West has more or less validated that new territory in exchange for the same promise he gave last time," when Russia signed a ceasefire agreement in September. "So whether there's a cease-fire depends entirely on whether Putin really wants one," said Baker, "and right now he may simply be saying, 'Well, in order to head off the delivery of arms to the Ukraine, I'll promise them the cease-fire and in a week I can take it back.'"

Vaccines DA

File Notes for Vaccine DAs

There are two ways this vaccination argument can be run:

1. **Surveillance module:** Surveillance functionally solves vaccination. The evidence on this is more specific to disease surveillance and tracking, so it's questionable whether the plan links or not. I don't recommend reading the surveillance module as much.
2. **Culture of rights module:** In the status quo, the pro-vaccination movement is gaining influence, but the plan reverses it by boosting a "culture of rights" that is used by anti-vaccination proponents to justify their beliefs. There are some decent cards in here that say anti-vaccination activists will use the rhetoric of things like Roe v. Wade and GMOs to anti-vaccination rights of parental "choice" and "freedoms".

For the aff section, there is not as much evidence, but I think it is fairly easy to win no link and no impact.

1NC Materials

1NC — Privacy Link

The plan builds on the virtuous cycle for privacy to create more reforms.

Ozer 12 — Nicole Ozer, the Technology and Civil Liberties Policy Director at the ACLU of Northern California (ACLU-NC), where she developed the organization's Demand Your dotRights online privacy campaign, 2012 ("Putting Online Privacy Above The Fold: Building A Social Movement And Creating Corporate Change" *New York University Review of Law & Social Change*, Lexis)

As noted in Part I, n226 one of the primary challenges of establishing a privacy social movement is sustainability. While the privacy community has had success in the past in addressing specific incidents, these successes did not initially lead to a coherent and sustainable privacy social movement. n227 More recently, however, advocates have successfully leveraged the environmental changes discussed in Part II to win specific battles to protect individual privacy. The privacy community has also used those victories to reinforce the climate for change and support the discussion necessary to sustain the nascent social movement. **This has helped to create a much-needed "virtuous cycle" n228 in which each successful advocacy effort reinforces awareness of the ongoing issues concerning online privacy and makes it easier both to challenge specific practices in the future and to lay the groundwork for broader-reaching change.**

1NC — Vaccine Surveillance Module

Bulk surveillance solving disease now – it's key to efficient medical databases that can predict patterns and detect outbreaks – prefer this in the context of evolving diseases and rapid spread.

Santos and Bernardino 6 – Ricardo Jorge Santos, holds a PhD Information Sciences & Tech, faculty member of the Centre of Informatics and Systems of the University of Coimbra; Jorge Bernardino, faculty member of Engineering Institute of Coimbra at the Polytechnic Institute of Coimbra, 2006 (“Global Epidemiological Outbreak Surveillance System Architecture”, 10th International Database Engineering and Applications Symposium, December 14, Available Online at 10.1109/IDEAS.2006.27 via MSU Library, accessed 7/14/15, KM)

Diseases such as avian influenza, severe acute respiratory syndrome (SARS) and Creutzfeldt-Jacob syndrome represent a new era of biological threats. Nowadays, these hazards breed, mutate and evolve at tremendous speed. Furthermore, they may spread out at the same speed as which we travel. This reveals an urgent need for an agent capable of dealing with such threats. Data warehouses are databases which provide decision support by on-line analytical processing (OLAP) techniques. We present the architecture for an effective information system infrastructure enabling the prediction and near real-time detection of disease outbreaks, using knowledge extraction algorithms to explore a symptoms/diseases data warehouse in a continuous and active form. To collect such data, we take advantage of the Internet and features existing in today's common communication devices such as personal computers, portable digital assistants and cellular phones. We present a case-simulation based on a small country, showing the system can detect an outbreak within hours or even minutes after its physical occurrence, alerting health decision makers and providing quick interaction and feedback between all users. The architecture is also functionally independent from its geographical dimension. 1. Introduction A data warehouse (DW) provides information for analytical processing, decision making support and data mining tools. A suitable data model is the core of representing part of the real world in the context of a database. Although many modeling techniques expressed in extended multidimensional data models were proposed in the recent past [5], many major issues such as information system architectures for specific health issues are not properly reflected. Diseases such as avian influenza, SARS and the Creutzfeldt-Jacob syndrome represent a new era of biological threats. New stripes of viruses and bacterias are becoming increasingly aggressive and rapidly adapting to resist vaccines and medication. The speed at which these diseases are mutating and evolving, combined with the fact that they may spreadout at the same rate as people and animals travel, greatens the risk for a major epidemic or pandemic outbreak. It is therefore crucial to detect when a potential outburst might by taking place in order to contain it as quickly as possible and minimize damage it may cause. Our architecture fulfils that need, using knowledge extraction algorithms to explore a symptoms/disease DW, looking for patterns of symptoms to predict the occurrence of a potential outbreak. We also present an experimental evaluation using a case-simulation for a small country. The rest of this paper is organized as follows. In section 2, we refer issues and existing solutions in epidemics and health information systems. In sections 3, 4 and 5, we respectively present our architecture, its database and the main algorithms and methods for outbreak prediction and detection. In section 6 a simulation of the system working for a small country such as Portugal is presented and the final section contains concluding remarks and future work. 2. Background and related work Accessing the Internet today, we can find several institutional and enterprise web portals which provide trustworthy health information (including epidemic and pandemic) such as in [1] by the Aberdeen Group, [7] by Great Britain's NHS, the World Health Organization [10]. We can also use web applications to perform a risk analysis on contagious diseases which can be disseminated through animal contact [9]. The work in [4] refers the importance of mathematical models given historical disease data as a mean of predicting and evaluating forms of action in certain situations. We can also use the Internet for reporting diseases to adequate health services, like what is done by the United States' Centre for Disease Control in what they refer to as “communicable diseases”. However, with new emerging diseases, using historical data based contention plans will not be an efficient way to handle the problem, as shown in [8]. Innovative solutions have emerged based on telecommunication and informatics technology, such as the EMPHIS Project [2], following the perspective and vision of the future presented in [6] by Great Britain's NHS. The architecture presented takes the next step, combining database, knowledge extraction and telecommunication

technologies to aid global health in rapidly predicting and/or detecting the occurrence of epidemic outbreaks, which is vital for minimizing losses and containing potential hazards. 3. The surveillance system's architecture The technological evolution in telecommunications and portable computerized devices makes it possible today to have real-time information availability, practically without geographical dependencies. Taking advantage of an agent with the highest level of availability such as the Internet, our architecture provides the infrastructure for collecting data of occurring symptoms and diseases, and points examples on how to effectively and efficiently process this data to discover symptom and disease associations. This is done achieved by inserting patient symptoms and diseases data in a web server database, which collects all information in a given geographical region and ships it to a DW located in a health decision centre. If the number of discovered cases within that region is considered relevant as a possible epidemic indicator, health decision makers and medical staff are immediately alerted. The architecture has 3 bottom-up tiers or levels, as seen in Figure 1. Symptom/disease data is uploaded by medical staff using personal devices with internet access, such as mobile phones, PDAs or common personal computers, getting stored in the second tier web servers. Each web server has the database and software applications needed to support the first tier requested services. The decision making server in the last tier holds a DW processing non-stop knowledge extraction algorithms finding disease record counts and symptoms/disease patterns in a defined geographical area. If a relevant number of suspicious patterns of symptoms or confirmed occurrences of diseases are detected, health decision makers and medical staff are immediately alerted. Figure 1 represents an example of an implementation covering three defined geographical areas. A major advantage in our proposal is that once the disease/symptom data is recorded, the detection process is much faster than bureaucratic processes used today. Nowadays, when a major disease is observed, medical staff fill in paperwork reporting those cases to entities such as the CDC in the United States or the NHS in Great Britain. These entities process and analyze the amount of cases received from each region and decide if that amount should be considered relevant. These processes usually take days, or, at least, many hours. Furthermore, if a "minor" disease is observed, such as a simple flu, for instance, it is not considered as relevant to report. Although it may be a "minor" disease, if it were to occur in a considerable amount of cases within the same region, it could become an important issue. With our system, this would be almost immediately detected and alerted; in the traditional existing processes it would not be detected, or, in the best case, would be noticed only after some time. For each medical staff disease or symptom input, they may not even physically know, see or even be in contact with each other, but their medical records will be matched almost in a real-time manner, detecting the possibility of an epidemic occurrence. Each second tier web server must contain the following components in order to insure the systems interaction and functionality: a) a data mart containing the database structure and all supporting data for the geographical region and population it serves; b) a web interface for first tier users to input data and to promote interaction between third tier users (health decision makers) and first tier users (medical staff); c) a software application available to first tier users for downloading, which allows working offline the Internet and capable of uploading that data to the second tier web servers whenever requested. This would allow medical staff to work at any location without Internet access; d) a software server component responsible for shipping the collected data to update the third tier DW server. 4. The surveillance system's database Today, most database systems offer features that go beyond management of static data and most information systems are powered by a database. The job of a database is to store data and answer queries. By contrast, the job of an information system is to provide a service, which are semantic entities entailing considerations that span the life cycle of the larger system [3]. Traditionally, database systems have been passive, storing and retrieving data in direct response to user requests without initiating any operations on their own. As the scale and complexity of data management increased, interest has grown in bringing active behaviour into databases, allowing them to respond independently to data-related events. Therefore, given the usage we wish to provide our database, we can look at it as an active database as discussed in [3], for it will be continuously querying and analyzing data and reporting it to the users makers involved in an interactive form. The database holds patient symptoms and disease data records, including both humans and animals. Based upon the characterization of these entities and their attributes, we propose in Figure 2 the partial DW schema supporting human disease outbreak detection. The schema for outbreak prediction is similar and given by adding tables relating to symptom data. The schema for animal disease outbreak detection and prediction are similar to the human schema, linking each animal with the human to which it belongs.

Anti-vaxxers cause outbreaks of dangerous diseases – highly contagious diseases means it will spread quickly.

Sifferlin 14 — Alexandra Sifferlin, Alexandra Sifferlin is a writer for TIME. She covers public health issues including infectious and chronic disease, big ideas in medicine, and breaking news, 3-17-2014 ("Here are some diseases we're seeing thanks to anti-vaxxers," TIME, 3-17-2014, Available Online at <http://time.com/27308/4-diseases-making-a-comeback-thanks-to-anti-vaxxers/>, Accessed 7-14-2015)

These should be avoidable

New York City isn't an anomaly, though. Diseases that are and have been avoidable in the U.S. thanks to vaccines, are resurfacing all across the country. Measles, for instance, was considered wiped out in 2000, but there have been several outbreaks in the past few years. This map shows outbreaks of vaccine-preventable diseases since 2008 (click on "Map" and select which diseases and regions you want to see).

The emergence of these diseases — especially measles — is alarming, and mostly due to parents in the U.S. not vaccinating their kids. "If you are unvaccinated and you come in contact with measles, there's a 90% chance you will get it," says Jason McDonald, a spokesperson for the Centers for Disease Control and Prevention (CDC).

Though measles outbreaks are primarily linked to unvaccinated people, McDonald notes that some vaccines aren't foolproof. For example, the whooping-cough vaccine may lose its efficacy over time. And, overall, most people do get their vaccinations. A CDC report looking at children entering kindergarten for the 2012–13 school year in all U.S. states found that more than 90% of these kids had their vaccines.

Still, there are people — including public figures and celebrities — who don't vaccinate their kids and promote their choices. Most infamously, Jenny McCarthy has espoused her antivaccination position because she believes vaccines are full of toxins and cause autism. When she recently posed a question on Twitter about finding a mate, the vaccination backlash was loud and clear.

Just how harmful are these notions, though? Below are some preventable diseases making a vicious return thanks to people not getting their vaccinations.

Measles

According to the CDC, for every 1,000 children who get the measles, one or two will die. Currently, public-health workers are worried about the situation in New York, but just in the past three months, there have been reported cases of the disease in Massachusetts, Illinois and California. The CDC reports that from Jan. 1 to Feb. 28, 2014, 54 people in the U.S. have reported being infected with measles. On average, there are about 60 cases reported in the U.S. every year. Most people in the U.S. are vaccinated against the measles, but since measles is still around in other countries, those who travel outside of the U.S. can contract it if they are not vaccinated. New York City has not been able to confirm the source of the disease.

Mumps

As recently as Monday, health officials confirmed 23 cases of mumps at Ohio State University. In 2011, there was a mumps outbreak on the University of California at Berkeley campus, with 29 reported cases confirmed by the CDC. The source of the outbreak was thought to be an unvaccinated student who had spent time traveling in Western Europe where there is still a presence of mumps. In 2013, a slightly smaller outbreak of the disease broke out among students at Loyola University in Maryland. The last major occurrence was in 2006, when there was a multistate outbreak of 6,584 reported cases. Less than 20 cases a year was considered usual at the time.

Whooping Cough

Whooping-cough outbreaks are thought to be spurred by waning immunity from the vaccine. However, a 2013 study published in the journal Pediatrics reports that California's worst whooping-cough outbreak, which infected more than 9,000 people, was also encouraged by a large number of kids who were unvaccinated.

Chicken Pox

In 2012, a county in Indiana experienced a major chicken-pox outbreak of more than 80 cases, which was thought to start from an unvaccinated child. The vaccine is 90% effective, so it's possible for people who have been vaccinated to contract the disease.

1NC — Vaccine Culture of Rights Module

Thanks to anti-vaccination proponents, measles risk is high now – pro-vaccination public opinion is reversing the trend.

Salzberg 15 – Steven Salzberg, Bloomberg Distinguished Professor of Biomedical Engineering, Computer Science, and Biostatistics at Johns Hopkins University, former researcher at The Institute for Genomic Research with a focus in sequencing the genomes of many bacteria, including those used in the 2001 anthrax attacks, member of the Human Genome Project and the co-founder of the influenza virus sequencing project, 2015 (“Anti-Vaccine Movement Causes Worst Measles Epidemic In 20 Years”, Forbes, February 1, Available Online at <http://www.forbes.com/sites/stevensalzberg/2015/02/01/anti-vaccine-movement-causes-worst-measles-epidemic-in-20-years/>, accessed 7/20/15, KM)

Measles is now spreading outward from Disneyland in California, in the worst outbreak in years. The epidemic is fueled by growing enclaves of unvaccinated people. The CDC reports that in just the past month, 84 people from 14 states contracted measles, a number that is certainly an under-estimate, because the CDC doesn't record every case. California alone has 59 confirmed cases, most of them linked to an initial exposure in Disneyland. A majority of people who have gotten sick were not vaccinated. For years, scientists (including me) have warned that the anti-vaccination movement was going to cause epidemics of disease. Two years ago I wrote that the anti-vaccine movement had caused the worst whooping cough epidemic in 70 years. And now it's happening with measles. Finally, though, the public seems to be pushing back. Parents are starting to wake up to the danger that the anti-vax movement represents to their children and themselves. What's sad about this – tragic, really – is that we eliminated measles from the U.S. in the year 2000, thanks to the measles vaccine. As this CDC graph shows, we've had fewer than 100 cases every year since. But we had 644 cases in 27 states in 2014, the most in 20 years. And 2015 is already on track to be worse. Measles may become endemic in the U.S, circulating continually, thanks to the increasing numbers of unvaccinated people. Until now, each outbreak was caused by someone traveling from abroad and bringing measles to us. The anti-vaccine movement has turned this public health victory into defeat. Anti-vaxxers have been relentless in the efforts to spread misinformation. Despite overwhelming scientific evidence that vaccines are beneficial, they endlessly repeat a variety false claims, such as: Vaccines cause autism. They don't. The preservative thimerosal in vaccines causes autism. It doesn't. Natural immunity is all you need. It isn't. Measles infects 90% of people exposed to it unless they are vaccinated. A healthy lifestyle will protect you from measles. It won't. Now, finally, some parents are pushing back. Parents and schools in California, where the epidemic began, are concerned that their children will be exposed to measles from unvaccinated children in schools. And the schools are starting to do something they should have done long ago: send the unvaccinated kids home. The problem arises from California's vaccine exemption policy: although public schools require kids to be vaccinated, parents can exempt their kids simply by saying they have a personal objection to vaccination. It's not just California: only two states, Mississippi and West Virginia, don't allow parents to claim a philosophical or religious exemption to vaccines And Colorado has the worst rate of vaccination, at just 82%, primarily due to parents claiming a “philosophical” exemption. These parents are the anti-vaxxers. Thanks to them, we now have large pockets of unvaccinated children through whom epidemics can spread further and faster than we've seen in decades. The CDC reports that in 2014, 79% of measles cases in the U.S. involving unvaccinated people were the result of personal belief exemptions. Anti-vaxxers don't recognize the threat their behavior poses to others, especially to children whose immune systems aren't functioning properly. CNN reported this week on the case of Rhett Krawitt, a 6-year-old California boy who has gone through 4 years of chemotherapy for childhood leukemia. His leukemia is in remission and he's back in school, but the treatment wiped out his immunity, and he's still not ready to get vaccinated. If Rhett gets measles, he might not survive. His father Carl wrote to school district officials to ask them to ban unvaccinated children from school. Krawitt expects the schools to deny his request. Meanwhile, the parents who refuse to vaccinate their kids aren't budging. The New York Times reported on one mother,

Crystal McDonald, who refused to vaccinate any of her four children, after “researching the issue” by reading anti-vaccine websites. When their high school sent her daughter home for two weeks, the daughter asked if she could get the measles shot so she could return. As quoted in the Times, McDonald told her daughter “I said ‘No, absolutely not.’ I said I’d rather you miss an entire semester than you get the shot.” Where does this breathtaking science denialism come from? It’s been building for years, as I and many others have written. The wave began with a 1998 paper published in The Lancet by Andrew Wakefield, claiming that the MMR vaccine was linked to autism. Wakefield’s work was later shown to be fraudulent, and his claims about the vaccine “dishonest and irresponsible.” After lengthy investigations, the paper was retracted and Wakefield lost his medical license. Despite this very public repudiation, Wakefield has stuck to his claims, though, and has spent much of the past 15 years speaking (or perhaps “preaching” would be a better term) to anti-vaccine groups, to whom he is a kind of folk hero. It’s not just Wakefield, though. Anti-vaccine messages have been broadcast aggressively by the group Generation Rescue, led by former Playboy playmate and MTV host Jenny McCarthy, and by Age of Autism, a group dedicated to the proposition that vaccines cause autism. (Age of Autism is doing it again right now.) And just last summer, Robert F. Kennedy Jr. published a new book further promoting the long-discredited claim that thimerosal causes autism. Most of the anti-vax crowd have no scientific training or expertise, which might explain (but doesn’t excuse) their complete ignorance of the science. Over the past 15 years, dozens of studies involving hundreds of thousands of people have shown convincingly that neither vaccines nor any of the ingredients in them are linked to autism. Vaccines are not only safe, but they are perhaps the greatest public health success in the history of civilization. Measles, though, is dangerous. The CDC’s Anne Schuchat had a message for parents this week: “I want to make sure that parents who think that measles is gone and haven’t made sure that they or their children are vaccinated are aware that measles is still around and it can be serious. And that MMR vaccine is safe and effective and highly recommended.” Make no mistake, measles is a very dangerous infection. In the current outbreak, 25% of victims have ended up in the hospital. And it is extremely infectious: the CDC’s Schuchat explained that: “You can catch it [measles] just by being in the same room as a person with measles even if that person left the room because the virus can hang around for a couple of hours.” Perhaps the Disneyland epidemic, which has now spread to 14 states, will finally convince parents, schools, and state legislatures that they need to insist that children get vaccinated before going to school. Perhaps it will also convince parents to stop listening to nonsense, and choose wisely by getting their children vaccinated against measles. We won this battle before, and we can win it again.

Anti-vaccination parents view the debate as a matter of the right to choose – plan gives their views legitimacy.

AP 15 – The Associated Press, 2015 (“Anti-vaccination parents explain their perspectives: ‘We are not anti-science’”, AP, February 23, Available Online at http://www.oregonlive.com/health/index.ssf/2015/02/anti-vaccination_parents_expla.html, accessed 7/14/15, KM)

Anti-vaccination parents include a mix of views -- from religious communities to families practicing alternative medicine and libertarians who shun government interference. But many are Americans with college degrees living in liberal communities such as Santa Monica or Marin County in California and Portland, said Gary Freed, a professor of pediatrics at the University of Michigan. Most hesitant parents do not avoid all vaccinations. They typically under-vaccinate, either delaying the shots until their child is older or refusing certain vaccines while continuing with others, Freed said. The parents who spoke to AP recounted spending hundreds of hours reviewing medical studies, books and news stories and networking on social media. They cited cases of children who were supposedly hurt by vaccines and the existence of a government-run vaccine injury-compensation program. And they worried about the oversight of pharmaceutical companies that reap profits from vaccines and are shielded from liability when a vaccine causes harm. Moore said she read a 1998 study published in The Lancet journal by Dr. Andrew Wakefield, who raised the possibility of a link between the measles-mumps-rubella vaccine, bowel disease and autism. She said she knows the study was later discredited and retracted. She believes the research was inconclusive. Moore concedes that the vast majority of studies show vaccines are safe, but she says some research points to inconsistencies, unknowns or negative effects that deserve further investigation. And while autism is still a concern, Moore and others also worry about how exposure to chemicals, bad nutrition and stress can affect genes and health. They say large doses of synthetic additives found in vaccines, including aluminum and mercury, can harm the immune and digestive systems and brain. They’re believers in living naturally and eating organic food who also question the safety of genetically modified organisms, pesticides and other common substances such as flame retardants and plastics. “There are so many environmental toxins, but anything in my children's world that I can influence I

do," Moore said. The CDC has phased out a mercury-containing preservative in vaccines as a precautionary measure, and the agency says vaccines containing aluminum pose extremely low risk to infants. Federal officials also say GMOs in foods are safe, as are pesticides if used according to labels. These parents say they should be able to decide whether their child undergoes a medical procedure -- a decision, they say, that goes to the core of what it means to have freedom of choice. "I have the right to decide what to put into my child's body," said Heather Dillard, a mom in Springfield, Missouri, who is also a registered nurse. "Nobody has the right to put toxic chemicals into my son's bloodstream. That's taking my rights away, and it's very scary to me." Dillard said she decided against vaccinating because her first child was born a preemie and has autism. Dillard does not believe vaccines caused the autism, but the disease led her to do a lot of research about health. She says she now chooses to build her son's immunity naturally, through diet, while avoiding shots or other medication. Dillard and others say they are not worried about measles because their children have strong immune systems. They cite statistics: Out of the 1,000-plus measles cases in the past decade, there was not a single death. "What I'm more nervous about is the hysteria that would result," if her children were to get ill, Moore said. Moore said she does worry about affecting children who are immune-compromised and cannot be vaccinated. Before visiting friends with babies or young children, she said, she always informs them her twins are not vaccinated "so they have the power to make a choice." She also keeps the girls home at any sign of sickness. Researchers say berating parents who oppose vaccines will not persuade anyone and only puts people on the defensive. Educational messages from health officials may also make little difference and could, in fact, be counterproductive, said Brendan Nyhan, assistant professor of government at Dartmouth College. A study conducted by Nyhan and his colleagues last year showed that when parents were presented with evidence that vaccines do not cause autism or that measles cause great harm, some ended up feeling even more ambivalent. "We tend to be skeptical toward information that contradicts our existing views," Nyhan said. If Oregon were to take away the right to a vaccine exemption, Moore said, she would likely home-school her twins. She's keeping an open mind about vaccinating as her children get older, but hopes more studies on the long-term effects of vaccines can help dispel her doubts. "I worry about living in a society that's progressively more intolerant toward any dissent," Moore said. "All scientific advances have come from questioning the status quo."

Anti-vaxxers cause outbreaks of dangerous diseases – highly contagious diseases means it will spread quickly.

Sifferlin 14 — Alexandra Sifferlin, Alexandra Sifferlin is a writer for TIME. She covers public health issues including infectious and chronic disease, big ideas in medicine, and breaking news, 3-17-2014 ("Here are some diseases we're seeing thanks to anti-vaxxers," TIME, 3-17-2014, Available Online at <http://time.com/27308/4-diseases-making-a-comeback-thanks-to-anti-vaxxers/>, Accessed 7-14-2015)

These should be avoidable

New York City isn't an anomaly, though. Diseases that are and have been avoidable in the U.S. thanks to vaccines, are resurfacing all across the country. Measles, for instance, was considered wiped out in 2000, but there have been several outbreaks in the past few years. This map shows outbreaks of vaccine-preventable diseases since 2008 (click on "Map" and select which diseases and regions you want to see).

The emergence of these diseases — especially measles — is alarming, and mostly due to parents in the U.S. not vaccinating their kids. "If you are unvaccinated and you come in contact with measles, there's a 90% chance you will get it," says Jason McDonald, a spokesperson for the Centers for Disease Control and Prevention (CDC).

Though measles outbreaks are primarily linked to unvaccinated people, McDonald notes that some vaccines aren't foolproof. For example, the whooping-cough vaccine may lose its efficacy over time. And, overall, most people do get their vaccinations. A CDC report looking at children

entering kindergarten for the 2012–13 school year in all U.S. states found that more than 90% of these kids had their vaccines.

Still, there are people — including public figures and celebrities — who don't vaccinate their kids and promote their choices. Most infamously, Jenny McCarthy has espoused her antivaccination position because she believes vaccines are full of toxins and cause autism. When she recently posed a question on Twitter about finding a mate, the vaccination backlash was loud and clear.

Just how harmful are these notions, though? Below are some preventable diseases making a vicious return thanks to people not getting their vaccinations.

Measles

According to the CDC, for every 1,000 children who get the measles, one or two will die. Currently, public-health workers are worried about the situation in New York, but just in the past three months, there have been reported cases of the disease in Massachusetts, Illinois and California. The CDC reports that from Jan. 1 to Feb. 28, 2014, 54 people in the U.S. have reported being infected with measles. On average, there are about 60 cases reported in the U.S. every year. Most people in the U.S. are vaccinated against the measles, but since measles is still around in other countries, those who travel outside of the U.S. can contract it if they are not vaccinated. New York City has not been able to confirm the source of the disease.

Mumps

As recently as Monday, health officials confirmed 23 cases of mumps at Ohio State University. In 2011, there was a mumps outbreak on the University of California at Berkeley campus, with 29 reported cases confirmed by the CDC. The source of the outbreak was thought to be an unvaccinated student who had spent time traveling in Western Europe where there is still a presence of mumps. In 2013, a slightly smaller outbreak of the disease broke out among students at Loyola University in Maryland. The last major occurrence was in 2006, when there was a multistate outbreak of 6,584 reported cases. Less than 20 cases a year was considered usual at the time.

Whooping Cough

Whooping-cough outbreaks are thought to be spurred by waning immunity from the vaccine. However, a 2013 study published in the journal Pediatrics reports that California's worst whooping-cough outbreak, which infected more than 9,000 people, was also encouraged by a large number of kids who were unvaccinated.

Chicken Pox

In 2012, a county in Indiana experienced a major chicken-pox outbreak of more than 80 cases, which was thought to start from an unvaccinated child. The vaccine is 90% effective, so it's possible for people who have been vaccinated to contract the disease.

2NC/1NR Materials — Privacy Link

2NC Privacy Winners Win Link

Plan shores up support for privacy which spills over.

Ozer 12 — Nicole Ozer, the Technology and Civil Liberties Policy Director at the ACLU of Northern California (ACLU-NC), where she developed the organization's Demand Your dotRights online privacy campaign, 2012 ("Putting Online Privacy Above The Fold: Building A Social Movement And Creating Corporate Change" *New York University Review of Law & Social Change*, Lexis)

Unlike modern software, privacy practices and laws do not auto-update. There must be sustained public pressure to support real change. Since 2009, the privacy community has been able to leverage factors to start to build a viable social movement to push for legal and policy change. The next several years will be significant in determining whether a privacy social movement is able to grow and mature like the environmental movement by utilizing recent successes and current attention to put down roots, mobilize broad public support, and achieve major reforms. It is my hope that, by reflecting on recent successes related to online privacy, identifying factors that have contributed to these advances, and [*281] suggesting a focus for privacy work that can reinforce these factors and break down remaining obstacles, this article contributes to the discussion of why and how the privacy community should build and sustain a viable social movement. If the privacy community can continue building the necessary infrastructure and taking the strategic policy steps necessary to increase transparency about how an individual's own information flows through the data ecosystem, it will be possible to sustain a large-scale social movement to ensure that, as technology advances, privacy protections are safeguarded in the modern digital world.

Studies prove that awareness of privacy consequences create impetus for more privacy.

Lewis, Kaufman, and Christakis 8 — Kevin Lewis, Ph.D. candidate in the Department of Sociology at Harvard University, Jason Kaufman, Ph.D., is a research fellow at the Berkman Center for Internet & Society at Harvard University, Nicholas Christakis, M.D., Ph.D., M.P.H., is a Professor in the Department of Sociology and Health Care Policy at Harvard University, 2008 ("The taste for privacy: An analysis of college student privacy settings in an online social network" *Journal of Computer-Mediated Communication* 14(1) Wiley)

Finally, our data are relevant to understanding online privacy more generally—especially within fledgling communication technologies like SNSs. In Ruling the Waves: Cycles of Discovery, Chaos, and Wealth From the Compass to the Internet, Debora Spar (2001) argues that new technologies tend to undergo a predictable pattern of transitions. At first, they are concentrated only among a small group of "innovators." This phase is characterized by excitement, freedom, and creativity. Next, the technology becomes "commercialized," as the lay public rushes en masse to adopt it. Eventually, however, this rapid growth outstrips the spirit of the innovative period. Problems of coordination and competition foster "creative anarchy" and the search for freedom is replaced by a demand for property rights. Finally, government enters the scene, restoring order at the behest of the very pioneers who once sought to escape it. While not identical in form, the negotiation of privacy in online settings may be characterized by a similar

pattern. When a new technology such as Facebook is released, there is a high degree of ambiguity over appropriate norms of conduct—the very definition of this space as public or private is contested. College students, professors, parents, employers, and Facebook itself each have different and potentially conflicting interests in the way the technology is used. Students are surely aware that the information they post is “public”—but the full extent and possible consequences of this display may not be recognized by all. Slowly but inevitably, excitement outstrips precaution. The technology diffuses throughout the population, and users provide ever more data on their profiles—all the while maintaining the (rather permissive) default privacy settings, not yet having reason to do otherwise (see Mackay, 1991). Eventually, however, this behavior becomes consequential. The boundary between public and private is suddenly and unequivocally asserted by virtue of being overstepped. Users venture too far into public space with private details, and the consequence is a crashed party, a lost job opportunity, or—at an extreme—sexual assault or identity theft. Awareness is suddenly raised for a certain type of user: those users concerned with safety, or with maintaining a division between their public “face” and their online profile, or whose own high level of online activity gives them a better perception of their surroundings; this awareness spreads, most directly through the social ties represented by Facebook friendships and cohabitation. Communication about the importance of noncommunication takes place. The upshot of this process is that a normative boundary emerges where before none existed. Facebook is increasingly recognized as a space within which some precaution must be exercised, and users respond by retreating behind a virtual line of privacy—in proportion to the extent to which their awareness has been raised by a concern that applies to them personally. Here, we have considered such a progression from excitement and ambiguity to (self-) regulation. However, rather than regulation being at once explicit, legal, and externally imposed (by government), the public/private boundary on Facebook is implicit, normative, and internally negotiated. We may thus see new online spaces as “self-regulating systems” where awareness is the impetus for change and equilibrium the final product—both proceeding along a pattern of predictable regularities. In the meantime, researchers of SNSs will watch their study populations wax and wane, and the sites themselves may become less open and more exclusive. Whether users will still “Facebook” in the future to share ideas and social ties, or whether the form and/or site of these interactions will change, remains to be seen.

2NC Congressional Action Link

The plan enables reform and self-regulation — it reclaims congressional decision-making authority on intelligence and spurs executive action

Berman 14 — Emily Berman, Visiting Assistant Professor of Law, Brooklyn Law School, LL.M. (Masters of Law) from New York University School of Law, J.D. from New York University School of Law, B.A. from Duke University, 2014 (“Regulating Domestic Intelligence Collection,” *Washington & Lee Law Review* (71 Wash. & Lee L. Rev. 3), Available Online to Subscribing Institutions via EBSCO Host)

The FBI’s mandate to protect civil liberties can be viewed as a “secondary” mission—one that frequently comes into tension with its primary mission of preventing security threats.²⁵⁶ Studies show that an agency will focus on what it considers to be its primary mission, and it will shirk on performing “secondary” or less easily evaluated goals.²⁵⁷ As a secondary mission, protection of civil liberties is, therefore, sure to be short-changed in favor of security in the same way that environmental concerns have so often gone under-addressed in favor of development or other economically profitable activities.

2. Relieving the Tension Among Multiple Missions

Fortunately, several administrative law strategies suggest ways to ensure that the Guidelines regime sufficiently takes into account civil liberties concerns as well as security concerns.²⁵⁸ Though all of the options discussed below are possible paths to follow, the final two approaches discussed below seem particularly promising.

Congress Reclaims Authority.

One option, of course, is for Congress simply to relieve an agency of responsibility for one of [End of p. 67] the competing goals, **reclaiming that decision-making authority for itself.**²⁵⁹ Following revelations of civil liberties violations in the 1970s, Congress reclaimed some decision-making authority regarding the executive’s surveillance powers by enacting the Foreign Intelligence Surveillance Act (FISA).²⁶⁰ Or Congress could generate more piecemeal limitations, barring particular techniques that pose threats to civil liberties, or defining the circumstances under which such techniques could be used.

Congress could, for example, statutorily reinstate the rule regarding the use of undercover agents to investigate First Amendment protected activities as it existed in the Guidelines in 2001, which required that the FBI have probable cause or a reason to believe a crime had been committed before sending an agent into the meetings of a religious or political group.²⁶¹ Congress need not legislate to bring such changes about. If Congress wanted to alter particular investigative tactics, or even to pressure the Justice Department to adopt of its own volition the type of procedural framework suggested in this Article, it has an array of tools at its disposal to press for its desired policy change. Just the threat of legislation, so long as it is credible, **can spur executive action**. Recall that the original Attorney General’s Guidelines were implemented to sap the momentum from Congress’s efforts to enact a legislative charter for the FBI.²⁶² So long as the option of enacting an FBI charter remains a viable means for Congress to limit the Attorney General’s discretion when it comes to FBI investigations, the threat of such legislation

can be used to press for Congress's desired policy outcomes. Congress possesses carrots as well as sticks—its control over the FBI and Justice Department's budget also can impose a great [End of p. 68] deal of pressure for policy change. Given the political economy of this policy area,²⁶³ however, reliance on Congress to reconcile the tension between the FBI's security mission and civil liberties is not the most promising route.

2NC Privacy Policy Link

Privacy policies like the aff build the infrastructure for future privacy social movements

Ozer 12 — Nicole A. Ozer, the Technology and Civil Liberties Policy Director at the ACLU of Northern California, developed the organization's Demand Your dotRights online privacy campaign, 2012 ("Putting Online Privacy Above The Fold: Building A Social Movement And Creating Corporate Change," *New York University Review of Law & Social Change* (36 N.Y.U. Rev. L. & Soc. Change 215), Available Online to Subscribing Institutions via Lexis-Nexis)

Conclusion

Unlike modern software, privacy practices and laws do not auto-update. There must be sustained public pressure to support real change. Since 2009, the privacy community has been able to leverage factors to start to build a viable social movement to push for legal and policy change. The next several years **will be significant** in determining whether a privacy social movement is able to grow and mature like the environmental movement by utilizing recent successes and current attention to put down roots, mobilize broad public support, and achieve major reforms. It is my hope that, by reflecting on recent successes related to online privacy, identifying factors that have contributed to these advances, and [*281] suggesting a focus for privacy work that can reinforce these factors and break down remaining obstacles, this article contributes to the discussion of why and how the privacy community should build and sustain a viable social movement. If the privacy community can continue building the necessary infrastructure and taking the strategic policy steps necessary to increase transparency about how an individual's own information flows through the data ecosystem, it will be possible to sustain a large-scale social movement to ensure that, as technology advances, privacy protections are safeguarded in the modern digital world.

2NC New Reform Link

Even limited reform created some momentum — plan creates the opportunity for further reform

Kopstein 15 — Joshua Kopstein, cyberculture journalist and researcher focusing on Internet law and disorder, surveillance and government secrecy, 2015 (“USA Freedom Act gives NSA everything it wants — and less,” *Al-Jazeera America*, June 2nd, Available online at <http://america.aljazeera.com/blogs/scrutineer/2015/6/2/usa-freedom-act-gives-nsa-everything-it-wants--and-less.html>, Accessed 7-21-15)

Even people within the NSA have been candidly celebrating the Freedom Act's surveillance “reforms,” calling it “a nothingburger for the privacy community.” And they might be right — with so many overlapping and redundant surveillance authorities, it'd be foolish to think the Freedom Act has ended bulk collection in any significant capacity.

That doesn't mean there's no reason to celebrate the first step, but **Congress will have to hit the ground running if it wants to build on the Freedom Act's momentum.**

In the House, Reps. Thomas Massie, R-Ky., and Zoe Lofgren, D-Ca., are already proposing an amendment to an upcoming “must-pass” Department of Justice appropriations bill that would stop the agency from compromising encryption standards, a measure that was removed from the original Freedom Act. (In September of 2013, Snowden revealed that the NSA and its British counterpart GCHQ routinely inject vulnerabilities into commonly used encryption software and influence the development of crypto standards from within the scientific community.)

A separate amendment to the same bill, by Lofgren and Republican Ted Poe of Texas, would also block the FBI from demanding these encryption backdoors. And another from Colorado Democrat Jared Polis would block the Drug Enforcement Administration from collecting bulk phone records — a response to recent reports that the agency for decades ran a domestic phone records database that preceded the NSA's.

Barring all that, the next major opportunity to challenge NSA surveillance won't be until 2017, when Section 702 of the Foreign Intelligence Surveillance Act is due to expire. But now that more transparency is in place, Congress has a chance to make up for the Freedom Act's shortcomings by putting the wheels in motion for real, comprehensive reform.

They Say: “Link Non-Unique — Generic”

Privacy movement is losing momentum — success strategies haven’t translated into wins.

Hosein 09 — Gus Hosein, Executive Director of Privacy International and Previous Visiting Senior Fellow at the London School of Economics and Political Science, 2009 (“Challenges in Privacy Advocacy,” *Reinventing Data Protection*, Edited By Serge Gutwirth, Yves Poullet, Paul De Hert Cecile de Terwangne, Sjaak Nouwt, pg. 254-255)

Over the past decade the landscape for privacy protection has transformed. A decade ago, privacy groups were focused on a number of policing and national security campaigns (e.g., closed-circuit television cameras), communications surveillance (e.g., surveillance being designed into the infrastructure), communications security (the ‘crypto-wars’) and free expression issues (particularly on-line issues). Privacy campaigners also focused on the private sector surveilling its customers, whether through collecting medical records (e.g., US laws on health insurance), financial records (e.g., credit records), or the then-budding area of electronic commerce. Campaign successes were achieved through coalition building and educational campaigns on the importance of privacy. Media organisations were becoming more aware of these challenges and began regularly covering some of these issues, though they were often too arcane for the general population. Politicians were coming to terms with the new political realities of the globalisation of markets, the movement of people and data across borders and technological advancements. It was still a nascent field in many ways, with a few strong leaders and small groups making the most out of their small resources. In the last ten years, the challenges grew, the coalitions fragmented and the moods of the public and the media fluctuated. The level of uncertainty rose, along with the stakes. Privacy groups were caught in the storm of trying to research the policies while rushing out responses to media and political developments. A number of successful ‘response’ strategies emerged. Media organisations around the world documented the greater incursions upon the private lives of the individual, with a particular focus on the actions of the US government even if it meant ignoring domestic programmes. Parliaments and privacy commissioners issued condemnations and damning analyses of proposed plans to collect, profile and share data. Legal and academic institutions released studies assessing proposed policies and identifying the fault lines. Some national constitutional courts released opinions that upheld the right to a private life, though surprisingly the number of cases brought before these courts dwindled. Despite these response strategies there have been practically no clear ‘wins’ in the past decade. Indeed, some amendments to policies have increased oversight and reduced harms. Some policies have withered, such as the data profiling of US citizens, whether under the ‘Total Information Awareness’ project (TIA) or the ‘Computer Aided Passenger Pre-Screening Program’ (CAPPS II), though the creators of these systems are insisting that these programmes be offered lifelines. Meanwhile, Europe seems set to become the next home of data-mining as these systems are the subject of government-funded research and play a key component in future government plans. As examples, the EU-funded iTRACS consortium is conducting research into data mining techniques that can be applied to financial, travel and communications data, albeit in a privacy protective way (if this is possible); and the EU plans for next generation border management that involves the collection and mining of travel, biographic, biometric and behavioural data. Just as bad policies travel

worldwide, rarely has a privacy-invasive bill not become law, a technological infrastructure not been developed, a data collection scheme abandoned. Even the withering programmes and policies have returned under new guises. As examples, data profiling systems re-emerged in the US to be applied at the border under the 'Automated Targeting System'; UK Parliamentary initiatives to reduce the invasiveness of plans to analyse communications records were corroded when the UK government managed to push a more invasive policy through the European Union; data breach legislation is being watered down to minimise the impact upon companies while disarming the rights of consumers. Many of these surveillance initiatives outlast the campaigns to oppose them. Often the decisions to implement surveillance systems take place behind closed doors, after controversies have subsided to some extent. The Passenger Name Record debate is a key example of this: original campaigns in 2003 against the US plans seem to lead somewhere as the EU was rejecting US demands for data from EU carriers. By 2004 a limited agreement was settled upon and another campaign followed that questioned the legality of the agreement. Many twists and turns later, we ended up in 2006 with an interim agreement that was worse and in 2007 with an agreement that was even worse than that. In the end, the EU agreed to an expansive regime of data sharing with the US because, behind closed doors, the EU was hoping that the US would offer data from its own carriers to the EU for its own expansive purposes. Campaigners tried as much as they could to follow this arcane issue during its 5 year gestation period but they were eventually shut out of a negotiations process involving secret agreements and oversight arrangements that involved non-disclosure agreements.

No momentum for privacy reform now — only the most privacy conscious of individuals disrupt big data's control

Mohan 13 — Vivek Mohan, Associate with the Science, Technology and Public Policy Program's (STPP) Project on Technology, Security, and Conflict in the Cyber Age (Cyber Project) at the Harvard Kennedy School's Belfer Center for Science and International Affairs, J.D. from Columbia, 2013 ("Privacy Consciousness in the Big Data Era," *Hive*, May 13th, Available online at http://belfercenter.ksg.harvard.edu/publication/23095/privacy_consciousness_in_the_big_data_era.html, Accessed 7-20-15)

Exploring how we are coping with our inability to answer the questions "who owns my data? And...why do they have it?" has become an increasingly popular topic for the mainstream media (notably, the Slipstream column in the New York Times). But prayers for regulation aside, the collection, use, and resale of data that was once exceptionally private is here to stay.

I'm not here to vilify data collectors — far from it. Despite my strong inclination towards maintaining the traditions of days past (I'm probably the only person in his twenties who still reads physical newspapers), societal inertia cannot be held up ipso facto to argue for stronger privacy protections when we ourselves are responsible for sharing the data that is now traversing the endless servers of cyberspace. The benefits of the big data revolution are myriad, cut across sectors, and the best is surely yet to come.

But how did we get to the point where I — theoretically a privacy and cybersecurity expert — find myself inured to the amount of data that I'm signing away the rights to at any given time? (Although, I must say it is comforting to say that it's not quite 1984 in the land of big data — Google Now seems to think I'm a Cubs fan). To focus the conversation a bit, let's focus on mobile

— and let's talk about how application and ecosystem developers together have, for lack of a better word, **conspired to remove bargaining power over data ownership from the individual.**

We are all (presumably) familiar with the process of installing an app on a smartphone. Once an app has been located on Google Play or the Apple App Store, we tap "install," whereupon we are presented with a list of device features that the app requests permission to access. I'm sure many of you — like me — have asked yourself "Why does that program need access to my GPS location?" It's even possible that when faced with a particularly egregious misrepresentation as to what's new in an app, you have refused to update. But that puts you in the minority — the rest of us absentmindedly tap "Accept and Download" and move on living our monitored lives.

How many crashes do you think were fixed by Facebook having more access to location data?

How did we end up here? Well, app developers have a pretty sweet deal given the current mobile ecosystems. In a classic case of fine print combined with unequal bargaining power, the ability of consumers to control their data have been eviscerated in a totally legal way. If you don't agree to the proposed permissions, you can take your smartphone and go home — you don't get to play with the latest, greatest apps. Those responsible for the major mobile ecosystems — Apple and Google — made a decision at some point, perhaps for technical reasons, to disallow users from toggling individual permissions on an app — it is all or nothing.

In this world, why wouldn't Facebook throw the kitchen sink of permissions in? **Only the most privacy conscious of individuals would be willing to give up the benefits** of such a critical app for the marginal, ineffable privacy benefits — after all, the preinstalled Google Maps is already collecting your location — what's the matter if Facebook has it as well?

In essence, the bigger and more valuable the app, the more able the developer is to collect data — on the terms that he or she sees fit. If the terms of service of the app say the data can be resold, that's that — the consumer has entered into a contractual relationship with the developer — in law school, we called this a "meeting of the minds." I'd argue that given current data collection practices, consumers and data collectors are about as far as possible from reaching a "meeting of the minds" each time an app is downloaded.

From a legal standpoint, this is all squeaky-clean. There isn't much law enforcement can do about it — disclosure cures all, and the major ecosystems are quick to disclose what apps are, at a hardware level, able to do. The Federal Trade Commission and state attorneys general, the agencies empowered to protect consumers, find themselves hamstrung absent a misrepresentation — and even in the most egregious cases, this usually ends up leading to a minor civil settlement and a change in the privacy policy — not exactly the biggest win for consumers.

As an entrepreneur developing applications that take advantage of the plentiful data collected and disseminated by today's app economy, it's easy to be of the mindset that collecting all the data that you can and sorting it out later is the best way to go. But it is important to take a strategic view — the present inequality in bargaining power will not last forever. Those developers are privacy conscious, and expressly so, will be hailed as leaders when the

pendulum of privacy norms in our society swings the other way. That said — don't hold your breath for Congress.

No momentum for change — actors like Verizon and Google have historically determined the future of surveillance

Agur 13 — Colin Agur, a PhD candidate in communications at Columbia University and a visiting fellow at Yale Law School's Information Society Project, 2013 ("Negotiated Order: The Fourth Amendment, Telephone Surveillance, and Social Interactions, 1878-1968," *Information & Culture: A Journal of History*, Volume 48, Number 4, Available Online to Subscribing Institutions via Project Muse)

For researchers of telecommunications and the law, the history of telephone surveillance offers important lessons. In telephone surveillance [End of p. 441] we see how decisions by actors gave a device a particular social meaning and how that meaning evolved over time and space thanks to an ongoing negotiation process among the key actors. Human agency played a significant role in the formation of rules on telephone surveillance, and the social organization that emerged in the late 1960s was the result of a long-term negotiation involving a wide range of participants. Thus, **rather than a case of a technology determining or** (in the words of Thomas Hughes) **giving "momentum"** to a set of social changes,¹¹² the jurisprudence governing telephone surveillance has been constructed by those who were able to establish practices and norms in telephony. In our efforts to understand the negotiation of telephone surveillance law and Fourth Amendment jurisprudence, Balkin's theory of cultural software serves us well. By examining a long-term economy of exchange involving technological, institutional, and cultural inputs, we can understand the social organization of the law. And by focusing on the negotiations and contexts in which they took place, we can understand the role of ideology in institutional practices, Supreme Court decisions, and legislation. At the same time, the history of telephone surveillance law helps us see the limitations of ideology and the importance of human agency. The actions of key agents, from engineers to administrators to lawmakers to judges, each contributed to ideology, which in turn shaped the evolution of Fourth Amendment jurisprudence.

They Say: “Link Non-Unique — NFA”

The link is unique — the New Freedom Act allowed momentum to dissipate and extended 215

Raimondo 14 — Justin Raimondo, an American author and the editorial director of Antiwar.com, 2014 ("The 'USA Freedom Act' Is A Fraud," *Antiwar.com*, November 17th, Available Online at <http://original.antiwar.com/justin/2014/11/16/the-usa-freedom-act-is-a-fraud/>, Accessed 7-21-2015)

Some civil liberties groups, like the ACLU and the Electronic Frontier Foundation, argue that the present bill is "a first step," and is better than nothing. This is nonsense: this bill is worse than nothing. With the passage of the USA Freedom Act the momentum for real reform will be blunted and allowed to dissipate. Further efforts to roll back the awful power of the NSA will be met with cries of "Didn't we already do this?" If this bill passes, the Washington insiders will win out, and the Surveillance State will remain intact – arguably even more powerful than before.

Some may say: But aren't you taking an all-or-nothing attitude? The answer is: not at all. A real reform means a partial reining in of the NSA, with no new extensions of its reach. This bill includes a full-scale codification of abuses coupled with ambiguous and easily reinterpreted "reforms" that don't mean what they appear to mean.

New surveillance reform reaffirms a changing political climate

The Hill 15 — The Hill, 2015 ("Spy critics eye next targets," Byline Julian Hattem, June 4th, Available Online to Subscribing Institutions via Lexis-Nexis, Accessed 07-14-2015)

Critics of government surveillance hope they're in the middle of a sea change.

Passage of legislation this week to rein in the National Security Agency was the first major congressional action to limit government spying in a generation, and it was a move away from the aggressive national security measures put in place after the Sept. 11, 2001 attacks.

But whether the congressional view of surveillance has changed for good remains to be seen, with the battle over NSA reform set to play out again during the 2016 race for the White House.

Civil libertarians on both sides of the aisle vowed to harness the momentum of their victory on the USA Freedom Act to push for other protections.

"This is only the beginning," said Sen. Ron Wyden (D-Ore.), one of Congress's most vocal privacy hawks. "There's a lot more to do."

The USA Freedom Act renews Section 215 of the Patriot Act and two other provisions that had expired on Monday morning. But in doing so, it also ends the NSA's bulk collection of U.S. phone records and other data.

The bill reauthorizes the Patriot Act provisions through Dec. 15, 2019, setting the stage for another showdown during the next administration.

But civil libertarians want to go much further to curb government spying.

2NC/1NR Materials — Vaccine Surveillance

Uniqueness – Surveillance now good

Vaccination surveillance solves preventable disease now – surveillance is key to refining coverage goals, effectiveness, and research.

Smith et al 11 – Philip J. Smith, PhD, Professor of Chemical Engineering at the University of Utah; David Wood, MD, nationally and internationally recognized cancer surgeon; and Paul M. Darden, MDc, General Pediatrics Professor and Section Chief at the College Of Medicine/Peds at the University of Oklahoma, 2011 (“Highlights of Historical Events Leading to National Surveillance of Vaccination Coverage in the United States”, National Center for Biotechnology Information, Available Online at <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3113425/>, accessed 7/14/15, KM) **edited for gendered language

The number of cases of most vaccine-preventable diseases is at an all-time low,¹⁴⁷ and hospitalizations and deaths from these diseases have also shown striking decreases. Our national vaccine recommendations in the U.S. target an increasing number of vaccine-preventable diseases for reduction, elimination, or eradication.¹⁴⁸ This success has been achieved at least in part because vaccination coverage among young children in the U.S. has reached record highs with estimated national coverage that exceeds 90% for many recommended vaccines.¹¹⁰ Achievement of this success has been due in part to the assessment of vaccination coverage. Assessment enables vaccination program managers to learn the extent to which their efforts have achieved vaccination coverage goals and to implement interventions or change policies to improve coverage. Also, assessment is an essential component in evaluating vaccine effectiveness, examining the relationship between increased coverage and population disease burden, monitoring vaccine safety, and studying public perceptions about vaccines. Across the U.S., both the rich and poor¹⁴⁹ live with little concern for many infectious diseases because of the great effort and sacrifice that has been made to develop and implement vaccination programs.¹⁵⁰ For the first time in the history of humankind, there is a nation where there is freedom from the fear of illness or death from what were formerly endemic killer diseases. Maintenance of that freedom depends, in part, on remembering what has gone before us, removing the barriers that remain in affording access to safe and effective vaccines for all people, using science to discover ways to prevent other diseases we have not yet conquered, and remaining diligent about knowing where we are through continued assessment of how well the nation is protected from vaccine-preventable diseases.

Link – Surveillance/tracking

Surveillance and tracking is key to effective vaccination – polio proves.

Ahmed 15 – Beenish Ahmed, World Reporter at ThinkProgress, former NPR Kroc Fellow, holds an MPhil in Modern South Asian Studies from the University of Cambridge as a Fulbright Scholar to the United Kingdom, 2015 (“How One Country Deals With Anti-Vaxxers: Arrest Them”, Think Progress, March 4, Available Online at <http://thinkprogress.org/world/2015/03/04/3629337/pakistan-polio-arrests/>, accessed 7/14/15, KM)

Last year while I was in Pakistan, a bus I took from Peshawar to Islamabad was hailed down by a small team of polio vaccinators. This wasn't surprising – we had after all, left a city the World Health Organization has called the single “largest reservoir” of the polio virus – but what proceeded seemed to undermine any hope that the disease which has been eradicated in most of the world can be fully snubbed out in Pakistan. The bus driver pulled over to a small gravel patch just as stretches of mustard fields and mud huts turned into modern walled bungalows with tidy little gardens. The vaccinator who had hailed us down strode over, pulled open the door, and pointed at two small children clinging sleepily to their mothers in the first row of seats. “Have your kids been given drops?” one of the health workers asked, using a general term for polio vaccines, which are to administered orally for times before a child turns six. The two women nodded. “My son was given drops at school,” one woman added for good measure. “All right,” the vaccinator said, “You can go.” He slammed the sliding door closed and tapped on it twice. With that, the bus rumbled away from the city from which a full 90 percent of polio cases in Pakistan and where the majority of cases in Afghanistan originated in 2013. Along with Nigeria, the two neighboring countries of Pakistan and Afghanistan are the last hold-outs against full vaccination against the virus which can forever cripple or even kill its victims. Given the dire situation, authorities are taking more severe measures to combat the spread of the disease. On Tuesday, police in Peshawar arrested more than 450 parents for refusing to vaccinate their children against polio. “[The arrests were] the last resort as there was no other option. There is a lot of pressure on the local administration to tackle these refusals,” Pervez Kamal Khan, the head of health services in the province of Khyber Pakhtunkhwa said. According to national figures, 60,000 children have not received the polio vaccine because their parents did not consent to it.

Among the three countries where polio is endemic, Pakistan is the worst at containing the spread of polio – not least because of a violent campaign on the part of terrorist groups to kill polio vaccinators and to discredit the actual intention of the polio vaccine. The threat posed by groups like the Taliban is not to be understated: it's estimated that more than twice as many people were killed while administering the vaccine than people who died because of polio last year. Still, militant attacks and extremist ideologies are not the only reason Pakistan has struggled to eradicate polio. It's also just hard to keep tabs on which children have been vaccinated and which have not as I saw firsthand on that bus to Islamabad last spring. The vaccinator didn't ask for identification numbers for the children. He didn't ask for the vaccination documents children are given when they are vaccinated. He simply took their mothers' responses as the truth – and, in so doing, may have let two cases of the highly contagious disease infect others. “Surveillance underpins the entire polio eradication initiative,” notes the Polio Global Eradication Initiative. “Without surveillance, it would be impossible to pinpoint where and how wild polio virus is still circulating, or to verify when the virus has been eradicated in the wild.” And yet, from what I saw while in Pakistan, very little in the way of surveillance is actually taking place. Polio vaccinators risk their lives to prevent children from developing the virus, but without tracking who they reach, their work – and their deaths – may all be in vain.

National surveillance and data collection is crucial to solving preventable disease – disease reporting, vaccination history, hospital records, and medical databases are all surveillance techniques that are necessary and sufficient.

Roush 14 – Sandra Roush, MT, MPH, Surveillance Officer for the National Center for Immunization and Respiratory Diseases, Centers for Disease Control and Prevention, former Director of the Florida Hepatitis and Liver Failure Prevention and Control Program in the Florida

Department of Health, 2014 ("Chapter 19: Enhancing Surveillance", Center For Disease Control and Prevention, April 1, Available Online at <http://www.cdc.gov/vaccines/pubs/surv-manual/chpt19-enhancing-surv.html>, accessed 7/14/15, KM)

Surveillance activities are critical to detecting vaccine-preventable diseases and gaining information to help control or address a problem.

However, complete and accurate reporting of cases is dependent on many factors, such as reporting source, timeliness of investigation, and completeness of data. In addition, various methods for conducting surveillance are used to collect information, depending on disease incidence, specificity of clinical presentation, available laboratory testing, control strategies, public health goals, and stage of vaccination program. For vaccine-preventable diseases, passive surveillance is the most common method, although active surveillance may be needed in special surveillance situations. Active surveillance is often short-term and usually requires more funding than passive surveillance.

Common systems used for disease surveillance include national notifiable disease reporting;

physician, hospital, or laboratory-based surveillance, population-based surveillance.^[1] Sentinel surveillance involves a limited number of recruited participants, such as healthcare providers or hospitals, that report specified health events that may be generalizable to the whole population.^[2] The National Notifiable Diseases Surveillance System (NNDSS)^[3] is

the passive surveillance system that includes all the diseases and conditions under national surveillance. Efforts are being made to integrate and enhance the surveillance systems for

national notifiable diseases. A collaborative effort between CDC and state and local health departments is in progress to enhance surveillance system capabilities with the implementation of the National Electronic Disease Surveillance System (NEDSS).^[4,5,6] NEDSS will eventually replace the National Electronic Telecommunications System for Surveillance (NETSS) and will become the electronic system used to report national notifiable diseases and conditions in the United States and territories.

Enhancing the surveillance system is only one part of improving surveillance data; data for notifiable diseases are still dependent on reporting, timeliness and completeness. This chapter outlines activities that may be useful at the state and local level to improve reporting for vaccine-preventable diseases. Some are more routinely used (encouraging provider reporting), while others, such as searching laboratory or hospital records, may be more helpful under certain circumstances. Encouraging Provider Reporting Most infectious disease surveillance systems rely on receipt of case reports from healthcare providers and laboratories.^[7-8] These data are usually incomplete and may not be representative of certain populations; completeness of reporting has been estimated to vary from 6% to 90% for many of the common notifiable diseases.^[9] However, if the level of completeness is consistent, these data

provide an important source of information regarding disease trends and characteristics of the persons affected.

Some mechanisms to encourage healthcare provider reporting are described here. Promoting awareness of the occurrence of vaccine-preventable diseases Some healthcare providers may be particularly likely to encounter patients with vaccine-preventable diseases. For example, they may see immigrants and travelers returning from areas where vaccine-preventable diseases are endemic. Promoting awareness of reporting requirements Although there is a list of diseases designated as nationally notifiable by the Council of State and Territorial Epidemiologists in conjunction with CDC,^[10-11] each state has laws or regulations stipulating which diseases are reportable.^[7]^[11] Efforts should be made to increase healthcare providers' awareness of their responsibility to report suspected cases.^[12-16] The list of reportable diseases with detailed instructions explaining how, when, and to whom to report cases should be widely distributed within each state. Mailings, e-mail list serves, websites, in-service and other continuing education courses, and individual provider interaction may be used to accomplish this goal. However, while these are all examples of possible methods to raise awareness of reporting requirements, studies of interventions have demonstrated that telephone and other personal contact with individual healthcare providers, rather than groups, is most effective.^[17] For example, interaction with healthcare providers in the Vaccines for Children program offers an opportunity to promote awareness of reporting requirements. Face-to-face communication is the most direct and dynamic means of communication, allowing feedback and responses to overcome objections and concerns.^[18] A study on mandatory chronic disease reporting by physicians suggests that public health should emphasize both the legal and public health bases for reporting.^[19] Giving frequent and relevant feedback Providing regular feedback to healthcare providers and others who report cases of vaccine-preventable diseases reinforces the importance of participating in public health surveillance.^[20] Feedback should be timely, informative, interesting, and relevant to the provider's practice. Ideally, it should include information on disease patterns and disease control activities in the area. Some examples of methods of providing feedback are monthly newsletters, e-mail list serves, regular oral reports at clinical conferences such as hospital grand rounds, or regular reports in local or state medical society publications. Contact with individual providers may be most effective. Examples of positive individual interaction for giving feedback on disease reporting include the following: Providing feedback to the provider on the epidemiologic investigations conducted for their patients; Providing feedback to the provider, in addition to the laboratory, for any cases that were first reported to the health department by the laboratory (or other source); Using every professional interaction with the provider to at least briefly discuss surveillance issues. Simplifying reporting Reporting should be as simple and as painless as possible for the healthcare provider. State health department personnel should be

easily accessible and willing to receive telephone reports and answer questions. Reporting instructions should be simple, clear, and widely distributed to those who are responsible for disease reporting. Ensuring Adequate Case Investigation Detailed and adequate case information is crucial for preventing continued spread of the disease or changing current disease control programs. The following steps are essential to ensuring adequate case investigation. Obtaining accurate clinical information During a case investigation, clinical information (e.g., date of symptom onset, signs and symptoms of disease) about a case-patient is often obtained by a retrospective review of medical records and interviews with the case-patient, family, friends, caretakers, and other close associates of the case-patient. Detailed and accurate information (e.g., date of onset, laboratory results, duration of symptoms) may indicate the source of the infection and possible contacts, allowing interventions to prevent the spread of disease. This clinical information also may be aggregated by disease to study other aspects of the diseases (e.g., trends, incidence, prevalence). For vaccine-preventable diseases, vaccination history is particularly important for determining whether the case represents a vaccine failure or a failure to vaccinate. In addition to medical and school records, the state's immunization registry may be used to provide the most complete vaccination history information. Obtaining appropriate laboratory specimens Efforts should be taken to ensure that healthcare providers obtain necessary and appropriate laboratory specimens. For example, specimens for bacterial cultures should be taken before administering antibiotics, and paired sera are often required for meaningful serologic testing. For more information on laboratory support for vaccine-preventable disease surveillance, see Chapter 22, "Laboratory Support for the Surveillance of Vaccine-Preventable Diseases." Ensuring access to essential laboratory capacity Availability of laboratory testing needed to confirm cases of vaccine-preventable diseases must be assured. Additional testing, such as serotype, serogroup, and molecular testing provides epidemiologically important information that can support disease control and prevention activities. Healthcare providers should be encouraged to contact the local or state health department for assistance in obtaining appropriate laboratory testing. Laboratory testing needed to confirm diagnoses of public health significance is a public responsibility and should be made available at no cost to the patient. For information on laboratory support available in individual states, contact the state health department. Investigating contacts Identification of all case contacts and follow-up of susceptible persons may reveal previously undiagnosed and unreported cases. This investigation will also reveal persons eligible for any indicated prophylaxis, thereby facilitating disease control efforts.[21] Improving the Completeness of Reporting Complete reporting involves accounting for as many cases of vaccine-preventable diseases as is possible. Completeness of reporting can be enhanced in many ways,[22] including using electronic laboratory reporting,[23-28] searching hospital and laboratory records, using administrative datasets, and expanding sources of reporting. Searching hospital and laboratory records For some vaccine-preventable diseases, a regular search of laboratory records for virus isolations or bacterial cultures may reveal previously unreported cases.[13] Likewise, hospital discharge records may also be reviewed for specific discharge diagnoses, [12], [27] such as Haemophilus influenzae meningitis, tetanus, and other vaccine-preventable diseases. Such searches may assist in evaluating completeness of reporting and may help improve reporting in the future. [20], [30] Identifying the source of missed cases may lead to modifications that make the surveillance system more effective and complete. Although not a substitute for timely reporting of suspected cases, such searches can supplement reporting when resources for more active surveillance are unavailable. Using administrative datasets Administrative datasets, such as Medicare or Medicaid databases or managed care organization databases, may be useful for surveillance; when linked to immunization records, administrative records have been useful for monitoring rare adverse events following vaccination. [31-32] However, unless extensive efforts are made to validate diagnoses, misclassification is likely. [33] Most vaccine-preventable diseases are now rare, and data quality may be insufficient for these datasets to be useful adjuncts to vaccine-preventable disease surveillance. [34]

2NC/1NR Materials — Vaccine Culture of
Rights

Uniqueness – pro-vaccination trends now

Pro-vaccination movement gaining steam now – plan reverses the trend.

Alcindor 14 – Yamiche Alcindor, USA TODAY national breaking news reporter, holds a Master's degree in Broadcast News and Documentary Filmmaking from New York University and BA in English and International Relations from Georgetown University, 2014 (“Anti-vaccine movement is giving diseases a 2nd life”, USA Today, April 8, Available Online at <http://www.usatoday.com/story/news/nation/2014/04/06/anti-vaccine-movement-is-giving-diseases-a-2nd-life/7007955/>, accessed 7/20/15, KM)

Now Mitchell, who takes care of her son full time, and Jeremiah, who faces more reconstructive surgeries, work with Meningitis Angels, a non-profit that supports families affected by bacterial meningitis and advocates for vaccinations. Other organizations including the National Meningitis Association, Every Child By Two, and PKIDs combine personal stories and scientific evidence to encourage vaccinations. From the medical side of the equation, some physicians have resorted to their own defenses to protect their patients from those who won't vaccinate. Doctors at Olde Towne Pediatrics in Manassas, Va., won't take new patients if the parents don't plan to vaccinate their children. It's not clear how many other physicians do the same, as experts say no comprehensive studies of the practice have been done. "We don't want to put our patients at risk because people for their own personal reasons don't want to vaccinate," said Anastasia Williams, a managing partner of the practice who has been a pediatrician for 15 years. "We are doing our due diligence to protect our children who wait in our waiting room." Several states have also worked to make getting an exemption tougher. In Colorado, where 4% of kindergartners last year didn't have their shots for non-medical reasons, a proposed bill sponsored by State Rep. Dan Pabon, a Democrat from Denver, would require parents to get a doctor's note or watch a video about risks before opting out of vaccines. VACCINE SKEPTICS Such measures offend Sarah Pope, a Tampa mother of three, and Shane Ellison, a father of three in Los Angeles. They both decided against vaccinating their kids because they fear the potential side effects. In 2006, all three of Pope's children — now 9, 11 and 15 — contracted whooping cough, the same disease that killed Brady. Seven years earlier, Pope had decided against vaccinating any of her children. After seven weeks of coughing, and with treatment by a holistic doctor and natural supplements, all three recovered without complications, she says. "I wasn't scared by it," says Pope, 49, who runs The Healthy Home Economist, a healthy living website and blogs about vaccines. "People only see the bad with infectious diseases. But infectious diseases do help children strengthen their bodies." Pope and Ellison say it is unfair to pressure parents into using vaccines that aren't 100% effective. However, doctors note that all drugs — even aspirin — have risks, and none is 100% effective. High vaccination rates can protect even unvaccinated people by lowering the level of infectious disease in the community, a phenomenon known as herd immunity, says Hinman, a senior public health scientist at the Task Force for Global Health. The more people who are vaccinated, the less likely anyone in that community will be infected. Though vaccines are considered safe, Schuchat points out that they can cause reactions in some children, which in rare cases can be serious. But one of the most publicized fears of the anti-vaccine movement — that they cause autism — has been debunked by dozens of studies that have found no link. Even so, parents like Ellison, 39, don't buy it, and he points out that he comes to the issue with some expertise: He has a master's degree in organic chemistry and used to work in the pharmaceutical industry designing medicines. His children — 6 months old, 8 and 12 — were all born at home. Aside from one visit to an emergency room for a bruised finger, none of them has ever been to a doctor, and they're all healthy, he says, except for the occasional sore throat or common cold. "The doctors all have the same script for vaccines," says Ellison, who runs The People's Chemist, a website about health. He is working to build and support his children's natural immune system using three healthy meals a day, exercise and sunshine. He says if his kids get sick he would rather rely on emergency care than vaccines. "It's much more soothing to trust emergency medicine than a vaccine, which for me is like playing Russian roulette," he says.

Preventable diseases are making a comeback – numerous areas are potential hotspots – the amount of influence of the anti-vax movement is the critical factor.

Alcindor 14 – Yamiche Alcindor, USA TODAY national breaking news reporter, holds a Master's degree in Broadcast News and Documentary Filmmaking from New York University and BA in English and International Relations from Georgetown University, 2014 (“Anti-vaccine movement is giving diseases a 2nd life”, USA Today, April 8, Available Online at <http://www.usatoday.com/story/news/nation/2014/04/06/anti-vaccine-movement-is-giving-diseases-a-2nd-life/7007955/>, accessed 7/20/15, KM)

Kathryn Riffenburg decided on a closed casket for her baby's funeral. She didn't want her family to see what whooping cough, her son's first illness, had done to 9-week-old Brady Alcaide. The nearly forgotten disease, which has in recent years afflicted thousands of Americans, left Brady's tiny body swollen and unrecognizable. So his mother dressed him in a white baptismal suit and hat and tucked him into a tiny white casket. Brady's burial came just four weeks after his first laugh — inspired by her version of I'm a Little Teapot — and two weeks after his family learned that he had contracted a vaccine-preventable illness. "It just seemed like it was impossible," says Riffenburg, 31, of Chicopee, Mass. "It felt like we were dropped in The Wizard of Oz. We went from sitting in the hospital day by day, waiting for him to get better for almost two weeks, to doctors telling us we had a 50/50 chance he was going to make it." The mother, who was inoculated years before giving birth to Brady, later learned that she could have gotten a booster shot during her pregnancy that likely would have saved Brady's life. Although Riffenburg didn't know to get revaccinated, people actively choosing not to are helping diseases once largely relegated to the pages of history books — including measles — make a comeback in cities across the nation, according to the Centers for Disease Control and Prevention. Recent measles outbreaks in New York, California and Texas are examples of what could happen on a larger scale if vaccination rates dropped, says Anne Schuchat, the CDC's director of immunizations and respiratory diseases. Officials declared measles, which causes itchy rashes and fevers, eradicated in the United States in 2000. Yet this year, the disease is on track to infect three times as many people as in 2009. That's because in most cases people who have not been vaccinated are getting infected by others traveling into the United States. Then, Schuchat says, the infected spread it in their communities. The 189 cases of measles in the U.S. last year is small compared with the 530,000 cases the country used to see on average each year in the 20th century. But, the disease — which started to wane when a vaccine was introduced in 1967 — is one of the most contagious in the world and could quickly go from sporadic nuisance to widespread killer. Measles kills about once in every 1,000 cases. As cases mount, so does the risk. "We really don't want a child to die from measles, but it's almost inevitable," says Schuchat. "Major resurgences of diseases can sneak up on us." Michaela Mitchell watches her son Jeremiah, 10, play Xbox in his bedroom in Tulsa. Mitchell is teaching Jeremiah how to live again after meningitis contracted from an outbreak at his school forced doctors to amputate both his arms and legs. Michaela Mitchell watches her son Jeremiah, 10, play Xbox in his bedroom in Tulsa. Mitchell is teaching Jeremiah how to live again after meningitis contracted from an outbreak at his school forced doctors to amputate both his arms and legs. Vaccination rates against most diseases are about 90%. Fewer than 1% of Americans forgo all vaccinations, Schuchat says. Even so, in some states the anti-vaccine movement, aided by religious and philosophical state exemptions, is growing, says Paul Offit, chief of infectious diseases at Children's Hospital of Philadelphia. He points to states like Idaho, Illinois, Michigan, Oregon and Vermont — where more than 4.5% of kindergartners last year were unvaccinated for non-medical reasons — as examples of potential hot spots. Such states' rates are four times the national average and illustrate a trend among select groups. "People assume this will never happen to them until it happens to them," Offit says. "It's a shame that's the way we have to learn the lesson. There's a human price for that lesson." The most vulnerable are infants who may be too young to be vaccinated, children with compromised immune systems and others who may be unable to be vaccinated for medical reasons, scientists say. In communities across the nation, Americans of all stripes are making dangerous decisions to reschedule or forgo immunization, says Alan Hinman, a scientist who sits on the scientific advisory board of Voices for Vaccines, which supports and advocates for on-time vaccinations. The anti-vaccination movement has picked up steam in the past decade with

support from celebrities such as actress Jenny McCarthy, actor Aidan Quinn and reality TV star Kristin Cavallari, who last month said not vaccinating was "the best decision" for her children. Many continue to believe the debunked idea that vaccines cause autism, while others don't trust the federal government or the pharmaceutical companies responsible for these vaccines. DISEASE CAN STRIKE ANYWHERE Riffenburg hopes her family's experience will serve as a wake-up call. At first, Brady seemed to have a simple cold. As his symptoms worsened, Riffenburg and her fiancé, Jonathan Alcaide, took him to the hospital, where doctors suspected he had whooping cough. Two weeks later, Brady stopped breathing. His brain was without oxygen for some time, and he was put on life support, where Riffenburg said the horrific effects of the disease made her child become unrecognizable. A day later, she made the excruciating decision to take him off machines. The child died while cradled in her arms. "I hope Brady has saved babies and protected them because we have spread his story," Riffenburg says. Since then, Riffenburg has made sure that her fiancé and her two daughters, now 7 and 10, get all of their booster shots. She was also inoculated while pregnant with her now 1-year-old son, Jaxon. And she insisted everyone — including doctors, family members and even the hospital photographer — got booster shots before they came near Jaxon. It is not clear where Brady contracted whooping cough. Schuchat says that is precisely why communities must maintain high vaccination rates. Many might not know they are carrying a disease but can still be contagious and pass it on before symptoms arrive. "It doesn't have to be on an airplane or at an airport. It could be at a grocery store or the concert you went to," Schuchat says. During a 2008 measles outbreak in San Diego, CDC officials were shocked to find school districts where one in five children were not vaccinated against the disease, she says. Last year, California had the largest number of unprotected kindergartners not vaccinated for their parents' philosophical reasons: 14,921. This year, 49 cases of measles had been reported by March. The state had four cases by that time last year.

Uniqueness – Yes influence

Changing the minds of anti-vaccination parents is possible – now is key.

Palmer 15 – Katie Palmer, senior associate editor at Wired covering science and health, member of the Science, Health and Environmental Reporting Program (SHERP) at NYU's Arthur L. Carter Journalism Institute, recipient of the Jeffrey Owen Jones Fellowship in Journalism, 2015 (“How to Get Silicon Valley’s Anti-Vaxxers to Change Their Minds”, Wired, February 12, Available Online at <http://www.wired.com/2015/02/get-silicon-valleys-unvaccinated-change-minds/>, accessed 7/22/15, KM)

THERE’S BEEN A lot of shaming and blaming of the anti-vaccination crowd in response to the Disneyland measles outbreak (even we did it). And when we released our investigation of vaccination rates at Silicon Valley preschools, people were justifiably angry: Every unvaccinated kid at those schools threatens the greater community’s protection against disease. But yelling at anti-vaxxers won’t change their minds—which is what we need most to prevent more outbreaks. That begs the question: What can turn them around? After writing about how vaccinated people got measles in California, I read the comments posted about it on Facebook. Among the anti-vax commenters, there were a few science-hating, vitriol-slinging, homeopathy-hawking kooks. But the vast majority were...reasonable. Take this person, for example: Someone strong enough to get the vaccine (and thus be conferred limited immunity for 2-10 years) is likely strong enough to handle the disease and consequently have real life-long immunity, which is what is really needed for “herd immunity” to actually work. This person is wrong, of course, but there’s some science—or at least some attempts at using science—in there. It’s worth repeating, clearly: Refusing vaccines is a bad choice, but anti-vaxxers aren’t evil for making that choice. Every parent who turns down a vaccine is simply trying to make the right decision for their kid. As long as that motivation exists, there’s a chance that a parent can be convinced that vaccination is the safest choice—for their child, and those around them. To figure out how to turn that “no” into a “yes,” it’s important to know how that decision occurred in the first place. As Amy Wallace explained in a WIRED cover story, vaccine refusal comes down to one emotion: fear. Or, in the current environment, the lack of it. Thanks to the success of vaccination programs, many Americans have never seen a single case of measles—they didn’t get it themselves, and probably don’t know anyone who’s had it. That interferes with how they process fear in two ways. Number one, we get responses like this one (from that same story, on Facebook): Measles is not a dangerous disease, it is just a normal childhood disease, it’s safer to get antibodies from the actual virus than from vaccines. Unvaccinated children have higher and stronger immune systems, so they fight it fast... Measles has, for many, become a hypothetical disease. And a hypothetical disease isn’t scary. “People become desensitized to the seriousness of the disease when they’re not exposed,” says Kristin Hendrix, a pediatric researcher at Indiana University School of Medicine. Measles was eradicated in the US in 2000, so even if you’ve seen a case, you probably haven’t met someone who pulled the short straw: The one person in 10 who gets an ear infection, potentially resulting in deafness, or the one in 20 who gets pneumonia, or the one in 1,000 who develops encephalitis—or dies. Which leads us to number two. The risk of vaccines—the one in 3,000 chance of seizure for the MMR, or the one in more than a million chance of a serious allergic reaction—starts to seem much bigger in comparison to those fading memories of measles past. “Parents can be scared very easily by hearing about potentially negative consequences,” says Gary Freed, a pediatric researcher at the University of Michigan. And the act of stabbing your kid in the arm with a needle is far more immediately threatening than the potential exposure to measles, especially if you’re counting on her not being exposed to the disease in the first place. My husband nearly died from the tetanus vaccine when he was a kid. Fear is a powerful, often irrational emotion. No matter how many times you drive home the statistical near-impossibility of a negative vaccine reaction, it’s often overlooked in the face of a personal anecdote. If someone has a relative who had a bad reaction to a vaccine—or even a great-aunt on Facebook whose friend’s daughter became withdrawn after one—the immediacy of that story will carry more cognitive weight than numbers. Humans are big on narrative. Science (usually) is not. So now, medical professionals and researchers must figure out how to use information—cold, impersonal facts—in a way that can counteract the power of that primal (and inaccurate) risk calculation. That job is far harder than it used to be. Doctors once were the primary source of medical information, but now it’s everywhere online—some of it true, some of it not, and the vast majority somewhere in between. That’s a problem, because humans suffer from a major case of confirmation bias. “We seek out and gravitate toward information that confirms what we know to be true,” says Hendrix. Sometimes confirmation bias is so extreme that it even turns positive messages into negative ones: One paper last year found that while pro-vaccine information corrected some misperceptions about vaccines—like the fallacy that it causes autism—reading it actually made some resolutely anti-vax parents even less likely to vaccinate. Unfortunately, recent

research has shown that presenting provaccine messages and evidence to anti-vaxers only makes them become more ingrained in their misguided beliefs. Researchers don't have any great ideas about how to change the "stickiness" of bad information once it gets that distorted. But there's hope. There always have been a certain number of staunchly anti-vaccine parents—researchers estimate about 2 percent of parents fall into that camp, and that number isn't changing much. It's a second group of parents and patients—the so-called vaccine-hesitant—that are the ones fueling the fire of vaccine refusal. But they're also the ones that still may be open to change. Doug Opel is a pediatrician at Seattle Children's Hospital working to target those fence-sitters with individually tailored information. "Parents themselves can have a hard time knowing where they are, or they don't fully disclose what they think about vaccines in an appointment," says Opel. "That turns a pediatric appointment into a chess match." Opel's shot at a solution is a 15-question survey that gives parents a score on a scale of 0 to 100—over 50, and you're much less likely to vaccinate. He's most interested in targeting parents in that 50-to-80 range, by addressing their specific concerns in one-on-one conversations instead of relying solely on an impersonal Vaccine Information Statement from the CDC. It's not an easy job: Any conversation he has with a parent is going head-to-head with personal horror stories from Facebook friends and anti-vaccine celebrities. "We know that personal narratives and anecdotes that are emotionally laden are very persuasive," says Hendrix, "and that people play into fear-based information more than positive information." Anti-vaccine stories are so powerful because they capitalize on both of those persuasive techniques. But two can play at that game. With this major outbreak—which has racked up 103 cases at last count—to play into the fear of parents, and a potent narrative to boot (Wow, we're not even safe in the Happiest Place on Earth), this might just be a pro-vaccine story that can change some minds. "Normally, pro-vaccine messages don't have the splash and the buzz of a crisis," says Freed. "Now we do." It may just be that the anti-vaccine movement has created the outbreak that could kill it.

Pro-vaccination is changing minds – recent California measles outbreak is persuading “vaccine-hesitant” parents to get vaccinated.

Frankel 15 – Todd Frankel, reporter for the Washington Post, teaches journalism at University of Washington-St. Louis, won several journalism awards, including a National Headliners Award, Livingston Award finalist, and a member of the 2009 Pulitzer Prize finalist team for breaking new, 2015 ("Forget 'anti-vaxers.' The Disney measles outbreak could change the minds of an even more crucial group.", The Washington Post, January 26, Available Online at <http://www.washingtonpost.com/news/storyline/wp/2015/01/26/forget-anti-vaxers-the-disney-measles-outbreak-could-change-the-minds-of-an-even-more-crucial-group/>, accessed 7/22/15, KM)

The child was behind on her vaccinations. Wendy Sue Swanson took note of this as she talked with the girl's parents last week at a medical clinic in Mill Creek, Wash., outside Seattle. Swanson, like many pediatricians, sometimes needed to coax parents to get the shots for their children. A few might be unmovable in their objections. But most were like this couple: A mom and dad who might harbor doubts or were just behind schedule. They were at least willing to listen. Now, Swanson had a new way to prod parents like them: Discussing the Disney measles outbreak in California, which has spread to at least 68 people in 11 states since Jan. 1 and raised alarms about the reemergence of a disease once considered all but vanquished. There was something powerful about the disease hitting a popular, recognizable vacation spot. The girl got her vaccination. Her parents were on board. "Their eagerness was different," Swanson said later. "I think it is changing people." Much of the scrutiny in the Disney measles outbreak has fallen on an entrenched anti-vaccination movement in places such as Orange County, Calif., home to the two Disney theme parks where the outbreak gained its foothold. These "anti-vaxers" are viewed as dead-set against vaccinations. But doctors believe the current outbreak could change the minds of a less-

known but even larger group: parents who remain on the fence about the shots. These “vaccine-hesitant” parents have some doubt about vaccinations, leading them to question or skip some shots, stagger their delivery or delay them beyond the recommended schedule. An estimated 5 to 11 percent of U.S. parents have skipped at least one vaccination or delayed a shot, according to studies. That compares to only 1 to 3 percent of parents who object to all vaccinations. Boosting compliance among the “vaccine hesitant” population could have major public health implications, doctors say, especially because last year the United States had its highest number of measles cases since 1977. The topic of “vaccine hesitant” patients has become the focus of a growing body of medical research in recent years. Doctors are trying to understand what triggers vaccine worries and which strategies work best for overcoming those fears. Doctors spend many office hours trying to convince these parents that the scientific evidence proves the shots are, in fact, safe and effective. But these hesitant parents have been bombarded by conflicting information. And they don’t view all of the shots the same way. The vaccine to protect against measles, mumps and rubella faces particularly strong resistance as a result of thoroughly discredited studies linking the vaccine to autism. So some parents, even those generally open to other vaccines, push to delay or skip this one. The shot is supposed to be given at 12 months and again at age 4. “One of the problems that vaccines face now is they work too well,” said Michael Smith, a pediatric infectious disease specialist at the University of Louisville School of Medicine in Kentucky, who has studied vaccine-hesitant parents. Parents don’t have experience with measles, how children can become very ill and in rare cases suffer brain swelling or even die, Smith said. At the same time, these parents are confronted with stories about the unexplained rise in the U.S. autism rate. “I can understand as a parent why you’d skip the vaccine if you’d been convinced that it’s a choice between giving my kids a shot or giving my kid autism,” Smith said. But the Disney outbreak changes the discussion. Now, doctors have an event to point to. The threat is no longer abstract or distant. “This is definitely going to be a talking point that pediatricians should keep in their back pockets,” Smith said. Studies have shown that “anti-vaxxer” parents are likely to remain steadfast in their opposition. Barbara Loe Fisher, president of the National Vaccine Information Center, a group that raises doubts about the shots, said she was not convinced that the Disney outbreak was even a story about the dangers of being unvaccinated. “I don’t think we know completely what’s going on,” Fisher said. But physicians such as Kathryn Edwards of the Vanderbilt Vaccine Research Program said the measles vaccine is at least 99 percent effective after the second dose. And measles is one of the most communicable diseases, much more so than the flu. The dangers posed by the disease have been forgotten. Many U.S. doctors have never even seen it. Edwards still recalls the only patient she ever saw with measles, years ago when she was a medical resident. He died. “So I have a lot of respect for measles,” Edwards said. At Boston Children’s Hospital, pediatrician Claire McCarthy said she is always happy when parents decide to vaccinate their children against measles in particular. She worries about the current situation in California. And she plans to use the Disney outbreak to try to convince hesitant parents that vaccinations are the right choice. “I am planning on talking this one up a lot with families,” McCarthy said. “I think this probably will make a difference.”

Uniqueness booster – anti-vaccination brink

Anti-vaccination movement is gaining momentum now – that’s leading to outbreaks of preventable disease – case studies prove the long-term effects will be catastrophic.

Offit 14 – Paul Offit, American pediatrician specializing in infectious diseases and an expert on vaccines, immunology, and virology; co-inventor of a rotavirus vaccine that has been credited with saving hundreds of lives every day; Maurice R. Hilleman Professor of Vaccinology and Professor of Pediatrics at the Perelman School of Medicine at the University of Pennsylvania; Chief of the Division of Infectious Diseases; member of the Centers for Disease Control (CDC) Advisory Committee on Immunization Practices; Founding Board Member of the Autism Science Foundation, 2014 (“The Anti-Vaccination Epidemic”, Wall Street Journal, September 24, Available Online at <http://www.wsj.com/articles/paul-a-offit-the-anti-vaccination-epidemic-1411598408>, accessed 7/20/15, KM)

Almost 8,000 cases of pertussis, better known as whooping cough, have been reported to California's Public Health Department so far this year. More than 250 patients have been hospitalized, nearly all of them infants and young children, and 58 have required intensive care. Why is this preventable respiratory infection making a comeback? In no small part thanks to low vaccination rates, as a story earlier this month in the Hollywood Reporter pointed out. The conversation about vaccination has changed. In the 1990s, when new vaccines were introduced, the news media were obsessed with the notion that vaccines might be doing more harm than good. The measles-mumps-rubella (MMR) vaccine might cause autism, we were told. Thimerosal, an ethyl-mercury containing preservative in some vaccines, might cause developmental delays. Too many vaccines given too soon, the stories went, might overwhelm a child's immune system. Then those stories disappeared. One reason was that study after study showed that these concerns were ill-founded. Another was that the famous 1998 report claiming to show a link between vaccinations and autism was retracted by The Lancet, the medical journal that had published it. The study was not only spectacularly wrong, as more than a dozen studies have shown, but also fraudulent. The author, British surgeon Andrew Wakefield, has since been stripped of his medical license. But the damage was done. Countless parents became afraid of vaccines. As a consequence, many parents now choose to delay, withhold, separate or space out vaccines. Some don't vaccinate their children at all. A 2006 study in the Journal of the American Medical Association showed that between 1991 and 2004, the percentage of children whose parents had chosen to opt out of vaccines increased by 6% a year, resulting in a more than twofold increase. Today the media are covering the next part of this story, the inevitable outbreaks of vaccine-preventable diseases, mostly among children who have not been vaccinated. Some of the parents who chose not to vaccinate were influenced by the original, inaccurate media coverage. For example, between 2009 and 2010 more than 3,500 cases of mumps were reported in New York City and surrounding area. In 2010 California experienced an outbreak of whooping cough larger than any outbreak there since 1947. Ten children died. In the first half of 2012, Washington suffered 2,520 cases of whooping cough, a 1,300% increase from the previous year and the largest outbreak in the state since 1942. As of Aug. 29, about 600 cases of measles have occurred in the U.S. in 2014: the largest outbreak in 20 years—in a country that the Centers for Disease Control and Prevention declared measles-free in 2000. Who is choosing not to vaccinate? The answer is surprising. The area with the most cases of whooping cough in California is Los Angeles County, and no group within that county has lower immunization rates than residents living between Malibu and Marina Del Rey, home to some of the wealthiest and most exclusive suburbs in the country. At the Kabbalah Children's Academy in Beverly Hills, 57% of children are unvaccinated. At the Waldorf Early Childhood Center in Santa Monica, it's 68%, according to the Hollywood Reporter's analysis of public-health data. These are the kind of immunization rates that can be found in Chad or South Sudan. But parents in Beverly Hills and Santa Monica see vaccines as unnatural—something that conflicts with their healthy lifestyle. And they have no problem finding fringe pediatricians willing to cater to their irrational beliefs.

These parents are almost uniformly highly educated, but they are making an uneducated choice. It's also a dangerous choice: Children not vaccinated against whooping cough are 24 times more likely to catch the disease. Furthermore, about 500,000 people in the U.S. can't be vaccinated, either because they are receiving chemotherapy for cancer or immune-suppressive therapies for chronic diseases, or because they are too young. They depend on those around them to be vaccinated. Otherwise, they are often the first to suffer. And because no vaccine is 100% effective, everyone, even those who are vaccinated, is at some risk. Parents might consider what has happened in other countries when large numbers of parents chose not to vaccinate their children. Japan, for example, which had virtually eliminated whooping cough by 1974, suffered an anti-vaccine activist movement that caused vaccine rates to fall to 10% in 1976 from 80% in 1974. In 1979, more than 13,000 cases of whooping cough and 41 deaths occurred as a result. Another problem: We simply don't fear these diseases anymore. My parents' generation—children of the 1920s and 1930s—needed no convincing to vaccinate their children. They saw that whooping cough could kill as many as 8,000 babies a year. You didn't have to convince my generation—children of the 1950s and 1960s—to vaccinate our children. We had many of these diseases, like measles, mumps, rubella and chickenpox. But young parents today don't see the effects of vaccine-preventable diseases and they didn't grow up with them. For them, vaccination has become an act of faith. Perhaps most upsetting was a recent study out of Seattle Children's Hospital and the University of Washington. Researchers wanted to see whether the whooping cough epidemic of 2012 had inspired more people to vaccinate their children. So they studied rates of whooping cough immunization before, during and after the epidemic. No difference. One can only conclude that the outbreak hadn't been large enough or frightening enough to change behavior—that not enough children had died. Because we're unwilling to learn from history, we are starting to relive it. And children are the victims of our ignorance. An ignorance that, ironically, is cloaked in education, wealth and privilege.

Vaccination critics are gaining influence – can even sway anti-vax legislation.

Gumbel 15 – Andrew Gumbel, foreign correspondent for The Guardian in Europe, the Middle East, and the United States, 2015 (“US states face fierce protests from anti-vaccine activists”, The Guardian, April 10, Available Online at <http://www.theguardian.com/us-news/2015/apr/10/anti-vaccine-protest-california-facts>, accessed 7/20/15, KM)

Four months after a measles outbreak at Disneyland, state legislators seeking to tighten immunisation laws across the country are running the gauntlet of anti-vaccination activists who have bombarded them with emails and phone calls, heckled them at public meetings, harassed their staff, organized noisy marches and vilified them on social media. Three states blindsided by the activists' sheer energy – Oregon, Washington and North Carolina – have either pulled back or killed bills that would have ended a non-specific “personal belief” exemption for parents who don't want to vaccinate their children. Now the battleground is California, which bore the brunt of the measles outbreak at the beginning of the year and saw school closures, extraordinary quarantine measures and a vigorous public debate lamenting the fact that a disease declared eradicated 15 years ago is once again a public health threat. A health committee meeting in Sacramento, the state capital, on Wednesday turned into a tense showdown between lawmakers seeking to argue that the science is unequivocally on the side of universal vaccination, and activists accusing them of being in the pocket of unscrupulous big pharmaceutical companies. One activist, Terry Roark, told the state senate committee her child had died from a vaccine and feared others could be next if parents lost the right to decide what was in their best interests. “Innocent people will die,” she said tearfully. “Innocent children will be killed.” The meeting degenerated at points into yelling and screaming, and two activists were removed. Lawmakers promoting the new law were tenacious in their own

way, challenging the claim that the bill would force vaccinations even on children with legitimate medical reasons not to have them. A doctor sympathetic to the anti-vaccination movement was ultimately forced to concede the bill contained no such language. "The danger I feel as a policymaker is that when assertions are made in public comment that aren't fact-based, that's irresponsible," state senator Holly Mitchell said. She and the co-sponsors of the bill, a doctor from northern California and the son of a polio survivor from southern California, have become hate figures to the movement and they and their staff have been chased and shouted at. The southern California co-sponsor, Ben Allen, told the Guardian that while many of his detractors were respectful he'd also been bewildered by "Facebook memes of me as a Nazi doctor". He added: "Some of them have definitely crossed a line." The activists were boosted by the participation of a Kennedy: the environmentalist and civil rights activist Robert F Kennedy Jr, son of the murdered attorney general and nephew of the murdered president, who has written a book denouncing the use of mercury traces in a vaccine ingredient, which repeated peer-reviewed studies have found to be safe and which has now largely been phased out. Kennedy showed a documentary based on his book, spoke at a rally and likened vaccinations to the Holocaust. Medical experts and legislators supporting the bill say vaccinating as many people as possible is vital to provide so-called herd immunity – a degree of protection strong enough to cover infants too young for vaccinations or those too sick to receive them. The more alarmist, contrary story of an out-of-control medical establishment covering up the "truth" – that vaccinations are responsible for an alarming spike in children diagnosed with autism – is the view of a tiny minority, perhaps 5% of the population. But the minority is a strikingly vocal one. In North Carolina, state senator Terry Van Duynsa described the backlash to a bill she sponsored as "very swift and very furious". "It created an environment that made it difficult to just even talk about it," she told the NPR radio affiliate in Charlotte.

Link – Generic

Framing the debate in terms of rights is dangerous – the language of “choice” and “freedom” conveniently justifies anti-vaccination that endangers society as a whole.

Thornton 15 – Paul Thornton, Los Angeles Times’ letters editor, 2015 (“Opinion Vaccine skeptics and Chris Christie say it’s about choice. They’re wrong”, LA Times, February 2, Available Online at <http://www.latimes.com/opinion/opinion-la/la-ol-chris-christie-vaccines-choice-20150202-story.html>, accessed 7/14/15, KM)

Chris Christie and vaccine skeptics say they want choice. What about those who can't be vaccinated? Vaccine skeptics have exchanged autism for an appeal to choice as their cri de coeur. "Choice" is a great word -- it has a universal, empowering appeal, and it's useful for winning a debate. Women's rights activists were smart decades ago to call their side of the abortion debate "pro-choice," asking us to ignore our feelings on the procedure itself and trust women enough to make their own medical decisions. So it's no surprise that vaccine skeptics have now changed the subject from their rightly ridiculed nonscientific claims on autism to the freedom to parent as they wish -- in other words, to make their own choices. And it appears they've convinced New Jersey Gov. Chris Christie (or maybe not), who says that even though vaccinating children is crucial and that his own kids got their shots, choice is great too, and parents deserve to have some when it comes to stopping the spread of communicable illness. Yes, we can note the irony of this being the same governor who recently locked a nurse in a tent to protect New Jersey from an Ebola virus this woman wasn't carrying, but that's beside the point. What's important is that Christie's statement (you might even call it gaffe) represents the latest strategy for the vaccine skeptics: They're trying to win apologists for their cause, not an argument on the efficacy of vaccines. Whether you agree with them doesn't matter -- you could even ridicule their efforts to pass off fraud as science in linking vaccination to autism. But freedom is a core American value, and everyone deserves to make his or her own choices, especially when it comes to parenting. This is Christie's logic. Christie isn't the only one making this argument. As I've noted before, this appeal to choice has replaced autism as our letter writers' preferred anti-vaccine argument. In response an editorial last week calling for an end to California's personal-belief exemption for parents who would rather not vaccinate their children, a small handful of readers hyperbolically accused The Times' editorial board of favoring totalitarianism (one said, "Sorry, but we don't live in Nazi Germany"). Previously, a reader from Nevada whose letter was published -- much to the dismay of at least a dozen others who sent us their own responses to their letter -- wrote that "freedom means choice. Plain and simple. Without choice, we are not a democracy." He continued: "It is my choice whether or not I want to be vaccinated. It is your choice whether or not to wash your hands or take basic public health precautions. It is an individual's choice whether he or she wants to gamble with their child's life. It is not your place to say what they have to do." Here's the problem: This isn't about choice, and vaccine skeptics' use of freedom instead of autism as their new cri de coeur exposes the joyful self-centeredness of their obstinacy. Any pediatrician (well, perhaps not all pediatricians) will tell you a parent's decision to vaccinate is as much about other children as their own. Parents who vaccinate their children not only protect their own kids as well as pick up some of the slack for the mothers and fathers who refused vaccination, they also help to protect those who cannot get immunized. It's sad for anyone to come down with a preventable disease, but lost in our focus lately on the children of vaccine-skeptical parents who have come down with measles are those who rely on the rest of us who can choose to immunize to make the right choice. These people -- organ transplant recipients,

cancer survivors and infants, among others -- might not have the choice that Christie and others champion.

The vaccination debate will come down to rights – SB 277 proves.

Herbert 15 – Steven Herbert, Night Editor of City News Service, 2015 (“Opponents of new California vaccination law gathering signatures to overturn it”, LA Daily News, July 15, Available Online at <http://www.dailynews.com/health/20150715/opponents-of-new-california-vaccination-law-gathering-signatures-to-overturn-it>, accessed 7/16/15, KM)

Opponents of SB 277, a recently signed law requiring almost all schoolchildren in California to be vaccinated against diseases such as measles and whooping cough, received permission Wednesday to begin gathering signatures that would qualify a referendum to overturn it. “This referendum is not about vaccinations. It is about defending the fundamental freedom of a parent to make an informed decisions for their children without being unduly penalized by a government that believes it knows best,” said former Assemblyman Tim Donnelly, the referendum’s proponent. Valid signatures from 365,880 registered voters — 5 percent of the total votes cast for governor in the 2014 general election — must be submitted by Sept. 28 to qualify the measure for the November 2016 ballot, according to Secretary of State Alex Padilla. Q&A: What you need to know about California’s new SB 277 If the attempt to overturn SB 277 qualifies for the ballot, its provisions would be suspended. The bill, signed into law by Gov. Jerry Brown on June 30, eliminates vaccination exemptions based on religious or personal beliefs. It will require all children entering kindergarten to be vaccinated unless a doctor certifies that a child has a medical condition, such as allergies, preventing it. The legislation was prompted in part by an outbreak of measles traced to Disneyland that began in late December and ultimately spread to more than 130 people across the state. Cases were also reported in Arizona, California, Colorado, Nebraska, Oregon, Utah and Washington state.

Making broad claims about the importance of civil liberties is hazardous – antivaxers will be making the same assertions – listen to how this “pro choice antivaxer” frames the debate—

Fisher 14 – Barbara Loe Fisher, Co-founder & President of the National Vaccine Information Center, 2014 (“Vaccination: Defending Your Right to Know and Freedom to Choose”, National Vaccine Information Center, November 13, Available Online at <http://www.nvic.org/nvic-vaccine-news/november-2014/vaccination--defending-your-right-to-know-and-free.aspx>, accessed 7/16/15, KM)

Following is a referenced excerpt from a keynote presentation given by Barbara Loe Fisher at the 2014 U.S. Health Freedom Congress in Minneapolis, Minnesota. View the video of her full 75 minute presentation here. The public conversation about whether we should have the freedom to choose how we want to maintain our physical, mental, emotional and spiritual health has become one of the most important public conversations of our time. It is a conversation that challenges us to examine complex public policy, scientific, ethical, legal, philosophical, economic, political and cultural issues. This may appear to be a new conversation but it has been around for centuries. 1 At the center of this new and old public conversation about health and freedom, is the topic of vaccination. 2 3 What unites those defending an open discussion about vaccination and health is a commitment to protecting bodily integrity and defending the inalienable right to self-determination, which has been globally acknowledged as a human right. 7 8 9 Whether you are a health care professional practicing complementary and alternative medicine or specializing in homeopathic, naturopathic, chiropractic, acupuncture, or other holistic health options, 10 or you are a consumer advocate working for the right to know and freedom to choose how you and your family will stay well, many of you have a deep concern about health and freedom.

Vaccination: Most Hotly Debated of All Health Freedom Issues The most divisive and hotly debated of all health freedom issues is the question of whether individuals should be at liberty to dissent from established medical and government health policy and exercise freedom of thought, speech and conscience when it comes to vaccination. 11 12 13 In the health freedom movement, there are some who will defend the legal right to purchase and use nutritional supplements, drink raw milk, eat GMO free food, remove fluoride from public water systems and mercury from dental amalgams or choose non-medical model options for healing and staying well, but are reluctant to publicly support the legal right to make vaccine choices. A Sacrosanct Status for Vaccination Vaccination is a medical procedure that has been elevated to a sacrosanct status by those in control of the medical-model based health care system for the past two centuries. Vaccination is now being proclaimed as the most important scientific discovery and public health intervention in the history of medicine. 14 15 16 Using religious symbols and crusading language, medical scientists describe vaccination as the Holy Grail. 17 18 19 20 Vaccines, they say, are going to eradicate all causes of sickness and death from the earth and anyone who doubts that is an ignorant fool. 21 22 23 24 25 In the 1970's, pediatrician and health freedom pioneer Robert Mendelsohn, who described himself as a medical heretic, warned that medical science has become a religion and doctors have turned the act of vaccination into "the new sacrament." 26 In the 21st century, if you refuse to believe that vaccination is a moral and civic duty and dare to question vaccine safety or advocate for the legal right to decline one or more government recommended vaccines, you are in danger of being branded an anti-science heretic, a traitor and a threat to the public health. 27 28 You are viewed as a person of interest who deserves to be humiliated, silenced and punished for your dissent. 29 30 31 32 Exercising Freedom of Thought, Speech and Autonomy "To learn who rules over you, simply find out who you are not allowed to criticize," said Voltaire, 33 34 the great 18th century writer during the Age of Enlightenment, who was imprisoned several times in the Bastille for defending freedom of thought and speech before the French Revolution. As contentious as the public conversation about vaccination, health and autonomy has become, we cannot be afraid to have it. There has never been a better time to challenge those ruling our health care with an iron fist. We have the power and all we need to do is exercise it. Information is Power We have the tools in the 21st century to bring about a modern Age of Enlightenment 35 that will liberate the people so we can take back our freedom and our health. The electronic communications revolution has provided a global platform for us to access the Library of Medicine 36 and evaluate the quality and quantity of vaccine science used to make public health policy and create vaccine laws. The World Wide Web allows us to circumvent the paid mainstream media dominated by industry and governments and publicly communicate in detail on our computers, tablets and smart phones exactly what happened to our health or our child's health after vaccination. 37 38 39 40 We are connected with each other in a way that we have never been before and it is time to talk about vaccines and microbes and the true causes of poor health. It is time to face the fear that we and our children will get sick and die if we don't believe and do what those we have allowed to rule our health care system with an iron fist tell us to believe and do. Who Will Control the Multi-Trillion Dollar U.S. Health Care System? What is at stake in this debate between citizens challenging the status quo and those resisting constructive change is: Who will control the multi-trillion dollar U.S. health care system? 41 If people have the right to know and freedom to choose how to heal and stay healthy, a free people may think independently and choose to spend their money on something different from what they have been carefully taught to spend their money on right now. 42 A free people may reject sole reliance on the expensive and, some say, ineffective pharmaceutical-based medical model that has dominated US health care for two centuries. 43 44 45 A free people may refuse to buy and eat GMO foods. 46 A free people may walk away from doctors, who threaten and punish patients for refusing to obey orders to get an annual flu shot or decline to give their children every single government recommended vaccine on schedule – no exceptions and no questions asked. 47 The most rational and compelling arguments for defending health freedom, including vaccine freedom of choice, are grounded in ethics, law, science and economics. The human right to voluntary, informed consent to vaccination is the best example of why Americans must not wait any longer to stand up and defend without compromise the inalienable right to autonomy and protection of bodily integrity.

Anti-vaccination advocates see the debate as a civil liberties issue – protests prove.

Mara 15 – Janis Mara, covers education for the Marin IJ and has won many awards for business coverage, live-blogging, and investigative work, 2015 (“Vaccination law critics hold protest at Golden Gate Bridge”, Marin Independent Journal, July 3, Available Online at <http://www.marinij.com/health/20150703/vaccination-law-critics-hold-protest-at-golden-gate-bridge>, accessed 7/16/15, KM)

Corte Madera chiropractor Donald Harte addresses protesters about the new California school vaccines law before demonstrating on the Golden Gate Bridge on Friday. Alan Dep — Marin Independent Journal [About 200 opponents of California’s new law mandating vaccination](#) for nearly all the state’s schoolchildren [protested at the Golden Gate Bridge](#) on Friday, wearing bright red and [vowing, “We’re not going away.”](#) The protest took place three days after Gov. Jerry Brown signed into law Senate Bill 277. The law requires immunization against diseases including measles and whooping cough in order to attend public or private school. Before the bill passed, parents could cite personal or religious beliefs to decline vaccination. Some medical problems, such as immune system deficiencies, will still be exempt under the new law. “We are large, we are powerful and we are going to be heard,” said event organizer Brandy Vaughan of the Council for Vaccine Safety during the rally. Adults, children and even one German Shepherd dog wore bright red T-shirts, many of them emblazoned with anti-vaccine slogans and images of syringes. “All of the nation of Islam are sincerely concerned about any law that imposes needles into the arms of men, women and children,” said Minister Keith Muhammad, an official speaker at the event and a local student representative of Louis Farrakhan, the leader of the religious group Nation of Islam, in Oakland. “Autism in black children increased with the MMR,” Muhammad said, referring to the measles-mumps-rubella vaccine. VACCINE, AUTISM In 1998, Andrew Wakefield and 11 other co-authors published a study in The Lancet, a respected medical journal, suggesting a link between this vaccine and autism. Subsequently, the study was retracted by The Lancet and Wakefield’s medical license was revoked. “Study after study has not found a link between vaccines and autism,” Marin Public Health Officer Matt Willis said at a March vaccination forum in San Rafael held by Marin’s public health department, the Marin County Office of Education and Kaiser Permanente. “The incidence of measles in California is very small and many of those who suffered were vaccinated,” Muhammad said. The speaker was referring to an outbreak of measles that started in Disneyland in December and eventually sickened more than 140 people. Of the California measles cases reported in January in which vaccination status was known, 80 percent weren’t vaccinated, according to Dr. Gil Chavez, state epidemiologist. “The majority of people who got measles were unvaccinated,” according to the website of the Centers for Disease Control and Prevention. The assertion was referring to the 178 measles cases reported in the United States between Jan. 1 and June 26 of this year. [“Are you ready to fight for your rights?”](#) asked [Rachelle Emery, who lobbied against the bill. The crowd roared back, “Yes!”](#) Emery called for [“an investigation of our legislators,”](#) specifically [Sen. Richard Pan, D-Sacramento, a pediatrician and an author of the bill.](#) Joshua Coleman of Roseville, who lobbied in Sacramento against SB 277, said, “We need to recall Senator Richard Pan.” He also urged the audience to educate the public on the issue. [“Is not injecting poison into a child, child abuse? Think about this!”](#) Donald Harte, a Corte Madera chiropractor, told the group. [PROCESSION After the speakers held forth, the group marched across the bridge, carrying signs with slogans such as “No forced vaccination,” and, “In matters of conscience, the law of the majority has no place” — Mahatma Gandhi.](#) A wagon with a bright red canopy holding three children was part of the procession. Two of the children belonged to Megan Fleming. “I have a background in Ayurvedic medicine and I read a lot of studies on holistic healing modalities before I had children,” the Mill Valley resident said. “I had a different perspective of what it means to create health. I did my research. I had an instinct that [I did not want to just go along with what I was being told,](#) Fleming said. [“Medical choice is a human right.](#) One of the issues with this is that vaccine studies are done by the companies that manufacture the vaccines. It would be good to have independent studies,” Fleming said.

Link – Privacy

The right to privacy becomes a tool for anti-vaccination parents to refuse vaccination – immunization is seen as an “intrusion”.

Friedersdorf 15 – Conor Friedersdorf, staff writer at The Atlantic, where he focuses on politics and national affairs, holds a Master’s degree in Journalism from New York University and BA in Politics, Philosophy, and Economics from Pomona College, 2015 (“Should Anti-Vaxers Be Shamed or Persuaded?”, The Atlantic, February 3, Available Online at <http://www.theatlantic.com/politics/archive/2015/02/should-anti-vaxers-be-shamed-or-persuaded/385109/>, accessed 7/14/15, KM)

While anti-vaxer ignorance has caused great damage, the vast majority are not, in fact, especially selfish people. But I part with the commentators who assume that insulting, shaming, and threatening anti-vaccination parents is the best course, especially when they extend their logic to politicians. For example, Chris Christie is getting flak for “pandering” to anti-vaccination parents. He said, “We vaccinate our kids, and so, you know that’s the best expression I can give you of my opinion. You know it’s much more important what you think as a parent than what you think as a public official. That’s what we do. But I understand that parents need to have some measure of choice in things as well, so that’s the balance the government has to decide.” Those remarks could be improved upon. Indeed, Christie’s office released a clarifying statement after his original comments came under criticism. But isn’t Christie’s approach more likely to persuade anti-vaccine parents than likening their kids to bombs? Let’s emulate the New Jersey governor. If I could address any anti-vaccine parents reading this article: Like you, I looked into the scientific evidence with an open mind. When I regard conventional wisdom or the ruling establishment to be wrong, I’m always eager to publicly dissent. In this case, I came to the same conclusion as my own hyper-cautious mother: Not only would I definitely vaccinate my own kid if I had one—the case is so strong that, were standard vaccinations more expensive, I’d spend 20 percent of my income to get my kids their shots. That’s how high my confidence is in their safety and importance. And if you’re surprised by this measles outbreak, you underestimated the costs of your choice, which you’d be smart to reverse as soon as possible. Testimony from people who actually have kids is, of course, going to be more credible. (See Roald Dahl’s story about his daughter for a particularly affecting testimony.) I’d urge parents with the impulse to shame and insult to try that approach instead, not just because it strikes me as more likely to persuade the typical anti-vaccine parent, but due to the conviction that while anti-vaxer ignorance has caused great damage, the vast majority are not, in fact, especially selfish people, and characterizing them as such just feeds into their mistaken belief system. Put another way, the parents I know who vaccinated their children, mine included, were not acting selflessly or sacrificially to protect the herd. They were appropriately confident that vaccinating their kids would significantly increase rather than reduce their chances of surviving and thriving in this world. Well-informed selfish people get vaccinated! Like Chris Mooney, I worry about this issue getting politicized. As he notes, there is presently no partisan divide on the subject. “If at some point, vaccinations get framed around issues of individual choice and freedom vs. government mandates—as they did in the ‘Christie vs. Obama’ narrative—and this in turn starts to map onto right-left differences ... then watch out,” he writes. “People could start getting political signals that they ought to align their views on vaccines—or, even worse, their vaccination behaviors—with the views of the party they vote for.” As a disincentive to this sort of thinking, folks on the right and left would do well to reflect on the fact that the ideology of anti-vaxers doesn’t map neatly onto the left or right, with the former willing to use state coercion and the latter opposing it. For example, consider some of the standard language used to talk about abortion. If you’re a progressive who believes in both a constitutionally guaranteed right to privacy and a moral right to autonomy over one’s body, do you also believe that choices about vaccinations ought to be between patients and doctors, and that the state has no right to intrude on such a sensitive matter? If you’re a conservative who believes that the community has a role in safeguarding innocent babies, even when that infringes on a parent’s choices and bodily autonomy, do you also believe vaccinations can be compelled by the state? I don’t mean to suggest that the abortion and vaccination debates map onto one another perfectly—only to illustrate that legally compelling vaccinations would be both consistent with and in tension with other positions taken by both the left and right. Personally, I can think of hypothetical situations where I’d support compelled vaccination and others where I’d staunchly oppose them, based not only on specific facts about the world, a given disease, and the vaccine against it, but also on the question of whether such a law would really improve public health outcomes.

Link – Constitution

Anti-vaccination proponents base their arguments in the Constitution too – according to this anti-vaxer, it’s a “fight for inalienable rights to freedom”

Fisher 14 – Barbara Loe Fisher, Co-founder & President of the National Vaccine Information Center, 2014 (“Vaccination: Defending Your Right to Know and Freedom to Choose”, National Vaccine Information Center, November 13, Available Online at <http://www.nvic.org/nvic-vaccine-news/november-2014/vaccination--defending-your-right-to-know-and-free.aspx>, accessed 7/16/15, KM)

NVIC: Defending Ethical Principle of Informed Consent I and the more than 100,000 followers and supporters 48 of the non-profit charity, the National Vaccine Information Center, take an informed consent position with regard to vaccination. Since our founding in 1982, we have defended the ethical principle of informed consent to vaccine risk-taking because vaccines are pharmaceutical products that carry a risk of injury, death and failure, 49 and because informed consent to medical risk taking is the central ethical principle guiding the ethical practice of medicine. 50 We support the “first do no harm” precautionary approach to public policymaking, which focuses on how much harm can be prevented from a policy or law and not how much harm is acceptable. 51 NVIC Supports Your Health Choices & Vaccine Exemptions We do not advocate for or against use of vaccines. We support your human and legal right to make informed, voluntary health care decisions for yourself and your children and choose to use every government recommended vaccine, a few vaccines or no vaccines at all. 52 NVIC has worked for more than 30 years to secure vaccine safety and informed consent provisions in public health policies and laws, including flexible medical, religious and conscientious belief vaccine exemptions. We are doing this in an increasingly hostile environment created by an industry-government-medical trade alliance that is lobbying for laws to compel all Americans to use every government recommended without deviation from the official schedule or face a growing number of societal sanctions. 53 Although historically, children have been the target for vaccine mandates, authoritarian implementation of federal vaccine policy is not just for children anymore, it is rapidly expanding to include all adults. 54 55 Californians Stood Up for Personal Belief Vaccine Exemption In 2012, many California residents traveled to Sacramento to protest a law introduced by a pediatrician legislator to make it harder for parents to file a personal belief vaccine exemption for their children to attend school. They responded to Action Alerts we issued through the online NVIC Advocacy Portal and lined the halls of the state Capitol building, many with their children, and waited for hours and hours to testify at several public hearings. Mother after mother and father after father, grandparents, nurses, doctors and students of chiropractic, came to the public microphone. Some talked about how vaccine reactions left their children sick and disabled but they can’t find a doctor to write a medical exemption so their children can attend school; others talked about how their babies died after vaccination; and others simply opposed restriction of the legal right for parents to make medical decisions for their minor children. It was a remarkable public witnessing by articulate, courageous citizens pleading with their elected representatives to do the right thing. The right thing would have been for lawmakers to vote to leave the personal belief vaccine exemption alone so parents could continue to make vaccine decisions for their minor children without being forced to beg a hostile doctor or government official for permission to do that. That didn’t happen. 56 Today, parents in California are forced to pay a pediatrician or other state-approved health worker to sign a personal belief vaccine exemption and the doctor can refuse to sign and parents are reporting many pediatricians ARE refusing to sign. Californians Inspired Colorado Citizens to Stand Up in 2014 Yet, because in 2012 California citizens made a powerful public statement by participating in the democratic process and taking action with calls, letters, emails and personal testimony, in 2014 Colorado citizens were inspired to do the same when the personal belief vaccine exemption was attacked in that state. Because in 2012 enough people in California did not sit back and assume the job of defending health freedom would get done by someone else, in 2014 enough people in Colorado did not assume it would get done by someone else. 57 And this time, we were able to hold the line and protect the personal belief vaccine exemption in that state from being eliminated or restricted. 58 This time, there were enough lawmakers in Colorado, who listened and carefully considered the evidence. 59 They did not cave in to pressure from drug industry, government and medical trade lobbyists labeling a minority of citizens as “ignorant,” “selfish,” “crazy” and in need of having their parental and civil rights taken away for defending the human right to self determination and informed consent to vaccine risk-taking. The Right to Make a Risk Decision Belongs to You I do not tell anyone what risks to take and never will. The right and responsibility for making a risk decision belongs to the person

taking the risk. When you become informed and think rationally about a risk you or your child will take - and then follow your conscience - you own that decision. And when you own a decision, you can defend it. And once you can defend it, you will be ready to do whatever it takes to fight for your freedom to make it, no matter who tries to prevent you from doing that. Einstein: "Never do anything against conscience" Albert Einstein, who risked arrest in Germany in the 1930's when he spoke out against censorship and persecution of minorities, said, "Never do anything against conscience even if the State demands it." 64 It takes strength to act independently. When the herd is all running toward the cliff, the one running in the opposite direction seems crazy. People who think rationally and act independently even when the majority does not, may be the only ones to survive! Gandhi: "Speak Your Mind" Gandhi was often persecuted by the ruling majority for challenging their authority and using non-violent civil disobedience to publicly dissent. He said, "Never apologize for being correct, for being ahead of your time. If you're right and you know it, speak your mind. Even if you are a minority of one, the truth is still the truth." 65 Sharing what you know to be true empowers others to make conscious choices. Jefferson: "The Minority Possess Their Equal Rights" The authors of the U.S. Constitution made sure to include strong language securing individual liberties, including freedom of thought, speech and conscience. They did that because many of the families immigrating to America had personally faced discrimination and persecution in other countries for holding beliefs different from the ruling majority. In his first Presidential inaugural address, Thomas Jefferson warned: "All, too, will bear in mind this sacred principle, that though the will of the majority is in all cases to prevail, that will to be rightful must be reasonable; that the minority possess their equal rights, which equal law must protect, and to violate would be oppression." 66 Getting Vaccinated Is Not A Patriotic Act There is no liberty more fundamentally a natural, inalienable right than the freedom to think independently and follow your conscience when choosing what you will risk your life or your child's life for. And that is why voluntary, informed consent to medical risk taking is a human right.

Link – Util

There's no getting out of the link – anti-vaccination advocates would love to get down with the 1AC and criticize utilitarianism together – listen to this deontological spiel by an anti-vaxer.

Fisher 14 – Barbara Loe Fisher, Co-founder & President of the National Vaccine Information Center, 2014 (“Vaccination: Defending Your Right to Know and Freedom to Choose”, National Vaccine Information Center, November 13, Available Online at <http://www.nvic.org/nvic-vaccine-news/november-2014/vaccination--defending-your-right-to-know-and-free.aspx>, accessed 7/16/15, KM)

A Utilitarian Rationale Turned Into Law It is important to note that the Supreme Court ruling in *Jacobsen v Massachusetts* at the turn of the 20th century was clearly based on a utilitarian rationale that a minority of citizens opposing vaccination should be forced to get vaccinated in service to the majority. Utilitarianism was a popular ethical theory in the late 19th and early 20th century in Britain and the U.S. and was used by government officials as a mathematical guide to making public policy that ensured “the greatest happiness for the greatest number of people.” 112 113 Today, utilitarianism has a much more benign and lofty name attached to it: “the greater good.” Minorities At Risk When State Employs Militant Utilitarianism Perhaps that is because utilitarianism went out of fashion in the mid-20th century after, beginning in 1933, the Third Reich employed the utilitarian rationale as an excuse to demonize minorities judged to be a threat to the health and well being of the State.114 Enlisting the assistance of government health officials, 115 116 117 118 the first minority to be considered expendable for the good of the State were severely handicapped children, the chronically sick and mentally ill, the “useless eaters” they were called. 119 120 And when the reasons for why a person was identified as a threat to the health, economic stability, or security of the State grew longer to include minorities who were too old or too Jewish or too Catholic or too opinionated or simply unwilling to believe what those in control of the State said was true...as the list of those the State branded as persons of interest to be demonized, feared, tracked, isolated and eliminated grew, so did the collective denial of those who had yet to be put on that list. 121 122 Jacobsen v Massachusetts Used to Embrace Eugenics in U.S. Prophetically, in 1927, U.S. Supreme Court Justice Oliver Wendall Holmes invoked the *Jacobsen v. Massachusetts* “greater good” utilitarian decision to justify using the heel of the boot of the State to force the sterilization of a young Virginia woman, Carrie Buck, who doctors and social workers incorrectly judged to be mentally retarded like they said her mother was. 123 In a chilling statement endorsing eugenics, 124 Holmes revealed the morally corrupt core of utilitarianism that still props up mandatory vaccination laws in the U.S. Pointing to the *Jacobsen vs. Massachusetts* decision, Holmes declared that the state of Virginia could force Carrie Buck to be sterilized to protect society from mentally retarded people. Coldly, Holmes proclaimed, “three generations of imbeciles are enough” and “The principle that sustains compulsory vaccination is broad enough to cover cutting the fallopian tubes.” 125 The 1905 U.S. Supreme Court majority made fundamental scientific and ethical errors in their ruling in *Jacobsen v. Massachusetts*. It is clear that medical doctors cannot predict ahead of time who will be injured or die from vaccination and that is a scientific fact. 126 127 Utilitarianism Is A Discredited Pseudo-Ethic Utilitarianism is a discredited pseudo-ethic that has been used to justify horrific human rights abuses not only in the Third Reich but in human scientific experimentation and the inhumane treatment of prisoners and political dissidents here and in many countries, which is why it should never be used as a guide to public policy and law by any government. Although we may disagree about the quality and quantity of the scientific evidence used by doctors and governments to declare vaccines are safe at the population level, at our peril do we fail to agree that, while the State may have the power, it does not have the moral authority to dictate that a minority of individuals born with certain genes and biological susceptibilities give up their lives without their consent for what the ruling majority has judged to be the greater good.

Spillover

Yes spillover – anti-vaccination advocates use Court cases, pro-choice rhetoric, and even GMOs to justify their beliefs.

McGough 15 – Michael McGough, Los Angeles Times' senior editorial writer that writes about law, national security, politics, foreign policy and religion, holds a Master's degree in law from Yale Law School, 2015 ("Opinion: A Supreme Court quote anti-vaxxers will love", LA Times, February 5, Available Online at <http://www.latimes.com/opinion/opinion-la/la-ol-vaccines-supreme-court-parents-20150203-story.html>, accessed 7/14/15, KM)

The Supreme Court has recognized the right of parents to make choices for their children The anti-vaccination movement has an interesting connection to the judicially created right to abortion Vaccination is the latest test of parental authority The refusal of many parents to vaccinate their children against measles has become a political story. Some (but not all) Republican presidential hopefuls are giving aid and comfort to anti-vaxxers. Meanwhile, some have argued (unpersuasively) that President Obama is guilty of the same sort of pandering. Outside the realm of electoral politics, a debate rages over whether credulity about the "dangers" of vaccination is primarily a feature of right-leaning libertarians or liberals who also harbor ridiculous fears about genetically modified food. No one to my knowledge has mentioned that the anti-vaccination movement also has an interesting connection to the Supreme Court and the judicially created right to abortion. In 1925, in Pierce vs. Society of Sisters, the court struck down on constitutional grounds an Oregon law that required children to attend only public schools. Ruling in favor of an order of Catholic nuns and a military academy, the court held that the law "unreasonably interferes with the liberty of parents and guardians to direct the upbringing and education of children." The decision includes this famous sentence: "The child is not the mere creature of the state; those who nurture him and direct his destiny have the right, coupled with the high duty, to recognize and prepare him for additional obligations." This ringing affirmation of parental authority continues to resonate in conservative and libertarian circles. The website of the Home School Legal Defense Assn. says it was established "to defend and advance the constitutional right of parents to direct the education of their children and to protect family freedoms." In American law as well as in American culture, parents rule. - But does the Constitution really give parents the power to decide how their kids will be educated? Not explicitly, but the court located such a right in the 14th Amendment, which says that no state may "deprive any person of life, liberty, or property, without due process of law." In a previous decision, the court had said that liberty "denotes not merely freedom from bodily restraint" but also a constellation of other fundamental rights. Now for the abortion connection. The landmark Roe vs. Wade decision cites Pierce vs. Society of Sisters. Like the right to shape your child's education, a woman's right to abortion (rooted in a larger right of privacy) is derived from a broad reading of "liberty." Many Americans are offended by the idea that abortion rights are fundamental; but some of those same people would enthusiastically agree with the court that parents have a constitutional right to shape the upbringing of their children -- whether the issue is education or medical care. I'm not saying that the Supreme Court necessarily would strike down a law requiring vaccination with no exemptions. But the court's statement that "the child is not the mere creature of the state" isn't that far removed from New Jersey Gov. Chris Christie's insistence in his vaccination comments that "parents need to have some measure of choice in things as well." A reader complained that I "said, basically, that the U.S. Supreme Court supports parents' rights over health concerns on vaccinations, citing a parochial school case from 1925. The analogy is incorrect; the Supreme Court clearly stated in 1905 that health concerns justify mandatory vaccinations." Actually I didn't say that the Supreme Court would

strike down a requirement that children be vaccinated. In fact, I wrote: "I'm not saying that the Supreme Court necessarily would strike down a law requiring vaccination with no exemptions." My point was the Supreme Court had used very expansive language about parental rights similar to that employed by opponents of vaccination (and supporters of home-schooling). But I should have mentioned the 1905 ruling, which involved the prosecution of an adult who declined to be vaccinated for smallpox. (Here's the court's ruling in *Jacobson vs. Massachusetts*.)

Spillover will occur – both politicians and advocates will make the connection between the plan and anti-vaccination rights – *Roe v. Wade* proves.

Napolitano 15 – Andrew Napolitano, former judge of the Superior Court of New Jersey, senior judicial analyst at Fox News Channel. Judge Napolitano has written nine books on the U.S. Constitution. The most recent is *Suicide Pact: The Radical Expansion of Presidential Powers and the Lethal Threat to American Liberty*, 2015 ("To Vaccinate or Not To Vaccinate? Why We Should Consult *Roe v. Wade*", Reason.com, February 5, Available Online at <http://reason.com/archives/2015/02/05/to-vaccinate-or-not-to-vaccinate>, accessed 7/16/15, KM)

New Jersey Gov. Chris Christie unwittingly ignited a firestorm earlier this week when he responded to a reporter's question in Great Britain about forced vaccinations of children in New Jersey by suggesting that the law in the U.S. needs to balance the rights of parents against the government's duty to maintain standards of public health. Before Christie could soften the tone of his use of the word "balance," Kentucky Sen. Rand Paul jumped into the fray to support the governor. In doing so, he made a stronger case for the rights of parents by advancing the view that all vaccines do not work for all children and the ultimate decision-maker should be parents and not bureaucrats or judges. He argued not for balance, but for bias—in favor of parents. When Christie articulated the pro-balance view, he must have known that New Jersey law, which he enforces, has no balance, shows no deference to parents' rights, and permits exceptions to universal vaccinations only for medical reasons (where a physician certifies that the child will get sicker because of a vaccination) or religious objections. Short of those narrow reasons, in New Jersey, if you don't vaccinate your children, you risk losing parental custody of them. The science is overwhelming that vaccinations work for most children most of the time. Paul, who is a physician, said, however, he knew of instances in which poorly timed vaccinations had led to mental disorders. Yet, he was wise enough to make the pro-freedom case, and he made it stronger than Christie did. To Paul, the issue is not science. That's because in a free society, we are free to reject scientific orthodoxy and seek unorthodox scientific cures. Of course, we do that at our peril if our rejection of truth and selection of alternatives results in harm to others. The issue, according to Paul, is: WHO OWNS YOUR BODY? This is a question the government does not want to answer truthfully, because if it does, it will sound like Big Brother in George Orwell's novel 1984. That's because the government believes it owns your body. Paul and no less an authority than the U.S. Supreme Court have rejected that concept. Under the natural law, because you retain the rights inherent in your birth that you have not individually given away to government, the government does not own your body. Rather, you do. And you alone can decide your fate with respect to the ingestion of medicine. What about children? Paul argues that parents are the natural and legal custodians of their children's bodies until they reach maturity or majority, somewhere between ages 14 and 18, depending on the state of residence. What do the states have to do with this? Under

our Constitution, the states, and not the federal government, are the guardians of public health. That is an area of governance not delegated by the states to the feds. Of course, you'd never know this to listen to the debate today in which Big Government politicians, confident in the science, want a one-size-fits-all regimen. No less a champion of government in your face than Hillary Clinton jumped into this debate with a whacky Tweet that argued that because the Earth is round and the sky is blue and science is right, all kids should be vaccinated. What she was really saying is that in her progressive worldview, the coercive power of the federal government can be used to enforce a scientific orthodoxy upon those states and individuals who intellectually reject it. In America, you are free to reject it. Clinton and her Big Government colleagues would be wise to look at their favorite Supreme Court decision: Roe v. Wade. Yes, the same Roe v. Wade that 42 years ago unleashed 45 million abortions also defines the right to bear and raise children as fundamental, and thus personal to parents, and thus largely immune from state interference and utterly immune from federal interference. Paul's poignant question about who owns your body—and he would be the first to tell you that this is not a federal issue—cannot be ignored by Christie or Clinton or any other presidential candidate. If Paul is right, if we do own our bodies and if we are the custodians of our children's bodies until they reach maturity, then we have the right to make health care choices free from government interference, even if our choices are grounded in philosophy or religion or emotion or alternative science. But if Paul is wrong, if the government owns our bodies, then the presumption of individual liberty guaranteed by the Declaration of Independence and the Constitution has been surreptitiously discarded, and there will be no limit to what the government can compel us to do or to what it can extract from us—in the name of science or any other of its modern-day gods.

Link booster – rights key

The defense of personal freedoms are the largest internal link – outweighs any other anti-vax defenses.

Earl 15 – Elizabeth Earl, citing Nadja Durbach, a professor of history at the University of Utah, 2015 (“The Victorian Anti-Vaccination Movement”, The Atlantic, July 15, Available Online at <http://www.theatlantic.com/health/archive/2015/07/victorian-anti-vaccinators-personal-belief-exemption/398321/>, accessed 7/20/15, KM)

After germ theory was expanded upon and researchers developed vaccines, the British government outlawed variolation, which still carried some risk of killing the person it was meant to protect, in the Vaccination Act of 1840. Safer vaccines, which contain a weakened form of a particular disease, replaced variolation, which was a controlled exposure to a disease by injecting a healthy person with some of the infected pus or fluid of an ill person. To encourage widespread vaccination, the law made it compulsory for infants during their first three months of life and then extended the age to children up to 14 years old in 1867, imposing fines on those who did not comply. At first, many local authorities did not enforce the fines, but by 1871, the law was changed to punish officials if they did not enforce the requirement. The working class was outraged at the imposition of fines. Activists raised an outcry, claiming the government was infringing on citizens’ private affairs and decisions. Many of the concerns of the 19th century, such as the role of government in personal choices, have reemerged. Over the course of a decade, multiple prominent scientists threw their support behind the anti-vaccination movement as well. “Every day the vaccination laws remain in force parents are being punished, infants are being killed,” wrote Alfred Russel Wallace, a prominent scientist and natural selection theorist, in a vitriolic monograph against mandatory vaccination in 1898. He accused doctors and politicians of pushing for vaccination based on personal interest without being sure that the vaccinations were safe. Wallace cited statistics from a report by the Registrar-General of deaths from vaccination from 1881 to 1895, showing that an average of 52 individuals a year died from cowpox or other complications after vaccination. Wallace pointed to the deaths to assert that vaccination was useless and caused unnecessary deaths. Pro-vaccinationists cited other statistics from London, where the number of deaths from smallpox fell significantly between the 18th and 19th centuries, after the discovery of vaccination. The National Vaccine Establishment figures claiming that nearly 4,000 people died in the city each year from smallpox before the discovery of vaccination, which Wallace and other anti-vaxers claimed was a grossly inflated figure. The Statistical Society of London noted in its journal in 1852 that “smallpox has greatly prevailed,” saying that vaccination was insufficient but that the registrars of the various counties were optimistic that it could work in the future. British government chose not to answer, staying silent behind the law as protests mounted. Epidemic disease was a fact of life at the time. Smallpox claimed more than 400,000 lives per year throughout the 19th century, according to the World Health Organization. Nadja Durbach, a professor of history at the University of Utah and the author of *Bodily Matters: The Anti-Vaccination Movement in England, 1853-1907*, says a major difference between the 19th century movement and today’s is that anti-vaxers in the past were more aware of the consequences of their choice: Disease was still rampant. Despite the existence of vaccines, thousands still died of infectious disease every year. Today, in most developed countries, large-scale epidemics are confined to the annals of history or to flash-in-the-pan flare-ups such as MERS in South Korea. By the time of the Leicester protest, public opinion was souring toward vaccination. The injections were not completely without risk, with a percentage of those who received the vaccination becoming ill, and riots broke out in towns such as Ipswich, Henley, and Mitford, according to a 2002 paper in the *British Medical Journal*. The Anti-Compulsory Vaccination League launched in London in 1867 amid the publication of multiple journals that produced anti-vaccination propaganda. Another chapter cropped up later in the century in New York City to spread the “warning” about vaccines to the United States. Under this pressure, the British government introduced a key concept in 1898: A “conscientious objector” exemption. The clause allowed parents to opt out of compulsory vaccination as long as they acknowledged they understood the choice. Similar to today’s religious exemptions in 47 U.S. states and the personal belief exemptions in 18 states, according to the National Conference of State Legislatures, the parents signed paperwork certifying that they knew and accepted the risks associated with not vaccinating. Modern vaccination activists come from a different world than those in the 19th century. While anti-vaxers today are largely upper middle class, the crowd opposing vaccination in the 19th century was largely composed of lower- and working-class British citizens, according to Durbach. “They felt that they were the particular targets, as a class group, for vaccination and for prosecution under the compulsory laws,” she says. “This was part of a larger expression of their sense of themselves as second-class citizens who thus lacked control over their bodies in the way that the middle and upper classes did not.” Unless the root issues are

addressed, the anti-vaccination movement will continue to resurface with different faces. By the close of the 19th century and the dawn of the 20th, the protests had come to a head. The anti-vaccination sentiment had spread to the U.S., garnering support in urban centers such as New York City and Boston. The British government ceded its stringent line to the protests of the people. The law was amended yet again in 1907 to make the exemptions easier to obtain—because of an extensive approval process, many parents could not obtain the necessary paperwork to claim the exemption before the child was more than four months old, past the deadline. The U.S. government, however, took a harder tack. In the 1905 Supreme Court ruling in the case of *Jacobson v. Massachusetts*, the court upheld the state government’s right to mandate vaccination. The Massachusetts Anti-Compulsory Vaccination Society lobbied hard for the court to rule in favor of the plaintiff, but all they won from the decision was the provision that individuals cannot be forcibly vaccinated. The protests quieted after these two decisions, but small pockets of unease have now bubbled up again. Durbach said that **unless the root issues are addressed—the boundaries of personal freedom versus social obligations—the movement will continue to resurface with different faces.**

2NC/1NR Impacts — Privacy Link

Privacy movements hurt economy

The privacy movement could tank the economy — hurts advertising, small business, and innovation

Wheeler 12 — Eric Wheeler, CEO and co-founder of 33 across, a company specializing in building tools for online publishers, 2012 ("How 'Do Not Track' is poised to kill online growth," CNET, 9-20-2012, Available Online at <http://www.cnet.com/news/how-do-not-track-is-poised-to-kill-online-growth/>, Accessed 7-20-2015)

Most painful, consumers themselves would end up suffering, gaining "privacy" (whatever that means in the context of anonymous data collection) at the cost of online subscription fees, less interesting and innovative online experiences, and less relevant advertising. On top of that, get ready for maximally confusing, overboard, opt-in mechanisms on every Website you visit. **We are headed for what feels like an anti-Internet, not a privacy movement.**

New "Do Not Track" policy could come out as soon as next year, so before it's too late, we need to step back and consider what's really at stake.

Compromising a \$300 billion industry

Online advertising has been one of the few unqualified success stories in our economy in recent years. By building a better infrastructure -- enabling brands to underwrite content and show relevant advertising -- the online ad industry has achieved an enviable growth rate. The Interactive Advertising Bureau (IAB) recently reported record ad revenues of \$8.4 billion for the first quarter of 2012, a 15 percent increase year-over-year. According to a recent Harvard study commissioned by the IAB, the online advertising ecosystem now accounts for \$300 billion of economic activity and 3.1 million jobs within the U.S.

But take away ad targeting, and the anonymous data collection that makes it possible, and **the bottom drops out virtually overnight.** Goodbye, relevant and effective ads, healthy rates, and healthy growth; welcome back, paywalls, jumping monkey ads, static tech growth, opt-in consent mechanisms and deep profiles tied to your personal information to replace anonymous, cookie-based behavioral advertising.

Handicapping small business

The perils of "Do Not Track" extend well beyond the ad industry. Small publishers and startup ventures alike stand to lose the most under more stringent online restrictions. Most of these companies depend heavily on advertising to generate revenue. Not just any advertising--but interest-based advertising provided by responsible third parties committed to strict industry regulation. Unable to leverage a targeted ad model, they'll likely drive consumers away when left only with paltry generic ads that scream for attention rather than attracting it through relevance -- and they'd have to run a lot more of them, cluttering the screen and infuriating consumers.

Better yet, they would have to employ subscription models where consumers pay a la carte to visit websites, for email, social networking, music, casual games, and other services. A double hit

on the economy: take away small businesses' means to make money and make consumers spend more. Good luck with that one.

Stifling innovation

Anonymous user data is far more than just a lens for ad delivery; for many startups, it's **the life's blood of innovation**. Once upon a time, a startup called Amazon revolutionized online retail, in part by leveraging behavioral shopping data that it gathered about its customers: by all accounts, this data has become a core piece of its shopping recommendation engine.

Similarly, Netflix uses anonymous, real-time user data to inform recommendations for its customers. The data Trulia processes helps real estate agents improve their listings, and enables consumers to buy or sell homes at the optimal time. Groupon uses mobile location data, as well as anonymous information on users' habits and interests, to help local businesses deliver daily deals to the right consumer at the right time and place.

The common denominator among all of these companies is that they use anonymous data to gain insight into their customers' favorite activities, interests, and connections, enabling them to create highly valuable online experiences that otherwise would have been impossible to deliver.

Is the FTC or W3C really aiming to prevent the next Amazon or Netflix from emerging?

Privacy movements threaten autonomous cars

Any advantages of autonomous cars require data collection and coordination that is threatened by privacy movements

Kohler and Colbert-Taylor 14 — William J. Kohler, Chief Legal Officer and Corporate Secretary at Dura Automotive Systems, LLC, and Alex Colbert-Taylor, J.D. Student at University of Michigan Law School, 2014 (“Current Law And Potential Legal Issues Pertaining To Automated, Autonomous And Connected Vehicles,” *Santa Clara High Technology Law Journal* (31 Santa Clara Computer & High Tech. L.J. 99), Available Online to Subscribing Institutions via Lexis-Nexis)

V. Privacy and Data Use

Far more profusely than today's vehicles, mature and market-ready autonomous vehicles will generate and broadcast personal data, the use and storage of which will implicate important privacy rights in complicated ways that will likely have to be faced well before Level 3 and Level 4 vehicles become a commercial reality. n131 Although exclusively sensor-based autonomous vehicles are certainly a possibility, n132 many of the most compelling reasons for adopting self-driving cars are dependent on the vehicles sharing and coordinating data with each other, both locally and through centralized infrastructure. It is self-evident that the efficient management of traffic at intersections, the intelligent distribution of traffic to minimize congestion, and the ability of autonomous vehicles to safely travel in close-packed platoons, for instance, are all largely or completely reliant on communication both between the individual vehicles and other cars in the vicinity, and between the autonomous vehicles and an external network. Even if this [*121] data is scrubbed of unique individual identifying markers, for instance VIN-numbers, or IP-or MAC-addresses, data-mining techniques will almost certainly be able to reconstruct personal identifying information about particular vehicles and by extension their regular occupants. n133 The way this data is used will be the subject of regulation and legal controversy. Concerns about user privacy have already drawn substantial attention from the media. n134

[Note to fellow students: Level 3 — Limited Self-Driving Automation, Level 4 — Full Self-Driving Automation]

Autonomous cars are threatened by privacy movements

Kohler and Colbert-Taylor 14 — William J. Kohler, Chief Legal Officer and Corporate Secretary at Dura Automotive Systems, LLC, and Alex Colbert-Taylor, J.D. Student at University of Michigan Law School, 2014 (“Current Law And Potential Legal Issues Pertaining To Automated, Autonomous And Connected Vehicles,” *Santa Clara High Technology Law Journal* (31 Santa Clara Computer & High Tech. L.J. 99), Available Online to Subscribing Institutions via Lexis-Nexis)

The 2012 push for consumer privacy protections seems to have made little progress, but there is some recent movement in Washington with respect to automakers' usage of personal data. In a December 2, 2013 open letter to auto industry executives, Senator Edward Markey of Massachusetts raised concerns about the disclosure of individual user data and aggregated data

from vehicles currently on the market, seeking information from automakers as to whom this data is shared with or sold to, how long the data is kept, whether vehicle users have any option to delete this data or else to have it not retained at all, and similar questions. n191 Senator Markey requested that automakers respond to his inquiry no later than January 3, 2014. n192 The Senator has not disclosed whether any responses were submitted, and if so, whether these responses will be made public.

2NC/1NR Impacts — Vaccine DAs

Warming/Environment

Vaccinations are key to adapt to warming.

Schulman 15 — Jeremy Schulman, Jeremy Schulman is based in Mother Jones' Washington bureau and works on the Climate Desk partnership. He was previously editor-in-chief of The American Independent and research and investigative director at Media Matters for America, 2-11-2015 ("Vaccines are one of our best weapons against global warming," Mother Jones, 2-11-2015, Available Online at <http://www.motherjones.com/environment/2015/02/vaccines-measles-rotavirus-climate-change>, Accessed 7-16-2015)

Sen. Rand Paul (R-Ky.) has suggested that vaccines cause "profound mental disorders." Paul has also said he's "not sure anybody exactly knows why" the climate changes. So the likely presidential contender would probably find this fact pretty confusing: According to leading scientists, vaccines are among the "most effective" weapons in our arsenal for combating the threats that global warming poses to human health.

In its landmark report (PDF) last year, the UN's Intergovernmental Panel on Climate Change warned that global warming poses a range of health threats—especially in the developing world. Warmer temperatures and changes in rainfall will reduce crop production, leading to malnutrition. Foodborne and waterborne illnesses will become a bigger problem. And, some scientists argue, diseases like malaria will spread as the insects that carry them migrate to new areas.

So how should humanity adapt to these dangers? The IPCC report lays out a slew of public health interventions, including widespread vaccination:

The most effective measures to reduce vulnerability in the near term are programs that implement and improve basic public health measures such as provision of clean water and sanitation, secure essential health care including vaccination and child health services, increase capacity for disaster preparedness and response, and alleviate poverty.

There are a number of reasons that vaccines will play an important role in our efforts to adapt to a warming world. The most obvious is their ability to protect vulnerable populations from diseases that will be made worse by climate change.

A prime example is rotavirus, a vaccine-preventable disease that can cause severe diarrhea. It killed roughly 450,000 children in 2008—mostly in South Asia and sub-Saharan Africa, according to the World Health Organization. "There is evidence that case rates of rotavirus are correlated with warming temperatures and high rainfall," according to Erin Lipp, an environmental health professor at the University of Georgia and a contributor to the IPCC report. This is particularly true in developing countries with poor sanitation and drinking water sources, Lipp explained in an email.

"A child weakened by measles is more likely to die from the malnutrition caused by climate change."

There are other, less direct, ways in which climate change can exacerbate a wide range of existing public health problems. Take measles, which is currently making a comeback in the

United States—thanks in large part to the unscientific claims of the anti-vaccination movement. Measles killed nearly 150,000 people worldwide in 2013; it's particularly common in parts of sub-Saharan Africa and South Asia that have extremely low vaccination rates—areas that will be hit especially hard by the impacts of climate change.

Unlike with rotavirus, there's no direct relationship between measles and global warming. But Kirk Smith—an environmental health expert at UC, Berkeley, and a lead author of the IPCC chapter on health impacts—points out that "a child weakened by measles is more likely to die from the malnutrition caused by climate change." In other words, anything we can do to reduce the impact of existing health problems will be even more important in a warming world. And vaccinating children, he says, is one of the most cost-effective public health tools we have.

Diseases like measles pose another threat, as well, says Alistair Woodward, who is also a lead author of the IPCC chapter. Woodward, an epidemiologist at the University of Auckland, points out that extreme climate events—crop failures in Africa, flooding in Bangladesh, and even storms like Hurricane Katrina—can displace large numbers of people. "In these circumstances, with crowding and poor living conditions, all the basic public health services are put under great strain," said Woodward in an email. "The risks of infection go through the roof, for all communicable diseases...So ensuring that people are vaccinated is a logical thing to do as part of managing the risks of a rapidly changing climate."

Of course, making sure people are inoculated against deadly diseases isn't easy. In the developing world, vaccination campaigns have to overcome transportation and security issues, as well as poor local health care systems. And these challenges, says Woodward, can dwarf the problems caused by the anti-vaxxer movement.

Anti-Vaxxers lead people to question environmental science.

Romm 15 — Joe Romm, Joe Romm is a Fellow at American Progress and is the Founding Editor of Climate Progress, which New York Times columnist Tom Friedman called "the indispensable blog" and Time magazine named one of the 25 "Best Blogs of 2010." In 2009, Rolling Stone put Romm #88 on its list of 100 "people who are reinventing America." Time named him a "Hero of the Environment" and "The Web's most influential climate-change blogger." Romm was acting assistant secretary of energy for energy efficiency and renewable energy in 1997, where he oversaw \$1 billion in R&D, demonstration, and deployment of low-carbon technology. He is a Senior Fellow at American Progress and holds a Ph.D. in physics from MIT, 2/9/2015 ("Medical Ethicist: Anti-Vaxxers Are Like Climate Science Deniers," ThinkProgress, 2/9/2015, Available Online at <http://thinkprogress.org/climate/2015/02/09/3620665/anti-vaxxers-like-climate-science-deniers/>, Accessed 7-14-2015)

If you feel a moral obligation to embrace science-based strategies to protect "unsuspecting infants" from serious dangers, should you be more concerned about those who oppose mandatory vaccinations for childhood diseases or those who oppose mandatory action against climate change?

That was a trick question: You should be exceedingly concerned about both, even though the dangers are very different in both timing and scale. Arthur Caplan, director of the Division of Medical Ethics at NYU Langone Medical Center's Department of Population Health, explains in the Washington Post:

Thankfully, only a few physicians in America have embraced fear-mongering in the middle of this dangerous and costly measles epidemic. They deserve a place of honor next to climate-change skeptics, anti-fluoridation kooks and Holocaust deniers. They doubt the facts, ignore established evidence and concoct their own pet theories. They shouldn't be allowed near patients, let alone TV cameras. But because their suggestions are so surprising and controversial, they often find themselves on cable news shows and in news reports about the "anti-vaxx" crowd. Their power, therefore, is radically disproportionate to their numbers.

Precisely.

Yet from MSNBC's "Morning Joe" Scarborough to the Wall Street Journal's editorial board, many leading conservatives want you to think that it's only that vaccine science that provides enough certainty to require government action. They are wrong. They ignore established evidence that the world's leading scientists and governments have "high confidence" the world faces "severe, pervasive and irreversible impacts for people and ecosystems" — devastating impacts that occur "even with adaptation" if we keep listening to the do-little or do-nothing crowd.

Last week, :

"There is not, at least in the science community, a debate about [vaccines causing autism] anymore," MSNBC's Scarborough said last week. "This is not even close, this is not even close — there is still a debate on climate change, the effects of climate change, how quickly climate change is coming on us. How much man contributes. There are a thousand different variables in that debate."

Not quite. There is very little debate in the scientific community about the conclusion that humans are the primary contributor — by far — to recent warming. The world's largest general scientific society, the American Association for the Advancement of Science, explained this in its blunt 2014 climate report, "What We Know":

The science linking human activities to climate change is analogous to the science linking smoking to lung and cardiovascular diseases. Physicians, cardiovascular scientists, public health experts and others all agree smoking causes cancer. And this consensus among the health community has convinced most Americans that the health risks from smoking are real. A similar consensus now exists among climate scientists, a consensus that maintains climate change is happening, and human activity is the cause.

We have a similar obligation to protect people from the dangers posed by climate change that we do to protecting people from the dangers posed by second-hand smoke

Scarborough apparently has no idea that the best estimate of climate scientists is that humans are responsible for all of the warming we have suffered since 1950. As the most recent IPCC report summarizing the recent scientific literature observations explains, "The best estimate of

the human-induced contribution to warming is similar to the observed warming over this period.” That line was sufficiently uncontroversial it was signed off on by all the major governments in the world.

The main “debate” on climate change among scientists is just how catastrophic the “irreversible” warming we face will be if we keep doing little or nothing to sharply reverse emissions trends, which is to say, if we keep listening either to people like Scarborough (aka the cocksure ignorati) or to the professional deniers.

Amazingly, the foremost climate-science-denying editorial page in the country — which belongs to Rupert Murdoch’s Wall Street Journal — is shocked, shocked that leading Republican politicians like Gov. Chris Christie (R-NJ) and Sen. Rand Paul (R-KY) have indicated doubt about vaccine science:

As for Mr. Paul, he will have to avoid these libertarian dormitory passions if he wants to be a credible candidate. Government doesn’t “force” parents to vaccinate children. The states impose penalties (such as barring attendance in public schools) on those who pose a risk to public health by refusing vaccinations against infectious diseases. This strikes us as a legitimate use of state “police powers” under the Constitution. It is also a reasonable and small sacrifice of liberty to prevent the potentially fatal infection of unsuspecting infants at Disneyland.

So it is a reasonable and small sacrifice of liberty to protect unsuspecting infants from serious harm by having the state impose penalties for those who don’t adhere to what science says is the optimal prevention strategy, in the case of vaccines. But for the Journal, it is wildly unreasonable and a major assault on liberty to protect unsuspecting infants — and billions of others — from serious harm by having the state impose penalties for those who don’t adhere to what science says is the optimal prevention strategy, in the case of climate change.

The Journal routinely spreads long-debunked disinformation, smears climate scientists and denigrates the entire climate science enterprise. A particularly inane a May 2013 op-ed actually urged “more atmospheric carbon dioxide”! Scientifically, that would be comparable to an op-ed urging “less vaccination.”

The Journal editors have a real contender in their pro-vaccine editorial for the most unintentionally hypocritical science piece of the year, especially with its final paragraph lecturing us on “human progress”:

“Let’s chalk up the weird science of Messrs. Paul and Christie to a lack of information, and we’re happy to send them 13 years of vaccine editorials if they want to study up,” the editorial concludes. “The not-so-great measles vaccine debate of 2015 is one of those events that makes us wonder if there is such a thing as human progress. But then we live in America, so we know there’s hope.”

Seriously, the Journal bemoaning whether “there is such a thing as human progress” is like Bernie Madoff bemoaning whether there is such a thing as business ethics or Chief Justice John Roberts bemoaning the overabundance of corporate money in politics....

Again, it's OK to use state power to protect "unsuspecting infants" from unvaccinated kids because science says so — and the WSJ will send you 13 years of editorials on the subject. But if you want to use state power to protect unsuspecting infants — and everyone else — from catastrophic climate change because science says so, well, the WSJ can send you 13 years of anti-science climate denial opposing all action and trashing our leading scientists.

One final note: In his Washington Post piece, Caplan puts anti-vaccination doctors in the same category as "climate-change skeptics" and "Holocaust deniers." I discussed my views on the term "deniers" in my December, post about the statement issued by four dozen leading scientists and science journalists/communicators urging the media to "Please stop using the word 'skeptic' to describe deniers" of climate science.

Disease — Measles Expensive

Measles outbreaks cost a lot of money.

Mnookin 15 — Seth Mnookin, 7-14-2015 ("» The financial implications of the US measles outbreaks," No Publication, 7-14-2015, Available Online at <http://blogs.plos.org/thepanicvirus/2011/05/25/the-financial-implications-of-the-us-measles-outbreaks/>, Accessed 7-14-2015)

Earlier today, the CDC released a report about the measles outbreaks that have been occurring across the country since the beginning of the year. (Hat tip to USA Today's Liz Szabo for this story.) I wrote a fair amount about measles in my book, and one reason measles outbreaks are so scary (and so difficult to contain) is that measles is the most infectious microbe known to man—it's transmission rate is around 90 percent. It has also killed more children than any other disease in history.

If you're skeptical about the correlation between measles vaccination rates and the spread of the disease, or about the danger deliberately unvaccinated members of the population pose to infants, you should check out the CDC's figures. They're pretty stunning:

* There have been 118 reported measles cases in the first nineteen weeks of the year — which is the highest number of infections for that period since 1996. That's particularly noteworthy because, as the CDC points out, "as a result of high vaccination coverage, measles elimination (i.e., the absence of endemic transmission) was achieved in the United States in the late 1990s and likely in the rest of the Americas since the early 2000s."

* Eighty-nine percent of all reported cases have been in people who've been unvaccinated. Almost 20 percent of that figure is made up of children who were less than a year old. That means they were too young to have received the first dose of the measles-mumps-rubella (MMR) vaccine, which is given once between the ages of twelve and fifteen months and again when a child is between four and six years old. Another twenty percent of the total number of reported infections were in children between the ages of one and four.

* Forty percent of the infections recorded so far this year have resulted in hospitalization — and 98 percent of the people who were hospitalized were unvaccinated. In its typically understated manner, the CDC noted that "nine [of the hospitalized patients] had pneumonia, but none had encephalitis and none died"— which is another way of saying that encephalitis and death are potential complications of serious cases of pneumonia.

The most significant factor in the spread of measles in the United States is the increase of pockets of the country where vaccination rates have declined below the level needed to maintain herd immunity` – and, similar to what occurred in the UK in the early part of the last decade, that decline can be traced back to the press-fueled panic sparked by anti-vaccine messiah Andrew Wakefield's discredited, retracted, and possibly fraudulent twelve-child case study linking the MMR vaccine to autism.

Indeed, it's striking just how many of the infections are clustered around Minnesota, where anti-vaccine activists have been for years targeting an immigrant Somali community...and where Wakefield has made multiple trips over the past several months:

Reported measles cases in US, Jan 1-May 20 2011

Anyone curious about how quickly a series of small measles conflagrations can spread horribly out of control should check out the situation currently unfolding in France, which is in the third year of a nation-wide outbreak.[^] In 2007, the number of reported cases in France was around forty. The next year, they jumped to six hundred...and they've been rising ever since. So far in 2011, there have been more than 6,400 infections in the country. Translated to a population the size of the US's, that would represent a jump from 188 cases to more than 28,000.

The toll that would take on the nation's health-care infrastructure is mind-boggling. Consider this: In 2008, a deliberately unvaccinated patient of "Dr. Bob" Sears caught measles while on vacation in Switzerland. That single infection ultimately resulted in a total of 12 cases...and the total cost of containing the outbreak topped \$150,000.

FOOTNOTES

[`] The beginning of this sentence had previously read, "The most significant factor in the spread of measles in the United States is declining vaccination rates." As some readers have pointed out, the overall vaccination rates in the country have more or less stayed the same; the issue is the increase in individual communities where vaccine refusal has grown.

[^] France also illustrates how the result of vaccine panics can be similar even when the roots causes are completely unrelated: A recent British Medical Journal story titled "Outbreak of measles in France shows no signs of abating" points out that "the publication in the Lancet in 1998 of the research article by Andrew Wakefield purporting to show a link between the MMR vaccine and autism had no significant effect on uptake of the MMR vaccine in France. The main vaccine controversy in France has centred on that against hepatitis B, and this has taken its toll on immunisation campaigns as a whole."

Measles are really expensive

Haelle 15 — Tara Haelle, I am a freelance science journalist and photojournalist who specializes in reporting on vaccines, pediatric and maternal health, parenting, nutrition, obesity, mental health, medical research, environmental health and the social sciences. My work has appeared in Scientific American, the Washington Post, Politico, Slate, NOVA, Wired, Science and Pacific Standard, and I write regularly for HealthDay, Frontline Medical Communications and my science and health mom blog Red Wine & Apple Sauce. I was the health editor at Double X Science and am currently co-authoring an evidence-based parenting book due in late 2015. I received my master's in journalism at the University of Texas at Austin (also my undergrad alma mater), and I teach journalism at Bradley University in Peoria, Ill. I previously taught high school and often think of my journalism as a form of teaching, by helping others understand science and medical research and by debunking misinformation about vaccines, chemicals and other misunderstood topics, 2-11-2015 ("Measles Outbreak in Dollars and Cents: It Costs Taxpayers

Bigtime," Forbes, 2-11-2015, Available Online at <http://www.forbes.com/sites/tarahaelle/2015/02/11/measles-outbreak-in-dollars-and-cents-it-costs-taxpayers-bigtime/>, Accessed 7-14-2015)

The official measles count is up to 121 cases in 17 states, the CDC reported on Monday, and 85 percent of those resulted from the outbreak stemming from the Disneyland exposure. That's more cases than were seen in all of 2012 – and it's only February.

Much virtual ink has been spilled in the past several weeks about what an awful disease measles can be, about the impact of irresponsible doctors' advice, and about the ramifications of not vaccinating on those unable to be vaccinated.

But only a handful of folks have talked about costs. Measles is expensive. Really expensive. And even if you live in a highly vaccinated area with no outbreaks, a measles case in your state – that's a third of the U.S. right now – still means health department tax dollars diverted from other programs to deal with a disease that was eliminated from the U.S. in 2000.

"These outbreaks have economic costs. They are disruptive," said Gregory Poland, head of the Mayo Clinic's Vaccine Research Group. "The smaller ones have cost a couple hundred dollars in public resources, and one cost nearly a million dollars. It's on the lesser side – health is more important – but it consumes public health resources that could be applied to the other pressing problems we face."

In 2011, the cost of 107 cases spread across 16 outbreaks cost local and state health departments an estimated \$2.7 million to \$5.3 million. Because measles is so contagious, infecting 90 percent of susceptible individuals and remaining airborne up to two hours after an infectious person has left the area, the number of contacts a single case can generate grows exponentially once an outbreak begins. The cases in 2011 involved contacting somewhere between 8,900 and 17,450 individuals, which required 42,000 to 83,000 personnel hours.

The outbreak tied to Disneyland is responsible for approximately 85% of the cases to date. Photo from the CDC.

The outbreak tied to Disneyland is responsible for approximately 85% of the cases to date. Photo from the CDC.

During another outbreak in 2008, during which an intentionally unvaccinated 7-year-old boy returned from Switzerland with the virus, San Diego grappled with 11 additional cases, costing taxpayers \$10,376 per case. That outbreak involved more than 800 exposed individuals, including 48 children too young to be vaccinated who had to be quarantined at a family cost of \$775 per child.

Among the ten measles cases in Illinois, eight are infants too young to be vaccinated, which means it's highly likely that other infants in those classrooms were exposed and may need to be quarantined for up to three weeks. If so, the costs will very likely be higher than they were in 2008.

Then there are the family costs of an actual measles case, which lasts about seven to ten days, though those costs are a bit harder to measure, according to health economist Adam Powell, president of Payer+Provider Syndicate Healthcare Consulting.

“While this cost can be absorbed by many employees through the use of sick days, employees with lower incomes are the least likely to have sick leave,” Powell said. “The Economic Policy Institute reported that the median wage for people without sick days is \$10 per hour. Assuming the person works five days a week, missing a week of work would cause a loss of \$400. If the absence extended to eight days of work and two days of weekend as a result of a ten day illness, the loss would be \$640.”

But that figure only accounts for an estimate of lost wages, not the any additional costs such as hospitalization. “After factoring in the cost of medical care, expenses could be even higher,” Powell said.

Contrast those numbers with the cost of the MMR (measles-mumps-rubella) vaccine, which prevents the measles in 95 percent of those who get one dose and 99 percent of those who get both doses. A provider under a CDC contract, such as those using the Vaccines for Children program, pays \$19.91* for a single pediatric dose of MMR (or \$37.04* for an adult dose), and the private sector price is \$59.91*.

Even those costs are not ones that consumers would have to pay, however.

“Although there is a cost to the vaccine, it is not borne by insured patients,” Powell said. “The Affordable Care Act requires that the MMR vaccine be fully covered without patient cost sharing in its provisions requiring the coverage of preventive services.”

It’s long been clear that the risk-benefit calculation from a health and scientific perspective comes down heavily in favor of the vaccine. Measles kills approximately one in 1,000 to 3,000 cases, and it causes brain damage from encephalitis in one in 1,000 cases, not including the individuals who develop pneumonia or other complications. The vaccine, by contrast, most commonly causes a fever, joint pain or mild rash and can cause a fever-caused seizure in one of 3,000 doses, a low platelets count (that usually resolves on its own) in one of 30,000 doses, or, in extremely rare situations, a severe allergic reaction in one in a million doses.

The cost-benefit calculation in dollars and cents looks pretty similar.

Racism

Diseases like measles disproportionately hurt African American communities.

As the Center for American Progress' Sam Fulwood III aptly pointed out in his recent analysis of the impact of the economic downturn in communities of color, there's an old saying that also applies when we're talking about health outcomes: "**When white folks catch a cold, black folks catch pneumonia.**"

And with the concerns of urban communities already less heard and less addressed in general, it's crucial that science and data dictate vaccination policy—not politics. So when our leaders make misguided and misinformed statements outside their space of expertise, it can undermine medical professionals who are trying to save lives.

Of course, that may not be the first thing on the minds of Republican presidential aspirants like Gov. Chris Christie of New Jersey and Sen. Rand Paul of Kentucky, who made irresponsible assertions this week that it's OK for parents to choose to ignore the science when it comes to decisions about the vaccination of their children. While Christie quickly backpedaled on his statements after a firestorm of public criticism, Paul—who is a physician—doubled down, stating that vaccines were to blame for "profound mental disorders" such as autism. This is simply not true.

These scientifically baseless assertions can lead to profoundly dangerous public health policy, particularly in communities of color. The ramifications for many African Americans and other minority groups are greater than for those who have better access to quality health care—as has been shown—even as the Affordable Care Act takes shape. These concerns are primary in densely populated urban centers or metropolitan areas, where communities of color are disproportionately concentrated.

As The Guardian's health editor Sarah Boseley correctly points out, infectious diseases "spread horrifyingly fast in cities." This was one major reason why, during my time as chief health officer of Washington, D.C., we instituted an ambitious citywide emergency school immunization

campaign in 2002 upon finding 21,000 public school students who had not been vaccinated to meet established standards. This was considered one of the largest immunization drives in U.S. history, and within just eight weeks we experienced a 99 percent success rate.

There was no conversation about choice, simply a conversation about how we could best protect the nearly 600,000 residents in the nation's capital and the tens of millions of people from across the world who visit each year. And at that time we were extremely sensitive about contagions and the spread of lethal infections, especially in the immediate wake of managing the country's first bioterrorism attack.

What's significant to note here is that we did this in a city that had, at the time, a majority-black population (more than 56 percent) and a public school population that is overwhelmingly African American.

In describing these communities, we frequently use the term "underserved." But in reality, communities of color in highly populated metro areas are highly underresourced. This makes these communities much more vulnerable to major epidemics, including measles. The need for surge capacity and an adequate emergency health care response is critical.

Measles is actually much more contagious than another disease that recently grabbed headlines, Ebola. Which makes the current political "debate" peculiar. Elected officials like Christie didn't hesitate to quarantine medical staff returning from fighting the disease in West Africa but appear somewhat nonchalant about fast-infecting measles. More alarming, and what some political leaders won't say, is that diseases like measles will spread faster in cities.

That will put people of color, especially African Americans, in the direct line of epidemiological fire, since nearly 20 of the largest cities in 13 states have black populations of 50 percent or higher.

The last major outbreak of measles in the United States erupted less than 25 years ago. More than 56,000 Americans were infected, including 11,000 nationwide who were hospitalized and, sadly, 123 reported fatalities. And as the Centers for Disease Control and Prevention later found, a disproportionate share of those infected were "inner-city, American Indian, Hispanic, non-Hispanic black and low-income children aged five years [or younger] who had not been vaccinated." In fact, the CDC discovered that "[r]acial/ethnic minority children were at three to 16 times greater risk for measles than were non-Hispanic white children."

This risk disparity is of particular concern to public health professionals and planners, and it was a main driver behind the federal government's creation of the Childhood Immunization Initiative in 1993.

For those who advocate for "choice," it's not an urban issue, but it is an example of mostly more affluent individuals imposing their preference on underresourced and vulnerable populations of color—which means, ultimately, that they are transferring the risk.

Anti vaxxers are privileged, although diseases mainly impact people of color.

Broadbent 15 — Elizabeth Broadbent, 2-9-2015 ("Why Vaccination Refusal Is a White Privilege Problem" xoJane, 2-9-2015, Available Online at <http://www.xojane.com/issues/vaccination-refusal-white-privilege>, Accessed 7-16-2015)

Vaccines work.

Anti-vaxxers will argue otherwise, but if they're given airtime, this will degenerate — like most vaccine discourse — into comparative science, misinformation, name-calling, and finally heated charges of baby-killing.

Someone will say all anti-vaxxers should be locked up, and someone else will invoke Hitler. So we're skipping that part. If you're interested in reading it, see the comment sections of every vaccine article ever.

Instead, let's look at the parents who refuse routine childhood vaccinations — and what that means.

There are two categories of kids without a full complement of routine vaccinations. Researchers call the first category the "undervaccinated": kids who have not received, for one reason or another, their all of their childhood shots. According to a study published in Pediatrics, these children tend to share several characteristics. Most live near the poverty level, in a central city. Their mothers are unlikely to be married or to have a college degree. And, most tellingly, undervaccinated children tend to be black.

Children without vaccinations, on the other hand, are generally referred to as "free riders"**: kids whose health gets a free ride from the immunity of the vaccinated people surrounding them (i.e. "the herd"). Their parents present a radically different profile from those of the undervaccinated kids. Free riders' mothers tend to be married and college-educated. Their household income generally averages above \$75,000. And those free riders are overwhelmingly white.

Ouch.

It doesn't take a methodological study to make sense of these numbers. Low-income city-dwelling mothers are less likely to enjoy easy access to the vaccinations themselves; one Los Angeles mother told a reporter that she had to schlep two kids on two different buses to get to her local clinic.

"These simple things were pretty difficult to get through," she says. This doesn't count the difficulties of making appointments in between full-time work and childcare, not to mention navigating the bureaucracy of Medicaid. These children's parents may worry about the ramifications of vaccine-preventable disease. But poverty can make it hard to do much about it. When you're worried about keeping the lights on, the rent paid, and the car running, routine vaxes understandably aren't high on your priority list.

Free riders, on the other hand, have easy access to vaccines — but choose not to use them. Free riders' parents believe vaccination itself to be far more dangerous than the risk of contracting a

vaccine-preventable disease. The maladies they attribute to standard childhood shots go way beyond the Jenny McCarthy/Andrew Wakefield autism debacle; they now include mercury and aluminum poisoning, increased risk of asthma, allergies, ADHD, ear infections, sinusitis, and brain damage of all stripes. If you can imagine a health concern, you can blame it on vaccines.

These parents tend to get their information about vaccination from like-minded parents, listservs, online groups, and natural-health gurus like Dr. Mercola and Dr. Tenpenny — both notoriously anti-vaccination. They rely, in fact, not on pediatricians, with their one-size-fits-all vaccine schedule, but on their own research: conducted mostly on the Internet, where stories of legitimate vaccine injury pass through news sites and Facebook groups like a horror-show version of Telephone.

Instead of vaccinations, free riders' parents claim other means of keeping their kids healthy. As Public Health professor Jennifer Reich argues, parents of non-vaccinated children believe breastfeeding, superior nutrition, and controlled environments (i.e., not daycare) keep disease at bay.

Unfortunately for most kids, these are all benefits of privilege.

With the lack of adequate maternity leave and laws to protect mothers' rights to pump breast milk, nursing in America has become a purview of the privileged mother, whose job — or whose decision to stay home — allows a stable nursing relationship. And despite WIC, SNAP, and other variations of food stamps, access to fresh, healthy food is also often out of reach for the poor, especially those who inhabit so-called food deserts. Finally, working mothers must rely on some kind of childcare, often institutionalized daycare. Undervaccinated children simply don't have access to the mythical protection free riders' parents invoke. As one such mother tells Reich, "I think there are some vaccines that maybe some kids, maybe it's okay for them to have, because maybe their parents. . . aren't at all educated and . . . so maybe they do need to rely more on outside sources, because that is being done to them."

Moreover, in general, children living in poverty have more government intervention in their lives. While it varies from state to state, and even social worker to social worker, many WIC recipients are required to produce shot records for their children. Social Services may use a lack of vaccinations as evidence of neglect. And as Reich says, more privileged parents "address experts as consultants and refuse their advice without fear of reprisal, choices less readily available to less privileged families, whose rejection of expert advice more easily results in state intervention, even around vaccination." A poor black woman refusing to give her kid an MMR shot might not just get the side-eye. She might earn herself a visit from Social Services.

Free riders' parents also often claim vaccine-preventable diseases are less dangerous than the vaccines themselves, particularly with illnesses like measles. Chicken pox (varicella) is seen as particularly innocuous, partly because most adults remember suffering through it with little more than an itch or two, and partly because of rumors that the vaccine will leave children vulnerable to shingles later in life (it won't). Whatever the dangers of the diseases, allowing children to catch them costs time and money: time taken off work to care for them, lost wages, and doctors' bills. It's more than many parents can afford, especially those without access to family or medical leave. As a rule, poor people don't throw pox parties.

Basically: It takes money and time to refuse vaccinations. And it's a lack of that same money and time that often unintentionally keeps parents from fully vaccinating their children.

This has serious public health repercussions. The head of the Sabin Institute for Vaccine Research, Peter Hortez points out that when vaccine rates start to drop, the people who suffer will be "people who live in poor, crowded conditions. So it's going to affect the poorest people in our country."

Privileged, usually white, free riders, who enjoy limited social contact, superior nutrition, and better medical care will likely have a lower incidence of complications of death from those diseases. The undervaccinated will be the ones to suffer: overwhelmingly black children from low-income families.

The anti-vaccine movement, then, affects more than just the privileged children whose parents choose to forgo vaccination. As scientists at Johns Hopkins recently said while investigating a whooping cough outbreak, "geographic pockets of vaccine exemptors pose a risk to the whole community."

That whole community doesn't just include the usual suspects: infants, the elderly, the immunocompromised, the vaccinated for whom the antigen simply didn't take. It also includes the marginalized who lack easy access to basic health care. Those marginalized communities are usually people of color. The anti-vaccination community is overwhelmingly white. In a very real sense, this leaves two distinct undervaccinated populations in America: privileged (largely) white people who've chosen to eschew modern medicine, and underprivileged minorities whose poverty has placed them, unwillingly, in that position. And it's the latter who will suffer more gravely for it, because the same economic and health factors that make their children vulnerable to undervaccination make them vulnerable to the worst effects of the diseases themselves.

Privileged white people refuse the vaccines in the name of individual freedom.

And public health suffers; this especially affects the lives of the poor. This will, of course, provoke unmitigated outrage from the anti-vaccination community as a whole.

Is the anti-vax movement itself racist? No. But it's buttressed by class and race privilege.

A drop in vaccination rates poses a danger to us all. But it poses a special danger to those least able to cope with serious illness, and least likely to be (unintentionally) fully vaccinated: minority, city-dwelling children.

Anti-Vaxxers = Anti-science

Anti-vaxxers are proponents of anti-science.

Huppke 15 — Rex W. Huppke, after earning a master's degree from the University of Missouri Graduate School of Journalism, he launched his career working for the Associated Press in Indiana. In 2003, he joined the staff of the Chicago Tribune, writing about everything from gang violence and inner-city poverty to the glory of competitive arm wrestling and a southern Illinois town famous for its albino squirrels, 2-3-2015 ("The anti-vaccine crowd could use an anti-science expert," The Chicago Tribune, 2-3-2015, Available Online at <http://www.chicagotribune.com/news/opinion/huppke/ct-talk-huppke-vaccines-20150203-story.html>, Accessed 7-16-2015)

I'm not exactly sure what "science" means. I could look it up in a dictionary, but I don't believe in dictionaries. I've heard they cause brainwashing and are in the pocket of Big Lexicography.

Besides, as a word-user, I think I'm best-qualified to determine the meanings of my words. That's why I pancake eggplant every chance I schadenfreude.

It's thanks to that kind of logic that America faces the return of the once-eradicated measles virus. A small, vocal and highly insufferable portion of the population has taken it upon themselves to doubt the irrefutable scientific evidence that childhood vaccinations are safe and effective. And so they don't vaccinate their kids.

According to the Centers for Disease Control and Prevention, there are now more than 100 measles cases in 14 states. And that's just in January. For all of last year, there were 644 cases in 27 states.

"We are very concerned by the growing number of people who are susceptible to measles, and to the possibility that we could have a large outbreak in this country as a result," CDC Director Tom Frieden said Sunday on CBS's "Face the Nation."

President Barack Obama also addressed the vaccination debate, telling NBC News: "You should get your kids vaccinated — it's good for them. We should be able to get back to the point where measles effectively is not existing in this country."

The problem is, we've got too many people who believe in "ecneics" (pronounced eck-nakes), which is "science" spelled backward. While scientists study the physical and natural world and reach consensus based on experimentation and observation, ecneictists (eck-nake-tists) look at a scientific consensus and then decide the opposite is true because that's what they want to believe.

A new Pew Research Center study highlights the growing gap between scientists and ecneictists. Asked if childhood vaccines, including one for measles, should be required, 68 percent of adults said yes compared with 86 percent of scientists with the American Association for the Advancement of Science. There was a 37-point gap between scientists and the public on whether climate change is "mostly due to human activity," with 50 percent of adults saying yes versus 87 percent of scientists.

And on whether it's safe to eat genetically modified foods, nearly 90 percent of scientists said yes compared with only 37 percent of non-scientists.

In most rifts between scientists and those who doubt them, someone claiming a certain level of expertise jumps in and sides with the regular folks, giving "proof" that their anti-science belief must be true. It could be anyone from a Greenpeace agricultural activist to a global-warming-denying politician to an anti-vaccine doctor.

One such pseudo-expert who has stood up for the anti-vaccine crowd lately is Jack Wolfson, an Arizona-based cardiologist, formerly of Chicago. According to his website, Wolfson became aware of the "brainwashing of medical training" after meeting the woman who would become his wife, a chiropractor with "a heavy focus on nutrition and healthy, chemical-free living."

It's your classic cardiologist-meets-chiropractor, cardiologist-falls-in-love-with-chiropractor, cardiologist-becomes-opponent-of-well-established-medical-science story. Totally legit.

Now Wolfson is saying things like this to the Washington Post: "Don't be mad at me for speaking the truth about vaccines. Be mad at yourself, because you're, frankly, a bad mother. You didn't ask once about those vaccines. You didn't ask about the chemicals in them. You didn't ask about all the harmful things in those vaccines. ... People need to learn the facts."

The fact is that people like Wolfson are shameless opportunists who encourage parents to embrace an arrogant, reckless and unhealthy belief. And because people want so desperately to believe what they believe — science be damned — Wolfson and his ilk probably make good money being contrarians.

So count me in. If you're a practicing science-denier and need someone to shamelessly vouch for your harebrained belief, I'm the expert for you — assuming you have a lot of money.

It's a well-established fact(oid) that journalists know a little about everything and a lot about nothing. That makes me the perfect person to speak with great authority about things with which I am barely familiar.

Say you don't believe in electricians. I wholeheartedly agree, and will stake my years of occasionally using the word "electrician" in newspaper stories on the belief that no "trained and licensed expert" knows the wiring in your house better than you do.

If that wiring is faulty and your house burns down, that's just nature's way of saying you need a new house. And if the fire from your house spreads across the whole neighborhood, that's not your fault. You can't be held responsible for the flammability of other people's homes.

See how easy this is?

Based on the swift and utterly absurd resurgence of measles, it seems being an advocate for incorrect causes might be a growth industry. And if people continue to doubt science, it seems like measles might be the least of our problems.

Which is why I shall pancake eggplant every chance I schadenfreude.

Antiscience is growing

Otto 12 — Shawn Lawrence Otto, Co-founder of ScienceDebate.org and author of Fool Me Twice: Fighting the Assault on Science in America. He is recipient of IEEE-USA's Award for Distinguished Public Service and writes for the Huffington Post and blogs at Neorenaissance.org, Shawn Lawrence Otto is an American novelist, nonfiction author, filmmaker, political strategist, speaker, science advocate, and screenwriter and co-producer of the movie House of Sand and Fog, 10-16-2012 ("Antiscience Beliefs Jeopardize U.S. Democracy," No Publication, 10-16-2012, Available Online at <http://www.scientificamerican.com/article/antiscience-beliefs-jeopardize-us-democracy/>, Accessed 7-20-2015)

It is hard to know exactly when it became acceptable for U.S. politicians to be antiscience. For some two centuries science was a preeminent force in American politics, and scientific innovation has been the leading driver of U.S. economic growth since World War II. Kids in the 1960s gathered in school cafeterias to watch moon launches and landings on televisions wheeled in on carts. Breakthroughs in the 1970s and 1980s sparked the computer revolution and a new information economy. Advances in biology, based on evolutionary theory, created the biotech industry. New research in genetics is poised to transform the understanding of disease and the practice of medicine, agriculture and other fields.

The Founding Fathers were science enthusiasts. Thomas Jefferson, a lawyer and scientist, built the primary justification for the nation's independence on the thinking of Isaac Newton, Francis Bacon and John Locke—the creators of physics, inductive reasoning and empiricism. He called them his “trinity of three greatest men.” If anyone can discover the truth by using reason and science, Jefferson reasoned, then no one is naturally closer to the truth than anyone else. Consequently, those in positions of authority do not have the right to impose their beliefs on other people. The people themselves retain this inalienable right. Based on this foundation of science—of knowledge gained by systematic study and testing instead of by the assertions of ideology—the argument for a new, democratic form of government was self-evident.

Yet despite its history and today's unprecedented riches from science, the U.S. has begun to slip off of its science foundation. Indeed, in this election cycle, some 236 years after Jefferson penned the Declaration of Independence, several major party contenders for political office took positions that can only be described as “antiscience”: against evolution, human-induced climate change, vaccines, stem cell research, and more. A former Republican governor even warned that his own political party was in danger of becoming “the antiscience party.”

Such positions could typically be dismissed as nothing more than election-year posturing except that they reflect an anti-intellectual conformity that is gaining strength in the U.S. at precisely the moment that most of the important opportunities for economic growth, and serious threats to the well-being of the nation, require a better grasp of scientific issues. By turning public opinion away from the antiauthoritarian principles of the nation's founders, the new science denialism is creating an existential crisis like few the country has faced before.

In late 2007 growing concern over this trend led six of us to try to do something about it. Physicist Lawrence M. Krauss, science writer and film director Matthew Chapman (who is Charles Darwin's great-great-grandson), science philosopher Austin Dacey, science writer Chris

Mooney, marine biologist Sheril Kirshenbaum and I decided to push for a presidential science debate. We put up a Web site and began reaching out to scientists and engineers. Within weeks 38,000 had signed on, including the heads of several large corporations, a few members of Congress from both parties, dozens of Nobel laureates, many of the nation's leading universities and almost every major science organization. Although presidential hopefuls Barack Obama and John McCain both declined a debate on scientific issues, they provided written answers to the 14 questions we asked, which were read by millions of voters.

In 2012 we developed a similar list, called “The Top American Science Questions,” that candidates for public office should be answering [see “Science in an Election Year” for a report card by Scientific American's editors measuring how President Obama and Governor Mitt Romney did]. The presidential candidates' complete answers, as well as the responses provided by key congressional leaders to a subset of those questions, can be found at www.ScientificAmerican.com/nov2012/science-debate and at www.sciencedebate.org/debate12.

These efforts try to address the problem, but a larger question remains: What has turned so many Americans against science—the very tool that has transformed the quality and quantity of their lives?

Antiscience grows on the political system

Otto 12 — Shawn Lawrence Otto, Co-founder of ScienceDebate.org and author of Fool Me Twice: Fighting the Assault on Science in America. He is recipient of IEEE-USA's Award for Distinguished Public Service and writes for the Huffington Post and blogs at Neorenaissance.org, Shawn Lawrence Otto is an American novelist, nonfiction author, filmmaker, political strategist, speaker, science advocate, and screenwriter and co-producer of the movie House of Sand and Fog, 10-16-2012 ("Antiscience Beliefs Jeopardize U.S. Democracy," No Publication, 10-16-2012, Available Online at <http://www.scientificamerican.com/article/antiscience-beliefs-jeopardize-us-democracy/>, Accessed 7-20-2015)

A Call to Reason

Today's denial of inconvenient science comes from partisans on both ends of the political spectrum. Science denialism among Democrats tends to be motivated by unsupported suspicions of hidden dangers to health and the environment. Common examples include the belief that cell phones cause brain cancer (high school physics shows why this is impossible) or that vaccines cause autism (science has shown no link whatsoever). Republican science denialism tends to be motivated by antiregulatory fervor and fundamentalist concerns over control of the reproductive cycle. Examples are the conviction that global warming is a hoax (billions of measurements show it is a fact) or that we should “teach the controversy” to schoolchildren over whether life on the planet was shaped by evolution over millions of years or an intelligent designer over thousands of years (scientists agree evolution is real). Of these two forms of science denialism, the Republican version is more dangerous because the party has taken to attacking the validity of science itself as a basis for public policy when science disagrees with its ideology.

It gives me no pleasure to say this. My family founded the Minnesota Republican Party. But much of the Republican Party has adopted an authoritarian approach that demands ideological conformity, even when contradicted by scientific evidence, and ostracizes those who do not conform. It may work well for uniform messaging, but in the end it drives diverse thinkers away—and thinkers are what we need to solve today's complex problems.

This process has left a large, silent body of voters who are fiscally conservative, who believe in science and evidence-based policies, and who are socially tolerant but who have left the party. In addition, Republican attacks on settled scientific issues—such as anthropogenic climate change and evolution—have too often been met with silence or, worse, appeasement by Democrats.

Governor Romney's path to endorsement exemplifies the problem. “I don't speak for the scientific community, of course, but I believe the world is getting warmer,” Romney told voters in June 2011 at a town hall meeting after announcing his candidacy. “I can't prove that, but I believe based on what I read that the world is getting warmer, and number two, I believe that humans contribute to that.” Four days later radio commentator Rush Limbaugh blasted Romney on his show, saying, “Bye-bye nomination. Bye-bye nomination, another one down. We're in the midst here of discovering that this is all a hoax. The last year has established that the whole premise of man-made global warming is a hoax! And we still have presidential candidates who want to buy into it.

By October 2011 Romney had done an about-face. “My view is that we don't know what's causing climate change on this planet, and the idea of spending trillions and trillions of dollars to try and reduce CO2 emissions is not the right course for us,” he told an audience in Pittsburgh, then advocated for aggressive oil drilling. And on the day after the Republican National Convention, he tacked back toward his June 2011 position when he submitted his answers to ScienceDebate.org.

Romney is not alone in appreciating the political necessity of embracing antiscience views. House Speaker John A. Boehner, who controls the flow of much legislation through Congress, once argued for teaching creationism in science classes and asserted on national television that climate scientists are suggesting that carbon dioxide is a carcinogen. They are not. Representative Michele Bachmann of Minnesota warned in 2011 during a Florida presidential primary debate that “innocent little 12-year-old girls” were being “forced to have a government injection” to prevent infection with human papillomavirus (HPV) and later said the vaccine caused “mental retardation.” HPV vaccine prevents the main cause of cervical cancer. Religious conservatives believe this encourages promiscuity. There is no evidence of a link to mental retardation.

In a separate debate, Republican candidate Jon Huntsman was asked about comments he had made that the Republican Party is becoming the antiscience party. “All I'm saying,” he replied, “is that for the Republican Party to win, we can't run from science.” Republican primary voters apparently disagreed. Huntsman, the lone candidate to actively embrace science, finished last in the polls.

In fact, candidates who began to lag in the GOP presidential primaries would often make antiscience statements and would subsequently rise in the polls. Herman Cain, who is well respected in business circles, told voters that “global warming is poppycock.” Newt Gingrich, who supported doubling the budget of the National Institutes of Health and who is also a supporter of ScienceDebate.org, began describing stem cell research as “killing children in order to get research material.” Candidates Rick Perry and Ron Paul both called climate change “a hoax.” In February, Rick Santorum railed that the left brands Republicans as the antiscience party. “No. No, we're not,” he announced. “We're the truth party.”

Antiscience reproductive politics surfaced again in August, this time in one of the most contested U.S. Senate races. Todd Akin, who is running in Missouri against Claire McCaskill, said that from what he understood from doctors, pregnancy from rape is extremely rare because “if it's a legitimate rape, the female body has ways to try to shut that whole thing down.” Akin sits on the House Committee on Science, Space, and Technology, which is responsible for much of the U.S. federal science enterprise, so he should be aware of what science actually says about key policy issues. In fact, studies suggest that women are perhaps twice as likely to become pregnant from rape, and, in any event, there is no biological mechanism to stop pregnancy in the case of rape. Akin's views are by no means unusual among abortion foes, who often seek to minimize what science says to politically justify a no-exception antiabortion stance, which has since become part of the 2012 national GOP platform.

A look at down-ticket races suggests that things may get worse. The large crop of antiscience state legislators elected in 2010 are likely to bring their views into mainstream politics as they eventually run for Congress. In North Carolina this year the state legislature considered House Bill No. 819, which prohibited using estimates of future sea-level rise made by most scientists when planning to protect low-lying areas. (Increasing sea level is a predicted consequence of global warming.) The proposed law would have permitted planning only for a politically correct rise of eight inches instead of the three to four feet that scientists predict for the area by 2100.

Knowledge and facts are key to prevent anti-science

Otto 12 — Shawn Lawrence Otto, Co-founder of ScienceDebate.org and author of Fool Me Twice: Fighting the Assault on Science in America. He is recipient of IEEE-USA's Award for Distinguished Public Service and writes for the Huffington Post and blogs at Neorenaissance.org, Shawn Lawrence Otto is an American novelist, nonfiction author, filmmaker, political strategist, speaker, science advocate, and screenwriter and co-producer of the movie House of Sand and Fog, 10-16-2012 ("Antiscience Beliefs Jeopardize U.S. Democracy," No Publication, 10-16-2012, Available Online at <http://www.scientificamerican.com/article/antiscience-beliefs-jeopardize-us-democracy/>, Accessed 7-20-2015)

An Existential Crisis

“Facts,” John Adams argued, “are stubborn things; and whatever may be our wishes, our inclinations, or the dictates of our passion, they cannot alter the state of facts and evidence.” When facts become opinions, the collective policymaking process of democracy begins to break down. Gone is the common denominator—knowledge—that can bring opposing sides together.

Government becomes reactive, expensive and late at solving problems, and the national dialogue becomes mired in warring opinions.

In an age when science influences every aspect of life—from the most private intimacies of sex and reproduction to the most public collective challenges of climate change and the economy—and in a time when democracy has become the dominant form of government on the planet, it is important that the voters push elected officials and candidates of all parties to explicitly state their views on the major science questions facing the nation. By elevating these issues in the public dialogue, U.S. citizens gain a fighting chance of learning whether those who would lead them have the education, wisdom and courage necessary to govern in a science-driven century and to preserve democracy for the next generation.

Anti-science Impact — Authoritarianism

Antiscience leads to authoritarian regimes, dominant narratives win and the voter remains uninformed.

Otto 12 — Shawn Lawrence Otto, Co-founder of ScienceDebate.org and author of Fool Me Twice: Fighting the Assault on Science in America. He is recipient of IEEE-USA's Award for Distinguished Public Service and writes for the Huffington Post and blogs at Neorenaissance.org, Shawn Lawrence Otto is an American novelist, nonfiction author, filmmaker, political strategist, speaker, science advocate, and screenwriter and co-producer of the movie House of Sand and Fog, 10-16-2012 ("Antiscience Beliefs Jeopardize U.S. Democracy," No Publication, 10-16-2012, Available Online at <http://www.scientificamerican.com/article/antiscience-beliefs-jeopardize-us-democracy/>, Accessed 7-20-2015)

An Antiscience Philosophy

If both Democrats and Republicans have worn the antiscience mantle, why not just wait until the pendulum swings again and denialism loses its political potency? The case for action rests on the realization that for the first time since the beginning of the Enlightenment era in the mid-17th century, the very idea of science as a way to establish a common book of knowledge about the world is being broadly called into question by heavily financed public relations campaigns.

Ironically, the intellectual tools currently being used by the political right to such harmful effect originated on the academic left. In the 1960s and 1970s a philosophical movement called postmodernism developed among humanities professors displeased at being deposed by science, which they regarded as right-leaning. Postmodernism adopted ideas from cultural anthropology and relativity theory to argue that truth is relative and subject to the assumptions and prejudices of the observer. Science is just one of many ways of knowing, they argued, neither more nor less valid than others, like those of Aborigines, Native Americans or women. Furthermore, they defined science as the way of knowing among Western white men and a tool of cultural oppression. This argument resonated with many feminists and civil-rights activists and became widely adopted, leading to the “political correctness” justifiably hated by Rush Limbaugh and the “mental masturbation” lampooned by Woody Allen.

Acceptance of this relativistic worldview undermines democracy and leads not to tolerance but to authoritarianism. John Locke, one of Jefferson's “trinity of three greatest men,” showed why almost three centuries ago. Locke watched the arguing factions of Protestantism, each claiming to be the one true religion, and asked: How do we know something to be true? What is the basis of knowledge? In 1689 he defined what knowledge is and how it is grounded in observations of the physical world in An Essay Concerning Human Understanding. Any claim that fails this test is “but faith, or opinion, but not knowledge.” It was this idea—that the world is knowable and that objective, empirical knowledge is the most equitable basis for public policy—that stood as Jefferson's foundational argument for democracy.

By falsely equating knowledge with opinion, postmodernists and antiscience conservatives alike collapse our thinking back to a pre-Enlightenment era, leaving no common basis for public policy. Public discourse is reduced to endless warring opinions, none seen as more valid than

another. Policy is determined by the loudest voices, reducing us to a world in which might makes right—the classic definition of authoritarianism.

Reporters who agree with this statement will not dig to get to the truth and will tend to simply present “both sides” of contentious issues, especially if they cannot judge the validity of scientific evidence. This kind of false balance becomes a problem when one side is based on knowledge and the other is merely an opinion, as often occurs when policy problems intersect with science. If the press corps does not strive to report objective reality, for which scientific evidence is our only reliable guide, the ship of democracy is set adrift from its moorings in the well-informed voter and becomes vulnerable once again to the tyranny that Jefferson feared.

Anti-science Impact — Warming

Warming and public health are inextricably linked.

Abrams 15 — Lindsay Abrams, Lindsay Abrams is an assistant editor at Salon and a former writer and producer for The Atlantic's Health Channel, 2-6-2015 ("What the anti-vaxx backlash can teach us about climate change: We need to be way angrier," Salon, 2-6-2015, Available Online at http://www.salon.com/2015/02/06/what_the_anti_vaxx_backlash_can_teach_us_about_climate_change_we_need_to_be_way_angrier/, Accessed 7-20-2015)

The words were barely out of the 2016 hopefuls' mouths before they were quickly made to regret them.

The backlash to comments made by Chris Christie and Rand Paul this week — suggesting that parents should be able to choose whether to vaccinate their children — was fast, furious and nearly universal, even among conservative news outlets. To wit: Fox News host Megyn Kelly stood up for "Big Brother" as a means of ensuring herd immunity. Breitbart News argued that Christie and Paul deserved the media criticism being hurled their way. And, in a stinging rebuttal, the Wall Street Journal editorial board rebuked Paul for "indulging bad science," calling vaccination laws "a reasonable and small sacrifice of liberty to prevent the potentially fatal infection of unsuspecting infants at Disneyland."

It was a bipartisan takedown driven not by politics, but a much deeper sense of moral outrage: that it is wrong to ignore science, and a downright crime when, in so doing, you put our children's health at risk. And as a society, we will not tolerate it.

Now, if only we could take that same outrage and channel it at climate change — and the denialists running our government.

The scientific consensus on man-made climate change, after all, is incredibly strong, and the health impacts of burning fossil fuels are undeniable. Air pollution is the "single largest environmental health risk" facing the world today, as well as a leading cause of cancer, and children are particularly vulnerable to its effects. Last June, when the EPA introduced its plan to limit pollution from coal-fired power plants, it emphasized the fact that we'd feel the benefit, first, in our lungs. Indeed, the American Lung Association predicted the rules could prevent up to 4,000 premature deaths and 100,000 asthma attacks in their first year alone. The agency took the same tack this past November when it unveiled its proposal to crack down on smog-causing ozone, arguing that the current standard of 75 parts per billion is too weak to protect public health.

Even if mitigating climate change was only a side effect of creating cleaner air, such policies would still be worth pursuing. But climate change is a public health threat in its own right, creating the conditions for new and intensified risks, many of which we're already experiencing.

In an investigative piece for Mother Jones, David Ferry attempts to garner outrage for the plight of prisoners in California's Central Valley, thousands of whom have fallen ill from valley fever. The potentially fatal disease, contracted from fungal spores and kicked up by dust, is raging

through the Southwest, fueled in part by a climate that's becoming increasingly hot and dry. "If valley fever was endemic to the hills above Rodeo Drive or the boulevards of Palo Alto and struck down Caucasians with the ferocity it lays out African Americans," Ferry charges, "it would be the kind of public health emergency that sends Anderson Cooper into the field with a face mask." And as climate change worsens, experts say, so too will the epidemic.

Then, there are the mosquitoes, which are growing in number and range where climate change leads to warmer and wetter conditions. As the insects continue to creep north, as scientists predict, the U.S. could see dengue fever epidemics of the sort that created a public health emergency in Central America last summer. (Globally, a recent study found, billions more will become newly vulnerable to the disease.) Meanwhile, other diseases Americans have barely if ever even seen before — like the painful, mosquito-born chikungunya — are posing a brand-new threat: Researchers at Yale University have warned of the potential for "a historic epidemic on U.S. shores." And Chagas disease, which is already gaining a foothold in Texas, is similarly poised to explode. Referring to the need for expensive, long-term treatment and the disease's disproportionate effect on the poor, tropical disease experts at Baylor College of Medicine in Houston dubbed it "the new AIDS of the Americas."

The list of climate-change threats goes on: air pollution from increased wildfires, the rising threat of waterborne illness, the health risks and hazards posed by natural disasters and the mental health impacts that can arise in their aftermath. A recent survey of members of the American Thoracic Society — physicians who specialize in respiratory and critical care — revealed that the majority are already seeing symptoms in their patients that they believe are linked to climate change. That includes an increase in chronic respiratory disease from air pollution, but also increases in symptoms of allergies and in injuries attributed to extreme weather.

And that's to say nothing of the threats of extreme heat, itself already the leading cause of weather-related deaths in the U.S. The National Climate Assessment warns that heat waves are projected to increase in frequency, intensity and duration, putting urban populations, and the poor in particular, at risk of death due to heat stroke, as well as cardiovascular, respiratory and cerebrovascular disease.

Over and over again, it's the most vulnerable — children and the elderly, the sick and the immunocompromised, the poor and certain minority groups — who get thrown under the bus when leaders ignore the risks in favor of scoring political points.

If the U.S. could get a handle on reducing greenhouse gas emissions, a recent study in the journal *Climatic Change* concluded, we could save between \$6 billion and \$14 billion in healthcare costs in 2020 — and between \$10 billion and \$24 billion if we really cracked down. Climate policy, in other words, is public health policy, and ignoring the science behind the former is a direct attack on the latter. This isn't a new idea, but it's one that's failed, thus far, to trigger our primal desire to protect the commons from the anti-science antics of the few.

Why aren't we angrier? Climate change is a more abstract issue, to be sure, as well as one that lacks a clear villain — it's easier to castigate a small group of people for threatening the larger public than to acknowledge the culpability we all share in climate change, not to mention the

sacrifices we'll all have to make to address it head-on. The anti-vaxxer community may be an intractable force, but they've got nothing compared to the money and power wielded by special interests insisting that climate change is a giant hoax — and who, in so doing, lead others to believe that the science isn't nearly as settled as it in fact is.

But where anti-vaxxers and climate deniers differ, the same logic that caused us to lash out at politicians pandering to the former should carry over to the latter. Science denial, in all its forms, has consequences. And it's about time we stopped tolerating it.

Economy

Vaccinations greatly help third world economies.

Berkley, 12— Seth Berkley, Seth Berkley is the founder and former president and CEO of IAVI. A medical doctor specializing in infectious disease epidemiology, Seth currently serves as president and CEO of the GAVI Alliance. Before launching IAVI in 1996, Berkley was an officer of the Health Sciences Division at the Rockefeller Foundation. Prior to that, he worked for the Center for Infectious Diseases of the US Centers for Disease Control and Prevention, the Massachusetts Department of Public Health, and for the Carter Center, where he was assigned as an epidemiologist at the Ministry of Health in Uganda. Seth played a key role in Uganda's first national HIV sero-survey and helped develop its National AIDS Control programs. He has been featured on the cover of Newsweek, recognized by TIME magazine as one of the "100 Most Influential People in the World" and by Wired Magazine as among "The Wired 25" —a salute to dreamers, inventors, mavericks and leaders. He has consulted or worked in more than 25 countries in Asia, Africa and Latin America. Berkley received his undergraduate and medical degrees from Brown University, and trained in internal medicine at Harvard University, 12-7-2012 ("How vaccines save lives, grow economies," CNN, 12-7-2012, Available Online at <http://www.cnn.com/2012/12/07/opinion/vaccine-gavi-seth-berkley/>, Accessed 7-21-2015)

We all know that vaccines save lives by protecting people against disease. What is less well-known is that vaccines also are an engine for economic growth -- far beyond their health benefits.

I am reminded of this in Tanzania this week, where my organization, the GAVI Alliance, is hosting a conference for its partners. GAVI's mission is to save children's lives and protect people's health by increasing access to immunization in developing countries.

We don't do this alone. We have many partners, including prominent companies that work closely with GAVI. They recognize that in addition to the humanitarian need, countries such as Tanzania are emerging markets that can fulfill their economic ambitions only if they also can ensure good health for their citizens.

The private sector is a critical part of the equation. Our corporate partners know they can do well by doing good.

Consider Tanzania. It has an ambitious five-year development plan that aims to transform the country into a middle-income economy by 2025. The plan includes critical funding to ensure a healthy population by strengthening the health system, which will significantly improve child and maternal mortality rates.

Tanzania already has begun this process by working closely with GAVI and its partners to significantly increase its routine vaccine coverage rates to above 90% today from 79% in 2001, the year before GAVI began its work there, according to data from the World Health Organization and UNICEF. At the same time, Tanzania's GDP growth has been astounding, rising to \$23.7 billion last year from \$10.2 billion in 2001, according to the World Bank.

Is there a connection? Further study is needed in the case of Tanzania. But we know for a fact that vaccines -- in addition to saving lives and improving health -- are the cornerstone of a vibrant economy, fuel growth and serve as a magnet for foreign investment. Indeed, research has shown vaccines to be among the most cost-effective investments in global development.

This has been borne out of several independent studies that look beyond the health impacts toward areas such as cognitive development, educational attainment, labor productivity and financial attainment.

In other words, healthier children -- spurred by immunization -- attend school more often, learn more while they are there and remain in school longer. As adults, they therefore are more productive, earn more money, save and invest more, and live longer. Healthier children also spread less disease through the adult population, further increasing productivity.

These academic papers, including one recently published that focuses on how to measure the economic benefits of the HPV vaccine, are getting noticed in African countries -- not only by health ministers, but also by finance ministers and other officials.

For instance, I attended a landmark meeting in Tunis in July organized by the African Development Bank, where its President Donald Kaberuka brought together a variety of ministers and experts to discuss how to allocate budgets and make healthcare a national priority.

I was in Tunis because of the wide recognition that immunization can be the high-octane fuel that leads to increased trade, capital infrastructure projects and technological improvement.

This brings me back to the private sector and the benefits many companies now see in playing a role in supporting global health, including immunization services. One benefit, of course, is humanitarian. The GAVI Alliance -- with help from partners such as UNICEF, WHO, the Bill & Melinda Gates Foundation, the World Bank and donors -- has helped countries immunize 370 million people, saving more than 5.5 million lives since 2000.

GAVI now is in the midst of helping immunize another quarter billion people, which could save an additional 4 million lives by 2015. The private sector is involved, providing core business skills to tackle key obstacles to immunization in the developing world.

For example, GAVI is working with a leading telecommunications company to explore the use of its mobile technology with hopes of improving vaccine stock management in implementing countries and alerting parents when children are due for vaccines.

GAVI is constantly looking for partners to lend their business savvy to help us accomplish our mission. An increasing number of them are responding, compassionate in their outlook while aware of the underlying economic value of vaccines.

They understand that this is the highest return on investment they could ever make.

Vaccination saves a ton of money

Naprawa, 15 — Amanda Z. Naprawa, Amanda Z. Naprawa is an attorney and will receive her Masters of Public Health from the University of California, Berkeley, in spring 2015. She is also the mother of 2 young children. She is passionate about immunization as a mother, lawyer, and

public health advocate, 6-9-2015 ("Vaccines Don't Just Save Lives—They Save Money," @berkeleywellness, 6-9-2015, Available Online at <http://www.berkeleywellness.com/healthy-community/contagious-disease/health-care-policy/article/vaccines-save-more-lives>, Accessed 7-21-2015)

Vaccines are considered to be among the greatest human inventions of all time. They are directly responsible for the increased life expectancy we enjoy by preventing childhood death from diseases such as measles, pertussis, and diphtheria. The CDC estimates that, among children born in the last 20 years, vaccinations will prevent more than 21 million hospitalizations and 732,000 deaths.

But beyond saving lives, this reduction in disease means a reduction in the cost of treating these illnesses. Which translates into vaccines being not only lifesaving, but money-saving as well.

How exactly do vaccines save money? When a child gets sick with a vaccine-preventable illness (as with any very serious illness), she will need to seek treatment and this of course is going to cost something. Now if the child gets a serious complication, she may need to be hospitalized. So there are hospital bills, medications, and doctor visits before, during, and after the illness. Tragically, if there are long-term complications, such as deafness from mumps or brain damage from measles, there will be costs associated with this as well (adaptive devices, special education requirements, etc).

One study in the journal Pediatrics examined the total costs associated with a variety of vaccine-preventable diseases—and thus the savings incurred by vaccinating—and the results were impressive. For example, the cost per hospitalization for an infection with haemophilus influenza type B (Hib), a very serious bacterial illness, with resulting meningitis can cost over \$43,000. An estimated 19,000 cases of Hib infection will be prevented over the lifetimes of children born in 2009 because of routine immunization, saving an estimated \$1.8 billion in disease-treating costs. When you add in all the other diseases that we routinely vaccinate against in the United States, the estimated savings are staggering.

In economic terms, those are considered "direct costs"—that is, the money that goes directly to the care of an ill child. But it's important to remember that when a child gets sick and hospitalized, there are costs beyond simply treating the illness. Her parents may have to take time off of work, incurring lost income. There may be insurance copayments to meet. If the child has long-term consequences from the illness, there may also be lost opportunities for income. And should this child have inadvertently exposed others, there might be a cascading public health crisis, with daycares shut and public health agencies mandating quarantines.

Public savings

The public can incur significant expenses from nonvaccination as well, often referred to as "societal" or "indirect" costs. For example, it can cost public health departments close to \$10,000 per day to contain an outbreak such as the recent measles outbreak—including identifying all possible infections, making contact with people who may have been exposed and following them for the entire incubation period, issuing orders to exclude unvaccinated children from school, working with other local health departments and hospitals on containment and

treatment protocols, and providing additional vaccinations. The average outbreak control period is 18 days; that's \$180,000 to control a disease that could have been prevented through vaccination.

These costs, both direct and indirect, are so impressive that it's considered financially irresponsible to limit access to routine immunizations based on family income or insurance status. In 1994, the U.S. government began a program called Vaccines for Children, which provides vaccines to children who would otherwise not be able to afford them. This program is estimated not only to have saved countless children from illness and death, but also to have saved nearly \$259 billion in direct costs and **\$1.38 trillion** in total societal costs. Think about that: \$1.38 trillion saved by vaccines. Honestly, that number makes the 238,857 miles between here and the moon sound like a short stroll, doesn't it?

The money-saving effect of vaccines is not limited to the United States. Worldwide, the three vaccine-preventable diseases that lead to the greatest mortality in children age 5 and under are pneumococcal disease, rotavirus, and Hib infection. Those children who survive these diseases may suffer long-term complications such as blindness, deafness, or mental retardation. It is estimated that if, over the next decade, we were to begin widespread vaccination against just three diseases (Hib, pneumococcal, and rotavirus) in the world's 73 poorest countries, it would save an estimated \$63 billion in treatment and lost productivity costs.

So there you have it. We know vaccines save lives. But it turns out they also save money, directly and indirectly. Yet one more reason to make sure you and your loved ones are fully vaccinated.

Vaccination saves over a trillion dollars.

Whitney et al. 14 — Cynthia G. Whitney, MD¹, Fangjun Zhou, PhD², James Singleton, PhD², Anne Schuchat, MD¹, ¹ National Center for Immunization and Respiratory Diseases, CDC; ² Immunization Services Division, National Center for Immunization and Respiratory Diseases, CDC, 4-25-2014 ("Benefits from Immunization During the Vaccines for Children Program Era — United States, 1994–2013," No Publication, 4-25-2014, Available Online at <http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6316a4.htm>, Accessed 7-22-2015)

The Vaccines for Children (VFC) program was created by the Omnibus Budget Reconciliation Act of 1993 (1) and first implemented in 1994. VFC was designed to ensure that eligible children do not contract vaccine-preventable diseases because of inability to pay for vaccine and was created in response to a measles resurgence in the United States that resulted in approximately 55,000 cases reported during 1989–1991 (2). The resurgence was caused largely by widespread failure to vaccinate uninsured children at the recommended age of 12–15 months. To summarize the impact of the U.S. immunization program on the health of all children (both VFC-eligible and not VFC-eligible) who were born during the 20 years since VFC began, CDC used information on immunization coverage from the National Immunization Survey (NIS) and a previously published cost-benefit model to estimate illnesses, hospitalizations, and premature deaths prevented and costs saved by routine childhood vaccination during 1994–2013. Coverage for many childhood vaccine series was near or above 90% for much of the period. Modeling estimated that, among children born during 1994–2013, vaccination will prevent an estimated 322 million illnesses, 21 million hospitalizations, and 732,000 deaths over the course of their

lifetimes, at a net savings of \$295 billion in direct costs and \$1.38 trillion in total societal costs. With support from the VFC program, immunization has been a highly effective tool for improving the health of U.S. children.

Data from the 1980s suggested that measles outbreaks were linked to an ongoing reservoir of virus among high-density, low-income, inner-city populations (2). Although most children in these settings had a health-care provider, providers missed opportunities to give measles vaccine when children were in their offices, sometimes referring low-income children to another clinic where vaccines were available at no cost (3). Approximately 50% of children aged <19 years are eligible to receive vaccines through VFC (Immunization Services Division, National Center for Immunization and Respiratory Diseases, CDC, unpublished data, 2014).^{*} Children can receive VFC-provided vaccine if they are Medicaid-eligible, uninsured, American Indian/Alaska Native, or, for underinsured children (i.e., whose health insurance does not fully cover immunizations), when they are receiving services at a federally qualified health center or rural health clinic (1). By providing vaccine for eligible children, at no charge, to public and private health-care providers who are enrolled in VFC, the program helped reinforce the "medical home." Inclusion of specific vaccines in VFC is determined by recommendations of the Advisory Committee on Immunization Practices (ACIP).

To assess improvements in coverage during the VFC era, data were obtained from the United States Immunization Survey (USIS) for the period 1967–1985, the National Health Interview Survey (NHIS) for 1991–1993, and NIS for 1994–2012 (3,4). Children included in USIS and NHIS were aged 24–35 months and those in NIS were aged 19–35 months. USIS and NHIS data were from parental recollection of vaccines received, and NIS data were obtained through provider report.

The cost-benefit model for U.S. children born during 1994–2013 employed methods previously used for children born in 2009 (5). A decision analysis birth cohort model was constructed using data on immunization coverage; vaccine efficacies from published literature; historical data on incidence of illnesses, hospitalizations, and deaths from vaccine-preventable diseases before immunization was introduced; and recent vaccination period data (through 2013, if available; otherwise 2012 data were used for 2013) on these same disease outcomes. Vaccines included all those universally recommended for children aged ≤6 years except influenza vaccine, which has been modeled separately (6), and hepatitis A vaccine. Infants in hypothetical birth cohorts from the period 1994–2013 were followed from birth through death. Benefits of immunization included savings in direct and indirect costs that accrued from averting illnesses, hospitalizations, and deaths among the 20 birth cohorts. Program costs included vaccine, administration, vaccine adverse events, and parent travel and work time lost. Costs were adjusted to 2013 dollars, and future costs related to disease were discounted at 3% annually. The cost analysis was conducted from both health-care (direct) and societal (direct and indirect) perspectives, and net present value (net savings) was calculated.[†]

When the VFC program began in 1994, vaccines targeting nine diseases were provided: diphtheria, tetanus, pertussis, polio, Haemophilus influenzae type b disease, hepatitis B, measles, mumps, and rubella (Figure). During 1995–2013, five vaccines were added for children aged ≤6 years: varicella (1996), hepatitis A (1996–1999 for high-risk areas, 2006 for all states),

pneumococcal disease (7-valent in 2000, 13-valent in 2010), influenza (ages 6–23 months in 2004 and ages 6–59 months in 2006), and rotavirus vaccine (2006). Since 1996, coverage with 1 dose of a measles-containing vaccine has exceeded Healthy People's targets of 90%, up from <70% before the 1989–1991 outbreak (Figure). For other vaccines licensed before VFC, coverage also was higher in the VFC era, as measured by NIS, than in the pre-VFC era, as measured by USIS. In general, coverage for new vaccines introduced during the VFC era increased rapidly.

Among 78.6 million children born during 1994–2013, routine childhood immunization was estimated to prevent 322 million illnesses (averaging 4.1 illnesses per child) and 21 million hospitalizations (0.27 per child) over the course of their lifetimes and avert 732,000 premature deaths from vaccine-preventable illnesses (Table). Illnesses prevented ranged from 3,000 for tetanus to >70 million for measles. The highest estimated cumulative numbers of hospitalizations and deaths that will be prevented were 8.9 million hospitalizations for measles and 507,000 deaths for diphtheria. The routine childhood vaccines introduced during the VFC era (excluding influenza and hepatitis A) together will prevent about 1.4 million hospitalizations and 56,300 deaths.

Vaccination will potentially avert \$402 billion in direct costs and \$1.5 trillion in societal costs because of illnesses prevented in these birth cohorts. After accounting for \$107 billion and \$121 billion in direct and societal costs of routine childhood immunization, respectively, the net present values (net savings) of routine childhood immunization from the payers' and societal perspectives were \$295 billion and \$1.38 trillion, respectively.

Ableism

Reject the ableist discourse surrounding vaccination debates – whether vaccines cause autism or not is irrelevant – treating autism as a negative condition comes from an incredibly neurotypical position of privilege.

Thériault 15 – Anne Thériault, Toronto-based writer and activist, 2015 (“What vaxxers and anti-vaxxers are missing: Autism isn’t the worst thing to happen to a child”, Quartz, February 11, Available Online at <http://qz.com/340623/what-vaxxers-and-anti-vaxxers-are-missing-autism-isnt-the-worst-thing-to-happen-to-a-child/>, accessed 7/20/15, KM)

Here are some typical arguments put forward by parents who choose not to vaccinate their otherwise healthy child (by “healthy” I mean they’re not asking for an exemption because the child is immunocompromised or otherwise couldn’t medically tolerate vaccinations). For this example, I will pull quotes directly from a recent New York Times Article, Vaccine Critics Turn Defensive Over Measles: “It’s the worst shot,” [Missy Foster, mother to an 18 month old daughter] said, with tears in her eyes. “Do you want to wake up one morning and the light is gone from her eyes with autism or something?” and Kelly McMenimen, a Lagunitas parent, said she “meditated on it a lot” before deciding not to vaccinate her son Tobias, 8, against even “deadly or deforming diseases.” She said she did not want “so many toxins” entering the slender body of a bright-eyed boy who loves math and geography. You’ll notice a common theme in these defenses—the brightness of or light in their children’s eyes. This is a direct reference to Jenny McCarthy’s narrative of the “light” leaving her son’s eyes after he was vaccinated. It’s used by parents who don’t want to say the word “autism” but want to imply that they’re scared their kid will become autistic (or something similar). Here’s what McCarthy said to Oprah in 2007: “Right before his MMR shot, I said to the doctor, ‘I have a very bad feeling about this shot. This is the autism shot, isn’t it?’ And he said, ‘No, that is ridiculous. It is a mother’s desperate attempt to blame something,’ and he swore at me, and then the nurse gave [Evan] the shot,” she says. “And I remember going, ‘Oh, God, I hope he’s right.’ And soon thereafter—boom—the soul’s gone from his eyes.” Now consider the standard response from vaccine advocates to stuff like this—it’s always, without fail, “Vaccines don’t cause autism.” Because they don’t, right? They absolutely, scientifically do not cause autism. That’s a solid fact. But here’s what everyone gets wrong: regardless of whether or not vaccines cause autism, our entire conversation surrounding them is completely ableist. When those in the anti-vaccination movement treat autism as a calamity far worse than a debilitating disease or death, that is ableism. What we also need to recognize is that every time we respond to fear-mongering about vaccines and autism with the words, “don’t worry, vaccines don’t cause autism,” that is also ableist. Because instead of pointing out that, hey, autism and neurodiversity are far from the worst things that could happen to a parent, “vaccines don’t cause autism” falls into the same narrative as “vaccines cause autism”—both suggest that autism is this boogeyman that lives under our kids’ beds that could strike at any time. Even though telling people that vaccines don’t cause autism is factual, the way in which it’s said only validates people’s negative view of autism. Says Allison Garber, an autism activist whose most recent claim to fame is being blocked by Jenny McCarthy on Twitter, “The language from both sides of the vaccine camps is definitively ableist. What’s even more jarring is that neither side seems to ever want to invite someone who is, you know, actually autistic to the party. I guess that’s because it would be awkward if they were actually in the room when we were all talking about how somebody’s neurological makeup is a tragedy to be feared and avoided at all costs.” Instead of reassuring parents that vaccines don’t cause autism (which, again: factually true), why don’t we start refuting anti-vaccination advocates with the fact that autism isn’t a catastrophe. Why not start sending them links to blogs and articles written by people who actually have autism. Why not say something like, “it’s been proven that there’s no link between vaccines and autism, but I think it would be great for you to re-evaluate why you think so negatively of autism.” And for the love of Pete can we please stop talking about how autistic people have no light in their eyes or no soul or whatever. First of all, you’re confusing vampirism with autism. Second of all, how can you talk about real, living people like that? Would you tell Temple Grandin to her face that the “light” (whatever that even means) is missing from her eyes? If you went to a book reading by John Robison, would you greet him afterwards with the words “So, what’s it like not having a soul? Do you still have a reflection? Can you eat garlic? Do you sleep in a

coffin?" Autistic people aren't "gone." Their brains function differently than neurotypical brains, which often leads to them becoming overwhelmed by outside stimuli in a way that other people might not. So, in a sense, they're more present than many of us are—they're bombarded by sights, sounds and smells that neurotypical people can ignore or dismiss. They are very much "here," trying way harder than most to process what "here" is. So get out of here with your misinformed ideas about autistic people having no light in their eyes or no soul. Get out of here and maybe go meet an actual autistic person. At the end of the day, words matter and how we talk about issues matters. And when those of us who believe it's important for children to be vaccinated keep pulling out "but vaccines don't cause autism" without following it up with some kind of explanation that also autism isn't a tragedy, we need to consider the impact our words might have. Because of course the end goal is to vaccinate every child eligible for vaccination, but we don't need to throw autistic people under the bus to accomplish that goal. The debate about vaccination should be autism-inclusive, and that means re-evaluating the way we talk about autism and vaccines. Because while it's great to raise a happy healthy kid, you can do that without turning them into an anti-autism bigot.

The anti-vax propaganda tactic of characterizing autism as "worse than death" is dehumanizing and false – voting neg against anti-vaccination is the first step to deconstructing ableism in society.

Raygender 15 – Raygender, social justice blogger that focuses on police brutality, racism, LGBTQ issues, and mental health issues, 2015 ("Ableism, Disability, and The Conversation About Vaccines: An Autistic Perspective", Raygender, February 6, Available Online at <https://raygender.wordpress.com/2015/02/06/ableism-disability-and-the-conversation-about-vaccines-an-autistic-perspective/>, accessed 7/21/15, KM)

There's been a lot of talk about vaccines lately, and how diseases that were once almost eradicated are starting to come back because unvaccinated children are being exposed, or exposing others, to viruses. I'm glad this issue is getting more attention. It's something we need to talk about! Vaccines have genuinely improved society by preventing people from contracting some illnesses they could potentially die from. Now that people are avoiding them, some of those diseases are coming back, and putting people's lives at risk. I would be even happier if the mainstream conversation reflected the conversation that's been happening in the autistic community for years. That's right — autistic people have been speaking out about vaccines ever since the anti-vaccination movement began. From the very beginning, the anti-vaccination movement has been an autism issue. You cannot talk about one without the other. People's reasoning for avoiding vaccines stems from the idea that childhood vaccines cause autism, and that autism must be avoided at all costs. To leave this out is to skip over one of the many ways the anti-vaccination movement is hurting people. The anti-vaccination movement has its origins in the work of Andrew Wakefield — a former medical researcher who published a study in 1998 claiming that the measles vaccine was responsible for the supposed "autism epidemic." No researchers could reproduce Wakefield's claims — a sure sign in the scientific community that a theory is false — and in 2004, an investigation revealed that Wakefield had conflicts of interest and had committed misconduct. This included subjecting the children involved in his study to unnecessary, abusive medical procedures. Sadly, debunking Wakefield's study was not enough to stem the tide of the anti-vaccination movement. The idea that childhood vaccines caused autism fits perfectly into people's ideas about the so-called "autism epidemic." It's a fact that autism diagnoses are on the rise, but it's not a fact that this is because of vaccines, or chemicals, or television, or smart phones, or anything else. In fact, the most likely "cause" is simply that doctors are getting better at diagnosing people. There's nothing sinister behind it, and there's certainly nothing sinister about autism itself — something else that autistic people have had a hard time convincing others of. Even if vaccines did cause autism — which, seriously, we have no actual proof that they do — why is that enough motivation to risk destroying herd immunity and creating a measles epidemic? You can die of measles; you can't die of

autism. The answer, of course, is ableism. People are afraid of disability. And it goes beyond just worrying that if disabled, they won't be able to work or they'll be excluded from society. People think disability is a fate worse than death, when really it's just another aspect of human diversity. And this attitude of fear is extremely harmful. Just look at Jenny McCarthy and her organization Generation Rescue, who have led the anti-vaccine movement, at the cost of thousands of lives. Generation Rescue's name refers to "rescuing" children from autism, or rescuing society from the "autism epidemic." Autism isn't something anyone needs to be "rescued" from; it is not holding children hostage, like another organization, Autism Speaks, has claimed. It is not depriving families of the "normal" child they feel they deserve to have, and it is not a danger to society. In fact, "rescuing" children from autism is far more dangerous. Therapies used to "treat" autism, like Applied Behavior Analysis, use the same principles as gay "conversion" therapy — in other words, the goal is to make the patient behave in socially acceptable ways, which means suppressing their own, natural ways of behaving — something that is best accomplished by abuse, and can lead to lifelong trauma. Parents have also been known to give their children bleach enemas, beat them, and "train" them like dogs, all in an attempt to "rescue" them from autism. Now, that this issue is hitting the mainstream, we have a unique opportunity to talk about autism and abliesm. The anti-vaccination movement is based on fear of autism. It is based on the idea that autistic children are soulless — that, in the words of one horrific advertisement, "you can't die from autism, but you can't really live with it either." This attitude just creates even more fear. People with a range of disabilities are affected by the vaccination issue. People with vulnerable immune systems are put at risk, with the message that if they can't survive without the aid of medical science, they're somehow a drain on society. And autistic people, or anyone else with a condition that's supposedly caused by vaccines, is told that they are soulless monsters, not even really alive, and that parents are right to do everything in their power to avoid having a child like them. Even well-intentioned pro-vaccine advocates have fallen into the trap of ableism. It's very easy to ignore the deeper issues all together. The facts say vaccines don't cause autism. So many people have assured parents that they have nothing to worry about; vaccines won't cause their child to come down with a horrible disease. But autism isn't a horrible disease. It isn't monstrous or tragic. And as long as people think it is, and avoid speaking out against fear, autistic people will continue to suffer. Just as all disabled people suffer when people think our lives are tragic, and that we are burdens. I hope that the mainstream conversation on vaccines has room for these issues. Illnesses like those we vaccinate against in early childhood are terrible, and can affect anyone. They can kill. This is not preferable to autism. It is not preferable to the disabilities that might result from illnesses like polio or meningitis. Disabled people are better off alive because all people are better off alive. This should be the focus, because so many lives are being threatened by the anti-vaccine movement. People are at risk for dying from preventable diseases, and autistic people are at risk for dying at the hands of caretakers and parents who see them as a burden. My greatest hope is that we can eliminate these deaths completely if we stand together and remember that autism isn't anything to be scared of.

Autism is not a "tragedy", "burden", or "crisis" – challenging the ableist logic of things like anti-vaccination is key to breaking down neurotypical constructions of disability that shape policies and cause violence.

Kurchak 15 – Sarah Kurchak, writer and autistic advocate, 2015 ("Autistic people are not tragedies. My life has value and joy", The Guardian, April 30, Available Online at <http://www.theguardian.com/commentisfree/2015/apr/30/autism-is-not-a-tragedy-take-it-from-me>, accessed 7/21/15, KM)

The existence of autistic people like me is not a "tragedy". Yet many autism awareness narratives insist it is because they prioritize the feelings of neurotypicals (non-autistic people) and dismisses the rest of us as little more than zombies. And when people buy into this idea, it actively hurts autistic people. When I was finally diagnosed with autism spectrum disorder six years ago, I wouldn't shut up about it. In part, this was because I, like many autistics, tend to persevere about the things that

intensely fascinate me and, at that moment, there was nothing more fascinating to me than discovering that there was an explanation for all of my sensory sensitivities, social issues, repetitive behaviors and obsessive interests. I also believed in the importance of autism awareness. But once I started participating in awareness campaigns I found the same overly simplistic and fear-mongering message over and over again: autism is a “crisis”. According to the highly influential charity Autism Speaks (which doesn’t have a single autistic person on its board), autistic people are “missing” – we leave our family members “depleted. Mentally. Physically. And especially emotionally.” Defining our existences solely as a tragedy for non-autistic people is hurtful on a personal level. No one deserves to be told that they are nothing but a burden to the people who love them and everyone has the right to feel like their lives have value. But it also has troubling implications for public policy. If autism is only presented as an unequivocally terrible curse that must be “cured” and eliminated, then charities that are primarily focused on finding a cure – like Autism Speaks – will continue to receive the bulk of ASD-related funding and volunteer hours. Even if a cure is possible or preferable (both of which are arguable) these wild stabs at hunting down genetic bogeymen in the hopes of eliminating them in the future do nothing to improve the lives of the autistic people and their caregivers who are struggling with a scarcity of both resources and understanding right now. This line of thought also eclipses more nuanced discussions that might help to make life more manageable for the people who make up this so-called autism epidemic. If you spend time following hashtags like #ActuallyAutistic and the work of organizations like the Autistic Self Advocacy Network and the Autism Women’s Network, a cure is the last things on any of our minds. We want to talk about autism acceptance. We want people to understand that everyone on the spectrum, verbal or otherwise, has value and we want to work so that everyone has a voice, be it verbal, written, assisted or otherwise. We want to talk about which therapies and treatments are actually effective for us and which ones are detrimental to our well-being. And we want to know how we can create an environment in which autistic children are not at constant risk of wildly disproportionate punishment due to misunderstanding and fear. This is a particular concern with autistic children of color who face both ableism and racism, like 12-year-old Kayleb Moon-Robinson, who was charged with a felony after kicking a garbage can. Genuine awareness of autistic people, of our lives, our needs and our value, could greatly improve the lives of people both on and off the spectrum. Autistic people and our allies just need the rest of the world to stop spreading “autism awareness” long enough to actually listen and gain some.

The anti-vaccination movement is wrong – it’s not “vaccines versus autism”, but “vaccines versus ableism” – discussion now is key to reverse the ableist fallacy of anti-vaccination.

Kurchak 15 – Sarah Kurchak, writer and autistic advocate, 2015 (“I’m Autistic, And Believe Me, It’s A Lot Better Than Measles”, The Archipelago, February 6, Available Online at <https://medium.com/the-archipelago/im-autistic-and-believe-me-its-a-lot-better-than-measles-78cb039f4bea>, accessed 7/21/15, KM)

Vaccines don’t cause autism. But even if they did, is being like me really a fate worse than death? The autistic brain is not particularly good at understanding irony, and yet most people I’ve met on the autism spectrum have, over time, developed a pretty strong grasp of the concept. Many of us have even managed to teach ourselves how to wield it. I’ve begun to suspect that this is due to our constant hands-on experience. Having an autism spectrum disorder in an ableist world means that you’re constantly exposed to cruel irony. Most frequently, this comes in the form of neurotypical (i.e. non-autistic) people who tell you, incorrectly, that you can’t or don’t feel empathy like them, and then stubbornly refuse to care about your feelings when they claim that you’re lost, that you’re a burden, and that your life is a constant source of misery for you and everyone who loves you. There’s also my current favorite: parents who are willing to put the lives of countless human beings at risk because they’re so afraid that the mercury fairy will give their kids a tragic case of autism if they vaccinate. Gotta protect the kids from not being able to feel empathy — who cares whether other children live or die? No matter what other lofty ideas of toxins and vaccine-related injury anti-vaxxers try to float around in their defense, that’s really what all of this is

about: we're facing a massive public health crisis because a disturbing number of people believe that autism is worse than illness or death. My neurology is the boogeyman behind a completely preventable plague in the making. The anti-vaccination movement is a particularly bitter issue for me because it doesn't just dehumanize me as an autistic person; it also sets off two of my biggest triggers. Like many people on the spectrum, I don't handle it well when people are 1) wrong, and 2) unfair. I've always struggled to be patient with people who are clearly and obstinately wrong. Most of my elementary school report cards contained some variation of "Sarah does not suffer fools gladly" and I can't honestly say that I've made significant improvements in that arena since then. And people who refuse to vaccinate their children because they believe that vaccines cause autism are wrong. Andrew Wakefield's infamous study that linked autism to the MMR vaccine, which first sparked anti-vax panic in 1998, was called into question in 2004 and fully retracted in 2010. Wakefield, who misrepresented or altered the subjects' medical histories over the course of his research, lost his license that same year. No scientist has been able to reproduce his results. Major studies by The Journal of Pediatrics and the Institute of Medicine have failed to find any link between vaccines and autism. This should be more than enough to persuade a rational person that vaccines are safe — or at least as safe as any other simple medical procedure — but there is nothing even remotely rational about the anti-vaccination movement. It's a dangerous and infuriating melange: poorly articulated fears of "toxins," a failure to understand the difference between correlation and causation, misleading articles on truther websites, and conspiracy theories that would make Fox Mulder and The Lone Gunmen blush. I can't even begin to wrap my head around anti-vaxxers' reasoning. How can you find fault with every single bit of evidence that we have, from every single source, about the safety of vaccines? How can you continuously misread every single fact about their contents? How can you disregard the efficacy of vaccines in the fight against deadly and debilitating illnesses across the globe? If you can't disregard it, how can you not care? If there really is a connection between autism and vaccines — which there's not — and Big Pharma and/or The Man really are causing autism through vaccinations, what on earth do you think the end game of this conspiracy is? What upsets me more than the wrongness, though, is the dangerously unfair behavior that results from it. When someone believes asinine things about vaccines, it hurts humanity on an intellectual level. When they put those beliefs into action and refuse to vaccinate their children, it puts all of us at risk of serious illness and death. The current measles outbreak, which has now infected over 100 people in 14 states and is currently spreading into Canada, is a glaring example of what can happen when people put their (ignorant) personal whims against the well-being of their community. Through no fault of their own, unvaccinated children, immunocompromised people, babies too young to receive the vaccination and the occasional vaccinated person (no vaccine is 100 per cent because science is not magic) across the continent are suffering from an infection that was essentially eliminated from the U.S. in 2000. All because a sizable group of mostly-privileged parents have decided that reviving a group of life-threatening diseases and potentially inflicting them on their loved ones and neighbors is infinitely preferable to having an autistic child. I take the decision not to vaccinate personally. I've tried to have empathy for the other side, I've tried to tell myself that it's none of my business, but I can't and it is. Someone who refuses to vaccinate their children because they're afraid of autism has made the decision that people like me are the worst possible thing that can happen to their family, and they're putting everyone at risk because of it. I've been told by some anti-vaxxers that they don't mean my brand of autism; they mean non-verbal autism, or as they are so fond of calling it, "profound autism." I'm not about to take any solace in the idea that they're willing to make exceptions for autistic people who can perform as neurotypical, or at least pose as little annoyance to neurotypicals as possible. That just means that I will cease to be of any value to these people if I am no longer able to pass as one of them, and that they see no value and no humanity in anyone who communicates or behaves differently from them. Tell me again who has the empathy problem? The best that I can muster in the anti-vaxxers' defense is that they're not 100 per cent responsible for the anti-autism sentiment fueling their movement. The idea that autism is an unparalleled tragedy didn't happen in a vacuum. It came from the very people who claim to support us. Take Autism Speaks, for example. The world's most prominent autism-related charity has a pretty cuddly exterior. Celebrities toss money at it. People wear blue things to help it raise awareness. It claims to help autistic people and their families. Why would anyone question its intentions? It would be absolutely absurd to run a charity for people you hate, after all. Right? But Autism Speaks isn't really a charity for autistic people. It's a charity for neurotypical people who have been afflicted with the horror of having autistic people in their lives. Since its inception in 2005, Autism Speaks has perpetuated the idea that people with autism are a burden and somehow "lost," and they've refused to listen to any actual autistic people who disagree with their party line. It's supported a number of dangerous and dubious treatments, like electroshock therapy and chelation, a lead poisoning treatment that has many risks and no proven benefit as an ASD cure, all in the name of making autistic people appear more neurotypical. Its official statements consistently refuse to acknowledge any humanity in autistic people, or recognize that their families experience anything other than abject misery. In its 2013 Call For Action,

founder Suzanne Wright, who has an autistic grandson, wrote that families with an autistic member “are not living. They are existing. Breathing — yes. Eating — yes. Sleeping — maybe. Working — most definitely — 24/7. This is autism. Life is lived moment-to-moment. In anticipation of the child’s next move. In despair. In fear of the future. This is autism.” And honestly, that’s one of the less offensive things she’s said about us. This is far from true for the countless families who have spoken out against Autism Speaks. It’s certainly not the case for mine. We are all, last I checked, living. We work together to bridge our differences in communication, sensitivities, attributes, and detriments to go about our lives in a way that expands far beyond the moment-to-moment. We’re no more or less imperfect or tragic than the average family. We don’t even have measles. I have good days where my strange and intense interests give me a unique perspective in my writing and my focus helps me get it down on paper. I have bad days where I can’t ride public transit without having a panic attack and I have to leave the room when my husband chews food because I find the sound of it unbearable and overwhelming. I have stimmed to my heart’s content and I have hit myself. Throughout all but the worst of it — depression is a common comorbidity of autism, likely because living in the neurotypical world is often trying — I’ve been pretty sure that I am “living,” and better for it. Throughout all of it, my loved ones have preferred my autism to my possible illness or death, or the deaths of others. I’d say I was grateful, but really, this should be a given. Autism Speaks is currently urging parents to vaccinate their children, though it was funding and supporting vaccine-related research as recently as 2009. But it continues to spout the kind of anti-autism rhetoric that made people who aren’t so great with critical thinking so scared in the first place. I’m not sure what the cure is here. Anti-vaxxers are very dedicated to being wrong. As The New York Times’ Brendan Nyhan discovered last year, they’re more resistant to irrefutable facts than vaccinated kids are to preventable diseases. But I’m at least a little bit hopeful that renewed interest in anti-vaxxer rhetoric, spurred by the current measles outbreak, will inspire a more thorough discussion about autism like Anne Theriault’s and Jen Zoratti’s excellent work on the topic (full disclosure—I’m quoted in the latter piece)—and that this discussion will do some good. For starters, we could talk about people on the spectrum like we’re better than measles, like we’re human, or like we’re there at all. Long before the fear of autism threatened everybody’s lives and well-being via the anti-vaccination movement, it threatened the lives and well-being of autistic people through isolation, improper treatment, and even outright murder. Even if we can’t eliminate these deaths — and I hope to Temple Grandin that we can — the way that people respond to the current public health clusterfuck still offers us a chance to save lives.

We must actively reject ableism and confront abled privilege – ableism shapes our assumptions and understanding of the world, dehumanizing those lacking privilege.

Phillips 15 – Kiah Phillips, contributor to Respectfully Connected, a blog that focuses on ableism and emphasizes neurodiversity, 2015 (“So, What is Ableism?”, Respectfully Connected, February 27, Available Online at <http://respectfullyconnected.blogspot.com/2015/02/so-what-is-ableism.html>, accessed 7/21/15, KM)

Ableism is a form of discrimination or prejudice against individuals with physical, mental, or developmental disabilities that is characterized by the belief that these individuals need to be fixed or cannot function as full members of society (Castañeda & Peters, 2000). As a result of these assumptions, individuals with disabilities are commonly viewed as being abnormal rather than as members of a distinct minority community (Olkin & Pledger, 2003; Reid & Knight, 2006). Because disability status has been viewed as a defect rather than a dimension of difference, disability has not been widely recognized as a multicultural concern by the general public as well as by counselor educators and practitioners. Laura Smith, Pamela F. Foley, and Michael P. Chaney, “Addressing Classism, Ableism, and Heterosexism in Counselor Education”, *Journal of Counseling & Development*, Summer 2008, Volume 86, pp 303-309. When our boy was first diagnosed as autistic, I had never heard the term “Ableism”. I have to be honest, I probably still didn’t hear it until well beyond the first anniversary of that day. I had no idea of just how much this concept, this idea, this reality was going to coincide with our boy’s life then - and to a lesser but still significant extent, our lives as parents too, for very different reasons of course. However, once my thinking shifted from the pathology perspective; common among most professional “experts” and vast numbers of parents, to the neurodiversity model, I began to

recognise the degree to which the thinking of many neurotypical people revels in the inherent discrimination, prejudice and privilege of ableism. These same people would be aghast at comments containing racism, sexism or homophobia as but three examples, yet when it comes to ableism, somehow there is a collective societal blind spot - or so it would seem. So what is going on here? Could it really be that people simply do not know what ableism is? - at least in the sense that they don't see it as obviously as they would other forms of discrimination, or are people aware and as a society, we willfully turn our heads in ignorance the way we used to in relation to discrimination in other areas such as race or sexuality? In other words, is this an issue of recognition or willful ignorance? For me personally, I have to own it; I was painfully ignorant of the issues facing people with disabilities but I cannot ignore the fact that I also carried a privilege that I was not even aware of: I am neurotypical and in a society where (currently) the majority is neurotypical and all infrastructure and societal norms fit around that majority, which means I have advantages conferred upon me that I do not have to think about, hence - to some extent - my lack of awareness. That makes my life easier - and even possible, in some instances. These are things that a person with a different neurological make-up, such as autism, cannot take for granted. Every institution of society is based around a neurology that differs from theirs and this places them at an immediate disadvantage. You might think, well, autistic people should just try to fit in, or that society has a right to expect all people to conform to the socially acceptable ways of behaving, socially acceptable values or ideas of what a successful, "functioning" person looks like. If you do, either by accidental default or by willful ignorance, you are exhibiting ableism. Just as I used to, before my beautiful boy opened my eyes and tore open my mind and my heart. When was the last time someone insisted on using functioning labels in a conversation with you about a person who is autistic? How often have you heard "experts" claim that autistics must be able to pass as indistinguishable from their neurotypical peers? How often have you heard it said that autistics must not engage in self-stimulatory behaviour because it makes them stand out? What about repetitive actions or "hyper-focus on a specific interest"? I know that you'll have heard people tell you that this prevents the autistic person from functioning. I know that I have. But break it down.....please; Functioning as what? Because as far as I understand it, an autistic whom is engaging in those self-regulatory actions, is functioning well as an autistic person, which is who they are, after all is said and done. But wait - the assumption is that the goal is to function as closely to neurotypical as possible, right? To fit into the society that is established around the normative values of it's majority? You see I have an issue with that right there; because that is ableism. There are many variations on this theme. I read commentary constantly where parents concern themselves that their autistic child may never marry and have children; that they may not achieve financial success (whatever that means) or have a career. Aside from the fact that many autistic people do, despite all obstacles, meet those measures of success, there are many people with a neurotypical neurology who do not. I wonder why there is a generally held assumption that an autistic person only meets with deemed success when they are able to pass as a neurotypical person or adopt the values of a society whose majority does not speak for them? The undercurrent of every conversation that involves autistic people needing to be fixed, to fit in, to be cured, to be avoided in the first place, to engage in normative behaviour, to not perseverate on specific interests, to change who they are, is underpinned by the ableist assumption that to be neurotypical is better, that neurological variance is "less than". Less than what? Let me try that another way, if you will: how would it sit with you if I said that women were less valuable than men? That Asian people were better than Europeans? That homosexual people should be forced to marry into heterosexual couplings? You see the nonsense - not to mention the outrage that these views would cause? Yet I can be told that my beautiful child should be everything that he is not and cannot ever be (without destroying himself in the process) - and scant few of my neurotypical brethren are here to pick up the mantle of outrage and demand change. I ask myself: Is it because they are willfully looking the other way? But you. I am hoping that you, you will stand with me.

Ableist Discourse bad

Discourse matters – the language of anti-vaccination proponents can and does hurt people with disability.

Marcotte 15 – Dawn Marcotte, creator and CEO of www.ASD-DR.com, an online searchable database to help autistic teens and young adults identify colleges that provide support services specifically for autistic students, 2015 (“Accidental Ableism”, Autism Daily Newscast, February 23, Available Online at <http://www.autismdailynewscast.com/accidental-ableism/23452/dawnmarcotte/>, accessed 7/21/15, KM)

It was not something I concerned myself with too much as I consider myself to be a pretty good person who doesn't discriminate against anyone. I certainly never thought it would apply to my daughter. Then I read an article talking about the vaccine-causes-autism issue. This issue is in the forefront of news again, due to the recent outbreak of measles across the country. The article pointed out that most, if not all, of these articles were ableist because they talk about whether vaccines cause autism or not, as if autism is a disease. This concept never even occurred to me until I read this article. I can think of several times where I have left comments or written articles that used much the same language. For this I am sorry and can only hope that I have not offended anyone. More importantly the article got me thinking about how the use of language and social media can be so powerful. I don't think most people really consider how the words they use can be interpreted in different ways, but in today's web connected world, words are even more important. You don't know who will read what you have written and more than likely you won't ever have a chance to explain a word that someone else may find offensive. It is also important to remember that once you post something, it is out there forever. So all those families, friends and parents who post about the trials and triumphs of their children, it is important to stop and wonder how those same children will feel when they read it themselves. It doesn't matter how old they are now – eventually they will see what is written. Will it make them happy it was posted or embarrassed and angry? It doesn't matter if the post is well intentioned or not. Posting on Facebook asking the public to send birthday greetings may seem like a nice thing to do, but I often wonder if those parents have asked that child permission before they post. Does the child really want the world to know they don't have any friends? Do they really want greetings from people who send them only because they feel sorry for them and will never hear from again? Do they even care about getting birthday greetings? or is the parent assuming a feeling the child doesn't actually have? It seems that as parents we tend to make a lot of assumptions, myself included, about how our children feel or think – without asking them. Our priorities are not always theirs and it is time to step back and take an honest look at how we behave online. As a freelance writer I tend to share a lot of stories about our experience with autism and raising an autistic daughter. I never really asked her if it was okay to share these stories and just assumed she wouldn't care because I keep her anonymous. However I am making a commitment that from now on I will check with her first, before sharing anything online that refers to her or her experience. I am going to work hard to remember that everyone deserves respect. If I post something that I would find embarrassing if it were about me then I just shouldn't post it. I think understanding that ableism doesn't just apply to 'other' people, but to everyone is an important step in autism awareness. I only hope that other parents will take note and start to think more about what they post.
